Lynch (2003) theorizes about heritage language development largely by drawing many parallels between HL development and Second Language Acquisition (SLA). He asks the same questions that are asked in SLA research: (1) What do heritage language learners acquire? (2) How do learners acquire a heritage language? (3) What differences are there in the way in which individual learners acquire a heritage language? and (4) What effects does instruction have on heritage language acquisition? Lynch notes that frequency of forms and structure of interaction influence HL acquisition and production as they do SLA. As in SLA, HL development also exhibits great variability and particular orders and stages. HL learners' language use is also characterized by features such as overgeneralization and simplification, lexical extension, and word order transfer the same way as that of SL learners is. According to Lynch, the factors that account for variability in HL learning include speaker generation and birth order, socioeconomic class, gender, speaker social networks, language attitude, and motivation. Learner aptitude, strategies, and pedagogical approach all play a role in the success of instructed heritage language learning.

Focusing on the particularities of the HL learner, Tse (1997) puts forth an "ethnic identity model" which explains the relationships among ethnic identity, attitudes/motivation, and HL development. In her model, she posits four stages of ethnic identification: lack of awareness, ethnic ambivalence/evasion, ethnic emergence, and ethnic identity incorporation. At each stage, she provides a corresponding language attitude description. At the third stage, the HL learner begins to show interest in learning about her ethnic culture and acquiring her HL. At the final (fourth) stage, the learner discovers her ethnic minority American group, finds membership in that group, and establishes positive attitudes toward the HL.

A more general identity-based approach is presented by He (2006), which looks at how the HL learning takes place as the learner moves

across time and space. He considers learner identity (trans-)formation as the primary motivation for HL learning and situates the learner in his/her ongoing, evolving assessment and adjustment of him/herself vis-à-vis other persons in interactions across varying settings and during different developmental stages. He posits that HL development is contingent upon the degree to which the learner is able to construct continuity and coherence of identity in multiple communicative and social worlds. Conceptualizing HL development as a socialization process with multiple agencies, multiple directions, and multiple goals, He further puts forth ten hypotheses to describe and predict the key variables responsible for HL development.

Also centering on learner identity but drawing upon the concept of world citizenship and transformative pedagogy, Zhang (in progress) delineates three levels of heritage language education. According to Zhang, the first level, Individual Identity Conformation, focuses on preserving traditional cultures, histories, and identities through HL for ethnic communities and individuals. The second level, National Identity Conformation promotes HL to fulfill the growing national demands for foreign languages proficiency. The third level is Global Identity Conformation, which uses HL to educate children in a democratic society to transcend their culture, nurture mutual respect, and acquire the ability to recognize the humanity and legitimacy of all people and all cultures.

### PROBLEMS AND DIFFICULTIES

Given the short history of HL research, the body of work we now have is rich, if not yet focused or coherent. In general, the challenges facing HL research are two-fold: the comparability of studies and the continuity among various research endeavors.

We have seen a number of empirical studies documenting the various formal and functional aspects of heritage language socialization as reviewed in the previous sections. These studies are, however, hardly comparable because they deal with different subgroups of HL learners. As HL learners are a heterogeneous population that encompasses learners from a wide range of backgrounds, some studies looked at developmental traits in learners who have minimal proficiency in the HL, whereas others focused on maintenance issues in the case of highly proficient HL learners and still others examined both subgroups. This makes it hard for empirical investigations to be replicable and comparable.

Another consequence of HL being a fledgling research area is that researchers (empirical or theoretical) have yet to build upon each other's work adequately. In addition to the problem of incomparable data at different language proficiency levels, there is also the issue of

comparisons/contrasts between HL socialization in different languages (Armenian, Chinese, Hebrew, Japanese, Korean, Spanish, etc.) and different sites (home, school, church, workplace, etc.). Finally, theories and models are thus far parallel and have yet to show advancement in thinking.

A big conceptual challenge for heritage language socialization is socialization into whose culture, whose values and whose norms? Heritage culture itself is ever shifting as the immigrants' life unfolds in the new country. It remains to be evaluated whether it is productive to think of competence and target culture or expertise and allegiance (Rampton, 1995) or perhaps a bicultural, biliteracy continuum (Hornberger, 2004).

#### FUTURE DIRECTIONS

Campbell and Christian (2001) and the short papers contained therein posed a wide range of research questions that warrant urgent attention in the areas of language ecological patterns, language ideologies, measurement, and literacy. The following suggestions are made in keeping with the fundamental considerations of language socialization.

Given our definition of heritage language, neither the HL classroom nor the family is the only domain relevant to heritage language development or maintenance. Efforts to understand HL will be most fruitful if we take into account not only formal, institutional settings such as schools (e.g., Byon, 2003; He, 2000) but also patterns of heritage language use in informal settings such as home and communities (Bayley and Schecter, 2003), and not only the impact of face-to-face interaction but also the role of technology and popular culture (Lam, *Language Socialization in Online Communities*, Volume 8). Temporally, HL socialization is not limited to any specific given period of time; HL competencies, choices, and ideologies change over the HL learner's lifespan, reflecting changing motivations, social networks, opportunities, and other variables. Research needs to examine the different stages as well as different domains of HL development.

HL socialization research needs to expand its focus from individual language learner to other co-participants as well. It will be important to realize that expert guidance in HL socialization may be multiple, conflicting, and contested. The HL learner is engaged in multiple speech events in multiple settings for multiple purposes. The learning of HL, for example, takes place through the learner's interactions with multiple participants including language instructors, parents, grandparents, siblings, and peers, each of whom positions the learner in unique speech and social roles and each of whose reactions and responses to the HL learner helps to shape the path of her language development.

Future HL socialization research will highlight the co-constructed, interactive nature of HL socialization activities.

Complementarily, future HL research will take a more dialectical, dialogical, and ecological perspective on socialization, in the sense that the process will be viewed as reciprocal. HL learners are not merely passive, uniform recipients of socialization. As the HL learners' allegiances and competencies evolve, the language choices and competencies of their parents, siblings, neighbors, and friends will also change, consequently and/or concurrently. In other words, it is important to keep in mind that the HL learner contributes to the HL socialization process of the very people who socialize him/her to use the HL. Heritage language learning has the potential to transform all parties involved in the socialization process.

Overall, heritage language research will be increasingly informed by bodies of disciplinary knowledge, including but not limited to developmental psychology, formal and functional linguistics, linguistic and cultural anthropology, discourse analysis, second language acquisition, and bilingualism. It can also be expected that heritage language research will contribute to the very disciplines which have served as its theoretical or methodological guidance in terms of fundamental theoretical constructs, research methods, units of analysis, etc. For example, heritage language learning provides fertile grounds for us to reconsider dichotomous concepts such as native language versus target language, native speech community versus target speech community, instrumental versus integrative motivations, and basic interpersonal communication skills versus cognitive academic language proficiency. Last but not least, HL research will challenge us to re-evaluate our unit of analysis from single snapshots of one-on-one, unidirectional interactional processes to trajectories of growth and change over space and time for all participants.

### **Language Socialization among Adolescents and Adults**

## LANGUAGE SOCIALIZATION IN THE LEARNING COMMUNITIES OF ADOLESCENTS

### INTRODUCTION

Throughout history, *learning communities* have generally come and gone with little public notice. They emerge from the impetus of groups of individuals who identify specific needs for certain times and places. Learning communities differ in fundamental ways from *institutions*, which are cross-generational persistent entities, such as State systems or governments, religions, the family, and formal schools. Institutions, by their very nature, commit to basic maintenance of the *status-quo*—that is, standardized language, process, and ideology. Thus all institutions have as core responsibilities the transmission of certain values and bodies of knowledge as well as the orderly succession of their core structures and functions. For at least two millennia, societies have sustained their belief in the necessity of a core set of institutions—government, religion, family, and education.

But institutions leave gaps—especially when it comes to meeting the socialization needs of the young in rapidly changing societies. Institutions cannot manage the speed of adaptation and degree of flexibility that learning communities provide. Every age group from infancy through the final years of life provides unique challenges in socialization—particularly in language and interactional needs. Most notably, middle childhood (generally from age 8 through 12) and the adolescent and young adult years from 13 into the early 20's present special challenges. Maturational change comes rapidly along with the certainty of alterations in relationships of the young with key institutions—most notably the family, State, and formal education.

In this review, I first consider the history of youth learning communities back to the Middle Ages. This brief review sets up the framework through which I then examine a sampling of contemporary learning communities drawn from various parts of the world (cf. Amit-Talai and Wulff, 1995). All of these include young learners between the ages of 8 and the early 20's—a span of years in which speakers develop language primarily to explore and to expand their identities and roles. They do so while gradually separating from the care-giving of families and preparing for responsibilities imposed on them by the State, families, schools, and in many cultures, by religion as well. In most

societies, the State expects the young to engage in formal schooling during these years, as well as to prepare for betrothal, marriage, and procreation plus civic and work responsibilities (including military service in some cases).

The various types of learning involved in such preparation call on highly specific and critical skills for both the production and reception of language. Within sociology and the public media, learning communities generally receive descriptors such as *informal*, *nonformal*, or *nonconventional*. What goes on within these groups may be termed *indirect* or *informal learning*. Such dichotomous labels set these communities apart from *formal learning environments* generally characterized by specific role assignments, hierarchical structures, and time and space boundaries. Moreover, learning communities of young people do not fit easily into transmission models in which teaching and learning stand apart, and the inheritance of a parent culture is assumed. Throughout this review, the perspective is that of linguistic anthropologist concerned primarily with what happens in communities of learners rather than with how they adhere to structure arrangements—formal or informal—that mark institutions.

Youth learning and what is popularly termed “youth culture” depend not only on oral production and reception of language, but also on embodied performance—particular ways of walking, using hand signals, or emphasizing the spoken word through gesture and posture. Furthermore, youth culture not only represents itself but is represented through multiple modes (e.g. film, video, dance, music, etc.; cf. Kress, 2002; Ross and Rose, 1994; Shary, 2002). The dialogic basis of rap, narrative renderings in folk music and rhythm and blues portray numerous features of youth language: direct quotation, marked intonation, and repetition. In addition, across widely divergent cultures, peer socialization among the young is marked by mixed genres and overlapping multiparty talk; examples include: reflections of child soldiers in Sierra Leone (Shepler, 2005); the South African gestural language accompanying Tsotital (the youth vernacular of townships, Brookes, 2000); and the teenage language of aboriginal teenagers in Australia (Langlois, 2004; Schmidt, 1985).

Across cultures, those from 8 years of age forward spend most of their out-of-school time with peers engaged in play and work. Their social interactions and inner voicing call for syntactic forms and genres to support self-monitoring, negotiating, building plans, and assessing contexts, individuals, and information. Of themselves and others, they ask the essential questions “who am I?,” “where do I belong?,” “how will I make my way into the future?,” and “to what and to whom will I be committed?” Their language changes in pronunciation, syntax, intonation, and vocabulary in line with their self-perception of identity

(Eckert, 1988, 1989, 2000; Mendoza-Denton, 1999), as do their styles of swearing (Schworm, 2006).

Their learning communities spring directly from the social interactional needs of the young, but this common need does not predict their form or activity focus. Some youth-based learning communities reflect tight organizational structures and political goals. Consider, for example, the South African township student defense units that formed in the 1980s during the most violent years of the apartheid era in South Africa. Other groups, such as vigilante groups, guerilla or rebel forces, or youth gangs, reflect varying degrees of structure and image of common good in their operations, activities, and manner of identifying themselves to outsiders. Varieties of youth learning communities range from highly governed and adult-directed (e.g. baseball teams, community service organizations, etc.) to loose and short-lived (e.g. temporarily "favorite" activities). Whether for positive or negative social ends, youth learning communities work to ensure that their members learn the modes, information, skills, and ways of working of value to the individual self-identity (Fine, 1987; Mahiri, 1998, 2004).

#### EARLY EXEMPLARS

Throughout human history, most learning communities composed largely of the young have disappeared without a trace except in the memories of those who took part. As far back as the Crusades, when widows of the soldiers who died in battle joined with indigent women and girls of the countryside to create communities caring for the sick, needy, and orphaned, learning communities have included odd assortments of members. Many of the earliest of such groups came into being not only to serve charitable ends without profit, but also to take advantage of and to profit from niche markets and vulnerabilities in the social fabric (Watt, 1997).

Evidence of the language and thought of these groups comes in the stories told by traveling bards who depended on the likes of Robin Hood and his band of young men for the stuff of good tales. As commerce, industry, and exploration spread on land and sea in the eleventh and twelfth centuries, more and more occupations included learning communities of young people who directly experienced increasingly technical lines of work (Constable, 1996). All of these depended on specialized language and representations of symbol systems, from navigation and cartography to illustrated manuscripts and books. Moreover, almost all their learning had to come from observation and trial and error with relatively little explication of process or norms. Bands of travelers, including young people, moved about the countryside, and glimpses of interactions within these groups come in books

such as *The Decameron* by Giovanni Boccaccio (1348–1351) and *Canterbury Tales* by Geoffrey Chaucer (1342–1400).

Once paper, printing, and publishing came about, young people working on the margins of these businesses had opportunities to expand their experiences with visual and verbal literacies. As illuminated manuscripts were replaced by illuminated books, the young served as apprentices, and they often introduced themselves and their ideas into the *vignettes* or borders of the books on which they worked. Histories and analyses of illustration leave no doubt that as young apprentices were left to complete these books, they added their own flourishes, grotesque animals and figures, and picture stories within the backgrounds of scenes or curls of letters of the alphabet (Watson, 2003). These “extras” often provided counter messages to those of the straight or sanctioned text. Today they give some evidence of the talents and tastes of the young for subverting authoritative voices and using visual means to do so.

As production of paper spread across Europe from China, young people—copists and students learning together—were needed to copy books for authorized university book dealers, called stationers. These stationers later became booksellers, and their ability to offer paper manuscripts to the public, especially in cities such as Paris and London, relied on the speed of these young copists (Clanchy, 1979).

With the invention of movable type in the mid-fifteenth century, the printing press trade rapidly increased their intake of apprentices who formed their own learning communities in the back of print shops all over Europe. Widening intellectual interests, the rise of universities, and the rapid increase of urban populations called for more and more books. Advertising came about, in part to help sell printers’ left-over books; as the arts expanded from urban centers to small towns, broad sheets and eventually programs and dramatic scripts were in demand. The spread of theatre from urban centers to regional markets depended on young male actors in their early teens, highly desired for their abilities to portray women on the stage.

Shakespeare’s plays (much complemented in the minds of filmgoers who saw *Shakespeare in Love* in the late 1990s) tell not only of the wandering young but also give numerous indications of the skills called upon from the young “strays” who hung around the bustling and active public theatres of the sixteenth and seventeenth centuries. Meanwhile, public records multiplied in detail and quantity with the expansion of towns as market centers, and young people, unaccounted for and often unaccountable to any institutions, figure increasingly in these accounts.

Meanwhile, governmental, legal, and accounting matters continued to require production of books and paper for their records. Throughout

the sixteenth and seventeenth centuries, shipping of goods and expansion of exploration brought new demands and increased specialized interests, such as cartography and botanical drawing, both of which drew the young once again in as copists and gradually as type-setters and binders. Formal schooling during these periods became available only slowly and then to the male privileged. Aside from convents and nunneries, opportunities for females to take part in any kind of formal schooling came about only well into the eighteenth century. Particularly for the West, literary writers and public records increasingly open up to historians' tales of youth learning communities exploited by adults for petty crime (recall Charles Dickens' tales) and laboring in apprentice-like groups in a widening range of economic ventures. Here, as in the Middle Ages, histories of the expansion of literacy, commerce, and industry indicate a reliance on learning communities of young people working under the direction and often the exploitation of adults with primarily their own economic interests in mind (Darnton, 1984; Eisenstein, 1979).

Scanty as these early accounts are, several features of language socialization contexts emerge that we find also in contemporary situations. Foremost is the persistent involvement of the young in activities linked to reading, writing, and representing information for transport across time, space, and audiences. Next are the take-risks-to-survive engagements of the young in learning communities, whether as tag-alongs to charity or pilgrim groups, or as ship hands. These high-risk activities, setting off for sea and managing on the open seas, involved endless demands for uses of visual literacies and planful language—demonstrated repeatedly by adults in charge, whether in barked commands related to maintenance of ship rigging or in preparation for facing pirates or the ravages of storms. Finally, we see in this early history that without opportunities for formal schooling, the young did learn primarily through observation, trial and error, and direct experience. They had to work with their hands in tasks requiring focused attention to visual detail and high-performance demands that almost invariably involved use of verbal or visual symbol systems.

#### MAJOR CONTRIBUTIONS

For contemporary research on language socialization of those in middle childhood and adolescents on their way to young adulthood, Romaine (1984) and Eckert (1997) offer brief overviews regarding language learning. How young people learn syntax, genres, discourse styles, and the visual and performative dimensions of communication relates to age-grading and gender differences, as well as to the extent and nature of their access to linguistic resources. The key research question is therefore: When, how, and where do the young have sustained

interaction with models and opportunities that give them opportunities to gain practice in receiving and producing verbal and visual symbols?

### *Home and School Studies*

We take up studies that compare home and school briefly to consider two small bodies of literature. First are studies that compare home and school language patterns and ideologies for older children (Zentella, 1997, 2005). Work carried out with an “ethnographic” approach has been inspired primarily by the seminal work of Cusick (1972); Heath (1982, 1983, 2007); Philips (1972, 1983); and George and Louise Spindler (see Spindler and Hammond, 2006; Spindler and Spindler, 1992, for bibliographies). Studies in the critical tradition illustrate the class-based nature of contrasts between school-based language choices and language and media usage and ideologies of teenagers (cf. McLaren, 1986; Sarroub, 2005; Willis, 1977).

Other language socialization and ideology studies carried out in schools point out the extent to which the young take in, modify, transfer, or subvert teachers’ instructions and norms related to performance of academic language and literacy (Everhart, 1983; Shuman, 1986; Snow and Blum-Kulka, 2002). Such norms include not only appropriate participation within question–answer routines in classroom discussion, but also adherence to the written language norms of spelling, mathematical calculation, and school genres (e.g. standardized tests, the *précis*, short answers, book or laboratory reports, and essays). The majority of studies centered on oral language uses focus on the talk of teachers and students, emphasizing the dominance of teacher talk and restricting attention generally to questions and answers, discussion, and teacher–student conferences. Most relevant from these studies is the extent to which literacies are hidden and the young creatively subvert and re-create school norms and standards in their peer interactions (e.g., note-writing, hand signaling, and social interactions outside the classroom in halls, lunchrooms, and sports activities; cf. Flinders, 1992; Wells, 1996).

### *Peer-Centered Identity Groupings*

Sociologists and linguistic anthropologists have ventured beyond schools into friendship groups and youth gangs. Their studies demonstrate the rapid-fire overlapping nature of talk, representations of group identity and popular culture, interdependence with visual and performative modes, and gender differences (e.g. Cintron, 2005; Corsaro and Eder, 1995; Eder, 1995; Jacobs-Huey, 2006; Mahiri, 1998, 2004).

Youth gangs work to shape language uses and structures as well as dress, performative modes, and graffiti arts (Moore, 1991; Vigil, 1993).

As migration of young people increases around the world—Ecuadoreans and Dominican Republicans to Spain, Brazilians to Portugal, Africans to European nations, youth gangs as communities of learners (e.g. Latin Kings and Queens) move with them. Able neither to identify with their parents' past nor to envision their own possible futures, young immigrants have strong needs for forming their own learning communities. Community service, youth mentoring, promotion and experimentation with youth culture mark their activities. Labor market and educational pressures move some gangs into criminal activities that range from vandalism to drug trafficking. To the extent that we have any information on language socialization within gangs, we depend largely on first-person accounts (Brotherton and Barrios, 2004; Rodriguez, 1994).

### *Community Organizations*

Peer-centered friendship groupings, whether in the parking lot of fast-food chains or street corners, or in parks and small village centers, generally receive little more than fleeting attention from adults. Gangs, also peer and friendship centered, on the other hand, generally raise suspicions and even legal resistance from adults. Standing apart from the extremes of being either nearly invisible or highly provocative are youth-oriented community organizations, generally adult-led. Considered "community service," participation in these organizations brings young people and the results of their learning to positive public attention through exhibitions, service pursuits, and performances (Heath, 2001). The most long-lasting and successful of these groups offer opportunities for young people to take on many roles that parallel those of adult work experiences, including management, marketing, security, public relations, and programming. Long-term research (1987-present) directed by Milbrey McLaughlin and Shirley Brice Heath of Stanford University analyzed the structures, uses, and values of language and multimodal development in community-service, sports, and arts-based community organizations (Heath and McLaughlin, 1993; McLaughlin, Irby, and Langman, 1994).

Critical to the interactional work of community organizations in which young people play key roles in producing goods and services is the sheer amount of talk in which they take active part. Immersed in group commitment, individuals receive sustained adult and multiparty input from learners that vary in expertise, talent, experience, and style. Across exemplary organizations studied in the McLaughlin-Heath longitudinal research, young people could hear and use directions to listen, look, feel, and imagine as many as 50 times in any 2-hour work session. In a similar time period, they could take part in spontaneous

demonstrations by a more capable adult or peer of what a particular detail could look, sound, or feel like under different circumstances. Explanation of routines, techniques, possible outcomes, as well as narratives of past shows or performances, could take place more than a dozen times in any 2-hour session (Heath and Smyth, 1999).

Participation in creating a performance or exhibition of any of the arts generates more language input and production during any unit of time than does involvement in community service or sports teams. More open and flexible in outcomes and process than either sports or service to others, the arts generate opportunities for hypothetical thinking, creating of models (verbal, visual, and performative), and explaining, comparing, and critiquing work-in-progress (Heath and Langman, 1994; Heath and Soep, 1998; Heath and Roach, 1999; Mandell and Wolf, 2003; Soep, 2000). The language socialization of rehearsals and studios resembles in numerous ways that of science laboratories. Both depend on “what if” queries, consideration of alternatives, and intensive observation of the process and products of others.

Young people who engage in such community organizations see their groups as filling gaps that institutions cannot fill. Whether a dance troupe made up of street children in Addis Abba, Ethiopia or an arts-based environmental sustainability center in Boston, Massachusetts, these organizations take on responsibilities that complement the work of institutions as well as originate services that institutions later absorb into their own units. For example, in Mumbai, India, street children working with social workers formed a network of support that street children could access through a toll-free telephone number. Called Child Line, the service was seen as so valuable by several state governments that they established internal units with similar procedures and goals (Heath and Robinson, 2004).

Regardless of physical location or period of history, learning communities exhibit certain core features. The young must work across media, in high-risk roles, under high-demand circumstances, and they learn primarily through observation, direct experience, and trial and error. Much of what they do in these learning communities depends on close visual attention, manual dexterity, embodiment of roles, identity strengthening, and orientation to the future.

#### WORK IN PROGRESS

With the turn of the twenty-first century and widespread publicity about the perceived inadequacies of schools and families, more and more researchers began to study learning communities outside institutional sponsorship (Hull and Schultz, 2002; Miles et al., 2002). The percentage of two-working parent and single-parent households increased in

economies driven by technological advances and information-access explosions. Commercial edu-tainment and video and computer games drew the young. Young people came to spend most of their time as spectators of the creative work of others, “plugged-in” cellphone and iPod users, and solo players involved in highly repetitive eye-hand manipulative activities. Interactive talk with adults in project work or plan development or critique decreased in the home and in out-of-school hours of the young (Buckingham, 1993; Lareau, 2003). New research underway in European nations, England, Australia, Canada, and the USA focuses primarily on learning communities created by youth engaged in the arts, community development, environmental sustainability, health education, and social marketing. The wave of the future promises to address the proposal made by anthropologist Margaret Mead that the future of learning would belong to the pre-figurative talents of the young that would inevitably take over the post-figurative orientation of their elders (Mead, 1970).

#### PROBLEMS AND DIFFICULTIES

Variation and variability within and across learning communities of the young pose the major challenge to advancement of methods and theory. No problems are more critical than the dominance of studies of *monolingual speakers*. Across societies around the world, most young people speak, perform, and create in more than one language or language variety and in multiple modes (cf. Rampton, 1995). Moreover, depiction of the young in terms of an assumed generational response (e.g. Generation X) strips away the fact that the young invent and reinvent themselves in personal meanings and community involvement when they undertake membership in peer friendship groups, gangs, community, or religious organizations (cf. Baquedano-López, 1997). Young people need a biographic space to understand how and what they mean to others now and for the future. Moreover, symbolic representation and manipulation, along with creation of visual and performative means of projecting identities, constitute a substantial part of young people’s sense of involvement in youth culture, local, and global.

These difficulties come in the mismatch of customary data collection methods with the ability of the young to exclude their elders and to have considerable insight into the *a priori* assumptions of adults who ask questions, hold interviews, and lead focus groups. Across cultures, the young also excel in “true lies,” saying earnestly what is “true” at the moment or to someone somewhere, but without verification (Heath, 1997). Research with young people, perhaps more than any other group, depends upon building trust and a sense of reciprocity, respect, and data-sharing along the way (Heath, 1995, 1996).

Furthermore, nothing more than a rough framework is possible in the study of the linguistic life course of any individual or group. In particular, categories, agents, and settings derived from research in mainstream Western societies cannot be transferred across either socioeconomic or cultural boundaries. In particular, findings and theories drawn from studies of monolingual speakers in societies that expect maturity to bring developing fluency in a standard variety have little or no relevance for bilingual or multilingual communities around the world.

#### FUTURE DIRECTIONS

The future for research on the socialization of the young in verbal, visual, and performative dimensions holds few prospects for long-term work. As noted above, speakers and listeners in this group present almost insurmountable difficulties for researchers because of their closed-group inclusion norms. The presence of adults alters the language and modal production and valuation underway in drastic ways.

For the future, youth voices through their own work or their collaboration with listening adults will be at the center (cf. Farrell, 1990). The young in their friendship groups and in their work within community organizations will, no doubt, be preferred contexts for data collection and analysis.

Community organizations offer some particular benefits. Adult presence in these environments is routine; moreover, many adults who come through the organizations are expected to enter into conversation with the young, learn more about their work, and offer evaluative comments as well as resources. Moreover, the service orientation and performative nature of many community organizations means that listening and recording and asking for explanations take place on a regular basis. The most effective and promising direction for research on language socialization of young people in these environments will come from highly creative collaborative work in which some data collection methods, such as interviews, questionnaires, and close observation can be undertaken by youth members themselves who have real questions they want answered about their group and its work.

We can expect that learning communities of young people will continue to be heavily influenced by the need for a sense of belonging and meaning by the young. Simultaneously, they strive for coherence and identity, all the while knowing that they must make some kind of place for themselves in the rules and resources of the adult world to come. Social criticism, along with the desire to serve, heal, and help, will continue to place the young in these communities at the margins and often in opposition to the everyday lives of adults. Hence,

problematization will continue to come naturally, and research asking “how” and “for what” will not lose appeal. Researchers who can work with these questions are likely to be welcomed so long as they are true learners along *with* the young.

## GENDERED SECOND LANGUAGE SOCIALIZATION

### INTRODUCTION

Despite the fact that gender is a central organizing principle in every culture and that conceptions of normative masculinities and femininities differ cross-culturally, the role of gender identity in second language socialization has received insufficient attention. In 1994, Burton commented on the paucity of studies addressing the intersection of multilingualism and gender: “With a few notable exceptions, the considerable body of work on language and gender deals with monolingual situations, whatever the cultural context. In the literature on bilingualism, on the other hand, gender is hardly mentioned; here, it seems, is an area in which the experience of women is little documented” (1994, p. 1).

More than a decade later, an increasing number of studies have contributed to a more complex understanding of gender identity and its role in second language (L2) socialization within culturally heterogeneous and multilingual settings. The perspective of gendered L2 socialization redefines what it means to learn a second language; more than just learning a structure for communication, learners are acquiring social, cultural, and gendered norms along with procedures for interpretation within a new cultural landscape. This concept has refocused the attention of researchers away from the acquisition of discrete language skills and toward the larger framework of identity and context that may provide or limit access to L2 socialization. Research has explored how gender influences access to language socialization opportunities, how L2 learning may lead to transformation of gender identities and performance and reconsideration of gender ideologies, and the influence of gender on the development of language ideologies. The primary focus of this chapter is adult gendered L2 socialization, but a few important studies on children’s L2 socialization are also included.

### EARLY DEVELOPMENTS

Research in gendered second language socialization emerged from two sources—research in the field of children’s first language socialization (see Kyratzis and Cook, *Language Socialization and Gendered Practices in Childhood*, Volume 8) and a growing interest in the exploration of language and gender in discourse. Current research in gendered

L2 socialization draws on the pioneering work of Ochs and Schieffelin (1984), which explored language socialization of young children. While investigating children's first language socialization, early work in the field viewed language socialization as a lifelong process, not complete in adolescence, inviting researchers to continue to explore language socialization in first and second languages throughout adulthood. Watson-Gegeo (1988, p. 582) indicates that "the substitution of *socialization* for *acquisition* places language learning within the more comprehensive domain of socialization, the lifelong process through which individuals are initiated into cultural meanings and learn to perform the skills, tasks, roles and identities expected by whatever society or societies they may live in." Language socialization allows exploration into how individuals become socialized into gendered and other identities.

Research in the field of language and gender was also an important influence on research in gendered L2 socialization. Influenced by the feminist political movement in the 1970s, this research explored inequitable power relations between men and women through discourse studies (for a detailed review on gender and language research, see Freeman, 1997). A growing interest in the role of gender in linguistic phenomena encouraged a number of studies which explored the role of gender in second language acquisition. Many of the early studies employed a binary and essentialist definition of gender, which resulted in an oversimplification of gender's role in linguistic phenomena.

Early developments in the area of gender within the field of second language acquisition were mainly experimental or quasi-experimental studies. Many of these studies resulted in universalizing claims about women's linguistic role. For example, Ellis (1994, p. 204) in an assessment of women's L2 learning abilities, states, "The female 'culture' seems to lend itself more readily to dealing with the inherent threat imposed to identity by second language learning." Although Ellis does note that gender is likely to interact with other factors such as age, ethnicity, and social class in determining L2 proficiency, statements such as these depict women as one monolithic culture and overlook the social context of the language learner.

Norton's (1997) article, which called for a reassessment of identity in the field of second language acquisition, had a significant impact on research in gendered second language socialization. Norton wrote that the field of second language acquisition had been unable to conceptualize the relationship between the language learner and the social world because researchers had not developed a comprehensive poststructural theory of identity which integrated the language learner and the social context of language acquisition. Her work was influential in moving the field of second language acquisition away from perceiving gender

as a variable and toward a consideration of gender as local and socially constructed.

Eckert and McConnell-Ginet's (1992) work, while not specifically within a second language context, was influential in understanding gender as embedded within the construction of other socially significant categories, which are constituted through language. They cautioned readers about the problems that might result from global claims about women's role in language change and urged researchers to "think practically and look locally" in understanding the tendencies of gendered language change and acquisition:

To think practically and look locally is to abandon several assumptions common in gender and language studies: that gender can be isolated from other aspects of social identity and relations, that gender has the same meaning across communities, and that the linguistic manifestations of that meaning are also the same across communities (Eckert and McConnell-Ginet, 1992, p. 462).

Their suggestion urges researchers not to globalize gender across different contexts, but instead to examine the social, economic, and political contexts which influence the construction of gender identity, and the ways in which the use of a particular language variety or form may index a gender identity. "Looking locally" calls attention to the importance of researching gender in local communities of practice, defined as groups "whose joint engagement in some activity or enterprise is sufficiently intensive to give rise over time to a repertoire of shared practices" (Eckert and McConnell-Ginet, 1999, p. 185).

Research in the area of children's first language socialization, growing interest in the role of gender in discourse and language learning, and a more nuanced understanding of gender as an aspect of identity led to a number of major contributions in the field of gendered second language socialization.

### MAJOR CONTRIBUTIONS

Researchers have investigated three main areas in which gender influences opportunities for language socialization. The first area focuses on the role that gender identity plays in enhancing or limiting access to linguistic resources. Studies in the second area investigate the ways in which gender identity influences interactional opportunities for male and female learners in L2 classrooms. The third area relates to the intersection of language ideologies and gender ideologies, examining how gendered ideologies about a second language influence a learner's investment in or resistance to learning (Norton and Pavlenko, 2004).

*Gendered Access*

Gender identity affects the communities of practice in which individuals can participate and their access to opportunities for L2 socialization. A number of researchers have explored how gender identities influence access to jobs, schooling, and other settings where second languages can be acquired. Holmes (1993), working with immigrant women in Australia and New Zealand, and Rockhill (1993), working with Latino women in the USA, have documented that immigrant women often have less access to L2 socialization in workplace settings than men. Goldstein's (1995) research with Portuguese immigrant women in Canada calls attention to the gendered cultural practices in the workplace. The women workers in her study resisted the use of English, despite the fact that English would lead to the possibility of job advancement, because of the benefits in solidarity and group membership associated with being a monolingual Portuguese speaker.

Researchers have also investigated the ways in which women may have limited access to formal study, and thus socialization into, a second language. Cumming and Gill (1991) call attention to sociocultural factors and traditional family roles, which may privilege men's interaction with the larger community and thus limit women's access to ESL classes. Kouritzin (2000) demonstrates that availability of L2 learning is not the same as access. She describes an Indian woman for whom an ESL class and daycare were available, but she was not able to take advantage of these, as her husband was adamant that only family should care for the children.

While many studies indicate that women have fewer opportunities to learn a second language through classroom study or naturalistically, others indicate that there are contexts in which enacting a female gender identity is beneficial in acquiring a second language. Günthner (1992) found that among Chinese students learning German, women were more likely to continue asking for assistance on language tasks from native speakers, whereas men found asking for assistance face-threatening and attempted to handle language learning problems independently. Moon (2000) demonstrated that among Asian international students in the USA, women were more likely to develop a relationship with a native-English-speaking man and thus had greater opportunities for extended interaction in the target language.

*Gendered Interactions*

A number of studies have examined the ways that gender influences opportunities for interaction in a variety of classroom settings, from elementary through higher education. Losey (1995, 1997) examines

the impact of gender and ethnicity on classroom interaction in a mixed monolingual English and bilingual Spanish/English community college composition course in California. Through analysis of differences in students' oral participation, she reveals the different types of participation of Mexican men and women in the course.

Willett (1995) describes the participation of ESL children in a mainstream first-grade classroom. Using a language socialization orientation, she describes how interactional routines were important sites for constructing social relations, identities, and ideologies in the classroom, and how these, in turn, affected the children's access to L2 socialization in the classroom setting. Contrasting the girls' experiences with those of the only ESL boy in the classroom, she demonstrates how constructions of gender and class positioned the girls as successful learners and the boy as a problematic learner.

Toohy (2001) investigated the connection between disputes and English language learning for children within the context of a Canadian public school classroom. The study closely examines how behavior in disputes with classmates influences girls' opportunities for participation in activities and conversation in the classroom, illustrating how gender and race influence positioning in the classroom, and thus, opportunities for L2 socialization.

Norton and Toohy (2001) explore both classroom and community contexts, which offer opportunities for language socialization. They reexamine the notion of "the good language learner" from a language socialization perspective, providing a critique of earlier research which focused on individual learner characteristics. Through an analysis of two learners—an immigrant woman and a five-year old girl, both of whom were learning English in Canada—the authors demonstrate how communities of practice are structured to facilitate or constrain learners' access to the linguistic resources of their communities. The contrasting contexts of their language development offer insight into the very different opportunities for L2 socialization available to children and adult L2 learners.

### *Gender Ideologies*

Researchers have explored how gendered ideologies about a second language influence a learner's investment in or resistance to learning. A number of studies from Japan indicate that English, in particular, is fundamentally linked to feminism and the opportunity for expanded gender roles for Japanese women. Kobayashi (2002) demonstrates that Japanese women are especially interested in English-language learning, as it offers the opportunity of travel and work in English-speaking countries, which offer more expansive gender identities for women.

McMahill's (2001) study of female Japanese learners in a feminist EFL class finds that English acquisition provides Japanese women with an opportunity to reassess gender ideologies and to use English as a language of empowerment. She writes that

speaking in a foreign language such as English, while obviously entailing a struggle with another set of linguistic gender ideologies, may be seen as a gendered linguistic choice, which offers them a linguistic space for reexamining more consciously the norms of gendered speech and identity in Japanese (McMahill, 2001, p. 312).

Studies by Siegal (1996) and Ohara (2001) demonstrate that learners may resist linguistic forms which are perceived to index problematic gender ideologies. In a case study of an American woman learning Japanese in Japan, Siegal (1996) demonstrates how gender identity and learner subjectivity influence the acquisition of sociolinguistic competency. Using phonetic analysis and ethnographic interviews, Ohara (2001) shows that English native speakers learning Japanese resist the use of a high-pitched voice, which is a resource for projecting femininity in Japanese culture.

Researchers have explored how L2 learning offers the potential to envision new gendered identities. Pavlenko (2001) connects second language learning with the transformation of gender performance and the reconsideration of gender ideologies. Through her analysis of 30 first-person narratives, which focus on L2 learning and use, she demonstrates how L2 socialization provides opportunities for the reexamination of previously unquestioned gender ideologies. She documents three contexts in which opportunities for reexamination present themselves: within intimate relationships and friendships, within parent-child relationships, and in workplace interactions. Other chapters within the same edited volume, entitled *Multilingualism, Second Language Learning, and Gender* (Pavlenko et al., 2001), explore the relationship between gender identity and L2 use in institutional, private, and educational contexts.

#### WORK IN PROGRESS

Although it represents a fairly recent development within the field of language socialization, a number of special journal issues and edited volumes on gendered second language socialization research have appeared. A *TESOL Quarterly* special issue, edited by Davis and Skilton-Sylvester (2004), explored gender in a variety of ESL and EFL teaching and learning contexts. Two articles have a particular focus on L2 socialization. Hruska's (2004) article investigates the ways that relationships and interactions are mediated through gender in an

English dominant kindergarten in the USA. This study demonstrated how local constructions of gender and race can both support and constrain English language learners' classroom participation, affecting students' opportunities for L2 socialization. Gordon (2004) investigates the interplay between gender identity shifts and L2 socialization, documenting the processes by which Laotian women and men redefine their gender identities in the USA. This study demonstrates the impact of gender identity shifts on access to second language resources, focusing on workplace and domestic language events as opportunities for L2 socialization.

Langman (2004) edited a special issue of the *Journal of Language, Identity and Education* entitled "(Re)constructing Gender in a New Voice," which examines the potential effects of gender identity on the process of L2 learning for bilingual and immigrant women. Warriner's (2004) article within this volume explores the gendered language socialization of Sudanese women refugees in the USA, examining how women are positioned and position themselves as language learners in the context of the workplace.

Bayley and Schecter's (2003) book, *Language Socialization in Bilingual and Multilingual Societies*, includes articles that explore language socialization in language contact settings across the lifespan. Two chapters specifically examine gendered L2 socialization. Luykx (2003) examines the connections between gender roles and relations and language socialization within the family language policies of bilingual Aymara/Spanish households. Khayatt (2003) examines socialization into a lesbian identity in a society in which the dominant language (Egyptian Arabic) offers no word to describe that identity.

Researchers have investigated gendered language socialization within intimate relationships, particularly bilingual couples. Piller (2002) examines gendered identities and linguistic choices among bilingual couples in which each individual is from a different linguistic background. She studied the ways in which bilingual couples perceive and perform their identities and the ideologies and beliefs which enable or constrain their language choices. Vitanova (2004) examines gender transformations in the face of L2 learning among recent immigrant couples from Ukraine and Russia in the USA.

Recent contributions have focused on the practical application of theoretical and empirical research findings regarding L2 socialization to the classroom. Norton and Pavlenko's (2004) edited volume offers studies that examine gender and language learning from a socio-cultural and cross-cultural perspective. The 11 chapters represent a diverse range of contexts, from primary to higher education in five countries. Contributions focus on ways in which gender inequities in language learning have been addressed within classrooms and schools,

and action research projects that promote critical reflection about gender and language learning.

### PROBLEMS AND DIFFICULTIES

As Langman (2004) notes in the introduction to her *Journal of Language, Identity and Education* special issue, the majority of gendered L2 socialization studies involve English as the target language. Much of the research has been conducted in the USA, mainly by American researchers. Broadening the research base to include non-English speakers from a variety of countries would contribute to the field.

Queer theory has influenced the field of sociolinguistics to examine lexical use and discourse strategies of previously marginalized groups such as gays and lesbians and the distinctive use of linguistic gender systems by transgendered individuals. Studies of gendered L2 socialization which have explored intimate relationships, however, have limited their focus to heterosexual couples and presupposed that individuals are being socialized into heterosexual gender identities. Studies such as Khayatt's (2003) referenced earlier, which explore language socialization among diverse sexual orientations, would offer insight into gender ideologies.

Much of the literature in gendered L2 socialization focuses on *women's* linguistic contributions. Identity theory has witnessed a growing interest in the construction of masculinity as an identity category, rather than an unproblematic norm against which femininity is analyzed. While relatively few studies have explored the connections between masculine identity and L2 socialization, there are significant exceptions. A study conducted by Pujolar i Cos demonstrates that language ideologies are connected to a society's construction of masculinity and may influence gendered language choice. Pujolar i Cos (1997) illustrates that young working class men in Barcelona discursively construct a masculine identity predicated on physical strength, heterosexuality, homophobia, and transgressive acts. This performance of masculinity is achieved in part through a rejection of Catalan, which is associated with school learning and femininity, along with a use of Spanish with an Andalusian accent that indexes a tougher, streetwise masculinity. In another study, Echeverria (2002) examines processes of erasure, recursiveness, and iconicization in Basque language schooling. She considers how representations in textbooks, linguistic features, and gendered patterns of language use work to connect masculinity with Basque ethnic identity and language.

Teutsch-Dwyer (2001) explores masculinity and L2 development in her case study of a Polish man acquiring English in the

USA. She suggests that his position as a heterosexual male may contribute to early fossilization of linguistic forms, as female interlocutors act as linguistic caretakers, making frequent interactional modifications in their own speech to accommodate his limited English ability.

#### FUTURE DIRECTIONS

Gendered L2 socialization offers as yet unrealized possibilities to explore how gender ideologies develop and change over time in settings of language contact. Norton discusses the tendency of many ESL teachers to perceive learners' ethnic identity as predominant, while ignoring the changes influenced by the new cultural landscape: "Whereas immigrant learners' experiences in their native country may be a significant part of their identity, these experiences are constantly being mediated by their experiences in the new country" (Norton, 1997, p. 413). Longitudinal studies, which examine the deeply felt cultural adjustments of long-term immigrants, would provide insight into the active negotiation and creation of gender ideologies over time. It would also offer insight into the influence of growing second language proficiency on gender ideologies and the development of language ideologies about the native and target language.

Research that explores various spheres of interaction in the home, workplace, and community will contribute to a fuller understanding of language socialization among men and women. Research in multiple contexts will offer a fuller and more complex picture of an individual's process of gendered identity formation and L2 socialization.

Gendered L2 socialization research has examined a variety of discourse types, including transcripts of audio-taped conversations, ethnographic interviews, and first person narratives. Computer-mediated texts are an untapped, but potentially rewarding, area for language socialization research (see Lam, *Language Socialization in Online Communities*, Volume 8). Internet chat rooms and other forms of computer-mediated discourses are not only informal learning environments for L2 socialization, but discursive spaces where identities are formed and social relationships are negotiated. Examination of these texts, particularly within bilingual chat rooms, such as the Chinese/English chat room investigated by Lam (2004), provides inviting possibilities for researchers.

Studies that investigate specific, local forms of gender in multilingual, multicultural settings will make a valuable contribution to the field, expanding our understanding of the interaction between gender identity and second language socialization in a variety of communities of practice.

## ACADEMIC DISCOURSE SOCIALIZATION IN A SECOND LANGUAGE

### INTRODUCTION

This chapter addresses an emerging area of research in applied linguistics that concerns the academic discourse socialization of university students in mainstream content areas or disciplines. Much of the earlier work on disciplinary socialization surrounded discussions about what academic discourse is and how students should be taught academic discourse or literacy (e.g., Bartholomoe, 1986; Elbow, 1991). This body of work tended to focus on students learning academic literacy—particularly composition skills—in their first language (L1), most often English. However, as the student population of postsecondary institutions in North America and other parts of the world grows increasingly multicultural and multilingual, recent work has started to deal with “nontraditional” students who need to acquire academic literacies in their second language (L2). The focus of this review therefore is recent literature on L2 academic discourse socialization. While much work has been done regarding how to prepare L2 students academically in English as a second language (ESL) or English for academic purposes (EAP) programs and courses, this chapter mainly reviews a relatively new area of research on students’ actual disciplinary socialization in undergraduate or graduate level courses.

### MAJOR CONTRIBUTIONS

Applied linguists have taken various theoretical and methodological approaches to studying L2 disciplinary socialization. In this chapter, we identify and review three major orientations. First, many studies, particularly in the area of EAP, have attempted to reveal the academic and linguistic knowledge and skills that students need to master to meet their academic demands. Two common types of research taking this orientation are needs-analysis survey research and genre-based research (e.g., Swales, 1990). For example, through a series of large-scale surveys conducted at US tertiary institutions, Ferris and Tagg (e.g., 1996) explored content-area instructors’ requirements as well as ESL students’ expectations regarding listening and speaking skills. In their pioneer work on genre analysis in EAP, Swales and Feak (1994) identified

certain linguistic and rhetorical conventions used in “research-process genres” in English-speaking academia. In addition to identifying the characteristics of general academic discourse (e.g., Johns, 1997), researchers have also found it useful to recognize discipline-specific genres and discourses (Berkenkotter and Huckin, 1995; Holmes, 1997). Holmes (1997), for instance, analyzed the Discussion sections of 30 social science research articles from three disciplines (history, political science, and sociology) and found that social science Discussion sections displayed some distinctive rhetorical features in comparison to their counterparts in natural sciences. As Swales and Feak (1994) emphasized, the primary goal of these studies is to assist learners in developing their academic communicative competence by means of explaining disciplinary practices, expectations, and discourses. However, some scholars have challenged this position by arguing that these types of research tend to essentialize disciplinary practices that are in fact in constant flux, and also tend to treat disciplinary socialization predominantly as a one-way assimilation rather than a more complex negotiation (Street, 1996; Zamel, 1997).

While the first orientation focuses on *what* students need to know, the second orientation asks *how* they are socialized. Studies taking the second orientation normally employ qualitative or ethnographic methods and document the socially and temporally situated process of socialization, often from participants’ perspectives (e.g., Casanave, 1995; Leki, 2001; Morita, 2000, 2004; Prior, 1998; Spack, 1997). For example, Prior (1998) presented “situated case studies of writing and disciplinary practices” (p. x) that documented how graduate students and their instructors in different disciplines engaged in and constructed a variety of “literate activities” (p. xi) in graduate seminars. Similarly, Casanave (1995) illustrated the ways in which a multicultural group of sociology doctoral students interacted with their instructors, teaching assistants, and other students to accomplish challenging writing tasks. Leki’s (2001) longitudinal study examined L2 students’ experiences in course-sponsored group projects across the curriculum. In particular, she explored the kinds of social/academic relationships that developed within work groups and their impact on L2 students’ participation and learning. Many of these studies find it useful to employ a “community-of-practice” perspective (Lave and Wenger, 1991; Wenger, 1998) in their analysis, and highlight the dynamic, complex, and coconstructed nature of disciplinary socialization. In other words, they document how newcomers negotiate not only their academic and linguistic demands but also the various contextual aspects—social, cultural, institutional, interpersonal, historical, and pedagogical aspects—of a given academic community, as well as their goals, personal histories, and multiple identities. Morita (2004), for instance, detailed the complex

negotiations experienced by a group of female students from Japan as each of them, with unique personal histories, participated in various courses and constructed different subject positions.

The third orientation represents a critical discourse/literacy perspective and foregrounds the issue of power. For researchers taking this orientation, academic discourse is not a set of neutral linguistic conventions but a value-laden, social practice that constructs and is constructed by unequal relations of power (Bizzell, 1992). Disciplinary socialization is also seen to involve power struggles in a substantial way. Issues examined from a critical perspective include the following: learner resistance (e.g., Benesch, 2000; Canagarajah, 1999), plagiarism and textual ownership (e.g., Currie, 1998; Pennycook, 1996), the role of gender and/or ethnicity (Losey, 1997), learner identity or voice (Atkinson, 2003), and the representation of multicultural learners (Harklau, 2000). Canagarajah (1999), for example, examined how learners as well as teachers of English in “periphery communities” (i.e., former colonies of certain European countries) not only resist English and the “linguistic imperialism” associated with the language, but also appropriate it creatively according to their local needs (cf., Atkinson, 2003). In his critical examination of the issue of plagiarism, Pennycook (1996) argued that the general beliefs in originality and textual ownership in the Western academy are not universal but culturally and historically specific, and that therefore, L2 writers’ apparent plagiarism is a much more complex phenomenon. Losey (1997) investigated the classroom behavior of Mexican American women in a US community college and contended that their social status as “double minorities” (in terms of gender and ethnicity) contributed to their relative silence. Harklau (2000) documented how a group of immigrant students appropriated certain institutional images or representations of ESL students (e.g., hardworking) in their secondary school, but later resisted the same representations in their postsecondary educational settings. As such, critical perspectives have explored how sociocultural, historical, and institutional forces, particularly in terms of power relations, impact disciplinary socialization, as well as how individuals accommodate or resist such forces in different ways.

#### WORK IN PROGRESS

There are several major areas of current work on L2 academic discourse socialization. One area concerns modes of discourse. Over the last decade, researchers have conducted a number of studies to examine university students’ development of academic language and literacy by focusing primarily on writing (e.g., Casanave, 1995; Prior, 1998; Spack, 1997). Although Poole’s (1992) study, which examined

teacher–student interaction in ESL classes in a US university, appeared in the early 1990s, it is a relatively recent development that researchers have begun to focus on oral activities (Kobayashi, 2004; Morita, 2000, 2004). The primary purpose of this line of research is to gain a holistic understanding of how newcomers, through their participation in oral activities, become socialized into the academic discourse, knowledge, and practices that constitute their target communities. For example, Morita (2000) explored the ways in which a group of graduate students in language education gradually became apprenticed into oral academic discourses as they prepared for, observed, performed, and reviewed oral presentations in graduate seminars. Kobayashi (2004) examined the L2 discourse socialization of Japanese undergraduate students through group presentations during their year-long academic studies at a Canadian university. An important part of language socialization in this particular classroom community was to make intertextual connections relating their field experiences and observations explicitly to the textbook and lectures in their presentations.

Another important area of current research relates to silence (Liu, 2001; Morita, 2004). According to Saville-Troike (1985), silence has traditionally been dismissed or downplayed within linguistics “as merely the absence of speech” (p. 3). Liu (2001) states that in situations like university classrooms where class discussion is expected, silence may be perceived negatively as a “lack of involvement with others” (p. 195). In fact, many of the ESL teachers in Tsui’s (1996) study reported that they disliked or were afraid of silence and that they felt uncomfortable or intolerant when they did not get a response from their students. However, Jackson’s (2002) study conducted in Hong Kong suggests that quiet or taciturn students may not be as passive as their professors regard them to be. Morita (2004) similarly found that her participants were actively negotiating their identities in their new academic community even when they appeared relatively passive or silent in class discussions. She also found that some students used silence to resist their perceived marginality. Based on these findings, Morita argues that silence not be treated merely as a lack of speech or action, calling for emic approaches to explore its multiple meanings and interpretations as situated in particular socioeducational contexts.

A third area of current research has to do with types of learning. As Lave and Wenger’s (1991) model suggests, socialization has traditionally been seen to take place through apprenticeship where cultural novices learn valued practices of their community with the help of experienced members. An example of this is with writing conferencing where an expert writer (i.e., teacher) and a novice writer (i.e., student) work together to improve texts produced by the latter (e.g., Patthey-Chavez and Ferris, 1997). Another type of apprenticeship that has been

observed in postsecondary educational settings is through teacher–student classroom interactions. The aforementioned study by Poole (1992) examined the types of cultural information that an L2 teacher displayed through classroom discourse. More recently, Mohan and Beckett’s (2001) functional analysis demonstrated how the instructor of an undergraduate content course employed grammatical scaffolds in her students’ oral presentation to socialize them into causal discourse. While these studies suggest the important roles that teachers can play as socializing agents, other studies suggest that peer collaboration can be an important locus of learning and socialization as well (e.g., Kobayashi, 2004; Ohta, 2001; Storch, 2005). For example, Ohta’s (2001) classroom study, informed mainly by Vygotskian sociocultural theory and conducted with students of Japanese at an American university, revealed that her participants often assisted struggling partners in peer learning tasks by waiting for and encouraging their contributions, coconstructing utterances, and providing explanations. Storch (2005) similarly reports that ESL students who chose to work in pairs fulfilled their task requirements better than their classmates who chose to work individually by demonstrating greater grammatical accuracy and complexity in their written texts. It is important to note that these are relatively successful cases of peer learning. In fact, Leki (2001) found that her focal students, who spoke English as an L2, were positioned by their L1 group members to be relative novices, and that this positioning coupled with differences in power seemed to have prevented them from benefiting fully from and contributing meaningfully to their group project work.

A fourth line of current research deals with the issue of intertextuality or “the use of links and references to create a dialogue between texts” (Maybin, 2003, p. 159). Maybin (2003) states that this concept is closely related to the work of Bakhtin (e.g., 1981), who saw “development as the evolving interaction of authoritative and internally persuasive discourses that arises as a person actively assimilates and resists others’ voices, words, values, affective and evaluative stances, and so on” (Prior, 1998, p. 21). For instance, Scollon, Tsang, Li, Yung, and Jones (1998) found that university students in Hong Kong marshaled a variety of L2 discursive resources in their writing tasks to create intertextuality and multivoicedness such as indirect speech, scare quotes, and paraphrases. Prior (1998) illustrated the ways in which two L2 graduate students writing a thesis appropriated words and phrases from their references by juxtaposing the sources and their final products. This intertextual analysis revealed a striking difference in the extent to which the students engaged in the academic practices of writing and knowledge construction: while one student demonstrated “strong evidence of appropriating, aligning with, and becoming responsible for

disciplinary practices” (p. 132), the other spoke through others’ voices without providing clear evidence of such “deep participation” (p. 103).

Finally, there is a growing interest in the role of L1 in L2 academic learning and socialization. Although not conducted within the framework of language socialization or situated in a content class, Antón and DiCamilla’s (1998) sociocultural study on the task-based interactions of English-speaking students of Spanish provides valuable insights on this issue. The analysis of discourse indicated that students’ use of their L1 allowed them to provide each other with scaffolded assistance and regulate their own cognitive activity. More recently, in the aforementioned study by Kobayashi (2004), Japanese undergraduate students used their L1 in the early phases of their presentation preparation during which they negotiated task definitions, requirements, and content; however, they used less Japanese as their focus shifted from content to language and performance. This finding seems to suggest that L1 might have served as an important scaffold for the students’ accomplishment of the oral presentation tasks, thus corroborating the findings of Antón and DiCamilla’s (1998) study. In short, this line of research has shed light on the mediational function of L1 discourse in L2 learning.

#### PROBLEMS AND DIFFICULTIES

One of the major challenges in theorizing L2 disciplinary socialization is that researchers have competing views on key concepts such as academic discourse, disciplinary practice, socialization, power, agency, identity, and culture. As we have outlined earlier, some take the position that it is possible and helpful to define certain characteristics of general academic discourse and practice and to raise learners’ awareness of them. Some believe that each discipline has its distinct genres, discourse conventions, and practices to be mastered by its newcomers. And yet, others consider disciplinary discourses and practices as being much more open and unstable, arguing that any effort of essentializing them would be counter-productive. Accordingly, different interpretations of disciplinary socialization exist: for some, it is largely a matter of acquiring a given set of knowledge, rules, and conventions, whereas for others, it is a more unpredictable, conflictual, and locally situated process. Theoretical issues have also been raised around the notions of power and human agency. A commonly debated issue is to what extent the existing power structures in educational institutions remain stable or unstable. Canagarajah (1999) summarized two competing perspectives on power within the critical pedagogical paradigm, namely, the “models of reproduction and resistance” (p. 22). According to Canagarajah, reproduction models explain how “the students are

conditioned mentally and behaviorally by the practice of schooling to serve the dominant social institutions and groups” (p. 22). Resistance models, which Canagarajah advocated for, explain how “there are sufficient contradictions within institutions to help subjects gain agency, conduct critical thinking, and initiate change” (p. 22). Different perspectives on power and agency also lead to different understandings of identity. Reproductive approaches to power tend to adopt a rather deterministic view of identity, dividing individuals into majorities and minorities. Other approaches, especially the ones informed by postcolonial and poststructural theories (e.g., Hall, 1990) understand that identities are constructed discursively and interactionally and therefore are multiple, conflictual, and unstable.

The issue of identity has also been discussed in relation to the notion of culture. Recently, applied linguists have engaged in debates on the role of learners’ cultural background and identity in L2 academic socialization. Many studies in contrastive rhetoric, cross-cultural communication, and other related fields have investigated how differences in norms, values, and communication styles between students’ L1 and L2 culture may cause certain difficulties and tensions (e.g., Flowerdew and Miller, 1995; Ramanathan and Atkinson, 1999). However, researchers such as Zamel (1997) and Kubota (1999) have recently challenged these studies, claiming that they tend to promote a deterministic and monolithic view of culture and also depict L2 learners as rigidly constrained by their cultural backgrounds. These researchers instead argue for a view of culture that is dynamic and constructed. For example, Zamel (1997) proposed the notion of *transculturation* that “celebrates the selective, generative, and inventive nature of linguistic and cultural adaptation” (p. 350). This dynamic model of culture treats L2 students as active agents who negotiate and construct their identities as they encounter their new cultural and academic environments.

In addition to the contestation of some of the key concepts discussed earlier, recent theoretical discussions also suggest some of the limitations of traditional language socialization frameworks. First, whereas traditional models tend to assume a relatively stable set of norms and practices of target culture or community, academic communities that are increasingly international, interdisciplinary, and intertextual may be characterized by the multiplicity and instability of their discourses, values, and practices. This, in turn, suggests that socialization into such a community can be more unpredictable and conflictual than, for example, children’s first language socialization. Second, while traditional frameworks usually rely on a relatively clear dichotomy between “experts” (e.g., caregivers, masters, teachers) and “novices” (e.g., children, apprentices, students), participants in disciplinary socialization situations may bring or construct

a much wider range of roles and identities. Furthermore, some studies have indicated that the construction of identity and expertise in disciplinary practices is achieved interactionally on a moment-by-moment basis, suggesting the need for a more dynamic notion of expertise (Morita, 2000; Tracy, 1997). Tracy (1997), for instance, demonstrated the complex negotiation of expertise and identity in departmental colloquia involving students and faculty members with various institutional roles and statuses. Third, power negotiation involving various roles, statuses, and goals, may take a more complex form than the one assumed by traditional models. For example, contrary to the assumption of traditional models that experts or peers assist novices, studies have shown that such assistance may not be granted equally to all learners depending on the intricate power relations formed in a given academic context (e.g., Leki, 2001; Morita, 2004).

Another difficulty in this area of research relates to the question, how can we document and evaluate the outcomes of L2 disciplinary socialization? As we have discussed earlier, previous research has effectively explored either the goals (e.g., needs-analysis survey, genre analysis) or process of socialization, but only limited attention has been given to the various outcomes of socialization, including learners' development (or lack of it). Very few studies have provided explicit illustration as to what L2 students were able to do as a result of their socialization or what kinds of development—including linguistic acquisition—occurred over time. Part of the difficulty is that it is not always easy to determine what counts as relevant outcomes or as evidence of socialization. For example, linguistic development may count as an important outcome. However, what kinds of linguistic development are indicative of successful socialization is not a simple question, if we take the view that disciplinary discourses are multiple and constantly changing. Other kinds of learning can be considered as important outcomes, such as gaining content knowledge, being increasingly able to participate in classroom and other academic activities, gaining membership or constructing certain types of identities, and learning through interaction with peers and instructors. However, what counts as a significant part of socialization depends on not only the values of a given academic community but also individual students' personal goals. Furthermore, each academic community's values can be multiple, and also, students may be participating in multiple academic communities at the same time. Thus, assessing socialization outcomes is by no means a simple matter.

Finally, while research has shown how L2 students may face various challenges in their mainstream content area courses, pedagogical issues such as how to assist these students remain relatively unexplored. The difficulty of providing general pedagogical implications may partly come from the variability and fluidity of academic discourses and practices; any prescriptive suggestion may be of limited use. Another

problem is that students' needs can vary greatly since they may come from a wide range of linguistic, cultural, and educational backgrounds. Furthermore, identifying the "special needs" of L2 students may not be as straightforward as one might assume; mastering academic discourses can be a challenge even to native speakers (e.g., Morita, 2000; Tracy, 1997). In fact, given the growing diversity in university classrooms, the traditional dichotomy between native speakers and nonnative speakers may be useful only to a limited degree; all students—L1 and L2 speakers alike—bring their unique set of needs, challenges, knowledge, and resources. Then, research should address not only the specific needs that L2 students might have, but also the tensions and difficulties that arise from the ever-increasing heterogeneity of university classrooms. Critical literacy/pedagogy perspectives may play a particularly important role in addressing such challenges and possibly transforming academic practices (Norton and Toohey, 2004). In addition, if academic socialization is a two-way process in which both newcomers and communities evolve (Wenger, 1998), it is important to explore not just what individual students and instructors can do, but what academic communities—including university institutions—should do to accommodate and benefit from the diverse backgrounds of their newcomers.

#### FUTURE DIRECTIONS FOR RESEARCH

Based on our review of the literature, we would like to suggest several important directions for future investigations. One is to examine the process of discourse socialization in various disciplines and with learners of different genders and from various linguistic/cultural backgrounds. Research is also needed on disciplinary socialization in various geographic contexts, considering that most university-level studies to date have been conducted within English-medium contexts in Canada and the USA. In addition, documenting L1 students' disciplinary socialization would allow for the establishment of a baseline for comparison with data on L2 students. Another line of future research is to explore multiple viewpoints: in addition to students' perspectives, it seems crucial to examine instructors' views and concerns about their students' socialization as well as about their own challenges and transformations, as they attempt to deal with various learner needs. A close examination of institutional factors that both enable and constrain instructors' decisions and actions would also be important.

Future research should also investigate different types of communicative practices or activities. As our literature review suggests, many studies to date have focused on oral presentations and single authoring of papers. Thus, studies on other types of activities such as on-line

communication and discussions (see the review by Lam, *Language Socialization in Online Communities*, Volume 8), coauthoring of a research paper, and meetings with professors and peers, as well as studies on connections between related practices and activities would be helpful. Moreover, Kress (2000) argues that we view “language as a multimodal phenomenon” (p. 184). With this reconceptualization, it seems fruitful to examine learners’ engagement with and juxtaposition of different semiotic modes including visual and electronic texts as well as oral and written discourse in classroom literacy events.

Intertextuality is another issue that deserves further investigation. Duff (2004) reports that her teacher participant’s frequent spontaneous references to pop culture in a high school social studies class tended to engage local students; however, the very same practice might have marginalized immigrant English learners by preventing them from fully participating in class discussions. Furthermore, Morgan and Ramanathan (2005) suggest that teacher talk can be used as a resource to juxtapose different texts in ways that encourage students to make multiple meanings and interpretations and challenge the received knowledge of their disciplines. Thus, future research should examine how the intertextuality and hybridity of classroom discourse may facilitate or hinder students’ participation and learning in different academic contexts. In addition, as Scollon, Tsang, Li, Yung, and Jones (1998) suggest, future research should explore students’ appropriation and representation of multiple voices in their L2 academic texts to better understand how they develop their linguistic resources to achieve intertextuality.

Future research can also document and assess relevant outcomes of disciplinary socialization. This is no easy task for the reasons given earlier. However, Swain (2000) reports an interesting example. In assessing learners’ language development, Swain and her colleagues found that pre- and posttest design was not appropriate as different participants, as active agents, focused on different aspects of language in their pair work. Therefore, they decided to trace L2 learning to the *collaborative dialogue* where the participants talked about the language they produced. Lantolf and Poehner (2004) have recently suggested the notion of *dynamic assessment* where learners would be provided with scaffolds to assess what they can do with assistance as well as on their own (see also the review by Lantolf and Poehner, *Dynamic Assessment*, Volume 7). These types of assessment may be more compatible with language socialization research and also attribute greater agency to learners than some other traditional approaches (e.g., with a pre- and posttest design). However, these approaches are based on overt participation; as several studies have shown, students who make limited oral contributions may be cognitively engaged as well. To assess the learning outcomes of such learners, researchers might need

to consider not only the language produced by learners but also learners' perspectives accessed through interviews and self-reports. Importantly, since such an approach would add a new level of complexity to the relationships between the researcher and the researched, researchers would need to be more reflexive about their own research practices. Findings of such studies would yield fruitful insights and shed valuable light on the complex, dynamic nature of L2 academic discourse socialization.

## LANGUAGE SOCIALIZATION, HIGHER EDUCATION, AND WORK

### INTRODUCTION

Although most language socialization research has historically been situated in homes and schools with relatively young language learners (see Ochs and Schieffelin, *Language Socialization: An Historical Overview*, Volume 8), a growing number of studies investigate socialization well beyond childhood and adolescence into adulthood. An examination of the length and breadth of language socialization, or “lifelong” and “lifewide” socialization, takes into account individuals’ and groups’ movement into new educational, vocational, professional, and other settings, and into the cultures, language and literacy practices, identities, and stances instilled there.

In this chapter, I focus primarily on the linguistic socialization of learners at work or preparing for work by means of education activities and apprenticeship, keenly aware that the distinction between (higher) education and work is becoming increasingly blurred. Formal education now offers various kinds of on-the-job internships and integrative cooperative (co-op) experiences as well as traditional in-class, mixed-mode (online and face-to-face), or distance-education study. At the same time, different kinds of work may involve considerable on-site training, professional development, and implicit or explicit socialization as well, especially in the context of the postindustrial, global knowledge economy. Furthermore, the traditional progression from secondary and tertiary education programs to work is not as seamless or linearly sequenced as it once was. Postsecondary programs admit a wide range of older or nontraditional students into diploma, certificate, and degree programs at various points in their lives and careers. In addition, nonformal education contexts, such as community center or after-school or after-work programs, or even narrative activity about work in private homes, also provide rich sites for language socialization and preparation for work.

In contemporary societies, the discourse demands of work are evolving with the endless infusion of new technologies, social and industrial restructuring, outsourcing and globalization, and with the emergence of powerful international lingua francas, such as English, that mediate

higher education and work in many spheres. Because people's career trajectories are quite dynamic and varied, they often must learn new ways of speaking and writing and representing meaning through graphic images and multimedia, for new purposes and audiences, and with new colleagues—both local and remote—as they move across jobs, communities, disciplines, professions, languages, cultures, and geographical boundaries. Thus, the need to understand complex socialization processes, outcomes, and points of tension has become quite acute.

#### EARLY DEVELOPMENTS

Heath's (1983) groundbreaking research in three diverse communities in southeastern United States provided an important early analysis of how people's educational and career trajectories are influenced by their own and their caregivers' oral and literate language socialization histories, activities, opportunities, and their "linguistic and social capital." Their ongoing language socialization and their future prospects are also inextricably linked to the economic conditions and vitality of their communities. Heath conceded that the power enjoyed by middle-class educated townspeople in her study in both schools and workplaces was largely "foredestined in the conceptual structures which they have learned at home and which are reinforced in school and numerous other associations" (p. 368). Her study also highlighted the importance of having teachers learn about their own and their students' home language socialization behaviors and patterns by means of professional development and graduate studies involving ethnographic fieldwork and the analysis of language and literacy in and across local communities and workplaces—including schools—in order to accommodate diverse learners better. In other words, the teachers themselves needed to be socialized into new modes of discourse through higher education.

Heath (1989) later wrote about the rapidly changing workplace affected by widespread industrialization, urbanization, migration, displacement, and the closing of textile factories in the region affecting her participants. Mainstream schools and curricula, she noted, with their emphasis on the development of individual autonomous learners and knowledge, were not socializing students into vaunted new collaborative practices or project work. Heath therefore underscored the need for language socialization involving collaborative teamwork, the joint authorship and interpretation of texts, graphics, and other media, and shared responsibility for plans, decisions, and actions of the sort required in many postindustrial workplaces. Ironically, she observed that this socially distributed view of knowledge and of the use of language to solve problems, collectively narrate events, and so on, long embraced by certain minority groups in the USA (e.g., African

Americans) and germane to their indigenous language socialization practices, was being lost with the breakdown of traditions and social structures in struggling minority communities just as they were being promoted in mainstream work environments.

Interactional sociolinguistic research that was being conducted concurrently in multiracial communities in England examined the difficulties faced by South Asian immigrants seeking employment in English workplaces (e.g., Gumperz, 1982; Jupp, Roberts, and Cook-Gumperz, 1982). Taking part in “gatekeeping” job interviews satisfactorily for that purpose and then becoming integrated within the local workplace culture and society proved challenging for many of these newcomers because of their prior linguistic socialization and cultural values and also the host culture’s unfamiliarity with—and often intolerance of—these same practices and values. However, in addition to their prior socialization, an obstacle for newcomers wishing to emulate the valued discourse of the local English-speaking community was their lack of access to naturally occurring peer-group English interaction and thus opportunities for their discourse socialization in English. As Heath and others subsequently observed, this negative situation is difficult to improve without concrete forms of intervention.

Under the auspices of the Industrial Language Training Service, Jupp, Roberts, and Cook-Gumperz, (1982) therefore developed ethnographically informed training programs aimed at “breaking the cycle” faced by these workers by creating “new contexts for language socialization” (p. 247). The well-known video *Crosstalk* (Gumperz, Jupp, and Roberts, 1979) illustrated their approach to linguistic socialization by simulating an interview between British college employers and a South Asian seeking a job as a college librarian, in which the candidate failed to “sell himself,” discursively, in an effective (Anglo-British) manner for the job in question. The researchers then worked with members of both communities to help them understand why the discourse of the two parties seemed to be operating at cross purposes and how that might be remedied.

Philips’ (1982) research in southwestern United States took place in a more exclusive academic and sociocultural environment—in a law degree program in which she immersed herself for a year as a participant observer. Her initial study of language socialization within the legal profession focused on the “legal cant,” the specialized, complex, and often publicly inaccessible or impenetrable legal terminology and discourse patterns, both oral and written, associated with appellate (case) law and practice. Indeed, Philips observed that “it is almost necessary to go to law school to learn how to use the language” appropriately (p. 196). The very segregated social organization of law school, moreover, ensured that law students spent a great deal of time

speaking to one another using this newly acquired in-group language and drawing on shared knowledge, with little need or chance to speak intelligibly about the law to nonspecialist outsiders. Interestingly, through her ethnographic research Philips was attempting to not only understand legal discourse socialization processes but to become sufficiently proficient in legal discourse herself to undertake subsequent research on judges' language use in courtrooms.

A fourth less well known but nonetheless intriguing early academic discourse and workplace-oriented language socialization study was undertaken by Cohn (1987), a self-described "anti-war feminist" who spent a year in the mid-1980s studying about nuclear strategic analysis within a community of "defense intellectuals" or analysts. She was a participant observer and also a learner of their "techno-strategic" language, as she called it. This language sanitized war with "clean bombs" and "surgically clean strikes." Military attack was likened, linguistically, to heterosexual domination and domestic bliss. It was to Cohn a language with "enormous destructive power, but without the emotional fallout" (p. 4). However, the longer she spent in this discourse community, the less galling she found the "bloodcurdling casualness with which they regularly blew up the world while standing and chatting over the coffee pot" (p. 27). And after some time, she noticed with chagrin, "what had once been remarkable became unnoticeable. As I learned to speak, my perspective changed." (p. 27)

These early ethnographic studies featuring participants in very diverse fields of training illustrate the importance of examining language socialization processes and discourse in their social, cultural, historical, political, institutional, and economic contexts. The first two studies also advocated for greater understanding, accommodation, and intervention across disparate communities in order to catalyze a greater integration of minority members into the mainstream labor market and society.

#### MAJOR CONTRIBUTIONS

##### *The Socialization of Linguistic Identities, Ideologies, and Discourse Practices*

Studies of language socialization continue to flourish in academic settings, vocational training programs, and workplaces. They now encompass such divergent contexts as physics labs, hospitals and nursing homes, courtrooms, hairstyling salons, manufacturing plants, and call centers. In those settings, newcomers learn (or are expected) to think, act, speak, and write more like their experienced co-workers and mentors.

In higher education, one recurrent activity analyzed in language socialization research has been academic presentations given in graduate

seminars, undergraduate courses, and at conferences, and the cognitive, linguistic, discursive, and technological (e.g., multimodal) preparation of students and other novices for this purpose (see studies reviewed by Morita and Kobayashi, *Academic Discourse Socialization in a Second Language*, Volume 8). In a study of doctoral students and postdoctoral fellows in physics and the distinguished physics professors supervising them, for example, Jacoby (1998) examined how the “conference talk rehearsal” served a number of functions related to the discursive and professional socialization of physicists. Through what she called “indigenous assessment practices” during mock conference-preparatory presentations and feedback phases in the physics lab, participants critiqued or commented on their own and others’ presentation rehearsals with respect to their form, content, and manner of delivery. Timing and effective graphic representations were especially critical dimensions because presentations at the most prestigious physics conferences must be very short and concise (e.g., only 10 minutes each). Interactions surrounding talk simulations in the lab were designed to socialize less experienced physicists into the values, discourse, and related practices of this academic community.

Many studies have also examined medical/healthcare, legal, mediational, and vocational discourse and how novices gain expertise and legitimacy as new members (e.g., Mertz, 2007; Sarangi and Roberts, 1999). As in Philips’ (1982) earlier research, Mertz (1996, 1998) analyzed ideology and language socialization in first-year American law school classroom discourse in which “students are socialized to a new identity and a new way of talking” (1998, p. 151). She examined student participation in Socratic dialogue with law professors, a common approach to instruction and a simulation of courtroom interaction that often leads to points of conflict and communication breakdown connected with students’ “incorrect” answers. Mertz also studied the “recontextualization of legal texts” (1996, p. 231) as a related form of socialization, based on the cases (appellate court opinions) that students must learn to read critically and that have authority as legal precedents in other cases or opinions, and thus must be newly entextualized through “mastery and manipulation” (p. 246) by students.

Jacobs-Huey’s (2003) language socialization research, situated in an African American cosmetology college in the southeastern United States, examined how novices learn to engage satisfactorily in the professional language and communication expected in hairstyling salons. In class, based on interactions with their cosmetology instructor, plus readings from the textbook, and folk wisdom from their home culture, the aspiring hairstylists learned to talk about haircare like medicine (“diagnose and treat sick hair,” p. 278), to speak indirectly to clients, and to be polite and soft-spoken (“Ladies are seen, not heard;”

“Manners will take you where money can’t” (p. 283), invoking proverbs that older female relatives had also used with them to socialize them when growing up. Through textbook readings, discussion, and role-play, they also learned how to deal appropriately with complaints from dissatisfied clients. One student was asked to read to the class the following excerpt from the course textbook, *Milady’s Cosmetology* (Milady’s Publishing Company, 1995), on “handling complaints by phone”:

Try to use self control, tact and courtesy, no matter how trying the circumstances may be . . . [Your] voice must be sympathetic and reassuring . . . Your manner of speaking should make the caller believe that you are really concerned about the complaint. Do not interrupt the caller . . . (Jacobs-Huey, 2003, p. 285).

Immigrant workers, as reported under Early Developments, often face more complicated and protracted socialization into new fields, especially when their prior socialization experiences were based on very different underlying value systems as well as different languages and discourse conventions. Entry-level, low-paying (e.g., blue-collar) jobs often attract new immigrants in English-dominant societies precisely because they do not require high levels of English, although some companies may provide free on-site language classes for their workers (e.g., Goldstein, 1997). However, many jobs, such as sewing, cleaning, and factory work, either require little language at all because of the isolated nature of the work, the noise of machines, or the physical location of coworkers, who may not face one another (McCall, 2003), or they are done within same-first-language (L1) cultural groups or ethnic enclaves. Employers may also encourage workers to remain within their L1-groups because it promotes better communication between management and workers (assuming that “translators” or go-betweens exist), promotes better harmony within groups, and at the same time may also reduce opposition to management practices if workers are not organized and do not communicate well across language groups (Goldstein, 1997; McCall, 2003).

In her in-depth critical ethnography of an English-owned manufacturing company in Toronto that employed a large proportion of Portuguese-Canadian workers, Goldstein (1997) reported that many of the employees, and especially women, used Portuguese and not English on the factory production lines for various practical reasons (e.g., speed and efficiency) and socio-affective ones (e.g., to maintain morale and friendships). Yet, the workers had resided for many years—even decades—in Canada, often knew English, and professed to need English for greater social integration into Canadian society. However, maintaining solidarity with their Portuguese-Canadian coworkers and friends

on the factory floor through the reciprocal use of Portuguese, the pervasive practice of “talking bad” (*falu mau*, making sarcastic or negative comments about others or gossiping), and exchanges about their personal lives in Portuguese, were seen to be preferable to the potentially alienating social consequences of breaking connections with their coworkers and moving up or out into positions involving greater use of English and more responsibility, and even authority over their friends. Friendship and the ability to provide mutual assistance on the lines were key. The women’s bilingual socialization was constrained by deeply held social values anchored in Portuguese culture and sociolinguistics, dense social networks, their shared (subordinate) position in the company, and the need to cooperate while on the assembly lines to get work done well. As a result, many of the non-Portuguese immigrant workers doing product assembly work together with the women were socialized to speak Portuguese, instead of English, as their second language.

Also in Ontario, Canada, Heller and her colleagues (e.g., Budach, Roy and Heller, 2003; Heller, 2002; Roy, 2003) have examined changes in language and literacy ideologies within minority franco-phone communities involved in call center work. Employees must learn to respond to e-mail and telephone inquiries from around the world often in multiple languages and in standardized ways that typically involve training, surveillance, evaluation, and the enforcement of tightly scripted, highly repetitive but empathetic, interaction patterns. The sociolinguistic conditions in call centers, combined with low pay, may contribute to worker stress, turnover, and ultimately the devaluation of their own communicative abilities and identities (Cameron, 2000). This has apparently been the case in several bilingual call centers studied in Ontario.

Roy (2003) and Budach, Roy, and Heller (2003) conducted ethnographic research on bilingual workers in a rural French Ontarian call center and also in literacy centers. In those sites, language ideologies and policies were shifting and tensions were apparent in response to two competing trends: (i) maintaining and commodifying “authentic” local culture and celebration of the vernacular to attract francophile tourism and to perpetuate solidarity around a strong local identity, versus (ii) implementing “an ideology of language purity” (without code-switching, Anglicization, or local slang), in the form of a more globalized, standardized variety of French required for international communication within call centers. The call centre provided important work for local community members, both monolingual and bilingual, in an otherwise economically depressed area, and helped maintain the French language and culture because bilinguals were paid more than monolinguals. In addition, obtaining work locally reduced the need to move to larger, English-dominant centers. However, workers were

being socialized into a new standard of bilingualism that even native (vernacular) French speakers fluent in English often could not attain. They were therefore hired as monolingual English-speakers instead, undermining their bilingual—and francophone—histories, identities, and aspirations.

In addition to these examples of workplace ideologies that stress pure, standardized bilingualism and professional language use, other changes in workplaces have been connected to the distribution of power and responsibility, in the name of both democratization and efficiency. “Fast capitalism”—which requires flexibility, speed, multi-tasking, problem-solving, information technology, communication skills, and so on—may actually disadvantage workers not previously trained to perform work in settings where responsibilities are increasingly distributed horizontally across workers, rather than vertically or hierarchically among different layers of management (cf. Heath, 1989; Lankshear, Gee, Knobel, and Searle, 1997). Katz (2000) and Hull (e.g., 1997) have documented some of the oral and written English skills that multilingual immigrant workers require in high-tech Silicon Valley companies in California. They describe culturally challenging ideologies in workplace discussion sessions in which employees, in the presence of their coworkers and managers, were expected to volunteer personal opinions and publicly demonstrate their abilities (“show what you know” and “speak your mind”) even when this was considered culturally inappropriate and boastful, especially for a cohesive group of Mexican American women.

Li (2000) also found that multilingual workplace ideologies and socialization are at times contradictory, not only when different norms exist between home and workplace cultures but also when native-(English) speaking peers, mentors, or superiors themselves, to whom one might otherwise look as reasonable sociolinguistic models of target language and cultural conventions, behave inappropriately, rudely, or inconsistently. The Chinese worker in Li’s case study had to learn to be assertive about the inappropriateness of some of her colleagues’ practices in a pragmatically inoffensive way, so as not to jeopardize her employment or relationships with coworkers or cause herself or others to lose face.

In the high-stakes, gatekeeping medical oral examination that foreign-trained doctors who seek membership in the Royal College of General Practitioners in the UK must pass to practice there, candidates must reconcile their own linguistic, professional, and institutional medical socialization experiences and those expected to be displayed in their interviews. Sarangi and Roberts (2002) document the case of a Spanish woman who, through a series of “misalignments” with examiners’ questions, failed her examination, because of what they construed

to be her inadequate English proficiency (i.e., fluency). However, the mismatch actually had more to do with her hesitation in providing “a display of her knowledge of professional literature at critical points” (p. 211), which led to lapses in the discussion. Thus, despite this candidate’s having spent the previous year in clinical practice training in Britain and her excellent albeit seemingly hesitant English proficiency, those aspects of her prior socialization, and her formal training, did not enable her to interpret the subtle and sometimes confusing contextualization cues in the examiners’ questions. Those cues or interactional framing devices signaled whether an answer was expected to draw on medical literature as opposed to opinion or institutional experience. As Erickson and Shultz (1982) put it, in gatekeeping encounters such as these, the “game” can seem “rigged” (p. 193) against outsiders—not because of shortcomings in their academic or professional competence but because of insufficient language socialization into the “hybrid discourses of gatekeeping interviews”, themselves blending “institutional, professional, and personal experience molds of talk” (Sarangi and Roberts, 2002, p. 222).

#### WORK IN PROGRESS

Workplace-oriented language socialization research continues to explore discipline-specific discursive socialization in engineering, law, medicine, nursing, and other fields. For example, Hobbs (2004), as a practicing lawyer in the US, represented the obstetrical department of an urban teaching hospital in medical malpractice cases. In that context, she began analyzing medical residents’ and doctors’ handwritten progress reports (treatment notes) as well as physicians’ implicit socialization into these practices/genres by means of their supervisors’ reviews and concurrence on cases. Along the way, she immersed herself in applied linguistics and sociolinguistics in order to analyze this “biophysical discursively constructed data” (p. 1603) in the medical field and data in her parallel research on legal discourse (e.g., lawyers’ closing arguments; judges’ use of humor).

The physicians’ progress reports, in the interest of efficiency and economy, used a mixture of Latin, English abbreviations, and other symbols, which Hobbs described as follows:

[a] system of notation, as mysterious as hieroglyphics, that renders medical records cryptic and incomprehensible to the uninitiated. However, although the lay reader ordinarily does not hold the key that unlocks the medical code, the medical resident quickly learns to match the abbreviations to the terms that are continuously recycled in the clinical environment. (p. 1586).

A partial extract from one physician's admitting note (report) follows:

3 Pt is 25yo BF G5P2Ab2 EDC ?8/81 who  
4 presented to Central w/ hx gross ROM on  
5 4/17/81 @ 7 pm ... (p. 1586)

Meaning:

The patient is a 25-year-old Black female, gravida [number of previous pregnancies] 5, para [liveborn deliveries] 2, abortus [aborted] 2, with an estimated date of confinement [delivery] of, questionably, August 1981, who presented to Central [Hospital] with a history of gross rupture of membranes on April 17, 1981 at 7:00 p.m ... (p. 1586)

To produce and interpret such reports accurately, physicians must have considerable theoretical and clinical experience, as well as knowledge of accepted discourse conventions (the 4-part "SOAP" report format: including Subjective data; Objective data; Assessment; and Plan). Hobbs' own experience of grappling with initially incomprehensible language, texts, and social practices, in this case in progress report production, much like Cohn's (1987) and Philips' (1982) earlier induction into the worlds of defense intellectuals and lawyers, gave her a first-hand understanding of how medical residents are socialized into these practices and genres. Her own socialization also transformed her "attitudes towards illness, health care, and people" in the clinical context (p. 1581). She concluded that the progress report notes "provide us with an invaluable resource in the study of the professional socialization of medical residents" (p. 1603).

In addition to research examining the intricacies of medical and legal discourse socialization in institutions (e.g., Mertz, 2007), many studies in the US, Italy, and Sweden are investigating socialization into ideologies, practices, and discourses related to work in family homes (Paugh, 2005). By participating in family dinnertime narrative activity in homes with dual-earner working parents who report on, problematize, or evaluate aspects of their own and each other's work lives, and through the children's homework activities, and other interactions connecting with scheduling and coordinating daily activities, children appropriate important understandings of work and ways of talking about it (see Paugh, *Language Socialization in Working Families*, Volume 8).

## PROBLEMS AND DIFFICULTIES

How cumulative language socialization experiences affect subsequent performance and subsequent socialization in other settings and academic or professional fields has not been examined sufficiently to date because most of the research, though typically longitudinal, does not

extend over enough years to capture these longer-term school-to-work (or work-to-school; home-to-work) or cross-career trajectories. In particular, the impact of newcomers' prior discursive socializing on their ability to negotiate requirements they encounter in the fields in which they seek membership needs to be examined more. In turn, we should also study how those same newcomers may attempt to change—or resist—the dominant cultures and practices within their new discourse communities and the consequences of such actions, or how they develop syncretic or hybrid practices instead.

Parks (2001) and Parks and Maguire (1999), for example, have conducted studies of the university-workplace transitions in nursing in Quebec, Canada. They analyzed the important and pervasive genres of *nursing reports* and *care plans* taught in nursing programs for use during or at the end of nurses' hospital shifts. However, the texts francophone student nurses had been socialized to produce (e.g., narratives in French nursing reports; 3-part care plans) actually differed from those expected in francophone hospitals; in the case of care plans, the experienced francophone nurses found them to be a waste of time. The reports they were taught to produce also differed from those expected in anglophone Montreal hospitals. In English, reports were expected to synthesize a patient's condition, using an assortment of abbreviations (e.g., pt for 'patient'; d/c'd for 'discharged'), of the sort described by Hobbs (2004), and often involved bilingual collaboration with other nurses. Their care plans in the English hospitals over time contained fewer reports of symptoms and fewer deadlines (for improvement) and more diagnosis (i.e., fewer than 3 parts). Their plans became more "efficient" and "simplified," like those of their anglophone nurse colleagues.

Another example of socialization across contexts comes from research examining the linguistic socialization of adult immigrants training to become long-term resident care (LTRC) aides in order to work in hospitals and nursing home facilities or to provide home care. Duff, Wong, and Early (2000) revealed the very different expectations and socialization experiences for participants while studying in their LTRC program versus while in their practicum or workplace settings. Their coursework included language instruction to develop their proficiency and fluency in English as well as technical medical terminology, plus basic nursing and healthcare. However, in actual workplace settings, the participants had to learn to (i) simplify their language to make it more comprehensible to elderly residents with varying levels of English proficiency (including none) and degenerative conditions affecting communication, (ii) reduce the rate of speech, (iii) avoid technical language that would not be well understood, and (iv) communicate using a variety of nonverbal strategies, such as through touch and

by “reading” body language. Thus, program participants and graduates were being socialized into new forms of discourse and communication in these complex, often multilingual, multigenerational new discourse communities, involving medical staff, other caregivers, family members, and the residents/patients themselves.

#### FUTURE DIRECTIONS

New forms and means of (tele)communication in the service industries and other professions, coupled with intensive globalization, migration, and market pressures, are associated with the development of new literacies, new measures of sociolinguistic control, and new expectations about language learning and use. Given the diverse composition of many classrooms and workplaces, clashing ideologies of competence, politeness, and discourse may be inevitable without careful monitoring and intervention (Katz, 2000; Li, 2000; Scollon and Scollon, 1995). Future language socialization studies related to higher education and work should take place in a wider range of contexts and languages and in settings outside of North America and Europe, as well as within those regions. Research that examines the intertextuality, interdiscursivity, and hybridity of language practices to a greater extent will also complement existing studies. Lingua franca interaction and socialization, within rich local linguistic ecologies, deserves more attention as well, in both face-to-face and electronically or technologically mediated interaction for education or work. Finally, including a wider cross-section of contexts, discourses/genres, and disciplines or vocations into which individuals and groups are socialized, particularly when the researchers have themselves been apprenticed or have gained membership within those same communities (as in some of the studies reported above), will yield important, nuanced insights into the social, cognitive and discursive complexities of language use across many walks of life in the so-called “new work order” (Gee, Hull, and Lankshear, 1996).

Ideally, the novices being apprenticed into these new orders and their mentors will also become better equipped to effect change in highly intercultural, interconnected, and multilingual societies where certain discourses may prove inaccessible or unattainable to outsiders yet extremely powerful in terms of their gatekeeping, exclusionary potential. As Heller (2002) reminds us, there are many “sites of struggle” when communities are confronted with the pressures of globalization, the commodification of languages (e.g., what constitutes “good French” or “good English” or “bilingualism”), potentially dehumanizing linguistic practices, and with new understandings of what constitutes “authentic” and “legitimate” competencies and identities.

## **Section 5**

### **Language Socialization in Particular Communities of Practice**

## LANGUAGE SOCIALIZATION IN CANADIAN ABORIGINAL COMMUNITIES

### INTRODUCTION

Children are socialized to cultural norms and values through language and also become familiar with preferences and expectations for how language should be used by participating in social interactions in their communities. As Schieffelin and Ochs (1996) note, language socialization researchers consider children's language use in light of the sociocultural context, including the "structures, processes, activities, understandings, and ideologies that give meaning and identity to a community" (p. 252). They also identify the methods typical of language socialization research: taping of spontaneous and multiple interactions involving children, analysis of transcripts derived from the recordings, and integration of transcript data with observational notes, and native speakers' perspectives on the significance of recorded events (see Ochs and Schieffelin, *Language Socialization: An Historical Overview*, Volume 8).

Adopting Schieffelin and Ochs' description, there are only a few studies of the language socialization of Canadian Aboriginal children. However, interview studies that elucidate Aboriginal beliefs and practices surrounding language use with and by children also exist. Preceding these two types of studies is earlier research that identified Aboriginal communicative practices and Aboriginal perspectives on them. New developments include efforts to redefine research in Canadian Aboriginal communities and the implications of these efforts for the study of language socialization.

### MULTIPLE COMMUNITIES OF PRACTICE

The study of language socialization and language use in Canadian Aboriginal communities covers a number of distinct cultural groups which can be broadly divided into First Nations, Inuit, and Métis. First Nations constitute over 60% of the 976,000 people reporting an Aboriginal identity in the 2001 Canadian census (Statistics Canada, 2003). They comprise 52 different nations organized into over 600 bands spread out across Canada. First Nations vary considerably with respect to Aboriginal language (over 50 different languages) and language

retention (Norris and Jantzen, 2004). Inuit, who make up about 5% of individuals identifying themselves as Aboriginal, reside in northern settlements that stretch as far east as the province of Newfoundland and Labrador and as far west as the Northwest Territories. For over 90% of Inuit in eastern Canada, Inuktitut remains the language first acquired by children in the home. In contrast, Inuktitun, a related language spoken by Inuit in the western Canadian arctic, is the first language of only a minority (Dorais, 1992). The Métis, comprising about 30% of all Aboriginal people, are concentrated in central and western Canada. Most Métis are native speakers of English and/or French, Canada's two official languages. A minority also speak or understand a First Nation language and/or Michif, a language that mixes elements of Cree and Canadian French and is "the historic and official language" of the Métis nation (Aboriginal Languages Task Force, 2005).

The 2001 census also indicated that about half of Canada's Aboriginal people live in urban areas, while the other half live on reserves or in rural, often remote, Aboriginal communities where Aboriginal languages are used more widely (Norris and Jantzen, 2004). However, language use alone does not determine cultural identity. According to Fettes (1997), over 80% of adults declaring Aboriginal descent in the previous census "report[ed] an attachment to their ancestral language, even if they no longer sp[oke] it" (p. 118).

Although the Aboriginal peoples of Canada vary in the ways identified here, and in yet other ways, such as political structures, spiritual beliefs, the advent of formal schooling, and history of contact with non-Aboriginals, they also have commonalities with each other as well as with other Aboriginal groups. One of these shared features is a history of European colonization and an ongoing struggle aimed at countering its long-term consequences. Indeed, in Canada, the movement for Aboriginal rights and nationalism is accompanied by a political discourse that both informs and relies on the idea of an Aboriginal identity. The Assembly of First Nations (2005a), for example, maintains that Aboriginal communities are culturally diverse but "bound together by a sacred tie to the land, a value of communal interdependence and a holistic worldview".

It is in this context of solidarity and shared identity combined with linguistic and cultural diversity that researchers investigating language use have conducted their research. Studies have often been of a single Aboriginal group, sometimes in a single location. Even then, one can hardly describe most Aboriginal children and adults as engaging in a single community of practice. Rather, they are individually and collectively negotiating two or more "worlds", whether those are geographical places like the Canadian North and South, traditional and recent economies, home and school, or an Aboriginal language and English or French.

## EARLY DEVELOPMENTS

An early study of communicative practices in a Canadian Aboriginal community was conducted by Darnell (1988). In the proceedings of a 1982 conference, she noted that certain of her findings concerning Cree were congruent with those reported for other Native North American groups, in particular “the positive functions of silence, the tendency to avoid eye contact, and the use of indirection in requests” (Darnell, 1988, p. vi). She and several other contributors discussed their findings in light of Aboriginal values and worldview. According to Rushforth (1988), for example, a Dene preference for implicit communication, indirect speech acts, and non-interfering, constrained behaviour in social interaction reflected the importance they placed on being one’s own ‘boss’ and recognizing the autonomy of the other. Black-Rogers (1988), too, remarked on a propensity for non-interference amongst Ojibwa: “The proper way to conduct oneself and one’s thoughts is simply to leave others alone and concentrate on steering one’s own ship. At the same time, care is taken not to offend any ‘living thing’ since all may have the potential to affect or control” (p. 46).

Studies like these revealed concepts that appeared to guide communicative behaviour in at least some Aboriginal communities and provided insight into the aspects of communication one might study with respect to adult–child interactions. The conceptual and methodological framework of language socialization research in Canadian Aboriginal communities has also been guided by seminal studies such as Schieffelin’s analysis of caregiver–child interaction among the Kaluli, an indigenous people of Papua New Guinea (Schieffelin and Ochs, 1986), and Heath’s (1983) comparison of language use and language learning across two working-class, racially distinct communities in the Piedmont Carolinas in the southern USA.

Research on classroom discourse in Canadian Aboriginal communities evolved from studies of language socialization in homes. It was also influenced by early educational ethnographies (Howard, *Language Socialization and Language Shift among School-aged Children*, Volume 8). These included studies that elucidated the cultural nature of talk in classrooms (Cazden, 1988) and attested to incompatibilities in the communicative patterns of Aboriginal children and their non-Aboriginal teachers in both the United States (e.g. Philips, 1983) and Western Australia (e.g. Malcolm, 1982). Philips (1983), for example, investigated classroom interactions in two contexts: one where the teacher was “Anglo” and the students were Warm Springs “Indians”, and one where teacher and students alike were “Anglo”. Relative to their non-Aboriginal peers, the Warm Springs children generally talked less, gazed more at each other and less at the teacher during lessons, signalled attention less,

responded less to being called upon to speak, respected turn order more, and distributed speaking turns more equally amongst themselves. Philips characterized Warm Springs Indians as organizing interaction in such a way so as to maximize individual control over one's own speaking turn yet minimize control over others' turns, an account consistent with the notions of "respect" and "non-interference" evoked in early investigations. Philip's work, only a small part of which is summarized here, is significant in that it demonstrated how Aboriginal children's educational success might be compromised by the 'invisible culture' of the school.

In the Canadian context, discussions about culturally-appropriate education for Aboriginal children and about Aboriginal education as a cultural activity (Stairs, 1985, 1994) have been and remain tied to discussions about the school's role in Aboriginal language retention and revitalization. Various aspects of this issue are covered in two recent reviews: one related to Aboriginal language maintenance and enhancement in and outside of Canada (Burnaby, 1996) and another regarding language policy for indigenous peoples (Corson, 1997).

The research discussed in the next section emphasizes language socialization. Past and current research on related topics, including the properties of Aboriginal languages, the acquisition of specific forms, and the impact of majority languages on Aboriginal language acquisition, have been excluded in order to limit the scope of the article. Canadian studies in all of these areas have been published in journals spanning a number of disciplines and in recent collections treating indigenous languages worldwide (e.g. Allen et al., 2006) or in specific regions of Canada (e.g. Maurais, 1996)

#### MAJOR CONTRIBUTIONS

Crago's (1993) ethnography of several Inuit families in Northern Quebec was the first language socialization study of an Aboriginal group in Canada. It was also the first in a series of studies conducted in collaboration with Kativik School Board, the Inuit-controlled board governing education in arctic Quebec. To begin with, Crago studied four children and their families longitudinally, starting when the children were 1–2 years old. The data taken from the videotapes was integrated with contextual notes, extensive observation notes of the families and of community events, and interviews of local Inuit women in different age groups. The findings showed that Inuit mothers shared certain beliefs and practices surrounding child-rearing and appropriate language behaviour for children. For example, mothers rarely asked questions just so children could display their knowledge, but rather reserved questions to elicit information from children they did not yet

know. Mothers also tended to evaluate children's knowledge of language based on comprehension, not production. Older mothers, especially, expressed a preference for quiet, visually attentive behaviour over talkativeness. Crago also described how Inuit caregivers used imitation routines, greeting rituals, and a "baby-talk" register (elaborated in Crago et al., 1998a) to simultaneously accommodate children's level of development and prepare them for community life. Crago's study informed Allen's subsequent research on Inuktitut acquisition (Allen, 1996) by documenting features of input, by revealing the kinds of participation one might expect in adult-child and peer-peer interactions, and by providing a model for establishing research goals responsive to local needs.

Crago et al. (1998b) later studied language use in Inuit families where English and/or French were being spoken in addition to Inuktitut. In some of the families, bilingual parents chose to speak only Inuktitut to their child to ensure acquisition of the language, but were no longer displaying the interactional patterns Crago had observed earlier among Inuit. The study showed that "traditional" language and "traditional" culture may dissociate, with one remaining relatively stable while elements of the other shift.

Hough-Eyamie (1999) used both qualitative and quantitative analyses in her comparative study of ten white, English-speaking Canadian families and ten Cree Nation/Cree-speaking families. The variety and number of communicative behaviours examined precludes discussion of each, but a few examples serve to illustrate the nature of the analyses and findings. First, an important difference between the Cree and "Mainstream" groups related to the "social structure of caregiving". Cree toddlers participated in more multi-party interactions, had greater freedom from schedules and structured activity, and engaged in fewer dyadic interactions with mothers than Mainstream children. Second, when mothers and children *were* observed in joint interaction, both Cree mothers and children were responsive to one another but talked less than Mainstream mothers and children, and used more nonverbal communication. Cree and Mainstream mothers expressed quite similar communicative functions but in different proportions. For example, Cree mothers directed children's attention and behaviour more than Mainstream mothers did. While this last result appears to contrast with a principle of non-interference discussed earlier, it may reflect a Cree distinction between appropriate behaviour for "all adult" talk versus talk between adults and toddlers, a possibility Hough-Eyamie alludes to.

Ball and colleagues have also conducted research on communicative practices in First Nations communities. Their work relates to participation in a teaching program: a university-community partnership that

prepares First Nations students to provide culturally-appropriate early childhood care and education. In one study, First Nations Elders and parents from central and western Canada were interviewed, in most cases by a First Nations interviewer (Ball & Lewis, 2004). Most of the 66 interviewees were monolingual English speakers, with the majority reporting Cree, Dakota, and Ojibway as ancestral languages. Several findings are of particular relevance to our discussion. First, over three-quarters of participants felt it was important that parents be 'talkative with their children to support . . . language learning' (p. 6). They identified many ways of stimulating language learning, including engaging children through dialogue. Second, while interviewees described listening as a valued communicative behaviour, over half of the interviewees expressed a preference for a 'talkative' child, a third expressed no preference or said 'it depends,' and only a minority preferred a 'quiet' child. The latter results contrast with a preference for quiet, reserved communicative behaviour suggested in the studies of certain Aboriginal communities. Perhaps there is a difference between Aboriginal groups. Perhaps we are witnessing change over time, as Crago and colleagues did when they compared younger and older Inuit mothers' views on children's participation in adult conversation (Crago et al., 1993). It is possible, too, that while First Nations interviewees had a positive opinion of talkativeness, their threshold for 'too much talk' may still be lower than non-Aboriginals. A third finding of interest was most interviewees' preference for bilingual early education (ancestral language plus English) or monolingual education in an ancestral language, rather than English-only education. These First Nations elders and younger parents clearly value Aboriginal languages and, according to Ball and Lewis' commentary, associate it strongly with cultural identity, despite the fact that most interviewees were not themselves speakers of an Aboriginal language. In a related study, Ball et al. (2004) used questionnaires to elicit the perspectives of predominantly non-Aboriginal speech-language specialists working in First Nations communities. These specialists noted that First Nations children were more responsive when conversational pace was slower and when peers were involved in interactions. The importance of peers is one that Inuit teachers also stressed, as discussed in the following study.

Eriks-Brophy and Crago (2003) investigated instructional discourse in Inuit communities in northern Quebec. In those communities, Inuit teachers taught in Inuktitut through grade 2. In grade 3 and beyond, the teachers were non-Inuit and the language of instruction was English or French. Eight Inuit and six non-Inuit teachers were compared with respect to how they managed students' turns and how they reacted to students' responses and initiations. Inuit teachers were not as likely as non-Inuit teachers to call on, evaluate, correct, reprimand, or praise

students individually. Inuit teachers used more group address and choral response and incorporated students' initiations more frequently. They also directed students to their peers as sources of information more often, and permitted higher levels of peer interaction during lessons. In interviews, the Inuit teachers revealed some of the cultural values underlying their classroom practices, including beliefs about the importance of cooperation, social interaction, and allowing children to maintain "face" (Eriks-Brophy and Crago, 1993). Based on these and other findings, the authors concluded that the shift in language of instruction in grade 3 was accompanied by a shift in classroom culture: fertile ground for miscommunication, devaluation of Inuit communicative patterns, and reduced academic success for children. In this study of Inuit, language and culture seemed to be linked; Inuit teachers and students used Inuktitut and also engaged in an Inuit version of instructional discourse. The relationship between teaching beliefs, culture, and language is, however, quite complex, as McAlpine et al. (1996) demonstrate in three case studies of teachers in a Mohawk community.

The studies reviewed thus far emphasize conversations in homes and instructional discourse in school. Studies that investigate other discourse genres in equal depth are rare. Narratives are of particular interest given oral traditions in Aboriginal communities and evidence of cross-cultural variation in children's narratives. Pesco and Crago (1996) studied older Algonquin children's stories of personal experience. They focused on narrative content, theme, and structure, as well as the contributions children made to each other's narratives, and supplemented these data with observations of community life. The features of the narratives were discussed in terms of how they interacted with one another and together reflected and contributed to cultural, community, and peer group belonging. References to other studies on the narratives of North American Aboriginal children can be found in their article as well as in Kay-Raining Bird and Vetter's (1994) study of the narratives of Chippewa-Cree children residing in the United States.

Patrick (2003a) has extended the study of language socialization to adolescents and adults and to settings outside of home and school. She studied a unique community in arctic Quebec inhabited by Cree and Inuit as well as by a minority of Euro-Canadians. Most of the community's inhabitants were bilingual or multilingual. Cree and Inuit were first-language speakers of their ancestral languages (i.e., Cree or Inuktitut), some Inuit spoke Cree, and many Cree and Inuit spoke English or French, or both. The Euro-Canadians spoke French and/or English. The observational and interview data collected by Patrick demonstrated the dominance of English (rather than French) as the second/third language of Inuit in the community, despite the status of French as the sole official language of the province; interviewees'

perceptions regarding its political, social, and economic value; and the availability of French schooling. Patrick connected the dominance of English as a second/third language to a number of factors. These included historical influences, the symbolic value of English, particularly amongst Inuit youth, the community-wide use of English in situations of intercultural communication, and Inuit perceptions regarding the time required for and priority of learning another (typically, third) language. Additionally, most anglophones and francophones in the community did not speak even rudimentary Inuktitut or Cree, a fact attributed by some interviewees to the complexity of learning an Aboriginal language or to a lack of learning opportunities and materials. In summary, Patrick's research showed how the beliefs and communicative practices of all members of this multilingual community contributed to determining which language was likely to be learned and adopted as a second language by the community's members.

#### WORK IN PROGRESS AND FUTURE DIRECTIONS

Research related to language use in Aboriginal communities remains quite varied. One source of evidence for this is a list of research, research development, or community-university research alliance (CURA) projects recently funded by the Social Sciences and Humanities Research Council of Canada (SSHRC). The list includes projects devoted to analysis of the structural aspects of Aboriginal languages, evaluation of pedagogical strategies for teaching endangered languages, identification of factors affecting Aboriginal students' school performance, and the implementation and evaluation of "community-based Aboriginal curriculum initiatives". Several of the studies relate to themes present in the language socialization literature, although they are not language socialization studies per se.

The topics of these particular projects and of other research we are aware of do not differ dramatically from those addressed in the last two to three decades. New developments relate to an intensification of "Aboriginal research" accompanied by movement towards greater Aboriginal control of the epistemology, methods, objectives, and dissemination of such research. Intensification is reflected, for example, in SSHRC's 2002 decision to make Aboriginal research one of its strategic priorities. That decision was followed by a public "Dialogue on Research and Aboriginal Peoples" involving more than 500 participants from Aboriginal, academic, government and non-governmental organizations (discussed at length in McNaughton and Rock, 2003). The dialogue resulted in the articulation of an approach to Aboriginal research and the proposal of several initiatives, some of which SSHRC has since implemented. The approach includes creation of research partnerships between researchers and Aboriginal communities, support of research

on Aboriginal systems of knowledge, building Aboriginal capacity for research and providing career opportunities for Aboriginal researchers, accrual to Aboriginal communities of greater research benefits, and heightened Aboriginal control over intellectual and cultural property.

Such an approach is, of course, not wholly new. As mentioned earlier in the chapter, individual language socialization researchers have worked in conjunction with Aboriginal community agencies such as school boards or research institutes and jointly tried to implement similar principles. A decade ago, The Royal Commission on Aboriginal Peoples suggested ethical guidelines for research that emphasized Aboriginal control. Furthermore, in many Canadian Aboriginal communities, local governing bodies such as band or community councils already have protocols for conducting research. The greater institutionalization of a collaborative approach should, however, make it flourish and become the norm. It should also be noted that SSHRC is not alone in the direction it is taking. The lead federal funding agency for health research, the Canadian Institutes of Health Research (CIHR), includes an initiative specific to Aboriginal health in urban communities: the Institute of Aboriginal People's Health. Although at first glance the objectives of a health research institute may seem inconsistent with language socialization research, linguistic and communicative competence are certainly related to children's well-being, and research in these areas has been supported in the past by the CIHR.

Shaw (2001), a linguist with extensive experience in Canadian First Nations communities, has written specifically about the necessity of a paradigmatic shift in linguistic research on endangered languages. She discusses the many issues that must be negotiated as language researchers, often non-Aboriginal, conduct research in Aboriginal communities. One of these is perspectives on language loss:

... to the field linguist ... it is primarily the imminent loss of 'the language'—as an intricately elaborated and constrained human cognitive system—which is at risk ... In contrast, to a First Nations community with only a handful of speakers left, there has already—throughout the post-contact period since colonization by the western European powers—been a progressive layering of devastating losses which are intricately linked to the erosion of language (p. 4) ...

Shaw asserts that the research relationship needs to be reconfigured so that research on language loss is not itself experienced by Aboriginal people as another loss or as exploitation and discusses ways that reconfiguration might and presently does manifest itself. Given that language socialization research may be conducted in conditions of language vitality, language shift, or language revitalization, Shaw's point of view certainly has relevance for language socialization researchers.

In summary, one of the important developments in the Canadian context is the loudening call for and broader adoption of a different model for Aboriginal research. From that, the future of language socialization research will unfold.

### PROBLEMS AND DIFFICULTIES

Aboriginal peoples and non-Aboriginal researchers face a number of challenges related to language research. One of these is the linguistic and cultural diversity of Aboriginal communities discussed earlier. This diversity increases the probability that research findings from one setting will not apply directly to other settings or to the large proportion of Aboriginal people residing in large, linguistically and culturally diverse cities. Nonetheless, research certainly has the potential to identify processes that are relevant to more than a single group. For example, Patrick's (2003b) study of a single community in northern Quebec is highly significant for other Aboriginal communities in that it articulates the relationship between everyday language use, the local and national economic and political context, and Aboriginal identity.

A second challenge in conducting language socialization research relates to the many pressing needs in Canadian Aboriginal communities. Compared to the entire Canadian population, the Aboriginal population is considerably younger, with about a third of people under the age of 14, and half under the age of 25. The majority are living in poor material conditions. According to indices of 'quality of life' based on labour force activity, income, housing, and education, the 'bottom 100' of nearly 4700 Canadian communities includes 92 First Nations communities while the "top 100" includes only one. Rates of high school graduation, post-secondary education, and employment are below national averages. Housing both on and off reserves is inadequate and often crowded. Infant mortality rates are higher, and life expectancy is lower. Suicide rates are high, particularly among youth, and diseases like diabetes and tuberculosis are more prevalent than in Canada overall (Assembly of First Nations, 2005b). All of these conditions, along with the human energy and material resources presently devoted to improving them, have implications for the degree and kind of research participation that Canadian Aboriginal community members and leaders will choose. Patrick (2003b) suggests that university-community alliances will continue to be necessary: "[The] realities of research and power mean that the need for university-based studies will continue for First Nations communities seeking legitimization and support for local cultural, linguistic, and economic issues" (p. 10).

Assuming that Patrick is accurate, the question of priorities regarding language research remains. In the aforementioned dialogue on

Aboriginal research (McNaughton and Rock, 2003) submissions by Aboriginal and non-Aboriginal individuals indicated a shared concern with the preservation and intergenerational transmission of Aboriginal languages. Given this concern and other data presented in this chapter, it is likely that the theme of language choice and its relationship to cultural identity will become a primary one should language socialization research continue in Canadian Aboriginal communities.

## LANGUAGE SOCIALIZATION IN DEAF COMMUNITIES

### INTRODUCTION

Language socialization in Deaf communities is unique in ways that are challenging for language socialization theory. Most members of the DEAF-WORLD (Lane, Hoffmeister, and Bahan, 1996) have not followed a straightforward path to identification with and membership in a Deaf community. A small percentage of Deaf children are born into Deaf families where everyday interaction occurs within a visually based culture through a natural sign language. For these children, the process of language socialization is similar to that of most children; only the modality differs. But for the majority of Deaf children who are born to non-Deaf parents who do not expect their child to be deaf (lower case denotes hearing status; upper case denotes identity status), early access to sign languages is absent. Since these children do not hear, they cannot fully participate in the spoken language socialization environment their parents naturally provide. And, because sign languages have been stigmatized historically and Deaf communities have been oppressed, marginalized, and some would argue colonized by non-Deaf majorities (Ladd, 2003; Markowicz and Woodwar, 1978), the primary sites of language socialization for most Deaf people have been community institutions such as Deaf schools and clubs. Deaf people have acquired sign language and become oriented to the DEAF-WORLD primarily when they have come into contact with peers and elders in the Deaf community, which may not occur until later in childhood, adolescence, or even adulthood.

### EARLY DEVELOPMENTS

Natural sign languages have emerged whenever and wherever Deaf individuals have had the opportunity for frequent and sustained social interaction among themselves. With the establishment of residential schools for Deaf students in Europe during the eighteenth century, access to natural sign languages greatly increased for Deaf people, especially for Deaf children. Those residential schools and the linguistic communities they gave rise to provided institutional stability and continuity of language socialization across generations.

Sign languages were viewed as nonlinguistic, ad-hoc gestural systems until William C. Stokoe's groundbreaking publication *Sign Language Structure* (1960) demonstrated that they were constructed and patterned in linguistically rule-governed ways like all other naturally occurring languages. Building on the revolutionary work of Stokoe and his colleagues in the USA and Tervoort (1961) and his colleagues in Europe, social scientists investigated not only the linguistic structure of natural sign languages but also the social and cultural aspects of these unique linguistic communities. Theoretical and descriptive studies during the 1970s and 1980s began to portray signing Deaf people from a cultural perspective in contrast to the prevailing pathological or medical view of Deaf people. The sociocultural view of Deaf people emphasized the centrality of natural sign languages and shared experiences, not degree of hearing loss, in constituting Deaf social identities, social organization, and cultural values (Baker and Battison, 1980; Meadow, 1972; Washabaugh, 1981). Most Deaf communities, at least in the USA, were described as bilingual and diglossic; natural sign languages were used in informal, intimate interactions (labeled the low variety or L in the literature on diglossia) and English-influenced sign language varieties were used in formal social settings such as classrooms, church services, lectures, and conversations with non-native signers (labeled the high variety or H in the diglossic literature) (Kuntze, 2000; Markowicz and Woodward, 1978). Within the DEAF-WORLD, it was argued, the social reality of Deaf people was indexed by a natural sign language while the spoken language of the larger community in its various forms indexed the non-Deaf world (Nash and Nash, 1981).

Writing specifically about socialization to the Deaf linguistic community at a time in American education when the majority of Deaf children attended residential schools, Meadow (1972) suggested that there were three transition points in the life cycle of Deaf individuals when they may be socialized to the sign language community. They are: (i) infancy (the child born into a signing family); (ii) the time of enrollment in a residential Deaf school (the child born into a nonsigning family who typically entered the residential school between the ages of five and thirteen); (iii) the time of graduation from a non-signing high school (Deaf individuals who had little or no contact with the Deaf community until entering the workforce, meeting signing Deaf adults, and socializing at the Deaf club). Early research on American Sign Language (ASL) acquisition was conducted on children with Deaf signing parents. Those studies provided the first systematic description of language socialization processes in Deaf ASL-using families although most often the primary focus was on the child's acquisition of grammatical features. A few studies described the socio-cultural context of language acquisition documenting systematic

modifications of parental signing to infants and toddlers which is not unlike child-directed speech in spoken languages (Kantor, 1982; Maestas y Moores, 1980); a young Deaf child's code-switching between ASL and varieties of signing that incorporate English grammatical structures (Williams, 1976); and the complex interaction of languages and modalities that supports the acquisition of written English in an ASL dominant home context (Maxwell, 1984). Other researchers examined language socialization processes in educational contexts where varying combinations of spoken languages, English-influenced signing, and natural sign languages were utilized. Microanalysis of Deaf children interacting in these multilingual and bimodal contexts revealed that language socialization took place primarily in the visual modality, a fact that was lost on most non-Deaf teachers of Deaf children (Cicourel and Boese, 1972; Erting, 1982/1994; Preisler, 1983). One early ethnographic study investigated how language use by adults, both Deaf and non-Deaf, and young Deaf children indexed cultural values, social identity, and other aspects of sociocultural knowledge, demonstrating that use of ASL indexed affiliation with the DEAF-WORLD and its values while use of manually coded English (MCE) referenced non-Deaf world contexts, interpretations and values (Erting, 1982/1994).

#### MAJOR CONTRIBUTIONS

During the past two decades, as evidence of the linguistic status of natural sign languages mounted, political movements championing the rights of Deaf people as linguistic and cultural minorities led to (i) the establishment of bilingual education programs for Deaf children, (ii) the selection in 1988 of the first Deaf president of Gallaudet University, the world's oldest university for Deaf students located in Washington DC, (iii) the first Deaf Way international conference and festival in 1989 celebrating Deaf cultures, histories, languages, and arts and (iv) the recognition and teaching of natural sign languages as foreign languages in high schools and universities (Erting, Johnson, Smith, and Snider, 1994). Paradoxically the trend to move Deaf children from large regional programs into small local school settings gained momentum during this same period. As a result, most Deaf students were isolated from signing peers and adult Deaf role models and thus were denied opportunities for sign language socialization during their formative years.

During the 1980s and 1990s increasingly sophisticated linguistic research on sign languages and ethnographic studies of Deaf people's lives provided insight into a variety of language socialization contexts: families, educational settings, Deaf clubs, Deaf minority communities, and isolated Deaf/non-Deaf rural communities. As psycholinguists

continued to investigate the sign language acquisition of children with Deaf, signing parents (Chamberlain, Morford, and Mayberry, 2000; Parasnis, 1996), ethnographers began to describe the complex interactional processes occurring in these bimodal, bilingual, and bicultural home environments during language socialization (Blackburn, 2000; Erting, Prezioso, and Benedict, 2000; Preston, 1994). In 1994, the first large scale study of adult non-Deaf offspring of Deaf parents (commonly known as CODAs, short for Children of Deaf Adults) was published. Preston, himself an adult CODA, interviewed 150 non-Deaf men and women between the ages of 18 and 80 across the USA who had Deaf parents. He concluded that despite the bilingual proficiency of many of his informants, there was a pervasive sense of cultural marginality due in large part to the history of conflict between the two language groups and what they regard as an artificial choice between two cultural identities, Hearing or Deaf. Blackburn's (2000) ethnographic study illustrates the complexity of language socialization in the Deaf community from another vantage point—a four-year-old Deaf child in a large non-Deaf family, a family who sought to transform itself into a visually oriented, bilingual, bicultural entity. The researcher lived with the family for 10 months documenting how the parents, siblings, and the child himself dealt with a variety of complex and challenging communicative, linguistic, and social situations that face mixed families with Deaf and non-Deaf members, even those who have adopted a proactive and positive stance toward the child's visual worldview.

Despite the fact that residential schools for Deaf children were historically the primary sites for language socialization to the Deaf community, only a few ethnographic studies exist that illuminate the complex social, cultural, and linguistic processes at work in these settings. Evans and Falk (1986) published the first in-depth study in the USA that focused on daily life in a residential school. Their observations and interpretations echoed the pervasive negative attitudes toward the indigenous or natural sign language (ASL) and culture of Deaf people. They reported that while ASL was the preferred language of the children, the non-Deaf adults who worked with the children did not often use the language and when they did, they used it poorly; few could understand the sign language of the children. Unfortunately, these researchers themselves failed to observe and report peer language socialization processes in any detail.

Reilly and Reilly's (2005) study of Deaf children interacting outside of the classroom at a residential school in rural Thailand during 1991–92 focused on the children's use of the indigenous sign language, documenting the intergenerational transmission of culture and knowledge by peers, what the authors call the Deaf way of education, supported by a social

organization and processes of language socialization created by the children (p. xii). Narrative, a “primordial tool of socialization” (Garrett and Baquedano-Lopez, 2002, p. 353), played a central role in how Deaf children learn about the world, about themselves and their place in the society (Erting, Johnson, Smith, and Snider, 1994; Ladd, 2003). Students who were recognized by their peers as sign masters, relayed the news, acted as interpreters, and created extended narratives with complex plots that captivated students one to three years younger for as long as thirty minutes at a time. Other contexts for language socialization were participatory gatherings that were “. . . dialogic and egalitarian activities by students of equal social status” (Reilly and Reilly, 2005, p. 189) including conversational circles, verbal dueling, and games and sports.

Studies of educational settings where Deaf adults as teachers or assistants did interact with Deaf children revealed the critical role these adults played in language socialization. Regardless of the type of setting or educational level of the students, Deaf adults code-switched between a natural sign language and a variety of signing influenced by spoken language to engage in extended dialog with students. They drew upon their Deaf cultural knowledge to mediate a variety of topics including learning the language of reading and writing (Bagga-Gupta, 1999–2000; Bailes, 2001; Johnson and Erting, 1989; Ladd, 2003; Ramsey, 1997).

While Deaf clubs are currently in decline in the Western world (Ladd, 2003; Padden and Humphries, 2005), they are cultural institutions within Deaf communities and historically have served as regular gathering places where Deaf people socialize with one another, exchange information, and help initiate newcomers to the process of learning how to be Deaf (Erting, Johnson, Smith, and Snider, 1994; Ladd, 2003; Padden and Humphries, 1988). Hall’s (1991) ethnographic study of folklore in an American Deaf club reveals how central the Deaf club was to members’ lives and how diligently members worked to socialize young Deaf people from various educational and linguistic backgrounds to ASL and the values so important to them, often through mentor relationships. Drawing upon traditional stories, personal narratives, riddles, jokes and sign play, mentors guided newcomers in their acquisition of the linguistic and cultural knowledge they needed to live their lives as culturally Deaf people. Deaf people often regarded the club as their second home, a place where they could express freely their sense of a shared heritage and a shared future and through which they could connect with other Deaf communities across space and time (Ladd, 2003; Lane, Hoffmeister, and Bahan, 1996; Padden and Humphries, 2005).

## WORK IN PROGRESS

Research in progress on language socialization in Deaf communities is characterized by its crosscultural and transnational emphasis as well as its more explicitly ethnographic orientation. In Monaghan, Schmaling, Nakamura, and Turner's (2003) edited work, studies of Deaf communities and their sign languages from the USA, Central and South America, Europe, Asia, and Africa are juxtaposed. Taken together, the studies reveal the globalization of Deafhood, the multilingual and multicultural nature of worldwide Deaf communities within the context of a unique transnational visually oriented languaculture (Agar, 1994). While historical circumstances, the larger sociopolitical and economic opportunity structure, and local cultural and linguistic traditions have fostered intriguing differences among Deaf communities and their language socialization practices and trajectories, cross-cultural commonalities also have emerged. For example, educational institutions, hereditary deafness, and urban density are all factors that contribute in culturally specific ways to the formation of Deaf communities across the globe. Visual orientation to the world and sign languages are central to those Deaf communities—even when speech-based communication has a significant role. Finally, sign languages and Deaf communities are shown to be resilient, having survived brutal campaigns to obliterate them.

Within the context of globalization, Breivik (2005) utilized Deaf life stories of Deaf Norwegians to explore issues of language and identity formation and in the process discovered the transnational nature of Deafhood and Deaf identities. He argued that although sign language is not an international language, Deaf people attending transnational events such as the Nineteenth Deaflympics (a word invented to mean the Deaf Olympics) in Rome in the summer of 2001, nevertheless quickly established ad-hoc linguistic and communicative conventions by which they were able to bond socially. In addition to the commonality of experiences that signing and being Deaf in a non-Deaf world gives rise to, the ability to bond helps foster translocal and even transnational Deaf identity. Breivik's exploration of the relationship between languages and Deaf identities through Deaf life stories illustrates the challenges inherent in employing ethnocultural models for understanding Deaf identity especially as these relate to center vs. periphery analyses (in terms of degree of deafness, with more Deaf at the center and less Deaf at the margins, an increasingly problematic model). Nevertheless, in every life story, exposure to a signed language and a community of signers was a formative experience, one that changed the way that meaning was structured and created. For some,

especially those for whom the introduction to the language occurred later in life or in only a limited way, it did not represent salvation but rather another world to which they had only partial access.

Ethnographic research on Deaf communities, while still in its infancy, is of critical interest for language socialization research, especially as it illuminates social and linguistic processes in specific activity settings (Senghas and Monaghan, 2002). One domain that has received increased attention in recent years is the bilingual classroom where the signed languages and written forms of the spoken language are utilized as languages of instruction. Singleton and Morgan (2006) reviewed research on natural sign language acquisition in the classroom, noting that the social context of the classroom is the only setting where many Deaf children have the opportunity to acquire a natural sign language, with the teacher as their primary linguistic model. Based on accumulating evidence, they argue that the most effective teachers are those who have a high level of ASL proficiency, are attuned to Deaf children as visual learners, and promote linguistically rich, visually based dialogic engagement in classroom activities. Furthermore, Deaf teachers create the opportunities in classroom contexts for Deaf children to visualize themselves as full participants in the Deaf bilingual community and through language, action, and participation to become full participants. In this regard, L. Erting (2006), in her ethnographic study of Deaf teachers sharing books with preschool Deaf children in ASL, identified specific, culturally based literacy practices used to co-construct meaning with Deaf children from linguistically and ethnically diverse backgrounds. These practices included connecting ASL and written English and translating English text into child-directed ASL, which, according to the teachers, helps scaffold children's ASL development, emergent literacy, and cognitive development.

Bagga-Gupta's (1999–2000) ethnographic research in Swedish high school classrooms for Deaf students challenged the educational policy of strict separation of the Swedish Sign Language and Swedish. Taking a sociocultural approach to her exploration of everyday life in these classrooms, she explored the ways in which teachers and students co-constructed visual literacy events through interaction using the cultural tools available to them. Deaf and hearing actors in these visually organized settings chained and mixed the two languages in dynamic, complex, patterned ways that helped make written Swedish more fully accessible to Deaf students. These findings are not unlike ethnographic evidence from ASL/English Deaf home environments where signing Deaf parents similarly draw upon ASL, fingerspelling, print and mouthing of spoken English words in complex and patterned ways to co-construct meaning with their very young Deaf children growing up

bilingually (Erting, Prezioso, and Benedict, 2000). Kuntze (2000) examined how a Deaf teacher wove English vocabulary and structure and ASL together while giving a lecture on China's Great Wall and in so doing, helped his middle school students prepare for reading their textbook on the subject. The teacher used code-switching as a pedagogical tool, making targeted English words and phrases accessible and comprehensible for the students by embedding them into ASL translations and explanations.

Studies of the Nicaraguan Deaf community have offered intriguing insights into the role of language socialization processes in the emergence of natural sign languages and signing communities (Monaghan, Schmaling, Nakamura, and Turner, 2003; Senghas, Senghas, and Pyers, 2005). While bidirectionality in socialization has long been acknowledged (Garrett and Baquedona-Lopez, 2002), Senghas, Senghas, and Pyers (2005) demonstrated this bidirectionality with respect to the regularization of spatial co-reference, a grammatical device in Nicaraguan Sign Language (NSL) whereby signs produced in a given location in space indicate a common referent. They argued that no single cohort of Deaf children created NSL. Instead, "... the sociocultural influence of Deaf Nicaraguan adolescents and adults interacted with the language-receptive and language-creative mental abilities of preadolescent children" (p. 304) to create the new grammar of their sign language. In this way, since the late 1970s when the government established a school and the Nicaraguan Deaf community began to have sustained contact, each new cohort of children has played a critical role in the development of NSL.

#### PROBLEMS AND DIFFICULTIES

While recent technological developments in computer and communications technologies such as pagers, videophones, and video relay services have resulted in greater access for Deaf people to each other and to the world at large, medically related technologies are giving rise to renewed efforts to suppress sign languages and signing communities. With the advent of nearly universal newborn infant hearing screening, deaf and hard of hearing children are identified much earlier than in the past. Instead of referring families with deaf infants to educational programs where the entire family may acquire and learn sign language, the medical system puts a majority of these infants on track toward cochlear implantation—now occurring at increasingly younger ages—and speech-only "intervention" programs (Johnson, 2006; Johnston, 2004; Ladd, 2003). Advocates of these programs stridently oppose providing these deaf children and their families with the

linguistic and cultural resources that derive from exposure to a natural sign language, arguing erroneously that progress in spoken language acquisition will be impeded if attention is diverted from the focus on hearing and speech. Ironically, research documenting the benefits of early exposure to signing for hearing children and their parents has resulted in popular enrichment programs largely for socioeconomically advantaged segments of the USA and western European nations who sign with their hearing babies to promote earlier communication and reduce frustration, improve cognitive development and even to assist their baby to speak at a younger age (Goodwyn and Acredolo, 1998).

As is so often the case in the education of Deaf children, a false dichotomy has been resurrected between two idealized versions of Deaf identity and their related educational philosophies: speech-only approaches versus visually based pedagogies utilizing a natural signed language and the written form of a spoken language as the primary languages of instruction. In fact, Johnson (2006) argues, the outcome of cochlear implantation is actually a population of Deaf students with great variation in functional hearing ability and spoken language use, not unlike the nonimplanted population. Some children develop enough functional hearing to participate in language socialization opportunities in an unimpeded manner; many do not. The bilingual education movement in Deaf education is based not only on the recognition of Deaf communities as bilingual and multicultural but also on empirical evidence that when Deaf children grow up in a natural signed language environment, “. . . they acquire language in a complete and timely way, while developing age-appropriate cognitive, physical and social capacities” (Johnson, 2006). Further, there is ample ethnographic evidence that Deaf people embrace linguistic and cultural diversity and utilize a range of linguistic and cultural tools in their communities of practice across the globe (Erting, Johnson, Smith, and Snider, 1994; Ladd, 2003; Monaghan, Schmaling, Nakamura, and Turner, 2003).

The medical-scientific establishment continues to dominate the public discourse about Deaf people as disabled and damaged, and genetic modification to eliminate Deaf offspring is now regarded as inevitable (Johnston, 2004; Ladd, 2003; Padden and Humphries, 2005). The challenge for Deaf communities and their ethnographers remains—to overcome the power imbalance, challenge the privileged “voices” in the debate which are never Deaf “voices” (Padden and Humphries, 2005), and to contest the prevailing medical-scientific discourse on “deafness” with a discourse of Deafhood, the process whereby Deaf people struggle to come to an understanding of what it means to become and to be a Deaf person in a Deaf community (Ladd, 2003).

## FUTURE DIRECTIONS

Since language is both the content and the medium for socializing children and newcomers to effective participation in a sociocultural group, complex and intriguing issues for language socialization theory emerge in the case of the Deaf community. One dilemma has been that of the persistent simplistic question as to whether the majority of deaf children (born to hearing parents) are to be socialized into the speaking community of their hearing parents or into the signing community. The reality is that most deaf children are primarily visually oriented and do not have full access to the speaking community; they eventually become part of the signing community, where their identity as a signing people with a history and future is discovered, anchored, and cherished. Of course, they also belong to and participate in the larger community and technological advances have made access to that community and the majority language(s) less problematic through visually based media such as the internet, pagers, and captioned digital video.

However, the World Federation of the Deaf (WFD) estimates that 80% of the world's Deaf children do not receive any formal education at all (Ladd, 2003, p. 436). Perhaps more serious than the lack of formal education is the denial of opportunities for language socialization that educational institutions afford. As Johnston (2004) argues, wealthier nations have a moral responsibility to address the poverty and lack of educational opportunities for Deaf children in the developing world. When new schools open in historically underserved areas, critically important opportunities will become available for ethnographers and language socialization researchers to document linguistic, social, and cultural processes that will unfold and the cultural products that will emerge.

One area that future work in language socialization research will need to address is the fundamental question of the kinds of family, educational, and community contexts that are necessary to enable Deaf children to use languages as social and cognitive tools. We need to understand how homes, schools, and communities can provide Deaf children with critical opportunities from the time they are born to engage in the socially and culturally co-constructed discourse so necessary for optimal linguistic, cognitive, and social/emotional development. While ethnographic research on Deaf communities and their particular language socialization practices is just beginning (Senghas and Monaghan, 2002), there is a sense of urgency as scientific and medical discourses regarding the techno-medical eradication of Deaf people threaten to obfuscate and trivialize the need to identify, understand, and implement the necessary and sufficient conditions for optimal language socialization in natural sign languages and majority spoken languages.

Studies of some small, isolated villages outside of the USA with a substantial hereditary, signing Deaf population (e.g. Branson, Miller, and Marsaja, 1996; Johnson, 1991) and ethnohistorical research on Martha's Vineyard (Groce, 1985) have demonstrated alternative possibilities for the future of Deaf/non-Deaf interaction. These small, face-to-face communities incorporated Deaf people and sign language as a taken for granted part of village life. While language socialization processes have not yet been documented in these settings, research evidence indicates that non-Deaf and Deaf villagers acquired sign languages and a visual orientation to communication with varying degrees of competence as part of the linguistic and cultural repertoire of the community. Perhaps it is conceivable to envision a future with new communities such as these in other contexts and even on a larger scale. Today we see considerable evidence of the growing popularity of sign languages outside of traditional Deaf community social arenas. In the USA, the number of parents learning signs for early communication with their nondeaf babies is on the rise. Opportunities to learn a sign language as a foreign language in K-12 programs are expanding. In the UK, the movement to institutionalize sign languages in mainstream societies is growing and the Federation of Deaf People there is campaigning for "... the recognition of British Sign Language, not simply for Deaf Britons alone ... (but) ... as a genuinely British cultural resource which should be made available to all British citizens" (Ladd, 2003, p. 438).

Finally, a cross-cultural investigation of patterns and constraints in language socialization in Deaf communities offers the opportunity to identify factors that remain constant across different sociocultural and linguistic circumstances and those that yield to pressure for change. One surprising characteristic of sign languages and their communities is their tenacity in the face of efforts by nonsigning majorities to suppress and eradicate them, especially given the discontinuity of traditional caregiver-to-child linguistic and cultural transmission across generations. The resilience of sign languages in terms of their ability to appear where there were none before and to survive under dismal conditions is evidence of their unique niche within the diversity of human languages. Language socialization studies in such circumstances promise contributions to theory building offered by few communities. At the same time, it is also necessary and valuable to investigate language socialization in Deaf communities where sign language is valorized, treasured, and promoted as a member of the family of human languages. Research in these sociocultural settings offers opportunities to validate as well as challenge existing theory with rich and extensive sign language socialization data and helps us envision possible futures for Deaf communities.

## LANGUAGE SOCIALIZATION IN ONLINE COMMUNITIES

### INTRODUCTION

This chapter considers how communication in computer-mediated digital environments has been and could be approached from a language socialization perspective. The study of computer-mediated communication (CmC) and cyber-culture encompasses a range of disciplines, including communication, linguistics, cultural studies, and sociology, to name a few, with research findings emerging and scholarly debates becoming prominent only in the last 10 years given the relatively recent popularization of the Internet in the mid- to late-1990s. Even with its short history, the exploration of linguistic and social behaviors in online settings has dealt with issues that are germane to language socialization research. In this chapter, I review and assess how the study of online communication draws upon and extends our understanding of language socialization in new technological and global contexts of communication. The thematic areas that comprise the focus of this discussion are (1) the role of language practices in the formation of culture and community online, (2) socialization in transnational and diaspora networks as facilitated by the Internet; and (3) language ideology and language change in online contexts. Both the educational implications and promising research directions for each of these research areas are addressed.

### THE LINGUISTIC CONSTRUCTION OF ONLINE COMMUNITIES: EARLY DEVELOPMENTS (1990S)

The notion “virtual community” came into prominence in the early to mid-1990s with the popularization of the term by Rheingold (1993) in his book, *The Virtual Community: Homesteading on the Electronic Frontier*. This period saw the growing adoption of the metaphor of “community building” in both Web media promotion and scholarly research of CmC (Jones, 1995, 1997; Porter, 1997). Researchers of communication, media, and linguistics started to explore the linguistic construction of community in, for example, Usenet newsgroups (e.g., Baym, 1995; Tepper, 1997), Internet Relay Chat (e.g., Bays, 1998;

Liu, 1999), MUDs and MOOs (see definitions below) that allow multiple users to communicate with each other in real time and interact with objects in a virtual setting (e.g., Cherny, 1999; Soukup, 2004), and, more recently, weblogs or blogs that are online journals or discussion forums maintained by single or multiple authors (Wei, 2004).

These studies show the use of linguistic and interactional patterns, genres, and discourses as a means for creating group culture in online communication. For example, in her research of a Usenet newsgroup (rec.arts.tv.soaps) devoted to the recreational discussion of daytime soap operas, Baym (1995) reveals the various forms of conventional expressions shared by members of the group, including the codification of acronyms for the soap operas and nicknames for the soap opera characters, the expectation that newsgroup members would disclose personal details of their lives akin to the narrative devices of the soap operas, and the development of unique forms of jokes that draw attention to the hilarity and absurdity of the soap opera world. Bays (1998) analyzes how community is used as a *frame* for interaction in an Internet Relay Chat (IRC) group. IRC is a form of real-time Internet chat or synchronous conferencing. It is mainly designed for group (many-to-many) communication in discussion forums called channels, but also allows one-to-one communication and data transfers via private message. Members of the IRC group portray in words the metaphoric physical and social setting of their conversation to construct a collective sense of community that is associated with familiarity, sharing, and working together for the common good.

Adopting an ethnography of communication perspective, Cherny (1999) studied what participants of an object-oriented Multi-User Dungeons or Dimensions (MUD) called ElseMOO need to know to communicate appropriately in the ElseMOO speech community. MUDs and MOOs (MUDs of the Object Oriented variety) are programs that allow multiple people to connect simultaneously over a network, and interact with each other and with objects in a virtual setting in real time. Cherny argues that the term "speech community" aptly describes ElseMOO based on the regular recurrence of interactional rituals and routines (such as greeting, leave-taking, expression of affect, jokes, and forms of language play), the creation of new syntactic and morphological forms (mostly through abbreviation and acronyms), and identifiable patterns of turn-taking and back-channeling in dialogic exchanges that mark the behaviors of ElseMOO participants. With regard to the more recent phenomenon of blogging, Wei (2004) argues that group conventions of informational and stylistic content are visible among blogs that belong to the same web ring, an Internet service and concept which links together a group of web sites that share a similar theme.

The sociolinguistic study of online communities, as exemplified in the aforementioned works, has been successful in showing that language practices are instrumental in creating the norms of behavior of particular online groups and how these norms function to provide sociability, support, information, and a sense of collective identity. Indeed, with the reduced physical cues of age, gender, ethnicity, or class, linguistic behaviors become one of the primary means to enact and inscribe social categories and normative behaviors in the “bodyless pragmatics” (Hall, 1996) of CmC. However, this body of research tends to focus on existing forms of behavior and interactional patterns and, hence, does not provide a perspective on the diachronic process of community formation and change. In other words, some questions that are central to language socialization research have not been adequately explored in the study of CmC and virtual communities, namely: (1) How do individuals come to adopt and develop competence in the language practices of particular online communities? (2) How do the social and linguistic practices of an online community develop and change over time? To answer these questions, it is necessary to develop research that is longitudinal in nature in order to document individual development within a community of practice and the formation and changes in group practice over time. It is also necessary to recruit research participants whose identity can be ascertained in order to obtain consent for the research and to ensure that their online participation is traced consistently across an extended period of time.

#### MAJOR CONTRIBUTIONS

##### *Creating Online Communities and Interactional Norms Across Diverse Cultures*

A recent study by Cassell and Tversky (2005) provides some insights into the process of community formation through their investigation of an international virtual forum hosted by the Massachusetts Institute of Technology, called the “Junior Summit ‘98,” that brought 3,062 youth from 139 countries online to discuss global issues. The participants, representing a wide variety of economic, cultural, and linguistic backgrounds, posted messages to the forum over a 3-month discussion period that culminated in an online election of 100 delegates who would meet in person with one another and with world leaders in a face-to-face summit. Using computational word frequency analysis of over 19,000 posted messages written in English, content analysis of 4,377 of those messages, and post-hoc interviews with a sample of 37 forum participants, the researchers were able to show the ways in which the diverse participants modified their language use over the

3-month period to constitute themselves as a community. These progressive changes included the following: (1) the increased adoption of a collective voice through the use of “we” instead of “I,” (2) giving feedback or responding to each other’s ideas rather than focusing on one’s own ideas and opinions, and (3) developing each other’s plans and integrating ideas to pursue common goals.

Cassell and Tversky’s design-based investigation illuminates the interactional process of community formation and suggests the potential of using online communications for educational purposes to facilitate the interchange of ideas and collective action among diverse groups of people around the world. This study also shows that the achievement of such educational purposes is contingent upon both the acknowledgement of differences/ability to see from other perspectives and the development of a shared sense of purpose and common goals. Other studies of collaborative language learning between university students learning foreign languages in the USA and their counterparts in France and Germany suggest that, in order for diverse participants to be able to communicate across difference and collaborate in online contexts, it is necessary to develop an understanding of culturally contingent forms of communicative genres, linguistic styles, and academic conventions and expectations (Belz, 2003; Kramsch and Thorne, 2001; Ware, 2005). An implication of these research studies for online educational endeavors is the importance of providing guided opportunities *both* to attend to and learn from linguistic and communicational differences *and* to construct a shared set of interactional norms for successful collaboration among culturally diverse participants.

Given the many emerging forms of social collectivities and interactions in online contexts, research that takes a diachronic perspective of language socialization holds the potential to trace not only the formation of identifiable linguistic and social behaviors but also how the collective deals with and struggles with differences and diverging practices, especially in its formative stages. Moreover, with the varying degrees to which online groups are able to sustain themselves and flourish, comparative studies of more and less successful (e.g., high vs. low activity) online collectivities might provide insights into the communicative mechanisms, group dynamics, and role relationships that contribute to the growth, persistence, or dissolution of communities in online settings, including how online and offline interactions mutually sustain each other (Fayard and DeSanctis, 2005).

### *Diaspora and Transnational Relations Within Ethnic Groups*

Whereas more research is needed to examine both the potential and limitations of using Web-based media to promote global understanding,

solidarity, and educational opportunities (as described in Cassell and Tversky's (2005) "Junior Summit '98 example above), recent research on diaspora and transnational online networks shows that individuals and groups at the grassroots level are already capitalizing on the global reach of Internet communications to build social, cultural, and political alliances across national borders among people from the same ethnic backgrounds (Kitalong and Kitalong, 2000; Lam, 2004; Landzelius, in press; Miller and Slater, 2000; Mitra, 2001; Valverde, 2002).

For example, Kitalong and Kitalong (2000) chronicle how people from Palau, an island nation in the Western Pacific that gained independence from the USA in 1994, construct Internet Web sites and e-mail lists to build connections among local residents and expatriate Palauans. Some of the Web sites are created for the express purpose of representing and teaching Palauan culture in contradistinction to the ways it was represented in colonial times by using a variety of media such as Palauan proverbial sayings, music, and paintings. Kitalong and Kitalong (2000) argues that a "postcolonial Palauan identity" is constructed through the Internet to signify both the autonomy of the Palauan nation and its interconnection with ethnic Palauans living overseas and in its surrounding island countries.

In Miller and Slater's (2000) in-depth ethnographic study of Trinidadians' use of Internet communications, they found a "natural affinity" between the everyday, mundane networking possibilities of the Internet and Trinidadians' intensely diasporic relations, because "being a Trinidadian family has long meant integrating over distances through any means of communication." (p. 2) The researchers provide ample evidence that Trinidadians in diaspora have appropriated the Internet to facilitate sustained contact and mutual support with their extended families, educate people of other nationalities about Trinidad through personal webpages to counter the global positioning of Trinidad as marginal or unknown, and recreate through the chat medium a unique form of Trinidadian social interaction called "liming" or "ole talk," full of banter and innuendoes. Miller and Slater (2000) argue that the Internet has provided Trinidadians a global platform to reconcile their national pride as a postcolonial society and their cosmopolitan outlook and diaspora condition.

Kieu Linh Valverde's (2002) study of the transnational linkages between Vietnamese Americans and Vietnamese nationals shows that Internet Web pages and listservs have emerged as important sites for the Vietnamese-American community to engage in the exchange of personal and political opinions with Vietnamese nationals. In some virtual sites, such as the Viet Nam Forum, Vietnamese-Americans are able to mobilize across the Pacific Ocean to voice concerns and press for changes regarding labor abuses in foreign-owned companies in

Vietnam and the civil and political rights of Vietnamese-Americans living in Vietnam. Kieu Linh Valverde argues that these trans-border connections fostered through Internet communication have allowed Vietnamese-Americans to develop a transnational identity that extends beyond their ethnic identity as an immigrant group in the USA.

More explicitly framed in terms of language socialization, my research with Chinese adolescent immigrants in the USA shows that English is used by these youth in networked communications to foster alliances with young people around the world through their common interests in Japanese popular culture and through creating diaspora Chinese relations represented in the mixing of English vernacular and romanized Cantonese into a hybrid linguistic code (Lam, 2004; Lam and Kramsch, 2003). Within these Web-based youth alliances, the focal students constructed multicultural and multilingual identities as English speakers that diverged from the monolingual imperative of their schooling experiences as minority immigrants learning English in the USA.

#### PROBLEMS AND DIFFICULTIES

From an educational perspective, the forging of diaspora and transnational relationships through Internet-mediated communication compels us to re-think the notion of *acculturation* in language socialization and development beyond a nation-centered perspective. Acculturation has been a major concept used to understand the adjustments and changes that take place within individuals as they move from one society to another (Fuligni, 2001) and appropriate new languages and forms of language use in the new context. Even though the concept of acculturation is meant to depict processes of change, its frame of reference is primarily anchored in the host society; in other words, migrants are studied as to how well they adapt to the structural conditions and cultural practices of their adopted country, and to what degree they are able to reconcile their “home culture” (and its languages/practices) with the “host culture.” Yet, digital communications are extending the scope for diasporic populations to sustain and recreate social relations of various sorts, and to foster multiple forms of group belonging and cultural participation across national borders. What challenges do these forms of digitally enabled transnational relations pose to the meta-narratives of assimilation or even cultural pluralism that still take the nation as the delimiting territory? How might the sustaining of social and cultural ties through online communication affect language maintenance and development among people in diaspora? The ways in which transnational virtual communities are contributing to new forms of identities and linguistic development is a promising area of research as we seek to understand language socialization among diverse populations in the digital age.

## WORK IN PROGRESS

*Linguistic Hegemony, Hybridity, and Change*

With the expansion of the Internet in different regions of the world affecting as many as a billion users and its integration in the global economy, issues of language ideology and language choice have rightfully begun to gain more attention in research on online communication. While studies of CmC that are published in English language journals have so far tended to focus on the practices of native speakers of English, some recent journal issues have called attention to the multilingual nature of the Internet in diverse societal contexts (e.g., the November 2003 issue, “The Multilingual Internet,” of the *Journal of Computer-Mediated Communication*, and the February 2004 issue, “Multilingualism on the Internet,” of the *International Journal on Multicultural Societies*). Notwithstanding this belated acknowledgement of the linguistic heterogeneity of Internet use, English is still a powerful and prominent language of choice online. The dominance of English could be attributed to its postcolonial and late capitalist status as a world lingua franca and the fact that Internet communication was originally designed on the basis of the ASCII (American Standard Code for Information Interchange) character set that relies on the use of the roman alphabet and the sounds of the English language (Crystal, 2003; Sue Wright, 2004).

The pervasiveness of English is seen in all of the diaspora social networks described in the previous section where English is used as a key medium of communication in conjunction with the native, national, or heritage languages shared in common by the particular population. English also seems to be emerging as the language of choice for online communication in officially multilingual states such as Switzerland (Durham, 2003), and at the regional level in public online forums sponsored by the European Union (Scott Wright, 2004). In the latter contexts where language input is not constrained by technological factors, language choice is more a matter of ideology—beliefs and practices—surrounding the use of a language. These trends illustrate how the adoption of the Internet as technology for wider communication tends to privilege English as a language that has already gained broad circulation around the world and is perceived as a more neutral language to use in multilingual contexts (Durham, 2003).

Yet, the interlingual contact of English and ASCII with other languages and writing systems on the Internet has also given rise to new hybrid languages and orthographic codes. For example, in a study of instant messaging among Gulf Arabic speakers in Dubai, Palfreyman and Al-Khalil (2003) found that the local university students had

developed a unique way of writing colloquial Arabic online that shows influences from computer character sets, standard Arabic script, English orthography, and other latinized forms of Arabic used in contexts before the introduction of the Internet. In other words, the college students invented a new code for a language, namely spoken Arabic, that has no formalized script. Palfreyman and Al-Khalil's (2003) analysis demonstrates that this ASCII-ized form of spoken Arabic is used to create an in-group culture that signifies the cosmopolitan youthful creativity of the university students. (See a similar argument in Warschauer, El Said, and Zohry, 2002, regarding online use of Egyptian Arabic.)

My research with a bilingual Chinese/English chatroom where young people of Chinese descent from around the world gathered shows the use of a variety of writing systems, including (1) Chinese writing in the Cantonese dialect, (2) written vernacular English, and (3) a hybrid code of vernacular English and romanized Cantonese (phonetic renditions of Cantonese with the roman alphabet). The hybrid blending of English and romanized Cantonese was adopted by young Chinese migrants to signify their dual linguistic identity and differentiate themselves from monolingual speakers of either language (Lam, 2004). In a reverse fashion, Su (2003) found that college-age students in Taiwan engaged in creative uses of the Chinese writing system in college-affiliated Electronic Bulletin Board Services, which includes the rendering in Chinese characters of the sounds of English, or Stylized English. Stylized English was used to tone down the elevated status of English in the local Taiwanese context and to produce humor that is derived from the playful dissonance between the phonological and orthographic meanings of the written words. Other forms of stylization involve the rendering of Taiwanese, which has no standardized script, and Taiwanese-accented Mandarin in Chinese characters.

#### FUTURE DIRECTIONS

The blending of multiple voices and codes in the hybrid linguistic practices described above seems to indicate that a new linguistic consciousness is developing among the younger generations who are versatile with digital and online communication. This is a new youth culture that thrives on metalinguistic awareness and creative experimentation with multiple orthographic systems and representational resources in electronic communication. Included in this culture are youth who are expressing their hybrid linguistic and cultural identities in wholly new codes. Given the co-existing realities of linguistic hegemony and hybridity in online communication, are young people being socialized into English or new kinds of Englishes and multilingual identities

on the Internet? This question calls for more research that considers processes of interlingual contact in online socialization. Specifically, the blurring of linguistic boundaries as exemplified in the remixing of languages and orthographic codes in online contexts may offer new opportunities for resisting the hegemony of English and envisioning the acquisition of dominant languages as a process of interlingual deconstruction and re-invention.

With each new confluence of communication technologies comes new conditions for the creation of social relations and collective identities. Just as “print capitalism” (Anderson, 1991)—the mass production, distribution, and reading of newspapers, pamphlets, books, maps, and other printed texts—was instrumental in creating an imagined community of citizenry for the modern nation-state, the development of electronic capitalism and trans-border circulation of cultural and symbolic materials is creating new imagined communities on a global scale (Appadurai, 1996). Networked electronic communication is redefining not only the scope of time and space in practices of socialization and group formation, but also the various ways in which linguistic and cultural boundaries are elided and re-inscribed. From collectivities based on common interests to those that extend and transcend the interests of the nation-state, online communication holds opportunities to examine language socialization at multiple scopes and scales.

## LANGUAGE SOCIALIZATION IN JAPANESE

### INTRODUCTION

This chapter discusses research on language socialization in Japanese, both socialization of native Japanese speakers as well as that of learners of Japanese as a foreign language.

The theoretical perspective of language socialization is couched in the phenomenological tradition (Husserl, 1970 [1910]) and grew out of linguistic anthropology, in particular, the ethnography of communication (Hymes, 1964). From these academic perspectives, language socialization research considers language acquisition to be embedded in cultural practice and investigates how novices learn to become competent members in a social group by participating in the daily routines of culturally organized activities. However, due to the fact that there has been no tradition of ethnography in Japan, language socialization research has not developed there (cf. Shibamoto, 1987). To date, most research on language socialization in Japanese has been conducted by scholars who were trained in the United States. And yet, Japanese is perhaps one of the ideal languages to investigate how novices are socialized into society through the use of language, for it has rich morphology, and a great deal of social information is encoded in the language (e.g., honorifics, pronouns, and sentence-final particles). For this reason, some scholars claim that in Japanese there is no neutral sentence (cf. Matsumoto, 1988). Even a simple utterance such as “it is fine today” has several variants with different degrees of politeness, formality, and other aspects of social information. In this sense, the acquisition of Japanese truly “goes hand-in-hand with acquiring sociocultural knowledge” (Ochs and Schieffelin, 1995, p. 74).

In what follows, I will first review the research on L1 socialization and then discuss the emerging field of L2 socialization in recent years. I will conclude the chapter by suggesting directions for future research.

### EARLY DEVELOPMENTS

There were only a few notable studies on Japanese L1 socialization during the 1970s and 1980s. The decade of the 1970’s saw several influential publications in English on Japanese culture and psychology,

which discussed Japanese communication patterns (e.g., Doi, 1973; Lebra, 1976). For example, Lebra (1976) described Japanese culture as “*omoiyari* culture.” In her words, *omoiyari* is “the ability and willingness to feel what others are feeling, to vicariously experience the pleasure or pain that they are undergoing, and to help them satisfy their wishes (p. 38).” Doi (1973) claimed that the Japanese way of communication stemmed from *amae* “dependence on others,” which is “the psychology of the infant in its relationship to its mother (p. 74).” Markus and Kitayama (1991) described Japanese as group-oriented, and nonconfrontational. These publications had a great impact on the formulation of the theories of Japanese behavior and psychology in the fields of anthropology, psychology, sociology, and linguistics in the Western society, and the characteristics of Japanese communication patterns described in these publications were believed to be applicable to all sectors of Japanese people and society until recently. The goal of the early studies on Japanese L1 socialization was to investigate how caregivers’ discursive practice helps socialize children into Japanese cultural patterns of behavior.

Socialization starts long before children produce their first word. Caudill and Weinstein (1974) observed that when infants were as young as 3–4 months Japanese mothers talked to infants significantly less often than American mothers and that Japanese infants’ rate of positive vocalization was lower than that of American infants. Based on these observations, the study suggested that by the age of 4 months, American and Japanese children were socialized into different communication styles.

Clancy’s study (1986) is perhaps the most important contribution to Japanese L1 socialization research. It pursued the questions of how Japanese young children learn to be indirect and empathize with others. Her study, based on naturally occurring conversation between Japanese mothers and 2-year-old children, found that Japanese mothers’ discursive practice was characterized by a mixture of indirect/direct commands, and empathy and conformity training. When the child did not understand the mother’s indirect directive, the mother used a more direct expression. The juxtaposition of indirect and direct commands taught children how direct commands could be paraphrased in an indirect manner. One of the significant contributions of Clancy’s study is that it clearly demonstrates that the Japanese mother deemphasizes the mother’s role as an authority figure and that empathy training is part of making children behave without foregrounding her authority. For example, when the child eats oranges without sharing them with the guest, instead of telling the child, “I want you to give oranges to the guest,” the mother mentions that the guest is saying that she wants to eat some oranges. Or if the child hits a pet dog, the mother may

say that the dog is saying “Ouch!” The control of the child’s behavior by pointing out the third party’s feelings accomplishes at least two things: one is to make the child behave himself without evoking the mother’s cold affect, and the other is to make the child empathize with others (i.e., *omoiyari* training). Cook (1990) also found the mother’s use of the sentence-final particle *no* helped to deemphasize the mother’s personal will and appealed to the social norm in order to control children’s behavior.

In sum, the studies by Clancy (1986) and Cook (1990) point out that Japanese cultural values of *amae* and *omoiyari* are socialized as an outcome of the Japanese mother’s de-emphasis of her authority. The Japanese mother’s particular discursive style simultaneously makes the child more sensitive to others and more dependent on the mother because the mother’s individual will is not in conflict with that of the child.

## MAJOR CONTRIBUTIONS

### *Japanese L1 Language Socialization Research*

L1 socialization research in Japanese examines socialization at home as well as at school. Studies on Japanese L1 socialization have dealt with the following issues: (i) socialization of affect; (ii) politeness and honorifics; (iii) gendered speech; (iv) connections between narrative and literacy; and (v) participation in elementary school classroom interaction.

Language encodes affect through lexicon, phonological system, and grammatical structure, among other devices (cf. Besnier, 1990; Ochs and Schieffelin, 1989). Learning to express affect in culturally appropriate ways is an important part of language socialization (Ochs and Schieffelin, 1989). Research provides evidence that Japanese mothers use a number of affect expressions to control children’s behavior and that children are socialized into appropriate affective expressions quite early in life. Clancy (1999), who investigated affect lexicon in conversations of three pairs of mothers and 2-year-olds, found that by 2 years, Japanese children were exposed to extensive affect lexicon. In particular, the mothers’ use of the word, *kowai* “be scary/be afraid (of),” helps children see themselves as the objects of others’ evaluative affect. Suzuki (1999) also found that Japanese mothers taught children appropriate behavior through the use of the aspectual suffix—*chau* (or the past tense—*chatta*), which indexes the speaker’s negative affect concerning the event or action soon to be completed (or just completed). Clancy’s study (1985) suggests that Japanese children’s early socialization of affect attributes to the early acquisition of the sentence-final particles.

Since the Japanese language has extensive honorific forms, scholars have investigated how Japanese children learn to talk politely. Japanese honorifics are divided into two main categories: referent and addressee honorifics (cf. Shibatani, 1990). Further, the referent honorifics consist of the respect and humble forms. The addressee honorific form is said to show politeness to the addressee while the referent honorifics raise the referent and his group or lower the speaker or his group. In addition, there is an honorific prefix *o-* or *go-* that attaches to nouns for beautification. The referent honorifics are morphologically complex and rarely occur in family conversation except for some formulaic phrases (Nakamura, 2002). For these reasons, except for formulaic phrases, children do not develop competence in appropriate use of the referent honorifics till much later in life. In contrast, although they mostly speak in the plain form, the caregivers at times use the addressee honorific *masu* form when talking to children at home. Researchers investigated when the caregivers and children shift to the *masu* form (Clancy, 1985; Cook, 1996, 1997; Nakamura, 1996, 2002). These studies found that Japanese caregivers tended to shift to the *masu* form in several well-defined contexts: reading a story book, quoting people outside the home, engaging in a role play, and carrying out parental responsibilities such as correcting children's behavior and serving food. The caregivers' uses of the *masu* form shed light on the nature of the "addressee honorific." Cook (1996, 1997) points out that the mother's shift to the *masu* form when serving food, for example, does not make sense if the *masu* form is merely a marker of politeness toward the addressee. Elementary school children speak in the *masu* form when engaging in the class activity called *happyoo* "presentation" but shift to the plain form (non-honorific form) when talking to the teacher, who is an observer of the *happyoo* activity (Cook, 1996). Cook (1996) argues that Japanese children learn to use the *masu* form as an index of the self-presentational stance both at home and school. By the age of three, Japanese children learn to use the *masu* form appropriately both in real life situations as well as imaginary plays (Cook, 1996, 1997; Fukuda, 2005, Ishida, 2002). For example, Ishida's study (2002), which compared directives in real life and role-play interactions between a mother and child aged 2:11, found that the child's formal directives (*masu* form) increased in the role play, reflecting the child's understanding of her social roles in the two different contexts.

Gender roles are in general more distinct in Japanese society than in Western societies. Not only are Japanese men and women brought up in different social groups but they are also expected to play different social roles throughout life. For example, Japanese mothers single-handedly take the responsibility of raising children (e.g., Imamura, 1987). Steverson (2004), who analyzed dinnertime narratives of

Japanese families, illustrates a clear gender role division reflected in dinnertime narratives. The Japanese mother plays a prominent role in the dinnertime narratives in the amount and quality of the contribution, while the father's contribution to the narratives is limited. One of the myths of the Japanese language is that there are many linguistic forms that are exclusively used by one gender. In reality, both men and women share a wide range of speech styles in many social contexts. Differences in speech between the sexes largely depend on social contexts. How, then, do Japanese children learn gendered speech? Studies have found that gender differences are socialized in interaction between the caregivers and children (Kawakami, 1997) as well as in peer play and that children as young as 3 years old have knowledge of how gender differences are indexed by linguistic forms (Nakamura, 2001). One of the questions is how boys are socialized into rough speech when the mother normally does not speak to the child in a rough manner. Nakamura (2001), who studied preschool children's peer play, contends that peers are the main source of socialization of so-called "gendered speech." In her study, boys use a wider range of rough sounding linguistic forms during same-sex peer play than when they speak with their mothers. She also finds that compared with other gentler play, when engaging in rough-and-tumble play with the same sex playmate, girls increase rough sounding linguistic forms as well. From these observations, Nakamura concludes that "gendered speech" is not used exclusively by one gender and that young children (aged 3–6) are socialized by peers into the use of "gendered speech" in appropriate contexts.

How do children make the transition from home to school? Researchers consider that the middle-class discourse style at home becomes a precursor to decontextualized language use (i.e., literacy) at school in Western societies (e.g., Bernstein, 1971; Snow, 1983). In Japanese society, while there is a transition from home to school, differences are also noted between the two. For example, Minami (2002) finds that there is continuity between language use at home and at school in Japan but that the kind of continuity in the Japanese context differs from that found in Western societies. Minami (2002), who examined narrative structures of Japanese children (ages 4 and 5) and their mothers, illustrates that Japanese narratives involve short turns with incomplete sentences and frequent turn changes. This characteristic of oral narratives is carried over to the literacy activity of story-book reading in the sense that the mother's questions and child's answers in book-reading activities are short and often within incomplete sentences. Minami also argues that this book-reading activity at home is a precursor to school literacy in Japanese society in that a typical sequence in book-reading activities is a three-part sequence that

resembles the I(nitiation)-R(esponse)-E(valuation) sequence typically found in classroom interaction (cf. Mehan, 1979). On the one hand, research on elementary school classroom interactions (Anderson, 1995; Cook, 1996) illustrates that unlike home interaction, where the informal speech-style is most frequent, the dominant speech-style employed in the classroom is the formal style. On the other hand, Cook (1996) argues that the way in which the *masu* form is used (self-presentational stance) is the same at home and school. Another manifestation of discontinuity between home and school is the participation structure of the book-reading activity at home and that of the elementary school classroom. The former involves a dyadic pattern between the mother and child, but the latter utilizes a multiparty pattern (Anderson, 1995).

Different participation structures of the elementary school classroom have been observed between Japan and the West. Anderson's ethnographic study on first- and second-grade classrooms (1995) shows that in Japanese classrooms the preferred participation structure is a multiparty interactional pattern [the I(nitiation)-P(resentation)-R(eaction)-E(valuation) sequence] instead of the I-R-E sequence. In the I-P-Rx-E sequence, the P and R turns are distributed to students. In P, the student gives a presentation, and in R, other students give reactions to the student's presentation. Anderson (1995) points out that whereas the I-R-E sequence promotes dyadic interaction between the teacher and student, the I-P-Rx-E sequence increases peer interactions in the classroom and leaves the teacher's role as a supporter of the peer interaction among students. The encouragement of peer interactions and the supporting role of the teacher in a wide variety of activities in a Japanese nursery school are also documented by an ethnographic study by Tobin, Wu, and Davidson (1989). Peer cooperation is also illustrated in Cook's (1999) study on Japanese elementary school classrooms. Students listen to the peer's presentations very carefully so that they can give reactions. The I-P-Rx-E sequence that Anderson found is part of training for peer cooperation and peer classroom management, an important Japanese cultural value.

### *Japanese L2 Language Socialization Research*

L2 socialization research grew out of the growing interest in teaching Japanese as a foreign language. Due to the increased number of Western learners of Japanese during the Japanese economic boom in the 1980's, universities in North America and other parts of the world expanded Japanese language programs. With this expansion, the field of teaching Japanese as a foreign language was established. Since the mid-1990s, the number of publications of Japanese L2 language socialization research has been increasing. To date, Japanese L2 socialization

research mainly studies learners of Japanese as a foreign language (henceforth JFL learners) who are native speakers of English. The central question asked in these studies is how JFL learners are socialized into the appropriate use of Japanese and cultural expectations in Japanese society. The majority of L2 socialization studies are based on classroom research in North America but some examine the study-in-Japan context. The classroom research deals with the issues of pragmatic particles and speech styles, interactional routines, and the teacher's status.

Japanese pragmatic particles and the addressee honorific form (*masu* form) are what Silverstein (1976) calls "non-referential indexes." They only point to or create aspects of social context but do not have any referential content. They are linguistic resources for the construction of social identities and other social categories. In contrast with Japanese children, who learn to use pragmatic particles and speech styles quite early in their interaction with the caregivers at home, as discussed above (cf. Clancy, 1985), JFL learners have difficulty in using particles and speech styles appropriately (cf. K. Ishida, 2001; Sawyer, 1992). Non-referential indexes are difficult, if not impossible, to learn through classroom instruction (cf. Gumperz, 1996). Studies by Ohta (1994) and Yoshimi (1999) suggest that difficulties may stem from the paucity of pragmatic particles in the teacher's talk as well as a difference in grammatical constraints between Japanese and English. Ohta (1994) investigated types and frequencies of pragmatic particles in first-year Japanese classrooms and compared them with those in ordinary Japanese conversations. The study revealed fewer types and lower frequencies of the particles used in the classroom and the impact of the teacher's philosophy on the particle use. Yoshimi (1999), who analyzed JFL learners' incorrect uses of the pragmatic particle *ne*, argued that a difference in Japanese and English epistemic constraints led to the improper uses.

While some studies report JFL learners' difficulty in learning appropriate speech styles basing their analysis on an assumption that the *masu* form is merely a politeness marker (Marriott, 1993; Rounds, Falsgraf, and Seya, 1997), Wade (2003) examined six JFL classrooms both in the United States and Japan without the assumption that the *masu* form is merely a politeness marker. Her study demonstrates that the *masu* and plain forms are building blocks of social identity and that JFL learners' appropriate speech styles are tied to their development of social identities in Japanese.

The language socialization model contends that novices acquire sociocultural knowledge through participation in routine language-mediated activities. From this perspective, classroom activities are the most important routines for most foreign language learners. Japanese

L2 socialization research has explored how interactional routines in the classroom help socialize learners into Japanese sociocultural norms (Kanagy, 1999; Ohta, 1999, 2001a). Kanagy (1999) observes that even young children in a Japanese immersion kindergarten are gradually socialized into cultural specific interactional routines with the teacher's scaffolding. Her study contributes to our knowledge of the importance of the predictability of routine activities for language socialization. Routine activities are socialization tools in college-level JFL classes as well. Ohta's (1999, 2001a, b) longitudinal study of a first year Japanese language class in an American university also shows that one of the classroom routines, an extended assessment activity, is a powerful tool to socialize learners into the Japanese cultural norm of the active listener role. While most JFL classroom studies focus on the participation structure of a teacher-fronted classroom, Ohta's (2001b) study, framed in Vygotskian sociohistorical theory, analyzes how peer interactions and private speech help learners acquire a foreign language. For example, Ohta shows that peers with different language proficiencies help each other through collaborative talk. In sum, Ohta's study is a major contribution to L2 classroom research in that it points out that a foreign language classroom is a much richer environment for language acquisition and socialization than was previously thought.

Inspired by Poole's study (1992), which examined the impact of the teacher's interactional style on socialization in an L2 classroom, a few researchers investigated the teacher's role and status in JFL classrooms and argued that Japanese teachers display their higher status in the classroom (Falsgraf and Majors, 1995; Lim, 1996; Rounds, Falsgraf, and Seya, 1997). Falsgraf and Majors (1995) compared the degree of directness in the teachers' directives in the Japanese and English classrooms in an immersion elementary school in the United States and an elementary school classroom in Japan. Their finding is that with respect to directives, Japanese teachers are more direct than American teachers. They interpreted this finding as an indication of the Japanese teacher's higher status. In order to determine the socialization effects of the teacher's use of more direct commands in the immersion school, Rounds, Falsgraf and Seya (1997) examined the immersion students' role plays in comparison with those of Japanese native-speaker children. The role plays consist of two types. One is an interaction between the teacher and student (T/S), and the other is an interaction between peer students (S/S). The assumption is that in the T/S role play the students will speak politely to the teacher in the *masu* form, and in S/S role play, they use the plain form. The findings reveal that neither immersion students nor native-speaker children consistently

use the *masu* form with the teacher, a behavioral pattern that the researchers had not expected. Lim (1996), who studied beginning college JFL classes in the United States, illustrates different cultural expectations that teachers and students have about each other's role. The teachers of Japanese, when confronted with American students' informal behavior, correct their students towards a more deferential demeanor. Lim (1996) reports that through teasing, ignoring, and modeling the correct ways, the teachers socialize the students into Japanese cultural values such as those of showing respect to the teacher, taking group responsibility as a class, being diligent and conforming to the class.

While L2 classroom socialization research focuses on how JFL learners are socialized into Japanese sociocultural norms through classroom interaction, language socialization research in study-abroad contexts deals with the issues of: (i) learners' social identity in Japanese society, and (ii) bidirectional socialization processes. These studies mostly deal with Caucasian students' linguistic behavior in interaction with Japanese people. Ethnographic studies by Siegal (1995, 1996) and Iino (1996, 2006) document the Japanese social expectation that projects different standards of behavior for Japanese and foreigners. For example, a JFL learner in Iino's study was laughed at by her host family when she used a referent honorific form appropriate for a formal social context. Another learner's pragmatic error was evaluated as "cute." Siegal (1996) also reports that a professor of Japanese in her study commented that he would not correct learners' inappropriate use of Japanese because foreigners do not understand Japanese customs. Cook (2006) demonstrates that JFL learners staying with a Japanese host family are socialized into the discourse of Japanese cultural beliefs and that by so doing, they learn to jointly construct a shared perspective with the Japanese host family.

Language socialization is a life-long process, and the novice is not the only party who is socialized. In this sense, socialization is a two-way process. Cook (2006) analyzes how learners' challenges prompt Japanese host families to shift the existing folk belief to a new version. Thus, due to interactions with the JFL learner, the Japanese host family members have opportunities to reflect on and modify their own belief system.

The contribution of the L2 socialization studies in the study-abroad context is that they point out that one of the problems that learners encounter in Japan is the difficulty of establishing their social identity (other than that of "a foreigner"). In contrast to L1 socialization in which the end point of socialization is the novice's attainment of the linguistic and cultural competence of the members of the community, the end point of L2 socialization varies according to learners' goals as well as the

target community's expectation about foreigners. These studies remind us that JFL learners are not automatic robots who simply emulate the L2 norms of speaking but are active agents who choose to display who they are in Japan utilizing the Japanese language as a resource.

#### PROBLEMS AND DIFFICULTIES

One of the problems stems from the assumptions the researchers themselves have about Japanese society. Some studies impose the researcher's beliefs about Japanese language and society on the data. This problem is particularly notable in some L2 classroom socialization studies. For example, Falsgraf and Majors (1995) interpreted the Japanese teachers' more frequent use of direct commands (compared to the frequency of American teachers) as evidence of Japanese teachers' higher status. However, direct commands in Japanese can index a range of social meanings depending on other co-occurring linguistic and contextual features. It may index a close relationship between the teacher and students and not necessarily the teacher's higher status. Without conducting or referring to ethnographic studies on classroom interactions in Japan, Lim (1996) also assumes that Asian teachers, including Japanese teachers, possess authoritative power. In contrast to Lim's assumption, as evidenced in ethnographic studies of Japanese schools, Japanese teachers are not authoritative, and not all Asian cultures are identical. For example, an ethnographic study by Tobin, Wu and Davidson (1989), which compared preschools in three cultures, clearly documents that in contrast to American and Chinese teachers, Japanese teachers do not directly control students' behavior but leave the classroom management to the students. Japanese teachers' self-effacing strategy found in Tobin, Wu, and Davidson (1989) is similar to that observed among Japanese mothers (cf. Cook, 1990). Anderson's ethnographic study of a Japanese elementary school (1995) also portrays the teacher's role as a supporter who assists students rather than someone who directly controls them.

Similarly, some scholars assume a one-to-one mapping between the teacher's higher status and the prescriptive, one-dimensional analysis of Japanese honorifics. For example, Rounds, Falsgraf, and Seya (1997) conducted their study on immersion school classrooms assuming the Japanese teacher's high position and the students' acknowledgement of this position through the use of the *masu* form. They found that Japanese native-speaker children's use of the *masu* form is less frequent than that of the Japanese immersion students, which suggests the possibility that Japanese native-speaker children may not use the *masu* form as a form of respect and/or they do not consider their

teacher as someone whose position is constantly recognized through the use of honorifics. The research on Japanese elementary schools (Anderson, 1995; Cook, 1996) indicates both possibilities.

Another issue is the difficulty of comparison between two languages and cultures. It is too simplistic to compare a social meaning of a particular grammatical category in one language and that of another. First, the social meaning of a given grammatical category differs from language to language. Second, there are multiple social meanings associated with a given linguistic form. For example, Falsgraf and Majors (1995), who compared the degree of directness of commands between Japanese and English using the scale of politeness proposed by Hill, Ide, Ikuta, Kawasaki, and Ogino (1986), equated the Japanese gerundive (e.g., *suwatte*) with the English imperative (e.g., *sit down*) as "normal imperative." Although Japanese also has the true imperative (e.g., *suware*), which sounds rougher and much more direct than the gerundive, Falsgraf and Majors did not include the true imperative in their analysis. This is perhaps because the true imperative did not occur in the teachers' speech. Since in English, there are no categories equivalent to the ones in Japanese, the Japanese gerundive form (e.g., *suwatte*) and true imperative (e.g., *suware*) are both translated into the English imperative form (e.g., *sit down*). In fact, an absence of the true imperative in the Japanese teachers' speech suggests the Japanese teachers' less direct and more intimate relationship with the students. In addition, even the polite imperative (e.g., *please sit down* and *suwatte kudasai*) may not be polite in some contexts. It is often observed that American mothers use the polite imperative when they scold their children. Thus, without including the co-occurring contexts, it is not clear if any token of directive forms is really direct or polite.

In sum, the researcher's preconception of the Japanese culture and language as a yardstick to measure L2 learners' verbal and nonverbal behavior only distorts the results of a study. In this respect, it is essential to expand ethnographic research on the use of language in a wide range of social contexts in Japanese society.

#### FUTURE DIRECTIONS

To date, L1 socialization research in Japanese has focused on children's socialization processes at home and in the elementary school, but since language socialization is a life-long process, a wider range of social contexts need to be investigated. Topics future research should examine include: (i) how junior and senior high school classroom routines socialize students; (ii) how club activities in high schools and universities prepare students to become competent workers (*shakaijin*); (iii) what

kind of socialization is accomplished by a training program for new employees in a company; and (iv) how the growing number of immigrants are socialized into Japanese society. Such studies will not only shed insightful light on dynamic language socialization processes in different social contexts in Japanese society but will also inform Japanese L2 socialization research.

## LANGUAGE SOCIALIZATION AMONG PEOPLE WITH MENTAL HEALTH DISORDERS

### INTRODUCTION

Language socialization is discussed in this chapter with reference to the recovery or improvement of one's social use of language. Principles discussed will refer primarily to people with chronic schizophrenia who have moved from hospital to community settings, but will also be relevant to other groups of people with mental health disorders (MHDs) living in the community. From existing definitions of language socialization, many concepts apply to this group of language users. For example, language socialisation has been described as a process that encompasses 'socialization *through* language and *into* language' (Ochs and Schieffelin, 1984; 1995; Schieffelin and Ochs, 1986a, 1986b, Ochs and Schieffelin, *Language Socialization: An Historical Overview*, Volume 8). It involves 'an interactional display (covert or overt) to a novice of expected ways of thinking, feeling and acting' (Ochs, 1986, p. 2). Furthermore, language socialization examines 'how [people] are socialized by and through language into new domains of knowledge and cultural practice' (Bayley and Schecter, 2003, p. 2).

Particular elements of these definitions (e.g. notions of *covert* or *overt interactional display*, *the novice* and *cultural practice*), though more usually applied to first- or second-language learners, can also be applied to the discussion of language socialization or *resocialization* among people with chronic schizophrenia. By *resocialization*, I mean the recovery of linguistic and social interaction abilities that individuals might previously have had greater expertise in before the onset of their MHD.

There are a number of reasons for a focus on people with chronic schizophrenia. Firstly, people with schizophrenia make up the largest group within populations of individuals with MHDs, taking up 'a disproportionate share of mental health services' (Mueser and McGurk, 2004, p. 2063). Secondly, these people often have language and communication impairments associated with, and intrinsic to, the illness (Newby, 2001), making language (re)socialization in rehabilitation terms particularly relevant to this group. Thirdly, exploring language socialization in a language or communication-impaired group may tell us more about the language socialization process as a linguistic activity, contributing to an area of study that has largely developed from

accounts of first language acquisition, and bilingual and multilingual language-learning contexts. However, before discussing language socialization within this population, some background to the nature of schizophrenia is necessary.

### *Schizophrenia*

Schizophrenia can be a life-long, severely debilitating mental illness that affects a person's thinking, feelings, social functioning and communication (Puri, Laking and Treasaden, 2002). It is a condition in which a great diversity of symptoms occurs, with varying degrees of severity and unpredictable outcomes. The experience of schizophrenia is, therefore, highly variable, with some individuals managing to remain employed and function well within society. Others, who may be more severely and chronically affected, experience repeated periods of hospitalization and require varying degrees of medical supervision throughout their lives.

Impairment in socialization is a key feature of schizophrenia (Wing, Cooper and Sartorius, 1974). In fact, an insidious social withdrawal in early adulthood can be one of the markers of the development of the condition (Mueser and McGurk, 2004). Shepherd (1986, p. 13) comments that social functioning is 'so much part of schizophrenia that it is virtually impossible to discuss this disorder without reference to its social implications'.

People who develop schizophrenia may experience significant language and communication difficulties (Emerson and Enderby, 1996, Walsh, Regan, Sowman, Parsons and McKay, 2004), particularly within the domain of spoken discourse and pragmatics (Byrne, Crowe and Griffin, 1998), where communication relevancy and appropriateness seem most often affected. The nature of the pragmatic language impairment in schizophrenia is now seen as secondary to a generalized cognitive decline (Linscott, 2005). Those who become chronically ill will often present with suppressed language and communication skills possibly as a result of a combination of factors, including: (i) the presence of formal thought disorder;<sup>1</sup> (ii) the effects of the often protracted illness process, as it takes its toll on a person's communication skills; and (iii) long periods of institutionalization. However, how much of the deterioration of the language and communication functioning can be attributed to the illness process and how much to the direct effects of institutionalization is difficult to discern. Regardless

---

<sup>1</sup> Linscott (2005, 226) states that formal thought disorder is a set of language features 'that are constructed as indicating that the form of underlying information processing is disorganized.'

of cause, the impact of the communication disability can be profound for the person affected, as the following quotes from people with schizophrenia, illustrate:

I had all these thoughts in my head but when I spoke it was just noise just high-pitched noises came out. It had lost the meaning. I could understand other people's language but not my own.

I thought my language was wrong. I believed that no one could understand what I said.

(Cutting and Charlish, 1995, p. 2, 11)

Therefore, language socialization or re-socialization becomes a focus of many rehabilitation regimes, once an individual moves from a hospital to a community setting. It is in the community where people with MHDs have to become accustomed to a new culture of living and even a new identity, leaving behind the safe, secure but often-oppressive environment of the hospital. Thus, these individuals may be seen as novices as they try to learn or relearn certain ways of behaving in the new community or culture in which they find themselves. Furthermore, the re-learning of socially appropriate communication skills most often takes place within the context of interventions, such as *social skills training*, with MHD professionals. Any discussion of language re-socialisation, therefore, must be considered initially within this context, before broadening the arguments to include other issues relevant to language socialization.

## EARLY DEVELOPMENTS

### *Social Skills Training*

Social skills can be defined as 'the performance of behaviour in social interactions' (Rustin and Kuhr, 1999, p. 5). The nature of social skills training (SST) emanates from a number of different disciplines, including social, applied and cognitive therapy as well as behaviour therapy. Rustin and Kuhr (1999, p. 8) discuss 'a cultural difference in perspective' between North American and European theory, research and practice in social skills training. They explain that in the USA, SST grew out of the work of behaviour therapists who believed that a person's social behaviour was a reaction to external social events. Conversely, Europeans looked to social psychology as a base for SST believing that a person's behaviour is more internally based and guided. Regardless of origins, SST programs for people with schizophrenia typically include, for example, conflict-management skills, assertiveness skills, community-living skills, vocational skills and medication-management skills (e.g. Bellack, Mueser, Gingerich and Agresta,

1997). These programs also invariably include a conversational-skills component. When one looks at the development of SST historically, it is obvious that a consideration of language socialization was only remotely evident in so-called 'conversational skills training'.

Lieberman, De Risi and Mueser (1989) and Rustin and Kuhr (1999) provide an account of the historical development of social skills training which allows us to place current practice in this area in a chronological context. According to Lieberman, De Risi and Mueser (1989), the focus over 50 years ago was predominantly 'assertiveness training' for those people with communication difficulties associated with MHDs. Assertiveness training (in the 1950s) was thought to facilitate self-expression and in turn help people with MHDs to communicate more effectively and overcome their anxiety, depression or social fears. In the late 1960s, a combination of modelling and role-playing to practice assertive behaviour was popular and soon became a core part of a broader social skills framework. Social communication skills gradually became an integral part of these programs in the 1970s when the mode of delivery shifted from individual to group therapies, with the realization that a more natural and realistic context was provided by the latter. 'Clinical trials' became popular as researchers tried to prove the efficacy of such interventions with some, if limited, success. Generalization of skills however, remained the main concern as it became apparent that some social-communication-related behaviours (e.g. eye contact for conversational interaction) were more easily transferred to new situations than others.

With methods of group or individual 'training' continuing into the 1980s and early 1990s, the difficulty of a lack of carryover of learned behaviours persisted. Wong et al. (1993) recognized such difficulties even within individually based conversational-skills training. Problems with generalization (or the transfer of training) arose when recently learnt communication behaviours broke down as the individual struggled to maintain the 'fragile' skill in the face of ever-changing conversational pressures. Thus, to invoke the phraseology of *language socialization*: the 'interactional (overt) display' of the desired behaviour in such programmes was not enough for the so-called novice learner in these contexts. Hence, a concern in relation to generalization of skills learnt slowly began to influence the trajectory of developments in SST and communication skills work for this group of language users.

#### MAJOR CONTRIBUTIONS

Though social skills training has been criticized for its efficacy due to problems with skills generalization (e.g. see Pilling et al., 2002), this has not lessened the impact of this mode of training on attempts to

(re)socialize people with MHDs through language. Bellack's (2004) extensive review of skills training for people with severe mental illness concludes that (i) SST has been validated by a number of studies as being effective for people with schizophrenia; (ii) it is an effective teaching technology within the regime of behavioural rehearsal in skill development; (iii) it remains a treatment approach of choice, welcomed by both patients and clinicians alike; and (iv) although it does not bring about symptom reduction or prevent relapse in schizophrenia, it does have a 'reliable and significant effect on behavioural skills' with a 'positive effect on social role functioning' (Bellack, 2004, p. 382). These conclusions, therefore, augur well for continued use and adaptation of such programs for this population.

### *Combined Approaches*

Other approaches that include a focus on communication have combined SST with other interventions with varying success. Integration and co-ordination of approaches are becoming increasingly popular (see Kopelwicz and Liberman, 2003) and are seen as a positive development in the rehabilitation of people with MHDs. Integrated approaches are not new, however, as a German study by Roder, Studer and Brenner (1987) shows. This study reported on an integrated psychological therapy program for training communication and cognitive abilities in the rehabilitation of people with chronic schizophrenia. Roder, Studer and Brenner (1987) concluded that significant changes were evident in individual cases in terms of communicative and social behaviour.

McQuaid et al. (2000) developed an integrated cognitive-behavioural (CBT) and SST training for older patients with schizophrenia. They report that patients found this approach particularly helpful, with one participant reporting that she was 'better able to communicate with a variety of people because of the skills learnt' (McQuaid et al., 2000, p. 154). In a Turkish study, Yildez et al. (2004) assessed the impact of a psychosocial skills training program for people with schizophrenia. Their program consisted of psycho-education, interpersonal group therapy and family education, incorporated into SST. Inherent in their approach was a focus on 'improving communication skills', 'developing friendships' and 'participating in social activities'—all language socialization activities. Their findings suggest that such a program had a better outcome for patients than those who received a standard or traditional treatment alone. As is often the case with schizophrenic participants receiving treatment, including SST training, the primary communities into which they are actively socialized may not be their own families, with whom they may have limited ongoing contact, but rather with others with MHDs and care staff.

Despite the proven success of some of these integrated approaches, Kallert, Leisse and Winiecki (2004), in a number of studies based in Germany, have consistently identified an unmet social need in the area of communication skills training for people with schizophrenia. They call for an increased focus on social skills and psycho-educational programs for community-based treatment.

### *Conversational Skills Training*

In 1993, Liberman et al. included a *Basic Conversational Skills Module (BCSM)* in their widely used *UCLA Social and Independent Living Skills Program* (Liberman et al., 1993) for use with people with a mental illness. The program has been widely used internationally both in Canada and the USA and translated into several languages in many countries, including France (e.g. Chambon and Marie-Cardine, 1998), Bulgaria (e.g. Buterin and Liberman, 1998) and Japan (Ikebuchi, Anzai and Niwa, 1998). Aside from the module directly focusing on conversational skills, many other modules stress the importance of sociable talk around tasks. For example, the 'medication self-management module' refers, among its requisite behaviours, to the need for a 'pleasant greeting' and a 'thank you for assistance'.

Other recent programs have a greater emphasis on conversational skills training *per se* (e.g. Walsh, 1997; Rustin and Kuhr, 1999; Henton, Sinclair and Sideras, 2001). These programmes are often designed by speech and language pathologists and can often be delivered in collaboration with other mental health professionals. As well as direct instruction or the demonstration of appropriate conversational skills through focused individual and group sessions, the enhancement of meta-communicative awareness has been found to complement and reinforce the didactic approach often adopted. Hence, role-playing of particular communication situations accompanied by discussion of these situations in meta-communication terms enhances learning and generalization. Themes dealt with in this way include co-operation in conversation, listening skills, turn taking, conversational breakdown and repair, and topic management strategies.

Almost without exception, however, these programmes follow a *deficit* model of intervention (Bellack, Mueser, Gingerich and Agresta, 1997; Hayes, 1997), that is, skills are identified as being 'deficient' and are thus taught (to a novice) or learned in much the same way as motor skills (e.g. walking) are re-learned following injury. The pervasive perception is that social skills and language 'are learned or are learnable' (Bellack, Mueser, Gingerich and Agresta, 1997, p. 5). However, can language socialization be most effectively realized within such a social skills framework if that framework, by its nature, primarily deals

with the *overt* interactional display of ways of behaving by ‘more able language users’ to novices?

#### WORK IN PROGRESS: OTHER APPROACHES

There is little doubt that groups that focus on conversational skills can be very beneficial (Hayes, 1997). However, more recently, some other approaches to social skills training and communication/conversational skills are being used with this group of language users, which serve to mitigate the limitations of, and at the same time complement, the more didactic approaches referred to above. These approaches, coupled with the talk-oriented philosophy behind community mental health nursing in general (e.g. see Burnard, 2003), characterize current practice in this area.

Liberman et al. (2001) present an extended and refined case management approach to SST, entitled *In Vivo Amplified Skills Training* (IVAST). The approach combines standard skills training with intensive case management and, if applied within the context of conversational/communication skills, could render more positive outcomes. Basically the case manager (i.e. the person who is primarily responsible for an individual’s care) is responsible for identifying and reinforcing opportunities to use trained skills and to establish links with support systems (e.g. ‘significant others’). In the context of working with communication skills, such significant others could be the individual’s main communication partners (such as a close friend or family member). Bellack (2004) reports that some applications of this approach have met with success in terms of greater and faster rates of improvement in skills targeted when compared to other approaches used.

Another popular approach that focuses more on the individual’s perception of himself or herself as a communicator is adapted from the principles of *Personal Construct Psychology* (PCP) (Kelly, 1955). Hayes and Collins (2001) claim that adaptation of the principles of PCP to communication skills is more successful than other behaviourally driven approaches to the training of conversational skills. A more holistic approach allows a focus on both the communication skills of the individual and associated psychological issues (e.g. self-esteem). In other words, it ‘focuses less on the problem and more on the person and the effect of communication difficulties on his or her life’ (Hayes and Collins, 2001, p. 284). PCP addresses how the person construes himself or herself as a person, which naturally includes how they view themselves as communicators. Therapy enables them to positively reconstrue social situations and themselves as communicators (hence reconsidering their identity as a good versus poor communicator and

thereby entering ‘new domains of knowledge and cultural practice’ (Bayley and Schecter, 2003, p. 2)).

Identity is also an issue when people with MHDs find themselves in a new community or culture, once discharged from the institutional context of the psychiatric hospital. Inherent in this shift from hospital to community is the assumption of a new identity; for example, that of a ‘resident’ as opposed to a ‘hospitalized psychiatric patient’. The shift precipitates different expectations of how a person should think, feel and particularly act. How they should act incorporates appropriate language usage in social contexts, as acceptance in the community in which they live often depends on this ‘appropriateness’ and is integral to rehabilitation. Community mental health nurses (CMHNs) are all too aware of this need.

The cornerstone of community mental health nursing is relationship building with those in their care. Communication is central to the building of relationships and is seen as the CMHN’s main tool in management and rehabilitation. As activities of daily living occur and are designed to mirror more typical daily social interactions, talk—including phatic talk—can play an important role. The notion of bi-directionality of language socialization as discussed by Schieffelin and Ochs (1986a) and more recently by Garrett and Baquedano-López (2002) is relevant here as both CMHNs and people with MHDs in their particular community of practice socialize each other through talk. In this context as in others, language socialization takes place within the ‘mundane activities and interactions’ that constitute the ‘warp and woof of human sociality’ (Garrett and Baquedano-López, 2002, p. 343). Hence CMHNs, when involved in the daily care of people with MHDs or more directly in SST programs, become both a model of language socialization (i.e. *an overt display of a way of acting through talk*) and a key conversational partner (i.e. *a covert display of a way of acting through talk*). Burnard (2003, p. 682), though recognizing how ordinary chat or phatic communication can ‘enhance the process of quality nursing’ in mental health contexts, fails to fully appreciate its value in terms of a novice recovering or relearning the art of sociable talk, for example.

Discourse analysis is a means of showing how a conversational sociability can be demonstrated in interactions between people with chronic schizophrenia and healthcare professionals (Walsh-Brennan, 2001). Inherent in this process is treating the person with a MHD as an equal conversational partner, not one who has an impairment ‘to be fixed’. This willingness and ability to engage in casual conversation—on the part of both participants—is a useful starting point for the enhancement of these skills and their generalization, once the communicative environment is conducive to that generalization. A conducive environment

is one in which opportunities for conversational participation are made available within talk situations. Considering conversational sociability in interactions implies that communication partners (i.e. carers or other significant others) must be:

1. made aware that conversational ability in people with MHDs may be masked or suppressed by the illness process, by their perception of the illness or the person, or by their inhibitive discourse style;
2. encouraged to re-evaluate the power of sociable talk and to realize the important socio-relational (and hence transactional) function it serves;
3. guided in ways to maximize effective conversational interactions so as to exploit opportunities for sociable talk in the pursuance of social and therapeutic goals.

Therefore, specialists are currently beginning to recognize the shortcomings of some traditional and even some current approaches to language re-socialization with this unique group of language users. However, though problems and difficulties remain, they continue to inform the future direction of work in this area.

#### PROBLEMS AND DIFFICULTIES: FUTURE DIRECTIONS

Though significant progress has been made, certain problems persist with the re-socialisation of people with MHDs, both within a theoretical language socialization paradigm and in practical terms.

#### *Language Socialization Concepts and Terminology, and People with MHDs*

Firstly, the meaning and usefulness of the LS term 'novice' as applied to this group or speech community of language users must be questioned. Can these individuals really be considered novices in the literal, *new learner* sense of the word? In fact, the language and communication competencies of these individuals may be better understood as being suppressed by the illness process or by virtue of long periods of what may be termed 'asocial institutionalization'. Thus, facilitating recovery of interactional skills through socialization may be a more accurate description of the process for some than the teaching of new social skills. This perspective lends a different connotation to the term 'novice' in this language socialization context.

Secondly, akin to this notion is the call made by Garrett and Baquedano-López (2002) for a greater awareness of language socialization across the lifespan, as originally proposed by Ochs and Schieffelin (1986a). Many people with chronic mental health disorders

drift into late adulthood where they find themselves faced with new institutional or lifestyle contexts (e.g. when discharged from hospital to community-based services). Their ‘communities of practice’ (Wenger, 1998) change and pose a new set of challenges for them as language users. Garrett and Baquedano-López (2002) call for increased research into language socialization of late adulthood, to include consideration of other communities such as those who have become communicatively disabled through strokes (see, e.g. Goodwin, 2000) or other acquired language disorders.

*Social Integration and the Generalization of Recovered or Newly Learnt Skills*

The most difficult part of any intervention with this group of language users is the generalization of recovered or re-learnt skills to daily living. A difficulty with generalization is particularly common in communication and conversational-skills groups where skills practised in the safety of the familiar group prove fragile once exposed in real-world social interactions. As Hayes (1997, p. 129) comments:

... social skills training can be very useful. However for many clients its benefits have proved limited and/or short lived. While there are some clients who lack a range of communication skills and therefore need to develop basic skills there are also many clients for whom the problem lies more in putting their already competent skills into practice. For them, the difficulty appears to lie more in their perceptions of themselves as communicators and the options available to them, that is the meaning that confidence, competence or opportunity holds for them.

The *options available* to people with MHDs in terms of opportunity are all too few, even for those who live in the community. Some people with MHDs who had moved to a community-based hostel from hospital made the following comments. Though their opportunities for social interaction had increased significantly, they often reported feeling lonely (from Gibbons and Butler, 1987, p. 351):

I feel isolated, I’ve no idea why. It’s not because people don’t want to be friendly.

Lonely, yes, but there’s nothing to say to anyone.

I should pay someone to talk to me.

It is acknowledged, however, in discussing socialization, that it is sometimes difficult to have other people with MHDs as friends because the conversation usually revolves around medication and symptoms of the illness (Barham and Hayward, 1995, p. 57):

It depresses you at times like that, you just don't want to talk about things like that, you want to talk about normal things everybody else talks about sex, drugs and rock and roll or something, or horse racing . . . You want to break out of that mould of being part of a schizophrenic fellowship or whatever. It does get you down at times.

A recurrent theme in these excerpts is the desire to simply engage in social talk or 'to have a chat' with others, an experience that often proves to be elusive. Hence, another problem related to the notion of 'speech community' in LS research is that people with MHDs do not seem to want to be part of a community of other people with MHDs, as the above quote suggests. Yet being able to break into or re-enter the non-MHD community can be a difficult and daunting task as they strive to be accepted and treated as equal communicators.

Innovative approaches such as IVAST, as referred to above, help address these recurrent problems of lack of skill-generalisation and social integration. Forward-thinking approaches taken by some well-trained CMHNs in the design and implementation of programs—where talk is seen as an integral and necessary part of rehabilitation regimes—also contribute significantly to progress in this area. However, these programmes need to be systematically evaluated and reviewed on a regular basis to establish efficacy and to map outcomes.

Additionally, the extremely variable and unpredictable course of some MHDs mitigates against an individual's progress and enhancement of re-learned or recovered skills. More community-based resources and trained personnel must be put in place if successful rehabilitation is to be achieved in language socialization terms. It is also imperative that service providers listen to people with MHDs so that services can be streamlined and made maximally effective and efficient.

### *Stigmatization and Society's Attitude to People with MHDs*

Society's attitude to people with mental health disorders (particularly schizophrenia) is predominantly one of fear and mistrust. Hence people who may have MHDs are often avoided or ostracized in communities. Such avoidance gradually permeates to the level of conversational interactions where people prefer not to engage socially on even a 'talk' level. Misconceptions stem invariably from often-misguided representations of MHDs in the media and ignorance of the nature and course of such illnesses. Hence, education programs need to demystify and promote understanding of the nature of MHDs that should lead to a positive reconstruction of the mentally ill person (and their capabilities) by society. Ideally too, family and friends can be encouraged and

facilitated to communicate more effectively with the person with a MHD in a way which promotes shared understanding and positive communicative experiences. Barham and Hayward (1995, p. 1) eloquently summarize this point:

It may be argued that if we are to take notions of social inclusion seriously, then it is incumbent on us to try to understand people with mental illness not simply in what we shall term the vocabulary of difference but more especially also in the vocabulary of membership, as 'one of us'.

The 'vocabulary of membership' extends to the notion of re-construing 'disability' in terms of 'ability' with a renewed focus on 'health' rather than 'illness'. The *International Classification of Functioning, Disability and Health*, commonly referred to as the ICF framework (World Health Organisation (WHO), 2002), is based on this premise and is a standard language framework for the description of health and health-related states. The ICF is designed to guide planning and policy making in health sectors. Its applications can be best seen in sample questions to be considered in guiding service provision (WHO, 2002, p. 6):

What treatments or interventions can maximize functioning?  
How useful are the services we are providing? How can we make the social and built environment more accessible for all persons, those with and those without disabilities?

Until such questions are accurately answered and actively used to guide decision making and planning for the most effective care of people with MHDs, language (re-)socialization for this group of language users may remain a desirable but partially elusive goal. It is time for anthropological linguists and others interested in language socialization research to engage in more rigorous ethnographic study of this unique and frequently misunderstood speech community of people with MHDs.

## **Historical and Theoretical Perspectives**

## A HUMAN RIGHTS PERSPECTIVE ON LANGUAGE ECOLOGY

### INTRODUCTION

In the language of ecology, the strongest ecosystems are those that are the most diverse. Diversity is directly related to stability; variety is important for long-term survival. Our success on this planet has been due to an ability to adapt to different kinds of environment over thousands of years. Such ability is born out of diversity. Thus language and cultural diversity maximises chances of human success and adaptability (Baker, 2001, p. 281).

Language rights are an existential issue for the political and cultural survival of individuals and communities worldwide, ranging from large minorities/peoples such as the 25–40 million Kurds in several countries in the Middle East or the 8 million Uyghurs in China, to the 70 million users of probably thousands of Sign languages worldwide, and small indigenous peoples such as Ánar Saami in Finland (fewer than 300 speakers). Language rights are a current research concern of social theorists, international and constitutional lawyers, political scientists, sociolinguists, educationists, and many others.

Understandings of language/linguistic ecology range widely. Many researchers use ‘ecology’ as a reference to ‘context’ or ‘language environment’, to describe language-related issues embedded in (micro or macro) sociolinguistic, economic and political settings rather than de-contextualised. Others have more specific definitions and sub-categories (e.g. articles in Fill and Mühlhäusler, 2001; Mufwene, 2001; Mühlhäusler, 1996, 2003).

The topic should be of major concern to humanity. Only some few hundred of the world’s around 7,000 spoken languages and a few dozen sign languages are learned in education systems even as subjects, let alone used as teaching languages. Schools have played and continue to play a major role in annihilating languages and identities (see Magga, Nicolaisen, Trask, Dunbar and Skutnabb-Kangas, 2004; articles in McCarty, 2005). Optimistic linguists estimate that half of today’s spoken languages may be extinct or seriously endangered by the end of the present century (see <http://www.unesco.org/endangeredlanguages>, or

UNESCO's position paper Education in a Multilingual World (<http://unesdoc.unesco.org/images/0012/001297/129728e.pdf>); pessimistic but fully realistic estimates place 90–95% of the world's languages in this category (Krauss, 1998). UNESCO's Intangible Cultural Heritage Unit's Ad Hoc Expert Group on Endangered Languages uses this more pessimistic figure in their report, Language Vitality and Endangerment ([http://portal.unesco.org/culture/en/file\\_download.php/1a41d53cf46e10710298d314450b97dfLanguage+Vitality.doc](http://portal.unesco.org/culture/en/file_download.php/1a41d53cf46e10710298d314450b97dfLanguage+Vitality.doc)).

It is because general human rights formulations are not explicit or proactive enough that efforts have been made since the early 1980s to specify which language rights are linguistic human rights that states cannot be justified in violating, and which can therefore be seen as having universal validity. Invariably the formulations specify the necessary rights that make it possible for a group or people to maintain its language and culture. The core linguistic human rights therefore relate to

- positive identification with a (minority) language by its users, and recognition of this by others,
- learning a (minority) language in formal education, not merely as a subject but as a medium of instruction,
- additive bilingual education, since learning the language of the state or the wider community is also essential,
- public services, including access to the legal system, in minority languages or, minimally, in a language one understands.

These factors can enable the diversity of the linguistic ecology to evolve in processes of modernisation rather than being sacrificed.

We envisage a balanced ecology of languages as a linguascape where interaction between users of languages does not allow one or a few to spread at the cost of others and where diversity is maintained for the long-term survival of humankind (as Baker, 2001 suggests). Seeing some language rights as human rights, with the protection that these enjoy, can support additive rather than subtractive (or replacive, Haugen, 1972) language learning and facilitate the maintenance of linguistic diversity. This article considers what a human rights approach can and cannot do and how a linguistic human rights system might serve to understand and challenge the unequal power relationships implicated in the destruction of language ecologies. We also discuss the relationship between languages and biodiversity.

#### EARLY DEVELOPMENTS

*Language Rights in Human Rights = Linguistic Human Rights (LHRs)*

References to language rights have figured sporadically over several centuries in both intra-state and bilateral legislation governing

relations between specific groups or states. The first multilateral instrument covering minority rights (including language rights) was the Final Act of the Congress of Vienna in 1815 (Capotorti, 1979, p. 2; see also our historical review of language rights in Skutnabb-Kangas and Phillipson, 1994). Many language rights were included in the post-1919 territorial treaties that fixed the political map of Europe.

Several historical developments have rendered language issues more salient. They include the establishment of postcolonial states with multilingual populations, the re-ordering of the linguistic hierarchy in Canada, the disintegration of the communist system, and the revitalisation efforts and international coordination (within the UN) of indigenous peoples. All have contributed significantly to an awareness of the need to regulate the rights of speakers of different languages, through constitutions, litigation, socio-political measures and education.

The search for a more just order within and between states intensified after 1945 with the United Nations (see the Office of the United Nations High Commissioner for Human Rights <http://www.ohchr.org/english/law/index.htm> for UN treaties themselves and <http://www.unhcr.ch/tbs/doc.nsf> for States parties to the treaties). The Capotorti report, commissioned by the UN in 1971 and published in 1979, is a major survey of juridical and conceptual aspects of the protection of minorities. It concluded that most minorities, including linguistic ones, needed more substantial protection.

Most research on language rights has been by lawyers. Most LHRs derive from basic (individual) human rights such as freedom of speech and freedom from discrimination. LHRs require multidisciplinary clarification, formulation in legally lucid and binding formulations, and the political will to undertake implementation.

*Language Plus Ecology = Language/Linguistic Ecology,  
Ecolinguistics*

The first serious sociolinguistic attempts to explore linguistic ecology pleaded for linguistics to be grounded in societal context and change. Trim (1959) and Haugen's (1971) seminal article entail multidisciplinary and build on multilingual scholarship (of the works cited by Trim, eight are in German, six in English, and four in French; academia has become more monolingual in globalisation processes). Haugen refers to status, standardisation, diglossia, and glottopolitics, but not to language rights. We concentrate here on the human rights perspective.

## MAJOR CONTRIBUTIONS

The struggle for linguistic human rights has concentrated on the rights of indigenous peoples and various dominated groups, including linguistic minorities. The terms majority/minority, dominant/dominated imply a relationship. Dominant majority languages and their speakers are part of the linguistic ecosystem of dominated and/or minority people(s). In general, speakers of most majority languages (in terms of numbers) and dominant languages (in terms of political and economic power) have access to most language-related human rights. This is especially true in countries where there is a demographic majority, rather than many language groups where none forms a majority (the situation in many African countries). Often the language rights of linguistic majorities (Russian speakers in Russia, Turkish speakers in Turkey, Portuguese speakers in Brazil, English speakers in Australia) are in force; they are seen as self-evident and the state organises everything through the medium of the dominant language as a matter of course. Most language rights can therefore be found in human rights instruments or clauses about minorities. Subtractive learning of dominant languages may violate linguistic human rights and contribute to linguistic genocide (on this, see Skutnabb-Kangas, *Human Rights and Language Policy in Education*, Volume 1).

Two types of language right are complementary. A constitutional lawyer, Rubio-Marín (2003, p. 56) distinguishes ‘the expressive interest in language as a marker of identity’ and an ‘instrumental interest in language as a means of communication’. *Expressive* language rights ‘aim at ensuring a person’s capacity to enjoy a secure linguistic environment in her/his mother tongue and a linguistic group’s fair chance of cultural self-reproduction;’ it is only these rights that she calls ‘language rights in a strict sense’ (Rubio-Marín, 2003, p. 56). These could, in other words, be seen as linguistic human rights. The *instrumental* language rights ‘aim at ensuring that language is not an obstacle to the effective enjoyment of rights with a linguistic dimension, to the meaningful participation in public institutions and democratic process, and to the enjoyment of social and economic opportunities that require linguistic skills’ (Rubio-Marín, 2003, p. 56). Sociolinguists and political scientists who ignore this distinction, or deny the importance of expressive rights and only focus on dominant languages for social mobility, tend to falsely see language rights in terms of either language X or language Y.

Basic concept clarification of the kind exemplified above has been an essential trait of work on LHRs (see de Varennes, 1996; Kontra, Phillipson, Skutnabb-Kangas and Várady, 1999; Skutnabb-Kangas and Phillipson, 1994; Thornberry 1997). Another example is the issue of who or what can have language rights. Languages can have rights;

they can be legal personalities. Individuals, groups, peoples, organisations and other collectivities, including states can have rights, and duties. Two important documents from the Council of Europe, the only binding international (here regional) treaties in force about language rights, can be seen as examples of these two types of right. The *European Charter on Regional or Minority Languages*, grants rights to languages, not speakers of the languages concerned. The *Framework Convention on the Protection of National Minorities*, on the other hand, grants rights to (national) minorities, i.e. groups. The texts of these documents and their ratifications are found at <http://conventions.coe.int/Treaty/EN/v3MenuTraites.asp>; treaty numbers 148 and 157. Language rights can be based on principles of personality (individual) or territoriality or combinations of these. Rights can be binding or non-binding. Treaties, charters, covenants, conventions etc are binding and often have both monitoring and complaint procedures. Declarations, resolutions and recommendations are in a strict sense non-binding even if there may be a moral pressure on a state to honour them. Litigation may also in time change interpretations of treaties.

Universal declarations of human rights generally contain clauses designed to prevent discrimination on grounds of language, so-called negative rights. Positive rights, including obligations imposed by treaties on states, require, firstly, that states *protect* individuals or groups from violations of their rights, and, secondly, that states '*promote or fulfil* an individual's rights, that is take the required steps to create a necessary and conducive environment within which the relevant rights can be fully realized' (*Human Rights Fact Sheet* No. 15 (Rev. 1), 2005, p. 5). Most binding LHRs so far have been negative but there are ongoing interpretation processes changing this to some extent. A promising example is the UN Human Rights Committee's General Comment on Article 27 (UN Doc. CCPR/C/21/Rev.1/Add.5.), UN *International Covenant on Civil and Political Rights*. Article 27 still grants the best legally binding protection to languages:

In those states in which ethnic, religious or linguistic minorities exist, persons belonging to such minorities shall not be denied the right, in community with other members of their group, to enjoy their own culture, to profess and practise their own religion, or to use their own language.

In the customary reading of Art. 27, rights were only granted to individuals, not collectivities. But the right to use a language obviously makes sense only if it is used together with others—many linguists claim that languages exist only in use. The UN 2005 Fact Sheet No. 15 on the Covenant expresses the new UN interpretation in their comment on Art. 27 (p. 7): 'While nominally expressed as an individual right, this provision, by definition, may best be understood as a group right

protecting a community of individuals'. The General Comment also sees Article 27 as entailing positive rights and obligations on the state.

## WORK IN PROGRESS

### *Linguistic and Cultural Diversity and Biodiversity*

While all language users should enjoy LHRs (HRs are universal), from the point of view of the global ecology, what is most urgent is LHRs for those indigenous and minority groups/peoples who have a long-lasting connection to a certain territory, which they know so well that phenomena in the ecosystem have been lexicalised. According to Mühlhäusler (2003) this takes minimally 300 years. The knowledge about how to maintain a balanced ecosystem is encoded in these languages and is often more detailed and accurate than western science, according to the International Council for Science (ICSU, 2002; see also Posey, 1999).

The United Nations Permanent Forum for Indigenous Issues (PFII) (<http://www.un.org/esa/socdev/unpfii/index.html>) has recognised the importance of language and expressive language rights in general but also their connection with the land and with self-determination (see, e.g. the interview with PFII's first Chair, Ole Henrik Magga, and Magga et al., 2005; see also reports by the UN Special Rapporteur on the human rights and fundamental freedoms of indigenous people, Rodolfo Stavenhagen).

Signed by 150 states at the 1992 Rio Earth Summit, the Convention on Biological Diversity, dedicated to promoting sustainable development, is the most important international treaty on ecology. It recognises that biological diversity is about more than plants, animals and micro organisms and their ecosystems—it is also about people and their environment (see <http://www.biodiv.org/convention/default.shtml>), and here languages are included. In its Article 8j about traditional knowledge, each of the states promises,

(j) Subject to its national legislation, [to] respect, preserve and maintain knowledge, innovations and practices of indigenous and local communities embodying traditional lifestyles relevant for the conservation and sustainable use of biological diversity and promote their wider application with the approval and involvement of the holders of such knowledge, innovations and practices and encourage the equitable sharing of the benefits arising from the utilization of such knowledge, innovations and practices.

Further work on the Convention stresses the interlocking of language and ecology in traditional knowledge and its inter-generational transfer:

Traditional knowledge refers to the knowledge, innovations and practices of indigenous and local communities around the world. Developed from experience gained over the centuries and adapted to the local culture and environment, traditional knowledge is transmitted orally from generation to generation. It tends to be collectively owned and takes the form of stories, songs, folklore, proverbs, cultural values, beliefs, rituals, community laws, local language, and agricultural practices, including the development of plant species and animal breeds (see <http://www.biodiv.org/programmes/socio-eco/traditional/>).

Biodiversity is disappearing at an alarming pace. Recent research (e.g. Harmon, 2002) shows high correlations between biodiversity and linguistic and cultural diversity. The relationship may also be causal, a co-evolution where biodiversity in the various ecosystems and humans through their languages and cultures have mutually influenced each other (e.g. Maffi, 2001; Skutnabb-Kangas, Maffi and Harmon, 2003; see also <http://www.terralingua.org>). If the detailed knowledge, encoded in small indigenous languages about the complexities of biodiversity and how to manage ecosystems sustainably, is to be maintained, the languages and cultures need to have better conditions: they need to be transferred from one generation to the next, in families and through schools. If global linguistic diversity is not to suffer irreparable attrition, as a result of linguistic genocide, major changes are needed in educational language policy.

## PROBLEMS AND DIFFICULTIES

The multidisciplinary needed in this area involves many so far unresolved challenges. There is still much concept clarification work to be done. The distinction between individual and collective rights is one example where language rights, because of the special character of languages (individual rights but used collectively), might contribute to a more general clarification of distinctions in human rights.

Some of the early work on LHRs has been critiqued (e.g. several articles in the *Journal of Sociolinguistics*, 2001, *Journal of Language, Identity and Education*, 2004, Freeland and Patrick 2004, Kymlicka and Patten, 2003) and accused of essentialising, of simplistically conflating language and identity, as though these are rigid, non-negotiable categories. They are necessarily relational and fluid, hence an integral part of struggles for political recognition, and for economic and social rights. It is essential to explore particular claims for rights in context. Minority rights must be established on objective criteria, and not determined by an often reluctant state. Sociolinguists and applied

linguists should have much to offer at the meeting-point between human rights formulations and attempts to improve these, and the dynamic complexities of specific cases.

Much of the scholarly ‘debate’ in sociolinguistics fails to appreciate that when LHRs require formulation in the conceptual worldview of international and national law, terms like ‘language’ cannot be subjected to apolitical post-modern academic hair-splitting. ‘Dialects’ and ‘speech communities’ have no status in law, whereas ‘language’ is used in public discourse terms that derive from folk linguistics rather than armchair theorising. Language and ethnicity are salient political terms. Calling them contingent seems to be doing the bidding of dominant groups who are reluctant to accord minorities any recognition. Condoning *Realpolitik* arguments that relate exclusively to instrumental uses and greater social mobility undermines the cause, in theory and practice, of oppressed groups. Education needs to confirm their linguistic and cultural identity as well as to equip them to operate in languages of the wider community. The practical realisation of this is complex, because of linguistic diversity, urbanisation, increased mobility, networks that are displacing territorially defined groups, the power of dominant discourses in fundamentally unequal societies, and the cumulative effect of all of these in linguistic hierarchies that threaten the lives of those (languages) at the bottom.

Some linguists working with endangered languages have suggested that endemic, typologically unusual or unique languages have a special case for protection because of their significance for linguistics. Human rights are an integrated whole and should be applied to all. When decisions are made on which languages to choose for education, in the media, etc, what criteria are legitimate to apply to resolve real dilemmas equitably? Political power, sensible pragmatism, research concerns, ethics (see also Phillipson, 2003)? LHRs are a necessary but not sufficient tool for educators concerned with language who want to contribute. The articulation of human rights is a paradigm case of thinkers formulating principles in the hope of influencing representatives of the state. Procedures should be in place to ensure implementation and redress for people who feel their rights have been infringed (regardless of whether they are citizens or not—see Human Rights Fact Sheet No 15, 2005, p. 4).

Lawyers tend to steer clear of sociolinguistic niceties (see de Varennes, 1996; Thornberry, 1997, 2002) but there are exceptions, multidisciplinary lawyer-linguists (see Dunbar, 2001a, b; Fife 2005). However, many sociolinguists (and political scientists, educationists, etc) tend to avoid engaging with legal aspects, which are vital, see [www.unesco.org/most/](http://www.unesco.org/most/) on Linguistic Rights and Legislation. It is

unhelpful to denounce the existence of concepts like language or mother tongue as social constructs with little or no basis in reality, because of unclear and permeable borders or because people are multi-lingual or multi-mother-tongued or shift from one to another. If (socio-) linguists claim that languages and mother tongues do not exist, how can one legislate for them? Lawyers treat languages as having ‘legal personality’ with certain rights, in the same way as individuals and groups and peoples can have rights. Another example is replacing negative terms (like LEP—Limited English Proficient, in the USA) with other terms which may have more positive connotations (in this case ‘linguistically diverse students’ or ‘English learners’) but do not give the students concerned any more rights: linguistically diverse students and English learners are non-entities in international law whereas minority students do have some rights. The *Draft Universal Declaration of Language Rights* (<http://www.linguistic-declaration.org/index-gb.htm>) can be criticised for presenting unrealistic suggestions that do not appreciate the limits of both international legal systems and national resources and political will. This undermines the chances of essential demands being heard.

#### FUTURE DIRECTIONS

Biocultural diversity (=biodiversity + linguistic diversity + cultural diversity) is essential for long-term planetary survival because it enhances creativity and adaptability and thus stability. Today we are killing biocultural diversity faster than ever before in human history. Seriously endangered languages disappear with little trace, at the same time as other not-yet-endangered languages, though official, are undergoing domain loss in high-status areas when English is being extensively used in research, universities, businesses, media, etc. Their speakers start experiencing what many minorities have experienced earlier when national official or ‘big’ languages have spread subtractively. The alternative is maximal support for linguistic diversity and additive multilingualism. Education is here a central space for the struggle—educational LHRs could be part of formulating and implementing necessary minimal support. This includes an absolute right to mother tongue medium education for indigenous peoples and minorities for most of the primary education, together with good teaching of an official language as a second language. For this to happen, many groups need to join forces. If researchers are to enhance this development (rather than become irrelevant or even antithetical to it), research needs to be multidisciplinary, constructive and activist.

## THE ECOLOGY OF LANGUAGE: INSIGHT AND ILLUSION

### INTRODUCTION

As a term and a focus of study, *ecology* is a mid-nineteenth-century coinage of Ernst Haeckel and, as its Greek root (*οἶκος* = home) implies, the emphasis is upon the holistic study of environments within which lives are lived and intertwined. Ecology is about adaptations whose necessity arises from inevitable linkages.

In both the ‘natural’ world and the constructed one, ecology is pivotal, and any ecological model deserves our notice. That is why it is important to understand the framework, the assumptions and the scope of the ‘new’ ecology of language. Although it is, I believe, a deeply flawed model, a broader ecological sensitivity is important; perhaps, in fact, the real value of current approaches is that their very inadequacies focus attention in salutary ways. In some ways, then, the ‘new’ ecolinguistics suggests a welcome extension to the breadth and depth of the larger ecological enterprise—and current ecological discussion does indeed touch upon the most central and relevant features of language-contact situations. A careful overview, however, of this new ecology of language reveals some substantial difficulties particularly in terms of its use in educational contexts. I have touched upon some of these in earlier publications (see e.g. Edwards, 2001, 2002) and it is important to deal with the matter here, as part of a multi-volume production aimed at an audience who may have neither the time nor the inclination for specialised study—and an audience who may (quite reasonably) equate the ‘ecology’ label with a fully fleshed treatment of the language-society nexus.

### EARLY DEVELOPMENTS

The first specific reference to the ecology of language is apparently found in a chapter by Voegelin, Voegelin and Schutz (1967), but the term is particularly associated with Einar Haugen (1972). His intent was to emphasise the linkages between languages and their environments, with particular regard to status and function, and he produced a list of contextualising questions—about who uses the language, its domains, varieties, written traditions and family relationships, degree and type of

support it enjoys, and so on (for more details and typological expansions, see Edwards, 1992, discussed further by Grenoble and Whaley, 1998). In themselves, these questions are neutral in tone. However, in a book forthrightly called *Blessings of Babel*, Haugen referred to a ‘problem of *social ecology*: keeping alive the variety and fascination of our country, diverting the trend toward steamrolling everything and everyone into a single, flat uniformity’ (1987, p. 11). The dislike of a monotonic landscape is clear, although Haugen’s quotation is not entirely transparent. He probably did not mean to imply that ‘social ecology’ was essentially devoted to the promotion of diversity, but rather that any such promotion would fall within its remit (see also his 1972 collection).

Haugen tells us that, in the 1970s, the biological model that the term ‘ecology’ brings to mind was not very popular among linguists. Haugen himself found it appealing, but reminded his readers that it possessed only metaphorical value; it suggested some analogies between languages and organisms, it was a useful fiction with some heuristic value, but ‘it could not be pushed too far’ (Haugen, 1972, p. 58). Similarly, Mühlhäusler (see later) has acknowledged that the ecological metaphor is a heuristic device, not to be evaluated ‘in terms of truth conditions—a language is no more an ecology than a mental organ or a calculus’ (see Fill and Mühlhäusler, 2001, p. 3). Unlike Garner—who, in his recent survey of the area, suggests that the ecological metaphor for language is ‘too limited and inconsistent to become a really useful tool’ (2004, p. 33)—Mühlhäusler thinks that the metaphor has ‘helped considerably in advancing a knowledge of human language . . . its potential is far from exhausted’ (p. 3). It will be my argument that this is a mistaken view, that the ‘new’ ecology of language provides no further insights, and represents in fact a limitation upon earlier and fuller understandings.

The most basic problem with the biological approach to language is—quite simply—that language is not organic. Languages themselves obey no natural imperatives, they have no intrinsic qualities which bear upon any sort of linguistic survival of the fittest, they possess no ‘inner principle of life’ (see later), they do not ‘die’. Languages do have an allotted ‘life’—but it is one granted by human society and culture, and not by any laws of nature. The fortunes of language are bound up with those of its users, and if languages decline or ‘die’ it is because the circumstances of their speakers have altered.

Given the centrality of biological metaphor and analogy to the ‘new’ ecology, a little more should be said about it here (cf. Pennycook, 2004). A linkage between nature and culture, between what is provided and what is constructed can be a valuable one in a world increasingly aware of environmental issues. The advantages of adding anxieties about language decline to concerns with pollution, loss of plant and

animal habitats and industrial depredation seem obvious. While not without its difficulties, diversity can make the world richer and more interesting—and is not linguistic diversity one part of the larger mosaic (see also later)? If we intervene to save the whales, or to clean up oil spills—or, indeed, to keep historic buildings from the wrecker's ball, or to repair and preserve rare books and manuscripts—then why should we not also stem language decline, ensure a future for all varieties, prevent larger languages from swallowing smaller ones, and so on?

The argument developed here is that the breadth of the earlier ecology-of-language view has progressively been reduced by new ecolinguistics so that the metaphor has began to obscure rather than illuminate the social contexts in which languages and their speakers co-exist. This is a result of the label of ecology increasingly being co-opted. As Mühlhäusler (2000, p. 308) noted in a recent review article, 'functioning ecologies are nowadays characterized by predominantly mutually beneficial links and only to a small degree by competitive relationships . . . metaphors of struggle of life and survival of the fittest should be replaced by the appreciation of natural kinds and their ability to coexist and cooperate'. We have a view of a world in which there is room for all languages, where the goodness of diversity is a given, where 'the wolf also shall dwell with the lamb.' This is certainly a kinder and gentler picture, but surely the key word here is 'should', surely the key question is whether the desire is also the reality. We could remember Woody Allen's reworking of that passage from Isaiah: 'the lion and the calf shall lie down together, but the calf won't get much sleep'.

#### MAJOR CONTRIBUTIONS IN THE 'NEW' ECOLOGY OF LANGUAGE: A LINGUISTIC HUMAN RIGHTS PERSPECTIVE?

The 'new' ecology of language is not so much a refinement of scientific methodology in the face of new understandings and new challenges—it is, rather, a socio-political ideology. Thus, Phillipson and Skutnabb-Kangas (1996, p. 429) point out that 'the ecology-of-language paradigm involves building on linguistic diversity worldwide, promoting multilingualism and foreign language learning, and granting linguistic human rights to speakers of all languages' (see also the writings of Mühlhäusler and others for similar advocacy of active intervention; Mühlhäusler's [1996, p. 2] note that language ecology implies that linguists become 'shop stewards for linguistic diversity', is representative here). This may suggest many things, but it does not suggest disinterested scholarship. Polzenhagen and Dirven (2004) note the irony that much of the thesis underpinning the 'new' ecology of language derives from a rejection of a conspiratorial ideology—by another ideology.

The new ecology is very concerned with linguistic human rights. Ecological organisations formed expressly for the protection of endangered languages—the American Terralingua society, for example, or the Foundation for Endangered Languages, based in England—typically have a charter or a statement of intent stressing linguistic rights. The former, for instance, observes that ‘deciding which language to use, and for what purposes, is a basic human right’ (Terralingua, 1999). As well, existing language associations have argued for rights. The most recent example is that of Teachers of English to Speakers of Other Languages (TESOL) which, in November 2000, passed a resolution advocating that ‘all groups of peoples have the right to maintain their native language . . . a right to retain and use [it]’. The other side of the coin, they argue, is that ‘the governments and the people of all countries have a special obligation to affirm, to respect and support the retention, enhancement and use of indigenous and immigrant heritage languages . . .’ Such specialised manifestos typically model themselves upon charters endorsed by the United Nations, the European Union and other international bodies.

There are many problems associated with linguistic rights. Government resolutions and charters, for example, are often outlined in a manner so general as to be virtually useless. There are often reasons for cynicism, too, for believing that the commitment they represent is essentially lipservice only. As well, many modern governments, while possibly more tolerant of diversity than before, still consider that toleration need not imply positive action, and arguments linking linguistic uniformity with efficiency, the need for one language to bind disparate groups within state borders, and so on, are frequently encountered. Consequently, supporters of language rights typically find existing legislation to be inadequate, and no sort of guarantee of protection.

Beyond official cynicism, or a reluctance to act based upon immediate and mercenary assessments, there are deeper issues. Linguistic rights are usually meant to have an effect at the group level—indeed, their existence is generally motivated by the plight of small groups whose languages and cultures are at risk—and this may sit uneasily with traditional liberal-democratic principles that enshrine rights in individuals, not collectivities. This is not the place for fuller discussion, but it should be noted that broader matters of pluralist accommodation in societies that are both democratic and heterogeneous—language rights are obviously a subset of concern here—are now of the greatest importance. They have become part of the province of political philosophy, for instance, which implies a very welcome breadth of approach, a search for cross-society generalities, an escape from narrower and intellectually unsatisfying perspectives (some of which, indeed, have been little more than outbreaks of special pleading). Recent treatments of general scope include Rawls (1999) and Dworkin (2000), while

Taylor's arguments (1992, 1994), which focus more closely upon matters of language and identity, can be profitably read in conjunction with those of Kymlicka (1995a, b). The debates here, whatever their specifics, and however their strengths and weaknesses may be perceived in different quarters, all suggest that any isolated statement or claim of language rights is simplistic and unprofitable.

There are even more basic issues with which the framers of language-rights manifestos rarely engage: do rights *exist* and, if they do, what sorts of things are they? Perhaps there are no rights; perhaps there are only cultural claims. This is a line of argument taken by Kukathas (1992), for example, and a recent brief overview by Brumfit (2001) brings the matter squarely to language rights. At the moment, he points out, these are typically assertions of things that ought to be, rather than statements which, through general agreement, have become objectified (usually in legal terms). Rights to language, then, are typically not of the same order as, say, those which proclaim freedom from slavery. While legal rights imply moral ones, the reverse does not necessarily hold—although, of course, what is merely desirable today may become lawfully codified tomorrow. The difficulty for moral claims, then—e.g. those made by concerned groups, like TESOL, even ‘charters’ to which countries may subscribe—is to effect this transition. For now, at least, this has generally not occurred and it is disingenuous to imply that *claims* are sufficient to somehow give language rights the same strength of footing as those rights underpinned by criminal or civil codes. As example of this is the *Universal Declaration of Linguistic Rights* which was approved in Barcelona in June 1996. It makes the usual assertions and jejune statements—its Article 25, for example, states that ‘all language communities are entitled to have at their disposal all the human and material resources necessary to ensure that their language is present to the extent they desire at all levels of education within their territory: properly trained teachers, appropriate teaching methods, text books, finance, buildings and equipment, traditional and innovative technology’. Despite its title, the UDLR is essentially the child of some interested parties: elements of PEN International, some NGOs, language ‘experts’, and so on (see [www.linguistic-declaration.org](http://www.linguistic-declaration.org)). And there is, above all else perhaps, a powerful practical matter to be faced: while it is possible to legislate rights of language expression, it is rather more difficult to legislate rights to be understood.

It is interesting therefore that an ecology that, by its nature, ought to be multi-faceted and inclusive—aware, above all, of nuanced (we could, in fact, say *diverse*) perspectives—should often see things in simplistic or dichotomous ways, should often construct inflexible and monochromatic outlines. Skutnabb-Kangas (2002; see also Phillipson, 2003), for instance, provides us with a table in which ten factors are

listed for each of two ‘paradigms’—a diffusion-of-English model and an ecology-of-languages one. Every item noted for the first is negative; every one of the ten ‘ecological’ factors is positive. The spread of English is associated with linguistic imperialism and genocide, subtractive bilingualism, cultural homogenisation, capitalism, and so on. (Also to be found on this negative side of the ledger, interestingly enough, are ‘rationalisation based on science and technology’ and ‘modernisation and economic efficiency’.) By contrast, the ecological thrust means multilingualism and diversity, communicative equality, economic democratisation, resource redistribution, and so on.

Mühlhäusler (2000) has also provided two lists: a dozen points of contrast between what he terms ‘segregational linguistics’ (old and bad) and the ‘ecological paradigm’ (new and good); and ten statements describing the ambit and the underpinnings of the latter. These are interesting because they summarise the ecological enterprise and expose its chief assumptions and concerns. Many of these summary statements, however, are naïve or questionable (e.g. ‘the non-cognitive functions of language are primary’ or ‘ecological language planning encourages permeable boundaries’) and others are unoriginal and truistic (e.g. ‘languages are an integral part of larger communication processes’ or ‘language planning requires attention to the overall physical and cultural ecology’). Such summaries and dichotomies are, in themselves, surely illustrative of underlying thought processes.

#### WORK IN PROGRESS: ALTERNATIVES TO THE ‘NEW’ ECOLOGY PARADIGM

The ‘new’ paradigm discussed earlier is not, of course, the only approach to ecolinguistics—particularly when matters of language diversity are being considered. A more nuanced view, for example, than those already noted is presented by Pennycook (2004), who provides some careful notes on the difficulties associated with the preservation of languages—notably, the problem of reconciling preservation with the dynamic nature of language and the undesirable levels of regulation that may be required to affect maintenance. Pennycook makes a third point of interest, one that has to do with the definition of just what is to be preserved. He cites Ammon’s (2000) argument that ‘inner-circle’ English speakers should become more tolerant of non-native variation—and Phillipson’s (2002) rejection of the point.

Despite the vaunted accuracy, value and morality of the ‘new ecology’, it is clear that our understanding of linguistic diversity and, in particular, of linguistic endangerment has not been enhanced. Like Pennycook (2004, p. 214), I am dubious about the ‘bright new dawn of language policy’ that contemporary ecology allegedly represents. We are no nearer a strong

logical base for the support of diversity, nor are we any closer to effective methods of maintenance—ones, that is, that are neither too draconian or undemocratic, nor workable only in highly restricted contexts. And there may be deeper waters here, too. For example—putting aside the unprecedented strength and scope of English in the current linguistic and cultural climate—history suggests an ebb and flow in matters of diversity and uniformity. The power of Latin—which once must have been seen as the killer of smaller European varieties—eventually spawned a renewed heterogeneity. And some contemporary opinion holds that linguistic globalisation stimulates counter-moves in support of local identities: consider the growth of indigenised ‘Englishes’, for example.

### PROBLEMS AND DIFFICULTIES

Two major problems of the new ecological approach are outlined below.

#### *Literacy and Education*

Part of the ideological underpinning of the new ecology is a distrust of literacy and education, on the grounds that they often undercut the preservation of linguistic diversity. Indeed, it is sometimes argued that literacy promotion actually works against ‘linguistic vitality’. Literacy is often seen as a sort of bully, then, in the same way that large languages are the villains, and small ones the victims—written varieties can push oral ones aside, writing is seen as sophisticated and, indeed, more likely to bear the truth, and so on. It is also sometimes seen as a sort of Trojan horse: speakers of at-risk varieties can be falsely lulled into security once writing arrives. It is certainly reasonable to point out the cruel fallacy that literacy inevitably leads to social or political improvement, or to refer to the single-mindedness of literacy campaigns. It is also true that writing does not automatically augment veracity (do you believe everything you read in the papers?). It would surely be yet another instance of ‘isolationism’, however, to try and purchase language maintenance at the expense of literacy.

A broader, related point is the suggestion that formal education is not always the ally of enduring diversity and bilingualism, for it often has intrusive qualities, championing literacy over orality, and imposing foreign (i.e. western) values and methods upon small cultures. Again there is the idea of cultural bullying. It is not difficult to sympathise with laments about supposedly intrusive ‘foreign’ education paradigms but—given that all education worthy of the name is multi-cultural in nature—the argument may be self-defeating. Formal education necessarily involves broadening the horizons, going beyond what is purely local and ‘traditional’. In an unequal world—one whose disparities

create risks for languages, in fact—education will perforce become yet another evidence of those disparities. Those concerned with gaining a place in the media for minority languages have learned that they are double-edged swords: while it is clear that access to them is important, they also facilitate the transmission of those larger influences upon decline. There are similar ‘risks’ associated with the medium of education.

### *The Romantic Perspective*

Current ecological models tend to identify some types of political villains more readily than others: unrestrained free-market capitalism, unfettered industrialisation, galloping globalisation. It is not uncommon to find disparagement of the scientific culture and concern for the ‘privileging’ of its knowledge over ‘folk wisdom’. There is a special regard for ‘small’ cultures and local knowledge, and it takes two forms: first, a simple and straightforward—and, indeed, perfectly reasonable—desire for the survival of such cultures and systems; second, the argument that they are in some ways superior to larger or broader societies and values. This view is often expressed in somewhat muted fashion; for a blatant expression, however, see Salminen (1998, p. 62): ‘without romanticizing or idealizing the indigenous cultures, it is clear that they are superior to the mass culture because their members retain the capability of living in at least relative harmony with the natural environment.’ Despite the half-hearted disclaimer, this is romanticism *tout court*. Or consider this dedicatory line in a recent anthology: ‘to the world’s indigenous and traditional peoples, who hold the key to the inextricable link between [sic] language, knowledge and the environment’ (Maffi, 2001).

A dislike of the contemporary world is often the background, in fact, for arguments on behalf of ‘indigenous’ cultures (I put the word in quotation marks here, as an example of another co-opted term, one which now has a particular resonance). Indeed, to suggest west-bashing is perhaps not unfair.<sup>1</sup> Standing up for the overdog is not a popular exercise, of course—but is it an advance to counter one species of insensitivity with another? Do the oppressed, as Bertrand Russell once discussed in a famous essay, hold the moral high ground because of oppression itself; can we agree with Orwell when he says that ‘this business about the moral superiority of the poor is one of the deadliest forms of escapism the ruling class have evolved’ (1944/1970, p. 230)? The disdain here naturally extends to the scientific culture generally, indeed to the generalities and ‘universals’ which many would see as the pivots of

---

<sup>1</sup> Polzenhagen and Dirven (2004, p. 22) discuss the ‘pronounced anti-globalisation, anti-Western and anti-Cartesian’ stance of the ‘romantic’ ecology-of-language model.

progress. Fishman, for instance, is cited as endorsing the theme that ‘the universal is a fraud, a mask for the self-interest of the dominating over the dominated’, in a paper defending those people who ‘have not capitulated to the massive blandishments of western materialism, who experience life and nature in deeply poetic and collectively meaningful ways’ (1982, p. 8). A representative comment deriving from a familiar theme is provided by Chawla (2001, p. 118): ‘Indians have traditionally treated the inanimate and animate world with awe and concern in ways that do not indiscriminately damage the natural environment.’ Two points can be made when such sentiments are expressed. First, there is a great deal of evidence that indigenous peoples can be as profligate as any contemporary urbanite when circumstances permit: when the American plains were black with bison, the Indians killed many, took the best bits, and left tons to rot; forested areas were burned to encourage more easily accessible populations of game animals; planting and grazing lands were used to exhaustion by groups who then simply moved on to greener fields; and so on. Second, even if aboriginal societies *were* the sensitive stewards of nature they are often depicted to be, this says nothing about the goodness of their languages, nor of any connection between those varieties and concepts uniquely expressible in and through them.

The unrealistic and potentially harmful romanticism that lies behind arguments for ‘small’ languages and cultures has been analysed in a recent chapter by Geeraerts (2003). He overstates his case a little—his contrast, for example, between a ‘language-as-communication’ view, said to be central to rational thinking, and a ‘language-as-expression-of-identity’ perspective underpinning romantic conceptions is entirely too neat. It could be argued, after all, that speakers in many majority-language ‘mainstream’ settings can have their linguistic cake and eat it, too: the language that carries their culture, traditions and literature is also the language in which they do their shopping. But, Geeraerts’s observations on romanticised ecologies are accurate: thus, he points to the assumptions made about the equivalence of all cultures, about the goodness of diversity, about global English as international oppressor. (Polzenhagen and Dirven, 2004, remind us that the sanction of Standard English in the educational system—and in other important social arenas—has attracted similar accusations of oppression and social exclusion. Yet, just as one could argue that Standard English actually levels a very bumpy playing field, so the use of English-as-lingua-franca in non-native contexts may permit a desirable unity of action—in movements for national liberation, for instance. Canagarajah [1999a, p. 207; see also 1999b], has argued that the linguistic-imperialism model neglects its contributions to ‘modifying, mixing, appropriating, and even resisting discourses’.)

## FUTURE DIRECTIONS

My critical remarks in this paper are not, of course, directed at ecology *per se*—for who could gainsay its essential elements? But, I think that the underlying ideology of the new ecology of language is insufficiently examined and, in fact, builds in various assumptions as if they were unremarkable, and beyond enlightened debate. While some of its underpinnings may be appropriate—in some cases, at least—there can be little doubt that a wholesale acceptance of them would be both unwise and counterproductive.

## ENDNOTE

This chapter is an abridged and revised version of a longer piece, to be published elsewhere.

My thanks to Angela Creese and Peter Martin for their editing of the original.

## LANGUAGE ECOLOGY AND LANGUAGE IDEOLOGY

### INTRODUCTION

An ecological approach to language in society requires investigation of the relationship of languages to each other, to the speakers of those languages, and to the social structures in the society in which the languages are spoken (Creese and Martin, 2003). These relationships are visible in the ways in which languages are used, and in social actors' attitudes to, and beliefs about, languages. Relationships between languages and their speakers, and languages and societal structures, are subject to their social, political and historical contexts. Language ecologies include the discourse which constructs values and beliefs about languages at state, institutional, national and global levels. That is, ecologies of languages may be better understood when complemented with discussion of ideologies of language.

### EARLY DEVELOPMENTS

In developing the notion of language ecology, Haugen (1972) argued that the ecology of a language is partly psychological, partly sociological, and is determined primarily by the people who learn it, use it, and transmit it to others. Haugen viewed language ecology as a natural extension of the kind of study pursued in the name of psycholinguistics, ethnolinguistics, linguistic anthropology, sociolinguistics, and the sociology of language. Haugen defined language ecology as the study of interactions between any given language and its environment, and considered that what was necessary was an analysis of the effect of the social and psychological situation of each language. Haugen saw the value of the language ecology model in the requirement to describe not only the social and psychological situation of a language, but also the effect of this situation on the language itself.

Fill and Mühlhäusler (2001, p. 3) argue that the ecological metaphor is useful in illuminating 'the diversity of inhabitants of an ecology', and 'the functional interrelationships between the inhabitants of an ecology'. Fill and Mühlhäusler suggest that the ecological metaphor contributes to our understanding of the diversity of inhabitants in an ecology, the factors that sustain that diversity, the housekeeping that is needed, and the interrelationships between the inhabitants of an ecology. These

early developments in the field of language ecology contributed to the development of research theory and method in language policy and planning, linguistic human rights, and language ideologies. It is to the latter of these features of the ecological metaphor that this chapter centrally attends. However, in reviewing major contributions to the field I also briefly consider language policy and planning, and linguistic human rights, as these fields of research are not easily separable from discussions of language ideologies.

#### MAJOR CONTRIBUTIONS TO THE FIELD

Hornberger (2003a) notes that scholars are increasingly turning to the metaphor of ecology to discuss language planning, teaching, and learning in multilingual settings. Hornberger cogently argues that multilingual language policies are about opening up ideological and implementational space in the environment for as many languages as possible to evolve and flourish rather than disappear. In the language ecology paradigm multilingualism is viewed as a resource rather than as a problem. Hornberger (2002, 2003a, b) focuses on three key aspects of the language ecology metaphor: language evolution, language environment, and language endangerment. She argues that languages, like living species, evolve, grow, change, live, and die in relation to other languages and in relation to their environment, and some languages, like some species, may be endangered. For Hornberger the language ecology movement has a practical role to play in contributing to the survival of endangered languages. Summarising the language ecology metaphor, Hornberger suggests that languages are understood to live and evolve in an ecosystem along with other languages, to interact with their socio-political, economic and cultural environments, and to become endangered if there is inadequate environmental support for them in relation to other languages in the ecosystem (2003b, p. 323). Hornberger (2002) extends the concept of ecology of language to the field of language planning, pointing out that the ecology of language metaphor underpins a multilingual approach to language planning and policy. In this paradigm, language policy and planning aims to maintain and cultivate languages and cultures, from a linguistic human rights perspective. Ricento (2000, p. 208) suggests that the jury is still out on the question of whether the ecology of languages paradigm will emerge as the most important conceptual framework for language policy and planning research. What Ricento argues, however, is that language policy and planning research must deal with issues of language behaviour and identity at the micro, individual level, as well as at the level of macro investigations.

Often linked to language ecology is the linguistic human rights movement. Similarly exploring the relationships of languages to their environment, and to each other, scholars in linguistic human rights have focused explicitly on the rights of indigenous peoples and various dominated groups, including linguistic minorities (Phillipson and Skutnabb-Kangas, 1997; Skutnabb-Kangas, 2000; Skutnabb-Kangas and Phillipson, *A Human Rights Perspective on Language Ecology*, Volume 9). Phillipson and Skutnabb-Kangas (1997, p. 39) propose that the ecology of language paradigm is characterised by a human rights perspective, and a commitment to equality in communication, multilingualism, maintenance of languages and cultures, protection of national sovereignties, and promotion of foreign language education. Here Phillipson and Skutnabb-Kangas argue that what is needed, in place of policies that extend the global expansion of dominant languages such as English, is an ecology of language perspective which embraces all languages. In the present volume, Skutnabb-Kangas and Phillipson point to the following core elements of linguistic human rights: positive identification with a minority language by its users, learning a minority language in education, additive bilingual education, and public services. They argue that a balanced linguistic ecology does not allow some languages to spread at the cost of others. In such an ecology, linguistic diversity is maintained 'for the long-term survival of humankind' (p. 4). Skutnabb-Kangas and Phillipson make the point that there are correlations between biodiversity and linguistic and cultural diversity, and that small indigenous languages should be protected in order to transmit knowledge about the maintenance of delicate ecosystems. They make the case that biodiversity, linguistic diversity and cultural diversity can be conflated in the term 'biocultural diversity', which is essential for long-term planetary survival.

### *Language Ideology and National Identity*

Language ideologies include the values, practices and beliefs associated with language use by speakers, and the discourse that constructs values and beliefs at state, institutional, national and global levels. Recently, studies of multilingualism in societies have drawn attention to the social positioning, partiality, contestability, instability and mutability of the ways in which language uses and beliefs are linked to relations of power and political arrangements in societies (Blackledge, 2005; Blackledge and Pavlenko, 2002; Blommaert, 1999; Blommaert and Verschueren, 1998a, b; Gal, 1998; Gal and Woolard, 1995; Heller, 1995, 1999; Kroskrity, 1998; Woolard, 1998). Attitudes to, and beliefs about, language, are often not only about language. Gal and Woolard (1995) persuasively argue that ideologies that appear to be about language

are often about political systems, while ideologies that seem to be about political theory are often implicitly about linguistic practices and beliefs. Debates about language are therefore not about language alone (Woolard, 1998), but are socially situated and tied to questions of identity and power in societies.

Language ideologies are positioned in, and subject to, their social, political and historical contexts. Nor are language ideologies always fixed, stable, or immutable. They may be multiple, and influenced by changes at local, national, state and global levels. Moreover, language ideologies are often contested, and become symbolic battlegrounds on which broader debates over race, state and nation are played out. However, to say that language ideologies are contested and changeable over time is not to assert that they are necessarily always negotiable. As I have suggested elsewhere (Blackledge and Pavlenko, 2001; Pavlenko and Blackledge, 2004a), there is often a dynamic tension between identities asserted and chosen by the self, and identities asserted and chosen for the individual by state, nation or institution.

In public discourse, language often becomes inseparably associated with a territorially bounded identity in a relationship that takes language, territory, and identity to be isomorphic (Freeland and Patrick, 2004). One implication of this is that ideally the nation should be monolingual, with adherence to another language often (mis)read as a lack of loyalty to the national identity. Claims to minority language rights effectively challenge the very basis on which states are founded, in demanding the institutionalisation of diversity. Nation-states are not founded on 'objective' criteria, such as the possession of a single language. Rather, they have to be 'imagined' as communities (Anderson, 1983, Billig, 1995). Billig (1995, p. 29) argues that the creation of a national hegemony often involves a hegemony of language. However, it is not sufficient to say that speakers of the same language belong to the same nation-state. This common-sense understanding of the relationship between language and nation ignores the diversity and variety of the language(s) spoken within many states. As Rampton's (1995) work has made clear, even the notion of a single 'English' language is an over-simplification, as new varieties emerge from different cultural and social contexts.

A relatively recent construct, national identities gained particular importance with the appearance of nation-states, the fundamental unit of world political organisation, since a nation in a modern sense cannot exist without a shared sense of identity (Anderson, 1983). However, even though nation-state boundaries may be clearly defined, national identities are far from unproblematic. Nations are ideological creations, caught up in the historical processes of nationhood (Billig, 1995). Billig argues that national identity is constantly being discursively

'flagged', with "banal words, jingling in the ears of the citizens, or passing before their eyes" (1995, p. 93). Words which reproduce dominant ideologies of nationalism are banal because they are familiar, routine, habitual, and hardly noticed. "Small words" offer constant but hardly conscious reminders of national identity.

The notion of a 'nation' carries the meanings both of the nation-state, and the nation of people living within the state. Of course, not all of the people living in a state view themselves as each others' equals. Nor do all inhabitants of a particular nation-state, or a particular state, see themselves—or each other—as a part of the dominant national identity narrative. I have previously (Blackledge, 2002) suggested that in Britain the media frequently constructs an oppositional national identity at the expense of some of the country's citizens and non-citizen residents. Furthermore, national identities and narratives may change within the span of one generation when nation-states collapse or redefine their boundaries and political allegiances, as happened in the case of the former Soviet Union, Yugoslavia, or Hong Kong, or when ethnic mobilisation comes into play, as in Canada in the 1960s (Heller, 1992). In this case, the inhabitants of a particular place have to struggle with redefining their own allegiances and identities within the new range of options—including linguistic ones—offered to them. In some cases, local, religious, ethnic or alternative national identities may override those offered by the state. For instance, due to the dominance of ideologies steeped in Islam, many citizens of Arab countries may feel they belong to an Arab nation rather than to a nation defined by their state (Barbour, 2000). Billig points out that "The battle for nationhood is a battle for hegemony, by which a part claims to speak for the whole nation and to represent the national essence" (1995, p. 27). The achievement of national hegemony is well illustrated by the triumph of official national languages and the suppression of rivals.

While national identities can be negotiated in a variety of ways, current research privileges language and literacy policies as increasingly important means of social control which allow nation-states to define 'who is in' and 'who is out'. Bourdieu argues that the official language is bound up with the state, both in its genesis and in its social uses: "It is in the process of state formation that the conditions are created for constitution of a unified linguistic market, dominated by the official language" (1991, p. 45). In order for one language to impose itself as the only legitimate one, the linguistic market has to be unified and the different languages (and dialects) of the people measured practically against the legitimate language:

Integration into a single 'linguistic community', which is a product of the political domination that is endlessly reproduced

by institutions capable of imposing universal recognition of the dominant language, is the condition for the establishment of relations of linguistic domination. (Bourdieu, 1991, p. 46)

This linking of language, literacy, and national identity happens in a number of sites which include language planning, standardisation, educational policy, citizenship testing, and language instruction for immigrants (Blackledge, 2005; Stevenson, 2006). Recent work on language testing for citizenship has demonstrated that in a broad range of national contexts particular languages and language varieties become gatekeeping devices to determine who is permitted to become a member of the community of citizens (Blackledge, 2005; Mar-Molinero, 2006; Maryns and Blommaert, 2006; Stevenson, 2006).

Another, related way to impose national identities is through educational policies that decide which languages are to be employed—and thus legitimised—in the public school system. Recent research has clearly documented the interpenetration of the ideological with the local, in institutional, nationalist, and political dimensions. When a language is symbolically linked to national identity, the bureaucratic nation-state faced with a multilingual population may exhibit ‘monolingualising tendencies’ (Heller, 1995, p. 374). Heller’s (1995, 1999) study of a Francophone school in Ontario observed tensions between the monolingual ideology of the school, and the language use and ideologies of at least some of its students, and found that some of the students resisted the linguistic ideology of the school. Also, in a school which was concerned with using French to resist the domination of English, students set up their resistance to the school through the very language which was oppressing them. Pavlenko (2002) demonstrates that when monolingualism in English emerged as an emblem of American national identity following World War I, this ideology resulted in laws, which delegitimised the use of languages other than English in the public school system in 34 states. The historical approach exemplified in Pavlenko’s work is crucial to a critical understanding of how language ideologies are produced and reproduced. May (2005) argues that the question of language rights should be addressed in the context of the fact that the establishment of state-mandated or national languages is a deliberate political act, and one that clearly advantages some individuals and groups at the expense of others. That is, issues of language rights can better be understood when viewed through a language ideological lens.

#### WORK IN PROGRESS

May (2004, 2005) acknowledges post-structuralist research which proposes that for some individuals and groups language may not be a

defining feature of identity, but argues that for others it may indeed be a salient feature. If identities are now theorised as multiple, hybrid, and contingent, they nevertheless are clearly important features of identity claims for some individuals and groups. If the loss of a particular language is not necessarily the end of the world for a particular ethnic identity, for some individuals and groups language certainly *is* a key ideological battleground in the assertion of identities. We can hardly argue theoretically that for students who died protesting the right to establish Bengali as the national language of East Pakistan in 1952, language was not a key feature of identity. There are of course many other examples in present-day Europe. May (2005, p. 330) points out that in these conflicts ‘particular languages clearly *are* for many people an important and constitutive factor of their individual, and at times, collective identities’. May (2004, p. 43) argues elsewhere that while theoretically language may be just one of many markers of identity, in practice it is much more than that, as ‘the link between language and identity encompasses both significant cultural and political dimensions’. Identities are inevitably mediated in and through languages, which (whether we like it or not) come to be associated with particular ethnic and/or national characteristics. Of course, some languages and language varieties are important for speakers’ identities without national or ethnic associations.

May argues that Bourdieu’s notion of *habitus* (Bourdieu, 1990, 1998) provides a useful way of understanding relations between language(s) and ethnicities. The relation between *habitus* and *field* creates the conditions in which existing shared self-evidences are produced and reproduced. In this context, ‘self-evidences’ are those apparently common-sense misrecognitions which constantly construct and reinforce hegemonic ideologies. This process of *symbolic violence* (Bourdieu, 1998, 2000), of production and reproduction of common-sense consensus, occurs in discourses in the media, education, politics, the economy, and the law, to mention only institutional contexts. Language ideologies contribute to the production and reproduction of social difference, constructing some languages and varieties as of greater worth than other languages and varieties. This process can only succeed when, in the ‘institutionalised circle of collective misrecognition’ (Bourdieu, 1991, p. 153), dominant and dominated groups alike accept the greater value of certain languages and varieties.

Bourdieu’s representation of the symbolic value of one language or language variety above others rests on his notion that a symbolically dominated group is complicit in the misrecognition, or valorisation, of that language or variety. The official language or standard variety becomes the language of hegemonic institutions because the dominant and the subordinated group both misrecognise it as a superior language.

For Bourdieu, this misrecognition of the arbitrary nature of the legitimacy of the dominant language (and culture) ‘contributes towards reproducing existing power relations’ (1977, p. 30). Irvine and Gal (2000) note that there are striking similarities in the ways ideologies misrecognise differences among linguistic practices in different contexts, often identifying linguistic varieties with ‘typical’ persons and activities and accounting for the differentiation among them. In these processes, the linguistic behaviours of others are simplified and are seen as deriving from speakers’ character or moral virtue, rather than from historical accident or evolution. Irvine and Gal offer the example of nineteenth-century Macedonia, which was unusually multilingual, with language use not falling within expected ethnic boundaries. Outsiders thus positioned Macedonians as untrustworthy, since apparently shifting linguistic allegiances were construed as shifting political allegiances and unreliable moral commitments. The official language, or standard variety, often comes to be misrecognised as having greater moral, aesthetic and/or intellectual worth than contesting languages or varieties (Blackledge, 2005; Bokhorst-Heng, 1999; Heller, 1999; Jaffe, 1999; Schieffelin and Doucet, 1998; Spitulnik, 1998; Watts, 1999). In Bourdieu’s terms, those who are not speakers of the official language or standard variety are subject to symbolic domination, as they believe in the legitimacy of that language or variety, and ‘Symbolic power is misrecognised as (and therefore transformed into) legitimate power’ (1991, p. 170).

#### PROBLEMS AND DIFFICULTIES

The discussion so far has more-or-less assumed that the ‘ecology’ metaphor is an appropriate one to account for and understand linguistic diversity and its relation to speakers of languages and powerful structures in society. However, Freeland and Patrick (2004) convincingly argue that whereas the biological metaphor implies that languages are ‘species’ or objects in the world, the focus of linguists is better targeted at the speakers of those languages, and the complex social, political and cultural practices for which they use them. Freeland and Patrick suggest that if the parallel between languages and species is to be taken as a real reason for preserving languages and as a basis for developing policy, its identification of linguistic elements as kinds of biological elements must be made more plausible (2004, p. 9). They suggest that the metaphor which likens languages to species, endangered languages to endangered species, and linguistic diversity to biological diversity, has become naturalised due to the dominant discourse which views languages as discrete objects. Ricento (2006, p. 46) argues that while linguistic diversity is a fact, analogies between biological ecosystems and

linguistic ecosystems break down very quickly on close inspection. Among other differences, language contact, shift and loss are not comparable to, nor do they involve, species extinction. Ricento suggests that such an analogy weakens the credibility of linguistic ecology as a model to resist the increasing dominance of global languages such as English.

While acknowledging that there are useful links to be made between linguistic diversity and biological diversity, Freeland and Patrick suggest that the 'invasion' of a linguistic habitat by an alien language-as-species need not be harmful to that environment. The dominant, 'host' language is (or should be) as open to change as dominated, minority languages. There is no intrinsic reason why cultural and linguistic change and adaptation should always be from a minority language/culture to a majority one (May, 2004). Freeland and Patrick argue that the 'conservation' approach, rather than countering oppressive practices, may act to restrict the social, economic and even geographical mobility of those who are tied to a linguistic niche which is subject to consistent discrimination. That is, it may not inevitably be the case that speakers of minority, marginalised languages wish to continue to be speakers of these languages. The argument that speaking a minority language rather than the majority language constrains the social mobility of the speaker is well-rehearsed, and is certainly quite convincing. However, May (2005) points out that speakers of minority languages are often also from ethnic minority groups, and are also subject to discrimination other than linguistic. Furthermore, to simply accept that social mobility is constrained by speaking minority languages is to accept rather than challenge this hegemonic situation. It is not inevitable that speaking minority languages in some public settings must disadvantage the speaker, even if it is usually the case at present.

May (2004) points out that while the ecology metaphor may be useful to highlight the seriousness of language loss, it potentially reinforces the view that the loss of languages is an inevitable part of social and linguistic evolution. As a result the wider political power relations which underlie language loss are lost from view: 'Language loss is not only, perhaps not even primarily, a linguistic issue—it has much more to do with power, prejudice, (unequal) competition and, in many cases, overt discrimination and subordination'. (May, 2004, p. 37). Inequalities are fundamentally social rather than linguistic. This view of course acknowledges that discrimination and prejudice are constructed and constituted in language, but proposes that arguments about which languages are validated in a society are often about more than languages alone. Some languages, and therefore the speakers of those languages, are discriminated against by speakers of majority/dominant languages. This process is powerful precisely because some

languages and varieties are misrecognised (by minority and majority groups alike) as being of greater value than others. More powerful socioeconomic groups frequently discriminate against those of lower status. When speakers of some languages are not able to activate their linguistic and cultural resources in some societal settings, the effect is one of both symbolic and material violence. Languages do not start out equal, and speakers of languages do not start out equal. Where speakers of minority languages are unable to access resources because their languages (and therefore they) are discriminated against, it is about more than the diversity of the inhabitants of an ecological system, it is a matter of social justice.

#### FUTURE DIRECTIONS

This chapter has argued that in many Western countries a dominant ideology is constantly produced and reproduced which positions the majority language (usually English) as the only language of communication in institutional and other public contexts. Minority languages associated with immigrant groups are, as Bourdieu put it, rejected into indignity (Bourdieu, 1998, p. 46). Minority languages which have historically been associated with particular ethnic identities often continue to be important for particular groups (May, 2004), but have little capital in majority-language markets. Very often, multilingual societies that apparently tolerate or promote heterogeneity in fact undervalue or appear to ignore the linguistic diversity of their populace. An apparently liberal orientation to equality of opportunity for all may mask an ideological drive towards homogeneity, a drive which potentially marginalises or excludes those who either refuse, or are unwilling, to conform.

Gal (2006, p. 15) argues that in powerful discourse monolingualism is often taken to be the natural state of human life. Furthermore, named languages are taken to be homogeneous, and to be expressions of the distinct spirit of a particular group. In this sense, where linguistic practices conform to certain norms and standards, they are effective in legitimating political arrangements. However, Gal also points out that in Europe a new elite of multilingual speakers (e.g. French, German and English) sustains a breadth of linguistic repertoires which transcends national boundaries. For such groups ethnolinguistic identity may be only an occasional issue. For multilingual speakers of languages with lower status, however, language issues may still be salient as people attempt to negotiate identities, often from relatively powerless positions.

As suggested earlier, however, language ideologies are neither simple nor monolithic. Notwithstanding the argument that minority

language speakers are subject to the symbolic violence of the dominant language ideology, some speakers who (or whose families) may traditionally have been associated with minority 'ethnic' languages are using language and languages in new ways (Rampton, 1995; 1999). While some speakers are either unable to negotiate their identities from inextricably powerless positions, and others in powerful positions have no need to do so, some speakers in modern nation-states are using their sophisticated linguistic skills to negotiate new subject positions (see also Blackledge and Pavlenko, 2001; Pavlenko and Blackledge, 2004). In what Gal (2006, p. 27) describes as 'self-conscious, anti-standardizing moves', such negotiations may include linguistic practices which reframe previous standard varieties, incorporating, *inter alia*, urban popular cultural forms, minority linguistic forms, hybridities and inventions. Here language practices associated with immigrant groups no longer represent backward-looking traditions, but may be linked to global youth culture and urban sophistication. Languages and language practices are not necessarily equated to national identity (but may be so), and are not necessarily dominated by the standardised variety. Despite powerful ideologies of homogeneity, populations in many countries—especially countries with a history of recent immigration—continue to be heterogeneous in their practices. May (2005) proposes that linguistic identities need not be oppositional, and asks 'what exactly is wrong with linguistic complementarity?' (p. 337). May calls for further ethnographic studies that articulate and exemplify the broad linguistic principles of language ideological research in complex multilingual contexts. An example of such work is the recent and ongoing research by Creese and Martin (2006a, b) and their collaborators, which provides illustrative accounts of the complementarity of languages in 'complementary schools' in urban Britain.

Stevenson and Mar-Molinero (2006) call for more critical examination of language policies which emerge from and contribute to the contradictions between monolingual ideologies and multilingual practices. In discussing language ideologies in contexts of modernity which include transnationalism and mass immigration, there is certainly a need for such rigour. At the same time, further studies are required which critically analyse the complexity and diversity of the multilingual practices of children, young people and teachers in and out of educational settings, and of their attitudes, values and beliefs about language. Through such studies, we can come to a more comprehensive understanding of the complex relationship of languages to each other, to the speakers of those languages, and to the social structures in the society in which the languages are spoken.

AN ECOLOGY PERSPECTIVE ON LANGUAGE  
PLANNING

INTRODUCTION: PROBLEMS AND DIFFICULTIES

In a general sense, language planning has been conceived as an effort, usually at national level, to change the language behavior of some population for some stated or implied reason. Although initial language planning and policy activity sometimes has been characterized as involving a wide range of social and political (i.e., status planning—van Els, 2005) and linguistic (i.e., corpus planning—Liddicoat, 2005) input to arrive at planning decisions (e.g., Jernudd and Baldauf, 1987), and because language planning is often perceived as having a national function, actual policy development has tended to be focused more narrowly on developing a national/official language within a particular polity. The term *polity* is used here with intent to signify political entities of any size (smaller than a nation—e.g., American Samoa or Puerto Rico within the USA; Hong Kong within the People's Republic of China—or larger than a nation—e.g., The African Union, The European Union, UNESCO) acting more or less independently in the context of designing and implementing language policy.

Such language planning within a particular polity often has as its focus the learning of a single common national/official language and/or a single minority language<sup>1</sup> (or a small group of minority languages) and, therefore, the responsibility for language planning is often delegated to the education sector (i.e., acquisition or language-in-education planning occurs—Baldauf and Kaplan, 2005). Crowley (2000, in Vanuatu), Daoud (2001, in Tunisia), Djité (2000, in Côte d'Ivoire), Gynan (2001, in Paraguay), Hornberger (1989, in Peru), Kaplan and Baldauf (2003, in Pacific basin), King and Haboud (2002, in Ecuador), Mangubhai and Mugler (2003, in Fiji), Medgyes and Miklósy (2000, in Hungary),

---

<sup>1</sup> In such cases, the term *minority language* is frequently defined on the basis of the size of its community of speakers; thus, in the United States, for example, Spanish is defined as a minority language, even though the number of speakers is approaching a sheer majority of the national population. Because of the size of the population, much attention has been devoted to dealing with Spanish-speakers. Languages implicating smaller populations can be ignored with impunity. Such considerations (having obvious economic implications) determine which of a multiplicity of minority languages will be addressed by the education sector.

Neustupný and Nekvapil (2003, in The Czech Republic), Nyati-Ramahobo (2000, in Botswana), and Tosi (2004, in Italy) (cf. Kamwangamalu, 2001, in South Africa) provide examples of this phenomenon. As a further planning activity, polities may take measures to increase the standing or prestige of various languages within their borders and in the international context (e.g., Ager, 2005; Baldauf, 2004). As the next section in this chapter indicates, these four types of planning activities have an effect on the sociocultural context or linguistic ecology in which all languages coexist.

Additionally, contrary to early thoughts on the matter within the discipline (e.g., Rubin and Jernudd, 1971), language planning is commonly a political—rather than a linguistic—activity; that is, status-planning decision-making occurs in the political sector rather than in the education sector, even when the planning task has been allocated to the education sector (Baldauf and Kaplan, 2003). Furthermore, such decision-making is constrained at least by budgetary considerations, by considerations dictated by the rigidity of the academic calendar and of the academic structure, and by considerations dictated by the dominant philosophy of education—that is, by decisions about what languages will be taught, about when and for how long they will be taught, and about the population sectors who will teach them and who will learn them, without reference to the readiness of either teachers or students to engage in the activity. As van Els (2005, p. 989) has pointed out, “the normal practice in second language learning and teaching planning—as in all education planning, for all we know—still is for uninformed laymen to develop policies without any recourse to empirical findings or expert advice.”

Kaplan and Baldauf have argued elsewhere (1997) that allocation of language planning to the education sector must of necessity have limited potential for success, because:

1. Only a single generation of children attends the educational institutions of a polity at a given time, thus, a relatively long period of time may be required to reach more than a tiny fraction of the total population;
2. Adults beyond the age of compulsory schooling are, by definition, exempt from the effort to induce some given new language behavior;
3. The education sector is often relatively under resourced in financial and manpower terms;
4. The education sector is internally focused, dealing primarily only with the schools under its control, the administrators of those schools, the teachers in those schools, the students in those schools and the parents of those students;

5. The education sector is isolated; that is, its efforts do not often reach other governmental sectors (e.g., the ministries of commerce, of communication, and those concerned with the military);
6. The education sector, although it is a feeder of manpower to the private sector, has no direct influence on the behavior of the private sector; on the contrary, it is often called upon to meet the expectations of the private sector;
7. The education sector rarely has the leisure or the resources to train teachers appropriately for activities in language teaching and learning, rarely has the resources to develop appropriate teaching and assessment materials, and rarely has the resources to undertake appropriate developmental activities necessary to understand who should learn the language, how long such teaching/learning should take and what levels of proficiency may realistically be expected.

More importantly, the education sector is rarely concerned with all the languages that coexist within a given polity and certainly not with the co-occurrence of those languages in proximate polities; rather, its attention is riveted on the national/official language and, perhaps, on one or two larger minority languages or foreign languages in that polity. There is rarely any understanding on the part of planners that modifications in any of the languages of the polity are likely to have unpredictable consequences with respect to all the other languages in the polity. Finally, the effect of such policy and planning on languages in proximate polities is only very rarely a consideration (but see, Asmah Haji Omar, 1975 for Malay/Indonesian, Willemys, 1984 for Dutch-Flemish).

This condition is very much a product of the self-defining “one-nation/one-language” myth (Grillo, 1989). That myth is itself a product of the notion that national unity is completely dependent on the existence of a single universal language and that the entire population must be homogenized linguistically to assure universal communication deemed necessary to national unity. (In the more recent past, this notion has carried over to national security as well.) The myth in combination with international politics also suggests that when two nations share a particular language, it may be expedient to designate those languages with different names, as in the case of Hindi/Urdu for India and Pakistan or Serbian and Croatian that emerged with the break up of the former Yugoslavia. The mythology frequently leads to a misunderstanding of the nature of literacy and of the potential benefits implicit in bilingualism.

As this brief introduction to language policy and planning suggests, despite the rather narrow way that language traditionally has been viewed in some social and political circles, languages interact with and affect one another both within and across polities—a reality increasingly being recognized by those involved in language planning.

EARLY DEVELOPMENTS: LANGUAGE ECOLOGY  
AS A CONCEPT

In order to be able to focus more clearly on these issues of language mutuality, language planners have begun to talk about language ecology. Mühlhäusler (1996, 2000) has examined the case of language planning and language ecology in the Pacific Basin, particularly in relation to pidgins and creoles, but also more generically. He notes that linguistic ecologies provide a “structured diversity” in a particular area and that “the first manifestations of . . . linguistic imperialism is not the reduction of the quantity of indigenous languages but the destruction of the region’s linguistic ecology, a fact often overlooked by those who write about language decline” (1996, p. 77).

It should be noted that the issue of creating a sustainable language ecology, with all its biological and ecological metaphors, as an utopian solution for resolving problems of minority language rights has been fiercely debated in the context of language policy and planning (see, e.g., May, 2003 for a recent summary; see also Pennycook, 2004). The discussion of this debate goes beyond the scope of this article, which uses the term *ecology* in a more general sense, that is that all languages exist in the context of other languages, dialects, ways of speaking, and so on, or to put it another way, exist in a particular language ecology. This is a fact that is frequently overlooked in language planning and policy-making.

Indeed, it can be argued that it is the linguistic ecology that constitutes a real language planning and policy problem in many situations. A polity may plan changes in a particular language without understanding that its planning may have an unknown impact on that particular language in proximate polities or in those polities elsewhere in the world in which the particular language has some role. France’s *Loi Toubon*, for example, which mandated specific changes in French usage, had influence not only on the French language in France, but on French in all those other participants in *Francophonie* in Africa, Asia, and the Pacific as well as in all those polities in which French is a favored foreign language, taught through the education sector.

Another way in which the language ecology may have been altered is through colonization (and neocolonialism), where new languages (and new language functions) may be introduced into the local linguistic ecology; that is, in the most widely discussed forms of colonization, European languages were introduced into non-European contexts, although historically other languages like Arabic or Chinese may also have had some major impact on such languages as Bahasa Indonesia or Japanese, Korean and Vietnamese. In addition, in many instances, literacy in the colonizing language was introduced (but not necessarily in

the local vernacular). Since much colonization was accompanied by the inculcation of some particular religious view (in parts of Africa, the Americas and the Pacific, Christianity; in the Middle East and North Africa, Islam; in Asia, Buddhism, Confucianism, etc.), missionary activity, often present, was seen to have some influence through two separate forms of language related activity:

1. On the one hand, *language spread*, the spread of the new language(s) (not previously part of the language ecology) through direct proselytization accompanied by the spread of literacy through the teaching of the word of God in the colonial language, without benefit of translation;
2. On the other hand, *language translation*, often in the case of Christian missionary activity, the translation of the gospel into the indigenous language(s), resulting in the introduction and spread of literacy in previously unwritten languages.

This translation activity may have resulted in another intrusion into the existing language ecology; since missionaries were rarely trained linguists, and since their functions were inherently pragmatic, their practical requirement for a “standard” indigenous language sometimes constituted a misperception of the indigenous language, resulting in the creation of a new language in the ecology (Makoni, Mashiri and Meinhof, submitted; Masagara, 1997). But even when the outcome was not a “new” language, it was frequently a new pidgin, a language form that morphed into a new Creole (see, e.g., Crowley, 2000 for Bislama; Romaine, 1996 for use as literary languages).

In the postcolonial era, there has been a heated debate about the role of English and its effect on language ecologies. Is English a “killer language” (Skutnabb-Kangas, 2000) spread through linguistic imperialism (Phillipson, 1992) destroying local language ecologies, or has the English language become a world language through its econocultural functions (Brutt-Griffler, 2002), creating an increasing demand for English, but thereby increasing the pressures on other languages in particular language ecologies? While, at the national level, this may lead to the sort of stable bilingualism predicted by Brutt-Griffler for Asia and Africa when English is added to an already wide range of languages, its increasing inclusion in the curriculum must, by definition, take time from subjects, often other languages, thus altering the language ecology.

Of course, the issue of language change and the alteration of language ecologies is not a recent phenomenon. However, in recent times the impact of such changes on language ecologies has become more noticeable as the pace of language change has accelerated, and as languages have been in more widespread contact. In addition, planned language change has become a formal function in many polities, adding

to the pressures for change found in a language ecology. Nevertheless, some aspects of these ecologies have been resistant to, or generated resistance to (e.g., Canagarajah, 1999—Tamil northern Sri Lanka; Clayton, 2002—Cambodia) such changes, perhaps because of their links to identity.

#### MAJOR CONTRIBUTIONS: JAPANESE LANGUAGE ECOLOGIES AS AN EXAMPLE

By way of illustration, the language situation in contemporary Japan shows how language(s) both shape and have been shaped by their ecological context. It must be remembered that Japan engaged in militant colonial activity for a half-century, during the period between the end of the Sino-Japanese War (1894–1895) and the end of World War II (1945). In the territories Japan occupied, it undertook to install not only the Japanese language (*kokugo*) but also the Japanese “culture” (*kotodama*); thus, it was engaged in the first of the two forms of colonial language activity (language spread). However, with respect to the second of the two forms of activity (language translation), in some linguistic environments Japan employed the indigenous language for its own ends, often as a temporary measure, serving as a transition to linguistic assimilation (see, e.g., Baldauf and Kaplan, 2003; Gonzalez, 1980 for the Philippines; Kratoska, 1998 for Malaysia; Rhee, 1992 for Korea; Tsao, 1999 for Taiwan).

Internally, in Japan, *Kokugo* (not *Nihongo*) is the national language, not as a matter of law, but as a matter of long-standing convention. There have been attempts to homogenize the regional dialects (as well as Ainu and Luchu) into “standard” Japanese in a long-term effort to create a universal “standard” form of Japanese, deemed necessary for maximum effective communication and for national unity. This has led many casual observers of the Japanese scene to consider that Japan is a linguistically and culturally homogeneous nation (see, e.g., National Language Research Institute, 1998). The actual language situation in Japan, however, reveals that:

1. There are a number of dialects of Japanese spoken in the polity (Kaplan, 2000);
2. A number of other languages are spoken in the polity—that is, Chinese, English, French, German, Korean, Tagalog, and so on (Kaplan, 2000);
3. Japanese is spoken across a substantial Diaspora—that is, in Brazil, in Mexico, in the United States (i.e., in California and Hawaii), in Nepal, and so on (Kaplan, 2000);
4. Popular opinion seems to support the idea that English is virtually the most important second language and perhaps should be legally

designated as the official second language of the polity (e.g., Baldauf and Kaplan, 2003; Kaplan, 2000).

5. Several of the languages used by people living permanently in Japan are also spoken in proximate polities; for example, in the two Koreas, in China, in Taiwan, in Hong Kong, in the Philippines, and so on.

In [Figure 1](#), an attempt is made to represent this situation visually, with the national language, of course, being Japanese (*kokugo*) lying at the center of the figure. Surrounding *Kokugo* are the several regional dialects: *Tokyo dialect* has become synonymous with “standard” Japanese; in addition, at least *Osaka dialect*, *Kyoto dialect*, *Tohoku dialect*, *Kyushu dialect* and *Okinawa dialect* must be mentioned. As these dialects are for the most part mutually intelligible with *kokugo*, they overlap with it. A second group of circles represents the foreign languages available to the Japanese public (largely through the education sector, but also through a large number of private schools—*juku*). Among these, English is the most widespread, and Chinese the second. These overlap slightly with *kokugo* because of the continued use of “Chinese Characters” as an element in the Japanese writing system (Kaiser, 2003) and the recent heavy borrowing from English (Daulton, 2004). The remaining choices are relatively less widely distributed—that is,

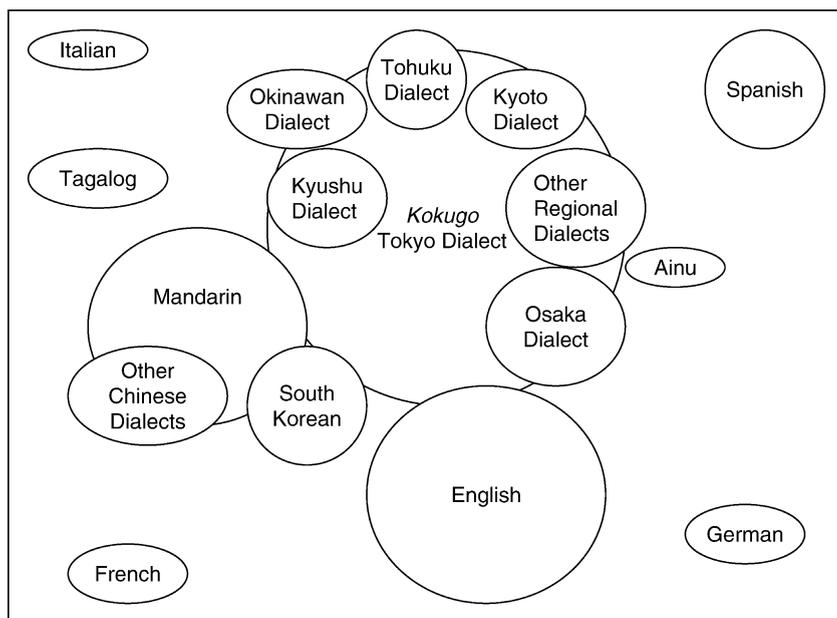

Figure 1 A schematic view of the language ecology of languages spoken in Japan.

French, German, Italian, Korean, Spanish, Tagalog, and so on. Ainu, which has virtually disappeared, and the Ryukyuan<sup>2</sup> languages deserve a special place as the only remaining vestigial indigenous languages.

It must be noted that the “foreign” languages—that is, Chinese, English, French, German, Italian, Korean, Spanish, and Tagalog—are spoken in other polities. Further, it must be noted that Ainu and Okinawan are not spoken anywhere else—not even in “Central Japan.” Additionally, it must be noted that the dialects of Japanese—that is, Kyoto dialect, Kyushu dialect, Okinawan dialect, Osaka dialect, and Tohoku dialect—exist only as varieties of standard Japanese in Japan. For many years, the intent of the government was to weaken those regional varieties in favor of “standard” Japanese. Finally, it must be noted that there is a Japanese diaspora and that additional varieties of Japanese have developed in various geographic settings in which the diaspora is represented—that is, in Brazil, in California, in Hawaii, and in Mexico. These external varieties of Japanese have accepted significant numbers of loan words from the dominant languages in the polities in which the diasporic contingent resides; that is, Portuguese in Brazil, Spanish in Mexico, English in California, and so on. Furthermore, there are generational changes in those communities, so that the Japanese spoken by the first (immigrating) population is likely to be substantially different from that spoken by the second (first foreign-born) generation and by the third generation, the latter constituting a population which may have lost spoken ability but may have retained some passive comprehension skills. This is a phenomenon not unique to the Japanese diaspora, but one that can be observed equally in the Chinese, Spanish, and other diaspora.

From this discussion it can be seen that, historically, Japan has engaged in two types of language planning: on the one hand, there has been a serious effort to move all Japanese speakers toward “standard” Japanese at the cost of Ainu, Okinawan (*Luchu*) and the regional dialects; on the other hand, there has been a serious effort to promote the use of English (and to a much lesser extent to promote other foreign languages), this effort having been almost entirely housed within the Ministry of Education. Neither of these efforts has given even lip service to the continuing nature of the complex language ecology of Japan; that is, efforts to assimilate the regional dialects into “standard”

---

<sup>2</sup> Central Okinawan, also called *Okinawan* or *Luchu*, has some 900,000 speakers. Other varieties include *Shuri*, *Naha*, *Torishima*, and *Kudaka*, spoken across southern Okinawa Island, the Kerama Islands, Kume-jima, Tonaki, the Aguna Islands, and islands east of Okinawa Island. These dialects are generally not mutually intelligible with Japanese or with other Ryukyuan languages (Shibatani, 2003). These varieties should not be confused with Okinawan dialect, a variety of Japanese spoken in Okinawa.

Japanese have not been entirely successful because the regional dialects persist, though gradually diminishing over time, and efforts to promulgate foreign languages—even English—have not been entirely successful, because Japanese commentators (see, e.g., Kaplan, 2000) admit they are in general not learned well. The lack of success can be significantly attributable to the fact that the policy has ignored the ecology and issues of identity (see, May, 2003 for a summary of the debate on this issue) in the population.

#### WORK IN PROGRESS AND FUTURE DIRECTIONS

While Japan can serve as a useful example, similar phenomena have been occurring across many other polities (see, e.g., Kaplan and Baldauf, 1997, p. 319—Malaysia; Kaplan and Baldauf, 2003, p. 138—Singapore). In a larger sense, Kaplan and Baldauf (1997, p. 269) have argued:

[T]he language planning activity must be perceived as implicating a wide range of languages and of modifications occurring simultaneously over the mix of languages in the environment, some of which may constitute the motivation for an attempt at planned change while some may be dragged along willy-nilly as an outcome of an attempt at planned change in a given sector. Language planning must recognise as well that language modification may not be susceptible to containment within a particular nation-state or other entity that may be isolated for the purposes of discussion but that in truth always remains embedded in a larger context. Rather, the language plan may cause a ripple effect in proximate communities, in nation-states, and across a region (or in other smaller or larger entities).

In this chapter, we have argued further that many language policy efforts in various polities are insufficient or mistaken because they ignore the reality of the language ecology, failing to recognize that whatever occurs in the context of a national/official language situation will in all probability have effects on all the other languages within a polity and across polities, without reference to political boundaries. As in the case of Japan, modifications to any part of the language ecology (e.g., the increasing demand for English has reduced the study of other European languages; the increasing time devoted to English has reduced time spent on the study of *Kokugo* and mathematics; English has also moved into the elementary school displacing other studies since the time available for teaching is fixed) within the polity will have unknown effects on all the other languages within the polity, as well as on those languages that extend beyond the borders of the polity.

More generally, there has been an increasing trend not only to examine and consider these matters of language planning and ecology at the macro or state level, but to look at issues at the micro level as well (Canagarajah, 2005).

There is a powerful metaphoric relationship between linguistic and biological ecology, even if equation is not entirely appropriate (May, 2003). Lewis Thomas, in *The Medusa and the Snail: More Notes of a Biology Watcher*, argues that:

When you are confronted by any complex social system, such as an urban center or a hamster, with things about it that you are dissatisfied with, and anxious to fix, you cannot just step in and set about fixing with much hope of helping. This realization is one of the sore discouragements of our century. You cannot meddle with one part of a complex system from the outside without the almost certain risk of setting off disastrous events that you hadn't counted on in other, remote parts. If you want to fix something you are first obliged to understand, in detail, the whole system (1979, p. 90).

Thomas, of course, is talking about *ecology* in the sense the term is used by biologists, but is a system of interacting languages less complex than a hamster or an urban center?

Aspiring language planners, take note.

THE ECOLOGY OF LANGUAGE LEARNING  
AND SOCIOCULTURAL THEORY

INTRODUCTION

Sociocultural theory (SCT) has received a significant level of prominence in educational circles and in language education over the past two decades or so (Lantolf and Appel, 1994; Moll, 1990). Historically speaking it is based directly on the work of Vygotsky and his colleagues or students (e.g., A.A. Leontiev, A.R. Luria, and P.Y. Galperin; for a recent overview see Kozulin, Gindis et al., 2003), but it has also (and increasingly) found connections with other work in various parts of the world, for example Jean Piaget, Maria Montessori, John Dewey, G.H. Mead, and Jerome Bruner.

Key features of Vygotsky's SCT are mediation, activity, the Zone of Proximal Development (ZPD) and the relationship between learning and development. Other areas that receive increasing attention are inner speech, scaffolding (although this term should be referenced to Bruner, e.g., Bruner and Sherwood, 1975), dynamic assessment, activity theory, agency and the use of tools and signs (this relates to mediation).

It must be noted (see also Kozulin, Gindis, Ageyev, and Miller, 2003; Valsiner and van der Veer, 2000; Wertsch, 1991) that Vygotsky left a hugely impressive body of work, but at the same time this body of work remained unfinished at the time of his early death at the age of 37. There are a number of aspects of the work that the researcher of the early twenty-first century needs to adapt, expand, interpret, and integrate with recent advances in education, linguistics, sociology, and psychology. Vygotsky's work is not a finished body of work that must be accepted as is and that should not be added to in any way. It was very much work in progress, cut short in an untimely manner as mentioned earlier. We therefore owe it to the memory of Vygotsky to place his unparalleled insights and achievements in the context of the current time and strengthen the original ideas with new but compatible sources of theory and practice. In this contribution I aim to do so by viewing SCT from within an ecological worldview. It is not my intention to systematically compare SCT and the ecology of language learning side by side to list the similarities and differences (see van Lier, 2004, Chapter 1, for a short

attempt at doing so). Rather, I will sketch some central ecological themes and place them within an SCT perspective.

### THEORETICAL DEVELOPMENTS: PERCEPTION AND ACTION

Central to an ecological approach to language learning are the processes of perceiving, and the insight that perception and action go together. The latter insight is largely credited to the work of James Gibson on the ecology of visual perception (1979). As Gibson explains (1979, p. 1), there are three basic modes of seeing:

1. Snapshot (an immobile perceiver)
2. Ambient (a perceiver looking around)
3. Ambulatory or panoramic (a perceiver moving around).

As J. Gibson explains, the richest information about the environment is obtained in the ambulatory or panoramic mode of perception:

The single, frozen field of view provides only impoverished information about the world. The visual system did not evolve for this. The evidence suggests that visual awareness is in fact panoramic and does in fact persist during long acts of locomotion (1979, p. 2).

Quite simply, you see more when you move around.

Forman (2005, p. 6) makes the interesting suggestion that Gibson's three modes of perception can be related to language learning in the following way: (i)—the snapshot view—relates to a focus on form, (ii)—the ambient view—relates to language use in the immediate context (the context of situation), and (iii)—the ambulatory view—relates to the context of culture. We might further note that the ambulatory or panoramic mode of perception occurs mostly in a project-based curriculum, where learners move around exploring, researching, sharing and jointly constructing particular projects. A traditional grammar-based and teacher-fronted class presumably mostly addresses the snapshot view of perception. We must however bear in mind that, even in such a perspective, learners might “move around” the subject matter mentally, and that language itself can construct its own panoramic space (through stories, examples, anecdotes, and so on). However, it seems unlikely that such a virtual panoramic world alone could sustain a rich multisensory experience of, in and with language. Ideally, the active body and all the senses, as well as social collaborative structures, are involved in the creation of learning experiences. (cf. “Handlungsorientierter Unterricht,”—action-based teaching, Finkbeiner, 2005b; Legutke, 1996).

E. Gibson and Pick (2000) distinguish between two theories of perception: the *enrichment* theory and the *differentiation* theory. They

explain that the enrichment theory is the traditional view in which sense data are seen as “fleeting fragmentary scraps of data signaled by the senses” (Gregory, 1991). It is the job of the cognitive apparatus, through schemata and information processing, to make sense of the data, to “enrich” it cognitively.

In contrast to enrichment theories, E. Gibson and Pick (2000) propose a differentiation theory, in which rich and varied environmental data are detected and used for increasingly varied responses and activities. Perceptual learning consists in learning to see, hear (etc.) different things, to combine perceptual data from various sources into patterned experiences, and to adapt one’s activities to the sensory data available. In real life, including in language learning, perception is multisensory. When we listen to a person speak in a foreign language, we do not just hear the words, we also see gestures, facial expressions, lip movements, and so on, and therefore the information potentially available comes from several sources of sense data at the same time.

In addition to the multisensory nature of language perception, we must tie perception to the realm of action. Analogous to the panoramic or ambulatory mode of seeing, language perception occurs in a context of activity and interactivity. In an ecological perspective, perception and action go together. The active learner hears and sees things most effectively and by virtue of engaging with the linguistic environment in which he or she moves, perceptual action, cognition and emotion are deeply connected, thus providing the conditions for emergent learning. Long before the appearance of J. Gibson’s ecological theory of visual perception Vygotsky already made this point in relation to his important concept of *interfunctionality*:

Throughout the child’s development . . . new systems constantly emerge within which perception acts. Within these systems, and only within these systems, perception acquires new characteristics that are not inherent to it outside that developmental system. (Vygotsky, 1987, p. 300).

The discussion so far suggests that perception is the foundation and the cornerstone of cognitive and social growth. We are not talking about perception as a receptive taking in of sensations, but as an active seeking out of information-for-action and action-for-information in the environment. In the following section I will argue that perception and action are also central to the development of self and identity.

#### MAJOR CONTRIBUTIONS: SELF AND IDENTITY

Vygotsky’s psychology is essentially a psychology of consciousness. Consciousness embodies all the higher mental functions that Vygotsky talks about. It is not a purely cognitive construct; rather, it is shaped by

and continuously enacted in sociocultural (inter)action and activity. *Consciousness* in Vygotsky's work is similar (perhaps identical) to current uses of the concept of *self*, and what Vygotsky calls *role* is close to what many social scientists and critical pedagogues call *identity*. I will now try to tease apart these concepts, realizing that they are used in a wide variety of different though overlapping meanings.

Let me give a practical example of identity, and from there move to the deeper notion of self as conceptualized from an ecological perspective. As an academic working in a small private graduate institution on the American West Coast, I have an identity vis-à-vis my students and colleagues as someone who speaks several languages, teaches such and such subject matter, has a good memory for references, aspires to be a knowledgeable, fair and engaging teacher, writes articles and books, and so on. Where does this identity come from, or more precisely, from what bits and pieces of beliefs, actions, aspirations, and perceptions is it being cobbled together on an ongoing basis? For it is not a fixed and finished thing, but it is enacted every day in my professional life, and it may be enhanced by what I do and say, or it may be eroded if I do or say things that seem to conflict with the identity. For example, if I suddenly start forgetting all the references that my students and colleagues ask me about (goodness knows, this may happen!), then that part of my identity will be changed or even erased. I might become the guy that forgets everything.

Note that there are two important issues here to take into account: first, my identity is a contextually bound mixture of the qualities and the beliefs that I have about myself, and the perceptions and beliefs of others in that community about me. As Finkbeiner (2005a) aptly puts it, there is not just "Cogito, ergo sum" (I think therefore I am), but also "Cogitat, ergo sum" (They think, therefore I am). My identity is not just how I see myself in this context, but also how others see me (and how I *think* they see me) in this context. Depending on how susceptible I am to others' opinions, my own or the others' views of me may predominate. In fact, we might see identity as a struggle between what I think of myself and what others think of me. Perhaps not always a struggle, but almost certainly always a job of matching and reconciling perceptions and beliefs that come from different directions. In Finkbeiner's model of self, actual, assumed and desired self-perceptions and other perceptions all influence how learners assess their own competence, the perceived difficulty of a task, and a number of aspects of their actual performance (Finkbeiner, 2005a, Chapter 5).

The particular identity that I illustrated earlier is not the only one. I also have identities at home, when I am visiting my relatives in my native town in the Netherlands, with friends, and so on. These identities all overlap, they do not have clear boundaries. However, they do all

form different constellations of beliefs, practices, histories, expectations, and aspirations. Underneath all these different contextual presentations and re-presentations of myself and receptions of me, however, there is an underlying constancy and continuity of who I am, and this deeper, more fundamental concept of who I am is the self.

The idea of a “self” (also called “soul,” or “spirit” in earlier days, and close to the notion of “mind” in some accounts) has a long history in philosophy (see Taylor, 1989; Valsiner and van der Veer, 2000), accompanied by a great deal of controversy. I will not go into that now, but focus on more recent conceptions of the self that take a sociocultural and ecological perspective.

#### WORK IN PROGRESS: SELF AND PERCEPTION

To perceive the world is to coperceive oneself.

*J. J. Gibson, 1979.*

The notion of self is not something we are born with ready-made and fully endowed (van Lier, 2004, p. 114). It is established in and through our interactions in the social and physical world first, and the symbolic world subsequently. However, many researchers of child development have found consistent evidence of the newborn baby’s remarkable propensity to engage effectively with the other (particularly the mother), as well as with the physical surroundings (E. Gibson, 1993; E. Gibson and Pick, 2000; Trevarthen, 1993).

Through perceptual action the child not only learns to perceive objects and events in the world, but also gains information about itself, its movements, its location in space, in sum, about “its self.” Action also provides information about the self as a causal agent, a source of control (E. Gibson, 1993, p. 35). Thus, the source of the self is perceptual, through seeing, hearing, touching, tasting, moving about, usually in combinations of different sensory information and communication and therefore, perceptual action is typically multisensory and multimodal.

As mentioned, there are a number of perspectives and theories about the notion of self, but in this chapter I will focus on social and semiotic interpretations of self. I note, as mentioned earlier, that in many accounts the notions of self and identity are conflated, but I will consider them as separate, though intimately connected constructs. I will argue that it is important to keep the constructs separate to account for both constancy (stability) and change.

In 1988 Ulric Neisser published a paper proposing five different kinds of self-knowledge: ecological, interpersonal, extended, private, and conceptual. The first two can be seen together as *the perceived self* (Neisser, 1993), that is they derive from perceiving the physical and the social

world and, as seen earlier, from coperceiving oneself simultaneously. The other three do not rely on perception but “on taking oneself as the object of thought” (1993, p. viii). Therefore, we might group them together as *the reflected (or reflecting) self*. The extended self draws on personal memories and builds anticipations; the private self is one’s awareness of one’s own individuality and uniqueness; and the conceptual self draws on all theories, beliefs and assumptions in which the person is embedded, and includes social roles and identities.

Neisser’s proposal of five kinds of self-knowledge has led to a number of publications and collections of studies exploring different aspects of the self (e.g., Neisser and Fivush, 1994; Neisser and Jopling, 1997). Central in a number of discussions is the extent to which the various facets of self are a direct result of the interactions of the person with the physical and social (and cultural-historical, one should add) environment, and to what extent mental representations, for example scripts and schemata of various sorts, increasingly influence the construction of self. Here, two different types of cognition might be put into conflict with one another, one the Gibsonian view that argues for direct, immediate perception of the world (and eschews perception via—mediated by—mental representations), and another that mental structures play an essential role in the way the world is perceived, understood and acted upon. Neisser argues however that these two views, though they have sometimes been placed in opposition, are in fact complementary, like two melodic themes weaving in and out in a musical composition (Neisser, 1992).

Moving back to language development, one can trace a sort of protocurriculum for language learning on the basis of the five selves (see van Lier, 2004, p. 118 for further details):

The five kinds of self-knowledge can be seen as strands of experience and agency, of linguistic processes and conceptual goals, and of socio-cultural and personal engagement. There is no sequence or set of stages implied here, although one might note that perception and action, not often highlighted as central in most language learning methods or theories, take center stage in this perspective. This is an important point to bear in mind when we draw up conclusions or implications for language teaching and learning. However, as a model for language development, Neisser's proposal remains incomplete in several respects, and I will just name two areas in which it needs amplification: the realm of emotions, and the future-oriented aspects of the self that Peirce traced in his semiotic system (for references to Peirce's collected papers and manuscripts, see Wiley, 1994).

Vygotsky already insisted that consciousness and thinking include the two essential contributing forces of intellect and affect (1987, p. 50). Affects, for Vygotsky, include motives, interests and inclinations, and these emotional processes together with thinking form a "dynamic meaningful system that constitutes a unity of *affective and intellectual processes*" (ibid., emphasis in the original). Thus, the work of connecting the self to the new languaculture (Agar, 1994) through identity formation includes interest, motivation, and agency, in short, the affective engagement of the learner through activity.

The second element not sufficiently addressed in Neisser's framework is the future-orientedness of self and identity. Predominant in Neisser's (and many other, e.g., G.H. Mead's) concept of self is its historicity, a focus on what the self "has become." Mead (1934) describes the self as an "I-me" relationship, an "I" of the present, dialoguing with the "me" of the past. The self therefore becomes essentially a historical self, in which the present "I" consults the past "me" selves. In studies of identity, this dominant perspective is manifested in a focus on autobiographies, remembered anecdotes, narrative, and so on.

In contrast to Mead's past-oriented view of self, C.S. Peirce's notion of self is future-oriented, an "I" of the present, and a "you" of the projected self in the immediate future. The "you" thus becomes the interpretant of the current "I." This is a very dynamic view, one that includes agency, motive and planned future action. In learning, this highlights the importance of planning one's activities, of charting a path or negotiating the strategic steps of a project (Heath, 2000).

Based on a comparative analysis of Mead's and Peirce's views of the self, Wiley (1994; see also Colapietro, 1989) proposes an integration of the two views, thus creating a present-past-future, I-me-you semiotic

triad (Wiley, 1994, p. 13). In terms of the role of identity in language teaching and learning, and in studies of identity in general, this has the advantage of encompassing a wide array of identity-constructing and maintaining processes, including both those that link the present I to the past, and those that link it to the future.

#### PROBLEMS, DIFFICULTIES, AND PROPOSALS: PERCEPTION AND SELF IN LANGUAGE LEARNING

Insofar as second language learning implies the formation of new patterns of identity, such identities are born of an interplay of perception and action, enacted in engagement with the new realities and perspectives the new “languaculture” (Agar, 1994; Lantolf, 2005) affords. Without learning to perceive the affordances of this new languaculture, the learner cannot learn to perceive his or her emerging new identities that need to take shape, and that themselves need to be in constant dialogue with the more stable social and semiotic self.

There is a delicate interplay between action/perception on the one hand, and the physical–social–cultural environment on the other. Analogous to the “I think–they think” perceptions of identity mentioned earlier, the surrounding host environment plays a major role in the options the learner has to develop healthy relations between self, identity and environment. For example, the host environment may be hostile or indifferent, thus impeding the formation of healthy new identities that can connect the self to the new environment and language. In such cases, the learning process is impaired, and the learner (or immigrant, as the case may be) may be unable to function fully in the new languaculture. The learners may withdraw into their native culture, form oppositional cultures (Gibson and Ogbu, 1991), or rebel and assert themselves in different ways (Peirce, 1995).

Closely related to the development of identity is the notion of *voice*, which refers to authentic ways of speaking (and writing). For a learner to speak authentically, he or she needs an authentic audience, that is an audience that not only grants the learner the right to speak, but that also listens and responds authentically (Kramsch, 1993; van Lier, 1996). Through developing a voice in the new languaculture the learner engages with it and has the opportunity to couple self and environment in productive ways by enacting new patterns of identity. In the following section I will suggest some pedagogical consequences of the views presented here.

## FUTURE DIRECTIONS: PEDAGOGICAL ACTION

The discussion thus far suggests an approach to language learning that is activity-based or action-based (cf. the German notion of “*Handlungsorientierter Unterricht*” mentioned earlier). This is nothing new, of course, since many pedagogues of old, from Jan Comenius to Maria Montessori to Lev Vygotsky to John Dewey (and many others) have emphasized the centrality of the active learner and an activity-driven pedagogy. However, it is always useful to advance new arguments to old ideas, and to connect them to concepts that are in current focus (such as communication, identity, agency, and context).

Language learning begins with learning to perceive while engaging in language-related activity. What we perceive are affordances, relationships of possibility between us and something in the environment (Gibson, 1979; Greeno, 1994; Neisser, 1987). Perceiving these affordances and acting upon them must be learned. Sometimes affordances may be directly and easily perceived, other times they may require much practice. Teachers, parents and caregivers direct the learner’s attention to affordances in the environment, and at the same time the learner also perceives certain affordances directly. Vygotsky already saw this interplay between immediate and mediated perception, and argued that words are the primary mediating tool in the gradual mastery of attention:

[T]he development of attention in the child from the very first days of his life finds itself in a complex environment consisting of two kinds of stimuli. On the one hand, things, objects, and phenomena attract his attention in proportion to the strength of their properties; on the other hand, corresponding stimuli-catalyzers, specifically words, direct his attention (1997, p. 167).

Activity (including specifically joint activity) guides the perception of affordances, and the affordances themselves guide (facilitate, direct, change) further activity. Activity involves motive, purpose, planning and emotional engagement, thus on the one hand combining affect and intellect in the ways that Vygotsky considered essential for the development of consciousness and the higher mental functions, and on the other hand including past–present–future orientations that, in the perspective of the semiotic self, lead to the establishment of healthy identities that can connect the self to the new languaculture.

One of the ways in which this action-oriented learning can be instigated is by creating proximal contexts (Bronfenbrenner, 1993) within which the learner’s agency is nurtured, guided and developed. A range of teaching strategies that promotes activity in proximal contexts is

known as *pedagogical scaffolding* (Gibbons, 2002; van Lier, 2004). Although scaffolding has been getting somewhat of a bad press recently (see, e.g., Ellis, 2003), and some alternative terms such as collaborative dialogue (Swain, 2000) or dialogic inquiry (Wells, 1999) have appeared, I still consider the construct worth preserving under its original meaning, as laid out in Bruner and Sherwood (1975). While it is undoubtedly the case that at times the notion of scaffolding has become watered down to refer to any kind of helping or instructional support, such functional erosion can occur with any term one cares to invent (e.g., with notions such as the Zone of Proximal Development, critical thinking, and etc.). As originally introduced by Bruner and Sherwood, scaffolding occurs during unpredictable, “nonrule-bound” moments in an otherwise well-structured, predictable game or activity (1975, p. 280; see also van Lier, 2004, p. 147). The interplay between the predictable and the unpredictable is crucial here. The learner can only develop agency within a structured environment, and must be assisted and stimulated (in a dialogical process that I have called handover/takeover) when new responses, behaviors or ventures occur that depart from the script in developmentally promising ways. This seems to me to be the essence of Vygotsky’s microgenesis, and also of the related anticipatory notion of prolepsis, that is, treating learners “*as if* they had abilities they do not yet possess (which is) a necessary condition of the development of those abilities” (Bakhurst, 1991, p. 67).

Thus, so long as we make sure not to lose sight of this essential process of scaffolding, the pedagogical structures (and proximal processes) within which it can be instigated can be sketched. I have proposed that pedagogical scaffolding, in this perspective, can be seen as unfolding on three planes:

1. A *macro* plane of planning projects or sequences of activities, including ritual and predictable elements that recur over time;
2. A *meso* plane, on which each activity is broken down into steps or actions;
3. A *micro* plane in which the processes of handover/takeover and prolepsis occur in moment-to-moment interaction among participants (van Lier, 2004).

In addition to this instructional perspective on scaffolding, we must also consider that scaffolding can occur not only in an expert-novice context, but also among equal peers, as in Donato’s study of *collective scaffolding* (1994) and Swain’s work on collaborative dialogue (2000). To this peer context I have proposed adding two further ones: working with a less capable other (learning by teaching), and learning by oneself, marshaling available resources (see also van Lier, 2004, p. 157; Vygotsky, 1987, p. 216). In sum, the notion of scaffolding affords a rich

array of proximal contexts and interactional opportunities, not all equal by any means, but all useful in different ways, and all capable of promoting a variety of learning opportunities.

### CONCLUSION

In this chapter I have traced connections between an ecology of language learning and SCT. While these two perspectives come from different traditions, they clearly share strong ideological, conceptual and pedagogical principles and practices. Studies of perception, semiotics, self and pedagogy from ecological sources such as Gibson, Peirce, Neisser, Bronfenbrenner, and others can provide a coherent way of framing pedagogical action that is both true to the spirit of Vygotsky's work and situated in today's complex world of the multimodal, multi-sensory and multicultural learner.

There are other areas of work in which SCT and ecology can illuminate problems and their solutions. A fruitful program of conceptual and empirical work remains ahead, and here I have merely traced some connections and possibilities.

## **Section 2**

### **Language Ecologies of Selected Countries and Regions**

## THE LANGUAGE ECOLOGY OF AUSTRALIA'S COMMUNITY LANGUAGES

### INTRODUCTION

Language ecology in a country of immigration such as Australia is the result of a complex interaction between:

1. the backgrounds and pre-migration experiences of a wide range of different groups and individuals;
2. the overarching effect of the dominant language of the receiving community (in this case English) on all of the incoming language users; and
3. the policies (either implicit or explicit) in place in the country of immigration towards the use of languages other than English (LOTEs).

This chapter considers under Early Developments the multi-lingual history of Australia and the changing attitudes towards linguistic diversity since European settlement. For the first 150 years or so there were few attempts to quantify or discuss in any depth the contribution of LOTEs to a national linguistic demography.

The later parts of the chapter outline the ways in which it has been possible to track the developing linguistic demography of Australia since the mid-1970s, both in terms of immigration intake and language maintenance efforts on the part of community language groups. Special attention will be paid to languages in the education systems.

### EARLY DEVELOPMENTS

Although English is the national language of Australia, and has been used as such since the arrival of the First Fleet from Britain in 1788, multi-culturalism and multi-lingualism have long been national realities, if not always viewed, acknowledged or promoted in the same ways. This chapter focuses on the languages imported at and after the time of European settlement.

#### *Before Federation*

The late eighteenth and nineteenth centuries were characterised first by an accepting but laissez faire attitude towards LOTEs, then by a still

tolerant but somewhat more restrictive approach, resulting largely from the advent of state compulsory education in the late nineteenth century, which mainstreamed monolingual education (Clyne, 1991). There was a vibrant multi-lingual press (Gilson and Zubrzycki, 1967), and the towns of the developing colonies saw the immigration of intellectuals and revolutionaries from a changing Europe. At the same time rural areas in South Australia, Victoria and Queensland were being settled by German-speaking Lutherans, along with speakers of Italian, Irish, Gaelic, Welsh, Danish, French and Polish. The gold rushes of the mid- to late nineteenth century brought with them a further influx of languages in the form of would-be miners from all over the world, including many from China. Bilingual education programs (largely 'private' initiatives) were introduced where there was sufficient demand, particularly among the German-speaking Lutheran enclaves, but also in languages such as French, Gaelic and Hebrew (Clyne, 1988).

### *After Federation*

The federation of colonies in 1901, which formed the nation of Australia, ushered in a period of aggressive monolingualism, accompanied by immigration policies severely restricting the settlement of non-white persons. These were to remain in place until the mid-1970s. English monolingualism was promoted both as a symbol of the British tradition and increasingly as a marker of Australia's national identity (Clyne, 1991), and strong assimilationist views replaced the less interventionist attitudes of the nineteenth century. Although some European migration continued to occur, the major source country was Britain, and the dominant language of the immigrants was English. The image of an essentially British–Australian people, recruited partly with government assistance and fitting into a prosperous and relatively egalitarian society, was the ideal on which continuing immigration policies were to be based.

### *The Post-War Immigration Boom*

In the wake of the Second World War, an extremely ambitious immigration policy was launched. The goals were twofold: to provide a bulwark against the perceived military threat from Australia's northern neighbours and to provide a workforce for a greatly expanding secondary industry (Clyne, 1991; Kipp, Clyne and Pauwels, 1995). The original plan was to import mainly Britons. When this did not prove possible, the government turned first to the refugee camps of Europe, and some 170,000 displaced persons were processed in Australia

between 1947 and 1954 (Lack and Templeton, 1995). Although the UK remained by far the largest single source of Australia's post-war immigrants until the 1970s, the net was cast ever more widely from the early 1950s to include economic migrants from all parts of Europe, including the Netherlands and Germany, but increasingly from Italy, Greece, Malta, Cyprus and Yugoslavia. In the late 1960s, when Southern and Eastern European sources began to dry up, agreements were signed with Syria and Turkey, and in the early 1970s assisted passages were extended to Lebanese. From the early to mid-1970s, with the final dismantlement of the White Australia Policy as well as the refugee crisis in Indo-China, the number of migrants from Asian sources increased dramatically, most recently through the business component of the immigration program.

Within a generation or two, the 'bold experiment' (Lack and Templeton, 1995) of the post-war years—an experiment devised to secure a white and British Australia—had led to an unarguably multicultural society. The population of Australia in 1947 was 7.5 million. By 1971 it had grown to 12.7 million, with immigration accounting for 58% of this increase. The foreign-born component had increased from 2.7% to 11.7% (Jordens, 1995). In 1947 almost 90% of the population was of British origin, and the rest were mainly European. Less than 1% were of Asian origin. In 2001 the population was 18,972,044, with some 28% born overseas and nearly 5% born in Asia (including south, south-east, north and north-east).

### *Policy Directions Since the Second World War*

The expectation of the immediate post-war years was that immigrants would assimilate as quickly as possible to monolingual Australia. There were laws in some states prohibiting bilingual education (Clyne, 1988) and severely restricting the amount of broadcasting in foreign languages. There was very little opportunity in the mainstream education system to acquire a language other than English, and those programmes that were available (most commonly French and Latin) were specifically conceptualised as foreign language programs. Immigrants of the time recall being verbally abused for using LOTEs in public places.

With the 1970s came a change of government, with the reformist Whitlam government elected in 1972 after 23 years of conservative rule. The White Australia Policy established at the time of Federation was finally dismantled, replaced by a points system that opened the way for immigrants from all parts of the world to apply for entry under a common set of conditions. Other enabling changes at the same time,

such as increased space on radio airwaves and the devolution of school governance to the local level, greatly enhanced the profile of community languages in Australia (as they were now called, in preference to foreign languages) (Clyne, 1991). An innovative telephone interpreter service (TIS) was introduced in 1973 to cater for the rapidly increasing diversity of languages in which services were needed, and Schools of Languages (after-hours government<sup>1</sup> language schools now<sup>2</sup> in Victoria, New South Wales, South Australia and the Northern Territory) provided a similarly flexible framework for the teaching of a wide range of languages to students who did not have access to the language of their choice in their day school. Other traditional providers of language education, such as community-run after-hours schools, now received government support. From the 1970s multi-lingual community and government radio and television stations have broadcast in a large number of community languages, and ethnic newspapers have proliferated. A (national) government-funded special broadcasting service (SBS) now operates alongside a number of community-run initiatives to provide radio and television programming (local and international) in a wide variety of languages.

Throughout this period of change in the 1970s a coalition of academic linguists, language teachers, ethnic, aboriginal and deaf groups had been lobbying for an explicit policy on languages for Australia, leading to the release of Australia's first official policy on languages in 1987. Lo Bianco (1987) stressed the complementarity of English and community languages and this was strongly based upon the social justice issues being foregrounded at the time (Clyne, 1997). By the late 1980s, however, the political climate had shifted to one of economic rationalism, and the next policy initiatives (Dawkins, 1991) reflected this shift, with the emphasis on the economic value of languages to the nation and the foregrounding of literacy (in English). The prioritising of a small number of Asian languages nationally (Rudd, 1994) also reflected this economic bias and continued the shift of emphasis away from Australian language communities. Even the local communities of the Asian languages included in the initiative (namely Mandarin, Japanese, Indonesian, Korean) were almost completely disregarded.

---

<sup>1</sup> These are Australian initiatives at the state level providing tuition, usually on a Saturday morning, in a wide range of languages at a number of centres.

<sup>2</sup> The Victorian school was established in the 1930s, providing the model for similar ventures in New South Wales and South Australia (1970s) and eventually the Northern Territory. Queensland may follow suit in the near future.

## MAJOR CONTRIBUTIONS AND ONGOING WORK

*Census Data and Language Use*

The year 1976 saw the introduction of a question on language in the 5-yearly Australian National Census, and much of the subsequent work that has been done on language ecology in Australia has been based at least partly on the longitudinal data obtainable in this way. The initial question (in 1976) targeted regular use of a language other than English, there was no question on language use in 1981, and since 1986 the question has been the same: 'Does this person speak a language other than English *in the home?* (my italics), and if so, which one? If more than one language is used, which is the most frequently used?'

According to the 2001 National Census, more than 200 languages were used in Australian homes at that time, and some 16% of the population spoke a language other than English in the home. This proportion rose to 29% and 27%, respectively, in Sydney and Melbourne, Australia's largest cities. Although, as already stated, the language question was somewhat different in 1976, [Table 1](#) illustrates in broad terms the shift of emphasis over nearly 30 years of large-scale data collection on language use.

Although the largest language communities in Australia in 2001 were still speakers of Italian and Greek, languages introduced by the economic migrants of the 1950s and 1960s, other languages of the immediate post-war years—such as German, Dutch, Latvian, Ukrainian, Lithuanian and Polish—have seen a substantial decline, accompanied by a significant increase in speakers of languages from the Middle East and Asia. The trends that are apparent for the entire population are even more apparent in the younger age brackets, as is demonstrated by [Table 2](#).

*Census Data and Language Shift*

The cross-tabulation of birthplace with language use has made it possible not only to establish the size of language communities but to estimate the differential language shift between language communities. For example, the shift rate of 11.4% for Italian ([Table 3](#)) indicates that, of all those born in Italy and permanently resident in Australia, 11.4% now report using only English in the home. Up until 1996 (see Problems and Future Directions), a similar calculation could be made for the second generation—of all those born in Australia with one or both parents born in Italy, 57.9% used only English at home in 1996.

The most retentive language communities in the 2001 Census are newly arrived groups from Asia, Africa and the Middle East, although Greek is still relatively well-maintained, and Macedonian even more so.

Table 1 Top ten community languages in Australia, 1976–2001 (Australian Bureau of Statistics)

| Language       | 1976    | Language       | 1986    | Language   | 1996    | Language           | 2001    |
|----------------|---------|----------------|---------|------------|---------|--------------------|---------|
| Italian        | 444,672 | Italian        | 415,765 | Italian    | 375,752 | Italian            | 353,606 |
| Greek          | 262,177 | Greek          | 277,472 | Greek      | 269,770 | Greek              | 263,718 |
| German         | 170,644 | Serbo-Croatian | 140,575 | Cantonese  | 202,270 | Cantonese          | 225,307 |
| Serbo-Croatian | 142,407 | Chinese        | 139,100 | Arabic     | 177,599 | Arabic             | 209,371 |
| French         | 64,851  | Arabic         | 119,187 | Vietnamese | 146,265 | Vietnamese         | 174,236 |
| Dutch          | 64,768  | German         | 111,276 | German     | 98,808  | Mandarin           | 139,288 |
| Polish         | 62,945  | Spanish        | 73,961  | Mandarin   | 91,911  | Spanish            | 93,595  |
| Arabic         | 51,284  | Polish         | 68,638  | Spanish    | 91,254  | Tagalog (Filipino) | 78,879  |
| Spanish        | 48,343  | Vietnamese     | 65,856  | Macedonian | 71,347  | German             | 76,444  |
| Maltese        | 45,922  | Dutch          | 62,181  | Tagalog    | 70,444  | Macedonian         | 71,994  |

Table 2 Use of selected languages by speakers 0–14 years old, Sydney and Melbourne, 2001 (Australian Bureau of Statistics)

| Language   | Melbourne | Sydney |
|------------|-----------|--------|
| Vietnamese | 15,395    | 15,242 |
| Greek      | 14,446    | 10,464 |
| Arabic     | 12,404    | 37,217 |
| Cantonese  | 10,241    | 21,199 |
| Italian    | 9,434     | 5,699  |
| Mandarin   | 6,540     | 11,320 |
| Spanish    | 3,349     | 6,128  |

Newer migrations from the Indian subcontinent and the Philippines are notable for their rapid shift, which may be at least partially explained by their pre-existing knowledge of English and the status of English in the homeland. A particularly high exogamy rate for the Philippines-born also contributes to the considerable shift in both generations for this group.

Factors affecting language use are complex and interwoven, but cultural distance, core value status of language (if possible combined with other core values, such as religion), community language group cohesion and geographical concentration of speakers have been noted as factors generally favourable to the maintenance of a community language in the Australian context. As already indicated, exogamy has been shown to facilitate shift, particularly for the succeeding generations. For a fuller discussion of factors related to language maintenance and shift in the Australian context, see Clyne, 1991, 2005; Clyne and Kipp, 1997; Kipp and Clyne, 2003; Kipp, Clyne and Pauwels, 1995; Smolicz, 1981; Smolicz, Secombe and Hunter, 2001).

### *Small-Scale Studies*

It should be noted that Census data, although extremely valuable, almost certainly under-estimates the number of people who regularly use a community language in Australia, given the focus of the question on the home domain. Even within the home domain, issues of frequency of use or complexity of language, as well as literacy levels, are not addressed. A number of researchers have supplemented Census data with smaller-scale studies. For example, Pauwels (1986) (for Dutch and German) and Bettoni and Rubino (1996) and Rubino

Table 3 Language shift in Australia, 2001 (first generation) and 1996 (first and second generation) (based on data from the Australian Bureau of Statistics)

| Birthplace                | % shift<br>(G1, 2001) | % shift<br>(G1 1996) | % shift<br>(G2 1996) |           |                  |

(2006) (for Italian) have examined the issues of standard/dialect and the ways in which situations of pre-existing diglossia between varieties may affect language maintenance efforts in the country of immigration. Pluricentricity, or differing national norms, has been addressed by Clyne and Kipp (1999) for Arabic (from Lebanon and Egypt), Spanish

(from Spain and Chile) and Chinese (Cantonese from Hong Kong and Mandarin from Taiwan). The latter study also addresses the issue of migration vintage, and finds that the attitudes and expectations of two vintages from the same place of migration and with the same language may be quite different. Explanatory factors here include prevailing policies regarding language in Australia, as well as the positioning of the immigrant language in the homeland, and these are also discussed by Borland (2006) (with relation to Maltese) and Søndergaard and Norrby (2006) (with relation to Danish). Country of origin, reason for migration, codification and status of the first language (L1) and the cohesion or otherwise of community language groups in Australia have been discussed in relation to language maintenance patterns by Clyne and Kipp (2006) for Macedonian, Somali and Filipino. Issues of gender have been explored by Pauwels (1995) and Winter and Pauwels (2000, 2006), the latter also looking specifically at friendship groups. Woods (2004) has devised a model for demonstrating the ways in which language and religious practice may interact for a number of immigrant groups. Fitzgerald and Debski (fc) have considered the potential of Internet technology for creating virtual communities in the diaspora. Two issues of the *International Journal of the Sociology of Language* (172 and 180) have been devoted to research on community languages in the Australian context, most of them small-scale studies.

From an international perspective, Fishman (2001) has applied his graded intergenerational disruption scale to both indigenous and community languages in Australia. Leitner (2004) describes and discusses the interaction between Australia's non-English language habitats (including indigenous as well as community languages) and the national language (Australian English).

### *Languages Other than English in Education*

The following section gives an overview of school language provisions in Australia, particularly as they relate to the language demography outlined earlier. For a fuller discussion of educational provision, (see Clyne and Fernandez, *Community Language Learning in Australia*, Volume 4). A special issue of the *International Journal of Bilingual Education and Bilingualism* (8(2, 3), 2005) has also been devoted to US and Australian perspectives of heritage/community language education, covering issues such as the status of LOTEs in schools (as well as the status of individual languages), the importance of home language maintenance, uptake of languages at senior secondary level, bilingual education, teacher training and language testing.

There are three main providers of language programmes for school-age students in Australia:

1. *Regular day schools.* Apart from state schools, there are Catholic schools and ‘independent’ schools, the latter largely affiliated with a Christian denomination other than the Roman Catholic Church, or with another religious or ethno-religious group (Islamic, Jewish, etc.). Non-government schools are attended by over one-third of Australian schoolchildren.
2. *Schools of Languages.* These are government schools, in New South Wales, Victoria, South Australia and the Northern Territory, which run out-of-hours classes (generally on a Saturday morning) for students who cannot study the language of their choice in their regular day school. They offer a wide range of languages, and are open to the introduction of new ones after a number of base criteria are met (demonstrated demand, availability of teachers and resources).
3. *After-hours ethnic schools.* These are run by communities or private individuals, many of which are subsidized by the federal and state governments and in some cases from overseas.

Up until the mid-1960s French was by far the most commonly taught modern language in the Australian education system, with German available as an additional language in a small number of schools and Italian and Russian also available in a very minor way (Clyne, Fernandez and Grey, 2004).

Lobbying from the mid-1960s by State modern language teachers associations, university departments and ethnic groups resulted in German and Italian, and in some States also Greek, being offered as alternatives to French, particularly in areas where these languages were widely used (Clyne, Fernandez and Grey, 2004). At about the same time, Asian languages—Indonesian and to a lesser extent Japanese and Mandarin—were introduced in some schools. Language offerings continued to be expanded through the comprehensive national policy on languages (Lo Bianco, 1987, see earlier). The number of languages examined as matriculation subjects has continued to rise since 1973 (when restrictive eligibility criteria were dropped), and the number of languages examinable stands currently at 43<sup>3</sup> (with two more under discussion), and with provision arrangement between the state authorities for low candidature languages to be examined nationally. Asian languages received a further boost via the NALSAS program (see earlier, Rudd, 1994), which continued to be funded until the end of 2002.

Primary schools have generally added languages to their curriculum relatively recently—in the 1970s in South Australia, the early 1980s in Victoria and even later elsewhere, although there had been individual initiatives and experimental programmes before this time.

---

<sup>3</sup> As of January 2006, five of these are under suspension due to low enrolments.

Table 4 sets out the relative ranking of languages by student numbers in Australian schools in 2001, and compares this with both their ranking in the top 20 languages nationally and in the top 20 languages in the 0–14 age group nationally.

It is clear that the strong position of Japanese in Australian schools over all educational sectors owes more to the position of Japan as the nation's biggest trading partner than it does to any significant community presence (28,317 speakers nationally). In contrast, Italian's position as a long-established, as well as the most widely spoken, community language in Australia is reflected in its strong position in schools, although it is better represented in the state and Catholic systems than in independent schools. This is largely due to a decision of Italian community organizations in the 1970s to devote their resources to teaching Italian in mainstream schools, especially primary schools as distinct from out-of-hour ethnic schools.

Apart from Italian, significant community languages in the Australian context are generally not well represented in the school sector. This is demonstrated most clearly by the cases of Arabic, Greek and Vietnamese. The positions of Arabic and Vietnamese are particularly weak when one considers the numbers of school age children who use these

Table 4 The top ten community languages in Australian schools (from Clyne, Fernandez and Grey, 2004, p. 7)

| Ranking/<br>Language     | No. of students | Ranking in top<br>20 languages<br>nationally | Ranking in<br>top 20 0–14<br>age group<br>nationally |
|--------------------------|-----------------|--|--|
| 1. Japanese              | 402,882         | <sup>a</sup>                                 | 17   |
| 2. Italian               | 394,770         | 1  | 5  |
| 3. Indonesian            | 310,363         | 20   | 13   |
| 4. French                | 247,001         | 18   | 20   |
| 5. German                | 158,076         | 9  | 15   |
| 6. Chinese<br>(Mandarin) | 111,464         | 6  | 6  |
| 7. Arabic                | 31,844          | 4  | 1  |
| 8. Greek                 | 28,188          | 2  | 4  |
| 9. Spanish               | 24,807          | 7  | 7  |
| 10. Vietnamese           | 22,428          | 5  | 2  |

<sup>a</sup>Not in top 20 languages nationally.

languages at home (see [Table 3](#)). For both Greek and Arabic, there has been less emphasis on mainstreaming the language, and more on language maintenance, leading to a larger presence in ethnic schools and the schools of languages. This also applies to Vietnamese, whose arrival in the late 1970s was too late to benefit from the push for community languages in mainstream schools during that period (Clyne, Fernandez and Grey, 2004).

The significant presence of at least two Chinese varieties in Australia (see [Table 1](#)) renders the issue of educational provision a vital one. Although the number of Mandarin speakers is significant, and growing, there are still more speakers of Cantonese in Australia than speakers of Mandarin. In spite of the importance of Cantonese as a language in Australia, and a lingua franca, trade language and media language in South-east Asia, it is one of the few community languages that are not examined, and barely taught, in Australia—fewer than 400 students nationally (Clyne, Fernandez and Grey, 2004; Kipp and Clyne, 1999). At present the only variety available for study at mainstream (and most ethnic) schools is Mandarin. This means that children of Cantonese-speaking backgrounds learning Chinese in school are in effect learning a second language.

The issue of L1 and L2 speakers and assessment procedures has become important, particularly with relation to Asian languages. Although there is a discourse that declares non-background learners to be disadvantaged in a mixed classroom, there is evidence that background speakers and their families are being discouraged from developing their language by the prospect of more stringent assessment measures (Clyne, 2005; Clyne and Kipp, 1999; Clyne, Fernandez, Chen and Summo-O'Connell, 1997). It is also clear that there is a long continuum of background—from passive competence in the home sphere in a vernacular variety to substantial secondary education experience in the standard or codified variety. Assessment becomes particularly relevant within a context of migration, which is often undertaken for the upward mobility of the children. The pluricentricity of Arabic, with a standard Arabic existing alongside a large number of national vernaculars (for example, Arabic from Egypt, Lebanon, Syria and Iraq), also has implications for education, with home background not necessarily equating with competence in the school target language. The issue has also arisen for Italian, where most immigrants spoke a dialect as their L1.

One must conclude that the educational offerings in Australia in terms of language are neither particularly consistent across state boundaries nor reflective of linguistic diversity nationally. There are also issues in terms of the treatment of background speakers, which are acting as disincentives for students to capitalise on or to develop their home language and for parents to encourage them to do so.

## PROBLEMS AND FUTURE DIRECTIONS

*Data Issues*

Given the consistent lack of a question on language first spoken in the national census (although this was included in a smaller-scale survey carried out in 1983), language shift in the first generation has had to be calculated as the proportion of persons born in a particular country who now use only English in the home. Up until 2001 it was possible to estimate language shift in the second generation as the proportion of persons born in Australia with one or both parents born in a particular country who now use only English at home. The modification of this question in 2001 to a binary choice of parent born in Australia/outside Australia means that it is no longer possible to trace intergenerational transmission in this way. The addition of an ancestry question is of limited practical value in this respect, due both to the subjectivity of the ancestry factor and the lack of generational specificity. Although the language question remains secure for the 2006 Census, allowing for a continuing longitudinal view of the first generation, the parental birth-place question has not been reinstated (despite lobbying from a variety of individuals and groups). This effectively precludes a similarly longitudinal view of the second generation.

*Developing Ecology*

In terms of national language ecology, it has been argued that the rich diversity of languages brought to Australia from all over the world is not always harnessed as it could be, and that language services and educational opportunities do not always keep pace with a changing linguistic demography (Clyne, Grey and Kipp, 2005). An examination of the migration trends over the last decade also reveals an overall downturn in numbers and an emphasis on English-speaking source countries (Kipp, *fc*), with implications for Australia's future linguistic profile.

However, institutions put in place during the halcyon days of language policy making and implementation are still making a significant contribution to multi-lingualism of Australia, and in many ways Australia's approach to its multi-lingualism and multi-culturalism since the 1970s has become a model for other countries to follow. In particular, open-ended systems such as the SBS (ethnic media), the TIS and the schools of languages are very effective in providing services to a wide and constantly changing range of language groups. The inclusion of a question on language use in the National Census still provides an excellent large-scale picture of linguistic demography as well as the basis for a growing amount of fascinating smaller-scale research.

## THE LANGUAGE ECOLOGY OF MARGINALISED ETHNO-LINGUISTIC GROUPS IN SOUTHERN AFRICA

### INTRODUCTION

Depending on how language ecology is viewed, Southern African, focusing specifically on Botswana, Namibia and South Africa, presents situations that suggest that language diversity is viewed as a problem (in Botswana, Lesotho and Swaziland—as they recognise one ethnic language) and a resource [in South Africa (Webb, 1995) and Namibia (Haacke and Elderkin, 1997)—as they recognise ethnic multilingualism]. The language ecology in Southern Africa started to change significantly even before the colonial period. More than ten centuries ago Southern Africa, now known for major Southern Bantu languages, was historically populated by autochthonous groups that have come to be known as the Khoisan or the Khoe and the San (Barnard, 1988). These groups are now marginalised (Chebanne, 2002; 2003) and exist as minorities in a region where they were the sole inhabitants. Southern Africa is now mainly inhabited by Bantu ethno-linguistic groups, and the Khoe and San only account for 0.025% of a regional population of 50 million people. It is therefore important to see how these indigenous groups feature and how language ecology is construed in the education policies of these Southern African states.

### EARLY DEVELOPMENTS

Historical and linguistic studies that have facilitated classification of the Khoe and San languages have been undertaken by Schapera (1930), Westphal (1971), Köhler (1981), Hitchcock (1982), Andersson and Janson (1997), as well as the notable work of Güldemann and Vossen (2000) and Vossen (1988). For a long time, linguistic interest in these indigenous communities did not match the anthropological commentaries on or description of these peoples' physical looks and cultural habits (Dorman, 1917). The genetic relationship of the Khoe and the San preoccupied most of the early studies on these people. It was in the early studies of Köhler (1981), based on historical sources, that a linguistic distinction between these languages was made. However, most of the modern understanding of the Khoe and San is credited to Schapera (1930), Westphal (1971), and Köhler (1981). The linguistic

and ethnographic distinction of Khoe and San is therefore not new and dates back to the early twentieth century (Barnard, 1992; Schultze, 1928). The term Khoesan (Khoisan) has, to non-linguists, taken a pejorative connotation often relegating these people to a subhuman class. It was only after Schapera (1930) that the term was rehabilitated as a label beyond racial and physical characterisation. The word Khoikhoi (a corruption of Khoekhoe), derived from Khoe with the meaning ‘person’ for most Khoekhoe speakers, has become a generally accepted term for the people and their languages. The word San is derived from Saon, which is a Khoekhoe word for ‘gatherers’. The classification that is retained here is mainly adapted from Snyman (1975), Traill (1986), Vossen (1988) and studies by Güldemann and Vossen (2000).

| Language family | Language   | Country                             |
|-----------------|--|-------------------------------------|
| Sandawe         | Sandawe  | Tanzania                            |
| Hadza           | Hadza  | Tanzania                            |
| Khoe-Kwadi      | Khoekhoe:<br>Nama and !Ora (Khoekhoegowab)<br>Kalahari Khoe Central (  Gana,  Gui, Naro)<br>Kalahari Khoe North (  Ani, Buga,  Ganda)<br><br>Kalahari Khoe East (Kua, Tshoa; Shua, Cirecire; Ganadi) | Namibia<br>Botswana<br>South Africa |
| San             | Southern San:<br>Taa~Tuu (!Xóõ; !Kui)<br>Northern San:<br>#Hoa; Ju (Jūn ’hoasi); !Xū   | Botswana<br>Namibia<br>South Africa |

A key to the use of click symbols is provided at the end of the chapter.

With the exception of a few pastoral communities (e.g. Nama) all these groups have maintained their autochthony. The term San, as used by some indigenous language activists, has become a general term for Khoesan (Khoisan). It is also worth noting that South Africa has lost almost all its indigenous Khoesan languages with the exception of recently resettled Khwedam and Nama communities from some parts of Namibia. These resettled communities are found in the Northern Cape Province where their ethnic languages are being integrated into community education.

#### MAJOR CONTRIBUTIONS

The encroachment by other groups into the land and the lives of indigenous communities has been very disruptive. The consequences have

been tragic, causing dispersal (voluntary or involuntary) as well as inappropriate socio-economic development policies that have adversely impacted on the lives of the Khoe and San communities. Cashdan (1979), for instance, reports significant settlement pattern changes and migrations which were in geographical and ethnic variance from accounts by Westphal (1971). Instances of majority languages annihilating minority languages are common in the whole region (Chebanne, 2003). The following subsections summarise some of the main factors in the language ecology of these groups. In view of important historical and social processes that continue to impact on the indigenous minorities and their languages, voices have started to be heard agitating for these communities' protection (Chebanne, 2002; Janson, 2000; Köhler, 1981; Smieja, 1996). Research on language and quality of life by Nyati-Ramahobo (2002), Webb (1995), and Sommer (1992) have demonstrated that linguistic marginalisation was a core factor in the educational process and development of an individual.

### *Factors in Educational Marginalisation*

While in Africa the pre-colonial language situation was by and large determined by consequences of social dynamics (inter-ethnic wars and assimilation), the colonial and post colonial language situations were based on language policies which favoured political consolidation over wide territories that contained different ethnic groups. Colonial language policies were not questioned. Except for Nama (Khoekhoegowab) in Namibia, all other Khoe and non-Khoe languages were not seriously considered for development and for introduction into education. They remained marginalised. Lack of policy to promote language diversity meant that there was no official obligation to match human rights in matters relating to minority linguistic and ethnic groups in the domain of language use. The perpetuation of this attitude has turned out to be assimilating, monopolistic and hegemonic to the detriment of indigenous speech communities. This is unfavourable to their development through the current education system.

### *Social and Linguistic Factors*

Indigenous language communities have faced and continue to face negative social attitudes from other ethnic groups due to their autochthony and their reliance on foraging for their existence. They are extremely poor and are prone to negative socio-economic relations and consequently discrimination even as they abandon their languages. Their small speech communities also leave them helpless under the imposing influence of other language groups. Except where there is outside activism by some non-governmental organisations, these speech

communities lack the capacity to promote their culture and language (Chebanne, 2003; Mphinyane, 2002). State languages policies, especially in Botswana have not taken indigenous languages into account. The situation is better in Namibia and South Africa where constitutional provision exists to cater for indigenous language development. However, only the majority indigenous languages benefit from such dispensations. The complex linguistic phenomenon of 'click', which characterises the Khoe and San languages, has given a false impression that these languages are difficult to learn and that they cannot be reduced to a practical orthography and literacy (Chebanne, 2003). The Khoe and San are therefore socially and linguistically segregated and this disadvantages them in education.

### *Socio-Economic Factors and Marginalisation*

Most indigenous people face socio-economic hardship and abject poverty (Cassidy, Good, Mazonde, and Rivers, 2001). A recent publication on the Khoe and San by Selolwane and Saugestad (2002) revealed that these communities experience powerlessness, marginalisation, disintegration, exploitation, pauperisation and deprivation, all of which result in social and economic exclusion from the main development programme of the State. They also have been rendered landless and have been profoundly traumatised by displacements from their ancestral lands. The fact that their culture is diminishing makes the situation worse. Even though San children go to school, most of them abandon education because of the negative attitudes towards them, as they are regarded as socially inferior. The linguistic trauma of the school languages that are forced on them from the first day at school, and at very tender age, when they are not capable of constructing concepts with any linguistic competence, marks them for life, and makes them school misfits. The societal integration model of the majority cultures, as well as the language policies, cause these ethnic groups to give up their own languages in favour of the majority language (Batibo, 1998). For the Khoe and San, the majority language is not negotiated but imposed at school.

The Khoe and San languages do not figure in language policies in countries in Southern Africa. They therefore remain undeveloped and have no role in promoting the lives of speakers. While combined regional strategies have hardly been envisaged, most of these indigenous communities live in cross-border situations, but unfortunately this does not provide them with any regional status. Due to their small numbers, the Khoe and the San are marginalised. This situation means that the languages of these communities do not feature in education (except for Nama in Namibia) or any social or developmental processes. In

recent years, however, the Working Group on Indigenous Minorities in Southern Africa (WIMSA, 2001) has championed efforts to provide Khoe and San languages with a common social reference, and the term San is now used to transcend ethnic and linguistic distinctions. The recommendation of the generic name San for all marginalised communities was made with their approval and with a view to obviate the historical prejudices associated with these indigenous communities in order to create a common basis for their linguistic and educational development.

#### WORK IN PROGRESS: PROBLEMS AND DIFFICULTIES

The indigenous people (the Khoe San) have found themselves at a social disadvantage because state policies work to eliminate their autochthony. As observed in various research (Cashdan, 2001; Chebanne, 2003; Saugestad, 2002), governments are very uncomfortable about the existence of indigenous people's culture. Regional development programmes, with the specific actions to develop, empower and promote, only result in the San becoming marginalised and the creation of negative attitudes to their identity, as well as to their forced assimilation. Some of the developmental actions and processes have caused traumatising change. Modernisation is problematic for them. Change of land use and tenure that started during colonialism impoverished them. The relocation practices and inappropriate development policies are alienating. The education systems that do not take into account their language use in the education of their children, discriminates them. All the so-called development efforts seem to be only under-developing them and, at most, dehumanising them. Even the efforts of activism from outside the region and the specific entitlement programmes of the States have generally experienced failures. Their free choice of development programmes and their right to their languages in education and indeed their unique ethno-cultural identity will be critical in their continued existence and identity (Selolwane and Saugestad, 2002; Visser, 1998). The following subsections report on specific situations from indigenous language communities. The metaphors used in the sub-headings attempt to illustrate their various problems and difficulties.

#### *!Xóõ: A Language Losing its Hold*

The !Xóõ live in small groups without much contact with each other. The language of these groups forms a dialect continuum. Research by Traill (1985) suggests that !Xóõ has two main varieties, namely

#Ama Oam (#Ama Pfam) (Western variety), and !Gwaa Oam (Eastern variety). The estimated number of speakers is 4,000. The speakers of !Xóǎ are scattered over a large area stretching from western Botswana to the eastern Namibian border (Andersson and Janson, 1997; Hasselbring, 2000), and are also found in some parts of the Northern Cape of South Africa. While the !Xóǎ language is fast losing its cultural and linguistic hold, it is still spoken in the cultural activities of family, and in interactions in the settlements and villages. All age groups use the language in most daily communication. However, school children are not allowed to use it even on school grounds, and this has adversely affected its vitality among the younger generation. Most !Xóǎ speakers are bilingual with another regional ethnic language. However, this bilingualism does not empower them as it is often the case that their bilingualism is with other marginalised languages which have no educational clout.

*Ju|'hoan and !Xǔ Cluster: Languages on Crutches*

Ju|'hoan, also commonly known as Kaukau in Botswana, is spoken mainly in north-western Botswana and Tsumkwe in Namibia. Ju|'hoan is considered the central variety of !Xǔ which stretches into southern Angola. Geographical and social conditions are the basis of the differences between the Namibia and Botswana varieties. From the research by Hitchcock and Holm (1993), surveys by Batibo (2002) and Hasselbring (2000), and the Botswana census statistics analysis by Chebanne and Nyati-Ramahobo (2003), the population of Ju|'hoan speakers can be estimated between 7,000 and 10,000 in Botswana and Namibia. The language is mostly used at the local village and family level, as well as at community meetings (with interpreters). There are many native speakers who can now read and write Ju|'hoan. This is mainly because of the efforts of the Nyae-Nyae Development Foundation and due to sustained linguistic, cultural research and missionary work. Ju|'hoan has been studied extensively by Jan Snyman (1975) who wrote a grammar guide and dictionary. Another dictionary was published by Dickens (1994), who also updated the orthography. This orthography is now official and used in literacy works in Namibia through the Nyae-Nyae Development Foundation at Tsumkwe. Teacher training will have to be a priority in its development to sustain community-based gains as this language relies on non-governmental assistance to provide crutches to develop its elementary education and literacy materials.

*#Hoan: A Language on its Death Bed*

The #Hoan falls under the Northern Khoe-San language sub-family, together with Ju|'hoan and !Xǔ. It is considered as the southern branch

of this sub-family, while the Ju|'hoan is the northern branch (Traill, 1973). #Hoan has no mutual intelligibility with the languages it is related to. Speakers of #Hoan are located in southern-eastern Botswana (in the Kweneng and Kgatleng Districts). The statistics derived from the Cassidy reports (Cassidy, Good, Mazonde, and Rivers, 2001) puts the total #Hoan-speaking population in the districts of Kgatleng and Kweneng at 1,500. The speakers are bilingual with Setswana and also with Shekgalagari, and there is a strong language shift towards these languages (Batibo, 2003; Hasselbring, 2000). Except for linguistic classification studies by Westphal (1971) and Traill (1973), there has never been any comprehensive linguistic analysis of #Hoan. There are no NGOs working among the #Hoan, and this means therefore that, unlike other San groups, it risks extinction without there being any record of the language. #Hoan is seriously marginalised and threatened with extinction.

*|Nu: An Observed Language Death*

The |Nu language which, according to Miller and Exter (personal communication, 2006) (two linguists working on the language) has less than ten speakers who claim knowledge of it. The speakers are found far apart in farms and settlements in Northern Cape Province of South Africa and do not readily interact to keep the language alive. Miller and Exter have also reported that two of the ten speakers are found in a remote settlement in southern Botswana. Whichever side of the border they find themselves, Afrikaans is their main language of communication. With only ten speakers averaging 60 years of age, |Nu is dying and the current research effort is for the purpose of recording the language rather than trying to revive it.

*The Khoekhoegowab: There is Safety in Numbers*

The languages that are listed under this label are the Nama, Damara, !Hemani and the !Ora, which are mainly Namibian languages. However, in Botswana they all identify themselves as the Nama (Batibo et al., 2003). Nama has long been codified and its orthography and a dictionary dating as far back as 1889 (Haacke, 2003) has inspired orthographies of other Khoesan languages. The large number of speakers and their pastoral lifestyle has been a major factor in the maintenance of this language. They do not face the general marginalisation of other Khoe and San languages. Research has progressed in this language. A new dictionary has been published by Haacke (2003), and there are also grammar guides in the language (Batibo et al., 2003). Nama is the only language from the Khoesan family that has

been adopted by Bantu ethnic groups, especially the Herero that fled German colonial repression in the early 1900 (Batibo, 2000). The Nama language has also been adopted by most Southern San language groups such as the Taa~Tuu language communities. Most of the Taa~Tuu speech communities have become extinct. The only remaining extant language from the Taa~Tuu languages sub-family is !Xóǀ. But in Namibia !Xóǀ communities seem to be shifting to Nama. There are various publications for primary schools and the general public. According to the Namibian language policy, the first three years of education (Grades 1–3) should be in mother tongue and Nama is benefiting from this dispensation.

*|Gui and ||Gana: Threats from Friends and Foes*

The |Gui and the ||Gana languages are mutually intelligible, although the speakers see themselves as different ethnic groups. According to Barnard (1988), there are at least 5,000 speakers of |Gui and ||Gana, of whom probably 2,000 are |Gui speakers and 3,000 are speakers of ||Gana. The |Gui consider ||Gana as ‘black Khoe’ because of their rather darkish skin and their adoption of the cultural ways of the non-Khoe Shekgalagari. The speakers are still relatively positive towards their own individual language. However, they have negative attitudes towards each other’s language. Despite the fact that they have lived alongside !Xóǀ speakers, there has been little language shift towards this language, although some lexical borrowings from !Xóǀ appear in |Gui. However, the speakers use Naro and Shekgalagari as a *lingua franca* (Chebanne, 2003), and this is a threat to the currency of their own language. Though |Gui and ||Gana are related and are mutually intelligible, the speakers use Shekgalagari for inter-ethnic communication. This is affecting the maintenance of the languages. As is the case with most of these languages, there is no orthography on which to base any literacy material. Only a few descriptive and socio-historical studies are available (Andersson and Janson, 1997). In Botswana the fact that |Gui and ||Gana are not developed means that there will be little motivation to include them in literacy programmes in schools, even in areas where speakers of the languages are in the majority.

*Naro: Nursed by Literacy Efforts*

The number of Naro speakers in Botswana (mainly in the Ghanzi District) is 6,000–8,000 (Hasselbring, 2000). Visser (1998) estimates the number at 10,000, while Andersson and Janson put the figure at 9,000 (6,000 in western Botswana and 2,000 in eastern Namibia). Naro has been studied by many researchers, mainly Barnard (1988), and Visser

(1998). The Naro spoken in the west near the Namibian border is substantially influenced by Nama. Historically, Naro belongs together with |Gui and ||Gana, but has evolved grammatically and phonologically, which suggests separate development over a long period of time. This means that its orthography and literacy development may not be of benefit to some of the other indigenous languages. For this reason, the Dutch Reformed Church has also focused and contributed its effort on the documentation of Naro by codifying it and developing its literacy materials. These materials include booklets on religious stories, extracts from the Bible (gospels and psalms), phonological studies, sociolinguistic discussions, and a revised Naro-English dictionary, published in 2001. These activities have nursed Naro and made it one of the most dynamic indigenous languages. Despite this fact, language policy makers in Botswana have not included Naro as a language to be taught in schools.

*The Eastern Kalahari Khoe: Self-Rejection and Abandonment*

Research by Andersson and Janson (1997) and Chebanne (2002) designate eastern Khoe as comprising the Khoe speech communities of Cirecire, Shua, Tshua, and Kua. Recent surveys (Hasselbring, 2000) and analysis of census data (Chebanne and Nyati-Ramahobo, 2003) indicate that there are about 10,000 speakers in the entire area of eastern Botswana area where the Eastern Kalahari Khoe are found. Some small numbers are found in north-western Zimbabwe. Ethnically and linguistically these communities are facing major socio-economic forces from their neighbours, and are now rejecting their language and massively adopting Setswana and Kalanga even in family communication situations. They have developed negative attitudes which will make any language development very difficult. This augurs badly for mother tongue education. Also, nothing will change as long as the Botswana government policy does not integrate ethnic language education.

*The Northern Western Kalahari Khoe: Khwedam (||Ani and Buga)  
Declared to Survive by the Penduka Declaration*

The ||Ani, Buga, and the |Ganda form the Western Kalahari Khoe. In studies by German linguists, they are grouped under the label Kxoe (but pronounced Khoe, as it is retained in this discussion). The north-western Khoe occupy mainly the Okavango Delta of Botswana and the Namibia Caprivi Strip. The ||Ani and the Buga are the main Khoe communities in the area. Their languages are mutually intelligible and are collectively called Khwedam. Population estimates (Cassidy, Good, Mazonde, and Rivers, 2001; Chebanne and Nyati-Ramahobo, 2003)

put the number of Khwedam speakers at around 15,000. While Khwedam has absorbed other Khoesan languages such as Ju/'hoan, it is itself assailed by the main languages of the Caprivi Strip and Okavango. The fact that it is only Khwedam speakers who are multi-lingual with knowledge of the languages spoken in the region means that they are dominated and marginalised linguistically in education. However, substantial descriptive studies by German linguists and anthropologists have been carried out on |Ani and Buga. Literacy efforts associated with the Penduka Declaration (WIMSA, 2001) will contribute to the standardisation of Khwedam and keep the languages alive. However, there is a need for careful planning in harmonising the two languages contributing to Khwedam and to demonstrate the benefits of the languages in terms of literacy development and linguistic studies. This is a viable school language. However, only Namibia has planned to include Khwedam in its elementary education system. The same unfortunately cannot be said about Botswana whose education policy insists on only two school languages, English and Setswana.

#### FUTURE DIRECTIONS

In the research by Janson (2000), the situation of indigenous minority languages is not in itself a problem, but that the lack of status afforded to the languages in the language policies of the states in Southern Africa is a threat to their survival. They have been disadvantaged historically and socio-economically and continue to be neglected. Socio-culturally, they have also suffered as the languages and cultures of these groups have met with negative attitudes from the majority groups who despise them and continue to exercise hegemonic, majority linguistic and cultural values which are life threatening to the existence of minorities such as the Khoe and San speech communities (Nyati-Ramahobo, 2002).

In the language ecology of Southern Africa, if the status quo is left to prevail, stronger languages will continue dominating the educational landscape, and marginalised languages, such as those of the Khoe and San groups will experience language death. This state of affairs has largely been encouraged by educational and social policies in the region which have recognised languages of wider communication for quick and cheaper educational provision (Webb, 1995). The negative impacts of modern social changes and developments (land use changes, sedentarisation, commercialisation, and the onset of mass education) leave these indigenous people in a situation of despair and serious marginalisation (Barnard, 1988). To guarantee the future of these languages several actions need to be envisaged: (1) political and constitutional provision needs to be put in place to ensure that the languages can be preserved through education and other positive social programmes in the

domain of culture; (2) mother tongue education and elementary and literacy efforts in these indigenous languages will ensure that the young learn them, get attached to them and develop learning skills in them; and (3) governments of the region, who have Khoesan communities, must ratify the ILO convention on indigenous and marginalised languages so that they have common strategies for a regional programme to safeguard them.

Finally, because these speech communities are small in number, another strategy for the future is linguistic codification, standardisation and harmonisation of their orthographies. Their grammatical descriptions and literacy materials should also be standardised to cut developmental costs and also avoid idiosyncrasies where writing systems of related languages are so different and unknown by other communities. This could assist in the conceptualisation of the relationships between the communities and could obviate the problems of the current situation that does not augur well for the future of these communities. The speakers themselves need to be put in the forefront of their own development through education. It is knowledge and the understanding of their being that will make them meaningfully engage with modernity and survive the processes of globalisation.

Key of Click Symbols

| Symbol | Phonetic description    | Example (Language names) |
|--------|-------------------------|--------------------------|
|        | Dental                  | Nu; Jun 'hoan            |
|        | Lateral (alveo-lateral) | Ani                      |

## THE LANGUAGE ECOLOGY OF SINGAPORE

### INTRODUCTION

The language ecology of Singapore has been shaped by educational policy, which in turn has been a response to a particularly complex language ecology. Concepts of indigeneity are meaningless in this city state, which has been a multicultural trading port since at least the fourteenth century (Gupta, 1994; Miksic, 2004), and whose present language make-up is the result of British colonialism and associated immigration in the nineteenth century (Gupta, 1994; Platt and Weber, 1980). The colonial government manipulated the delivery of education as a tool of ethnic management and social engineering, and this policy has been continued by the government of independent Singapore (Benjamin, 1976; Bloom, 1986; Chua, 1995; Gopinathan, Pakir, Ho and Saravanan (eds), 1998; Gupta, 1994; Murray, 1971; Pennycook, 1994; PuruShotam, 1998; Tan, Gopinathan and Ho (eds), 1997; Tremewan, 1994).

The extreme societal and individual multilingualism of the early twentieth century (Kuo, 1976; Murray, 1971; Platt and Weber, 1980) has given way to a linguistically more homogeneous society, in which the norm is for everyone to be able to use English and the official language associated with their officially defined race (either Malay, Mandarin Chinese or Tamil). Considerable language shift to English and Mandarin, mostly from non-official languages, has taken place. The entire population is now much more linguistically united than it was, through English, and the Chinese population is also more united than in the past, through English and Mandarin. Those born after independence are likely to know fewer languages, and are less likely to have some knowledge of a language associated with another ethnic group than are those born in the 50 years before independence.

Some aspects of the linguistic ecology of Singapore are shared with the whole Malay world (potentially extending as far as modern Thailand and modern Australia), and even more is shared with (modern) Malaysia and Brunei Darussalam, to which Singapore has close historical and geographical links. But Singapore has always been, to varying degrees, politically distinct from the wider region, and in this paper I will link it to the wider region only when that is unavoidable.

## DEVELOPMENTS

Modern Singapore is a city state, about 640 sq km in area, built across over 30 islands, many of them very small. It is located in calm waters at the southern tip of mainland Asia, where the monsoons of the South China Sea and the Indian Ocean meet, at a crucial point on the trade routes that link China, India, and Arabia. In this small corner of the Malay region, there are cities and the ruins of cities that are or were international trading posts, such as Sri Vijaya, Malacca, Banten, Banda Aceh, and Singapore (the classic history is Wheatley, 1961). Some of these cities (especially Sri Vijaya and Malacca) at their height controlled a wide region. Groups of foreign traders settled in the cities in districts that were set aside for them, and the cities were open to influence by the cultures and languages of India, Arabia, China and Europe. Miksic (2004) argues that although Singapore fits into this 'port of trade' category, it is possible that the foreigners in Singapore may have had more freedom to mix with the local population than was usually the case. In Singapore, we see what seems like rapid change in the twentieth century, but this should be placed in the context of two millenia (at least) of cosmopolitan trading ports in the immediate region, and 600 years in Singapore itself.

There are a number of early Chinese (quoted by Miksic, 2004; Wheatley, 1961) and European accounts of pre-colonial Singapore in the context of the wider region of the Malay peninsula and archipelago. The language which gave rise to most attention was Malay. De Houtman van Gouda (1603) supplied the first European treatment, and Marsden's became the classic account (1812a, b). Malay was the lingua franca of the entire region, and its adaptations as a lingua franca were a considerable source of fascination (especially Bowrey, 1701). The negotiation of multilingualism in the region was to be a central topic of much of the writing on the area.

In 1819, Stamford Raffles and William Farquhar made an agreement with Singapore's Malay rulers and began a formal connection with Britain that was responsible both for its later ethnolinguistic composition and for the prominence that English came to have. Because of the trade established under British control, many immigrants were attracted to Singapore, most of them from groups that had been associated with the region for centuries, and many coming to Singapore from other cosmopolitan cities in the region, especially Malacca. As a result, the population is still dominated by three groups, all of them internally diverse, which in Singapore are officially labelled<sup>1</sup> as follows:

---

<sup>1</sup> The terms used for ethnic groups, languages and dialects are always problematic. I have used the terms currently used in official Singapore documents and glossed them

- Chinese: people of Chinese ancestry, mostly from Southern regions of China now part of the People's Republic of China. Brought with them a range of varieties of Chinese, the largest of which are the closely related Hokkien (Amoy) and Teochew. Also large numbers of Cantonese speakers.
- Malay: people whose ancestors formed the majority population in the Malay Region. Most spoke dialects of Malay, which was also the lingua franca of the whole region, but there were substantial groups who spoke other related languages, especially Javanese and Boyanese.
- Indian: people of South Asian ancestry (modern Bangladesh, India, Pakistan and Sri Lanka). Most were from Southern India, a small majority being Tamil speakers. Other groups included Malayalees and Punjabis.

There are also a number of groups that are identified as resulting from a genetic and cultural mixture before the nineteenth century, some of which (especially those descended from Arab or Indian Muslim men) were partly absorbed into the Malay population, adopting Malay, and some of which developed contact varieties of Malay (Malacca Chitty, Straits Chinese) or Portuguese (Malacca Portuguese). Some nineteenth century migrants came from smaller groups, often via India, and some of these people (Arabs, Armenians, Europeans, Eurasians and Jews) were important in the development of English in Singapore (Gupta, 1994).

Singapore was briefly (1963–1965) a part of Malaysia, and became a fully independent country in 1965, since when the *People's Action Party* has been returned as the governing party at every election. The government of Singapore is active in social engineering, and has used language, especially as expressed in educational policy, as a major tool in shaping Singapore society (Bloom, 1986; Chua, 1995; Gopinathan, Pakir, Ho and Saravanan (eds), 1998; Gupta, 1994; PuruShotam, 1998; Tan, Gopinathan and Ho (eds), 1997; Tremewan, 1994).

The British colonial power was concerned to classify and manage the population of Singapore, which it did through its decennial censuses (from 1871) and annual reports on education (from 1856). Gazetteers of the region (such as Crawford, 1856; Hamilton, 1815) outlined the salient features of people and languages. Many of those

---

by alternatives. The variety called 'Mandarin Chinese' can also be called 'Modern Standard Chinese' and is also known as *guoyu* ('national language'), though this implies a political evaluation that would be regarded as inappropriate in modern Singapore. I use 'Malay' in its widest sense, to refer to all dialects, including the standard varieties of Malaysia, Brunei, Singapore and Indonesia. Singapore designates English, Malay, Mandarin and Tamil as its official languages. Malay is the 'national language', which is a ceremonial designation.

working on the sociolinguistic situation of Singapore (such as Bloom, 1986; Chua, 1995; Gupta, 1994; PuruShotam, 1998) are indebted to Benjamin (1976) for an insight on how multiculturalism is a powerful cultural and social institution in Singapore. Singapore's multiracialism is one in which the state is seen as being composed of the three main constituent 'races' (Malays, Chinese, Indians), with a 'stereotypical list of defining characteristics ascribed to it' (Benjamin 1976, p. 124): an individual's full Singaporean identity depends on membership of a 'race'. A citizen's official racial classification is allocated at birth, based on paternal ancestry: it is expressed as membership of a 'race' (such as 'Chinese') and a 'dialect group' (such as 'Hokkien'). Official race has consequences in allocation of housing, school, and, probably most crucially, in allocating languages studied at school (see below). The sharp official classifications mask the amount of blurring of boundaries that has happened, though most Singaporeans do have a sense of belonging to (at least) one of these subgroups, and will attribute cultural traits to this ancestry (such as appearance, how festivals are celebrated, the style of domestic cuisine, taste in clothes). The younger a person is the less likely they are to speak the language associated with their official dialect group, especially if it is one of the smaller varieties.

The categories used by the British have been persistent into the censuses and the thinking of modern Singapore (Gupta, 1994; Kuo, 1976; Lau, 1993; Leow, 2001; Saw, 1981; Tay, 1983). There are accurate records of officially classifiable race and ethnicity, but the data on language use and knowledge is patchy. It is important to remember that as a result of language shift and intermarriage, it cannot be assumed that a person can speak their official 'dialect group', let alone that it is their native or best language. Censuses do have information on literacy in the official languages, and, since 1980, they have had limited information on language of the home. The way these questions are asked ('what is the main language you speak to...?') underestimates the amount of domestic bilingualism. The Ministry of Education collects some information on home languages of children coming into Primary School, which are released annually. The census and Ministry figures taken together represent the most accurate data on current language ecology that there is, but they are based on self-report, and limited in scope. There has never been reliable information on native language patterns in Singapore: rather researchers use intelligent guesses triangulated with what is available.

In a place as complex as Singapore, the choice of code is highly rule-governed. The home is a place of freedom and knowledge. Members of a family know the repertoires of the individuals and choose a code that is appropriate to either include or exclude other family members. Mixing of codes is routine and expected in the family setting, as is the use

of colloquial varieties of the languages. In interactions with strangers, codes are selected on the basis of an assessment of the ethnic and social characteristics of the speaker, the interlocutor and the setting. The rules are complex and subtle. Many Singaporeans habitually use two or three or even four or more languages on a daily basis. This is an area of Singapore behaviour that has been little studied.

#### MAJOR CONTRIBUTIONS AND WORK IN PROGRESS: EDUCATION AND LANGUAGE SHIFT

The story of languages in Singapore is one of language shift motivated by pragmatism and linked to educational policy, which in turn is linked to the politics of race. Until the middle of the twentieth century, most people spoke the language their ancestors had brought to Singapore, and often several other languages as well. Bazaar Malay had been established for centuries as a lingua franca over a wide region, and most of those who lived in Singapore had to learn it. The largest single Chinese dialect, Hokkien, was known by most of the Chinese population, and even by many non-Chinese, and also functioned as a lingua franca, especially within the Chinese population.

The colonial education policy provided education in the medium of Malay for Malays, and gave some support to education in English for the rest of the population. Most education in the mediums of English and Chinese was fee-paying, with a great deal of charitable and church involvement. Much of the Chinese-medium education was provided by community associations of various types and was in the medium of the dialect associated with the association. By 1900, about half of all boys had some education, but the literacy rate in females was less than 20% (there are details of this history in Bloom, 1986; Gupta, 1994). Between 1900 and 1920, participation in education rose dramatically and was extended to more social and ethnic groups, and both genders. Recruitment in English-medium schools increased faster than in any other medium. The effects of the change can still be seen in census reports: the younger you are, the more likely you are to be literate, and the more likely it is that one of the languages in which you are literate is English.

Education is a major tool of social engineering and is also the principal route of social and economic advancement: the bulk of the population is enthusiastic about education and keen for their children to achieve. Tertiary education in the medium of English became available in Singapore from 1929 and was available in Chinese from 1958. By the 1950s, girls were as likely to go to school as boys, more children were enrolled in English-medium schools than in any other medium, and someone who was literate in Chinese was likely to know

Mandarin. There are two cornerstones of the racially based policy that has shaped modern Singapore:

- There are four official languages, but English is the language of government;
- There are three main ‘racial’ groups, each of which is recognised as distinct and whose culture is validated. Each group is associated with one of the official languages other than English (Malay, Mandarin Chinese, Tamil).

Education is highly controlled in Singapore, and it is usually not possible for Singaporean children to be privately educated in Singapore. In March 2004, the Ministry of Education announced that it would allow privately funded schools to be established that Singaporeans could attend, but these schools have not yet been developed: it is still best to think of private schools as being principally schools for foreigners. In 2003, education became compulsory for children over 6 years and below 15 years, but it was nearly half a century before it became compulsory.

Until the 1950s, education in the medium of English competed with education in the mediums of (Mandarin) Chinese, Tamil, and Malay. However, over the twentieth century, English-medium education became the most popular, and, from the 1950s onwards, all children were required to learn English, even if they were educated in some other medium. By the 1980s almost no children were educated in any other medium, and from 1987, all education under government control (which means all education for Singaporeans) was required to be principally or solely in the medium of English. Tertiary education in Chinese-medium had ended by 1978.

Since the 1950s it has been required that all children study a language in addition to English. Until 1981, children could choose any of the official languages, the main consequence of which was that, while most children studied the language congruent with their ancestry, some children of Chinese and Indian ancestry studied Malay. Malay, Mandarin, and Tamil are articulated by policy as being associated with the maintenance of culture and cohesiveness in the three racial groups, as providing ‘cultural ballast’. Confusingly, the ethnically representative language is often referred to as the ‘mother tongue:’ this does not imply anything about the child having grown up speaking the language, and Mandarin was rarely a native language until the 1970s. In 1979, the government began to strenuously promote Mandarin, encouraging its use by Chinese people in domains where formerly southern dialects were used. In line with this philosophy, the educational policy has been tightened up, so that (with rare exceptions) children are required to study the language associated with their official race. Virtually all Chinese children now study Chinese, and Malay is studied by few non-Malays.

The prescription of the language to be studied presents problems mainly to people of mixed ancestry, and to members of minority groups that have no affiliation to any of the three languages: the situation is especially fraught for the Indian community (PuruShotam, 1998; Schiffman, 2002). It also presents practical problems for Malays and Indians, because Malay and Tamil cannot be offered in as many schools as Chinese is. A further negative consequence is the emergence of many schools that are attended only by Chinese children. Regulations cap the proportion of minority children allowed in a school: there are no schools that are dominated by minority ethnic groups. Like minorities everywhere, the ethnic minorities of Singapore are more familiar with the majority than the majority are with them (Gupta, 1994).

The lack of opportunity for non-Chinese children in the school system to learn Mandarin, the language linked to the largest ethnic group, has often been commented on in the press, many members of minority groups feeling that they are linguistically excluded from some commercial and social activities dominated by Chinese-speakers. The policy has also resulted, in the 20 years of its operation, in a decrease in the knowledge of Malay by non-Malays, something that was commented on in the Singapore press (Straits Times, 18 February 2005) when Singapore sent help to victims of the Pacific tsunami of 26 December, 2004. Senior members of the government came to the realisation that non-Malays could not communicate with Indonesian authorities in Aceh (Sumatra is visible from Singapore), as the only younger Singaporeans to know Malay now are Malays. The decline in knowledge of cross-ethnic languages arises partly from the education policy having halted a move to Malay that had happened at the expense of Chinese and Indian languages, and partly because English is now available as a universal lingua franca in Singapore.

There has in recent years been some move to redress the ethnic separation that resulted from the prescription of the language to be studied. Within the state education system it has for some years been possible for only the most able students to study a third language formally, from the age of 12 years. Initially the languages offered were Malay, French, German and (for those who already knew Chinese) Japanese. Following a suggestion from the then Prime Minister, Goh Chok Tong in 2002, Chinese became available to academically able non-Chinese in this way from 2004. In response to continuing concerns expressed about the lack of cross-ethnic language knowledge, and in recognition of fact that '[t]he ability to speak a third language is useful, and will help young Singaporeans of all races operate effectively in the region and beyond', there has been an extension of this third language scheme, so that '[f]rom 2007, Sec[ondary] One students will be allowed to offer another M[other] T[ongue] L[anguage] in addition to

their native M[other] T[ongue] L[anguage], as long as they have the interest and inclination' (Ministry of Education, 2004). This means that students of all levels of ability may study Chinese or Malay, or, if there is demand, Tamil, as a third language, even if they do not have high marks in their primary school subjects. The extension of this scheme does make it possible in a limited way for children to learn cross-ethnic languages in school: it is not clear how many will take up the opportunity. Some schools also now have limited 'programmes for students to pick up conversational skills in either Malay language or Chinese language' (Ministry of Education, 2006).

The selection of English as the medium of education for all Singaporean children had an inevitability about it once Singapore broke away from Malaysia in 1965. English was already the dominant medium of education and it unified the racial groups. The negotiation of a potentially difficult racial situation is central to Singapore's politics. The People's Action Party has faced the difficult balancing act of being a small country with a clear Chinese majority enclosed by two large Malay nations (Gupta, 1994). The Chinese population of Singapore is the successor of a division between 'Chinese-educated' and 'English-educated' that is still to some extent linked to a class division, the 'English-educated' having been on average of higher social class, as are the English-focused of today (Kuo, 1976). The better educated you are, the better English you are likely to know, the richer you are likely to be, and the more likely you are to speak English to your parents. The move to universal English-medium education has broken this down to some extent, but there is still a perception that the Chinese of the 'HDB heartlands' or 'neighbourhoods' are Chinese-focused and perhaps chauvinistic. English is the bulwark against this, and Mandarin is the gesture towards this majority group.

The language policy has supplied a universal lingua franca, English, but has unfortunately produced some mono-ethnic (Chinese-only) schools and has reduced the opportunity to learn languages associated with racial groups other than one's own. The situation is a difficult one, and is under constant political discussion. The academic studies referenced here are a mixture of critiques of policy, and studies of how policies are being implemented.

Whenever a language is used as a medium of education, it is likely to become someone's best language. As education was extended to the whole population, the languages of education attracted speakers at the expense of other languages. It is not surprising that English should recruit people who prefer to speak it to any other language, and who speak it to their spouses and friends. And as a result of Mandarin being the variety of Chinese used in education, and because of the government's attacks on other Chinese dialects from 1979 onwards, the

ancestral dialects of Chinese came to be seen as low prestige. Parents who can speak both school languages are likely to use them to their children because they think it is an advantage for their children to be able to speak the languages of education before they go to school. Moreover, most parents of school-age children now can speak both school languages, so that most children now come to kindergarten already able to speak both school languages.

Patterns of intermarriage have long promoted language shift in the cosmopolitan cities of the Malay region. There is widespread intermarriage of different 'dialect groups' within the Chinese community, facilitated by the post-1960 breaking up of the ethnic residential enclaves and by the spread of education. Intermarriage across ethnic boundaries within the Muslim population (84% of whom were officially Malay in 2000) has been commonplace for centuries and through processes of assimilation Malay has also largely displaced related languages like Javanese and Boyanese. English-focused Chinese and Indian Singaporeans of high social class are also likely to intermarry, especially if they are Christian. The fact that only paternal ancestry is recorded makes it hard to estimate just what proportion of the population is mixed in some sense. The languages that benefit from intermarriage are English, Mandarin and Malay.

The use of Mandarin in education from the 1920s created a Chinese population that had a latent knowledge of Mandarin, but used it little. As a result of the drive to switch to Mandarin, over the 1980s oral use of Mandarin in social interaction rocketed, and it is now probably the single largest native language of children under 10 (Gupta, 1994).

Over the generations, the languages passed down to children have changed – Mandarin and English have gained many native and non-native speakers; Malay has gained native speakers but is less commonly learnt as a non-native language; and all other languages (especially Indian languages, languages closely related to Malay, and dialects of Chinese other than Mandarin) have lost native and (especially in the case of Hokkien) non-native speakers. New *lingua francas* have emerged. In the nineteenth century, the main *lingua franca* across racial lines was (Bazaar) Malay, while among the Chinese it was Hokkien. Now, English is the main *lingua franca*, with Mandarin an important *lingua franca* in the Chinese community. English, and even more so Mandarin, are relatively new in the linguistic ecology of Singapore.

English spread to the whole population over the course of the twentieth century. It is hard to find a Singaporean under 60 who cannot speak English, but in a snapshot of the present we see the past—the younger you are, and the higher your social status, the more likely you are to have English as a native language and to speak it in more

domains. However, by the late twentieth century, English was not *restricted* to the social elite, as it had been in earlier generations. The link of English with particular ethnic groups is relatively weak, though the minority groups (Malays and, especially, Indians) are more likely to use English in more domains. The rise of Mandarin has promoted unity among the Chinese population, but Mandarin has spread in some domains at the expense of English, giving rise to some dissatisfaction in other ethnic groups.

Those born roughly 1930–1960 were the most multilingual generation, especially the Chinese, who were typically able to speak English, two or three varieties of Chinese, and Bazaar Malay (Murray, 1971; Platt and Weber, 1980). Their parents and grandparents may have spoken just the ancestral language, plus one or two lingua francas (English, Hokkien, Malay), and their children probably speak just English and the official language of their race, possibly making them unable to converse with their own grandparents, which is the tragic consequence of rapid language shift.

#### FUTURE DIRECTIONS

Singapore continues to change. One of the most apparent recent changes is that a remarkably high proportion of those who live in modern Singapore are now non-citizens. There has been a considerable rise in the number of foreigners living in Singapore, from 10% of the population in 1970 and 14% in 1990 to 26% of the population in 2000, and the revelation of this in the 2000 census returns was the subject of extensive comment in the press.

In the reports on the 2000 census, information on most questions is recorded only for Singapore ‘residents’, who are defined as Singapore citizens plus foreigners with a permanent right to reside in Singapore. Apart from visitors, and children at boarding schools in Singapore, there are two groups of ‘non-resident’ foreigners living in Singapore—low-paid ‘work permit holders’ and high-paid ‘employment pass holders’. The overwhelming majority of ‘non-resident’ foreigners living in Singapore are work permit holders in low-paid manual and domestic jobs, most of them from Indonesia, South Asia, and the Philippines. There is legal and societal discrimination against them, although, according to the ILO the conditions under which they work compare favourably to conditions for similar workers elsewhere (Ofori, 1998). The status of the (diverse) higher prestige group of foreigners is closer to that of the Singaporean population, and as they are allowed to be accompanied by family members, some groups have established private schools following, for example, the British, American, Canadian, French, German, Japanese and Swiss curricula.

Foreigners who become Singapore residents still come predominantly from the three traditional sources: the Malay region, India and China. Some of the 'resident' population born outside Singapore are the children of citizens temporarily overseas, but the majority are likely to have, or to have been born with, another nationality. The world's population has become highly mobile, and especially the Chinese. 82% of Singapore 'residents' born outside Singapore are described as 'Chinese:' Singapore is attracting diasporic Chinese from all over the world. The effect on language ecology is likely to further strengthen the two strongest languages, English and Mandarin.

There are moral, hegemonic and ideological issues around the choice of medium of education and associated language shift, which will continue to be explored in relation to Singapore (Pennycook, 1994; Phillipson, 1992; Skutnabb-Kangas, 2000). Language shift in Singapore appears to have taken place rapidly in relatively happy circumstances, associated with the rise in participation in education, and in a context of increasing prosperity and social equity. It has also taken place in a region with a long tradition of openness to multiple cultures and languages: Singapore is the latest in a long line of cosmopolitan trading ports in the Malay Region, and pragmatism is what it is about. At the moment the dominant languages in Singapore are English and Mandarin, but, should the need arise, Singapore could just as rapidly adjust to a Chinese, Malay, or even Arabic, focus.

The identification of Mandarin Chinese, Malay and Tamil as 'Mother Tongues' reflects past and current patterns of migration, and shapes what is seen as 'Singaporean'. There is still an ambivalence towards English, which is a vital language in Singapore, but which is still seen within Singapore as in some senses 'foreign'. At official and unofficial levels, for example, it is not accepted that a large proportion of Singaporeans are native speakers of English: when the government discusses the use of 'native speakers of English' in education, they mean people from countries such as the UK, USA and Australia.

The central role of education in a directed policy of language shift is unusually clearly articulated in Singapore. It is hard to know what constitutes free choice of language and what constitutes coercion, and this is something that scholars need to continue to explore. Perhaps the distinction is meaningless. De Swaan (2001) shows how individuals make choices, defend their rights to choice, and shows how individuals will only respond to governmental decisions on language if they correspond with the actual communication value of a language. He celebrates 'complex language constellations' and bilingualism, and the fact that lingua francas have increased 'the coherence of the human species in its entirety' (p. 186). I personally endorse these views. I do not think our present is determined by our ancestral endowment: nearly all of

us must have ancestors who at one point or another were engaged in language shift, and each generation changes the culture of its parents. Language shift need not damage the individual or the society that engages in it. We are actors in a real world of functional language, and of change, and that is the context in which the language ecology of Singapore has taken place, and will continue to take place.

## LANGUAGE SURVIVAL AND LANGUAGE DEATH IN MULTILINGUAL ITALY

### INTRODUCTION

Although Italy's widespread multilingualism is usually attributed to complex historical circumstances, it is largely rooted in its geography (Savoia, 1997). Once the great barrier of the Alps has been surmounted, there are then the massive Apennines which run from the northwest to the south of the peninsula for nearly 1000 km, being as wide as 50–100 km in some parts. Tortuous routes and severe weather often impede communication, increasing the isolation of many communities. The result today is a country with a rich linguistic mosaic and cosmopolitan spirit, but one where rival local identities still flourish (De Mauro, 1996).

This paper provides an overview of the linguistic transformations in the Italian peninsula since political unification in 1861. It aims to present an account of language policies and their effects on language change, focusing on five dimensions: (1) the spread of Italian (Early Developments), (2) the impact of education (Major Contributions), (3) the debate on the language curriculum (Work in Progress), (4) the struggle for language maintenance (Problems and Difficulties) and (5) new sources of pressure for language change (Future Directions).

### EARLY DEVELOPMENTS

Modern Italian which emerged from Florentine has become a major European language despite originating from a country with widespread multilingualism. This unique situation results from the late unification of Italy (Devoto, 1978; Lepschy and Lepschy, 1977; Vincent, 1981), which also provides an explanation for some controversial decisions in the field of language policy and planning (Tosi, 2004). In the thirteenth century, when Florence failed to become the political leader of the Italian peninsula, Florentine, which had gained the status of a pan-Italian literary language, was kept alive for several centuries almost exclusively by poets and scholars (Migliorini and Griffith, 1984). Outside Tuscany, Florentine was rarely spoken: other states continued to speak their local vernaculars, with the exception of the Papal Court of Rome, where Florentine was used as a *lingua franca* by the

clergy in this cosmopolitan community. Language policy and language planning were first discussed in 1861, the year in which the peninsula was politically unified. Some scholars have estimated that, at that time, for 97.5% of the population Italian was a foreign language (De Mauro, 1963). More generous estimates (Castellani, 1982) indicate that, for some 10% of the population, Italian was neither a mother tongue nor a foreign language.

Two major actors in this debate were the novelist Alessandro Manzoni and the scholar Graziadio Isaia Ascoli. Manzoni enthusiastically supported the use of spoken Florentine as the national language. Ascoli (1870), a linguist in the modern sense, pointed out the impracticality of using the school system to teach a language that was alien to the vast majority of Italians, a prediction fully confirmed by what happened in the following 150 years.

After unification, the linguistic conservatism of communities isolated for several centuries was challenged by what was to become the most influential factor in the spread of the national language: internal migration. There were two major patterns: across regions, mainly from the rural south to the industrialised north; and the urbanisation that took place in all regions. If intra-regional mobility challenged the linguistic isolation of many dialect-speaking communities, inter-regional migration provided the major impulse for the promotion of Florentine, the *lingua franca* of Italy, to overcome the communication problems of the country's widespread linguistic diversity.

In terms of language evolution versus language death, two points need to be noted. First, with the increased contacts between different regional speech communities, monolingualism in the local language was gradually replaced by bilingualism in national Italian and the local community language. This suggests that language maintenance can last as long as bilingualism is stable and the L[ow] language can revitalize the H[igh] language. Second, the promotion of Italian as a national language challenged the status of all other languages of Italy, e.g. Venetian, Piedmontese, Neapolitan, Sicilian, etc., which had previously been spoken not only by peasants and urban working classes but also by aristocrats and scholars. These Italo-Romance languages, now demoted to the status of 'dialects', began their struggle for survival, mainly in rural situations and/or in domains little affected by the national integration. This set in motion a process of gradual extinction, which was accelerated by industrialisation and urbanisation, confining these regional languages to the private domain (Maiden and Parry, 1997).

#### MAJOR CONTRIBUTIONS

The adoption of Italian and the rejection of the local language were welcomed by the literary and educated circles—predominantly middle

class in extraction—as a transition from *parlare sporco* (wrong talk) to *parlare pulito* (right talk). Yet in the eyes of ordinary people and sometimes the upper classes—especially where the local dialect was strongly supported by historical traditions—the attempt to Italianise everyday spoken language was seen as affected and ostentatious. The linguist De Mauro recalls ironic comments common all over Italy ridiculing the new linguistic habits of the recently urbanised bourgeoisie (in Milanese: *parla come te manget* [‘speak as you eat’], and in Neapolitan *parla comma t’ha fatto mamma-te* [‘speak as your mother made you’]). Schools were another major factor in the spread of the national language. The commitment shown by the school authorities to imposing ‘good’ models of the literary language led to such radical stigmatisation of the local dialects (called ‘weeds’) that, for the first 100 years after unification, the mastery of the national language was simply used as an instrument of social selection. Privileged social groups who were already Italianised were admitted into higher education, but large sectors of the national community (the lower classes in the cities and the rural communities) struggled in the primary classroom with a mother tongue that was, in fact, a foreign language. At the turn of the century, researchers, doctors and teachers often believed that large sectors of the rural and working population were not competent in Italian because of a mental state of confusion produced by their poverty. This view, however, was not shared by all intellectuals and educators and the cultural historian Giuseppe Lombardo Radice, concerned about the limited access to schools, proposed an innovatory scheme significantly entitled ‘*Dal dialetto alla lingua*’. His aim was to raise the status of the dialects and to use the pupils’ native competence in these languages as a basis on which schools could develop the teaching of Italian. This project was short-lived, partly because of the quiet resistance of conservative teachers and partly because of the overt opposition of the new Fascist government. On a par with other expressions of local culture and regional diversity, the use of dialects was considered to be anti-Italian and, if they could not be stifled altogether, they were systematically ignored (De Mauro, 1963).

At that time language education focused primarily on patriotic literature, so as to teach young people to be good Italians and to speak the ‘correct’ language. Grammar lessons were common in the language curriculum but it was taught prescriptively, for pupils who were mainly selected on their mastery of the formal rules of the language.

The anti-fascist scholar and politician Antonio Gramsci was against both the old-fashioned normative approach to grammar teaching and the idea that schools could stand back and let language teach itself as proposed by the Education Minister Giovanni Gentile. Gramsci’s vision of ‘conservative schooling for radical politics’ (in Entwistle’s words, 1979) was expressed half a century before the widespread

concern of contemporary sociologists for the *laissez-faire* policies of conservative governments, who back liberalism to foster consent while maintaining the status quo. Gramsci's non-conformist view of language education becomes clearer when viewed in his long-term perspective: he felt that it was a priority for a national community to share the same language, because of the limited cultural and political value of dialects in modern society. Yet at the same time he knew that dialects provided young children with solid emotional and intellectual support. Gramsci's innovative ideas contained many of the conclusions modern linguists have reached when debating the ways in which to teach the standard language to speakers of dialects and non-standard varieties. However, his ideas could not stimulate a national debate until after the war, as he was imprisoned by the Fascists for life, though he was an elected member of parliament.

For some 15 or 20 years after the war, apart from Gramsci's lessons, language education stagnated. While language teaching remained hopelessly unimaginative, it was instrumental in maintaining a selective school system. For at least 15 years, language curricula did no more than teach eloquence to those who knew the language and failed to teach the language to those who did not. In the school year 1959–1960, only 20.4% of 13–14 year olds successfully completed a post-elementary level of education. Almost 31% of children of the same age were still in elementary schools or in the first two years of post-elementary schools or training courses, and just under 50% had left school without completing the five years of compulsory elementary education (De Mauro, 1963).

Things changed in the 1960s when attendance at lower secondary school (between the ages of 11–14) became compulsory and when this middle school became comprehensive with the reform '*scuola media unica*' in 1963. A debate on the national language, the treatment of dialects in school and the need to reform language courses was stimulated by the work of the linguist Tullio De Mauro. He enriched the debate on language education by confronting social class, linguistic diversity and school achievement. This was probably the most important attempt to revive Gramsci's recommendations in post-war Italy. Working from the historical division between language and dialect, De Mauro highlighted the fact that the lower classes sought to achieve competence in the national language and that schools and society had often combined to deny them such opportunities. He stressed that children are cut off from reality when schools attempt to eradicate dialects. Historically, these, as De Mauro showed, had been sources of linguistic creativity for individual speakers and of cultural resources for the national language. It was wrong, therefore, for a child's development, and in terms of language and cultural loyalty, to ignore the dialects and to

concentrate on teaching the national language on the norms and models of the literary tradition (De Mauro, 1963).

A passionate call not to undervalue or stifle the linguistic and cultural experiences of underprivileged communities was also made in a wonderful book written by primary school children in an isolated, socially deprived area: '... we should settle what "correct language" is. Languages are created by the poor, who then go on renewing them forever. The rich crystallise them in order to put anybody who speaks differently on the spot' (Scuola di Barbiana, 1967). Don Milani, the teacher-priest who inspired this work, entered the controversial domain of language education in a class-divided society, and his pupils succeeded in demonstrating how everyday language teaching in the classroom is often used to select rather than to educate the new generations (see also don Milani and Scuola di Barbiana, 1977).

#### WORK IN PROGRESS

With the reforms of the 1960s, large numbers of young people from rural and working-class backgrounds gained access to education. However, 'native competence' in Italian was idealistically assumed in all children and teachers were still only able to communicate with middle-class pupils who had already been Italianised by their parents. Gradually, many teachers came to feel that the new ministerial guidelines and old-fashioned classroom instruments were teaching neither good everyday use to all, nor academic mastery to a few. In the early 1970s, the association Group for Action and Research in Language Education (GISCEL) co-ordinated initiatives for school and university teachers who were interested in developing language education methods especially for social groups who had previously been excluded from schools. In a country that was finally changing from a rigid class system into a democratic society with new needs and different priorities, its manifesto '*Dieci Tesi per l'educazione linguistica democratica*' (Ten Theses for Democratic Language Education) (GISCEL, 1977) set out some innovative principles for the teaching of the national language. The main principles counteracted the traditional belief that language is uniform and speakers can easily conform to the most prestigious models. In schools, this manifesto helped to spread new projects based on the idea of freedom to criticise, rather than conform, which was seen as a prerequisite for both teachers and learners and was essential for the success of language education. Since teachers would need training in how to elicit language awareness in pupils, reservations were advanced that, once sanctioned by the central authorities, such projects could not always be carried through, as teachers had little or no training to help them implement the new ideas.

Another reason for teachers' dissatisfaction was that remodelling pupils' language for classroom purposes was not really teaching language. There was also a moral argument that probably influenced the profession in that training children in linguistic hypocrisy was an effective way of training them to all kinds of hypocrisy (Mengaldo, 1994). Gradually three main positions emerged within the profession. An élite of extremely motivated teachers became the protagonists in later debates and changes. They were backed by a large number of progressive, sensitive teachers who were prepared to support the innovations initiated by the first group, though perhaps not always to implement them. The majority of classroom teachers were, however, reluctant to adopt any change that might interfere with their comfortable though uninspiring routine. Numbers varied from North to South and between cities and rural areas. Many linguists spoke of a typically Italian situation where school change is initiated by the teaching profession rather than by the education authorities.

Because of a lack of ideas and/or political impotence, for years the school authorities pursued a compromise between (a) language education as training for social emancipation (under pressure of the changes proposed by the most innovative teachers) and (b) language education as a way of exercising the mind and learning to think systematically and logically, studying the notions and models of the old literary tradition. Berruto (1983) comments that this produced two types of language teaching in Italian schools: one based on the unquestioning acceptance of the old tradition, the other innovative. The latter was adopted by only a small élite of the profession, because the teachers had to organise their own re-training and to take charge of ordering equipment and materials and to take any measures necessary in the running of the school or classroom management.

The state's response to the new campaign which aimed to translate the comprehensive approach to equal opportunities into more effective classroom teaching is still contradictory and inconsistent today. No government has so far taken the responsibility for initiating a reform which would lead to a systematic definition of the role of language teaching in compulsory education, and above. All governments have allowed pilot projects, which means that the most innovative teachers have been able to make important changes in their schools. Today, there is still an obvious contradiction between the ruling that each *sperimentazione* ('pilot project') should last only 3 years and the obligation for approved projects to be of national relevance. In fact, the political responsibility for national reform was too big for any government, while no government wished to be accused of suppressing the best models developed by the most innovative and successful schools.

## PROBLEMS AND DIFFICULTIES

The recession of dialects has had as much to do with their stigmatisation in schools as with the rapid transformation of Italian society (Sobrero, 1997). Ignazio Buttitta (1899–1997), a poet who composed verses in his native vernacular which he himself recited to co-villagers, described the gradual extinction of Sicilian in his community with these words:

You may clap a people in irons,/strip it bare,/gag it,/it will still be free./You may take away its work,/its passport,/the bed where it sleeps,/the table where it eats:/it will still be rich./ A people, /becomes poor and enslaved /when they rob it of the language /passed down by its fathers, /and it is lost for ever./It becomes poor and enslaved/ when words no longer give birth to words/ and they eat each other out of house and home. I realise it now, /as I tune the guitar of my 'dialettu' / which each day loses another string. (Translation by Roger Griffin)

A stabilisation in the use of dialects, however, has been confirmed by two recent national surveys (Doxa, 1991, 1996), although with some regional variations (De Mauro, 1994). The comparison between the data of the two surveys suggested to Lepschy (2002) that if Italy was a monolingual country at the time of unification, today it is largely bilingual.

Bilingualism today is not, however, a condition of speakers of Italian 'dialects' but also of speakers of established 'minority languages'. They include historic minority languages and domestic minority languages. The pattern that has emerged for all minorities is bilingualism, though with a shift towards the expansion of Italian and the decline of minority languages, with the exception of historic minority languages. An important factor of decline is that these communities are often trilingual or quadrilingual rather than bilingual (Denison, 1972). Occitan developed from old Provençal and is still spoken in the western part of Piedmont. Franco-Provençal is mainly concentrated in the Aosta Valley, a region which acquired autonomous status in 1945. Standard French was the traditional language in schools and churches and Italian was usually reserved for official use and for higher education. This balance has changed, especially in the Aosta Valley, where political support for bilingualism and bilingual education is reinforcing French at the expense of the Franco-Provençal variety. The German-speaking communities are committed to the preservation of German even at the cost of maintaining, or spreading, its use in domains—like education and work—which may seriously hamper the use of the national language. In the Eastern Alps, Slovene communities, also fluent in

Friulian, are increasingly dominated by a third language (Italian) and occasionally by a fourth language (German). Croatian, Albanian and Greek communities in the eastern and southern regions have been influenced by contact with Italian and the distance between the communities has hindered the koineization of their dialects and the identification of common models for teaching purposes. The Catalan minority in Alghero differs in that linguistic contacts with the city of Barcelona have increased in recent years. Yet Catalan is under pressure from Italian, and from Sardinian, because the new generations seem less committed and sometimes have receptive competence only. Although Sardinian has long been recognised as a distinct language of the Italo-Romance family and is the most widely spoken minority language in Italy with a million and a half speakers, it has always been treated as a dialect, both in schools and society. Today, many young people are still competent in Sardinian, and use it more frequently than other Italians use their local dialects but this circumstance is not expected to provide secure support for long-term maintenance. Ladin—which is Raetro-Romance in origin—also continues to be exposed to the penetration of the national language, mainly because the dispersion of its communities makes language loyalty and community solidarity difficult. Friulian, also in the north-east, is the second largest domestic minority language, and its maintenance is due to its speakers' loyalty to the rural past (Francescato, 1993). However, the declining competence is due to poor literacy (when a hybrid koiné is taught with a supra-local orthography the language seems artificial) and the rapidly developing non-rural economy which encourages young people to adopt Italian at work.

#### FUTURE DIRECTIONS

In 1999, a law on minority language rights (482/1999) was introduced to implement a number of EU resolutions. The two major criteria for eligibility were: (1) identification of the minority language with a specific geographical area; and (2) the fact that the community had been settled there for a long time. The legislation, referring to these communities as 'historic linguistic minorities', declared the intent 'to safeguard their language and culture'. This legislation's main limit was immediately identified by linguists. It defined the same conditions and applied the same criteria to all listed minorities—but not to speakers of Italo-Romance dialects—without distinction between the quality and quantity of language maintenance activities and their impact on minority identities. Linguists have argued that the new law should have introduced a differential treatment for the rights of the most committed communities living in large areas (e.g. the German-speaking people in

South Tyrol), those with a historic loyalty to an old minority language (e.g. Friulian and Sardinian) and longstanding minorities which include few speakers without significant commitment to their linguistic heritage (e.g. Greek and Croatian).

In terms of language evolution versus language death, the destiny of minority languages is very different. Those which have survived because they are rooted in a rural background, with or without community isolation, will face a struggle not dissimilar from that of the Italo-Romance languages called 'dialects'. School education and literacy do not encourage efforts and resources invested in less marketable languages, although fluency may survive as a mark of individual identity and/or group commitment to local customs. Bilingual education in support of stable bilingualism is, therefore, a realistic prospect only for those minority communities (French, German and Slovene) who feel that their economic opportunities and mobility will be enhanced by high levels of fluency and literacy in two EU languages.

In Italy, most scholars agree over the diverse future of regional and local languages and dialects: in some cases stabilisation within compartmentalised domains, in some others gradual but steady extinction. There is no consensus, however, about the risk to Italian (but note Claude Hagège's accusation that Italians do not do enough to protect their own language, in *Corriere della Sera*, 6/5/2005). The dominance of English as a lingua franca is undoubtedly on the increase in Europe, but many cannot believe that it will lead to a worldwide crisis and that the major languages of Europe must soon face the prospect of 'language murder' (where the speakers of the dominant language overwhelm those of the recessive one) or one of 'language suicide' (where the speakers of the recessive language voluntarily give it up in the face of a language with greater prestige). Certainly the Italian linguistic mosaic, with its interplay of regional and local languages and dialects, provides a valuable testbed for discussions on the factors leading to language evolution or, vice versa, to language extinction in Europe (Terracini, 1957; Vincent, 2002).

Multilingualism within Italy has never been official, nor supported by a national policy. By contrast, multilingualism in Europe today is official, and Europe does not have, nor is it very likely to have, a policy of a common language, or a lingua franca, at least in the near future. But there are other considerations. Like Latin during the expansion of the Roman Empire, Florentine, once it became the official language of Italy, spread neither by promotion nor by coercion. Not even the nationalistic language policy introduced by the authoritarian fascist regime succeeded in displacing local dialects and minority languages and replacing them with the national language. Italian spread as soon as it found a consensus instrumental in consolidating its socio-economically hegemonic

position. This dilemma is very well known in sociolinguistics and Bernard Spolsky writing about endangered languages in 1972 put it very poignantly, when he said that to salvage a language and to salvage its speakers is not the same thing.

THE LANGUAGE ECOLOGY OF THE MIDDLE EAST:  
JORDAN AS A CASE STUDY

INTRODUCTION

The Middle East is geographically, historically, linguistically and culturally diverse in ways that do not permit simple generalisations about its language ecology. This is true of the Arabic-speaking part of this region where, in spite of shared cultural commonalities, a mosaic of historical, political and socio-economic conditions has created diverse language situations with their own special characteristics. Thus, although Arabic is shared as a common code by most people in the Arab world, the language largely exists in a diglossic situation consisting of the standard and many dialectal varieties, some of which are hardly intelligible to the speakers of other dialects (Ferguson, 1959, 1996). Even the standard, which is assumed to be constant by Arabs, does exhibit phonological and lexical variation from one dialect area to another. This variation is most apparent in the oral medium, but it also exists in writing, especially between the Mashreq (Eastern part of the Arab world) and the Maghreb (North Africa). These variations are due to, *mutatis mutandis*, historically deep contact situations between Arabic and other indigenous languages and, in more recent times, to pervasive contact with the major European languages, mainly English and French (Abu-Absi, 1997; Shaaban, 1997). Hybridised intermediate forms of Arabic, embodying features of the standard and the dialects, are generated in inter-dialectal and other situations (El-Hassan, 1977; Hary, 1996) through classicistion, colloqualisation and dialect koenisation/levelling (Ibrahim, 1989). In the Gulf region, owing to the influx of large numbers of workers from the Indian sub-continent in the last two or more decades, a pidgin form of Arabic is emerging for use in restricted spoken domains and, in some cases, in the press in cartoons and other humorous writings (Smart, 1990). To overcome these difficulties of scope, this chapter focuses on Jordan using it as an example to point to similar trends in the linguistic ecologies of other parts of the Arabic-speaking Middle East. The paper also concentrates on the dialectal varieties—with little reference to the standard except in the field of education—whose position as the official and dominant language of culture is assured in the ecologies of the Arab Middle East.

## EARLY DEVELOPMENTS

The language ecology of Jordan is shaped by its history as a recent state (Robins, 2004), the influx of populations into the country as a result of wars in the region, other less-intensive migrations from outside the Middle East, modernisation and urbanisation. Most of these factors are at play in other countries of the Arab Middle East, although their onset and trajectories may differ from place to place depending on contextual factors. As a country, Jordan was created in 1921 mainly out of what used to be called Bilad al-Sham (Greater Syria, including present Lebanon, Syria and historical Palestine). Its indigenous population were mainly nomadic and semi-nomadic Arabs, although before the creation of the country they were joined in the late nineteenth and early twentieth century by three waves of Circassian and Chechen immigrants from the North Caucasus, whose numbers at present stand in the region of 100,000 and 10,000 people, respectively. In addition, the population mix of the country includes 100,000 Gypsies, and a small community of Armenians of around 3,000–4,000 people whose ancestors arrived in the region after 1915. Each of these minorities has its own indigenous language, but Arabic in its various forms, standard and dialectal, is the dominant language in Jordan. This kind of linguistic mix is characteristic of most Arabic-speaking countries. In some cases—for example Algeria, Iraq, Lebanon, Oman and Sudan—the linguistic mix is more diverse and/or more politically volatile, leading to complex and more combustible language ecologies.

Politically and linguistically, Jordan has been fundamentally shaped by its relationship to Palestine and the Palestinians (Nasser, 2005). The 1948 war with the Jewish population in Palestine led to the dismemberment of the country. Jordan took control of what came to be known as the West Bank (of the River Jordan) in the same year and, in 1951, consolidated its hold on this territory by linking it in a political union with what used to be called Transjordan, now re-christened as the East Bank (of the River Jordan). As a result of the 1948 war, around 500,000 Palestinians took refuge in Jordan, mainly in the East Bank, becoming citizens of the newly configured state. This number grew considerably as another wave of Palestinians, some of them second-time refugees, moved from the West Bank to the East Bank following the 1967 Arab–Israeli war.

The first two massive population movements into Jordan brought two language ecologies into contact with each other. With its emblematic phonological variant [g] as a reflex of standard [q], East-Bank Jordanian Arabic is classified as a Bedouin variety. Before 1948, the East Bank lacked any urban centres of sufficient historical depth and socio-cultural influence to lay claim to an urban variety of its own.

Palestinian language ecology, by contrast, was characterised by three varieties: an urban variety (*madani*), a sedentary variety (*fallahi*) and a demographically smaller Bedouin variety. These varieties are stereotypically symbolised by the glottal stop [ʔ] and [k] and [g] as reflexes of standard [q]. Early research on these varieties consisted of describing their main linguistic features and commenting on their dialect geographies, with little information on contact phenomena among the dialects or on any emerging shift in the linguistic repertoire of the country (Cleveland, 1963, 1967). However, more recently, Sawaie (1994) has offered some cogent comments on language contact between the East-Bank Jordanian and the Palestinian dialects and the possible patterns of shift that might have existed between them during the first two decades of the new state (1950s and 1960s). Since Palestinians were more highly educated than East-Jordanians, and since, as a result, the Palestinians had a greater share of jobs in the institutions of the state, particularly education, it is likely that some (urban) Palestinian speech norms served as models for East-Jordanians. Amman, as a rapidly expanding capital, was most likely to have been moving in this direction because of the high concentration of Palestinians in the city. The fact that the state-building project in Jordan along East-Jordanian lines did not start in earnest until the 1970s (Massad, 2001), in spite of its roots in an earlier period (Nasser, 2005), gives credence to this situation, as we shall see later.

#### MAJOR CONTRIBUTIONS

In the early 1980s, dialect maintenance, dialect shift and language attitudes emerged as the main research topics of the language situation in Jordan. A similar research orientation existed for Egypt (Schmidt, 1974), Bahrain (Holes, 1987) and Tunis (Jabeur, 1987), confirming the influence of the Labovian paradigm on Arabic sociolinguistics. Work on the urban, sedentary and Bedouin varieties in Jordan sought to establish their prestige values relative to each other and, further, to use this information as the basis for explaining patterns of dialect maintenance and dialect shift (Abdel-Jawad, 1981; Al-Wer, 1991; Al-Khatib, 1988; Hussein and El-Ali, 1988; Hussein, 1980; Sawaie, 1986; Suleiman, 1985). The urban variety was judged to be highly valued because of the connotations of prestige and sophistication it traditionally enjoyed. In attitudinal studies, the urban variety was judged to be the most beautiful of the three dialectal varieties. But it was also judged to be the most effeminate variety, a view not unrelated to the position advocated by the famous fourteenth-century sociologist Ibn Khaldun (1958, Vol. I, p. 257), who placed Arabic firmly in its social milieu. Commenting on this urban feature, Sawaie notes that ‘men

using [?] ... in the regions where this variant is not spoken indigenously are generally viewed on the positive side as urban, and on the negative side as sissy, effeminate and 'city-slick' (1994, p. 82). As we shall see later, attitudes such as these are important in explaining the patterns of dialect maintenance and dialect shift in Jordan.

The Bedouin variety enjoys high prestige among East-Jordanians. It is regarded as the indigenous variety for this group. It is also rated as the most masculine of the three dialects and the closest to standard Arabic. Among Palestinians, Bedouin Arabic is traditionally not highly rated—a view consistent with the position expressed by Ibn Khaldun over six centuries ago—but this view changed dramatically in the 1970s when the state embarked on reconstituting its state-building project along East-Jordanian lines. It is, however, important to point out that the term Bedouin designates not so much a living environmental ecology in Jordan as it does a set of social structures that hark back to such an ecology (Layne, 1994; Shryock, 1997).

The sedentary variety is heavily stigmatised. In attitudinal studies in Jordan, it is judged as the least prestigious and least beautiful variety. This assessment of the variety replicates the negative attitudes towards it in its indigenous Palestinian setting, although these attitudes are less acute in the latter context (Shorrab, 1981). In addition, this assessment seems to be linked to deeply held negative attitudes towards the fallahin (sedentary population/peasants/agriculturalists) in Arab culture. Ibn Khaldun (1958, p. 289) talks about the meekness of those who work in agriculture (filaha), and quotes Prophet Muhammad who is reputed to have said that the 'ploughshare never entered anyone's house save accompanied by humbleness'. This negative attitude is found in Arabic literature, in which agriculture was considered as 'one of the lowliest occupations, suitable only for the meanest type of human being' (Badawi, 1985, p. 28). Thus it is nature rather than the farmer (fallah), and the garden rather than the gardener, who were the subject of poetic compositions in Arabic literature.

These perceptions of the three dialects help explain the patterns of dialect maintenance and dialect shift that have emerged in Jordan in the past few decades (Abdel-Jawad, 1986). Broadly speaking, speakers of the sedentary variety have been squeezed from both sides. Men tend to shift to the Bedouin variety because of its masculinity connotations, while women tend to shift to the urban variety for the opposite reason. This is particularly true of young male and female speakers, who, mainly through education, have social networks that encourage these shift patterns. Older speakers tend not to conform to these two patterns, but they may code-switch to standard-like features in inter-dialectal or inter-generational contexts to suppress the low prestige of their indigenous dialect. It is, however, important to stress that the dialect shifts

described here principally affect Palestinian sedentary [k] which is replaced by Bedouin [g] and urban [ʔ] in male and female speech, respectively. Other feature shifts—for example the replacement of sedentary [θ] by urban [t] or [s] or the replacement of sedentary [ð] by urban [d] or [z]—lag behind. The same may also apply to aspects of vowel quality in the speech of sedentary men when shifting to the Bedouin variety. We may ascribe the advanced nature of the shift from sedentary [k] to Bedouin [g] to the stereotypically emblematic nature of these two variants.

The shift from urban to Bedouin and vice versa reflects the perceptions of these varieties in the Jordanian socio-cultural sphere. In inter-dialectal situations involving Bedouin speakers, urban men tend to switch to the Bedouin variety by replacing their emblematic [ʔ] with [g]. This switch has been ascribed to the masculinity connotations of [g]. Although this may be true, masculinity cannot completely explain this switch, not least because indigenous [ʔ] speakers switch back to their native variety in neutral situations. In conversations at home with other [ʔ] speakers or when abroad, urban men stick to their urban variety. Furthermore, the shift to the Bedouin variety does not extend to other less-emblematic features, for example replacing urban [t] and [s] as reflexes of standard [θ] by Bedouin [θ], in spite of the correspondence between the two instances of [θ] and the high prestige of the standard. In fact, Bedouin male speakers have been found to use some low-salience urban features, for example [t] for their native [θ], which is a switch in the opposite direction. We also know that, in conversation with speakers of other varieties, for example Egyptian Arabic, Bedouin speakers do switch from [g] to [ʔ], although this switch may not be universally practised (Abu-Melhim, 1991). These examples strongly suggest that the masculinity of [g] as an indexical symbol of the Bedouin variety is restricted to its own political geography and is valid in language use, for urban males, mainly when inter-dialectal contact occurs within the linguistic ecology of Jordan.

The opposite shift from Bedouin [g] to urban [ʔ] characterises women's speech. This is ascribed to the beauty, softness and effeminateness perceptions of this variety. The traditionally high prestige value of this variety regionally is another factor behind this shift. However, we must not assume that this shift is complete. In cities or towns where no or few [ʔ] speakers live—for example Karak and Ma'an in the south and or Ajloun in the north—the shift to the urban variety is weak or non-existent. In addition, the further a locality is from Amman and the other big urban centres, the weaker is the shift to the urban variety. Even in the big urban centres the shift is not uniform across the repertoire of variants that distinguish the urban from the Bedouin variety. Thus, the shift from Bedouin [θ] to urban [t] or [s], as reflexes of

standard [θ], tends to lag behind the shift from [g] to [ʔ]. The same is true for the shift from Bedouin [ð] to urban [d] or [z] as reflexes of standard [ð]. In addition, the shift from Bedouin [g] to urban [ʔ] may be stunted in localities and under social conditions where one may expect it to occur, owing to the dense social networks in the speech community in question and the way speakers position themselves in relation to their community in affiliative terms, at the individual and collective level. Age and inter-generational factors are also relevant in establishing the parameters that operate in this shift.

This description of language attitudes and dialect shift identifies sex/gender as a key factor in shaping the language ecology of Jordan, with men and women tending to go their separate ways. On the one hand, Bedouin men stick to their variety, with sedentary and urban men shifting or code-switching to it, subject to the caveats given earlier. On the other hand, urban women stick to their variety, with sedentary and Bedouin women shifting or switching to it, subject to the caveats mentioned earlier. A distinction is made here between dialect shift (for sedentary speakers) and dialect switch (for urban speakers) to signal the rootedness of the former phenomenon and the provisional character of the latter in the linguistic behaviour of the two groups. The sedentary variety in Jordan is losing speakers; it is squeezed on the female side by the urban variety and on the male side by the Bedouin variety. Should these shift patterns persist, as I think they will, it is likely that the sedentary variety will lose its speakers in Jordan over the next 2–3 generations. This in turn would raise the question of the very identity of the Bedouin variety. Would it continue to be seen as Bedouin? Or would it take on a new character in which Bedouinness would be a relic of the past?

These patterns of dialect shift make the Bedouin variety the prestige code for men and the urban variety the prestige norm for women. However, the rate of shift to the urban variety among women is more advanced than the corresponding shift to the Bedouin variety for men. It may be that this dialect shift has been in progress for a longer period, augmented by the high esteem of the urban variety extra-territorially in the region at large.

#### WORK IN PROGRESS: PROBLEMS AND DIFFICULTIES

The sex-based account does not provide a full explanation of the factors that led to the switch or shift from the urban and sedentary dialects to the Bedouin variety or for the maintenance of this variety. First, this account does not explain the fact that the shift or switch to [g] started to make itself felt following the 1970/1 clashes between the Jordanian

armed forces and the Palestinian guerrilla movement, which led to the defeat of the latter and their subsequent eviction from the country. This event had a cataclysmic effect on Palestinian East-Jordanian relations, ushered in an accelerated phase of state building on East-Jordanian lines, and, as a result, marginalised the Palestinians politically, culturally and economically in terms of government employment (Abu-Odeh, 1999). Second, the sex-based account does not explain the historical coincidence between the shift to [g] and the use of the ethno-linguistic label *beljiki* (lit. Belgian) to designate the Palestinians as the out-group in Jordan. Third, the sex-based explanation does not explain why on the Syrian side of the Syrian–Jordanian border [g] speakers shift to [ʔ] in contact situations with urban speakers to escape the stigma associated with [g]. This discrepancy suggests that the masculinity connotations of [g] and their impact on dialect shift are context-dependent and that other factors may be involved in motivating this shift. And, finally, the sex-based explanation does not capture the perception among speakers in Jordan that [g] is judged to be the Jordanian variant, and that sedentary [k] is judged to be a Palestinian variant. Although [ʔ] is a Palestinian feature, it is not exclusively associated with the Palestinians, perhaps because it has a strong regional showing extra-territorially in Egypt, Lebanon and Syria. For these reasons, the sex-based explanation must be supplemented by other considerations.

Recent research strongly suggests that one of the most important factors in understanding the dialect shift/switch to [g] is state-building and the drive to achieve this on East-Jordanian lines (Massad, 2001; Suleiman, 1993, 1999, 2004). On the linguistic front, this state-building project has given currency to [g] as the emblematic linguistic symbol of Jordanian national identity through its association with the security-related institutions of the state (armed forces, police and intelligence services) and through popular culture (music, drama, soap operas). In the charged political and security atmosphere of the 1970s, continuing into the 1980s, shifting to [g] was a sign of belonging, of declaring one's identity as a loyal Jordanian citizen. Palestinians, particularly those of sedentary background, adopted the Bedouin variant in a double move to suppress their identity and to blend into the emerging political sphere. The fact that sedentary Arabic is a stigmatised variety accelerated the process of dialect shift that had already begun in its indigenous setting, although this process was in the direction of urban [ʔ] not Bedouin [g] (Cadora, 1992).

Although the language ecology of Jordan has been dominated by the dynamics of the East-Jordanian and Palestinian contact situation, attention in recent years has turned to the language situation of the main ethnolinguistic minority groups in the country: the Circassians, the Chechens, the Gypsies and the Armenians. All these groups exhibit

strong bilingualism involving Arabic and their indigenous languages, which are mainly spoken. However, the Chechens and the Gypsies exhibit a strong tendency towards language maintenance. In contrast, the Armenians display an advanced case of language shift. The Circassians stand somewhere between the two, although the forces of language shift are in the ascendance. In all cases, there is no minority language provision in the education system in Jordan. Any existing provision is offered through community centres, although this does not apply to the marginalised Gypsies who, as far as I know, do not have such centres.

Language maintenance among the Chechens defies the three-generation rule, whereby the language of the host society, as the language of socio-economic opportunity and social mobility, is said to replace the community language in the home and the crib within three generations of settlement (Fishman, 1989). There are many reasons for this maintenance, including the compact nature of Chechen settlement in Jordan, the tight social networks among members of the community, resistance to inter-marriage with members of the host community and the positive attitude towards the Chechen language and the original homeland (Al-Wer, 1999; Dweik, 2000). As a result, Chechen is used in the home, in the neighbourhood and in most intra-community affairs as a medium of intimate communication, social bonding, solidarity, cultural exchange and boundary-setting. These factors ensure a high proficiency rate and language use for Chechen across the generations. Constant attachment to the original homeland, fuelled by the continued political trauma associated with it in recent years have had a positive influence on language maintenance in the community, which seems set to continue.

Gypsy language maintenance presents another case that breaches the three generation rule (Al-Khatib and Al-Ali, 2005). The Gypsies exhibit a high rate of passing their language (called *Dom*) to the younger generations, which they use in home and community settings. Unlike the Chechens, the vast majority of the Gypsies are nomads, and they exist as a disenfranchised and lowly group on the margins of Jordanian society. Gypsies who have given up nomadic life and settled in the urban centres exhibit high rates of language shift to Arabic. This discrepancy in language proficiency and language use between the two categories of Gypsies, the settled and the nomadic, suggests that the social and physical isolation of the Gypsies is a strong factor in their language maintenance. It also suggests that language shift to Arabic would take hold among the Gypsies if their social and physical isolation were to be ended, and that, within three generations, they may experience severe language loss. The fact that the Gypsies rate Arabic more positively than *Dom*, their native language, is a harbinger of this.

Although both the Gypsies and the Chechens exhibit strong language maintenance, the conditions that give rise to this phenomenon are not the same. The Chechens practice this from a position of self-confidence in their capacity as a community with higher-than-average socio-economic status, strong links to the political and security establishment in the state and a strong sense of extra-territorial belonging to the original homeland. The Gypsies enjoy none of these privileges; in fact there is a sense in which language maintenance is imposed on the Gypsies from the outside by a host community that stereotypes, stigmatises and rejects them.

The Armenians are a small minority in Jordan (4,000 people) who are positively oriented towards their indigenous language, perceiving it to be more beautiful than Arabic, the host language to which they are shifting (Al-Khatib, 2001). Although Armenian is used in the home and church settings, Arabic is moving into the former at a high rate among the young age group. In addition, Arabic is widely used in intra-community settings in a wide variety of contexts, replacing Armenian, which is undergoing strong attrition. This process of language shift is aided by the small number of Armenians in Jordan, their diffuse pattern of settlement and their integration in society at large.

The Circassians stand roughly halfway between the Chechens on the one hand, and the Armenians on the other in terms of language maintenance and language shift. The Circassian language is still being passed from generation to generation, but this is happening at an ever decreasing rate, in spite of the fact that there is a strong attachment to the original homeland among members of the community. The Circassians rate their indigenous language highly, considering it more beautiful than Arabic (Dweik, 1999), but this positive attitude is not sufficient to reverse the course of language shift the community is undergoing. And, finally, although the language is dominant in family and community settings, among the young generation, Arabic is making strong inroads in these settings. The Circassians lack the pattern of compact settlement found among the Chechens to be able to resist the shift to Arabic. And, unlike the Gypsies, they are integrated in Jordanian society at the highest political and security levels, a fact that calls for social and linguistic integration.

Standard Arabic, which is the sole medium of the written syllabi in all state schools in Jordan, is not a monolithic language across the Arabic-speaking world. It exists in varying forms, particularly in the lexical domains, in different Arabic-speaking countries and regions (Bentahila and Davies, 1991). Standard Arabic is acquired through formal instruction, thus making the linguistic distance (Ibrahim, 1983) between it and the dialects in structure and domain specialisation the source of learning difficulties and problems, which can be very acute

in promoting literacy (Al-Musa, 1990). These difficulties have become a rallying cry for the language reformers who call for simplifying pedagogic grammars, but with little success. A state of linguistic inertia—caused by long-established norms and practices that favour rote learning, social and cultural conservatism in engaging the language issue from a modernising perspective, and the lack of political will as an engine for change—has not served standard Arabic well as a means of communication. In the schools and universities, standard Arabic learners are short changed by teachers who use non-standard forms of the language in instruction most of the time, even in Arabic language teaching. Learning standard Arabic in the schools and even universities is, therefore, primarily a form of learning about the language rather than learning the language itself as a living means of communication. This prevalent practice limits student exposure to the language and perpetuates the status quo. Impaired learning in the language and limited exposure to it in the classroom cause speaker anxieties and a reluctance to use it in public. In Jordan, as in most Arab countries, Arabic is one of the most dreaded school subjects. This feeling towards Arabic is sometimes combined with satirical views of Arabic language teachers who are constructed as sticklers for grammatical rules—which even they do not master—and as champions of archaic or fossilised modes of expression (Haeri, 1997).

Arabic language teaching in Jordan, as in most Arabic-speaking countries, tends to be teacher-centred and outcomes- or product-oriented. The emphasis, in other words, is on *what* students learn rather than on *how* they learn it. This mode of approaching language teaching encourages rote learning and testing regimes that favour recognition and recall instead of engaging the students' analytical and critical skills. The system therefore produces learners with low-level language skills and limited literacy capacities. Diglossia is an important factor in this, but so are societal attitudes that favour foreign languages, mainly English and French, for instrumental and language display purposes. The position of standard Arabic as a marker of group identity is not called into question in all of this. The efficacy of a language as a symbolic marker of identity does not necessarily depend on its linguistic vitality. This is true of standard Arabic. However, instrumentally the language seems to be squeezed by competition from two directions: the colloquial and the foreign languages (English in Jordan). Although the colloquial is not part of the official syllabus, it is nevertheless part of the classroom syllabus in that both teachers and students use it extensively in activating the written syllabus. It is ironic that teachers and students use the stigmatised colloquial in the education field to (1) denigrate the colloquial and (2) extol the beauty and other constructed virtues of the standard.

Alongside Arabic as a standard language, the different dialectal varieties and the minority languages dealt with earlier, English has made strong inroads into the language ecology of Jordan. In education, it is the second language in state schools and it is used as the language of instruction in some private schools in pursuing foreign school-leaving qualifications. At university level, English is used as the language of instruction in the pure, applied, medical and medical-related sciences, although this needs qualification. Based on my observations of lectures at Jordanian universities, as well as teacher and student reports the situation is more complex, with both English and Arabic sharing this domain for different functions and in different configurations as matrix and embedded languages. This is similar to the situation in Egypt, which Qabary (2003, p. 69) succinctly describes as follows: 'Though textbooks in medicine [in Egypt] are . . . in English, and the prescribed language for [instruction] is English . . . , lectures are actually a mix of Arabic and English'. English is also used widely in shop signs as a marketing device to convey to prospective shoppers an image of modernity and quality (El-Yasin and Mahadin, 1996; Kamil, 2005; Salih and El-Yasin, 1994). Even when a shop's name is Arabic, the sign often appears in Roman alphabet alongside Arabic to lock into these same connotations of modernity and quality. In Internet use and mobile texting the Roman alphabet is increasingly used to render Arabic words with the help of additional customised symbols, some of which are acquiring a high degree of fixity (Sakarna, 2004; Warschauer, 2002, for a comparison with Egypt). Information technology is creating a big gap with Arabic, which English fills in a variety of ways (Al-Khawaji, 2005; Ali and Hijazi, 2005), although, judging from the Egyptian experience, the use of this technology in educational reform may not be as effective as policy makers would let us believe (Warschauer, 2003). In upmarket areas, the linguistic landscape tends to have a high percentage of English language use. Finally, with the levels of English language competence improving steadily, code-switching to English is emerging as a style of speaking among segments of the population, particularly the elites and educated young speakers who use it as a form of language display to project an image of modernity and sophistication (Kamhawi, 2001). The fact that a documentary film has been made about this phenomenon reflects its popularity among a growing segment of the population, mainly the young and the materially and socially upwardly mobile in Amman who act as trend-setters (Al-kury, 2005). In all of these respects, Jordan is no different from other Arabic-speaking countries where an imperial or ex-colonial language is involved, for example French in North Africa and Lebanon (Bentahila, 1983, for code-switching in Morocco; Al-Dhwadi, 1986, for code-switching in Tunisia other North African countries; Abou,

1962, for Lebanon; Abou, Kasparian and Hadded, 1996, for Lebanon). These incursions by English in the Arabic-speaking world, mainly under the influence of globalisation in recent years, have sounded alarm bells among the language defenders. A recent issue of the popular Egyptian magazine *Al-Hilal* (May, 2006) considers these terrifying incursions as part and parcel of the dangers threatening Egypt's national security. Egypt is not alone in this: Jordanians express similar views.

#### FUTURE DIRECTIONS

Modernisation and the creation of urban centres in Jordan and other parts of the Arab Middle East have generated new contexts for the mutation of the existing language ecologies. Population movements, whether for socio-economic reasons or because of wars, have helped shape these emerging ecologies. In linguistic terms, contact of speakers, languages and dialects in new and expanding social and linguistic spaces is the engine of ecological change. Within these spaces, new conditions of group settlement, language use and language attitudes develop. More research is needed in the Arabic-speaking world to understand this new complex structure and its impact on language ecology.

State building is another important factor in understanding the language ecology of the Arabic-speaking countries. Jordan presents an example of how the state-building project can skew this ecology in favour of a given variety that, through the institutions of the state, is constructed as a symbol of a male-gendered nation. More empirical research is needed to test and refine our understanding of the impact of the state-building project on language ecology in the Arab Middle East. For this purpose, researchers can exploit some of the methodological instruments developed for similar contexts, with appropriate customisation (Bourhis, Giles, Leyens, Tajfel, 1979). Conducting such field research may, however, meet with security-concocted obstacles owing to the sensitivity of this research and the fragile nature of the Arab states and their state-building projects (Ayubi, 1995).

The incursion of the erstwhile colonial or imperial languages into the Middle East, namely English and French, is an important feature of the developing ecologies of the Arabic-speaking countries. Coupled with modernisation, urbanisation and globalisation, the pervasive spread of these languages in the last few decades is set to continue and intensify. The linguistic landscape of most urban centres provides ample evidence of this spread through shops and other public signs, as does the use of these languages in education and code-switching. More research is needed to ascertain the exact impact of these languages on the native ecologies or the extent to which these languages have been appropriated, moulded and made to bed in these ecologies.

A proper understanding of these issues cannot be made without drawing a categorial distinction between the functional role of language as a means of communication and its ability to serve as a symbol or motif of socio-political identity. This distinction between the functional and the symbolic is important for understanding the dynamics of language shift from variety to variety or from language to language in the Arabic-speaking Middle East. This distinction is also important for understanding the value-laden contact between the ex-colonial and imperial languages and Arabic.

INDIGENOUS CONTRIBUTIONS TO AN ECOLOGY OF  
LANGUAGE LEARNING IN LATIN AMERICA

INTRODUCTION

New current ideas regarding the ecology of language and the ecology of language learning do not seem to be explicitly reflected in existing specialized literature in Latin America, with a few notable exceptions (Hornberger, 2002, López, 2005, López and Sichra, *Intercultural Bilingual Education among Indigenous Peoples in Latin America*, Volume 5, Menezes de Sousa, 2002). Nonetheless, it must be singled out that the principles underlying such current tendencies have indeed been present in various aspects of language learning and teaching in the region for some time now, particularly in relation to indigenous languages and to learning and teaching languages in indigenous settings in the context of intercultural bilingual education programs (known by the acronym EIB in Spanish). This ecological principle has become more evident as of the late 1980s and 1990s when programs adopted the intercultural paradigm (López, 2005), and were increasingly designed and implemented with active indigenous participation and as the result of indigenous struggle and commitment (López and Sichra, *Intercultural Bilingual Education among Indigenous Peoples in Latin America*, Volume 5). It could have not been otherwise since most of the basic thoughts that underlie current understandings of the ecology of language (Haugen, 1972, Mühlhäusler, 1996) and of the ecology of language learning (van Lier, 2003) are inherent in the views indigenous persons have of language and in the readings they commonly share of the ways languages are learned and used in every day life.

The indigenous approach to language from what I would call a “language in life” perspective indeed points in the direction of the ecology of language since it regards language and the acquisition and learning of languages not only in their own specific social setting but also in the political context in which these processes take place. This language in life perspective is periodically reconstructed in strict connection with the history of linguistic domination and oppression under which the indigenous languages function in the prevailing colonial organization of Latin American societies (López, 2005). Indigenous monolingualism, bi and multilingualism as well as the accelerated

processes of language decay and loss experienced in the region are a direct result of such conditions.

But apart from these political considerations, indigenous leaders establish other connections between language use, learning and teaching and aspects of everyday reality that one could hardly imagine. Such is the case for example of the connections between language and health suggested by Benjamín Chumpi, a Peruvian Awajun leader concerned with the state of education in Amazonian indigenous communities (personal communication 1998). He argues that the denial of the right to use one's native language derives in depression and even in physical illness, such that the relationship between language and health needs to be looked into.

Yet indigenous views of language have not been sufficiently studied in Latin America. Had they been the field of language learning and teaching would have benefited immensely from insights pointing toward more situated and meaningful language teaching practices in the region. The fact is that the integral and holistic view of life that indigenous peoples share (Bolaños, Ramos, Rappaport and Miñana, 2004; Prada, 2006) leads to unique understandings and explanations of language use, learning and teaching which call for urgent systematic study.

#### EARLY DEVELOPMENTS

In Latin America, ecological understandings of language can be inferred from the indigenous political agenda and from indigenous "life plans" or platforms for the future. The indigenous positions captured in FORMABIAP (1997) and Bolaños group (2004) point us in the direction of new views of language use, learning and teaching and also into new understandings of literacy (Menezes de Souza, 2001, 2002; Aikman, 2003) and authorship (Lindenberg-Monte, 1996) in indigenous multilingual settings.

Indeed, in the 1970s when the Nasa indigenous leaders in the Colombian Andes began their explorations of a new type of education, called *ethnoeducation*, they were aware of their children's learning needs and opted for an approach to education that uses two languages simultaneously: their own (L1) and Spanish (L2) (Bolaños, Ramos, Rappaport and Miñana, 2004). 35 years ago their autonomous educational program stated their children had to speak, read and write both languages equally well. Today their agenda also includes English in the upper primary school curriculum and is increasingly challenged by the fact that in many communities children have lost active use of the ancestral language (Libio Palechor, personal communication). But in contrast with ongoing discussion in bilingual education academic circles related to whether the L1 merits exclusive or privileged attention during

the first one to three years of schooling, indigenous views seem to be freer of such technicalities, generally pointing out untried and innovative concurrent approaches rather than resorting to the language separation strategies language planners generally suggest. The fact is that, in indigenous everyday life, the two—or in some cases three or more—languages are needed many times in connection to one another and not as discretely separate as is often supposed. Furthermore, even in predominantly monolingual indigenous settings, the two languages might be used in relation to one another, many times for specific purposes under a complementary distribution scheme.

From a similar perspective, in the late 1980s when FORMABIAP designed a new teacher training curriculum for and with 15 different indigenous ethnolinguistic communities of the Peruvian Amazonian region, the multi-ethnic team of educators responsible for its preparation broke away from the mainstream tradition of identifying specific and separate subjects for each domain of knowledge. They organized their curriculum around integrated areas of knowledge and practice, one of which was that of language and communication (FORMABIAP, 1997). Although they specifically identified objectives and content related to the L1 and the L2, they looked for explicit links and connections between L1 and L2 use and also regarding the processes of learning and teaching these languages, since their aim was to prepare indigenous teachers and educators (FORMABIAP, 1997). But what is interesting to note is that this curriculum proposal also included specific attention to other forms of discourse indigenous persons learn when involved in the social dynamics of their communities, as well as to other non-linguistic forms of expression: corporal, musical and graphic, amongst others (FORMABIAP, 1998). Critical observations have recently foregrounded the apparent overemphasis given in the classroom to the written word in detriment of orality, an important cultural trait in the indigenous societies this program intends to serve (Vigil, 2004).

It must also be pointed out that in both the Nasa and FORMABIAP cases, language learning was not singled out as a specific independent activity but as directly connected to other curriculum areas such as natural and social sciences. Although that might be the norm in language teaching at primary school level, this type of curriculum organization is not common in the education of adults and even less in teacher education. The FORMABIAP curriculum considers eight integrated areas of study, one of which is ecology or ecosystems.

This model of curriculum integration and of a more comprehensive and less compartmentalized view of language gained further impetus in the mid-1990s when at PROEIB Andes an MA professional development program in EIB was implemented. In this case four integrated and interrelated areas were identified: education, culture, language, and indigenous

language development (PROEIB Andes, 1998). Each of these areas, although geared to specific objectives and content, relates to the objectives and content of the other areas, the underlying principle being that each area directly feeds or impacts on the development of professional capacities the MA indigenous students require to enhance their practice either as teacher-educators or as educational planners.

With these considerations in mind, language education at PROEIB Andes encompasses (i) the oral and written development of the students' most used and preferred language, which at the time they begin their graduate studies might no longer be their L1, (ii) the oral and written development of the indigenous language they speak or learn whilst in the program, (iii) the acquisition of digital literacy and (iv) the development of a critical awareness of language and literacy, beginning with the reconstruction of the participants' autobiographies as bi or multilingual individuals. Additionally, they develop insights into language pedagogy, sociolinguistics, language policy and planning, and the history of language contact and conflict in their societies, vis-à-vis the process of colonization and of the enshrining of a Eurocentric view of life in the region. A good portion of each semester is spent in field work, where they explore the views community elders and indigenous men and women in general have of language learning and use. Finally, as part of their education, these indigenous professionals carry out empirical research and produce numerous written reports, thus discovering the meaning and sense of becoming an *author*.

Indeed, it is this notion of indigenous authorship—in both the patrimonial and hegemonic languages—that forms part of the education of indigenous teachers. In many contexts, Indigenous authorship is a strong component of community teachers' education in Brazil (CIESI, 2005; Franchetto, 2003; Lindenberg-Monte, 1996). As a result of two decades of intensive work there is now an increasing body of literature on this notion and on its implications for language learning and development in connection with the empowerment of these indigenous educators. Along similar lines, in Guatemala and Bolivia experiences have been carried out to prepare indigenous teachers as authors of written materials in the vernaculars. In Bolivia, in a 3-year project (2001–2004), 11,000 teachers were trained in the production of written texts in Aimara, Guarani and Quechua (cf. López, 2005; von Gleich, 2004). In so doing, they applied to the vernaculars some of the basic competencies they already had for writing in Spanish. They used the written mode creatively and to depict different aspects of contemporary indigenous everyday life. In most cases, these written materials also enriched indigenous language teaching in their classes (Lauracio and Plaza, forthcoming).

The emphasis given to the written word in indigenous communities, as a result of the demands the formal education system places on schools and communities, has recently led researchers into other avenues. Some are beginning to look into alternative modes of graphic representation through indigenous textile and ceramics production (cf. Arnold, Yapita et al., 2000; López, 2001), and also through body-painting (Franchetto, 2003), while others have identified the development of multimodal understandings of literacy in which alphabetical writing is combined and complemented with other types of graphic representation in order to give “fullness” to a given message indigenous authors wish to transmit (Menezes de Souza, 2001). Some researchers have also begun to wonder if other types of literacy should be the object of formal study in EIB programs since written texts by indigenous persons seem to reflect a combination of oral and written strategies (Rockwell, 2001). Such strategies may point in the direction of new and alternative modes of literacy (Sichra, *Language Diversity and Indigenous Literacy in the Andes*, Volume 2; Zavala, 2002), and even, in some cases, in accordance with the views of small and isolated indigenous communities, the possibility of reserving literacy only for Spanish as an internal strategy to defend their culture and language (Aikman, 2003).

#### MAJOR CONTRIBUTIONS

Several ecological themes emerge from a consideration of indigenous perspectives and experiences in language and education.

*Towards an integrated view of language and learning.* Indigenous organizations and leaders have long claimed that language cannot be studied in isolation and detached from the territory in which it is or was spoken. They consistently and insistently claim that the ancestral indigenous territory constitutes the most appropriate setting for the reproduction of culture and language (CONAMAQ et al., 2004). The indivisible link established between language, culture, identity and territory (Prada, 2006) leads to more integrative understandings of language and learning. It is also this territorial view of language that underlies an equally integrated understanding of indigenous demands regarding their position and their rights in a democratic society. Language, cultural and territorial rights are part of a comprehensive and globalized agenda that forthrightly claims the indigenous peoples’ right to their own existence in the context of multiethnic and multicultural societies.

On this basis, indigenous educational proposals suggest a shift in the ways in which language is taught. It is an approach similar to the

'whole-language' orientation, where meaning and content are regarded as more important than form and the classic distinction between L1 and L2 may not apply as rigidly as it used to (FORMABIAP 1997 and 1998; Vásquez, 2002; Walqui and Galdames, 2005). From this language in life perspective, concurrent L1–L2 approaches might be called for, as well as recognition of the role code-switching plays in everyday life, and hence in the classroom and in language learning. In indigenous communities, naturalistic language teaching approaches might be more culturally sensitive and appropriate since they seem to match indigenous people's expectations and understandings. In the same vein, the relationship between orality and literacy as well as between reading and writing needs to be revisited related to the social practices that influence indigenous community language behavior, but also in light of the needs indigenous students face today in their trajectories as individuals who also need to read and write in order to go through the formal educational system successfully and to participate as intercultural citizens.

*Awareness of the diminished political and social position indigenous languages enjoy.* Indigenous views of language and learning go beyond the recognition of the social environment in which language learning takes place, and intend to also account for the long history of linguistic oppression and domination. These views are counter-hegemonic in as much as they question the status-quo. Indigenous school-children and their parents are acutely aware of the critical socio-historical conditions affecting their patrimonial language and because of it they many times favor learning in the L2. Parents see this possibility as a viable strategy to counteract linguistic oppression and marginalization (Aikman, 2003; Lopez and Küper, 1999). Nonetheless, when they become aware that their L1 deserves official government recognition and that there are cognitive and affective advantages in learning through the indigenous language, they usually embrace a two-language orientation. This recognition includes the concomitant demand that mainstream children learn an indigenous language and hence a two-way EIB proposal emerges (CONAMAQ et al., 2004; CNEM, 2004, López, forthcoming). Otherwise, EIB could be regarded as a modality planned only for the indigenous population and suspicions arise as to the sincerity of this new educational program most Latin American governments now endorse (López and Sichra, *Intercultural Bilingual Education among Indigenous Peoples in Latin America*, Volume 5).

*A new emphasis on language revitalization.* Over the past two decades—alongside with significant progress in political participation of indigenous leaders at national and international levels, political demands on language education increasingly point in the direction of language revitalization. Indigenous leaders are aware of the dangers

their languages now face and see the school as the agency responsible for reintroducing in society the patrimonial language at risk. "The school must return to us the language it once took away from us" is a slogan increasingly heard in vulnerable indigenous communities (López, forthcoming). Furthermore, it must be noted that the purposes sustaining this claim go beyond communicative needs or aspirations and deal with the necessity and desire to exercise territorial rights, to defend indigenous knowledge, to guarantee sustainable development and even the individual's survival as an indigenous citizen.

*A new look at indigenous ancestral orality.* A process of repositioning indigenous appropriation of the written word with regard to the revitalization of indigenous orality is under way, precisely as a result of the integrative view of language and language learning the indigenous agenda is pushing for in those countries and regions where the indigenous political movement is strong. The repositioning of indigenous orality seems to be a by-product of the increasing attention indigenous claims have gained regarding the educational and political reconsideration of their own knowledge, ways of knowing and cultural practices and values (Galdames, Walqui and Gustafson, 2005; Prada and López, 2005). The search for an intercultural approach to education and the renewed indigenous demands regarding their cultural heritage are drastically changing the scene of indigenous education in Latin America (CNEM, 2004; CONAMAQ et al., 2004; Rodríguez, 1999). For the first time in centuries, indigenous demands are both political and epistemological and have put the ontology of school knowledge at stake (Howard, Barbira-Freeman and Stobart, 2002; Prada and López, 2005). The need to reposition indigenous orality has become more evident than ever and in many ways indigenous oral discourse is seen as the basis of indigenous everyday life (Prada, 2006; Rodríguez, 1999, 2003). Hence educational proposals are shifting from the exclusive attention placed on writing towards a more balanced understanding of indigenous language use and learning (Galdames, Walqui and Gustafson, 2005) and explicit attention is now given to the inclusion and development of indigenous orality at school (Bolivia, 2003; Francis and Reyhner, 2002; Rodríguez, 1999).

*An intercultural approach to language education.* The ecological approach the indigenous view of language has put forward is fundamentally intercultural, since language and culture are regarded as indivisible. This might be the reason why indigenous persons establish a direct connection between language and identity even in cases where they may have lost active use of one of the languages they acquired in childhood (Anacona, 2006).

In the view of some indigenous intellectuals and leaders, indigenous students must learn the hegemonic language beyond what schools

generally consider necessary, since in everyday life they might need to write complex texts and even poetry in this language, at times to defend their own (Green and Houghton, 1996). In the same vein of maintaining an indivisible link between language and culture, the indigenous approach implies establishing a close connection between the indigenous language and the knowledge system it forms part of, thus breaking away from the tradition established by the early missionary approach that used the indigenous languages detached from the indigenous culture and world view and only as a more efficient mode to transmit Christian religious and official curriculum content (López, 2005). As of the 1990s, most EIB teacher education programs have become involved in processes of curriculum redefinition with more consideration paid to indigenous knowledge systems, as in Mato Grosso, Brazil (CEISI, 2005; Franchetto, 2003) and Popayan, Colombia (Bolaños, Ramos, Rappaport and Miñana, 2004).

*Language education as a tool for social emancipation.* Counter-hegemonic language policies and practices such as those oriented to language revitalization and to the repositioning of indigenous orality in the school-curriculum reveal a shift in the perception of schooling and of the role education should play in indigenous societies. Language renewal policies seem to be part of the prolonged indigenous counter-hegemonic struggle and fight for a different political, social and cultural arrangement of power and knowledge in the multiethnic countries they live in. Most indigenous leaders and organizations see EIB as part of that struggle.

#### WORK IN PROGRESS

Language policy and planning is an area where attention is increasingly paid to an ecological approach to language and language learning. This is a by-product of the close link established between language policy and planning and indigenous people's rights (Hamel, 1997) and also of the growing attention given to indigenous voices and demands (Hornberger, 1996, López, forthcoming). An ecological orientation to language policy and planning entails the analysis of their locus of enunciation. Both top-down and bottom-up policies would need to be made explicit, compared and analyzed vis-à-vis the specific sociohistorical and political context in which they are formulated and applied.

Similarly, an unprecedented concern for curriculum diversification and the need to formulate different and specific local curricula become evident. This new curricular concern offers an equally new opportunity for the repositioning of orality and for a renewed balance between orality and writing in indigenous societies (Sichra, Language Diversity and Indigenous Literacy in the Andes, Volume 2; Zavala, 2002), particularly

in connection with the teaching of indigenous languages at school (Galdames, Walqui, Gustafson, 2005; Rodríguez, 1999).

New alternative proposals for the teaching of Spanish as L2 in basic education have been reconsidering the relationship between the pupils' L1 and L2 in light of what occurs in indigenous communities (Bolivia, 2003; Hamel et al., 2004; Mandepora and Limachi, 2003; Peru, 2002; Sainz and Ruiz, 2004; Trillos, 2003; Vásquez, 2002; Walqui and Galdames, 2004). In many ways these new schemes go beyond traditional approaches to L2 teaching in Latin America: in general they are needs oriented, content-based, meaningful and situated, communicative, intercultural and influenced by new insights from discourse analysis and text linguistics. They also look at L2 teaching in relation to other school curriculum areas and to the specific social context in which they are implemented. More often than not, these approaches are the result of action-research projects within the framework of pre-service or in-service teacher training projects (Hamel et al., 2004; Mandepora and Limachi, 2003; Rodríguez, 2003; Sainz and Ruiz, 2004).

Similarly, in the new educational reforms of the 1990s, the area of language and communication in Spanish L1 mainstream education has received special attention (Condemarin, 2003). Under the influence of text linguistics, sociocultural theory and cooperative learning approaches, and taking into consideration the social and cultural context in which learning takes place, new materials for the teaching of Spanish as L1 were prepared in most countries. The written word and the appropriation of reading and writing in particular have been given more systematic attention (Jolibert, 1992). The emphasis placed on the students' autonomous production of written texts has set Spanish L1 teaching in a new light in various South American countries (Argentina, Bolivia, Colombia, Chile, Paraguay and Peru). In some cases, these didactic principles have later been successfully applied in indigenous communities and with vernacular languages as well (Lauracio and Plaza, forthcoming; López, 2005).

#### PROBLEMS AND DIFFICULTIES

One of the limitations for further development of an ecological approach to language learning in Latin America derives from the shortage of bibliographic references in Spanish or Portuguese and the insufficient attention universities pay to issues related to language learning and teaching in general. Although the field of language teaching in EIB programs shows progress in developing and implementing an ecological orientation, we have no news of similar progress in mainstream education in relation to either foreign language teaching or mother tongue teaching.

Nevertheless, foreign language teaching does show a renewed interest in communicative approaches, under the influence of pragmatics and discourse analysis, while the teaching of Spanish and Portuguese as L1 during the last decade has experienced a singular shift towards more meaningful and communicative approaches with a special focus on the production of written texts. In these two areas research is insufficient, the field being characterized in the best of cases by the consumption of research results produced in the North. Very little research is done on elite bilingual education (see de Mejía, *Enrichment Bilingual Education in South America*, Volume 5), foreign language teaching and Spanish or Portuguese L1 teaching. Nonetheless, some of these issues such are looked into at national and international professional meetings. Two recent international conferences, for example, in Argentina in 1994 and in Colombia in 1996, have discussed the issue of elite bilingualism, including the contrast with indigenous bilingualism.

One of the most serious limitations for an ecological understanding of language in indigenous settings is related to the little attention formal education in general gives to indigenous ancestral orality. Whilst orality as such has generally been the concern of anthropologists and in a lesser degree of descriptive linguists, language educators and applied linguists have most generally paid attention to the development of oral expression in the classroom, overlooking the difference between orality and classroom oral expression. Hence attention has been given to new functions the indigenous language must fulfil when introduced in formal settings such as the school and the classroom. The lack of understanding of the role orality plays in a predominantly oral society in connection with the construction and transmission of knowledge, values, beliefs, and even history and simply every day life, along with the separation traditionally established between indigenous communities and schools have severely affected the necessary repositioning of orality in the education of indigenous students. The insufficient thought given to ancestral orality as a way of life could be overcome if language teaching evolved into an interdisciplinary endeavor with applied linguists and language educators working closely with anthropologists and descriptive linguists. However, we could arrive at even more radical approaches if language planners and educators were to make a deliberate effort to listen attentively to indigenous voices so that cooperatively we could engage in uncovering and systematizing indigenous ways of knowing about language and language learning through a process of comparison and contrast with more Western oriented hegemonic views.

Last but not least, apolitical understandings of language teaching in indigenous settings do not contribute to the development of an ecological approach. Educational planners and language educators have

tended to stress the technicalities of language teaching while paying less attention to the political role they as educators and planners are expected to play regarding the indigenous people's life plan and political project. The emphasis given to the technical and didactic aspects of language teaching has not taken into account the counter-hegemonic views that unite indigenous leaders and organizations in their struggle for a rearrangement of power, culture and knowledge in the continent.

#### FUTURE DIRECTIONS

There is still more to do to structure an explicit ecological approach to language learning and teaching in Latin America. Language planners, educators and researchers in general need to listen carefully to those other voices that have long been silenced. Indigenous views of language and language learning could indeed help revitalize the language teaching field and turn it into an enriching real life experience. The fact is that indigenous peoples share an integrative and holistic view of life that can contribute to new and innovative approaches to language teaching. Listening to those new-old voices and working with indigenous community elders and leaders would definitively contribute to the systematization of the ecological view of language as well as to the renovation of language planning and language teaching.

In both indigenous communities and mainstream education, an ecological approach to language learning implies a shift in what has been done so far. On the one hand, teaching has to become multimedia and different kinds of resources need to be taken into account at a time when technology marks a new and different history even in remote indigenous communities. For instance, video and DVD recordings could facilitate the reinsertion of the oral word in the classroom and also help indigenous orality regain its role in the education of indigenous children and youngsters, thus conquering new domains of use. Community elders could be invited to visit schools and talk to young children as a preliminary step for school children to then visit wise-persons' homes and restart listening to their advice and learning from them. In urban settings, the use of videos depicting indigenous life, culture and knowledge in rural communities could most certainly generate interesting discussion and learning experiences for all.

Strategies such as these could contribute to the language in life approach that indigenous leaders have implicitly put forward. This approach applies in indigenous language teaching and extends to the teaching of the region's hegemonic languages as L2 and even as L1. This language in life approach also entails paying specific attention to local and regional varieties of Spanish and Portuguese and formally introducing them into the classroom, thus establishing new and richer

links between the school, the home and the community and in turn richer and healthier learning environments.

Repositioning orality and the local and regional varieties of the languages in question, including code-switching in indigenous communities and neighborhoods, could contribute to better student attainment as well as to fulfilling the indigenous aspiration of achieving mastery in reading and writing in the hegemonic language. The repositioning of orality in indigenous schools could also be an excellent starting point for the introduction of the written word wherein we could begin by introducing narratives and not isolated sentences and words (Rodríguez, 1999). But to do so we must be extremely creative and critically aware so that we do not reduce a way of life—orality, and the complex and varied types of discourse it encompasses, simply to oral expression or even worse a bad transcription or a mere text for school.

What cannot be forgotten in reimagining language teaching in indigenous Latin America is the conditions in which learning takes place. On the one hand, we face a political and epistemological challenge from the increasingly important indigenous political movements concerning education and life in general, and the call for construction of a new intercultural and democratic order in the region, and, on the other, we need to reflect on the still difficult circumstances and endangered settings in which learning and teaching take place. That obliges us to commit ourselves to make of language teaching a tool to the social emancipation indigenous peoples seek. When designing and implementing language teaching proposals from an indigenous ecological perspective, other equally important aspects of life cannot be put aside.

Languages do not have an autonomous life. If they want to be living languages they must be language of living peoples. Indigenous languages share their histories with the communities that speak them . . . If we the indigenous people speak of our languages it is because we are convinced that sociolinguistic conditions can be modified. We believe that it is possible to recuperate the spoken word. We are committed to the transformation of the present situation of our indigenous languages, to reversing the process of loss of prestige, mutilation and prohibition that has seriously affected our languages. We believe in and dream of a future in which when we say river we hear it roar, when saying thunder our elders' spirits emerge from earth, and when we say children one hears their unending laughter.

Las lenguas no tienen vida propia. Si quieren ser lenguas vivas deberán ser lenguas de pueblos vivos. Las lenguas indígenas tienen las mismas historias de los pueblos que las

hablan . . . Si los indígenas hablamos de las lenguas es porque estamos convencidos de que las situaciones sociolingüísticas pueden ser modificadas; porque creemos que es posible recuperar la palabra. Nos encontramos comprometidos con transformar la situación de las lenguas indígenas [. . .], en revertir el proceso de desprestigio, mutilación y prohibición de que han sido objeto. Creemos y soñamos en una mañana en el cual al decir río se vuelva a escuchar su caudal, en que al decir trueno los espíritus de los padres emerjan de la tierra, y en que al decir niños todos escuchen una risa interminable.

## **Section 3**

### **The Language Ecologies of Dispersed and Diasporic Communities**

## LANGUAGE ECOLOGY AND LANGUAGE COMMUNITIES IN THE MALAY WORLD

### INTRODUCTION

The Malay World can be described, on geographic and linguistic grounds, as those parts of Southeast Asia where the Malay language is spoken, whether as a first or second language. This simple description encompasses many parts of Southeast Asia. In Indonesia, Malaysia, Brunei, Singapore, and Thailand, Malay is spoken as a home language; while, in the Philippines, Cambodia, and Vietnam, Malay is spoken by some communities as a second or third language. The Malay World, then, straddles two regions usually identified separately in surveys of Southeast Asian ethnic groups: Mainland Southeast Asia (LeBar, Hickey, and Musgrave, 1964) and Insular Southeast Asia (LeBar 1972).<sup>1</sup> This orientalist bipartition rests on significant differences among the hundreds of languages of the region as well as complex patterns and traditions of language use. Malay is sited in this complex ecology as the main language of Southeast Asia.

This contribution will consider four aspects of the ecology of languages in this Malay World:

1. The history of studies about the ecology of languages in the Malay World;
2. Major studies about language ecology in the Malay World;
3. Problems in studying the language ecology of the Malay World; and
4. Directions for the study of languages in the Malay World.

---

<sup>1</sup> This tradition has been maintained even in more recent categorizations of the region. For example, in a recent popular language atlas (Comrie, Matthews and Polinsky, 1996), parts of Southeast Asia are discussed and illustrated in a chapter entitled South and Southeast Asia, while other parts of Southeast Asia are treated in a separate chapter entitled Pacific. In both LeBar's and Comrie's systems of classification, the Malay peninsula is in the awkward position of being unavoidably geographically located in mainland Southeast Asia, but being conceptually assigned to another region, i.e. "Insular Southeast Asia" (LeBar) or the "Pacific" (Comrie).

EARLY DEVELOPMENTS: THE HISTORY OF THE  
STUDY OF LANGUAGE ECOLOGY IN THE MALAY  
WORLD

The first European visitors to the Malay World had much to say about its language ecology. As early as the sixteenth century (Collins, 2000; Reid, 1988), these authors noted three important facts. First, they observed that there was an enormous diversity of languages, often with little or no mutual understanding. Second, in that forest of language diversity, Malay was the single, most widespread language of Southeast Asia, where it served as a contact language among speakers of different languages. Third, moreover, Malay was not simply the language of trade, a pidgin language, but it was also the language of diplomacy, religion, and learning; Malay was a written language.

Francis Xavier summarized the language ecology in his 1546 letter written in Ambon, on the eastern edge of the Malay World (see Schurhammer, 1980, pp. 135–136):

Each of these islands has a language of its own ... The Malayan language is very common in these parts ... and the language which they write is Malay ... which the Moorish *cacizes* taught them to write and still teach them.

Indeed, as A. Galvaõ, governor of the Portuguese outpost of Ternate also on the eastern periphery of the Malay world, wrote in 1544 (Jacobs, 1971): Malay was “like Latin in Europe.”

All three ecological features, namely language diversity, Malay pre-eminence in that diversity, and literacy in Malay, had important repercussions on the European response to language communities in the Malay World. Precisely because of the large number of languages in the region and the usefulness of Malay, neither the Portuguese nor, later, the Dutch paid much attention to local languages other than Malay. In Xavier’s 1546 letter noted above, this missionary listed all the Catholic prayers and doctrinal articles he himself had translated into Malay to be taught to potential converts in the Malay World. So, at this very early period, Malay had already been chosen as the medium of instruction even where it was not the indigenous language, for example in Ambon and North Maluku.

This policy of language appropriation for education persisted, in fact, was expanded, in the formative Dutch colonial period. A Calvinist missionary, François Valentyn (1726, p. 26), writing almost 200 years after Xavier listed the titles of numerous hand-written Malay-language books being circulated among Muslim villagers of Ambon Island, although the Muslims’ home languages were not Malay. Valentyn (1726, pp. 119–130) also provided the titles of dozens of Malay-language printed books being used in 1708 in schools in the Christian villages of Ambon.

It was not until the nineteenth century that the Dutch began to pay attention to local languages. Under the aegis of the Dutch missionary board (*Nederlandsch Bijbelgenootschap*), the complexity of north Sumatra's Batak languages, the Ngaju Dayak language of southern Borneo and the Bugis and Makassar languages of southern Sulawesi were documented and described (Teeuw, 1971, p. xiv). But in other areas of the Malay World the emerging awareness of minority languages was coupled with the realization that they had been or were being replaced. In Ambon, for example, by the late nineteenth century the local languages of almost all Christian villages had been completely replaced by the regional dialect of Malay (van Hoëvell, 1876, pp. 4–5).

The use of Malay as the language of mass education under the colonial system, particularly in what is now Indonesia, coupled with the choice of Malay as the national language, renamed Indonesian, by the independence movement in 1928, accelerated this process of language replacement (Collins, 1999). By the late twentieth century, a regional Malay dialect, Manado Malay, had replaced most local languages of northernmost Sulawesi as the first language of most inhabitants (Danie, 1991). Modern Indonesian has also encroached on many domains previously restricted to local languages; see Kuipers's (1998) report on language use in Sumbawa, for example. Mühlhäusler (1996) went as far as to declare that Indonesian was a "killer language" because it had been replacing minority languages at an ever-increasing rate.

Elsewhere in the Malay World, the impetus of Malay as the language of education and often the language of locally dominant ethnic groups also has had an impact on the survival of other languages. In northern Borneo, in particular Brunei, minority languages are being replaced by the local dialects of Malay (Martin, 1994); see also Zainah (1982) and Aminah (2000). In Indonesia's western Borneo there are documented cases of shifts in ethnic affiliation and subsequent language shift as early as the mid-nineteenth century, for example the Embau Malays (Yusriadi, 2005), and elsewhere in western Borneo of language shift in progress (Collins and Sujarni, 2004). Other authors (Benjamin, 1983) have made the same claim about language shift among speakers of Mon-Khmer languages in the Malay Peninsula.

#### MAJOR CONTRIBUTIONS

In this setting of diverse languages and a long history of colonial domination, surprisingly there are few in-depth studies of language ecology in the Malay World. Of course, enumerations and lists of languages can be found (Grimes, 1988, for example), but studies of how these languages interact, how they are used and for what purposes are not

widely available. Two exceptions are Oetomo's (1987) study of language use and language choice among ethnic Chinese in a medium-sized city of Java's northeast coast, and Florey's (1990a), study of language use and language choice among Alune villagers in a small hamlet in the interior of Seram in central Maluku.

Clearly, these are two very different settings and topics. The one deals with an immigrant group in a harbor city of densely populated Java with a focus on identity and language choice. The other presents research on language obsolescence within a small indigenous ethnic group in a sparsely settled rural area far from Indonesia's administrative center in Java. However, both studies were undertaken in two regions of Indonesia with the longest histories of colonial contact and intense exploitation, dating to the sixteenth century. Moreover, both studies are firmly grounded in participant-observer methodology with extensive use of authentic recordings of language use.

Oetomo's (1987) sample was 30 households of ethnic Chinese in a community of 5,500 Chinese in Pasuruan, a small coastal city of 94,000 people. In the larger Pasuruan community, three Austronesian languages were in wide use: Javanese, the language of the ethnic majority in the city, Indonesian, the national language, and Madurese, used by a smaller local ethnic group. However, in the ethnic Chinese sample, although Madurese played no role, a much larger number of languages was available: Javanese, Indonesian, East Java Malay, Hokkien, Hakka, Mandarin, and Dutch. Hokkien, Hakka, and Mandarin are Sino-Tibetan languages and Dutch Indo-European. Knowledge of and competence in these languages, some of which are not related to each other even distantly, was not distributed equally within the community; nor were attitudes towards these languages shared equally in the sample population.

Oetomo (1987) found that within the Chinese community there were strong class differences, that were in part based on subethnic differences. In Java, in general, ethnic Chinese are often classified into two distinctive groups, the *peranakan* group, whose ancestors immigrated to Java several generations ago and whose culture reflects a longer stage of assimilation, and the *totok* group, who immigrated to Java in the mid-twentieth century and whose patterns of assimilation reflect their "late" arrival in the Javanese cultural environment. At least some *totok* Chinese can choose Hokkien, or even Hakka, because these languages once or still are used in the family setting. Some of these *totok* Chinese also had had access to Mandarin language education (before all Mandarin language schools in Indonesia were closed in 1965); so Mandarin is also a language that some members of the community can choose to speak. In contrast, *peranakan* families do not speak Hokkien, Hakka or Mandarin. Upper class *peranakan* Chinese,

however, can choose Dutch for in-group communication, because up until the 1950s Dutch language education was still an option for the well-to-do in Indonesia.

Both *peranakan* and *totok* Chinese speakers share Javanese, East Java Malay and Indonesian as parts of their linguistic repertoire, but their attitudes towards these languages, as well as their use of them, differ. Among *totok* Chinese, Javanese is a likely choice as the day-to-day home language; whereas *peranakan* Chinese, especially the upper class, have chosen East Java Malay as their home language. Both groups, however, choose Javanese to speak with the Javanese majority of Pasuruan, except in certain very formal settings where Indonesian would be the choice of both groups. Interactions between *totok* and *peranakan* Chinese are not infrequently hampered by their different attitudes towards Javanese. For upper class *peranakan* Chinese, only East Java Malay is acceptable in most intraethnic (*totok-peranakan*) exchanges, whereas some *totok* Chinese and lower class *peranakan* may mix Javanese into the East Java Malay they speak with *peranakan* resulting in “almost violent” reactions (Oetomo 1987, p. 116) on the part of the insulted *peranakan* Chinese.

In short, Oetomo’s study provides numerous detailed accounts of language use and choice related to power, status, age, and ethnicity, all within the context of a dominant national language that now is the medium of instruction for all Indonesians. The differences in the codes used by subethnic groups within even this small sample of ethnic Chinese are also striking and reflect different histories and different attitudes towards the language resources available. In contrast, Errington’s (1998) study of the use of the Indonesian and Javanese languages in rural ethnic Javanese hamlets in the interior of Java provides a glimpse of a different ecology, where Indonesian and Javanese interact not to mark subethnic or class distinctions but stylistic differences.

In contrast to Java with its few, but very large, language communities, for example Javanese with its 80 million speakers (Grimes, 1988), Maluku is a region of enormous language complexity, both historic and contemporary. In Central Maluku where Florey (1990a) conducted her research as many as 40–50 autochthonous languages (Collins, 1983) are spoken by small communities in an area with a long history of colonial exploitation and contemporary turmoil. Florey’s research was conducted in Lohiatala, an Alune village near the south coast of Seram island with 666 inhabitants (in 1988), of whom fewer than 30 were not ethnic Alune. However, Lohiatala is only 10 km from the main coastal road and only 20 km from the polyglot administrative capital, Kairatu. Indeed, the village nearest to Lohiatala, Waihatu, consists of an Indonesian government resettlement village with migrants chiefly from Java and Lombok. In this village of 1900 people (three

times larger than Lohiatala) and in the small neighboring village of Waesamu, the regional dialect of Malay, Ambonese Malay, is the most frequently used language code.

In Lohiatala, three languages are used: Alune, Ambonese Malay, and Indonesian; all are Austronesian languages but Alune is only very distantly related to Indonesian and Ambonese Malay. The use of Indonesian in the village is restricted to very formal domains, such as education, church services, and village meetings. However, Ambonese Malay has become the language most frequently used in this village, although “the displacement of Alune by Malay is occurring along generational lines.” Florey found that, because of radical social changes, such as conversion to Christianity and the introduction of Malay language education in the 1920s as well as forced removal to the coast in the 1950s, younger fluent speakers of Alune (aged 35–45 years) have initiated “a change in the role of Alune from a language used in all domains of daily life to a secret language . . .” (Florey, 1990a, pp. 154–155). These speakers are “unintentionally” accelerating language shift in Lohiatala.

Florey’s research is exemplary because of the insights she obtained as a participant–observer resident; she was able to see beyond overt patterns of language usage to explore language allegiance and the local epistemology of knowledge. In so doing, she surpassed earlier, superficial treatments of language change in other parts of Maluku. Laha, another village forced to move during social upheavals—in this case in the seventeenth century (Knaap, 2004), has managed to retain a distinctive Laha language but only at the cost of a drastically remodeled grammar that parallels Ambonese Malay (Collins, 1980), but this analysis was based on mere comparison of overt language data rather than a study of other aspects of the culture and without a careful consideration of cross-generational differences in language use and language attitudes. Using Kaartinen’s work as a participant–observer resident in Banda Eli, language use among the Bandanese, refugees from seventeenth century colonial mayhem in the Banda islands to the Kei islands, could be more adequately described (Collins and Kaartinen, 1998) based on observed social uses of the four language codes available: Bandanese, Keiese, Ambonese Malay and Indonesian.

#### PROBLEMS AND DIFFICULTIES

Language ecology in the Malay World is more complex than the simplistic image of an ever-advancing assault of the Malay/Indonesian language on other languages of the region, as Mühlhäusler (1996) depicted it. If we fail to realize the nuanced complexity of the ecology, we will proceed from false assumptions and flawed methodologies. Let us consider some facts about the relationship of Malay/Indonesian to

minority languages. First of all, in the brief descriptions of studies in Java (Oetomo, 1987) and Maluku (Florey, 1990a, b, 1993, 2001) above, it is clear that language choice is multifaceted. Members of the same ethnic group, like the Pasuruan Chinese, may have very different language competencies and attitudes towards Malay and other languages in their repertoires. Moreover, it may be precisely the loyal, fluent speakers of a language, like Alune, who unintentionally accelerate language death. Second, in some parts of the Malay World, Malay is actually in retreat. Tadmor (1995) has documented the increasing shift from Malay to Thai in certain formerly Malay-speaking villages in central Thailand. This matches the historic loss of Malay as a spoken language of Manila in the sixteenth century and in modern times in southern Burma (Ainsworth, 1930). We should note too the considerably reduced domains for Malay language use in Singapore, recently documented by Roksana (2003) even among the ethnic Malays of Singapore. Third, in contrast to the apparent expansion of Ambonese Malay in Maluku noted by Florey (1990a, b, 1993, 2001), in other parts of the Malay World, local Malay dialects are disappearing in favor of standard Malay/Indonesian dialects or koine Malays (Collins, 1997). Thus, the image of an advancing Malay is more diverse and complicated because in those cases Malay replaces Malay. Fourth, in some areas speakers of minority languages in the Malay World abandon their languages, not to shift to Malay at all but to shift to another locally dominant language. About 40 years ago, for example, language replacement was observed in Sarawak (Needham, 1963), but in this case the shift was from Penan to another local language, Bintulu, not Malay.

Nonetheless, Malay/Indonesian is the language of education, religion, government, media and commerce in many parts of the Malay World. It is true that many smaller minority languages are in danger of being completely replaced by this national language of Brunei, Indonesia, and Malaysia. Consequently, one of the problems that needs to be addressed is one of the basic issues in the study of language ecology: an inventorization of the languages used by societies in the Malay world. Recently it was estimated that there are 800–850 separate languages spoken in Malaysia and Indonesia alone (New York Times, 2005). However, the present poor documentation and description of those many languages is a serious impediment to intensive study of how those languages relate to each other. We cannot discuss issues like language death, multilingualism, creolization, and language contact without knowing what languages are out there.

#### FUTURE DIRECTIONS

The fact of Malay is that it is an ancient, complex language spoken in dozens of varieties within the context of 800–1000 other languages.

That many of those hundreds of languages have not been studied and described already indicates a major direction for needed research. First, as noted above, all the languages of the Malay World must be studied in order to understand the basic building blocks of the language ecology of the region. But there is a second issue: These studies must be undertaken in a spirit of broad ranging comparative inquiry. Too often linguists approach the study of a language as if it were spoken in isolation from other languages. Therefore, they discover unique phonological features and remarkable morphological retentions in “their” language only because they have closed their eyes to the context in which these languages are spoken. They overlook areal features and even linguistic mimicry because they are not interested in complicating their elegant analyses.

Malay, for example, has changed from its Western Malayo-Polynesian origins as a language with intricate affixational systems to mark patient and subject relationships; Malay has moved from a grammar that was similar to that of a Philippine language and has become grammatically more like languages of Mainland Southeast Asia, in which syntax and syntactic markers bear the weight of expressing agent–patient relationships. More linguists need to study the South-east-asianess of Malay, as suggested by areal phenomena such as convergence, serialization, and grammaticalization. As Duranti (1994, p. 102) wrote: “What we need to do is move beyond idealization of language, speech genres, and formalization and look at concrete examples of how language is used . . .”

Another comparative issue is at stake as well. Oetomo (1987), as outlined here, provided a detailed description and analysis of the language ecology of a small community of ethnic Chinese in a Javanese city. However, the documentation of this minority group’s language ecology should be the starting point for examining other ethnic Chinese communities in other parts of the Malay World. Recently Chong Shin (2005) broadened our perspective of the use and choice of languages among the Chinese in this region by studying the language ecology of such a community in the interior of Indonesia’s western Borneo. The fact that he noted an ecology considerably different from the one that Oetomo described should be a challenge to other linguists to carry this task to other areas and to other ethnic groups.

Finally, and perhaps of even greater importance is the need to study language maintenance and shift. Florey’s pioneering study of almost 20 years ago remains the only in-depth, empirical research on the processes of language change in a small community of the Malay World. She demonstrated the specific histories and psychologies that have had a deleterious impact on the survival of the Alune language in Lohiatala. The hundreds of other endangered languages of the Malay World merit just as meticulous a program of research.

THE ECOLOGY OF THE CHINESE  
LANGUAGE IN THE UNITED STATES

INTRODUCTION

Increasingly, leaders across public and private sectors are recognizing the rise of Asia as one of the central facts of the twenty-first century. Fundamental to this shift is China's tremendous economic growth and emergence as a social and political leader in the region. Responding to these changes, the educational system in the USA is scrambling to increase the number of American students who can demonstrate a functional proficiency in Chinese (Asia Society, 2005). The same task, only a few decades ago, would have been inconceivable. What are the factors that affect the prestige, desirability, and marketability of a language other than English? In order to answer this question, this chapter takes an ecological perspective by examining the Chinese case in the USA.

As a nation of immigrants, the USA has been caught in the ideological struggle about languages between *unum* (assimilationist) and *pluribus* (pluralist), which is symbolized in the motto of the nation, *E pluribus Unum* ("out of many, one") (Lo Bianco, 2001). The ecology of the Chinese language has also evolved as it responds to the waxing and waning of public discourses and language policies in the US context.

Building on the themes synthesized in Hornberger's language ecological framework (2003) and my own work (Wang, 2004), this chapter reports on Chinese immigrants and their languages in the USA. It is important to note that all varieties of Chinese spoken by Chinese people dispersed from China, Taiwan, Hong Kong, Singapore, and other South-East Asian countries, or in other parts of the world are referred to in this discussion.

EARLY DEVELOPMENTS

*Chinese Immigrants and their Languages in the USA (Evolution)*

Complicating the ideological struggle is the fact that different languages are placed in different hierarchical orders of need and importance based on their real or perceived economic, political, and socio-historical-cultural relationships with the USA and the world. Russian stands out

as a good example (Brecht with Caemmerer and Walton, 1995). The historical account of the status and positioning of Chinese speakers inside and outside the USA also illustrates this equation.

As early as the Revolutionary War, the first wave of Chinese settlers began to arrive. With the exception of a few wealthy merchants and students who were allowed to bring their families, most settlers were uneducated laborers from villages in southeastern China searching for work on the plantations in Hawaii and then in farms in California (Takaki, 1989; Tuan, 1998). These laborers, who looked and dressed distinctively different from other groups of settlers, came without families and were willing to work hard for longer hours and for lower wages. They stirred racial hysteria among white workers. A series of discriminatory laws, for example the Nationality Act of 1870, the Page Law of 1875, the Chinese Exclusion Act in 1882, and the Immigration Act of 1924 (Hing, 1993), coupled with their forced segregation into Chinatowns in various cities, drove Chinese male settlers into life-long bachelorhood. Before the Chinese Exclusion Act was repealed in 1943, Chinatowns were essentially communities of bachelors, instead of families. That explains why there were not many third, fourth, or fifth generation native-born ethnic Chinese in the USA before the 1970s, as compared with ethnic Japanese (Tuan, 1998).

After World War II, the public sentiment toward Chinese slowly changed from unfavorable to a more tolerant one. The year 1965 was a significant turning point for the Chinese when the Immigration Act was signed, which abolished racial discrimination against all immigrants and re-opened the doors for the Chinese. The subsequent immigration laws passed in 1970 and 1976 further changed the demographics of Chinese communities in the USA. Because these new laws gave preferences to those with professional skills or seeking family reunification, they brought many well-educated intellectuals and highly skilled workers who made up the second wave of Chinese immigration to the USA (Hing, 1993; Takaki, 1989). Instead of congregating in Chinatowns, these newcomers tended to spread out near major universities and into the suburbs.

In the late 70s and the 80s, the third wave of Chinese immigrants that consisted of four different sub-groups began to arrive. One was a large influx of refugees and *boat people* from Southeast Asia, many of whom were ethnic Chinese, who arrived during the decade from 1974 to 1984 as a result of the US policy in the area (Wong, 1988). The other group was a steady stream of working-class Chinese, both legal and illegal, who arrived in the USA from the People's Republic of China (PRC). Another group consisted of affluent people from Hong Kong and Taiwan, who came here under the immigration investment category. The last group included professionals, students, and their families

who came around and after the Tian'anmen Square Incident in 1989 from the PRC (Zweig and Chen, 1995).

Once again these four groups changed the landscape of the Chinese communities in the USA. For example, many traditional Chinatowns that are concentrated in metropolitan areas have expanded to become Asian-towns due to the influx of Southeast Asians and Chinese settlers. The more affluent people emigrating from Hong Kong and Taiwan have created modern versions of Chinatowns such as the "Chinese Beverly Hills" and "Little Taipei" in Monterey Park (California), Flushing (New York), or in many suburbs in California and New Jersey (e.g., Takaki, 1989). The continuous emigration of Mainland Chinese graduate students and scholars has also joined the second wave of Chinese immigrants from Taiwan and Hong Kong to move into the suburbs in significant numbers (Zweig and Chen, 1995). Not only do these professionals know how to insert themselves into the mainstream society, but they also quickly learn how to use their high human and cultural capital to build social capital to engage the dominant groups (Wang, 2004).

Similarly, the macro environment for the Chinese language has been changed as China transformed itself into an emerging global power, aided by the fact that Chinese-speaking regions such as Hong Kong, Singapore, and Taiwan are also important players in the global market economy. In theory, the prestige, desirability, and marketability of the Chinese language should be able to ride with the forces of globalization. In reality, however, the Chinese language has simultaneously been subjected to both endangerment and counter-endangerment actions in the US educational context.

## PROBLEMS AND DIFFICULTIES

### *Assimilationist Ideologies and Policies in the USA (Environment and Endangerment)*

To examine US language educational policies, Ruiz's concept of *language orientations* that analyzes each policy's underlying public attitudes is useful: language-as-problem, language-as-right, and language-as-resource (Ruiz, 1984).

The *problem* orientation stems from the US assimilationist ideology on learning the de facto official language of the nation, English. Under this view, and while English is not the official language of the USA, there has been a prevailing monolingual ideology in US society that immigrants and indigenous groups like American Indians and Alaskan Natives should give up their "little" languages that impede their assimilation to the society and are the root of their collective problem of poverty and underachievement (Kloss, 1978/1998; Macias and Wiley,

1978/1998, p. ix; McCarty and Zepeda, 1995). Since US Senator S.I. Hayakawa first proposed an English Language Constitutional Amendment in 1980, the discourse of *Unum* has been gaining ground. At least 24 states have passed English only legislation. Additionally, California (1999), Arizona (2000), and Massachusetts (2002) voters have passed anti-bilingual education referenda (Crawford, 2003).

Throughout the 60s and 70s, while the problem orientation continued to prevail, the view that language minority children should enjoy equal *rights* to education became a concern during the civil rights movement. The Bilingual Education Act was signed into law in 1968 with the assumption and hope that the bilingual programs established under this Act would rectify the linguistic handicap of language minority students and raise their school achievement (for more details on bilingual education policies and orientations, see Evans and Hornberger, 2005). It is interesting to note that the famous landmark case of Lau versus Nichols (1974) argued for the rights of a group of Chinese-speaking children to meaningful education (Ruiz, 1984).

This kind of environmental hostility toward immigrant languages is epitomized in the provisions of *No Child Left Behind* (NCLB, Public Law 107–110, 2001), which mandate that all children must be tested for their English literacy from Grades 3 through 8 in order for the schools or school districts to avoid punitive sanctions. Although the original intent of NCLB is to emphasize accountability for all children, the effect has been to reinforce the language-as-problem orientation. Based on the place of birth, date of entry to the USA, the assessed proficiency and literacy level in English and academic subjects, immigrant children, Chinese included, are subject to these provisions. The development of their heritage language and the notion of tapping into their heritage language as a resource for learning English and academic content have been glaringly absent in the discourses in and around the implementation of NCLB.

As assimilationist ideologies and educational policies continue to play out in the society, the *resource* orientation that has entered the public discourse since the late 1980s further complicates the issues of language education. On the one hand, competence in another language other than English has long been viewed as a desirable asset for English-speaking mainstream students. On the other hand, foreign language education (FLE) in the USA has been susceptible to world events and immigration patterns and has not received adequate support (Lantolf and Sunderman, 2001). The 9/11 terrorists' attacks on the US created a sense of urgency and resulted in a series of Congressional Resolutions (e.g., House Resolution 22; House Resolution 115; and Senate Resolution 28; see <http://www.languagepolicy.org>). As of the summer of 2005, however, FLE remained an intelligence and political issue in the US Departments of State and

Defense that had yet to be translated into policies of the US Department of Education.

Because of a lack of coherent and comprehensive language education policy, one consequence of this *crisis-response* approach has resulted in the *languages of the moment* phenomenon (emphasis is mine but see Lantolf and Sunderman, 2001 for detail). For example, the National Defense Education Act (NDEA) of 1958, enacted after the Soviet Union's launch of Sputnik, identified Russian as a critical language; so have Arabic, Chinese, Japanese, and Korean shared the spotlight in the discourses arguing for US national security and economic competitiveness. Slowly and gradually students of these and other home language backgrounds have been recognized as "heritage language" speakers who are viewed as personal and societal resources (Brecht and Walton, 1994; Fishman, 1968; Peyton, et al., 2001; Wang, 2004; Webb and Miller, 2000). However, as mentioned earlier, under the NCLB, heritage languages have continued to be viewed as barriers to students' achievement, which must be eradicated within 3 years of enrollment in the K-12 public educational system. The implications of these conflicting policies in the USA are evidenced in the fact that numerous bilingual educational programs and foreign language programs have been terminated or seriously marginalized (Crawford, 2003; Evans and Hornberger, 2005; Rosenbusch and Jensen, 2005).

## MAJOR CONTRIBUTIONS

### *Chinese Heritage Language Schools and Language Maintenance (Counter Endangerment)*

Because freedom of speech is considered a constitutional right of US citizens, the policy and attitude toward immigrant languages used in the private sphere of ethnic communities is "tolerance oriented," as categorized by Kloss (Macias and Wiley, 1978/1998, p. x), which means the use of non-English languages in communities or homes are neither prohibited nor encouraged. Under this *laissez faire* policy, Chinese heritage language schools came into being. These schools are examples of what Fishman calls *reversing language shift* (1991), as they represent efforts to preserve heritage languages in the dominant society.

Paralleling the immigration patterns of the Chinese, there are three major groups of Chinese community schools in the USA: the traditional Chinese schools in and around Chinatowns in large cities; the suburban Chinese schools established by the second wave of Chinese immigrants since the late 60s and 70s; and the Mainland Chinese schools since

the 80s. These three systems are independent of one another and usually do not interact.

The earliest US Chinese language schools began in the nineteenth century, and served the needs of a few Chinese merchants who were allowed to bring their families in Chinatowns in large cities on the West Coast. Because the residents of Chinatowns in the USA had traditionally come from Guangdong, most of these first type Chinese schools taught and still teach in Cantonese. The early Chinese schools were bilingual in nature because Chinese children were not allowed to attend public schools at the time. These private or church-run schools taught classical Chinese along with other subjects, and the language of instruction was Chinese (Chan and Tsang, 1983). Their goal, in addition to teaching the regular American curricula, was to prepare young Chinese scholars to continue their education in China should their parents return to the homeland. Later when public schools began to accept Chinese students, these community Chinese schools remained open but changed into either after-school programs or weekend schools. Today Chinatown Chinese schools continue to offer Cantonese, Taishanese, or Fukienese to their students. As Chinatowns have expanded to become Asian towns, these Chinese schools also offer instruction in Mandarin, Vietnamese, Hmong, or Cambodian as a home language and English as a second language (Hardman, 1994; Skilton-Sylvester, 1997). Because these Chinese schools service a large number of immigrant children, many of them have been incorporated into the local educational system and have become bilingual schools or service centers for new arrivals.

The second type of Chinese schools was established by the second wave of Chinese immigrants from Taiwan or Hong Kong, most of which teach Mandarin. Because Chinese is normally not available as a foreign language in American schools, and because of the Chinese tradition of setting up private one-room schools in the villages, Chinese families would often get together to set up their own schools, teaching children their ancestral language and culture at the weekends. These Chinese schools also had a humble start, operating in the basement of a church or a few rented classrooms from a nearby university or school (X. Wang, 1996). Since the early 1990s, because of the political movement driven toward independence in Taiwan, a new branch of Chinese schools emerged from the second-wave of Chinese schools and began to teach Taiwanese, a dialect related to Minnanyu, also known as Fukienese.

The third type of Chinese schools, also teaching Mandarin, was established by immigrant families from the People's Republic of China (PRC). These families followed the second wave of Chinese immigrants, and they faced challenges and issues similar to the second-type

of Chinese schools (for details about challenges facing Chinese heritage language schools, see X. Wang, 1996).

In 1994, with the support of the National Foreign Language Center (NFLC), the ten regional associations of the Taiwan/Hong Kong system formed the *National Council of Associations of Chinese Language Schools* (NCACLS). Its mission is to help the second type of Chinese schools meet the needs of their students, voice their concerns to the mainstream society, and forge a link between Chinese heritage language schools and the formal educational system at both the K-12 and college levels. In 1995, there were 82,675 students and 5,540 teachers in 634 Chinese schools nationwide (X. Wang, 1996). In early 2005, student enrollment was estimated to be around 100,000 (<http://www.ncacls.org/>).

Almost simultaneously in 1993, under the auspices of NFLC, the PRC group also formed a national organization named *The Chinese School Association in the United States* (CSAUS), whose membership quickly grew to 130 by 1999 and which expanded to 300 schools with 60,000 students in 2005 (see <http://www.csaus.org/>). Table 1 summarizes the chronological order, family origin, and languages taught in these three groups of school.

Since the 1990s, many Chinese schools have been experiencing a new phenomenon—the presence of non-Chinese families who adopted children from China. According to figures released by the Families with Children from China (FCC), the number of such adoptions has grown from a few dozen in 1985 to 5,053 in 2000, bringing the total number of adoptions from China since 1985 to 23,903 nationwide (<http://www.fwcc.org>, 2004, para 5). This special population presents another dimension of need because most of the parents are not

Table 1

| Group type            | Chinatown Chinese Schools                        | NCACLS  | CSAUS      |
|-----------------------|--|---|------------|
| Time of establishment | Nineteenth century                               | Early 1970s                                     | Late 1980s |
| Family Origin         | China, mainly from Guangdong or Fujian Provinces | Taiwan and Hong Kong                            | PRC        |
| Language taught       | Cantonese, Taishanese, Hakka                     | Mandarin, a few teach Taiwanese (a Min Dialect) | Mandarin   |

Chinese-speaking and do not practice Chinese culture. The majority of Chinese heritage schools are not equipped to service the linguistic and socio-cultural needs of these families.

In fact, because these heritage schools are operated by parents and community members, they are left alone to wrestle with a myriad of challenges such as teaching Chinese as a second language in the US context, getting trained teachers, developing content-rich curricula, finding adequate textbooks and assessment, as well as receiving credits from local schools or universities, to name some key examples. Their efforts have largely been unnoticed by the mainstream society (X. Wang, 1996; S.C. Wang, 2004). The national organizations marked the beginning of dialogue between the heritage and the formal educational sectors. The sense of urgency created in the post-9/11 context has finally brought the heritage language schools to the table of FLE.

#### WORK IN PROGRESS

##### *Promoting Chinese as a Foreign Language (Language Spread Efforts)*

In academic circles, taking the resource orientation to building national language capacities, numerous projects have been dedicated to linking the five sectors of the FL field: the formal educational system, the government, business proprietors, the home government, and the heritage communities (Brecht and Walton, 1994). The two national Chinese school organizations reflected one aspect of these efforts.

In the formal educational system, however, Chinese is a newcomer as opposed to the commonly taught European languages such as French, German, or Spanish. Because the National Defense Education Act Title VI of 1958, now Title VI of the Higher Education Act, focused the introduction of the non-Western European languages to a limited number of graduate programs in select universities, it did not have much impact on spreading the study of Chinese in K-12 schools (Moore et al. 1992, pp. 1–2). Two major private initiatives were instrumental for introducing Chinese to the US schools: The Carnegie Foundation's initiative in the early 60s throughout the 80s and the Geraldine Dodge Foundation's initiatives from the 80s through the early 2000s.

The Carnegie initiative took a top-down approach by establishing 7 university centers, under which 200 high school Chinese programs were built and supported. By 1980, only two Carnegie funded high schools still offered full-fledged Chinese language programs (Moore et al., 1992, p. 6). Building on the lessons learned from the Carnegie initiative, the Dodge Foundation's multi-million dollar initiative took

a bottom-up approach by establishing: (i) 60 high schools nationally, (ii) a Secondary School Chinese Language Center at Princeton University, and (iii) the *Chinese Initiative for Children* in 11 elementary schools in the State of New Jersey (Moore, 1992; Secondary School Chinese Language Center Newsletter, August 2002). To date, the Princeton Center has ceased to operate, and it is unclear how many of these Dodge-funded schools still offer the Chinese language.

Besides the Carnegie and Dodge initiatives, federal funding support has been limited to the Foreign Language Assistance Program (FLAP). First enacted in 1988 and 1990, respectively, FLAP grants award state and local educational agencies for 3 years to develop model programs that establish, improve, or expand foreign language study in elementary and secondary schools. In the 1992 reauthorization, Chinese was identified as one of the “critical languages” that should receive funding priority, but the funding had been too little and too competitive to put Chinese language programs on the map significantly.

Interestingly, the June 2004 National Language Conference turned out to be a defining event in the recent history of USFLE. The Departments of Defense, State, and Education, in partnership with the Intelligence Community and the Center for the Advanced Study of Language of the University of Maryland, hosted the conference and produced an influential white paper, recommending immediate and long-term engagement by public, private, and government agencies to improve the nation’s foreign language and cultural competency, particularly on critical need languages such as Arabic, Chinese, Russian, Hindi, and Farsi (<http://www.nlconference.org>). In response, President George W. Bush announced the National Security Language Initiative (NSLI) in January 2006, which was co-sponsored by the US Departments of Defense, Education, State, and the Office of the Director of National Intelligence, requesting 114 million dollars for fiscal year 2007 (<http://www.ncela.gwu.edu/spotlight/NSLI>).

On the non-governmental side, the College Board, the Chinese government, and the Asia Society have been important players in promoting the Chinese language in the USA. For example, the College Board is developing Chinese Advanced Placement (AP) courses and tests, along with Italian, Japanese, and Russian, to be available in 2007 (<http://www.apcentral.collegeboard.com>). The Office of Chinese Language Council International (commonly known as Hanban, see <http://www.hanban.edu.cn>) of the PRC has been engaging in a variety of activities ranging from teacher training, professional development, materials and curriculum development, to assisting the College Board to develop the Chinese AP Program. It also collaborated with the US Department of Education in developing a free-of-charge language

learning system in English and Chinese (<http://elanguage.cn>). The Asia Society convened a series of leadership meetings that produced a report about how to expand the Chinese teaching field and a handbook for establishing Chinese programs in K-12 schools (Asia Society, 2005, 2006).

Taken together, these initiatives illustrate how Chinese is gaining prominence in becoming an important foreign language in the USA. Time will tell if these efforts will come to fruition.

#### FUTURE DIRECTIONS

The Chinese case illustrates the following points about language ecological systems: First, numerous factors in the environment shape, enable, or impede the evolution of an ethnic community language in a hosting society; these include the language orientation of the dominant society toward the particular language and the real or perceived need for the language by its speakers and the society.

Second, the “fate” of an ethnic community is closely tied to who their members are; that is, race, ethnicity, national origin, education level, occupation, manner of entry, and the size of the group, to name some examples (Portes and Rumbaut, 2001). Immigration laws, political power and relations between the home and host countries, and the socio-cultural and economic impacts of the group as perceived by the dominant society also play important roles. The history of the Chinese groups in the USA provides strong evidence for how these factors have played out.

Third, an ethnic community group can counter language shift by engaging in intergenerational transmission of its heritage language and culture. The conditions for each group vary, but the mechanism and challenges are similar from group to group. By pooling the community’s resources, the group can create a space of its own in the dominant society (Wang, 2004). By maintaining its heritage language, the group is also helping the USA to maintain and expand its foreign language capacity.

Fourth, because the desire to form a unified national identity through language is strong in the USA, as seen in the motto of “*E pluribus Unum*,” immigrant children are always subject to the English language learning policies of the dominant society. While English proficiency is a ticket for social mobility for any individual in the US society, there is a danger in promoting a monolingual policy in the context of globalization. Such a myopic view will significantly reduce the human capital stock of the USA in the long run (Wang, 2004).

Finally, in building its foreign language capacity for the twenty-first century, the USA must re-evaluate its language educational policies in

a comprehensive way in order to avoid creating conflicting policies and engaging in practices that are counter-productive to the language needs of all children and of the nation.

The story of the Chinese language in the USA is a continuing saga. In this global age when the world's population is constantly and continuously migrating, this Chinese case helps shed some light on the field of language planning and language education in many contexts in the world.

## SMALL WORLDS: THE LANGUAGE ECOLOGY OF THE PENAN IN BORNEO

### INTRODUCTION

Borneo Island sits astride the equator, is 750,000 km<sup>2</sup> in area, and had an estimated population of 15 million people at the beginning of the twenty-first century. It is divided politically among Brunei Darussalam (hereafter Brunei), Indonesian Kalimantan and the East Malaysian states of Sarawak and Sabah.

The ethnonym Penan is used here generically to refer to those in Borneo who were, have been or, in a few cases, continue to live as nomadic hunter-gatherers, i.e. people whose economies are based on hunting wild game, fishing and gathering uncultivated plant foods, without plant or animal domestication other than dogs (cf. Lee and Daly, 1998). This article provides a brief socio-cultural outline of the Penan. This serves as an introduction to the language ecology of the congeries of Penan people in the East Malaysian state of Sarawak (124,450 km<sup>2</sup>, population approximately 2.18 million, capital Kuching) and the independent sultanate of Brunei (5,765 km<sup>2</sup>, population around 350,000, capital Bandar Sri Begawan), with close reference to the dominant languages and formal education in these states. This discussion does not include Sabah where there are no Penan; neither does it take account of Penan in the three northern provinces of Kalimantan (in Indonesia), whose circumstances are substantially different in a number of ways, largely historical and political, from the Penan in Sarawak and Brunei (for details of Penan in Kalimantan see, for example, Sellato, 1994).

### EARLY DEVELOPMENTS

There are three main ethnic groups in Borneo, Chinese, Dayak and Malay. The Penan are part of the Dayak group of peoples who are generally seen as indigenous to Borneo and non-Muslim. Penan in Sarawak and Brunei currently number around 11,000 people and thus constitute an ethnodemographic minority (cf. Haarmann, 1986). They traditionally inhabit mountainous areas between river basins and can be divided into Western and Eastern Penan. The Western Penan are situated upriver in Sarawak between the state's two longest rivers, the Rejang and the Baram, and generally comprise larger communities than their Eastern

counterparts. The Eastern Penan also live mostly inland, east of the Baram River as far as the Limbang River watershed, with one small community in the southern part of Brunei's western enclave. Compared to Western Penan, nomadic Eastern Penan encampments are of shorter duration, they generally have smaller foraging areas, and less developed institutions of group leadership. The two broad varieties of the Penan language (Eastern and Western), although there is diversity within these, are dialects of Kenyah (Blust, 1972; Sercombe, 2002), a language of a Central Bornean group of settled agriculturalists; and the linguistic division of (Eastern and Western) Penan coincides with the socio-cultural and geographical separation of the two clusters.

Detailed information about the Penan has only been available since the 1950s (prior to which little had been written of Borneo's hunter-gatherers), including Needham (e.g. 1953) comprising ethnographic work mostly on Eastern Penan; Langub's (e.g. 1974) ongoing interest in and accounts of Penan transition to settlement, along with their reactions to development, including formal education; and Brosius' (e.g. 1986) work among Western Penan. The latter two authors have foregrounded the often depleted social circumstances of Penan communities in Sarawak.

There are a number of salient points regarding the Penan's changing ecology, including the following: they have largely shifted towards sedentism (sometimes under pressure and sometimes voluntarily) since the middle of the twentieth century, although individual groups continue to maintain a sense of political independence. Settlement, however, has not necessarily brought an improvement in quality of life, according to Penan (Sarawak News, 2002; Voeks and Sercombe, 2000 among others). With sedentism has come increasing contact with settled groups, representatives of government and national institutions (although minimal exogamy) and greater exposure to other languages, with the Penan very much an ethnosociological minority (cf. Haarmann, 1986). Most Penan are now involved in slash-and-burn rice agriculture (albeit not always successfully) and or wage labour, although most still continue to hunt, collect uncultivated wild flora, and other forest products for sale or trade, where this is viable. Eastern Penan have an egalitarian form of social organisation and a limited suite of ritual traditions, although these have been affected in two main ways: conversion, among many communities, to Christianity (in Sarawak) and a sense of shame about traditional beliefs (Sercombe, 1996); and Islam (by nearly half the Penan group in Brunei) and acquisition of language associated with this. Secondly, there has been the introduction of a government-paid stipend for village headmen in both Sarawak and Brunei, increasing socio-economic differences within communities. Extensive extraction activities practised by government-licensed logging companies in Sarawak

have also resulted in a loss of resources and material hardship for many Penan (although not in Brunei). All the above-mentioned factors have affected symbiotic relations within communities with, for example, the waning of the practice of sharing perishable resources; and have also brought about some borrowing of Malay language features into Penan (Sercombe, 1996). The Suai-Niah Penan in Sarawak's Miri District, however, unlike many Penan communities, have made a less painful transition to settlement, since settling on the coast (Langub, 1996), but they have access to roads, local markets and government services which other Penan do not.

#### MAJOR CONTRIBUTIONS

The hegemony of the Malay-dominated government in Brunei (Martin, 2002) and Sarawak over other ethnic groups is an ethnopolitical variable (cf. Haarmann, 1986) that affects the language ecology of the Penan in a number of ways, a significant aspect of which is education. State schools do not exist in a vacuum but within a larger social and cultural context and language and literacy education (qv. *Literacy*, Volume 2) can be as much about the distribution of knowledge and power in society as the imparting of skills, such that education is an agent of social control rather than nurture. Schools in Malaysia and Brunei act as conduits for curricula that reflect government-led views, including the importance of Malay as the dominant national language, Islam as the principal religion and English as, in effect, 'the' foreign language, largely ignoring local language ecologies. In interior parts of Borneo, neither Malay nor English is endemic. Both have relatively little ethoglossic value in districts inhabited by Penan in Sarawak or Brunei. Malay, nonetheless, is more accessible to Penan, than English, as a language that is typologically closer to their own; and is more likely to function as a lingua franca between local inhabitants and teachers or other government representatives, from parts of Brunei or Malaysia who are not cognisant of Penan or other local languages. Nonetheless, the imposition of Malay and English contributes towards an 'artificial ecology' (Mühlhäusler, 2000, p. 326), in areas inhabited by Penan. Martin (2002) describes 'race', 'language' and 'nation' as central to the language ecology of Brunei. These are also significant to the language ecology of Sarawak. It is through Malay that state-controlled ideology is attempting to solidify or, in the case of Brunei, homogenise its populous (qv. *Language Policy and Political Issues in Education*, Volume 1). In the same way 'English was used to spread Christianity and western civilisation, so Malay is being used to spread Islam and Islamic civilisation' (Mühlhäusler, 1996, p. 209), in both Brunei and Malaysia.

In upriver areas, where most Penan live, there are few Chinese traders or permanent Malay inhabitants. Penan are exposed to at least

three languages, apart from their own. Firstly, there is the language(s) of their settled neighbours, most likely to be Kayan, Kelabit, Kenyah or Sa'ban in Sarawak; or Dusun and Iban for Penan in Brunei. Penan are primary bilinguals in acquiring a neighbouring language without instruction, and balanced in their use often by having near first language levels of proficiency (qv. *Knowledge about Language*, Volume 6). The second local language is additive in that it is useful, as a means of communication within the wider district level speech community, and is acquired without pressure, or at the expense of Penan (Sercombe, 2003). At primary school, pupils receive instruction in Malay, the national language of both Brunei and Malaysia, the Penan's third language, with English being a fourth (other) language, in which few Penan achieve a functional level of proficiency. However, since 1985 in Brunei, the supranational language, English, officially became the medium of instruction for geography, science and mathematics, as well as English language, from the fourth year of primary school (qv. *Bilingual Education*, Volume 5). Penan are generally multilingual and, if they learn to read and write, they are monoliterate in Malay, in Brunei; while in Sarawak, Penan become both multilingual and, if they gain reading and writing skills, biliterate in Malay and Penan, often having access to religious texts in their own language. Thus, for most Penan language is not a binary but a multidimensional issue. It is, however, uncommon (and unknown in Brunei) for members of other ethnic groups to acquire or learn Penan (qv. *Second and Foreign Language Education*, Volume 4).

Penan children's entry into formal education influences interactional, ethnocultural and ethnolinguistic aspects of their language ecology (cf. Haarmann, 1986). Penan living in the interior are dependent on education as a means of upward social mobility, the only way they are likely to improve their economic lot. Penan endorse the value of formal education, but have long had a poor record of success in formal education (in Sarawak and Brunei), achieving low levels of text literacy, compared to their traditionally settled neighbours, with few Penan completing primary education and even fewer progressing to secondary, let alone higher, education. Kedit's (1982) ecological survey of the Penan in the middle Baram area of Sarawak revealed that, among six Penan communities, only a handful of individuals from three groups had attended any formal education. Langub (2000) reported on five Western Penan communities, in the Belaga District of Sarawak. At that time, no Penan child from this district had completed secondary education, mainly due to financial hardship, or some form of exploitation. Sercombe (2002) found a similar situation in Sukang primary school in Brunei, where Penan comprise the majority of school pupils, but have the lowest rate of academic success, with only one Penan ever

having progressed to secondary education (since 1964). Officially, English is the main medium of instruction in the upper 3 years of primary school, in Brunei, but there are few Penan pupils in these year groups and those few were unable to produce more than a few phrases or brief formulaic utterances in English, after 6 years of exposure to the language. As Cummins (2000, p. 103) suggests: 'major causal factors in linguistic minority students' underachievement are socio-political in nature.' Sercombe (2002) also found reduced levels of knowledge of Penan traditional activities and material culture, with many Penan children in Sukang (in Brunei) no longer aware of Penan neonyms or teknonyms, language related to processing sago or the names of certain hunting tools. The result is that while Penan children are not succeeding at school, they are also losing touch with their own heritage (qv. Knowledge about Language, Volume 6).

In June 2002, in the Baram River district of Sarawak, Penan area representatives evaluated a range of features of quality of life, including government rural educational provision, with an 'F', the lowest possible rating (Sarawak News, 2002). Nevertheless, there has been educational advance for some Penan. Established in 1957, at Long Lamei in the upper Baram, the first primary school located in a Penan village, with trained qualified Penan teachers has probably produced more Penan primary school graduates than any other school in Sarawak (although not without some of the problems already mentioned). Unfortunately, those Penan who do progress academically are less likely to return to their own communities (Sercombe, 2002).

#### WORK IN PROGRESS

Hunter-gatherers had, until a relatively short time ago, generally not lived under the yoke of national governments. In the twenty-first century, there can hardly be a hunting and gathering community around the globe that has not been, in some measure, affected by the emergence of the centralised nation state, with its inclination towards national uniformity (Lee and Daly, 1998) and the incursions of industrialisation, often in areas inhabited by hunter-gatherers. However, the domination of ethnic minorities has generally been seen as in their best interests, by the state at least (Sellato and Sercombe, 2007); and Penan have been expected to 'adopt the discourse of development and all its entailments' (Brosius, 1993, p. 47), with nomadism otherwise being perceived as indicative of backwardness and anarchism.

With specific regard to the ecology of state schools and language education, there are a number of issues which affect Penan's levels of achievement. There is little similarity between rurally located Penan village schools and those in urban parts of Malaysia and Brunei:

physical inaccessibility (frequently only by river or footpath), limited access to resources (such as print and electronic media) and services (for example, electricity is often only available for part of the school day, if at all); teachers from coastal areas may resent being posted to an upriver school, a sentiment that can be reflected in their perceptions of Penan as having low social status, as ex-hunter-gatherers and their attitudes towards Penan, as is the case in Brunei (cf. Rousseau, 1990; Sercombe, 2002). Teachers are unlikely to know Penan, may speak Malay as a second language (particularly in Sarawak, where Malays are in a minority) and know English as a foreign language. Few Penan reach the necessary level of language proficiency in Malay (and certainly not in English) in order to benefit from state education.

There is a contrast between the formal stratified and disciplined setting of the school compared to the more informal, egalitarian environment of Penan communities and homes. Schools tend to be male teacher-dominated, unlike Penan domestic contexts where women are of similar numerical and social status. There appears to be a schism between the traditionally oral, fluid culture of the Penan and the teaching of literacy (and other) skills in schools. Learning in school is compartmentalised and there are clear levels of social stratification with concomitant individualisation (implying privacy and isolation) versus communality. The hierarchical and competitive nature of schools with their regimes of authority are at odds with the atmosphere of social autonomy and traditional means of learning and sharing knowledge in Penan society. Penan children's homes are places where the acquisition of life skills tends to be holistic. In literacy, language tends to be isolated, such that printed text has independent meaning (unlike spoken language) and the object rather than the conduit for analysis, divorcing it from the experiences of Penan. Very rarely are the benefits of literacy obvious in school so that Penan children can see how they might gain from reading and writing.

Penan children's behavioural and learning styles also appear to be at odds with those of the institutions in which they are taught (cf. Heath, 1983). Penan children tend to learn by observation and imitation (an inductive process), a form of apprenticeship, rather than through explicit verbal instructions (often a deductive process). Talk itself is frequently more of a social than a formal or transactional function for Penan; and participation in discourse is voluntary, such that non-participation is not necessarily equated with non-cooperation. Penan parents tend not to foster individual academic ambition through, for example, the domestic use of Malay, as do parents of children from other ethnolinguistic groups, in Brunei in particular (Martin, 2002). However, Penan parents say that they value the idea of educational

success although they do not expect it, based on past experiences (Sercombe, 2002).

Teachers' expectations in Bruneian and Malaysian schools often reflect the myth of the 'universal child' (Christie and Harris, 1985, p. 81) and little credence is given to Penan worldviews. Penan pupils' performances seem to fulfil teachers' perceptions of them as lazy and academically weak (Sercombe, 2002). Penan children are also generally unused to overt criticism, which they are less likely to experience in their own communities. This does not encourage them to pursue formal education, given what may be a miserable experience, the acquisition of a fairly negative self-concept and the absence of parental pressure.

Penan gain no personal or official recognition or credit for their first language knowledge and teachers from elsewhere often do not speak Penan and may prohibit Penan from using their language in the classroom (qv. Knowledge about Language, Volume 6). The national curriculum has no Penan history, stories, myths, pictures, language or songs. The media of education (Malay, and English in particular) have very limited functions for the Penan outside the immediate school environments and, as Malone (2004) suggests, the success of children in second or foreign language immersion education depends on their economic status. Beyond the school, most Penan children have little access to either of these languages, either through the media, or through social contact with groups who use Malay or English, given their limited mobility and their levels of poverty.

#### PROBLEMS AND DIFFICULTIES

If adaptation to settlement has been a major upheaval for human beings in general, then few Penan have been able to make the shift, as citizens of either Brunei or Sarawak, in ways that might (economically) benefit their communities. The major challenges faced by Penan are common to hunting and gathering groups elsewhere who have made, or who are making, the transition to settlement. Foremost among these, for the Penan, is the attenuating ecology of their physical environment, through the commercial exploitation of the rainforest (under the state's approval) in Sarawak, on which they have long depended. This has embittered many Penan towards the state, in the light of: firstly, their concept of *molong*, a form of stewardship that involves judiciously preserving and fostering natural primary resources. And, secondly, their own close emotional relationship with the landscape, its association with significant past events, genealogies through granting names of geographical features to relatives and friends, and vice versa, and the inter-relationship of these connections in their language.

The Sarawak government's position was made explicit, however, in a special 1992 state-administered Sarawak Museum exhibition, the point of which was to show the Penan entering the mainstream of Malaysian society (Brosius, 1993). And it was as far back as 1937 that the British influenced Brunei government had decided it would be unable to provide education in different local languages, and moved towards the idea of assimilating non-Malay peoples (Brunei Government, 1938).

Within Malaysia and Brunei's language ecology, language planning takes little account of pupils who come from non-Malay-speaking backgrounds (qv. Language Policy and Political Issues in Education). Children from ethnolinguistic minorities are under external pressure to be multilingual in Malay and English if they are to progress in education and beyond. They have to acquire a sufficient command of the selected medium if they are to profit from the education system. This can be seen as a form of transitional bilingualism that aims (deliberately or otherwise) at the reduction of linguistic diversity and language shift.

Penan is still the language of primary socialisation among most communities; and Penan continue to use their language as their social networks remain primarily rooted among their own ethnic group. They have mostly not succumbed, as yet, to a trend of acculturation towards Malay, as has happened among other groups in Brunei (Martin, 2002). For the few Penan who have been able to improve their situations since settling, this has often taken place outside their own communities and the intra-ethnic domain of Penan language use, sometimes with a shift to another language.

The lack of Penan materials in written form does not seem to have affected the chances of its continuity. There is an orthography for Penan and most of the Bible (Bible Society of Singapore, Malaysia and Brunei, 1974) is available in Sarawak in Eastern Penan, albeit the result of a standardisation process that makes it appear somewhat stilted and removed from the way Penan is used orally.

#### FUTURE DIRECTIONS

The prognosis for the language ecology of Penan, within the context of Brunei and Malaysia, is uncertain at the present time. Penan in Sarawak are affected by issues of logging and customary native land rights; and in Brunei, they number less than 60 people, are not seen officially as indigenous to the state and are under ongoing pressure (of prosyletisation and financial incentives) to embrace the national religion (Sercombe, 2002).

While Malay and English may be suitable as media of education, their roles are not being articulated as appropriately as they could be,

given the low success rates of Penan in formal education and the national language ecologies of Brunei and Malaysia. This should have implications for the content and style of educational provision in both Sarawak and Brunei. Policy makers and planners would do well to engage with Penan communities as there is certainly a need for schools to work with, rather than in opposition to, the homes of Penan pupils. At a minimum, some account needs to be taken of Penan communities at large in, for example, the orientation of posted teachers, if there is to be any improvement in Penan children's rates of academic success. Greater Penan participation in social institutions, to which they presently have only limited and often token access, is likely to lend Penan a greater sense of involvement in the (planning of their) future. Moll (1992), for example, supports the idea of a socio-cultural approach to bilingual education that utilises the resources available in children's communities, 'funds of knowledge', such that the domestic community becomes a resource and is legitimised to the same level as school knowledge.

Even so, outside of state intervention, neighbouring group languages contribute towards a balanced local ecology (cf. Mühlhäusler, 2000), where patterns of language use are very different from those in coastal parts of Borneo island. Penan, by dint of their relatively remote rural circumstances, have more chance of maintaining their language, where current group cohesion is greater than if they lived in urban circumstances (where the possibilities for group fragmentation, disparate social networks and exposure to other social variables would be greater). Penan are both positive about both their own language (Sercombe, 2002) despite there having been a case of language shift among one community in Sarawak (Needham, 1965); and in Brunei at least, there being signs of language change (with the adoption of Malay terms, even where there are Penan equivalents) and shrinkage (with the decline of necronymy and tekronymy), as well as a case of shift among Penan individuals (Sercombe, 2002).

Neither Malaysia nor Brunei will be able to resolve many of their challenges in language and education until politicians, planners and educationists are clear about the criteria they are using to decide 'what is best for children: knowledge acquisition, individual growth, economics, national unity, religious development or ethnic identity maintenance' (Clammer, in Gaudart, 1987, pp. 544–545) (qv. Language Policy and Political Issues in Education).

## THE MOROCCAN COMMUNITY IN THE NETHERLANDS

### INTRODUCTION

In January 2005, 314,699 people of whom at least one parent was born in Morocco were living in the Netherlands, among a total population of more than 16 million. More than 1.5 million people have a non-Western background. The largest groups are Turkish, Surinamese, Moroccan and Antillean/Aruban, as can be seen from [Table 1](#).

Most members of non-Western minority groups live in the major cities, but they are not equally distributed. In both Amsterdam and Utrecht, the number of Moroccans is higher than the number of Turks. But in cities like Rotterdam, Den Haag, Arnhem and Deventer it is the other way round, as illustrated in [Table 2](#).

The focus of this article is the Moroccan minority in the Netherlands. It was in the 1960s and 1970s that Moroccan men started to come to the Netherlands as migrant workers. At the time, it was not their intention to settle in the country. However, from the 1980s onwards many workers were joined by their families, and they did indeed begin to settle in the country.

In Morocco, approximately 30–40% of the population are Berbers who use one of the varieties of Berber as their mother tongue. Usually, three main groups of Berber languages are distinguished: Tarifit or Rifberber, spoken in the Northern Rif mountains; Tamazight in the Middle-Atlas region; and the variety of Berber in the South is referred to as Tashelhit. The remaining 60–70% of the population speaks Moroccan Arabic, which is the lingua franca in the country.

Arabic and Berber differ from each other in many respects, but since they have been used alongside each other for a long period of time, they have mutually influenced each other. In the Netherlands, however, 70–80% of Moroccans originate from the Berber speaking Rif mountains, in the North of the country. Among the first generation, Moroccan Arabic is the lingua franca, as in Morocco, but among the second and third generations, Dutch is dominant. More general introductory information about Moroccans and their languages in the Netherlands can be found in Dorren (1999) and Otten and de Ruiter (1991). Maarten Kossmann published bilingual traditional stories from Berber communities (Kossmann, 2003).

| <i>Netherlands</i> | 16,258,032 | 10.1          | 1.9        | 2.2       |

The sections below provide some information on Moroccans and their languages in the Netherlands. Due to space constraints, the choice of literature is selective. It will, however, become clear that in the past 30 years the focus has taken into account both an educational and linguistic perspective. In the final section of this article, some problems concerning research and the Moroccan community in the Netherlands will be touched upon.

#### EARLY DEVELOPMENTS

Since the presence of Moroccans in the Netherlands is relatively new (about 40 years), the earliest studies appear from the late seventies onwards, written mainly in Dutch. These mainly focus on the acquisition of Dutch by Moroccans and other migrant workers, as well as on

problems arising in educational contexts. Many of these early sources take contrastive analysis or error analysis as their starting-point (for example, Coenen, van Wiggen and Bok-Bennema, 1978). In addition, teaching Dutch as a second language was and continues to be a central theme (qv. Kramsch, *Applied Linguistic Theory and Second/Foreign Language Education*, Volume 4). Another source worthy of note is that by Appel, Cruson, Muysken and de Vries (1980), which is a collection of articles focusing on language problems in education, and the acquisition of Dutch. In the majority of the articles in this collection, Moroccans and Turks are treated as one group, due to the similarities between the two groups, even though the linguistic profile of the two groups is different.

Beside studies on educational aspects, there have also been studies which provide a sociological or anthropological perspective, and these are useful for those who wish to study the Moroccan community in the Netherlands. There are also works targeted at an audience which is not familiar with the Moroccan community in the Netherlands. For example, van den Berg-Eldering (1982) investigated the motives, norms and values of single men who had migrated to the country, both prior to migration and when they were in the Netherlands. She concluded that the main reasons for Moroccan wives and children to migrate and join their husbands were family problems at home and an attractive and cheap system of social welfare and health care in the Netherlands. Usually the intention was to return to Morocco after a relatively short stay in the country. Families were in no way prepared for the Dutch way of life and their migration frequently lead to culture shock. In another study, van der Meer (1984) investigated the Moroccan styles of communication and how this was different from Dutch communicative processes. One example is the way in which Moroccans experience illness and how this might cause misunderstandings between doctors and their Moroccan patients.

In 1982, Roel Otten published an article about language problems for Moroccans learning Dutch (Otten, 1982). In this article, he sketched the complex linguistic situation in Morocco, and focused on differences between Rif Berber and Dutch, at the phonological, morphological and syntactic levels. For each of the levels mentioned, he predicted the problems Berber-speaking Moroccans would encounter in learning Dutch based on first language transfer. For example, Dutch has more vowels than Berber, leading to the difficulty in distinguishing between Dutch minimal pairs such as *bom-boom* ('bomb'-'tree') and *deur-duur* ('door'-'expensive').

Appel (1984) focused on the sociolinguistic and psycholinguistic aspects of second language acquisition in Holland. He refers to the evaluation of an experimental transitional model in primary education.

In this model, Turkish and Moroccan children were taught through their native language in the first year, and gradually Dutch replaced their first language. The conclusion was that there were no negative effects on the children's school success. In 1993, Erin Wagenaar published a book about the same topic, though focusing on younger (4–6 year olds) children (Wagenaar, 1993) (qv. Cruickshank, *Arabic-English Bilingualism in Australia*, Volume 5).

#### MAJOR CONTRIBUTIONS

Following the earlier studies referred to in the section above, the focus on the linguistic ecology of the Moroccan community in the Netherlands as linked to the education of members of that community gradually became broader. Studies on mother tongue teaching gained momentum and more attention was given to issues such as bilingualism, code-switching and language attrition.

#### *Minority Language Teaching*

In the Netherlands, mother tongue teaching to Moroccan children in Dutch primary schools was supported by the government from 1974 until August, 2004. In the early years, the purpose of this type of education was to facilitate re-migration to Morocco, and to serve as an extra help for children who had just arrived, and to avoid alienation from their community. In the early years, schools with a certain minimum of Moroccan children could provide 2.5 hours of mother tongue teaching within school hours. Teachers usually commuted between schools which made it difficult for them to get involved in the different schools, and to stay in close contact with other teachers in the same school. Therefore, these teachers were often more 'outsiders' than 'insiders'. After 1980, when it became clear that most Moroccans would not return to Morocco, the main purpose changed from re-migration to help avoid identity problems and to facilitate the acquisition of Dutch and integration into Dutch society (van de Wetering, 1990).

The short history of Moroccan mother tongue teaching in the Netherlands has been beset with problems, and there are also issues to do with political will. One of the main problems in mother tongue teaching to Moroccan children was a matter of language choice. For the Moroccans themselves it was unacceptable that the oral languages Moroccan Arabic or Berber would be the languages to learn. Written proficiency is only possible in Standard Arabic, which is highly prestigious and very different from both oral languages. (cf. Suleiman, *The Language Ecology of the Middle East: Jordan as a case study*, Volume 9) One major problem, for example, was that there were not enough teachers in the Netherlands,

resulting in the recruitment of teachers who came straight from Morocco without any knowledge of Dutch language and society.

In 2002, minority language teaching became the responsibility of the municipalities instead of the central government. In addition, a distinction between the first and last years of primary education was made: in the first four years (age 4–8), minority language teaching would take place within school hours, and it would serve to facilitate the acquisition of Dutch as a second language. In the last four years (age 8–12) it was only meant to strengthen cultural identity and it had to take place outside regular school hours. However, the new structure set in place in 2002 ended in 2004 when all government support for minority language teaching was withdrawn. Initiatives that were in place were thus never allowed to develop (qv. Pennycook, *Critical Applied Linguistics and Language Education*, Volume 1).

The use of Moroccan languages at home and in school is discussed in Extra and Gorter (2001) and Extra, Aarts, van der Avoird, Broeder and Yağmur (2002). In the latter, results of a survey showed that more than 90% of 4–17 year old Moroccan children (both Berber-speaking and Moroccan Arabic-speaking) are able to understand and speak Berber or Moroccan Arabic. It was found that of the youngest children, 45% had a preference for Moroccan Arabic or Berber. At age 10–11 this decreased to 25%, but it increased to 36% at the age of 17.

One further contribution is that of Bos (1997), who has studied the bilingualism of school-age Moroccan children in the Netherlands. The book focuses mainly on the development of bilingualism before the age of 12, and it provides little information on the relation between bilingualism and educational achievement.

### *Linguistic Aspects*

Within the Dutch context, it is impossible to see Moroccans and their languages as independent from educational and political developments in the country. There are a number of studies which focus on the contact between Berber and Moroccan Arabic on the one hand, with Dutch, on the other.

De Ruiter (1989) studied proficiency in Moroccan Arabic and Berber and proficiency in Dutch among Moroccan children, noting that some informants were no longer able to express themselves in Moroccan Arabic or Berber. He cautioned against use of the term ‘mother tongue’, preferring in its place the term ‘original language’.

In 1990, one of two studies on code-switching between Dutch and Moroccan Arabic appeared (Nortier, 1990). In this book, information is provided about the speakers’ backgrounds, their bilingual proficiency, and the functions and positions of the languages involved, both in

Morocco and the Netherlands. The data showed that code-switching is a common phenomenon in contact between bilingual Moroccans. Code-switching within sentence boundaries (intra-sentential switching) and the insertion of single Dutch words in Moroccan Arabic statements were more frequent than switches between sentences.

A second book on code-switching between Dutch and Moroccan Arabic is that by Boumans (1998). This study is more linguistic in nature and is mainly concerned with the development of a theoretical framework, based on Myers-Scotton's Matrix Language Frame (MLF) Model, which Boumans has adapted to fit his data. The main claim in the MLF model is that in code-switching, there is always a base (matrix) language which sets the grammatical frame in which elements from the other language may be inserted. Instead of referring to matrix language and embedded language, Boumans proposes Community language versus Superimposed language, a distinction based on more sociolinguistic principles than Myers-Scotton's distinction.

In the Netherlands, there is an ongoing process of language shift. The native languages Moroccan Arabic and Berber are clearly being replaced by Dutch. At least two studies have focused on language shift and loss among Moroccans. El Aissati (1996) studied the loss of Moroccan Arabic and E-Rramdani (2003) compared the acquisition of Berber in the Netherlands and Morocco. El Aissati showed that his group of 25 second-generation informants used more Dutch than Moroccan Arabic in daily life. Moreover, proficiency in Dutch is higher than in Moroccan Arabic. The lower Moroccan Arabic proficiency, the more problematic correct plural formation was. Also on the syntactic level, for example, with respect to the formation of relative clauses, the control group in Morocco performed better than the Moroccan informants in the Netherlands. Comprehension of Moroccan Arabic sounds was not different from the control group in Morocco, but production was affected by Dutch.

E-Rramdani conducted a study among 4–5 and 12–13 year old children in the Netherlands and Morocco, in which he focused on grammatical morphemes and the command of different word orders in Tarifit-Berber. Of the three possible word orders, one (VSO) was absent in the children's speech, both in Morocco and in the Netherlands. This is surprising since Berber is assumed to be a VSO language. This might be an indication of a change in progress.

#### WORK IN PROGRESS

In Amsterdam and Tilburg a project entitled Development of Academic skills at School and at Home (DASH) is being carried out among Moroccan and Turkish students over the period 2004–2009.

The Moroccan (that is, Berber) part of the study is being carried out by Mohammadi Laghzaoui and Yahya E-Ramdani and is titled 'Academic language development of 3–6-year-old Moroccan–Berber (–Dutch) children in communicative contexts at home and in school'. Since Moroccan children entering Dutch schools face a range of language-related problems, a smoother transition from home to school is one of the aims of the study.

Since the late nineties, there has been considerable interest in the ways adolescents in ethnically mixed groups use Dutch. A lot of words in these youth languages have their roots in other languages spoken in the Netherlands, such as Sranan (Surinamese creole), Papiamentu, Arabic, Berber, Turkish and (American) English. This urban variety is only used in very specific and informal contexts, preferably among insiders and only when adults such as parents and teachers are absent. In cities like Amsterdam where there is a large Surinamese minority, Sranan lexicon dominates the non-native lexicon and in Utrecht with its relatively large Moroccan minority, the influence from Moroccan Arabic and Berber is strong. This, and other multilingual and multicultural phenomena related to Utrecht are presented in Bennis, Extra, Muysken and Nortier (2002) which summarizes the findings of an interdisciplinary study on the mixing of languages and cultures in a multicultural neighbourhood in Utrecht. This book, written in Dutch, has a comprehensive list of references, many written in English.

Several studies in progress are concerned with language use among teenagers and adolescents. Two of them will be mentioned here. During the period 2005–2009 a large-scale quantitative project is being carried out in Amsterdam and Nijmegen. In this study, ethnolects of Dutch are studied among Moroccan, Turkish and Dutch 11–19 year old males<sup>1</sup>. In a separate study, in Utrecht, Margreet Dorleijn and Jacomine Nortier, are carrying out a qualitative study in which they focus on the use of a Moroccan (both Berber and Moroccan Arabic) accent and intonation in Dutch, which has strong covert prestige. It appears that not only Moroccans, but also others such as teenagers with a Dutch or Turkish background make use of this recognizable accent and intonation (Dorleijn, Nortier, Boumans, Cornips and El Aissati, 2005).

#### PROBLEMS AND DIFFICULTIES

Despite the increasing number of studies on the changing language ecology of Moroccans in the Netherlands, there is nevertheless a lack of literature on Moroccan Arabic and Berber. This is linked to the

---

<sup>1</sup> More about this project can be found on <http://www.meertens.knaw.nl/meertensnet/wdb.php?sel=3239&ql=ethnolects>

low status of these oral languages and the fact that there is no real standard for Berber and Moroccan Arabic. Another problem is that until recently, there was little possibility for native speakers of Dutch to learn Rifberber in the Netherlands, even though courses in Moroccan Arabic have existed for some decades now. It is possible that as native Berber speakers have now started to obtain research positions in universities in the Netherlands more work will appear in the future.

In the last few years, political developments as well as incidents in which members of the Moroccan community were involved have negatively influenced public opinion about the Moroccan community. As a group, and often as individuals, they are highly stigmatized. The government's reaction is that integration into Dutch society should have priority above emancipation and development of Moroccan languages and culture. One major issue then, is how young Moroccan adults deal with the combination of home and mainstream culture (Ait Ouarasse, 2004).

#### FUTURE DIRECTIONS

Work in progress stresses the importance of understanding the interdependency of language and societal processes. It is to be expected that this tendency will be elaborated on in the future, though one can never be sure about the impact of socio-political developments. It will be a major challenge to show that the stigmatized position of a large group of immigrants, like the Moroccans in the Netherlands, is not caused by intrinsic characteristics of the group itself, but by the way that this particular group and other parts of society react to each other. Furthermore, an increasing focus on success factors of social mobilization within minority groups could have positive practical consequences. It would be good if future research could show that mother tongue proficiency influences overall performance and self-confidence, both on the individual and on the societal level. It is to be hoped that this is more than wishful thinking.

## **Classroom Language Ecologies**

## POLICY, PRACTICE AND POWER: LANGUAGE ECOLOGIES OF SOUTH AFRICAN CLASSROOMS

### INTRODUCTION

The linguistic ecologies of South African classrooms are embedded in complex local, national and global linguistic ecologies, with far-reaching implications for access and equity in education.

South Africa is a multilingual country with 11 official languages now recognised in the democratic Constitution of 1996 (South Africa, Constitution of the Republic of South Africa, 1996) (see [Table 1](#)).

Multilingualism is considered the norm (Makoni, 1994, p. 20; Reagan, 2002, p. 421) and the Language-in-Education Policy (LiEP) states, ‘being multilingual should be a defining characteristic of being South African’ (South Africa, Department of Education, 1997). This is symbolised by the national anthem (South Africa, Department of Education, 1997), which has four verses, each in a different national language: Xhosa, Sotho, Afrikaans and English.

Despite attempts to promote linguistic equality and raise the status of African languages, English, the home language of only 8% of the population, continues to dominate the linguistic landscape at the centres of political, economic and social power (Wright, 2002). Although African languages are widely spoken at regional and community levels, particularly in rural areas, and are valued as languages of intimacy (Haugen, 1972, p. 329) and as symbols of cultural identity (Banda, 2000), the dramatic drop in the numbers of students studying African languages at universities (Wright, 2002) seems to indicate that they are losing rather than gaining status. Afrikaans, which was an official language alongside English prior to 1996, has now been stripped of its political power and consequently has lost some status nationally. Thus it would seem that Gal’s observation holds true for South Africa: namely that as a result of globalisation, the characteristic form of language change is that local languages are ‘subordinated to “world languages” in diglossic relations’ (Gal, 1989, p. 356; see also Makoni, 1994, p. 22).

Mesthrie (2002) provides a detailed linguistic analysis of contemporary South Africa and reminds one that the linguistic situation is a dynamic one. Classrooms are the sites where the dynamics and tensions between the global, national and local linguistic ecologies

Table 1 South African official languages and speakers

| Official languages and percentage of population speaking languages as first home language |    |
|---|----|
| IsiZulu   | 24 |
| IsiXhosa  | 18 |
| Afrikaans   | 13 |
| Sepedi  | 9  |

are possibly most acutely experienced. Although there are currently few analyses of South African classroom language that are framed in explicitly ecological terms, there is much that refers to the complexities of linguistic history, politics, economy, identities, attitudes and pedagogy, that impact on classroom language ecologies and learning in classrooms.

#### EARLY DEVELOPMENTS

While South Africa is a country best defined in as being ‘in transition’ from a colonial and apartheid (Afrikaans: segregation) past to a future democratic ideal, defined in terms of equity, social justice and redress, the heavy imprint of the past continues to be felt in every aspect of society including language attitudes and classroom practices.

Hartshorne (1992) provides a clear and detailed analysis of the historical–political context within which current language in education policy and practices are nested (see also Mesthrie, 2002; Murray, 2002). Language, and in particular, language in education policies have been central to South Africa’s political struggles. Successive Dutch and then British colonial governments used language in education as an instrument to enforce political and ideological domination. British anglicisation policies, particularly those in schools, rankled deeply

with the Afrikaner community and set the scene for a bitter 'taalstryd' (Afrikaans: language struggle) which provided a focus for 'a powerful Afrikaner identity which would provide the emotional drive for the acquisition of political and economic power' (Hartshorne, 1992, p. 191; see also Lanham, 1996, p. 25). Linguistic equality for Afrikaaners was finally achieved with the political compromise of the union of South Africa in 1910 and the recognition of two official languages: English and Dutch (replaced by Afrikaans in 1925). Proficiency in both languages became a requirement for employment in the civil service.

At the political periphery in the nineteenth century, African languages were transcribed and standardised by missionaries, for use in the initial education and religious conversion of indigenous peoples. Literature in African languages was published, as were several African language newspapers. However mission education of Africans was mainly through the medium of English, and so, as in other parts of Anglophone Africa, education came to be synonymous with English (Pennycook, 1994, p. 261), a perception that persists today.

It was from the ranks of an elite group of mission-educated Africans that the political leadership of the African National Congress (ANC) emerged, to challenge the political status quo that excluded them from political rights. Although the Freedom Charter of the ANC (1955) recognised the 'equal right of all people to use their own languages,' the political struggle for liberation, where it engaged with national and international audiences, was waged through the medium of English and so English accrued additional status as the language of liberation (Mesthrie, 2002, p. 22). The role that African languages played in the liberation struggle was primarily to mobilise, resist and subvert, frequently through song (see Hirsch, 2002).

After the succession of the Afrikaner Nationalist Government in 1948, segregation on the basis of racial and linguistic identity became the cornerstone of apartheid ideology, with Africans being forced to live in designated areas on urban peripheries known as 'townships' or in ethnolinguistically defined rural 'homelands'. Mission schools for African students were forcibly closed and in 1953 the notorious system of 'Bantu Education' was introduced for Africans, with the expressed purpose of limiting their academic progress, in line with the limited socio-economic and political roles the government intended for them. This was made clear by Verwoed, Minister of 'Native Affairs' and later Minister of 'Bantu Education' who stated: 'When I have control over native education, I will reform it so that natives will be taught from childhood that equality with Europeans is not for them'; and, 'There is no place for the Bantu in the European community above the level of certain forms of labour' (Verwoed, 1955 in Christie, 1985, p. 12).

Thus the internationally accepted principle of home language medium of instruction was used by the apartheid government to justify the ethnolinguistic segregation of schools (including separate schools for English-speaking and Afrikaans-speaking white students) (Heugh, 1995, p. 42). When home language medium of instruction was extended from Grade 4 to Grade 8 in African schools, this was initially resisted by the majority of Africans who correctly interpreted the motives of the apartheid government as that of divide and rule, and to restrict African access to cultural and economic capital.

It was the state's efforts to impose Afrikaans as a medium of instruction for 50% of subjects in African secondary schools that sparked off the 1976 student uprising in Soweto (a township outside Johannesburg) which rapidly spread to the rest of the country and ignited almost two decades of political struggle, much of it based in township schools. One of the immediate results was that English was restored as the sole medium of instruction from Grade 5, after an initial period of home language medium of instruction.

A long-term result of these political struggles around language has been the negative attitude of African parents and students towards Afrikaans as the 'language of the oppressor,' and towards African language medium of instruction as part of the Bantu Education package; and on the other hand to entrench the notion of English as the desired language of education (Hartshorne, 1992; Mesthrie, 2002; Reagan, 2002), despite the seemingly obvious problems that this creates for learners in the classroom. These political perceptions, coupled with the very real global hegemony and economic power of English (Wright, 2002), have served to promote English as the language of aspiration for the majority of South Africans.

#### MAJOR CONTRIBUTIONS

##### *The Language Ecology of Schools under Apartheid*

Under apartheid, English and Afrikaans students learned through the medium of their respective home languages, with all the attendant cognitive advantages, and accrual of cultural and linguistic capital in a political system dominated by Afrikaans speakers and an economic system dominated by English speakers. By contrast, African parents and students, for all the political reasons outlined, and with a recognition of the economic value of English, opted to switch to English medium of instruction as soon as possible, on the basis of the popular belief that 'time on task' would maximise opportunities for English acquisition (NEPI, 1992, p. 64).

*Problems for African Learners*

From the outset Bantu Education was designed for inequality: it was marked by gross under-resourcing (for example in 1984, government per capita spending was R1926 on white students and R294 on African students (SAIRR, 1995)), separate and inferior training for African teachers (Hartshorne, 1992), plus massive increases in the numbers of learners (Macdonald, 1990a, p. 36). After 1948, opportunities for English acquisition by both teachers and learners was deliberately restricted by the apartheid government, in efforts to re-orientate the African population to Afrikaner influence and control: teacher training which had been largely under the control of English-speaking missions was taken over by the state; those teacher training colleges in urban areas were closed down and new colleges opened in rural areas designated as homelands; the English-speaking staff were replaced by Afrikaans speakers and 'the standards of English at the colleges deteriorated rapidly and alarmingly' (Hartshorne, 1992, p. 236). These factors combined with the geographic separation of the population on basis of language and race, to make the development of adequate English proficiency by African teachers increasingly difficult and problematic, given that it remained the chosen medium of instruction in African schools. However, the blatant inequalities of apartheid education, along with the post-1976 political education struggles in African schools, tended to divert attention from the language medium and the contribution of this to high dropout and failure rates (Probyn, 2001, p. 262).

*Research in Response to Problems*

Nevertheless by the mid-1970s some academics were starting to pay attention to the problems of language and learning in African schools and two successive research studies provided some insights into classroom practices. The Molteno Project (Rodseth, 1978, 2002) investigated optimum literacy teaching methods and in the preliminary classroom based research found poor literacy teaching and achievement in the vernacular (ibid., pp.101–103). They concluded that 'an efficient vernacular reading is the key to effective reading in English . . .' (Rodseth, 1978, p. 4) and designed a mother tongue-based literacy programme 'Breakthrough to Literacy' for Grade 1, followed by 'Bridge to English' in Grade 2, programmes that have achieved wide success in Africa (Rodseth, 2002), but ironically have had limited government support in South Africa itself.

The second research study, the Threshold Project headed by Macdonald (1990a, b), stands as a seminal investigation into the problems faced by

African learners in Grade 5 when they switched from home language to English medium instruction and revealed the deep learning problems that resulted from this policy. Macdonald noted that apartheid had denied black students contact with mother tongue models of English (1990a, p. 39) and identified some of the limiting factors in the Grade 5 classrooms, where English was the medium of instruction:

- a. the teacher's difficulty in giving clear expositions in English;
- b. the paucity of the children's English, specifically in relation to giving a reasoned account of new concepts;
- c. the virtual absence of learning aids of any description;
- d. the virtual unusability of conventional text material, and
- e. the relative remoteness of the concepts from the child's experience (ibid., p. 141).

Macdonald observed: 'The global effects of these factors is loss of meaning. The children are likely to be alienated by what they have to learn, and only dimly perceive the implications and linkages between the concepts they are presented with' (ibid., p. 141).

Macdonald found that the difference between the levels of English in the English curriculum materials at the end of Grade 4 and the level of English required in content textbooks in Grade 5 when learners switched to English was an insurmountable gap for most second language learners (ibid., 1990a, pp. 48–49). She concluded that the language proficiency of the learners moulded the task of teachers who tended to code-switch and to write up simplified notes for learners to learn by rote (ibid., 1990b, p. 44). Macdonald made the point that the 'Rote Rhythm' method of question and answer (where learners chorus the last word in a sentence provided by the teacher) was common and this enabled learners 'to answer quite intelligibly *in the words of the passage which they did not understand*' (original emphasis) and that that kind of teaching 'forms a closed loop from which genuine information about what is not understood simply cannot escape; the teacher is safe as the controller of knowledge' (ibid., 1990a, p. 143). Chick (1996) described this interactional style as 'safe talk' as it enabled teachers and learners to preserve the appearance of purposeful classroom activity, without exposing their lack of competence.

Macdonald also noted the affective impact of these practices and concluded that Grade 5 learners were subjected to a stressful experience of failure (ibid., 1990b, p. 17) and were 'alienated from the process of schooling from an early age' (ibid., 1990a, p. 47). The Threshold Project recommended a gradual transition to English over a number of years and that children should become effectively literate in their mother tongue before introducing English literacy (1990a, p. 57).

These research projects provided valuable insights into what was actually happening in classrooms in terms of language and literacy

practices and offered practical solutions to the perceived problems. However, they did not problematise the notion that English medium instruction was the desired and desirable goal.

*Critique of English Hegemony/Advocacy for African Languages*

Against the backdrop of the intensified political struggles in the mid-1980s, Ndebele, in a speech in 1986 to the Jubilee Conference of the English Academy of Southern Africa, inserted a sharp critique of the hegemony of English in South Africa, pointing to its role in imperialism (Ndebele, 1987, p. 3) and noted that as such 'it cannot be considered an innocent language' (ibid., p. 11). He pointed out that the choice of many post-colonial countries to adopt a colonial language as their official language was as a result of 'the necessity of limited choices' (ibid., p. 3), given the role of English in international business and technology. He questioned the assumption that the acquisition of English should be regarded as synonymous with education and suggested that 'a fracture between the acquisition of knowledge and the acquisition of English must be brought about' (ibid., p. 14).

The critique was echoed by language NGOs such as the National Language Project (NLP) and the Project for the Study of Alternative Education in South Africa (PRAESA), as well as the National Education Policy Investigation (NEPI), a broadly consultative process that served to broaden the debate around education policy issues, including language in education, in the run up to the political changes of 1994. The NEPI report on *Language* offered a view of linguistic diversity and multilingualism as a national resource and claimed that any language in education policy should be based on the principles of non-sexism, non-racism, a unitary system of education democracy and redressing the historic imbalances between the statuses of languages (NEPI, 1992, p. 4). The report noted the need to actively promote African languages, while also recognising the need for increased access to English and favoured the 'simultaneous pursuit of both' (ibid., pp. 17–18) while warning that

the promotion and development of African languages will require great political will and financial resources. This cause can only credibly be taken up by African protagonists who have access to power of various kinds, including state power. The paradox is that it is precisely their proficiency in English that is a salient marker of what enables them to be in power. And it is the visible status and privileges of those who are proficient in English that give rise to the call for more English from those who have little power and few privileges (ibid., p. 19).

The report provided a comprehensive overview of language in education issues in South Africa and discussed various policy options, noting that the contexts of schools varied widely and that no one policy would fit all (*ibid.*, p. 15). It highlighted the tension between giving parents the democratic right to choose a language policy for their school and the risk of such decisions being made on popular sentiment in favour of English, rather than sound pedagogical grounds (*ibid.*, p. 43). It warned that ‘comparative studies have shown that L2 medium of instruction is a serious obstacle to children in poorly resourced schools in areas where there is no reinforcement of skills in that language outside the school, and where teachers’ proficiency is limited’ (*ibid.*, p. 89).

Advocacy for an increased role for African languages as ‘language of learning and teaching’ (LoLT) was taken up by a range of academics, notably Alexander (1990) and Heugh (1995) who drew on the theories of Jim Cummins, to advocate a language in education policy that promotes ‘additive bilingualism’ (see also Luckett, 1995). However, other academics such as Makoni (1994) and Banda (2000) have questioned whether such theories developed in Canada, with a very different linguistic ecology, are directly applicable to South Africa. An influential report to advise the new government on language policy and planning was drawn up by the Language Plan Task Group (South Africa, Language Plan Task Group, 1996) and included recommendations for a language in education policy.

### *Policy Initiatives*

Redress for indigenous languages found fulfilment in the language provisions of the new Constitution (South Africa, Constitution of the Republic of South Africa, 1996) and the establishment of the Pan South African Language Board with the brief to ‘provide for the recognition, the promotion, and the development of all South African official languages, with particular attention being given to those languages that were previously marginalised’ (South Africa). Likewise, the LiEP (South Africa, Department of Education, 1997) reflected these concerns: it values cultural diversity, and multilingualism as a means to intercultural communication and nation building, and for national and international communication; it recognises individual language rights and the right for learners to be taught in their home language; and it aims to provide learners with equitable access to the education system. To this end it advocates policies that will promote additive multilingualism, which it claims are most supportive of general conceptual growth among learners, with the underlying principle of maintaining home languages while ‘providing access to and effective acquisition of

additional languages' (ibid., 1997). However policy formulation is the responsibility of School Governing Bodies, made up of parent, teacher and student representatives and is subject to a 'practicability' proviso, which leaves the way open for the maintenance of the status quo.

#### WORK IN PROGRESS: THE LANGUAGE ECOLOGY OF SCHOOLS POST-APARTHEID

In state schools, different linguistic ecologies exist: since the achievement of democracy in 1994, a united non-racial education system has been established. With the desegregation of schooling, the demographic shift of learners has been from the rural and township peripheries to the historically better resourced schools in urban centres. Thus typically the student bodies of former 'coloured', Indian and white schools have become racially mixed and multilingual (Chisholm, 2004) while the racial and linguistic makeup of the teaching staff has remained relatively unchanged (Soudien, 2004, p. 101). However access to such schools has been limited by parents' ability to pay the fees that public schools are allowed to charge in order to supplement limited state funding (to maintain smaller class sizes, better infrastructure and resources) and so class appears to be replacing race and language as the determiner of access to better resourced schools where English is the LoLT (Fiske and Ladd, 2004, p. 58). The vast majority of African learners remain in impoverished township or rural schools, physically on the periphery and relatively unchanged in terms of their linguistic-racial composition, resourcing or the quality of education they are able to offer (although there are some notable exceptions). Apart from the multilingual metropolitan areas such as Gauteng, where township schools reflect the multilingual nature of the townships, the majority of African learners still attend schools where a regional language dominates and is generally shared by teachers and learners (Heugh, 2002, p. 185).

Ironically, the pedagogically sound LiEP has not received popular support. Research shows that for the most part, the LiEP has not been implemented as required at school level (Probyn et al., 2002; South Africa, Department of Education, NCCRD, 2000; Vinjevd, 1999). Reasons cited include: the lack of an implementation plan; the fact that the LiEP was overshadowed by the new curriculum which was introduced at the same time; the perceived need to access English and the commonsense assumption that time on task is a necessary condition for acquisition; the perception that African languages have not developed the necessary corpus for academic use; a lack of available textbooks to support the extended use of African languages as LoLT; a lack of capacity for policy formulation on the part of School Governing

Bodies in township and rural schools; and an apparent lack of political will, possibly stemming from a lack of familiarity with underlying language acquisition theories and a reluctance to push a policy that does not enjoy popular support.

In addition, in African schools there is a perception among teachers that parents are choosing to send their children to formerly white, Indian and 'coloured' schools so that they can acquire English; and so teachers feel under pressure to introduce English as the LoLT even earlier to counter this trend and protect their own jobs. Research by De Klerk (2000) into the motivation African parents for sending their learners to formerly white schools, revealed that although access to English was a major consideration, the better resources, pupil teacher ratios and learning opportunities at such schools were also an important part of their motivation. De Klerk found considerable conflict in the minds of both parents and children as to the future role of their home language, Xhosa, in their lives and the majority of parents believed it was important to support and maintain their children's mother tongue for cultural and communicative functions in family and community (*ibid.*, p. 209). As Banda (2000) notes: 'Blacks want to use English as a tool for socioeconomic mobility, while preserving their linguistic and cultural identity' (*ibid.*, p. 57).

Where changes to language policy have been made in the formerly white, 'coloured' and Indian schools, it has generally been to introduce an African language as subject, or in previously Afrikaans medium schools, to introduce an English medium stream to accommodate African learners (Probyn et al., 2002; South Africa, Department of Education, NCCRD, 2000; Vinjevd, 1999). The ethos in these schools has been largely that of assimilation (Soudien, 2004, p. 89) with consequent home language loss and shifts in culture and identity for many learners. Teachers' general lack of proficiency in African languages in such schools means that teachers do not have recourse to African learners' home language and so there is a close fit between intended and enacted language policies. However, there have been some reports that this lack of proficiency has led to discipline problems with African learners who are able to use their home language to subvert teachers' authority (Murray, 2002, p. 440).

The great majority of African learners (80%) remain in township or rural schools and any changes to language policies have been to introduce English as LoLT earlier: to coincide with the start of the Intermediate Phase of the curriculum in Grade 4, or in many cases, even earlier. This is despite learners' lack of exposure to English outside the classroom and lack of reading resources in homes and communities to support literacy development (Probyn, 2005). Thus the material conditions described by Macdonald (1990a, b) have not changed

substantially for such schools; nor have the classroom practices. The cited research studies show that when learners have to switch from home language to English LoLT, there is frequently a wide gap between intended (even if these are implicit policies) and enacted language policies. Most often, the common home language and English are used for functionally differentiated purposes, with the home language used for oral communication outside classrooms and to some extent inside classrooms as well, while reading and writing are done in English.

Teachers are faced with the dual task of teaching the content and language, and acknowledge that these goals are frequently in conflict (Probyn, 2001; Setati, Adler, Reed and Bapoo, 2002). Neither teachers' (see Horne, 2001) nor learners' English language skills allow for unproblematic communication of the curriculum through English and so the most common strategy used by teachers is that of code-switching to the learners' home language for a range of communicative, affective and management purposes as follows:

- to communicate aspects of the lesson content, for example new concepts and vocabulary;
- to draw learners' attention to a new idea or word;
- to clarify a difficult English grammatical construction;
- as an attention check (for example, using a home language question tag);
- to encourage learners to participate in classroom discussion;
- to create a relaxed atmosphere in the classroom;
- to crack jokes to relieve the stress of learning through a second language;
- to relate aspects of the lesson to the learners' own lives and contexts;
- to appropriate unfamiliar terminology by adding home language prefixes to English words (for example using the Xhosa prefix 'i-' as in i-battery or i-cell);
- for classroom management and discipline (Probyn, 2005).

Learners' language use in the classroom is most frequently characterised by oral-written diglossia, with informal group discussion in home language and reporting back attempted in English, with some code-switching sanctioned by teachers (Probyn, 2001; Setati, Adler, Reed and Bapoo, 2002). All reading and writing is done in English but research indicates that in fact relatively little reading and writing is done in class (Vinjevold, 1999; Taylor, Muller and Vinjevold, 2003), and reading is severely constrained by a lack of reading materials. There is little evidence of teachers having explicit knowledge of how to mediate the gap for learners between oral home language and written English (Probyn, 2005; Setati, Adler, Reed and Bapoo, 2002).

In addition, research indicates that many teachers regard code-switching as illicit, a lack of proficiency in the LoLT, rather than a valid linguistic strategy (Adendorff, 1996; NEPI, 1992, p. 49; Setati, Adler, Reed and Bapoo, 2002): for example, a teacher referred to 'smuggling the vernacular into the classroom' (Probyn, 2001). It should be noted that teachers' classroom language practices, including code-switching, and the practices of learners in their classrooms, are by no means uniform and vary according to teachers views on the matter, their own language skills and contexts of practice (Probyn, 2001; Setati, Adler, Reed and Bapoo, 2002)

Teachers have noted that teaching and learning through the medium of a poorly acquired additional language is time consuming and as a result they frequently do not complete the syllabus. In addition, it is stressful for learners as well as teachers, who feel helpless in the face of such problems. It has been suggested that learners may feel alienated from the subject content when it cannot be expressed in their own language because the corpus has not been developed to express subject-specific terminology (Probyn, 2001).

Despite the obvious difficulties of teaching and learning through the medium of English, it appears from available research studies (Barkhuizen, 2001; Probyn et al., 2002; South Africa, Department of Education, NCCRD, 2000) that the majority of African teachers, parents and learners are resolutely in favour of English as the medium of instruction after the initial phase of home language medium of instruction. This speaks partly to the naturalised status of English as the language of education, and the very real power of English as a language of access to the centres of power, economically, politically and socially.

## PROBLEMS AND DIFFICULTIES

In South Africa, there is growing public recognition of the role of language in learning and the obstacle to effective learning that the LoLT poses for many learners. This is partly as a result of the negative publicity surrounding the poor performance of South African learners in the Third International Mathematics and Science Study and the link made by the research report between poor performance in mathematics and science, and poor proficiency in the language medium (Howie, 2001).

A more recent research report has also linked proficiency in English to achievement in mathematics and science (Clynick and Lee, 2004, pp. 53–56); and the shortage of good quality Grade 12 passes in mathematics and science is perceived as a serious limitation on economic growth (Kahn, 2005, p. 147). However, as discussed, proficiency in

English can now be taken as a proxy for social class, and is but one of a range of factors, including historic inequalities in terms of teacher training and resources, that account for learners' poor achievement levels (see Taylor, Muller and Vinjevold, 2003).

Although political change has translated into some material improvements for rural schools, rural education remains grossly under-resourced in communities marked by dire poverty (Emerging Voices, 2005), and so language in education is an additional obstacle to equitable access to the curriculum. Recent research into rural education in three predominantly rural provinces found that on average 42% of learners reported that they had difficulty understanding their teachers and more than a quarter reported they did not find it easy to understand textbooks (*ibid.*, p. 88).

There have been some public calls in the press for a greater role for African languages as languages of learning and teaching and as subjects for study—largely in response to the poor matriculation examination results. However, opinions both at an academic and political level remain divided on the issue with some academics strongly advocating an increased role for African languages in education on pedagogic grounds (see Heugh, 2002) while others advocate an acceptance of English as the dominant language of education on pragmatic and political grounds (see Vinjevold, 1999).

However, this at times adversarial debate has tended to mask the issue of literacy *per se* (Murray, 2002) and the fact that learners' home language literacy levels are also cause for concern: a national evaluation of Grade 3 learners, where they were tested in their home languages (apart from in a minority in multilingual classes), found average scores of 39% for reading and writing (South Africa, Department of Education, 2003). Research that identifies the lack of reading resources in schools (80% of schools have no libraries (Bot, Wilson and Dove, 2000), low prevalence of reading and writing in classrooms (Taylor, Muller and Vinjevold, 2003) and confusion among Foundation Phase teachers as a result of the training for the new curriculum (Macdonald, 2002) provide some answers as to causes of low literacy levels. In addition, there is frequently a gap between the African language dialect that learners speak at home, and the standardised form of the language they are expected to master at school (Emerging Voices, 2005, p. 95). Ironically, the standard varieties are associated with rural areas and so are less prestigious than urban varieties (Banda, 2000; Mesthrie, 2002).

Contests around policy at a macro-level have also tended to divert attention from the gap between policy and practice in township and rural classrooms, where the LoLT is an additional language, and the ways in which teachers code-switch between English and the learners' home language to achieve a range of cognitive, management and

affective purposes. Although there is some small-scale research evidence of skilful and strategic use of languages by experienced teachers (Probyn, 2001), generally there is still a deficit view of code-switching and little training for teachers in how to use the language resources of the classroom in a planned and strategic manner.

In middle-class schools, the assimilationist policies of schools and lack of proficiency by most teachers in the learners' home language have implications for learners' personal identity and identification with the education process. Research has shown the dilemmas experienced by African learners in such contexts: a tension between the shift to English language and culture and a loyalty to home language and culture. Perhaps in these multilingual settings a new South African identity is being forged.

#### FUTURE DIRECTIONS

In post-apartheid South Africa, the emergence of a small but rapidly expanding black middle class has meant that class rather than race has come to determine access to well-resourced schools (Banda, 2000; Chisholm, 2004) with concomitant proficiency in English, and as a result, further upward mobility. Chisholm concludes that although the stated intent of education policy has been redress for the poor, 'educational development and the emerging system have favoured an expanding, racially mixed middle class' (*ibid.*, p. 7).

Researchers comment on a 'pragmatic shift' towards English by urban youth who equate upward mobility and economic success with English (Setati, 2005, p. 151). There would appear to be a change in focus among urban youth from the political activism of pre-1994, to that of post-democratic consumerism. It seems questionable whether those who do acquire the cultural capital to access the centres of economic and political power, will use their position to champion the cause of the urban and rural poor, or whether a form of 'elite closure' (Myers-Scotton, 1993) is taking place, with the gap between the minority of well-resourced middle-class schools and the majority of historically disadvantaged schools widening rather than narrowing.

The tensions between policy intentions and practice at a macro-level are reflected at a micro-level in township and rural classrooms, where schools have resolutely opted for English LoLT, for a range of practical and political reasons, but where the existing linguistic ecologies make policy intentions unsustainable. At present, there is little research-based teacher training to address the contradictions and uncertainties in policy and practice in township and rural schools. There is a need for the development of systematic and appropriate use of both languages in the classroom, backed by appropriate resources, which will bridge the

current gap between languages and modes in practices that open access to the curriculum.

Language, both in terms of literacy and LoLT, has been identified as a point of leverage in the curriculum (Taylor, Muller and Vinjevd, 2003). However, academics need to relinquish strongly held ideological positions in the interests of addressing questions of language and learning from a more nuanced and pragmatic perspective, to take into account local linguistic ecologies and work with social attitudes and aspirations.

Current classroom language ecologies are nested within local, national and global language ecologies which in turn reflect the dynamically evolving social, political and economic transition of South Africa. Current trends appear to reflect a widening class gap and increasing marginalisation of the urban and rural poor. The challenge for education is to counter these trends and to deliver on the post-apartheid democratic ideal of social justice by broadening access, equity and redress.

LANGUAGE ECOLOGIES AND THE MEANING  
OF DIVERSITY: CORSICAN BILINGUAL EDUCATION  
AND THE CONCEPT OF ‘POLYNOMIE’

INTRODUCTION

Language ecology approaches to multilingual classrooms have focused attention both on the way that linguistic practices in the school articulate with the wider sociolinguistic context as well on the way that classrooms themselves constitute “microecologies” of linguistic, social, political, and pedagogical practice (Creese and Martin, 2003). Diversity is one of the focal concerns of a language ecology approach, which both takes linguistic diversity to be an intrinsic good (Mühlhäusler, 1996, p. 310) and looks at the social and cultural conditions in which linguistic diversity is maintained or reduced (Fill and Mühlhäusler, 2001; Mühlhäusler, 1996).

Bilingual education on Corsica is explicitly intended to change the language ecology on the island; specifically, to counter the effects of language shift and create a bilingual ecology where there is greater balance in the use and status of Corsican and French. Because of the advanced state of language shift from Corsican to French, bilingual schools themselves constitute controlled and relatively isolated language ecologies. The use of the two languages in school for similar functions and amounts of time contrasts sharply with children’s largely monolingual French usage in the home and wider society. Bilingual schools are not modeled on the bilingualism of the society; rather, they are models of a possible bilingual society/individual/practice. The language ecology of the school thus has a dual focus. First, it is designed as a socializing environment for children into a mode of bilingual behavior that is not modeled elsewhere. Secondly, it serves a political and representational role that is oriented outward to the wider society: by displaying Corsican as a legitimate language, Corsican bilingual schools aim to change the ideological landscape of the Corsican language ecology (diglossic language attitudes) and thereby, encourage more use of Corsican and more support for its teaching.

In light of these dual focuses, I consider bilingual school practices and ideologies related to two kinds of “internal” diversity: (i) regional dialectal diversity of Corsican and (ii) diversity resulting from language contact, domination and shift. Both of these kinds of linguistic diversity

exist “out there” in the world outside the schoolroom doors and neither of these kinds of diversity has traditionally been recognized or legitimated by French school practice, which has been dominated by a monolingual and monodialectal norm (Marcellesi and Treignier, 1991, p. 269). In this sense, my study explores the ways in which minority language education both responds to and shapes the new linguistic ecologies created by minority language shift *and* by minority language revitalization processes. As we will see, this is a complex dynamic that has implications not just for the relative status and use of the two languages but also for the way that linguistic codes are defined. This perspective is the basis for a reflection, at the end of this chapter, on both the potential and limitations of a language ecological framework for understanding processes of language revitalization, focusing on the difference between defining ecologies in terms of properties and positions of codes vs. defining ecologies in terms of social/political responses to the issue of linguistic diversity and variation.

#### EARLY DEVELOPMENTS AND MAJOR CONTRIBUTIONS

The ecological metaphor is consistent with a rich anthropological view of social and cultural process which emphasizes the interconnections between the multiple systems (cultural, economic, institutional, ideological and so forth) that affect language practices, as well as how shifts in relationships between those systems influence patterns of language use over time. Creese and Martin’s 2003 volume *Classroom Language Ecologies* is perhaps the first to assemble research around this explicit label, but this work is very consistent with a tradition of ethnographic and sociolinguistic work on language in education that includes work by Hornberger (2002, 2003), King (2001) and Freeman (1998). In the discussion of work in progress, I explore these kinds of interconnections in a Corsican bilingual classroom, with a focus on the way that linguistic and pedagogical choices and patterns in the school have to be understood with reference to the history of Corsican relations with French, traditional French language pedagogical practice, language attitudes and practices of social actors “outside” the school, as well as the political and ideological context of Corsican language revitalization efforts. In particular, I address the impact of a particular model of language that has gained wide currency in Corsican pedagogical circles: the concept of “*polynomie*.”

First coined by the French sociolinguist Marcellesi, *polynomie* is a pluralist ideology of language that locates language identity in collective recognition of unity in diversity (1989, p. 170). A polynomic language is:

une langue à l'unité abstraite, à laquelle les utilisateurs reconnaissent plusieurs modalités d'existence, toutes également tolérées sans qu'il y ait entre elles hiérarchisation ou spécialisation de fonction. Elle s'accompagne de l'intertolérance entre utilisateurs de variétés différentes sur les plans phonologiques et morphologiques, de même que la multiplicité lexicale est conçue ailleurs comme un élément de richesse (1989, p. 170).

*a language with an abstract unity, which users recognize in multiple modes of existence, all of which are equally tolerated and are not distinguished hierarchically or by functional specialization. It is accompanied by tolerance of phonological and morphological variation by users, who also view lexical diversity as a form of richness.*

This “abstract unity” of a polynomic language is not linguistic, but social: it is the community that applies the label of “language” to a set of linguistic practices (Marcellesi, 1983). In fact, the recognition of unity in Corsican dialectal diversity is embodied in the Corsican orthography first outlined in a manual called *Intricciate è Cambiarine* (Geronimi and Marchetti, 1971) and largely followed today. This system allows writers to encode their own regional pronunciations. For example, in the center of the island where the school was located, there was microregional variation between /i/ and /ɛ/. A person who pronounced “we are” as [simu] would write it “simu” and a person who said [semu] would write “semu.” This legitimation of Corsican dialectal variation implies a classroom language ecology in which there are no hierarchies between variants of Corsican, and stands in sharp contrast to the monolingual ecologies of traditional French schooling. A polynomic perspective also has the potential to legitimate mixed codes that result from language contact and shift; according to Marcellesi, there are no linguistic forms that are excluded a priori from being legitimate (Marcellesi, 2003, p. 285).

#### WORK IN PROGRESS

The brief analysis that follows focuses on the implications of the concept of polynomie for school practice. A polynomic classroom ecology has implications for the relationship between the bilingual school and existing bilinguals in the society, and more widely, for the nature of what Corsicans will label the Corsican language. I explore the complexity of these issues in the analysis of classroom data involving the visit of a carpenter to a Corsican bilingual school. The scheduling of his visit was intended to integrate school and society in a single language ecology and to offset the relative isolation of these classes.

*The Ethnographic Context*

The data reported on here were collected during a year of fieldwork in 2000 in a Corsican bilingual primary school located in a village. The school comprised two multiaged classrooms—one for children aged 3–6 (through first grade) and the other for the 7–11 year-olds (through fifth grade). The two teachers in the school were very early advocates and adopters of bilingual education, and of a polyomic approach. The 27 children in the school came from diverse linguistic backgrounds with respect to Corsican. Many did not speak or hear much Corsican in the home. A minority of the children (two pairs of siblings) had parents who had spoken to them only in Corsican during their first years of life. About 4–5 (this number changed during the fieldwork period, which spanned two school years) had grown up bilingual, though all of these children’s French competence was higher than their Corsican competence.

*Classroom Data: The Status of Dialectal Diversity and Contact-Induced Practice*

In a year of observations, I found that teachers invariably commented positively on dialectal diversity, and took pains to make these values explicit. For example, teachers told children that spoken variants (such as [peura] or [paura] for “paura” [fear] and written variants (such as “Sabbatu” and “Sabatu” [Saturday]) were equally correct. Teachers also used different spoken and written variants in their own practice, such that students saw and heard multiple varieties incorporated into the official, “legitimate” discourse of the class.

Teachers’ responses to linguistic diversity brought about by language shift from Corsican to French was more varied and nuanced. In this section, I describe in some detail the classroom visit of a carpenter called Mr. Ottaviani, because this visit prompted a dramatic and extended focus on Corsican/French boundaries in the lexicon. Mr. Ottaviani was recruited to come to visit the school because he was a carpenter who spoke Corsican and was willing to talk about his job to the children in the bilingual program. The recruitment of visitors like Ottaviani was explicitly designed to reduce the gap between the school and the Corsican-speaking “outside” society: to create a unified ecology. In the Corsican sociolinguistic context, this bringing-in, however, involves some staging: visitors are asked to engage in linguistic interactions with children (in Corsican) that do not correspond with their daily practice, even though those people may speak Corsican regularly with certain adults in the course of a work day. In this respect, in any event of this kind, there is a built-in gap between habitual linguistic practice

and the (almost) exclusive use of Corsican during the visit. This gap exists both for the outside visitors and for the schoolchildren. For both, the visit imposes a greater use of Corsican than usual.

The day that Mr. Ottaviani arrived, he came with a number of tools and pieces of wood, and set them on a table. The discussion and presentation took two forms. First of all, the children had prepared written questions for him, which they took turns reading out loud. Because of the emphasis on the display of tools and practices that were unfamiliar to many of the children, vocabulary became a focus of the discussion. Some of this discussion positioned Mr. Ottaviani as having expert linguistic knowledge in Corsican; the children were the apprentices. For example, he showed them a square, and named it, “a squadra.” The teacher then asked the children, “A cunniscite? Serve à . . . .” (Do you know this one? It is used to . . . .”). A child filled in the blank successfully: “à circà l’anguli dritti” (“to find the right angles”). The teacher then brought in additional math vocabulary: the Corsican words for obtuse and acute angles that the older children knew from their math lessons. In these moments, Mr. Ottaviani was aligned with adult expert knowledge in his supportive role in the pedagogical discourse.

Mr. Ottaviani also showed the class a truss and named it in Corsican: “a raffia.” He said he did not know the French word; the teacher supplied “trusquin.” He told them a Corsican term for the curly shavings created by planing (“a sicatura”) and did not provide the French word. Not knowing a French word, and providing “traditional” Corsican vocabulary terms without translation positioned Ottaviani as an authentic Corsican speaker. But if Mr. Ottaviani did not know the French word “trusquin,” his technical vocabulary was peppered with French and corsicanized French terms, like many speakers in his generation. This usage gave rise to both an implicit and an explicit contrast to classroom discourse. The implicit contrast stemmed from the fact that some of his professional vocabulary overlapped with school vocabulary: in addition to the geometrical terms, he talked about pencils, scissors and workshops—terms used every day in the bilingual school. However, the children had been taught a “pure” Corsican vocabulary for these things, and this ended up contrasting with Mr. Ottaviani’s usage. So when Mr. Ottaviani mentioned writing with a pencil, he called it “u crayon,” a Corsican adaptation of the French word for pencil (“crayon”) that involved the use of a Corsican article “u” and a Corsican pronunciation (a rolled “r” and a lack of nasalization on the final syllable). However, the children used the classroom term (“a minna”) when asked to summarize the tools he had shown them. Mr. Ottaviani also referred to his four workshops as “quattru ateliers,” where the French word “ateliers” was used more or less unmodified in the Corsican phrase. These workshops were subsequently referred to as

“atelli” by the children, following their classroom usage of that word for small-group centers. His remarks about the smells of the woodshop included reference to “u parfumu” (from the French “parfum”); this was revoiced as “profumi” in the very next turn by one of the teachers.

From a polyomic perspective, this differential usage by Mr. Ottaviani and the teachers and children could have been part of an integrated ecology, and could have coexisted without any implied hierarchy. However, as the explicit metalinguistic discourse of the lesson illustrated, his gallicisms were in fact devalued. Almost every time he used a term derived from French, it became the object of a Corsican word search. This is in large part because the pedagogical activity that the teacher initiated when Mr. Ottaviani started to speak was listing carpentry vocabulary *in Corsican* on the board. So, when he held up a screwdriver and called it a “tournevis,” the teacher asked how that might be said in Corsican. Ottaviani came up with “tornavita;” this term got written on the board. A similar sequence occurred for the word for “scissors:” Ottaviani called them “scisiseaux à bois” and then—having begun to be socialized to the pedagogical task—rapidly translated himself and provided “tagliolu.” A few minutes later, confronted with the word for wood drills, he first provided the French noun (“perceuse”) and then the Corsican noun (“u trapanu”) which, he explained, was used to “trapanà” (INF: to drill). He also noted that the “trapanu” had been replaced by “les perceuses.” In doing so, he revealed that in his semantic system, “trapanu” referred only to the hand tool that hardly anyone used anymore and “perceuse” was the word for the modern piece of equipment in his shop. Only “trapanu,” however, was written on the board. In fact, the final list of words written on the board excluded all of the French or French-origin terms Mr. Ottaviani had used in his Corsican description of his trade, as illustrated in [Table 1](#).

Mr. Ottaviani’s engagement with the pedagogical exercise was good-natured, as was the entire discussion. But that discussion set up an academic framework of linguistic authority that was far removed from Mr. Ottaviani’s base of knowledge. This became evident to him quite early on, as evidenced by his comment that he did not know if the word “raffia” (for which he only knew the Corsican) was spelled with one or two “f”s. Later, after he had provided the word “trapanu” and saw it written on the board, he asked whether that spelling would be pronounced [trapanu] or [trabanu]. This question is interesting because in asking it, Gionga revealed lack of confidence in his native-speaker knowledge of pronunciation (he had himself pronounced it correctly as [trabanu]). The teacher explained that the letter “p” in between two vowels was pronounced [b].

Here we see that the frame of the interaction made it “about” Corsican as a bounded linguistic code, used as a vehicle for high-status

Table 1 Words excluded and included from the final classroom written record

| Words excluded from final list on board |                        | Words included in final list on board |                       |
|---|------------------------|---------------------------------------|-----------------------|
| u crayon                                | <i>the pencil</i>      | a minna                               |                       |
| a raboteuse                             | <i>a planer</i>        |                                       |                       |
| machine                                 | <i>machine</i>         |                                       |                       |
| frese                                   |                        |                                       |                       |
| parfumi                                 | <i>perfumes</i>        | profumi                               |                       |
| ateliers                                | <i>workshops</i>       | atelli                                |                       |
| camions-grues                           | <i>cranes</i>          | a sicheria                            |                       |
| u tournevis                             | <i>the screwdriver</i> | u tornavita                           |                       |

pedagogical work. Mr. Ottaviani was invited to the school in order to talk about his profession in *Corsican*. This is not to say that there was no interest in his practice, or that the communicative function of the interaction was completely overridden. In fact, the teachers in this classroom often conducted content instruction on a given topic in *both* languages over the course of a unit of instruction. But for this particular

event, the focus on content and communication was accompanied by a heavy emphasis on form. In these circumstances, Mr. Ottaviani's mixed set of competencies and his mixed vocabulary was only partially validated by school practice: it was subject at every turn to correction, and the only official record (the list of words written on the board) was a purely Corsican one.

*Discussion: Implications for the Classroom Language Ecology*

The fact that teachers in this school positively evaluated and incorporated different spellings and pronunciations of Corsican shows that minority language education practices have the potential to rework dominant language ideologies by creating classroom language ecologies in which dialectal variation is valued. There is real evidence of polynomic practice in this school. At the same time, experimental research I conducted on these schoolchildren's perceptions of Corsican orthography shows that the teachers' more or less *passive* enactment of polynomie only partially offset children's perceptions that teachers endorsed a single correct norm (Jaffe, 2003a). Here, we see the persistence of dominant language ideologies and hierarchical relationships in the language ecologies of schools in general. Children may encounter practices that validate linguistic diversity, but they have far more extensive school experience being tested and evaluated with reference to a single and undisputable linguistic norm. This implies that making significant change in the status of linguistic diversity in classroom language ecologies requires a concerted effort to make that diversity a central and explicit part of the curriculum.

The data on Mr. Ottaviani's visit further illustrate the point that habitual school practices—particularly literacy practices—tend toward a monolingual and a purist norm. This is the case even in a school like this one, where teachers were comparatively open to multiple and mixed codes. This is due to a number of factors. First, there is the attempt on the part of the teachers (and all those involved in Corsican bilingual education) school to create two parallel, equally elaborate and independent school discourses in both French and Corsican. Because Corsican has never historically been taught in school, the creation of a Corsican school vocabulary automatically involves a certain amount of purism; this purism is also an integral part of the work of social legitimation of Corsican done by the bilingual schools. In this respect, we see the way that schools participate in the wider sociolinguistic ecology—and its governing politics of representation. In Corsican society, regional dialectal diversity, though evoked in public discourse as a potential impediment to Corsican linguistic unification and teaching, does not have the same delegitimizing implications for Corsican as French “interference.” Within the school, the teachers were also trying

to counteract the dominance of French in the children's lives and practices, which made French influences on their own (or others') Corsican problematic.

It is also the case that the kinds of habitual literacy practices that took place during the carpenter's visit focus attention on form, and this in turn focuses attention on the maintenance of linguistic boundaries—the autonomy of linguistic codes. That is, within the ecology of the school, there are some activities that are more or less hospitable to plural and mixed practices than others. This activity was defined as a Corsican-only one, but many other moments in the day were not, and during those moments, alternation between Corsican and French, or the use of Gallitized terms, would have attracted far less attention. What we see, in effect, is that the “staged” quality of the “outside-inside” Corsican-language interactions organized by the teachers made the expression of the diversity of everyday sociolinguistic practice off-limits. This had the unintended consequence of emphasizing the gap between school and everyday Corsican language practice.

The teachers' negative reactions to French elements in Mr. Ottaviani's Corsican also illustrate a continuing tension between traditional models of Corsican language authority and authenticity and new academic ones created by the very advent of Corsican language education. This event underscores the way that school practice engenders language hierarchies, narrows the range of linguistic forms that are considered legitimate and therefore potentially limits internal diversity (in this case, the diversity of language forms to be used and recognized by a community of future speakers of Corsican as being “Corsican”). The responses to Mr. Ottaviani also may have unwittingly contributed to a diglossic dichotomy between Corsican as the language of “tradition” and French as the language of modernity, since the referents of the Corsican technical vocabulary written on the board were all hand (not power) tools.

#### PROBLEMS AND DIFFICULTIES

Although the above analysis points to some of the strengths of an ecological approach, there are also several embedded elements of the ecology metaphor that call for caution when evaluated in the light of the data I have presented. In particular, the first is the implicit equation of language with biological species—the naturalization and essentialization of linguistic and cultural boundaries (and the relationships between them). In an ecological discourse, “a” language is sometimes viewed as separable from an environment that either sustains or weakens it. Mühlhäusler's formulation provides a partial remedy to this tendency: he emphasizes the effect of particular ecologies on the maintenance of linguistic *diversity* rather than on the maintenance of named codes (1996, p. 322).

## FUTURE DIRECTIONS

Language ecological approaches to the classroom can be enhanced in the future by the acknowledgment of the inseparability of language-as-practice from “environment” or “ecology” themselves. In educational contexts, language practices often embody *ideologies* of essential, bounded identities. But sometimes they do not. Moreover, the central questions in multilingual classroom ecologies (for both researchers and local social actors) are about the interface between practice and ideology (Creese and Martin, 2003, p. 4; Heller and Martin-Jones, 2001; Jaffe, 2003b, c). Thus in the Corsican case, it is not just a question of asking: does the bilingual classroom constitute a language ecology in which Corsican (or Corsican-French bilingualism) will thrive? Rather, the question is: how do classroom practices shape taken-for-granted ideas and assumptions about what kinds of linguistic diversity will be defined as speaking language X, who will count as a legitimate speaker, and how language use/competence and individual or collective identity are/should be linked? Bilingual classrooms on Corsica and elsewhere are not just *acting on* an existing language ecology, they are part of it, and the influences (and linguistic repercussions) go in both directions. Here we see complex interconnections between traditional models (tied to local varieties) and inevitable change. People who learn Corsican in school will not speak in the same way as Corsican speakers who were schooled only in French, and speaking Corsican will inevitably have a different constellation of meanings attached to it because of those different paths of acquisition. These kinds of questions call for a social, rather than a linguistic definition “health” or “sustainability” associated with the ecological metaphor.

## LANGUAGE MINORITY EDUCATION IN JAPAN

## INTRODUCTION

Currently there are 20,692 foreign-national students in Japanese public schools (elementary through high school) identified by the Ministry of Education as “requiring Japanese language instruction” (Monbukagakusho, 2006b) (henceforth referred to as Japanese as a Second Language [JSL] students). This is still a tiny fraction—0.13%—of the total student population. However, the number has nearly quadrupled since the ministry started a tally in 1991 (5,463), and the JSL students are spread across 5,281, or 13% of all public schools in Japan. The fact that 80% of the JSL students attend schools where there are fewer than 5 of them while 1% attend schools with more than 30 such students (Monbukagakusho, 2005b) suggests that there are pockets of regions across the country with large concentrations of foreign-national families. Brazilians, Chinese, and Peruvians make up more than 70% of the JSL students in public schools (Monbukagakusho, 2006b).

This chapter provides an overview of language minority education in Japan, focusing in particular on the education of non-Japanese-speaking children in public schools (see also Fujita-Round and Maher, *Language Education Policy in Japan*, Volume 1). Throughout the chapter, I use the term *language minority (LM) students* to refer broadly to elementary- to high-school level students for whom Japanese is not their first language (L1). *JSL students*, on the other hand, refers to a subset of LM students who are beginning-level Japanese learners and who have been identified by the Ministry of Education as “requiring Japanese language instruction.”

## EARLY DEVELOPMENTS

LM education in Japan has a short history. Although there had always been ethnic/linguistic minorities in Japan throughout its history, LM students emerged as a major educational issue only in the late 1980s and the early 1990s. This is closely related to the country’s current and projected labor shortage. Japan is a rapidly ageing society. With the nation’s current fertility rate of 1.25 (Koseirodosho, 2006), one of the lowest in the world, the Japanese government is aware of the need for immigration to support the nation’s economy. Although the government

does not officially allow the entry of unskilled foreign workers, it has devised a number of “backdoor” and “side door” immigration policies that in fact enable foreign nationals to enter the country and engage in unskilled labor legally (Cornelius, 1994; Kajita, 1998). For example, the Immigration Control Law was revised in 1990, making it legal for *Nikkei-jin* (descendents of Japanese emigrants) and their spouses to work in unskilled job sectors in Japan (Sellek, 1997; Vaipae, 2001). As a result, the number of Nikkei Brazilians and Peruvians in Japan jumped from 18,649 in 1989, to 145,614 in 1991 (Tanaka, 1995, p. 218), to 359,808 in 2005 (Homusho, 2006). Similarly, the government started the “corporate trainee” programs in 1990, enabling private companies to accept trainees from developing countries. Although called “trainee” programs, in reality they have become a convenient way for small companies and farms to secure cheap labor for menial jobs that most Japanese citizens would not take (Cornelius, 1994). Currently, 54,107 trainees live and work in Japan, more than 70% of them Chinese (Homusho, 2006).

Many of these “newcomers” as well as a number of international students—the majority of them from China and South Korea—started sending their children to Japanese public schools in the 1990s, creating a challenge that Japanese schools have not faced before: Educating children whose L1 is not Japanese.

In response to the rapid increase of LM students in public schools, in 1992 the Ministry of Education began allocating extra teachers to schools that had large numbers of JSL students to hold pullout JSL classes (Ota, 2002). This system continues to date: A budget is set aside to cover the salary of up to two extra teachers at each designated school, and the JSL teachers are chosen among the school’s existing staff. It is important to note that the vast majority of JSL teachers are regular classroom teachers with virtually no prior training in second language acquisition and who must learn to work with JSL students on the job (Ota, 2002). Vaipae (2001, p. 199), who surveyed LM education in the mid-1990s as it began to take shape, writes, “The only language education model apparent in our observation was submersion with the goal of assimilation.”

#### MAJOR CONTRIBUTIONS

A decade later, Vaipae’s (2001) observation remains an accurate description of LM education in Japan today. By now, various forms of JSL support have been implemented across the country, such as pull-out JSL classes, the Center School system (where LM students from nearby schools are gathered in one school to receive JSL instruction on a regular basis), and team-teaching between homeroom and JSL teachers (Noyama, 2000). But Sakuma (2005) points out that even after

two decades of the arrival of LM students on the Japanese education scene, no systematic methodology of teaching JSL has been established. There is an awareness among Japanese researchers that academic language proficiency in an L2 is distinct from conversational fluency and that the former takes much longer—5–7 years—than the latter (Cummins, 1981; Thomas and Collier, 1997; see also Cummins, BICS and CALP: Empirical and Theoretical Status of the Distinction, Volume 2). Yet, JSL instruction in most schools does not reflect this knowledge. The pullout classes focus on elementary-level Japanese, instruction centering around basic Japanese conversational skills, the learning of two basic scripts (*hiragana* and *katakana*), and Grades 1–2 level Chinese characters (Kanno, 2004; Nakanishi and Sato, 1995). LM students who achieve grade-level academic proficiency in Japanese are the exception rather than the rule.

Moreover, LM students' academic learning is put on hold while they are learning Japanese (Ota, 2000; Sato, 1995). They are either placed in the regular classroom where they do not understand the instruction, or pulled out for JSL instruction, in which they engage in cognitively undemanding, content-less language exercises, while their Japanese classmates march on with their academic learning. A veteran junior high-school JSL teacher in Kanno's (2004, pp. 333–334) study points out:

For those who arrive in Japan in the middle of elementary school, Japanese language instruction takes the priority, which means that subject matter learning is put on hold. And the students arrive in junior high school without having filled in the missing pieces. When they arrive in junior high and come face to face with even more difficult instruction, they are totally lost.

In other words, the current LM education in Japan has a systemic mechanism that forces LM students to take on an identity of incompetence (Kanno, 2004; Ota, 2005).

LM students' L1 plays little role in the school setting. Bilingual instructional aides are often hired on a part-time basis to assist students who arrive with little or no Japanese proficiency and to act as liaisons between homeroom teachers and LM parents. But the use of students' L1 for instructional purposes is kept to a minimum: Pullout JSL instruction is predominantly in Japanese as is regular classroom instruction. Some schools and local boards of education provide L1 maintenance support, but again this is the exception rather than the rule. The importance of L1 maintenance is recognized, if at all, only with respect to the children of Brazilian and Peruvian migrant workers who are planning to return home one day. For those who are to stay in Japan, schools consider their L1 to be irrelevant. Other aspects of L1, such as identity development (Skutnabb-Kangas, 1981), interdependence with L2, and its role in cognitive development (Cummins, 1979) are not at all taken into

account (see also Skutnabb-Kangas, *Language Rights and Bilingual Education*, Volume 5).

Spending a large part of the day in schools that afford little or no room for their L1, many LM students undergo L1 attrition with a major negative impact on their cognitive development. Many LM students develop subtractive bilingualism (Lambert, 1975): They lose their L1 rapidly while not acquiring grade-level Japanese language proficiency. Subtractive bilingualism deprives a person of any language for higher-order thinking and learning. Both Ota (2000) and Kanno (2004) have observed that many LM students fail to learn Grade 3 level Chinese characters. Ota (2000) speculates that it is not simply the orthographic complexity of the characters or the number of characters that third graders are expected to learn that causes the problem; rather, that it is the cognitive complexity of the concepts underlying these characters that are taxing LM children who have been prevented from acquiring academic language proficiency in either language. For, unlike Grades 1–2 level characters that refer to concrete objects, characters introduced from Grade 3 on represent more abstract concepts.

Beyond their negative impact on the students' cognitive development, the current assimilation policies in LM education in Japan have major consequences for LM students' identity as well (see also Norton, *Identity, Language Learning, and Critical Pedagogies*, Volume 6). Even among Japanese children, the dominant ideology of Japanese public education is "to treat everyone equally," which in practice means to ignore differences and to force children to fit into one mold (Shimizu, 2002). Japanese schools apply the same principle to LM students and expect them to manage most of the cultural and linguistic adjustments themselves. Ota (2005) argues that for LM students to participate in the Japanese school community requires a major restructuring of their identity: Doing well in math, for instance, involves not just performing math per se but also performing the role of a model Japanese student. Kanno (2003, 2004) reports that even in a public school she studied, where 43% of the students were LM students, she never heard two of them conversing with each other in their L1. In this school, there was enough openness and understanding to allow LM students to participate in the community fully—rare in public schools. Even so, LM students learned to participate by shedding their ethnic and linguistic identities and assimilating a Japanese identity. Other studies report instances of bullying of LM students by Japanese classmates (Miyajima and Ota, 2005b; Yamawaki, 2005), and of LM students denying their ethnic identity, insisting that they are Japanese (Sekiguchi, 2003; Shimizu, 2002).

The point is that such "passing" is possible for many LM students (Sekiguchi, 2003). The majority of LM students in Japan are either

ethnically Japanese or Asian. Physically they blend in. Many of them also have official or unofficial Japanese names. Once they acquire conversational Japanese, it is therefore possible for many of them to pass as Japanese—if not actively claiming a Japanese identity, then at least downplaying their differences. In an environment where assimilation is strongly promoted, it is not surprising that many LM students try.

Another issue that has emerged as a major problem recently has to do with LM students' educational career beyond junior high school. Up to the end of junior high school (Grade 9), LM students are admitted to public schools. They move from one grade to the next regardless of their academic performance. But high school is not part of compulsory education; students must pass entrance examinations to be admitted to high schools. In reality, the majority (97.7%) of Japanese students advance to high school (Monbukagakusho, 2006a), making a high-school diploma absolutely a minimum requirement for any kind of career in contemporary Japan (Sakuma, 2005). In contrast, only about 50% of LM junior high graduates advance to high school (Noyama, 2000; Ota, 2005).

Some measures have been taken to facilitate LM students' admission to high schools. Some boards of education provide special provisions such as permission to use bilingual dictionaries during the entrance exam, extended exam time, and printing *hiragana* on exam questions alongside Chinese characters to facilitate reading (Enoi, 2000). Enoi cautions that although these measures represent some progress, they may benefit only those rare LM students who have achieved near-academic parity with Japanese students and who only need a little extra help to be competitive. Even with such newly implemented policies, LM students who advance to high school tend to be admitted into less competitive schools and night-time high schools, which are usually the only option for those who have failed to secure entry into day-time schools (Enoi, 2000). High school, which has long become part of the standard educational career for Japanese nationals, therefore, continues to be beyond reach for the majority of LM students.

#### WORK IN PROGRESS

Japanese language instruction for LM students so far has fallen on the shoulders of regular classroom teachers and teachers who have been designated as "JSL teachers" but who in fact lack training in L2 instruction. Several standard JSL textbooks exist, but it has been left up to each local board of education and school to devise its own curriculum, often resulting in mechanical drills and cognitive undemanding, decontextualized language exercises. Slowly emerging is an awareness of the importance of moving beyond elementary-level conversational

Japanese and nurturing academic language proficiency in Japanese. In 2003, the Ministry of Education published its first comprehensive JSL curriculum for elementary school level LM students (Monbukagakusho, 2003). The main difference between this curriculum and existing JSL textbooks is that it aims to foster academic language proficiency in Japanese and provides concrete ideas for integrating JSL instruction and subject matter teaching. The committee is currently working on the development of a junior high school JSL curriculum (Kawakami, 2005).

Another recent development is a growing awareness of nonschooled LM children. Research on LM education in Japan has so far focused mostly on LM children who are attending school. However, recent reports point out that a significant fraction of LM students are not attending any type of school. Miyajima and Ota (2005b) have recently published an edited volume on this topic, the first of its kind. At present no official statistics are available, but Ota and Tsuboya (2005) have attempted an estimate of nonschooled, foreign-national children on the basis of statistics issued by the Ministry of Internal Affairs and Communication in 2003. According to their estimates, of the approximately 106,000 foreign-national children (age 6–14) living in Japan at that time, 12,098 of them, or 11.4%, were not receiving any type of full-time schooling. In a country where virtually every child attends a full-time school, this is clearly an anomaly. The Ministry of Education, which has been slow in acknowledging this problem, has finally decided to investigate the state of nonschooled, foreign-national children in 2005 (Monbukagakusho, 2005a).

The large number of LM children's nonenrollment in schools can be attributed to several factors, many of which have already been discussed: Inadequate JSL instruction, submersion education in the regular classroom, assimilation policies that often lead to bullying among children. However, a critical factor is the lack of foreign-national children's rights to public education in Japan. Japanese-national children have a constitutional right to 9 years of compulsory education: "All people [i.e., Japanese citizens] shall be obliged to have all boys and girls under their protection receive ordinary education as provided for by law" (Japanese Constitution, Article 26). Japanese parents who fail to send their children to school are repeatedly and persistently warned by the local school boards, because it is their legal duty to ensure that their children receive compulsory education. However, this right does not apply to foreign children. In reality, most public elementary and junior high schools (i.e., compulsory education) accept foreign-national children if their parents wish to enroll them. But the fundamental aim of Japanese public education is to foster Japanese citizens;

as such providing education to non-Japanese children is seen as “doing a favor” (Sakuma, 2005). The lack of legal obligation has led to a *laissez-faire* attitude both at the Ministry of Education level and at the level of local schools about LM children who stop coming to school or who do not enroll in the first place (Sakuma, 2005). Essentially, as far as Japanese schools are concerned, LM students are admitted if their parents approach the schools, but they are also free to leave or not to come in the first place.

#### PROBLEMS AND DIFFICULTIES

The nonschooling of LM children is often associated with Nikkei Brazilian children, who at present constitute the largest group of JSL students in Japanese public schools (Monbukagakusho, 2006b). One characteristic of this group is that their parents are migrant workers who intend to return to Brazil in the future. They come to Japan for economic motives: They plan to work in Japan, save enough money, and return home in a few years. Some educators point out that in addition to the institutional factors that alienate LM students, in the case of Brazilian children who do not attend any school, their parents are partly to blame (Ishikawa, 2005; Miyajima and Ota, 2005a; Ota and Tsuboya, 2005; Sekiguchi, 2003). They argue that these parents are so preoccupied with making money that they are not sufficiently involved in their children’s education in Japan. What complicates the situation further is that despite their intention to return to Brazil one day, many Brazilians in Japan are prolonging their stay and turning into *de facto* permanent residents (Ishikawa, 2005; Ota and Tsuboya, 2005; Sekiguchi, 2003). If Brazilian parents neglect their children’s schooling in Japan because “they are going home soon” and yet stay indefinitely, they run the risk of leaving their children stranded between two worlds: The children would not be able to increase their educational and social participation in their host society while becoming increasingly estranged from their home country. As a junior high-school teacher quoted in Miyajima and Ota (2005a) states, “Parents need to receive counseling and be told squarely that children’s education is not something you can put off; that it is an immediate concern” (p. 9, my translation).

Two other basic problems with LM education in Japan have to do with the criteria by which to identify JSL students and the exact number of such JSL students. The official figure the Ministry of Education releases every year—20,692 for 2005—counts those “foreign pupils and students who require Japanese language instruction.” This immediately excludes LM students who have become naturalized citizens. Also, even for foreign-national students, the ministry does not have

clear criteria by which to decide who “requires Japanese language instruction.” Kawakami (2005) writes that the way the ministry calculates the figure is to simply add up all the numbers of foreign-national students needing JSL instruction reported by public schools around the country; who is to be included in this category is left entirely up to each school to decide. It is most likely that those who are already conversationally fluent in Japanese and are no longer receiving any JSL instruction are excluded from the figure. But as we have seen, many LM students who sound fluent on the surface fail to acquire grade-level academic Japanese. Given that the ministry’s figure excludes both naturalized LM students and foreign-national students who possess basic conversational skills in Japanese, it is likely that the figure vastly underestimates the real number of students who are educationally disadvantaged by a lack of sufficient academic language proficiency in Japanese.

Then, exactly how many LM students are there who are not yet at grade level in Japanese language proficiency? According to statistics that the Ministry of Education has released once, in 2005 (Monbukagakusho, 2005b), 70,345 foreign-national students attended public schools in 2004. But this figure includes second- to fourth-generation ethnic Korean students who, though Korean by nationality, are Japanese monolingual speakers. On the other hand, this figure excludes those LM students who have become Japanese citizens. This figure, then, does not immediately equal the number of LM students in public schools. How many such LM students are not yet at grade level in their academic Japanese language proficiency is even harder to estimate from this figure. However, the figure does suggest that the LM student body that needs continuing support in JSL is much larger—100% or potentially even 200% larger—than the Ministry of Education acknowledges.

#### FUTURE DIRECTIONS

As the initial shock of an influx of LM students arriving in Japanese schools subsides, and as an infrastructure for their systematic education builds slowly, a number of issues remain. Future directions for research include: An accurate assessment of LM students’ Japanese and L1 proficiency and academic performance; the development of criteria by which to determine LM students who require special JSL instruction; an analysis of the impact of the Ministry of Education JSL curriculum on school practice; an inquiry into LM students’ development (or lack thereof) of multilingual and multicultural identities and how the

Japanese school education influences this process; an investigation of the academic trajectories of different groups of LM students; and asking ourselves, if some LM students reach higher education against all odds, what combinations of factors and circumstances have enabled them to do so.

In closing, two future research agendas deserve some elaboration. The first is the need for more ethnographic research on LM education in Japan. Educational research in Japan has a tendency to rely heavily on questionnaire surveys, and research on LM education is no exception. Although surveys are useful in capturing broad pictures, they do not reveal ideological conflicts, competing discourses, and power struggles among different stakeholders that underlie those general patterns (see also Toohey, *Ethnography and Language Education*, Volume 10). Some ethnographic studies have investigated complex interactions surrounding LM education in Japan (Kanno, 2003, 2004, 2007; Morita, 2002; Ota, 2000; Sekiguchi, 2003). Yet much more is needed to inquire into why, despite good intentions of many teachers who devote themselves to supporting LM students, the Japanese education system on the whole is failing LM students.

A second agenda, which is closely related to the first, is to apply perspectives of critical pedagogy and critical ethnography to research on LM education in Japan. Although earlier works were largely descriptive (relying heavily on surveys), recent research (Kanno, 2003; Miyajima, 2002; Ota, 2002; Sakuma, 2005) is more politically aware, exposing systemic discrimination underlying LM education in Japan. However, the idea that education is political clashes with the deep-rooted egalitarianism in the Japanese school education—itsself an ideological position—which leads to the claim that if everyone is treated equally, one's ultimate educational attainment is determined by one's merit. An important research agenda, therefore, is to expose and interrogate the mechanisms of social and cultural reproduction (Bourdieu, 1977; Bourdieu and Passeron, 1990; Willis, 1977) by which schools ensure that the vast majority of LM students stay at the bottom of the socio-economic hierarchy, just like their parents.

IDEOLOGY, POLICY AND PRACTICE IN BILINGUAL  
CLASSROOMS: BRUNEI DARUSSALAM

INTRODUCTION

English language and English medium classrooms in a non-native context are intrinsically bi/multilingual and bi/multicultural as both learners and teachers bring their multiple identities and home–community sociolinguistic practices into the classroom. In countries where policy makers and other stakeholders have realised and accepted this fact, these identities and practices are exploited (or expected to be) as ‘resources’ (in the case of Britain, for example, see Martin-Jones and Saxena, 2003); where this is not the case, they are positioned as ‘problems’. The latter is generally seen in post-colonial multilingual countries (e.g., see Arthur, 2001; Canagarajah, 2001; Hornberger and Chick, 2001; Lin, 1996) where the interaction between oppositional values of local dominant ideologies on the one hand and ‘English-only’ ideology on the other shape bilingual classroom ecologies. These ecologies are often reflected in language choices, rules for interaction and norms of interpretation. This essay focuses on how this post-colonial tension is played out in the bilingual classrooms in Brunei Darussalam, a small, oil-rich country in Southeast Asia, with a population of 379,444 and a land area of 5,270 km<sup>2</sup>.

Brunei, an ethnolinguistically diverse country, is located on the north-western coast of the island of Borneo. This Muslim kingdom is a ‘state’ (Tollefson, 1991, p. 10) headed by the 39th Sultan of a Malay Muslim ruling dynasty stretching back 600 years. The Sultan belongs to the dominant Brunei Malay Muslim group that overwhelmingly dominates Brunei in numerical, administrative and political terms. There are nine other indigenous ethnolinguistic groups: Belait, Bisaya, Dusun, Kedayan, Murut, Tutong, Mukah, Iban and Penan, whose cultural and linguistic *habitus* (Bourdieu, 1990) hardly command any value in the cultural and linguistic markets of Brunei (see Saxena, 2006). Among the non-indigenous communities is a large population of Chinese and smaller groups of transitional expatriate groups. *Bahasa Melayu* (Standard Malay) is officially the language of administration and education. The local variety, Brunei Malay, however, is spoken, as first or second language, by the majority of the population. English is also used for certain official purposes. Both Malay and English are

taught and employed as media of instruction in the country's bilingual education system. The use of Malay–English code-switching is a common practice in Bruneian communities and classrooms (Saxena, 2006, forthcoming).

A complex interaction between Brunei's broader sociolinguistic context, its bilingual education policy and classroom ecologies is shaped by a constant negotiation between 'convergence' and 'divergence' forces associated with the national ideology, *Melayu Islam Beraja* (MIB), Malay Islamic Monarchy, and the ideology of modernisation/internationalisation (for a complete discussion, see Saxena, 2006). On the one hand, the national ideology reconstructs Brunei's history and invokes Islamic values in support of the monarchy. Consequently, an inextricable link between Malay ethnic identity, Malay culture, Malay language (the official/national language), Islam and the nation is legitimised. On the other hand, increasingly, Brunei also perceives itself as part of the global economic and political system, and strives to diversify its economy beyond the production and export of oil and gas. Consequently, it considers the learning and use of English essential for modernisation and internationalisation. The constant interaction between the ideology of Brunei's traditional social hierarchy and Brunei Malay culture instituted into MIB philosophy and an ideology of modernisation and internationalisation helps provide an explanation for the development of Brunei's bilingual education policy and bilingual classroom practices.

#### EARLY DEVELOPMENTS: EVENTS LEADING TO THE DEVELOPMENT OF BILINGUAL EDUCATION POLICY

Prior to the establishment of the British Residential system of government in Brunei, the only form of schooling available was quasi-seminarial, the focus being on basic Arabic literacy and *Koranic* recitation. Formal education in Brunei was instituted during the British Residential period (1906–1959) with the opening of the first Malay vernacular school in the capital of Brunei in 1912. The earliest statement on the language-in-education policy in Brunei was made by the British Resident, Graham Black, in the Brunei Annual Report of 1939:

As at least a quarter of the indigenous population of the state is composed of races whose mother tongue is not Malay . . . The provision of education in their several languages is obviously impracticable, and it is inevitable that, linguistically at any rate, the other races must be *assimilated* [my emphasis] to Malay (Government of Brunei Darussalam, 1939, pp. 33–34).

This policy aimed at centralising the (British) administration by educating local bureaucrats in a single language. In later times, however, it also consolidated the authority of the Sultan over an ethnolinguistically heterogeneous state. It provided a sociolinguistically assimilatory model for Brunei to develop later as a cohesive 'one language—one culture—one nation' state (Saxena, 2006). This 'liberal pluralism' model (May, 2001) is encapsulated in the national ideology of MIB (enshrined in the 1959 Constitution of Brunei). MIB favoured Malay culture and language over other indigenous languages and cultures, and raised their status to that of national culture and national language. Since independence, MIB has been the guiding philosophy for social, cultural and education policies.

By the middle of the last century, Malay schools and, following the discovery and production of oil, Chinese schools and English Mission schools were the three separate systems of education in existence, but without any cohesive education policy (Martin, 1997). However, the 1959 Constitution declared Malay (*Bahasa Melayu*) the official language of the country, which set the scene for the current bilingual education policy.

The post-residential and pre-independence period (1959–1984) saw the commissioning of two education policy reports with the aims, among others, of making Malay the main medium of instruction in primary and secondary schools, and promoting a common national identity. The first report, the Aminuddin Baki-Paul Chang Report (1959), was based on a Malaysian (then Malaya) policy report, the Tun Razak Education Report (1956). It was adopted as the National Education Policy in 1962. However, it was not implemented due to 'the 1962 rebellion by dissident groups who were opposed to the Sultan's rule' (Jones, 1995, p. 108).

The second report, the Report of the Education Commission of 1972, emphasised the importance of the Malay language on the grounds of national ideology, stating that 'Brunei is a Malay State, with Malay as the official language, Islam as the State Religion and is also a Constitutional Monarchy' (Government of Brunei Darussalam, 1972, p. 7). The report recommended the merger of the dual system of separate streams of Malay and English medium education in existence at that time, into a single stream of Malay education. For Malay to become the sole medium of instruction, education experts from Malaysia would have played a central role in corpus planning. However, as Jones (1995) has pointed out, political and diplomatic tension between Brunei and Malaysia in 1974 became one of the main reasons why the report was not implemented. This political situation instead reinforced the position of English in education as Brunei stopped sending students for teacher training in Malaysia. The lack of higher

education institutions in Brunei left Britain as the sole destination for teacher training.

#### MAJOR CONTRIBUTIONS: BILINGUAL EDUCATION POLICY, ATTITUDES AND PRIMARY CLASSROOM PRACTICES

The separate education system of Malay and English streams in Brunei changed in 1985, a year after Brunei's independence, when Brunei introduced the *Sistem Pendidikan Dwibahasa* or Bilingual System of Education. In maintaining the aims of the 1959 and 1972 reports, the concept of a bilingual system of education was 'a means of ensuring the sovereignty of the Malay Language', but there was a departure from the earlier reports in respect of 'recognising the importance of the English Language' (Government of Brunei Darussalam, 1985, p. 2). In this system, except for English as a subject, Malay is used as the medium of instruction for all the subjects in the first 3 years of education (the lower primary). From the fourth year (the upper primary) onwards, there is a switch to English for mathematics, science, geography and history (although, subsequently the language medium for history changed to Malay in 1995). This 'abrupt' language medium switch from lower to upper primary in the fourth year of schooling has attracted considerable research interest because it is seen as being associated with students' poor performance and code-switching in English language and English medium lessons.

Baetens Beardsmore (1993, 1996) and Jones (1995, 1996) thoroughly examined the education system and proposed an alternative distribution of the subjects and language medium to address the problem of students' poor performance in English at the upper primary level. Drawing on Cummins' (1984) work, they suggested that subjects like mathematics and science are 'cognitively difficult subjects', and therefore they should be taught in the Malay medium until lower secondary (Year 8), whereas physical education and arts (and handicraft) are 'not cognitively demanding', and therefore they should be taught in English. Earlier, in an attitudinal survey (Ahmad Haji Jumat, 1992), principals, head teachers and teachers attributed students' poor performance in English to its early introduction, a demanding curriculum and examination system, the difficult language of the textbooks in English, an overemphasis on rote learning, and use of Malay in English medium classes. Other attitudinal surveys among teachers and students attributed the switch from English to Malay to teachers' need to explain abstract concepts (Murni Abdullah, 1996), teacher's own lack of proficiency in English (Martin, 1999; Zulkarnain Edham, 1997), and the snob value associated with the use of English in and outside the classroom (Zulkarnain Edham, 1997).

As for actual classroom practices, from his detailed micro-ethnographic Ph.D. study (see Martin, 1997) in rural and urban primary IV level classrooms, Martin (1996, 1999) has reported that teachers used substantially more 'Brunei Malay-*Bahasa Melayu*' mixed code for classroom management talk in the rural schools than in the suburban schools. He found Malay-English code-switching more common in history lessons than in science, and the least in mathematics lessons. He showed how demands of the curriculum led to a high frequency of code-switching. For example, teachers and students often switched from English to Malay while negotiating the meanings of difficult words. Drawing on the norms of community level code-switching, learners expressed themselves more freely, which created a more meaningful interaction with the teachers. However, generally, teachers dominated the talk and controlled the interaction. These two features of teacher talk left very little room for meaningful communication as they led to slot filling, labelling and chorusing, which, Martin concluded, amounted to 'safe talk' (Chick, 1996).

Another noteworthy finding of Martin's study was the exclusion of the minority indigenous languages from the classroom. For example, he observed that in the ethnically mixed population of students, while both Brunei Malay and minority languages were used outside the classroom, only Brunei Malay was used, with English, in the classroom.

#### WORK IN PROGRESS: IDEOLOGICAL INTERPRETATIONS OF INTERACTIONAL PATTERNS AT HOME, COMMUNITY AND CLASSROOM

As I have tried to show in the previous section, the agenda for the earlier research on Bruneian bilingual classrooms at the upper primary level has been mainly defined by the problems seen to be arising from the abrupt switch in language medium at this stage of schooling. As a consequence, serious research at the secondary school level has largely been neglected. In this section, I will draw on general findings from my ongoing micro-ethnographic research in Bruneian classrooms, the only in-depth study of this nature to be carried out since Martin (1997). It has been carried out both at primary and secondary levels, but in this paper my main focus will be on the latter because the findings from the former are similar to what has been reported by others as shown in the previous section. I will relate the classroom findings to my ongoing micro-ethnographic research in Bruneian families and communities, as well as broader values and ideologies. Both the classroom and community level research has involved ethnographic observations, audio recordings of communicative events, semi-structured interviews and

focus group discussions, as well as discussions during chance encounters. I highlight below only the general findings of my research due to limitation of space.

*Code-switching, IRE and Silence in 'English' Classrooms*

Recent work demonstrates that there is a great deal of variation in practices across schools and classrooms. However, two characteristics of Bruneian primary level classrooms are present in secondary level classrooms also, viz. code-switching and an Initiation-Response-Evaluation (IRE) pattern of interaction. The main difference, in general, between the primary and secondary classroom is that the frequency of code-switching and IRE patterns reduces slightly and group work increases slightly as one moves from primary to secondary classrooms, from classrooms with more experienced teachers to less experienced teachers, from overcrowded to less crowded classrooms, from low to high-ability classrooms, from low to high-achieving schools and from English language lessons to English medium lessons (e.g. mathematics and science), particularly at the upper secondary level.

At upper secondary level, teachers from 'English' classrooms (both language and content-based) say that they feel under great pressure to 'police English' for a number of reasons. At this level, for example, the syllabus demands more group work and requires students to debate their opinions on certain social issues. But teachers are not always successful in maintaining students' discussions in English alone, even where students' English proficiency is not a problem. Since their earlier schooling, students have been habitually using Malay and/or code-switching between Malay and English with each other inside and outside the classroom. They often get excited and go off-task, creating a noisy classroom which is interpreted by the authorities and other teachers as an undisciplined classroom because, as one teacher said, 'a silent, disciplined classroom is where learning is taking place'. Occasionally, even when students are on-task, they tend to engage in 'disputational' and 'cooperative' talks rather than 'exploratory talk' (Mercer, 1995). I am also discovering that the ground rules for group work are not made explicit to them because the teacher is inexperienced or traditionally trained, and/or students are not used to offering their opinions as in most of their earlier schooling they had experienced mostly IRE talk.

The predominance of the IRE pattern in Brunei classrooms stems from a number of reasons. The top-down administration style of Brunei education has its origins in the Ministry of Education (MoE). The MoE sets guidelines for syllabus, schemes of work, and examination schedules. It actively discourages the use of code-switching in English classrooms. Many teachers feel that the pressure to use only English coupled with a heavy syllabus and the pressure of examinations make

them resort to IRE. In order to avoid an unfavourable annual appraisal by the MoE and therefore loss of annual bonus, teachers say that their main concern is to try to meet syllabus deadlines and to try to produce good results by drilling into students the right answers. In recent times, a growing pressure for good results in English is also coming from parents who are becoming more vocal during parent–teacher meetings and expressing their opinions through local newspapers.

Long-serving teachers who are not selected for in-service courses are either not aware of or do not favour communicative methods of teaching and mainly use IRE. The more recently trained inexperienced younger teachers overlook or fail to follow the communicative methods as they are more susceptible to the pressures from the MoE, school authorities and parents for good results. If anything, the number of such teachers is on the rise. A rapid process of localisation in the last couple of years has seen experienced expatriate teachers being replaced by fresh TESL graduates from the local university, regardless of their degree grades. The IRE pattern of interaction reduces the pressure on such inexperienced teachers and students' limited resources of English, and thus reduces the dependence on code-switching into Malay.

When I showed them the transcripts of classroom interaction, some secondary level students thought the reason for the excessive use of IRE in Brunei was that 'Teachers want to maintain authority and status and don't want to feel insecure, paranoid, or lose face if a student asks a difficult question'. On the other hand, many students believed that they were being taught 'culturally to accept whatever teacher says and not to question her authority . . . teacher is always right'. Teachers do not wish to be caught off-guard because as one teacher said 'there is a feeling among students the teachers should know everything'. Therefore, with or without code-switching, the IRE pattern produces rhythmic and ritualised choral responses from students to teachers' display questions. This helps save the face of all the participants involved, which amounts to 'safe talk' as observed also by Martin (1997). On the other hand, individually nominated display questions and open questions, more often than not, lead to silence as students are generally reluctant to offer an opinion.

Many of the reasons for the silence and low level of response given by the students in Brunei are similar to the ones observed in bilingual classrooms in other countries, for example the fear of error, negative evaluation, correction, being laughed at by other students, dislike for being put on the spot and losing face. Other reasons are associated with the marginalisation of home and community languages as a result of English-only ideology, as can be seen in students' resistance through silence and the silence produced by teachers 'policing English' and levying fines. However, I would like to focus and elaborate on another reason for silence that is considered rather important by the teachers

and students in Brunei. They tend to attribute the silence among students to the highly hierarchical nature of the society, guided by the MIB philosophy, which socialises young people to be silent in the presence of higher status people, such as teachers, and prevents them from offering their opinion.

*Ideology, Socio-Cultural Hierarchy and Silence at Home and Community*

As my ethnographic research in the families and communities is revealing, Bruneian children are socialised into picking up subtle politeness signals for deference and indirectness embedded in everyday interactions. Brunei Malays as a discourse community and a community of practice learn that the Brunei–Malay culture is, as one student said, ‘all about gentleness, politeness, decorum and hospitality’. The national ideology that produces and reproduces this discourse community encapsulates ‘the principles of social order and system of beliefs’ (Ochs, 1986, p. 2) to which individuals are exposed in family and social networks, in education, at work, mosques, festivals and social and official ceremonies. The principles of obedience and filial piety are socialised through participation in language-mediated interactions in socio-cultural events. Often, my older respondents pointed out that any disobedience or impiety is considered to bring misfortune, as told in Malay folktales such as *Si Tanggang* and *Nakhoda Manis*, in which the ungrateful son turns to stone. *Menjawab* (Malay ‘talking back’) is said to lead to *ketulahan* (bad luck) as often Malay children are told *ketulahan kan karang* (‘beware of God’s punishment’; or ‘told you so’ when children meet some misfortune, e.g. falling down). Such sociolinguistic encounters underscore the status of parent vis-à-vis children.

As children grow and are socialised into various events in other domains and attend MIB classes at school, they begin to acquire and learn the sociolinguistic behaviour associated with the social hierarchy in Brunei society: the Sultan, the immediate royal family, other nobles (*Pengirans*) and non-nobles with honorary titles at the top, followed by those from higher socio-economic classes and people of older age, in a descending order of social status. The hierarchical interactional behaviour is embedded in and manifests itself most markedly in the Brunei Malay address system. For example, in case of the use of second person pronoun ‘you’, the variant *gian* [ñian] (you) is appropriate when interacting with a *Pengiran*, and when addressing an elder, *kita* or *abiskita* (you) is used to show respect instead of informal *kau* (you). The general agreement among the respondents was that by about age ten, children are expected to have learnt proper ways of addressing and interacting with their elders. They are not allowed to participate or interfere in elders’ conversation. They are taught not to initiate a

conversation and not to respond unless prompted. From a very early age, they learn to be quiet in adults' company. They learn that voicing an opinion is the prerogative of the person of the higher status, a lesson that lasts a life time.

*Interactional Negotiation of Competing Ideologies  
in 'English' Classrooms*

As Brunei is a small, closely knit society, social impropriety is not taken lightly. I often heard from my respondents that people in this society do not wish to be a 'nuisance'. Individuals go to a great length to avoid causing offence to others in their sociolinguistic behaviour as that would bring shame to the family and/or hamper their progress in the society/career. Brunei classrooms are not immune to these sociolinguistic norms. The boundary between the classroom and other social situations is blurred, and with that the associated roles and subject positions. Teachers are not just teachers of English with their identity constructed by the English-only ideology; they are also Bruneian adults. They are, as focus group discussions with teachers and students reveal, reluctant to threaten students' face who, given the small population, might be related to them or belong to a higher status family. Students are also MIB-inducted Bruneians who are taught not to make their teacher lose face by asking a difficult question or by voicing their opinion. Therefore, the rules for interaction and norms of interpretation acquired outside school shape the classroom discourse practices, which is predominantly IRE. The silence on students' part may simply be socio-culturally constructed and not necessarily due to a lack of competence in the subject matter or English.

Classroom organisation and recurrent classroom events are constant reminders of MIB oriented culture, for example, the MIB seating arrangement whereby boys and girls do not sit together, and students greeting teachers with Arabic/Islamic expressions at the beginning and end of a lesson. Further reinforcement comes from regular attendance at 'Civik' or MIB and Religious Knowledge classes along with other subjects as part of the school curriculum. These classes constantly reinforce in the minds of students the juxtaposition of Islamic religious morality, Malay culture, Malay language and their national Malay identity. These reminders often manifest themselves when students try to redefine the interactional context of the classroom. For example, when teachers impose the English-only ideology on students' use of code-switching, students say that they sometimes respond by evoking the MIB slogan *utamakan Bahasa Melayu* (Priority to Malay). Sometimes they say it to provoke teachers or as a form of resistance to the wider English-only ideology. At other times they say it out of genuine confusion because the MIB classes, government-sponsored signboards at

important road junctions and their parents at home always remind them to prioritise use of Malay. Either mindset partially explains the use of code-switching by the students in the English classrooms. Like their teachers' use of code-switching for pedagogical and social purposes, the students can be seen as trying to negotiate the tension between the two dominant competing ideologies, English-only and MIB. These ideologies are divergent and convergent, respectively, in terms of serving the interests of the centre and periphery in the classroom.

#### PROBLEMS, DIFFICULTIES AND FUTURE DIRECTIONS: THE DILEMMA

There is a dearth of informed micro-ethnographic research on bilingual classrooms in Brunei, particularly at the secondary level. Among other reasons, research on education in Brunei did not start until the establishment of the only university in Brunei in 1985, a year after the independence of Brunei, and it did not pick up until the 1990s. Earlier research has identified a number of problems, including the difficult English textbooks and syllabus, overemphasis on examinations, an earlier switch of language medium from Malay to English at the upper primary level, and inexperienced teachers. However, such problems cannot be tackled unless there is a better understanding of how Brunei's bilingual classroom ecologies are being shaped.

The post-colonial dilemma policy makers and teachers in Brunei face is that the main aim of Brunei's education policy is to produce citizens who can uphold the principles of the MIB ideology, yet they cannot escape 'the monolingual fallacy' (Phillipson, 1992) of the English-only ideology. As in many other post-colonial contexts (Creese and Martin, 2003; Heller and Martin-Jones, 2001), this dilemma produces two dominant patterns of bilingual classroom interaction in Brunei, viz. IRE and code-switching. Among other reasons, these patterns are the product of negotiating the tension between good performance in English and upholding Brunei's unique socio-cultural hierarchical structure of the society shaped by its national ideology and reproduced by various government institutions, including education.

We need to recognise the agency of the participants in Bruneian classrooms in their skilful negotiation of the opposing values of the two ideologies as manifested in Malay-English code-switching and their silence. However, the participants from the indigenous minorities do not have such active choices available to them due to the marginalisation of their languages and cultures inside and outside the classrooms. Their silence is due to the monopolisation of the education policy, classroom practices and societal multilingualism by the dominant ideologies and the two legitimised official languages, viz. Malay

and English, which are squeezing out the minority languages. The consequences of this culture of silence are evident in many post-colonial nation states as reflected in the alarming rate at which language shift, attrition and death is taking place around the world (e.g. see Nettle and Romaine, 2000). Each multilingual context has to arrive at its own local solutions; however, for Brunei, some future directions in this regard may come from countries which practise multilingual education policies in the belief that linguistic diversity empowers individuals to participate fully in the social, political and economic life of the nation (e.g. see May, 2001; Tollefson and Tsui, 2004).

## CLASSROOM ECOLOGIES: A CASE STUDY FROM A GUJARATI COMPLEMENTARY SCHOOL IN ENGLAND

### INTRODUCTION

The human and linguistic ecology of Britain has changed substantially over the centuries. Since World War II, particularly, there has been a dramatic increase in the number and diversity of groups of peoples which have settled in the country. These groups include displaced refugees who entered the country in the immediate aftermath of World War II, people from the Indian sub-continent, East Africa and the Caribbean, and, most recently, other groups which have moved to Britain to escape from political upheavals, war or famine. These 'new minorities' in Britain brought with them their own languages which are often referred to as 'community languages', 'heritage languages' or 'Languages other than English'. These languages have largely been left to fend for themselves, with little or no government support. Many of the groups have taken it upon themselves to provide some support for cultural and linguistic maintenance, and this has been done mainly through the setting up of 'complementary schools'. Until recently, complementary schools had received little official acknowledgement and, in addition, they remain largely under-examined and under-theorised. This chapter provides a case study of one Gujarati complementary school in England, focusing on the multilingual experiences in the school environment. It is recognised that classroom experiences are shaped by experiences outside the classroom, as well as the pressures, policies, values and ideologies which exist in the wider environment. In exploring the subtle dynamics of classroom life in one complementary school within the framework of these external pressures, policies, values and ideologies, an account of the multilingual classroom (and school) ecology is provided.

### EARLY DEVELOPMENTS

Several sources provide brief accounts of the histories of migration patterns of the new minority groups. For example, *The Other Languages of England* (Linguistic Minorities Project, 1985) provides a typology of migrations into Britain up to 1985, based on the time frame of the migration and on the reasons for the initial migration and settlement.

In this typology, the two major categories are migrant labour and political refugees. More detailed and up-to-date information is provided in Edwards (2005), in a chapter entitled 'Roots of Diversity', a chapter which also contains information on the histories of migrant populations in other parts of the world, notably Australia and the USA. Other sources have provided accounts of particular communities, such as Ghuman (2003), who reviews the history of the migration of South Asians to the USA, Canada, the UK and Australia. What is clear from the literature is that there are very significant numbers of linguistic minorities, and these have increased dramatically over the last few decades. With reference to the city of London alone, it was noted in Rosen and Burgess' (1980) study that there were 55 languages used by London school children. A later study, by Baker and Eversley (2000), noted that over 300 languages are spoken by children in the city's schools.

Within Britain, although government rhetoric appears to highlight the importance of multilingualism, the maintenance of the languages of the new minorities has historically been seen as beyond the remit of mainstream education. The Swann Report suggests that linguistic and cultural maintenance is 'best achieved within the ethnic minority communities themselves' (Department of Education and Science 1985, p. 406). A fuller discussion of the language policies related to the minority communities is provided in Rassool (Language Policy and Education in Britain, Volume 1).

Many minority communities have indeed taken steps to ensure that their languages and cultures are passed on to the younger generations through a formal educational process. Several terms are used for this type of education, such as community language education and out of hours learning, and the schools in which this learning takes place are referred to as supplementary schools, community (language) schools or complementary schools. In the USA and Australia, a term in common use is 'heritage/community language education' (Hornberger, 2005). Such education provides a "borrowed" but "safe" and largely "hidden" space in which communities can learn about their own cultures and languages (Creese et al., 2006a; Martin et al., 2006) but, as noted in the introduction above, little has been reported in the literature about how these educational spaces function. What is clear, though, is that there is a considerable number of these educational institutions around the country. Kempadoo and Abdelrazak (1999) provide a directory of 'supplementary and mother-tongue schools' but, although they list over 1,000 schools, they are at pains to point out that the list only scratches the surface. They make reference to the significance of this form of education and how the schools help children with their learning in several ways, not least due to the 'positive impact on pupil self-esteem and confidence' (1999, p. iv). Verma et al., (1994, p. 12) noted that the initial aim of this type of education was to strengthen 'cultural

and religious identity in the face of the threat of cultural assimilation'. Similarly, Hall et al., (2002, p. 415) refer to the way schools 'correct' the rather 'subtractive' approach to language learning in the mainstream sector with an 'additive' approach, 'filling in the gaps of cultural specificity that mainstream schooling neglects'.

In order to begin to consider how these 'hidden' educational spaces function, and to investigate the discourses within them and the relationships with the wider environment outside the school, this chapter draws on an ethnographic study of one complementary school in England. In focusing on the classroom culture within the school and in relation to the wider environment, an ecology metaphor is used in order to capture the complexity and importance of the interactions and inter-relationships which occur. The ecology metaphor as applied to schools and classrooms is not new. In fact, Breen (1986) has likened the classroom to a 'coral reef' due to its incredible complexity. Much of what goes on in a coral reef is unseen, and the relationships between the members of the ecosystem and the environment outside the ecosystem are also unclear. Likewise, although we can see and hear what is going on in a classroom, there is a lot more going on under the surface.

#### MAJOR CONTRIBUTIONS

The complexity of classroom life is illustrated in a recent volume which, within an ecological framework, explores the interaction between languages and their speakers in multilingual and multicultural classrooms, the dynamics of multilingual classroom interaction, and the positionings of classroom languages and their speakers in dominant educational discourses (Creese and Martin, 2003). The multilingual classrooms are located in diverse contexts but they all investigate some aspect of interactions and inter-relationships between teachers and learners and how the discourses within and between micro and macro levels of education are institutionally and societally (re)produced. For example, the study by Skilton-Sylvester (2003), which focuses on Khmer/English biliteracy in multilingual classrooms in the USA, considers the legal and official language policies in relation to minority groups, linking these to the implicit policies and ideologies which exist outside the official discourses. The major focus of the paper is the interplay between policy making, the ideologies which support these policies, and the micro-level practices in schools and classrooms. Skilton-Sylvester's study provides a telling account of how teachers support and contest ideologies about the education of linguistically diverse students. In the same volume, Creese (2003) explores how, in a London secondary school, bilingual teachers' ethnicity and language resources in Turkish and English are employed by the school to (re)produce a discourse of equality that actually seeks to level out difference. The study shows how the

bilingual teachers mediate, negotiate, and action identification positionings towards and away from the dominant discourse of institutional sameness.

The studies referred to above provide an ecological perspective through their focus on minority groups within the mainstream schooling sector. Up until recently there has been an almost complete dearth of studies which focus on the ecologies of complementary schools and their classrooms. There are several possible reasons for this. In the first place, as noted earlier, these schools tend to be hidden away from the public gaze, using borrowed space for their activities. Although the communities themselves recognise the importance of their languages and cultures, this recognition is not generally found in the wider environment, an environment which, although it purports to 'celebrate' multilingualism and diversity, does not appear to be able to cope with multilingualism in actual practice. The complementary schools have therefore been left to fend for themselves and there has been very little public acknowledgement of the work they do. However, a recent government report has noted that attendance at complementary schools 'can enhance pupils' respect, promote self-discipline and inspire pupils to have high aspirations to succeed' (Department for Education and Science, 2003, p. 26).

A small number of studies which focus on the ecologies of complementary schools have begun to be reported in the literature. Arthur's (2003) study, for example, focusing on after-school lessons in Somali in Liverpool, explores the roles of Somali literacy practices in the daily lives of the young people who attend these lessons. She relates the bilingual language practices to the different values associated with the languages they speak, as well as to the social and linguistic experiences these people bring to the classroom. Arthur's study explores the potential role of Somali literacy (including the teaching of literacy) and the effect this has on the development of cultural and linguistic identity which young Somali people have in their community.

Wu's (2006) study of what she refers to as Chinese community schools in the UK, focuses on language choice and cultures of learning in the schools. Wu notes the importance of the different socio-cultural histories of the participants and, in particular, how this influenced the language choices of the students and teachers in the school, as well as the importance of cultural traditions such as respect for elders and use of address terms. Using extracts from several lessons, Wu shows how both English and Chinese were used to accomplish the lesson.

In a study of 'parallel literacy classes' in second or third generation Pakistani children in Watford, England, Robertson (2006) notes how the children learn to switch between literacy systems, and how they use a range of strategies to negotiate the simultaneous learning of multiple literacies. The study focuses on English literacy classes in a

mainstream school, Urdu literacy classes in a complementary school and Qur'anic classes in the local mosque. Robertson's study demonstrates the realities and complexities of the children's multilingual lives—and this resonates with Sneddon's (2000, p. 103) assertion that '[c]hildren all over Britain live their daily lives in two, three or more languages'. With reference to the Urdu classes in Robertson's study, it is shown how the teacher routinely asks children to discuss and translate words in both English and Urdu, as well as their home language Pahari. The significance of Robertson's study is that it shows that where the English literacy lessons present the children with a 'closed system of literacy . . . based on a monolingual "English-Only" version of literacy', in community language lessons, the children's knowledge of English and Pahari is 'used as a springboard for teaching and learning' Urdu (Robertson, 2006, p. 57). In a similar vein to the work of Robertson, Kenner (2004) notes how children growing up bilingual and attending community languages classes, experience their worlds as 'simultaneous' rather than as separate linguistic and cultural entities. Complementary schools are thus an important site where children integrate and synthesise their linguistic and literacy resources.

#### WORK IN PROGRESS

This section reports on a recent study on complementary schools in Leicester, England, and work in progress which has emerged from this study. The initial study surveyed all the complementary schools in Leicester in order to determine the scope of provision in supporting minority linguistic and ethnic communities in the city (Martin et al., 2004). Following the survey, two Gujarati complementary schools were selected for ethnographic observation in order to explore the teaching and learning practices in the schools as well as the classroom and school discourses. These practices were located within a framework which takes into account the pressures, policies, values and ideologies which exist in the wider environment outside the schools. The Leicester study (Martin et al., 2004) shows that the two schools: (i) are important sites for the acquisition of linguistic and literacy knowledge; (ii) add value and enhance learning across other educational settings; (iii) play an important role in community cohesion; (iv) provide a positive and uncontested model for bi- or multilingualism; and (v) widened the participants' choices and uptake of identities. In the discussion of the work emerging from the Leicester study below, we pick up on several of these issues within an ecological framework.

Li Wei (2006, p. 80) has noted, with reference to the Leicester study, the significance of the 'dynamic and negotiated nature of social identity and on the strategic use' of Gujarati and English in the

complementary schools in the study. Both these issues are central to an understanding of the ecology of the classrooms. With reference to the former, Creese et al. (2006a) refer to three identity positions which emerge from the interview data in the Leicester study: multicultural, heritage and learner identities. The first two of these explore the importance of ethnicity as a social category for those attending the complementary schools whereas the final one refers to the opportunities that complementary schools provide for students to perform their identities as successful learners. The study of Creese et al. (2006a, p. 40) demonstrates the way the two complementary schools provide experiences which are different from those in mainstream schooling, in that they allow 'young people to meet and consider (reproduce or contest) existing categories around nationality, culture, ethnicity, bilingualism and learning'. Such schools are therefore important contexts for participants 'to explore identity positions and create narratives in new and imaginative ways'.

Focusing specifically on how one Gujarati complementary school in the Leicester study 'manages' bilingualism, Martin et al., (2006) note that both Gujarati and English are used in the school, in the assemblies, in the corridors and in the classrooms. The two languages do not appear to be compartmentalised in any formal way. On the contrary, the use of both languages is spontaneous, flexible and unproblematic. The way two languages are used in the classrooms appears to resonate with studies in other contexts, particularly in a range of post-colonial contexts where policy dictates that a former colonial language is the language of instruction. In such contexts, teachers and learners switch into their own languages during lessons (see, for example, Arthur and Martin, 2006).

In the classrooms observed, the teachers often initiate in Gujarati and the students usually respond in English. This is, perhaps, not surprising, as English is the first language for the majority of the children. At the younger end of the school, English is used to a greater extent, apart from in cases where the teacher is drilling a particular structure. In classes in which students have been learning Gujarati for longer, more Gujarati is used. Extracts from such classrooms show clearly how the negotiation of meaning is managed both jointly, between teacher and students, and bilingually. The classroom talk tends to be very structured, based around an exchange framework in which the teacher controls what is said. Labels are often requested in Gujarati or, alternatively, English labels are requested for Gujarati words. A common initiation by the teacher, in either English or Gujarati is 'What does X mean?' and the discourse conventions of the classrooms require the students to provide the label in the other language. Instances of more spontaneous talk are usually in English. The teachers will

sometimes request ‘Gujaratima’ (‘in Gujarati’), but this does not usually occur in spontaneous speech. What is very evident is that the teacher is happy for the students to discuss issues in English. An example occurs in one classroom where the teacher and students are unravelling the content of a letter written in Gujarati. The letter is about wedding ceremonies, and they unravel the meaning of the letter in two languages. The teacher is using mainly Gujarati and the students mainly English. What is of interest is that the teacher puts no pressure on the students to use Gujarati. The teacher recognises the importance of the cultural content of the lesson and he later opined in an interview that ‘you can’t separate language and culture’ (Martin et al., 2006, p. 15).

In all classrooms, a major feature is the importance given to literacy. Many parents actually send their children to these schools with the particular purpose of developing some level of literacy—often due to the fact that these parents themselves missed out on learning to read and write Gujarati due to their particular migration trajectories.

What emerges from the studies discussed here is the way they provide bilingual and bicultural spaces in an institutional context, far removed from the sort of ‘celebration’ of bilingualism and biculturalism discourse which exists outside the school. By this we mean that the complementary school provides a safe space for the actual social experiences of bilingualism and biculturalism, in a wider environment where monolingualism is a perceived norm (cf. Rassool, *Language Policy and Education in Britain*, Volume 1). As noted by Hall et al., (2002, p. 410), such schools provide ‘a sense of belonging to a community that supports [students] practically, culturally, socially, emotionally and spiritually’. The classroom ecology of the schools provides some evidence of how this sense of belonging is provided. At the same time, the interactions and inter-relationships in the classrooms and school demonstrate how dominant ideologies around bilingualism are contested. The school allows students opportunities to bring together their different life experiences and to express fluidity in their identities (rather than essentialised ethnic identities), and flexibility in their use of languages (cf. Creese et al., 2006a).

#### PROBLEMS AND DIFFICULTIES

Complementary schools have, traditionally, not been the focus of detailed research. Although some studies have provided information on the numbers and types of schools, their aims, and the languages that they teach, as noted above, very little detailed research has been carried out within an ecological framework, specifically the investigation of the multilingual practices in the schools and their relationships with the

wider environment. One of the reasons is that schools very often remain hidden from the public 'monolingual gaze'. Until recently, although schools and communities recognise the important function that they fulfil, people outside the communities have tended to ignore them.

### FUTURE DIRECTIONS

Findings from the Leicester study (Martin et al., 2004) mentioned earlier in this chapter have shaped new research agendas and a large comparative study is now underway which investigates multilingualism in complementary schools in four communities. The focus of this new project (Creese et al., 2006b) is to investigate how complementary schools extend or restrict the performance of young people's multilingual repertoires. The ethno-linguistic groups concerned are Bangladeshi, Chinese, Gujarati and Turkish in Birmingham, Newcastle, Manchester, Leicester and London. The project aims to explore the social, cultural and linguistic significance of complementary schools both within their communities and in wider society, and to investigate how linguistic practices of students and teachers in complementary schools are used to negotiate their multilingual and multicultural identities. We bring an ecological approach to this research, exploring the relationship of languages to each other and to the society in which these languages exist. This ecological framework highlights the importance of linking together patterns of language use in particular contexts with ideologies about language(s) and their users at the macro-sociopolitical level.

There are a number of other future directions in which work on the ecologies of classrooms in complementary schools could proceed. An important starting point could be Hornberger's (2002, 2003) ecological framework for ideologies underlying multilingual language policy and practice. In this framework, Hornberger includes 'language evolution', 'language environment' and 'language endangerment'. In relation to complementary schools, we certainly need more studies that consider these issues. One important area is the way that complementary schools provide a context for language evolution, how languages come together, how languages are used and how they change, and what new multilingualisms are emerging from such a context. According to Li Wei (2006, p. 82), these new multilingual practices 'constitute vital socio-symbolic resources for linguistic minority speakers and communities'.

Secondly, we need more information about how environmental factors and ideological positions influence language use. What role do complementary schools play in contesting prevailing and privileged ideologies? Does the type of flexible bilingualism that is part of the complementary school classroom play a role in counteracting the rather 'monolingualising' nature of the UK? This requires that we begin to

look beyond the traditional boundaries of sociolinguistics and focus on ‘more fluid ways of thinking about language, identity and belonging’ (Pennycook, 2003, p. 514), crossing (cf. Rampton, 1998), and new multilingualisms. Finally, and significantly, the whole issue of language endangerment needs to be explored. We know that one of the major aims of complementary schools is language and cultural maintenance, but little is actually known about how successful these schools are in the maintenance of language and literacies. All these questions are inter-related, and hence the usefulness of an ecological approach.

## **Section 5**

### **The Language Ecology of Literacies, Oracies, Discourses**

## CONTINUA OF BILITERACY

## INTRODUCTION

The continua of biliteracy model offers an ecological framework in which to situate research, teaching, and language planning in linguistically diverse settings (Hornberger, 2003). The framework uses the notion of intersecting and nested continua to demonstrate the multiple and complex interrelationships between bilingualism and literacy and the importance of the contexts, media, and content through which biliteracy develops. The notion of continuum is intended to convey that although one can identify (and name) points on the continuum, those points are not finite, static, or discrete. There are infinitely many points on the continuum; any single point is inevitably and inextricably related to all other points; and all the points have more in common than not with each other.

Biliteracy, in this model, is defined as “any and all instances in which communication occurs in two (or more) languages in or around writing” (Hornberger, 1990, p. 213), a definition which follows from Heath’s definition of literacy events as “occasions in which written language is integral to the nature of participants’ interactions and their interpretive processes and strategies” (Heath, 1982, p. 50). Unlike Heath’s definition which focuses on the literacy event, my definition of biliteracy refers to instances, a term encompassing events, but also biliterate actors, interactions, practices, activities, programs, sites, situations, societies, and worlds.

The continua of biliteracy is an ecological framework, incorporating three key themes of the ecology of language metaphor: language evolution, language environment, and language endangerment. Numerous scholars, beginning with Haugen (1972), take up one or more of these themes in considering what Haugen called the reciprocity between languages and their psychological and sociological environments. Common across writings on the ecology of language are these themes that parallel those in the ecology movement more generally—evolution, environment, and endangerment. Specifically, an ecological view of language posits that languages (i) live and evolve in an ecosystem along with other languages (*language evolution*), (ii) interact with their sociopolitical, economic, and cultural environments (*language*

*environment*), and (iii) become endangered if there is inadequate environmental support for them vis-à-vis other languages in the ecosystem—and the ecology movement is about not only studying and describing those potential losses, but also counteracting them (*language endangerment*). The continua of biliteracy is an ecological framework in that the very notion of bi- (or multi) literacy assumes that one language and literacy is developing in relation to one or more other languages and literacies (*language evolution*); the model situates biliteracy development (whether in the individual, classroom, community, or society) in relation to the contexts, media, and content in and through which it develops (i.e., *language environment*); and it provides a heuristic for addressing the unequal balance of power across languages and literacies (i.e., for both studying and counteracting *language endangerment*).

### EARLY DEVELOPMENTS

Early papers on biliteracy (Goodman, Goodman, and Flores, 1979; Lado, Hanson, and D'Emilio, 1980; Spolsky, 1981) often left the meaning of the term implicit or assumed rather than stated. Genesee (1980) uses the term only in the title and concluding paragraph of his article reporting results of a survey on second language reading habits of adolescent immersion students in Montreal; and Cummins (1981) also uses biliteracy in his title, while referring within to “bilingualism and the acquisition of literacy skills.” His plea for attention to biliteracy is matched by Valdés' (1983) call for language planning to develop the use of written Spanish language in Hispanic communities; she too does not define biliteracy, instead assuming a meaning which can be roughly glossed as “reading (and writing) in two languages (or in a second language).”

Niyekawa, on the other hand, defines biliteracy as “an advanced state of bilingualism where the person can not only speak two languages fluently but also read and write these two languages” (Niyekawa, 1983, p. 98), excluding from her definition not only those who are less than fluent but also those who are biliterate but not bilingual; her definition is thus considerably more strict than mine in disallowing “lopsided” bilingual or biliterate instances. Fishman's definition of biliteracy as “the mastery of reading in particular, and also of writing, in two (or more) languages” (Fishman, Riedler-Berger, and Steele, 1985, p. 377) is, like Niyekawa's, more specific than mine, in that it focuses on mastery; yet it shares with mine a perspective encompassing not just the use of two languages, but of two (or more) languages (or language varieties).

The original impetus for my 1989 review of literature relating to biliteracy was an ethnographic research project initiated in Philadelphia in 1987, the Literacy in Two Languages project (see below). Finding

very little scholarly work attending explicitly to biliteracy, I looked instead to its component parts, i.e., the literatures on bilingualism and the teaching of second/foreign languages and the literatures on literacy and the teaching of reading/writing. A common ground that emerged was that dimensions of bilingualism and literacy traditionally characterized in terms of polar opposites, such as first versus second languages (L1 vs. L2), monolingual versus bilingual individuals, or oral versus literate societies, turned out, under the scrutiny of research, to be only theoretical endpoints on what is in reality a continuum of features (cf. Kelly, 1969, p. 5).

This notion became the building block for the continua model of biliteracy. Specifically, the continua framework depicts the development of biliteracy along intersecting first language–second language, receptive–productive, and oral–written language skills continua; through the medium of two (or more) languages and literacies whose linguistic structures vary from similar to dissimilar, whose scripts range from convergent to divergent, and to which the developing biliterate individual’s exposure varies from simultaneous to successive; in contexts that encompass micro to macro levels and are characterized by varying mixes along the monolingual–bilingual and oral–literate continua; and with content that ranges from majority to minority perspectives and experiences, literary to vernacular styles and genres, and decontextualized to contextualized language texts.

The continua framework can be schematically represented as in [Figures 1, 2, and 3](#). [Figures 1 and 2](#) depict the nested and intersecting nature of the continua, respectively, while [Figure 3](#) summarizes all 12 continua (four nested sets of three intersecting continua each). The three dimensionality of each set of three intersecting continua is representative of the interrelatedness of those three constituent continua; and the nested three-dimensional spaces indicate that the interrelationships extend across the four sets of continua as well. The two-way arrows represent the infinity and fluidity of movement along each of the continua; and the three-dimensional spaces must also be visualized as infinitely expanding and contracting, not as bounded boxes as in the diagram.

The notion of continuum conveys that all points on a particular continuum are interrelated, and the intersecting and nested relationships among the continua convey that all points across the continua are also interrelated. This ecological framework suggests that the more their learning contexts and contexts of use allow learners and users to draw from across the whole of each and every continuum, the greater are the chances for their full biliterate development and expression. Implicit in that suggestion is a recognition that there has usually *not* been attention to all points and that movement along the continua and across the inter-

traditionally **less** powerful ← → traditionally **more** powerful

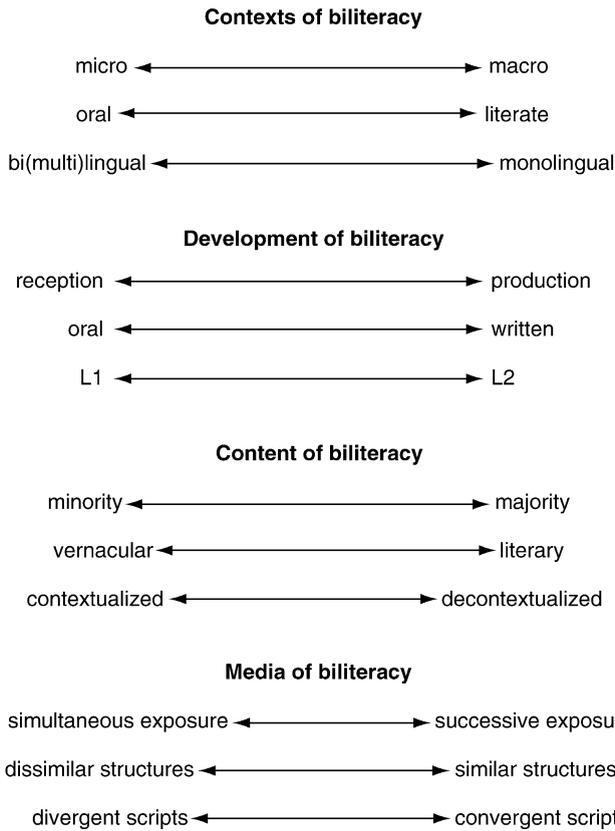

Figure 3 Power relations in the continua of biliteracy. Reprinted with permission from: Hornberger, N.H. and Skilton-Sylvester, E.: 2000, 'Revisiting the continua of biliteracy: International and critical perspectives', *Language and Education: An International Journal* 14(2), 96–122.

sections may well be contested. In educational policy and practice regarding biliteracy, there tends to be an implicit privileging of one end of the continua over the other such that one end of each continuum is associated with more power than the other (e.g., written development over oral development; see Figure 3); there is a need to contest the traditional power weighting by paying attention to, granting agency to, and making space for actors and practices at what have traditionally been the less powerful ends of the continua.

## MAJOR CONTRIBUTIONS

The initial impetus for formulating the continua of biliteracy framework was the Literacy in Two Languages project, a long-term comparative, ethnographic research project in two language minority communities of Philadelphia. Through participant observation, interviewing, and document collection in school and community settings in the Puerto Rican community of North Philadelphia and the Cambodian community of West Philadelphia, the study sought to understand biliteracy attitudes and practices in classroom and community, and their fit with local, state, and national policies and programs addressing them. The continua framework proved useful in analyzing the data and drawing conclusions from the research; and by the same token, the ongoing research continually informed the evolving framework.

For example, an early paper from this project showed how *biliteracy contexts* for Puerto Rican and Cambodian students in Philadelphia in the 1980s were framed and constrained by an ecology in which national policies emphasized English acquisition at the expense of minority language maintenance (e.g., the proposed English Language Amendment to the Constitution, the 1984 and 1988 renewals of the Bilingual Education Act of 1968, and the Immigration Reform and Control Act of 1986), the educational system used minority languages only to embed the more powerful English literacy, and the assimilative “charm” of English pulled students’ biliterate development toward English. Also part of the Literacy in Two Languages project, Joel Hardman and I reported on our study of adult *biliteracy development* in programs for Puerto Ricans and Cambodians in Philadelphia, making an argument for the inadequacy of an autonomous, cognitive skills-based view of literacy with its emphasis on a single, standardized schooled literacy in the L2 and for the benefits of an ecologically complementary ideological, cultural practice view (Hornberger and Hardman, 1994, p. 168).

When we turned our attention to the *media of biliteracy* in two-way bilingual programs in the Puerto Rican community, we found that faculty and staff continually faced challenging media-related decisions with regard to, for example: (i) placement of students in English-dominant and Spanish-dominant streams; (ii) distribution of English and Spanish in the program structure and the classroom; and (iii) instruction and assessment in (a language ecology of) coexisting standard and non-standard varieties of English and Spanish (Hornberger, 2005d; Hornberger and Micheau, 1993). In a related, spin-off of the Literacy in Two Languages project, specifically her own ethnographic dissertation study of literacy, identity and educational policy among Cambodian women and girls in Philadelphia, Ellen Skilton-Sylvester (1997) found

it necessary to supplement the original three sets of continua (context, media, and development) with the continua of *biliteracy content*, in order to account for the identities and meanings expressed through biliterate practices and especially for the important role of contextualized, vernacular, and minority texts in (the ecology of) the women's and girls' biliterate development.

Beyond this original work within the ecology of languages in Philadelphia, the continua framework has been applied in a range of other ecological contexts in the USA and internationally. At the level of multilingual classroom ecologies (Creese and Martin, 2003), Bloch and Alexander (2003) use the continua as heuristic in exploring ways of developing, trying out, and demonstrating workable strategies for teaching and learning multilingually in one Cape Town primary school, in the context of South Africa's recent language policy initiatives promoting multilingualism and the African languages. Schwinge uses the content and development continua to analyze how two US "elementary school bilingual education teachers who teach a mandated curriculum utilize the various linguistic, cultural, and textual resources that are available in their bilingual classrooms to help ensure that their classroom instruction is comprehensible, draws upon the community's local funds of knowledge, and enables students to successfully become bilingual and biliterate" (Schwinge, 2003, p. 248).

At the program level, Jeon (2003) argues that the continua of biliteracy framework provides a rationale for Korean-English (and other) two-way immersion program policies, while Basu (2003) uses the continua comparatively in analyzing the ecology of bilingual education programs in two schools of New Delhi, India, to understand why it is that, despite the far reaching and progressive goal of the bilingual education policies, one school is more successful in making its students proficient in the L2 than the other.

Bilingual teacher professional development offers other instances of biliteracy ecology that the continua framework has been used to elucidate. Bertha Pérez, Belinda Bustos Flores, and Susan Strecker (2003) apply the continua in comparing the experiences of two groups of bilingual teacher education candidates in US Southwest, following them through different phases of their preparation, including admissions interviews, written tests, and fieldwork tutoring practicums. The four US resident "*normalistas*" (graduates of a Mexican normal school) and the three homegrown "*paraprofessionals*" share Latino culture broadly defined, but differ in specific ecologies of their cultural upbringing and their use of vernacular and standard, literary Spanish and English language skills. The authors find the dynamic of the biliteracy continua in evidence within the teacher preparation program in the acceptance of the use of both English and Spanish vernaculars,

which in turn enables both groups to understand the local community's use of the vernacular, while also providing opportunities for their development of standard English and Spanish for academic purposes.

Also related to the ecology of teacher professional development, Cahnmann (2003) and Hardman (2003) each look closely at teachers' classroom practice, using the continua framework to explore tensions, struggles, and contradictions around the control of content in an ESL/bilingual classroom (Hardman) and a bilingual teacher's assessment and correction of students' oral and written productions (Cahnmann). Hornberger (2004) also addresses ecological dilemmas confronting bilingual (and language) educators and ways in which the continua framework might shape a response by enabling educators' awareness of the complex ecologies of biliteracy and providing a heuristic for their decision making in shaping curriculum and classroom practice—in relation to global/local contexts for biliteracy; standard/nonstandard varieties as media of biliteracy; language/content in biliteracy development; and teacher's and students' languages/cultures/identities in biliteracy content. Lincoln (2003) and Mercado (2003) provide rich case studies of this last dilemma in particular, in a consideration of language minority student voices in rural Arkansas (Lincoln) and of biliteracy development among Latino youth in New York City (Mercado).

Canagarajah (2005, p. 198) emphasizes that the continua framework offers an ecological heuristic for considering language policy; and this is exemplified in the work by Bloch and Alexander (2003) in South Africa, Baker (2003) on the Welsh National Curriculum, Freeman (2004) on Puerto Rican (and other language minority) community bilingualism in the USA, and Hornberger (2003) looking comparatively at implementational and ideological spaces for multilingual education in South Africa, Bolivia, and Paraguay. The continua framework has also been applied in describing, analyzing, and interpreting heritage language education at the level of policy, program, classroom, community, and individual, for Korean-American (Jeon, 2005; Pak, 2003, 2005) and Chinese-American heritage learners (Wang, 2004; *The Ecology of the Chinese Language in the United States, Volume 9*) in the USA, as well as in a comparative US/Australian dialogue (Hornberger, 2005b), in all cases illustrating the centrality of ecology and identity in the biliterate development of heritage languages and their speakers (Hornberger and Wang, 2007).

#### WORK IN PROGRESS

Similarly to work more generally in language planning and policy (cf. Ricento, 2000, 2005), recent and ongoing work using the continua framework takes up themes of ideology and identity in relation to the

ecology of biliteracy. A group of researchers and educators in the Pacific Islands explore the language policy/practice connection in classrooms which they characterize as linguistic borderlands, sites where teachers contend every day with postcolonial educational policies where English is designated the main medium of instruction, even though the children come to school speaking for example Marshallese, Palauan, or Samoan. Low and her colleagues use the continua of biliteracy framework to analyze ideological tensions and paradoxes in teachers' discourses about the contexts, development, content, and media of biliteracy; and to call policymakers' attention to the need to create "a dialogic space where community members can query which language(s) should be the medium of instruction and for what purposes" (Low, Penland, Ruloked, and Sataua, 2004, p. 32).

Hélot (2005) applies the continua framework as analytical heuristic to elucidate ideological principles and biases underlying language education policies in France, which have tended to favor prestigious bilingual education for monolingual learners and neglect the bilingualism of minority speakers. Illustrating through a counter-example to this tendency, she reports on a language awareness initiative carried out in a small, rural primary school in a multicultural community in the south of Alsace, demonstrating how teachers "reversed the relations of power imposed by the curriculum through opening their school to parents and making their classrooms inclusive of all the languages and cultures of their pupils," including the Alsatian dialect, immigrant languages such as Arabic, Turkish, Berber, Serber-Croate, as well as more prestigious languages such as Japanese, Italian, Spanish, Russian, and Chinese. She uses the continua framework, then, to argue for a more ecological approach to policy and practice, one that would bridge the gap between prestigious bilingualism and minority bilingualism.

An ongoing 4-year ethnographic study of multilingual, multimodal, transnational literacy practices of Latino immigrant youth in Manhattan, USA, employs the continua of biliteracy framework in seeking to understand how "academic English literacy intersects with the literacy practices of these Latino students outside of school and/or in Spanish; as well as how these multiple literacies might ultimately serve as resources in schools" (Bartlett, 2004). This research promises to provide insights on identity development in relation to a transnational ecology of language and literacy practices. Similarly, Utakis and Pita (2005) consider the transnational practices and identities of the Dominican community in the Bronx, in a context where current educational policy and practice presents Dominican students with unacceptable forced choices between Spanish and English, home community and host community, local and global affiliations. The authors argue that, in contrast, the continua of biliteracy provides a framework "to

articulate the policy and pedagogical changes that would do justice to the educational needs of Dominican students” (Utakis and Pita, 2005, p. 159).

Utakis and Pita (2005, p. 160) also emphasize the potential of the continua framework as a heuristic tool teachers can use in opening up ideological spaces in the local contexts of classrooms, in turn contributing to changes in the community and society. This latter point takes up a theme that had emerged when I used the continua of biliteracy framework as ecological heuristic for situating community and classroom challenges faced in implementing transformative multilingual language policies in three national contexts—post-apartheid South Africa’s new Constitution of 1993, Bolivia’s National Education Reform of 1994, and Paraguay’s post-dictatorship democratic education reform of 1992; and found, following Chick (2001), that ideological space opened up by top-down policies can contribute to the emergence of new discourses in implementational spaces at the grassroots level (Hornberger, 2003, 2005c).

Issues of identity, ideology, and ecology in relation to the continua of biliteracy are also salient in my recent and ongoing comparative ethnographic research on multilingual language education policies and indigenous language revitalization. In indigenous contexts of socio-historical and sociolinguistic oppression involving Quechua in the South American Andes, Guaraní in Paraguay, and Maori in Aotearoa/New Zealand, I consider examples of contentious educational practices from an ecological perspective, using the continua of biliteracy and a Bakhtinian notion of voice as analytical heuristics, and suggesting that the biliterate use of indigenous children’s own or heritage language as medium of instruction alongside the dominant language mediates the dialogism, meaning-making, access to wider discourses, and taking of an active stance that are dimensions of voice (Holland and Lave, 2001). Indigenous voices thus activated can be a powerful force for both enhancing the children’s own learning and promoting the maintenance and revitalization of their languages (Hornberger, 2006). My current work in progress explores these themes of voice, identity, and the continua of biliteracy in the context of a graduate program in bilingual intercultural education for indigenous educators at PROEIB-Andes in Bolivia (Hornberger and Hult, forthcoming; Hornberger and Johnson, forthcoming).

#### PROBLEMS AND DIFFICULTIES

The usefulness of the continua of biliteracy in a variety of contexts and for a range of purposes is testimony to a certain versatility, enabled perhaps by its complexity. That same complexity has been one of

the drawbacks of the framework as well; it is a difficult framework to grasp intuitively and has proven resistant to easy representation. Similarly, existing representations of the continua framework (e.g., [Figures 1, 2, 3](#)) are sometimes misinterpreted as conveying a static, bounded, dichotomized (essentialized or structuralist) view rather than the fluid, flexible, and infinitely expanding model intended. Those who struggle with the model long enough to grasp the dynamic nature of the intersecting and nested continua, however, eventually conclude that its complexity is also perhaps its greatest virtue, in that the phenomena it intends to represent are complex and too easily reified by oversimplification. Hanauer (2005) aptly captures this tension between the continua model's unifying conceptualization and, simultaneously, its postmodern sensitivity to locality and fragmentation.

Hanauer (2005) also points to another related tension inherent in the model, namely that "its strength as a complex network of embedded continua makes it problematic for the practical purpose of conceptualizing specific cases of interaction among variables" (Hanauer, 2005, p. 302). It is perhaps for this reason that the continua model is so often used in conjunction with other theoretical constructs—in alliance with other theoretical frameworks, as Street (2003) puts it. Indeed, the continua model informs and is informed by work in sociolinguistics, linguistic anthropology, ethnography of communication, cross-cultural psychology, sociocultural and activity theory, cultural anthropology and ethnography, critical ethnography, critical discourse analysis, critical literacy studies, semiotics, and constructivism, among other disciplines and perspectives (Hornberger 2005a). At the same time, the continua model is clearly not a *sine qua non* to do biliteracy work, since there is continuing research on biliteracy that does not explicitly draw on the continua model, though it is certainly not incompatible with it (e.g., Bialystok, 1997; Dworin, 2003; Moll and González, in progress; Wiese, 2004; University of California Linguistic Minority Research Institute Research Initiative on Biliteracy Development).

#### FUTURE DIRECTIONS

There remain unanswered questions about the continua framework. It has proven useful in ethnographic research, but has yet to be tested as a basis for experimental or survey research. Likewise, it originated as a descriptive framework, but remains relatively uncharted for predictive and explanatory uses. Such uses need further exploration through continuing research in a wide range of settings and circumstances. For example, colleagues in Singapore are beginning to explore how measures might be constructed for the different continua as part of an effort to make the framework more predictive and explanatory

based on empirical modeling of the interrelationships among the various variables and their impact on biliteracy acquisition (Peter Gu and Guangwei Hu, National Institute of Education, Singapore, personal communications, July and September 2005).

In the meanwhile, Freeman suggests that the continua framework already “helps explain how microlevel language teaching and learning processes can challenge macrolevel sociopolitical relations” (Freeman, 2004, pp. 110–111). She emphasizes the activist, transformative uses to which the continua can be put at individual, classroom, community, and societal levels. For instance, language planners can use the continua to look closely at the contexts, media, and content of particular individuals’ or groups’ biliteracy, identifying contradictions between beliefs and practices, or discrepancies between ideal policy and actual implementation, and then using those contradictions and discrepancies to further pry open ideological and implementational spaces for biliteracy development (Freeman, 2004, p. 83; Hornberger, 2005c).

Egbo (2005) too draws attention to the fact that the continua model “simultaneously allows for an explanatory critique of existing language policies, practices, and programmes, while at the same time, provides a conceptual framework for praxis and critical change . . . few conceptualisations of biliteracy in the emerging body of literature offer such tangible methodological guide” (Egbo, 2005, pp. 87–88). Cook-Gumperz similarly emphasizes the move “beyond a programmatic concern with multilingualism to seriously address the instructional needs that arise in today’s multilingual societies” (Cook-Gumperz, 2004).

It is this praxis side of the continua model, which offers both its greatest attraction and the greatest potential for its improvement and refinement, through application locally in actual contexts. For example, Goh and Silver (2006) incorporate it in their language teachers’ guide as an overarching conceptual tool for teachers in understanding the reciprocal roles of language in literacy development and of literacy in language development; they have found it to be important not only for teachers in bilingual classes but for any classroom teacher with bilingual students. LoBianco highlights its usefulness as a “schema for both understanding and intervention at community level, within educational institutions for pedagogical intervention, and at the wider social and political level for policy-making” (LoBianco, 2004, p. 337). Luke (2005), speaking at a regional meeting of education ministers in Southeast Asia, also suggests the possible utility of the continua to guide policy-making. In other words, these scholars emphasize the practical uses of the continua model for policy makers at classroom, community, and macrosocial levels. Indeed, Canagarajah points out that “a distinctive feature of Hornberger’s model is that policy is

not made only for macro-social domains in education. Local life in the classrooms is also treated seriously” (Canagarajah, 2005, p. 198).

Basic questions about biliteracy remain unanswered or partially answered. Questions like: Who becomes biliterate and where, when, how, and why do they do so? How can biliteracy best be acquired, nurtured, maintained, and promoted? What is the role of the family, the home, the school, the community, and the wider society in fostering and promoting biliteracy acquisition and use? It is to be hoped that the continua framework can contribute to answering some of these questions more fully than they have been answered up to now and that it will, indeed, “serve teachers, researchers and policy-makers well . . . in intervening positively to bring about more optimistic and just language and literacy futures” (LoBianco, 2004, p. 341).

## THE ECOLOGY OF LITERACY IN HONG KONG

### INTRODUCTION: HONG KONG AS A CULTURAL AND LINGUISTIC CROSSROADS

The majority of people in Hong Kong are ethnically Chinese, and are either immigrants from southern China, especially from Guangdong and Fujian provinces, or descendants of immigrants from those regions of China. Hong Kong presents an interesting case for literacy research as one of the major meeting places of diverse peoples, cultures, and language varieties given its over 150 years' history as a trading port ceded in 1842 from Dynastic China to Britain until 1997, when it was handed over to the People's Republic of China as a Special Administrative Region keeping many of its existing legal and civil institutions intact. As an international financial city in the twenty-first century, it seems even more globalized than other cities in China and Asia with its advanced, globalized telecommunications systems, western free trade and legal institutions, and frequent flows of tourists and business executives from Mainland China, Taiwan and other parts of Asia and the world.

The everyday literacy practices of the predominantly Cantonese-speaking people in Hong Kong are thus highly hybridized with linguistic and cultural influences from diverse sources, including frequent linguistic mixing and switching in both speech and writing. Such hybridized practices are, however, seldom seen as 'good' literacy practices by mainstream literacy education and government official norms. However, Hong Kong people's everyday literacy practices have not been subjected to any serious linguistic planning or standardizing efforts of the government, either. While Cantonese can be written by newly made characters or by drawing on characters in written Chinese (see studies on newspaper literacy below), the Hong Kong government and official, educational institutions do not recognize Cantonese as a written language in its own right, but only as a spoken vernacular. School literacies and everyday literacies outside of school, thus, seem to be treated as two systems largely encapsulated from each other. Research studies in these two areas also seem to be encapsulated from each other due to traditionally little interaction between sociolinguists and literacy educators in Hong Kong. In this chapter I outline the development of literacy research in Hong Kong and propose some directions for future research that seek

to both respond to the emerging new media literacy practices among young people and to build bridges between school literacies and everyday literacies, drawing on the ecological framework of *Continua of Biliteracy* from Hornberger.

#### EARLY DEVELOPMENTS

Luke and Richards' (1982) article on the status and functions of English in Hong Kong represents one of the early efforts in charting out the general ecology of language use in Hong Kong. While the paper focused on English, it also touched on the functions and status of other language varieties used in Hong Kong. Hong Kong was characterized by Luke and Richards (*ibid*) as a situation of 'diglossia without bilingualism'. As a British colony (from 1842 to 1997) English occupied the high position of formal language in most official and educational domains while the vernacular, Cantonese, occupied the low domains in people's social and everyday life. Luke and Richards (1982) argued that there existed a small group of Chinese-English conversant bilingual elite who function as the middle-people between the British ruling class and the Cantonese-speaking masses. The ruling English speakers and the mass of Cantonese speakers were characterized in this study as largely socially and linguistically encapsulated from each other.

Luke and Richards' (1982) study provided a general background to understand the language ecology in Hong Kong in the 1960s to the 1980s. (Li's (1999) study, discussed in the following section, will provide an update on the situation from the 1990s onwards). It can be said that the majority of people in Hong Kong largely function in a Cantonese linguistic environment. Snow's studies (e.g. his doctoral thesis in 1993 and his book based on his thesis in 2004) offered the most comprehensive documentation of the historical development of a written Cantonese literature since the Ming dynasty (e.g. Cantonese opera scripts, Buddhist chants and verses written in Cantonese) in Southern China. Snow's detailed study of the historical origins and development of the Dialect Literature Movement (DLM) in Southeast China in the first half of the twentieth century (particularly related to the literacy work of communist workers in the rural areas) provided us with a rare window on how written Cantonese literature has had a long history associated with community development work and empowerment of the rural and working classes in the Cantonese speaking areas of Southeast China, including Hong Kong. Snow also provided a historical outline of the social and economic factors leading to the flourishing of Cantonese-style writing in popular newspapers, magazines, advertising and private communications after the Second World War, especially during the

1970s–1990s when Hong Kong became increasingly urbanized, commercialized and witnessed an economic boom that brought about the rise of local Cantonese popular culture and Cantonese mass media entertainment.

Other early studies by local sociolinguists, mainly based on the linguistic analysis of texts, have focused on newspaper literacy in Hong Kong. For instance, Luke and Nancarrow (1991) described the unique linguistic features of Hong Kong newspaper writing and identified the sources of linguistic influences as multiple: spoken Chinese (*Putonghua*), modern written Chinese (*baihua wen*), Classical Chinese (*wenyan*) and spoken Cantonese. This unique form of literacy also feeds back into spoken Cantonese as a high variety of spoken Cantonese (e.g. in formal news broadcast speech, documentary commentaries and dialogues and narration in historical TV dramas). Luke and Nancarrow (*ibid*) thus argued that the ability to speak formally must also be regarded as part of literacy, and spoken Cantonese in its more formal styles would equally require learning and practice. Luke and Nancarrow also argued that the unique way of teaching Chinese texts in Hong Kong schools also provided the general reading public with the skills and conversion rules to read Hong Kong style newspaper literacy. Children in Hong Kong schools are taught to read aloud modern written Chinese in spoken Cantonese. In this way Hong Kong people have been socialized into ways of converting formal Chinese writings into spoken Cantonese and vice versa. However, as sociolinguists researching language use largely outside of school settings, Luke and Nancarrow (*ibid*) did not provide any detailed description of the processes in which children are socialized into the above literacy and oral practices between spoken Cantonese and Standard Written Chinese and there has been little research in this specific area to date.

Apart from analysing the linguistic sources of influences on newspaper writing style, early studies also focus on analysing the systematic ways in which spoken Cantonese is represented in popular writing. Luke (1995) analysed the writing system in Cantonese paperbacks in Hong Kong. The 1980s witnessed the rise of popular pocket-size books in Hong Kong. These books cover a variety of genres (e.g. ‘how-to’ manuals, short essays, stories, romance fiction, jokes, etc.) and a diverse range of topics (e.g. how to invest, how to keep fit, how to make friends, how to dress up, etc., or short witty essays on everyday observations of city life and people from different walks of life in Hong Kong). Since these topics are closely related to the everyday life of most Hong Kong people the language style of these popular books is very close to the colloquial spoken language used in Hong Kong people’s daily life; i.e. spoken Cantonese with occasional mixing in of English words related to everyday topics and events in Hong Kong

(e.g. marketing, creative, presentation). Luke (1995) focused on the informal but systematic ways in which the everyday spoken language of Hong Kong people is represented in these books. He concludes that when a spoken Cantonese word does not have a corresponding Chinese character, the most frequently used ways to overcome this orthographic gap are: (i) to use a Chinese character that has the same or a similar sound to that of the Cantonese word, and (ii) if no Chinese character with the same or a similar sound exists, new characters will be made from parts of existing Chinese characters to represent the Cantonese word. Sometimes, English letters or words with similar sounds are used but this is not a frequent practice compared with the above-mentioned two practices.

### MAJOR CONTRIBUTIONS

Due to the expansion of secondary education in the late 1970s and 1980s and the expansion of higher education in the 1990s, the bilingual middle class has expanded and in a recent article by Luke (2003), Hong Kong society in the post-1997 era is described as one experiencing 'decreasing diglossia with increasing bilingualism'. Luke (2003) argued that after 1997 many important political speeches are made in both Cantonese and English (or more in Cantonese than in English, e.g. in the Legislative Council) and there is the rise of Cantonese as a main working language in more and more high domains which used to be the exclusive territory of English. Putonghua (the national standard spoken language of China), on the other hand, in the post-1997 era has risen in importance in two radically different domains: the 'super-high' domain where its use is symbolic of national sovereignty, and the low domain of tourism and services where its use is functional and practical in dealing with tourists from the Mainland.

Li (1999) also provided an update of language education in Hong Kong since Luke and Richards (1982). Li described the sociolinguistic matrix by outlining the distribution of the main functions of the two written languages: standard written Chinese (SWC, also variously known as MSC—modern standard Chinese, modern written Chinese, or 'baihua wen') and English, and the three spoken languages: Cantonese, English, and Putonghua (the standard spoken language of China), in four key domains: government, media, employment, and education. Cantonese and English remain the most important spoken languages in Hong Kong society. Li argued that the macro-sociolinguistic analysis, 'diglossia without bilingualism' (Luke and Richards, 1982), should be replaced by 'polyglossia with increasing bilingualism'. Li pointed out that there are two written High varieties, SWC and English, and the former is

penetrating into some domains formerly dominated by the latter in post-1997 Hong Kong. Cantonese, typically interspersed with some English words or phrases is assigned Low functions in both spoken and written mediums. Li argued that there is some indication that Putonghua is getting increasingly important in post-colonial Hong Kong, but there are as yet no significant social functions assigned to it. Compared with the early 1980s, significant changes have taken place at all levels. These changes centre on the increasing hybridization of different language resources (e.g. English, Cantonese, SWC) in everyday informal spoken and written language: code-mixing and switching practices are increasingly common nowadays in Hong Kong (see Li, 2002 for a comprehensive survey of code-mixing and switching research in Hong Kong).

The language-in-education policy issues have also been intensively researched. Pennycook (1998, 2002) analysed language-in-education policy issues in nineteenth and early twentieth century Hong Kong, and argued that the British colonial government's Orientalist mother-tongue (vernacular) education policy might itself be infused with social control and cultural governance desires (e.g. via Confucianist ideologies of respect for the authorities). Key studies have revolved around the research questions of how the government's recent medium-of-instruction policy for secondary schools has been received or resisted in the schools (Poon, 1999; 2000a, 2000b). Lin (2005) summarized the research literature and discussed how the government and official educational institutions' English dominant policy (reinforced by recent globalization forces and discourses) has further stratified the society into the English-conversant bi/multilingual cosmopolitan elite and the largely (Cantonese) monolingual working masses, and how language policy functions to produce subaltern (marginalized) identities and subjectivities. Tsui's study (2006) also expressed similar views.

Recent studies on mass media literacy have largely carried on with the linguistic tradition of analysis from early studies laid down by Luke and his colleagues. For instance, Li (2000) offered a comprehensive review and extension of the linguistic analysis of Cantonese literacy styles in newspaper and other mass media in Hong Kong in the 1990s. He focused on the major research question that Luke and others started off with: how do Cantonese mass media workers in Hong Kong cope with the task of representing colloquial Cantonese speech in writing. He concluded that many young people in Hong Kong, when they write and speak in informal situations, readily draw on whatever resources are available to them for effective communication:

A more realistic analysis of the trilingual situation in Hong Kong is that, given the need to lend expression to the vernacular they know best, speakers of Cantonese turn to

Modern Standard Chinese (MSC) and English for contingent, sometimes idiosyncratic solutions to fill the orthographic gap in the non-standard variety (Li, 2000).

The ‘non-standard variety’ in the above quote refers to the newspaper style of writing that Luke and others have studied since the early 1990s. Recent studies by Wu (2000, 2006a, 2006b) on the features of orality in Hong Kong print media, especially in commercial and political advertising and local news and entertainment news texts, showed the increasing use of oral involvement strategies:

Three different forms of orality that are mingled in the different types of written media discourse are identified: (i) question-answer pairs; (ii) general emphatics, first person pronouns and second person pronouns; (iii) colloquial Cantonese. Besides their interpersonal function of involvement and the social functions of solidarity and in-group identity, these orality features and strategies are found to (i) help the success of an advertisement by enhancing its attention value, readability, memorability and consequently selling power, (ii) enhance the immediacy, credibility, and objectivity of the news reporting by foregrounding the individual’s voice, style or comments. (Wu, 2000, p. 87).

Wu (2000, 2006a, 2006b) argued that a dynamic rather than a purist approach towards language use and cultural expressions in society should be taken and the use of colloquial Cantonese speech features and the mixing of SWC, English and Cantonese in print media should be seen as the creative use of diverse linguistic resources for persuasive writing and effective communication rather than as signs of a decline in the society’s language standards.

While the above-cited sociolinguists have largely researched on the majority language—Chinese or Cantonese (albeit with the mixing in of some English words/letters)—mass media texts, a number of local sociolinguists have also researched on the linguistic features of English as well as the ecology of English use in Hong Kong. Bolton’s edited volume (2002) offered one of the first comprehensive efforts to document works in this area. Of particular interest in this collection are articles by Bolton (2002), Chan (2002) and Lam (2002).

Bolton (2002, p. 34) argued that Hong Kong has moved from ‘elitist bilingualism’ to ‘mass bilingualism’, citing the census statistics that

Table 1 Census results for self-reported knowledge of English in Hong Kong 1931–2001 (From Bolton, 2002, p. 34)

| 1931 | 1961 | 1966  | 1971  | 1991  | 1996  | 2001  |

indicate a rise in the proportion of the population claiming a knowledge of English over the decades, as illustrated in the table below:

While self-reports cannot be taken as accurate measures of the population's English proficiency, they do reflect a rising trend of confidence in one's knowledge in English among Hong Kong people. Drawing on a number of criteria for the development of world Englishes, Bolton (2002) argued that Hong Kong society has the potential to develop its own variety of English-Hong Kong English.

However, Bolton's view might be seen as a bit optimistic as the actual proportion of Hong Kong people actively using English in their everyday life seems to remain small. Chan (2002) offered an instructive window with telling figures and statistics on the diminishing readership of the *South China Morning Post*, the major English language newspaper in Hong Kong. Similar trends are happening in English language broadcasting: the audiences of the English TV and radio channels have been limited and have further diminished after 1997. English 'mass' media in Hong Kong seems to draw their readers and audiences mainly from the expatriate communities as well as the well-educated professional bilingual communities, and has not reached the 'masses' yet.

Are there any English creative works and literacy circles in Hong Kong? Lam's (2002) article provided observations on the small but vibrant amount of English literacy activity in Hong Kong, mainly among English writers or well-educated Chinese writers. While Lam (2002) proposed that there should be more English literary creative programmes in university, it seems that to attract more young people to engage in English literary activities, language arts education needs to be strengthened in the primary and secondary school sectors too and more links and cross-fertilization should be fostered between young people's Chinese/Cantonese pop cultural activities and English language arts activities (see Lin's work-in-progress in the next two sections).

#### WORK IN PROGRESS

There is much work in progress which cannot all be covered in the limited space here. I shall, therefore, summarize studies deemed to be most relevant to literacy educators. One interesting area of research is that of 'Hong Kong English': for example whether it is a fully or partially developed indigenous variety of English, and whether pedagogically Hong Kong English can be adopted as a viable target model (see views expressed by Andy Kirpatrick, 2006, cited in *Ming Pao Daily*, 4 September 2006, p. 16). Li concludes in his recent study (under review) as follows:

In sum, what is proposed here is a radically re-structured curriculum that incorporates the strengths and insights of WE [World Englishes] and ELF [English as a Lingua Franca] research and the empowering potential of Standard

English. . . . [we have] HKE [Hong Kong English], where a common core is similarly supplemented by an indigenized vocabulary that is incomprehensible to those who are unfamiliar with Hong Kong culture . . . (Li, under review, p. 17).

Another piece of work-in-progress (Cheng and Warren, forthcoming) examines the structure and linguistic realisations of disagreements in a corpus of Hong Kong spoken business discourses. The findings are compared with the forms of disagreement, and their associated realisations, represented in Hong Kong school English language textbooks. Important differences were found: Students in Hong Kong are taught to be more direct in English than real-life norms would permit. Cheng and Warren (forthcoming) find this problematic, especially when Hong Kong Chinese tend to have a cultural preference to be indirect and to be other-oriented.

While Hong Kong English has been a hot topic for research, few studies have researched the development of spoken Cantonese of children in Hong Kong. A seminar by Benjamin Tsou and his colleagues (2006) reported on their ongoing pioneering work to develop a Hong Kong Cantonese Oral Language Assessment Scheme (HKCOLAS) for use by speech therapists working with Cantonese children in Hong Kong. Their study involves analysis of large corpuses of Chinese newspaper language and textbook language collected over the past ten years, which provide useful data for future research on the features of media literacy in Hong Kong. With further research and development the scheme might be adapted for use by teachers in school settings too.

Even fewer sociolinguistic studies in Hong Kong have looked at youth sub-cultural literacies and explored the educational potential of these informal youth literacies. Lin's (forthcoming) study of hip hop youth subculture and rap lyrics in Hong Kong is the first study of this kind in Hong Kong. Making local hip hop music and lyrics in Hong Kong has always been a marginal practice engaged in mostly by grass-root youths who find in this trans-local music genre and subculture the powerful symbolisms to express their defiant voices to mainstream society. These Hong Kong youths use rap lyrics in their local language—Cantonese—to express their sharp critique of society, of the education system, and of what they see as mainstream hypocritical practices and overly commercialized mass media practices. Through using Cantonese rap in artful ways they construct alternative discursive spaces where their defiant voices and sharp social critique can be heard in a fun yet powerful genre. In Lin's study (*ibid*), she drew on interviews of a first-generation Hong Kong hip hop MC - *MC Yan* of the former popular Hong Kong band, LMF (*LazyMuthaFuckaz*), and analysis of his Cantonese hip hop lyrics to discuss how some youths

in Hong Kong construct their powerful voices and identities in pockets of alternative spaces in a society that privileges the middle classes with their cultural capital, and in an education system where the local language of Cantonese is *officially* placed at the bottom of the linguistic hierarchy, albeit it is the indispensable (but often backgrounded) working language of everyday life. To MC Yan, both rapping and street graffiti are part of his larger public educational project to make his message known/seen/heard by more people in Hong Kong and China. In his words, 'My message is to ask people to reflect, to use their brains to think and their hearts to feel.' The artwork he did for a local magazine (see Figure 1) shows his experimental efforts to combine street graffiti art with Cantonese rap lyrics in print media, using

Figure 1 MC Yan's artwork for a local magazine: combining Street Graffiti artwork with Cantonese rap lyrics in print media.

metaphors to satirically refer to China's political moves to set up legislation that will reduce the freedom of speech in Hong Kong. Blurred in the background picture were some policemen rounding up a pedestrian in a street in Sam Shui Po, one of the poorest ghetto areas in Hong Kong. Overlaid on the picture in the left bottom corner is a photo of MCYan's street graffiti tag (his signature: SYan). The white graphic design above the Cantonese lyrics is composed of two Chinese characters (meaning 'seventeen', the name of the local youth magazine) written in graffiti style and turned anti-clockwise by 90°. Analysis of this piece of artwork, drawing on Hornberger's (2003) *Continua of Biliteracy*, would involve blurring the boundaries of oral and written language, of English and Chinese, of Chinese and Cantonese (The English words, 'The Rap is:', precede the Cantonese rap lyrics written in Chinese characters), of reception and production (e.g. rap lyrics written to be both *read* and *rapped*), and of micro and macro-analysis (e.g. the micro-analysis of the Cantonese rhyming structure and colloquial lexical pattern in the rap lyrics should be situated in the analysis of the macro-socio-political context to which this piece of rap lyrics respond with a protest message).

It seems that there is a possibility to draw on youth sub-cultural hip hop culture and its artistic and linguistic creative practices as resources for a critical public pedagogy (Carrington and Luke, 1997) that reaches out to youths and people beyond the classroom. There remains a lot of work to be done in this area to chart out what exactly such a pedagogy would look like and what effects that might have.

#### PROBLEMS, DIFFICULTIES AND FUTURE DIRECTIONS FOR RESEARCH

It seems that the body of research on the ecology of literacy in Hong Kong has traditionally focused mainly on linguistic analysis of mass media texts. The research methodology can be broadened from linguistic text analysis to include ethnographic studies of youth literacy practices; i.e., to analyse not only the texts but also the literacy practices situated in different communities and youth subcultures. In fact the everyday, informal literacies are as important as school literacies in light of Hornberger's (2003) ecological framework of continua of biliteracy. Traditionally, researchers and educators in Hong Kong have tended to treat everyday literacies as separate from school literacies instead of seeing them as lying on continua—the oral and the literate traditions, the standard Chinese language and the vernacular Cantonese language, Chinese and English linguistic and literary resources. All of these should be conceived as constituting overlapping continua rather than different, encapsulated language systems. Researchers whose works are reviewed above tend to work in largely encapsulated arenas;

e.g. on Hong Kong English, or on Chinese media literacy. However, if we are informed by Hornberger's continua of bi/multi-literacy, there should be more cross-over and collaboration among researchers working on English and Chinese literacies, formal and informal literacies, oral and written language practices, standard and vernacular language practices, and so on.

Literacy researchers should also expand their analysis to cover the newly emerging literacies mediated by new digital media. Every day many Hong Kong young people spend a lot of their time using literacies in the new communication media: MSN/ICQ ('I seek you'), email, SMS, weblogs, and so on. A lot of literacy practices are going on without receiving the attention of sociolinguistics researchers and literacy educators (but see the on-going research projects of Angel Lin on youth SMS practices and on-going projects of Rodney Jones (2006) on ICQ and electronic discourse practices in Hong Kong). Without understanding young people's outside-of-school informal literacy practices, school literacy educators cannot think of innovative ways to link everyday literacies with school literacies to help students access school literacies without finding the latter alien or irrelevant to their everyday lives. Treating different literacies as encapsulated systems only makes us neglect the rich potential of innovative bi-/multi-literacy and language arts programmes that can be developed to draw on different linguistic, sub-cultural and literate traditions and resources to support the development of multiple literacies; e.g. using rap lyrics genres to bridge youth popular cultural literacy and school literacy (see Lin, A. and Chan K. Y., forthcoming). Future research directions should therefore take a much more holistic, ecological perspective on multiple literacies and draw on the framework of continua of biliteracy developed by Hornberger to conceptualize, research, and develop education programmes on different literacies as mutually affecting and supporting one another.

THE ECOLOGY OF LITERACY AND LANGUAGE:  
DISCOURSES, IDENTITIES AND PRACTICES IN HOMES,  
SCHOOLS AND COMMUNITIES

INTRODUCTION

An ecological model of language and literacy is a useful metaphor that recognises multiple languages and literacies, taking on the different oral and written languages communities draw on in their daily lives, but also accounting for institutional policies and practices that impinge on those everyday practices. Scholars in the field of language and literacy studies have drawn upon cultural studies, psychology, sociology, anthropology and theories of the mind and culture to understand literacy and language within a wider structure. One of the challenges for researchers who draw on the ecology metaphor is that this approach to language learning both asks for attention to identity and learning, but also requires an understanding of the relationship between language, literacy and social environments. Therefore, researchers of literacy and language have to account for institutional policy thinking on language and literacy, while at the same time studying face-to-face interaction in sites as diverse as homes, classrooms, community centres and neighbourhoods. One key aspect of thinking in the field of the ecology of literacy and language is the concept of *social practice*. By focusing on practice theory, relationships between people and things can be unpacked and described. Practices take place within communities and social structures, and come into being through interaction and can be understood as taking place within a network of social relations. By understanding the concept of ecology as one connected with studying the web of everyday practice and interaction, a lens can be created to look at that ecology in relation to language and understand its workings.

EARLY DEVELOPMENTS

The term ‘ecology of language’ has been used by a number of scholars, with reference to literacy and language, including Haugen, who defined language ecology as, ‘the study of interactions between any given language and its environment’ (Haugen, 1972, p. 325), and in doing so, considers the environment as both psychological and sociological. Barton described the ecological metaphor as being useful because it

takes as its starting-point an interaction between individuals and their environments (Barton, 1994, p. 29). He referred to Bateson's *Steps to an Ecology of Mind*, written in the 1930s and 1940s, which brings the lens of an anthropologist onto a number of disparate areas, including biology and psychology (Bateson, 1972 reprinted 2000). This signalled the way in which the ecology metaphor enables an appreciation of the inter-disciplinary nature of literacy and language studies.

This review discusses an ecological approach to studying language and literacies in homes, schools and communities. For example, Heath, in *Ways with Words* paid attention to the way in which the families in her study decorated their houses, lived their lives, and organised their children's bedtime routines in relation to their interaction and literacy and language practices (Heath, 1983). In order to research out-of-school literacy practices, Heath's work drew on the study of language, and the ethnography of communication, as developed by Del Hymes and others at the University of Pennsylvania (Hymes, 1996). Hymes used the ethnography of communication to describe the way in which language was linked to context, to people's lived social worlds, and to their narrative patterns. Gee drew on this to study literacy in diverse socio-cultural contexts, across home, school and communities, and in doing so, identified that discourses were linked to social and cultural models, and developed the idea of 'cultural models' to describe the ways people construct and reconstruct language in interaction, arguing that schooled under-achievement can be linked to a misunderstanding of different ways of speaking and being in the world (Gee, 1996). These early developments have been built upon in the studies described later to identify how different D/discourses can be identified with particular sites or domains of literacy and language. The New Literacy Studies identified that literacy and language practices sit within wider social practice. The focus of literacy as a social practice often concentrated on different sites where different literacy practices could be observed. These could be identified as domains of literacy, which connected to specific sites (Barton and Hamilton, 1998). By looking at different sites and domains, the ecological view of literacy, as connecting across domains, can be brought to the fore.

An ecological approach which looks at literacy in everyday life deals with culture, and research in this field needs conceptual tools to theorise culture. Williams understood culture as being a set of material practices, which in their performance construct meanings, values and subjectivities (Williams, 1981). Culture is 'made' within these practices. Street's concept of culture as being, 'an active process of meaning making' is a useful starting point for a discussion of the way literacy flows from and within everyday social practices (Street, 1993, p. 25). In an ecological view, literacy and language practices have to be seen

to be in a constant process of transformation and change. Street, in his work in Iran, identified the concept of ideological and autonomous models of literacy. The autonomous model was often used by institutions to describe a skills-focused functional view of literacy, while the ideological model describes the culturally situated, contested nature of literacy (Street, 1984). An ideological approach can be identified with an ecological approach, which takes in language as a cultural form, inextricably tied in with the active making of culture (Blackledge, *Language Ecology and Language Ideology*, this volume). Early developments focused on ways of conceptualising culture, and how culture and language were intertwined, with a focus on ways in which literacy practices changed across sites.

### MAJOR CONTRIBUTIONS

In this section, the review considers theoretical developments and approaches used within the field of research into homes, schools and communities. As an ecological approach is necessarily broad, the review reflects this complex field. The review focuses on theoretical and epistemological approaches and then considers methodological developments. Hornberger's *Continua of Biliteracy* (see Hornberger, *Continua of Biliteracy*, this volume) is a notable heuristic which contributes to an ecological view of literacy, while also accounting for power imbalances across sites. Other approaches include the use of French social theory, including structural theory from Bourdieu and Foucault to illuminate connections between the wider social context and linguistic interactions. Methodological approaches include a focus on events and practices, instances, discourse analysis and ethnography, including linguistic ethnography. Finally, two ethnographic studies of literacy are discussed, looking at literacy practices in homes and communities.

A number of different theoretical and epistemological perspectives have illuminated studies of literacies and languages in homes, schools and communities. Hornberger's *Continua of Biliteracy* model offered an ecological account of biliteracy, as it describes complex and intersecting relationships across the fields of development, content, media and contexts, across a number of sites and domains (Hornberger 2003, this volume). Hornberger and Skilton-Sylvester used the model in the context of public high schools in Philadelphia, and described ways in which there continued to be an implicit privileging of one end of the continua to another, and were able to show through this how certain practices, contextual features and instructional strategies have been tools for gaining power and others less so (Hornberger and Skilton-Sylvester, 2003). The authors argue that researchers need to open up ideological spaces for multiple languages and literacies in

classroom, community and society. They can do this by focusing on instances of practice, but then linking these to multiple actors, identities, ideologies, and tracing the relationship between texts, discourses and practices in multiple sites and domains.

In order to provide a theoretical framework in which to see how literacy practices in specific sites connect up to wider social relations, many scholars in this field have drawn on theorists such as Bourdieu and Foucault. For example, Collins and Blot argued that their work enables literacy researchers to consider the relationship between structure and agency, understanding how literacies are shot through with power relations (Collins and Blot, 2003). Collins and Blot's contribution lies in carefully dismantling the arguments that keep literacy and its oral counterpart, language, separate. Instead, they argue for a socially situated view of literacies which also takes account of power (Collins and Blot, 2003). Many scholars argue that these power relations need scrutinizing, particularly in educational contexts. For example, Heller's work has outlined how within diverse institutional structures, educational programmes and practices are defined by dominant groups, and it is possible to trace and describe the struggles particular groups have in being heard, and their particular literacy or language practices in being recognised (Heller, 2002).

Bourdieu's habitus theory, describing everyday lived dispositions of people, their settled ways of being and inherited dispositions, has been a fruitful starting point for research on literacy within homes and communities (Bourdieu, 1990). Research by Pahl into home communicative practices has described, through ethnography, how the habitus can be observed sedimented into text making, recognising that families not only inherit culture, but are *makers* of culture, often improvising upon the habitus in the process of migration creating new kinds of texts (Pahl, 2002). People in lived worlds construct their texts and artefacts in different ways, and the shaping of everyday home experiences into texts is constructed through a complex relationship between home practices, and texts as traces of practice (Pahl, 2004).

An ecological view of literacy is about connecting up the way texts arise with wider social practice. By focusing on texts, and their connection to other social words, a fruitful theoretical space is unfolded. A number of scholars have worked from the entity of 'text' and examined relations of power within and beyond texts. For example, Smith describes how texts can be understood as going beyond the moment of reading and writing and connecting to larger discourses of power (Smith, 1999). This way of viewing texts in some way reifies literacy practice. Brandt and Clinton (2002), identified the 'thing-like' status of literacy, that it can become reified and divorced from its original context. Their article argued for an understanding of literacy as having

some kind of autonomous status when divorced from contexts that illuminate the practice. Street understood this process as one of embedding and disembedding, taking this terminology from Giddens (Street, 1993). By focusing on the embedding and disembedding mechanisms, the way in which literacy becomes used in contexts other than original context can be understood. Texts carry within them discourses which themselves can be identified with different institutions and practices (Chouliaraki and Fairclough, 1999). Many scholars have traced the way in which different discourses are called upon in social interaction and in texts in the context of homes, schools and communities (Barton, Hamilton and Ivanic, 2000; Rogers, 2003). By focusing on how power relations construct and privilege certain discourses and texts, text-making can be traced across the domains of home, school and community, thus avoiding reification.

Another lens from which to view literacy and language in an ecological framework takes in a focus on identity within texts. Holland and colleagues, in their anthropological work studying cultures and practices described a practice view of identity, which saw identities as in practice, drawing on figured worlds, and using artefacts to open up figured worlds (Holland, Lachicotte, Skinner, and Cain, 1998). Bartlett and Holland made a study of literacy and used this theoretical framework to see literacy as an artefact of identity, arguing that Bourdieu's practice theory has as its drawback insufficient attention to the way in which texts contribute to the improvisation of the habitus, its transformation (Bartlett and Holland, 2002).

Identity in texts has been studied in relation to digital literacy practices (see Tusting, *Ecologies of New Literacies: Implications for Education*, this volume). Increasingly on-line texts are being viewed in relation to understandings of on-line and off-line identities and relations of power. Gee uses the term 'affinity space' to delineate the spaces that can be found in on-line communities (Gee, 2005). Studies of on-line interactions have described how identities are reconfigured and transformed on-line, as settled notions of identity, for example, the adolescent, are reconfigured in the context of an on-line conversation about rap music (Alvermann, 2006).

Another configuration of identity in relation to texts is actor network theory. Clarke and others have explored how actor network theory is a way of tracing the way in which discourses and texts are transformed in the processes of interaction (Clarke, 2001).

In the process of analysing texts, the definition of text as an entity is shifting. An approach to texts needs to account for materiality. Literacy is part of a wider landscape of communication (Kress, 1997, 2003). Literacy can be linked to inscription, as alphabetic script, but it is also situated within a multimodal communicational landscape, and can be

understood as linked to language and gesture. Literacy practices in homes are often linked to wider semiotic systems (Kenner, 2004; Pahl, 2004).

An ecological account of literacy involves a range of possible methodological approaches to consider the relationship between sites, practices and texts. These have necessarily focused on practices within language and literacies. For example, Hornberger focuses on *instances*, a term which also encompasses events, but also actors, interactions, practices, activities, programs, situations, societies, sites, worlds (Hornberger, 2003). The notion of an instance of practice informs practice theory, but allows the researcher to freeze frame practice, to focus on the micro as well as the macro in research situations (Pahl and Rowsell, 2006). Street, *New Literacies, New Times: Developments in Literacy Studies (Volume 2)* has argued that a focus on literacy events and practices helps researchers to consider moments where a literacy event can be observed, as opposed to the observing over time of a literacy practice, which can take place within people's heads and be not observable (Street, 2000).

The ethnography of communication as developed by Hymes (1996) and Gee (1999) has generated methodological insights into ways of understanding language in context. Gee has described the way in which the terms big d and little D discourses can help interpret language in use. Big D Discourses include 'language and other stuff' and these can include dress, gesture, ways of behaving and doing (Gee, 1999, p. 7). These discourses are informed by cultural models that inform what meanings are attached to these discourses (Gee, 1999). Gee's work has described how certain practices and discourses can be found linked together, and he described the spaces where these linkages take places as affinity spaces.

In the UK, linguistic ethnography has developed as a methodological approach to an ecological study of language and literacy (UK Linguistic Ethnography: A discussion paper 2004). Drawing on the more established traditions of ethnography, which focus on the specificity of the local, on cultural ecologies, and the interactions between them, together with a view of language which acknowledges that language and culture can be taken together, linguistic ethnography aims to work at the interface of language and culture. The UK Linguistic Ethnography forum paper describes a number of different traditions, including the New Literacy Studies, Interactional Sociolinguistics and Critical Discourse Analysis bringing key elements to bear on the methodological approaches of linguistic ethnography.

Two studies of home and community literacies are described that have taken an ecological view of literacy. They have been chosen because they engage with the twin challenges of migration and globalisation with a focus on literacy practices across sites. Kell studied a

house-building project in South Africa. Her focus was on the movement of meanings across sites, and the ways in which texts were recontextualised in the process. In her study of a woman's struggles in building her house, and through tracking the meaning of the text she created which described the problem, as it traversed sites and contexts, Kell was able to show how the processes and practices accompanying these shifts are more complex than simply being movements from local to global literacies. She concluded that it is impossible to describe what is global, rather it is more appropriate to think about what is not local. Rather than move outside their domains text trajectories took uncertain and sometimes problematic routes across the different sites she observed (Kell, 2006).

Keating, in her study of Portuguese women who have migrated to London, looked at the role of language and literacy in their lives (Keating, 2005). She argued that by focusing on practice as a helpful analytic tool to establish the link between individual doings and understandings and cultural/social ways of using literacy, a way of understanding literacy in everyday life emerged which was dynamic and constantly reconfigured (Keating, 2005). By drawing on practice theory, but, through her ethnographic work, combining this with an understanding of literacy practices as focused on change and transformation, Keating could understand the role of literacy in these women's lives more precisely. She identified how their values and identifications were present in their literacy practices and yet also how their literacy practices transformed these values and identifications. By focusing on life as lived, and on practices, the role of literacy in everyday life was re-configured as something dynamic and subject to transformation (Keating, 2005, p. 114).

#### WORK IN PROGRESS

In this section, work that breaks new ground both methodologically and epistemologically is described. These studies focus on sites including homes, schools and communities. In each case, the work is unfolding as described in conference papers, as well as recent published work. Heller's work focuses on the role of language in the construction of social difference and social inequality in communities in the post-nationalist, globalising new economy. Her ethnographic, sociolinguistic research mainly examines these processes as they unfold in francophone Canada. Heller argued that while some social structures and processes are tightly bound to each other, in others there may be multiple centres and a more diffuse set of structures and processes (Martin-Jones and Heller, 1996, p. 3; Heller, 2002).

In Toronto, a collaborative project with educators from the whole of Canada, Cummins and colleagues are developing a project entitled 'From Literacy to Multiliteracies: Designing Learning Environments for Knowledge Generation within the new Economy' (Cummins et al., 2005). This project seeks to engage students from diverse backgrounds to focus on the kinds of interactions that will support student's literacy and language learning. These new pedagogies are derived from the multiliteracies pedagogies (Cope and Kalantzis, 2000) and draw on the students' linguistic resources and new technologies to engage them in learning.

Blommaert and colleagues have been working on a project called the Spaces of Multilingualism, from the Institute of Education, London and the University of Ghent, Belgium. This involved an ethnographic project in immigrant neighbourhoods in Ghent, focusing on the different patterns of multilingualism within and across the neighbourhoods. They have focused on an approach which both looked at the historical and spatial anchoring of patterns of language, but at the same time looking on micro-interactions. Space is seen as a semiotic resource, as well as a complex, layered set of trajectories, which is bound up with human interaction (Blommaert, Collins and Slembrouck, 2004).

At the University of Birmingham Angela Creese and colleagues are involved in a project funded by the ESRC which aims to investigate how complementary schools open up spaces for the multilingual performance of young people's identities and to make visible the 'new multilingualisms' currently developing in complementary school communities. The ethno-linguistic groups concerned are Bangladeshi, Chinese, Gujarati and Turkish in Birmingham, Manchester, Leicester and London (Creese, Blackledge, Li Wei, Lytra and Martin, ESRC RES-000-23-1180).

A recent call from the Arts and Humanities Research Council in the UK, for new research on the subject of diasporas, migration and identities has yielded some interesting new research projects. (For more information see [www.diasporas.ac.uk](http://www.diasporas.ac.uk).) For example, a project based at the University of Sheffield is using linguistic ethnography to examine the identity narratives of families from the British Asian community of Ferham, Rotherham, and to develop an exhibition of narratives and artefacts in partnership with a local school and early years' centre (Pahl and Pollard, 2006).

## PROBLEMS AND DIFFICULTIES

In researching literacy across the sites of home, schools and communities there are imbalances of power, and the issue of whose literacies

count in what context, is urgent. Educators and researchers need to pay attention to issues of identity, culture, language and institutional forces when trying to answer this question. Researchers need to identify what language and literacies are recognised for whom and by whom. Hornberger has also observed that in some countries where institutional language policies are intentionally liberal, they are not supported by those who use them (Hornberger, 2003). Increasingly, research is focusing on the relationship between identities and migration and the need to support the linguistic resources of migrating communities. New work in post-colonial studies has looked at ways of researching issues like positionality and languages from the point of view of migrant communities. Out-of-classroom experiences and linguistic resources continue to be marginalised in mainstream classrooms. The way in which migration contributes to a re-combination and reconsideration of identity narratives remains under-theorised. In-depth ethnographies of home and community literacy practices, particularly in multilingual settings, continue to be rare. There is an urgent need for more researchers with linguistic minority backgrounds to do this work. A very clear problem is the rich and complex nature of working with an ecological lens; the work is multi-disciplinary, can be time-consuming as it often requires ethnography, necessitates working in non-institutional contexts, and across multiple domains.

#### FUTURE DIRECTIONS

The study of literacies and languages in homes, schools and communities has recently become more spatialised. Recent work by Leander and Sheehy has considered that literacy practices produce space, that they need to be seen as spatial as well as temporal (Leander and Sheehy, 2004). Migration has led to an increased focus on transformations and hybridity. The transformation of the habitus across diasporas is one such focus, as families follow economic pulls across the globe (Appadurai, 1996). Kenner's work in homes had documented the importance of satellite television in upholding home and community languages (Kenner, 2004). Digitised literacies cut across institutional boundaries and the growth of Internet cafes in multilingual areas has increased access to many other cultural groups and identities than previously. The tracking of these new digitised literacy and language practices needs to be done. Attention needs to be paid to the multiple linguistic and symbolic resources multilingual communities draw on when using web-based texts (Lankshear and Knobel, 2003). An ecology of language and literacy research focus means that attention has to be paid to ways in which changes in literacy and language practices take place. Models of these

forms of change have enabled researchers to identify how people take hold of these practices in new and improvisatory ways.

ECOLOGIES OF NEW LITERACIES: IMPLICATIONS  
FOR EDUCATION

INTRODUCTION

From e-mails and word processing to blogs, podcasting and wikis, the possibilities afforded by new technologies have transformed the way we work, learn and live. Such 'new literacies' have offered a fertile field for research in recent years, and much of this research draws out particular implications of such changes for education. This article outlines the major work in this field to date, and considers possible future developments.

Lankshear and Knobel (2003) distinguish between 'paradigmatic' and 'ontological' senses of the term 'new literacies'. By paradigmatic, they are referring to the 'New Literacy Studies' as a new paradigm in the approach to literacy, an approach which focuses on literacy practices in particular social, cultural and economic contexts (Barton, 1994; Gee, 2000; Street, 1984). By ontological, they refer to 'changes [that] have occurred in the character and substance of literacies associated with changes in technology, institutions, media, the economy' (p. 16), changes which have impacted on social practices throughout everyday life. The principal area of focus of this review is new literacies in the ontological sense. However, the majority of the works cited are situated within the paradigm of the New Literacy Studies. It is in this sense that this review describes an ecological perspective on new literacies, which studies how changing literacy practices are intimately associated with networks of changing social practices and technologies, from local to global levels.

EARLY DEVELOPMENTS

With the introduction of information and communication technologies came a range of commentators exploring how these possibilities were going to change our literacy practices. One short, but particularly influential article was Lanham (1995), which argued that the term 'literacy' has extended its meaning in the digital age to encompass the understanding of information presented in many different ways. Increasingly, meaning is presented in multimedia forms, which in contrast to the

fixity of print have the potential to be endlessly reshaped, transformed and passed on. This foreshadows some of the themes to be addressed in this review.

Other early pieces included experimentations with the possibilities afforded by hypertext, such as Kaplan's (1995) piece on 'e-literacies', a hypertextualised version of a keynote address to a literacy conference. At this point, many claims were being made for the possibilities offered by hypertext of putting together arguments in new ways and making new kinds of reading possible. Kaplan's piece is interesting in that, unlike many of the technologically deterministic commentators of the time, she insists on the social origins and effects of electronic literacy development. Her punning title, 'e-literacies', refers both to the reading and writing resources specific to electronic texts, and to the socio-economic elites whose interests might be served by these electronic literacies. Her hypertext links include extended passages from the authors she cites, and it is therefore a particularly interesting essay for an overview of debates at that time.

An important early collection was the *Handbook of Literacy and Technology* (Reinking, McKenna, Labbo and Kiefer, 1998). The handbook explores key differences between printed and electronic texts, such as the interactivity, multimodality and non-linearity of digital forms, and the implications of these new textual forms for re-defining what it means to read and write, inside and outside classrooms. The effects of introducing new writing technologies into a range of schools and classrooms are examined. Case study examples show the importance of the social conditions which permit or encourage transformations of literacy learning. The broad societal implications of the shift to electronic forms of texts are addressed, examining linkages between changes in literacy practices and social and cultural change more generally. The book insists that technology, society, culture and literacy—both inside and outside classrooms—cannot adequately be understood separately. Instead, transformations which might initially appear isolated need to be understood as part of a sociocultural tapestry. All the chapters address the educational implications of a shift from a primarily print-based typographic mode to a more multimedia screen-based digital literacy world.

Another significant edited collection published in the 1990s is Snyder's *Page to Screen* (1998), which looks at the implications of a shift from the literacy practices of the page to those of the screen in a context of rapid change, and the implications of this for education and pedagogy. This collection foreshadows many of the themes picked up in later work, including the widening gulf between expert students and novice teachers, and the embeddedness of these new literacies in social and cultural contexts.

MAJOR CONTRIBUTIONS: ECOLOGIES  
OF NEW LITERACIES

The ecological perspective insists on how new literacies are shaped by and shape their contexts, and significant contributions in this field have offered different ways of approaching this process. Kress' (2003) analysis of how the screen is replacing the book and the image displacing writing offers a framework for identifying four types of factors which interact in shaping new literacies: social, economic, communicational and technological ones. He claims that simultaneous, interplaying changes in these four areas are so profound that we can justifiably speak of a 'revolution' in the landscape of communication, which calls for changes in our theoretical perspectives on communication, and in our education systems.

However, despite his insistence on the essentially social nature of these changes, Kress' work can tend towards a certain utopianism, claiming that the shift to multimodal, interactive forms of communication carries with it intrinsically democratic potentials and effects. Other writers (e.g., Freebody, 2001) would challenge this position, claiming that existing structures of power and control are just as likely to be reinforced and continued through the use of new communications technologies—as can be seen for instance by the predominance of the English language on the Internet, and the dominance of a small number of US corporations such as Yahoo!, Microsoft and Google.

Contributors to Snyder (2002) take a critical approach, exploring the social, cultural and educational impact of electronic literacy practices, and looking particularly at how the notion of 'being literate' has changed with the advent of multimodality. The book shows how the new communication order is part of the technological revolution reshaping the material bases of society, embedded within a dominant political/ideological order of high tech and global capitalism. Chapters analyse a range of new online literacy practices, from the ratings system of eBay to the specialist complex literacies of role-playing computer games. They show how a complex interplay between the new communication order, new political order and new work order shapes and circumscribes the lives, identities and possibilities of teachers and students. Similarly, a collection describing Web practices from ten different countries (Hawisher and Selfe, 2000), from Hungary to Palau, Norway and Mexico, shows how culturally specific new literacies practices are shaped by concrete cultural contexts, challenging one dominant notion of the Internet as a 'culturally neutral' literacy environment.

Studies of new literacies from the ecological perspective have focused in particular on the changing nature of the multimodal communicative landscape, on youth practices, and on new understandings of learning.

Analyses of these three areas show that much of the education system is failing to prepare students adequately for the new literacies they will encounter, and are already dealing with, in their lives outside education.

### *Multimodal Communicative Landscape*

A key theme in this field is the way the communicative landscape is becoming increasingly multimodal, and the impact that this has on education. Work by Kress (Kress, 2000, 2003; Kress and Van Leeuwen, 2001) has been particularly significant here. He has identified how the possibilities for multimodal communication afforded by new technologies have altered our whole approach to communication, with for instance school textbooks now often looking more like a web page than a traditional written text. Similarly, Jewitt's (2005) exploration of the interaction of word and image in both home and class texts shows writing becoming increasingly visual in character, with the traditional domination of the word being unsettled by the predominance of the image. She calls for new understandings to be developed by educators, related to the specific affordances of different kinds of texts and the new ways school-age readers interpret such multimodal texts.

The forms and effects of multimodal communicative practices in a globalised networked world are explored in Snyder and Beavis (2004). Chapters in this collection show the uneven distribution of information and communication technologies across the world, and how new literacy practices can be understood only within their social, political, economic, cultural and historical contexts. They draw out questions that educators need to be asking: what it takes to become competent in a domain where words, symbols, images and artefacts combine to create complex situated meanings; how different skills and experiences in this area can transfer across domains, for instance between home and school; and where these processes are being blocked.

A pedagogical approach to the multimodal communicative landscape has been developed by the 'New London Group' in *Multiliteracies* (Cope and Kalantzis, 2000). This linked group of articles is framed by an analysis of the contemporary communicative and globalised situation as being characterised by multimodality, multilingualism, diversity and post-Fordism, which are transforming people's working, public and personal lives. On the basis of this analysis, they develop a detailed framework for a pedagogy of multiliteracies, combining four existing approaches to literacy pedagogy from different traditions: situated practice, overt instruction, critical framing, and transforming practice. The collection describes a range of projects, which implemented different aspects of this approach, including a community college course in

the USA for Mexican-American students, a Masters in English Education in South Africa, a South African management development programme, and a school in Alice Springs, Australia. This approach combines dealing with the multimodal nature of contemporary texts with the development of critical analyses on the part of teachers and students. The aim is to enable students both to engage in new literacy practices, producing and using multimodal texts, and to critique and challenge the nature of such texts in relation to their cultural contexts.

### *Youth Practices*

The distinctiveness of youth practices and their implications for education is a particular focus in this area, since it is often young people who lead the way in adopting and adapting new literacies. A range of studies of adolescents' practices (Alvermann, 2002) shows how for this group, these literacies are not particularly 'new', they are simply part and parcel of ordinary life. These practices are shaped by the 'portfolios' they bring with them, including their income, ethnicity, language, class and gender. This everydayness gives adolescents a very different experience of new literacies from that of their teachers or even researchers, and the parallels and disjunctures between the different generations are described.

Another international collection (Marsh, 2005) focuses on young children, exploring their engagement with popular culture, media and digital texts in home, community and early years' settings. The collection shows how global cultural artefacts—often across different media, such as the Pokémon television programme/computer games/magazines/cards—are adapted locally, with children creating their own multimodal meaning making practices combining local and global narratives. The work challenges a narrow, pen-and-paper notion of 'emergent literacy', showing children confidently moving across a range of media in their early years and actively re-making meaning rather than being passive consumers, and calls for early-years education settings to develop understandings of these media knowledge very young children are bringing with them.

A recent special issue of *Discourse* (Carrington and Marsh, 2005) also addresses childhood and youth engagement with new literacies, relating the production and use of digital texts to changing perceptions of childhood and youth more generally. The editors speak of a 'paradigm shift' in communicative practices with implications for literacy education, summarised in terms of the conjunction between technology, globalisation and social and cultural instabilities. Articles in the special issue give a range of examples of research on how literacy practices are changing, some of which will be returned to below.

Throughout, implications for curricula and pedagogy are drawn out, in relation to children and adolescents for whom these practices are not 'new', but 'normal'.

The key themes of work taking an ecological perspective on young people's practices in this area are therefore the 'naturalness' of such practices for them in comparison to the teachers and researchers of a different generation, and the ways these practices are shaped by their social and cultural settings. We also need to remember, while celebrating young people's abilities in this field, that this does not universally apply; many young people do not have access to such resources, because of the social and financial inequalities which characterise our social structures.

### *New Understandings of Learning*

Taking an ecological perspective on new literacies has helped to develop new understandings of learning, by examining the ways people learn to engage with new literacies, which are often very different from traditional ideas about how people learn. Gee's work is particularly significant in this area. His video games research (Gee, 2003) begins by observing that video games can be long, hard to master and frustrating. Yet many are very popular, with gamers devoting huge reserves of time to mastering them. This is in contrast to much of what goes on in schools, where gaining and keeping students' attention remains a challenge for many teachers. Gee claims that if we can understand the principles of learning game designers build in to their game design, we can understand better how people need to learn in the new technology world. He draws out 36 principles of learning, including active, critical learning, seeing interrelationships, being rewarded for achievement, incremental learning of tasks at an appropriate level of difficulty, discovering situated meanings, and being part of a learning community.

A similar argument is made by Cross (2005), who observed practiced video-gamers in primary school classrooms. She challenges accusations that playing video games leads to negative cognitive and social effects, showing how gamers develop particular ways of thinking and communicating that could be built on in classroom settings, such as the ability to develop and follow complex, multi-layered narratives which take account of varied contributions and audience needs.

Thomas' (2005) study of adolescents playing online role-playing games shows the extent of their learning as they engage in both playing their characters and in discussions on a web-based forum, including poetry recitals and storytelling, fan fiction and critique. She argues that the learning they exhibit can best be understood as learning from one

another in a 'community of practice' (Wenger, 1998), in contrast to much educational theory based on Vygotskian notions of scaffolding by experts. Thomas claims that the level these children reach in this arena may exceed the expectations of their teachers in schools, and that this participation fulfils needs for belonging and development which schools do not address.

### *Inadequate Preparation of Students*

This work on learning draws out clearly the differences between learning in schools and learning new literacies in the world outside. A constant theme of work in the ecology of new literacies is that educators, particularly in schools, are not preparing students adequately for the world they will move into. Gee (2004) draws out the implications of his research for education, suggesting that there are new ways with words and ways of learning in the world which are rewarding and important for success, different from school-based learning. He claims there is a particular problem with the language associated with academic content areas, often experienced as being complex, technical and alienating. Children's facility at learning complex specialist varieties of language related to popular culture shows that it is not the capacity for learning that is lacking, but the alienation associated with abstract academic language varieties that is the problem. In addition, the language of academic subject areas is usually divorced from concrete experiences; but the human mind works best when it can tie new knowledge to experiences. Video games work much better as simulations of experience, and can therefore (as described earlier) teach us a lot about learning.

Gee claims that learning in the high-tech global economy happens in new ways. To be successful, people need to be able to participate in shared social spaces, to learn and change quickly and to gain diverse experiences to adapt to fast-changing circumstances. Schools are very behind in preparing students for this. Children's learning experiences outside school may well be preparing them better for their future than their learning in school.

Similarly, in an interview (Bearne, 2005) Kress accuses schools of being locked into 'nineteenth century notions' of literacy and texts. Leu, Kinzer, Coiro and Cammack (2004) note that given the rapid pace of change in this field, we have found ourselves in a situation where it is essential to prepare students for using new literacies in life after school, but many teachers know far less about this area than (some of) their students.

Lankshear and Knobel (2003) distinguish between 'insider' and 'outsider' perspectives on new literacies. They claim most young people are

'insiders' to new literacies. But education is dominated by 'outsider' perspectives, which they describe as mystifying, bemusing, alienating and miseducating students. They analyse classroom activities and resources, such as Britain's (now defunct) 'National Grid for Learning', which they claim impose the stamp of the 'old' on what should be 'new'. Activities are developed which are teacher-directed and based on rigid curricula, whereas in the new world outside the classroom, it is more important to be prepared for ongoing change and constantly ready to explore and play.

There have been several research projects which have sought to find ways to use digital literacies differently in education. Bigum (2002) argues that schools have often 'domesticated' new technologies, adapting them to fit in with existing school culture and practice rather than using them as they are used in the world beyond schooling. He calls for a shift in focus, towards considering schools' relationships with local communities, and how information technologies can be used creatively to foster and develop these, giving students opportunities to use new technologies in real ways. Lankshear and Snyder (2000) report on school-based research identifying issues and barriers framing how new literacies have been taken on in different educational institutions, developing concrete suggestions, recommendations and guidelines for pedagogy, policies, programs and professional development. Hull (2003) reports on an out-of-school action research program giving young people the opportunity to produce multimedia digital stories about their lives. She shows the young people's mastery of sophisticated multimedia practices, producing complex re-contextualisations of their identity, highlighting the need to embrace multimodal, multimedia conceptions of literacy. Beach and Bruce (2002) give examples of how participation in digital technologies by adolescents gives them alternative ways of constructing identities through engaging in critical inquiry. Such pedagogical developments are an important application of new literacies research.

## PROBLEMS AND DIFFICULTIES

### *Insider/Outsider Perspectives*

One of the principal difficulties in researching this field is similar to the difficulties involved in teaching it. In a world of 'insider' and 'outsider' perspectives, many researchers as well as teachers are, to some extent, 'outsiders'. Of course, these are fuzzy categories. In a world where most researchers spend their days writing on computers, looking things up on Google and editing personal web pages, we cannot suggest that the gulf is absolute. Nevertheless, few academic researchers have the

sorts of vibrant multiple online identities described by Thomas (2005); few of us co-ordinate our relationships by text and instant message, work/playing in a virtual environment juggling simultaneous multi-modal streams of communication. While in the New Literacies field this can lead to a fascination with this area, rather than the suspicion described earlier often evinced in other institutional settings, such a fascination can carry its own dangers; for instance, romanticising and over-emphasising aspects of such practices which may appear unusual, novel or marked to the outsider, but to the insider are simply the norm.

### *Clashes with Dominant Discourses*

Research from this perspective clashes with some dominant discourses of education and policy. The research described earlier suggests that the way to prepare students for the new world is to facilitate playful, explorational communities of peers, moving from expert-novice relationships to a relationship of equals exploring together, with activities being realistically responsive to the broader social ecology, and teachers and students prepared to go in unexpected directions. However, this is difficult to achieve in a world in which increasingly centralised, prescriptive curricula are being introduced, assessed by skills testing at increasingly regular intervals. This is happening in both Britain and the USA, and leaves little space for unstructured, fluid explorations of ecologies of new literacies in the classroom, in the way people learn to engage with them outside school settings (Luke, 2002; Selfe, 1999).

Lankshear and Knobel (2005) identify what they call an 'it' perspective on new literacies, seeing them as skills to be obtained rather than as constellations of practices to engage in, which dominates in policy and educational discourses. They consider a range of conceptual definitions and 'standardised operationalisations' of digital literacy, concluding that such accounts portray only a very limited model. They show how standards in the digital field, such as the European Computer Driving Licence or the standards produced by the Global Digital Literacy Council, turn new literacies into a set of abstracted skills and techniques which are curricularised and certificated. They argue that digital literacies should be conceptualized as plural rather than singular, and to illustrate this sketch out a few of the wide range of different practices they have identified in their years of research, contrasting dominant 'it' perspectives with the perspectives of digitally literate young people taken from interview data.

One important aspect of dominant discourse is the various 'moral panics' (Cohen, 1972) which arise regularly in media and policy discourses around new technologies. Carrington (2005) analyses public

discourses about mobile phone texting, showing how texting and texters are positioned in a discursive chain linking texting, youth, declining standards, poor academic achievement and social breakdown. Research in new literacies from a social practice perspective can challenge the assumptions of such moral panics. We have already mentioned work by Cross (2005) and Gee (2003) challenging dominant notions that video games cause hyper-activity, violence and short attention spans. Beavis and Charles (2005) similarly challenge the notion that simulation games like *The Sims* encourage gendered patterns in game play, showing how teenagers playing the game in Australian schools used it to subvert traditional gendered practices. But within a social situation where the dominant discourse includes this level of fear and suspicion, it is hard for the positive messages of research to be taken up in constructive ways.

### *Pace of Change*

A final difficulty in researching this field is in the nature of the object. New literacies practices are changing faster than research can follow them, particularly given the insider/outsider tensions described earlier. The meanings of such practices are open and emergent, developing and changing unpredictably. It can be difficult to tell which practices will remain and develop, and which are short-lived trends.

## FUTURE DIRECTIONS

This constant development of new forms in the new literacies field leaves future directions of research open. One interesting focus, both as a field and a tool of research, is the practice of blogging—using a regularly updated personal website to record and reflect on one's life, ideas or experiences. Blogging and related developments such as podcasting (where people upload their own radio programmes onto the net) are challenging the dominance of mass media corporations in transmitting information, and the implications of this are still playing out.

This also has implications for how research is carried out. Julia Davies and Guy Merchant from Sheffield are using auto-ethnographic methods to research their own blogging (<http://drjoolzsnapshotz.blogspot.com/>, <http://myvedana.blogspot.com/>), with a jointly authored meta-blog (<http://blogtrax.blogsome.com/>) serving as a space to reflect and develop ideas. They are part of a group of New Literacies scholars keeping blogs which cross the boundaries between the personal and the professional, who co-reference each other to create an online new literacies research community, which includes Lankshear and Knobel (<http://everydayliteracies.blogspot.com/>), Thomas (<http://anya.blogsome.com/>)

and Carrington (<http://victoriacarrington.blogspot.com/>). Given the pace of change in this field which makes traditional rhythms of academic publishing inappropriate, research on new literacies which takes place online in the same timeframe as the phenomena under study seems an important future direction.

Another developing area is the study of how new literacies facilitate the building of new sorts of communities. Gee's (2005) work on affinity spaces and semiotic social spaces opened up this area for exploration in relation to online gaming, but it has a range of different manifestations which have yet to be fully investigated. For instance, Davies is researching the rise of communities of photo-sharers on [www.flickr.com](http://www.flickr.com) (Davies, 2005), arguing that this site enables reciprocal teaching and learning partnerships, generating new meanings and discourses, in a dynamic multimodal learning community. Communities are also central to some of the new online ways of doing business, with sites like eBay with its personal ratings system generating new understandings of concepts of trust and membership (Lankshear and Knobel, 2003, Chapter 6).

Even the nature of knowledge construction is changing, with implications both for future fields of research and for the way such research is represented. Wikipedia, an online encyclopedia which any reader can edit and add to, has become one of the most popular sites online—consistently in the top 25 sites accessed (according to the traffic ranking site [www.alexa.com](http://www.alexa.com)). An expert review of Wikipedia articles (Giles, 2005) found them to be comparable in accuracy to those in the Encyclopaedia Britannica. This is knowledge emergent from a community of peers, rather than handed down from above by a small group of knowledgeable experts. The implications of this and similar initiatives (e.g., developments of open source software by communities of peers) have yet to be fully explored.

The most significant future direction for research in this area is around the issue of insider/outsider perspectives, described earlier. New literacies and new technologies are already a normal part of many young people's lives. These are the teachers, researchers and policy-makers of the future, and may therefore be able to take a different perspective from the currently dominant outsider view. The distinctions between Lankshear and Knobel's 'it' perspectives and the 'constellations of practice' approach may dissipate as time goes on.

This is not a guarantee. There are established conservative discourses which will work to resist this change. As described earlier, policy changes to increasingly centralised curricula are reinforcing the 'it' perspective in classrooms. And if the new literacies field continues to change and develop just as rapidly as it does now, the 'insiders' of today might be the 'outsiders' of the future. Alternatively,

they may prove highly adaptable—Gee's (2004) 'shape-shifting portfolio people'—demonstrating a fluid responsiveness to the changes the future will bring. Time will tell.

**Language, Society and Education**

## THEORETICAL AND HISTORICAL PERSPECTIVES ON RESEARCHING THE SOCIOLOGY OF LANGUAGE AND EDUCATION

### INTRODUCTION: THE SOCIOLOGY OF LANGUAGE

The designation ‘sociology of language’ is often used in conscious distinction to the designation ‘sociolinguistics’. The intent of this distinction is commonly relevant both to personal disciplinary orientation as well as to the level of data-aggregation preferred by the researcher. From a disciplinary point of view, the designation ‘sociology of language’, rather than ‘sociolinguistics’, implies a greater concern with sociology than with linguistics, on the one hand; and a greater preference for higher levels of behavioral data collection (‘higher’ in the sense of more abstract, i.e., further removed from directly observed phenomena) and for higher levels of data-aggregation on the other hand.

This contribution will trace the development of sociology of language and its key research approaches. It will consider the challenges of different research approaches and the relevance of those that focus on *verstehende* (understanding) and those whose primary goal is *erklärende* (explanatory).

### EARLY DEVELOPMENTS IN THE SOCIOLOGY OF LANGUAGE

The sociology of language has developed alongside of sociolinguistics at least since the summer of 1964, when the modern study of language in social contexts was (re)constituted by a specially convened group of primarily U.S. scholars. The linguists (mostly, anthropological linguists) and sociologists (most of them macro-level oriented), spent an 8-week faculty seminar at the Summer Linguistic Institute, held that summer at Indiana University in Bloomington (Tucker and Paulston, 1997). Since linguists were already focused upon language behavior (whereas sociologists were not, by and large), the perspective of ‘sociolinguistics’ had greater momentum from the outset and could look forward to an academic home in departments of linguistics from the very first days onward. While a few of the Bloomington seminar sociologists immediately began to define themselves as ‘sociologists

of language' (indeed, some not present at the Bloomington seminar had already so defined themselves much earlier, viz. Herzler, 1965; Cohen, 1956), they did not form a cohesive interest-group, either then or afterwards, few sociology departments being interested in the new specialty area. Even the designation 'sociologists' was somewhat questionable for some of them, since it included the political scientists and the social psychologists among them. Accordingly, although the sociology of language began (and has largely remained) as a recognizable perspective of individual scholars, it never became a well-defined theoretical school nor developed a distinctive research methodology. It has remained a minority position within the total sociolinguistic enterprise, particularly in the U.S.

Like sociology itself, the sociology of language has neither well defined limits nor methods distinctly its own (see Fishman, 1965, 1968, 1970, 1972). As a result, whereas sociolinguistics has gravitated toward microanalyses of snippets of 'talk' and pre-selected conversations (Gumperz, 1982) or toward particular genres of pre-selected texts (Hymes, 1981), and therefore has no problem incorporating samples of actual speech or recitation in its presentations, the sociology of language has largely been 'social problems' oriented (e.g., bilingual education, language maintenance and language shift, reversing language shift, the spread of English, language death, etc.), often utilizing contrasted polities, population groupings and even the world at large as its universe of study and generalization for inquires into one macro-topic or another. As a result, the data of actual speech is no longer evident in its reports, such data being replaced by language or variety names or categories.

## MAJOR CONTRIBUTIONS

### *Contributions from Sociology*

'The sociology' of any topic involves the social structure or differentiation of its manifestations in society. A sociological analysis frequently compares individuals in different ethnic groups, racial groups, religious groups, professional groups, age groups, occupational groups or economic groups with respect to a particular social behavior (attendance at a Yankee game, participation in a general strike, armed forces service, participation in the elections, engaging in recreational reading, etc.). Some sub-groups (ethnic group 1, ethnic group 2, ... ethnic group  $n$ ) may well manifest more of this behavior than others. In that case, the investigator may conclude that ethnicity does play a role in the social behavior being studied (participation in the May Day parade in New York City) or may try to push the analysis further to try to relate

the ethnic differences that have been discovered to differences in family income, individual education, immigration status, etc. What may initially have seemed to be ethnic differences per se may, upon further inquiry, be more fully explainable in terms of economic or education differences between the groups involved. Sociologists will derive their hypotheses from the manifold previous studies that have been already been completed on the categorical groups that they are studying in a particular inquiry and on the social dimensions of concern to them (education, income, age, citizenship, etc.). Of course there will be a language variable involved too in the sociology of language and education (e.g., speaking a LOTE [language other than English] at home), but we will turn to such distinctly language variables below.

Sociological interpretations as to 'causal factors' typically stop at the societal or group-membership level. This leaves it to other investigators (sometimes from other disciplines, including sociolinguistics) to investigate the role of more individual or psychological factors prompting attendance at Yankee games or participation in May Day marches. Whether or not to extend one's research to the individual level too will also depend on the investigator's (inter)disciplinary training and particular focus of inquiry. Although personality factors may be involved in Yankee game attendance, neither the sociology of language nor the Yankees per se may be interested in sponsoring research on such variables because they would provide little valuable information to them that could easily be incorporated into their own prior *modus operandi*.

### *Connections to Education*

The sociology of language has been drawn to the study of language in education more by need than by prior intellectual interest. Each of the above-mentioned macro-topics has most often been researched within educational settings and institutions (school-systems, school-districts, school grades, school-rooms, etc.). School settings and situations are often selected for sociology of language inquiry because of various assets that they possess and prominently manifest. Schools have research budgets to expend, populations (including minority populations with language problems) that can easily be tapped as data-collection participants, qualified staffs that can be relied upon to keep order, provide background data and, in general, assist with the 'book-keeping' that all research entails, shielding investigators from interruptions, interference or other disturbances. Few of the aforementioned assets amount to theoretical or substantive preferences and, as a result, the outcomes of such investigations are often both less specifically relevant for education and

more relevant for larger scale societal institutions and social processes more generally than might otherwise have been anticipated.

Although 'education' is commonly defined as school-situated or school-related input or output, that need not necessarily always be the case. Education need not be conceptualized in a manner that limits it to either formal settings, curricular emphases, or stereotypic roles ('students', 'teachers', 'administrators', 'school board members', 'parent body', etc.). Language use during recess in the school yard (playground) is a perfectly reasonable example of simultaneously minimizing formal school influences on informal language use while still easily locating subjects of both sexes and various ages. More generally, therefore, education need not be limited to formal settings or scheduled curricular processes. 'Education' may be taken in its broadest generic sense of 'to lead, rear, bring up', whether by example, instruction or other influences, planned or unplanned and with or without extra-familial intervention.

In its most general terms then, education can be seen as a lifelong process of elicited responses, growth, development and change. The sociology of language and education, therefore, necessarily focuses on only part of the total educational process, that pertaining to language-in-society, but that is an important part indeed, language being both a major part of the input and a major part of the output of the entire process of education-in-society, regardless of its localizations. All in all, the sociology of language and education entails a triangulation between societal influences, educational processes and language input or output. The need to include data collection and theoretically guided interpretation on three different dimensions contributes both to the difficulty and to the stimulation encountered in research on the sociology of language and education.

### *Key Research Approaches*

The social sciences in general, and the sociology of language and education (SLE) among them, share a small array of research methods and techniques. This array extends from ethnography and observation, at one extreme, through to controlled experiments, at the other, with correlational studies based upon content analyses, questionnaires and other investigator-constructed 'tests' occupying a middle ground between the two extremes. Each of these methods possesses its very own and distinctive advantages and disadvantages.

*Ethnography*, the classical approach of anthropology, based upon the *in situ* fieldwork observations and recordings of trained and sensitized observers, has gained a considerable following during the past half century in conjunction with the study of language and education.

It typically pursues the formulation, disconfirmation or confirmation of hypotheses (e.g., 'Teachers in X-town public schools reinforce English only speaking students more often and more positively than they do speakers of LOTE's') by means of a large number of extensive observations in various school-settings. Ethnographic reports typically include many verbatim excerpts from teacher-pupil interaction, as well as holistic descriptions of persons, places and events that provide the reader (or viewer of filmed information) with a feel for the 'real thing', second only to being 'there' while ongoing life unfolds. This 'slice of life' realism is obtained at a price, as is the case with every research method bar none.

Ethnography finds it difficult to control certain factors (e.g., pupil social class, ethnicity, age, general attractiveness, etc.) while focusing on others, primarily because life does not present itself naturalistically in terms of neatly controlled but otherwise comparable packages. Of course, given sufficient experimenter time and funds, all of these secondary 'causes' or elicitors of teacher reinforcement can be observed in action and the differences between their rates can be noted and taken into consideration as indications of stronger or weaker co-causes than the major one (pupil's variable classroom usage) and their separate or combined effect upon or modification thereof. However, researchers seldom if ever have sufficient time and resources, and ethnography is, therefore, not an easy or precise method of unraveling complex interactions between the large number of possibly contributory ongoing aspects of any real-live interaction. An additional concern is that of observer reliability and validity. Wherever there is only a single personally invested observer for any data-set we are left with the problems of observer bias, observer consistency over time and the entire 'issue of degree' of any observed and counted 'teacher-reinforcement' versus those not counted because they are simply unnoticed or judged to be too weak or ephemeral to count. Investigators also obviously differ from one-another in their 'ethnographic sensitivity' or 'ethnographic aptitude' and, therefore, although the method provides much direct and immediate researcher gratification, it is so labor-intensive and so bound-up with the quirks of a single observer, that some researchers have concluded that other methods are needed (or needed in addition) for the sociology of language and education if its frequent confounding of method and researcher is soon to be overcome.

*Controlled experiments*, at the other end of the methodological continuum, are the characteristically preferred method of psychological research. Whereas ethnography sacrifices precision and complexity so that it can maximize 'holistic realism', exactly the opposite is true for controlled experiments. Thus, in a study of teacher-interpretations of English-Spanish code-switching by pupils, three different pre-filmed

scenarios (representing high, medium and low degrees of code-switching by the same group of student actor-confederates) were viewed by randomly assigned Black, White and Latino teachers in a large metropolitan high school, each of whom viewed only one scenario. After their viewing the scenario to which they had been assigned, teachers were debriefed as to their knowledge of Spanish, frequency and types of out-of-school interactions with Latinos, attitudes toward switching and their interpretations of the overt and the latent meanings of 20 switches that had been built into each scenario. Variables that were excluded from research-attention (e.g., teacher age, experience and attitudes toward race/ethnicity) were 'controlled out' of the study by means of random selection and random assignment of teachers to switching-groups, so that these variables could not effect any discovered 'between teacher-group' differences with respect to levels of switching at more than a 'chance' level. Unlike ethnographic researchers, experimental researchers never have the satisfaction of experiencing the reality of 'actually having been there'. On the other hand, the latter have the satisfaction of precise answers to precise questions (e.g., does intensity of switching behavior among students effect teacher understanding of latent meaning among teachers who are White and non-Latino?), with the probability of error (false negatives and false positives) being known in connection with answering each such question.

Somewhere near the middle of the continuum of naturalness and precision are the *questionnaire methods* (including most investigator-constructed data elicitation methods, even if they are not of the traditional questionnaire type, e.g., *guided interviews*, *observational check-offs*, certain *projective techniques*, etc.). Wherever total scores can be derived independently for each member of a studied sample from a summation of that member's item scores (Fishman and Galguerra, 2003), both fully structured and less-structured elicitation methods can be constructed by means of exacting item-analysis methods and can be tried out and improved, item by item, for both item and total instrument reliability and validity.

The only conditions or limitations on the latter claim are (i) that all item scores be independent of each other (i.e., 'non-iterative') and (ii) that a single criterion measurable in 'more vs. less' terms be applicable to them all. Thus, for a criterion such as amount of switching during a prior unstructured conversation on 'What I do after school', the predictors of switching can be true-false (or other dichotomized) items, attitudinal or behavioral degree items (fully agree, agree more than disagree, neutral, disagree more than agree, totally disagree), investigator observed check-off items, projective or other interpretation items with a choice among several enumerated replies, etc. Thus, although

formal and semi-formal measurements provide neither for the naturalness and holism of ethnographic methods, nor for the exact estimation of 'error variance' in responses (i.e., variation on factors that the investigator prefers to exclude from a given study) of experimental methods, they do possess several significant benefits of their own, particularly with respect to demonstrable reliability and validity or the lack thereof.

The major lesson from the brief methodological review in this section is that there is no fool-proof research method for the sociology of language and education. Nor are its researchers methodological factotums, each being most comfortable and productive at a certain point along the entire methodological range. There is no methodological orthodoxy that pervades the entire field, to which all funding agencies, research centers and journals pay allegiance. A greater or smaller degree of methodological heterodoxy is both the rule and is very much to be recommended as well. Only by increasing the methodological range of one's own competence and comfort can investigators really weigh all of the assets and debits of any choice among them in each particular study that is undertaken. Methods and researchers should never become fully redundant considerations. The trustworthiness of research findings are much enhanced by multi-method and multi-investigator replications, both within and between topical and sub-topical areas of the sociology of language and education.

#### PROBLEMS AND DIFFICULTIES: REALITY AND COMPLEXITY

Every bit of research that is reported was conceived of as a means of tapping into both the reality and the richness of 'actual life'. However, reality is complexly multi-layered and it is very difficult (or perhaps even impossible) to be sure that one has captured enough of the subtle layering of any dimension being studied to be able to draw inferences pertaining to these dimension as a whole. Teacher acceptance of code-switching and code-switching per se both present many obvious and subtle examples of this difficulty.

In our discussion of factors contributing to teacher acceptance of switching we have recognized at least some of the complexity of common influences on both teachers and bilingual pupil behavior. We have not doubted that there may be other factors at play here, but we have decided to either treat them as 'error-variance' or to 'control them out' via random selection of subjects and random assignment of subjects to differing intensities of switching presentations. Both questionnaire data and experimental data can be subjected to a statistical analysis via a technique known as *analysis of variance (ANOVA)*. This technique essentially compares the variation associated with the

data related to any particular dimension of analysis with the total variation exhibited by the data as a whole. Only if the latter is sufficiently great relative to the former can that particular dimension be considered a significant one (i.e., one unlikely to be merely a chance finding due to random sampling factors alone).

While it is impossible in a single brief article to render this technique intuitively transparent, it becomes even more useful if an outside criterion is also available (e.g., the ratings of expert judges [speech therapists] of the switching frequency of each student during several months of interactive observation with a variety of 'others' and in a variety of 'settings') then this criterion can be used to gauge the extent to which any predictive dimension by itself (e.g., race of student or bilinguality of the teacher), or all of them taken together, account(s) for the variance on the criterion. In this manner the investigator can tell whether the criterion is adequately and significantly accounted for by the research instruments utilized. Obviously, the higher the correlation between the two, the more reliable and valid the explanatory capacity of the particular dimension or set of dimensions. But this crucial determination, available only for experimental and questionnaire data, does not convince ethnographers that these 'other' methodologies have studied 'the real thing' to any degree similar to that attained by their own studies. Similarly, the quantitative analysts are never convinced by the qualitative findings produced via ethnographic research. Why not?

Ethnography's implications that its method (and its alone?) can study 'the real thing' (and, therefore, 'discover the real truth' about it) raise an intricate set of fundamental issues for the sociology of language and education and for social research more generally. How do we know 'real' reality and recognize it when we have (or have not) found it? Is finding actual reality (and all of it) the *sine qua non* of research methodology and of the researcher's craft? This query touches upon an old and painful dispute that extends far beyond the boundary of the sociology of language and education.

### *Verstehende versus Erklärende Sciences and their Corresponding Methods*

The time has come, as it ultimately does in all social science that maintains a links with the most distinguished thinkers of its own past glories, for a few German words. More than 150 years ago, beginning even before the Bismarkian unification of Germany in mid-19th century and accelerating significantly thereafter, both the physical and the social sciences were essentially German preserves. It was not until the rise of Nazism, approximately 75 years ago, that this leadership

clearly passed to the Anglo-American orbit where it largely remains until this day. Accordingly, it is not merely a silly nuisance that the 'human', 'mental' or 'cultural' sciences retain a few particularly apt German terms to this very day. *Gestalt*, *zeitgeist*, *wissenschaft*, *volksprache*, *gemeinschaft/gesellschaft* and *ausbau/abstand* are among those that it would be a pity to give up, because for several generations many of our theories and findings have been formulated with them and through them, even if (as happens in all scientific fields) most of these have become substantially modified or even eliminated during this same period. These terms remind us of where we have been intellectually, and unless we know where we have been, we cannot really appreciate how we have gotten where we are (or think we are) today and where we would like to be tomorrow. Among these are the two terms that I will introduce here, *verstehende* and *erklaerende*, that represent two kinds of conceptual goals and methodological procedures for scientific research.

*SLE as an Erklaerende Science.* One school of German social science thought firmly believed that the rigorous methods and refined quantification of the exact sciences were not only proper and desirable but crucial models and methods for the social sciences to aspire and work toward. The goal of such sciences was *erklarung*: explanation. Today, when we think of the 'explanation' of any variable in human behavior it is exactly its variation or variability that challenges us. Why does it wax and wane in the same human subjects on different occasions and why do two different human groups differ with respect to the human behavior being examined such that Group A stands higher than Group B on some occasions while the opposite is true on others? Since this is not the case with respect to the measurement of properties of inanimate objects the discovery of constant and inescapable variation in human behavior was originally a matter of great anxiety (not to say consternation) among scholars in the latter area.

In the beginning the variation noted was attributed to errors of measurement, laxity in the training of measurers, or lack of consensus as to the proper units of measurement for research on human behavior. The psychophysicist Gustav T. Fechner (1801–1877) was so distraught by this phenomenon of inescapable human variation, individually or in groups, and by his obvious failures in trying to overcome or remedy it via utilizing different units of measurement, different methods of measurement or different methods of training measurers, that he ultimately went mad due to the aggravation and humiliation that he anticipated in that connection and that he understood to be a result of his own scientific shortcomings. It was almost a century later before the social and behavioral sciences fully understood that it was precisely the study and explanation of this variation that constituted their major

responsibility and analytic task. From then onward a large proportion of social scientists began to differentiate between true variance and error variance, between expected (and, therefore, insignificant) variance and unusual (and therefore significant) variance. The ‘standard error of measurement’ of any measure being employed enabled investigators to distinguish between normal variation and clearly unusual variation and to focus their explanatory efforts on the latter. Such clearly unusual variation from the expected might be attributable to ‘independent variables’ that the experimenter per se either manipulated or that the researcher discovered to exist to different degrees ‘in the field’, so that their impact on the ‘dependent variable’ could be studied both separately and together.

Briefly put, ‘explanatory (*erklärende*)’ research is so named because it attempts to *explain* the degree of variation in the dependent variable in terms of degrees of variation (whether experimenter manipulated or field encountered) in the independent variable(s) under study. Such research can also inform its practitioners and advocates of the extent to which the total variance in the dependent variable still remains unexplained (unaccounted for) by the independent variable(s) under study and by the measuring devices employed. This is important because it enables investigators to realize whether explanatory progress is being made, over time and study after study, when focusing upon the same independent variable. Even if this *is* the case, then in the future the recording, observing and stimulus conveying instruments can still be improved and honed. If it is *not* the case, then it might be appropriate to start all over again, not only with instrumentation but with the formulation of underlying hypotheses, predictive (‘independent’) variables and the ‘unitization’ (units of measurement) established for both.

Rigorous though the above sketched approach may seem, it still has its skeptics and non-believers, primarily because it has been over-promised and has, inevitably, underachieved in explanatory power. Therefore we now turn, in closing, to the *verstehende* approach to research in the sociology of language and education.

### *Verstehende Research to the Rescue*

Even its most adamant defenders must grant that the *erklärende* model in social research has not turned out to be as fruitful as originally expected while, at the same time, natural or physical science research utilizing this very approach has gone on from one success to another, in one substantive area after another. As a result, the social sciences have remained, in the eyes of many of its most prominent investigators,

singularly unreformed and un-enriched by the adoption of the rigorous *erklärende* research model. Accordingly, many researchers (particularly including many of the young and female among them) have returned to the previously much maligned *verstehende* model (carefully avoiding or sidestepping the Fechnerian error in connection with behavioral variance). The renewed *verstehende* model is anything but ‘apologetic’ concerning any possible errors of the past (certainly not for that part of the past for which its practitioners assume no responsibility whatsoever).

Why, its critics ask, has the *erklärende* model failed to produce satisfying results? Because the complexity of human behavior is so great and so manifold that *erklärung* in neutral and precise measurement terms is essentially impossible with respect to it. Instead of the false god of *erklärung* (explanation) it is claimed that the human sciences should pursue the more limited but also perhaps the more appropriate model of *verstehen* (understanding). *Verstehen* does not assume a physical/natural sciences model. Quite the contrary, it proceeds on the basis of seeking a disciplined and careful human understanding, that is, the understanding of human behavior that only another human being can achieve, derived from observation and empathy. *Verstehen* does not pursue the explanation of variance but, rather, the grasping of holistic and ‘undessicated’ behavioral phenomena, at the very level as do most adults who are native co-members of the same culture. Cultural understanding is and should be the proper goal of *verstehende* science, being the only goal that is distinctly appropriate for research on human subjects. Adult-child interaction that socializes infants into panhuman but also into distinctly Xian culture and teacher-pupil interaction also guides neophytes into pan-human but also into distinctly Xian school-learning culture. It also renders possible the recording and the analysis of the exact language use and behavior of any such interactions, something that *erklärende* research has well-nigh abandoned at the verbatim level.

This is a level of research involvement (problem definition, data collection and processing, and conclusion derivation) which is so different from that of *erklärende* research that the two often have very little to share with each other. When basic methods are very far apart from each other then research traditions unfortunately become soliloquies rather than confederates in a common venture. Regrettable though that may be for the pursuit of knowledge within the total enterprise of the SLE, most find it to be preferable to the constant skirmishing and mutually recriminating rejection that would and once did result from forcing incommensurables to interact and collaborate.

## FUTURE DIRECTIONS

The total research enterprise of SLE must be inclusive enough and supportive enough to provide room and recognition for both *erklaerende* and *verstehende* approaches to its subject matter. The rift between these different approaches is sufficiently recent that few researchers have thus far even had the opportunity to attempt to be trained so as to be equally at home and equally proficient in both approaches, so as to be able to choose between them (or to combine them) on substantive grounds rather than on personal, emotional ones. Perhaps that outcome will be a byproduct of the 21st century that stretches immediately ahead. *Ojalá!*

SOCIOLOGY OF LANGUAGE AND EDUCATION:  
EMPIRICAL AND GLOBAL PERSPECTIVES

INTRODUCTION

The sociology of language and education (SLE) seeks to describe and explain the relationships between society and language in education. Major areas of inquiry in sociology of language include language contact (including language spread, shift, loss and revitalization); language conflict and language attitudes; and language planning (Cooper, 1989) in the public arena (Fishman, 1971). SLE then addresses these processes in relation to schooling and education. SLE research is increasingly concerned with understanding the role language plays—at both the micro and macro level—in post-colonial societies as ‘the vehicle for identifying, manipulating, and changing power relations between people’ particularly in educational institutions, viewed as sites where discourse practices can ‘repress, dominate, and disempower diverse groups whose practices differ from the norms that it establishes’ (Corson, 2001, p. 16).

Though many of the notable major trends in SLE research can be traced to the 1960s and 1970s and to scholars like Fishman, Ferguson, Bernstein, and Labov (see Fishman, *Theoretical and Historical Perspectives on Researching the Sociology of Language and Education*, Volume 10), current research in the area is greatly impacted by worldwide developments, in particular those associated with globalization. The waves of internal and international immigration in many parts of the world, together with the advent of technology and the resultant global networking, have posed new linguistic challenges for researchers and educators alike.

SLE research encompasses a complex and diverse array of methodologies set in both the positivist and constructivist traditions, utilizing both quantitative and qualitative approaches to investigate sociolinguistic phenomena in educational settings. While some research methodologies have been borrowed and adapted from the fields of sociology, anthropology, social psychology, or linguistics, others generate unique forms based in the amalgamation of several distinct approaches. This survey reviews early developments and research orientations in SLE, many of which remain prominent today. An account of some major current contributions follows, culminating in a brief discussion of the role of globalization in shaping major SLE research directions.

## EARLY DEVELOPMENTS

The pioneering work of Joshua Fishman in the sociology of language (1971) triggered great interest in investigating the social organization of language behaviour as well as the applications of findings to areas such as language teaching and educational policy decisions. Early research sought to describe speech (and writing) communities (see Gumperz, 1968) and to answer the question ‘who speaks (or writes) what language . . . to whom and when and to what end?’ (Fishman, 1971, p. 46). In comparing language usage norms, researchers conducted detailed case studies, based on descriptive accounts as well as data from census and surveys of language use and language attitudes. In this early work, scholars identified phenomena and concepts that have become part of the established vocabulary of SLE research. For example, Ferguson (1959) used the Greek-derived word *diglossia* (meaning two languages) for situations where two varieties of the same language were used in the same community but for different functions and with different status accorded to each. Fishman (1971) extended this concept to describe a condition where two different languages were in use in one community. This concept continues to be important and discussed in SLE research for different functions (see discussion of Rampton’s work later).

The driving force behind many SLE studies is to explain and redress social disadvantages that result from linguistic inequalities. On both sides of the Atlantic, scholars have questioned the notion of a ‘deficit model’ (that certain social or cultural groups may ‘suffer’ from a language deficiency which could be remedied by compensatory education). British and American educators and linguists were intrigued by the claims of Bernstein (1971) and his followers who revealed through empirical investigations (observation, interviews and discourse analysis) that while there was no direct correlation between code-choice and social class, there was sufficient evidence (of different levels of elaboration in parent-child discourse) to justify reorganizing of schooling to enable students to have broader exposure to different socio-linguistic codes. A similar area of investigation (though in contrast to Bernstein’s agenda) was pursued by Labov in his seminal work in the USA (1969), which shed light on the contentious topic of cultural and linguistic deficiency. He argued that speakers of ‘non-standard English’ were neither verbally deprived nor cognitively deficient.

Sociolinguists in SLE continue to follow many of the patterns of investigation led by Fishman, Ferguson, Bernstein and others since the mid-1970s, but the research questions and methodologies have expanded to address educational questions which are local (as in a school district, or even a cohort of student language teachers), national

(e.g. the language education policy of an emerging nation state) or international (as in policy decisions for a continental educational alliance).

An example of a prime community SLE concern is the maintenance of heritage or ancestral languages through education. Heritage language speakers can be defined as having achieved some degree of bilingual proficiency (Valdés, 2001), or more broadly (see Fishman, 2001a), whereby heritage language learners can be acknowledged as such even though they may hardly speak the heritage language. This issue has been brought to the forefront in recent decades regarding both indigenous and immigrant communities where heritage languages are no longer used in home contexts (Fishman, 2001a; Lie, 2003). Fishman, again, was the leader in the ‘reversing language shift’ movement (1991), raising awareness of linguistic rights, and language loyalty, with intense concern for the survival (and development) of heritage languages. Much of the work in this area relates to educational processes, whether at the level of medium-of-instruction in the classroom, or of state or government policy (Skutnabb-Kangas, 2000), be they formal or informal (as in the case of intergenerational family transmission that is seen as the basis for reversing language shift).

As with the above mentioned studies, the employment of quantitative methodologies (based on surveys, questionnaires and the use of test data) is still predominant in SLE research on policy issues and decision-making at a national level (Lasagabaster, 2000). However, over the last 20 years, the field has witnessed increasing employment of the ethnographic research approach with its qualitative methods of data collection and analysis appealing to those who seek deep and rich meaning in local sites of inquiry by acquiring the ‘native’ point of view (Henry, 1998; Jo, 2002).

The advent of critical theories emerging from post-structural, post-modern and post colonial thought has generated studies that look into ‘the ways that social relationships are lived out in language and how issues of power . . . are centrally important in developing critical language education pedagogies’ (Norton and Toohey, 2004, p. 1). Hence, a growing number of research orientations, predominantly qualitative in nature, embrace an ‘emancipatory’ approach (Cameron, Fraser, Harvey, Rampton and Richardson, 1993). Features of such an approach include: (i) emic-oriented studies, where the researcher adopts the insider’s point of view (see McLaughlin, 1992), and is involved in the study both as an informant and an active participant (e.g. Skilton-Sylvester, 2002); (ii) the democratizing of research, whereby the research sample is involved in the study in pro-active ways like participatory action research (Muthwii, 2004); and (iii) more eclectic practices, which embrace both quantitative and qualitative data as

their samples or evidence for analysis (e.g. Clyne, Rossi Hunt and Isaakidis, 2004).

Though many SLE research methodologies have borrowed from other disciplines, unique approaches and research-based models have also been generated. One such example is the ecological approach. The concept of 'language ecology' was originally coined by Haugen (1972) to highlight how a language relates to other languages in the environment and the broader social context (Mühlhäusler, 2000). In the area of language policy and planning, the term has been used to discuss means for promoting multilingualism and linguistic diversity (Phillipson and Skutnabb-Kangas, 1996) and the impact of macro-sociopolitical forces on individual linguistic choices (Ricento, 2000). The ecological perspective is used to explore 'the inter-relationships between an individual and her/his languages, and across individuals and their languages . . . negotiated through different types of interactions, underpinned by situated and ideological, cultural and political histories' (Creese and Martin, 2003, p. 1). Research studies which adopt an ecological approach thus explore language-related issues and phenomena keeping in mind learner diversity vis-a-vis political, social, economic, cultural and linguistic factors.

A notable ecological framework which allows for the research, analysis and subsequent setting and implementation of linguistic policy in multilingual educational settings is the continua of biliteracy (Hornberger, 2003). Through a matrix of 12 intersecting continua which characterize the 'contexts for biliteracy, the development of individual biliteracy, the content of biliteracy, and the media of biliteracy' (Hornberger, 2003, pp. 5, 35), the framework facilitates a multidimensional analysis of literacy events and practices in macro and micro contexts, across skill areas of language use, in varied text contents, and in the media through which the bilingual language user communicates. Since its conception in 1989, this framework has served to both stimulate and guide research and discussion in the areas of language learning and teaching, particularly with regard to language planning and choice and learners' identities, bilingual programmes and curriculum development in various contexts around the globe. The aforementioned ecological framework and the previously noted emancipatory approach exemplify today's broader scope for SLE concerns and research. Nevertheless, the basic issues of 'Who speaks what to whom; when, where, how and why?' still persist.

#### MAJOR CURRENT CONTRIBUTIONS

Current research reflects the complexities of current social life, including turbulence, change, and development. Globalization, the emergence of

newly dominant communities, local states reasserting their national rights, the aftermath of colonization, the development of multi-national unions, and the establishment of different power bases at local as well as at governmental levels, provide a major current area of investigation. This is particularly true where language status and language education are concerned. The focus, therefore, in the next section is on language spread and maintenance in relation to globalization and how they impact formal education.

The transnational mobility of individuals, goods and services, along with the diffusion of mass information via telecommunications, has reshaped the SLE research agenda in recent years. The spread of English, the emergence of post-colonial New Englishes (Jenkins, 2003), and the struggle for language maintenance in the face of English dominance have prompted research with far reaching consequences on macro linguistic and educational policy decisions, on micro classroom issues, and on the interaction between the two. An example is Dei and Asgharzadeh's ethnographic and critical examination (2003) of the ramifications of 'imposed languages' on schooling issues in two different sites: English dominance in post-colonized Ghana, and Farsi in Iran.

The threat of English hegemony has generated studies of trilingual and quadrilingual language programmes (especially in bilingual European contexts such as the Basque, Catalan, Sweden and Friesland), where English is studied as the third or additional language (Cenoz and Jessner, 2000; Cummins, 2001). A critical examination of the English as a European *Lingua Franca* research reveals that studies focus on macro-oriented policy issues using quantitative procedures (such as surveys and attitude questionnaires) with little emphasis on how individuals actually use the language, to what extent and for what purposes. James (2000), therefore, makes the case for the need to shift the research emphasis to include micro language transactions between language users using a variety of research designs and instruments to facilitate such investigations.

The increasing use of corpus research methodology has meaningful implications for language programmes and resources. Research on codification and standardization, such as the ELF (English as a *Lingua Franca*) corpus research conducted by Seidlhoffer (2004), will have consequences for educational settings in terms of criteria for ELF language use and standards for assessment. Corpus research is also utilized for the validation of hierarchical standards, such as the Granger and Thesissen study (2005), which looks at the links between error types and levels of proficiency in the Common European Framework of Reference for Languages.

One of the outstanding global phenomena in language instruction and research is the evolution of new communication technologies, their

environments and pedagogies (Thorne and Payne, 2005), creating options in both the area of research method (data collection and analysis options), and communicative trait (media genres). Among the SLE research concerns are language contact and environment on the internet (Holmes, 2004), and intercultural communication. Kern, Ware and Warschauer (2004) note the shift in research from networked language learning in classrooms to collaboration projects conducted online allowing for broader social discourse and intercultural competence. Belz (2002), for example, using methodology grounded in social realism frameworks, examines the interaction between American students (learners of German) and university students in Germany.

Transmigration and language spread have drawn attention to native speaker concepts and privileges, with special focus on the resources afforded the native speaker of the Central versus Peripheral English varieties (Brutt-Griffler, 2002), hence giving rise to a new research focus in SLE: the relevance and respective merits of language teachers who are either native or non-native speakers of the language they teach. The search for insight into teachers' perceptions (on how they are perceived by others), their self-efficacy and effectiveness, draws on data collected via both quantitative and qualitative methodology (with often a mixture of both), thus allowing for a multi-angled representation of the examined phenomena (see e.g. the edited volume on non-native English teachers by Llurda, 2005).

Prevalent among recent studies are those concerned with the maintenance or reversal of indigenous languages, the maintenance of heritage languages, and language spread, as they relate to the medium and the content of instruction, and the power of education to effect change. Studies from Africa, Europe, Asia, North America and Australia, demonstrate the burgeoning nature of the SLE discipline. Many manifest the social activist attitude of SLE researchers who are not content to study a topic, without being involved in a pro-active manner (see, e.g. Cameron, Fraser, Harvey, Rampton and Richardson, 1993). Some of the cited work herein is avowedly interventionist (Cooper and Maloof, 1999; Muthwii, 2004), while others are participatory, being ethnographic (Adgebite, 2003) or action research studies (Nagai and Lister, 2003). The diverse methodologies employed to investigate, explain, or perhaps advocate, reflect the multilingual—and multidimensional—communities in the complex sociolinguistic and socioeducational situations that exist today.

We still, however, find studies which adhere to a single research method such as quantitative analysis of census data. For example, MacKinnon (2004), employed empirical analysis of census data regarding Celtic languages to demonstrate that reversal of a downward trajectory could be achieved through sustained instruction. Likewise Lasagabaster (2000)

analysed standardized test data to investigate the preferred and most efficacious type of multilingual education in secondary schooling in the Basque area. However, the majority of the studies incorporate a variety of data from a range of sources. Muthwii, for example, used official government records, questionnaires and interviews to compare a community's perceptions of mother-tongue use in schooling with that of official policy and the stated medium of instruction (2004). Ejieh's ethnographic work (2004) in Nigeria explored participants' perceptions of the indigenous tongue (as medium of instruction) as an instrument for social and economic advancement in light of the growing power of English as an international *Lingua Franca*.

In many post-colonial nations, the status of indigenous language(s) is threatened considerably by English. Adgebite (2003) engaged in participatory action research attempting to raise awareness of the importance of indigenous language maintenance by conducting a course of progressive 'enlightenment' on this topic for an elite group of students. Others have tried to redress a situation of threatened language loss (with a modicum of success) by introducing culturally relevant topics into modes of instruction (see Henry, 1998; Nagai and Lister, 2003).

Despite the rapid decline of many languages in this new millennium, linguistic diversity is still widespread, with many urban areas boasting a plethora of different home languages. Progressive educational authorities strive to meet the needs of diverse communities to accommodate the use and maintenance of home-tongues (or heritage languages) by incorporating some system of bi- or multilingual education. Pro-active efforts to this end are exemplified in the large-scale action research of Clyne, Rossi Hunt and Isaakidis (2004), a study which involved teachers, school students and curriculum organizers in promoting the study of community languages as second or third languages. An attempt to redress the loss of heritage tongue through medium of instruction is recounted by Cooper and Maloof (1999) who conducted participatory action research involving native-speaking parents in teaching elementary-level Chinese, Japanese and Korean in a US school. Jo's ethnography (2002) of diasporic cultural identity (of Korean American women in the USA) and maintenance of heritage language exemplifies a different, yet still significant aspect of the situation: investigating attitudes and identity with regard to heritage and other tongues.

#### PROBLEMS AND FUTURE DIRECTIONS

Though the field employs diverse research methodologies, there remains an abiding perceived dichotomy between the value of quantitative and qualitative research paradigms (Lazaraton, 2005; see Fishman, Theoretical and Historical Perspectives on Researching the Sociology of Language

and Education, Volume 10). The debate as to the relative importance of each tradition was recently brought to the forefront by the No Child Left Behind Act (2001) in the USA, which called for 'scientifically-based' research, implying the prioritization of positivist research over constructivist paradigms (Eisenhart and Towne, 2003). This is especially crucial in areas pertaining to SLE research, where exclusive reliance on experimental research would exclude critical and interpretative social research on phenomena such as gender, identity, linguistic and cultural ethnicity. Clearly, it is the research purpose which ought to guide the choice of research methodology (rather than vice versa) in order to allow researchers to find the answers to 'burning critical questions about social life' rather than restrain them (Shohamy, 2004, p. 732).

Furthermore, concern over adherence to specific methodologies may divert attention from the primacy and robustness of the underlying theory for the research (Cummins, 1999). An approach which addresses this concern is that of Rampton, Harris, Leung and Roberts (2002), who have proposed a breaking down of assumptions that paradigms dictate in favour of an interdisciplinary collaborative approach to the examination of contemporary urban language, learning and interaction (see Creese, *Linguistic Ethnography*, Volume 10). An example of this approach is the ongoing ethnographic research on multilingual adolescents in various settings which has yielded data on social systems and attitudes regarding ethnicity and identity in relation to popular and media culture (Rampton, 2005). The gradual emergence and recognition of alternative research paradigms is also applicable to the role and required qualifications of the researchers: It is evident that practitioner research in the form of reflective action research is slowly being legitimized by the research community although it must be acknowledged that despite its promotion, educational stakeholders have yet to award it equal status with other research forms (Burns, 2005).

With regard to future orientations, SLE research will continue to respond to the impact of current developments on education. Issues that require greater attention include first language literacy and the role of language shift and language maintenance in second and third language early childhood education (Cenoz and Jessner, 2000). In-depth, qualitative research modes are appropriate for examining the implications and outcomes of different multilingual education alternatives for different communities (indigenous, immigrant or migrant, multi-generational or single family units). Other important areas of inquiry include the experiences of refugee and immigrant language users and learners in acquiring needed life skills and schooling, and the possibilities of adult education in their adopted language (Warriner, 2004; Weinstein, 2001). Also important is further attention to the levels of acceptance of non-standard varieties among second or third language learners.

Future research will likely see an increased utilization of communication technology which allows for massive worldwide data collection, instantaneous data analysis and direct public accessibility. However, communication technology may also have adverse effects on the research process due to the relative ease of placing accessible research tools in cyberspace for use by the wider public or for specific groups. Such practice needs to be treated with caution, for while opening new avenues for data collection on an immediate and large scale, it may also lead to research abuse if quality-control measures, for example in terms of sampling, are not maintained.

Another area which will be pursued further in SLE research is public advocacy related to bilingual education (Cummins, 2001; Varghese, 2004) or linguistic rights (Skutnabb-Kangas, 2000). There is a need for more participatory studies, where every stakeholder (researcher, native speaker informant or case study subject) has a voice, representing their identity and their values. As Corson (2001) asserted, the school should be the locus of language in education policy. Granting of agency to the less powerful is a central aim of the emancipatory approach. Such an approach can be applied to both pressing local and more global SLE issues which concern us today.

## INVESTIGATING LANGUAGE EDUCATION POLICY

### INTRODUCTION: DEFINITIONS

Before we can discuss how to carry out or read<sup>1</sup> research in language education policy, we need to define the field. Language education policy is a significant part of language policy. In the model developed by Kloss (1966) and enriched by Cooper (1989), language policy deals with the status of languages and varieties (are they official or not?), their form (are they appropriately cultivated to perform the functions associated with their status?), and who (apart from people who grew up speaking them) else should learn them. Cooper called this last point ‘language acquisition policy’ and I call it language education policy. In practice, these three areas are closely intertwined. For instance, in a nation where a language is official (in status), it will generally be used as the medium of instruction in state schools and therefore will need a writing system and terminology for modern concepts and technologies and have to be taught to a lot of children.

Language policy has three main components: the practices of the members of the speech community (who actually uses what variety and for what purpose?), their beliefs (what do they think they should do?), and management, which is when someone with or claiming authority tries to modify the practices of someone else (Spolsky, 2004). From this, it follows that language *education* is language *management*. Management is modifying the language practice of someone by adding a language or changing the variety they use. However, it is still relevant to identify the actual practices. For example, teachers in Arabic-speaking countries say they want their pupils to learn Classical or Modern Standard Arabic, but most commonly they conduct their classes in the local vernacular (Amara and Mar’i, 2002); and certainly many teachers claiming to teach in English are actually speaking the local language while using English textbooks.

---

<sup>1</sup> Among books on research methods in applied linguistics, Seliger and Shohamy (1989) set out to teach students how to do research; Perry (2005) assumes a more manageable task is to train them how to read research.

MAJOR CONTRIBUTIONS AND WORKS  
IN PROGRESS: FOUR KEY QUESTIONS

*Research Question: What is the Policy?*

In research, the appropriate method depends on the question. In studying language education policy, there are two regular research questions. The first is: what is the policy of a particular social group or institution or region or nation? Elana Shohamy and I investigated this in Israel (Spolsky and Shohamy, 1999). I have also tried to do this for the USA (Spolsky, 2006). The second is: what is the effect of any particular policy? There have been a whole slew of studies of the effects of various kinds of bilingual and immersion education policies (see, e.g., Baker, 2001). A third question can be derived from these two: what is the most desirable policy for any particular group? The first important such case that I was involved in was the Navajo Reading Study, in which we were encouraged to investigate the effect of teaching young Navajo children to read in their own language first (Spolsky, 1974, 1975). I will derive a number of my examples from this experience.

None of these three questions is easy to answer, although as is common in difficult public policy issues, there are many people who hold strong opinions about the correct answer. For example, UNESCO experts believed (UNESCO, 1953) and still regularly proclaim that children would find it easier to learn to read a language or variety of language that they could speak. Most school systems however assume that their first responsibility is to teach children how to read the official national language. Walter (2003, p. 621) estimates that ‘Ninety-one countries have populations in which 40 percent or more of the national population consists of ethnic and linguistic minorities most of whom receive their schooling (if any) in a language other than their first language.’

If we wish to investigate the language education policy of a defined social unit (usually a nation, but one can ask the same question fruitfully of a region or a city or a church or even of a family), the easiest place to start is to look for explicit official documents. But there is a first important point to make. One of the traps we fall into with the word *policy* is that there is no obvious verb form. I prefer management because there is clearly an underlying sentence, ‘someone manages something.’ This should immediately set us to ask, who is the manager? Is it the constituent assembly, and if so, how was it elected? Language policy is one of the questions facing the constituent assemblies in Afghanistan and Iraq at the moment. Is it the Prime Minister or the government? In Malaysia two years ago, the prime minister surprised many people by proclaiming a change in medium of instruction at all

levels, from Bahasa Melayu to English. The Philippines parliament is currently debating a similar change from bilingual Pilipino and English to English only. In Japan, in 2006, a new minister of education is calling for teaching Japanese well before starting to teach English. For language education policy, is it the Ministry of Education, the Minister, the curriculum director, the school principal, or the teacher? Without clarity on these matters, it will be hard to know the standing of any policy document. Some scholars, following Phillipson (1992) seem to believe that all language policy is made by some hidden powerful elite, but more generally it turns out to be the result of complex dynamic interactions among a wide number of stakeholders. Identifying the nature of these interactions is a critical goal for research.

For a modern nation-state, overall language policy is commonly set out in a constitutional clause, in countries with a constitution (for a collection of national constitutions, see Jones (2001)) or in a law dealing specifically with language. In some cases, constitutions or laws will specify which languages are to be media of instruction or which languages are to be taught or otherwise encouraged. But it needs a lawyer to do the initial research on what the law is: see for instance the detailed study of US law (Del Valle, 2003), of Israeli law (Deutch, 2005, Saban and Amara, 2002), of Welsh laws (Huws, 2006), and of the early stages of the Maori Language Act (Benton, 1979). Once a written policy has been found and interpreted (e.g., deciding the meaning of such disputed terms as 'official' and 'national' and 'minority'), one next needs to look for evidence, for instance, in published regulations, or in institutional arrangements, or in budgetary allocations, that the stated policy is in fact being implemented.

In the case of language education policy, it often turns out to be quite difficult to find clear evidence. Even when there is a written policy, such as the Dutch National Programme (van Els, 1992), the definition of terms and the meaning attached to language names can be problematic. For example, most Arabic-speaking states have a constitutional clause stating that their religion is Islam and their language is Arabic. While this generally can be assumed to include the goal of teaching both Qur'anic Arabic and Modern Standard Arabic, it gives no indication of the language variety used in the classroom. Many countries with complex multilingual ecologies do not make clear which variety of language is normally chosen as medium of instruction at various educational levels and how that relates to the home language of the students. As an example, home language is often referred to as the 'mother tongue,' but that term is also rarely defined; what about children brought up in bilingual homes? Generally, though, a good place to look for evidence of the languages used or taught in school

is in a curriculum: if there is no other specification, it can be assumed that the unmarked medium of instruction is a variety of the national or official language, and that any other language taught would be listed officially.

Language education policy will sometimes be found in the reports of conferences or committees, or occasionally ex-cathedra pronouncements by prime ministers. Phillipson (1992) describes the various conferences at which proposals for language education policy in Africa were debated. The decision that Jewish and Arab schools should teach in Hebrew and Arabic, respectively was made by a committee set up just before the State was established. The Thelot committee in France shocked many by proposing that the status of English in schools should be raised (Thelot, 2004).

Ideally, an investigator will try to find the highest level explicit statement of language of instruction for the various levels of educational system and details of the use and teaching of other languages. He or she will also look for evidence of implementation in teacher selection and training, years and hours of instruction, provision of textbooks and other resources, inclusion of language proficiency in examinations, and any other evidence of evaluation.

All of this produces what we might loosely call the management plan, and the research approach followed is similar to the study of other aspects of educational policy.

### *Research Question: Why This Policy?*

There are two directions a researcher might next want to follow: to investigate the reasons for a policy or to see how it is implemented. Language education policy, like language policy in general, derives essentially from an understanding (often weak and imprecise and rarely accurate) of the current language practices and proficiencies of a society and from a set of beliefs (or ideology) of what should be an ideal situation (Spolsky, 2004). Language managers sometimes make their motivations explicit. They will commonly describe pragmatic goals, such as improving the economic prospects of the country, integrating new immigrants, or building a more skillful or educated citizenry, or they will set symbolic goals such as unifying the nation, preserving heritage values, providing access to the true faith, and building democracy. The investigator's goal may be to discover which of these motivations are relevant, or in their absence, to analyze the policy and determine who benefits from it.

In order to do this, the scholar studying language education policy will often find it necessary to move outside the educational realm to discover (in published material or through direct investigation) the

current sociolinguistic ecology of the relevant speech community: what languages or varieties of language are used by what members or sections of the community and for what functions.

In the Navajo Reading Study, our first task was a sociolinguistic study to see whether the Navajo language was still widely spoken. We found that 90% of the children coming to Bureau of Indian Affairs schools in 1969 encountered English for the first time upon arrival (Spolsky, 1970). Some of this material may be available in national censuses, but census results need careful use (de Vries, 1990; Thompson, 1974). Other information may have been published in sociolinguistic surveys, such as the Ford Foundation language surveys of East Africa (Bender, Bowen, Cooper, and Ferguson, 1976; Ladefoged, Glick, and Criper, 1972).<sup>2</sup> Not uncommonly, the investigator will need to conduct an original sociolinguistic survey, such for example, as our study of the situation of Navajo in 1969 (Spolsky, 1970), or the survey of the health of the Maori language (Statistics New Zealand, 2001).

Such a survey might also usefully include a study of the beliefs and attitudes of the community and its various sectors. Do they believe monolingualism is natural? Do they think a multilingual society is possible or desirable? What values do they attach to plurilingual proficiency? How do they value the languages potentially included in the policy? Questions like these need to be asked separately of the managers, of the teachers, and of the students in the education system and of parents and other community members. At this point, one can usefully look for conflicts in values and attitudes: does the school have the same goals as the national government on the one hand and as its pupils on the other? Are there significant sections of the community with different opinions?

### *Research Question: How is the Policy Implemented?*

Once the management plan is known and the beliefs or ideologies that underlie it, the next obvious task is to find out what happens in practice. One useful starting point is the linguistic proficiency of the teachers in the system. If the policy calls for a specific language of instruction to be used are there in fact enough teachers to do this? After a while, the Navajo Reading Study moved its emphasis to teacher training (see Varghese, *Language Teacher Research Methods*, Volume 10). When I revisit New Zealand from time to time, Maori educators often express regret that my recommendation to the Department of Education

---

<sup>2</sup> SIL International has started to conduct and publish electronically detailed sociolinguistic studies; see <http://www.sil.org/silesr/>. These give clear and useful methodological information.

to put emphasis on teacher training (Spolsky, 1987) was never taken seriously enough. Another is the availability of resources: if a certain language is chosen, is written material available for school use in the language? One of our first products in the Navajo Reading Study was a list of materials in the language (Holm, Murphy, and Spolsky, 1970). Are there developed curricula that coincide with the language aims of the policy?

The approach so far has been descriptive rather than evaluative, although it is clear that a careful description will reveal major discrepancies between various parts of the policy and between the policy and its implementation. Examples are unfortunately very easy to come by: when I first visited Navajo schools in the late 1970s, I found that all the teaching was being done by monolingual English-speaking teachers using normal curricula for English-speaking US students while most of the pupils were Navajo speakers with very limited English ability. When I visited Thailand a little later, English was included in the elementary school curriculum although most teachers at that level had only a rudimentary knowledge of it. It is still the case in many schools throughout the world that the system does not take into account the fact that pupils come to school speaking a variety or language that is not the goal of the system. A complete description then will already reveal the problems in a language education policy. Other gaps and inconsistencies will emerge from comparing the goals of instruction of various sectors of the community (e.g., the Bahasa Melayu policy in Malaysian education and government and the English policy in the business world) or from comparing the language skills output by the system with the skills that appear to be needed in the workplace.

*Research Question: Can the Policy be Improved?*

This brings us to studies that wish to move beyond description to prediction; for instance, what change in policy will lead to a change in output? Or to evaluation? In other words, is this the best policy in the given situation, or to knowledge-based prescription, what changes in the policy are desirable? Here again, we seem to have plenty of opinions and comparatively little hard evidence.

There is a school of educational research that likes the agricultural model: in agriculture, one can compare the yield of a crop given regular water and fertilizer with one left alone. In education, including language education, the number of potential factors and the ethical implications of controlled experiments mean that this model is not usable. There are others that prefer the clinical model of matched populations and the double blind use of placebos ('Please forgive us if we give you a sugar pill rather than using one we believe will cure you.') This

too has practical and ethical problems. Rather, a long and expensive process of making minor approved changes and observing the effects of a whole range of results which are difficult to measure seems to be called for. In the Navajo case, it took 10 years to produce a longitudinal study of the effects of starting instruction in Navajo in the first grade (Rosier and Holm, 1980), but the authors drew attention to all the other changes that had taken place in the same time. In the 1970s, a committee recommended to the US Office of Education to start collecting baseline data to observe the effects of proposed bilingual programs. This was never implemented. However, political and other pressures on an educational system appear to militate against the possibility of this strategy too. This point is illustrated by the reluctance of the US Department of Education to permit publication of a study it funded to review the research literature on the development of literacy among language minority children and youth because its results did not support current policy.<sup>3</sup>

Lacking usually the resources to conduct the necessary long-term research with careful collection of a wide range of potentially relevant data, one research strategy is to undertake historical or comparative studies. When arguments are presented for the need to teach speaking a language before reading it, how do we account for the seemingly successful maintenance over centuries of knowledge of classical and sacred languages like Latin and Hebrew that were not spoken?

Some earlier studies that attempted to evaluate language education policy are worth noting. Scherer and Wertheimer (1964) made a valiant but failed effort to study the value of the audio-lingual method (ALM). First year German classes at the University of Wisconsin were divided into two groups, one set to receive 'traditional' teaching and the second to be given ALM teaching. The results of the first year suggested that the traditional group did a little better in reading and grammar and the ALM group did a little better in speaking. The experiment did not continue into its planned second year, as students declined to be assigned to the no-treatment condition.

Much more successful in its effect on language education policy was the study by Lambert and Tucker (1972) of the St. Lambert experiment in bilingual education. Reacting to their sense of the growing language consciousness of the Francophone majority in Quebec, a group of middle-class Anglophone parents in one part of Montreal persuaded the Protestant School Board, against its better judgment, to permit them to try early French immersion instruction for their English-speaking

---

<sup>3</sup> See <http://www.nabe.org/press/press9.html>. An article by Michael Grunwald in the October 1 2006 in the *Washington Post* describes a report by the Inspector-General of the Department of Education on similar problems with Reading First.

children. Lambert and Tucker agreed to provide the evaluation, which produced two important conclusions—children in the program learned more French than in traditional French classes, and once they had moved to a balanced English and French instructional program, they reached the expected standards in the subjects taught and tested in English. It was only some time later that further studies (Swain and Lapkin, 1982) showed that their French remained less than native. The success of the program and of similar Canadian bilingual programs for English-speakers provided support for continued expansion of a politically supported effort to produce Canadian Anglophones with proficiency in French.

Two similar studies with minority groups had less effect, though their results were similar. An important study by Modiano (1973) in the Chiapas Highlands produced evidence that Indian children taught to read first in their own language were later more successful than others in learning to read Spanish. A study inspired by the Chiapas study which was conducted among Navajo Indians (Spolsky, 1974) was ultimately tested in a longitudinal study in one school; Rosier and Holm (1980) showed that Navajo children taught reading first in their own language ultimately reached much better than normal results in regular English tests. Other examples include a recent report by Little and McCarty (2006), which finds encouragement in recent studies of bilingual and immersion programs in some Native American communities; also, studies like King and Benson (2003) and Hornberger and King (2001) describe the effects of language revitalization projects in South America. For a variety of reasons (Spolsky, 2002), these and many other studies that show the effectiveness of well-designed and monitored bilingual programs (Walter, 2003) form a part of the ‘*connaissance inutile*’ (Revel, 1988) that fails to inform language education policy in the USA and elsewhere.

#### CURRENT AND FUTURE QUESTIONS: WHO SHOULD DO RESEARCH ON LANGUAGE EDUCATION POLICY?

I turn to a related—and increasingly pervasive—question, that of who should investigate language education policy. Apart from the obvious academic qualifications (adequate skills according to the research method in the languages involved, statistics, testing, history, discourse analysis, ethnographic observation, questionnaire writing, and interpreting, interviewing, for instance), one important question is the researcher’s own identity as an outsider or as a member of the group being studied. By definition, an academic researcher is an outsider, trained to look as dispassionately as possible at the people and phenomena he or she is studying.

But, scholars like Joshua Fishman have taught us how rigorous scientific methods can be combined with deep empathy for the group being studied. At the same time, in language education studies as in other sociolinguistic work, it is valuable to involve in the research members of the community being studied. In my work with Navajo, I depended largely on Navajo associates and colleagues and learned from them constantly. In our study of the Old City (Spolsky and Cooper, 1991), while we used research assistants with knowledge of local languages, the absence of a senior Arabic-speaking colleague probably biased our presentation; this was corrected in subsequent studies of an Israeli Palestinian village (Amara and Spolsky, 1996; Spolsky and Amara, 1997) and of a West Bank Arab town (Spolsky, Amara, Tushyeh, and Bot, 2000). More and more, the local informant is being transformed into the research associate or director.

#### PROBLEMS AND DIFFICULTIES: SUPPORT FOR RESEARCH AND ITS POSSIBLE COST

Moving closer to the nitty-gritty, we turn to the selection of a topic and the often related question of finding support for research in language education policy. Here, there is an obvious distinction between independent and dependent researchers. By independent researcher, I mean someone who can and will carry out the research without any additional resources or funding. One such case may be a classroom teacher who decides to conduct a study in his or her classroom, requiring only the appropriate permissions from institutional authorities including committees on the rights of human subjects. I remember my son's fourth grade teacher who made a detailed study of what happened in his highly innovative classroom; the principal told me that the teacher spent several hours every day after school analyzing the extensive notes he took on each pupil's behavior during the day, and weekends writing up his results into a thesis that ultimately earned him a doctorate (and lost him a wife). Because the research was part of a degree program, it was of course partly shaped by his dissertation advisers, but all the resources of time were his own. Similarly, the choice of topic was influenced by his professors, but his research design and methods were simply an intelligent exploitation of readily available data. When research depends on published or archival material, and increasingly nowadays when such material is readily available on the web, the main concern of the researcher is to find time.

Moving a little from independence, the time is sometimes provided by a sabbatical or other leaves or by a grant or fellowship. In these cases, the research project is likely to need review and approval by some committee or foundation. When the research involves not just

one person collecting their own data (or two or more collaborating on this), the need to obtain funding to pay for assistance, equipment, statistical advice, payments to subjects, travel, and other costs usually involves the prospective researcher in applying to a government or private agency for the funds, a process which inevitably means that the project must conform to some degree in the agency's program of research. When I was starting out, I recall an aphorism that I continue to quote: theoretical research is what you want to do and applied research is what they will give you money to do. The happy researcher is of course the one who gets money to do what he or she wants to do. When we started the Navajo Reading study on the initiative of a senior educator in the Bureau of Indian Affairs who wanted us to repeat the Chiapas (Modiano, 1973) study with Navajos, we were exceptionally fortunate that he set no timetable and allowed us to proceed with the task in what seemed to us the most logical way. In practice, the initial grant only allowed for a number of preliminary projects, including the language survey which depended on access to the schools which we obtained through our semiofficial status. From then on, each stage of the study depended on obtaining new funding, usually from the US Office of Education under the Bilingual Education program. One unfortunate result of the limitation to 1-year grants was a damaging annual tempo: shortly after receiving a new grant (and commonly it did not arrive at the beginning of the school year), we had to start work immediately on a final report and new grant application. This left our research staff without financial support at the beginning of the school year. One year, my research assistant came back late in the summer with a check he had received from the family foundation of a stranger he talked to in a restaurant about the project; we were thus able to keep paying the Navajo students who played a significant role in our work. Fortunately, we were subsequently able to persuade the Ford Foundation of the value of the project, and their grant came without the time constraints of the US government.

In obtaining outside support, we regularly had to tailor our goals and methods to the programs that were supporting us. The potential ethical quandary is one that all researchers face when they seek outside support. In essence, the researcher must constantly balance his or her own research goals with those of the supporting institutions. For this reason, it is most useful to have a research program that can be adapted to changing circumstances and resources. I recall with admiration a doctoral student who developed a plan to study language and identity using as subjects a group of Latin American teachers who were due to spend a year at the university. When the project was cancelled, he got a job at a Bilingual Education Centre in a distant part of the country.

With appropriate modifications, he was able to carry out the study successfully with newly arrived Latin American pupils at high school.

#### FUTURE DIRECTIONS

Research in language education policy covers a wide range of significant topics and so requires, as I have tried to suggest, an equally wide range of methods, all of which are described in detail in this volume. With the growing recognition of the importance of the area, there is an expanding choice of academic journals in which to publish results and of publishers who will consider monographs on the topic. This provides the best test of the value of the research, as its publication permits other scholars to question it or to build on it.

With this increasing interest in the field, no doubt a great deal of research will continue to earn degrees or promotion rather than to add to knowledge, but there are signs that many scholars are now backing their beliefs with reasonably solid data rather than rhetoric. A study like King (2000) that bases hypotheses about language revitalization on a long-term ethnographic study, or like Walter (2003), which discusses the choice of medium of education on the basis of rigorous analysis of statistical data rather than by appeals to rights are examples of the best methods.

RESEARCHING HISTORICAL PERSPECTIVES ON  
LANGUAGE, EDUCATION AND IDEOLOGY

INTRODUCTION

This article considers research on language ideologies and the relevance of this work for educational contexts. To be sure, the amount of theorizing and empirical investigation on the topic of language ideologies published just over the past several decades is substantial; therefore, I will focus only on particular aspects of this topic which relate to education and the social processes, relations, and especially social hierarchies which are reflected in and produced through ideologies of language. In doing so, I will have to leave out much of the theoretical work from the literatures of anthropology, critical theory, philosophy, political science, sociolinguistics, cultural studies, among other areas that could be cited.

As Woolard and Schieffelin (1994, pp. 55–56) point out, ideologies of language ‘are not only about language. Rather, such ideologies envision and enact links of language to group and personal identity, to aesthetics, to morality, and to epistemology.’ Language (and languages) are not simply ‘conveyor belts’ for transmitting information between human interactants; rather, they are complex systems which perform a number of social functions, including signaling who we are (i.e., information about where we were born or raised, how much education we have had, our social skills, the group(s) we wish to be identified with, and so on). One of the primary socializing environments in most societies is formal schooling. Schools are places where young children are taught the ‘correct,’ usually dominant ‘standard,’ language, where they may come into contact with students from different cultural and/or linguistic backgrounds, and in multicultural and multilingual settings, they are likely to begin to develop identities which include an awareness of the relative social status of the language(s) they use (or do not use). If the child’s home language variety is the same as that spoken and written at school, the transition from home to school with regard to linguistic identity is not usually a problem; however, when the home variety is substantially different from the school variety, and the home variety is stigmatized as ‘non standard’ or deficient, the mismatch can lead to problems. The assumption that the ‘standard’ variety of the dominant (often national or regional) language is ‘better’ than, more ‘logical’ than,

and more ‘pure’ than the ‘non standard’ variety is an example of one of the most ubiquitous and powerful language ideologies around the world.

#### EARLY DEVELOPMENTS

Questions surrounding language are almost never exclusively about language, *per se*. They are very often concerned with identities, both ascribed and achieved, in particular sociohistorical contexts. Scholars have identified the rise of the modern nation state beginning in the eighteenth century in Europe as the primary factor in the association of a particular language with a particular ethnic group living within a geographically contiguous, politically defined area. Johann Gottlieb Fichte, the German metaphysician who championed the cultural and linguistic uniqueness of the German *Volk*, famously said: ‘Wherever a separate language is found, there is also a separate nation which has the right to manage its affairs . . . and to rule itself’ (cited in Inglehart and Woodward, 1992, p. 410). The roots of the language/nation nexus, of course, extend far back into antiquity; in the third century BC, Ashoka, India’s Buddhist Emperor, pursued political unification through linguistic toleration whereas Qin Shihuangdi, the first emperor of a united China, suppressed regional scripts and selected a single standardized writing variety and mandated its use (cited in Lo Bianco, 2004, p. 745). Dante Alighieri (1265–1321) chose to write his greatest work, *La Divina Commedia*, in his native Tuscan variety of Italian rather than in the customary Latin, and in so doing brought to the fore the *questione della lingua* (‘Language Question’), a debate that runs through the entire course of modern Italian history. The ‘Language Question’ continues to intrude in all aspects of social life in the contemporary world. Questions and conflicts about which language or language variety is valued (or not valued), taught (or not taught) in school, used (or not used) for different functions in different domains often are implicated in deadly conflicts between groups with historical reasons for not wanting to share territory, power and/or resources.

Some of the most important early research by sociolinguists with implications for language ideology in education was done by William Labov. In his now classic essay ‘The Logic of Nonstandard English’ (1972), Labov debunked the Verbal Deprivation theory promoted by psychologists (e.g., Bereiter and Engelmann, 1966) which claimed, among other things, that African American children in the USA come to school without sufficient verbal ability to succeed. Bereiter et al. (1966, pp. 112–113), based on a study of 4-year-old black children from Urbana, Illinois, claim that their communication was by gestures, ‘single words,’ and ‘a series of badly connected words or phrases.’ He describes their speech as ‘the language of culturally deprived

children . . . [that] is not merely an underdeveloped version of standard English, but is a basically nonlogical mode of expressive behavior.' Labov argued that the idea of verbal deprivation has no basis in social reality, that black children in the urban ghettos receive a lot of verbal stimulation, and participate in a highly verbal culture. He claimed that the psychologists' lack of understanding of linguistics along with poor experimental design and methodology resulted in a fundamental misreading and misinterpretation of the verbal abilities of black children.

Another early landmark study was conducted by Ray Rist (1970). In a two-and-one-half-year longitudinal study of a single group of African American kindergarten children, Rist found that the teacher developed expectations of the academic potential and abilities of each student based on her subjective evaluation of that student's oral language. Importantly, students judged by the teacher to be 'fast learners' (placed at the first of three tables) were quite verbal and displayed a greater use of Standard American English within the classroom compared to children at the other tables, who usually responded to the teacher in black dialect (p. 420). The children more adept at 'school language' were viewed by the teacher as more capable and more likely to succeed in school and life, despite the fact that IQ test scores indicated no statistically significant differences among the children at the three tables. Students labeled as 'slow learners' were unable to move up in their reading groups even if their performance in reading warranted such a change in classification. All the children in the class and the teacher were African American. Despite this shared cultural background, differences in socioeconomic class appeared to correlate with students' placement in reading groups. Rist concludes that 'the child's journey through the early grades of school at one reading level and in one social grouping appeared to be pre-ordained from the eighth day of kindergarten' (p. 435).

To summarize, research in the 1960s by some psychologists (e.g., Bereiter and Engelmann, 1966; Jensen, 1969) and sociologists (e.g., Basil Bernstein, 1966) placed the blame for school failure on minority children who were characterized as having a variety of cognitive deficits, especially with regard to their language abilities. Other researchers from linguistics and anthropology located the problem not in the children but in the relations between them and the school system. This position found that, for example, inner city children differ from the standard culture of the classroom, and that these differences (in language, family style, and ways of living) are not always understood by teachers and psychologists. This research lead scholars in the social sciences and education to examine the nature of ideologies about language, and how these ideologies impacted the school experiences of

different groups defined in terms of socioeconomic status, ethnicity, race, and/or language or language variety spoken. In the decades following the groundbreaking research described earlier, researchers used a variety of research methods (especially ethnographic and discourse analytic techniques) to better understand the impact of ideologies on educational practices and policies, from the classroom to the national policy-making level.

#### MAJOR CONTRIBUTIONS

As suggested by the studies described earlier, a major contribution in applied linguistics and educational research over the last 40 years or so has been the critical examination of the causes of social inequality and how language (often implicitly) plays a role in maintaining such inequalities. Scholars in the field of language policy (e.g., Pennycook, 1994; Phillipson, 1992; Tollefson, 1991) have relied on theories developed by thinkers such as Bourdieu (1991), Foucault (1972), Gramsci (1988), and Habermas (1975) among many others, to develop models to explain how language is imbricated in all aspects of social life, and how it plays a central role in the establishment and maintenance of social control by powerful elites. However, despite the critical turn in research in language policy, educational policies and practices in most parts of the world continue to be informed by ideologies about language, which can be detrimental to the achievement of greater educational access for many language minority groups.

Critical scholars, in analyzing the causes for the persistence of educational programs and practices which (in their view) are relatively ineffective in closing the educational and economic gaps between dominant (majority language) groups and marginalized (minority language) groups in many settings around the world, have identified ideologies which often inform such programs and practices. Methods of analysis used include discourse analysis of both spoken and written language in the communication and reproduction of racism (e.g., van Dijk, 1984), in gender bias (e.g., Corson, 1993), and in the marginalization of language minorities in various contexts (e.g., Tollefson, 1989, 1991). An example of a study which employs a historical analysis in the US context is Wiley and Lukes (1996), who describe three ideologies which, together, inform social and educational policies which tend to marginalize speakers of minority languages in US classrooms. The first is the 'ideology of individualism.' This ideology is evident in research in second language acquisition, which assumes that the variables which are involved in second language acquisition (or the acquisition of a standard variety of a language) are located entirely within the individual. An important effect of this view is that

motivation—and lack thereof—is viewed by practitioners and policy-makers as something an individual has or does not have. A person's class, racial, or linguistic characteristics (achieved or ascribed) are seen as largely irrelevant to his or her motivation or prospects for social mobility. Scholars in second language acquisition (e.g., Norton, 2000) have conducted ethnographic research among immigrant populations and found that learners' identities influence motivation and, ultimately, acquisition of a second language. Rather than viewed as a constant or fixed trait, researchers have shown that identity (and motivation) is a 'contingent process involving dialectic relations between learners and the various worlds and experiences they inhabit and which act on them' (Ricento, 2005, p. 895).

The second ideology described by Wiley and Lukes is the 'ideology of English monolingualism' (in the US context, but it applies to other languages in other polities as well). This ideology reflects the view that language diversity is essentially something imported as a result of immigration. The 'normal' situation in the USA, according to this ideology, is English monolingualism. Thus, a language such as Spanish, which existed within what is now the continental USA prior to and after the declaration of independence from England is characterized as a 'foreign' language rather than an 'American' language, which it demonstrably is. This ideology informs the 25-year-old movement to ban bilingual education programs (with many 'successes' along the way), and federal and state initiatives to declare English as the (only) official language of a state or the USA. Research by Veltman (1983) using US census data from 1940, 1960, and 1970 found a dramatic shift from minority languages to English as evidence that assimilation to virtual English monolingualism was beginning in the second generation and nearly complete by the third generation among immigrant populations in the USA. A number of critical scholars (e.g., Ricento, 2003; Wiley, 1998), using historical and discourse analytic research methods, have shown that the ideology of English monolingualism in the USA was largely achieved during the Americanization movement in the period prior to and immediately following US entry in World War I.

The third ideology is the 'standard language ideology,' which elevates a particular variety of a named language spoken by the dominant social group to a (H)igh status while diminishing other varieties to a (L)ow status (Ferguson, 1972). This variety is claimed (by its speakers) to be more 'logical,' 'efficient,' and 'correct' than most other varieties. The 'standard' variety tends to gain legitimacy through the publication of dictionaries, style sheets, and grammar books which provide usage guides, 'correct' spelling and pronunciation (however, reflecting the fact that no language can be completely standardized, variations for

both spelling and pronunciation are included, thousands of new words are not represented, the meaning of well-attested words often shift, and changes in spelling, grammar, and pronunciation render dictionaries less authoritative than language purists would care to admit). Those who speak other varieties, often referred to as 'bad [English/Spanish/French, etc.],' or 'vulgar,' 'uncivilized,' 'illogical,' and so on are often ascribed other defects in intelligence, behavior, and morality. Speakers of these 'non standard' varieties may suffer discrimination and obstacles in education and employment opportunities simply because they do not command the prestige (standard) variety. The 'cure' for speakers of 'non standard' varieties, according to mainstream educators, is to replace the 'bad' language variety with the 'good' ('standard') variety. While some individuals clearly do have opportunities and the desire to modify their language, those who do not are then blamed for their own failure to 'assimilate' or become acculturated to the mainstream language variety. As Lippi-Green (1997) points out, communication is (at least) a two-way process, requiring good will on the part of both parties in a two-way communication. If a teacher (as seen in the research by Rist earlier), for example, prejudges a person's intelligence and character based on the way they speak, the blame for 'miscommunication' typically resides with the speaker society deems to be deficient. Thus, language minorities are often blamed for their educational failures because of the 'shortcoming' of speaking a variety different from those of higher social and economic class. The claims made by Lippi-Green and many other scholars in recent years are based on findings from sociolinguistic research, including attitudinal measures such as Likert, Matched Guise, and the Semantic Differential techniques, and ethnographic studies in multilingual communities (see Baker, 2006, for discussion of methods used in assessing attitudes toward languages and those who speak them).

Another important contribution to research in language and ideology has come from scholars working in poststructuralist/postmodern paradigms (see Pennycook, 2006 for a discussion of these two terms). While scholars from critical paradigms have tended to invoke categories such as race, class, and ethnicity as crucial in understanding the nature and effects of language policies and practices in educational contexts, scholars working in postmodern paradigms have expressed great skepticism about such categories. Rather, as Pennycook (2006, p. 63) notes, such 'taken-for-granted categories . . . are seen as contingent, shifting, and produced in the particular, rather than having some prior ontological status.' This approach does not discount the fact that racialized and gendered categories are ascribed by others and even taken up by group members themselves, and that such ascribed characteristics are implicitly or explicitly invoked in policies involving

language status, use, or acquisition in educational and other contexts. Rather, postmodern research is concerned (among other things) primarily with the specific ways in which power is exercised and reflected in the discourses of powerful interests. Scholars working within a postmodern framework tend to be skeptical of research which posits particular pedagogical approaches (such as bilingual/mother tongue education) as inherently superior to other approaches, since such approaches can as easily be employed by some groups to maintain social control as can a policy of monolingual instruction (see, e.g., Pennycook, 2000). Postmodern scholars in applied linguistics tend to question the validity and utility of sweeping Grand Narratives (such as those associated with Linguistic Imperialism (Phillipson, 1992)) because such narratives often tend to perpetuate the same ideologies and modernist discourse (e.g., nation state, standard language, mother tongues, discrete ethnic/racial/gender categories, and so on) which have enabled the dominance and domination of European 'imperial' countries in the first place. For researchers, the most important implication of this shift in theory is that structural analyses which, for example, tended to localize the causes of social inequality within institutions, social structures, or ideologies are viewed as being too deterministic in explaining educational failure among language minority populations. Instead, researchers working within postmodern approaches have adopted methodologies, such as Critical Discourse Analysis (van Dijk, 1993), which investigate the ways in which social structures are mediated through discourse and how individuals (re)create and respond to these discourses in their lived (performed) experiences as members of diverse communities with complex identities.

#### WORK IN PROGRESS

The critical turn in linguistics and applied linguistics has placed in doubt many of the foundational concepts that have guided research in the language sciences since at least the advent of modern linguistics in the mid-nineteenth century. Perhaps the most fundamental critique has been the questioning of the nature of language itself as a fixed, discrete code, with the corollary (within the Chomskyan framework) of the native speaker who possesses, in his or her brain, the 'rules' necessary to produce and interpret an infinite number of sentences. Critics of the 'autonomy of syntax' paradigm, such as Talbot Taylor (1997), have argued that rather than describing language as it is used, the Chomskyan model is actually a prescriptive model which reflects the more-or-less standard version of the written language. Thus, 'correct' grammar as determined by the intuitions of linguists, reflects the rules of usage and 'grammaticality' of the written standard language of the educated

classes, i.e., the language of the linguists and the language of social power and mobility. In second language contexts, the 'native speaker fallacy' promulgated by Chomsky and his adherents has dominated research in second language acquisition, learning, and teaching for the last 50 years. The ideology of the construct 'native speaker,' the possessor (owner) of the 'correct' language, has elevated the standard varieties of written languages as the only legitimate language in schooling and public life, generally, whereas indigenized varieties of 'world' languages (such as English and French) have often been viewed as inferior or inadequate in comparison. This ideology has helped to perpetuate the dominance of particular varieties of 'standard' languages (such as British and North American English) while casting into doubt the abilities and qualifications of teachers in EFL settings where such varieties of the language are not spoken.

Critical scholars in applied linguistics and related areas have investigated the effects of the ideology of the 'native speaker' along with several other ideologies, on research and practice in various educational contexts. Researchers working in postmodern paradigms, while not disputing the benefits of such critical research, have none the less questioned basic assumptions that have informed such research. That is, received categories such as language, mother tongue, native speaker, and so on, these scholars argue, may help perpetuate some of the very problems and inequalities such research seeks to correct. For example, scholars within a postmodern paradigm have claimed that the very positing of language as a discrete, rule-governed system by linguists and other social scientists is in itself an important result of the modernist project, which has privileged and help promote the hegemony of Western languages, thought and tools of inquiry throughout the world. Terms such as 'standard' and 'non standard' already imply a normative hierarchical framework with regard to language(s) and language varieties. The term 'native speaker' implies there are 'nonnative' speakers, and both terms are rooted in eighteenth century European conceptions of the 'nation,' a group of culturally similar people who speak a common language (whether or not this is actually the case as it very often is not). In this sense, the 'nonnative' speaker is almost by definition a 'foreigner,' an 'outsider,' someone who can never really fully belong to the 'nation.'

Another term of art, 'ethnicity,' needs to be critically examined as well. Glynn Williams (1992) argues that in American sociology, ethnicity became a dichotomized construct of the normative/standard group—a unitary citizenry speaking a common language (us)—and nonnormative/nonstandard groups—including those speaking other languages—(them). This naturalizing of a sociological construct (ethnicity) informs the widely held popular view promoted by Western

scholarship that ‘reasonable’ (modern) people should naturally become part of the culture of the state (or the transnational world) and speak its language, whereas irrational (traditional) people will tend to cling to their ethnic language and culture.

Interesting work has been done to counteract the hegemony of Western ways of ‘knowing’ the world. The articles in Canagarajah (2002) demonstrate how researchers can use local knowledge in diverse settings to understand other cultures in ways that avoid the pitfalls of normative ‘etic’ research. Makoni and Pennycook 2006 argue that Western-based and Western-imposed ideas about language—what it is, how it is represented—help perpetuate imperialist/colonized mentalities in South Africa and in other countries in the developing world. Borrowing from the work of Michel Foucault (1991), Makoni and Pennycook use the term *governmentality* defined as an ‘array of *technologies of government*,’ which can be analyzed in terms of the different strategies, techniques, and procedures by which programs of government are enacted (in Pennycook, 2006, p. 64). Pennycook (2006, p. 65) explains that language governmentality is best understood in terms of ‘how decisions about languages and language forms across a diverse range of institutions (law, education, medicine, printing) and through a diverse range of instruments (books, regulations, exams, articles, corrections) regulate the language use, thought, and action of different people, groups, and organizations.’ A consequence of a governmentality approach is the questioning of grand narratives, which offer totalizing views of the role and effects of languages, such as English, in killing other languages and in homogenizing world culture, and the related claim that languages need protection through regimes of language rights. Such totalizing views, labeled ‘preservationist’ and ‘romanticist’ often assume an ineluctable connection between language and ethnicity (Pennycook, 2006). Pennycook (2006, pp. 68–69) argues that while linguistic imperialism and language-rights discourses ‘operate from different epistemological and political assumptions . . . both operate from within theories of economy, the state, humanity, and politics that have their origins in the grand modernist project.’

Blommaert (2006, p. 249) provides a case study on the limitations of the state to enforce a particular totalizing ideology on a multilingual nation. The attempt by the Tanzanian socialist government to effectuate socialist ideological hegemony through the spread of Swahili failed because of the existence and role of English and local indigenous languages in social life, as well as the persistence of ‘impure’ varieties of Swahili. Blommaert argues that language policy should be seen as a *niched* activity in which, for example, the role of certain actors (such as the state) is limited to specific domains, activities, and relationships, not general ones.

The work of these and many other scholars does not seek to downplay the negative effects of linguistic imperialism nor diminish the possible benefits of a language-rights approach in contexts in which cultures and the languages that express them are threatened; rather, it seeks to problematize assumed causal relations between actors, groups, and language policies which may be empirically unsubstantiated and complicit with the very ideologies and constructs they wish to defeat.

#### PROBLEMS AND DIFFICULTIES

While the facts and effects of Western imperialism are debated by scholars in applied linguistics and other social sciences, conflicts involving language in education continue unabated in many parts of the world. For example, in the USA the movement to 'protect' English through the passage of official English declarations and constitutional amendments continues to thrive despite the continued global reach of English. In recent years, three states (California, Arizona, and Massachusetts) have passed laws essentially outlawing bilingual education, replacing it with Structured English Immersion. The ideology of English monolingualism has created both long- and short-term problems in the provision of fluent speakers of strategically important languages, such as Arabic, Urdu, Pashto, and Farsi. Despite modest increases in federal spending to promote the learning of strategic languages, the number of students studying these languages, in absolute terms, remains quite low. For example, based on the data on foreign language enrollments in US postsecondary institutions for Fall 2002, compiled by the Modern Language Association, only 10,584 students were reported to be enrolled in Arabic language classes, representing .8% of the total foreign language enrollments. Research on attitudes toward the study of languages in addition to English in schools in the USA, generally, has tended to focus on the perceived economic and social benefits associated with learning and using particular foreign/second languages in various contexts. Critical scholars, using techniques of discourse analysis and historical analysis (e.g., Ricento, 2005b) have argued that immigrant languages in countries such as the USA have generally not survived into the third generation due to many factors, including social pressure for immigrants to assimilate fully to English and American cultural norms. In the European context, Francois Grin (2003) provides a model for evaluating competing language plans for protecting and promoting minority languages relying, in large part, on cost-effectiveness as a criterion for policy selection and design. This approach takes into account a range of variables relevant to language planning and decision-making and can be applied to diverse demographic and sociolinguistic contexts and settings.

Decisions about which language(s) should be used as the medium of instruction or offered as subjects in schools are often contentious and in a state of flux, reflecting changes in local, regional, national, and/or global political conditions. All these factors play a role in Malaysia, where Chinese-medium schools have come under pressure and where a public controversy erupted over a government decision to start teaching mathematics and science in English after twenty years in which they had been taught in Malay.

Another case involving controversies about medium of instruction is in the Republic of Slovakia in which the minority Hungarian population has resisted attempts by the Slovak majority to replace Hungarian mother-tongue education with a Slovak-Hungarian bilingual program (Langman, 2002). Each group is guided by particular ideologies about how the Slovak state should be constructed and the role of language in this process. This is an example in which the histories of various ethnolinguistic groups continue to influence their current aspirations and fears about their status, both within the Republic of Slovakia and also within an expanding European Union. Long memories and fears about absorption and assimilation (by the Hungarians) or about the emergence and realignment of a 'Greater Hungary' in the region (by the Slovaks) has complicated prospects for a solution acceptable to all parties.

There have also been some notable successes in instantiating multilingual language ideologies, however. Egger and Lardschneider McLean (2001) report on a solution to the 'standard' language problem with regard to Ladin in South Tyrol, Italy. Ladin is used primarily as a spoken language (although it is written) and attempts to standardize the many dialects of Ladin into an artificial, common variety have been resisted and perceived as a danger to the survival and vitality of the language. This suggests one way that the ideology of 'standard language,' which privileges one particular variety of a language, while downgrading other varieties deemed to be 'non standard,' can be thwarted. Another example of how a minority language can be revitalized, despite lack of official governmental recognition, exists in the Basque region of France. The Basque language is not officially recognized or supported by the French state (although it does have co-official status with Spanish within the Autonomous Basque Community of Spain (Euskadi)). In the 1960s, a small group of Basque parents in France organized a Basque language preschool. Out of this effort an organization (called 'Seaka,' meaning seed) began coordinating a few community-based Basque-language primary schools, using a model developed in Spain during the Franco era (Paulston and Heidemann, 2006, p. 304). By the end of the 1970s, enrollment had grown from 8 to over 400 students. By 1990, over a dozen schools were operating,

serving 830 students. As the commitment of the Basque community became more widespread, by the year 2000, nearly 2,000 students were enrolled in two dozen Basque-medium schools from preschool to the high-school level.

Another relatively successful attempt to revitalize a threatened minority language concerns the Saami language in Norway. Since the early 1990s, the status of Saami in public schooling has improved dramatically, and it is recognized as a legitimate medium across the curriculum (Todal, 2003). The new attitude toward Saami has come about through a combination of regional political mobilization and the work of international indigenous rights organizations, which helped facilitate 'a new attitude towards conflict solving on the part of the [Norwegian] authorities' (p. 191).

#### FUTURE DIRECTIONS

One of the most promising areas of research on language, education, and ideology is critical discourse analysis (CDA). The central goal of CDA is to provide 'an account of intricate relationships between text, talk, social cognition, power, society and culture' (van Dijk, 1993, p. 253). Research in CDA is especially concerned with uncovering the implicit arguments and meanings in texts which tend to marginalize nondominant groups, in part by selectively asserting certain attributes, e.g., physical characteristics, cultural beliefs, and behavioral characteristics, among others. Examples of research in CDA relevant to language policies in education are Santa Ana (2002) and Ricento (2005b). More recently, quantitative studies using large text corpora have been conducted allowing researchers to investigate the relative frequency and distribution of words and phrases in large numbers of texts. CDA research has depended, largely, on linguistic analyses of written and spoken texts, uncovering the often implicit meanings which may be different from the explicit claims made by politicians in speeches and legislation on topics such as immigration and affirmative action. CDA, however, has been criticized for this focus on textual analysis at the expense of a deeper and theoretically motivated analysis of society. Another criticism is that not enough attention has been paid to ideas and models developed in cognitive and evolutionary psychology, which could help explain why certain types of exclusionary behavior persist and why the language forms associated with such behavior are so powerful (Chilton, 2005). Despite these (and other) criticisms, CDA offers great promise as a research approach in the analysis of the nature and effects of ideologies on language and education at all levels of society.

## SURVEY METHODS IN RESEARCHING LANGUAGE AND EDUCATION

### INTRODUCTION

What are survey methods? A typical image of a survey is the use of a questionnaire with a large sample of people, and a resulting set of relatively basic statistical analyses. This is too simple. A survey can occur via different techniques: structured and in-depth interviews; structured, semi-structured or systematic observation; content analysis of documents as well as by questionnaires. In terms of sampling, a survey can occur with one classroom of students, on large and representative samples of teachers and students, and a country's population (e.g. a National Census).

Surveys are characterized by a structured and systematic collection of data in the form of variables. By nature, a survey is preordinate and reductionist in design, quantitative in analysis, but not always embedded in positivism. This chapter outlines, in practice, the main forms of surveys in language and education, highlighting methods of approach, but particularly surveys that have been influential in education policy-making, education provision and pedagogic practice.

### EARLY DEVELOPMENTS

Survey methods in language and education develop from particular historical traditions. Surveys are sometimes wrongly thought of as a product of the twentieth century and emanating from social science. To the contrary, ancient Egyptians, the Romans, the Chinese from the Ming dynasty onwards and the Norman conquerors of Britain conducted surveys. A bureaucratic society typically requires data gathering to administer efficiently, assess the characteristics of the population, and particularly to levy taxes. Hence, first, surveys in education typically derive from information gathering requirements of a bureaucracy.

National censuses are a particularly strong example of such bureaucratic needs. Although censuses have been carried out since Biblical times, regular decennial censuses began in the middle of the nineteenth century. The first language census in Belgium occurred in 1846. Other countries were soon to follow Belgium's lead: Switzerland in 1850, Ireland in 1851, Hungary in 1857, Italy in 1861, Canada in 1871, Austria and Finland in 1880, India and Scotland in 1881, the USA in

1890, Wales in 1891 and Russia in 1897 (Ó Gliasáin, 1996). Other countries have not included language questions in their census (e.g. France) often for political reasons (e.g. to avoid any emphasis on immigrant languages and to diminish debates on the rights of indigenous minorities).

Second, surveys in education derive from the investigation of social, health and economic inequities. The liberal and utilitarian ideology of the nineteenth century encouraged an investigation of social problems that a capitalist market and industrialism had exacerbated. Early surveys of poverty, health and the unemployed heralded in an era where surveys become part of conscience building and profile raising, particularly of forgotten minorities. Surveys of language minorities, including such minorities in education systems, are in this second tradition. This will be exemplified in later sections.

Third, an early development in the use of surveys in language and education derived from the widespread use of attitude scaling techniques. The unidimensional techniques produced by Thurstone and Chave and then by Likert were followed by Guttman's Scalogram analysis, the semantic differential technique and the Matched Guise technique (Garrett, Coupland and Williams, 2003). Once methodological tools for measuring attitudes were in vogue, their application to language surveys was quickly recognized. One influence on the style of language surveys relating to education has been the availability of a recognized social psychological methodology.

Early work in this fourth tradition concerned attitudes to language groups, attitudes to a language itself, attitudes to the features and uses of a language, attitudes to learning a language, attitudes to bilingual education and attitudes to language preference and policy (Baker, 1992; Garrett, Coupland and Williams, 2003). Such early work can be characterized as measuring attitudes to language with implicit rather than explicit theorization, unidimensional measurement, simple bivariate relationships, with more concern for internal reliability than validity (Baker, 1992). Small-scale, unrepresentative sampling and a lack of understanding of the complex relationship between attitudes and behaviour were also the weaknesses of this early work. Although there is plentiful advice on random, cluster and quota sampling (e.g. Fink, 2003; Fowler, 2001), there remains a tendency in local research to ignore sampling procedures and depend on convenience sampling with a consequent limited generalization of results.

#### MAJOR CONTRIBUTIONS

One major contribution in survey methods in researching language and education has been in the internationally widespread use of language

questions within national censuses. Language census analyses provide essential information in the politics, policy-making and provision of education. Knowledge of the location and size of language groups aids planning, particularly when there are local or regional analyses. Using census data, geographers map the proportion (density), numerical size and location of minority language speakers and communities (Williams, 2004).

Both language activists and education administrators may determine needs for educational provision based on such 'age by language' census tabulations. Language activists will use such language census results to demand more bilingual education (Scott and Ní Bhaóill, 2003). Administrators may decide, for example, on the supply of teachers for such language minority indigenous and immigrant populations (e.g. bilingual teachers and English language teachers).

Language information from a census is often conceptualized by central bureaucracy as a measure of outcome. A census provides a performance indicator of success as to whether policies with regard to language in schools have been effective or not. For example, in regions where there has been high immigration (e.g. USA), the stated degree of fluency in the majority language (e.g. English) is intended to provide a performance indicator of educational policies that may have aimed at assimilation, integration, or the maintenance of language minorities.

US census data is used by states and counties to benchmark and measure progress in meeting their objectives and legislatively mandated targets (e.g. in English language spread among immigrants). Given the role of education in fostering English among US immigrants, such census data become directly relevant to educational policy-making (for linguistic information from the United States 2000 Census, see: <http://www.census.gov/> and <http://www.usefoundation.org/foundation/research/lia/>).

In Wales, the decennial census is regarded as the key indicator of the relative success of government policy on bilingual education, even though the equation of language shift and revival is highly complex (<http://www.bwrdd-yr-iaith.org.uk/>).

The analysis of national census data impinging on education has become relatively sophisticated (e.g. in Canada, USA, Wales, Scotland, Ireland and Australia). For example, the mapping of language shift indicates change across censuses and not just a snapshot picture in one particular year. The use of statistical approaches, such as cluster analysis and multiple regression, can provide clarity in major trends to avoid a mass of descriptive statistical analyses. The linguistic detail and interpretation from censuses in Venezuela (Oficina Central de Estadística e Informática, 1993) and Bolivia (Riester et al., 1995) are particularly noteworthy.

However, with all language census data there are typically many limitations and weaknesses: e.g. ambiguous questions that do not differentiate between use and proficiency; no reference to language across different domains; oracy tending to be accented rather than literacy with infrequent specification of the four abilities of understanding, speaking, reading and writing; answers that reflect identity as well as language, positioning as well as practice (Baker, 2006).

A major breakthrough in describing the variety of languages and dialects in schools, revealing the strengths of community languages and cultures, was by the Linguistic Minorities Project (1985) in London and various urban areas of England. Through an attractive and innovative cartoon-like questionnaire, this project documented the hitherto unknown extent of bilingualism in schools in key urban areas of England. This project also surveyed the provision of minority language teaching in both mainstream and community-run schools and classes. More recently, a survey of 850,000 children in London schools revealed the presence of over 300 different languages (Baker and Eversley, 2000). Since no language questions are included in England in the decennial national census, such surveys provide important information and intelligence gathering that impacts on education provision and policy. At the least, such surveys raise the profile of low status, forgotten language minorities and their educational needs.

In the USA, a pioneering survey of public opinion was performed by Huddy and Sears (1990). They used a telephonic-interview survey of a US national sample of 1,170 people and found that the majority of the public in the mid-1980s tended to be favourable towards bilingual education, although a substantial minority opposed bilingual education. The amount of parental and public support that exists for different forms of bilingual education is important in participative democratic societies, as bilingual education is often both an educational and a political key topic (Crawford, 2004; Krashen, 1996).

Krashen (1999) provides a wide-ranging review of the US public opinion surveys regarding bilingual education. In polls that have attempted to ask a representative sample of people, approximately two-thirds of the public are in favour of bilingual education. However, considerable differences in public opinion polls occur because questions differ considerably (e.g. how bilingual education is defined). Leading questions that hint at the preferred or desirable answer, and the ambiguity of what respondents perceive as bilingual education, clearly have an effect on results. When questions are phrased so that bilingual education includes proficiency in the English language, then generally there is a consensus support for bilingual education.

The discussion in this section so far has concerned one major aspect of survey work, that of measuring public opinion, fact finding and

information provision. However, there is opposition to this approach. The harvesting of opinions and the description of the characteristics of the population has been anathema to some sociologists, psychologists, linguists and educationalists who are critical of a lack of theoretical foundation to such surveys (Garrett, Coupland and Williams, 2003). Such authors argue that the interpretation of survey data best avoids simplistic reporting and a superficial commentary on the findings. Rather, deeper and wider understandings come from interpretation that uses sociolinguistic, sociological and psychological theories.

Despite these criticisms, there is a place within a democracy, not for mob rule by opinion poll, but for the views of the majority being counted and represented. Such democratically surveyed public opinions can be balanced against the individual views of those elected and pressure groups and persuasionists (e.g. crusading academics, interest groups, language activists and educational campaigners). Factual and opinion surveys have moved from a nineteenth century idea of an informant to the psychological idea of a respondent, and recently to framing the person answering the questions as a citizen within a democracy. In this sense, the survey becomes a polling situation, a collection of votes, a raising of the profile of those who are neglected by the elected. Such surveys may aid the recognition of language minorities and their needs in education. However, within language and education, surveys can become an intelligence gathering for a centralized ruling class who use the information for manipulation and control. However, this is a criticism of government and not of surveys.

Language surveys from a different tradition to censuses do commence from an explicit theoretical basis (Garrett, Coupland and Williams, 2003). For example, using theoretical work on the relationship between attitudes and behaviour, or employing theories of attitude change, attitudes to language can be put in a multivariate, interactive and developmental theoretical framework. One example is research that seeks to establish a probabilistic and interactive, but not deterministic, set of relationships between individual characteristics, schooling, language background, forms of cultural activity, language ability and attitude to language (Baker, 1992). Though reductionist in approach, a statistical modelling of language attitude data attempts to uncover weaker and stronger relationships and, at its basis, a finer insight into what support systems are required within formal and informal education to maintain a minority language.

This more theoretically derived approach in language surveys originates particularly from the pioneering work of Robert Gardner and colleagues in Canada (Gardner, 1985). It culminated in his socio-educational model that interrelates social and cultural background,

intelligence, language aptitude, motivation and attitude, situational anxiety, formal and informal language learning and bilingual proficiency.

A second theoretical input into survey research is from language maintenance, language shift, social networks and language reproduction. A particularly fine example is Ó Riagáin's (1992) survey based on in-depth interviews with 150 adults in West Kerry, Ireland. His study relates bilingualism in Ireland to extensive socio-economic transformations that have occurred in Ireland this century, with the theoretical input of Pierre Bourdieu particularly influential in analysis and interpretation.

A third theoretical influence on language and education surveys derives from language planning (Baker, 2006). Given the foundational nature in language maintenance and language revitalization of language transmission in the family and language production via schooling, language use surveys examine the extent of language uptake across key domains. A European-wide example of this kind of survey research is the Euromosaic Project. Based on the research on 48 language minorities in Western Europe, the first Euromosaic Report (European Commission, 1996) provided a comprehensive and comparative study of the chances of language survival and reproduction among many European language minorities, with language acquisition and production theoretically and analytically prominent (Martí et al., 2005). In 1999, Austria, Finland and Sweden were added to Euromosaic II and ten new member states of the European Union were added in September 2004 as Euromosaic III (<http://www.uoc.edu/euromosaic/web/homean/index1.html>).

The Euromosaic research used a combination of national questionnaires, detailed observational reports from 'key language witnesses' and eight detailed language surveys. Included in the 40 language-planning dimensions were several relating to language education and illustrating variety in language domains:

Dimension 9.

- (a) Use of language in education in primary and secondary education
  - (i) As a medium of instruction
  - (ii) As a subject itself
  - (iii) The history and culture surrounding the language
  - (iv) Provision of teachers, schools and curriculum materials
- (b) Use of language in further, vocational, technical, adult, continuing and higher education.

Dimension 10. Literacy and biliteracy of the language group

Dimension 11. Provision of language learning classes for in-migrants.

The 40 dimensions were then collapsed into seven central language-planning themes: language reproduction in the family, language

production and reproduction in the community, language production and reproduction through education, the value of language for social mobility, relevance of language in cultural reproduction, legitimization (e.g. legal status, language rights) and institutionalization. European language minorities were then contrasted and compared on these themes, revealing different levels of language maintenance, revitalization or decay.

Another trend in recent decades has been in survey sampling. One of the early patterns of research was small-scale survey work. Not only were samples often small, but use of random selection and stratification in sampling was typically missing or inadequate. For example, Jones (1949, 1950) used small and unrepresentative samples (129 students and 211 students, respectively) allowing little generalization of findings. In comparison, the monumental 5-year study, the Committee on Irish Language Attitudes and Research (CILAR, 1975), drew-up a stratified random sample for interview in a ratio of 13 respondents per 10,000 members of the Irish population. Another comparison is the sampling technique used in language surveys by Von Gleich and Wölck (1994) in Peru. Entitled a 'community profile', Von Gleich and Wölck (1994) use local 'guides' to gain information on, for example, the occupational, political, educational, religious, communication and residential organization of a community. Such information enables the social structure of a community to be more fully represented in the sample to be interviewed.

Small-scale sample survey work is especially justified when there is an intensity of investigation. For example, a highly detailed, longitudinal consideration of changes in language use among children across domains may require continuous observation in just one school or community. Such small-scale research is also of value where no generalization beyond the sample is expected or required (e.g. in local policy-making).

This is where the margins of survey work merge with techniques such as systematic observation and ethnography. A similar borderline area, this time between surveys and experiments, is the use of the Matched Guise Technique (Garrett, Coupland and Williams, 2003) to infer attitudes to language varieties (e.g. evaluation of different accents among schoolchildren). Other areas that involve surveys, but also use a psychometric and experimental style, include research on language-learning preferences in school, reasons for learning a language, styles of language teaching, and parent's language attitudes. These are reviewed by Gardner (1985) and Baker (1992).

A further development in survey work in language and education has been the use of surveys to measure language performance and achievement in school. Language surveys in schools in the 1980s and 1990s

were predominantly focused on curriculum content and curriculum evaluation (e.g. Baker and Griffith, 1983; Baker and Williams, 1993; Johnson, 1987). Recently such surveys have particularly studied standards, performance monitoring, high-stakes testing, benchmarking, and target setting (Abedi, 2004). With a focus on quality assurance and quality enhancement, benchmarks and baselines enable comparisons and accent the need for an upward spiral in centralist-defined educational standards. Language performance surveys enable comparisons across time, across countries, states and counties, across types of school and language groups with the spotlight on performance enhancement, reaching standards of international comparability, raising the performance of individual schools and regions and locating the 'value-added' contribution that particularly effective schools display in first and second language achievement.

#### WORK IN PROGRESS

Language surveys have global and continuous usage. There are continued examples of language censuses on all continents, at national, regional and local levels. For example, In Asia, every 3 years the Japan Foundation conducts a questionnaire survey of overseas organizations offering Japanese-language courses to obtain an accurate picture of the current state of Japanese-language teaching around the world (e.g. Japan Foundation, 2003).

A sociolinguistic survey of Singapore is investigating language use to inform educational as well as language planning. Using qualitative and the quantitative approaches, the survey is collecting information on language use across major domains as well as data on code switching (Vaish, 2007).

The status of the many European majority and minority languages is regularly debated in Europe, particularly in attempted moves towards increased national co-operation and partnerships. The Eurobarometer surveys are symbolic of a drive to celebrate the diversity of European languages. For example, the European Union's (2001) Eurobarometer Survey of 15,900 people throughout Europe found that 93% of parents say it is important for their children to learn one or more European languages other than the mother tongue. Improving job opportunities is given as the main reason (by 74% of parents).

The Council of Europe (2005–2007) is funding a Europe-wide survey of community language learning (language minorities). In particular, this focuses on school-age children learning a minority language at school or in their community (e.g. Saturday schools, religious classes in the synagogue, temple and mosque). Such endeavours are either funded by educational authorities or derive from voluntary language

education. Across Europe, this is an innovative attempt to document the number of languages being transmitted through language education, the numbers and distribution of those children, the length and intensity of language learning, the curriculum approaches taken, availability of materials and resources, the training of language teachers, and the outcomes of such language education.

Attitudes to language and to language education are still prominent in research. Such attitude surveys in, for example, Brittany and Wales (Cole and Williams, 2004), Flanders (Belgium) (Dewaele, 2005) and the Basque Country (Spain) (Aiestaran and Baker, 2004; Echeverria, 2005) continue with a widening theoretical base. Thus, Aiestaran and Baker (2004) connect attitudes with a multidimensional model of language change and use latent variables and structural equation modelling in multivariate analyses. Different forms and experiences of language education are related to language attitudes. Dewaele (2005) explores the relationships between language attitudes in high-school students and personality, gender, language competence, political-cultural identity and communicative frequency of the use of French and English.

Attitude to trilingualism and multilingualism is a recent trend (Extra and Yagmur, 2004; Lasagabaster, 2004, 2005a, b; Turunen, 2001). Working in the Basque context, Lasagabaster (2004) has moved from attitudes to English as a third language to attitudes to three languages taken separately (Basque, Spanish and English), to attitudes to three languages as a holistic, multicompetent, integrated, additive entity (Lasagabaster, 2005a, b). This latter view is represented in an attitude item such as 'people can earn more money if they speak Basque, Spanish and English' (Lasagabaster, 2005a, p. 50).

## PROBLEMS AND DIFFICULTIES

Surveys are generally surrounded by a series of criticisms and limitations. At one level, there are philosophically based criticisms such as surveys cannot establish causal connections between variables; they are incapable of uncovering meaningful aspects of social action; people's opinions are not socially or politically contextualized and therefore are capable of being misunderstood; surveys assume that human action is determined by external forces and neglect the role of human consciousness, intentions and understandings as important sources of action; surveys follow ritualistic methodological rules and lack of imagination or depth of penetration in understanding; theoretical input is implicit rather than explicit; only the trivial and superficial is measured, and the construction of surveys fails to penetrate the meanings and understandings of a people who are surveyed but rather arranges answers to fit a conceptualization that is essentially that of the researcher.

Pavlenko (2002) provides a critique of such socio-psychological studies of language. She argues that in a post-structuralist approach, language attitudes are replaced by language ideologies that are seen as more socially and culturally derived, ever-developing and not static, and capable of being criticized and changed. For example, saying that someone has an integrative attitude to Irish may imply a relatively stable trait that is individually derived and owned. Instead, it is possible to depict that person's language identity as related to political, cultural, social and economic ideologies surrounding Irish that are ever-changing and fluid, and open to challenge and conflict. Language attitudes thus become part of larger societal processes and ideologies that can be examined for bias, racism, discrimination and oppression. The psychological is merged with the political. A relatively stable and separate variable (attitude) is a part of a multiple and dynamic scenario (identity construction) that allows second language acquisition to have individual, group and societal dimensions.

In addition, Pavlenko (2002) suggests that language survey research tends not to offer insight into the social and political origins of attitudes. Such assumes that cause-effect is stable and in one direction whereas social contexts and attitudes/motivation constantly shape and influence each other. Individual differences are socially constructed with variations across communities and cultures, and there is a tendency in such research to relate to wholesome, agreeable contexts whereas: 'In reality, no amount of motivation can counteract racism and discrimination, just as no amount of positive attitude can substitute for access to linguistic resources such as educational establishments' (Pavlenko, 2002, p. 281).

There are many technique-based criticisms of surveys within language and education that overlap with the ideological critique. Among the criticisms are the following: surveys are inadequately designed and piloted; the questions are ambiguous, sometimes leading, have in-built social desirability or prestige biases in answers; the questions themselves can create artificial opinions; little evidence is given for reliability or validity; surveys are often unpiloted; there is an over-reliance on single item measurement; the data provide a quick snapshot but no film of interaction and language life; samples are often small and unrepresentative; surveys often lack clear aims with key concepts not being clarified; answer categories insufficiently discriminate between different sensitivities; the interviewer or researcher has an effect on responses; the physical setting of the research and the 'season' in which research is carried out affects responses; evidence is attenuated to simple categorization and a number system, and ahistorical accounts of issues are presented.

There are also criticisms of the way language is conceived in surveys. A full investigation of language use across a wide variety of domains is rarely presented, including the different domains in schooling. Instead, the many language domains are reduced to a few attenuated dimensions. Thus contextual use of language tends to be aggregated to a small number of categories, or in the case of a census, often to merely speaking that language or not. Language census questions sometimes fail to distinguish between use of language and ability in language, and fail to distinguish the various sub-skills of language ability (e.g. listening, speaking, reading and writing). In such local and national surveys, questions about home language, mother tongue, first language, second language and official language are often ambiguous and distant from the respondent.

### FUTURE DIRECTIONS

Within language and education, the methodological pendulum has partly swung towards a preference for qualitative, ethnographic and phenomenological types of approach. Although quantitative approaches have been much criticized within the study of language and education, it is unlikely that they will disappear. As this chapter has presented, survey work in language education lends itself to two movements.

The first movement is the requirement of central government, local government, local education authorities and interest groups to acquire factual information about populations, as well as opinions. Thus, the use of national, local and small-scale census-type language surveys is likely to continue. Such surveys provide language group profiles, collect votes, as well as reveal facts about who speaks what language, where and to whom. Thus, as one part of the information collection procedure of a democracy, and as part of the current consumerism ideology, being responsive to public opinion is expected and respected.

The second movement, particularly concerned with surveying attitudes, has tended to become more theoretical, using more complex multivariate statistical techniques. On the other hand, the prominence of this approach as a major topic in language and education has decreased since the heyday of the 1980s. With major theoretical and research studies having been accepted, replicated, and mostly validated, the discernible movements in the future appear to be in methodology rather than theory (e.g. use of WWW for survey work; student surveys within universities and colleges being electronically generated, completed and analyzed).

One continuously important area appears to be language surveys that measure the performance of children in schools to allow comparisons

between institutions and over time (e.g. high-stakes testing). One perspective derives from those assimilationists who are concerned with the performance in the majority language (e.g. in USA and Britain, there is political concern about high standards of oracy and literacy in English). Another perspective comes from those concerned with the preservation, partly by bilingual education, of a minority language. Both assimilationist and maintenance policies seek information about language performance and language under-achievement to ensure politics and policies are effective. In an increasingly competitive economic world, there is also a need for 'foreign' language competence surveys to ensure strength in trading languages (e.g. attainment in Arabic, Spanish and Mandarin). Such 'foreign language competence surveys' could become the research focus of many future surveys in language and education.

## RESEARCHING LANGUAGE LOSS AND REVITALIZATION

### INTRODUCTION

Language loss refers to a societal or individual loss in use or in the ability to use a language, implying that another language is replacing it. It is a very common phenomenon world-wide wherever languages are in contact. Language loss may be the result of subtractive bilingualism where a new language is learnt at the cost of the mother tongue (Lambert, 1974), or it can be seen as the choice of a person who believes that ceasing to use a lower-status mother tongue will result in a better position in society or in higher prospects for the next generation. While this type of shift is often framed as “speaker’s choice,” we can question if this kind of choice is really “free” as it is strongly influenced by unequal power relations between languages and language groups (Dorian, 1993).

The issue of language loss on a large scale, ultimately leading to the extinction of entire languages, was brought to a wider audience by Krauss (1992) more than a decade ago. According to his estimates, only 600 languages, that is, fewer than 10% of the languages spoken today, have good chances of surviving until the year 2100. One of the factors counteracting this trend is the corresponding efforts at language revitalization. Efforts to bring back and strengthen small and threatened languages are being carried out today on all continents and under varying circumstances. This chapter provides a short description of previous and on-going research on these issues as well as special questions and problems connected to this kind of research.

### EARLY DEVELOPMENTS AND MAJOR CONTRIBUTIONS: LANGUAGE MAINTENANCE AND LOSS

The field of language maintenance, loss, shift, and revitalization, on individual as well as societal levels, is highly interdisciplinary, drawing from linguistics, sociology, education, psychology, anthropology, political science, and other fields as well. During the first decades of study, until the 1950s and 1960s, a distinct emphasis was put on the language loss and shift aspect, largely neglecting its opposite: language

maintenance and revitalization. Explicit revitalization movements such as they manifest themselves today—and research on such movements—were rare at that time. Up through the 1970s, researchers generally expected that minority languages would disappear in due course. This was regarded as a natural development and people engaged in language maintenance efforts were often considered to be backward-looking romantics, political separatists, or unrealistic idealists (cf. Dorian, 1998; Fishman, 1992). Minority languages were seldom associated with economic or political power and therefore they were considered as having no future. In immigrant communities, individuals were mainly perceived to be concerned with learning the majority language of the host country, while the original language often lost importance or was taken for granted by its speakers.

In his classic 1953 work, Weinreich laid the foundation for the scholarly study of language contact. He defined language shift as “the change from the habitual use of one language to that of another” (p. 68) and went on to ask “whether interference ever goes so far as to result in a language shift?” While placing substantial focus on language contact and interference, Weinreich emphasized that language shift was rather motivated by language-external factors than by language-internal ones, and recommended that language shift be studied in terms of the functions of the languages in society (e.g., in communication with authorities, at school, in the home). He also recommended studies on the order in which languages shifted in their functions and whether shift in one function brings about shift in others. Weinreich also discussed the effects of what he called “language loyalty” in counteracting language shift and noted that many languages with low prestige had managed to resist threatening shifts for long periods.

An early study by Haugen (1953) focused on language loss and shift among Norwegian speakers in the USA. He described language use and linguistic attitudes prevailing among Norwegian-Americans in the homes and in religious life, and the impact of English on Norwegian dialects. He also noted a gradual emergence of an opposition towards the rapid language shift to English taking place within the community. Haugen described a typical process of language shift as a series of stages all the way from monolingualism in language A (the minority language) through three bilingual stages to monolingualism in language B (the majority language):

$$A > Ab > AB > aB > B$$

Bilingualism during this process is characterized as a gradual shift from minority language dominance (Ab) through equal competence in both languages (AB) to majority language dominance (aB) leading finally to the loss of the minority language (B).

A third scholar, Joshua Fishman, also had a strong impact in this field. His early work, *Language Loyalty in the United States* (1966), focused on the support among immigrant groups for language maintenance efforts. Ever since his early research, Fishman has strived to describe and analyze the feelings and positions of linguistically and culturally endangered groups and has stood in favor of language maintenance efforts in research and in practice.

In the 1970s, sociologically oriented studies were carried out in various language communities. For instance, in Sweden, sociologist Magdalena Jaakkola (1973) detailed the strictly diglossic situation in Tornedalen in the 1960s, which was gradually paving the way to a language shift from Finnish to Swedish. Finnish was widely used by parents and elders, while the stigma attached to Tornedalen Finnish during almost a century of overt assimilation policies contributed to the common pattern of parents and grandparents speaking Swedish to their children and grandchildren.

A well known study on language death in a community was carried out by anthropologist Susan Gal (1979), who showed how industrialization and urbanization contributed to language loss and shift among Hungarian-speakers in Oberwart, Austria. As in the Swedish context mentioned above, in Oberwart there was a long history of societal Hungarian-German bilingualism. When industrialization gained importance in Oberwart, the status of Hungarian declined as it was associated with peasant life. This led to a language shift from Hungarian to German, starting with the young generation.

Another very influential work on societal language loss and death was linguist Nancy Dorian's (1981) study of a Scots Gaelic community in East Sutherland. Although a stigmatized, lower prestige variety, Gaelic had a strong covert prestige among its speakers as the sign of group loyalty and fisherman identity. A large-scale language shift from Gaelic to English started when the importance of fishing declined and the segregation of the Gaelic-speaking population in society eased.

The studies by Jaakkola, Dorian, and Gal reflect the importance of the status of minority languages and the status of the groups speaking the language as perceived by the speakers themselves, as well as by the surrounding society. If maintaining a certain language is perceived as a sign of backwardness, poverty, or lack of formal education, shift to the dominant language is easily seen as the best option. For immigrant minorities, this kind of option, often resulting in the loss of the original language, may appear as the only way to go, especially in a situation where immigrant parents are not informed of the possibility of bilingualism. Wong Fillmore (1991) describes how young children in the USA speaking a minority language at home, rapidly lost

their first language when they started preschool in the USA. Learning the new language was seen as a first priority, and the younger the children were when coming into contact with English, the sooner they started losing their original language.

Through the 1980s and 1990s, language loss gained increased scholarly attention. Greater focus was given to the context in which language loss took place, and there was a shift to more detailed, descriptive, and anthropologically oriented studies. By interviewing groups of Saami about their language choices and attitudes in their lives decade by decade, Aikio (1988) described in detail a case of Saami language shift in Finland. Kulick (1992) studied the shift from the local language Taiap Mer to Tok Pisin in a New Guinea village where contact with Europeans changed local ideas about cultural identity and where parental language socialization patterns favored language shift. Norberg (1996) showed in her study on language choice and language attitudes in a Low Sorbian village in former Eastern Germany that a political change favoring cultural maintenance was not able to halt the continuing language shift to German. In these studies, as in several earlier ones, educational and employment opportunities, marriage patterns, or migration contributed to language shift, but views and attitudes towards one's own culture and their impact on language choice patterns in individual homes were given greater focus.

In spite of an increasing number of detailed studies on language shift and loss, the language itself was rarely focused on. An early and important work focusing more on linguistic analysis, for instance, stylistic flexibility, vocabulary, and grammatical structures was *Investigating Obsolescence* edited by Dorian (1989). In her introduction, Dorian observed that this area of research was still largely lacking consistent terminology and devices to measure progression in language obsolescence, contraction, and death. The volume contains a large variety of data, illustrating linguistic change in declining speech communities. This collection together with a growing number of other case studies in this field have shown that language obsolescence is, in Dorian's words, "what we look to now for clues to organizational principles in language and in cognition generally" (p. 2).

#### RECENT AND CURRENT WORK: LANGUAGE REVITALIZATION

Some of the contributions included in Dorian's (1989) volume on language obsolescence, and many other studies as well demonstrate the persistence of minority language speakers to maintain their languages against seemingly overwhelming odds. This kind of persistence, often

regarded with surprise and even suspicion by some nonmembers, is a common feature in the context of community-based language maintenance and revitalization. Studies on language shift typically address situations where subordinate languages give way to more powerful and prestigious ones in a minority/majority constellation, while in language revitalization the process is slowed down or halted, and former subordinate languages rise in status and prestige.

Many revitalization efforts are connected with ethnic revival movements present in many parts of Europe and elsewhere since the 1960s, but also with many nationalistic movements in the 19th and 20th centuries. In the earlier cases, subordinate languages were not necessarily endangered at all, as for instance in the case of Norwegian in Norway and Finnish in Finland in the 19th century, but they were lacking in prestige and political power. In both the Norwegian and Finnish movements, the goal was to enhance the status of subordinate languages, while earlier nationalist movements typically promoted monolingualism and monoculturalism. Modern ethnic revival movements most often promote multilingualism and the idea of several cultures living side by side.

Ethnic revival has meant a new pride in formerly stigmatized languages and identities. In many parts of the world, ethnic movements started when the indigenous and minority languages were already seriously endangered, and the revitalization of the language was often seen as a crucial part of the overall ethnic revival. For instance, Stordahl (1997) observes in the Norwegian Sámi movement in the 1970s, that part of the movement was transforming the image of the Sámi language from that of a “dying language” to a “mother tongue” (p. 146).

Revitalization is commonly understood as giving new life and vigor to a language which has been steadily decreasing in use. It can be seen as a reversal of an ongoing language shift (cf. Fishman, 1991), or it can be regarded as “positive language shift,” denoting the process of reclaiming an endangered language by its speakers. As King (2001) has observed, it is “possible to conceptualize language shift as positive or negative, referring to either the gain or loss of a group’s language, and thus encompassing all societal-level processes of language change” (p. 12). This view is especially useful when trying to describe the often contradictory tendencies present in many language contact situations. The revitalization process is hardly ever unidirectional; both assimilation and conscious revitalization within the minority group take place side by side (Lindgren, 2000, p. 43). [Table 1](#) illustrates this tension by using two columns: the left one consists of various stages of (negative) language shift and loss (taken from Baker and Prys Jones (1998, p. 151)), and the right one consists of corresponding hypothetical stages of language revitalization.

Table 1

| Language shift and loss   | Language revitalization   |
|---|---|
| ←   | ←   |
| Speakers of language A come into contact with language B.   | Bilingualism in language A and B is seen as a merit on the labor market and in society at large.  |
| Language B is spoken by a socially, economically, and/or politically dominant group.  | The status of language A continues to rise among its speakers and in society at large. Language A is introduced in local administration and the media.  |
| Over time speakers of language A become bilingual in language B.  | The need of strong models of bilingual education (immersion or minority language medium education) arises within the group.                             |
| Language B becomes the preferred means of communication for an increasing number of language functions.                       | Bilingualism in language A and B is seen as an obtainable and desirable goal within the group.  |
| Gradually, younger speakers of language A lose fluency in their native language.  | A growing number of adults use the language on various occasions and the language is taught as a subject in school.                                     |
| Language B becomes the preferred language of the younger child-bearing generation and most of them speak it to their parents. | Consciousness about the risk of losing language A altogether spreads within the population and some parents make efforts to use it with their children. |
| Eventually, no children are raised to speak language A.   | Some individuals make efforts to raise the status of language A and relearn it.   |
| By this time only a few adult native speakers of language A are left. As these grow older and die, language A dies out.       | An interest in language A and a will to save it is born among some of its speakers or those who have lost it.   |
| →   | →   |

Up in the left column we have a monolingual situation where only minority language A is used. A process of gradual language shift towards the dominant language B takes place and down in the left column language A is seriously weakened or lost. At the bottom of the right column some individuals or local groups however, have revalorized their original

language; a revitalization movement is born and eventually it gains acceptance. All group members are not of the same opinion, and phenomena belonging to the left column are present in some parts of the community. If the revitalization movement reaches the final stage up the right column, the crucial question is whether societal and individual support for language A has grown strong enough to counteract the assimilatory factors also present—otherwise there is a risk that left column tendencies take over again. As bilingualism (in the situation up in the right column) has become widespread and monolingual speakers of A are rare if not nonexistent, the process of language shift and loss might even turn out to be quicker and easier than earlier.

Since the 1990s, there has been more research on endangered languages and attention to the need to contribute to their survival, as well as discussion of critical issues. (Crystal, 2000; Grenoble and Whaley, 1998; Hinton and Hale, 2001; Nettle and Romaine, 2000; Skutnabb-Kangas, 2000). Researchers and practitioners have presented examples of what could be done and has been done in order to curb language decline. Across several areas of research, one of the driving questions has been why some languages survive and others do not. Also, what are the factors that are most relevant when explaining what affects language maintenance and loss. Many attempts have been made to pinpoint the most relevant factors and the ways in which they interact (e.g., Crawford, 2000; Crystal, 2000; Edwards, 1991; Fishman, 1991; Stiles, 1997), although no conclusive, predictive framework exists.

A major advance in this direction was Fishman's *Reversing Language Shift. Theoretical and Empirical Foundations of Assistance to Threatened Languages* (1991), the first large-scale attempt to construct a theory of language revitalization. He presented a Graded Intergenerational Dislocation Scale (GIDS), a model assigning languages stages from one to eight, with the larger figures implying a more intensive disruption of the normal situation, a "more severe or fundamental threat to the prospects for the language to be handed on intergenerationally" (Fishman, 1991, p. 87). Stage 8, the most threatened position, implies that the language is only used by some scattered, socially isolated old people, while at stage 1, cultural autonomy has been reached, with the language used in higher education and government as well as in the media nationwide. As can be seen in the name Fishman has given his typology, he regards intergenerational transmission as the crucial factor in language shift reversal without which all other efforts are futile in the long run.

While acknowledging the importance of intergenerational transmission of minority languages (as emphasized by Fishman and others), many researchers and practitioners engaged in grassroots revitalization

see education as a powerful agent of revitalization (e.g., McCarty, 2002; Stiles, 1997). The introduction of an endangered language in preschool and later education is expected to compensate for the typical lack of speakers among children and youth. Several recent studies around the world suggest, however, that revitalizing languages through schools is by no means an uncomplicated endeavor; even in circumstances where general attitudes towards the original language are becoming more and more favorable and the schools are officially expected to pay special attention to linguistic and cultural revitalization, the results often remain modest (Hornberger, 2007; Huss, Camilleri, and King, 2003; King, 2001; Todal, 2002). The schools might succeed in producing pupils with second language skills in the endangered language, but the problem remains how to go further and increase the number of pupils with high enough competence to maintain the language in the long run and, at best, to transmit it to their own children.

#### PROBLEMS, DIFFICULTIES AND FUTURE DIRECTIONS

##### *From "Neutral Research" to Advocacy*

Since the early 1990s, there has been active debate on the role of the researcher in maintenance, loss, and revitalization research. The central question was whether the researcher should (or even could) maintain a "neutral" position, observing and describing the endangered language and accepting its imminent death as natural. Or whether it was legitimate (or even desirable) that researchers become engaged in actively assisting the community in their language maintenance efforts. The latter position is gaining ground and scholars today are moving towards advocacy, some of them seeing the extinction of the world's languages as serious a thing as the diminishing of biological diversity (Maffi, 2001; Skutnabb-Kangas, 2000). However, what has been described "responsible linguistics," "reformed linguistics," or "preventive linguistics" may still be subject to suspicion and negative labeling (e.g., Edwards, 2002; Mufwene, 2006; Newman, 2003).

In considering the changing role of researchers in language revitalization, it is important to stress the need of the endangered language communities to form and steer their own language revitalization movements in order to gain lasting results. Outside scholars and "experts," however, are often welcomed and needed by the groups concerned, but they should limit their role to that of additional contributors to already existing movements and efforts. The revitalization of a formerly underprivileged language is much more than the mere saving of the threatened language; in fact it aims at empowering the speakers

by giving them greater self-respect and self-sufficiency vis-à-vis the majority society. In this way, revitalization can be seen as the emancipation of the minority language as well as the identity attached to it, leading to the integration of the minority into the surrounding society on more equal terms than before. As in all emancipation efforts, the strength must come from inside the group, not outside.

### *Defining “Success” Versus “Failure” in Language Revitalization*

A special difficulty connected to research on language revitalization concerns defining when a revitalization movement has been successful and when not. Which criteria should be used to assess the outcome, and who should have the right to choose the criteria? Different revitalization movements may have very different goals and also different ways of defining their own success or failure. In the case of extremely endangered or even moribund languages, the goal of documenting the language and promoting conversational competence in it might well be sufficient, while in other cases, the promoters of a language might aim higher, for instance at promoting literacy in the language through school education (Reyhner, 1999).

Another question is whether we can really assess the outcome by studying the situation as it is at a certain point of time, without knowing, and wisely refraining from guessing, what will happen in the future? There are cases with a strong long-term tendency pointing towards language death when the situation suddenly alters and a new, opposite tendency appears. There are even cases where a language which has not been spoken by anybody in decades is revived and taken into use in some domains (Amery, 2000). Similarly, a linguistic revitalization movement might experience a backlash and die out, without ever attracting wider circles.

### *Collaboration Between Researchers and Revitalists*

Some conferences and workshops held during the last few decades in the field of language endangerment and revitalization have shown that close links have been established between researchers from various countries on one hand and between researchers and practitioners on the other hand. A striking example of the latter is a series of symposia titled *Stabilizing Indigenous Languages*, which started in 1994. The goal of the symposia series is to bring together indigenous language educators and to provide a forum for exchange of scholarly research on the teaching of indigenous languages (see <http://jan.ucc.nau.edu/~jar/History.html>)

Collections of papers from various other symposia and conferences (e.g., Grenoble and Whaley, 1998; Robins and Uhlenbeck, 1991; Shoji and Janhunen, 1997) also witness cooperation between researchers and practitioners in exchanging experiences and ideas and passing on information about successful revitalization efforts such as the language nests originally developed by the Maori in New Zealand, immersion education originating from Canada, and the Californian Master-Apprentice-programs (see e.g., Hinton and Hale, 2001, for these and other programs). The importance of this kind of researcher and practitioner collaboration will not diminish in the future; rather it is likely to grow in importance as more and more language communities discover and get access to these forums.

### *New Technologies and Language Revitalization*

Globalization is often regarded as a major threat to endangered languages, and one of its aspects, modern information and communication technologies, have also been viewed with suspicion by language revivalists. Recently, however, new possibilities offered by technology for documentation and mass circulation of linguistic material, online language education, and other activities on behalf of endangered languages have become a strong focus of interest among those who have access to modern technology—all groups do not have it. The privileged practitioners as well as researchers working in endangered language communities are now in the process of creating data bases, tools, and techniques for the advancement of their languages. On a larger scale, the *Hans Rausing Endangered Languages Project* (SOAS, University of London) recently launched an online library of documentation and revitalisation of endangered languages (see <http://www.hrelp.org/languages/resources/>). For endangered language communities and individuals interested in language revitalization, information and communication technologies also offer new ways of networking and communicating. Using the language digitally is expected to attract especially the younger generation and to help isolated individual language learners practice their skills with others. Computer-based mediation (as indeed radio and television broadcasting) in endangered languages is also seen as a means of generally raising the status of the language in question and associating it with prestige and modernity.

While the benefits of the new technologies in language maintenance are emphasized by many, critique has also been voiced. Eisenlohr (2004) discusses how practices of electronic mediation, and language ideologies are necessarily embedded in, and are related to, the sociocultural processes of language obsolescence and revitalization. The fact

that new technology not only mediates linguistic practice but also, adds new forms and social functions to the language concerned, mean in the context of cultural endangerment. The notion of minority language ownership is also actualized when electronic media are used for documenting and spreading knowledge of a language worldwide. The present scholarly discussion concerning the benefits versus drawbacks of modern technologies in language revitalization (e.g., Saxena and Borin, 2006) is likely to continue and intensify in the future as a growing number of endangered language communities gain access to electronic resources.

*Promotion of Multilingualism as a Means to Peaceful Coexistence between Languages and Groups*

Obviously, the emancipation of one group should not lead to the disempowerment of another; neither should an increase in the linguistic rights of one group be allowed to weaken the same rights of another group. If language revitalization leads to a hegemony of a former endangered language at the cost of other languages which through the process become oppressed, the ethics of revitalization can be questioned (Shohamy, 2006). Official promotion of linguistic diversity and multilingualism is a way of counteracting this kind of development. As Crystal (2000) has stated, multilingualism is a positive phenomenon in society as it offers a possibility of peaceful co-existence between dominant and nondominant languages as well as their speakers. The tradition of viewing individual monolingualism in a dominant language of a nation-state as it were the only normal or correct alternative, however, remains strong and it is a serious impediment to the revitalisation of many endangered languages around the world. How to definitely put an end to this tradition is a major challenge for future research.

### **Language Variation, Acquisition and Education**

## VARIATIONIST APPROACHES TO LANGUAGE AND EDUCATION

### INTRODUCTION

For over four decades, variationists have investigated the social dilemmas of language and education. This effort is based on the study of language variation, with language variation being a cover term for both synchronic and diachronic variation (variation in space and over time). Since language variation is a daily presence in the classroom, many proactive efforts of variationists have focused on how educational policies and practitioners handle language variation.

Variationist sociolinguistics can be seen as both a subtype of sociolinguistics and linguistics: This work is exemplified by *The Handbook of Language Variation and Change* (Chambers, Trudgill, and Schilling-Estes, 2002). As linguists, variationists work from the findings of cognitive science to construct explanations for language variation both in the speech community and in the mind. The extraordinary trait of variationists-cum-linguists is the inclusion of social factors as well as linguistic factors in their explanations.

From their scholarship, variationists argue against two “common sense” beliefs about language: the concept of the homogenous correct form and the reification of language (e.g., English). Over recent decades, educational professionals<sup>1</sup> have begun to transition from an assumption of language having only one correct/incorrect form to an assumption of language having multiple, linguistically legitimate forms. Second, treating a “Standard English” as a single, coherent entity is an empirical mistake (Bex and Watts, 1999; Milroy and Milroy, 1999). Standard English is defined synchronically and diachronically by shifting social standards. There are standard Englishes throughout the world, but there is no one “Standard English.”

This article covers some early developments of language variation and education, some major contributions, prescriptivist views and

---

<sup>1</sup> *Educational professionals* signifies anybody employed by a school system who influences children’s education, including teachers, teachers’ aides, librarians, principals, or system-wide administrators.

variationist approaches, and a conclusion of the challenges for researching this topic.

#### PRELIMINARY DEVELOPMENTS

The pervasive question across both public and scholarly debate concerns what role nonstandard language should play in institutional education: Should vernacular language be encouraged, allowed, or discouraged in the classroom? Through 1960s and 1970s, sociolinguists sided with two different approaches to language variation and education. The first is the dialect rights position (see Wolfram, Adger, and Christian, 1999, p. 115), which maintains that students have a right to their own language. The second approach involves the so-called additive dialect methods, where standard language features are supposedly taught to vernacular speakers (rarely are vernacular features taught to nonvernacular speakers).

The difficulty with this second approach is twofold: it often conflates a community's language variation patterns with written genre conventions of traditional prescriptive grammar (e.g., treating *need* + past participle in *The sentence needs fixed* on a par with semicolons or capitalization). In addition, it is assumed speakers can "pick up" a second dialect. Successful students in such programs should be able to control different registers and genres, primarily writing conventions. For variationists, *dialect* is a label for a set of language variation patterns associated with a social group, including everything from vowels to syntactic patterns. For educational professionals, the term *dialect* most often refers to only stigmatized features. From a variationist perspective, humans do not have the ability to develop two separate dialects (in the variationist sense) (Hazen, 2001; Labov, 1998), but certainly all humans have different styles which may reflect different ethnic and social sources (cf. Sledd, 1969).

A single source to begin exploring such variationist work would be Wolfram, Adger, and Christian (1999). A complimentary book with a variationist understanding is Adger, Snow, and Christian (2002), *What Teachers Need to Know About Language*. For a reference source, the Rickford, Sweetland, and Rickford (2004) bibliography should be a touchstone. For a general source on language stigmatization in English, readers should consult *English with an Accent* (Lippi-Green, 1997).

#### MAJOR CONTRIBUTIONS

Modern variationist methodologies (e.g., Chambers, Trudgill, and Schilling-Estes, 2002) were developed from dialectology (the study of the geographic distribution of language variation), and many variationists

also shared the dialectologists' interests in education. One prominent dialectologist, McDavid (1962), recognized the importance of knowledge of language variation for teachers and discusses how knowledge of dialect variation could assist the teacher and student in their educational goals.

### *Key Positions*

Numerous points of this early period have continued relevance. For example, Stewart (1964, p. 1) cited the "increase in realism" as the most fundamental change in language teaching, whereby he means "simply the view of language as it is rather than as it ought to be, and of the learner's need for it as a personally useful tool of social interaction rather than as a rottenly learned device of principally esthetic value." One technique also suggested by dialectologists and variationists was a second-language approach for African-American Vernacular English<sup>2</sup> (AAVE) speakers. This pedagogy was also being examined with creoles. Craig (1966), for instance, described the foreign-language-like teaching techniques used for speakers of Jamaican Creole.

At this time, the works of variationists were often in stark and contentious opposition to the educational researchers. Baratz (1969) is an important article summarizing three possible stances. The third approach, the one Baratz champions, is the modern approach of variationists since the late 1960s: AAVE is a dialect of English like any other dialect of English. Baratz (1969) found that African-American children in Washington, DC, did significantly better at accurately repeating AAVE sentences, and European-American children were significantly better at accurately repeating nonstigmatized sentences. The implications from this article affected both language variation study in speech pathology and in other educational fields: The dialect of the community has to be evaluated on its own terms. Other countries have gone through similar shifts in public opinion. Dalphinis (2001, p. 701) described how the UK went through stages of eradicationism, assimilation, tolerance, and acceptance in regard to Black English. These stages result from increased knowledge about language variation and its role in stigmatization.

---

<sup>2</sup> Most variationists consider the terms African-American English (AAE) and African-American Vernacular English (AAVE) to designate different sets of language. AAE would be any language (from rhetorical styles through syntax all the way to intonation) used by African Americans. AAVE would be a subset of AAE which contains the stigmatized items (e.g., habitual "be", theta to "f" in the US North). However, AAVE features may be adopted by other ethnicities. It is not clear within the original documents cited in this article that all researchers adopt this distinction.

Continuing Baratz's momentum, Fasold and Shuy (1970) edited a volume still valuable for researchers today: Wolfram's (1970) contribution in that volume lays out the basics of variationist research for educational professionals and argues forcefully for granting priority to some teaching goals over others, such as focusing on the most stereotyped features and those which are sharply stratified between social classes. Complementarily, Shuy's (1970) contribution cites deprecating quotes from teachers about AAVE and suggests teachers learn about how English varieties work, especially the minority varieties.

Perhaps the most widely known text from this early period of variationist work is Labov's "The Logic of Nonstandard English" (Labov, 1969), which has both educational and social implications. Claiming that vernacular dialects are legitimate is often seen as ludicrous by the general public, but for variationist approaches to be effective, this argument must be faced directly.

### *Nonstandard Dialects and Literacy*

Beyond scholars' engagement with spoken language practice, some saw implications for literacy. Labov (1967) discusses the possible interference between students' development of literacy and their dialect, and in (2001) argues that textbook writers and many teachers do not understand enough about the target vernacular varieties to produce truly helpful exercises. For example, in Labov (1967, pp. 157–162), the regular past tense form <-ed> is noted to be absent often in AAVE, yet this language-variation pattern received little to no attention from publishers of educational materials.

As with Labov's work, most of the foundational work by variationists applied to urban US settings. Carrying these findings to new regions, Nichols (1977, p. 155) in turn focuses on the US Southern rural schools: "The reading teacher must be thoroughly familiar with the major phonological and syntactic patterns used by the children in order to determine when a child reading aloud is making the right associations between meaning and the printed symbol." Nichols also suggests that for some vernacular-speaking populations, employing the local vernacular in the classroom for both writing and reading yields results in developing literacy. In a different language context which also requires local modification to educational materials, that of Guyana and Barbados, Tyndall (2000) posits that rural speakers are practically acquiring a second language when learning to write as their varieties are more basilectal than more urban speakers.

Creoles have been a focus of several studies. For example, Carrington (1976) discusses the wide diversity of Creoles with different lexifier

languages and the subsequent effects on education in the Caribbean territories. He also discusses the proscription of vernacular varieties and prohibitive attitudes toward nonofficial languages, providing guidelines for determining relationships between vernacular varieties and school policies.

In 1979, a legal case involving variationists became widely publicized. This case centered on African-American elementary students in Ann Arbor, Michigan who were segregated into special education classes. Advocates for the students argued that their civil rights were being violated as their cultural and linguistic background was not accounted for in planning instruction. The ruling reaffirmed the school's obligation to accommodate their language variation (see Smitherman, 1981, 2000, p. 154). Relatedly, Stockman and Vaughn-Cooke (1982) review the deficit research of the 1960s and highlight its lasting influence. By the 1990s, the deficit approach was no longer an overt position for educators, and variationists had correspondingly shifted their focus away from proving minority varieties were not linguistically deficient. Following on this transition, Foster (1992) focuses on the effects of students having a different communicative competence than the one expected. Though Foster praises the researchers for overturning previous educational views, she criticizes the field for not thoroughly applying the findings to solid and transportable pedagogy for literacy.

At the end of 1996, the foundational issues of the difference/deficit debate roared back onto the international stage when the Oakland California School Board took steps to assist their African-American students, many of whom were performing poorly in school. Their approach was to bring students to full literacy by introducing the written word in the style and form of AAE (see Rickford and Rickford, 1995). For a full account of the firestorm surrounding the Oakland School Board's activities, readers should consult Rickford and Rickford's *Spoken Soul* (2000), Green (2002), and Rickford (1999).

Similarly, in response to the social furor that eliminated bilingual education in California in 1998, students and professors developed the anthology *Tongue Tied* (Santa Ana, 2004). Variationist approaches are found throughout the volume in application to numerous multilingual situations. For both the Ebonics debates and multilingualism, a safe prediction is that such media-sponsored uproars will occur in the future.

Although these situations are the most widely publicized, the status of the nonstandard variety is not always stigmatized. For instance, Norway has two written standards, *bokmål* and *nynorsk*, both based on Norwegian speech. Vikør (1989, p. 42) reports that, "forced speech standardization is forbidden by law." This institutional respect for

language variation has a long tradition dating back to a parliamentary motion in 1878. The underlying belief is that regional dialects reflect Norwegian cultural tradition uncontaminated by Danish rule. The import for the educational researcher is that stigmatization of nonstandard varieties does not have to be accepted or institutionalized.

As an introduction to variationist insights on literacy and education in European school systems, Cheshire, Edwards, Münstermann, and Weltens (1989) provides national perspectives, a review of the literature from 1970 to 1989, and classroom initiatives. For example, Weltens and Sonderen (1989) investigate nonstandard Dutch in school settings: Through examining language tests and both teacher and student questionnaires, they find that these speakers are at a disadvantage in comparison with their standard-speaking peers. Researchers in Europe have given clear descriptions of the attitudes surrounding more and less standard varieties. Van de Craen and Humblet (1989, p. 19) conclude that the standard Dutch in Belgium has “enormous prestige” which covers both the realms of friendliness and intelligence.

### *Arguments for Non-Intervention*

Complementary to these debates of vernacular dialect in schools, Cheshire (2005, p. 2346) argues from a survey of recent literature that nonstandard varieties are not as “detrimental to educational success as might be thought.” Several studies illustrate this point. Williams (1989) found that both standard and nonstandard speakers used colloquial forms in their writing. Williams illustrated the importance of analyzing written work and disambiguating which issues result from normal literacy development processes and which from vernacular interference. In St. Lucia, Winch and Gingell (1994) also argued that such developmental difficulties were being wrongly labeled as stigmatized variation interference from local creoles. Abd-Kadir, Hardman, and Blaize (2003) report the same findings in the commonwealth of Dominica for 55 students whose writing was sampled.

In analyzing three areas of England, Williamson and Hardman (1997a, p. 255) advise teachers not to concern themselves with problems of prescriptive grammar and lexical items, but to focus on punctuation and orthography. In their study, vernacular forms were rare compared with spelling and punctuation mistakes. This comparison is even true when the students’ spoken language contained more vernacular features (cf. Hudson and Holmes, 1995). For researchers intent on giving teachers some grammatical focus, Williamson and Hardman (1997b, p. 168) suggest nonstandard verb forms, as they constituted more than half of the nonstandard written forms in their samples.

*Classroom Solutions*

Although variationists have identified related problems in educational practice, they have received criticism for not producing solutions. This section discusses some of the potential solutions variationists have discussed.

Ranging from the study of names, regional variation, shibboleths such as *ain't*, and vernacular varieties in the composition classroom, Glowka and Lance (1993), like Fasold and Shuy (1970), provide opportunities for teachers to learn how to incorporate language variation into a classroom. Of special note, in "Bilingualism and language variation among Chicanos in the Southwest," Galindo emphasizes that Chicano English is an increasingly important part of North American English and should be addressed throughout the nation (see Fought, 2002 for further discussion of Chicano English).

Rickford and Rickford (1995) is a modern discussion of the role dialect readers can play and the benefits they provide. The other important text from this period is Labov (1995), where he proposes five principles which require educational professionals to understand the language variation patterns of AAVE. Perhaps the two most important principles are (1) *Teachers should distinguish between mistakes in reading and differences in pronunciation* and (2) *Give more attention to the ends of words*. All of Labov's principles are based on both classroom research and extensive linguistic study of vernacular varieties.

Shifting the focus to an understudied spectrum of language, Hoyle and Adger (1998) emphasize discourse analysis for older children. For this reason, understanding the communicative competence of different students should bolster their opportunities to be active agents in their education. Three complementary works are Denham and Lobeck (2005), Wheeler (1999), and Wheeler and Swords (2006). These works justify modern grammar study and encompass several different linguistic approaches. They include sections on classroom methodology and linguistic influences on writing. Similarly, Baugh (1999) investigates what has not worked, "educational malpractice," and motivational strategies for literacy. One strategy is the Lyric Shuffle set of literacy games which tie oral skills to emerging literacy skills such as phonological awareness.

Focusing on pidgins and creoles, Siegel (2001) develops categories of programs and evaluates their qualities. His categories of programs—instrumental, accommodation, awareness—incorporate pidgins and creoles to different extents. He further notes that research on instrumental programs, where the home variety is used as the main medium of instruction, in Australia and the Seychelles "has shown that students

educated bilingually in their creole mother tongue and the standard outperformed students educated in only the standard language” (2001, p. 748). Siegel attributes the positive benefits of these and other studies to both educational logistics (e.g., students find it easier to develop literacy in familiar varieties first) and to the more positive attitudes such programs engender.

Educational researchers have also adopted variationist approaches to develop solutions to pedagogical problems. For example, Craig and Washington (2004, p. 228) address long-standing variationist questions: The general consensus of researchers is that AAE speakers do not have reading comprehension troubles related to their dialect (2004, p. 237) and that no single language variation pattern will explain the black-white achievement gap, especially in terms of literacy (2004, p. 240).

A caveat to such research is that variationists may find educational analysis of language variation differently minded in its linguistic description. For example, Craig and Washington (2004, Table 11.1) include several phonologically influenced language variation patterns in their morphosyntactic characteristics of child AAE (e.g., *a*, *an* indefinite article variation/absence; copula absence; auxiliary verb absence; past tense *-ed* absence). Some traits listed as phonologically AAVE are normal for almost all US English speakers, such as unstressed syllable deletion (e.g., *'cause* for *because*).

### *Teachers and Teachers' Attitudes*

Several variationist researchers have evaluated teachers' attitudes toward vernacular speakers, including Winford's (1976) investigation of teacher attitudes toward a creole community. Blake and Cutler (2003) report findings from a survey of New York City teachers from five high schools. Part of their findings (2003, Figure 6) are that positive responses to the statement that AAVE has its own rules range from 78% to 30%. From surveys in the 1970s, Blake and Cutler surmise that teachers have a generally more positive attitude about AAVE and minority dialects. Student attitudes were also studied by Horner (2001): A strong correlation existed between students' academic success and their Caribbean-American identity. In addition, Haig and Oliver (2003) report for Australia that teachers' assessments of educational problems and their causes varies by the socioeconomic status and grade level of the students.

Teacher and student attitudes are considered the fulcrum of disadvantages for vernacular speakers by Barbour and Stevenson in their study of German variation. They (1990, p. 191) find that German-speaking Swiss schools, where traditional dialects are normal, do not note educational dialect problems; only those German schools where

vernacular and nonvernacular speakers interact report such issues: "... this strongly suggests that the problem is overwhelmingly one of social attitudes, rather than of the linguistic characteristics of non-standard German." Correspondingly, Cheshire and Trudgill (1989, p. 106) write: "The greatest dialect-related problems in the United Kingdom ... continue to be the attitudes and prejudices that many people hold towards non-standard dialects and accents of English, combined with the lack of understanding about the nature of dialect differences and of their social significance." As a complement to this view, Cameron (1995) provides a reexamination of linguists' descriptivist stance in relation to education and details educational reforms in the UK.

Rampton (2006) presents a contrastive scene in English schools. In responding to the work of Trudgill in the 1970s which propagated the idea of respecting nonstandard dialects, Rampton argues (2006, p. 318) that the same dialect prejudices do not persist in the new century and that the nonstandard-speaking students may not be as linguistically insecure as previously thought.

In a study of similarly potential conflict, Pauwels and Winter (2006) explore one dilemma for teachers: They must both persist as "guardians of grammar" and as "agents of social language reform" and may run up against thorny issues such as third person singular generic pronouns in English. They find that younger teachers implement nonsexist pronouns rather than perpetuating the grammatical tradition of "generic" *he*. Importantly, attitudes for students and teachers have to be a recognized part of the curriculum. Cheshire (2005, p. 2349) writes: "The research indicates, then, that educational programmes that recognise the associations that standard and nonstandard English have for speakers, and that build on these, are more likely to result in children becoming proficient in using standard English than are policies which assume that acquiring the standard language is simply a matter of substituting one variant for another."

Beyond attitudes, the current research methodology now includes a direct assessment of students' language abilities. Charity, Scarborough, and Griffin (2004) quantitatively assess the frequency of standard variants in specified tasks. They distinguish AAVE and school English by degree of features, not categorical presence or absence. Their scholarly stance includes the position that the level of AAVE language variation patterns is not the important factor in predicting reading failure, but that the familiarity with school English (SE) is the crucial factor. They write: "... how often the SE forms are reproduced, was thus chosen as our measure of children's familiarity with SE." Charity, Scarborough, and Griffin (2004, p. 1354) find that "individual differences in familiarity with [school English] are strongly related to reading achievement in

young, African-American students.” Their study inverts the reading conundrum by focusing on knowledge of school English.

Around the world and in the USA, the future of variationist research into language and education is bright. Although educational concerns were secondary to variationists in the past, the newest generation of variationists is making them a primary focus. Three dissertations focusing on different components are recently completed. Charity (2005) reports findings from the study of dialect variation of African-American children in school settings. Sweetland (2006) discusses the study of the development and implementation of language variation teacher training programs. Reaser (2006) examines dialect awareness programs and their effects on teachers’ and students’ attitudes about language variation. All three of these dissertations should provide substantial benefits for educational professionals.

#### WORKS IN PROGRESS: VARIATIONIST VIEWS AND PRESCRIPTIVIST TRADITIONS

For educational professionals to confidently adopt a modern view of language variation, they should understand how it contrasts with traditional prescriptivism and how it can further their own pedagogical goals.

Common beliefs about language are undergirded by several modern myths: the primary myth is that a supremely correct form exists for all contexts and times; in previous centuries, this belief extended to the superiority of some languages, for example Latin, over other languages. Today, Western societies are currently in transition from a traditional belief to a scientific belief.

Two signs of this transformation have become obvious to linguists who deal with public opinion: People more readily accept that no one language is inherently superior and that language change is not decay. Were the other tenets of variationists’ findings to be taken up, such as the legitimacy of language variation, then the educational goals of literacy and writing would be accomplished more completely and efficiently.

The traditional prescriptivist view does not allow any kind of legitimate language variation, even though its current social rules for English were formulated mostly in the eighteenth century. Many prescriptivist doctrines of today were established in that early period, often in erroneous but well-intentioned comparisons between English and Latin: Do not split infinitives (e.g., *to boldly go*); Do not strand prepositions (e.g., *We have much to be thankful for*).

The challenge for educational researchers is to demonstrate that traditional prescriptivist approaches are less effective and efficient at achieving institutional goals. Fine-grained, quantitative examinations

of pedagogy would provide evidence for which basic assumptions about language produce the best results. Within students' written and spoken language variation is a wealth of learning opportunities (Hazen, 2005); if educational researchers can construct an accurate model of what students do when they complete institutional goals, the modern view of language variation would be seen as an integral part of that process.

The variationist educational goals are to help people understand the natural linguistic equality of all languages and help them establish teaching tactics that incorporate a scientifically sound view of language. The new assumption for educational purposes must eschew several components of traditional prescriptivism. This scientifically informed prescriptivism allows teachers to encourage literacy at all levels while accurately portraying language. Prescriptivism with an assumption of rhetorically focused language will be more successful for students and teachers alike because of its harmony with the true nature of language.

#### CONCLUSION: CHALLENGES AND FUTURE DIRECTIONS

For over 40 years, variationists have contributed to language education research and practice. Variationists will likely continue to play an important role in the development of language education policies and programs surrounding non-standard dialects in education. Variationist researchers have learned over this time about attitudes and stigmatized varieties. In the next 40 years, they should inquire about the best methods for shifting attitudes to a proper understanding of language variation. The most general results of the variationist approach to language and education should be a better understanding of language use in society and thus students' increased awareness of their own language variation.

One crucial component is to work with teachers to develop materials which reflect a modern, scientific view of language. Understanding of how language works, including its social intricacies, makes the teaching of standard codes less of a social hand grenade, increasing both the efficiency and effectiveness of the teaching. When language variation is properly respected, students are less opposed to institutional language and the social connotations of it.

## SECOND LANGUAGE ACQUISITION RESEARCH METHODS

### INTRODUCTION

The field of second language acquisition (SLA) has grown significantly in recent years. Of the 20 plus journals (in English) concerned with topics of second and foreign language (L2) learning, for example, nearly a third were established in the past 15 years. The vast majority of these journals are devoted to empirical research, providing a forum for SLA researchers to present their findings on the linguistic, cognitive, social, contextual, psychological, and neurobiological characteristics of L2 learning and processing. Concomitantly, SLA research methods have been developed, expanded, and refined in an ongoing process as researchers investigate increasingly complex questions.

### EARLY DEVELOPMENTS

Since SLA first emerged as a serious field of inquiry in the 1960s, a wide variety of approaches have been used to investigate the process of learning a nonnative language. Early studies focused on *differences*, namely, areas of divergence between the first language (L1) and the L2 to predict areas of difficulty for L2 learners (e.g., contrastive analyses, and the work of Lado, 1964). Later, researchers focused more on purported *universals* of SLA, or those processes or capacities that were believed to underlie all L2 learning, regardless of the particular L2 being learned or the L1 background of the learner. Investigations in this area focused, for example, on the role of an innate language capacity (e.g., universal grammar and the work of Schachter, 1989) and on the fixed orders in which particular morphemes were acquired, irrespective of the L1 of the learner (e.g., the morpheme order studies, and the work of Dulay and Burt, 1974). Subsequently, the focus on language universals expanded to include cognitive mechanisms such as attention and awareness, working memory, and input processing strategies. At the same time, increased attention has been devoted to areas of *individual differences*—including personality, motivation, age, preferred language learning strategies, anxiety, gender, and even back to the role of the L1 in L2 learning. The vast majority of these studies have employed quantitative designs (as discussed by Lazaraton, 2005; Mackey and Gass,

2005), and it is to this form of empirical research that we turn in the next section. However, in recent years, alternative research designs, qualitative approaches, and even mixed method approaches have gained increased currency. These forms of research will also be addressed after our discussion of quantitative research.

## MAJOR CONTRIBUTIONS

### *Quantitative Research*

Quantitative research, traditionally defined, refers to research that stresses the importance of large groups of randomly selected participants, manipulating variables within the participants' immediate environment, and determining whether there is a relationship between the manipulated (independent) variable and some characteristic or behavior of the participants (the dependent variable). Statistical procedures are used to determine whether the relationship is significant—and when it is significant, the results are typically generalized to a larger population beyond the immediate group of participants.

One of the simplest quantitative designs employed, the one-shot design, involves examining the language of learners at a single point in time. No pretest or posttest is used to measure learning, and there is no treatment involved. Although not usually considered true experiments, one-shot designs have been employed fruitfully in several SLA studies. More commonly, however, SLA researchers have used comparison group designs, where participants are randomly assigned to different groups—for example, one group which receives treatment (e.g., a type of instruction) and another group which does not (i.e., a control group). This approach is commonly employed with a pretest-to-posttest design, allowing researchers to assess the L2 learners' knowledge before and after the treatment (and hence the effectiveness of the treatment), and occasionally with delayed posttests as well, enabling researchers to assess the long-term retention of learning (see Long, 2006 for a discussion on the importance of delayed posttests). Typical examples of the comparison group design include Loschky's (1994) examination of the effect of negotiated interaction on the comprehension and acquisition of Japanese vocabulary and locative constructions, as well as Long, Inagaki, and Ortega's (1998) investigation into the effect of recasts and models in the acquisition of Japanese and Spanish as foreign languages.

It is also interesting to note the different ways in which development or change in the learners' interlanguage, or knowledge of the L2, is measured in quantitative studies. In some studies, development is assessed by comparing pretest and posttest proficiency scores, or scores for suppliance in obligatory contexts or target-like use (e.g., Dulay and

Burt, 1973, 1974; Pica, 1983). In another approach, frequency data are used to determine the number of learners who change in terms of developmental sequences. An example of the latter type of study was carried out by Mackey and Philp (1998), who made use of Pienemann and Johnston's (1986) six-stage sequence of question formation to examine the impact of recasts on the learning of questions by L2 learners at different development levels. Some researchers have also measured change in terms of fluency, accuracy, and complexity (e.g., Foster and Skehan, 1996).

Researchers have also pointed out that, when measuring second language development, it is important that tests should match treatment types where possible. It would be problematic, for example, to give a written posttest when the treatment had consisted of oral language use. Finally, attention should be paid to issues of implicit and explicit knowledge (N.C. Ellis, 2005; R. Ellis, 2005). A number of researchers have argued that implicit and explicit knowledge need to be distinguished, and that failure to do so can result in underestimating a learner's development in the L2. For example, if development is operationalized solely as the learners' ability to explicitly formulate a rule, this would only tap into one aspect of their knowledge of the L2 (the explicit aspect). However, learners may very well be able to correct sentences even if they are unable to explain the rule (evidence that implicit learning has occurred). Thus, if a researcher only looked at the learners' ability to formulate a rule, s/he may overlook the implicit learning that has occurred.

In addition to experimental designs, second language researchers have also made extensive use of quasi-experimental designs, or designs which do not involve the random assignment of subjects to control and experimental groups. One type of quasi-experimental design is to give tasks or treatments to individuals in different orders. This approach, which involves repeated measures, entails assessing each participant at multiple points. Gass' (1994) investigation into the reliability of acceptability judgments is an example. Another popular type of research is correlational—this is research that seeks to examine whether there is a relationship between variables (e.g., age of arrival and the learner's proficiency in the L2). Correlational designs have been used to investigate, for instance, learner motivation (Dörnyei and Clément, 2001) and the role of personality in L2 speech production (Dewaele and Furnham, 2000).

The time-series design is also considered quasi-experimental. Although this design is not very common in the field, there are some indications that SLA researchers are beginning to include this method in their research repertoire. This design, which involves neither randomization nor control groups, calls for conducting repeated observations

both before treatment (to establish a baseline) and after treatment (to measure the effects of the treatment)—making it ideal for use in SLA where questions concerning change over time are often asked. Typically used in instances where there is a small participant population or when a single intact group of learners are being investigated, time-series designs have been used to investigate such issues as the effect of dyadic grouping on discourse (Mellow, Reeder, and Forster, 1996) and the effect of recasts on the acquisition of Japanese grammar (Ishida, 2004).

Likewise, factorial designs, which involve more than one independent variable, can be implemented with or without randomization and thus may be considered quasi-experimental. Occasionally employed in L2 research, factorial designs have been used by researchers to measure foreign language aptitude (Grigornko, Sternberg, and Ehrman, 2000) and to investigate the effect of the instructional approach and language of communication in L2 writing tutoring sessions (Cumming and So, 1996) among others. Multifactorial designs have also been used extensively in work on the effect of planning on L2 oral production. Foster and Skehan (1996), for example, used a multifactorial design to examine the effects of task choice (personal information exchange, narrative, and decision making) and implementation conditions (no time for planning, time for planning, and time for detailed planning).

As the field of SLA matures and makes increasing use of more and varied types of research methods, there has come a greater concern for replicability, validity, and reliability. The first, replicability, refers to the ability to repeat a study in the same or different contexts and to obtain the same results. If the results of a study cannot be replicated, this would suggest that the results may have been spurious and would curtail the generalizability of the original study. The fact that few replication studies have been conducted in the field of SLA has led researchers to call not only for more replications, but also for more detailed information in research reports (such as the participants' proficiency levels and how proficiency was assessed)—something which would better enable other researchers to conduct these vital replication studies (e.g., Polio and Gass, 1997).

Validity, or the extent to which one can make correct generalizations based on the result of a particular measure used, is also a concern (e.g., Tarone, 1994). Researchers typically distinguish between two major types of validity: internal validity (the degree to which confounding variables are eliminated) and external validity (the degree to which findings can be generalized to a wider population of learners). Researchers should be aware of various factors which can compromise validity—including participant attrition and maturation, instrument and

test effects, and the nonrepresentativeness of the particular sample of learners at hand—and take adequate steps to minimize the impact of these factors (Mackey and Gass, 2005; Porte, 2002).

The third concern, reliability, is the degree to which results are dependable, and relates to the consistency of scores by different raters (interrater reliability), as well as the consistency of measurements by different instruments (instrument reliability). In recent years, there have been increasing calls for SLA researchers to focus more on reliability, and in particular, to report interrater reliability statistics (e.g., Polio, 1997). If researchers do not provide sufficiently detailed information about how judgments are made (e.g., how an L2 learner's proficiency is assessed) and on the extent of agreement or disagreement between raters with respect to those judgments, this can again compromise the replicability of the study.

Along with expressing a greater concern for these important issues, researchers have sought to continually expand the research horizons of SLA, for example, by making greater use of what is known as split, mixed, or combination methods research, which combines characteristics of both quantitative and qualitative research. Although increasingly common in both the field of SLA and elsewhere, it should be noted that mixed methods have not been without controversy. Some researchers claim that the two approaches are epistemologically and ontologically incompatible, making split methods little more than unprincipled methodological opportunism. However, while the debate is ongoing, there is increasing consensus in various fields that qualitative and quantitative research methods are in fact compatible (Howe, 1988) and that the judicious use of both methods can allow the researcher to examine different aspects of the same problem (e.g., Mackey and Gass, 2005).

While quantitative research can shed light on many aspects of learning and development, qualitative research can offer a different perspective, one that is often grounded in teachers' and learners' experiences and involves taking a more holistic and contextualized perspective on the many factors that interact in second language learning. Used in tandem with quantitative research in a split methods approach, or on its own, qualitative research can yield a clearer understanding of SLA. We turn next to examining qualitative research in more depth.

### *Qualitative Research*

Qualitative research generally refers to research that places primary importance on studying small samples of purposely chosen individuals; *not* attempting to control contextual factors, but rather seeking, through a variety of methods, to understand things from the informants' points of view; and creating a rich, holistic, and in-depth picture of the

phenomena under investigation. There is less of an emphasis on statistics (and concomitant attempts to generalize the results to wider populations) and more of an interest in the individual and his/her immediate context. An additional characteristic that is often mentioned when describing qualitative research is that it is inductive—that is, that it does not begin with hypotheses to be tested or models to be supported, but rather seeks to develop insights from the patterns seen in the data.

While this description stands in contrast with that presented for quantitative research (with its emphasis on randomization, statistics, and generalizability), it should be understood that quantitative and qualitative approaches are not polar opposites (as the traditional labels of “positivistic” and “interpretivist” for quantitative and qualitative research, respectively, sometimes imply; see Fishman, *Theoretical and Historical Perspectives on Researching the Sociology of Language and Education*, Volume 10). It should also be kept in mind that, as will be discussed in more detail later, it is not the case that certain methods (e.g., questionnaires, interviews, tests) are inherently either qualitative or quantitative. Questionnaire results, for example, can be analyzed quantitatively by determining what percentage of respondents answered in a particular manner, or qualitatively, by examining in detail the exact responses individuals provided and using them to triangulate other data from those same participants. It is the researcher’s approach to the data collection and analysis task that may be considered qualitative or quantitative—not the methods themselves.

Keeping in mind the caveat that data collected from various methods can be analyzed either quantitatively or qualitatively, it is nevertheless useful to discuss certain methods that are commonly (but not exclusively) associated with qualitative research in SLA. These include classroom observations, case studies and ethnographies, verbal protocols, diaries and journals, as well as techniques associated with survey-based research such as interviews and questionnaires. Some of these methods may be considered more “etic” in the sense that they focus on the insights of an outside observer, while others are more “emic” in that they seek to gather data about the learners’ perspective.

One commonly used method is the observation. Observational data can be collected through a combination of audio or visual recordings and field notes. Field notes record the researchers’ impressions or questions during the observation. Audio or visual recordings allow researchers to revise and refine their original thoughts, to analyze language use in greater depth, and to make the research available to other researchers who may want to examine or analyze the data. Researchers often choose to use observations to supplement data obtained from interviews, questionnaires, and classroom data, including homework and grading. For example, Bailey (1996) used classroom observations

in her study of teachers' decision-making processes as an important part of data on teachers' behaviors. Her observations, along with written lesson plans, formed the basis of subsequent, in-depth interviews with the teachers.

Another common form of qualitative research in SLA is the case study, a longitudinal, in-depth examination of a single learner or a small group of learners. In case study research, as in most forms of qualitative research, multiple data collection techniques are used together to create an account that is as complete and accurate as possible of learner behaviors, interactions, or development in the research context. This is commonly known as triangulation. Normally, researchers identify the individual or group to study and perform observations in the learning context, conduct interviews with the research participants and others connected to them and to the setting, and gather evidence of second language performance. For example, Watson-Gegeo's (2001) ethnographic work in Hawaiian immersion classrooms involved observing classes and learner behavior outside of class, interviews with students, teachers, parents, and administrators, and the collection of learner language production, homework, tests, grades, and writing samples.

Another method that has received increased attention in recent years is the verbal protocol. This is a method for probing learners' thought processes either during an activity, as in think-aloud protocols, or immediately later, as in retrospective protocols (also known as stimulated recalls) (see Gass and Mackey, 2000). Think-aloud protocols have also been used to investigate processes or strategies related to writing (e.g., Roca de Larios, Manchón, and Murphy, 2006) as well as the role of attention or awareness (e.g., Leow, 1998).

In addition to verbal protocols, SLA researchers have also made extensive use of learner diaries (also referred to as L2 journals or learner autobiographies) to gain a better understanding of the learners' language learning experiences. If a diary task is set up so that learners are able to record any of their impressions or perceptions about learning, they are not constrained by predetermined areas of interest. This allows researchers to uncover new ideas or trends related to learners' internal processes such as attention and memory, as well as learners' uncoached reactions to instructional methods or classroom processes. The influential *noticing hypothesis* of SLA (Schmidt and Frota, 1986), for example, emerged following a diary study. Based on Schmidt's introspective descriptions of his learning opportunities and success at learning abroad, Schmidt and Frota were able to determine that he had noticed forms shortly before beginning to use them. They concluded from this that conscious noticing played a role in language learning. Since diaries represent holistic accounts of language learning from a learner's viewpoint, careful analysis of diaries can yield insights

into the learning process inaccessible from a researcher's perspective or observational data alone.

Questionnaire data, usually considered to be a survey research tool, have also been used to gather more information on learner perspectives, including such aspects as their level of motivation (e.g., Dörnyei and Clément, 2001) and attitudes toward feedback received on L2 written compositions (Hedgcock and Lefkowitz, 1994). Questionnaires can allow researchers to investigate phenomena such as perceptions or motivation that are not observable, as well as allowing them to investigate sufficient quantities of observable phenomenon in a restricted time frame.

Like questionnaire data, interviews can allow researchers to investigate cognitive processes such as awareness, or constructs such as perceptions or attitudes that are not directly observable. There are many reasons why classroom researchers might choose to employ both questionnaire and interview data. For example, some L2 learners are less at ease with writing and are more likely to feel comfortable answering questions and providing informative details in a conversational setting. Conversely, there are learners who find it easier to write than to speak and may benefit from the extra time typically provided in responding to a questionnaire. In addition to learner characteristics, the social dynamics of the two methods should also be considered. Some respondents may be emboldened by the relative anonymity of the questionnaire and provide fuller responses, while others may only give complete details after researcher's probes in an interview setting. Thus, including multiple methods of data collection (e.g., both questionnaires and interviews) can help the researcher obtain richer data.

As with quantitative research, there are practical considerations associated with qualitative research as well, including the need for the research to have credibility, transferability, and dependability. Credibility means that the findings are believable to the research population being studied. Suggestions for enhancing credibility include continuing the data collection procedure with enough intensity over a sufficient length of time to accustom the participants to the research (and thus ensure that they are behaving naturally) and collecting the data in as many contexts and situations as possible (e.g., Fraenkel and Wallen, 2003; Mackey and Gass, 2005). Transferability refers to whether the findings from the study can be applied (or transferred) to other contexts. Although transfer is not the goal of all research, this helps make it possible to draw comparisons across studies. In order to do this, providing a "thick" description—that is, a description which reports in sufficient detail the particulars of the study and its participants—is necessary. Similarly, when the research context and relationships among the participants have been reliably characterized, the research

may be said to be dependable. One way for this to be accomplished is by asking the participants themselves to review the patterns in the data—ideally, data that are electronically recorded so as to help recreate the original context in which the data were gathered.

### WORK IN PROGRESS

Various works in progress today are following the influential meta-analysis carried out by Norris and Ortega (2000) and seeking to synthesize previous research (e.g., Mackey and Goo, *in press*). Mackey and Goo synthesized the findings of interaction research published up until 2006 to investigate the link between interaction and the acquisition of specific grammatical and lexical features. Results provided evidence that groups that were given the opportunity to interact with other speakers of the L2 substantially outperformed control and comparison groups on posttests.

Other new techniques, such as confederate scripting (e.g., McDonough, 2006), also represent promising directions for future research to investigate how speakers coordinate syntactic structures during conversation. In confederate scripting, a participant carries out a task with an interlocutor who, unbeknownst to the participant, is a confederate of the researcher. In interaction research, this has included being given a script containing primes, which are exemplars of the target linguistic structure. Their interaction is structured so that the confederate's prime always immediately precedes the participant's utterance, and syntactic priming is demonstrated when the participants produce the same structure provided by the confederate's prime.

### FUTURE DIRECTIONS

As a relatively young field, SLA has many promising directions to take. These include a greater number of longitudinal studies (e.g., Lardiere, 1998), increased explorations of various language acquisition theories (including frequency-based approaches and connectionist models, e.g., MacWhinney, 2001), more explorations of the social context within which learning occurs (Block, 2003), and more investigations into the neurobiology of acquiring a nonnative language (Schumann, 1998), as well as more studies that investigate the acquisition of a greater variety of languages (beyond English as a second and foreign language).

In addition, as Mackey (2006) points out, the field of SLA would be enriched by greater collaboration with researchers from other disciplines, such as cognitive neuroscience and psycholinguistics. For example, making more extensive use of techniques such as electroencephalography (EEG) and functional magnetic resonance imaging (fMRI) would

provide more information about the neural regions involved in different types of language processing; similarly, more widespread use of techniques such as eye tracking and keystroke tracking may provide richer stimuli for stimulated recalls (Marinis, 2003). Other promising psycholinguistically oriented techniques include using reaction times as measures of processing difficulty and thus as means for determining whether L2 learners and native speakers employ the same processing strategies (e.g., White and Juffs, 1998), as well as the moving window technique (also known as self-paced reading or listening) in which subjects read a sentence word-by-word and then press a button to receive the next word—also to gain more information about the processing of the L2 (e.g., Juffs and Harrington, 1996).

In terms of refining research methodology, there is a need for clearer and more consistent definitions of key constructs (e.g., recasts) across studies (Long, 2006). Researchers have also discussed the importance of greater reliability in elicitation and scoring, pointing out several procedural concerns for how acquisition should be measured in SLA (Norris and Ortega, 2003). Similarly, Chaudron (2003) provides a very comprehensive analysis of methods in use for collecting second language data, pointing out that a variety of procedures are available and using a wide range of measures is desirable for use in order for researchers to obtain the most representative samples of learners' language.

By expanding our research repertoire to make use not only of methods from other disciplines but also of qualitative and split-method approaches; by refining our definitions and measurements of key constructs in SLA; and by seeking to gain a deeper and more holistic understanding of the complex endeavor that is learning a second language, the field of SLA will continue its growth and its ability to enrich our understanding of the human mind, social interactions, and second and foreign language pedagogy.

## THIRD LANGUAGE ACQUISITION RESEARCH METHODS

### INTRODUCTION

Research methods in third language (L3) acquisition are used to address questions about acquisition processes and products, their educational and social contexts, as well as the individual variables involved. The field only started in the late 1980s. Consequently, the methodology is innovative and highly eclectic, with designs borrowed both from linguistics and psychology by way of second language acquisition (SLA) research. Surprisingly for a young field, quantitative, hypothesis-testing studies outnumber qualitative, question-generating designs. Not uncommon are mixed designs combining description and interpretation with descriptive and even inferential statistics. Data are collected both longitudinally and cross-sectionally, often from large samples in tutored contexts, only occasionally following experimental intervention and most often elicited by means of questionnaires, tests, and interviews. The most popular quantitative procedures include analyses of variance (ANOVA), correlations, and regressions.

### EARLY DEVELOPMENTS

In an age of migration and supranational entities it has become widely recognized that multilingualism is the norm rather than the exception. Changes in general attitudes toward minorities have led to greater recognition of language rights and needs of minority populations, sometimes resulting in the development of educational policies that address such rights. Increased communication between European and American researchers is also responsible for the growing interest in trilingualism and L3 acquisition.

In the context of these shifts, a new focus on the relationship between bilingualism and cognition led to laboratory research investigating the role of prior experience on the acquisition of an L3 (McLaughlin and Nayak, 1989; Nation and McLaughlin, 1986; Nayak, Hansen, Krueger, and McLaughlin, 1990). Multilingual subjects (i) were found to habitually exert more effort when processing verbal stimuli; (ii) were better able to shift strategies to restructure their language systems; and (iii) used cognitive processing strategies that facilitated the construction of formal

rules. The designs of these studies are characteristic of the cognitive framework to which they belong. For example, they are experimental and compare the effects of highly controlled, computer-generated treatments on the acquisition of an artificial grammar. Conclusions are based on results from ANOVAs and post-hocs on accuracy and latency data.

From a Chomskyan approach, but also process-oriented in nature, Klein's investigation (1995) of the acquisition of the preposition-stranding parameter by ESL learners shows that multilinguals and monolinguals produce the same type of errors but multilinguals learn faster because they more efficiently identify the key verbs that trigger the parameter. This result indicates that prior language experience promotes noticing of key elements in the input.

The establishment of immersion programs in Canada and later in Europe led to a series of product-oriented studies. This work aimed to provide insight into appropriate timing and procedures for the incorporation of foreign languages (L3s) into bilingual curriculum; to properly document the development of different types of immersion programs, and to investigate the underlying psychosocial variables involved. Cenoz and Valencia's (1994) comparison of English proficiency among students instructed in the minority (Basque) or majority language (Spanish) yielded evidence in favor of bilingualism and bilingual education as contributors to L3 learning, independent of cognitive, sociostructural, sociopsychological, and educational variables, as well as independent of the first language (L1). Sanz (2000) compared L3 (English) acquisition of bilingual Catalan/Spanish in a Catalan immersion program with monolinguals from a Spanish region with parallel results. In turn, Swain, Lapkin, Rowen, and Hart (1990) investigated the effect of L1 literacy on L3 (French) learning in Toronto and found that knowledge of a heritage language had little facilitative effect on L3 acquisition without L1 literacy. Their conclusions support Cummins' (1981) linguistic interdependence hypothesis, according to which children learn to use language as a symbolic system while acquiring literacy skills in their first language (see Cummins, Vol. X). As a result, learners are able to generalize linguistic information in a way that can be transferred to subsequent language learning contexts. However, counter-evidence for this relationship also exists: Wagner, Spratt, and Ezzaki's (1989) study of Berber and Arab children in Morocco concludes that L1 literacy is not necessary to achieve native-like literacy norms in Arabic or French.

A possible explanation for the difference is the status of the languages involved; indeed, socioeducational variables are likely an important component of L3 acquisition. For this reason, more research within different sociolinguistic contexts (Lambert, 1981) is important. One

challenge in making cross-context comparisons, however, is the striking methodological differences across L3 research. For instance, Wagner and group (1989) is a 6-year longitudinal study of primary school literacy in three languages, whereas Swain and group (1990), Cenoz and Valencia (1994), and Sanz (2000) are cross-sectional designs focused on general linguistic ability, and include older participants. Despite their differences, these designs are characterized by their product-oriented nature; large sample sizes; complex batteries of attitudinal, motivational, and background questionnaires; nonlanguage-based IQ tests, attention to language knowledge and use patterns; and a preference for correlations and regressions. Importantly, they overcome the methodological limitations that plagued research prior to the 1960s, when socioeconomic status, intelligence, and bilingualism were usually confounded (see Wei, *Research Perspectives on Bilingualism and Bilingual Education*, Volume 10).

### MAJOR CONTRIBUTIONS

*The International Conference on Multilingualism*, which takes place annually, focuses exclusively on L3. In addition, research on L3 acquisition is presented at the *International Conference on Child Language*, *American Association for Applied Linguistics Conference*, and *EuroSLA*. As for publications, articles have appeared in *Applied Psycholinguistics*, *ITL of Applied Linguistics*, *EUROSLA Yearbooks*, *Spanish Applied Linguistics*, *TESOL Quarterly*, *International Journal of Bilingualism*, *Language Learning*, and *Canadian Modern Language Review*. *Multilingual Matters* is the main outlet for books on trilingualism and L3 acquisition. Although some of these volumes include reviews or descriptions of the role of language in education, the majority of chapters report on case or experimental studies. The remainder of this section presents a summary of each of these volumes. Methodological details—including sample, languages, materials, analysis and conclusions—are provided in [Tables 1](#) (quantitative studies) and [2](#) (qualitative studies).

The volumes by Cenoz and Jessner (2000) (code 1 in [Tables 1](#) and [2](#)) and Cenoz, Hufesein, and Jessner (2001b) (code 2) provide an up-to-date overview of the sociolinguistic, psycholinguistic, and educational aspects of L3 learning. Even though Cenoz and Jessner (2000) focus on the acquisition of English in Europe, both volumes contain papers from differing theoretical perspectives and cover many issues that are relevant for researchers and educators from other parts of the world.

The publication of these two volumes introduced general issues in L3 learning. They lead to the publication of others focusing on more specific, key issues in the field, such as transfer and age. In 2001, Cenoz, Hufesein, and Jessner also published *Cross-Linguistic Influence*

in *Third Language Acquisition: Psycholinguistic Perspectives* (code 3), a collection of nine studies on transfer among nonprimary languages. They identify intervening psycholinguistic factors such as linguistic distance, competence, age of acquisition, recency, degree of pragmatic formality, amount of formal instruction, and frequency and contextual use of both languages. The studies further examine how these factors interact to predict and explain the frequency and direction of cross-linguistic transfers. The role of psychotypology [e.g., language is psychologically perceived as closer or further in terms of language distance (Kellerman, 1983)] appears repeatedly in this volume. Except for Fouser's chapter, which examines the acquisition and use of Korean honorific expressions, this volume largely focuses on lexical production.

The age factor in foreign language learning is the topic of the edited volume by García Mayo and García Lecumberri (2003) (code 4) that provides an overview of current research on the age factor in foreign language learning, addressing issues which are critical for language planning. This line of research has been followed mainly by the BCN-SLA group (Barcelona-Second Language Acquisition, <http://www.ub.es/filoan/BCN-SLA/BCN-SLA.html>) and the Research in English Applied Linguistics group at the University of the Basque Country (REAL, <http://www.vc.ehu.es/depfi/real>). The studies have investigated the role of age of first exposure to L3 learning, not only in terms of general language proficiency (e.g., grammar, vocabulary, fluency) but also in terms of specific aspects of L3 acquisition such as the pro-drop parameter. Both groups show that 11-year-olds learn faster than 8-year-olds, which compensates for any advantage provided by longer exposure that younger students may have. The similarity in results obtained by both lines of research despite differences in language distance and samples strengthen the conclusions, also reinforced by the high quality of the design: longitudinal, with a large sample.

#### WORK IN PROGRESS

The BCN/SLA and the REAL groups continue to investigate the role of motivation and attitudes towards the L3 and its speakers and the impact of socioeconomic status, age, gender and intelligence on general L3 (English) proficiency, with a focus on the following three variables: age of first exposure to L3, educational context (in the Basque Country where different educational models coexist), and level of oral and written L1 and L2 knowledge. Work in progress continues to suggest that increasing the number of hours of exposure to the L3 by implementing L3 teaching early in the academic program does not lead to higher language proficiency. Also, Sanz's (forthcoming) work likewise supports Swain and group's results (1990): self-perceived balanced bilingualism

at the written level in terms of literacy skills explains successful L3 learning in terms of efficiency as shown by speed and level of attainment. In Catalonia and the Basque Country, balanced bilingualism is the outcome of minority immersion programs (Sanz, forthcoming). Said studies that focus on general and specific aspects of L3 proficiency, are cross-sectional and longitudinal, and most of them include large samples of child and adolescent learners. Analysis of variance, correlations and regressions are the preferred procedures.

This and previous research concludes that there is an advantage in favor of bilinguals over monolinguals when it comes to L3 acquisition. However, why do bilinguals pick up other languages faster? Bialystok (2001) proposes that the bilingual advantage emerges under ambiguous conditions, which suggests that the advantage is related to the ability to control attention when processing information. Research now in progress at Georgetown University is picking up where McLaughlin's group (see Sanz, forthcoming) left off in the 1980s. Sanz's Latin Project is an investigation of the interaction between prior linguistic knowledge (level of bilingualism), and the type of input (varying in degrees of explicitness) that includes cognitive variables (working memory and awareness) as moderating variables.

The design of all these studies is experimental, with treatments and tests (pre, post and delayed) delivered through computer. Eight different conditions combine explicit input (before and during practice as part of feedback), input-based practice, implicit input, and exposure. The effects are measured by oral and written interpretation tests, grammaticality judgement tests, and production tests, which include old (items present in the treatment) and new items. Both accuracy and latency data are recorded. Computers also administer a battery of working memory tests (one language based, two digit span tests), debriefing questionnaires, and gather think aloud data, to study the role of awareness during online processing. Recent implementations also include the MLAT and phonological short-term memory tests. The focus is on processing strategies, specifically the use of word order, case, and number morphology to assign semantic functions (who does what to whom) in L3 Latin by native speakers of English (L2 Spanish), Spanish (L2 English), and Chinese (L2 English). Latin is a natural language, which strengthens the study's validity while simultaneously allowing control for prior knowledge. The studies identified critical differences between levels that emerge under more demanding conditions, specifically, in treatment 2, which provided less grammatical information, and for items that were present in the tests but not the treatment (Bialystok, 1988; Bialystok, Craik, Klein, and Viswanathan, 2004; Nation and McLaughlin, 1986). Evidence that experienced bilinguals outperform less experienced bilinguals under more difficult external

conditions has implications for language policy and bilingual education, as this work illustrates that a certain level of bilingualism needs to be reached before learners can reap the benefits of their bilingual experience. The study also finds evidence that greater cognitive capacity is related to higher rate and achievement level. This evidence emerges depending on the nature of the treatment and the measurements. Specifically, the more explicit treatment (i.e., the one with more grammatical information), levels the field for all learners (Sanz, 2005; a description is available at <http://www.georgetown.edu/faculty/sanzc/>).

### PROBLEMS AND DIFFICULTIES

L3 acquisition and use are complex phenomena and researching them requires sophisticated designs. The challenges are many, stemming from four basic components of the design: sample, constructs, measurements, and analyses.

In order to answer some of the questions, especially those that require multifactorial, correlational types of analyses, researchers need to identify large, homogeneous samples. This is no easy task because such participants are not always available or willing. In addition, institutional review boards make it difficult to include certain items in questionnaires or certain treatments in the design, citing the potential for lawsuits concerning discrimination based on gender, race, or place of origin, all of which provides another reason to establish limits to the proportion of minorities in the sample. Obtaining a homogeneous sample, especially in terms of knowledge, frequency of use, and age of acquisition of the three languages involved is a major achievement in and of itself.

Most constructs, including motivation, aptitude, and awareness, are elusive, difficult to define, operationalize and measure. It is often necessary to reformulate the tests, recode, and revise the procedures after a discussion among raters to avoid inter-rater reliability problems. The inclusion of certain procedures, for example, requiring learners to think aloud while completing a treatment in order to measure awareness, might turn against the researcher by altering the very same processes under investigation (i.e., reactivity). The construct L3 *proficiency* is especially problematic both because it assumes a standard variety and because it includes a multiplicity of elements (e.g., oral and written productive and receptive skills). Furthermore: Is the multilingual's proficiency in any of their languages the same as that of monolinguals? While there are a number of proficiency tests available, they are not sufficiently fine grained to evaluate highly skilled multilinguals.

Naturally, because constructs are hard to define, measurements also suffer. A classic example is the MLAT, a measure of aptitude to learn

nonnative languages. Aptitude is actually a macro concept made up of four smaller constructs (phonetic coding ability, rote learning ability, grammatical sensibility, and inductive language learning). Due to its multicomponential nature, any results associated with higher or lower aptitude do not actually inform us about the specific microconstruct which ultimately accounts for the results. Recent operationalizations of aptitude also include working memory and phonological short-term memory.

Regressions and correlations are the preferred procedures in quantitative studies because L3 acquisition and use is multifactorial and demands an interactive approach, which leads to several problems. First, it demands large samples. Also, while these analyses clearly establish relationships among the factors, the direction of the relationship is left to interpretation. Moreover, a relationship does not imply cause and effect. Finally, the variety of methods implemented and the lack of replication are a challenge for any scholar trying to draw general conclusions for the research (Sanz, 1997).

#### FUTURE DIRECTIONS

L3 research is such a new field that it can only expand and deepen its methodology to both isolate the internal and external variables involved in L3 learning and to account for their multiple interactions. Scholars will continue to not only borrow and refine methods from linguistic and cognitive approaches to SLA, but also to create their own. Methods will expand to include research on the acquisition of nonprimary languages in formal contexts, case studies, and laboratory research.

Research on the acquisition of nonprimary languages in formal contexts with an emphasis on the outcomes (as influenced by type of bilingual program, language status, and language typology) will extend to include different sociolinguistic contexts, especially in developing countries. As Eastern European states join the European Union and new common markets are created—take Brazil, Argentina, and Chile as example—a growing need for new measurement techniques of factors such as, for example, socioeconomic status and language proficiency, will emerge. Language proficiency tests will be developed for highly skilled bilinguals.

Question-generating case studies will continue, as they are necessary in a young field in which homogeneity in the sample is extremely difficult to achieve. For certain types of questions, especially those related to transfer, case studies will continue to be the best way to proceed. Another advantage of case studies is that they allow the learner's voice to be heard. To include the learners' reactions is a growing trend in language research in general, including laboratory research, resulting in

mixed designs that combine highly controlled procedures with debriefing questionnaires and stimulated recalls, for example. As a result, a combination of micro, macro, and learner-centered designs will develop. Take for example the study of motivation. Gardner's macro model (Masgoret and Gardner, 2003) for bilingual contexts and immersion programs and Dörnyei's (2002) task-based micromodel for the foreign language classroom will certainly need to be adapted to new populations. Rather than an exclusive top-down approach, which imposes theoretical models on a population, a bottom-up model, i.e., an investigation, through interviews of motivational underpinnings of L3 language acquisition for the specific sample, will triangulate the process.

Finally, laboratory research within the cognitive framework will continue to increasingly implement computers in the design as more and larger laboratories become available, research institutions hire technicians, and software becomes more affordable. Computers allow for highly controlled treatments and data gathering procedures. Moreover, they let researchers track learners' performance, manipulate the amount and type of input presented, and even individually adapt it based on performance. They also facilitate the inclusion of reaction time—not just accuracy—data in the design, expanding our view of learners' performance. Theoretical developments in neurolinguistics, closely tied to advances in neuroimaging techniques, although still rare in SLA, will certainly reach L3 research soon. This new line of research will contribute to our knowledge of internal factors, including individual differences, and their interaction with external factors, which is necessary to explain such a complex phenomenon as L3 acquisition.

## RESEARCH PERSPECTIVES ON BILINGUALISM AND BILINGUAL EDUCATION

### INTRODUCTION

This chapter outlines various research perspectives on bilingualism and bilingual education. Three broad perspectives within this interdisciplinary area are identified: linguistic, psycholinguistic and sociolinguistic. The chapter focuses on theoretical questions and methodological approaches within each of the three broad perspectives, highlighting the differences and links across each.

### EARLY DEVELOPMENTS

Bilingualism and bilingual education became a major focus of scientific research only in the last century, especially since the 1970s. Two disciplines that have influenced much of the research on bilingualism and bilingual education are linguistics and psychology. The research agenda of much of modern linguistics was defined by Chomsky (1986) as consisting of three basic questions:

1. What constitutes knowledge of language?
2. How is knowledge of language acquired?
3. How is knowledge of language put to use?

For bilingualism research, these questions can be rephrased to take into account knowledge of more than one language:

1. What is the nature of language or grammar in a bilingual person's mind and how do two systems of language knowledge co-exist and interact?
2. How is more than one grammatical system acquired, either simultaneously or sequentially? In what respects does bilingual acquisition differ from monolingual acquisition?
3. How is the knowledge of two or more languages used by the same speaker in bilingual interaction?

Linguists and psychologists working on bilingualism have addressed these questions with a variety of methods and types of data.

Concerning bilingual knowledge, for example, Weinreich (1953) proposed three types of bilinguals (see [Figure 1](#)) representing three types of relationships between the linguistic sign (or signifier) and the semantic content (signified). In Type A, the individual combines a

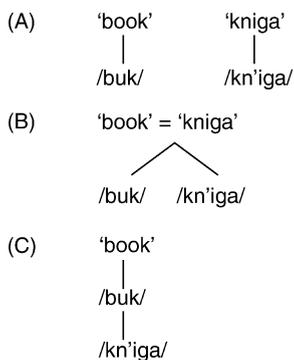

Figure 1 Three types of bilinguals.

signifier from each language with a separate unit of signified. Weinreich called such individuals 'coordinative' (later often called 'coordinate') bilinguals. In Type B, the individual identifies two signifiers, but regards them as a single compound, or composite, unit of signified; hence 'compound' bilinguals. Type C refers to people who learn a new language with the help of a previously acquired one. They are called 'subordinative' (or 'subordinate') bilinguals. His examples for each type were from English and Russian.

Weinreich's typology is often misinterpreted in the literature as referring to differences in proficiency in each language. But in fact the relationship between language proficiency and cognitive organisation of the bilingual individual is far from clear in Weinreich's model. Weinreich argued that some 'subordinate' bilinguals demonstrated a very high level of proficiency in processing both languages, as evidenced in grammaticality and fluency of speech, while some 'coordinative' bilinguals showed difficulties in processing two languages simultaneously (i.e. in code-switching or in 'foreign' words identification tasks). Using Weinreich's distinctions, bilinguals are distributed along a continuum from a subordinate or compound end to a coordinate end, and can at the same time be more subordinate or compound for certain concepts and more coordinate for others, depending on, for instance, the age and context of acquisition.

On the acquisition of bilingual knowledge, both linguists and psychologists have intensively studied language development of bilingual children. For instance, in an early study, Volterra and Taeschner (1978) suggested three key stages of lexical and syntactic development among children exposed to two languages:

Stage I: The child has one lexical system comprising words from both languages.

Stage II: The child distinguishes two different lexicons, but applies the same syntactic rules to both languages.

Stage III: The child speaks two languages differentiated both in lexicon and syntax, but each language is associated with the person who uses that language.

Although there is some research support for Volterra and Taeschner's model, it has also been heavily critiqued, especially with respect to the first two stages (e.g. De Houwer, 1990; Genesee, 1989; Meisel, 1989). This is generally known as the 'one-system-or-two' debate, i.e. do bilingual children begin with a fused linguistic system and gradually differentiate the two languages or do they start with a differentiated system? Part of that debate centres around the question: what counts as evidence for differentiation or fusion? Volterra and Taeschner (1978), for instance, based their decision on whether the child made appropriate sociolinguistic choices, i.e. whether the child spoke the 'right' language to the 'right' person. They argued that awareness of the two languages as distinct plays a crucial role in deciding the issue of differentiation, and a child's ability to make appropriate language choices reflects that awareness. However, as McLaughlin (1984) points out, this is a circular argument unless some criterion is provided for assessing what is meant by awareness other than that children separate the languages. A child's apparent (in)ability to choose the right language for the right addressee is a rather different issue from whether the child has one or two linguistic systems. There now exists a large body of literature rebutting the 'fused' system hypothesis, suggesting instead that bilinguals have two distinct but interdependent systems from the very start (see Genesee, 2002; Meisel, 2004).

Research on bilingual language use began with broad descriptions of language choice patterns. Fishman's domain analysis (1965), for example, outlined the ways in which speakers make their language choices according to topic, setting and participant. Gumperz (1982) identified a range of discourse functions of bilingual code-switching, which he defined as alternation of language within an interactional episode. Such functions include for instance quotation, addressee specification, interjections and reiteration (Gumperz, 1982). In the meantime, linguists proposed various grammatical constraints on code-switching (e.g. Myers-Scotton, 1993; Poplack, 1980). Such descriptive accounts laid the foundation for subsequent research on bilingual interaction.

The earliest work on bilingual education in turn was heavily influenced by the widespread view in the field of psychology that bilingualism had a detrimental effect on a human being's intellectual and spiritual growth. The following is a quote from a professor at Cambridge University, which illustrates the dominant belief of the time, even among academics and intellectuals:

If it were possible for a child to live in two languages at once equally well, so much the worse. His intellectual and spiritual growth would not thereby be doubled, but halved. Unity of mind and character would have great difficulty in asserting itself in such circumstances. (Laurie, 1890, p. 15)

Laurie's quote represents a commonly held belief through the twentieth century that bilingualism disadvantages rather than advantages one's intellectual development. The early research on bilingualism and cognition tended to confirm this negative view point, finding that monolinguals were superior to bilinguals on intelligence tests. One of the most widely cited studies was done by Saer (1923), who studied 1,400 Welsh-English bilingual children between the ages of seven and 14 in five rural and two urban areas of Wales. A 10-point difference in IQ was found between the bilinguals and the monolingual English speakers from rural backgrounds. Saer concluded that bilinguals were mentally confused and at an intellectual disadvantage compared with monolinguals. It was further suggested, with a follow-up study of university students, that 'the difference in mental ability as revealed by intelligence tests is of a permanent nature since it persists in students throughout their university career' (1924, p. 53).

A later version of this deficient view of bilingual children manifested in the term 'semilingual'. Semilinguals were believed to have linguistic deficits in six areas of language (see Hansegard, 1975; Skutnabb-Kangas, 1981):

1. Size of vocabulary
2. Correctness of language
3. Unconscious processing of language
4. Language creation
5. Mastery of the functions of language
6. Meanings and imagery

It is significant that the term 'semilingualism' emerged in connection with the study of language skills of people belonging to immigrant and ethnic minority groups. Supporting research was conducted in Scandinavia and North America and was concerned with accounting for the educational outcomes of submersion programmes, where minority children were taught through the medium of the majority language. However, these studies, like the ones conducted by Saer, had at least four methodological flaws (MacSwan, 2000). First, the tests which were used to measure language proficiencies were insensitive to the qualitative aspects of language use. Language may be specific to a context; a person may be competent in some contexts but not in others. Second, as bilingual children are still in the process of developing their languages, it is not valid to compare them to some idealised adults.

Third, the comparison with monolinguals is also unfair. It is important to recognise that bilinguals are ‘naturally’ qualitatively and quantitatively different from monolinguals in their use of the two languages, i.e. as a function of being bilingual. Fourth, if participants’ languages are relatively underdeveloped, the origins may not be in bilingualism per se, but in the economic, political and social conditions that evoke under-development. Monolingual and bilinguals in these studies were not comparable in other respects (e.g., SES), so results were confounded.

## MAJOR CONTRIBUTIONS

### *Psycholinguistic Approaches to Bilingualism*

Many of the questions first raised in these earlier studies were challenged by subsequent research, using better methodologies and technologies. For example, current psycholinguistic models of the bilingual lexicon [e.g., Potter, So, Von Echaradt and Feldman’s (1984) Concept Mediation Model and the Word Association model, and Kroll and Stewart’s (1994) Revised Hierarchical Model] take into consideration proficiency level, age and context of acquisition and have much great explanatory power.

Psycholinguists also have used the latest functional neuroimaging technologies to investigate the cognitive organisation of languages in the bilingual brain (see Abutalebi, Cappa and Perani, 2005). The key research question here is the relationship between the neurobiological substrate for multiple languages and environmental influences such as age of acquisition, exposure and proficiency. Whilst the patterns of brain activation associated with tasks that engage specific aspects of linguistic processing are remarkably consistent across different languages and different speakers, factors such as proficiency seem to have a major modulating effect on brain activity: more extensive cerebral activations associated with production in the less-proficient language and smaller activations with comprehending the less proficient language.

In terms of acquisition of bilingual knowledge, a more interesting question than the one-or-two-systems debate has emerged. Specifically, is bilingual acquisition the same as monolingual acquisition? Theoretically, separate development is possible without there being any similarity with monolingual acquisition. Most researchers argue that bilingual children’s language development is by and large the same as that of monolingual children (Meisel, 2004). In general terms, both bilingual and monolingual children go through an initial babbling stage, followed by the one-word stage, the two-word stage, the multi-word stage

and the multi-clause stage. At the morphosyntactic level, a number of studies have reported similarities rather than differences between bilingual and monolingual acquisition. Nevertheless, one needs to be careful in the kinds of conclusions one draws from such evidence. Similarities between bilingual and monolingual acquisition do not mean that (i) the two languages a bilingual child is acquiring develops in the same way or at the same speed; (ii) the two languages a bilingual child is acquiring do not influence and interact with each other.

There is one area in which bilingual children clearly differ from monolingual children, namely, code-mixing. Studies show that bilingual children mix elements from both languages in the same utterance as soon as they can produce two-word utterances (e.g. De Houwer, 1990; Deuchar and Quay, 2000; Lanza, 1997). As with adult code-switching, bilingual children's language mixing is highly structured. The operation of constraints based on surface features of grammar, such as word order is evident from the two-word/-morpheme stage onward, and the operation of constraints based on abstract notions of grammatical knowledge is most evident in bilingual children once they demonstrate such knowledge overtly (e.g. verb tense and agreement markings), usually around 2.6 years of age and older (Koppe and Meisel, 1995; Meisel, 1994). As Genesee (2002) points out, these findings suggest that in addition to the linguistic competence to formulate correct monolingual strings, bilingual children have the added capacity to co-ordinate their two languages on-line in accordance with the grammatical constraints of both languages during mixing. While these studies provide further evidence for the separate development, or two systems, argument, they also suggest that there are both quantitative and qualitative differences between bilingual acquisition and monolingual acquisition.

Psycholinguistic approaches to bilingualism have offered insights into how multiple languages are simultaneously acquired and represented by the bilingual individual. The typical methods psycholinguists use tend to be laboratory based, using carefully designed experiments or standard assessments. These methods, together with the theoretical models that psycholinguists have developed, have enhanced the status of bilingualism research in the scientific community. Nevertheless, the transfer of the scientific knowledge of bilingualism to real-world issues, such as the education of bilingual and multilingual children in schools and communities, remains a challenge.

### *Sociolinguistic Approaches to Bilingualism*

In contrast to linguistic and psycholinguistic researchers, sociolinguists see bilingualism and multilingualism as socially constructed

phenomena and the bilingual and multilingual person as a social actor. For the multilingual speaker, language choice is not only an effective means of communication but also an act of identity (Le Page and Tabouret-Keller, 1985). Every time we say something in one language instead of another we are reconnecting with people, situations and power configurations from our history of past interactions and imprinting on that history our attitudes towards the people and languages concerned. Through language choice, we maintain and change ethnic group boundaries and personal relationships, and construct and define 'self' and 'other' within a broader political economy and historical context. Issues of identity and identification are paramount for the sociolinguist.

In early variationist sociolinguistic work (e.g. Labov, 1972), identity was taken to mean the speaker's social economic class, gender, age or place of origin. It was assumed that speakers expressed identities through their language use. Scholars such as Cameron (1990) and Johnstone (1996) strongly criticised such assumption, arguing that identities are negotiated through social interaction. Further, linguistic forms and strategies have multiple functions and cannot be directly linked to particular identities outside of interactional contexts. Work by Rampton (1995, 1999) and Lo (1999), for example, demonstrated how identities are locally constructed. More recent work by Pavlenko and Blackledge (e.g. Blackledge and Pavlenko, 2001; Pavlenko and Blackledge, 2004), using critical discourse analysis, emphasises the negotiation of identities.

The idea that identity is negotiable can be traced back to the work of social psychologists, who were interested in group processes and inter-group relations (e.g. Tajfel, 1974, 1981). Identity, from this particular perspective, is reflective self-image, constructed, experienced and communicated by the individual within a group. Negotiation is seen as a transactional process, in which individuals attempt to evoke, assert, define, modify, challenge and/or support their own and others' desired self-images (Ting-Toomey, 1999). Identity domains such as ethnic, gender, relational, facework are seen as crucial for everyday interaction. Speakers feel a sense of identity security in a culturally familiar environment, but insecurity in a culturally unfamiliar environment. Satisfactory identity negotiation outcomes would include the feelings of being understood, valued, supported and respected.

There are two major problems with such an approach. First, the categories used in the analysis are often rigid and ill-defined and have a monolingual and unicultural bias. The world is often seen as consisting of 'them' and 'us', 'in-group' and 'out-group', or 'we code' and 'they code'. The so-called negotiation, in this particular perspective, is unidirectional—the native speaker abandoning (or at least modifying) his or her first language and culture in order to learn the language of the host culture. This process is often known as 'convergence' or

'acculturation'. The second major problem concerns the approach's static and homogeneous view of culture and society. It does not take into account the historical, ideological, economic processes that led to the present social grouping or stratification (see Heller, 1999).

Adopting a post-structuralist approach to the notion of identity, Pavlenko and Blackledge (e.g. Blackledge and Pavlenko, 2001; Pavlenko and Blackledge, 2004) argue that the relationship between language and identity is mutually constitutive and that identities are multiple, dynamic and subject to change. For them, negotiation of identities is the interplay between reflective positioning (after Davies and Harre, 1990), that is, self-representation and interactive positioning, whereby others attempt to reposition particular individuals or groups. Their analyses of multilingualism and identities in a variety of social contexts demonstrate that languages are appropriated to legitimise, challenge and negotiate particular identities, and to open new identity options. Identity options as constructed, validated and performed through discourses available to individuals at particular times and places—that is, certain linguistic resources may be available to certain groups of speakers, while others may not (Tabouret-Keller, 1997).

Parallel to the work on multilingualism and negotiation of identities, sociolinguists critically examine some of the concepts and notions commonly used by other researchers in the field of bilingualism and multilingualism. For example, the very idea of code-switching raises questions as to what a language is. Instead of thinking of languages as discrete systems, sociolinguists tend to see multilingual speakers as actors of social life who draw on complex sets of communicative resources which are unevenly distributed and unevenly valued (Heller, 1999). The linguistic systematicity therefore appears to be at least as much a function of historically rooted ideologies (of nation and ethnicity) and of the ordering practices of social life as of language per se (Gal and Irvine, 1995). This perspective goes beyond a focus on mental representation of linguistic knowledge and opens up the possibility of looking at bilingualism and multilingualism as a matter of ideology, communicative practice and social process.

This particular sociolinguistic perspective has important implications for the way researchers collect, analyse and interpret data. Informed by developments in anthropology, sociology and cultural studies, sociolinguists have examined communicative practices within and across sites that can be ethnographically demonstrated to be linked. Working with the ideas of *trajectories* (of speakers, linguistic resources, discourses, institutions) across time and space and of *discursive spaces* which allow for, and also constrain, the production and circulation of discourses, Heller (e.g. 1995, 1999) has examined multilingual practices

in a number of communities and argued that multilingual practices contribute to the construction of social boundaries and of the resources those boundaries regulate. They therefore also raise the question of the social and historical conditions which allow for the development of particular regimes of language, for their reproduction, their contestation, and eventually, their modification or transformation.

A further, closely related area in which sociolinguists have extended the work by linguists and psycholinguists on bilingualism is that of the acquisition of linguistic knowledge. Building on earlier research on language socialisation, which focused on young children acquiring their first language in culturally specific ways, scholars such as Crago (Crago, Annahatak and Ningiuruvik, 1993), Kulick (1992), Schecter and Bayley (2002) and Zentella (1997) examine bilingual and multilingual children's developing competence in various speech and literacy events. Particular attention is given to the range of linguistic resources available, or not, in bilingual and multilingual communities and the ways in which children, as well as adolescents and adults, learn to choose among these resources for their symbolic value. The researchers emphasised language socialization as an interactive process, in which those being socialised also act as agents rather than as mere passive initiates. This line of inquiry also demonstrates how domains of knowledge are constructed through language and cultural practices, and how the individual's positioning affects the process of knowledge acquisition and construction (Bayley and Schecter, 2003).

### *Current Work on Bilingual Education*

Whilst traditional research questions (e.g. cognitive advantages and disadvantages of bilingualism for children, bilingual assessment, bilingual classroom interaction and language-in-education policy) continue to influence research on bilingual education, an important strand in the current bilingual education research examines how new minority communities respond to the lack of status accorded to them and their languages. Mainstream education in many contexts neglects the real-life social experiences of cultural and linguistic diversity (e.g. Hornberger, 1991). As a result, new minority communities often set up schools themselves in order to promote their cultures and languages. Indeed, in the UK, the government has put the issue of language and cultural maintenance in the hands of the new minorities themselves, and such educational provision has been set up in addition to the education provided by the state (Martin, Bhatt, Bhojani and Creese, 2004).

This form of community language education has provided a 'safe' but largely hidden space in which specific communities can learn about

their own cultures and languages. Although there has been a large amount of work in Britain, North America and Australia which points to crucial connections between minority communities and their languages, cultures, religions, literacy practices and identities (e.g. Clyne, 1991; Heller and Martin-Jones, 2001), there is a dearth of studies which focus specifically on community language education initiatives. Much of the work which is available demonstrates how ethnic minority children benefit from their multilingualism and the bilingual opportunities which the schools provide. For example, Hall, Kamil, Mohsin and Jon (2002) note how attendance at supplementary schools provides 'a way of reclaiming the specificity of cultural and social identity . . . missing from mainstream schooling'. In their comparative study of provision, purposes and pedagogy of supplementary schooling in Leeds (UK) and Oslo (Norway), they found that supplementary education 'imbues its participants with a sense of belonging to a community that supports them practically, culturally, socially, emotionally and spiritually' (Hall, Kamil, Mohsin and Jon, 2002, p. 410). These important issues can be linked back to the social experiences of using languages, rather than simply the celebration of linguistic diversity. Such educational opportunities provide a safe haven for young people from the new minorities to use their bilingualism in creative and flexible ways (cf. Martin, Bhatt, Bhojani and Creese, 2006). Critically, little is still known about the educational pedagogies of such schooling as well as the relationship between mainstream and supplementary education.

#### CHALLENGES AND FUTURE DIRECTIONS

The highly politicised nature of bilingual education, especially the education of children from immigrant and minority ethnic backgrounds, poses an important challenge to both policy and research in this area. Important questions need to be addressed, such as: Why are there different viewpoints about linguistic minorities and bilingual education? Why do some people prefer the assimilation of linguistic minorities and others prefer linguistic diversity? What role can schools play in a more multicultural and less racist society? Ideally, a bilingual educational programme should aim to produce bilingual products in the form of bilingual speakers; though in practice it is often the case only one language is taught or used in the actual classroom. Many of the so-called bilingual education programmes in the UK and Europe, for example, are in fact English or other European languages programmes for children whose first languages are different. In the meantime, the heritage/community language schools often insist on teaching or using their heritage/community language only. The official discourse does

not encourage students and teachers to practice bilingualism in the heritage/community education context.

Yet the most important feature of a bilingual being is bilingual practice, and the form of practice that is most distinctly bilingual is code-switching. In the last four decades, code-switching has attracted a considerable amount of interest in various branches of linguistics, including sociolinguistics and psycholinguistics. The vast majority of this work, however, focuses on non-institutional contexts. There is an urgent need to extend our knowledge of code-switching in specific institutional contexts, for example, the classroom. Real tensions are often found in such educational contexts. Whereas code-switching in the community is regarded as acceptable bilingual talk, the same cannot be said to be the case for many classroom contexts (Canagarajah, 2005; Lin and Martin, 2005). Indeed, the literature on classroom code-switching is littered with metaphors which underpin such conflict. For example, the notions of 'collusion' (Arthur, 1996), 'safe talk' (Chick, 1996), 'sabotage' (Martin, 2005) and 'incomplete journeys' (Setati, Adler, Reed and Bapoo, 2002). Further research on the use, conflict and tensions of code-switching in the classroom will not only help to focus on what really matters to bilingual individuals in real life but also extend and link the fields of education, linguistics, psycholinguistics and sociolinguistics (see also Lin, *Code-switching in the Classroom: Research Paradigms and Approaches*, Volume 10).

RESEARCH APPROACHES TO NARRATIVE,  
LITERACY, AND EDUCATION

INTRODUCTION

Narratives rest at the core of human activity and relationships. Since ancient times, scholars and thinkers have conceptualized and analyzed narratives from diverse disciplinary perspectives. In this chapter, we define narrative as a genre of oral discourse that characterizes and facilitates culturally determined ways of communicating lived or imaginary events to others. We see narrative as a linguistic tool that represents ideas and past actions in memory, structures and evaluates present experiences, and helps humans make sense of the world around them. Loyal to this definition, narrative, literacy, and education are intimately intertwined, as early narratives lay the foundation for literacy development, and literacy, in turn, is the cornerstone of a successful formal education. Here we review past and current work addressing children's narrative development and the connections between their oral narrative abilities and the skills necessary for their ultimate educational success.

EARLY DEVELOPMENTS

The study of oral narrative has its roots in structuralist investigations of written narrative. In one of the earliest works, *Morphology of the Folk Tale*, Propp (1928), a Russian scholar, analyzed the basic plot components of fairy tales to derive their simplest irreducible narrative elements. Nonetheless, the most influential study for the contemporary narrative orientation used in the present review is the one conducted by Labov and Waletzky (1967). Their seminal work was first presented in the spring of 1966 as a conference paper in the meeting of the American Ethnological Society. Breaking from the long-standing tradition of studying written narratives, Labov and Waletzky paved the way for the investigation of oral stories of personal experience, that is, of narratives in their everyday context. Their work focused mostly, as had Propp's (1927), on the structural aspects of narratives. They outlined the basic units of narrative analyses (e.g., clauses) and formulated their basic structure and organization (i.e., high point analysis).

Although Labov and Waletzky's investigation was conducted with adults, it became a springboard for study of children's conversational

narratives. As with adults, main questions of this early work focused on both the basic structural elements of children's narratives and how these were organized into a cohesive story. Within this field of research, two main perspectives emerged. In one view, scholars grounded in cognitive psychology conceptualized narratives as part of a larger cognitive domain and, as such, they considered children's narrative abilities to be linked to the development of specific cognitive skills (e.g., Stein and Glenn, 1979). In the second, scholars adopted a linguistic approach and viewed narratives as part of children's development of discourse abilities and, thus, linked to children's linguistic and conversational gains. Working from this latter perspective, Peterson and McCabe (1983) documented the developmental progression of children's narrative organization. Their work was instrumental in translating Labov and Waletzky's narrative analyses to children's oral stories and in examining the development of narrative organization as it approximates the canonical form of adult stories. Moreover, by developing a specific method of elicitation—the *conversational map*—their work opened the door for developmental narrative studies of children from different cultures.

Almost parallel to the interest in the organization and development of children's narrative skills, the emergence of the ethnography of communication approach (Gumperz and Hymes, 1972; see also Creese, *Linguistic Ethnography*, Volume 10) led to various naturalistic studies on children's language uses, practices, and development in diverse communities around the world (see also Duff, *Language Socialization, Higher Education, and Work*, Volume 8 and review by Garret, *Researching Language Socialization*, Volume 10, for cultural perspectives on language learning). In most of these ethnographic studies, oral storytelling or sharing stories about the past emerged as a form of discourse used frequently with, around, or by children across societies. Yet, this early work also highlighted cultural variations in narrative realms (e.g., Heath, 1983; Miller, 1982). For example, communities differ with regard to the frequency with which stories are shared, the socialization functions narratives play, and the roles adults and children play in the creation of stories. Heath's (1983) study on language and literacy development in three different sociocultural communities in the USA became a pivotal contribution to the field of education, namely to the area focusing on the intersection between oral language and literacy. Her study highlighted how purposes and practices of narrative differ in diverse sociocultural communities, and more importantly, how narratives in classrooms differ from those in the home. All children entering school must, therefore, adjust to the culture of the school if they are to become successful achievers in that milieu.

## MAJOR CONTRIBUTIONS

The last two decades of the twentieth century witnessed a surge in child narrative research. Most of the work was geared at understanding various aspects of children's narrative development, individual and social-cultural variations in narrative processes and outcomes, and the predictive relation between oral narrative skills and children's literacy development.

*Narrative Development*

A major line of inquiry within the area of children's narratives concerns the progression of narrative development. This work, conducted primarily by developmental psychologists, has been grounded in Vygotskian theory that highlights early social interaction between parents and children as a primary means by which children gain mastery of linguistic and higher-order cognitive skills. Using traditional developmental methods, such as cross-sectional and longitudinal designs, these studies have documented change in children's narrative abilities over time in conversations with experimenters or primary caregivers.

Through this work, we have learned that children begin to tell narratives around the age of two. These early narratives are constructed in the context of everyday conversations with key adults such as parents, siblings, and other family members. During these conversations, the more skilled conversational partner asks questions and provides statements about the experience that guides the child's construction of a meaningful personal narrative. At the early stages, most child-directed questions are "yes-no" (e.g., Did Graham go to the park with mama?). As children gain greater narrative competence, conversational partners request from them more complex information using open-ended questions (e.g., What did you do at the park?). Therefore, the input and contributions of others act as a scaffold for children's narratives by providing the information and the organization to construct a meaningful story that will be understood and valued by the larger society. As children develop, they internalize the structure modeled by adults, thereby gaining the ability to construct personal narratives independently.

By age five, children are able to construct a basic narrative that approximates the canonical form of oral stories valued in their community. To tell such a narrative, four basic skills need to be in place: (a) knowledge of the event to be discussed, (b) ways of weaving the events in a coherent manner, (c) language skills to represent the events in a cohesive manner, and (d) the ability to tailor the narrative to the specified audience. Numerous studies, most of which were conducted

in the late 1980s and early 1990s, focused on how children developed these four basic skills and incorporated them into their oral narratives (for a review, see Bamberg, 1997; Hudson and Shapiro, 1991).

### *Individual and Sociocultural Variations*

A second major line of research investigates individual and cultural variations in children's narrative styles, as well as variations in the context of narrative development.

Studies on children's independent storytelling have focused mostly on variations in their narrative discourse, either as a function of culture-specific conventions of a good story (e.g., Gee, 1989) or as a function of language typology and grammar (e.g., Berman and Slobin, 1994). The majority of these studies prompt children to narrate wordless books or to talk about past experiences.

Studies on the context of narrative development have focused mostly on the discourse used by English-speaking, middle-class, European-American parents and children during conversations about past experiences. These studies have noted individual differences in the amount and type of support parents provide their children, identifying two broad elicitation styles (Fivush and Fromhoff, 1988; McCabe and Peterson, 1991; Reese and Fivush, 1993). Some parents adopt a high-elaborative style, engaging in lengthy conversations and asking numerous and varied questions. Other parents adopt a repetitive (or low-elaborative) style, talking less about past experiences, asking fewer and more redundant questions, and providing less information to the child.

Although to a lesser extent, parental narrative support has also been examined with families from other social, cultural, linguistic, and ethnic backgrounds. Researchers have either conducted comparative studies between two different groups or have performed rich ethnographic discourse analyses in one particular community. Taken together, this body of work has shown variations in narrative topics discussed by parents and children, types of parental prompts used, functions of the prompts used, and the socialization functions of the narrative conversations. Miller and colleagues (e.g., Wiley, Rose, Burger, and Miller, 1998), for example, found that parents and children from working-class European-American backgrounds engaged in more co-narrations about past experiences than did European-American dyads from middle-class backgrounds. However, the children from working-class backgrounds were expected to provide factual accounts of the past experience, whereas the children from middle-class families were allowed to express their own views whether these were factual or not. Research conducted with different ethnic/cultural communities has incorporated

various immigrant and nonimmigrant groups around the world, including Korean (e.g., Choi, 1992), Chinese (e.g., Han, Leichtman, and Wang, 1998; Miller, Wiley, Fung, and Liang, 1997), Japanese (e.g., Minami and McCabe, 1995), African-American (e.g., Champion, 1998), and various Latin American groups (Eisenberg, 1985; Melzi, 2000). Overall, researchers conclude that societal values and ideological orientations (e.g., highlighting the self or others), as well as communicative patterns (e.g., communicating in subtle ways or direct ways) are responsible for the discourse parents use to support children's developing narrative abilities.

### *Narratives and Literacy Development*

A third major line of research extends narrative research beyond the descriptive level to predict future educational outcomes. Most of this work has examined the connection between narrative skills and later literacy and reading ability. This work rests on the premise that narrative is a type of *decontextualized* language. That is, narrative is a form of extended discourse that requires children to move beyond the observable and create meaning solely through language. Children's early use of language in such a decontextualized manner as part of their daily routines (e.g., dinner time conversations or during play) is a powerful predictor of their future use of school-related literacy because texts presented for comprehension in the school setting typically demand children to interpret complex messages without the support of a conversational partner or shared knowledge with an audience (Reese, 1995; Snow, 1991).

Recent research has shown that at kindergarten entry, children with relatively better-developed narrative skills have an advantage educationally over children who enter kindergarten with relatively less well-developed narrative abilities. For example, children's oral narrative abilities during the kindergarten years predict reading comprehension skills and receptive vocabulary during middle childhood (e.g., Dickinson and Tabors, 2001; Griffin, Hemphill, Camp, and Palmer, 2004).

The importance of narratives for children's ultimate academic success also resides in the fact that the school context is an environment in which children must listen and exchange their own stories as part of interactions with both teachers and peers. Difficulty with storytelling, therefore, might ultimately manifest itself in the classroom environment in terms of poorer language and cognitive skills, as well as poorer social interactions. Yet, the seminal work of Cazden (1988) underscores that classroom discourse privileges a culture-specific narrative style. Children whose home literacy and narrative interactions resemble more closely what occurs in the classroom tend to enjoy

greater success in school than those whose prior conceptualization of the role of narrative has been attained through everyday experiences that differ from school-like interactions. Teachers might fail to acknowledge the narrative and literacy style children bring to bear on their education and, in turn, dismantle their ability to achieve (e.g., Michaels, 1991).

#### WORK IN PROGRESS

As educators focus on school readiness and the concept of literacy more broadly, narratives emerge as a compelling and powerful tool through which to understand not only children's language and reading abilities, but also their cognitive and social-emotional development. Three main lines of research have steered narrative work in recent years: narrative and culture, narrative and the development of self, and narrative and social-cognitive development.

The first line of current research expands on previous cultural and cross-linguistic work continuing to build a knowledge base to broaden the scope of our current understanding of narrative development (e.g., Champion, 2003; Leichtman, Wang, and Pillemer, 2003; Melzi and Caspe, 2005). The majority of this work has combined the strengths of quantitative (i.e., larger sample sizes and advanced statistical analyses) and ethnographic methods to continue documenting that different communities value distinct types of stories and that older members of the community guide children's construction of stories in the manner valued by their community. However, unlike previous work, this research begins to unpack the cultural influences that dictate distinct narrative practices. For instance, do narrative practices correspond to general communicative patterns, language, and storytelling practices with children? Or, do narrative variations stem from ideological cultural orientation and child-rearing goals? Moreover, how do these cultural styles relate to children's narrative development and later academic success? Answering these questions is crucial not only to build a more comprehensive understanding of the intersection between narrative, language, and culture, but also because of the importance narratives have for literacy development—thus helping educators understand what emergent literacy skills children from different socio-cultural backgrounds are bringing from home to school.

A second line of work explores the connections between narrative, cognition, and social-emotional development. Related to cognition, narrative is associated with skills such as abstract thought processes, representational development, the construction of knowledge bases, and problem-solving strategies. Narrative is also related to the

organization of memories, in particular, autobiographical memory (Fivush and Haden, 2003). Autobiographical memory is defined as the component of memory that holds all key experiences related to building a concept of self. Therefore, personal narratives are not only theorized to be a critical aspect of memory, but also the link between memory and the development of self. In narrating stories about past experiences, children are learning to organize their life history into a coherent narrative of self, weaving factual information with their subjective interpretation of personal account of events. Fivush and Nelson (2006), for example, argue that the subjective or evaluative aspect of narratives links personal memories and the development of a self-concept. Recent studies explore the relation between memory, narrative, and construction of self across diverse age groups and in various cultures. Taken together, this work suggests that “each of us creates a life narrative embedded in sociocultural frameworks that define what is appropriate to remember, how to remember it, and what it means to be a self with an autobiographical past” (Fivush and Haden, 2003, p. viii).

A third line of contemporary research explores the relation between narratives and children’s social-cognitive skills, in particular theory-of-mind development (Nelson, Plesa, Henseler, Presler, and Walkenfeld, 2003). Theory-of-mind is a milestone in children’s social-cognitive development usually emerging around the age of four. Theory-of-mind encompasses a range of abilities, including the ability to see another’s point of view, to ascribe mental states (e.g., desires, beliefs, intentions, and emotions) to others, and to use this information to predict others’ behavior. Findings from developmental studies suggest that individual differences in children’s theory-of-mind are related to several aspects of social functioning, including prosocial behaviors, peer acceptance, and successful communication with friends (Cutting and Dunn, 1999; Slomkowski and Dunn, 1996), which in turn have been found to be powerful predictors of academic outcomes (Wentzel, 1993). Given the dialogic nature of narrative construction, children’s ability to narrate has been posited as promoting theory-of-mind development. A number of studies have been conducted on the relation between children’s narrative skill and theory-of-mind (e.g., Guajardo and Watson, 2002). Findings suggest that opportunities for sharing stories promote children’s understanding of others’ intentions, beliefs, desires, and emotions. In turn, children’s understanding of others’ internal states influences their ability to engage in effective social transactions in a variety of contexts. However, more research is still needed to understand the ways in which social-cognitive skills and narrative abilities jointly influence children’s readiness to meet the social demands inherent in formal schooling.

PROBLEMS AND DIFFICULTIES:  
FUTURE DIRECTIONS

Two major problems in the narrative literature include defining and assessing narrative skills in children and translating the knowledge gained in research studies into successful practices and interventions. These two problems rest on the importance oral narrative skills play on children's literacy development, and therefore, their ultimate educational success. In addition, they originate on the interdisciplinary nature of both theory and methods used to carry out narrative research. In addressing these two main problems, basic research in narrative development can be applied in a manner that might lead to the improvement of educational prospects for all children.

*Defining and Assessing Narratives*

A major problem in narrative inquiry is that of definition and assessment. Numerous factors need to be considered in obtaining narrative data, such as the type of narrative to elicit, the degree to which supports (e.g., books, pictures, conversational partner) will be included in the assessment, who will listen to the stories that are produced (e.g., experimenter, familiar adult, peer), and how the collected narratives relate to demands of the children's home culture as well as those of the mainstream community. A variety of narrative assessment procedures have been used in research over the past 30 years. These include, but are not limited to: production of fictional stories in response to open-ended prompts; recounting of story whereby children are told a story and asked to retell it while looking at the pages; personal narrative production in which children are prompted by a parent or another adult about an experience that might have happened to them and asked to elaborate about it; response to structured prompts in which children reply to questions about a picture or story; storytelling with wordless books either with or without adult scaffolding; adult-child conversations; response to picture tasks whereby children spontaneously talk about the pictures they see (e.g., TAT); and play narration where children are provided a set of play animals and introduced to a verbal conflict and asked to tell the rest of the story.

Likewise, throughout the last 30 years, multiple methods for narrative analyses have been used depending on investigators method of elicitation, definition of narrative, theoretical stance, and focus of study. Recently, narrative scholars have attempted to provide an integrative framework for analyzing narratives. For example, McCabe and Bliss (2003) suggest four main types of analyses that surface different narrative abilities and features: high-point microanalysis, story grammar

analysis, stanza analysis, and narrative assessment profile. High-point microanalysis assesses specific aspects of narrative (e.g., the presence of an opening, complicating actions, evaluation) to provide a window into a child's overall narrative structure. Story grammar analysis is used in evaluation of fictional stories by examining explicit goals of a protagonist. Stanza analysis involves breaking narratives into sentences or phrases and grouping these phrases into stanzas to understand subtopics of a larger discourse. Finally, narrative assessment profile evaluates discourse coherence including topic maintenance, event sequencing, informativeness, referencing, cohesion, and fluency.

Although narrative tasks are easy to administer, a major drawback of narrative research is that it involves labor-intensive procedures for collecting, coding, scoring, and analyzing data. In recent years, researchers, educators, psychologists, and policy makers in the field of early childhood have become interested in translating approaches to narrative analysis into standard assessments for large-scale research and intervention projects. This interest is due, in part, to the unique ability of a narrative to tap into multiple dimensions of children's developing capacities at once. For example, narrative highlights vocabulary, grammar, pragmatics, the ability to stay on task, the use of goals, statement of conflict, and resolution and attribution of social skills including feelings and mental states. Both educators and researchers argue that although many approaches exist for collecting and analyzing data, a more standard approach for administration, coding, and analysis is needed to alleviate the burdens of time, cost, and training, as well as to ensure the collection of reliable and valid data across a range of settings (e.g., preschools, center-based and home-based programs, family day care). That is, narrative is still mostly a psychologist's or a language researcher's tool, with little cross-over to educational practice.

Standardized assessments to assess narrative ability do however exist. Hirsh-Pasek, Kochanoff, Newcombe, and de Villiers (2005), for example, include the task of narrative language (TNL) (Gillam and Pearson, 2004) and a subtest of the diagnostic evaluation of language variation (DELV) (Seymour, Roeper, and de Villiers, 2003) in their review of promising narrative measures. Culturally appropriate standardized tests are also needed to allow teachers and large-scale researchers to include narrative analysis in their work more readily.

### *Implementation of Research: Intervention*

Because of the importance of narrative for different domains of children's development, researchers have recently begun to design interventions to improve children's narrative ability. This work has been conducted mainly with low-income children, disproportionately at risk

for reading failure in the later years. By targeting families and early childhood programs, these interventions hope to improve children's narrative skills before they enter kindergarten. Two interventions, evaluated with randomized control experiments, have been particularly effective in producing improved narrative outcomes for young children. First, "dialogic reading," a book reading intervention developed by Whitehurst, Arnold, Epstein, and Angell (1994), consists of two elements: a 30-week shared-reading program conducted at school and at home and a 16-week phonemic awareness program conducted at school. Teachers and parents of children in the intervention condition are taught how to read to their children using an interactive reading technique called dialogic reading. In a study of over 100 low-income children living in the Northeast of the USA, children in the intervention group included significantly more evaluative devices (references to internal states of characters and dialog) in their narratives at the end of the intervention than the control group (Zevenbergen, Whitehurst, and Zevenbergen, 2003). That is, the children who participated in the intervention program appear to have gained specific narrative skills through their shared-reading experiences.

A different intervention developed by Peterson, Jesso, and McCabe (1999) centers on visiting mothers in the home to support parent interaction styles that foster the narrative skills that help children in school. The intervention emphasized talking to children frequently about past experiences; spending a lot of time talking about each topic; asking "wh" questions and few "yes/no" questions; listening carefully; encouraging children to say more; and following children's lead. In home visits, mothers were provided transcripts and tapes to model and illustrate the types of interaction style they wanted parents to employ. Mothers were visited frequently in the first month, and then every other month for a year. Children whose mothers had participated in the intervention program substantially increased their scores on tests of language by the end of the intervention, relative to what they had been during the pretest (Peterson, McCabe, and Jesso, 2003). In contrast, the control group children had language scores almost identical to those at the pretest. These findings maintained over time. The children in the intervention group were telling more narratives than the children in the control group 1 year later, and these narratives were longer than those of their control peers (Peterson, Jesso, and McCabe, 1999).

Together, these two interventions suggest that effective practice to improve children's narrative abilities targets families as a primary context in which children develop narrative skills. However, parenting interventions, especially for low-income families, are difficult to implement and evaluate for various logistical reasons such as parents' work schedules and the ability of intervention staff to implement curriculum

consistently. In addition, future narrative work must investigate whether these styles of interaction adopted are appropriate for different cultural groups. For example, there is a mounting body of evidence to suggest that while asking a predetermined and structured set of questions might be culturally appropriate for one population, it might not be relevant to others (Heath, 1983; Eisenberg, 2002). Moreover, intervention programs such as these have been often criticized as adopting a deficit-based approach and thus not building on the cultural assets of families. Some notable exceptions to this general trend however, include the work of González, Moll, and Amanti (2005) with Latino families in the southwestern region of the USA and Au (2005) in multicultural classrooms of Hawaii. Both projects have used a strengths-based approach to build curricula using as a foundation the cultural assets of the home and community.

### CONCLUSION

In this brief review, we synthesized past and current research on children's narrative development and the possible connections between children's oral narrative abilities and other skills necessary for academic success. Storytelling is a complex ability combining various linguistic, cognitive, and social skills. Consequently, narrative is associated with various areas of academic achievement, such as literacy and social competence. The study of narrative has a long history that has built on the successes of investigations in various disciplines, including linguistics, literary studies, anthropology, and psychology. Throughout the progression of this scholarly work, narratives emerge as a window into individuals' selves and their communities.

## RESEARCH METHODS IN THE STUDY OF GENDER IN SECOND/FOREIGN LANGUAGE EDUCATION

### INTRODUCTION

Over the past three decades, the relationship between language and gender has attracted significant attention from researchers in a variety of fields, including education. Several recent monographs, volumes, special issues, and state-of-the-art reviews have specifically addressed the role of gender in second and foreign language learning and education (Chavez, 2001; Davis and Skilton-Sylvester, 2004; Langman, 2004; Norton, 2000; Norton and Pavlenko, 2004; Pavlenko, Blackledge, Piller, and Teutsch-Dwyer, 2001; Sunderland, 2000; see also Pavlenko and Piller, *Language Education and Gender*, Volume 1). What remained relatively obscured in this literature, however, is the relationship between the theoretical framework and methods selected to address one's research questions. The present chapter aims to bridge this gap, identifying methodological strengths and weaknesses of the current studies and pointing out methodological and conceptual issues that need to be addressed in future work.

### EARLY DEVELOPMENTS

Early sociolinguistic and educational research sparked by Lakoff's (1975) *Language and Woman's Place* conceptualized the relationship between language and gender through the notions of difference and dominance. In the *dominance* framework, theorized in Lakoff (1975), "women-as-a-group" were seen as linguistically oppressed and dominated by "men-as-a-group." In the study of second and foreign language education, this paradigm translated into two methodological approaches. Text and content analyses were used to examine gender representation and sexism in foreign and second language textbooks. These analyses focused on frequency counts of male versus female names, pronouns, and appearances in illustrations, on comparison of social roles and occupations assigned to men and women, and on the uses of masculine generics. Interaction analysis was used to determine who speaks how much and when in the language classroom. This analysis also focused on frequency counts, this time of turns taken by male and female students and on the mean length of all turns taken by each group.

In the *differences* framework, introduced by Maltz and Borker (1982) and developed and popularized by Tannen (1990), “women-as-a-group” and “men-as-a-group” were seen as speakers of different genderlects, developed through socialization in same-gender peer-groups. Second language acquisition researchers adopted this framework to look at classroom interaction and at language learning outcomes. Interaction analysis was conducted to see whether men and women have different goals in classroom interaction and concluded that men interact to produce output and women interact to receive input. In turn, studies of language learning strategies correlated reports of strategy use with language learning outcomes to conclude that female learners outperform male ones due to their positive attitudes and superior use of language learning strategies; these results in turn were explained through brain and socialization differences.

Both frameworks still inform some of the current work (cf., Chavez, 2001; Julé, 2004). However, since the early 1990s, they have been repeatedly criticized by feminist linguists for their essentialist assumptions about “men” and “women” as homogeneous categories, for insensitivity to diversity, and for lack of attention to the role of context and power relations (Cameron, 1992; Eckert and McConnell-Ginet, 1992). Feminist linguists also criticized the methodology of the studies of difference and dominance and in particular the unfounded causal assumptions about gender and learning outcomes. They argued that in the case of textbooks, the focus on numeric representation overshadowed the subtler ways in which stereotypes are created and reproduced, such as discursive roles assigned in dialogs (Poulou, 1997), and showed that teacher discourse around the text cannot be predicted from the text itself (Sunderland, Cowley, Abdul Rahim, Leontzakou, and Shattuck, 2002). They also argued that higher quantities of specific strategies or interaction in general do not necessarily lead to higher achievement. In effect, it is quite possible that excessive attention to boys may be prompted by their misbehavior and that students who speak most in the classroom are not necessarily the same that do best (Sunderland, 2000). Most importantly, it was argued that in their relentless focus on men-as-a-group and women-as-a-group difference and dominance frameworks ignore ethnic, racial, social, and cultural diversity that mediates gendered behaviors, performances, and outcomes.

#### MAJOR CONTRIBUTIONS AND WORKS IN PROGRESS

In the “postmodern turn” of the early 1990s, research organized around binary paradigms was superseded by the framework that focused on *diversity* of gender identities and gendered practices (Cameron, 1992,

2005a; Eckert and McConnell-Ginet, 1992, 2003). Studies conducted in this framework are predicated on the following assumptions, all of which have consequences for research design:

1. Gender is discursively, culturally, and socially constructed and inseparable from other facets of social identity. In this view, men-as-a-group and women-as-a-group are no longer meaningful comparison categories, because certain members of one category (e.g., middle-aged low-income heterosexual immigrant women from Southeast Asia) may have little in common with other members of the “same” category (e.g., young white middle-class Canadian lesbians) and a lot in common with some members of the “opposite” category (e.g., middle-aged low-income heterosexual immigrant men from Southeast Asia). Generic gender groupings are also problematic because they obscure oppression in terms of class and race and thus the fact that it is low-income and immigrant women who do not have access to educational resources, working-class boys who are silenced in the classroom, or young black men who do not have powerful role models in the school hierarchy. The diversity framework urges researchers to replace simplistic questions such as “Are women more likely to do X than men?” or “How do men and women differ in Y?” with more open-ended questions such as “Who is most affected by Z?” and to consider how gender functions at the intersection with race, class, age, ethnicity, sexuality, and (dis)ability. In many cases, instead of contrasting two genders, this framework encourages a comparison of different versions of the same gender to understand, for instance, how foreign language learning outcomes of upper-middle-class suburban girls with access to private schools and study abroad options may differ from outcomes of their female counterparts in low-income urban areas.
2. Linguistic strategies are relative—there is no one-to-one mapping between linguistic forms and interactional functions or social identities. Consequently, it is futile to try to associate particular linguistic features with men’s or women’s speech, as the same features and strategies are invariably used by different men and women in different contexts for different purposes. Instead the diversity framework encourages researchers to examine how normative femininities and masculinities are produced and validated by dominant discourses, what consequences the process has for various members of a particular community, and how these members use language to reproduce, challenge, and resist existing gendered practices.
3. The relationship between language and gender is mutually constitutive; in other words, with the exception of pitch, it is not the

case that individual men and women speak or learn in a particular way because they belong to a particular biological (sex) or social (gender) category. Rather, the acts of speaking and learning are constitutive of their membership in a particular gender category, it is through learning and speaking that they construct themselves as particular men and women. Consequently, the pursuit of male and female genderlects or learning strategies is by definition misguided, and so are generic explanations of particular linguistic outcomes as conditioned by nature or nurture. Instead, we can view the relationship between gender and second and foreign language learning as mutually constitutive: on the one hand, learners' motivations, investments, choices, and options may be influenced by gender as a system of social relations and discursive practices. On the other, additional languages may offer second language learners access to symbolic and material capital and resources to perform gender and sexuality differently than they would in their native language (cf. Pavlenko, 2001a). The diversity framework encourages researchers to examine how gendered power relations shape speakers' linguistic choices and how speakers use language to cross and transgress gender boundaries previously believed infallible.

4. The basic unit of analysis in the diversity framework is activity. In this view, analyses that focus on the use of a particular linguistic feature by men-as-a-group or women-as-a-group produce epiphenomena, that is, results that are easily challenged when sufficient attention is paid to additional characteristics of each group. The diversity framework encourages researchers to move away from reliance on unexplained links between linguistic features and generic gender groupings and instead consider how a particular linguistic form or feature functions in the context of discursive activities and gendered practices.

The theoretical shift that prompted increased attention to context and activity led to a methodological shift to qualitative research methods, reflected in current scholarship in the field of second and foreign language learning and education. Many current studies in the field use *ethnographic* methods of data collection, such as participant observation, audio- or videotaping, tape-recorded interviews, and collection of documents and media texts, to examine gendered language practices in particular educational contexts (cf., Davis and Skilton-Sylvester, 2004; on Toohey, *Ethnography and Language Education*, Volume 10).

Some of the same data collection methods, in particular interviews, are used to conduct *case studies* of individual learners or contexts (Kingingier and Farrell Whitworth, 2005; Norton, 2000; Teutsch-Dwyer, 2001; Vitanova, 2004). A subgroup of such studies is *teacher-research case*

*studies* that discusses implementation of curricular changes and new pedagogical approaches to promote gender equity in particular contexts (cf., Norton and Pavlenko, 2004).

In terms of analytical methods, an important new development, prompted by increased attention to discourse, is reliance on *discourse analytic approaches*, and in particular on critical discourse analysis, to either replace or at least supplement thematic and content analyses. This trend is particularly visible in the new wave of textbook studies that examine gender ideologies displayed through particular textual choices and omissions (Poulou, 1997; Shardakova and Pavlenko, 2004; Siegal and Okamoto, 1996), as well as classroom talk around the texts (Sunderland, Cowley, Abdul Rahim, Leontzakou, and Shattuck, 2002). Discourse analytic approaches have also been used to analyze gendered aspects of second language learners' oral and written narratives (Pavlenko, 2001a, b; Vitanova, 2004) and gendered ideologies and practices in classroom interaction (McMahill, 2001).

Finally, some scholars also found ways to creatively combine quantitative (phonetic analysis, analysis of temporality, analysis of test scores) and qualitative approaches (discourse analysis of ethnographic interviews) to understand language learning processes and outcomes (Kinging and Farrell Whitworth, 2005; Ohara, 2001; Teutsch-Dwyer, 2001), whereas others combined discourse analytic and historiographic methods to examine gender in language education from a historic perspective (Pavlenko, 2005; Robinson, 2004).

## PROBLEMS AND DIFFICULTIES

An overview of recent studies in the field of second and foreign language education shows that acknowledging that gender is socially constructed is not paramount to accepting the implications of this notion for research purposes. Some recent studies claim the diversity framework as a theoretical paradigm, only to revert to either difference or dominance framework in conceptual assumptions and methodological choices. This trend is particularly visible in studies of classroom interaction that continue to focus on distribution of talking time between boys and girls or men and women (Chavez, 2001; Julé, 2004; Shehadeh, 1999). Six conceptual errors lie at the heart of the theoretical and methodological discontinuity:

1. *Lack of clear conceptualization of 'gender'*, seen in cases where researchers pay the obligatory lip service to the social and constructed nature of gender and then proceed to talk about men-as-a-group and women-as-a-group without explaining clearly what precisely is socially constructed in the case of their study participants, what aspect of gender relations or construction they are

interested in, how the categories of men and women fit in with their conceptualization, and, more generally, how their view of gender informs their research design. Alternatively, novice researchers assume that a study conducted with men or women is by definition about gender, or that gender is always a relevant analytical category, although in reality their results may be best understood in terms of other social identities and contextual features.

2. *Lack of clear conceptualization of 'language'*, seen in cases where researchers proffer tired diatribes about important links between language and social identity and then proceed to the study that may or may not illustrate any such links, offering no explanation or justification as to why particular linguistic features were singled out in the study.
3. *Lack of clear conceptualization of the language and gender interface*, seen in cases where researchers cannot offer a specific explanation for their findings and rely instead on the nature (brain) or nurture (socialization) assumptions made in the differences framework, or on the "men, by definition, are more powerful than women" assumption made in the dominance framework.
4. *Lack of clear links between theory and methodology and consequently of a clear rationale for using particular methods*, seen in cases where researchers first pay tribute to current theories of language and gender and then adopt traditional research designs that do not fit their theoretical assumptions. It is often mistakenly assumed that because the contemporary theory is "on the record," one does not need to bother with linking theory and methodology. Cameron (2005b) also points to another temptation novice researchers succumb to these days: theoretical and methodological eclecticism. She argues that such eclecticism is not self-evidently a good thing and should not be unproblematically equated with interdisciplinarity and reflexivity. While one might combine several approaches successfully for a particular purpose, in small-scale case studies such a combination may lead to theoretical incoherence. Cameron (2005b) advises that to pull such a combination off one needs "a clear rationale for putting approaches together, a sophisticated understanding of each approach, and an account of how the tensions between approaches will be handled in your study" (pp. 125–126).
5. *Lack of attention to data analysis*, seen in research design descriptions that privilege data collection methods and spend little if any time on discussion of analytic approaches. An additional problem here is the reliance of many recent case studies and ethnographies on pseudoanalytic approaches such as content or thematic analyses of "emerging themes." These approaches display

numerous weaknesses, including the lack of a systematic procedure for matching instances to categories and overemphasis on recurring patterns that may lead analysts to overlook important events or phenomena that do not occur repeatedly (for detailed discussion, see Pavlenko, in press).

6. *Overreliance on narratives and interviews* that replace, rather than supplement, language data from natural contexts; it is particularly disconcerting when researchers confuse the two and analyze language use reports from narratives or interviews as actual interaction instances. Cameron (2005b) also comments on the disturbing “trend towards case study research in which presenting the particular instance becomes an end in itself” (p. 128).

These problems and weaknesses undoubtedly have multiple sources, but the key one is graduate student training in the field of education that—at least in North American academia—often divorces theory from methodology and data collection from data analysis. Theory classes expose students to a variety of theories but do not focus on implications of particular theories for research design. Similarly, research design classes focus on issues of validity and generalizability but do not often discuss theories informing particular approaches. The only theoretical and methodological divide students are trained to think about is the patently false qualitative/quantitative dichotomy, which misleads students to think that one can be a competent researcher using only one paradigm and avoiding the other.

Two more problems of disconnect plague research design courses in education. The first is the preference for data collection methods over data analysis. Students engaged in ethnographic research may spend years collecting data and at the end not know what to do with the amassed amount of field notes and transcriptions. Their favorite approach is the laborious and ultimately meaningless color-coding of words and segments that oftentimes passes for analysis. Students taking statistical analyses courses do not necessarily fare better. In many programs, these courses teach students the ‘how to’ without necessarily linking the approaches to the actual designs and studies. As a result, students may know how to construct a proper experimental study and how to carry out a multivariate analysis but have no idea how to select the most appropriate statistical approach for their particular study, nor are they able to analyze why certain factors appear to influence learning processes and outcomes.

To address problems that plague some of the research in education, including but not limited to second and foreign language education, we need to begin by addressing weaknesses in graduate education and by implementing curricula that offer students meaningful links between theory and methods of data collection and analysis.

## FUTURE DIRECTIONS

Some, if not all, of the pitfalls outlined earlier could be avoided if researchers began by asking the following questions in the studies of language and gender in education:

1. *Gender*: How do I conceptualize gender? What aspects of gendered identities, practices, and relations are particularly important for my study? What are the implications of my conceptualization for research design and the choice of study participants? Am I sure that mine is not a convenience sample but a well-selected group?
2. *Language*: How do I conceptualize language? What linguistic features, forms, and strategies are of particular interest to me and why? Am I interested in language learning, language use, learning outcomes, or perhaps in dominant discourses and narratives that normalize particular masculinities and femininities while devaluing others? What are the implications of my choices for research design and methods of data analysis? Am I familiar with all of the languages spoken by my participants and if not, what choices do I have at my disposal to overcome this weakness?
3. *Language and gender interface*: How might linguistic features or language learning processes I am interested in be connected to gendered practices and identities?

And, last but not least: Is gender truly relevant to the issues I am interested in or would my results be better explained through other factors? Asking this question is not paramount to saying that gender inequities are no longer an issue. The new economic order of the globalization era brought with it new opportunities but also new forms of oppression and exploitation, seen, for instance, in the emergence of a heavily feminized and underpaid language workforce in the tourist industry and call centers (Piller and Pavlenko, in press). The focus on gender, however, should not blind researchers to the fact that in many contexts, including education, gender inequities are exacerbated and sometimes even eclipsed by disparities created by class and race.

**Language, Culture, Discourse and Education**

## ETHNOGRAPHY AND LANGUAGE EDUCATION

## INTRODUCTION

The term ethnography refers both to a set of research methods and to the written report of information obtained by these methods. Originating in the discipline of anthropology, ethnographic methods include participant observation, face-to-face interviewing, researcher reflection/journaling, and analysis of archival records (Eisenhart, 2001). Ethnography as a written genre is aimed at describing and understanding the cultural practices and perspectives of groups of people. Appropriating ethnography from anthropology in the 1970s or thereabouts, educational ethnographers were hopeful that ethnographic research methods might illuminate aspects of educational practice that were difficult to see in quantitative descriptions of learning and teaching activities. They were (and are) further hopeful that specific situated descriptions of the varieties of ways people organize their cultural and educational practices would prove helpful in improving schooling at all levels. Ethnographic language education researchers attempt to understand learners' and teachers' perspectives on how languages are taught and learned in local as well as larger societal contexts. After briefly examining the disciplinary history of the approach, focus in this chapter is on contemporary (1995–2005) ethnographic contributions to our understandings of language education. The chapter concludes with a discussion of problems with the research method and of future potential directions for research.

## EARLY DEVELOPMENTS

Franz Boas, one of the pioneers of North American anthropology and an eloquent advocate for anthropological fieldwork, argued at the end of the 1800s that understanding human culture and development could only be approached after systematic descriptions and analyses of the diverse means people used to organize their cultures. The necessity to produce descriptions and explanations of cultures, that is, to do and to produce ethnographies, began to be seen as urgent in the late nineteenth

century with increasing worldwide recognition of the physical and social prices to be paid for technological “progress,” and increasing awareness of the destructive impact of European colonization of native peoples. Clifford (1983) noted that by the 1930s there was international agreement that theory in anthropology was to be generated on the basis of intensive descriptions (ethnographies) by qualified anthropologists who were physically present with “their people” for extended periods of time, participating in community activities, learning what they could of those people’s language, customs, practices, beliefs, and so on.

Ethnographies of schooling became increasingly common in the 1970s at the same time that there was increasing concern about the failure of educational institutions to serve ethnic and linguistic minority children well. Perhaps because anthropologists were typically seen as most knowledgeable about nonmainstream, minority communities, the use of anthropological research methods (ethnography) in schools in such sites was not surprising as efforts were being made to increase educational opportunities for children from such communities. Paradigms of explanation for the failure of educational institutions shifted from a focus on the perceived deficits in the minority children to a focus on the cultural differences between homes and schools.

Ethnographic language education research might be seen as originating in the late 1960s and early 1970s calls of anthropologist Dell Hymes (1972) for building a body of knowledge (for, as he termed it, an ethnography of communication) (see Creese, *Linguistic Ethnography*, Volume 10) about the variety of ways people organized their speaking. In addition, the emergence of discourse analysis within linguistics and conversational analysis within sociology provided important methodologies for study of language use “close-up”. Two early and influential ethnographies of communication were Philips’ (1972) examination of “participant structures” in activities on an American Indian reservation in Oregon, compared with participation structures in school, and Heath’s (1983) ethnography of communication in homes and schools of three different southern US communities. Studies like these investigated aspects of home and/or classroom means of learning, communicating and making sense of the world, of various groups of students, in the hope that with better understanding of the sociolinguistic means and practices of diverse communities, schools could better organize instruction for the children they served. As well, such studies sometimes tried to show how educational practices reproduced economic and political practices in the wider society, and thus attempted to establish links between local practices and larger social processes.

## MAJOR CONTRIBUTIONS FROM 1995 TO 2005

In a special issue of *TESOL Quarterly* devoted to qualitative research, Lazaraton (1995, p. 467) observed that qualitative research (including ethnography) was not widely published in applied linguistics research, and she wondered if “10 years hence qualitative research will be on an equal footing with quantitative research.” It is now 10 years since Lazaraton’s query, and the number of ethnographic language education studies available has dramatically increased. I focus here on reviewing studies published after 1995, but there are, of course, earlier studies that are of lasting importance, and interested readers can find helpful discussions of such work in Watson-Gegeo (1997), Hornberger (1994), and the *TESOL Quarterly* referred to earlier. Taken as a whole, much of the work of the last decade examines specific linkages among negotiations of identities, practices, and resources, and language learning. In addition, some ethnographic work examines how those local negotiations are constrained/enabled by wider societal processes. Although there is certainly overlap among these categories, for sake of simplicity, I use identity, practices and resources to organize the following descriptions of recent ethnographic work on language education. Readers will note that this review is limited to materials published in English and I acknowledge its partiality therefore.

*Identities*

Many language education researchers have been interested lately in how learners negotiate their identities in the various communities in which they participate. Beginning with Norton’s (2000) groundbreaking ethnographic study of how five immigrant women in Canada negotiated their identities as second language learners in particular class, ethnic and gendered social contexts, a number of other studies of identity and language learning in a variety of global contexts (e.g., Maguire and Graves, 2001; Pavlenko and Blackledge, 2003) have been published. Many of these studies of identity and language learning draw on feminist and/or poststructuralist theories of identity and subjectivity, and draw attention to effects of the negotiations of those identities on possibilities for language learning. In Hong Kong, for example, Lin (1999) examined four classrooms in which Cantonese-speaking students were more or less comfortable in learning English. Lin found French sociologist Pierre Bourdieu’s (1977, 1991) notion of the transmission of cultural and social “capital” through familial socialization is helpful in understanding what kinds of diverse capital children bring to their English language learning, and what kinds of

identities are therefore available to them (see Garcez, *Microethnography in the Classroom*, Volume 10). Lin argued that some learners in her study were able to creatively claim agentive identities in resisting the reproduction of their social status in learning English, but that teacher support was important in developing such agency. In a study of primary school English language learners (ELLs) in Canada, I also saw affiliation with teachers as important in children being able to claim desirable classroom identities (Toohey, 2000). As well, I found that affiliation with peers and access to certain classroom practices were important in determining children's rights to desirable classroom identities and thus, learning. Harklau (2000) showed how older ELLs were positioned as "good kids" in their high school by teachers, but as the "worst students" at the post secondary institutions they attended, and she also found that particular school practices made available certain identities for students. Many other ethnographic studies that focus on learners' identities are available in the new *Journal of Language, Identity and Education*.

### *Practices*

Teaching and learning are accomplished through participation in sets of culturally and socially organized practices. Examining language practices ethnographically in diverse contexts with respect to the opportunities they provide for language learning has been a popular interest currently. Rampton's (1995) study of language "crossing" in Britain showed youth creatively engaging in "hybrid" language practices with peers in outside-of-school contexts so that Afro-Caribbean youth used and learned Punjabi in their interactions. Also interested in hybridity, Gutiérrez, Baquedano-López, and Tejeda (1999, p. 127) described students learning, in what they termed the "Third Space"—one that "honor[s] alternate and competing discourses that transform conflict and differences into collaborative learning." Their endorsement of the hybrid linguistic practices of particular communities has been echoed in other ethnographic work by Vasquez (2002) and the Santa Barbara Discourse Group (see <http://www.education.ucsb.edu/socialjustice/bibliography.pdf>) and in on-line articles in the Bilingual Research Journal (<http://brj.asu.edu>).

Other ethnographic work also focuses on classroom practices. Moll, Saez, and Dworin (2001), for example, showed bilingual kindergarten children engaged in the activity of producing bilingual "texts," even before they controlled conventions of alphabetic literacy in either Spanish or English. This classroom practice, they argued, had the potential to act as a counter-discourse to internalized negative societal attitudes toward bilingualism.

Still other ethnographic work looks more explicitly at the connections between local and societal practices. Ramanathan (2005), for example, examined how state-mandated educational practices in schools in India were enacted in two colleges. Similarly, Gebhard (2002) examined how educational reforms at the state level impacted the classroom experiences of three English language learners such that they were constrained in their efforts to acquire academic literacy and thus were placed in highly vulnerable positions.

### *Resources*

A common thread in some North American research has been to emphasize the importance of resources offered by first language communities and the effects of using such knowledge for literacy learning. Moll (2000), for example, argued for recognition of the educational possibilities of using the “funds of knowledge” of minority communities. Although Moll’s work shows the benefits of using community resources, Duff (2002) found ELLs precluded from some classroom activities because of their unfamiliarity with the resource of North American popular culture. Her study, done with secondary students, showed that classroom discourse was permeated with popular culture references and that ELLs could not enter this discourse, and the popular cultures with which they were familiar were not seen as classroom resources.

Many qualitative researchers have used Bourdieu’s (ibid) ideas about the political and economic conditions that underlie language use, and the kinds of “capital” that learners bring to educational settings. Dagenais (2003), through analysis of interviews with parents of children of diverse language origins enrolled in Canadian French immersion school programs, argued that such parents see multilingualism as a form of transnational capital, and these parents pose challenges to traditional objectives of French immersion education (see de Mejía, *Researching Developing Discourses and Competences in Immersion Classrooms*, Volume 10). Similarly, Heller’s (1999) study of language practices in a Francophone school in Toronto showed that students were aware of this globalized “market” and that they saw their maintenance of French as positioning them advantageously in it.

These studies focus on the accessibility of resources to language learners. They demonstrate that access to the resources of educational activities crucially defines learners’ opportunities for participating in the activities necessary for acquiring English and achieving academic success. Additionally, the research reveals that for many language learners such access is often uncertain.

## DIFFICULTIES AND COMPLEXITIES

Eisenhart (2001) recently reflected on her own experiences as an educational ethnographer and the “muddles” that have characterized both the method and the product in her and others’ work. She argued that the political, economic, social, and cultural conditions of the postmodern world (globalized economies, hybrid identities, late capitalistic political systems, and so on) as well as destabilizing “postmodernist ideas about truth, knowledge, values, and ethics” (p. 17) have had enormous effect on the ways ethnographic educational research is conducted and regarded. Here, I examine four difficulties/complexities in doing ethnographic language education research, and point out in the next section how some contemporary researchers are attempting to deal with them. The four difficulties I summarize here are: ethnographic representations, the ethics of ethnographic research, ethnographic methods, and ethnography in postmodern conditions.

Eisenhart and many others (e.g., Rosaldo, 1993) have pointed out that ethnographies, no less than any quantitative methodologies, sometimes assume that “one true account” or representation of a research situation is available for discovery by the careful researcher. Clifford (1983, p. 120) outlined the difficulties:

How is unruly experience transformed into an authoritative written account? How, precisely, is a garrulous, overdetermined, cross-cultural encounter shot through with power relations and personal cross purposes circumscribed as an adequate version of a more-or-less discrete “other world”, composed by an individual author?

The problem of one writer taming “unruly experience” was graphically illustrated in anthropology with the publication in the 1950s of an ethnography of a small Mexican town, an account which was widely divergent from that published by another anthropologist earlier (see discussion in Murphy, 1971). The forms of ethnographic accounts have also come under scrutiny, as many have observed that the social construction of many ethnographies is not made apparent to readers, and the authority of the text derives from its unproblematic presentation of “what really happened.” Rosaldo (1993, p. 128) pointed out that ethnographers, “in their zeal to become members of a “science,” attempted to produce distanced accounts that not only presented the ethnographer as an omniscient impartial observer, but also tended to underestimate the agency of human actors and to situate them as culturally determined. Recognizing that power relations in most ethnographic representations were complex but often ignored, ethnographers have also become concerned about the privileged position of the observer in providing authoritative (but highly problematic) accounts.

Recognition of the “politics of representation” leads to a second issue ethnographers have faced: the ethical ambiguities involved in these research practices. Although traditionally ethnographers have sought to have as little impact on their research sites as possible, many ethnographers recently have felt compelled to intervene on behalf of their informants, or to use their “expert” knowledge to attempt to improve conditions in their informants’ lives. However, at the same time that many ethnographers have assumed increasing responsibility for informants, postmodern theory has troubled truth claims, such that: who is to say if the ethnographer’s judgment of particular situations are any more “true” than anyone else’s? For ethnographers of language education, such a question might involve the dilemma of observing what one considers inadequate or even “bad” practice in classrooms. Is the ethnographer’s judgment any more accurate, helpful or ethical than anyone else’s? Can (or *must*) ethnographers intervene at times, and if they can and should, how should their intervention be framed?

Third, although ethnographers have typically justified their methodological approach on the grounds that it more clearly (than other methods) “reveals” the complex social situations it tries to describe and explain, there is debate within the field about the adequacy of traditional ethnographic research methods to examine and describe the lives and experiences of “Others.” Block (2000), for example, argues that interviews, a common ethnographic method, should be understood not merely (or even mostly) as giving “true” descriptions of what informants do or think or feel in certain circumstances. Rather, he argues that they provide researchers with evidence about what informants think “is intelligible or plausible to say in a given discourse community and how members of that community use shared resources to construct a position in an interview” (p. 762). Leung Harris, and Rampton (2004) discuss the “messiness” of audio or videotaped classroom data and the reductionism inherent in transcribing, selecting, and presenting coherent arguments about data.

A final area of complexity/difficulty that ethnographic researchers face is that identified by Eisenhart (2001): the political, economic, social, and cultural conditions of the postmodern world. Ethnography’s traditional assumption of distinct cultural and geographical boundaries, as well as the notion of transmission of cultural practices over time to newcomers, may be less relevant in a world with global economies, constant shifting and hybridizing of cultural and geographical/political boundaries, the global reach of mass communication media, and so on. As we have seen from some of the ethnographic work discussed earlier, immigration and “culture contact” are much more complicated than they may have been when transportation/communications means were

less sophisticated than they are currently. For ethnographic language education research, such complexity may require new conceptions of culture that take global hybridity as a new norm, and new methods of investigating those cultures—with access to learners' intricately inter-related realities. Focus too may need to shift from local to broader contexts and back again, as the effects of practices in other contexts are keenly felt at the local level.

#### WORKS IN PROGRESS AND FUTURE DIRECTIONS

Much of the most recently published ethnographic work in language education aligns with critical ethnographic perspectives, with focus on how identities, resources, and institutional practices might be supportive of enhanced and increased participation in institutional and community life on the part of language learners. Broadly characterized, critical ethnographic language education research engages with the experiences of learners to understand how power operates locally and at more macro levels, so as to investigate how social change might support minoritized peoples' experiences in learning. In order to address some of the complexities and issues raised in the previous section, the commitment of many language education ethnographers to critical perspectives is perhaps to be expected.

With respect to identity, many language education researchers argue that we must be concerned with the interlocking questions of identification and desire in education (Ibrahim, 1999; Day, 2002), as learners negotiate their complicated lives. These studies challenge us to ask questions that have not typically been raised in applied linguistics research: Who/what do ELLs want to be/do in their new communities? How do they see their futures and how can they move in those directions? What enables such movement and what constrains? Such questions assume that learners' identities are complex and shifting and that postmodern conditions of flux and hybridity obtain. Grappling with such questions should constitute an important part of future research investigating language learning and education.

Future research must also be concerned with documenting the language and literacy practices that individuals and communities engage in and their congruence (or not) with institutionalized language and literacy instruction. Hawkins (2004, p. 14) argued in a review of schooling for immigrant children in the USA: "There has not been, to date, a comprehensive look at how ELLs do and/or do not engage in [classroom language and literacy] practices, what strategies they have available to them . . . to enable participation and what scaffolding and supportive environments might look like." As well, at a time when educational reform is high on international agendas, researchers also

need to document the influence of new educational policies on the kinds of classroom literacy activities available to language learners. Gutiérrez, Baquedano-López, and Asato (2001, p. 4) showed linkages between classroom level practices and macrosocietal politics (i.e., the passing of legislation in California that limited opportunities for ELLs to receive instructional support in their home language), showing how educational policies fundamentally “institutionalize practices that help ensure failure for an extremely vulnerable population: the English language learner.”

The resources learners bring to language education sites and those made available to them in these sites will also be a matter for future research. The Santa Barbara Discourse Group’s already mentioned work with children showed ways that teachers and language researchers have to investigate the resources children bring. Analyzing how classrooms and other learning sites might more equitably distribute resources for powerful language use should also be a major focus in future research.

There are, however, promising developments in ethnographic research. Goldstein (2004) attempted to make explicit the social construction of information she collected ethnographically in a secondary school by presenting it as a dramatic script. She described means of using such a script in a “theatre of the oppressed” manner, such that viewers of the play could participate in constructing alternate events and outcomes. Increasingly, the work of scholars who have insider knowledge of the communities with whom they engage in research is becoming well known (Grant and Wong, 2003; Lee, 2000). Other researchers have examined the transnational literacy of language learners using electronic communication (Lam, 2000; Warschauer, 2002) (see Snyder, *Research Approaches to the Study of Literacy, Technology and Learning*, Volume 10). As well, ethnographic language education research in postcolonial societies is becoming increasingly available (Appleby, Copley, Sithrajvongsa, and Pennycook, 2002; Stein and Mamabolo, 2005).

Ethnographic studies of language education have become increasingly popular and well known over the past 10 years and there is every reason to expect that they will become even richer and more textured as time goes on. The move toward investigating means of creating less authoritative and more “porous” descriptions of ethnographic research, which will allow multiple interpretations and dialogicality about others’ realities, is much to be celebrated.

## RESEARCHING LANGUAGE SOCIALIZATION

### INTRODUCTION

Language socialization is the human developmental process whereby a child or other novice (of any age) acquires the knowledge, skills, orientations, and practices that enable him or her to participate in the social life of a particular community. A key aspect of language socialization is the development of communicative competence, which involves acquiring proficiency in the use of a given language (or languages) as well as the culturally based knowledge that one needs in order to use language in culturally intelligible, socially appropriate ways (Garrett and Baquedano-López, 2002; Ochs and Schieffelin, 1984; Schieffelin and Ochs, 1986a).

Language socialization occurs primarily through the child or novice's interactions with older or otherwise more experienced persons, although in most cases it involves interactions with peers as well. Socializing interactions may be highly formalized and regimented, designed explicitly to promote a particular kind of learning: a classroom lecture or a job training workshop, for example. But to a great extent, language socialization is the stuff of everyday social life: mundane interactions and activities ranging from the game of "peek-a-boo" played between a mother and her infant to the pointed but good-natured teasing that goes on among professional colleagues as they collaborate on a project, bringing their differing skills and varied levels of experience to the task at hand. This being the case, language socialization researchers who focus on formal education must venture outside the classroom and other institutional settings to gain understanding of how formal education relates to, and articulates with, their subjects' home and community lives. As will be explained further, this holistic ethnographic perspective and the methodological framework out of which it emerges are among the key contributions of language socialization studies to research on language and education.

Although many kinds of social interactions can be regarded as sites of socialization, language socialization research is not just the study of such interactions for their own sake. Language socialization researchers seek to understand how such interactions—taken collectively, not as isolated instances—shape the developmental trajectories of individuals, how they fit into larger systems of cultural meaning and practice,

and how they are reproduced and transformed over the course of time. Such understandings are made possible by another hallmark of language socialization research: its longitudinal perspective, which involves close tracking of individual developmental processes over extended periods of time and investigation of the sociocultural and historical contexts within which those processes unfold.

Since its initial formulation in the early 1980s, the language socialization research paradigm has been resolutely interdisciplinary, combining the perspectives and insights of scholars in anthropology (particularly linguistic anthropology), linguistics (particularly applied linguistics), education, and other fields united by their commitment to investigating the relationships among language, culture, and society. A basic assumption of language socialization researchers is that the acquisition of language is inseparable from the acquisition of other kinds of social and cultural knowledge. As an individual comes to know a language, she or he also comes to understand the workings of everyday life in the community in which that language is spoken. This is perhaps nowhere more clearly seen than in interactions between young children and their primary caregivers, which were the main focus of the earliest language socialization studies (Schieffelin and Ochs, 1986a, b). These studies showed that in learning how to use the language(s) of their community, even at the earliest stages, children are also learning how to think, how to make sense of happenings in the world around them, how to relate to others, how to comport themselves, even how to feel in particular situations and how to express (or otherwise manage) those feelings. As a developmental process, then, language socialization is much more than a matter of learning to produce grammatically well-formed utterances. It is also a matter of learning to use language in socially and pragmatically appropriate, locally meaningful ways, and as a means of engaging with others in the course of—indeed, in the constitution of—everyday interactions and activities.

Language socialization research is thus concerned with the “microgenesis” of communicative competence (Schieffelin and Ochs, 1996), which comprises but also goes well beyond linguistic competence in the narrower generativist sense. Communicative competence also comprises the practical knowledge, much of it prediscursive if not preconscious, that one must have to use language as a social tool, to engage in talk as a social activity, and to coconstruct meaningful interactive contexts with others. Language socialization researchers strive to take into account all of the varied forms of knowledge and practice that make it possible for an individual to function as (and just as important, to be regarded by others as) a competent member of, or participant in, a particular community, however broadly or narrowly defined.

## EARLY DEVELOPMENTS

The language socialization research paradigm was initially formulated in the early 1980s by Elinor Ochs and Bambi Schieffelin (Ochs and Schieffelin, 1984; Schieffelin and Ochs, 1986a, b). At that time, a significant body of research on language acquisition already existed, as did another on socialization, sometimes referred to as “enculturation.” But the two had developed quite separately from one another. Language acquisition research, rooted in developmental psychology and psycholinguistics, tended to treat language acquisition as a rather self-contained individual developmental process, largely ignoring the sociocultural contexts within which it occurs; conclusions drawn from studies conducted in mainstream North American and European settings were assumed to be universally valid. Meanwhile socialization research, rooted in anthropology and sociology, was conducted in a variety of ethnographic settings worldwide, but gave little attention to the central role of language as the primary medium through which socialization occurs. Working in collaboration with researchers from several disciplinary backgrounds, including linguistic anthropology, developmental psychology, sociolinguistics, applied linguistics, and education, Schieffelin and Ochs sought to combine the strengths of both of these established bodies of research and to bridge the gap between them.

One of the most important ways in which they did so was by integrating the methods of each, particularly the longitudinal approach characteristic of psycholinguistic research on child language acquisition and the ethnographic approach characteristic of anthropological research on socialization. Schieffelin (1990) carried out her pioneering study among the Kaluli of Papua New Guinea and Ochs (1988) conducted hers in Western Samoa. Another pioneering study was that of Shirley Brice Heath (1983), who examined language practices in two neighboring working-class communities, one black and one white, in the USA—and in so doing, set an important precedent for all subsequent ethnographically oriented studies of schools and the communities in which they are situated. A signal event in the formulation of the language socialization research paradigm was the publication of a volume edited by Schieffelin and Ochs (1986b), to which Heath and several other researchers of varied disciplinary backgrounds contributed chapters based on studies conducted in a broad range of sociocultural settings. Of the eleven studies represented, only Heath’s dealt directly with the relationship between language socialization and formal education or schooling; the rest focused primarily on household and community settings, and on interactions between young (preschool-age) children and their primary caregivers.

Numerous education-related studies carried out in following years were influenced, to varying degrees, by the language socialization paradigm. Vasquez, Pease-Alvarez, and Shannon's (1994) examination of a bilingual (Spanish–English) working-class community in northern California focuses on continuities and discontinuities between home and school contexts, demonstrating that the relationship is a considerably more fluid (and potentially complementary) one than has generally been assumed—especially by researchers who have not ventured outside classroom settings. In other studies, classroom-based interaction in institutional settings is the primary focus. Baquedano-López (2001) examines narrative practices as a resource for the socialization of ethnic identity in another Spanish–English bilingual setting: a Catholic parish in Los Angeles where a particular narrative, the story of the Virgin of Guadalupe, figures prominently in constituting a transnational, transgenerational Mexican–American community. He's (2001) work on Chinese heritage language classes in the USA shows that by combining elements of school, home, and community settings, they constitute important sites for the socialization of “traditional” Chinese cultural values and social roles. Most of this work has been conducted in the USA, but there are exceptions. Duff's (1995) study of English-language history lessons in Hungarian secondary schools, for example, examines significant changes in classroom discourse practices that have been fostered by political and educational reforms of the post-Soviet era. Cook (1999) focuses on Japanese classrooms, demonstrating important culturally based differences between Japanese and Western pedagogical practices, particularly with regard to participant structures. In Japanese classrooms there is considerably greater emphasis on learning through interactions with peers; knowledge and opinions are formulated and negotiated with relatively little direct intervention from the teacher. Particular emphasis is placed on the cultivation of attentive listening skills, which are considered crucial to successful interaction.

### MAJOR CONTRIBUTIONS

In whatever setting a language socialization study is conducted, and whatever specific linguistic and sociocultural phenomena constitute the main focus of investigation, four key methodological features are essential. These four features, which reflect the paradigm's interdisciplinary origins and are also the basis of its major contributions to the methodology of education research, are outlined below.

1. *Longitudinal study design.* Language socialization researchers closely track developmental changes in individual subjects by periodically observing and recording their participation in multiple

kinds of interactions and activities, ideally in a variety of social settings, over a developmentally significant span of time. In order for such tracking to be feasible, a language socialization study usually focuses on a relatively small number of children or novices—typically four to six, or a single small cohort, if the study is conducted in a school or other institutional setting. Qualitative depth of analysis is thus emphasized over quantitative breadth. Data in the form of naturalistic audio and audio–video recordings of the focal children or novices interacting with peers, caregivers, teachers, and other community members are collected at regular intervals (e.g., weekly or monthly), often over the course of a year or more of sustained fieldwork.

2. *Field-based collection and analysis of a substantial corpus of naturalistic audio or audio–video data.* Regular, periodic data collection as described earlier give rise to a large corpus of recordings, typically 75–100 hours. A corpus of this size strikes a balance between ethnographic and longitudinal adequacy and practical manageability. But collection of the recordings is only a first step; in order for them to serve as a meaningful data set, the researcher must transcribe and annotate them. In most cases, this is accomplished with the aid of local consultants, normally members of the community in which the research is being conducted. For language socialization researchers, particularly those working outside their own communities (as is typically the case), this one-to-one collaboration with native-speaking local consultants is indispensable. In addition to assisting with the most basic aspects of transcription, such as clarifying specific words and phrases captured in the recordings, consultants can bring to the researcher's attention layers of meaning that would otherwise escape his or her notice or understanding. Collaborative transcription also provides ongoing opportunities for the researcher to benefit from consultants' native-speaker intuitions about the use of particular linguistic forms and variants, and their perspectives on many other aspects of social life within the local community.
3. *A holistic, theoretically informed ethnographic perspective.* This is achieved in part through sustained fieldwork and a commitment to ethnographic methods (including participant observation), and in part through familiarity with current theoretical issues and debates concerning such methods. Both depth and breadth of ethnographic observation are important in language socialization research. In addition to tracking individuals over the course of time (as described earlier), the researcher must observe and record in a broad variety of contexts in order to understand how different social settings may influence those

individuals' language usage and modes of participation. Doing so allows the researcher to observe and record a broad range of persons as well; in effect, tracking a particular focal subject across contexts provides access to an entire social network, and often to a broad cross-section of the community that includes fictive kin, peers, neighbors, etc. Although most recorded data are collected during everyday activities, the researcher must be attentive as well to exceptional events (i.e., those that occur rarely or unpredictably) and to periodic activities such as those associated with seasonal or ritual cycles. The systematic collection of recorded data that is central to any language socialization study may be supplemented by surveys, interviews, elicitation sessions, or other methods, depending on the kinds of data that are needed to address the study's central research questions. Whatever complementary methods are chosen, the researcher should have a thorough understanding of the theoretical issues in which they are based.

4. *Attention to both micro and macro levels of analysis, and to linkages between them.* This can be considered part of the ethnographic perspective outlined earlier, but is important enough to merit consideration in its own right. Language socialization research is not just a matter of producing detailed ethnographic accounts of individual developmental processes and the local contexts in which they occur. An overarching goal is to understand how such individual developmental processes relate to larger sociocultural and historical processes. As they analyze their recordings and other microethnographic data, language socialization researchers are constantly on the lookout for patterns and principles that may also be discernible at macro levels of analysis. Likewise, when they make broader, macroethnographic observations, they consider various ways in which the patterns and principles thus identified may be in evidence, writ small, in their recorded data. Ultimately, the language socialization paradigm is comparative in perspective, recognizing that while some aspects of language socialization are universal, others vary considerably from one sociocultural setting (or historical period) to another. Attention to micro–macro connections is an important means by which researchers are able to distinguish between the universal and the culturally specific, and to consider the relationships between them.

Many education-related studies make excellent use of one or two of these four features, but outside those that explicitly take the language socialization paradigm as their framework, relatively few studies systematically integrate all four and take advantage of their complementarity. It is this specific configuration of features that distinguishes language socialization

studies from, for example, longitudinal studies that are confined to classroom settings, and ethnographically oriented studies that do not involve systematic collection and close analysis of naturalistic data.

#### WORKS IN PROGRESS

In recent years, prominent themes that were raised in the earliest language socialization studies have been carried forward and taken in productive new directions. Among researchers who work in schools and other educational settings, Heath's (1983) work has had enduring influence; in particular, it continues to inform recent studies that examine various kinds of continuities and discontinuities between children's home and community environments and those of the school and classroom. The dinner table conversations of white middle-class American families, for example, have been shown to foster specific types of problem-solving orientations and to encourage children to display verbal skills that are expected and rewarded in the classroom (Ochs, Smith, and Taylor, 1989; Ochs, Taylor, Rudolph, and Smith, 1992), and to orient them, from an early age, to the world of work (Paugh, 2005). Meanwhile, research focusing on children from immigrant and ethnic minority communities in the USA suggests that when classroom activities and modes of interaction draw on communicative practices and participant structures that are familiar to these children, their levels of participation and academic achievement improve significantly (Gutiérrez, Baquedano-López, and Alvarez, 2001).

Fader's (2001) study of a Hasidic community in New York City focuses on the interplay of home and school socialization practices, particularly those concerning school-age girls' use of Yiddish and English. Yiddish functions as a language of ethnically and religiously based aspects of identity, and is also implicated in the maintenance of community boundaries that separate the Hasidim from non-Hasidim, including other Jewish groups; whereas English is the language of boundary crossing, that is, communication with non-Hasidim, a duty that fall primarily on adult women. It is therefore important for Hasidic girls to be proficient speakers of both languages. Fader's work examines how girls are socialized to use these two codes in both home and school contexts, revealing that the girls develop among themselves patterns of bilingual language use that in some respects run counter to the wishes of their elders and the conventional expectations of the community as a whole. Fader's study, like a few others conducted in recent years (Duranti, Ochs, and Ta'ase, 1995; Gutiérrez, Baquedano-López, and Alvarez, 2001), also considers the differing meanings of literacy and literate practices across home, community, and school contexts and examines the complex interplay among them.

In addition to the aforementioned studies that explore the interface between home and school in various communities within the USA, several have been conducted in other societies worldwide. Watson-Gegeo and Gegeo's work in the Solomon Islands examines disjunctures between home and school settings that tend to be a source of poor educational outcomes (Watson-Gegeo, 1992; Watson-Gegeo and Gegeo, 1992). Here as in many other postcolonial societies, teachers tend to rely heavily on highly formalized, rigidly formulaic modes of language use (e.g., modeling by the teacher followed by rote repetition, in chorus, by the students) that tend to perpetuate the gulf between the local vernacular and the language of instruction. Moore (2004), however, finds that such situations can give rise to syncretic activities that effectively and productively meld home-based and school-based practices, thus transforming apparent discontinuities into new kinds of continuities. Moore observes that in some Cameroonian communities, school-based practices such as "guided repetition," used in Islamic religious instruction as well as in secular classroom pedagogy based on French colonial models, have been taken up in home and community settings and have become the preferred method for socializing knowledge of traditional folktales. Howard (2004) likewise examines a complex blend of disjunctures and continuities between home and school settings, focusing on the socialization of respect in a Northern Thai community. Studies such as these problematize the notion that differences between home and school inevitably lead to educational failure and call for special pedagogical interventions, if not major institutional reforms.

Related themes come to the fore in language socialization studies of older students as they prepare to take on adult roles. Dunn (1999b) examines Japanese college students' self-initiated efforts to develop proficiency in the use of high honorifics and other aspects of formal-register speech as they prepare to enter the job market and otherwise broaden their social horizons after graduation. Use of formal speech registers is a social skill that they have had only limited opportunities to develop in both home and school contexts during their youth. Therefore, during their college years, they attempt to rectify this perceived deficiency in their own communicative competence by inviting distinguished guest speakers to campus, thereby creating social events in which the use of formal, honorific speech is necessary.

#### PROBLEMS AND DIFFICULTIES

Over the past three decades, the language socialization paradigm has proven to be both durable and flexible. As new generations of researchers have taken it up, they have updated it as necessary to keep pace with

ongoing developments in the social sciences, such as new ways of conceptualizing communities in a “globalizing” world (Baquedano-López, 2001; Duranti, Ochs, and Ta’ase, 1995). Perhaps the greatest challenge that remains is to realize the full potential of the paradigm as it was originally formulated; indeed, recent critiques of language socialization research typically do little more than to reiterate issues that were explicitly raised in the paradigm’s very earliest formulations, but have not yet been fully elaborated in field-based research. Such critiques are salutary, however, insofar as they remind those currently engaged in language socialization research that these issues remain to be dealt with.

The oldest and still most commonly raised criticism of language socialization research is that it focuses primarily on sociocultural reproduction—that it does not sufficiently address anomalous or unusual developmental outcomes, and does not acknowledge the potential for innovation and change. It is true that language socialization studies have rarely dealt with abnormal, pathological, or otherwise atypical developmental trajectories; important exceptions include Ochs (2002) on autism and Capps and Ochs (1995) on agoraphobia. As for innovation and change, a considerable amount of recent work has taken as its central concern the role of language socialization in language shift, language obsolescence, and other socially and culturally transformative processes (e.g., Field, 2001; Garrett, 2005). A potential weakness of some studies in this vein, however, is that language socialization tends to be regarded primarily as a mechanism or conduit of changes that originate elsewhere, and not as a locus and source of change in its own right. In many cases, language socialization can fairly readily be shown to be a domain of activity in which large-scale social, political, and economic transformations are manifested locally through the dynamics of face-to-face interactions and specific kinds of communicative practices, such as code-switching. However, it is always necessary, and often more challenging, to reverse this perspective and to consider as well that subtle changes in the most mundane of practices at local, micro levels may have surprisingly consequential ramifications that ultimately manifest themselves at macro levels, as Kulick (1992) demonstrates in his study of a case of rapid language shift. The language socialization paradigm’s linking of ethnographic and longitudinal perspectives facilitates this latter mode of analysis, as the kinds of change in question may be discernible only by means of close observation over extended periods of time. However, the paradigm’s methodological emphasis on qualitative depth over quantitative breadth may pose certain challenges in this same regard, and in some cases may make it necessary for language socialization researchers either to partner with researchers of a more quantitative orientation or to find ways of integrating some such methods (e.g., large-scale surveys) into their own studies.

Another early insight that has been foundational to language socialization research, but remains to be further developed, is the idea that socialization is always a reciprocal process in which the child or novice's agency must be recognized and taken fully into account. Although virtually all language socialization studies acknowledge this basic fact, few have made it an explicit focus of inquiry. It may be that it is especially easy to lose sight of this issue in classroom-based research and in formal education settings more generally, where the environment tends to be configured and regimented in accordance with conventional "top-down" models of learning. Language socialization frameworks that take the activity as a key unit of analysis, and that stress the situated, emergent, coconstructed nature of learning processes, lend themselves to just these kinds of settings, however, so there is good reason to expect that this gap in the literature will soon be filled.

A final consideration is that as the language socialization research paradigm has become more widely influential, it has become somewhat more diffuse. This is in many respects indicative of the paradigm's vitality and relevance; numerous researchers have taken it up, taking it in multiple directions in the process. However, a negative consequence is that it has become increasingly difficult for all those engaged in language socialization research to find venues in which to come together, to exchange findings and insights, and to forge shared goals and objectives. The kind of strongly integrative comparative framework that characterized the first generation of language socialization studies, and that gave researchers a basis for sorting out the universal and culturally specific aspects of socialization, is now lacking. One consequence of this is that contemporary studies tend to be more narrowly ethnographic, and more preoccupied with the specific theoretical concerns of the various disciplines; on the whole, today's researchers seem to be less inclined than their predecessors to consider the potential for their work to yield insights into the universal aspects of language socialization, and of communicative practice more generally. The paradigm's founders, meanwhile, have upheld their commitment to this important line of inquiry (Ochs and Schieffelin, 1995; Schieffelin and Ochs, 1996), offering hope that this and other unifying themes and integrative frameworks will receive greater attention in coming years.

#### FUTURE DIRECTIONS

The challenges and problem areas that have been outlined here overlap with some of the most promising areas for future development. Kulick and Schieffelin (2004) have recently written of the need to be attentive to "bad" subjects—those individuals found in every community who persistently display culturally dispreferred traits and engage in nonnormative,

“deviant” behaviors. Kulick and Schieffelin (2004, p. 355) point out, “the focus on expected and predictable outcomes is a weakness if there is not also an examination of cases in which socialization does not occur, or where it occurs in ways that are not expected or desired.” Language socialization research must account for reproduction as well as “why socializing messages to behave and feel in particular ways may also produce their own inversion” (ibid. p. 356). Certainly unanticipated and undesired outcomes are frequently encountered in educational settings, but thus far they have received relatively little attention from language socialization researchers. As suggested previously, this generalized preference for dealing with normal or typical developmental trajectories, and with instances of “successful” socialization, also seems to have inhibited researchers from examining other atypical or less commonly encountered forms of language socialization that have been identified (though not necessarily regarded as such) by researchers in closely allied fields; Goodwin’s (2004) study of an aphasic man’s interactions with members of his family offers a striking example.

Another likely direction for future research is language socialization as it occurs later in the lifespan, i.e., beyond childhood. The end of childhood, however defined in a given sociocultural context, is by no means the end of language socialization. Adults continue to be socialized into new roles, statuses, identities, and practices, many of which involve new ways of using language (Dunn, 1999a). Adults may find it necessary or desirable to master new registers or styles associated with changes in their vocational or professional lives, or with new avocations or other activities that broaden their social horizons and involve participation in new communities of practice. Similarly, emigration, religious conversion, and other significant life changes may make it necessary or desirable for adults to master new codes and/or new discursive genres, which may involve either spoken or written forms of language. A few studies have already marked this path, such as Schieffelin’s (1996) work on the missionization of the Kaluli, Duff, Wong, and Early’s (2000) study of job-seeking immigrants in Canada, and Ochs and Jacoby’s (1998) study of physicists in laboratory settings. Thus far there have been relatively few studies of adult learning in classroom settings, despite the fact that in the USA and other societies, formal education is increasingly regarded as a potentially lifelong enterprise (Ohta, 1999).

Studies of language socialization of children and adults alike in educational settings underline the need for researchers to avoid conceptualizing human development as a matter of individuals acquiring static, predetermined bodies of cultural knowledge and linguistic forms. Both language and culture must be conceptualized in relational terms that capture their symbolically mediated, coconstructed, dynamically emergent

qualities (Kramsch, 2002). Similar concerns inform language socialization researchers' nonteleological perspectives on the outcomes of socialization. Individual development must be recognized to be variable, contingent, nonlinear, and ultimately open-ended. Differing degrees and types of developmental progress and multiple kinds of "successful" outcomes must be recognized and accounted for—even when the arena of investigation is a classroom or other institutional context in which the participants themselves may differentiate "success" and "failure" in much starker terms.

## DISCOURSE ANALYSIS IN EDUCATIONAL RESEARCH

### INTRODUCTION

One might argue that discourse analysis is nothing new in educational research. For decades, educational researchers have drawn on key concepts from anthropology, linguistics, linguistic anthropology, sociology, and sociolinguistics to analyze discourse. At the same time, recent work has contributed new perspectives, insights, and methods to the analysis of discourse—whether we define that as language in use; the relationship between text and context; or the ideological effects of discourse. The different types of discourse analysis utilized by educational researchers over the years have enhanced our collective understanding of teaching and learning processes, both in and out of school settings, as well as the historical, social or political factors that influence those processes. Drawing on theories and analytic tools from a variety of disciplinary traditions, educational researchers have examined a range of topics and questions, including: how underlying systems regulate interaction; how different discourse communities accomplish things with words; how identities are constructed in and through talk; the relationship between interaction and learning in both formal and informal educational contexts; and—more recently—how the presentation of self in texts (written and oral, in one modality or in multiple modalities, individually or collectively) might be influenced by a number of factors including race, ethnicity, gender, class, and sexuality as well as context, situation, audience, purpose, power, and politics.

The present chapter offers a glimpse at this burgeoning field in order to highlight both the historical influences on current approaches to discourse analysis in educational research and the ways that educational researchers continue to draw on different theoretical and methodological traditions to analyze discourse. Although discourse analysis has been widely utilized in bilingual education and second language learning research, constraints of space require that I narrow my focus to discourse analysis that is centrally relevant to first language research. This brief overview of “discourse analysis in educational research” is not meant to be taken as comprehensive but, instead, to spark interest in one of more of the approaches mentioned and promote further intellectual inquiry.

## EARLY DEVELOPMENTS

As early as 1959, the sociologist Erving Goffman emphasized the importance of studying face-to-face interaction for understanding how individuals construct identities in and through talk, how speakers and listeners mutually negotiate meaning, and how everyday interactions come to constitute a particular “presentation of self” over time. More than a decade later, in *Functions of Language in the Classroom* (Cazden, John, and Hymes 1972), key scholars extended those insights by paying close attention to language and to the cross-cultural aspects of communication. Contributors to this edited volume illustrated how theories and methods from linguistic and cultural anthropology might be fruitfully applied to questions of educational equity, opportunity and access; they also brought into sharp relief the importance of looking at communicative competence *in relation to* questions of culture and context. Focusing on how assumptions and expectations regarding what constitutes the right way to talk (or write) might impact the educational experiences of children from traditionally marginalized groups across a range of educational contexts in US society, this work fundamentally reshaped how many educational researchers viewed the role of language in education, discourse in learning, and culture in communication.

Meanwhile, Sacks, Schegloff, and Jefferson (1974) were examining the organization of turn-taking in conversation, while Sinclair and Coulter (1975) were investigating how teachers and students interacted with a focus on the very common initiation-response-evaluation (IRE) sequence present in most classroom discourse. Such insights became the conceptual pillars of what would later be called conversation analysis (CA), a field that contributed a great deal to our understanding of discourse and interaction as co-constructed in and through talk in a minute-by-minute fashion unfolding over time. Such insights inspired Michaels’ (1981) investigation of the distinct ways that children from different class and race backgrounds told stories during “sharing time” activities in a first-grade classroom (and different teachers’ reactions to the structure and content of those stories). Cazden (1988) too observed that “differences in how something is said, and even when, can be matters of only temporary adjustment, or they can seriously impair effective teaching and accurate evaluation” (p. 3). Implicit in the theory and methods of such approaches is the assumption that all the information necessary to analyze (and understand) an interaction can be found in the interaction itself (or in the transcript).

The ethnography of communication, on the other hand, was founded on the premise that the analyst cannot fully understand individual speech events or speech acts without attending to questions of culture and context. In line with Hymes’ (1974) call for an ethnographically

grounded approach to the study of language in use, educational anthropologists conducted ethnographies of communication in order to investigate the gap between the different “ways with words” (Heath, 1983) that children from different race, class, and cultural backgrounds learn in their communities, the kinds of communicative practices and participation structures that are valued in most classroom contexts, and the consequences of such “mismatches” for youth who are not from “mainstream” backgrounds. In this work, the close analysis of linguistic data was supplemented with extensive participant observation, with questions of surrounding context and culture highlighted and prioritized. Early ethnographies of communication (e.g., Heath, 1983; Philips, 1983) demonstrated both a continuation of and a departure from *Functions of Language in the Classroom*, primarily in the ways they looked *outside of classroom contexts* in order to expand notions of what’s possible and desirable *in the classroom*. This approach has influenced a number of ethnographic studies of talk and interaction across a range of educational (formal and informal) settings over the past three and a half decades, particularly in the field of educational anthropology.

Another complementary line of work emerging from the ethnography of communication was that developed by Gumperz (1982), who sought specifically to understand the day-to-day communication of speakers from different cultural, national or linguistic backgrounds and the contextual factors that contributed to intercultural miscommunication. His examination of context provided insights into the use of different “discourse strategies” in interaction as well as the notion of “contextualization cues” (defined as the contextual information, conveyed for example in speaker’s intonation or tone, or a particular gesture which accompanies a bit of interaction or talk). By enhancing our theoretical understanding of the different ways that particular verbal utterances gained meaning from nonverbal cues, Gumperz advanced a complicated and highly influential theory of how identities are displayed, constructed, and performed in and through talk in a minute-by-minute fashion, unfolding over time.

Gumperz’s theories of contextualization have significantly influenced the pursuits of interactional sociolinguists (IS), a group of scholars that draw from theories and methods in both sociology and linguistics to examine the discourse strategies used by people from different cultural, ethnic, racial or gender backgrounds. Although sociolinguists such as Erickson, Tannen and Schifffrin also rely on Goffman’s interest in the minute-by-minute construction of identity (and meaning) in face-to-face interaction, they are profoundly influenced by Gumperz and his theory of contextualization. Erickson’s (1982) analysis of co-membership and gatekeeping in counseling sessions; Tannen’s (1984) analysis of conversational styles of women

and men; and Schiffrin's (1987) examination of discourse markers in interaction are all examples of the importance of looking beyond *what* was said to consider *how* things were said (including tone, gesture, etc.) and with what effect.

#### MAJOR CONTRIBUTIONS

Building on these early works and the questions of context that emerged, the study of language and discourse in education has blossomed into a dynamic and interdisciplinary endeavor, resulting in a number of ethnographies, published in both edited volumes and book-length monographs, up to the present. Two early and highly influential volumes were *The Acquisition of Literacy* (Schieffelin and Gilmore, 1986), in which ethnographic and interactional studies of literacy in and out of school were combined to better understand the relationship between literacy, learning, and culture across contexts; and *The Social Construction of Literacy* (Cook-Gumperz, 1986), which considers teaching and learning as interactional processes that are informed by institutional ideologies. In *Discourse, Learning and Schooling* (Hicks, 1996), authors explored how discourse mediates (culturally and cognitively) learning in social contexts, the impact of sociocognitive theories of learning and sociocultural theories of language, and the social dimensions of knowledge construction; and contributors to *Kids Talk: Strategic Use in Later Childhood* (Hoyle and Adger, 1998) examined the "strategic language use" of youth (with friends, in school, and at work) in ways that complicate theories of situated learning and "developmental progress" (p. 4). In each of these edited volumes, it is the systematic analysis of linguistic data that provides insights into language, literacy, and learning as practices situated within cultural processes and institutional structures.

#### *Anthropological Investigations of Discourse*

A number of book-length ethnographies are also noteworthy for their careful examination of the relationship between talk (or text) and surrounding context. For instance, in *He-Said-She-Said*, Goodwin (1990) analyzed the specific ways that African American children achieved both cooperation and conflict in their locally situated interactions. Rampton's (1995) *Crossing: Language and Ethnicity among Adolescents* highlighted the specific ways that British-born adolescents "recognize and even exaggerate the differences in their communicative repertoires in a set of stylized and often playful interactions that up to a point at least constitute a form of antiracism" (p. 21). More recently, in *Learning Identity: The Joint Emergence of Social Identification and*

*Academic Learning*, Wortham (2006) examined how two students developed unexpected identities over the course of an academic year and how imposed categories might influence developing identities such that the two students come to see themselves as low-achieving students with less potential (and less “promise”) for academically succeeding in the future. In each of these ethnographic explorations, the authors analyze discourse closely—albeit drawing on different methodological approaches—in ways that illuminate the complicated, often contradictory, aspects of identity performance in and through language as well as the contested nature of the relationship between individual identity construction and institutional constraints.

Linguistic anthropologists have demonstrated the value of conducting close analysis of language as part of and informed by a larger ethnographic research project, with a particular focus on the fluid, situated, changing nature of individual identity performances among youth from a range of race, class and cultural backgrounds. Morgan (1999), for instance, has closely analyzed the interaction of African American girls and found that their identity was “tied to the construction of a cool social face” within peer–group interaction (p. 41); while Goodwin (1999) has re-examined the talk among African American girls in her original (1990) study in order to problematize the (assumed) relationship between language, ethnicity, and identity and “seek a more contextualized understanding of how people mobilize linguistic resources for their interactive projects” p. 389); and Mendoza-Denton (1999) has described how Latina adolescents “align or disalign with one another” in their talk and thereby take on stances that create “conflictive corroboration” (p. 288). Foregrounding social class in her analysis, Eckert (2000) investigates the intricate ways that linguistic variation among adolescents influences and is influenced by other social practices, social networks, and social categories.

In an edited volume that explicitly attempts to bridge the fields of linguistic anthropology and education, *Linguistic Anthropology of Education* (Wortham and Rymes, 2003), the contributors demonstrate how conducting ethnographically grounded analyses of interactional processes illuminate key questions and processes in educational research (e.g., situated learning, language socialization, the acquisition of “competence,” and language and literacy ideologies). More recently, Rampton, in *Language in Late Modernity: Interaction in an Urban School* (2006), demonstrates how combining a close analysis of interaction with long-term participant observation and document collection provides valuable insights into learning processes. Through his vivid analysis of classroom talk in relation to questions of context, he addresses important questions about the role of social class, traditional authority relationships in schools, popular media culture, and the experiences of learning at school. Examining numerous transcripts as part of three

extensive case studies, Rampton explores the intersections between identity, insecurity, and the organization of talk for marginalized youth in school contexts.

In each of these edited volumes, book-length ethnographies, and chapters, researchers take an anthropological approach to the study of language and discourse and demonstrate the value of combining ethnographic methods of data collection (e.g. long-term participant observation, document collection, and individual interviews) with a close analysis of discourse in order to provide a grounded and nuanced account of the specific, local, and complicated ways that institutional and social processes (bureaucratic, social, economic and political) are related to individual identity construction or performance. With an assumption that discourse and interaction serve as local practices that mediate the relationship between institutional ideologies and individual identities, this work provide important insights into the relationship between discourse, learning, and identity.

### *Critical Approaches to Discourse Analysis*

By the early 1990s, explicitly “critical” approaches to discourse analysis were emerging, initially out of the U.K. (Fairclough, 1989) and then, later, out of Australia (Luke, 1996) and the USA (e.g., Gee and Green, 1997; Gee, 1999; Rogers, 2004, 2005). Drawing on systemic-functional-linguistics, critical linguistics, and Foucault’s (1971) notions of power in discourse, most critical discourse analysts are primarily concerned with illustrating how the close analysis of discourse is informed by a critical analysis of social (and power) relations. In *Language and Power* (1989), Fairclough articulated the importance of critically and systematically analyzing texts in order to critically analyze social relations (and vice versa). Since then, Fairclough has written a great deal about the theory and the method of critical language awareness, analyzing discourse, and “textual analysis for social research.” Gee (1999), in *An Introduction to Discourse Analysis: Theory and Method*—a text widely recognized and utilized in educational research—provides an accessible yet nuanced description of the theoretical underpinnings, analytic tools, and potential contributions of a critical approach to the analysis of discourse.

In recent years, an increasing number of educational researchers have become interested in applying a critical lens to the analysis of discourse, in large part because it explicitly prioritizes questions of power, hegemony, subjectivity, and intertextuality in its analysis of texts (and the relations between texts). According to Luke (1996), the value of this approach to educational research is “to disarticulate and to critique texts as a way of disrupting common sense. Part of the disarticulation

can involve the analysis of whose material interests particular texts and discourse might serve, how that articulation works on readers and listeners, and strategies for reinfecting these discourses in everyday life. This is a viable, practical agenda for critical literacy in the classroom” (p. 20). For a thorough and nuanced discussion of critical discourse analysis in educational research see Rogers 2004 and Rogers 2005 and (Rogers, *Critical Discourse Analysis in Education*, Volume 3).

### *Narrative Inquiry*

Another approach that has captured the interest of an increasing number of educational researchers is narrative analysis or narrative inquiry. This approach permits an examination of the complicated ways that narrators position themselves in and through talk by creating certain voices (and thus identities) for the characters in their story, by constructing and enacting particular identities as the narrator, and by providing critical commentary on the institutional or societal constraints on their individual situations. To conduct narrative analysis, educational researchers have relied on a large body of work that comes from outside educational research (e.g., Ochs and Capps, 1996; Schiffrin, 1996). They also draw on notions of positioning in and through discourse as described by Davies and Harre (1990), where the term “positioning” is used to capture not only how an individual might be positioned *by* others but also how one might position oneself, through storytelling or narrative, in relation *to* others. For a discussion of the potential utility of this analytic approach for educational research, see Wortham (2001).

Researchers who are interested in the particular ways that identities are taken up, constructed, enacted or performed in and through narrative or storytelling in particular educational contexts (e.g., Menard-Warwick, 2004; Ochs and Capps, 1996; Orellana, 1999; Schiffrin, 1996; Warriner, 2004; Wortham, 2001) have contributed to our collective understanding of the power of narrative to accomplish certain presentations of self, academic learning, and interactional agendas. Menard-Warwick (2004), for instance, closely examines storytelling practices among two adult immigrant English as a Second Language speakers in order to better understand the “learners’ perspectives on the connection between gender identities and second language learning” (p. 295). Warriner (2004) analyzes the narrative accounts of recently arrived women refugees from the Sudan in order to expose “the multiple and complicated ways that identities are constructed, negotiated, and deployed within specific situations and circumstances” (p. 279). Orellana (1999), in looking at the written narratives of her Latina and Latino student writers in Grades 1, 2, and 3, also demonstrates

how storytelling “provides a space in which identities can be constructed” and narrators can “position [them]selves in relation to others” (p. 65).

*Natural Histories of Discourse*

Coming directly out of anthropological investigations of language, discourse and power, the “Natural Histories of Discourse” approach (Silverstein and Urban, 1996) combines the ethnographically oriented focus of linguistic anthropologists with an explicit investigation of power and positionality as accomplished in and through discourse. Scholars utilizing this approach rely on information gleaned from long-term participant observation to interpret the meaning of a text or an excerpt of discourse. Additionally, they bring a “contextual perspective”—or an interest in the relationship between text and context—to the investigation of questions of power. In these ways, this scholarship distinguishes itself from earlier anthropological investigations (e.g., the *Ethnography of Communication*).

While there is substantial work developing from this tradition, I focus only on selected research that has clear educational implications here. One example can be found in Collins (1996, 2001), where he applies a “natural histories of discourse” lens to a multilayered analysis of the relationship between actual written texts (and the verbal practices surrounding them) from a school context. Focusing on how ideologies broadly circulating inform how one might interpret both texts and practices, Collins (1996) observes that orientations toward reading, literacy and learning are “effects and constituents of a system of stratified literacy” such that “poor readers” have very different experiences with (and opinions about) the purposes of decoding texts than the “good readers” do. Further, he notes that, despite their more realistic insights into the mechanisms of control and power in their classroom, the “poor readers” remain ill-equipped to act upon their increased knowledge. In these ways, Collins’ analysis of the relationship between “large-scale ideological formations and institutional practices” and “the reciprocity of the social and the textual” (p. 225) demonstrates how the natural histories of discourse approach might be effectively applied to important questions and concerns in educational research.

WORK IN PROGRESS

Current works in progress reflect the ways that educational researchers draw upon different theoretical and methodological approaches to discourse analysis as well as the ways that once seemingly distinct approaches might be combined to very good ends. For instance, Cole

and Zuengler have compiled an edited volume entitled *The Research Process in Classroom Discourse Analysis: Current Perspectives* (to be published in 2007) which aims to make explicit the ways in which different theories and methods of discourse analysis might be applied to the examination of the same data. With the goal of bringing different approaches into conversation with each other in order to promote dialogue about what “doing” discourse analysis means to different researchers, the volume centrally focuses on the *process* of analyzing discourse rather than on any final product of the analysis.

In other recent work, researchers examine the role of positioning in and through discourse among learners (adult and youth) in various educational settings. Blackburn (forthcoming), for example, draws upon the notion of multiple subject positions to examine the discourses that students use as they tell stories about school and illustrates the ways that queer youth “shift from one to another way of thinking about themselves as discourse shifts and as their positions within varying story lines are taken up” (Davies and Harre, 1990 cited in Blackburn, forthcoming, p. 7). In all these lines of inquiry, researchers are self-consciously drawing on multiple approaches to the analysis of discourse in order to address questions of context, agency, and power, as well as “the analytic stance of the researcher” (p. 63).

As Bucholtz (2003) argues, recent and emerging work in language and gender scholarship explicitly wrestles with the relationship between method and theory as well as the value of intellectual cross-fertilization in emerging language and gender scholarship, asking “is gender, as many conversation analysts would have it, an achievement of discourse, or is it an ideological system with broad contextual parameters, as suggested in different ways by critical textual analysts and by those who study language ideologies?” (p. 63). For a comprehensive discussion of promising future directions in language and gender research see Bucholtz (2003).

#### PROBLEMS AND DIFFICULTIES

Because there are so many different theoretical and methodological approaches to analyzing discourse available to new researchers in the field, one challenge facing educational researchers interested in analyzing “discourse” is the difficulty of choosing from among the different approaches available. Because it is important for educational researchers to recognize that the terms “discourse” and “discourse analysis” have been used by researchers to mean a variety of things (with some emphasizing linguistic definitions and others explicitly rejecting linguistic definitions), “discourse analysis in educational research” must be understood as an eclectic set of theoretical and methodological

approaches to the systematic study of discourse, language in use, notions of context and contextualization, and questions of power.

Contributing to this ongoing challenge is the unavoidable fact that, during the analysis of discourse, context is not only a theoretical construct, it is also something to be “discovered,” analyzed, or created by the researcher. Similarly, even while things “outside” the text do indeed influence it, the text also simultaneously influences—indeed “creates”—context. As Blommaert (2001) cautioned, “one of the most important methodological problems in discourse analysis in general is the *framing* of discourse in particular *selections of context*, the relevance of which is established by the researcher but is not made into an object of investigation” (p. 15). This tension between situated language and the reality that both influences and is influenced by that situated language use remains a central challenge for discourse analysts, regardless of their intellectual “leanings,” in the analysis and representation of data; questions of authority and voice also remain unresolved. For an extensive discussion of the treatment of context in discourse analysis (in both CDA and linguistic anthropology), see Volume 21, Issue 2 of *Critique of Anthropology* (2001).

Meanwhile, in literacy and teacher education research, new methodological challenges have contributed to the call for increased attention to the role of silence (and silencing) in interaction, discourse, and power (e.g., Leander, 2002; Schultz, 2003). Additionally, while some scholars are paying increased attention to the temporal and spatial dimensions of context and contextualization (e.g., Leander, 2002; Wortham, 2006), the methodological implications of these theoretical advancements remain undertheorized in educational research. This highlights the fact that it is important to examine not only dimensions of context and contextualization but also the ways that conceptions of time and space influence data collection, methods of analysis, and representation of findings.

For educational scholars interested in utilizing discourse analysis in their research, it is important to recognize that there are multiple ways of defining the term discourse as well as multiple intellectual histories associated with the term. Additionally, it is necessary to think critically about questions of context and contextualization, the role of silence (and silencing), and the methodological implications for theoretically nuanced notions of space and time. What is the unit of analysis? How is context defined? What historical moments have influenced a particular literacy event, narrative account, researcher’s gaze, or location of the subject? The answer to such questions will influence decisions regarding the unit of analysis, how text and context are defined, and what “methods” are utilized in the collection and analysis of that text.

## FUTURE DIRECTIONS

Educational researchers are attracted to the systematic analysis of discourse for a variety of reasons. Some see value in the close analysis of the minute-by-minute construction of talk, identity, positioning and meaning when two or more people interact. Others like to connect individual practices with historical “structuring” influences, focusing on the ways that language mediates the two. Still others want to find textual evidence for the claim that all relations are relations of power and argue that we must therefore explicitly foreground power in our analysis. Combining elements from different theories and methods of discourse analysis has become more common than rare, as the thoughtful combination of multiple approaches to the study of discourse allows researchers to “[bring] new models to bear on one’s data, as well as [interrogate] familiar frameworks with novel research questions.” (Bucholtz, 2003, p. 64)

Increasingly, too, we have become aware of the need to find new methods and new modes of representation for analyzing the texts, talk and discourses that are made possible by new communication technologies. Issues of multimodality and representation addressed in recent research (e.g., Gee, 2004; Hull and Nelson, 2004; Leander and Sheehy, 2004) raise important questions about what new modes of communication imply for new methods of research and representation. These new directions in educational research will undoubtedly influence questions of context, definitions of “text,” and notions of discourse. Moving forward both theoretically and methodologically in this arena requires a continued re-examination of the relationship between “text” and “context” as well as the ever-present dimensions of power that influence not only the researcher’s gaze but also the voices represented in the analysis and interpretation of data. Such a re-examination has profound implications for the ways we theorize and understand connections between modes of communication, modes of engagement, and learning processes for learners (adults and children) in and out of school settings.

## RESEARCHING DEVELOPING DISCOURSES AND COMPETENCES IN IMMERSION CLASSROOMS

### INTRODUCTION

It has been more than 40 years since the beginning of the first experimental Canadian French Immersion programme in St Lambert, Montreal in 1965 and the initiation of research into this educational phenomenon. Today, there is a well established and well regarded research literature on immersion programmes, both in Canada and in other parts of the world. Indeed, as Stern acknowledged as long ago as 1984, immersion is probably one of the most thoroughly investigated educational innovations of all times. According to Baker (2001), there are now over 1,000 research studies on this type of educational provision. Although the term ‘immersion’ is frequently used in relation to the ‘dual’ or ‘two-way immersion’ modality which has become popular recently in the United States, in the context of this article, the term will be used to refer only to the type of (one-way) bilingual programmes which originated in Canada in the 1960s.

Over the past four decades, the type of research carried out in this field has changed direction considerably, both in relation to focus and methodological orientation. The growing internationalisation of the immersion movement in many European nations, in certain Asian countries such as Hong Kong and Japan, and in Australia has led to the recognition of immersion as a world-wide phenomenon. Furthermore, the differing conceptualisations of immersion programmes as foreign language development, as minority language provision for majority language students, as language revival, as language support, and as contact with a language of power (Swain and Johnson, 1997) have meant that increasingly diverse research interests and concerns are being addressed in this field.

### EARLY DEVELOPMENTS

The early Canadian immersion programmes were conceived right from the start as integrally bound up with a process of systematic evaluation and research. The focus was on assessment of their impact on the linguistic, intellectual, and attitudinal development of the children

involved (Lambert and Tucker, 1972). This type of extensively funded, policy-driven research was situated in a psychometric tradition, and designed to have immediate educational impact on school planning (Tosi, 1989). Thus, the actual lines of enquiry involved were largely restricted initially to a focus on educational outcomes, comparing immersion students with non-immersion students (de Courcy, 1997). This was explicitly recognised by Lapkin and Swain (1984) and justified by the perceived need to demonstrate to policy makers that immersion was indeed a viable educational alternative, and to reassure Anglophone parents that their children would not suffer either academically or in respect to their English language proficiency.

The performance of immersion and non-immersion students was compared initially in three main areas: the maintenance and development of students' L1 and L2; students' academic achievement; and the attitudes of both learners and their parents towards Canadian Francophones.

Overall, the results of these assessments were positive in linguistic and in academic terms. The students' L1 did not suffer. Student proficiency in their comprehension of French (listening and reading) was seen to be approaching 'native speaker standard' (Cummins and Swain, 1986, p. 41) and there were no negative reports on academic achievement levels. However, while immersion students' production levels of spoken and written French were found to be higher than results from the regular programme, these were judged to be considerably lower than their comprehension skills. These early findings have also been replicated in later studies carried out in different immersion contexts (see Genesee, 2004).

The early research on change in participants' attitudes was less conclusive. Lambert and Tucker (1972) found little difference in students' perceptions towards Canadian francophones as a result of the St Lambert programme, while Lapkin and Swain (1984) found some evidence of broader perspectives towards cultural and linguistic diversity among immersion students in comparison to their non-immersion counterparts. In this respect, Heller (1990) maintains that the general lack of opportunity for the development of intergroup relationships between francophones and anglophones outside the school context is an important factor in accounting for the maintenance of stereotyped ethnic group images.

## MAJOR CONTRIBUTIONS

### *Changing Perspectives: Calls for the Use of Ethnography*

From the middle 1980s onwards, the early, almost exclusive focus of immersion research on educational outcomes was modified. Stern

(1990) situates this change of emphasis within the general debate on communicative language teaching which began in the late 1970s. He charts the concern of immersion researchers, such as Harley and Swain (1984), to identify positive and negative aspects of proficiency development in immersion students and to identify problem areas in the development of the proficiency of immersion classes. Thus, a significant strand of immersion research began to concentrate on aspects of classroom practice which were seen to be associated with the development of L2 proficiency.

There were also calls for immersion research to investigate the nature of classroom processes. In an influential article, Tardif and Weber (1987) suggested that attention to processes of classroom interaction and to the ethnography of communication in the immersion classroom might illuminate some of the language acquisition processes at work.

This emphasis on ethnography as a fruitful methodological stance for immersion research was further endorsed by Heller in 1990 (qv Toohey, *Ethnography and Language Education*, Volume 10). She advocated conducting ethnographic studies into the realities of the learners' communicative needs and the issues of intergroup relations within the wider Canadian socio-political context in order to solve such dilemmas as the 'plateau' effect in L2 learning. She argued that,

since so few ethnographic studies of immersion (whether of the classroom or its school and community environment) are available, it is difficult to pinpoint further the communicative constraints of the French immersion classroom which may be blocking further development, or whether it is possible in fact to do anything further in an instructional context of any kind. (Heller, 1990, p. 76).

Responses to these calls for a change in research perspectives may be classified into four main currents or directions: research into immersion pedagogy; research into teacher beliefs and practices; research into language learning processes; and research into sociocultural and political factors. All of these will be examined briefly below.

### *Researching Immersion Pedagogy*

In Finland, researchers at the University of Vaasa were particularly interested in examining some of the methodological assumptions underlying the newly established Swedish immersion programmes, claiming that the adoption of immersion principles facilitated 'a pedagogic-didactic renewal' (Laurén, 1992, p. 21). As a result of his observation of teaching in the Swedish immersion programme, Laurén proposed what he called, 'a two-phase-didactics for school' (1992, p. 71) to create a basic level of linguistic fluency at an early stage of language

learning when prerequisites are optimal, which can later be expanded on and extended.

Another member of the Vaasa Immersion research team, Vesterbacka (1991), was interested in the development of meaningful, ritualised routines in context-bound situations in immersion programmes. The researcher examined young children's language use in Swedish in relation to unchanging 'routines' and partially changing 'patterns'. Vesterbacka argued that these ritualised routines and patterns should be recognised as an important teaching and learning strategy at this level in immersion programmes. She saw them as key means of providing confidence for young children to express themselves at an early stage in their bilingual development and to communicate with others in meaningful contexts in an effort to fulfil their basic needs as efficiently as possible.

### *Investigating Teacher Beliefs and Practices*

In the 1990s, increasing emphasis was given to process orientated work in immersion research in the US, as evidenced by an in-depth study of teachers and teaching in two immersion programmes, one French immersion and the other Spanish immersion, in the midwestern US (Bernhardt, 1992). This two-year ethnographic research project focused on examining immersion teachers' beliefs and experiences as a way to understand how they approached their classroom practice. The researchers were also interested in examining 'immersion teaching' as 'a particular kind of teaching . . . not just language teaching' (Bernhardt, 1992, p. 3). There was thus, a new emphasis on pedagogical concerns rather than on the hitherto more widely discussed topics of the development and maintenance of student language proficiency independent of teaching and learning processes. The focus on teachers and classroom interaction, as seen through the eyes of principals, supervisors, and teacher trainers and the detailed discussions of classroom routines and aspects of contextualised student-teacher interactions provided a fascinating glimpse of how teaching and learning is accomplished moment by moment in different foreign language immersion contexts.

More recent work in Hong Kong, carried out by Hoare (2001) and Hoare and Kong (2001) has continued this emphasis on interaction in immersion classrooms, focusing particularly on different teacher strategies used in the teaching of Science in English by 'language aware' teachers and their 'non language aware' counterparts (qv Knowledge about Language, Volume 6). According to the results of their study, there is evidence to suggest that a teacher who is aware of the role of language in the curriculum can provide richer language environments which help to broaden students' thinking.

The issue of how teachers view their classroom practice has been another new development in immersion research in Catalonia. Arnau (2000) situates this type of analysis within a ‘teacher thinking’ approach, involving teachers reflecting on how they teach, either through narratives based on personal experience or collaborative reflection between teachers and researchers. A preliminary study, based on this approach, carried out in 2000 confirmed that the L2 principles that appear to guide teacher decisions are notions such as planned language, contextual contrast, comprehension, verbalisation, access to interaction, and individualisation. There is recognition that this type of reflection could result in curricular improvements in immersion settings.

The importance of pedagogical considerations in discussing classic issues in immersion literature relating to amount and intensity of student L2 language exposure on acquisition has been highlighted recently by Genesee (2004). He makes reference to ‘the nature and quality of classroom instruction’ (p. 562) as a key variable in accounting for the level of student L2 achievement. He also foregrounds the need for future research into the effect of different pedagogical approaches in the promotion of L2 development, thus firmly linking the importance of differing approach to teaching and learning with language acquisition (qv *Bilingual Education*, Volume 5).

### *Emphasizing Learner Perspectives on Learning*

There have also been studies carried out on language learning from a student’s perspective. A recent qualitative study into the experiences of immersion learning of a group of second year students in a late Chinese immersion programme at a university in Queensland (Australia) carried out by de Courcy in 2002 provides interesting insights into how learners view the ongoing process of learning a typologically and orthographically different language.

De Courcy found that the group of immersion students seemed to pass through four distinct phases in trying to make sense of classroom interaction with the first stage involving a heavy reliance on translation as a receptive strategy. This seems to be at odds with official immersion policy of a separation approach to language use based on Swain’s (1983) principle of ‘bilingualism through monolingualism’. Nevertheless, according to the empirical data analysed, this seemed to be a common initial strategy used by members of the Queensland Chinese immersion programme in order to try to make sense of classroom interaction in Chinese. This finding foregrounds the importance of empirical research in providing informed criteria to modify or confirm established classroom policies and practices.

*Examining Sociocultural and Political Factors*

Another important strand of research has focused on sociocultural and political factors involved in immersion teaching and learning, particularly as a result of the internationalisation of this type of educational provision. Genesee (2004, p. 560) has recognised the influence of contextual variables in making predictions about the effectiveness of specific programmes, stating,

the question of when to begin bilingual education cannot be answered by theoretical arguments and empirical evidence alone. Sociocultural and political factors must also be considered. The 'best' starting grade for bilingual education can depend on the goals, needs, and resources of the community.

This statement by one of the leading researchers in the field constitutes an important milestone in the change of direction towards a more socially informed perspective in immersion research.

There is evidence of interesting work being carried out on sociocultural aspects of learners and the language learning in various parts of the world. I will cite a few examples. Caldas and Caron-Caldas (1999) have focused on the developing cultural and linguistic identities of French/English immersion students with respect to aspects of both Québécois and US culture. The results of their study indicate that although there is evidence that bilingualism is valued among adolescent immersion students, there are also unmistakable signs of 'the enormous power of the predominant peer group to negatively influence individual views on bilingualism—whether in French Canada or the US' (Caldas and Caron-Caldas, 1999, p. 54).

In Japan, Downes (2001) has investigated changes towards a sense of Japanese cultural identity among elementary school children in an English immersion programme. Mindful of Swain and Johnson's (1997) contention that immersion does not aim at membership in the target language community, the researcher found that the learners' exposure to Western (English) culture provided a positive educational environment and that participation in the programme seemed to lead to more flexible cross-cultural attitudes and a stronger sense of Japanese cultural identity than noted in non-immersion students.

In Australia, de Courcy's (1997) work on classroom language learning in a Chinese late immersion programme has led to insights on how cross-cultural conflict is dealt with by students and teachers from different academic cultures and with different, culturally based learning scripts. Points of conflict identified in the study had to do with differing expectations of student interactional patterns in classroom settings, levels of politeness, and teacher responsiveness to learners' needs. De Courcy concludes that 'teachers need to help students to interpret

not just the literal meaning of the language, but the cultural meanings expressed through it' (ibid, p. 256) and echoes Tardif's (1994) support for more longitudinal classroom-based studies highlighting communicative processes.

#### WORK IN PROGRESS

##### *Language Acquisition and Development with L1 and L2 Student Populations*

In a recent review of bilingual education, Baker (2003) states, 'if a count were made of research on bilingual education in the last three or four years, it is qualitative investigations that have become relatively voluminous' (p. 103). In immersion settings this is certainly the case, if we take into account recent work on literacy development, classroom code-switching, and learners' perspectives on language learning. However, there is still a strong continuing strand of research based mainly on quantitative criteria focusing on second language acquisition and on programme effectiveness from a comparative perspective.

This does not mean, however, that research concerns have not moved on, as can be seen by the work currently being carried out by Merrill Swain, one of the most well known of the immersion researchers, who has been associated with developments in the field since the 1960s. As Block (2003, p. 107) notes, 'Swain . . . is in the unique position of being perhaps the only prominent IIO (Input-Interaction-Output) insider to engage with Sociocultural/Activity Theory in her research'. Block also refers to Swain's (2000) move to incorporate a process orientation towards her work on comprehensible output, postulating that this contributes to interactive problem solving and knowledge building, or 'collaborative dialogue' among learners, which, in turn, may lead to better levels of target language comprehension (qv *Foreign and Second Language Education*, Volume 4).

Comparative research on the performance of immersion and non-immersion students is continuing (see Genesee, 2004), in spite of Carey's (1991) critique of the validity of such comparisons, based on the contention that variables such as student motivation, teaching methodology, and parental attitudes are difficult to control in this type of study. As an example, Rivard (2001) compared summary writing by a group of French immersion students and a group of francophone students. He found that although at the beginning of secondary school immersion students were linguistically weaker than their francophone counterparts, by the end of the final school year significant differences between the two groups were only evident in stylistic concerns.

Hickey (2001), comparing L1 speakers and L2 learners of a target minority language in mixed early immersion programmes in Ireland, has provided evidence that the linguistic composition of the groups significantly affects the frequency of target language use by both L1 speakers of Irish and Irish/English bilinguals, though not L2 learners of Irish. The investigation into the effects of mixing of L1 and L2 learners in the same class shows an important change of orientation from the original Canadian immersion programmes, where separation of immersion students from L1 speakers of the target language was part of official immersion policy (Swain, 1982). It also bears witness to the increasing diversification of programmes and research interests in immersion education.

### *Language Learning in Relation to Literacy Development*

An interesting recent development over the last four or five years has been research into the phenomenon of literacy per se, rather than as part of a general discussion of the relationship between language and content teaching and learning (qv Literacy, Volume 2). In a qualitative study carried out by Ewart and Straw (2001) on literacy development in two Canadian immersion classrooms, the researchers looked at the effect of differing teacher linguistic and pedagogical practices on young children's literacy development. The results of the study revealed the complexities underlying the debate around the issue of language and initial literacy and indicated that teacher pedagogical practices were probably more important than language of instruction in students' biliterate development.

A second study, also conducted in Canada, focused on immersion students' perceptions of their developing biliteracy in Grade 5 and in Grade 7. This was part of a wider longitudinal study to evaluate the effect of increased intensity of exposure to the target language as a means of overcoming the plateau effect in L2 learning. Using interview and questionnaire data, Bournot-Trites and Reeder (2005) found a great variety in student perspectives on their process of literacy development and advocated that more attention should be paid to the voices of students in improving learning opportunities.

### *Codeswitching and Classroom Language Use*

In line with the focus on sociocultural concerns and the increasing recognition of the situated nature of immersion classroom practices, there is a further strand of research which has begun to concentrate on school and classroom language use, in particular, teacher and pupil use of language choice and codeswitching (qv Lin, Code-switching in

the Classroom: Research Paradigms and Approaches, Volume 10). Thus, the strong separation view of languages which characterised the early work on immersion has now given way to a more integrated, 'bilingual' vision of classroom talk (qv *Discourse and Education*, Volume 3). Researchers have turned their attention to the recurrent bilingual routines and communicative practices evident in classroom participants' interaction. As examples of this, I will cite two instances of work carried out in South America.

The first study is based on qualitative study of storytelling events with young children in immersion classrooms in Colombia (de Mejía, 1998, 2002). Far from being a deficit strategy used to supplement imperfect linguistic proficiency on the part of the teachers, the use of two languages in teaching and learning revealed a sophistication and complexity of language development often ignored by educationalists. Recently, Spezzini (2005) has been doing work on sociocultural dimensions of language learning and use in English immersion classrooms in Paraguay, within a wider study of language learning variability. She notes that some immersion students are conscious that their codeswitched discourse is significantly different from standard usage, and see this as a reflection of their unique identity as students of a particular bilingual school.

#### FUTURE DIRECTIONS

Since the change in emphasis in immersion research in the mid 1980s, towards a more process-oriented, classroom-based stance, there have been significant changes in ways in which researchers have chosen to investigate different aspects of immersion students' developing discourses and competences. As the need to make the case for immersion as a viable educational alternative to traditional foreign or second language programmes is no longer a priority, there has been an increase in longitudinal studies, designed to examine developmental aspects of language learning, academic progress and sociocultural consciousness of students in immersion programmes in many different parts of the world. There has been a recognition of the complexity of the processes involved, as well as of the increasing diversity of student and teacher linguistic and cultural backgrounds. There is also a heightened awareness of the role of codeswitching and language choice as a communicative resource and as an indicator of identity.

In a recent review of immersion programmes, Genesee (2004, p. 574) stated that he considered bilingual classroom discourse as a fruitful avenue for research in the future, asking, 'Is there a role for bilingual usage—that is, the use of both languages in the same lessons, in bilingual education? In other words, should the languages always be

kept separate and if not, how can they be used coextensively to promote language learning?' There, thus, seems to be interest in examining bilingual classroom discourse in immersion settings to see how this is related to the teaching-learning process.

Another area of future research interest has to do with the phenomenon of increasing multilingualism within immersion programmes. Although Canadian researchers, such as Genesee, discuss 'bilingualism', immersion programmes in Finland, Israel, and Australia are having to come to grips with an increasingly multilingual programme, designed to prepare students for engagement in a globalised universe. This is increasingly becoming an issue for Canada as well, as the immigrant population is expanding and must learn two languages, French and English, as well as maintaining their home language. In addition, the introduction of immersion programmes involving typologically and orthographically different languages such as Japanese and Chinese has opened up new possibilities for future research, as there is, as yet, little data on students' level of achievement in the written forms of this type of target language (Genesee, 2004).

There is, thus, evidence to suggest that research on immersion programmes is moving forward in important ways. Increasing numbers of longitudinal and ethnographic studies are focusing on aspects of classroom interaction, bilingual/multilingual language use, and socio-cultural issues. There is also continuing concern with carrying out comparative research on student achievement in different national contexts throughout the world. In short, it can be seen that since its beginnings in the late 1960s, immersion research has broadened both its methodological outlook as well as its sphere of interest in line with the spread of immersion programmes worldwide.

## LINGUISTIC ETHNOGRAPHY

### INTRODUCTION

As a term designating a particular configuration of interests within the broader field of socio- and applied linguistics, ‘linguistic ethnography’ (LE) is a theoretical and methodological development orientating towards particular, established traditions but defining itself in the new intellectual climate of late modernity and post-structuralism.

The debate about ‘what is’ and ‘what is not’ distinctive to an understanding of linguistic ethnography is current and the term linguistic ethnography itself is in its infancy. On the one hand it positions itself very much alongside anthropological traditions to the study of language, such as the ethnography of communication (Hymes, 1968, 1972) and interactional sociolinguistics (IS) (Gumperz, 1972, 1982), while on the other hand, it claims a distinctiveness by keeping the door open to wider interpretive approaches from within anthropology, applied linguistics and sociology. Linguistic ethnography typically takes a post-structuralist orientation by critiquing essentialist accounts of social life. In conjoining the two terms ‘linguistic’ and ‘ethnography’ it aligns itself with a particular epistemological view of language in social context. In a recently published discussion paper on linguistic ethnography, its general orientation is described as follows:

Linguistic ethnography generally holds that language and social life are mutually shaping, and that close analysis of situated language use can provide both fundamental and distinctive insights into the mechanisms and dynamics of social and cultural production in everyday activity. (Rampton et al., 2004, p. 2)

The discussion sets out an epistemological position which has much in common with contemporary sociolinguistics more generally—an interest in the interplay between language and the social, the patterned and dynamic nature of this interplay and the processual nature of meaning-creation in the making of context.

### EARLY DEVELOPMENTS AND MAJOR CONTRIBUTIONS

Linguistic ethnography (LE) has been shaped by major developments in linguistic anthropology (LA) in the mid-twentieth century in the

USA. Particular strands of LA which have influenced linguistic ethnography are the ethnography of communication (Hymes, 1968, 1974, 1980), interactional sociolinguistics (Gumperz, 1982, 1999) and micro-ethnography (Erickson, 1990, 1996). These traditions have of course been shaped themselves by a *mélange* of theoretical and methodological traditions. However, they also share a genealogy in seminal publications appearing in shared volumes and in sharing a critical mass of scholars working in particular locations (see Hornberger, 1995, 2003 for a fuller account).

In the following section, I outline these traditions in brief and show their relevance to researchers in the UK, where much of this work has been done. I end this section by looking at more recent developments in the USA in Linguistic Anthropology of Education (LAE) (Wortham, *Linguistic Anthropology of Education*, Volume 3) and consider the need that both LE and LAE express to extend beyond the earlier generations of linguistic anthropological research mentioned earlier to create new approaches to analysing the social and the linguistic.

### *Ethnography of Communication*

This approach from within LA has typically been concerned with challenging assumptions about cultural homogeneity through a focus on language use in interaction. Hymes is well known for criticizing both linguistics, for not making ethnography the starting point for the analysis of language use, and anthropology, for insufficiently drawing upon linguistics to understand and describe culture and context.

... it is not linguistics, but ethnography, not language, but communication, which must provide the frame of reference within which the place of language in culture and society is to be assessed ... (Hymes, 1974, p. 4)

Even the ethnographies that we have, though almost never focused on speaking, show us that communities differ significantly in ways of speaking, in patterns of repertoire and switching, in the roles and meanings of speech. (Hymes, 1974, p. 33)

For Hymes, what was needed was a general theory and body of knowledge within which diversity of speech, repertoires, and ways of speaking take primacy as the unit of analysis. Hymes' argument was that the analysis of speech over language would enable social scientists to articulate how social behaviour and speech interact in a systematic, ruled and principled way. This view became articulated in the ethnography of speaking (Hymes, 1968) and later the ethnography of communication (Hymes, 1974).

*Interactional Sociolinguistics*

Another tradition within LA is interactional sociolinguistics (IS), which focuses on discursive practice in social contexts and considers how societal and interactive forces merge. The goal of IS is to analyse how interactants read off and create meanings in interaction. Because language indexes social life and its structures and rituals, language use can be analysed to understand how presuppositions operate in interactions. Moreover, IS has looked at how interactants use language to create contexts. An important concept emerging from IS is 'contextualization cue', which according to Gumperz describes how a 'sign serves to construct the contextual ground for situated interpretation and thereby affects how constituent messages are understood' (1999, p. 461).

IS is often concerned with intercultural encounters and the systematic differences in the cultural assumptions and patterns of linguistic behaviour which are considered normal by those involved. Gumperz and others (Ochs, 1993) in their empirical work show how when we speak, we have ways of conveying to the listener complex information about how we intend them to treat the message. Ochs argues,

... in any given actual situation, at any given actual moment, people in those situations are actively constructing their social identities rather than passively living out some cultural prescription for social identity ... (Ochs, 1993, p. 296, 298)

In Gumperz's 'crosstalk' studies the focus is on how people of differing cultural backgrounds make assumptions about the kind of speech event they are participating in.

The aim is to show how individuals participating in such exchanges use talk to achieve their communicative goals in real life situations by concentrating on the meaning making processes and the taken-for-granted background assumptions that underlie the negotiation of shared interpretations. (Gumperz, 1999, p. 454).

A main purpose of IS analysis is to show how diversity affects interpretation and in this respect, it has much in common with micro-ethnography and the work of Erickson (1990, 1996).

*Micro-Ethnography*

Erickson's work has used video technology to look carefully at interactions for the importance of local framing. The focus here is on how interaction is constructed locally. Micro-ethnography has shown that people do not just follow cultural rules but actively and non-deterministically

construct what they do. Erickson shows us that listening is just as important as speaking in creating these environments and that speakers are in an ecological relationship with auditors (2004). Erickson's work has been influenced by Erving Goffman (1959), whose concern with the presentation of self in daily life has done much to show us that in any encounter we give off signals revealing aspects of our identities. Erickson, like Goffman, has emphasized close detailed observation of situated interaction.

The approaches described earlier, with their emphasis on close observational and textual analysis interpreted through an ethnographic understanding of the context, have all in some way shaped the work of scholars aligning with LE. Like the early work in the ethnography of communication which argued that linguistics had wrongly occupied itself wholly with the structure of the referential code at the expense of the social (Hymes, 1974, 1980), LE's argument is also for a socially constituted linguistics.

#### WORK IN PROGRESS

As indicated above, LE shares much in common with other approaches to research in sociolinguistics in making linkages between language, culture, society and cognition in complex ways which are not easily amenable to the application of strictly controlled a priori analytic categories. In terms of current research LE is shaped by a disciplinary eclecticism some of which is described below.

##### *Linguistic Ethnography*

It is the consideration of what is to be gained by conjoining the two terms 'linguistics' and 'ethnography' which begins to define linguistic ethnography. Linguistic ethnography is an orientation towards particular epistemological and methodological traditions in the study of social life.

Linguistic ethnography argues that ethnography can benefit from the analytical frameworks provided by linguistics, while linguistics can benefit from the processes of reflexive sensitivity required in ethnography. In a recent discussion paper, Rampton et al. (2004) argue for '*tying ethnography down and opening linguistics up*' (p. 4) and for an enhanced sense of the strategic value of discourse analysis in ethnography. Ethnography provides linguistics with a close reading of context not necessarily represented in some kinds of interactional analysis, while linguistics provides an authoritative analysis of language use not typically available through participant observation and the taking of fieldnotes (p. 6).

In LE, linguistics is said to offer an ethnographic analysis of a wide range of established procedures for isolating and identifying linguistic and discursive structures (p. 3). In contrast, in ethnographic analysis is said to offer linguistic analysis a non-deterministic perspective on the data. Because ethnography looks for uniqueness as well as patterns in interaction, it 'warns against making hasty comparisons which can blind one to the contingent moments and the complex cultural and semiotic ecologies that give any phenomenon its meaning' (p. 2).

An LE analysis then attempts to combine close detail of local action and interaction as embedded in a wider social world. It draws on the 'relatively technical vocabularies' of linguistics to do this. Rampton et al. (2004) suggest that although 'there is certainly much more involved in human communication' than the issues that these technical vocabularies can reveal they 'can make a valuable contribution to our understanding of the highly intricate processes involved when people talk, sign, read, write or otherwise communicate' (p. 3).

In addition to the study of interaction, the study of situated literacy practices is also well represented in LE where the focus is on community-based literacy research (Barton and Hamilton, 1998; Barton et al., 2000; Gregory, 1996; Gregory and Williams, 2000), multilingual literacy (Bhatt et al., 1996; Martin-Jones and Jones, 2000), and cross-cultural perspectives on literacy (Street, 1984). As with interactional studies in LE, such research starts from an understanding of literacy as social practice. In such studies, researchers made a distinct break from viewing literacy as a measurable cognitive achievement concerned predominantly with educational success and instead began to look at how people actually use literacy in their lifeworlds and everyday routines.

Linguistic traditions which construct language and literacy as social and communicative action in the organization of culture(s) have therefore been heavily represented in LE and some of these have been described in the previous section as characteristically linguistic anthropology. However, LE attempts to distinguish itself from the antecedents of linguistic anthropology, namely the ethnography of communication, IS and micro-ethnography in several ways. First, it brings a UK research perspective to historical developments in LA and makes explicit the importance of this work. Of particular mention here is literacy research which steps outside the classroom and looks at literacy within the broader setting of the communities in which people live out their lives (see Tusting and Barton, 2005 for a summary of Community-Based Local Literacies Research). Second, it draws on different approaches to the analysis of discourse such as conversation analysis (CA) and thus moves beyond those typically associated with early work in linguistic anthropology. Moreover, it draws heavily on literatures associated with

the general movement of post-structuralism in the social sciences and therefore combines fields of study not typical in earlier linguistic anthropology, such as media studies, feminist post-structuralism and sociology. Third, much LE has emerged from traditions within UK applied linguistics (see later) rather than anthropology and for this reason typically takes language rather than culture as its principal point of analytic entry into the problems it seeks to address. Rampton et al. (2004) argues that the influence of applied linguistics in the UK, has resulted in a particular kind of response from researchers in this vein or work

So in fact, even if they had wanted to produce “comprehensive ethnography. . . documenting a wide range of a way of life” (Hymes, 1996, p. 4), they didn’t really have the accredited expertise to do so. Instead, UK researchers tended to develop their commitment to ethnography in the process of working from language, literacy and discourse outwards, and so even though they have varied in just how far ‘outwards’ they reached, for the most part the ethnography has taken the narrower focus that Hymes calls “topic-oriented” (Hymes, 1996, p. 5) (Rampton et al., 2004, p. 6).

LE has therefore been shaped by major North American research as well as constituted through research past and present emerging from British universities. With regard to the latter, Rampton et al. (2004) describe linguistic ethnography as shaped by five ongoing and recent fields of socio and applied linguistic research. These are

- A focus on local literacies described in the work of New Literacy Studies (NLS) (Barton, 1994; Barton, Hamilton and Ivanic, 2000; Gregory and Williams, 2000; Martin-Jones and Jones, 2000; Street, 1984, 1993; see Tusting, *Ecologies of New Literacies and their Implications for Education*, Volume 9) in which texts are viewed as processual and constructed in social discourse and action. Street and the NLS played a major part in introducing the post-structuralist ‘turn’ to applied linguistics in the UK, and they influenced a wider shift of interest beyond texts-as-products to texts-in-culture-as-a-process (Street, 1993; see *Literacy*, Volume 2).
- A focus on ethnicity, language and inequality in education and in the workplace (Barwell, in press; Lytra, 2003; Martin-Jones, 1995; Rampton, 1995; Roberts, Davies and Jupp, 1992). Rampton’s work on linguistic crossing and urban heteroglossia is important in this group in having shaped LE. Rampton’s work deals with the agentive and creative nature of adolescent talk in creating new identities around ethnicity and shows how ‘adolescents attempt to escape, resist or affirm the racial orderings that threaten to dominate their everyday experience’ (1995, p. 20) (see also *Language Policy and Political Issues in Education*, Volume 1).

- A focus on ideology and the cultural dynamics of globalization represented in those working in critical discourse analysis (Fairclough, 1990, 1993, 1996; Kress, 1993). This area of work in the UK opened linguistics up to a wider range of sociologists and social theorists.
- A focus on the classroom as a site of interaction. There are two strands represented in this area. The first is the neo-Vygotskian research on language and cognitive development. Scholars working in this field have typically used Vygotsky's concept of the zone of proximal development (Vygotsky, 1962), as well as the neo-Vygotskian notion of scaffolding (Bruner, 1985), to investigate teaching and learning interactions between adults and children (Mercer, 1995). The second strand of classroom work is more focused on the classroom as a cultural context with its own sites of struggle and its own local institutional imperatives and affordances for particular kinds of learning and interaction (Creese, 2005; Maybin, 2003, 2006). This work shows how interaction is multi-layered and contested within the classroom with certain discourses neglected and others privileged.
- A focus on applied linguistics for language teaching. Work in this area is associated with scholars such as Widdowson (1984), Brumfit (1984) and Strevens (1977). In the UK this work has been important in shaping applied linguistics agendas through its attention to communicative competence in EFL teaching and teacher education.

LE, therefore, has been particularly influenced by research on literacy, ethnicity and identity, ideology, classroom discourse and language teaching. It aims to use discourse analytic tools in creative ways to extend our understanding of the role language plays in social life. It combines a number of research literatures from conversational analysis (CA), post-structuralism, urban sociology and US linguistic anthropology. It also has much in common with the North American perspective of LAE. It is worth summarizing the particularly influential elements of more recent US LAE work on LE.

Wortham describes 'contemporary linguistic anthropology of education as prioritizing educational institutions as research sites to explore how language ideologies get created and implemented' (Wortham, 2003, p. 2). Wortham, goes on to explain that,

Instead of imposing outsider categories, linguistic anthropology induces analytic categories that participants either articulate or presuppose in their action, and it insists on evidence that participants themselves are presupposing categories central to the analysis. (Wortham, 2003, p. 18)

Wortham (2003) describes major influences on LAE. In addition to the work of Hymes and Goffman (which also informed LE), research in

LAE has been influenced by the work of Michael Silverstein (1976, 2003) and others (Hanks, 1996; Lucy, 1993). Silverstein's interests in language ideology and metapragmatics has shown the unavoidable referentiality of language. He describes his work on indexicality as composed of two aspects. The first is 'appropriateness-to' contextual parameters already established and the second is, 'effectiveness-in' brining contextual parameters into being. Within LAE, this work is used to look at the interactional in relation to the macro-sociological and in considering the role schools play in cultural reproduction.

LAE has used Silverstein's work on metapragmatics and ideology (Silverstein, 2003; Silverstein and Urban, 1996) to describe how institutional social identities are interactionally accomplished and shifted in schools. In an overview chapter in the LAE volume (Wortham and Rymes, 2003), Hornberger brings a critical historical perspective to the formation of LAE:

Linguistic anthropology of education is, perhaps fundamentally, a field that seeks to understand macro-level societal phenomena, and in particular societal inequities, in terms of micro-level person-to-person interaction, in the hopes of enabling work for change from both the bottom up and the top down (Hornberger, 2003, p. 266).

LAE therefore, like LE, stresses the complementarity of anthropology and ethnography with linguistics.

From this short description of LAE we can see that both LE and LAE have their traditions in similar strands of US literature but with notable differences, the most salient of which is the influence of applied linguistics on LE. Perhaps LE can be described as more 'disciplinary eclectic' with less evidence of the strong genealogy in cultural anthropology which characterizes LAE. However, both aim to bring new analytical tools and different literatures to the study of discourse in social life. Both make education one of their core sites for research.

#### PROBLEMS AND DIFFICULTIES

At several points in this paper, it has been acknowledged that the term LE is new and under debate and we might say its future security is not certain. It faces several challenges and four of these are described below. First, certain 'linguistics' traditions when put alongside 'ethnography' do not necessarily sit comfortably together. Although as described earlier, there are established traditions of research which have addressed language and culture together, there are other traditions within linguistics which have not. The epistemological assumptions in

the two fields of study are not necessarily shared and therefore need consideration in defining what the unit of analysis is. For example, how might ethnography combine with particular approaches from within linguistics that do not take context as fundamental to analysis? As Rampton et al. (2004) suggest,

Linguistics is a massively contested field. There are a number of very robust linguistic sub-disciplines which treat language as an autonomous system (separating it from the contexts in which it is used) . . . (p. 3)

Such differing epistemological starting points can lead to different notions of what the principal object of study is. Defining an object of study requires finding a common language which can both describe and capture the dynamic nature of social life and its interactions. Debates within LE serve to consider some of these methodological and epistemological issues and look for a language of description which would enable researchers with opportunities to move beyond where we currently are.

A second challenge with LE is the danger of not keeping up with major developments either in linguistics or in ethnography and therefore taking a too narrowly defined position on both. To counter this argument, there already exists a range of traditions in linguistics and in ethnography which have an established history of working together, e.g. in linguistic anthropology as described earlier. However, there are also examples where relations between the two fields are more strained. Hymes (1983) shows how over the last 100 years, there have been moments/projects where linguistics and ethnography have been working in tension and moments when they have operated fairly smoothly.

A third challenge is germane to many areas of the social science and concerns the difficulty of relating micro-level phenomena and broader social trends and theories. In articulating linguistic ethnography a concern has been expressed that LE does not fully engage with its social responsibility in making the connection between small scale findings and wider social implications. That is, rather than simply raising issues of power and inequality and offering a balanced perspective, a question remains about what LE offers in addressing these inequalities.

A fourth challenge is concerned with this institutional pressures that researchers in micro-interpretive methods face. A potential problem with the micro-focus of linguistic ethnography described above is that it is out of step with research councils and their agendas for funding research, which is generalizable and large scale, generating statistical findings of significance and validity to a number of different contexts.

## FUTURE DIRECTIONS

It is not yet clear what the future of linguistic ethnography is. In some ways, as this chapter has argued, it already has a long and established history through its connection to LA and other socio and applied linguistic traditions. However, in others, its newness is in the attempt to negotiate and articulate a distinctiveness. As this chapter is written, LE is in the process of negotiating itself into being and its career length and trajectory is not known. The debate about ‘what is’ and ‘what is not’ distinctive to linguistic ethnography is of course, like any field of study, an ideologically and interactionally negotiated process. As Silverstein argues,

the macro-sociological is really a projective order from within a complex, and ever changing, configuration of interdiscursivities in micro-contextual orders, some of which, it turns out, at any given moment of macro-order diachrony asymmetrically determine others (Silverstein, 2003, p. 202)

Whether LE will emerge in the macro-socio and applied linguistic ‘order’ as determinant will depend on the interdiscursive possibilities of micro-interactions and their reconfiguration, ‘entextualization and regimentation’ (see Silverstein, 2003; Wortham, 2003). Following Silverstein further, LE’s future will depend on its ability to reflect ‘appropriateness to’ already well established sociolinguistic parameters and ‘effectiveness-in’ bringing about new conversations and analytical frameworks.

Rampton argues for leaving the intellectual space open in terms of the kind of work which might emerge and sees the endeavour as an ‘enabling mechanism’ rather than setting goals and purposes to pursue.

LE in the UK isn’t a large, rich and well-oiled machine. Instead, there are scholars and research students scattered around lots of different institutions, a few with quite a few other LE researchers but a lot of people working more or less solo, and all of us operating in a highly competitive audit culture (Rampton, February, 2005, email correspondence).

A continuing aim in linguistic ethnography is to build a community and extend dialogue to develop theory and methodology.

In recent years, there has been a recognition of the emergence of ‘linguistic ethnography’ as an umbrella term bringing together these areas of work, and the need for scholars in these areas to engage in informed dialogue to develop the field methodologically and theoretically. In 2001, a group of UK-based researchers therefore came together to set up the *UK Linguistic Ethnography Forum* ([www.ling-ethnog.org.uk](http://www.ling-ethnog.org.uk)), a group which holds regular seminars and colloquia to explore these issues. Such events have covered a range of thematic areas including

asymmetrical discourses, the interface of linguistic ethnography with other fields of study (e.g., education, feminist post-structuralism and US linguistic anthropology) linguistic diversity and multilingualism, NLS, reflexivity, representation and translation, and urban heteroglossia. This group serves as one important site for dialogue around and development of work in linguistic ethnography in the UK. The linguistic ethnography forum attempts to raise questions, provoke discussion and formulate some answers about whether and how reasonable it is to speak of 'linguistic ethnography' in social science research (Rampton et al., 2004, p. 1).

Although heavily indebted to early work in the ethnography of communication, LE also sees itself as offering a new perspective relevant to researchers working in the social sciences in post-modernity (Rampton, Maybin and Tusting, in preparation). Substantial developments in US linguistic anthropology and the turn to post-structuralist accounts of discourse and meaning making in the research literature in the UK and Europe, have allowed LE to draw on more hybrid literatures in its analytical frameworks than those traditionally associated with the ethnography of communication.

#### ACKNOWLEDGEMENTS

I am grateful to Richard Barwell, Adrian Blackledge, Vally Lytra, Janet Maybin, Ben Rampton and Karin Tusting for their critical engagement with and feedback on this chapter.

## ARTS-BASED APPROACHES TO INQUIRY IN LANGUAGE EDUCATION

### INTRODUCTION

With the acceptance of postmodern approaches to language research in the last few decades including feminism, poststructuralism, critical theory, and semiotics, assumptions about what counts as knowledge and the nature of research, have dramatically changed (see Fishman, *Theoretical and Historical Perspectives on Researching the Sociology of Language and Education*, Volume 10). The tools we use to collect data and display findings have diversified to include artistic as well as scientific methods. Arts-based approaches to inquiry refer to the use of the literary, visual, and performing arts through all stages of research. For example, there has been recent interest and support for including poetry, story, theater, and visual image as methods during data collection and analysis to increase researchers' attention to complexity, feeling, and new ways of seeing. Researchers increasingly turn to artistic forms of representation to communicate findings in multidimensional, penetrating, and more accessible ways to larger and more diverse audiences.

### EARLY DEVELOPMENTS

Artistry has often been as much a part of what language researchers have drawn upon in their research process as science. This ranges from the visual clarity and originality of graphic organizers to represent findings to hybrid writing styles that include rich, evocative language to describe the research field and share quoted speech from interviews. However, early developments of language education research methodology were rarely explicit about the place of art in scholarship.

Since the beginning of the study of language in anthropology, linguistics, and education, researchers have been particularly close to what Dewey (1934) described as the *aesthetic experience* involved in teaching, learning, researching, and communicating within and across different speech communities. For example, the Sapir-Whorf (1956) theory of linguistic relativity, although largely discredited, had tremendous influence on early studies of language and culture, influencing the emergence of *ethnopoetics* as a field of study. Ethnopoetics, a field

coined by poet-ethnographer Jerome Rothenberg in 1968 (Brady, 2000) focused largely on differences in aesthetics between indigenous verbal artists and Western literary traditions. Ethnopoetics was of central concern to linguistic anthropologist, Dell Hymes, in his research among Native American communities. Hymes (1964), the first to propose the “ethnography of communication” as a merged field between linguistics and anthropology, is himself a poet, who for years has been judging an annual poetry contest for the Society for Humanistic Anthropology.

Despite the implicit connections between early language education research and the arts, there were few, if any, explicit references to the arts in research before 1980. As to artistic products, there were fewer still. In fact, one of the first female anthropologists, Ruth Benedict (1934), whose book, *Patterns of Culture*, was one of the first to introduce the public at large to cultural diversity, published her poetry under pseudonyms to keep them hidden from her mentor, Franz Boas, and other academic colleagues (Behar, in press, pp. 5–6). By mentioning the arts in academic study, one risked leaving the impression that one’s research was less a piece of scholarship than a fictive invention. For some researchers, these fears gave way to a postmodernist turn in research, one that became disenchanting with absolute knowledge and objectivity in favor of “an epistemology of ambiguity . . . [celebrating] meanings that are partial, tentative, incomplete, and sometimes even contradictory and originating from multiple vantage points” (Barone, 2001, pp. 152–153). It was not until the 1980s that language education researchers and others in the social sciences began to embrace this postmodern turn, leading to the origins of what later came to be called “blurred genres,” “arts-based inquiry,” “scholARTistry,” and “a/r/tography.”

#### MAJOR CONTRIBUTIONS, “BLURRED GENRES”

Whether in the study of linguistic anthropology, language policy, discourse studies, or multicultural education, in the last few decades researchers and theorists have drawn explicitly upon blurred genres of the arts and sciences to analyze data and present their findings. In the 1980s, these front-runners in arts-based inquiry—though not called as such—paved the way for present-day arts-based researchers to take even further risks, crossing entirely into artistic genres of fiction, poetry, painting, and drama. As writing is a vital element of research inquiry, most of the initial contributions concentrated on the use and analysis of literary art forms in the human sciences with nods to music and the visual arts.

Heath’s (1983) classic ethnography of children learning to use language in two different communities was one of the first studies in education to use a literary approach to ethnography, drawing upon

narrative structures and metaphor (see also Toohey, *Ethnography and Language Education*, Volume 10). Lawrence-Lightfoot (1983) was the first to use the visual arts' term "portraiture" to describe her method of combining systematic, empirical description with aesthetic expression to describe the qualities of "goodness" in high school-learning communities. Clifford and Marcus (1986) book *Writing Culture* collected the first group of essays to address the poetic and political nature of cultural representation, drawing attention to the literary and rhetorical dimensions of ethnography.

Music theory and technique have also influenced some of the most noteworthy discourse studies in education, analyzing speech for its rhythm, meter, pitch, and tone. For example, Erickson and Shultz's (1982) study of counselor and student interactions used musical notation in analysis to discover that distorted rhythms in communication were heavily associated with cultural and perceived racial differences. Erickson, who has experience in music composition and theory, used his creativity and training to enhance his ability to hear and make sense of discordance and harmony in everyday talk. Similarly, Foster's (1989) study analyzed the musical qualities of an African American teacher's classroom discourse to shed light on the qualities of her success in an urban community college classroom. In particular, Foster focused on the teacher's use of church-influenced discourse patterns such as vowel elongation, cadence manipulation, and repetition.

Finally, the visual arts have been extremely influential in the study of language and education. Eisner's (1991) work in educational connoisseurship and criticism was foremost in this regard, using examples from the visual arts to describe, interpret, evaluate, and identify explicit educational themes. Edelsky (1981) addressed the visual as well as aural aspects of transcription, identifying areas of concern as to how to best represent the authenticity and dimensionality of an observed interaction for conversational analysis.

#### WORKS IN PROGRESS, "ARTS-BASED INQUIRY" IS BORN

The expansive directions of inquiry in the 1980s and early 1990s set the stage for the diversity and visibility of arts-based inquiry in the new millennium. However, arts-based research methodologies are still in conflict with established research paradigms and current political climates that emphasize and financially support traditional, scientific definitions of research. For example, in a report from the U.S. National Research Council (Shavelson and Towne, 2002), Eisner's (1991) "connoisseurship" and Lawrence-Lightfoot's (1983) "portraiture" were explicitly identified in opposition to sanctioned research methods that

are reliable, replicable, and generalizable in rigorously scientific ways. Despite increasing publication of arts-based research in a wide range of top tier scholarly journals, this scholarship is rarely eligible for financial support or the basis for academic promotion. Thus, modern-day Ruth Benedicts may still exist: researchers may produce poems using authentic names, but they can expect little professional support for doing so.

Despite plentiful deterrents, qualitative researchers in education such as Behar (1993), Ellis (1999), Barone (2001), Saldaña (2002) among others, too numerous to mention—confident that alternative arts-based methods are rigorous, relevant, and insightful—continue to take even greater risks, exploring new dimensions of arts-based methods that experiment at the scientific perimeter to push research questions and methodologies outward and enhance the field. There are two strands to contemporary arts-based research methodology today: those that embrace *hybrid forms* of artistic and scientific scholarship and those that produce *art for scholarship's sake*.

### *Hybrid Forms*

The hybrid arts-based research text was described by Barone and Eisner (1997) when they first introduced the concept of “arts-based inquiry” in Richard M. Jaeger’s edited book *Complementary Methods for Research in Education*. Barone and Eisner focused largely on contributions of the literary arts in educational research producing blurred genres between the arts and sciences. They laid out a theoretical framework for arts-based research, describing the qualities of arts-based texts: the creation of a virtual reality and a degree of textual ambiguity; the presence of expressive, contextualized, and vernacular forms of language; the promotion of empathetic participation in the lives of a study’s participants; and the presence of an aesthetic form through the unique, personal signature of the researcher.

In the spirit of hybrid genres of arts-based inquiry, one of the best-known book-length examples is Tom Barone’s (2001) merger of fiction and scholarship in *Touching Eternity*. The hybrid form allowed Barone “to play two games at once” in his study of a high school art teacher and his former students:

On the one hand, I assuaged a felt need to speak in an analytical voice about motifs confronted within my conversation with former students. On the other, I wanted to honor the life stories of participants before transforming them into life histories. So I experimented with a format in which life stories were presented extensively and physically distanced from the commentary of the researcher (p. 171).

Similarly well known, Ruth Behar's (1993) feminist ethnography, *Translated Woman*, is a blurred genre that integrates artistry and anthropology. Behar shares long, uninterrupted stretches of discourse from her informant Esperanza's *testimonio* about life experience as a single mother and peddler in Mexico. In addition, Behar shares her own reflections as an anthropologist *del otro lado*—literally from the other side of the border and figuratively from the other side of life in terms of race and class status. Behar's work, as well as that of Carolyn Ellis (1999), has opened the territory of "autoethnography," a merger between autobiography and ethnography, highlighting the extent to which the researcher foregrounds his or her own reflections and experiences in a given study.

Blurred genres of arts-based inquiry contextualize the creation of art—story, poetry, printmaking, sculpture, autobiography, ethnodrama—within their experimental science, perhaps, as Barone (2001) suggests, "because many postmodernist innovators began their careers as ethnographers and sociologists (rather than as artists, literary critics, or art theorists)" (p. 153). Nielsen (2005) identified blurred genre work as "scholARTistry," a hybrid practice which combines tools used by the literary, visual, and performing arts with tools used by educators and other social scientists to explore the human condition. Nielsen (2005) addresses three goals of scholARTistry on her web site, "to make academic writing an area where virtuosity and clarity are valued, to make educational research an area where the arts are legitimate inquiry, and to infuse scholarship with the spirit of creative connection." Varieties of teacher research and action research also constitute forms of scholARTistry where an educator uses narrative portraits to document her own literacy classroom (e.g., Hankins, 2003) or where an administrator autoethnographically documents her process to begin the first dual-immersion charter school in Georgia (e.g., Perry, 2005). In visual arts, Irwin and de Cossen (2004) published *A/r/tography* a collection of work that explores curriculum as aesthetic text through visual renderings as well as prose interpretations.

ScholARTists working with blurred genres share many of the same goals in their work. First, they incorporate tools from the sciences and the arts to make new, insightful sense of data during and beyond the research project. New insights and questions take precedence over a desire for absolute answers to educational and linguistic questions. Second, these blurred genre scholARTists share an explicit recognition of the self-other continuum, where the researcher is explicitly recognized as the primary instrument for documenting and interpreting knowledge from participants or from a specific context that ultimately informs the researcher about himself or herself as well. Thirdly, blurred

genre writers tend to have the goal to speak to diverse audiences both within and outside the academy. The use of accessible, vernacular, and aesthetic language and image, are used explicitly to reach beyond the academy to larger, more diverse audiences and to engage in what Barone (in press) called “truly dialogical conversation[s] about educational possibilities” (p. 23).

### *Art for Scholarship's Sake*

If hybrid art forms exist between two ideal forms of “art” and “science” then *art for scholarship's sake*, as I define it, exists just beyond hybridity and plants itself more squarely in the realm of stand-alone artistry—poems, short stories, paintings, dance, and drama among other forms of artistic expression. Unlike those creating hybrid forms, most creators of art for scholarship's sake have years of advanced training in their art form in addition to their studies in the social sciences. These scholARTists use their experiences during language education fieldwork to create pieces of art that capture the essence of their findings in emotionally penetrating ways. What distinguishes this work from art for *art's* sake is often the context in which this type of scholARTistry is found and that the scholARTistry's content is typically grounded in the experience of data collection and analysis.

Johnny Saldaña has used his 25 years of experience as a theater artist to produce what he calls “ethnodrama,” transforming fieldwork data into scripts for live theater. One of Saldaña's best-known ethnodramas is his adaptation of educational anthropologist, Henry Wolcott's research into a play called *Finding My Place: The Brad Trilogy* (Saldaña, in Wolcott, 2002). In this ethnodrama Wolcott, the researcher, and Brad, his research participant, become characters in a script that dramatizes the research findings as well as the complicated and, at times, controversial nature of the research process when the researcher becomes intimately involved with a participant.

Adrie Kusserow and Kent Maynard are two cultural anthropologists who have extensive backgrounds as poets. Both use poetry and ethnographic writing separately to share findings from their studies in different ways with different audiences. Kusserow has published her research in traditional ethnographic books and journals, regularly publishes ethnographically inspired poetry in a blurred-genre journal, *Anthropology and Humanism*, and has also published an acclaimed book of poetry, *Hunting Down the Monk* (Kusserow, 2002), which illuminates themes from her fieldwork in Nepal and Northern India. Likewise, Maynard has placed his work in a range of venues from conventional ethnographic writing to his published poetry in the Wick Poetry Chapbook Series (Maynard, 2001). Through poetry Maynard's

research on indigenous medicine among the Kedjom peoples of the Republic of Cameroon comes alive through scintillating and unexpected language.

Stephanie Springgay is a visual artist working on projects that explore women's subjective experiences of bodied space through community-engaged art. Springgay (in press) describes her academic curriculum vitae which includes international art shows of her work alongside published papers and conference presentations. Springgay's two recent bodies of work are titled *Nurse-in* and *Spillage*. These sculptures created from felted human hair, glycerin soap, and parts of a breast pump are designed to illuminate the contemporary feminist negotiations between motherhood, breastfeeding, and work.

In sum, art for scholarship's sake is grounded in extensive artistic training and aims to imbue art with socially engaged meaning from research and imbue socially engaged research with art. Increasingly, language and education research journals such as the *Journal for Latinos and Education* and *Anthropology and Education Quarterly* formally exhibit creative reflections on fieldwork in nontraditional forms such as poetry and autobiographical prose. Other journals such as the *International Journal of Education and the Arts* and the *Journal of Curriculum and Pedagogy* feature an even wider array of representational forms and formats including musical, pictorial, and videographic, as well as verbal and print and multimedia. There are poetry readings, performances, and arts exhibitions at major research meetings such as the American Education Research Association (through the arts-based educational research special interest group) and the American Anthropology Association (through the society for humanistic anthropology). Examples of art for scholarship's sake in language education research share renderings of inquiry in ways that are unexpectedly memorable due to their emotive and visceral impact.

#### PROBLEMS AND DIFFICULTIES

Due to degrees of risk—professional and personal—involved, the artistic aspects of language education research have often been implicit, seldom acknowledged as such, and have often been achieved through luck rather than purposeful development. Consequently, there is very little explicit training for current and future language researchers to practice research methods that embrace tools and techniques from the arts as well as the sciences. Without explicit training, there can be no critical community to establish what constitutes quality in arts-based research.

The problem that arises by not creating a critical community is that there are few measurements of quality in arts-based inquiry. Without a critical community, arts-based inquiry is at risk of “anything goes”

criteria, making it impossible to distinguish what is excellent from what is amateur. Accompanying the demand for arts-based approaches to inquiry must also be a call for tough critics, those who advocate alternatives but will not substitute “novelty and cleverness for substance” (Eisner, 1997, p. 9). To foster a tough critical community, more arts-based educational researchers need to share the techniques and aesthetic sensibilities they use to prepare other researchers to understand, sensibly critique, and further develop arts-based approaches to scholarship.

Jane Piirto (2002) has been especially critical in regards to the question of quality in arts-based inquiry. She distinguishes arts-based exercises for personal creativity enhancement versus a higher level of scholARTistry that requires extensive and disciplined training. Piirto prescribes a minimum of an undergraduate minor, preferably a major, and evidence of peer-reviewed success for those who wish to make art for “high-stakes” research purposes such as dissertations, theses, or publications (p. 443).

Critical of anthropologist Ruth Benedict’s “cloying” attempts at verse, contemporary anthropologist, Ruth Behar (in press), advocates that scholars stick to genres they know well, enhancing them with what she describes as a “poetic anthropology”:

“The more important work I’m doing right now is the effort I’m making to craft a poetic anthropology. After all, we have a lot of poetic poets out there, but tell me, how many poetic anthropologists do you know? Anthropology needs poetic anthropologists. And the funny thing is that most anthropologists don’t know that. Or don’t want to know that (p. 95)”.

Aside from quality, another tension in arts-based research concerns the metaphoric novelty of the work versus its literal utility in a climate where our audiences require answers for practice rather than an additional set of ambiguous, beautifully stated questions (Eisner, in press). Eisner (in press) contends: “Novelty is a part of creativity and creativity is important to have, but when it trumps instrumental utility . . . namely that it contribute to the enrichment of the student’s educational experience, it loses its utility as a form of educational research” (pp. 16–17). Thus, an important concern for arts-based researchers in language education is how to make the process and products of scholARTistry valid and useful to other researchers, educators, politicians, and others wishing to benefit from the outcomes of inquiry.

The challenges of distinguishing quality in arts-based research and creating arts-based forms of inquiry that matter, especially in a political climate insistent upon definitive, unambiguous, generalizable answers, are not to be taken lightly. There are still more researchers writing *about* arts-based research criteria than those providing examples of what it looks like in each area of the literary, visual, and performing

arts. Thus, increased numbers of researchers need to experiment with hybrid forms and art for scholarship's sake to continually refine our critical sensibilities. Increased numbers of scholARTists working with an established criteria for excellence help others in the field of language research discover aesthetic forms that are useful to language inquiry as well as to diverse audiences of scholars and lay people outside the academy including teachers, administrators, politicians, and others involved in pedagogical practices and high-stakes decision making in educational contexts.

#### FUTURE DIRECTIONS AND POSSIBILITIES

Arts-based approaches to inquiry are not an either-or proposition to traditional research paradigms. Arts-based researchers in language education do no service to themselves to define their methods in opposition to more traditional approaches to inquiry. Rather, the literary, visual, and performing arts offer ways to stretch a researcher's capacities for creativity and knowing, creating a healthy synthesis of approaches to collect, analyze, and represent data in ways that paint a full picture of a heterogeneous movement to improve language education.

Among the value arts-based inquiry provides to a researcher's own imaginative thinking is also the value of sharing the process and products of arts-based research with a much larger readership than that of a typical language education study with more immediate and lasting impact. For example, sharing a poem may be a much more effective way to bring a discussion of research findings back to a group of students or teachers, than sharing a lengthy research article or book-length manuscript. Sharing a series of photographic images in the hallways of a college of education may disperse research findings to pre- and in-service teachers in more penetrating and immediate ways than any traditional text. Finally, hybrid forms and art for scholarship's sake may be more likely to find venues outside the immediate academy. For example, Jonathan Kozol's (2005) hybrid piece of journalistic ethnography found a large, influential home in *Harper's Magazine*, potentially reaching tens of thousands of readers about the conditions of under-resourced schooling in low-income areas of the urban USA.

Based on interviews with US Latino youth about their language abilities and attitudes toward Spanish, English, and code-switching I wrote the following poem, "What You Are" (Cahnmann, 2000, 2006). The poem captures the combined voices of these youth to dramatize the mistrust that can occur when Latino students are forced to choose between the languages of school and languages of home. Persona poems are opportunities to articulate another point of view, a means of exploring both the inner and outer worlds of lived experience. The

metaphor of the “plantain stain” emerged from an interview with a Puerto Rican principal who described his school’s success as indebted to his own “mancha de plátano”—literally “plantain stain” and figuratively an idiom used to describe Puerto Rican identity. I learned through this exchange and the crafting of this poem that the Caribbean diet is based on plantains, and the process of peeling a lot of plantains leaves the peeler’s fingers, the “real” Puerto Rican, with a lasting purple stain.

#### WHAT YOU ARE

Between Halloween and Martin Luther King Day,  
 Ramona forgot her language, started to leave it at home  
 the day her classmates laughed, the day she picked up  
 a dirty piece of paper when the teacher really said,  
 “RuhMOhnuh, you dropped your glove.”

That’s how it starts, the *señoras* say.  
 When a piece of you drops off,  
 and you pick up something else instead.  
 Nobody gives you that other piece back.

You have to fight for it. Like Ramona’s cousin Gloria  
 who flew back to the island when she was nineteen  
 because she was all-English, and the family said  
 she wasn’t Puerto Rican anymore.  
 She was *cool* and *what the fuck man*  
 She even thought you made *sancocho* from a can!

No way, Gloria says to Ramona when she returns.  
 Ain’t nobody gonna give you back your culture  
 once you leave it lying there like a wrinkled  
 piece of paper. You have to put your name on it.  
 Purple with plantain stains on your fingers.  
 Puerto Rican. *Puerto Riqueño*. If they ask you,  
 that’s what you are.

This poem appeared in a literary journal (Cahnmann, 2000) and in *Language Arts*, a US language education journal (Cahnmann, 2006). Not only am I able to share this piece of scholARTistry with audiences of poets, scholars, and teachers, but I am also able to share this poem and others directly with young people (often with the profanity deleted)—those who participated in my study and those with whom I work in ongoing projects concerning bilingual youth. The poem helps me engage conversations about language acquisition and language shift, opening up space for bilingual youth to share their fears about

language learning and cultural identity. As a language education researcher and poet, it has been important for me to develop my interests, skills, and identity as a scholARTist, rather than feel traitorous to art or science. I aim for the art and science to live together and breathe.

Researchers in language education cannot lose by acquiring and applying techniques employed by arts-based researchers. We must assume an audience for our work; one that longs for fresh language and imagery to describe the indescribable emotional and intellectual experiences in and beyond language education contexts. We may not all be poets, dancers, or painters, but we can all draw on the arts to craft poetic discourse analysis or artful case studies—renderings that realize the heights of artistic as well as scholarly potential, challenging the academic marginality of our work.

We might decide to read more poetry, take a dance class, and thus find ourselves taking more risks in the ways we approach our research methodology—whether this means incorporating sketches of a field site in our notebooks, writing “data-poems” from interview transcripts, or creating a scripted dialogue between the “characters” of influential theorists such as Bakhtin and Vygotsky wrestling with theory and data. My hope is for language education researchers to explore arts-based research methodologies mentioned here as well as others as a means to add more joy, meaning, and impact to our work.

## **Language, Interaction and Education**

## MICROETHNOGRAPHY IN THE CLASSROOM

Microethnography is concerned with the local and situated ecology among participants in face-to-face interactional engagements constituting societal and historical experience. *Ethnographic microanalysis of interaction*, as microethnography is also known, aims at describing how interaction is socially and culturally organized in particular situational settings such as classrooms. Microethnographers typically work with audiovisual machine recordings of naturally occurring social encounters to investigate in minute detail what interactants do in real time as they co-construct talk-in-interaction in everyday life. As such, microethnography offers a methodology for the investigation of face-to-face interaction and a particular point of view on language use in multiparty arrangements in complex modern societies (Erickson, 1992, 2004; McDermott, Gospodinoff, and Aron, 1978). This view stresses that the social and cultural organization of human communicative action (Erickson and Shultz, 1982) involves conversationalists contained in physical bodies, occupying space in simultaneously constraining and enabling social situations, who must reflexively make sense of each others' actions as they act, without the benefit of an interpretive system that is shared completely among interlocutors.

## EARLY DEVELOPMENTS

As an interdisciplinary research approach, microethnography has intellectual origins in distinct research traditions that converge in their interest in aspects of the organization of human social interaction. Among early influences is *context analysis*, the collaborative work of a multidisciplinary research group, including Gregory Bateson and Ray Birdwhistell, which pioneered the use of audiovisual records as primary sources of research data to study communicative interaction (see Kendon, 1990). Their work fundamentally shaped microethnography's commitment to the examination of nonverbal behavior and the unspoken activities of listenership in the study of face-to-face interaction (e.g., Erickson and Shultz, 1977/1981; McDermott and Gospodinoff, 1979/1981; Streeck, 1983). A second intellectual root is the *ethnography of communication*, from which microethnography inherited a linguistic anthropological concern with culturally appropriate forms of

talk and with variation in the function-form relationship in language use within and across speech communities (e.g., Michaels, 1981; Shultz, Florio, and Erickson, 1982; see Wortham, *Linguistic Anthropology of Education*, Volume 3). Yet a third source of insight is Goffman's studies on the "situational" (Goffman, 1981, p. 84) character of *the interactional order*. Based on the view that social interaction occurs within constraints of what participants agree is the situation they are currently in, microethnographies aim to demonstrate empirically the subtle ways in which participants (re-)arrange their alignments toward one another and (re-)frame their communicative actions accordingly. In addition to their significance for the analysis of the organization of communicative actions in face-to-face encounters (e.g., Shultz and Florio, 1979; Streeck, 1983), these observations also help explain key interactional mechanisms in phenomena such as interethnic miscommunication in the classroom and beyond (e.g., Erickson and Shultz, 1982; McDermott and Gospodinoff, 1979/1981).

Ethnographic microanalysis of interaction has also profited from contemporary studies in *conversation analysis* about the real-time sequential organization of conversation (see Mori and Zuengler, *Conversation Analysis and Talk-in-interaction in Classrooms*, Volume 3). Given the shared methodological stance of privileging the participants' recognizable sense-making perspectives in the analysis of talk and social interaction, the conversation analytic and microethnographic perspectives often display close affinity (cf. Goodwin, 1981; Hellermann, 2006; Mehan, 1979).

Similar influences have also marked research in *interactional sociolinguistics* (Gumperz, 1982), with which microethnography shares most concerns and assumptions. Considerable overlap and cross-fertilization therefore exist between the two approaches (cf. Tannen, 1992) to the extent that they are often not differentiated (see Wortham, *Linguistic Anthropology of Education*, Volume 3; McKay, *Sociolinguistics and Language Education*, Volume 4; Tsui, *Classroom Discourse: Approaches and Perspectives*, Volume 6; Toohey, *Ethnography and Language Education*, Creese, *Linguistic Ethnography*, Warriner, *Methods of Discourse Analysis in Educational Research*, Volume 10).

#### MAJOR CONTRIBUTIONS

Initial microethnographic work began in the 1970s through an interest in examining processes of mutual social influence among face-to-face interactants, particularly in terms of how participants create context and *make sense* during their activities together in educational environments. This early work, led by Frederick Erickson and Ray McDermott, carried the hallmarks of the microethnographic contribution to the study of language and social interaction in educational settings, especially in

the classroom (cf. Trueba and Wright, 1981). Among its features are, first, methodical attention to nonverbal and listener behaviors *simultaneously* with the (traditionally studied) verbal behaviors of speakers, including the noting of interactional rhythm and cadence; and, second, a thematic focus on mutual, simultaneous and successive influences among participants in interaction, the construction of labile situated social identities, and the management of culture difference.

Mehan (1998) identifies four major themes as the highlights of ethnographic microanalysis of interaction in education. First, in their demonstration “that face-to-face interaction is a productive site for the study of cultural production and reproduction,” microethnographies have also shown that “significant cognitive structures, such as intelligence, ability and disability, such social structures as identities and steps in educational career ladders are socially constructed in locally organized social situations” (p. 248), with classrooms as one key setting for such work (see Duff, *Language Socialization, Participation and Identity: Ethnographic Approaches*, Volume 3; Valencia Giraldo, *Talk, Texts and Meaning-making in Classroom Contexts*, Volume 3; McKay, *Sociolinguistics and Language Education*, Volume 4; Toohey, *Ethnography and Language Education*, Volume 10). Second, in doing this, microethnographers have produced not only a methodology, they have also helped underscore the “context-specific nature of human behavior” (p. 247), of which the educational community and public political discourse seem to need constant reminding lest judgments are made on the basis of ungrounded overextension of theoretical or personal presuppositions that often expose the behavior of participants in classroom interaction as incompetent, disorganized, senseless or inferior (see Green and Dixon, *Classroom Interaction, Situated Learning*, Volume 3). A third major contribution has been the research work contrasting the social organization of classroom lessons with that of the children’s home, especially of low-income and ethnic minority backgrounds, which has produced the “cultural discontinuity account of school difficulty” (p. 249) for children who may need to make major adjustments to the interactional etiquette they bring from home if they are to be seen as socially competent in the classroom, and thus deserving of access to the social opportunities made available by the educational system (see Ching Man, *Classroom Discourse and the Construction of Learner and Teacher Identities*, Volume 3; Haglund, *Ethnicity at Work in Peer-group Interactions at School*, Volume 3; Fenner, *Cultural Awareness in the Foreign Language Classroom*, Volume 6; Blum-Kulka, *Language Socialization and Family Dinnertime Discourse*, Volume 8; Howard, *Language Socialization and Language Shift among School-aged Children*, Volume 8; Pahl, *The Ecology of Literacy and Language: Discourses, Identities and Practices in Homes, Schools and Communities*, Volume 9). A fourth contribution

has been the empirical evidence provided for the characterization of the social nature of human learning which has in turn quite unwittingly supported the view that learning is constructed through guided assistance, a view that is widely held today by sociocultural theorists of education of various persuasions (see Green and Dixon, *Classroom Interaction, Situated Learning*, Volume 3; Lyle, *Learners' Collaborative Talk*, Volume 3; Maybin, *Revoicing across Learning Spaces*, Volume 3; Valencia Giraldo, *Talk, Texts and Meaning-making in Classroom Contexts*, Volume 3; and Hardman, *The Guided Co-construction of Knowledge*, Volume 3; van Lier, *The Ecology of Language Learning and Sociocultural Theory*, Volume 9).

In a seminal contribution, Erickson and Shultz (1977/1981) ask the crucial microethnographic question: "when is a context?" In their search for a methodological approach that would incorporate contemporary advances in the understanding of human social interaction to the analysis of social competence in naturally occurring scenes in everyday life, Erickson and Shultz draw attention to aspects of interactional behavior whose meaning may be redundant across the different communicative channels. They show that this redundancy—easily mistaken for interactional noise—is in fact essential for face-to-face interactants to be able to gauge what and "when" the context is in order to act in socially appropriate ways. Moreover, they argue, appropriate displays of this ability can be a determining factor in judgments made about social competence, an issue of paramount importance in educational encounters. This work also outlines the analytical steps for microethnographic research and has thus become a key reference for the research methodology of ethnography microanalysis of interaction.

In a series of classroom studies investigating how teacher and minority children learning to read organized their activities and time together, McDermott (e.g., McDermott, Gospodinoff, and Aron, 1978) builds a solid case for the microethnographic notion that "people constitute environments for each other" (McDermott, 1976, p. 27, cited in Erickson and Shultz, 1982, p. 7). In the situational ecologies where discourse is produced in face-to-face interaction, it is through the monitoring of the effects of his/her performance on the listener that the speaker can see how effectively he/she is interacting, and where he/she must change according to the continuously emerging context. McDermott (1977), for example, focuses on systematic postural shifts in relation to bids for the floor in a reading group ecology to show how the participants' actions made sense in the local environment they created together—even if that meant more time working on "relational struggles" and less on learning to read, which in and of itself may not make good educational sense.

In another study, McDermott and Gospodinoff (1979/1981) puzzle over the conflicting interaction between a white teacher and her Puerto Rican

kindergarten student. The boy conspicuously flouted culture-specific social etiquette norms for address, bodily touch, and interactional space in the classroom until the teacher joined him in creating an incident which disrupted her work session with the bottom reading group. Combining careful scrutiny of the participants' verbal and nonverbal behaviors with attention to the micropolitics of the interaction, McDermott and Gospodinoff show that student and teacher are engaged in *border work*, that is, they are adding a sociopolitical layer onto cultural identity markers. McDermott and Gospodinoff posit that participants often exploit cultural differences—simple *boundaries* of identity which can be crossed over and do not intrinsically constitute impediments to optimal communication, such as norms for bodily touch in interaction—as convenient tools to deal with immediate interactional pressures or to communicate conflicting interests over resources. In the short run, the researchers point out, the classroom incident they described was “to everyone’s advantage” (1981, p. 224). The boy secured the teacher’s attention to what he had bothered her about, while “the teacher and the children in the bottom group [got] a brief rest from their intense organizational negotiations” (p. 224). In the long run, however, occurrences of interactional conflict due to the micropolitical exploitation of small cultural differences sediment what would otherwise be passable *boundaries* of identity into insurmountable interactional *borders*, with lifetime consequences for those like the student mentioned above, as these borders serve as cultural trenches for societal struggle among individuals in competing identity groups.

Erickson and Shultz’s (1982) detailed microanalysis of interethnic counseling interviews in junior colleges is a classic microethnographic investigation of participation structure, interactional rhythm, and listening behavior in relation to speaking. It shows how the local interdigitation of concerted action—the interlocking of interactional gears—enters into the achievement of critical gatekeeping decisions which are consequential in terms of access to social opportunity. Highly significant to the study of cross-cultural communication is Erickson and Shultz’s (1982) empirical finding that, despite the clear relation between culture difference and interactional trouble, when culturally dissimilar student and counselor managed to activate particular “attributes of shared status” (p. 35), or *comembership* (e.g., common interest in Catholic high school sports), their interactions were observed to be significantly less uncomfortable. In addition to providing evidence of the dynamically emergent nature of context in everyday interaction, Erickson and Shultz (1982) bring forth the social-scientific relevance of examining the real-time organization of verbal and nonverbal activities of speakers and listeners. They discuss these issues in terms of *reciprocity* (i.e., “the interdependence of actions taken successively across moments in time,” p. 71) and *complementarity* (i.e., “interdependence

of actions taken simultaneously in the same moment,” p. 71), thus emphasizing the microethnographic view that face-to-face interaction is built on actions in physical time and space, rather than simply on the exchange of meaningful utterances.

A concern with real-time, locally appropriate ways of making sense in embodied interaction is also the focus of Shultz and Florio (1979). They show how a teacher’s routine verbal and nonverbal behaviors—outside her own or the students’ conscious awareness—are critical to the organization of classroom life, regulating the timing and social space for appropriate student contributions. Learning how to make sense of these contextualization cues (Dorr-Bremme, 1990; Gumperz, 1982), they show, enables students to navigate across the classroom environment appropriately and ultimately reflects on their perceived interactional competence.

Concerned with child-child interaction, Streeck (1983) examines linguistic and kinesic features composing the ecology of communicative processes in “peer teaching” events in a group of five minority schoolchildren. He describes in concise detail the procedures by which the children organize their interaction frame by frame to achieve and sustain a consensus of what their activity is, and to seal off their interactional space from the surrounding world, a process in which they “thereby contextualize the linguistic process of giving and receiving instructions” (p. 2).

Shultz, Florio, and Erickson, (1982) investigate the contrastive social organization of different participation structures for conversation that Italian-American students encountered at home and at school. While some social participation structures found in the classroom resemble the structure and timing for appropriateness of those in the children’s homes, mismatches were observed. Participation structures in which the speaker-audience relationships allow for the simultaneous occurrence of more than one *floor* (i.e., access to a turn at speaking that is attended to by others) were routinely found to be sanctioned at home. However, when students produced them at school, the same participation structures constituted reason for reproach by the teacher. This analysis suggests that floor, as an aspect of the ecology of interaction, is not necessarily a unitary phenomenon, as previous work had proposed. In addition, it shows how small children may find it difficult to know what constitutes appropriate communicative behavior at school.

A number of microethnographic studies focus closely on such mismatches between home and school cultural norms for communicative behavior. Among them, Au (1980) and Au and Mason (1983) argue that cultural congruence in the rules governing participation in classroom activities may facilitate academic learning. These studies show how native Hawaiian children were more comfortable in a classroom

ecology where participation structures similar to the ones they were familiar with at home were used in reading lessons, resulting in improved reading scores in the long run. Michaels (1981) analyzes “sharing time” in an ethnically mixed first-grade classroom and argues that the observed mismatches in teacher/student culturally based discourse strategies and prosodic conventions for giving narrative accounts have potentially adverse effects on the minority students’ access to key literacy-related experiences.

In sum, microethnographers have provided, according to Mehan (1998) “a new paradigm for understanding inequality” (p. 254) as they “removed social structures from a disembodied external world and relocated them in social interaction” while they also “took cognitive structures out of the mind and related them in interaction” (p. 254). In addition to this theoretical contribution, microethnography has also had pedagogical implications in that it called attention to the need to bridge cultural discontinuities in the classroom while exposing the benefits of variety and flexibility in the social organization of classroom talk-in-interaction as a resource in classroom instruction. But it has been perhaps in the methodological arena that microethnography’s contributions have been disseminated most widely. Its firm commitment to a fully accountable interpretive approach made it develop firm and consistent roots in empirical investigation built on the grounding of claims in the interaction as can demonstrably be seen in the participants’ actions.

#### WORK IN PROGRESS

Microethnographic studies are deeply concerned with the elusive nature of context in social interaction (Erickson and Shultz, 1977/1981), and the role it may play in the interpretation of utterances and other communicative behavior. Having offered early evidence for the understanding of context as the online and embodied creation of co-present interactants, microethnographers have also provided useful heuristics for the analysis of context in face-to-face interaction (Erickson, 1992; Erickson and Shultz, 1977/1981; McDermott, Gospodinoff, and Aron, 1978). Theirs has been a significant contribution to unravel what constitutes social and communicative competence—especially in interaction in institutional settings and among socioculturally dissimilar interactants—and to connect these interactional processes to societal issues such as social opportunity and cultural politics.

The main empirical concerns of early microethnographic work—the relationship of listening behavior in relation to speaking, the nature of contextualization processes in interaction, the construction of situated social identities and the lability in the foregrounding of aspects of social

identity in everyday face-to-face interaction—continue to be the focus of later work (Dorr-Bremme, 1990; Erickson, 1996; Fiksdal, 1990; O'Connor and Michaels, 1996). In addition, insights from that early work have also been taken in new directions.

One such direction is research on *the language and culture of classrooms* conducted by the Santa Barbara Classroom Discourse Group, which congregates researchers with special interest in issues of classroom interaction and reading and writing instruction, learning and practice (see contributions in Green and Dixon, 1993; Jennings and Green, 1999). An example of such focus can be seen in Castanheira, Crawford, Dixon, and Green's (2001) interest in "what counted as literacy" in the practices of teacher and students across five classes in a vocationally oriented secondary school in Australia. Through analysis of what counted as text, as literate practices, and as participation in each class, they illustrate the research approach they term "Interactional Ethnography", and provide relevant theoretical discussion of the relationships between theory and method (see chapters on Bloome, *Literacies in the Classroom*, Volume 2; Valencia Giraldo, *Talk, Texts and Meaning-making in Classroom Contexts*, Volume 3; Pahl, *The Ecology of Literacy and Language: Discourses, Identities and Practices in Homes, Schools and Communities*, Volume 9; Melzi and Caspe, *Research Approaches to Narrative, Literacy, and Education*, Volume 10).

Similar research concerns are also present in the work of David Bloome and his associates on *literacy practices*. Bloome and Egan-Robertson (1993), for example, microanalyze a first-grade classroom reading event to show the moment by moment emergence of intertextuality as a social construction that can be "located in the material of people's social interaction" (p. 330). In demonstrating this, moreover, the authors interpret an event in which two students resisted full participation in a reading lesson and seemed off-task, when in fact they were making relevant intertextual links, though using intertextuality differently from the rest of the class to "define themselves as readers outside the definition of being students" (p. 330). Contemporary work on face-to-face interaction and literacy thus takes the initial microethnographic methods and point of view to the specific understanding of how reading and writing are constructed as integrally social processes.

Bloome, Caster, Christian, Otto, and Shuart-Faris (2005) bring that line of microethnographic research to date by dealing with classroom literacy events now in the light of increasingly explicit concerns with gender, race, identity and power relations within and beyond classrooms. In the tradition of microethnographers, they keep methodological, theoretical, and epistemological issues well united, as they deal with broad social and cultural processes, always stressing the conception of people as complex, multi-identity actors working together with

the tools given by culture, language, social, and economic capital to create new meanings, social relationships and possibilities within the affordances of interaction in all of its complexity, ambiguity, and indeterminacy (see Moss, *Gender and Literacy*, Volume 2; Bloome, *Literacies in the Classroom*, Volume 2; and Edwards, *Reading: Attitudes, Interests, Practices*, Volume 2).

Microethnography has also been introduced to new academic environments, where it is shedding light on complex issues of social identities, schooling, and opportunities to learn crucial literacy skills. By examining how some students were able to participate in classroom literacy events more centrally than others, Jung and Garcez (forthcoming) show how students and teacher in a first-grade classroom in a semiliterate multilingual rural community in Brazil reproduce and recreate complex social identities which may be evident in various settings throughout the local community. The students' deployment, as they participate in classroom interaction, of various traits related to urban versus rural, pan-Brazilian versus German-ethnic, Brazilian Portuguese versus dialectal German-speaking are set against the illuminating background of gender identities. The resulting view shows that the same classroom literacy event may afford different opportunities to participate and learn the literacy practices which are hard to come by outside the school environment. Thus a "good learner" is often expected to emulate the practices usually associated with the female, Catholic, German-ethnic and non-German-speaking local semiliterate, and students unwilling to participate as such may be especially challenged (see Luk Ching Man, *Classroom Discourse and the Construction of Learner and Teacher Identities*, Volume 3; Nielsen and Davies, *Discourse and the Construction of Gendered Identities in Education*, Volume 3; Heller, *Language Choice and Symbolic Domination*, Volume 3; Duff, *Language Socialization, Participation and Identity: Ethnographic Approaches*, Volume 3; McKay, *Sociolinguistics and Language Education*, Volume 4; Freeman Field, *Identity, Community and Power in Bilingual Education*, Volume 5; Tsui, *Classroom Discourse: Approaches and Perspectives*, Volume 6; Howard, *Language Socialization and Language Shift among School-aged Children*, Volume 8; Hornberger, *Continua of Biliteracy*, Volume 9; Pahl, *The Ecology of Literacy and Language: Discourses, Identities and Practices in Homes, Schools and Communities*, Volume 9).

#### PROBLEMS AND DIFFICULTIES

The insights and contributions of ethnographic microanalysis of interaction to the fields of education, cross-cultural communication and the organization of face-to-face interaction have long been recognized

(Trueba and Wright, 1981), and microethnography remains a productive research approach. Yet the relatively limited additional microanalytic work with “the same sort of intensive videotape analysis that was the hallmark of the early research” (Shultz, 1996, personal communication) bespeaks of difficulties in its wider application as a research method.

As Erickson (1992) points out, ethnographic microanalysis of interaction is labor intensive, and “should not be used unless it is really needed” (p. 204). It is especially appropriate when one is interested in investigating social interaction in face-to-face events that are “rare or fleeting in duration or when the distinctive shape and character of such events unfolds moment by moment, during which it is important to have accurate information on the speech and nonverbal behavior of particular participants in the scene” (pp. 204–205).

The very strengths of microethnography—a research method which permits investigation of the full range of variation and the determination of the typicality or atypicality of event types, modes and interactional organization—are indicative of how onerous it is. Improvements in technology have greatly facilitated the collection and handling of video records of interaction, such as digital audio and video, which now allow computer-aided management of recordings. Yet the benefits of microethnographic research can only be fully achieved through careful and continued revisitation of these records in a long process of reviewing the whole event numerous times, identifying its major constituent parts and the aspects of organization within them, then focusing on the actions of individuals and finally comparing instances of the phenomenon of interest across the research corpus. This process of “considering whole events, . . . analytically decomposing them into smaller fragments, and then . . . recomposing them into wholes” (Erickson, 1992, p. 217) demands great attention and time, inevitably limiting the amount of data that can be processed (thus the case-study nature of microethnographies). Nonetheless, it remains a distinctive strength of microethnography that it can produce deep analysis of phenomena which may be impossible to perceive in real time observation and which may be too heavily laden with common-sense perceptions for participant-observers to even notice.

Moreover, in its focus on complete analysis of audiovisual records of naturally occurring interaction, ethnographic microanalysis has the potential to reduce the analyst’s limitation to the investigation of frequently occurring events and his/her dependence on premature interpretation of interactional phenomena. It thus offers tools “to identify subtle nuances of meaning that occur in speech and nonverbal action—subtleties that may be shifting over the course of activity that takes place” and whose verification may enable us to see “*experience in practice*” more clearly (Erickson, 1992, p. 205). Recent technological

tools to support video analysis have played a role in facilitating and enhancing this process, but they have also made it more complex in the sense that analysts must become familiar with equipment and procedures which often impose demands of their own.

The laborious quality of microethnography—as the methodological pursuit of a comprehensive point of view on social interaction—makes it an especially apt qualitative method for examining micro social processes and establishing their connection to more encompassing processes that ultimately constitute society and history (Giddens, Duneier, and Appelbaum, 2007). It is in this light that microethnographers refer to the inadequacy of “micro” as the label for their research work, which can in fact be quite macro (cf. Bloome and Egan-Robertson, 1993, p. 331; Bloome, Caster, Christian, Otto, and Shuart-Faris, 2005; Erickson, 1992, pp. 222–223). Since the microethnographic approach to data analysis is largely inductive, *a priori* concerns with macrostructural formations do not drive the analytic process (cf. Erickson, 1992; Gumperz, 1982). Though such issues often do emerge from the participants’ observable behavior, it is only when substantial emic evidence warrants their treatment, in later stages of the research process, that they become analytically foregrounded. As a result, microethnographers may be seen as ignoring the wider social contexts that shape the interactants’ displayed stances, in what Mehan (1998) refers to as “radical contextualism” (p. 259). However, in showing the subtle ecologies that participants create in face-to-face interaction, as social actors who are both reproducing and altering their macro social structures in situated talk-in-interaction, microethnographies in fact describe the co-construction, in and through discourse, of joint social realities which are intimately connected to wider societal processes such as, for example, interethnic struggle and social opportunity (e.g., Erickson and Shultz, 1982).

Erickson (2004) is directly concerned with bridging the gap between microethnographic analytic perspectives and wider concerns which have more typically been addressed by social theorists who favor the view “that the conduct of talk in local social interaction is profoundly influenced by processes that occur beyond the temporal and spatial horizon of the immediate occasion of interaction” (p. viii). In his synthesis of much of his own previous work, some of which was referred to above, Erickson shows how what happens in the here and now of people living their lives in particular situations sediments in larger social phenomena observable with the passing of time and across different settings. A constant interest is in tracking how inequality is constructed across situations, and how the inequality which can be spotted more widely in society is actually made to exist in face-to-face encounters.

Bloome, Caster, Christian, Otto, and Shuart-Faris (2005) also address the connections between local interactional issues and the wider social contexts that shape the interactants' displayed stances. In a book with heavy emphasis on metaresearch issues, their Chapter 4 "Microethnographic Discourse Analysis and the Exploration of Power Relations in Classroom Language and Literacy Events" provides an especially telling analysis of two elementary education classrooms (7th grade Language Arts/6th grade Social Studies) in the US as the authors contrast them to show "different formulations of how literacy is implicated in power relations and, more specifically, how literacy events may be implicated in transforming power relations" (see chapter on Janks, *Teaching Language and Power*, Volume 1). "In both classrooms, students had to address written texts associated with academic knowledge (a poem and library books), and those written texts became props for examining knowledge and power relations" (p. 220).

Both Erickson (2004) and Bloome, Caster, Christian, Otto, and Shuart-Faris (2005) show contemporary microethnographers' commitment to keep bringing about insight into what is happening in classrooms that has emic validity and "the potential to reveal systems of power and control (and resistance to them) that are grounded in the realities of people's everyday lives, the ways or possibilities through which people create meaningful lives and caring relationships for themselves and others" (Bloome, Caster, Christian, Otto, and Shuart-Faris, p. 56).

#### FUTURE DIRECTIONS

Contemporary social theory has restored the notion that the situated communicative activities of flesh and blood interactants are critical to the constitution of society and historical experience (Giddens, Duneier, and Appelbaum, 2007). In that it offers a consistent methodological framework for the investigation of video records of everyday face-to-face interaction as well as a broad theoretical basis guiding its practice (Bloome, Caster, Christian, Otto, and Shuart-Faris, 2005; Erickson, 1992, 2004; Erickson and Shultz, 1977/1981; McDermott, Gospodinoff, and Aron, 1978), microethnography stands as a discourse-and-interaction analytic research method that can in fact support the empirical characterization of what people do when they interact face to face in everyday life. With video now a common and accessible data collection resource, and with the increasing realization that verbal/speaker discourse is but one aspect of what needs to be attended to for the comprehensive understanding of the embodied and situated activities of human communicative behavior, we should therefore expect microethnography to offer increasingly significant contributions to the description of societal-historical processes constituted in the situated reflexive practice of social agents.

Following the criticisms of their radical contextualism that may jeopardize its capacity to illuminate what is going on in educational encounters such as those that happen in classrooms—which are always fraught with echoes from beyond its walls, microethnographers’ head-on attempt to improve the field’s grasp of the complex “interconnections between social structure, culture and social interaction” while also attending to the need “to reconcile the conflictual and consensual dimensions of learning” (Mehan, 1998, p. 264) is proof of the vitality of microethnographic analysis of interaction in educational settings.

## CODE-SWITCHING IN THE CLASSROOM: RESEARCH PARADIGMS AND APPROACHES

### INTRODUCTION

Classroom code-switching refers to the alternating use of more than one linguistic code in the classroom by any of the classroom participants (e.g. teacher, students, teacher aide). In this discussion, both code-mixing (intra-clausal/sentential alternation) and code-switching (alternation at the inter-clausal/sentential level) will be referred to by the umbrella term, code-switching, as this is also the general practice in many classroom code-switching studies. The aim of this contribution is to provide an overview of the research literature and to point towards future research directions.

### EARLY DEVELOPMENTS

While classroom code-switching studies have been diverse, the often-quoted early studies chiefly have been conducted in North American settings in two main kinds of contexts: (1) second language contexts (e.g. ESL classrooms) and (2) bilingual education classrooms. The research methods largely drew on quantitative and functional coding analysis. Research interest has mainly been directed at two aspects: the relative quantities of first language (L1) and second language (L2) use in different activity settings, and the functional distribution of L1 and L2. Below is a review of the research methods used in some early studies.

#### *Early Studies on Relative Amounts of L1/L2 Use Across Activity Types and Settings*

This type of research has largely been conducted in North American settings with children in bilingual education programmes (e.g. Wong-Fillmore, 1980). The main emphasis of such work is to investigate whether linguistic minority children's L1 (e.g. Spanish, Chinese) and the wider, societal language (English) are given equal emphasis by calculating the relative quantities of use in the classroom (in terms of the number of utterances in each code or the time spent on it). Data

for such studies is typically collected through class visits and observations with subsequent analysis of field notes and audio/videotapes. For instance, Wong-Fillmore (1980) found a range of L1 use depending on the degree of individualization in teacher-student interaction. In a Cantonese-English bilingual programme, the teacher spoke the least L1 (8% of all her utterances) and the most L2 (92%) during whole-class instruction. She spoke more L1 (28%) during interactions with individual students in seatwork. The child chosen for observation, on the other hand, spoke much more L1 (79%) in seatwork than during teacher-directed whole class instruction (4% L1). This study suggests the preference for the use of L1 in less formal, more intimate participant structures.

In another study (Frohlich, Spada and Allen, 1985) on the communicative orientation of L2 classrooms in four different programmes in Canada (e.g. core French, French immersion, extended French with subject matter courses, ESL classrooms), teacher talk in all four programmes was found to reflect very high L2 use (96%). However, the researchers noted that students generally used the target language only while the teacher exercised control over classroom activities. During seatwork most interaction occurred in the students' L1. Again, it seems that students show strong preference for using L1.

While the interactive sociolinguistic notion of 'participant structure' (Goffman, 1974; Heller, 2001) was not used in these early studies, they relied instead on the related notion of activity type or setting (e.g. individual seatwork, group work, whole-class instruction) as an important factor affecting the relative amounts of L1/L2 use in both studies above. In contrast, other work used functional coding systems in their analysis to develop categories of functions for which L1 is used.

### *Early Studies on Functional Distribution of L1/L2 Use*

Many of the functional studies were conducted in bilingual content classrooms in the USA and only a few on second and foreign language classrooms. In these studies, classroom utterances were usually coded by the observer with a functional system (e.g. Flanders, 1970) yielding frequency counts of distribution of L1 and L2 over different functional categories. For instance, in a study based on observations of five kindergartens in Spanish bilingual programmes and using an adaptation of Flanders' Multiple Coding System, Legarreta (1977) reported on the functional distribution of Spanish (L1) and English (L2) in two different models: the Concurrent Translation (CT) and Alternative Days (AD). She found that the AD model generated an equal distribution of Spanish and English by teachers and children overall, with more Spanish used for 'warming' and 'directing' functions and English as

the primary choice for disciplining children. However, in the CT model, instead of using the L1 (Spanish) of the majority of the pupils to express solidarity (warming, accepting, amplifying), the teachers and aides predominantly used English for these functions.

In another study, Milk (1981) coded teacher talk in a twelfth grade bilingual civics lesson according to eight basic pedagogical functions (e.g. informative, directive, humour-expressive) based on Sinclair and Coulthard (1975). English (L2) was found to dominate the teacher's directives (92%) and meta-statements (63%) while there was a greater balance between L1 and L2 in other functions (e.g. elicitation, expressive, reply, informative). In addition, Milk described the skilful manner in which the bilingual teacher employed extensive switching between Spanish and English to create humour, both as a means of social control (via the creation of a sense of solidarity) and as a way to arouse students' interest.

Guthrie (1984) used similar research methods in a study of an ESL lesson attended by 11 first-grade Cantonese-American students (ranging from limited-English proficiency to fluent). Two types of lessons were analysed: reading in English with a Cantonese-English bilingual teacher, and oral language with an English monolingual teacher. Field notes and audio recording of six hours of lessons were obtained and coded by two bilingual observers. It is found that interactions of the English monolingual teacher with the limited-English-proficiency students in the oral lessons were characterized by a higher proportion of conversational acts such as 'attention-getters', 'requests for action' and 'protests', indicating a certain lack of teacher control and a frequent loss of student attention. On the other hand, while the bilingual teacher used Cantonese (L1 of the students) very rarely (less than 7% on average) in the English reading lessons, when she did it was for a distinct reason. She told the researchers that she tried to avoid using Cantonese during these lessons and was surprised to find she has used L1 as much as she had. The functions of L1 use reported by Guthrie can be summarized as: (i) to act as a 'we-code' for solidarity, (ii) to clarify or check for understanding, (iii) to contrast variable meanings in L1 and L2 and to anticipate likely sources of confusion for students.

So, while the functional coding approach dominated early work in some studies (e.g. Guthrie, 1984; Milk, 1981) preliminary use of ethnographic interviews and interactional sociolinguistic methods were incorporated, a trend which continued in later work.

#### MAJOR CONTRIBUTIONS

Many early studies seemed to have worked with the assumption that functional categories were stable, valid categories of classroom speech and that analysts could reliably assign utterances to each category. Yet

the functional coding approach in early studies in fact involved a lot of sociolinguistic interpretive work on the part of the coder. This interpretive work was, however, not made explicit but taken for granted in the form of final frequency counts of L1 and L2 distributed across different functional categories.

Later studies (e.g. Adendorff, 1993; Creese, 2005; Eldridge, 1996; Heller, 1999, 2001; Jacobson, 2001; Lin, 1990, 1996, 1999; Martin, 1996, 1999, 2003; Martin-Jones, 1995, 2001; Merritt, Cleghorn, Abagi and Bunyi, 1992; Ndayipfukamiye, 1994; Polio and Duff, 1994; Simon, 2001) have, to varying degrees, dispensed with a priori lists of functional categories and drawn on research approaches from interactional sociolinguistics and ethnography of communication (e.g. Goffman, 1974; Gumperz, 1982; 1986); conversation analysis (Sacks, 1965/1992); interpretive research paradigms; critical social theory (Bourdieu and Passeron, 1977); and critical research paradigms to study classroom code-switching (see also Wei, *Research Perspectives on Bilingualism and Bilingual Education*, Volume 10; Toohey, *Ethnography and Language Education*, for these or related research paradigms).

Just as interactional sociolinguistics (IS) and ethnography of communication (EC) provide the most useful analytic tools for researching and understanding code-switching in different settings in society, their concepts and methods have been drawn upon in classroom studies on code-switching. For instance, the most frequently and fruitfully used ones are: code-switching as contextualization cues (Gumperz, 1984) to signal a shift in the frame or footing (Goffman, 1974) of the current interaction (e.g. see Adendorff, 1993). Frame or footing is the definition of what is happening and it is constantly being negotiated, proposed (signalled) and re-defined by the speakers engaged in interaction. Different frames or footings that are being evoked (or signalled and proposed by a speaker) involve the simultaneous negotiation of different role-relationships and the associated sets of rights/obligations. Lin's studies (1990, 1996), for instance, drew on these interactional sociolinguistic analytic concepts to analyse code-switching in Hong Kong classrooms. Below is an example from Lin's (1996) reanalysis of Johnson's (1985) data in Hong Kong secondary schools, using IS analytic concepts. The data presentation format is as in Johnson's: Tape-recorder counter numbers precede utterances; italics indicate originally Cantonese utterances, and only teacher's utterances have been transcribed.

### *Example 1*

A junior secondary maths teacher in Hong Kong begins his lesson in English and then breaks off and switches to Cantonese to deal with

late-comers; once they are settled, he switches back to English to continue with the lesson work ('Example 1' in Johnson, 1985, p. 47):

008 Close all your textbook and class work book.

012 *There are some classmates not back yet. Be quick!*

017 Now, any problem about the class work?

Johnson (1985) analyses the Cantonese utterance as an example of an informal aside done in Cantonese. While agreeing partially with this analysis, we note, however, that if it is to mark out a mere topical digression, the teacher can well have done this by means other than code-switches, e.g. intonational changes, hand-claps, or pauses to bracket the aside (see e.g. in Lin, 1990, pp. 32–36). The use of these contextualization cues (Gumperz, 1984) does not involve a violation of the institutional 'use-English-only' constraint which teachers in Anglo-Chinese secondary schools in Hong Kong were well aware of. It can, therefore, be argued that what is being signalled here is not only a topical aside, but also a radical break in the English pedagogic frame and an urgent change in the teacher's concerns. The switch from English to Cantonese seems to relay to his students this implicit message, 'Now I'm so annoyed by these late-comers that I have to put aside *all* kinds of teaching, including that of English teaching, and concentrate on one single task: that of getting you to settle down quickly! And you'd better take my command seriously as I'm single-minded in enforcing it!' This break in the English pedagogic frame to highlight a different, urgent set of concerns cannot have been achieved without the teacher's switch from English (L2) to Cantonese (L1).

The key, therefore, to understanding the implicit meanings signalled by code-switches lies in a recognition of the sociolinguistic fact that whenever Hong Kong Cantonese have something urgent and earnest to relay to one another, they do so in their shared native language; whenever Hong Kong Cantonese speak to one another in English despite their having a common native language, it is usually because of some institutionally given reasons, for instance, to teach and learn the English language in an English immersion classroom. When teachers want to establish a less distanced and non-institutionally defined relationship with their students, they will also find it necessary to switch to their shared native language, Cantonese.

Similar kinds of analysis drawing on IS and EC research methods are offered in Simon's (2001) study of code-switching in French-as-a-foreign-language classrooms in Thailand. Teachers are seen as code-switching for a number of purposes, among which are those of negotiating different frames (e.g. formal, institutional learning frame vs. informal friendly frame), role-relationships and identities (e.g. teacher vs. friend). Code-switching is seen as having a 'momentary boundary-levelling effect' in the classroom (Simon, 2001, p. 326). Whether similar effects

might be achieved by code-switching in different contexts would, however, seem to depend on different sociolinguistic statuses and values associated with different codes in different societies.

In studies along this line, IS and EC analytical concepts and methods are drawn upon to analyse instances of classroom code-switching. The findings look remarkably similar across different sociocultural contexts. Code-switching is seen to be an additional resource in the bilingual teacher's communicative repertoire enabling her/him to signal and negotiate different frames and footings, role-relationships, cultural values, identities and so on in the classroom (e.g. see Merritt, Cleghorn, Abagi and Bunyi, 1992; Ndayipfukamiye, 1994). These studies have the effect of uncovering the good sense or the local rationality (or functions) of code-switching in the classroom. To summarize by drawing on the functional framework of language from Halliday (1994), code-switching can be seen as a communicative resource readily drawn upon by classroom participants (usually the teacher but sometimes also students) to achieve the following three kinds of purposes:

1. Ideational functions: Providing limited-L2-proficiency students with access to the L2-mediated curriculum by switching to the students' L1 to translate or annotate (e.g. key L2 terms), explain, elaborate, or exemplify L2 academic content (e.g. drawing on students' familiar lifeworld experiences as examples to explain a science concept in the L2 textbook/curriculum). This is very important in mediating the meaning of academic texts which are written in a poorly understood language—the L2 of the students.
2. Textual functions: Highlighting (signalling) topic shifts, marking out transitions between different activity types or different focuses (e.g. focusing on technical definitions of terms vs. exemplifications of the terms in students' everyday life).
3. Interpersonal functions: Signalling and negotiating shifts in frames and footings, role-relationships and identities, change in social distance/closeness (e.g. negotiating for in-group solidarity), and appealing to shared cultural values or institutional norms.

Apart from the above studies which draw on interpretive research paradigms, there is also a major trend of studies led by Monica Heller and Marilyn Martin-Jones (e.g. in their edited 2001 book, *Voices of Authority: Education and Linguistic Difference*), which draws on both interpretive and critical research paradigms and relates micro-interactional functions of code-switching in the classroom to larger societal issues, such as the reproduction or sometimes contestation of linguistic ideologies in the larger society (e.g. which/whose language counts as standard and valued language; which/whose language counts as inferior or not-valued language).

Heller and Martin-Jones (2001) provided some examples on how micro-ethnographic studies of classroom code-switching are not actually 'micro'

in their implications if we see the classroom as a discursive site for reproduction or contestation of linguistic ideologies and hierarchies. The discursive construction/negotiation of what counts as front stage and back stage (Goffman, 1974) and the legitimation of what goes on in the front stage (largely controlled and set up by the teacher) as legitimate, standard, valued language versus what gets marginalized, reproduced as inferior, non/sub-standard language in the back stage. Usually the societal dominant L2 occupies the first position and students' L1 occupies the latter position. For instance, in Ndayipfukamiye's (2001) study of Kirundi-French code-switching in Burundi classrooms, the bilingual teacher is seen to be using Kirundi (students' familiar language) to annotate, explain and exemplify French (L2) terms and academic content. While the linguistic brokering functions of code-switching is affirmed (i.e. the value of providing students with access to the educationally dominant language, French), the linguistic hierarchy as institutionalized in the French immersion education policy in Burundi is largely reproduced in these code-switching practices.

However, not all studies are about reproduction of linguistic ideologies and practices. For instance, Canagarajah (2001) shows how ESL teachers and students in Jaffna (the northern peninsula of Sri Lanka that has been the political centre of the Tamils) negotiated hybrid identities through code-switching between Tamil and English, defying both the Tamil-only ideology in the public domains and institutions, and the English-only ideology from the ESL/TESOL pedagogical prescriptions from the West. Canagarajah argued that both teachers and students, by code-switching comfortably between these two languages are also constructing their bilingual cosmopolitan identities, refusing to be pigeonholed by essentializing political ideologies (of Tamil nationalism) or English-only pedagogical ideologies.

Lin (1999) also showed that by skilfully intertwining the use of L1 (Cantonese) for a story focus with the use of L2 (English) for a language focus, a bilingual teacher in a Hong Kong English language classroom successfully got her students interested in learning English and gaining confidence in reading English storybooks, and thus transforming the habitus of these working class students for whom English had been an alien language irrelevant to their daily life. Drawing on the discourse analytical methods of conversation analysis applied to educational settings (Heap, 1985), Lin (1999) offered a fine-grained analysis of how L1-L2 code-switching was built into two kinds of Initiation-Response-Feedback (IRF) discourse formats to enable the teacher (Teacher D) to engage students in both enjoying the story and in learning English through this process:

Teacher D uses two different IRF formats in the following cycle in the reading lesson:

1. Story-Focus-IRF:  
     Teacher-Initiation [L1]  
     Student-Response [L1]  
     Teacher-Feedback [L1]
2. Language-Focus-IRF:  
     Teacher-Initiation [L1/L2]<sup>1</sup>  
     Student-Response [L1/L2]  
     Teacher-Feedback [L2], or use (2) again until Student-Response is in L2
3. Start (2) again to focus on another linguistic aspect of the L2 response elicited in (2); or return to (1) to focus on the story again.

This kind of discourse practice allows the teacher to interlock a story focus with a language focus in the reading lesson. There can be enjoyment of the story, via the use of the story-focus IRF, intertwined with a language-learning focus, via the use of the language-focus IRF. We have noted above that the teacher never starts an initiation in L2. She always starts in L1. This stands in sharp contrast with the discourse practices of Teacher C (another teacher in the study) who always starts with L2 texts or questions in her initiations. It appears that by always starting in L1, Teacher D always starts from where the student is—from what the student can fully understand and is familiar with. On the other hand, by using the language-focus IRF format immediately after the story-focus IRF format, she can also push the students to move from what they are familiar with (e.g. L1 expressions) to what they need to become more familiar with (e.g. L2 counterparts of the L1 expressions) (see Lin, 1999).

#### WORK IN PROGRESS

In this section, we shall look at new research that hints at a slightly different research angle that starts to draw on research approaches from different fields such as genre analysis and English for academic purposes (EAP).

Setati, Adler, Reed and Bapao provided a mid-term report (2002) on findings from their larger ongoing study of code-switching and other language practices in Mathematics, Science and English language classrooms in South Africa. These schools had adopted a small-group inquiry teaching approach and built on notions of additive bilingualism and strategic code-switching as encouraged by the authorities. While good in their intentions, this approach might have overlooked some pitfalls in two areas:

1. The indirect, student-centred, exploratory, group-work, learning-from-talk teaching approach: This is found to be done mostly in

---

<sup>1</sup> “L1/L2” denotes “L1 or L2”.

students' L1. However, without teacher's input on scientific content (e.g. in whole-class instruction), students may suffer from a lack of input in the English academic discourses required to talk about science topics or writing extended texts in English.

2. So, some traditional teacher-fronted whole-class teaching may be needed to provide the necessary L2 academic discourses to students, especially those in rural areas.

Setati, Adler, Reed and Bapoo (2002) found that the progressive pedagogies (e.g. student-centred group work) alone did not provide the much-needed direct teaching of subject domain-specific academic discourses and English academic literacies and thus aggravated social inequalities. The Setati, Adler, Reed and Bapoo (2002) report, however, did not show much analysis of how this academic discourse can be provided or inserted into the progressive teaching approaches along with the integration of some conventional pedagogies. While this report seems to be work-in-progress, it does point out the importance of drawing on research tools of genre analysis of different subject-specific academic discourses in future studies of code-switching in the classroom. In the next section, I shall discuss why this might provide a potentially useful direction for achieving a breakthrough of our current state of affairs in researching classroom code-switching.

#### PROBLEMS AND DIFFICULTIES

Researching code-switching in the classroom, unlike researching other kinds of related classroom phenomena (e.g. classroom discourse, classroom interactions), has often been engaged in consciously or unconsciously with either apologetic or corrective motives. Given the official pedagogical principle of prescribing the use of only one language in the classroom in some contexts (e.g. in Hong Kong, Singapore, Malaysia; see Haroon, 2005; Lin and Martin, 2005), many researchers have studied classroom code-switching practices either to seek out their 'good sense' and local rationality or to document their pitfalls or pedagogical inefficacy. These two (implicit) aims have often shaped the research questions and research approaches used in classroom code-switching studies.

Because of these (implicit) 'legitimizing' concerns of researchers, the studies in the literature tend to stop short of pointing ways forward for analyzing how code-switching practices can be further improved to achieve better pedagogical and social critical purposes. They tend to be descriptive rather than interventionist; i.e. they describe existing practices (either approving of or condemning them) rather than experiment with innovative ways of code-switching practices as ways both to provide access to L2 and to critique linguistic ideologies and hierarchies in the larger society and institutions. Because of the lack

of critical, interventionist research questions, the majority of studies in the classroom code-switching literature tend to offer little new insight into how existing classroom code-switching can be further changed to achieve more: e.g. more of the transformation (as hinted at by Lin, 1999 and Canagarajah, 2001), and avoid the reproduction consequences (e.g. reproducing societal ideologies about linguistic hierarchies, marginalizing the students' familiar languages while privileging the dominant societal languages). The findings of the existing research literature thus seem to be variations on similar themes (as summarized above) without providing new research questions and research approaches to achieve new findings beyond what has already been known (and repeated frequently) in the literature on classroom code-switching.

Only when we begin to think beyond the binary research question of whether it is good or bad to code-switch in the classroom (or whether classroom code-switching has largely positive social functions or largely negative pedagogical consequences) can we liberate ourselves from the limiting research agenda of just describing the good sense or local rationality of classroom code-switching or the vice versa (e.g. describing the reproductive, negative pedagogical as well as ideological consequences).

#### FUTURE DIRECTIONS FOR RESEARCH

To the author's knowledge, there have been no published studies of the longitudinal, interventionist type. Also, most studies were conducted by a sociolinguist or a discourse analyst, usually an outsider coming into the classroom studying the interactional practices of classroom participants. As discussed here, many studies draw mainly on the interpretive research paradigms (IS, EC and CA research approaches). These limitations in existing studies make it difficult for us to know what will happen if classroom participants (e.g. teachers, students) themselves become researchers of their own classroom practices, and what will happen if they embark on systematic study of their own practices, getting a deeper understanding of their own practices through their own research and then modify their own practices with systematic action plans and study the consequences, much like the kind of action-research carried out by the teacher-researcher. Below I outline what a future study might look like in order to achieve new insights into classroom code-switching:

1. Longitudinal research: Instead of one-shot classroom video/audiotaping studies, we need to have studies that follow the same classroom for a longer period of time; e.g. a whole course, a whole semester.
2. Interventionist research agenda: We need to integrate the sociolinguistic interpretive and conversation analytic with the action-research approaches so that the teacher becomes conscious of trying out

specific bilingual classroom strategies with respect to achieving specific sets of goals. We also need to build into the research design ways of ascertaining the degree to which these goals are achieved. This is similar to the mode of teacher action research (see Varghese, *Language Teacher Research Methods*, Volume 10). Close collaboration between teacher and researcher is also needed; e.g. the teacher is the researcher or there is close collaboration between the teacher and the researcher. Likewise, depending on the readiness of the students, students can also be solicited to become researchers in the study of their own bilingual classroom practices.

3. Drawing up specific goals and designing specific bilingual classroom strategies to achieve those goals: This will require the teacher and researcher to understand the specific situated needs and goals of the educational context in which they find themselves. These educational goals need to be set up with reference to the needs and choices of participants in specific contexts, and not taken to mean any universal set of goals.
4. Drawing on research methods of genre analysis of domain-specific academic discourses and literacies: For instance, we need to know what are the specific genre features and discourse structures of a biology course in order to design bilingual strategies to provide students with access to biology discourses through familiar everyday discourses. There will be frequent inter-weaving between academic discourses (mostly mediated in a less familiar language to the students such as the L2 or the 'standard' dialect) and students' familiar discourses (e.g. everyday life examples and experiences mediated in students' familiar language such as their L1 or a home dialect). How can the teacher provide access to the formal, academic (often L2) discourses through the informal, everyday, familiar (often L1) discourses of the students' will become a key research question.
5. Systematically studying effectiveness of different bilingual classroom strategies will require a carefully planned integration of different research paradigms (including interventionist action-research, interpretive, critical) and research approaches (including those from sociolinguistics, academic genre analysis, pedagogical analysis, analysis of students' spoken and written samples of academic work, plus assessment of students' mastery of academic genre features and skills in performing academic tasks using the appropriate registers).
6. Taking a holistic, contextualized approach: We need to situate the classroom in its larger socioeconomic and political contexts and to re-examine the pedagogic goals of the classroom to see if they

are really serving the interests of the students. Then we need to find out/explore possible ways to achieve these goals including (but not limited to) bilingual classroom strategies. Both traditional (e.g. teacher whole-class instruction) and progressive pedagogies (student-inquiry groups) need to be used in conjunction with a consideration of which code-switching patterns can be intertwined with which pedagogical patterns and participant structures. All these require an approach that allows for try-and-see and then document and re-try another pattern and see what happens and re-design future action plans that will progressively better achieve the goals through both bilingual and other pedagogical practices.

The above suggestions might sound like an ‘unholy’ eclectic approach to the linguistic or research methodological purist. However, to have breakthroughs in our current state of affairs in researching classroom code-switching, we need to be both pragmatic and flexible in our research paradigms and approaches. As code-switching is still seen as a negative practice in the classroom in many mainstream educational contexts, we need concrete designs of bilingual classroom strategies and research studies that can systematically develop these designs and show their effectiveness (with respect to the situated goals of the classroom). Without designing these systematic longitudinal, interventionist studies that can work on refining bilingual classroom strategies and pedagogies to achieve the goals deemed worthwhile in specific contexts, our research literature on classroom code-switching might be seen as repetitive of apologetic statements about the good sense or diverse functions of classroom participants’ practices without advancing our knowledge of how they can do better what they are already doing with different degrees of success and failure, as the studies reviewed above show.

## LANGUAGE TEACHER RESEARCH METHODS

### INTRODUCTION

The study of language teachers is a relatively recent area of research that focuses on how teachers learn to teach, how they teach, and who they are as individuals and professionals. Over a decade ago, Richards (1990, p. 3) observed that there had been “little systematic study of second language teaching processes that could provide a theoretical basis for deriving practices in second language teacher education.” The field has developed since then and has become an important area of study in language and education. It has included methods used to study language teachers by outsiders and those used by language teachers themselves to study their own classrooms. In addition, topics have ranged from those predominantly confined to the classroom, such as action research, to studies of teachers across different settings, such as those describing teachers’ professional trajectories.

### EARLY DEVELOPMENTS

Early forays into analyzing second-language classrooms focused on attempts to evaluate student language learning through the identification of the best method or a set of teacher behaviors. Chaudron (1988) outlined four methods of research into second-language classrooms, which are useful to consider here: (1) psychometric analysis, a quasiexperimental method that uses pre- and post-analysis of classrooms with experimental and control groups; (2) interaction analysis, an observation scheme of the social interactions in the classroom; (3) discourse analysis, an observation scheme of the linguistic interactions in the classroom; (4) ethnographic analysis, an analysis of the classroom based on interpretation, including interviews with and observations of participants. The language teacher in the first three types of analysis was viewed as transmitter of a particular method, and the focus was on teacher behaviors and student outcomes. In the fourth approach, the emphasis was more of a holistic understanding of teacher and student interactions and motivations.

Two often-cited, early studies of second-language classrooms used mainly psychometric methods to determine student outcomes: the Pennsylvania project that attempted to compare the audio-lingual method with traditional methods by looking at the test scores of students in a secondary school in the different programs (Smith, 1970) and Politzer's (1970) study of secondary French classrooms where the frequency of certain techniques (different types of drills) used by teachers were related to learner outcomes. A number of studies subsequently used interaction and discourse analysis (Chaudron, 1977; Fanselow, 1977; Tsui, 1985) rather than experimental studies. With the onset of communicative language teaching, many of these studies were conducted for purposes of teacher training and evaluation, using standardized and analytic observation frameworks, with the goal of removing the bias of the observer. A number of these derived from first-language classroom analysis, but a widely used example of this in second-language teaching is Communicative Orientation of Language Teaching (COLT) (Fröhlich, Spada, and Allen, 1985). This observation scheme allows for analysis of communicative variables in the classroom, such as classroom activities (tasks, participation structures) and classroom language. Much of the research on language teaching then remained confined to the classroom setting as opposed to including factors outside the classroom.

#### MAJOR CONTRIBUTIONS

What was viewed as a simplistic cause-effect model in the earlier process-product framework was challenged by, among others, Nunan (1988) and van Lier's (1988) book on ethnography in second-language classrooms. These scholars provided a conceptual rationale for addressing the complexity in the language classroom. In turn, this shift moved language teacher research into a qualitative domain and provided a central role for the teacher's perspective. Research in language teaching, thus, moved from a behaviorist model based on teacher triggers and student behaviors and outcomes as illustrated in some of the examples mentioned earlier, to an integrated and multifaceted understanding of teaching and learning. Predominantly qualitative and classroom-based, there have been two major strands of this research aim. The first aims to study language teachers' professional development, beliefs, decisions, and actions independently and also in interaction with their learners; the second attempts to provide ways for language teachers to study and document their own practices.

It is useful to frame the first set of studies within Freeman and Johnson's (1998) call for a reconceptualization of the knowledge base of language teacher education. Freeman and Johnson outlined the

knowledge base of what language teachers should know as including the following: teacher as learner, the social context of schooling, the professional environment of the teacher, and the actual practices and activities of teaching and learning the teacher is involved in. As a result, this shift in the understanding of language teaching naturally called for research into language teaching and teachers to be conducted across diverse settings (beyond the classroom), and to understand the process from the view of different participants. Within this framework, teacher learning is conceptualized “as normative and lifelong” (Johnson and Golombek, 2003, p. 730).

Two volumes of language teaching and teacher practice reflect this reconceptualization. Bailey and Nunan (1996, p. 1) describe their volume as containing studies that have been conducted naturalistically, that is, where “naturally occurring events are studied,” as well as ones having multiple data sources so that triangulation can be achieved. This volume provides 19 qualitative studies, from teacher thinking and interpretation to classroom studies, from ones that are based on curriculum changes to those that are largely situated within their sociopolitical context. An example of a study examining teacher thinking is an investigation into why ESL teachers depart from their original lesson plans where Bailey (1996) found that teachers chose to do so to further the lesson and accommodate student learning styles, and a number of other reasons. Additionally, the studies in this volume originate from different countries and also display a range of different types of language teaching, from ESL to EFL, and from bilingual to world language/foreign language teaching (such as van Lier’s (1986) description of classroom teaching influenced by a bilingual education project in the Peruvian Andes). In the other volume, Freeman and Richards (1996), in turn, discuss language teacher learning, broadly defined as “how people learn to teach languages” (Freeman and Richards, 1996, p. 2).

Similar to other areas of education in the late 1980s, teacher learning and teacher cognition became the focus of inquiry for language teacher research in the 1990s. This new focus places teachers at the center of the process of understanding language teaching. Most of this work can be described as second-order research (data are viewed as evidence that has to be interpreted through the participants’ perspectives). Such studies have been mainly qualitative and interpretive, ranging from understanding teacher decision-making through different data elicitation techniques and analysis (interviews, narrative studies, journal studies, discourse-based studies, and ethnographic analysis). Examples of these include Johnson’s (1996) rendering of how one preservice teacher experiences tensions between her vision of the teaching and the realities of classroom teaching during her practicum and Pennington’s (1996) description of how a group of secondary English

composition teachers in Hong Kong adopt a process approach to writing.

Two larger studies of language teacher cognition are also of import. Woods (1998) examined cognitive processes of decision-making through ethnographic methods. Woods himself clarifies that he does not consider his study fully ethnographic; he observes that a study that would have been ethnographic in its goal (rather than solely with regard to methods) would have focused on describing the shared sub-culture and processes of the teachers. Woods analyzed how decisions were made by eight ESL teachers at four universities in Canada in their courses and lessons through ethnographic interviews, observations, and video-based elicitation (asking teachers to view videos of their own practice and comment). Woods charts teachers' decision-making processes, based on an interaction between their beliefs, planning, and implementation of their teaching, and shows how these all loop back into their future teaching. In a similar type of study and the earliest of its kind, Johnson (1992) analyzed the beliefs and decisions made by preservice ESL teachers based on their student input and shows how these are cognitively organized. In a review article of studies in language teacher cognition, Borg (2003) provides a summary of these two studies and others.

The second strand of research that has been influential has been that of language teachers studying their own classroom. Allwright and Bailey's (1991) book on classroom research for language teachers attempts to provide guidelines for teachers to conduct research in their own classrooms. The aim is to provide tools for teachers to address immediate and practical issues that come up in their classrooms rather than actually testing different types of large-scale methods. One of the most popular forms of teacher research has certainly been action research although the methods described in this volume span a range: from the naturalistic (observations, case studies, diaries) to ones that require more intervention (action research, elicitation), as well as those that are more quantitative (experimental, analytic observation frameworks). Much of the research Allwright and Bailey (1991) provide guidelines for is the examination of classroom interaction (e.g., error correction, student participation, teacher talk). They conclude that each of the areas of language learning and teaching need to be investigated as they emerge by teachers in their own settings, and by involving their learners (e.g., having students keep a language learner diary). Allwright and Bailey (1991) synthesize their own approach to classroom research on/with language teachers as exploratory teaching, which has subsequently expanded into a research approach and methodology for teachers referred to as exploratory practice (Allwright and Lenzuen, 1997). Exploratory practice is a process where language teachers

attempt to understand what is happening in their classrooms through puzzling over their area of focus in a systematic fashion. Differently from action research, here the focus is on a teacher actually changing a practice as a result of the research conducted by the teacher in her classroom. Originating in Brazil, it became a more popular form of teacher research across the world when it was integrated with the establishment of the Exploratory Practice Centre at Lancaster University in 2000.

The topic of Edge and Richards' (1993) edited volume is also classroom research but for the explicit purpose of teacher development. The authors in this volume also use a range of methods (experimental, naturalistic) but share characteristics with the problem-solving orientation of action research. In Edge's (2001) book on action research for the TESOL professional development series, he describes action research as an inquiry-based approach to one's teaching and practice that can be transformative at a personal, social, and political level. A number of books exist that are notable in the area of action research and language teaching, among those is one by Wallace (1998). Once again, all these monographs illustrate a range of methodologies that can be used by language teachers to study their own classrooms, from questionnaires to case studies, and from observation schemes to quasiexperimental studies (McDonough and McDonough, 1997). The range of the scope of language teaching is also evident in these different books; that is, from the individual to the social, from the politically neutral to the overtly political.

#### WORK IN PROGRESS

As qualitative research has become more popular in understanding language teaching and teachers, ethnographic methods, in particular, have been increasingly employed for this purpose. This has also taken place due to the greater acknowledgment of the social and the political contexts of language teaching (Johnson and Freeman, 1998), which places more emphasis on the roles that language teachers take on beyond the classroom. Studies of language teachers in recent years often have taken an ethnographic approach toward language teaching with the understanding that it is shaped by and shaping the sociopolitical context surrounding teachers. For example, Skilton-Sylvester (2003) primarily uses this methodology to understand how ESL teachers in the USA can be language policy makers in a context where students' native languages and cultures are undervalued. More recently, in her book-length ethnography, Creese (2005) describes the roles of Turkish language specialists in mainstream classrooms and shows how they are marginalized in the classroom and in the schools although they serve

as critical resources for their students. A snapshot of Creese's study, Skilton-Sylvester's study, and a number of other studies of this nature can be found in Creese and Martin (2003).

Ethnographic methods, like other methodologies that have become more popular such as the case-study approach and narrative analysis, also highlight the importance of the local perspective as well as that of narrative and stories in understanding language teaching and teachers. In her study of four ESL teachers in Hong Kong, Tsui (2003) uses the case-study approach of the four teachers to provide a description of a range of expertise in second-language teaching. To develop the case studies, Tsui conducted classroom observations of the teachers where she took field notes and interviewed the teachers. In her interviews, she initially focused on their life histories and backgrounds and then progressively on issues that came up in their classroom teaching; particular attention was paid to how the teachers' professional development connected to what they did and how they thought of what they did in the classroom. Duff and Uchida (1997) also used a case-study approach of four EFL teachers in Japan and looked at how the teachers saw themselves as cultural agents in the classroom and how these self-images interacted with their curriculum, classroom practices, student interactions, and larger institutional issues.

In what can be described as the narrative turn of language teacher research methods, much has been made of the importance of teachers' biographical experiences, from their own early childhood and schooling experiences to their professional learning experiences, and especially their influence on teachers' practice. Primarily through interviews of language teachers, studies using narrative analysis (Alleksaht-Snider, 1996; Bailey and Nunan, 1996; Freeman and Richards, 1996; Galindo, 1996) have shed light on this critical aspect of teacher development. Interestingly, some of these studies (Alleksaht-Snider, 1996; Galindo, 1996; Liu, 1999) have used this approach to examine how bilingual and non-native English-speaking language teachers relate their own, specific minoritized experiences to their own teaching. Like action research and exploratory practice, the narrative inquiry approach is one where teachers have studied their own narratives and those of their classrooms to reflect on and improve their teaching (Johnson and Golombek, 2002).

#### PROBLEMS AND DIFFICULTIES

Two prominent difficulties in understanding and documenting language teaching and teachers are theoretical in nature: (i) how to understand and view language teacher knowledge and (ii) how to conceptualize language teacher learning. Naturally, questions around the theoretical orientation of language teaching greatly influence the

research methods that are promoted or challenged in language teaching. A salient issue in that regard is how to describe or categorize language teachers' knowledge. As described earlier, Freeman and Johnson (1998) have called for a reconceptualization of language teacher education and for changing what constitutes the knowledge language teachers develop. In fact, the location and the categorization of teacher knowledge has recently been a subject of lively debate—from those who advocate that this knowledge develops in relation to individual teachers in interaction with their particular contexts (Edge, 2001), and is actually “a process of reshaping existing knowledge, beliefs, and practices” (Johnson and Golombek, 2003, p. 730) to those who have argued that it is of primary importance to consider the body of knowledge more statically (Yates and Muchisky, 2003). What has also been equally problematic is understanding the nature of language teaching since it can vary widely according to setting and context. For example, when Yates and Muchisky (2003) argue that second-language acquisition needs to be considered the main body of knowledge for language teachers, they fail to consider that a number of language teachers teach both language and content, especially in K-12 schools.

Another conceptual issue that also needs to be addressed is how to define teacher learning, as touched upon in earlier parts of the chapter (Freeman and Richards, 1996). What is important to keep in mind is that recent work in cognition and learning have opened up possibilities of defining learning that is more external than internal (Putnam and Borko, 2000). Under this perspective, teacher learning is viewed primarily in the social context that it is being learnt and in the relationships that are being formed. This view locates teacher learning more on a social plane rather than an internal, cognitive plane although these are seen as related to each other.

A major issue remains of whether there is currently a formalized research agenda around language teacher research. As far as the 1980s, scholars in language education pointed to the need to establish a research agenda for language teaching, especially as it relates to teacher education (Allwright, 1983; Freeman, 1989; Richards and Nunan, 1990). A similar concern has been voiced by researchers in mainstream teacher education as well (Cochran-Smith and Zeichner, 2005). Within this research agenda, a critical question is how to connect language teaching to student outcomes. The push for focusing on language teachers, their cycle of learning, and their work and lives as well as the movement of language teacher research have been extremely useful endeavors; nevertheless, for many there is still a need to understand what can be viewed as generalizable in the research and how language teacher education can make use of these research findings. From this, connections need to be established to how and what students learn.

This has become even more critical in the K-12 arena since schools are becoming increasingly accountable for students' achievement in the USA, the UK, and elsewhere, thus, looking for ways to increase the success of their linguistically and culturally diverse student body. Recently, Canagarajah (2005) and several authors in his edited volume show that due to the growing global and local pressures many face to learn English, this has become a concern for governments and citizens all over the world and it is international in scope.

#### FUTURE DIRECTIONS

From the accountability perspective, there has been more of a push to connect how language teachers learn to how they eventually teach, and in turn, how to connect this to student outcomes; consequently, teacher education programs have increasingly been a focus of research in language teaching and will continue to be so. Much of the research methodology around studies of these programs has been naturalistic or qualitative; for instance, Ramanathan's (2002) study of an MA TESOL program. However, due also to the increasing demand/need for accountability of these training programs and to the consideration of how they are related to student outcomes, it will be important to use mixed methods in understanding the process and outcomes of these programs, as, for instance, in some of the bilingual teacher education programs described in the edited volume by Minaya-Rowe (2002) and the immersion teacher education programs described in Erben (2004). This trend is also evident in countries other than the ones that have traditionally been the focus of much of the research (such as the USA and the UK), as mentioned earlier.

Another prominent direction of language teacher research has been in understanding who language teachers are, their identities, and their roles (Varghese, Morgan, Johnston, and Johnson, 2005). Within this, the political (Creese, 2005; Ramanathan, 2002; Skilton-Sylvester, 2003) and moral dimensions (Johnston, 2003) of language teaching have been studied. Along with the ethnographic methods that have been used to study language teaching and teachers in this way, a poststructural lens using a discursive approach (Creese, 2005; Johnston, 1997; Varghese, Morgan, Johnston, and Johnson, 2005), in particular, has examined how teachers take up particular ideologies or discourses. In his interview study of Polish EFL teachers, entitled "Do EFL teachers have careers?," Johnston (1997) uses the work of Mikhail Bakhtin to show that the teachers use specific discourses to talk about themselves as not having a purposeful and linear career.

Since language teachers, language teaching, and language teacher education have only recently been recognized as central areas of

research in applied linguistics, debates around some of the theoretical questions pertaining to this area of research will continue, as will the use of the different methodologies that have been used to study this area. At the same time, as with other areas of educational research, the forces of globalization and of accountability will inevitably continue to influence the research methodologies used to understand the following critical questions: how language teachers learn what they do, why language teachers do what they do, who language teachers are, and how what they do and who they are shape students' experiences and outcomes. On one hand, an increase in experimental studies may be an outcome of the accountability movement; on the other hand, the importance of understanding and taking into account the local perspective in language studies and globalization may lead to the promotion of more studies that are bottom-up and critical in understanding language teaching and teachers, foregrounding methodologies such as critical ethnographies and those using a poststructural lens.

## RESEARCH APPROACHES TO THE STUDY OF LITERACY, TECHNOLOGY AND LEARNING

### INTRODUCTION

Since desktop computers were introduced into educational settings in the late 1970s in the economically developed world, researchers have been trying to find ways to explain the conceptual, textual, technical and identity processes involved when information and communication technologies (ICT) are used that might inform curriculum and pedagogical practices. Much important work has been done to devise effective ways to investigate the complex connections between literacy, technology and learning. This review provides an international perspective on how researchers, in universities and schools—working either independently or collaboratively with teachers—have studied the changes to social and cultural practices associated with the use of ICT for educational purposes.

The history of the approaches to research parallels the trajectory of the wider area of educational studies. The first investigations were most often quantitative—there was a gradual shift to qualitative methods—then studies adopted multiple perspectives, drawing on methods from both traditions. It would be a mistake, however, to represent the history as a process of evolution. Each of the earlier waves is still operating in the present as a set of practices that researchers follow or argue against. An array of choices now characterises the field with no single approach privileged.

### EARLY DEVELOPMENTS

Investigating written composition, pioneering researchers asked if computers used as word processors improved writing (Gould, 1978). Although survey and case study methods were employed to examine students' attitudes and responses to computers, the early computer-writing studies were most often experimental or quasi-experimental in design. They assessed whether the quality of texts produced with computers was better than those produced with pens.

The findings were equivocal—some studies produced evidence of enhanced quality, but just as many found no improvement. With hindsight, the explanation is clear. The research question, which asked

about the 'impact' of computers 'on' writing, attributed too much power to the technology and not enough to the social and cultural context in which it was used. There is a short answer to the question, 'Do students write better with computers?' It depends—on the writer's preferred writing and revising strategies, keyboarding skills, prior computer experience, teaching interventions, the teacher's goals and strategies, the social organisation of the learning context and the school culture.

Mainly from the perspective of cognitive psychology, early research also examined the effects of the use of computers on composing processes, particularly pre-writing and revising (Daiute, 1986). Other studies concentrated on writing pedagogy, often a process approach that teachers adopted when introducing the technology, examining the computer as a potentially felicitous tool that might both facilitate and enhance a process approach (Sommers, 1985).

By the mid-1980s, socio-cultural understandings of literacy became more widely accepted and provoked different kinds of research questions and orientations. As there was a gradual shift to an emphasis on the socially constructed nature of reality (Dickinson, 1986) and correspondingly, increased sensitivity to the socio-cultural setting, research became more ethnographic. Researchers were also beginning to examine computer-mediated contexts from multiple perspectives (Hawisher and Selfe, 1989). Overall, the field was in transition: some researchers were operating in the current-traditional paradigm, concerned with correctness and error; many were operating in the writing-process paradigm and a few were beginning to adopt the social view.

At the end of the 1980s, feminist criticism, cultural criticism and critical pedagogy were all invoked to frame and inform research. There was a hiatus in the war between quantitative and qualitative approaches (see Fishman, *Theoretical and Historical Perspectives on Researching the Sociology of Language and Education*, Volume 10) and the researcher was increasingly understood as implicated in research processes. Descriptions of paperless writing classes in which all student and teacher contributions occurred over a network began to appear. The contextual approach to computers and their use made gender issues central to discussion of technology and there was the growing recognition that computers in classrooms appear 'unlikely to negate the powerful influence of the differential socialisation of students by social class and its effects on their success or failure in school' (Herrmann, 1987, p. 86).

A comprehensive review of the first decade of research addresses the difficulties of interpreting studies that reflect contrasting conceptual frameworks and which differ in design, methods of data collection, variables examined and modes of analysis (Bangert-Drowns, 1993).

## MAJOR CONTRIBUTIONS

No longer concerned whether the use of technology made things better, researchers in the 1990s asked different kinds of questions, which again influenced their approaches. Qualitative methods, including observation and interviews, seemed the best way to investigate how the use of ICT affects students' literacy practices. Cochran-Smith, Paris and Kahn (1991) worked with teachers and students in five elementary classrooms over two years to explore how computers made learning to read and write different. In a case study that involved active participant observation, Miller and Olson (1994) found that the existence of innovative practice associated with the introduction of computers in the classroom had less to do with the advent of technology than with the teacher's pre-existing conception of practice.

At the same time, some researchers continued to investigate the influence of word processing on writing quality and revision strategies, but took into account variables that had confounded the earlier studies. These included the students' word processing experience, the differences in their writing abilities and the effect of interventions or guidance from either teachers or specially designed software. The findings were correspondingly more persuasive.

Researchers also examined computer-mediated communication, made possible when computers were used to create electronic forums on local-area networks and wide-area networks. The electronic spaces produced were widely seen as having the potential for supporting student-centred learning and discursive practices that can be different in form and perhaps more engaging and democratic than those in traditional classrooms (Batson, 1988). Most of these studies focussed on college students; however, the findings still have implications for other educational sectors. Researchers carried out comparative observational studies of students engaged in both face-to-face discussions and electronic exchanges about their writing and concluded that the use of networked communication both shaped and was shaped by the curricula. They also concluded that the interaction between networked communication and face-to-face may lead to better academic performance. By contrast, other researchers argued that computer-mediated peer review had many of the drawbacks of distance learning.

From the early 1990s on, hypertext, fully electronic non-linear reading and writing, became a research focus. Before the Web, the research was dominated by explorations of the technology's convergence with contemporary literary theories (Landow, 1992, 1997, 2005), although some theorists suggested somewhat cynically that linking the new textual environment to an esteemed body of critical writing made it 'appear' to be substantial. However, using mainly qualitative approaches, such as

observation, semi-structured interviews and student journals, researchers also described hypertext's potential to improve teaching and learning. By transferring to students the responsibility for accessing, sequencing and deriving meaning from information, hypertext was seen to provide an environment in which discovery learning might flourish. In the teaching of writing, the use of hypertext was seen to promote associative thinking, collaborative learning, synthesis in writing from sources, distribution of traditional authority in texts and classrooms and the facilitation of deconstructive reading and writing (Johnson-Eilola, 1997).

Increasingly, the Internet, including the Web after 1992, has become a site for research (Jones, 1999). Informed by the understanding of literacy as a set of social practices, investigations have focussed on new literacy practices (Lankshear and Knobel, 2003; Snyder, 2001), multimodality (Kress and van Leeuwen, 2001), issues of identity (Turkle, 1995), class and access (Burbules and Callister, 2000) and the maleness of the Web (Takayoshi, Huot and Huot, 1999). The research findings emphasise the need to teach students how to critically assess the reliability or value of the information they find on the Web by understanding not only its textual, but also its non-textual features such as images, links and interactivity (LeCourt, 1998).

The *Digital Rhetorics* study (Lankshear and Snyder, 2000) exemplifies research informed by the understanding of literacy as social practice. This relatively large-scale qualitative study argued that in the age of the Internet, education must enable young people to become proficient in the operational, cultural and critical dimensions of literacy (Green, 1988). The investigation of eleven research sites across Australia identified five broad patterns of practice: complexity, fragility, discontinuity, conservation and limited authenticity. The analysis suggested five principles for practice when ICT are used: teachers first, complementarity, workability, equity and focus on trajectories.

In addition to social approaches, critical and post-structuralist perspectives have also garnered researchers' interest, suggesting a further range of approaches and modes of analysis. Rather than blaming technology for the failure of schools or the end of books and reading, more measured approaches suggest the importance of critical engagement with ICT in the context of education (Postman, 1993). Researchers have criticised short-sighted policy efforts that have spent large amounts of money on technology without first asking questions about use, support and learning (Cuban, 2001). Others have pointed to the non-neutrality of computing technologies and how over time they tend to become naturalised (Burbules and Callister, 2000). Yet others have represented computers, not as the harbingers of strengthened democracy, increased freedom and more support for educators, but as

instruments of social control and dependence, both in wider society and for teachers and students in schools.

#### WORK IN PROGRESS

Although the trend has been there since the mid-1980s at least, increasingly, researchers are acknowledging the need to pay attention to the social, cultural and political changes associated with the use of ICT. Finding ways to use their affordances in productive ways, but at the same time helping students to become capable, critical users is a major contemporary preoccupation. Often implicit in research proposals and reports is the understanding that the relationship with technology is never one-way and instrumental: it is always two-way and relational.

Of the research overviews (e.g. Reinking, McKenna, Labbo and Kieffer, 1998), *The Impact of ICT on Literacy Education* (Andrews, 2004) is particularly useful, even though its title suggests a tacit acceptance of a deterministic relationship between ICT and literacy learning. The analysis concludes with a mixed set of findings. For some learners, it seems that ICT bring no improvement in educational outcomes, whereas in some instances educational practices and learning are made worse.

As a caution against technological optimism, Andrews proposes that randomised trials should precede further investments in ICT for literacy education. However, his confidence that rigorously designed randomised trials evaluating the Impact of ICT will attach scientific evidence to direct future policy settings is optimistic. As already discussed, experimental designs do not capture the interactive, iterative and dialogical character of literacy learning and teaching. By contrast, qualitative approaches, informed by a social view of literacy, are providing more nuanced accounts of the use of ICT in education (Schultz, 2002).

Finding the language to talk about the new literacy practices associated with the use of ICT and discerning how meanings are made with them is a current focus of research (Snyder, 2002). Interested in issues of Web design and use, researchers have examined online culture and young people's Web authoring practices, paying attention to the fusion of visual, textual and structural elements. They have explored how different semiotic modes contribute to the meaning-making potential of Web sites and that what goes on behind the screen is just as important for users as what is visible on it. Burbules (2002) has examined hyperlinks and how they can become 'invisible' and 'neutral'. He suggests new metaphors for thinking about learning with, through and about ICT—metaphors that posit learning as a kind of mobility that has special import for reconceptualising education in an information age.

Research is investigating the complex connections between 'school literacies' and 'out-of-school literacies'. Large-scale and multi-method studies, based on interviews and surveys of young people's use of old and new media, have investigated the complex relationships between the media and childhood, the family and the home (Livingstone, 2002). As a useful counterpoint to large survey studies, in-depth case studies of young people both at school and at home are providing deeper understanding of how computers are used in the real world of inequitable distribution. The *ScreenPlay* project (Facer, Furlong, Furlong and Sutherland, 2003) examined what young people do with computers at home, how parents and children negotiate access to and use of them and the role computers play in the day-to-day lives of families. On a smaller scale, Snyder, Angus and Sutherland-Smith (2002) investigated the ways in which four families used ICT to engage with formal and informal literacy learning in home and school settings. The findings draw together issues of access, equity and cultural capital in the context of school success and failure.

Popular culture is also receiving attention. Research has highlighted the benefits of using 'non-school' literacies in schools for consolidating and extending students' understandings of how texts are read (Alvermann, 2002). Often perceived as antithetical to mainstream print-based literature, using case study and discourse analysis, researchers have demonstrated how video and computer games require complex literacies that extend students' knowledge and teach a degree of multimodal visual and linguistic sophistication often ignored in curriculum design (Beavis, 2004; Gee, 2003). After examining the learning theory underpinning 'good' video games, Gee concludes that it resembles the best kind of school science instruction. Using survey and case study methods, Snyder, Bulfin and North (2005) examine the cultural forms with which young people engage in three domains: school, home and community. A key aim is to learn more about the complex connections between literacy practices and cultural form.

When exploring the possibilities for creative changes to pedagogical and institutional practices when ICT are used, researchers argue that a prerequisite is understanding the history of the new literacies. Bruce (2002) asks how literacies, technologies and social circumstances have co-evolved and what changes in literacy practices mean for young people. He argues that literacy becomes inextricable from community, from the ways that communities and society change and from the material means by which knowledge is negotiated, synthesised and used. Moreover, valuing the lessons to be learned from history, Lankshear and Knobel (2003) outline how the field has moved from 'reading' to the new literacy studies, reminding readers that just 30 years ago the term literacy hardly featured in formal educational discourse.

## PROBLEMS AND DIFFICULTIES

The communication landscape is changing, as it has always done, but more rapidly and more fundamentally. As new sites for research emerge, sites that are virtual and boundless, researchers are faced with the challenge of how to investigate them effectively. Researchers require flexible, sensitive frameworks for understanding and portraying the complex phenomena of technology-mediated literacy settings. At the same time, researchers find themselves pressured to work within the constraints of a positivist paradigm as funding bodies increasingly provide support only for 'evidence-based' research (Lather, 2004). The kinds of questions asked and the kinds of studies carried out are directly affected by this trend. More than ever, researchers need to 'think outside the box' and to resist automatically adopting approaches to research dictated by conservative funding regimes.

Another difficulty with research in this area is that technological determinism—the assumption that qualities inherent in the technology itself are responsible for changes in social and cultural practices—continues to permeate the academic discourse. New technologies are credited with transforming education systems and democratising schools. Electronic forums are represented as open spaces in which issues related to gender, race and socio-economic status are minimised. Such claims, however, need to be interrogated as they overlook the human agency integral to all technological innovation. No technology can guarantee any particular behaviour simply by its nature, as its use and effect are closely tied to the social context in which it appears. Technology succeeds or fails not by its own agency, but as a result of how it is used by people and institutions that take it up. Researchers need to assume a critical perspective to explore the implications of the cultural and ideological characteristics of technology in educational settings.

Although some researchers rue the cultural cost of the rise of ICT (Postman, 1993), a further difficulty for the field is the privileging of 'newness'. Yet the so-called 'new' literacy practices associated with the use of ICT do not simply represent a break with the past—old and new practices interact in far more complex ways, producing hybrid rather than wholly new practices (Bolter and Grusin, 1999). Indeed, the current tendency is not displacement but rather convergence—a coming together of previously distinct technologies, cultural forms and practices, both at the point of production and reception. Just how a range of different forms of communication—writing, visual and moving images, music, sound and speech—are converging and the implications for meaning-making represent an important focus for future research.

## FUTURE DIRECTIONS

The research agenda is rich with possibilities. In the first instance, researchers should build on previous investigations, adding to the growing knowledge base about the connections between literacy, technology, curriculum and culture. It would be salutary to concentrate on students who have grown up with ICT. A longitudinal approach to the study of young people immersed in techno-culture, at school, at home and in the community, would produce new understandings of technology-mediated literacy practices. Attention also needs to be directed towards the intersection between multiple languages and the multiple modalities of the new technologies. There are many educational settings in which multiple languages are present both inside and outside classrooms. Research could investigate the place of multilingualism and multiculturalism in ICT-mediated educational contexts.

Further research aimed at investigating the complex relationships between the verbal and the visual in communication and representation would also provide opportunities to examine at close hand new literacy practices in real contexts: to observe teachers and students, to discuss the emerging technology-mediated communication practices and to apply to those practices understandings that draw on the work of theorists such as Bolter and Grusin (1999), Gee (2003), Kress (2003), Kress and van Leeuwen (2001) and Lankshear and Knobel (2003).

The need for more research investigating the complex relationships between literacy, ICT and disadvantage is manifest. Research needs to keep up with technological and market developments in relation to access—to track shifting and diversifying contexts of use, including the institutional and social influences on young people's Internet use and to critically examine causes and consequences of exclusion (Livingstone, 2002).

As the introduction of ICT into literacy curricula is a contextual change that encourages alterations in the political, social and educational structures of systems, it is important to look more closely at how it is carried out. There needs to be more research into how language and literacy teachers integrate technology into curricula. How does pedagogy change? Do teachers' expectations alter? What are the implications for teachers' professional development and for the training of pre-service literacy teachers?

More research on patterns of resistance to the use of ICT are required. Why do teachers who work in environments that have technology facilities remain wary of its use in their classrooms, despite the fact that the future promises to be increasingly dominated by ICT? There also needs to be care in ascribing to the technology powers it does not possess. If ICT are used in innovative ways, caution about

inferring a cause and effect relationship between adopting ICT and effective teacher practice is essential.

Confronted by the largely uncharted territories of cyberspace in which young people are often the navigators, messier, less certain, more reflexive, multi-voiced research texts seem to be a useful way to respond. It is likely, however, that the problem of representation will continue to be complicated by the fluid, metamorphosing, unpredictable nature of the electronic spaces themselves.

## RESEARCHING COMPUTER MEDIATED COMMUNICATION IN EDUCATION

### INTRODUCTION

Computer-mediated communication (CMC) refers to human-to-human communication through a network of computers using the Internet or local area network and which can take place synchronously or asynchronously. Synchronous CMC refers to communication that takes place on a real-time environment such as Internet Relay Chat (IRC), commonly known as chatlines or chatrooms, virtual world or MUD Object Oriented (MOO; MUD for multi-user domain) and the more recent are instant messaging (IM), gaming and Virtual Reality (VR). Whereas examples of asynchronous CMC, communication at different times, are emails, bulletin boards or mailing lists, online forums, and more recently wikis and blogs (for further explanations on CMC see Thorne, *Computer-mediated Communication*, Volume 4).

Rapid developments in CMC technology and the need for inquiry into its influence on educational practices and values have offered rich insights into theoretical frameworks, research designs, and methodologies and have challenged researchers to be innovative and adaptive. The research questions of early CMC research in education focused on evaluating the effectiveness of the CMC tool on learners and learning, while the current research emphasizes the nature of interaction between and among individuals using CMC as well as the impact of multiple CMC tools and their direct applications, for example, on E-Learning and foreign language education.

### EARLY DEVELOPMENTS

One of the early developments in researching CMC in education was Electronic Network for Interactions (ENFI), first used in network-based classroom for teaching English composition (Bruce, Peyton and Batson, 1993). ENFI was initially used among hearing impaired students learning English as a second language. These students learned to write compositions by interacting through ENFI, a local area network (LAN), with other students in the class. They were instructed to interact through ENFI to discuss their composition topics before they began to compose.

To evaluate the ENFI, students' responses to questionnaires were collected and analyzed quantitatively (Batson and Peyton, 1986). At the same time, comparative studies, between ENFI and non-ENFI students and teachers, were also conducted using both qualitative and quantitative approaches (Batson, 1993). The central finding confirmed that the CMC interaction among the students played a positive role in the composing process and on their motivation to write. The use of ENFI marked the beginning of research in network-based classrooms, i.e. CMC, in composition classes. The CMC environment of ENFI continues to be reevaluated while new and innovative research tools were built into the computer and the network.

The increasing use of CMC for E-Learning and Distance Education also encouraged research into, for instance, the effectiveness of Internet communication on learners and learning (Berge and Collins, 1985). Rohfeld and Hiemstra (1985), for instance, examined the experiences of students and course facilitators in courses delivered via CMC. The methodology utilized the researchers' own perspectives and familiarity when examining their students' learning in their distance education program. This approach revealed the nature of participation in the learning and teaching and the adequacy of training and support on the electronic system. Through, for example, online mentoring, peer-review of writing or peer learning, simulations, personal networking, and course management, researchers were able to gather rich data for critical analysis and subsequently make further improvements on E-Learning and distance education as well as preparing the teachers and the learners.

With the growth of online and distance education programs, there is a need to evaluate the system design (the basis for developing CMC tools), in order to examine the requirements for the systems and its usage. An evaluation of the system design in E-Learning or distance education is crucial since a good system ensures effective communication via the different CMC tools being used in the study. Several works on the evaluation of the online system design (Harasim, 1990; see Kerr and Hiltz, 1982) have managed to capture the intricacies of CMC research and offered useful insights into the conceptualization of variables and research design. Kerr and Hiltz (1982), for example, in investigating the virtual classroom at the New Jersey Institute of Technology, provided comprehensive perspectives on researching CMC. In their attempt to investigate educational technology and educational effectiveness, they examined a variety of types of courses, students, and implementation environments through pre- and post-course questionnaires, behavioral data, qualitative observations, and interviews.

Comparative studies is another popular CMC research approach. Early on, many studies attempted to compare face-to-face (FTF) to

online environments. These central questions have compared CMC interactions with FTF, also examining the effects of such interactions on the participants' motivation and participation. Among the methodologies used are field experiments (see Benbunan-Fich and Hiltz, 1999), case study (Arvan et al., 1998) longitudinal field study (Hiltz et al., 2000), and longitudinal and quasi-experimental (Hiltz, 1993). These comparative studies offer useful perspectives on the process and outcomes of traditional FTF courses versus online learning. Many of these studies describe the process and outcomes of online education, as well as measure the students' performance and effectiveness.

### MAJOR CONTRIBUTIONS

Research in CMC has been an indispensable tool for various disciplines in education due to its effectiveness, efficiency and flexibility of its data collection methods and analysis. Several useful research tools in education have emerged from various CMC research approaches. Some of the direct contributions of researching CMC in education are in E-Learning, applied linguistics and second language acquisition, corpus linguistics, and ethnographic investigations.

Perhaps the most significant contribution of researching CMC in education is to the area of E-Learning or distance education (see Harasim, 1990; Hiltz and Goldman, 2005; Hiltz et al., 2000). CMC tools have been used to evaluate and examine the process and effectiveness of E-Learning. A good CMC research tool allows researchers to evaluate the learning environment while providing valid and reliable findings that can be generalized to other institutions. With the rapid expansion and powerful capability of the computer network, new state-of-the-art data collection tools and analysis have also emerged. For example, computers have the ability to save extensive logs of interactions that can directly be retrieved for later analysis, as well as allow a multiple level analysis. Kerr and Hiltz (1982) as pioneers in these innovative methodological tools, described how the computer medium could capture and save interactions, such as computer conferencing among the participants for later evaluation and analysis. Since then, this technology continues to evolve becoming more user-friendly, error-free, and inexpensive and thus, "permits greater research flexibility and potential productivity than do traditional methods" (Kerr and Hiltz, 1982, p. 170). This encourages more CMC researchers to further examine the CMC environment.

CMC research has also made broader contributions to the field of applied linguistics and second language acquisition. Numerous studies have successfully quantified and described the amount and quality of participation and interaction through qualitative and quantitative

designs. For example, Warschauer and Kern (2000) introduced the term Network-Based Language Teaching (NBLT), a different form of Computer-Assisted Language Learning (CALL). Warschauer and Kern managed to compile some illuminating research on language learning using the computer network, for instance, studies that compare FTF and computer-assisted discussion by measuring the students' participation (Condon and Cech, 1996). A number of quantitative research studies have compared the amount of participation among language learners and evaluated aspects of online environments (see Kern, 1995; Sullivan and Pratt, 1996). Warschauer and Kern's (2000) edited volume on NBLT highlights research using NBLT that provides new and valuable insight into CMC within the foreign and second language teaching contexts. This insight creates further avenues for CMC research which might lead to improved or effective teaching of language. Specifically, researching CMC in education has contributed to a better understanding of second language acquisition's aspect of collaboration, learner-centeredness and the nature of input.

Furthermore, CMC tools allow corpus linguists to examine a collection of sample texts of language used in real world settings. These samples, more popularly known as corpora, are analyzed to find meaningful patterns of vocabulary and grammar within the texts. For instance, researchers have used corpora for pedagogical interventions (Belz and Vyatkina, 2005) to promote pragmatic competence among the learners and intercultural communication (Belz and Vyatkina, 2005; Belz and Kinginger, 2003). Corpus linguistics is gaining popularity among researchers as it allows them to handle large amounts of data and examine the interconnected subsets of language elements or variables being investigated such as corpus-based linguistic profiles (see Belz and Kinginger, 2003; Belz and Vyatkina, 2005).

Researching CMC has also brought new understandings and provided fresh opportunities for ethnographic investigation of cyberspace through its interactive media and interpretive flexibility. As an example, Hine (2000) provides a comprehensive discussion on recent developments in ethnographic thinking which is useful in developing an alternative, ethnographically focused approach to the study of the Internet. Virtual participant observation, which emerged with the creation of cyberspace, refers to "being online in the same virtual spaces simultaneously with the participants as well as participating in their conversation and activities. This participant observation aims at seeking an insider's understanding of the participants' interaction on the computer screen and gaining new awareness of such interaction" (Wan-Mansor, 1998, p. 49). Virtual participant observation is a useful research methodology for investigating the chatrooms or chatlines and virtual world such as LambdaMOO, LinguaMOO or MediaMOO. As noted above,

MOO stands for MUD object oriented (MOO) while MUD refers to Multi-User Domain (or Dungeon or Dimension). We are reminded by CMC researchers that the role of the researcher in educational research is active and constantly changing. For instance, in a virtual participant observation, the researcher needs to be in the same virtual space in order to make sense of the interaction among the participants, while adapting to the computer environment. As reported in numerous studies, this is especially true due to the fact that a virtual uninhibited environment and anonymity normally lead to active and increased participation.

### CURRENT WORK

CMC research in education advances with the development of new and improved research tools for investigating both traditional classrooms and virtual classrooms. In recent years, CMC researchers in E-Learning or distance education and in foreign and second language education have utilized a multi-method approach in their research. In the field of foreign or second language learning, a few significant CMC research projects will be discussed here for their uniqueness in utilizing a multi-method research approach. Such an approach is necessary in order to understand the role of the medium and the interaction it entails: how CMC affects the interaction and how interaction affects the way CMC is used. This is to ensure that the intricate nature of CMC can only be optimally captured and analyzed by using a multi-method research approach.

*CULTURA* (Bauer et al., 2005; Furstenberg, 2003; Furstenberg et al., 2001), for example, is one of the most prominent projects which utilized the CMC tools for intercultural interventions within foreign and second language education. Even though *CULTURA* began in 1997, it continues to be upgraded and is currently being used among different groups of foreign language students. The *CULTURA* project was designed and based at MIT and was used among American students enrolled in a French language course at MIT and French students learning English at Institut National des Telecommunications. Aside from utilizing CMC for interacting, the French and American students in the study would collaborate on responding to web-based questionnaires. These web-based questionnaires (containing word associations, sentence completions and situation reactions) were designed to highlight cultural differences as a way to make the students aware of the other culture. Using the web and CMC tools, the project started with the goal of comparing cultures, allowing the learners and the teachers to learn about the target language and culture from each other.

One of the research methods utilized is the comparative French and American opinion polls that deal with many societal issues. What sets

this CMC opinion research apart from others is the hands-on approach aspect where students are producing and analyzing their own data. Students then share their observations within the classroom, and then via several online forums (under each item on the questionnaires). Responses to the questionnaires and the results of the opinion polls are archived and can also be accessed by the students. Another interesting research method used in the *CULTURA* project is the students' comparisons and analysis of the French and American videos and texts. The juxtaposition of video segments and texts enables the students to uncover cultural differences. Later viewpoints about these materials were shared and exchanged in online forums. Finally, at the end of each semester, students are asked to complete evaluation questionnaires on the project with the following criteria:

- Usefulness and interest for cultural understanding
- Quality of materials and activities
- Web interface
- Nature and frequency of resources used
- General assessment concerning gains in understanding the target culture (Furstenberg et al., 2001, p. 87; Furstenberg, 2003)

By using a hands-on approach (utilized within the multi-method approach) and by utilizing CMC technologies to the fullest in order to optimize their data collection and analysis, this project illustrates an invaluable research design that should be useful for future CMC research.

In recent years, the term *telecollaboration* (Belz, 2003; Kinginger, 2004; Warschauer, 1999; 2000), also known as *Tandem Learning* in Europe, was introduced to refer to the use of a combination of CMC technologies such as chat rooms and emails that internationally link partner classes around the world. Partner classes are two classes set up in the two respective participating countries. The members of these two classes only communicate with other members via any available CMC tools.

Warschauer's (1999; 2000) ethnographic multi-site case study of four colleges made use of various research methods to investigate online learning among his students in second language classrooms. Not only was the research ethnographic in nature, it was also longitudinal, and employed participant observation, longitudinal open-ended interviews with the teachers and the students, and an analysis of electronic texts such as email. Students used CMC in the classrooms to share paragraphs, and also to participated in listservs or bulletin boards. Further, the students also communicated through email with their long distance keypals. Warschauer states that the findings of this study could relate to "the effects of sociocultural context on use of technologies, the importance of electronic literacies, and the purpose of literary activities" (2000, p. 42).

Another CMC research project on telecollaboration that is currently underway is the “Telekorp: The telecollaborative learner corpus of English and German”. Led by Julie Belz, “Telekorp is a bilingual learner corpus of diachronic, Internet-mediated, NS-NNS interactions with built-in NS control corpora” (Belz, 2005). Within the context of telecollaborative language and culture learning exchanges, Belz uses quantitative approaches and a variety of ethnographic research methods through:

- writing and speaking diagnostics
- biographical surveys
- technological surveys
- video and audio recording of classroom discourse
- retrospective verbal report interviews
- learner portfolios
- observer field notes

Even though it is a challenge for researchers to employ various research methodologies in CMC research, further exploration through multi-methods in these projects shows how research methodologies in CMC research can be innovatively modified, harnessed, and utilized to achieve the research goals. Besides attempting to capture the complexity of CMC research, a multi-method approach is necessary for the purpose of triangulating whereby researchers need to cross-validate analysis from various data collected.

### PROBLEMS AND DIFFICULTIES

The growing popularity and the abundance of CMC research should be viewed as a positive development, but with caution. Traditional FTF researchers will argue that even with the presence of innovative research design such as those described above, we have yet to really understand certain nuances of cultural or social phenomena. How are the CMC tools compared to those of their FTF counterparts? In what ways do CMC tools complement them and richly contribute to research and knowledge in general?

As in traditional FTF methodological issues in education, CMC methodologies will continue to be debated as CMC research continues to flourish. Typical problems in traditional FTF research (such as validity, generalizability, and authenticity), which have influenced CMC research, have been duly addressed (Beatty, 2003; Hine, 2000). Authenticating participants interacting on the Internet, for example, poses one of the main problems in researching CMC. Notions of participation, authenticity of audience, and authenticity of tasks have been reconceptualized within CMC research. Hine (2000), in discussing virtual ethnography, asserts:

Cyberspace is not to be thought of as a space detached from any connections to real life and face to face interaction. It has rich and complex connection with the context in which it is used. It also depends on technologies which are used and understood differently in different contexts (p. 64).

Even though researching CMC in education should be viewed in its own right, methodological comparisons to FTF research may be inevitable due to the socially driven and interdisciplinary nature of research in education. Thus, another challenge for the CMC researcher, especially the novice, is to provide the necessary methodological rationale for using CMC tools and determine how they influence the principles and practice of data collection and data analysis. However, there are problems and difficulties expected in some CMC research which will be outlined as follows:

- For a descriptive or ethnographic study (see Toohy, *Ethnography and Language Education*, Volume 10) seeking naturalistic data in a CMC environment, the methodology must take into account the nature and degree of participation of both the researcher and the participants interacting in the technology-mediated environment. The natural elements of CMC interaction must be accompanied by the description of the interactive tools of the CMC environment and whether or how those features are fully utilized. With multiple participants interacting using various CMC tools simultaneously, research methodology must be flexible enough to make sense of the interaction.
- CMC researchers who use previously established FTF methods or instruments to investigate CMC may overlook the absence or hidden social and cultural cues in the CMC environment. Since the instruments were originally meant for FTF investigation, CMC tools must be sufficiently versatile and data analysis must be holistic in order for the researcher to capture the meanings.
- CMC research design that may overlook the participants' computer and technical skills as well as the atmosphere of the research site may seriously affect the research validity. The skills, atmosphere, and attitudes towards technology may pose as moderating variables and must be properly addressed at the outset of the research. This can be a problem stemming from improper sampling or insufficient training of those skills.
- The institutional research, especially those measuring E-Learning or program effectiveness may not yield the desired generalizability normally needed by other institutions which expect the transfer to practice of the results of the research (see Arbaugh and Hiltz, 2005; Reeves, Herrington and Oliver, 2004; on the need to improve quantitative design for research on online learning).

- CMC researchers may not be conversant with CMC technology, and therefore, may not fully utilize both the CMC tools and its environment in the research design. This is natural since the researchers are education practitioners or professionals who may not be technologically savvy. Or the research task could very well be delegated to the technical professionals or administrators who are without strong conceptual framework with minimal help from education practitioners or professionals. This problem, however, can be overcome if educational researchers can collaborate closely with technical professionals with planning the research design.
- The potential negative effects of the CMC environment on CMC research participants has been one of the main problems in data collection. For example, participants disappear from CMC interaction because they lose interest in the interaction, quitting due to the overwhelming nature of CMC technology, or sometimes disruptiveness or playfulness during the interaction (through flaming, spamming, etc.).

#### FUTURE DIRECTIONS

Due to its versatility and flexibility, the CMC environment will continue to be a popular research site where researchers or mere enthusiasts will take advantage of its convenient features, produce original research, or replicate existing traditional FTF research. In recent years, CMC practices have expanded to the use of instant messaging (IM), Wikis, Blogs (Godwin-Jones, 2003; 2005; Thorne and Payne, 2005), Short Messaging Service (SMS), and online gaming. In the near future of CMC research, Personal Digital Assistants (PDAs) and possibly iPods, will be experimental research tools for educators and researchers. For example, the growing use of mobile web portals among university students and faculty members will enhance the need for CMC researchers to investigate, for instance, the process and outcome of this device and how its mobility affects the students' learning. In addition, the researchers could examine the impacts and effects of the mobile medium or the mobile web portal environment on the university community, specifically with student-to-student and student-to-faculty social interactions.

Another near-future CMC research site would probably venture into the 3D or 2D Virtual Reality worlds or communities that have been rapidly growing on the Internet. These sites, to name a few, SIMS online, second life, and active worlds are social worlds. Active Worlds Educational Universe (AWEDU) which made its "Active Worlds Technology" available to educational institutions and individuals posits that "via this community, educators [would be] able to explore new concepts,

learning theories, creative curriculum design, and discover new paradigms in social learning” (AWEDU homepage). These social construction sites could be fertile grounds for CMC researchers to challenge themselves and perhaps, bring CMC research to a new level systematically examining these highly synchronized interactions.

Future trends in researching CMC in education will focus on mixed or multi-methods of qualitative and quantitative research (see Goldman et al., 2005; on qualitative and quantitative). There will be a trend for longitudinal studies, for instance, on learner corpora, or system design evaluation. Mixed methods and longitudinal designs will be important in measuring learning or program effectiveness; developing language or cultural competence; and improving pedagogical practices. Due to the complex nature of research in education, future CMC research tools must ensure a methodology that captures “broad based complex problems critical to education, maintains a commitment to theory construction and explanation while solving real world problems” (see Reeves, Herrington and Oliver, 2004; on the development of research agenda for online collaborative learning).

CMC environments have redefined the meanings of community, culture, and the nature of interaction. Since interactive media can be understood as both culture and cultural artifact (Hine, 2000; Thorne, 2003), the challenge for virtual ethnographers is to give equal attention to both aspects in their methodologies, data collection, and data analysis. Through its versatility, CMC methodology can be made to suit the local cultures of the participants it investigates (see Thorne and Payne, 2005; on culturally adaptive methodology). Researching CMC in education will continue to make great contributions to knowledge and a global research agenda. Computer and Internet-mediated technologies will allow researchers to explore new territories enabling them to address new global phenomena.

## SUBJECT INDEX

- Academic English 77–79, 149, 151, 153  
Academic literacies 146, 152–155,  
227–236, 256, 257  
Academic literacies research 229, 230,  
232–236  
Academic writing 62, 155, 156, 231–234  
Access and availability 325  
Adult education 10, 42, 180, 184, 185, 187,  
292, 311, 321, 327, 329  
Affordances 6, 7, 57, 58, 121, 243, 248  
Africa 309  
African American English in education  
340, 343  
African languages 30–33, 35, 37, 38,  
311, 315  
African scripts 29, 35–37  
Alphabetic principle 324  
Andean history 285–288, 291–292, 294  
Andean textiles 292, 294  
Apprenticeships 135  
Argentina 283, 288, 324, 325, 327  
Artifact 61, 78, 170, 244, 325  
Assessment of prior experiential learning  
(APEL) 140  
Author 12, 29, 156, 158, 247, 325  
Autonomous model 4–7, 13, 230, 300,  
309, 312
- Bilingualism 123, 124, 127, 128, 266, 269,  
294, 316, 322, 351  
Biliteracy 119  
Black discourse practices 338, 342  
Bolivia 272, 287–292, 294, 322, 330, 331  
Brazil 108, 186, 322, 326, 332
- Centro de Cooperación Regional para la  
Educación de Adultos en América  
Latina* (CREFAL) 327  
*Centro Regional para el Fomento del Libro  
en América Latina y el Caribe*  
(CERLALC) 328  
Chile 325, 327, 331, 332  
Colombia 283, 325, 330  
Communicative language teaching (CLT)  
146–148
- Communities of practice 101, 137,  
140, 236  
Computers 54, 58, 139, 157, 302, 305, 332  
*Conscientização* 323  
Critical literacy(ies) 80, 107, 108, 111–117,  
212, 257, 258, 313  
Critical literacy, anthropological  
approaches 110  
Critical literacy, applied linguistic  
approaches 115  
Critical literacy, cultural approaches 236  
Critical pedagogy 109, 112  
Critical race theory 15–27  
Cultural assimilation 231, 323, 332  
Culturally relevant literacy education 340
- Decoding 9, 43, 284, 289, 291, 292, 326  
Dominican Republic 321  
Donor-relations 192, 194, 202, 203
- Ecuador 284, 288, 289, 291, 292, 322, 330  
El Salvador 321  
English as a second language (ESL) 74  
English language teaching (ELT) 146, 148,  
151, 153  
Ethnographic 3
- Figured worlds 7–10  
Funds of knowledge 208, 212, 217, 241,  
255, 256
- Gender 321  
Genre 139  
Globalization 7, 119  
Governance 115, 192, 196, 200, 203, 204  
Graffiti 124, 137, 251, 304, 331  
Guatemala 321, 322
- Habitus 8, 9, 11  
Haiti 266, 321  
Higher education 33, 148, 155, 228, 229,  
231–236, 294, 311, 330  
Home-school links 140, 209  
Home-school relationships 140, 209  
Honduras 321

- Identities 135, 240  
 Ideological model 4–7, 13, 212, 230, 293, 300, 350  
 Illiteracy 44, 50, 86, 96, 200, 292, 312, 322, 325, 330, 349, 353, 354  
 Indigenous languages 322  
 Indigenous peoples 20, 289, 292, 294, 321  
 Industrialisation 348  
 Inequality 22, 111, 171, 183, 185, 203  
 Informal learning 58, 63, 134–142, 301  
 Information and communication  
   technology 10, 55, 65, 66, 202  
*Instituto Nacional de Educación para Adultos* 327  
 International Literacy Research Award 325  
 Internet 53  
 Internet technologies 53–60, 63–67, 316, 332  
  
 Knowledge production 34, 35  
  
 Language learning 135  
 Language policy 187, 192, 203, 204, 285, 288, 336  
 Latin America 268, 289, 294, 321–332  
 Lifelong learning 133, 184  
 Linguistic ecology 121, 124  
 Literacies, city 347–354  
 Literacies, classroom 259  
 Literacies, contrasting 351  
 Literacies, digital 246, 258, 259  
 Literacies, local 193, 312, 350, 351, 354  
 Literacies, multi 222, *see also*  
   Multiliteracies  
 Literacies, out-of-school 172, 239, 243, 245, 246, 299, 313, 318

## SUBJECT INDEX

- Activity 112  
Activity theory 5, 62, 63, 334, 335, 338  
Africa 147  
Agency 308  
Argumentation 87, 143, 320, 331–333  
Assessment 44  
Assimilation 172, 216, 218, 232  
Authority 178
- Categorizing learning difficulties 144  
Categorizing practices 136–138  
Classroom 3–12, 15, 17, 19–25, 42–44, 47–50, 56, 58  
Classroom interaction(s) 62  
Classroom language practices 147, 155, 269  
Classroom research 18, 22, 25, 69, 132, 160, 233, 235, 265, 323, 324, 326, 359  
Classroom talk 19–21, 24, 70, 75, 88, 159–162, 164, 165, 188, 189, 255, 258, 260, 265, 266, 268, 275, 280, 281, 317–319  
Code-switching 25, 78, 86, 125, 153, 193, 230, 323, 324, 326  
Collaborative talk 25, 73, 256, 279–289, 299  
Colonial era 147–150, 212  
Colonial power 147–149  
Colonialism 98, 110, 207  
Common knowledge 8, 189  
Communicative competence 115, 281, 307, 313, 342  
Communicative practices 3, 219, 275, 313  
Community of inquirers 331  
Comparative studies 168  
Contestation 75, 96, 174, 175, 177, 219, 231  
Context 93  
Conversation analysis 8, 12, 15, 57, 132, 180, 182, 267, 268, 270, 289, 309, 338  
Counter-hegemony 173, 175, 177  
Critical discourse awareness and critical race theory 55, 58, 60, 63  
Critical discourse awareness and representation of identities 59, 60  
Critical discourse awareness and social action XX 54, 58, 59  
Critical discourse awareness and written texts 57, 61, 62  
Critical discourse studies 53, 63  
Critical language awareness (CLA) 54, 56, 322  
Critical literacy 58, 63, 349  
Critical theory 55, 171  
Cultural models 54, 59, 323, 342, 343  
Curriculum 41  
Curriculum knowledge 357, 360
- Dialogue 280, 291  
Diaspora 195  
Discourse 41, 53, 171, 305, 329, 341  
Discourse analysis 69  
Discourse representation 81, 83, 87  
Discourse, classroom 69, 121, 317  
Discourse, conceptual 323  
Discourse, counter 110, 177  
Discourse, institutional xiii, xvii, 17, 22, 23, 62, 108, 127, 128  
Discourse, mathematical 317, 319–322, 324, 326  
Discourse, official pedagogic xiii, 43, 44, 45–50, 145, 168, 185, 195, 289, 365  
Discourse, pedagogic xix, xx, 41, 42–44, 47–50, 128, 346  
Discourse, procedural 321, 323  
Discrimination 96, 173, 218, 242  
Discursive practice xxviii, xxix, 12, 58, 164, 193, 281, 289, 321–324, 326, 329, 331–338, 345, 352  
Discursive psychology xiv, xxi, xxvii, 279, 301  
Disqualification 230, 232  
Domination xxiv, 55, 173, 174, 177, 181, 182, 201, 202, 206, 213, 219, 220
- Early years xxvii, xxviii, 268, 285, 287, 301, 302, 362  
Educational achievement 267

- Elite xxiii, 147–151, 154, 155, 172, 174, 214, 215, 218, 239, 240, 269, 330  
 English as a second language (ESL) 38, 46, 47, 70, 190, 216, 270, 295, 308, 310, 313  
 English for specific purposes (ESP) xx, 29, 30, 33, 36  
 English language skills 148, 150  
 English literacy 149, 150, 153  
 Epistemology 10, 335  
 Epistemology, issues in 9, 311  
 Ethnicity 171  
 Ethnographic approach xvii, 7, 12, 25, 107–118, 132  
 Ethnography 107, 203  
 Ethnomethodology xiii, 8, 267, 268  
 Exclusion 143, 173, 190, 191, 195, 214, 275  
  
 Functional grammar 34, 48, 324  
  
 Gender constructions 159, 164, 166–168  
 Gender identities xvi, xxi, xxiii, 12, 60, 71, 74, 85, 161–163, 165, 167, 168, 190  
 Gender positions xvi, 71, 167  
 Gender structures xvi, 160, 167  
 Gender subjectification 164, 167  
 Genre 29, 81  
 Globalization 205  
 Group work xxvii, xxix, 20, 21, 162, 191, 256, 280–288  
  
 Hegemony 62, 98, 149, 173, 175, 211, 213, 214, 216  
 Hermeneutics 322  
 Home-school relations 46  
  
 Identity and second language acquisition (SLA) xxviii, 122, 194, 305  
 Identity construction xvi, 70, 121, 125, 128, 132, 167, 185, 192, 194, 195  
 Identity formation xxiii, 60, 162, 163, 168, 180, 193, 232  
 Identity(ies) 41, 95, 107, 172, 185  
 Ideology 211  
 Immigrant minority language teaching 227  
 Inclusion ix, 61, 143, 145, 148, 191, 337  
 Indigenous languages 48  
 Interaction 171  
 Interaction analysis in classrooms 3  
 Interaction in mathematics classrooms 319  
 Interactional routine xxiii, 72  
 Interactional sociolinguistics xiii, 89, 132, 191, 267, 312, 313, 319  
 Intercultural education 232  
 Interdisciplinarity, lack of 267  
 International triangulation 226  
 International-comparative studies 225–227  
 Internet 179  
 Intertextuality 62, 83, 88, 89, 90, 115, 128, 129, 321  
  
 Kenya xxiii, 147–151, 153, 155, 219, 269  
 Key incident analysis 227  
 Kiswahili 148, 150, 153, 154  
 Knowledge 41  
 Knowledge as socially constructed 9  
  
 Language and mathematics 318  
 Language as evidence of learning 6  
 Language ideology(ies) x, xxi, 97, 99–101, 211, 237, 215, 243, 324  
 Language in education policy 149, 154, 273  
 Language in use xiv, 4, 7, 8, 10, 95–99, 101, 234, 317  
 Language of instruction 4, 111, 147, 149, 150, 153, 205, 346  
 Language of the classroom 3, 6  
 Language planning and policy xxv, 211  
 Language practice 90, 117, 147, 153, 155, 171, 172, 174, 181, 273, 314, 345–347  
 Language socialization ix, 12, 24, 25, 93, 107–110, 145, 168, 181, 182, 203, 307–311, 321, 326, 365  
 Language support 228, 230, 234  
 Language use 93  
 Languages other than English (LOTE) 46  
 Learning how to mean 7  
 Legitimate language xiv, xv, xvi, 205  
 Limited English proficiency (LEP) 46  
 Linguistic anthropology xiv, xvii, xviii, xxi, xxx, 12, 55, 93–96, 99, 108, 113, 321, 326, 338  
 Linguistic deficit 202  
 Linguistic difference, 171  
 Literacy pedagogy 29, 32, 34, 47  
 Literacy practices 296  
  
 Mathematical conventions 318, 321  
 Mathematical meaning 318, 319, 321, 324  
 Mathematical texts 319, 321, 322  
 Mathematical vocabulary 318, 323  
 Mathematics classroom discourse 317, 319, 326  
 Mathematics education xxviii, 289, 317–319, 325  
 Mathematics register 317–319  
 Mediation 129, 130, 172, 270, 271, 273, 335

- Metaphor xxix, 322  
 Metonymy 322  
 Mocking 175, 178–180  
 Modality 35, 320, 322, 358, 360  
 Mother tongue teaching xxv, 30, 33, 225, 227  
 Multicultural classroom 126

## SUBJECT INDEX

- Aboriginal languages 256, 258  
Academic circles 309, 311, 317  
Acquisition of technology 232  
Adjunct courses 60, 61, 64, 269, 274, 275  
African American Vernacular English  
(AAVE) 20  
After hours (supplementary) schools 169,  
170, 175  
Algeria 228  
Amazon 296  
Anadolu University 231  
Andes 294, 295, 299–301, 305  
Anglicizing 230  
Apartheid 183–188, 190  
Applied linguistics 3, 4, 6, 9–12, 25, 63,  
88, 108, 145–147, 173, 192, 210,  
261, 270–276, 358  
Arab states 227  
Arab world 232  
Arabic 12, 22, 77, 130, 138, 144, 169, 173,  
178, 227, 228, 230, 232, 233,  
358–360, 365  
Arabic discourse 233  
Arabization 228, 229  
Asia 227  
Assessment 62, 210, 347, 353  
Assessment tasks 9, 31, 71–78, 136,  
149, 289, 297, 327, 328, 333,  
339, 340  
Attention 60  
Attribution 60, 327  
Australia 169, 255  
Autonomy 48, 51, 53, 64, 67, 68, 108, 157,  
217, 286  
  
Background speakers 173, 179  
Bangalore, India project 71  
Bantu Education Act 186, 188, 193  
Bilingual classroom 231  
Bilingual education 169, 231, 293  
Bilingual programmes 258, 260  
Bilingual(ism) 22, 31, 97–100, 145–147,  
152, 154, 158, 159, 169, 170, 173,  
174, 198, 231, 243, 245, 246, 302  
Blog 331, 332  
Bologna process 316  
British 3, 8, 11, 24, 114, 163, 169, 185,  
197–200, 205, 206, 227, 228, 233,  
239, 255, 315  
British English 233  
British mandate 228  
  
Canadian immersion 60, 98, 101  
Center for Applied Linguistics 63,  
145, 358  
Classical Arabic 227, 230  
Code-switching 22, 192  
Cognitive academic language learning  
approach (CALLA) 61  
Cognitive academic language proficiency  
(CALP) 60  
Cognitive processes of learning 60  
Collaborative strategic reading 64  
Colloquial Arabic 22, 227  
Common European Framework of  
Reference (CEFR) 5, 7, 11, 136,  
209–211, 316  
Communicative language ability 81  
Communicative language teaching 8, 71,  
135, 246  
Community languages 169–179, *see also*  
immigrant languages  
Competence 229  
Complementarity of native-speaker/  
nonnative-speaker EFL teachers  
309–318  
Components 53, 60, 74, 135, 151, 191,  
212, 216, 235, 365  
Comprehensible input 8, 45, 46, 60,  
78, 311  
Computer 281  
Computer adaptive test(ing) (CAT) 354,  
355, 357, 359, 360  
Computer assisted language learning  
(CALL) 68, 202, 247, 261, 281, 289,  
348, 353, 367, 369  
Computer assisted language testing  
(CALT) 353, 354, 358–362  
Computer mediated communication  
(CMC) 7, 11, 51, 282, 287, 288, 289,  
325–329, 332–334, 353, 365,  
369–372, 374

- Concept oriented reading instruction  
   (CORI) 64  
 Concordance 345, 346  
 Content and language integrated learning  
   (CLIL) 62, 63, 66, 97–100, 103–108  
 Content based instruction (CBI) 59–68, 200  
 Content based language teaching with/  
   through technology (CoBaLTT) 61,  
   62, 97  
 Content learning 59–61, 64, 66, 67, 137  
 Content-compatible language 63  
 Content-driven curricula 59  
 Content-obligatory language 63  
 Cook Islands 261  
 Cooperative learning 61, 64  
 Corpus 3, 23, 24, 67, 68, 329, 337–349  
 Corpus linguistics 3, 67, 68, 337, 345  
 Courseware 347, 348  
 Creole 21, 146  
 Critical language awareness 305  
 Critical Thinking Test 231  
 Cultures 32, 89, 90, 103, 104, 106, 107,  
   129, 133, 134, 174, 207, 216, 232,  
   239, 249, 262, 264, 286, 296, 315,  
   318, 333  
 Curricular design 148, 151

## SUBJECT INDEX

- Aha Pūnana Leo* (“language nest gathering”), 245
- Academic proficiency 68, 313
- Acoma 247
- Additive bilingualism 83, 255
- Additive language learning 4, 6, 7
- Advocates of Indigenous California Languages 249
- Alaska Native(s) 14, 239, 241, 248
- Algonquian 243
- American Indian Language Development Institute (AILDI) 243, 249
- American Indian(s) 239, 241–243, 249
- American Sign Language (ASL) 12, 129, 138, 141
- American Sign Language (ASL) Curriculum 137, 138, 140–142
- American Sign Language (ASL) Dictionary 141
- American Sign Language (ASL) Literature Week 140
- American Sign Language (ASL) Parent Child Mother Goose Program 141
- Arabic 6, 61, 205, 207, 226, 281–290
- Assimilation 4, 7, 41, 81, 118, 151, 172, 240, 296, 312, 317
- Attitude planning 134, 135, 139, 142
- Australia 281
- Austronesian languages 192
- Bilingual education 20, 51, 135, 151, 225, 255, 311
- Bilingual Education Act (1968) 14, 39, 241
- bilingual instructional approaches 65, 70, 74
- Bilingual programmes 39, 128, 182, 184, 186, 187, 195, 207, 212, 214, 215, 217–219, 228, 232–234, 283, 323, 325, 328, 329
- Bilingual/multilingual education xiii–xviii, 3, 4, 14, 15, 20–30, 51, 73, 91, 96, 97, 100, 101, 119, 166, 168, 170, 172–174, 207, 210, 218, 219
- Bilingualism 19–24, 26, 29, 31, 37–39, 41, 42
- Bilingual teacher training, 98, 127, 137, 182, 184, 209, 244, 290, 329
- Biliteracy 325
- Bill, 4, 137, 139
- Boarding school(s) 109, 120, 213, 240, 244
- Bureau of Indian Affairs 240
- California 3, 23, 40, 60, 83, 84, 119, 246, 248, 249, 256
- Canada 253
- Cherokee 40, 119, 240
- Cheyenne 243
- Chinese-foreign language bilingual education 176, 177
- Choctaw 119, 240
- Ciulistet (Yup’ik teacher-leaders) 243
- Civil Rights Movement 241
- Civil society 159
- Cochiti 247
- Colonial languages 26, 119, 152, 154, 158, 276
- Community 77
- Comprehensive school reform 60
- Concept definitions 3
- Continua of biliteracy 45, 54, 55, 81, 82
- Cree 119, 243, 255
- Crow 243
- Curriculum 137
- Deaf Culture Centre 142, 143
- Deaf View Image Art (De’ VIA) 142
- Direct method 65, 66, 73
- Dual immersion 13, 28, 83, 325
- Dual language education 57, 84, 253, 254
- Dual language programs 57, 84, 253, 256
- Dual language schools 212, 272
- Early childhood education 57
- Economic globalization 178, 179, 184
- Economic reform 178
- Emergent biliteracy 56, 57
- Endangered language(s) 8, 9, 85, 124, 267
- English as a foreign language (EFL) 5, 178
- English as a second language (ESL) 5, 20, 28, 239, 257, 270

## SUBJECT INDEX

- Accuracy 20, 119, 122, 138, 139, 159, 162, 213, 299, 303, 306
- Activity theory 266
- Adult 6, 8, 48, 109, 110, 119, 121, 147, 158, 256, 307, 321, 360
- Adult time 8
- Age of L2 learning (AOL) 160
- Alphabetic orthography 156
- Anthropology 95, 193, 270
- Articulatory mechanisms 164
- Assessment 280
- Attention 133
- Attitudes 170, 329
- Automaticity 208, 365
- Awakening to languages 219
- Awareness 133
- Categories 49, 62, 85, 124, 173, 261, 291, 344
- Child 105, 107–110, 112–114, 122, 161, 208, 229, 245, 316, 321, 323, 394, 397
- Classroom discourse 34–36, 261–270
- Codeswitching 319
- Coding scheme 38, 39
- Cognition 59, 61, 64, 68, 72, 239, 242, 294
- Cognitive linguistics 79–89
- Communicative competence 33, 193, 194, 209, 275, 362, 377
- Communicative sensitivity 318
- Computer assisted language learning (CALL) 300
- Computer mediated communication (CMC) 300
- Conscious knowledge 10, 11, 308, 309
- Consciousness 119, 135, 357
- Consciousness-raising (CR) 9, 12, 15, 24, 143, 149, 185–188, 210, 304
- Consciousness-raising (CR) task 149, 210
- Consonants 156, 158, 159
- Construal 85
- Content and language integrated learning (CLIL) 233, 282
- Conversation analysis 34, 60, 63, 68
- Core meanings 88
- Corpora 174, 296, 305, 306
- Critical Language Awareness (CLA) xiii–xiv, 6, 18, 31, 32, 37, 39, 175, 234, 235, 359, 388
- Critical literacy 34, 39, 50
- Critical pedagogy 46, 393
- Cultural awareness 197, 273, 276, 282, 375
- Deductive 4, 5, 21, 149, 210
- Detection 133, 136, 200
- Dialogue 275
- discourse analysis 31
- Discourse awareness 31, 36, 37, 39–41, 106, 175
- Discursive psychology 68
- Ecological 128, 256, 267, 382
- Educational language policy 219, 228
- Educational linguistics 5, 361
- Emotion 93, 94, 97–100, 323
- Energeia 4, 12
- Ergon 4, 12
- Ethnolinguistic vitality 335
- Ethnomethodology 61, 68, 69
- European language portfolio 252, 281
- Explicit knowledge 15, 119, 143
- Explicit learning 121
- First language (L1) 107, 119, 134, 205
- First language (L1) acquisition 80, 108, 134, 205
- First language (L1) background 107
- Fluency 125, 138, 208, 213
- Focus on form(s) 15, 20–22, 24, 122, 135–140, 188, 189, 199, 207, 212, 266, 361
- Foreign accent 160, 162
- Foreign language acquisition 20, 25, 164, 237, 381
- Foreign language classroom 19, 155, 162–164, 179, 275, 277, 279–282
- Gender 160
- Glosses 305
- Grammar teaching 9, 26, 89, 150, 290, 292

- Grammar-translation method 149  
 Grammatical consciousness-raising 9  
 Grapheme-sound relationship 159
- Identity 45, 330  
 Illiterate 156, 157  
 Image schemas 79  
 Implicit knowledge 9, 10, 119, 125,  
 143–148, 151, 205, 211, 248, 309  
 Implicit learning 121, 122, 125–127, 134,  
 140, 147, 150, 362, 366  
 Implicit memory 120, 124, 125, 134  
 Incidental learning 305, 365  
 Individual differences 73, 125, 129,  
 131, 139  
 Inductive 4, 21, 24, 124, 149, 210  
 Infant speech perception 109, 155  
 Input 155, 185, 262, 299  
 Instruction 301  
 Interaction 261  
 Interactional practices 63, 64, 71,  
 72, 336  
 Intercultural awareness 242, 277–282  
 Intercultural education 32, 376, 380  
 Interface 10, 11, 31, 120, 122, 126,  
 148, 188  
 Interface hypothesis 9, 10, 148  
 Interlanguage 183, 184, 209, 212, 213,  
 256, 263, 266, 287, 296  
 Interpretation task 149  
 Intonation 156  
 Introspection 4, 128, 181, 278  
 Intuitive 4, 6, 10, 25, 150, 184, 186
- Knowledge about language (KAL) 3, 8–10,  
 15–23, 25, 26, 287–290, 293,  
 385–387  
 Knowledge of language 5, 10, 20, 119,  
 124, 125, 129, 241, 291, 309, 315,  
 318, 364, 385
- Language attitudes 329–332, 334–336, 339  
 Language awareness (LA) 3–12, 31, 32,  
 233, 287–291, 293, 295, 296, 364,  
 365, 372–382, 385, 387  
 Language comparison 6  
 Language development 105  
 Language diversity 7, 8, 17, 37  
 Language education at primary level 371  
 Language faculty 237  
 Language learning 45  
 Language learning aptitude 8, 17, 160  
 Language liberation movement 6  
 Language planning 100, 329, 338, 344  
 Language socialization 59, 110, 269
- Language use 160  
 Learner autonomy 247–249, 251–256  
 Length of residence (LOR) 160  
 Linguistic competence 7, 193, 241, 251,  
 265, 275  
 Linguistic landscape 343–353, 395  
 Linguistic sense 4, 10  
 Linguistics 96  
 Literacy 31, 34, 37, 39, 42, 50, 51, 55,  
 73, 112, 206, 234, 236, 241, 250,  
 318, 372  
 Literate 156, 157, 179, 189  
 Literature 96
- Memory 59, 61, 62, 68, 75, 119–121, 124,  
 125, 127, 134, 136, 138, 147, 306,  
 323, 365  
 Metalanguage 15, 18, 22, 23, 26, 40, 106,  
 107, 359, 361–363  
 Metalanguage development 107  
 Metalinguistic 315  
 Metalinguistic ability 106, 364  
 Metalinguistic awareness 179, 379  
 Metalinguistic knowledge 15, 19, 106,  
 147, 181, 185, 205, 206, 214, 293,  
 361, 366  
 Metalinguistic skills 206, 221, 322,  
 358, 361  
 Metaphor and metonymy 81, 82  
 Minority languages 17, 223, 329, 330,  
 338, 347, 374, 379, 382  
 Monitoring 146, 247, 366  
 Motivation 162  
 Multilingual awareness 390–394, 398  
 Multilingual(ism) 315, 343, 357,  
 371, 385
- Native speaker 46, 106, 119, 120, 136, 161,  
 163, 288, 374  
 Neogrammarian 4  
 Non-native speaker 296  
 Noticing 19, 25, 119, 123, 125, 127, 139,  
 142, 148, 181, 199–201  
 Noticing hypothesis 123, 136, 181,  
 198, 200  
 Noticing-the-gap 123
- Observation 4, 22, 25, 38, 53, 62, 70, 174,  
 261, 332  
 Output 120, 138, 207, 211, 254, 263, 265,  
 302, 361
- Philosophy 59, 61, 68, 93, 98  
 Phonemic awareness 156  
 Phonetic awareness 155

- Phonetic sensitivity 230  
 Phonetic symbols 163  
 Phonetics 4, 164  
 Phonological awareness 112, 155, 156, 159, 318  
 Plurilingual competence 219, 225, 226  
 Plurilingualism 225, 226, 377  
 Practice 207  
 Pragmatic awareness 193–198, 200  
 Preliterate 156, 157  
 Process 4  
 Processing 299  
 Products 4, 10, 36, 96, 144, 156, 256, 339, 360, see also *ergon*  
 Proficiency 19, 71, 128, 149, 200, 225, 238, 252, 290, 293, 294, 362–365, 391, 398  
 Protocols 141, 201, 265, 299, 301, 307, 317  
 Prototypes 81, 87, 125  
 Psychology 4, 7, 59, 68, 73, 94, 120, 126, 139, 185, 200, 299, 309, 310, 330, 359  
 Radial categories 81, 85  
 Reason 35, 93–95, 98–100, 179, 274, 280  
 Second language (L2) experience 114, 158, 159  
 Second language (L2) input, quantity and quality of 160–162  
 Second language (L2) instruction 25, 122, 123, 188, 214  
 Second language (L2) learners 23, 88, 135, 143, 146, 150, 158, 186, 197, 208, 213, 305  
 Second language (L2) pronunciation 160–164  
 Self-awareness 122, 163  
 Self-observation 4  
 Skill acquisition 135, 146

## SUBJECT INDEX

- Academic corpora 249  
Academic English 78, 118, 249, 250  
Academic language 4, 38, 41, 42, 43,  
47–49, 112, 245, 327, 337, 343, 356,  
382, 405, 449  
Academic lexis 54, 56, 62, 246, 250  
Accommodation 30, 32, 41, 89, 102, 199,  
200, 310, 331–337, 339–342, 393  
Accountability 12, 100, 106, 135, 257, 258,  
303, 304, 314, 324, 325, 328, 334,  
365, 369, 373, 374, 375, 379, 388,  
391, 407, 409, 419, 429, 431,  
437, 438  
Adolescent corpora 246, 250  
Advanced learner knowledge 246  
Alignment 266, 290, 337, 349  
Alternative assessment, xiv, xvii,  
97–107, 289  
Alternatives in assessment 98, 103,  
107, 287  
Alternative testing 98  
American Council on the Teaching of  
Foreign Languages (ACTFL) 142,  
143, 157, 158, 159, 160, 163, 170,  
172, 227, 289, 367, 438, 449  
American National Corpus (ANC) 243  
Analysis of test language 186  
Annotation 434, 435  
Appropriateness 57, 58, 62, 70, 71, 168,  
305, 332, 337, 338  
Argument-based approach to validation  
189, 192  
Assessing second/additional language 391  
Assessment activities 99, 120, 259, 261,  
265, 372  
Assessment as social practice 415, 418,  
423, 424  
Assessment criteria 42, 204, 205, 246, 262,  
303–306, 314  
Assessment culture 9, 102, 104, 106, 107,  
285, 287–296  
Assessment for learning 33, 287, 292, 311,  
383, 384, 393  
Assessment of achievement 265, 419  
Assessment of learning 33, 257, 286,  
292, 311  
Assessment reform 266, 287, 289, 292,  
296, 366–376  
Assessment systems and standards 264, 265  
Assessment, alternative 7, 10, 19, 32,  
97–107, 289, 313, 373  
Assessment, authentic 232  
Assessment, classroom 97, 115, 164, 257,

## SUBJECT INDEX

- Aboriginal peoples 274, 280–282  
Academic discourse socialization 243, 245, 253, 261, 269  
Affect 7, 10, 77, 93, 102, 107, 110, 165, 190, 207, 266, 275, 302, 306, 315  
Affective stance 73, 181  
Agency 8, 45, 47, 75, 79, 80, 107, 111, 130, 139, 195, 248, 249, 252, 281  
Appropriate language use 334  
Asia 207  
Assertiveness training 330  
Axiological stance 19, 23  
  
Basic conversational skills module 332  
Behavior therapy 329, 331, 333  
  
Call centers 260, 263  
Canada 273  
Caribbean 11, 180  
Chat 239, 301, 302, 305, 334, 337  
Children, young 3–7, 65, 73, 74, 79, 116, 117, 119, 122, 130, 131, 134, 135, 137, 146, 191, 232, 314, 317, 320  
Classroom interaction 192  
Coding orientation 61, 62, 64, 65, 67  
Cognitive therapy 329  
Communication 327  
Communicator 333, 336, 337  
Community living 329  
Community 327  
Conference talk/presentation 261  
Conflict management 329  
Conformity 75, 208, 314  
Context of situation 8, 18, 60, 183  
Continuity/discontinuity in schooling 167  
Conversation 332  
Conversational sociability 334, 335  
Cross-cultural communication 249  
Culture 11, 25, 43, 47, 57, 62, 81, 87, 92, 96, 116, 119, 145, 153, 202, 217, 225, 252, 290, 302, 323, 334  
  
Deaf community 287, 288, 290, 295–297  
Deaf culture 289  
Deaf identity 292, 295  
  
Deaf language socialization 287–297  
Deficit model 61, 332  
Dialogism 23, 25  
Diaspora 11, 47, 123, 301, 304–307  
Dinner talk 90–92, 95–97  
Disability 329, 338  
Discourse 71, 257  
Discourse analysis 334  
  
Empathy 53, 314  
Enculturation 44, 87  
Ethnographic studies 145, 149, 150, 151, 260, 289, 290, 321, 322  
Ethnography 4, 21, 32, 35, 37, 51, 119, 202, 262, 276, 302, 313  
  
Family discourse 88, 92, 94  
First Nations 273, 277, 278, 281, 282  
Foreign language education 176, 177  
Formal thought disorder 328  
  
Gender 231  
Gender practices 145–153  
Gender identity 231, 233, 234, 236, 237, 239  
Gender role 103, 146, 148, 169, 181, 235, 237, 316, 317  
Generalization 36, 37, 64, 240, 330, 332, 334, 336  
Genres 265  
  
Healthcare 261, 267, 334  
Heritage language 11, 34, 38, 77, 123, 167, 201–211, 307  
Higher education 234, 237, 257, 258, 260, 268  
Holism 18  
Homes 10, 33, 104, 106, 115, 116, 117, 118, 120, 121, 122, 123, 136, 163, 191, 194, 204, 257, 260, 266, 275, 279, 296  
Honorific 75, 178, 179, 313, 315, 316, 319, 321–323  
Hospitalization 328  
  
Identity(ies) 115, 231, 244, 329  
Illness 266, 327, 338

- Illness process 328, 335  
 Impairment 64, 327, 328, 334  
 In vivo amplified skills training (IVAST) 333  
 Indexical meanings 9, 73, 203  
 Institutionalization 281, 328, 335  
 Interactional patterns 72, 177, 183, 277, 302, 303  
 Interactional routine 72, 75, 105, 191, 203, 235, 319, 320  
 Interconnectedness 18, 19  
 Intercultural communication 148, 280  
 Interlanguage pragmatics 20, 75, 78, 81  
 International classification of functioning, disability and health (ICF) 338

## SUBJECT INDEX

- Academic language proficiency 239, 240, 242, 244
- Academic skills 200
- Accent 201
- Action-based learning 60
- Adolescents 201, 321, 322, 324
- Antillean/Aruban 195
- Assessment, tensions in 80, 282
- Assimilation 46, 87, 89, 107, 162, 171, 216, 238, 240, 241, 242, 265
- Attitudes iii, 27, 29, 37, 69, 70, 77, 87–89, 92–94, 127, 128, 130, 134, 136, 162–165, 171, 188, 208, 221, 225, 226, 252, 280
- Australian language demography 77
- Berber(s) 195, 197, 198, 199, 200, 201, 202, 283
- Bilingual classrooms v 234, 249, 253, 255, 258, 281
- Bilingual proficiency 199
- Biliteracy development 276, 280, 282, 285, 286
- Biodiversity and linguistic diversity ii, 8, 9, 11, 29
- Borneo, v, 161, 166, 167, 183, 184, 185, 191, 250
- Borrowing, 47, 92, 185
- Brunei 183, 250
- Chinese heritage language schools v, 173, 175
- Chinese immigration 170
- Chinese language ecology iv, 169–179
- Chinese language education v, 45, 46, 48, 74, 77, 79, 80, 102–107, 166, 169–178, 293, 300
- Christianity 45, 164, 184, 185
- Classroom assessment, validity of 43, 80, 103, 176, 282
- Classroom language v, 208, 218, 221, 226, 227, 232, 265
- Codeswitching 218, 254, 257
- Codeswitching, intrasentential 200
- Cognitive academic language proficiency (CALP) 239, 245
- Continua of biliteracy ii, v, vi, 275, 276, 278–281, 283, 284, 292, 300, 301, 307
- Contrastive analysis 197
- Covert prestige 201
- Critical ethnography 245, 285
- Cultural shock 197
- Discourse(s), everyday 10, 33, 169, 172, 173, 265, 267, 284, 298, 306, 309, 310, 326, 327
- Diversity 16
- Dutch as a second language 197, 199
- Dutch, acquisition of 196, 197, 198
- Ecology of language ii, iii, iv, vi, 4, 15–17, 20, 24, 28, 29, 47, 53, 63, 141, 159, 275, 281, 283, 292, 306, 313
- Ecology of language learning iii, iv, 53, 63, 141
- Education (primary and secondary) 11, 80, 186, 187, 197, 199, 294
- Emancipation 118, 148, 152, 202
- Equivalence constraint (on codeswitching) 218, 254, 257
- Error analysis 197
- Ethnography 253
- Ethnolects 201
- Ethnolinguistics 27
- First language attrition 198
- Foreign language (FL) 185
- Government 198
- Home language 77, 80, 102, 159, 160, 163, 173, 174, 207, 208, 210, 212, 214, 216–220, 267
- Human rights 3
- Hunter-gatherers 183, 184, 187, 188
- Identity 198, 239
- Ideology(ies)/ideological 17, 27
- Immigrant languages 172, 173, 283
- Immigrant languages and education 173, 283

- Immigration policy in Japan 70  
 Indigenous language(s) 86  
 Indonesia(n) iv, 43, 44, 72, 78, 79, 105, 108, 159, 161–166, 183  
 Inequality 211, 311  
 Integration 31, 59, 88, 114, 133, 198, 202  
 Intercultural bilingual education 141, 146  
 Intonation 58, 201  
 Islam 31, 45, 78, 184, 185, 250, 251  
 Italy iv, 42, 71, 73, 76, 113–116, 119–121
- Japan v, 46–49, 76, 79, 237–243, 245  
 Japanese as a second language (JSL) 237–239, 241–244
- Khoe and San 85–89, 91, 94
- Language attrition 198  
 Language change 45, 113, 164, 166, 191, 207  
 Language death iv, 91, 94, 114, 121, 165  
 Language education iii, ix, x, xi, 24, 29, 53, 72, 77, 93, 115–118, 144, 146–148, 162–164, 172, 173, 179, 186, 187, 197, 199, 226, 232, 233, 237, 238, 245, 264, 282–284, 294  
 Language ideologies iii, 28–30, 32, 33, 36, 37, 232  
 Language ideologies and policies, United States 28–30, 175, 232, 282  
 Language learning 53, 141  
 Language maintenance 21, 69, 75–77, 80, 113, 114, 120, 132, 133, 166, 173, 280  
 Language minority education v, 237  
 Language minority students 172  
 Language planning iii, vi, 20, 28, 32, 41–44, 48–50, 114, 151, 179, 190, 275, 276, 282  
 Language policy and practice 270  
 Language policy, multilingual ii, 28, 270, 284  
 Language proficiency 212  
 Language revitalization 146, 148, 226, 284  
 Language rights iii, x, 3–9, 11, 18, 19, 30, 32, 44, 120, 214, 240, 245  
 Language shift 73, 161, 200  
 Language survival iv, 113, 115, 117, 119, 121  
 Language teacher professional development 177, 281, 282, 324  
 Language teaching iv, 24, 43, 59, 116–118, 134, 142–144, 146, 149–152, 198, 199, 286
- Learning styles 58, 188  
 Lingua franca 23, 80, 92, 100, 101, 103, 105–107, 113, 114, 121, 185, 195, 297  
 Linguistic human rights iii, 4, 6, 17, 18, 28, 29
- Malay iv, 43, 99, 100, 101, 103–109, 159–166, 183, 185, 186, 188–191, 249–258  
 Malaysia v, 46, 49, 50, 99, 101, 106, 159, 165, 185–187, 190, 191, 251  
 Marginalized and endangered languages 4, 10, 11, 18, 28, 34, 122, 166, 173, 295  
 Matrix language 200

## SUBJECT INDEX

- a/r/tography 244, 247  
Academic achievement 161, 195, 218  
Action research 17, 20–22, 247, 282, 283, 287, 290–292  
Aesthetic experience 243  
Anthropology 6, 15, 41, 43, 69, 144, 161, 177, 178, 182, 190, 191, 203–205, 207, 212, 213, 229, 230, 233–237, 239, 243, 244, 247–250, 258  
Applied linguistics x, xi, 44, 47, 48, 50, 115, 130, 179, 184, 190, 191, 229, 234–236, 294, 311  
Art for scholarship's sake 246, 248, 249, 251  
Arts-based research 244–241, 246, 249, 250, 253  
Attitudes 56  
Autoethnography 247  
Autonomy of syntax 47
- Basque communities 51, 52  
Bilingual classroom interaction 145  
Bilingual classroom strategies 283, 284  
Bilingual pedagogies 284  
Biliteracy 224  
Blurred genres 244, 246, 247
- Caregivers 153, 190, 191, 193  
Case study 23, 49, 105, 171, 266, 292, 299, 301, 304, 311, 314  
Census 16, 20, 31, 45, 55–59, 62, 65  
Child 13, 16, 22, 74, 88, 92, 115, 131, 138–140, 142, 153, 154, 156, 158, 189, 191, 198, 262, 274  
Childhood 22, 117, 155, 159, 160, 199, 206, 292, 304  
Children see child  
Classroom code-mixing 142, 273  
Classroom codeswitching xvii, 142, 224, 278  
Classroom discourse 155, 181, 192, 204, 211, 225, 226, 235, 245, 258, 259, 264, 265, 269, 281, 315  
Classroom research 91, 106, 147, 225, 290, 291
- Codeswitching xvii, 8, 142, 224, 225, 278, 279  
Comembership 261  
Communicative competence 89, 91, 189, 190, 196, 204, 235, 263  
Community 189  
Community of practice xv, 22, 27, 147, 167, 178, 189, 304, 306  
Comparison group design 100  
Comprehensible output 223  
Connoisseurship 245  
Context 257  
Context analysis 257  
Conversation analysis 204, 233, 258, 269, 276, 279  
Correlational design 101  
Critical discourse analysis (CDA) 47, 52, 53, 143, 169, 209, 212, 213, 235  
Cross-cultural communication 261, 265  
Cross-sectional 113, 115, 131, 153  
Cultural conflict 222  
Cultural knowledge 190, 199
- Delayed posttest 100  
Description 7, 32, 59, 69, 90, 92, 104–106, 113, 115, 132, 139, 170, 177–179, 183, 185, 208, 236, 237, 245, 268, 289, 292, 300, 316  
Development 151  
Developmental trajectory 189, 197, 199  
Dialect 86  
Discourse analysis 203  
Discourse competences xvii, 181, 185, 225  
Diversity 218
- Endangered Languages 75, 78, 79  
Ethnicity 44  
Ethnodrama 247, 248  
Ethnographic research 10, 17, 22, 45, 171, 177, 182, 183, 185, 207, 220, 260, 264, 266, 300, 315  
Ethnography and language education 168, 219, 245, 258, 259, 270, 276, 316

- Ethnography of communication xvi,  
 152, 178, 204, 205, 210, 219, 229,  
 230, 232, 233, 239, 244, 257, 276  
 Ethnography(ic) 189, 218, 287  
 Ethnopoetics 243, 244  
 Euromosaic 60  
 Evaluation 30  
 Exploratory practice 290–292  
  
 Face-to-face interaction 197, 204,  
 205, 257, 259, 260, 262–265,  
 267, 268  
 Factorial design 102  
 Fieldwork 6, 177, 193, 248, 249  
 Floor 260, 262  
 Foreign language (FL) 165  
  
 Gatekeeping 205, 261  
 Gender 165  
 Governmentality and language policy 49  
 Grammaticality 47, 125, 131, 138  
 Grand narratives 47, 49  
  
 Hybrid forms 246, 248, 251  
 Hybridity 180, 184, 248  
 Hypertext 301, 302  
  
 Identity(ies) 222, 259  
 Identity research 22  
 Ideology(ies)/ideological 235  
 Ideology of English monolingualism 45, 50  
 Ideology of individualism 44  
 Immersion programmes 217, 219, 220,  
 224–226 see also Immersion,  
 Immersion education, Language  
 Immersion  
 Indexicality 236  
 Information and communication  
 technologies (ICT) 78, 299, 301–307  
 Interaction 257  
 Interactional sociolinguistics xvi, xvii,  
 229–231, 258, 276  
 Intercultural communication 20, 312  
 Interdiscursive 238  
 Interethnic communication 258  
 Interviewing/interviews 8, 16, 21, 34,  
 55, 60, 72, 104–106, 113, 127,  
 129, 134, 168, 169, 171, 177, 183,  
 194, 208, 243, 251, 261, 275, 287,  
 289, 290, 292, 301, 302, 304, 310,  
 314, 315  
  
 Laboratory research 113, 133, 134  
 Language (medium) of instruction 30, 31,  
 127, 196, 224  
  
 Language acquisition/acquisition of  
 language 190  
 Language alternation in the classroom 29,  
 88, 166, 258, 287, 288  
 Language attitudes 15, 16, 56, 61, 63,  
 64, 72  
 Language attitudes, measurement of 16  
 Language awareness 208  
 Language beliefs (ideology) xv, 27, 30, 85,  
 94, 178, 220, 290, 293  
 Language education practices 180  
 Language ideologies, multilingual xv, 41,  
 51, 78, 79, 226  
 Language ideology(ies) and education  
 x, 42  
 Language learning and resources 19, 63,  
 168, 179  
 Language loss xiv, xv, 21, 69–72  
 Language management 27  
 Language planning xv, 15, 18, 50, 60,  
 62, 130  
 Language policy ix–xi, xv, 18, 27–30, 44,  
 49, 132  
 Language practices 30, 168, 180, 181,  
 191, 280  
 Language proficiency 218  
 Language revitalization 34, 37, 60, 69,  
 73–79  
 Language shift 70  
 Language variation xv, xvi, 85–95, 159  
 Learner diaries 105  
 Lifespan 199  
 Linguistic anthropology 190, 191, 203,  
 207, 212, 229, 230, 233–237, 239,  
 244, 258  
 Listenership 257  
 Literacy practices 301  
 Literary, visual and performing arts 243,  
 247, 251  
 Longitudinal research 282  
  
 Microethnography 180, 230, 257, 258,  
 263, 265–268  
 Minority languages and language  
 ideologies 44, 45, 73  
 Mixed methods research 103  
 Multilingual(ism) 63, 73, 226  
  
 Narrative xiii, xvi, 47, 49, 102, 151–161,  
 169, 171, 172, 192, 209, 212,  
 221, 245, 247, 263, 264,  
 289, 292  
 Narrative analysis 159, 209, 292  
 Narrative inquiry 158, 209, 292

- Native speaker 20, 23, 47, 48, 74, 108, 131, 143, 193, 218
