GENERAL EDITOR'S INTRODUCTION<sup>1</sup>

ENCYCLOPEDIA OF LANGUAGE AND EDUCATION

This is one of ten volumes of the *Encyclopedia of Language and Education* published by Springer. The Encyclopedia bears testimony to the dynamism and evolution of the language and education field, as it confronts the ever-burgeoning and irrepressible linguistic diversity and ongoing pressures and expectations placed on education around the world.

The publication of this work charts the deepening and broadening of the field of language and education since the 1997 publication of the first Encyclopedia. It also confirms the vision of David Corson, general editor of the first edition, who hailed the international and interdisciplinary significance and cohesion of the field. These trademark characteristics are evident in every volume and chapter of the present Encyclopedia.

In the selection of topics and contributors, the Encyclopedia seeks to reflect the depth of disciplinary knowledge, breadth of interdisciplinary perspective, and diversity of sociogeographic experience in our field. Language socialization and language ecology have been added to the original eight volume topics, reflecting these growing emphases in language education theory, research, and practice, alongside the enduring emphases on language policy, literacies, discourse, language acquisition, bilingual education, knowledge about language, language testing, and research methods. Throughout all the volumes, there is greater inclusion of scholarly contributions from non-English speaking and non-Western parts of the world, providing truly global coverage of the issues in the field. Furthermore, we have sought to integrate these voices more fully into the whole, rather than as special cases or international perspectives in separate sections.

This interdisciplinary and internationalizing impetus has been immeasurably enhanced by the advice and support of the editorial advisory board members, several of whom served as volume editors in the Encyclopedia's first edition (designated here with\*), and all of whom I acknowledge here with gratitude: Neville Alexander (South Africa), Colin Baker (Wales), Marilda Cavalcanti (Brazil), Caroline Clapham\* (Britain),

---

<sup>1</sup> This introduction is based on, and takes inspiration from, David Corson's general editor's Introduction to the First Edition (Kluwer, 1997).

Bronwyn Davies\* (Australia), Viv Edwards\* (Britain), Frederick Erickson (USA), Joseph Lo Bianco (Australia), Luis Enrique Lopez (Bolivia and Peru), Allan Luke (Singapore and Australia), Tove Skutnabb-Kangas (Denmark), Bernard Spolsky (Israel), G. Richard Tucker\* (USA), Leo van Lier\* (USA), Terrence G. Wiley (USA), Ruth Wodak\* (Austria), and Ana Celia Zentella (USA).

In conceptualizing an encyclopedic approach to a field, there is always the challenge of the hierarchical structure of themes, topics, and subjects to be covered. In this *Encyclopedia of Language and Education*, the stated topics in each volume's table of contents are complemented by several cross-cutting thematic strands recurring across the volumes, including the classroom/pedagogic side of language and education; issues of identity in language and education; language ideology and education; computer technology and language education; and language rights in relation to education.

The volume editors' disciplinary and interdisciplinary academic interests and their international areas of expertise also reflect the depth and breadth of the language and education field. As principal volume editor for Volume 1, Stephen May brings academic interests in the sociology of language and language education policy, arising from his work in Britain, North America, and New Zealand. For Volume 2, Brian Street approaches language and education as social and cultural anthropologist and critical literacy theorist, drawing on his work in Iran, Britain, and around the world. For Volume 3, Marilyn Martin-Jones and Anne-Marie de Mejía bring combined perspectives as applied and educational linguists, working primarily in Britain and Latin America, respectively. For Volume 4, Nelleke Van Deusen-Scholl has academic interests in linguistics and sociolinguistics, and has worked primarily in the Netherlands and the USA. Jim Cummins, principal volume editor for Volume 5 of both the first and second editions of the *Encyclopedia*, has interests in the psychology of language, critical applied linguistics, and language policy, informed by his work in Canada, the USA, and internationally. For Volume 6, Jasone Cenoz has academic interests in applied linguistics and language acquisition, drawing from her work in the Basque Country, Spain, and Europe. Elana Shohamy, principal volume editor for Volume 7, approaches language and education as an applied linguist with interests in critical language policy, language testing and measurement, and her own work based primarily in Israel and the USA. For Volume 8, Patricia Duff has interests in applied linguistics and sociolinguistics, and has worked primarily in North America, East Asia, and Central Europe. Volume editors for Volume 9, Angela Creese and Peter Martin, draw on their academic interests in educational linguistics and linguistic ethnography, and their research in Britain and Southeast Asia. And for Volume 10, Kendall A. King has academic interests in sociolinguistics

and educational linguistics, with work in Ecuador, Sweden, and the USA. Francis Hult, editorial assistant for the Encyclopedia, has academic interests in educational and applied linguistics and educational language policy, and has worked in Sweden and the USA. Finally, as general editor, I have interests in anthropological linguistics, educational linguistics, and language policy, with work in Latin America, the USA, and internationally. Beyond our specific academic interests, all of us editors, and the contributors to the Encyclopedia, share a commitment to the practice and theory of education, critically informed by research and strategically directed toward addressing unsound or unjust language education policies and practices wherever they are found.

Each of the ten volumes presents core information and is international in scope, as well as diverse in the populations it covers. Each volume addresses a single subject area and provides 23–30 state-of-the-art chapters of the literature on that subject. Together, the chapters aim to comprehensively cover the subject. The volumes, edited by international experts in their respective topics, were designed and developed in close collaboration with the general editor of the Encyclopedia, who is a co-editor of each volume as well as general editor of the whole work.

Each chapter is written by one or more experts on the topic, consists of about 4,000 words of text, and generally follows a similar structure. A list of references to key works supplements the authoritative information that the review contains. Many contributors survey early developments, major contributions, work in progress, problems and difficulties, and future directions. The aim of the chapters, and of the Encyclopedia as a whole, is to give readers access to the international literature and research on the broad diversity of topics that make up the field.

The Encyclopedia is a necessary reference set for every university and college library in the world that serves a faculty or school of education. The encyclopedia aims to speak to a prospective readership that is multinational, and to do so as unambiguously as possible. Because each book-size volume deals with a discrete and important subject in language and education, these state-of-the-art volumes also offer highly authoritative course textbooks in the areas suggested by their titles.

The scholars contributing to the Encyclopedia hail from all continents of our globe and from 41 countries; they represent a great diversity of linguistic, cultural, and disciplinary traditions. For all that, what is most impressive about the contributions gathered here is the unity of purpose and outlook they express with regard to the central role of language as both vehicle and mediator of educational processes and to the need for continued and deepening research into the limits and possibilities that implies.

Nancy H. Hornberger

INTRODUCTION TO VOLUME 1: LANGUAGE POLICY  
AND POLITICAL ISSUES IN EDUCATION

ADDRESSING THE POLITICS OF LANGUAGE

The late David Corson, the General Editor of the first edition of the *Encyclopedia of Language and Education*, was both an outstanding social theorist of language and a committed activist in the language policy and language education fields. His position was that an acute understanding of theory was a necessary prerequisite for action, not an alternative to it—particularly if one were ever to hope to change existing language conditions that disadvantage, most often, minority groups. Corson articulated this position consistently throughout his work (see May, 2002) and this might explain why the first volume of that first edition of the *Encyclopedia*, under Ruth Wodak's editorship, began with the question of the politics of language.

Under Nancy Hornberger's General Editorship of the second edition, this understanding and commitment remain intact, and the first volume of this current edition again begins with a focus upon the politics of language—highlighting and foregrounding the importance of the social and political contexts of language policy and language education. And yet, for some, this might still seem surprising. After all, for much of its history, linguistics as an academic discipline, particularly in its more trenchant structuralist forms, has been preoccupied with idealist, abstracted approaches to the study of language. But this is precisely the problem. Language has too often been examined in isolation from the social and political conditions in which it is used, resulting in a synchronic or 'presentist' approach to language (Bourdieu, 1982, 1991; May, 2005). As the French sociologist and social anthropologist, Pierre Bourdieu, comments ironically of this process:

bracketing out the social . . . allows language or any other symbolic object to be treated like an end in itself, [this] contributed considerably to the success of structural linguistics, for it endowed the 'pure' exercises that characterise a purely internal and formal analysis with the charm of a game devoid of consequences. (1991, p. 34.)

The legacy of this decontextualized approach to language analysis can be seen in the ahistorical, apolitical approach perspectives that have too often characterized academic discussions of language policy and

language education. In the language policy (LP) arena, for example, this was most evident in the early stages of formal LP development, in the 1960s–1970s. During this period, LP was seen by its proponents as a non-political, non-ideological, pragmatic, even technicist, paradigm (see Tollefson, *Language Planning in Education*, Volume 1). Its apparently simple and straightforward aim was to solve the immediate language problems of newly emergent postcolonial states in Africa, Asia and the Middle East. While concern was often expressed for the ongoing maintenance of minority languages in these contexts, the principal emphasis of LP at this time was on the establishment and promotion of “unifying” national languages in postcolonial contexts, along the lines of those in Western, developed contexts.

What was not addressed by these early efforts at LP were the wider historical, social and political issues attendant upon these processes, and the particular ideologies underpinning them. As Luke, McHoul and Mey observe, while maintaining a ‘veneer of scientific objectivity’ (something of great concern to early language planners), LP ‘tended to avoid directly addressing social and political matters within which language change, use and development, and indeed language planning itself, are embedded’ (1990, pp. 26–27.).

To take just one example: this presentist approach to LP did not question or critique the specific historical processes that had led to the hierarchizing of majority and minority languages, along with their speakers, in the first place. As we shall see, these processes are deeply imbricated with the politics of modern nationalism, and its emphasis on the establishment of national languages and public linguistic homogeneity as central, even essential, tenets of both modernization and Westernization (see, for example, May, *Language Education, Pluralism and Citizenship*, Volume 1; Branson and Miller, *National Sign Languages and Language Policies*, Volume 1). Consequently, the normative ascendancy of national languages was simply assumed, even championed, by early advocates of LP, and all other languages were compared in relation to them. As Bourdieu again observes of this process:

To speak of *the* language, without further specification, as linguists do, is tacitly to accept the *official* definition of the *official* language of a political unit. This language is the one which, within the territorial limits of that unit, imposes itself on the whole population as the only legitimate language . . . The official language is bound up with the state, both in its genesis and its social uses . . . this state language becomes the theoretical norm against which all linguistic practices are objectively measured. (Bourdieu, 1991, p. 45.; emphases in original)

As Jan Blommaert argues, this kind of approach to LP—or to sociolinguistics more generally—takes no account of human agency, political

intervention, power and authority in the formation of particular (national) language ideologies. Nor, by definition, is it able to identify the establishment and maintenance of majority and minority languages as a specific ‘form of practice, historically contingent and socially embedded’ (1999, p. 7.). In contrast, all the contributions to this volume highlight the importance of adopting a wider sociohistorical, sociocultural, socioeconomic and sociopolitical analysis of LP and/or language education. In particular, the contributions explore ongoing questions surrounding the status, use, and power of various languages or language varieties, along with the contexts in which they are situated. These contexts include a wide variety of local, national and transnational ones and, at least for English, a global context as well, given its current ascendancy as the world language, or *lingua mundi*.

This focus on the wider social, economic and political contexts of language policy and language education is consonant with recent research on the ideological influences of language policy (Blommaert, 1999; May, 2001, 2005; Patrick and Freeland, 2004; Ricento, 2006; Schiffman, 1996; Schmid, 2001; Woolard, 1998). It is also consonant with more critical, postmodernist conceptions of language (Makoni and Pennycook, 2007; Pennycook, 2001). As such, the contributions in this volume incorporate and address the very latest developments in language policy and education.

Section 1 focuses directly on contextual factors. James Tollefson begins the section with a summary of key developments in language policy and planning. Stephen May addresses the highly relevant, and still-often controversial challenge faced by many modern nation-states—how to accommodate cultural and linguistic diversity without prejudicing social cohesion. David Block discusses key trends and challenges in the current globalization of language(s), particularly English. Joan Kelly Hall explores the multiple connections between language and culture, while Aneta Pavlenko and Ingrid Piller examine the intersections of language and gender, particularly in multilingual contexts. These latter two contributions, along with Ben Rampton, Roxy Harris, James Collins and Jan Blommaert’s analysis of language and class, address directly questions of identity politics, as well as their material consequences. The material consequences of language policies, and language education, are also a principal concern of François Grin, who provides a timely analysis of language and economics. The final contribution in this section, by Bill Johnston and Cary Buzzelli, explores the moral dimensions of language education and some of the potential challenges and controversies therein.

A key concern that threads throughout this volume is given particular attention in Section 2. This section focuses on the importance of addressing, and where possible remedying, underlying, often highly

discriminatory processes that stigmatize and undermine minority languages and their speakers—not only linguistically, but also culturally, socially, economically and politically. Tove Skutnabb-Kangas examines how linguistic human rights for minority language speakers might ameliorate existing contexts of linguistic disadvantage and/or discrimination, arguing strongly for their further development in both national and supranational contexts. Fernand de Varennes discusses this issue also but in relation to wider developments in international law, outlining the history of minority rights protection schemes and the possibilities that recent changes offer for the further development of minority language rights, particularly at the supranational level. Teresa McCarty explores how the world's indigenous peoples have established a highly effective international movement over the last 40 years or so, aimed specifically at redressing the long colonial histories of minoritization and disadvantage they have faced. This has included a particular focus on the revitalization of indigenous languages and cultures, and the crucial role that education has come to play in this. Jan Branson and Donald Miller conclude this section by discussing the language rights of deaf communities around the world, with a particular focus on their long struggle for the recognition of sign languages.

Section 3 focuses on key theoretical and related pedagogical developments in the language education field. Alastair Pennycook provides an overview of the critical turn in sociolinguistics and language education, discussing the ongoing development of the still nascent field of critical applied linguistics. Hilary Janks explores the impact of such developments on language pedagogy and practice, particularly via the emergence of critical literacy approaches to teaching and learning, which highlight and deconstruct notions of power. Mary Kalantzis and Bill Cope examine these developments from another direction—the emergence of an educational approach focused on the promotion of multiliteracies. Multiliteracies include those new literacies needed in a digital age and in relation to new forms of work in an increasingly globalized world. The remaining three chapters in this section explore the implications of these various developments in critical language theory and practice in relation to particular fields of education. Suresh Canagarajah examines, and at times problematizes, the arena of second language education, particularly in relation to the increasingly global reach of English. Terrence Wiley discusses the field of teacher education and how neophyte teachers might be better equipped to address positively these new literacy demands and the increasing cultural and linguistic diversity of our student populations. Noeline Wright extends this analysis into schools themselves, exploring what schools require in order to change their literacy practices along these lines.

Section 4 completes this volume by providing a wide range of contributions that focus on the language policies and language education characteristics of particular regional or national contexts. While this section is inevitably selective, there has been a deliberate attempt to include more non-Western contexts—extending the range of contexts discussed and providing at least the beginnings of a more representative overview of such contexts. Links are also made throughout this section with the more general issues and concerns discussed in the previous sections. Robert Phillipson begins by analysing language policy developments at the European supranational level. Naz Rassool discusses language policy in Britain—including the often-overlooked areas of Scotland, Wales and Ireland. Thomas Ricento and Wayne Wright provide an overview of language debates in the USA, including the latest developments in the so-called English-Only movement. Enrique Hamel discusses Mexico and Juan Carlos Godenzzi the region of the Andes, with both authors highlighting the significance of indigenous language education initiatives within their respective regions, as well as the ongoing legacy of Spanish colonialism. Barbara Burnaby updates the language policy context in Canada, while Joseph Lo Bianco discusses recent developments in Australian language policy, most notably, with respect to the retrenchment of some of the key multicultural language policy initiatives of the 1980s. Kathleen Heugh provides an overview of the latest language policy and language education developments in South Africa, highlighting how the potential of the new, ostensibly multilingual, South African Constitution is being undermined by an increasingly de facto English-language education approach. Lachman Khubchandani examines the multiple challenges and opportunities for language policy and language education in multilingual India, while Tariq Rahman focuses on the similarly multilingual language context in Pakistan. Sachiyo Fujita-Round and John C. Maher discuss language policy in Japan, while Agnes Lam concludes this volume by examining the complexity of language policy and language education in Greater China.

All of the contributions to this volume acknowledge the centrality of the politics of language in discussions of language policy and language education. Such policies and educational practices are *always* situated in relation to wider issues of power, access, opportunity, inequality and, at times, discrimination and disadvantage. Returning to the quote by Bourdieu at the beginning of this introduction: language policy and language education are demonstrably not games ‘devoid of consequences’ which can be examined blithely by a synchronic or presentist approach. Rather, as these contributions hope to show, it is only when a diachronic, critical view is taken that we can begin to understand just what is at stake—socially, politically, economically and

linguistically—for all those affected by language policy and language education initiatives. As David Corson would have argued, such an understanding is also the only effective basis we have for changing such policies for the better.

Stephen May

## GENERAL EDITOR'S INTRODUCTION<sup>1</sup>

### ENCYCLOPEDIA OF LANGUAGE AND EDUCATION

This is one of ten volumes of the *Encyclopedia of Language and Education* published by Springer. The Encyclopedia bears testimony to the dynamism and evolution of the language and education field, as it confronts the ever-burgeoning and irrepressible linguistic diversity and ongoing pressures and expectations placed on education around the world.

The publication of this work charts the deepening and broadening of the field of language and education since the 1997 publication of the first Encyclopedia. It also confirms the vision of David Corson, general editor of the first edition, who hailed the international and interdisciplinary significance and cohesion of the field. These trademark characteristics are evident in every volume and chapter of the present Encyclopedia.

In the selection of topics and contributors, the Encyclopedia seeks to reflect the depth of disciplinary knowledge, breadth of interdisciplinary perspective, and diversity of sociogeographic experience in our field. Language socialization and language ecology have been added to the original eight volume topics, reflecting these growing emphases in language education theory, research, and practice, alongside the enduring emphases on language policy, literacies, discourse, language acquisition, bilingual education, knowledge about language, language testing, and research methods. Throughout all the volumes, there is greater inclusion of scholarly contributions from non-English speaking and non-Western parts of the world, providing truly global coverage of the issues in the field. Furthermore, we have sought to integrate these voices more fully into the whole, rather than as special cases or international perspectives in separate sections.

This interdisciplinary and internationalizing impetus has been immeasurably enhanced by the advice and support of the editorial advisory board members, several of whom served as volume editors in the Encyclopedia's first edition (designated here with\*), and all of whom I acknowledge here with gratitude: Neville Alexander (South Africa), Colin Baker (Wales), Marilda Cavalcanti (Brazil), Caroline Clapham\* (Britain),

---

<sup>1</sup> This introduction is based on, and takes inspiration from, David Corson's general editor's Introduction to the First Edition (Kluwer, 1997).

Bronwyn Davies\* (Australia), Viv Edwards\* (Britain), Frederick Erickson (USA), Joseph Lo Bianco (Australia), Luis Enrique Lopez (Bolivia and Peru), Allan Luke (Singapore and Australia), Tove Skutnabb-Kangas (Denmark), Bernard Spolsky (Israel), G. Richard Tucker\* (USA), Leo van Lier\* (USA), Terrence G. Wiley (USA), Ruth Wodak\* (Austria), and Ana Celia Zentella (USA).

In conceptualizing an encyclopedic approach to a field, there is always the challenge of the hierarchical structure of themes, topics, and subjects to be covered. In this *Encyclopedia of Language and Education*, the stated topics in each volume's table of contents are complemented by several cross-cutting thematic strands recurring across the volumes, including the classroom/pedagogic side of language and education; issues of identity in language and education; language ideology and education; computer technology and language education; and language rights in relation to education.

The volume editors' disciplinary and interdisciplinary academic interests and their international areas of expertise also reflect the depth and breadth of the language and education field. As principal volume editor for Volume 1, Stephen May brings academic interests in the sociology of language and language education policy, arising from his work in Britain, North America, and New Zealand. For Volume 2, Brian Street approaches language and education as social and cultural anthropologist and critical literacy theorist, drawing on his work in Iran, Britain, and around the world. For Volume 3, Marilyn Martin-Jones and Anne-Marie de Mejia bring combined perspectives as applied and educational linguists, working primarily in Britain and Latin America, respectively. For Volume 4, Nelleke Van Deusen-Scholl has academic interests in linguistics and sociolinguistics, and has worked primarily in the Netherlands and the USA. Jim Cummins, principal volume editor for Volume 5 of both the first and second editions of the *Encyclopedia*, has interests in the psychology of language, critical applied linguistics, and language policy, informed by his work in Canada, the USA, and internationally. For Volume 6, Jasone Cenoz has academic interests in applied linguistics and language acquisition, drawing from her work in the Basque Country, Spain, and Europe. Elana Shohamy, principal volume editor for Volume 7, approaches language and education as an applied linguist with interests in critical language policy, language testing and measurement, and her own work based primarily in Israel and the USA. For Volume 8, Patricia Duff has interests in applied linguistics and sociolinguistics, and has worked primarily in North America, East Asia, and Central Europe. Volume editors for Volume 9, Angela Creese and Peter Martin, draw on their academic interests in educational linguistics and linguistic ethnography, and their research in Britain and Southeast Asia. And for Volume 10, Kendall A. King has academic

interests in sociolinguistics and educational linguistics, with work in Ecuador, Sweden, and the USA. Francis Hult, editorial assistant for the Encyclopedia, has academic interests in educational and applied linguistics and educational language policy, and has worked in Sweden and the USA. Finally, as general editor, I have interests in anthropological linguistics, educational linguistics, and language policy, with work in Latin America, the USA, and internationally. Beyond our specific academic interests, all of us editors, and the contributors to the Encyclopedia, share a commitment to the practice and theory of education, critically informed by research and strategically directed toward addressing unsound or unjust language education policies and practices wherever they are found.

Each of the ten volumes presents core information and is international in scope, as well as diverse in the populations it covers. Each volume addresses a single subject area and provides 23–30 state-of-the-art chapters of the literature on that subject. Together, the chapters aim to comprehensively cover the subject. The volumes, edited by international experts in their respective topics, were designed and developed in close collaboration with the general editor of the Encyclopedia, who is a co-editor of each volume as well as general editor of the whole work.

Each chapter is written by one or more experts on the topic, consists of about 4,000 words of text, and generally follows a similar structure. A list of references to key works supplements the authoritative information that the chapters contains. Many contributors survey early developments, major contributions, work in progress, problems and difficulties, and future directions. The aim of the chapters, and of the Encyclopedia as a whole, is to give readers access to the international literature and research on the broad diversity of topics that make up the field.

The Encyclopedia is a necessary reference set for every university and college library in the world that serves a faculty or school of education. The encyclopedia aims to speak to a prospective readership that is multinational, and to do so as unambiguously as possible. Because each book-size volume deals with a discrete and important subject in language and education, these state-of-the-art volumes also offer highly authoritative course textbooks in the areas suggested by their titles.

The scholars contributing to the Encyclopedia hail from all continents of our globe and from 41 countries; they represent a great diversity of linguistic, cultural, and disciplinary traditions. For all that, what is most impressive about the contributions gathered here is the unity of purpose and outlook they express with regard to the central role of language as both vehicle and mediator of educational processes and to the need for continued and deepening research into the limits and possibilities that implies.

Nancy H. Hornberger

## INTRODUCTION TO VOLUME 2: LITERACY

This collection of articles is intended to be both Encyclopaedia and something more. The chapters represent an Encyclopaedic account of current knowledge in the literacy field, in the sense that they cover a broad range of topics and regions by the leading researchers in the field. But they also aim to provide something more in that they are also cutting edge considerations of the nature of the field and how new concepts and ideas are being applied in different contexts. And that itself is a break through in literacy studies, in the sense that traditionally research in literacy has tended to focus on narrower issues, such as the acquisition of skills by those lacking literacy—mostly children but also encompassing ‘illiterate’ adults—and the measurement and recording of these skill ‘levels’. Certainly national and international agencies have been concerned to address this category of people and to ‘improve’ their ‘literacy rates’ by enhancing methods of delivery, so requiring attention to pedagogy, curriculum and assessment. But recent research in the field has begun to step back from these assumptions and has asked ‘what is literacy?’ as a prior question to issues of delivery and learning. The answers to the question ‘what is literacy?’ have been sometimes surprising. It turns out that literacy means different things to different people across different periods of time and in different places. So the concern for those ‘lacking’ literacy has first to be located in time and space and the practical and policy responses will differ accordingly.

To address these prior questions, we have asked historians, anthropologists, linguists, and educationalists to review what we know about literacy across these spans of time and space and to explain to readers in accessible language how we can come to understand what literacy means in these different contexts and from these different perspectives. The result is not simple answers but further complexity. The in-depth, scholarly accounts provided here indicate just how literacy varies as authors consider what it has meant in past times, whether in Europe and the USA (*Harvey J. Graff and John Duffy*), in Africa (*Pippa Stein*) or in South America (*Kwesi K. Prah*) or across different social contexts, such as urban spaces in the UK (*Eve Gregory*) communities in Australia (*Trevor Cairney*) or Nepal (*Roshan Chitrakar and Bryan Maddox*) or Latin America (*Judy Kalman*). Or, to take another cut through the perspectives that scholars now bring to bear on literacy, some authors address what literacy means for children and parents in

South Africa (*Pippa Stein*) or the USA (*Vivian Gadsden, Kathy Schultz, and Glynda Hull*). And this perspective raise further conceptual points, as researchers consider the relationship between literacies in and out of school (*Jabari Mahiri; Kathy Schultz and Glynda Hull; David Bloome; Alan Rogers*) and also in higher education (*Mary Lea*).

Nor is it just a matter of educational contexts, whether for children or adults, that are at stake in reviewing what we know about literacy. What we take literacy to be, whose definitions count and have power in different societies, lie at the heart of all of these accounts—as *Arlette Ingram Willis* brings out in her accounts of Critical Race Theory and *Gemma Moss* in considering Gender and Literacy. The issue of definitions and of power is also evident in chapters on language and literacy by *Jim Cummins, Marcia Farr* and *Constant Leung* and how we frame these social issues associated with the definitions and meanings of literacy are put into broader context for us by *Peter Freebody* in a review of the literature on Critical Literacy and by *Viniti Vaish* on Biliteracy and Globalization. Still, this does not exhaust the range of topics we need to take into account in considering literacy in the contemporary age. Inevitably, we have to look at the place of literacy in broader communicative patterns, notably recent developments in ‘Literacy and Internet Technologies’, which are explored in a chapter by *Kevin Leander and Cynthia Lewis* whilst *Brian Street* attempts an overview of these developments in his ‘New Literacies, New Times’ piece. But at the same time, more familiar considerations regarding how literacy is acquired remain important for our understanding of the field and a number of papers do address reading as a significant dimension of literacy practices, notably *John Edwards* in his chapter ‘Reading: Attitudes, Interests, Practices’ and also those papers already signalled that deal with literacies in and out of school, such as those by *David Bloome* and by *Kathy Schultz and Glynda Hull*.

This summary, then, has in a sense come full circle, starting with reference to ‘traditional’ concerns with literacy as reading acquisition, moving through varieties of time and space, attending to social categories such as gender and race, taking on board recent sophisticated considerations of language and language varieties as they relate to literacy, noting the significance of new technologies and finally reminding ourselves of the role that education and learning must play in addressing these issues. And that is probably the major significance of what the authors in this volume have to tell us—that if we wish to address issues of policy and practice with regard to literacy, including how we learn to use it, then we will need to take account of various combinations of all of these other issues and the complexity they indicate even as we address any one context and set of practices. How these issues and topics combine will vary, as the authors show in demonstrating the different

literacies and policies and meanings to be found in Africa, Asia, the American continent and Europe and across different time spans. If that makes it harder for all of those involved—policy makers, educationalists and researchers—then that is the job of an Encyclopaedia such as this, to help us to come to such topics in the full light of what is known rather than acting out of partial knowledge.

Having indicated some of the key themes and issues, we now provide a brief summary of the 26 chapters included in this Volume, as a kind of map of the overall text. The first section of the volume is entitled ‘Literacies and Social Theory’ and attempts to provide the reader with some key theoretical frames and organising concepts before authors address more closely particular social institutions, in Section 2 and particular social and cultural experiences of literacy, in Section 3. The sections inevitably overlap but this organisation can provide one route through the volume for those who wish to move from the more theoretical to the more concrete and contextualised accounts of literacy. However, since the topic itself is literacy, we are acutely conscious that each reader will develop your own route through the text.

## SECTION 1: LITERACIES AND SOCIAL THEORY

The volume begins with a piece by the editor, who suggests his own map of the field of literacy studies and how it is learning to deal with what he terms ‘New Literacies, New Times’. He begins with an outline of the current theoretical frameworks, in particular work in New Literacy Studies, in multi-modality, and in theories of technology and artefact. He then considers some of the educational responses evident in different countries as they come to terms with the challenges posed by new literacies. Anticipating the end rather than the beginning of the Volume, he also makes some suggestions as to why it is that policy in some countries—notably the USA and UK—seems to be facing in the opposite direction to that which the research base tells us is needed. We begin to see possible answers to this question straight away in the recognition by *Arlette Willis*, writing about the USA, that literacy cannot be separated from social position, which for many is a racialised position. In addressing Critical Race (CRT) Theory she argues, firstly, that this topic is not limited to some sub categories of society, such as African Americans’ experience, or individual acts of prejudice. Rather, she suggests, activists and scholars have long believed that it is equally important to address epistemological and ideological racism along with psychological and emotional effects of racism situated in US social and political systems and institutions. And secondly, she argues that the acquisition and use of literacy can be seen as a key component of such epistemological and ideological positioning. To understand

the nexus of CRT and literacy, she reviews the genesis, definitions, basic concepts, and tenets of CRT from legal studies, followed by its evolution in educational and literacy research. Pointing, as all of the chapters do, to 'Future Directions', she suggests that work by Literacy scholars will envisage CRT's 'emancipatory and transformative positioning' so that knowledge of racial/cultural positioning will be effected through use of narratives and voice and that this in turn will offer a more adequate route to examine race, racism, and power in society. Literacy, in the sense of narrative and voice, calling upon autobiography, biography, parables, stories, *testimonio*, voice infusing humor, and allegory can expose hidden truths and explicate and situate race, racism, and power within the experiences of people of colour. This, then, is a broader and more 'social' and power laden view of literacy than many accounts simply of acquisition or of reading have allowed.

Moving to another continent, *Kwesi K. Prah* provides a scholarly and detailed summary of Language, Literacy and Knowledge Production in Africa, that likewise brings home the significance of power relations and of different epistemological and language based definitions in understanding literacy. Kwesi locates our view of literacy within the larger purview of language and provides a detailed account of the different languages known to exist in Africa and how they have been mapped by linguists. This is partly in contrast with earlier and perhaps still dominant perspectives that are uncertain what we really know about Africa—the 'uncertainty principle lingers,' as Prah suggests. Following this account we should be less uncertain both about the actual languages but also about their social roles and their relationship to literacy. For instance, Prah indicates the difference to be observed between the languages of the elites and the languages of the broad societal majorities. Education and literacy, in the dominant languages (and in English), have a significant role to play in both reinforcing and challenging this divide. The relationship between oral and written channels of communication and bases for knowledge may not be as clear cut as earlier scholars such as Goody suggested or as superficial views of Africa may suggest—indigenous knowledge, embedded in oral cultures, plays a significant role even as literacy spreads. Following a scholarly summary of the impact of outside scripts and the development of indigenous scripts in Africa in the past century, Prah argues that African development requires the spread of literacy in African languages.

Prah's historical account of literacy development in Africa is complemented by an analysis by *Harvey J. Graff* and *John Duffy* of the development of literacy in western societies. Building on Graff's earlier historical work they argue that our understanding of these developments is often better characterised as 'Literacy Myths' and, like Prah, they throw doubt on Goody's and others' hypotheses that 'the acquisition

of literacy is a necessary precursor to and invariably results in economic development, democratic practice, cognitive enhancement, and upward social mobility'. Problems of definition and measurement in particular have undermined such claims. Despite this, as they show, many public institutions continue to develop policy and practice based on this myth. In keeping with many of the chapters, for which theirs provides a key conceptual framing, they argue that the myth 'is not so much a falsehood but an expression of the ideology of those who sanction it and are invested in its outcomes'. Building on this social analysis, they document major elements of the myth over time—the myth of decline, and the myth of the alphabet—and then consider its role in current public policy. Like many authors in this volume they suggest that what research can tell us, in terms of educational implications, is that 'there are multiple paths to literacy learning'. They conclude that the reflections provided in this chapter 'offer a more complex narrative than that of the Literacy Myth. They may also point toward new and different ways of understanding, using, and benefiting from the broad and still developing potentials that literacy may offer individuals and societies'.

*Kevin Leander* and *Cynthia Lewis* bring these historically based arguments up to date in a chapter entitled 'Literacy and Internet Technologies'. In keeping with the other authors, Leander and Lewis recognise that such an account 'reveals as much about the current theoretical and ideological paradigms operating in any time period as it does about technology's relationship to literacy'. Nevertheless, we learn a great deal about contemporary technologies and their uses in literacy activity, such as interactive and networked computing media, and the use of a range of semiotic modalities beyond just print in order to make meaning, including sound, icons, graphics, and video. They are particularly interested in 'how networked technologies fundamentally change the relationships of literacy to social relations' and the chapter provides detailed examples of such practices in and out of school, including inevitable reference to blogs, video games, multimedia etc. Maintaining their focus, though, on the social contexts rather than just the technologies, they point to the location of technologies in fanfiction communities, in children's learning in and out of school, and in 'zones of mobility for underserved youth' and argue for multidisciplinary approaches to understanding such processes.

*Jim Cummins* has been one of the leading scholars in developing theory about language development in educational settings and in this chapter he addresses some of the criticisms that have been made of his work as it relates to literacy theory. He takes us through the distinction he developed, that has provided the basis for much work in education, between basic interpersonal communicative skills (BICS) and cognitive academic language proficiency (CALP). He discusses

its relationship to other theoretical constructs, and shows how it has evolved such as with regard to studies of power relations between teachers and students and with respect to theories of multiple literacies. With regard to critiques that his distinction locates him within an autonomous model of literacy, Cummins argues that there is no contradiction between his theoretical interests and those of New Literacy Studies but that the BICS/CALP distinction has been specifically located in educational settings where likewise different literacies may be operationalised: 'One can accept the perspective that literacies are multiple, contextually specific, and constantly evolving (as I do) while at the same time arguing that in certain discursive contexts it is useful to distinguish between conversational fluency and academic language proficiency'. This latter stance is developed later in the volume in the account of 'academic literacies' by Mary Lea and what the argument indicates is that the authors in this Volume, whilst strongly grounded in the scholarship of their field, are using their chapters to develop key arguments and debates, not just providing lists of previous knowledge. In that spirit he concludes by seeing future directions in the field being dependent on 'teachers, students, and researchers working together in instructional contexts collaboratively pushing (and documenting) the boundaries of language and literacy exploration'.

*John Edwards* picks up exactly this nexus of researchers and practitioners as the site for development of our understanding of that dimension of literacy concerned with 'Reading: Attitudes, Interests, Practices'. He argues for the importance of the social psychology of reading, that attends to the 'questions of what people read, how much they read, and the purposes and effects of their reading' and not just the technical decoding skills that continue to dominate the literature and to influence policy and educational design. In this vein, he argues that 'in many modern societies, *aliteracy* is as much an issue as functional literacy. It is certainly more compelling in a social-psychological sense, because the question here is why some of those who *can* read *don't* read'. He summarises the research literature that considers what and why people read rather than more narrowly their cognitive skills, using surveys such as the Roehampton Institute's study of children's reading habits in the UK. He addresses through such studies, issues of gender differences in reading, the difficulty of measurement and questions of content and preferences such as fiction and non fiction, citing also his own survey of children's reading habits that combined large respondent numbers with detailed assessment instruments. Despite a long record of such work, he still sees 'future directions' as needing to move beyond descriptive to more robust theoretical perspectives. One possibility here might be the marrying of the more 'technical' approaches with the more social ones evident in his work and that of others in the volume.

A number of the chapters reviewed so far indicate that understanding of the relationship between gender and literacy is crucial to such new social and theoretical approaches. *Gemma Moss* provides an incisive overview of work in this field, linking it especially to educational interests. She notes that interest in gender and literacy has recently shifted from concern for girls to current worries about boys' underachievement. She links this to the current dominance of performance-management cultures and their aim of securing maximum homogeneity in outcomes from education. Literacy plays a leading role in these debates but, as we have seen with other chapters, its definition is contingent on both specific contextual issues and broader policy frames, such as the concern for 'homogeneity' identified by Moss. Moss firstly summarises debates in the field, notably the two strands represented by feminist concern with content on the one hand and those more focussed on literacy learning on the other. By the 1990s it was boys' underperformance that became a centre of attention and she provides close summaries of different perspectives on this theme, addressing views of what needed to be 'fixed'. Her own position focuses on what she sees as the 'turn in analysis from what the curriculum says directly about gender to how the curriculum orders its knowledge base and regulates knowers' and she wonders whether this might be the best direction for committed researchers to turn. New regimes of accountability and managerialism, she suggests, may create new struggles for gender politics and the role of literacy may take on a different hue in this context than it did in earlier ones.

*Peter Freebody* addresses many of the themes raised so far, under the heading of 'Critical Literacy Education' for which he provides a sub heading that indicates the focus of the chapter: On Living with 'innocent language'. What he means by this is that 'Socialization entails, among other things, using language as if its relation to material and social realities were innocent and natural—transparently determinable, fixed, singular, and portable'. It is this critical reflection on language that provides a grounding for likewise critical perspectives on literacy, a link that occurs in a number of other chapters in this Volume (e.g. *Sichra, Leung, Farr*). The educational dimension of this, especially, involves the contest between training students to critically think and providing regulatory frameworks. He summarises early accounts of this contestation and its significance for literacy in both theory and practice and then describes a 'loose affiliation of theories' that have particularly focussed on literacy in education. He then identifies some of the problems currently facing critical theories generally, notably their particular expressions in different disciplines, and 'tussles between these disciplines for the ownership of the essence of the critical literacy education project'. He lists a set of questions that critical literacy theorists

will have to address and attempts to articulate in a succinct conclusion exactly what distinguishes the field:

“There is a positive thesis at the heart of critical literacy pedagogies, methodologies, and practices: Interpreting and producing texts is a way of rendering experience more understandable, of transforming experience through the productive application of epistemological, ideological, and textual resources, thereby re-visiting and re-understanding experience through active work on articulating the ‘stuff’ of experience and on re-articulating the experience of others”

An appropriate conclusion to the first Section of this Volume is provided by *Viniti Vaish* whose chapter ‘Biliteracy and Globalization’ brings together many of the themes raised, within the wider context of global movements. Building on Hornberger’s seminal work on bi-literacy, she asks telling questions about who meets around what texts in the new global flows. More precisely, she asks ‘What does a biliterate text in our globalizing world look like?’, a question addressed (as do others in this volume) to both in and out of school. As a way of addressing these questions, she provides data from two countries where she conducted research—India and Singapore. In ‘Early Developments’ she provides a helpful summary of theoretical work in globalisation and in the field of biliteracy and raises a number of themes that emerge from putting these areas together: ‘changing media of instruction in national school systems, new literacies required in the workplace, the threatened linguistic ecology of the globe, and finally biliterate textual practices influenced by the internet’. She concludes with a brief summary of some of the problems that work in these areas signals, notably what implications new texts and practices have for the bilingual classroom, a theme that complements the questions raised by Street in the opening chapter. Future directions will include studies of local workplaces and their relationship to global markets and what role schools play in providing the skills needed in these new contexts. Many of the chapters in subsequent sections of this volume address these issues from their own specific contexts and the theme of literacy, language and education runs throughout.

## SECTION 2: LITERACIES AND SOCIAL INSTITUTIONS

In this Section authors consider many of the issues raised above in the context of specific social institutions in which literacy practices are located. Given the importance of educational institutions for the overall theme of this volume, a number of the chapters address educational issues both inside and outside of the formal institutions with which literacy is usually associated. We begin with a paper on Informal

Learning and Literacy by *Alan Rogers* who points out that formal institutions tend to have dominated not only education for children but also that for adults. In contrast, he explores the learning of literacy by adults outside of the formal learning process. He first reviews some of the developments in our understanding of informal learning, discusses some new findings from research into adult literacy learning in developing societies, and suggests some applications of this to literacy learning programmes in the future. These proposals include a greater emphasis on task-related learning; cyclic rather than linear; collaborative learning rather than individual; real literacy activities and texts drawn from the literacy learners themselves rather than imposed from outside; critical reflection on both the literacy learning tasks and the contents of the teaching-learning materials; changed relationships of the teacher and learners.

*Constant Leung* brings together two aspects of literacy learning that have sometimes been kept too separate: Second Language learning and Academic Literacies. He points out that literacy learning has often been seen as a matter of moving to a second language, frequently English in formal educational contexts in many parts of the world. However, the ability to communicate informally for social purposes in a second language does not automatically translate into effective academic use, particularly in relation to reading and writing. Some of the requirements of academic literacy, as we saw in Cummins' piece and as Mary Lea also points out in her paper, may be specific to that context and not easily derived from more everyday social uses of a second language (L2). Drawing upon communicative approaches to language learning he concludes that we need to move beyond general abstractions and take account of the actual ways in which students and tutors do things with language in context, as a way to then facilitate the learning of academic literacy in context.

*Vivian Gadsden* brings together many of the themes raised by other authors under the heading of Family Literacy. She notes the shift in this as in other such topic areas within the overall field of literacy, from a more normative perspective focused on an autonomous model of literacy to a more analytic approach based on the notion of multiple literacies. In particular she cites the traditional deficit views that informed family literacy policy and shows how more recent research has looked more broadly at the cultural and social dimensions of learning and the contexts in which it occurs. Future work, then, is likely to address a more in depth focus on and analysis of culture, attention to gender and identity, and recognition of the different learning environments for families and their literacies. Understanding of variation and difference seems to be the underlying theme here, as in many of the chapters. Gadsden concludes by recognising just what a challenge this shift of agenda and perspective entails.

Gadsden's reference to gender here echoes that by Gemma Moss in Section 1, which provided an overview of the ways in which gender issues have been raised in the context of literacy learning. *Anna Robinson-Pant* now provides an application of some of these themes in the field of Literacy and Development. She reviews early programmes that focused on Women in Development (WiD) and charts the change to a Gender and Development (GAD) approach. Current work in feminist and 'ideological' approaches to literacy, informed by the New Literacy Studies challenges the dominant agenda evident in the programmes of development agencies. She concludes by noting the slow movement towards a rights perspective on literacy and argues that the growing popularity of qualitative research approaches within this area suggests that a gendered perspective on literacy and development may be more evident in the future.

Still working within the development context, *Roshan Chitrakar and Bryan Maddox* describe A Community Literacies Project in Nepal in which many of the principles raised by authors so far, including by Anna Robinson-Pant who also worked in Nepal, are worked through in practice. They begin with the principle enshrined in the programme that local meanings and uses of literacy should inform the design and implementation of adult literacy programmes, and that literacy programmes should respond, and be flexible to people's expressed needs. They describe how this principle was worked through in a number of sites in Nepal, and indicate the problems this raised in particular concerning the tensions between the articulation of 'local' meanings of literacy within the wider national and international discourses of development. Indeed this raises questions about any reified use of the term community, since 'local' communities are always shot through with national and international politics and institutional politics, a theme that again runs throughout the Volume and is picked up in the next chapter by *Trevor Cairney*. He looks at Community Literacy Practices and Education in Australia, using the local case to make broader points beyond, for instance, the focus on 'family literacy' that has tended to dominate government agendas. Cairney is especially interested to identify variation in literacy practices within the community and draws upon the home school literature cited by authors in Section 1. One such variation is to be seen in the changing nature of communication and growth in multimedia, of the kind signalled earlier by Leander and Lewis and by Street, whilst another range of community literacy practices is signalled by work in critical theory, of the kind summarised by Freebody who also works in Australia. Building on these insights, Cairney offers a review of the literature that encompasses, firstly, early foundational research efforts that explored community literacy practices as well as the relationship of this work to major theoretical traditions. Secondly

he summarises significant recent and current explorations that have acknowledged more complex definitions of literacy and community, with special consideration of work in Australia, including that on indigenous literacy. Finally he iterates the need to problematise the existing research literature in this area and map out possible future directions. These include again a recognition of how literacy varies across home, school and community contexts, and how these relate to other factors such as social disadvantage, gender, and language diversity.

*Mary Lea* moves from everyday community contexts to the role of literacy in higher education, applying many of the same theoretical and methodological principles as we have seen in other contexts. She explores the concept of Academic Literacies as a way of understanding student writing, which highlights the relationship between language and learning in higher education. She reviews early approaches that tended to see literacy as a unitary skill, looking at work in freshman composition in the USA and notes the shift there and elsewhere to a more social view of writing. Recent expansion of universities, in the UK amongst other countries, has led to concern there too for student writing and approaches from New Literacy Studies, notably the concept of 'academic literacies', have been added to the array of theoretical perspectives. Lea also notes the methodological issues involved here, as approaches shifted from simple 'measurement' of student attainment to new forms of data collection that are more qualitative and ethnographic. She locates current research in the larger context of globalisation and of changing media, of the kind already indicated by Leander and Lewis and by Vaish, amongst others. One new direction she indicates in these changing contexts is for researchers to pay more explicit attention to reading as part of writing, in both print based and virtual contexts and she suggests that this could be combined with research that addresses the lack of longitudinal ethnographic research in specific institutional settings.

Work on literacies in and out of school has already been signalled by a number of authors and *Kathy Schultz and Glynda Hull* look at research in this area in the USA, at the same time offering broader theoretical and practical frameworks for comparative work. They sketch the major theoretical traditions that have shaped research on the relationships and borders of literacy in- and out-of-school—the ethnography of communication, cultural historical activity theory, and the New Literacy Studies—and then introduce recent perspectives from cultural geography and semiotics. Their own previously published work has established a key benchmark for such approaches and they locate this in the longer history of approaches to literacy in both the in-school and the out-of-school traditions. They summarise the recent documentation of literacy practices across the boundaries of school and out-of-school

contexts, noting such specific examples as Chinese immigrant youth in the USA, and youth uses of digital technologies and blogging. They conclude by expecting and encouraging research on several fronts: ever changing conceptions of space, place, and borders; multiple identities; and inequality and social reproduction. Many of the chapters in this volume offer ways of addressing these aims in specific contexts, in and out of formal education.

*David Bloome* then brings us back to Literacies in the Classroom, but now seen from a broader and more methodologically sophisticated perspective than usually serves to pronounce on mandated policy in this area. Whilst recognising the role of ‘unofficial’ literacies, he focuses here on ‘official’ literacies. He summarises research on the nature of classroom literacy practices; on the relationship of literacy practices outside of the classroom (in home and community) to literacy practices in classrooms; and on the use of classroom literacy practices for schooling, academic literacies, critique, and community action, many of which have been addressed in other chapters in this volume. His particular concern is with such questions as what is going on in the literacy classroom and how can we research it? He notes recent interest in the cultural and the power dimensions of such activity and cites research that has facilitated students themselves to reflect upon their own community literacies, using ethnographic methods. Such work points towards a way of handling the problems of the next generation, how to conceptualise and to teach literacy in changing times. For instance, communities will variously choose to resist, to adapt themselves, to balance between the local and the global, to incorporate globalisation within their own economic, cultural, and linguistic frames, or some combination. Such choices will affect classroom literacy practices as such choices shift the epistemological content and the context of social relationships. We cannot, then, avoid making the links across contexts for literacy learning and use that tend to be ignored in research and policy that detaches school from its wider context.

### SECTION 3: LIVING LITERACIES—SOCIAL AND CULTURAL EXPERIENCE

In this section authors explore in greater depth the specific issues associated with literacy for people in different social and cultural environments, whether multilingual Chicago, post apartheid South Africa or South American communities. *Marcia Farr* opens the section with a classic linguistic survey of the city of Chicago and draws out the implications of such language variation for literacy uses and learning. An immediate link to the chapters we have been considering above is that she sees Chicago as a global city, closely linked to other places in the

world economically, culturally, and linguistically. Another is that she addresses the issue of identities in such a context, as linked to the ways of using language and literacy. She takes us through historical accounts of the language map of the city, looks at current demographics that show the linguistic and ethnic diversity and the associated variations in scripts and uses of literacy. Amidst these general surveys she also focuses upon specific examples that indicate the relationship between identities and literacies, noting how use of proverbs constructs people in a Mexican transnational social network and how Chinese migrants use traditional Chinese writing systems. There are many populations in Chicago not yet studied in these ways and the links across communities also remain to be researched. Farr's work provides a model of how such future research could be conducted.

In a similar vein, *Inge Sichra* documents Language Diversity and Indigenous Literacy in the Andes. In particular she provides a review of indigenous literacy in the Andes centering on Andean languages that have managed to survive Spanish language rule and maintain certain functional spaces in national societies and she puts such local language variety in the broader context of national policies and of research interests. Local languages have increasingly come to symbolise ethnic identity and she notes how in this context literacy acquires a driving role in the social participation of sectors traditionally marginalised by their societies. She reviews the literature from seventeenth century Spanish conquest through to current post-Freirean debates, educational reforms and indigenous publishing. One ironic problem is that amidst all of this challenge to central hegemony of Spanish, the language of the conquest is still seen as the model for standards and for education by many in government. Against this and building upon new research directions that are more sensitive to multiple literacies, she sees two directions for research in this field: On the one hand, understanding and promoting indigenous literacy must take as a point of departure the indigenous languages themselves and their characteristic orality. On the other hand, multiple, complementary modes of literacy (alphabetic, graphic, textile) must be taken into account.

*Jabari Mahiri* shows the limitations of depending upon the traditional view, in this case within cities in the USA, where surprisingly similar issues emerge to those signalled by Sichra and others for different contexts. He looks at Literacies in the Lives of Urban Youth and pays particular attention to What They Don't Learn in School. He sees the urban youth he is concerned with as living in the new digital age, the new times signalled by authors in Section 1 and his work, both in this chapter and more broadly published, can be read as a concrete working through of the implications of some of those ideas. Again he associates local literacies for such youth with broader links to global culture

that involve particular styles of music, language, dress, and other practices linked to hip-hop culture and that serve for core representations of meaning and identity. He takes us through shifts in literacy theory as researchers have attempted to come to terms with these changes and then focuses in on work that began to explore sociocultural contexts like transnational communities and the uses of new media. In doing so he draws upon ethnographic work amongst Mexican communities, Heath's accounts of communities in the Piedmont Carolinas, Gutiérrez's notion of 'third space' and the work of Richardson whose chapter in this volume on Hip Hop literacies nicely complements that by Mahiri. Indeed, his own current research is at the intersection of digital media and hip-hop culture and he cites others who are building up a rich pool of data in this field. A key direction, then, for future research on the literacy and learning of youth is the centrality of practices of meaning making and representation through musical texts and how their selection enacts narratives.

Shifting continents again, *Pippa Stein* takes us to urban and rural schools and out of school practices in South Africa, again pursuing many similar themes. Her particular question in the context of literacy and education is: what does it mean, in practice, to design a curriculum which works towards integrated understandings of South African identities, despite the diversity of races, cultures, languages, religions, and histories? To address this question she provides a selected overview of research projects in South Africa which investigate alternative ways of conceptualising literacy learning. For Stein, literacy is constructed as a multiple semiotic practice, in keeping with the frequent references by authors in the volume (Leander and Lewis, *Literacy and Internet Technologies*, Volume 2; Street, *New Literacies, New Times: Developments in Literacy Studies*, Volume 2, etc.). She summarises, firstly, work in post-colonial, cultural and historical studies that explores the relations between indigenous cultural and linguistic forms in Southern Africa, which were predominantly oral and performative in nature, and their interaction with western cultural forms and epistemologies, including literacy. She then looks at education policy initiated in the post apartheid era and its implications for literacy learning. Here significant research projects have been conducted in and out of school to address these changes and their implications in a multilingual and multiethnic context. Stein herself has been involved in the Wits Multi-literacies Project that has developed classroom-based pedagogies which are multimodal, multilingual and involve different kinds of 'crossings'. Pointing to future directions, she calls for not only a continuation of the research on out-of-school literacies that she has cited, but also for research into 'in' school literacies which has been neglected: it is time to look in much deeper ways into children's actual experience of

literacy learning across the curriculum (as Bloome, *Literacies in the Classroom*, does in Volume 2).

Switching continent again, *Judy Kalman* provides an overview of research into Literacies in Latin America. Complementing *Sichra's* account of Andean Literacies, Kalman likewise provides an overview of research traditions in the region known as Latin America and the Caribbean that includes not only the land mass stretching from Mexico to Argentina but also the small English, Spanish, and French speaking islands as well. Unlike many of the other regions mentioned in this volume, Latin America has high educational gender equality. Male and female enrolment is nearly equal and the difference between genders in adult literacy statistics is just 4%. However, indigenous peoples are more likely to be illiterate than other groups and, as with Andean literacies it is here in particular that research and policy are focusing. Kalman provides first an overview of the role of schooling in the region. With respect to literacy she notes that not all prehispanic languages were unwritten; in Mexico, for instance, writing developed around 600 B.C. and was passed on from one culture to another. In more recent times, the role of literacy has been located within national educational development programmes but research suggests that their attention to narrow technical features of acquisition was in practice offset by the importance of literacy classes as sites for socialisation. Again the broader view of literacy described by many authors in this volume points towards new understandings and indeed new data sets. There is now a small but growing body of research on literacy, schooling, and social practice in Latin America. Indeed, Kalman's own study from Mexico, documenting the dissemination of literacy in a semi urban township, recently won the UNESCO International Literacy Research Award. Ongoing discussions in Latin America and the Caribbean around the meanings of the term literacy and its representation in different languages and the recent UNESCO Global Monitoring Report have given more credence in policy circles to the notion of a 'literate environment' rather than simply individual skills and statistical accounts of 'literacy rates'. However, one direction for future research is to study literacy in indigenous communities which continues to be problematic and insufficiently understood. Like other authors, Kalman also notes that new literacies, including graffiti and murals and new technologies will become increasingly important in practice and therefore need to be taken into account in both educational policy and in research.

In the USA similar themes emerge as researchers look more closely at youth patterns of literacy use and their connections with other media of communication. *Elaine Richardson's* account of African-American Literacies complements both the kind of study indicated by Kalman for other continents and also the work on urban youth already signalled

in the chapter by Mahiri. Focusing on African American literacies involves looking at how cultural identities, social locations, and social practices influence ways that members of this discourse group make meaning. She takes us through sociocultural approaches to African American literacy education advanced by the various subfields: including sociolinguistics, rhetoric and composition, and New Literacies Studies. Early developments in African-American literacies, as Willis showed in her piece on Critical Race Theory, inevitably involved issues of race and prejudice as the Civil Rights and Black Liberation Movements of the 1950s and 1960s struggled for access to educational and other institutions for African American people. The work of academic researchers played a part here as it showed the validity and power of local dialects, a perspective that has only recently begun to also play a part in the definition and consideration of local literacies. In this vein, researchers have sought to develop literacy curricula using well-documented research on African American language and culture as the basis of instruction. Making visible language and literacy practices that appeared hidden has been a major role of researchers in both educational environments and policy more broadly. The achievement gap for African American children in formal education may, from this new research perspective, have to be explained in terms other than cognitive 'deficit'. Work in progress includes attention to youth identities, links to other semiotic practices: again the role of music, hip hop—on which Richardson has just written a significant book—and new media play a key role. Richardson concludes by noting the contribution of the work on African American literacies to broader comparative study of the kind indicated by the authors in this volume.

Finally, *Eve Gregory* brings us back to the theme of cities, focusing on London where she has conducted ethnographic research on community literacies over a long period but also, like Richardson and others, linking this local knowledge with the broader themes articulated throughout the volume. Cities, she suggests, are the home of many of the world's great libraries, and have traditionally been recognised as a hub of both literacy and illiteracy. She provides, then, a review of existing literature documenting the history and development of 'city literacies', translated into 'literacies in cities'. This is followed by a more detailed account of recent major contributions to the field and trends in research in progress with special reference to individuals growing up and becoming literate at the beginning and the end of the twentieth century in London, one of the largest and most ethnically diverse cities in the world. Looking at early developments in the study of city literacies, she goes back to Athens around 500 B.C., gradually bringing us up to date with accounts of Renaissance cities and then the industrial revolution with its associated class and educational issues. Throughout, the theme has been of cities as

both facilitating high levels of ‘cultural’ literacy and at the same time excluding a great many of their inhabitants. More recent debates have addressed inequality though largely in policy terms through surveys, tables indicating literacy rates and it is only now that the literacy lives of urban populations are being addressed in more qualitative and ethnographic terms. Gregory’s own work (with Williams) entitled ‘City Literacies’ represents one amongst a small number of key contributions to this growing field (along with that of the Lancaster group in the UK and of a UK organisation Research and Practice in Adult Literacy and the recent publication by the UNESCO Institute of Education (UIE) of studies in *Urban Literacy*—see Rogers, *Informal Learning and Literacy*, Volume 2). New directions she signals will have to include taking account of the literacies brought by the many migrants who now move into cities from rural areas, bringing with them literacy practices developed in their own communities and sometimes perhaps not acknowledged by educators and policy makers. Here, as in Far’s and others’ work, the issue of multi-lingual literacies will loom large, whilst in educational terms the key issue will be the ‘many pathways to literacy’ that such varied backgrounds involve, as well as new ways of addressing the relationship of literacies in and out of formal contexts. Finally new technologies may mean that libraries may no longer be the main repositories of information, giving way to new digital technologies which may be sited outside as well as within new urban contexts.

As with other papers and in keeping with the opening comments of this Introduction, we find that when we address a particular site of literacy practice—in this case urban literacy, but in others as we have seen it might embrace different continents and different time periods—we have to take into account a range of themes that until recently were considered extraneous to the study of literacy: gender, class, race; literacies in and out of school; language variety; new technologies and in particular their uses by youth; national policy and its relation to what ethnographic accounts tell us about actual uses and meanings of literacy on the ground. This volume, then, has pointed to such themes as key elements in future literacy research and practice.

## GENERAL EDITOR'S INTRODUCTION<sup>1</sup>

### ENCYCLOPEDIA OF LANGUAGE AND EDUCATION

This is one of ten volumes of the *Encyclopedia of Language and Education* published by Springer. The Encyclopedia bears testimony to the dynamism and evolution of the language and education field, as it confronts the ever-burgeoning and irrepressible linguistic diversity and ongoing pressures and expectations placed on education around the world.

The publication of this work charts the deepening and broadening of the field of language and education since the 1997 publication of the first Encyclopedia. It also confirms the vision of David Corson, general editor of the first edition, who hailed the international and interdisciplinary significance and cohesion of the field. These trademark characteristics are evident in every volume and chapter of the present Encyclopedia.

In the selection of topics and contributors, the Encyclopedia seeks to reflect the depth of disciplinary knowledge, breadth of interdisciplinary perspective, and diversity of sociogeographic experience in our field. Language socialization and language ecology have been added to the original eight volume topics, reflecting these growing emphases in language education theory, research, and practice, alongside the enduring emphases on language policy, literacies, discourse, language acquisition, bilingual education, knowledge about language, language testing, and research methods. Throughout all the volumes, there is greater inclusion of scholarly contributions from non-English speaking and non-Western parts of the world, providing truly global coverage of the issues in the field. Furthermore, we have sought to integrate these voices more fully into the whole, rather than as special cases or international perspectives in separate sections.

This interdisciplinary and internationalizing impetus has been immeasurably enhanced by the advice and support of the editorial advisory board members, several of whom served as volume editors in the Encyclopedia's first edition (designated here with\*), and all of whom I acknowledge here with gratitude: Neville Alexander (South Africa), Colin Baker (Wales), Marilda Cavalcanti (Brazil), Caroline Clapham\* (Britain),

---

<sup>1</sup> This introduction is based on, and takes inspiration from, David Corson's general editor's Introduction to the First Edition (Kluwer, 1997).

Bronwyn Davies\* (Australia), Viv Edwards\* (Britain), Frederick Erickson (USA), Joseph Lo Bianco (Australia), Luis Enrique Lopez (Bolivia and Peru), Allan Luke (Singapore and Australia), Tove Skutnabb-Kangas (Denmark), Bernard Spolsky (Israel), G. Richard Tucker\* (USA), Leo van Lier\* (USA), Terrence G. Wiley (USA), Ruth Wodak\* (Austria), and Ana Celia Zentella (USA).

In conceptualizing an encyclopedic approach to a field, there is always the challenge of the hierarchical structure of themes, topics, and subjects to be covered. In this *Encyclopedia of Language and Education*, the stated topics in each volume's table of contents are complemented by several cross-cutting thematic strands recurring across the volumes, including the classroom/pedagogic side of language and education; issues of identity in language and education; language ideology and education; computer technology and language education; and language rights in relation to education.

The volume editors' disciplinary and interdisciplinary academic interests and their international areas of expertise also reflect the depth and breadth of the language and education field. As principal volume editor for Volume 1, Stephen May brings academic interests in the sociology of language and language education policy, arising from his work in Britain, North America, and New Zealand. For Volume 2, Brian Street approaches language and education as social and cultural anthropologist and critical literacy theorist, drawing on his work in Iran, Britain, and around the world. For Volume 3, Marilyn Martin-Jones and Anne-Marie de Mejia bring combined perspectives as applied and educational linguists, working primarily in Britain and Latin America, respectively. For Volume 4, Nelleke Van Deusen-Scholl has academic interests in linguistics and sociolinguistics, and has worked primarily in the Netherlands and the USA. Jim Cummins, principal volume editor for Volume 5 of both the first and second editions of the *Encyclopedia*, has interests in the psychology of language, critical applied linguistics, and language policy, informed by his work in Canada, the USA, and internationally. For Volume 6, Jasone Cenoz has academic interests in applied linguistics and language acquisition, drawing from her work in the Basque Country, Spain, and Europe. Elana Shohamy, principal volume editor for Volume 7, approaches language and education as an applied linguist with interests in critical language policy, language testing and measurement, and her own work based primarily in Israel and the USA. For Volume 8, Patricia Duff has interests in applied linguistics and sociolinguistics, and has worked primarily in North America, East Asia, and Central Europe. Volume editors for Volume 9, Angela Creese and Peter Martin, draw on their academic interests in educational linguistics and linguistic ethnography, and their research in Britain and Southeast Asia. And for Volume 10, Kendall A. King has academic interests in sociolinguistics

and educational linguistics, with work in Ecuador, Sweden, and the USA. Francis Hult, editorial assistant for the Encyclopedia, has academic interests in educational and applied linguistics and educational language policy, and has worked in Sweden and the USA. Finally, as general editor, I have interests in anthropological linguistics, educational linguistics, and language policy, with work in Latin America, the USA, and internationally. Beyond our specific academic interests, all of us editors, and the contributors to the Encyclopedia, share a commitment to the practice and theory of education, critically informed by research and strategically directed toward addressing unsound or unjust language education policies and practices wherever they are found.

Each of the ten volumes presents core information and is international in scope, as well as diverse in the populations it covers. Each volume addresses a single subject area and provides 23–30 state-of-the-art chapters of the literature on that subject. Together, the chapters aim to comprehensively cover the subject. The volumes, edited by international experts in their respective topics, were designed and developed in close collaboration with the general editor of the Encyclopedia, who is a co-editor of each volume as well as general editor of the whole work.

Each chapter is written by one or more experts on the topic, consists of about 4,000 words of text, and generally follows a similar structure. A list of references to key works supplements the authoritative information that the chapter contains. Many contributors survey early developments, major contributions, work in progress, problems and difficulties, and future directions. The aim of the chapters, and of the Encyclopedia as a whole, is to give readers access to the international literature and research on the broad diversity of topics that make up the field.

The Encyclopedia is a necessary reference set for every university and college library in the world that serves a faculty or school of education. The encyclopedia aims to speak to a prospective readership that is multinational, and to do so as unambiguously as possible. Because each book-size volume deals with a discrete and important subject in language and education, these state-of-the-art volumes also offer highly authoritative course textbooks in the areas suggested by their titles.

The scholars contributing to the Encyclopedia hail from all continents of our globe and from 41 countries; they represent a great diversity of linguistic, cultural, and disciplinary traditions. For all that, what is most impressive about the contributions gathered here is the unity of purpose and outlook they express with regard to the central role of language as both vehicle and mediator of educational processes and to the need for continued and deepening research into the limits and possibilities that implies.

Nancy H. Honberger

INTRODUCTION TO VOLUME 3: DISCOURSE  
AND EDUCATION

This volume of the Encyclopaedia surveys the diverse and changing landscape of research on discourse and education. In order to capture the full sweep of this landscape, we have adopted the broadest definition of ‘discourse’, as embracing both the view of discourse as ‘talk-in-interaction’, commonly espoused in studies of classroom discourse, and the critical, post-structuralist view of discourse as ‘ways of understanding and constituting the social world’.

The first view of discourse has, of course, been influential in research on language in education, since the 1970s, and emerged as part of the broad interactional turn which took place as new fields of social science, such as ethnomethodology, conversation analysis, interactional sociolinguistics and micro-ethnography were being established. Within this tradition of work, the contexts for teaching and learning are not taken as given but as being constituted in and through everyday discourse practices and interactional routines and therefore continually open to change and negotiation. Meanings are seen as being situated, moment by moment, in the ongoing flow of talk-in-interaction.

The second view of discourse has been developed, more recently, by researchers concerned with the ways in which power relations are played out within educational institutions. In this body of work, the term ‘discourse’ is often used in the plural (e.g. official pedagogic discourses; school discourses; discourses about language). Discourses are seen as socially constitutive systems of meaning, which are embedded in particular social, institutional and historical contexts, and “as different ways of structuring areas of knowledge and social practice” (Fairclough, 1992, p. 3). They are also viewed as sources of power—the power to define boundaries and categories and to construct objects and social subjects.

Different chapters in the volume draw on, and sometimes combine, these two broad views of discourse in education. They do so in diverse and subtle ways and offer different means of conceptualising the relationship between ideological and interactional processes. The first section of the volume presents different theoretical and methodological perspectives on discourse, encompassing ethnomethodology, conversation analysis, genre theory, critical discourse analysis (CDA), post-structuralist approaches to discourse, recent theory-building around

the notion of 'voice' and practice-based approaches, focusing on language-in-use and on power relations, which have been developed within linguistic anthropology. Individual chapters in this section foreground the influence of different strands of social and anthropological theory, including the work of Bakhtin (1953/1986), Bernstein (1996), Bourdieu (1991), Foucault (1972), Hymes (1974), Silverstein (1992), Walkerdine (1990) and Wetherell (1998), offering diverse lenses through which to view the links between the everyday interactions that take place in schools and classrooms and wider social, cultural and ideological processes.

The second section focuses on the workings of discourse in local cultural and institutional contexts. Here, we see different approaches to the study of situated discourse practices, including the ethnography of communication, micro-ethnography, conversation analysis and discursive psychology. We also see the ways in which constructionist perspectives have been incorporated in these different strands of work on discourse in education. These chapters make reference to studies of spoken interaction in classrooms and in other educational settings (e.g. in school staff meetings about pupil welfare, as in the chapter by Eva Hjörne and Roger Säljö). Different authors have different foci: some provide accounts of discourse practices in routine educational encounters, detailing some of the ways in which these practices contribute to language socialisation, to the construction of teacher or learner identities (e.g. along the lines of class, ethnicity or gender) or to the construction of different categories of learners (e.g. 'slow readers', 'students with learning difficulties', or 'exceptionally gifted learners'). Identity is a recurring theme in this section. In some chapters, we see primacy given to the ways in which 'identities' are imposed from above, within prevailing social and institutional orders. And, in other chapters, the focus is on the negotiation of identities within local interactional orders.

The third section foregrounds the ways in which ideologies about language or linguistic diversity are constructed in language policies, in language planning processes and in national debates about language in the media. As Monica Heller points out in her chapter, research on the discursive processes involved in the choice and legitimisation of particular languages or language varieties as media of instruction provides key insights into one of the central sociological issues of our times, namely the role of education in social and cultural reproduction. Drawing on the work of Bourdieu (1977), she argues that education is a key site for defining what counts as 'legitimate language', that is, language and literacy practices which are considered to be 'good', 'normal', 'appropriate' or 'correct'. By exercising control over the value of linguistic resources in societal domains such as education,

dominant groups in society contribute to the regulation of access to other resources (such as knowledge or material goods). The authors in the chapters in this section provide different windows on the discursive processes involved in defining 'legitimate language'. These processes are uncovered through different levels of analysis: at the global or national level, at the level of local education or curriculum authorities or in local school and classroom contexts.

The fourth section deals with the role of disciplinary discourses and of everyday interactional practices in classrooms in the construction of knowledge and 'ways of knowing'. Here, there are contributions which focus on classroom talk and multimodal communication in different kinds of classrooms, in different kinds of classroom conversations with different participant structures (e.g. conversations between teachers and learners or among small groups of learners) and in different areas of the curriculum (e.g. in the teaching and learning of mathematics, science or language). Some authors (e.g. Elizabeth Birr Moje) are also concerned with the nature and significance of the interface between everyday funds of knowledge (from outside the classroom) and school discourses, and with identifying ways in which change-oriented third space for knowledge-building can be created.

#### THEMES RESONATING ACROSS THE VOLUME

Several themes resonate across these four sections and the chapters within them. We will touch on just three here. All three relate to different aspects of theory and method in research on discourse and education.

##### *Widening the Scope of Enquiry, Combining Approaches to Discourse*

Several authors in the volume propose ways of combining approaches to discourse so as to widen the scope of enquiry. Whilst rigour and fine-tuning of approach is achieved through specialisation within one particular empirical tradition, these authors take the view that significant insights can be achieved through interaction across research traditions.<sup>1</sup>

For example, Monica Heller argues for an approach to language choice which combines close analysis of the interactional order of schools and classrooms with social and historical analysis of the wider social and symbolic order, so as to explain why particular language choices in particular settings turn out to be the way they are. Harriet

---

<sup>1</sup> This is part of a more general trend already identified in a special issue of *Applied Linguistics* in 2002, focusing on approaches to the analysis of classroom discourse (see Rampton, Roberts and Harris, 2002).

Bjerrum Nielson and Bronwyn Davies suggest that different perspectives on discourse and gender in education, perspectives which emphasise gender structures, gender identity formations and gender positionings, need to be seen as complementary rather than as distinct and separate. They argue that it is by linking an account of the processes of “‘being’ gendered and ‘doing’ gender” that a full account can be given of the social and discursive processes involved in gender identity construction. Rebecca Rogers sees considerable scope for combining CDA with the critical ethnographic study of literacy, as developed within the New Literacy Studies tradition. She cites, in particular, the need for closer attention to multimodal literacies and to the uses of digital texts in schools and classrooms. Silvia Valencia Giraldo echoes this concern, drawing attention to the profoundly textually mediated nature of contemporary social life, in and out of classrooms.

A significant proportion of the authors in this volume (e.g. Judith Baxter, Jill Bourne, Grace Bunyi, Charlotte Haglund, Monica Heller, Carey Jewitt, Jasmine Luk Ching Man, Vally Lytra, Janet Maybin, Rani Rubdy and Silvia Valencia Giraldo) mention that they are concerned with identifying means of linking the analysis of macro-social structures and of the discursive processes at work in educational institutions (e.g. the categorisation and positioning of learners, the production and reproduction of ‘legitimate language’) with the close study of day-to-day discourse practices in classrooms. At the same time, they are mindful of the significance of human agency and they argue that the imposition of dominant discourses about identity, about language or about ways of knowing is always open to contestation and change.

Among these authors, there is considerable consensus about the need for close study of everyday interactional practices as an essential part of any research endeavour, while also aiming to link analyses of these practices to wider social and ideological processes. Methodologically, this is what Judith Baxter calls a ‘bottom-up’ and ‘top-down’ approach.

### *Linking the Study of Discourse with Ethnography*

A particularly salient theme in this volume is that of linking the study of discourse in education with ethnography. This theme has its origins in early work on the ethnography of communication and in the work of scholars such as Erickson (1986), Gumperz (1982) and Hymes (1974) who were concerned to ensure that the cultural context of discourse was not taken for granted and that the perspectives of participants in day-to-day conversations, in and out of classrooms, should be taken into account. However, since the 1970s, there has been considerable diversification within ethnographic studies of language and literacy in

education. Goals and methods have been conceptualised in different ways. This increasing diversity is reflected in the chapters of this volume.

Some authors suggest ways of linking research on discourse, in their particular area, with Hymes' original approach to the ethnography of communication. Jasmine Luk Ching Man stresses the value of this approach, in combination with other perspectives. Diana Boxer takes a similar stance, using the related term 'ethnography of speaking'.

Some authors note the contributions made to the study of discourse in education in particular strands of ethnography. Thus, for example, both Jasmine Luk Ching Man and Vally Lytra mention the work on micro-ethnography, developed by Erickson (1986), with its close focus on the interplay between verbal and non-verbal cues in speech events, in and out of classrooms. Junko Mori and Jane Zuengler suggest that ethnographic approaches can be particularly fruitful, when combined with conversational analysis, in the study of institutional discourse (although they do note that there is ongoing debate about this among conversation analysts).

Other authors give primacy to the link with sociolinguistics and to the project of combining micro-analysis of everyday discourse practices with the study of wider social and ideological processes. Jeff Bezemer and Sjaak Kroon use the term 'sociolinguistic ethnography'. This was first employed by Monica Heller (1999/2006) in her ethnographic work in French Canada and was then taken up again by Heller and Martin-Jones (2001) in an edited volume on discourse practices in multilingual schools and classrooms. Vally Lytra describes her current research collaboration with colleagues as being 'ethnographically informed sociolinguistics', echoing recent writing on this topic by Hornberger (1995). In looking ahead to future research on discourse practices and identities among urban youth, Charlotte Haglund argues that critical ethnography will be best suited to such work, since future researchers will need to take into account not only micro-level interactional practices and narratives, but also asymmetries of power at the macro-level, along with widening processes of socio-cultural transformation and change, such as globalisation and transnationalism.

There are also chapters in the volume that orient to two distinct strands of ethnographic research on language and literacy that have been developed in recent years, in the North American context (linguistic anthropology) and in the British context (linguistic ethnography). Over the last two decades, linguistic anthropologists in North America have become increasingly concerned with inequality and ideology in language, with the discursive construction of authority and with reflexivity in fieldwork and ethnographic writing. Stanton Wortham is located within this tradition and has brought particular insights into

the ways in which linguistic anthropology can be applied to research in educational settings (e.g. Wortham and Rymes, 2003). In his chapter in the volume, he outlines a linguistic anthropological approach to the discourse processes involved in the construction of social relations in educational settings.

Whilst North American linguistic anthropology is rooted within the Boasian tradition of cultural anthropology, British ethnographic writing on language and literacy has emerged primarily from the field of applied linguistics. Rampton et al. (2004) trace this genealogy, arguing that “UK researchers tended to develop their commitment to ethnography in the process of working from language, literacy and discourse outwards” (2004, p. 11). This recent work in linguistic ethnography, developed over the last decade, is mentioned in the chapters by Sheena Gardner and Aizan Yaacob and by Silvia Valencia Giraldo. It is also reflected (though not explicitly mentioned) in the chapter by Janet Maybin, a British researcher who has been a key contributor to the development of this particular strand of ethnographic research on language, literacy and discourse.

### *Dealing with the Changing Nature of Contemporary Patterns of Communication*

A third theme that cuts across the chapters in the volume is that of meeting the challenge of dealing with the rapidly changing nature of contemporary patterns of communication. We are witnessing far-reaching changes in forms of representation due to the advent of new technologies. In anticipating future directions in research on discourse, a substantial number of the authors in the volume draw attention to the challenge posed to theory and method by the increasingly multimodal nature of contemporary communication.

Frances Christie makes explicit reference to the new text types and genres emerging in this new media age and notes that we need to further refine theory-building around the notion of ‘genre’. She says that: “the contemporary multimodal world will require much more sophisticated tools for analysis to explain the meanings of texts in which verbal, visual and diagrammatic resources . . . all operate”. Jeff Bezemer and Sjaak Kroon draw attention to the methodological challenges posed by the increasing multimodality of educational practice. Their particular focus is on research on discourses about national standard languages. They note that: “recent classroom studies show that discourses on standard language teaching are indeed realised not only through speech, but also, and often primarily, through image, gesture, wall displays, and other worlds of representation and communication”. Carey Jewitt reviews some of the ways in which the challenges of

multimodality are being addressed in classroom-based research, focusing on different areas of the curriculum, such as language and science.

Jill Bourne points to the opportunities opened up by the changing nature of contemporary modes of representation and communication and, in particular, by the shift away from uni-directional to multi-directional communication, from a central 'message producer' aiming at a mass audience to multiple 'message producers' involved in more complex, and more egalitarian, communicative exchanges. As she puts it: "this shift offers space for a transformative remaking of pedagogic discourse". However, she also acknowledges the need to remain wary of 'management interests' in exploring the potential of hypertextual links. This concern is echoed in Rebecca Rogers' recommendations regarding the future directions of critical research on multimodal discourse. She warns of the dangers inherent in globalised flows, particularly in the circulation and commodification of educational software and calls for the development of critical approaches to 'network effects', on and off-line.

#### THE INDIVIDUAL CONTRIBUTIONS TO THIS VOLUME

Many of the contributions to this volume come from scholars who have led the way in developing particular approaches to empirical work and/or theory-building. The volume also provides international coverage of research on discourse in education. Our intention, as editors, was to build on the ground established by Bronwyn Davies, the editor of the volume on *Oral Discourse*, in the first edition of the Encyclopaedia and to chart new directions opened up over the last decade, extending and deepening our understanding of discursive processes in education.

##### *Section 1. Discourse in Education: Theory and Method*

Judith Green and Carol Dixon focus on the nature of the relationship between classroom interaction and situated learning. They approach this topic by tracing the distinct intellectual traditions within which the study of these two dimensions of classroom life have been developed, by drawing attention to the key theoretical and disciplinary perspectives that have been incorporated into these traditions and, then, by showing how greater convergence has been achieved in research on classroom interaction and learning as a result of the emergence of new ways of theorising learning as a situated process.

Junko Mori and Jane Zuengler chart the contribution of conversation analysis to our understanding of the dynamics of talk-in-interaction in classrooms and the interactional processes involved in construction of

local social orders. They discuss current controversies concerning the adequacy of this type of analysis for the investigation of classroom interaction and they consider whether other theoretical or methodological approaches, such as CDA, ethnography or socio-cultural perspectives, should be combined with conversational analysis with a view to developing deeper insights into classroom discourse.

The chapter by Frances Christie provides a detailed account of the development and application of the notion of ‘genre’ in three areas of educational linguistics: in systemic functional linguistics (SFL), in English for Special Purposes (ESP) and in the New Rhetoric Studies. Christie also weighs up the different points of view in the intense debates that have taken place in the field of genre studies. Then, in the final section of her chapter, there is a discussion of the particular challenges facing researchers in this field, notably that of developing an adequate account of multimodality.

Jill Bourne examines, in detail, a key concept from the later work of Basil Bernstein—the concept of “official pedagogic discourse” (Bernstein, 1996)—and shows that it provides a means of theorising the link between macro-social structures, institutional processes of categorisation and the micro-interactional practices of classroom life. She also traces the ways in which pedagogic discourse and models of pedagogy have been played out in multilingual contexts. Taking the UK as an example, she shows that not only have different models of pedagogy been ushered in with shifts in educational policy over time but, also, that particular models have predominated in the organisation of educational provision for different categories of student (e.g. students learning English as an additional language vs. monolingual English speakers).

Rebecca Rogers examines some of the ways in which CDA has been applied to the interpretation and analysis of issues related language and literacy education. She begins by tracing different strands of CDA, foregrounding commonalities across strands, and then shows how new avenues of investigation are being explored in contemporary research. She focuses, in particular, on research which links CDA and social action, on research where CDA is used to uncover different ways in which social identities are represented and research which reveals the ways in which ideologies are constructed in written texts.

Judith Baxter describes recent empirical work and theory-building in a related field: that of post-structuralist discourse analysis (PDA). Researchers in this field share, with critical discourse analysts, a concern with developing means of conducting bottom-up *and* top-down analyses of discourse in educational settings. As Baxter demonstrates, the development of PDA has been shaped by influences from research on language and gender, so it foregrounds the multifaceted nature of

subjectivity. It also explores the ways in which participants in classroom conversations can be positioned, as either powerful or powerless, by different discourses. The chapter provides an account of intersecting influences in the development of PDA, starting out from positioning theory (Davies and Harré, 1990), early work by sociologists such as Valerie Walkerdine (1990) on the construction of gendered identities and more recent work in discursive psychology which draws together post-structuralist and conversation analytic approaches to discourse (e.g. Wetherell, 1998).

Janet Maybin interrogates Bakhtin's notions of 'voice' and 'revoicing' and considers the ways in which they have been employed in different kinds of educational research: research which draws primarily on socio-cultural theory relating to learning and socialisation, and research which focuses on the linguistic features of recontextualised discourse and the links between these features and wider social practices. She also provides examples of recent research on revoicing in both spoken and written discourse. This includes research with students in different age groups and in different social and cultural contexts: for example, research on young children's appropriation of fragments of texts from popular culture in their own writing; research on revoicing in the informal talk of 10–12-year-old children (Maybin's own research); studies of 'language crossing' among adolescents as part of everyday talk and social activity (i.e. the use of words and phrases from languages not associated with the speakers' cultural inheritance) and research on the use of different sources in academic writing by university students. In contemplating the significance of this strand of research, Maybin stresses that students' revoicing practices constitute important strategies for exploring new kinds of knowledge, new relationships and identities and suggests that closer attention could be paid to their practices in studies of the daily cycles of life in and out of classrooms.

Stanton Wortham locates his approach to language use in education within the North American tradition of linguistic anthropology. The concepts that are central to his approach are 'signs' (e.g. language forms), 'sign use' and 'contextualisation', 'ideologies of language' and 'domains'. 'Domains' are defined as "the set of people who recognize the indexical link between a type of sign and the relevant ideology". This broad conceptual framework makes it possible to capture some of the complexity of the semiotic processes at work in educational settings and to show how signs come to have both referential and relational meaning in different kinds of educational encounters. Wortham stresses, in particular, the value of the concept of 'language ideology' in building an account of the relationship between signs in use, ideologies which circulate across space and time and wider social structures and he reminds us that educational institutions are key sites

for the legitimisation of the ideological links between types of speakers and types of sign use.

### *Section 2. Educational Discourses, Situated Practices and Identities*

In the first chapter in this section, Patricia Duff provides an overview of ethnographic research examining language socialisation, participation and identity, with particular reference to the North American tradition. She shows us how ethnographic research on educational discourse has provided insights into how students learn to engage with the 'legitimate' oral and written discourse practices associated with different areas of the curriculum and, in particular, how, in the daily rounds of classroom life, they negotiate the routine questions, responses and evaluative practices of their teachers and peers. Throughout the chapter, she emphasises the need to see these processes of negotiation and engagement as part of a broader process of language socialisation taking place through participation in different learning communities.

Jasmine Luk Ching Man examines the intricate relationship between identity and contextualised use of language in the classroom and traces the ways in which this relationship has been explored in different traditions of research. She also provides a useful overview of different perspectives on identity, mapping the shift away from essentialist notions of identity towards the more dynamic and fluid conceptualisations adopted in recent work embracing social constructionist and post-structuralist viewpoints. She maintains that these recent perspectives on identity enable us to gain deeper insights into the ways in which teachers' and students' identities are negotiated, moment by moment, within the ebb and flow of classroom talk.

Eva Hjörne and Roger Säljö focus on discourse practices outside of the classroom. They draw on data from their own research in Sweden on 'pupil welfare meetings' conducted by multi-professional teams for example, school staff, school psychologists and social workers. This illuminating data are used to demonstrate how particular learners are categorised, in the talk exchanged at such meetings, as having 'learning difficulties'. Hjörne and Säljö show that categories are defined in vague, ambiguous and negative ways and that there is considerable consensus among participants in these meetings. They also show that the learners' difficulties are represented as traits located in individuals rather than being shaped in any way by the learning environment. The discussion of the data from the Swedish context is embedded in a wider account of research on the discursive processes involved in categorisation, focusing in particular on research in institutional contexts. The authors conclude by considering the implications of such research in the context of the growing trend, in different public

education systems, towards organising special education provision, outside the mainstream, for learners identified as having ‘special needs’.

In the next chapter, Grace Bunyi begins by tracing the social and historical processes involved in the construction of elites in Kenya via the introduction of western type education and the use of English as a medium of instruction by missionaries in the eighteenth century. Using ethnographic evidence from contemporary research, she then shows how social hierarchy continues to be produced and reproduced through school policies and classroom discourse practices and through the expansion of English-medium private education. She draws attention, in particular, to the differences that have been identified between the routine interactions between teachers and learners in elite schools and those in non-elite schools, often in rural areas, and she considers the implications of these differences for learners of non-elite backgrounds. The issues addressed in this chapter regarding school language policy and classroom discourse practices resonate clearly with the findings of research in other African countries (e.g. see Heller and Martin-Jones, 2001).

Harriet Bjerrum Nielsen and Bronwyn Davies elaborate in detail on research that has investigated the complex relations between usual patterns of talk in classrooms and the formation of gendered identities. They show that early qualitative research revealed that the apparent success of strategies aimed at ‘gender neutrality’ was illusory and that gender inequality resulted from differential treatment and double standards in the classroom. They then chart a shift in research focus, from the 1980s onwards, towards an emphasis on the active role that learners play in constructing gendered social worlds and in responding to gendered discourses. They note that, in this body of research, classroom discourse practices were seen as embedded within a broader cultural context and within wider social processes of gender identity formation. In the final part of their chapter, they consider research that incorporated social constructionist and post-structuralist perspectives, from the 1990s onwards. They demonstrate how this most recent body of research has challenged the representation of gender in binary terms and has reconceptualised identity in a more dynamic and processual way.

Charlotte Haglund approaches the question of identity through the lens of ethnicity. She builds her chapter around ethnographic research that she has carried out recently, in Sweden, with young people of migrant origin (primarily Turkish and Kurdish) in a multi-ethnic neighbourhood. She gives an account of some of the ways in which the identifications and allegiances of these young people were played out in everyday encounters in school and community contexts. She also

draws attention to the resonances between the discourse practices she observed in these contexts and the findings of other studies in other cities which have become hubs for migration. Charlotte's account of her study in Sweden is embedded in a penetrating discussion of the wider research context. She reviews studies that have considerably advanced our understanding of how 'new ethnicities of the margins' are being constructed and what the social and cultural consequences of these processes might be. She also considers the theoretical and methodological challenges facing researchers who wish to probe the relationship between everyday social and cultural practices (including discourse practices) and the wider socio-historical and economic conditions of the late modern age.

Vally Lytra focuses on learners' active role in the construction of identities in schools and classrooms and on the semiotic resources and discourse strategies they draw on in 'doing' identity work. Here, the starting point is with Janet Maybin's (2006) observation that research on classroom discourse has tended to adopt an 'educational gaze', focusing on curriculum-oriented talk, often involving teacher-learner interaction. Vally Lytra argues for more focus on 'off-task' talk in school corridors, playgrounds and canteens. The term 'playful talk' is used, in this chapter, as a general analytic category that includes ritualised verbal activities, such as teasing, and other more fleeting verbal activities, like chanting, humour, joking, making inter-textual references to popular culture, parody, singing, verbal play. With reference to a number of studies, including her own study in Greece, Vally Lytra argues for adopting playtalk as a lens on the processes of identification. She also points out that focusing on playtalk provides an important means of uncovering some of the heterogeneity of voices, genres, practices and discourses in school and classroom life, and of exploring the ways in which these resources are drawn upon in identification processes.

### *Section 3. Discourses about Language and Linguistic Diversity*

The starting point for Monica Heller's chapter is with the key question of how schooling contributes to the reproduction of existing social hierarchies. Drawing on the early work of Bourdieu (1977), she argues that language is central to social and cultural reproduction and to the ways in which the symbolic domination of the privileged classes in society is achieved. She then makes the case for research which draws together the strengths of the interpretive tradition within sociolinguistics and the perspectives on symbolic domination and social and cultural reproduction offered within French social theory. This approach is proposed as a means of going beyond earlier debates about how to account for

different patterns of school achievement among children of different backgrounds, from different social classes and from different minority ethnic groups. The second section of her chapter provides a valuable overview of three main ways in which differential patterns of achievement have been conceptualised. The third section considers and exemplifies some of the directions taken in research which seeks to identify the linkages between the interactional order of schools and classrooms and the wider social and institutional order. Monica Heller emphasises that this is still work in progress and that these linkages still need to be more fully understood. She anticipates that a deepening of our understanding is likely to come from research that combines close analysis of interaction with institutional ethnography and socio-historical analysis. She also calls for moves towards comparison across socially and historically situated cases, so as to gain insights into the impact of wider processes of change, such as globalisation.

Rani Rubdy focuses on one particular field of research in sociolinguistics, namely that of the study of language planning and policy. She shows that, since the 1990s, there has been a significant shift in the discourses about language planning and policy processes within this field: this was a shift from discourses about modernity and about the 'neutrality' of top-down planning to a discourse about the central role of language and ideologies of language in social and cultural change and about the ways in which asymmetries of power are constructed through language policy-making. The second section of her chapter considers the themes emerging in this new critical, post-modernist body of research on language planning processes. The third section examines the issues that have been opened up through the extension of research on language policy-making from the countries of the South to the countries of the North (e.g. those in North America and in Europe). These include issues related to bilingual education, to English-only policies and to the impact of globalisation. In the concluding pages of her chapter, Rubdy draws attention to the increasing interest among language policy and planning scholars in developing an understanding of the role of human agency in language change processes and, specifically, in ways of developing critical perspectives on the link between ecology, ideology and agency.

Jeff Bezemer and Sjaak Kroon focus on the teaching of national standard languages in multicultural urban contexts in Europe, taking particular account of the ways in which teachers' practical knowledge and monolingual bias is reflected in the discourses they produce in classrooms and in interviews. The chapter draws on extensive empirical work carried out as part of a European research project (IMEN—International Mother Tongue Education Network). The authors draw attention to the ideological processes of attribution and legitimisation

at work in the teaching of the so-called ‘mother tongues’ of European nations and they remind us that the teaching of national standard languages has, since the nineteenth century, been seen as a key part of the process of cultivating future citizens and defining national culture.

Ann Williams focuses on one particular standard language, standard British English, and on the changing discourses about it in educational policy and practice in England. She traces the ideological processes which led to standard British English being seen as the main code of authority and distinction in England and she examines, in detail, the consequences of the rise of standard English for speakers of other varieties of English, particularly in the context of education. Her account is illustrated with reference to transcripts of classroom conversations and to interviews with teachers in different regions of England. From the detail about language policy and practice in her chapter, we see how ideologies of language become embedded in a particular social and historical context and what is at stake for speakers of different language varieties. There are clear resonances here with the ideological processes at work in other national contexts (e.g. those described by Jeff Bezemer and Sjaak Kroon).

#### *Section 4. Discourse and the Construction of Knowledge*

Frank Hardman’s chapter opens the section on the role of discourse in the construction of knowledge. It surveys the ways in which researchers working within a broadly social constructionist view of learning have investigated classroom discourse. It also traces the roots of this approach to learning in the work of scholars such as Bruner (1996) and Vygotsky (1992). And, in addition, it considers different types of educational intervention which have drawn inspiration from constructionist thinking about learning. Frank Hardman interrogates the findings of different studies of teacher–student interaction, including studies of whole class and small group settings and studies of small group interaction between students. He also outlines some of the debates that have centred on research topics such as teachers’ questions, teacher evaluations, the link between teachers’ theories of learning and the patterns of talk in their classes and, most recently, the concept of ‘dialogic talk’. His concluding sections focus on ongoing research which draws attention to the persistence of teacher-led recitation routines and on the implications of such findings, especially for teacher education.

Silvia Valencia Giraldo’s chapter draws our attention to the significance of texts in day-to-day classroom routines and in meaning-making in different kinds of classroom encounter. She defines the notion of ‘text’ in the broadest sense, including students’ handwritten notes and

electronic texts, as well as school textbooks and other printed materials (e.g. occasional handouts) used in teaching and learning. The chapter reviews a selection of studies which have investigated the uses of texts and talk around text in different kinds of classrooms, in monolingual and multilingual settings, and shows how pedagogy is enabled and constrained by different kinds of textual practices. We see the importance of taking account of the textual dimensions of classroom life and we also see how micro-analysis of talk around texts in classrooms can provide a window on wider processes of social and cultural change, such as globalisation.

Susan Lyle opens a window for us on research that has focused on collaborative talk between learners. She shows how this research is ground in 'hybrid' fields of study, such as cultural psychology, socio-cultural studies and discursive psychology and she provides details of early ground-breaking work. She then identifies some of the directions that have been taken in the empirical work conducted within these fields of study. These include explorations of the link between collaborative talk and the development of learners' thinking skills; the contribution of collaborative talk to second language learning; the role of narrative and playful talk in building understanding in group work and the role of teachers in planning opportunities for collaborative talk. The chapter concludes with an expression of concern about the ways in which the demands of national curricula and a shift back towards whole class teaching constrains teachers committed to encouraging dialogue and collaboration between learners.

Sheena Gardner and Aizan Yaacob provide an account of studies that have focused on sociodramatic play in early childhood and on the ways in which these studies, in early years education and in home and community contexts, have enhanced our understanding of role play and dialogue in child development. They begin with the interdisciplinary work of the 1970s that first established the link between sociodramatic play and the language and literacy development of pre-school children. They then outline different strands of research on role play and dialogue that have been developed since then. This includes experimental research, involving role play in educational interventions and research of an interpretive, ethnographic nature that explores role play in natural settings, at school and at home. In the former strand of research, the concern is with the links between sociodramatic play and cognition. In the latter strand, the research aims to reveal the spontaneous ways in which children incorporate other voices, genres, texts and languages into their play. Sheena Gardner and Aizan Yaacob also review recent studies which focus on different contextual variables, such as the resources available for sociodramatic play, the role of adults, negotiation of play involving blind and sighted children and

the availability of different channels of communication (e.g. pretence play using the telephone). In concluding, they allude to the fact that, despite this rich vein of research demonstrating the value of play, the early years curriculum in different countries is increasingly being organised in ways which close off opportunities for play.

Diana Boxer presents a detailed and probing analysis of the ways in which research on second language acquisition (SLA) has advanced through the incorporation of insights from discourse analysis and, specifically, conversation analysis. She begins by reviewing studies in the 1970s that laid the groundwork for the turn towards discourse in some strands of SLA research. She then surveys three main ways in which SLA research has been extended, in recent years, to take account of learners' points of view and learners' contributions to conversations, in and out of classrooms. These include approaches that foreground language identity or language socialisation and those which are based on social-cultural theory. She gives examples of recent empirical work to illustrate the different themes that have been addressed at the interface between discourse and language learning. She then outlines the different positions taken in recent debates about the nature and significance of the insights that accrue from the application of conversation analysis in SLA research. Diana Boxer's final section calls for further extension of research on spontaneous use of language in both interactional and transactional contexts with a view to developing a baseline for SLA research and practice.

Richard Barwell directs our attention to research that has investigated the use of language in the teaching and learning of mathematics. He starts out from seminal work on mathematical registers and shows how this laid the foundations for later discourse-oriented research. He then gives us a clear overview of three different areas of research on the role of discourse in mathematics education. He covers studies which incorporate different perspectives from social theory, including sociological, socio-cultural, social semiotic and post-structuralist perspectives and he demonstrates how this empirical work has advanced understanding of the conventions of mathematics classroom talk (including talk around texts) and of the role of teachers in the socialisation of learners into local conventions. In his conclusion, Richard Barwell anticipates that the increasing multilingualism of the mathematics classrooms of the future will pose challenges and create opportunities for future research.

Gregory Kelly opens a window for us on the world of research on discursive practices in the teaching and learning of science. He charts the shift from research that focused on individuals acquiring 'final form scientific knowledge' to research that focuses on the social interactions that contribute to knowledge-building about the natural world and that

enable or constrain learner participation in science classrooms. He begins with reference to the seminal work of Jay Lemke (1990) who opened up the possibility of researching the day-to-day discursive practices of science learning, by introducing a social semiotic perspective on classroom discourse. Then, in the central sections of the chapter, Kelly examines some of the insights gleaned from contemporary research on scientific discourse (e.g. the discourse of published articles) and research on discourse in science education. These include insights into the diverse nature of science discourse, the uses of analogy, metaphor and argumentation in the teaching and learning of the sciences, the socio-cultural dimensions of learning science in small group work, the uses of written texts in science classes and the role of teacher education in raising awareness of the discourse practices of science teaching and learning. He then identifies four directions in which research on the discourse practices of science learning is moving. These relate to access and equity in science, the practical sense-making and knowledge-building that takes place in the daily routines of school science, the application of activity theory to the study of situated learning in science classrooms and research taking on the theoretical and methodological challenges posed by multimedia literacy and talk about different kinds of texts, artefacts and electronic resources in science classrooms.

In her chapter, Elizabeth Birr Moje explores the interface between research that has documented the funds of knowledge, networks and ways of knowing associated with students' lives outside school and research on school discourses. School discourses include ways of talking, reading and writing historically associated with different disciplines *and* the discourse practices associated with the teaching and learning of different subjects in the school curriculum. Taking examples from school-based instruction in science and in history, Elizabeth Birr Moje shows how practices vary across subjects, in the type of evidence used to provide warrants for claims and in the types of texts that are produced. Her main concern is with identifying ways in which teachers can provide students with practice in recognising the different school discourses that they encounter and, at the same time, engage them in discussion about those discourses. The goal of such discussions, she argues, should be to raise students' awareness of the privileged nature of different school discourses and to develop a metadiscursive approach, that is, not only to get students to engage with different discourse communities but also to know how and why they are engaging and what these engagements mean for them in terms of social positioning and power relations. Her vision for metadiscursive pedagogy is that it can be a means of creating change-oriented third space for learners at different stages of their school experience.

The final chapter of the volume looks to the past and to the future, focusing on the study of multimodal discourse in educational settings. Carey Jewitt opens the chapter with a brief genealogy of research on multimodality, tracing its origins to Halliday's (1978) social semiotic theory of language. She shows how the first conceptual advances were made through attempts to link verbal and visual signs as different modes of meaning making (e.g. in work by Kress and Van Leeuwen, 1996 and by the New London Group, 1996). She also notes that these attempts to develop new conceptual frameworks constituted a response to the changing nature of the contemporary landscape of communication. Carey Jewitt then goes on to consider major developments in research on multimodality. These include refinement in the description and analysis of specific modes, including sound, movement, gesture and spatiality as well as verbal and visual signs; investigation of multimodality in new media and exploration of the interplay of modes in teaching and learning in different areas of the curriculum. She also outlines recent directions in theory-building, noting the shift from descriptive accounts to making more explicit connections with macro-social, political and cultural concerns in education. She concludes with a call for future research which explores the 'change potential' of multimodality in education and for consideration of how research can link in with future-thinking about educational practice.

#### DESIGNING RESEARCH ON DISCOURSE AND EDUCATION FOR THE TWENTY-FIRST CENTURY

In addressing themes, issues and debates such as those detailed above, several authors point to the need to develop spaces for dialogue across academic traditions and across approaches to discourse (e.g. Richard Barwell, Judith Baxter, Diana Boxer, Gregory Kelly, Jasmine Luk Ching Man, Elizabeth Birr Moje, Junko Mori and Jane Zuengler, Harriet Bjerrum Nielsen and Bronwyn Davies, Rany Rubdy and Silvia Valencia Giraldo). We hope that this volume of the Encyclopaedia will contribute to the facilitation of such dialogues. Setting out to survey, the broad landscape of research on discourse in education has been fruitful in that it has not only enabled us to identify different traditions of theory-building and empirical work, but also numerous areas of overlap and interaction. We have also been able to identify research that is conducted 'bottom-up' or 'top-down' (or both) and research conducted with or without particular strands of ethnography.

In a recent review of research on critical approaches to language, culture and society, Blommaert (2005) demonstrates how linguistic anthropology, originating in the North American context, and CDA, originating in Europe, have become 'separate worlds' where there are

'untapped sources of mutual inspiration' (2005, p. 9). The separation of these particular intellectual worlds has taken place despite the fact that researchers have broadly similar concerns, draw on overlapping strands of social theory and sometimes employ similar analytic tools.

The researchers contributing to this volume represent a much wider range of intellectual worlds and participate in diverse scholarly networks that span the countries of the South as well as the countries in North America and Europe. We thus hope that the readers of the chapters in the volume will be able to identify themes that are pertinent to them and will find sources of inspiration that they can build on in their own research. We also hope that there will be greater South-North and South-South dialogue (as well as North-North dialogue) in the coming years. It is through dialogue and exchange of perspectives that we are likely to be able to design and develop robust new approaches for research on discourse and education in the twenty-first century and move towards deepening our understanding of the global processes of change at work in education.

GENERAL EDITOR'S INTRODUCTION<sup>1</sup>

ENCYCLOPEDIA OF LANGUAGE AND EDUCATION

This is one of ten volumes of the *Encyclopedia of Language and Education* published by Springer. The Encyclopedia bears testimony to the dynamism and evolution of the language and education field, as it confronts the ever-burgeoning and irrepressible linguistic diversity and ongoing pressures and expectations placed on education around the world.

The publication of this work charts the deepening and broadening of the field of language and education since the 1997 publication of the first Encyclopedia. It also confirms the vision of David Corson, general editor of the first edition, who hailed the international and interdisciplinary significance and cohesion of the field. These trademark characteristics are evident in every volume and chapter of the present Encyclopedia.

In the selection of topics and contributors, the Encyclopedia seeks to reflect the depth of disciplinary knowledge, breadth of interdisciplinary perspective, and diversity of sociogeographic experience in our field. Language socialization and language ecology have been added to the original eight volume topics, reflecting these growing emphases in language education theory, research, and practice, alongside the enduring emphases on language policy, literacies, discourse, language acquisition, bilingual education, knowledge about language, language testing, and research methods. Throughout all the volumes, there is greater inclusion of scholarly contributions from non-English speaking and non-Western parts of the world, providing truly global coverage of the issues in the field. Furthermore, we have sought to integrate these voices more fully into the whole, rather than as special cases or international perspectives in separate sections.

This interdisciplinary and internationalizing impetus has been immeasurably enhanced by the advice and support of the editorial advisory board members, several of whom served as volume editors in the Encyclopedia's first edition (designated here with\*), and all of whom I acknowledge here with gratitude: Neville Alexander (South Africa), Colin Baker (Wales), Marilda Cavalcanti (Brazil), Caroline Clapham\* (Britain),

---

<sup>1</sup> This introduction is based on, and takes inspiration from, David Corson's general editor's Introduction to the First Edition (Kluwer, 1997).

Bronwyn Davies\* (Australia), Viv Edwards\* (Britain), Frederick Erickson (USA), Joseph Lo Bianco (Australia), Luis Enrique Lopez (Bolivia and Peru), Allan Luke (Singapore and Australia), Tove Skutnabb-Kangas (Denmark), Bernard Spolsky (Israel), G. Richard Tucker\* (USA), Leo van Lier\* (USA), Terrence G. Wiley (USA), Ruth Wodak\* (Austria), and Ana Celia Zentella (USA).

In conceptualizing an encyclopedic approach to a field, there is always the challenge of the hierarchical structure of themes, topics, and subjects to be covered. In this *Encyclopedia of Language and Education*, the stated topics in each volume's table of contents are complemented by several cross-cutting thematic strands recurring across the volumes, including the classroom/pedagogic side of language and education; issues of identity in language and education; language ideology and education; computer technology and language education; and language rights in relation to education.

The volume editors' disciplinary and interdisciplinary academic interests and their international areas of expertise also reflect the depth and breadth of the language and education field. As principal volume editor for Volume 1, Stephen May brings academic interests in the sociology of language and language education policy, arising from his work in Britain, North America, and New Zealand. For Volume 2, Brian Street approaches language and education as social and cultural anthropologist and critical literacy theorist, drawing on his work in Iran, Britain, and around the world. For Volume 3, Marilyn Martin-Jones and Anne-Marie de Mejia bring combined perspectives as applied and educational linguists, working primarily in Britain and Latin America, respectively. For Volume 4, Nelleke Van Deusen-Scholl has academic interests in linguistics and sociolinguistics, and has worked primarily in the Netherlands and the USA. Jim Cummins, principal volume editor for Volume 5 of both the first and second editions of the *Encyclopedia*, has interests in the psychology of language, critical applied linguistics, and language policy, informed by his work in Canada, the USA, and internationally. For Volume 6, Jasone Cenoz has academic interests in applied linguistics and language acquisition, drawing from her work in the Basque Country, Spain, and Europe. Elana Shohamy, principal volume editor for Volume 7, approaches language and education as an applied linguist with interests in critical language policy, language testing and measurement, and her own work based primarily in Israel and the USA. For Volume 8, Patricia Duff has interests in applied linguistics and sociolinguistics, and has worked primarily in North America, East Asia, and Central Europe. Volume editors for Volume 9, Angela Creese and Peter Martin, draw on their academic interests in educational linguistics and linguistic ethnography, and their research in Britain and Southeast Asia. And for Volume 10, Kendall A. King has academic interests in

sociolinguistics and educational linguistics, with work in Ecuador, Sweden, and the USA. Francis Hult, editorial assistant for the Encyclopedia, has academic interests in educational and applied linguistics and educational language policy, and has worked in Sweden and the USA. Finally, as general editor, I have interests in anthropological linguistics, educational linguistics, and language policy, with work in Latin America, the USA, and internationally. Beyond our specific academic interests, all of us editors, and the contributors to the Encyclopedia, share a commitment to the practice and theory of education, critically informed by research and strategically directed toward addressing unsound or unjust language education policies and practices wherever they are found.

Each of the ten volumes presents core information and is international in scope, as well as diverse in the populations it covers. Each volume addresses a single subject area and provides 23–30 state-of-the-art chapters of the literature on that subject. Together, the chapters aim to comprehensively cover the subject. The volumes, edited by international experts in their respective topics, were designed and developed in close collaboration with the general editor of the Encyclopedia, who is a co-editor of each volume as well as general editor of the whole work.

Each chapter is written by one or more experts on the topic, consists of about 4,000 words of text, and generally follows a similar structure. A list of references to key works supplements the authoritative information that the chapter contains. Many contributors survey early developments, major contributions, work in progress, problems and difficulties, and future directions. The aim of the chapters, and of the Encyclopedia as a whole, is to give readers access to the international literature and research on the broad diversity of topics that make up the field.

The Encyclopedia is a necessary reference set for every university and college library in the world that serves a faculty or school of education. The encyclopedia aims to speak to a prospective readership that is multinational, and to do so as unambiguously as possible. Because each book-size volume deals with a discrete and important subject in language and education, these state-of-the-art volumes also offer highly authoritative course textbooks in the areas suggested by their titles.

The scholars contributing to the Encyclopedia hail from all continents of our globe and from 41 countries; they represent a great diversity of linguistic, cultural, and disciplinary traditions. For all that, what is most impressive about the contributions gathered here is the unity of purpose and outlook they express with regard to the central role of language as both vehicle and mediator of educational processes and to the need for continued and deepening research into the limits and possibilities that implies.

Nancy H. Hornberger

## INTRODUCTION TO VOLUME 4: SECOND AND FOREIGN LANGUAGE EDUCATION

### INTRODUCTION

The present volume brings together a wide variety of perspectives on second and foreign language learning and teaching. As reflected in the title of the second edition, this volume has added an emphasis on “foreign language” in addition to second language education to underscore the increasing significance of foreign language learning in a global context, and both the commonalities and differences between foreign and second language teaching. The Volume contains a unique collection of chapters which examine the most recent theoretical, methodological, and pedagogical insights in the field of foreign and second language education and focuses on diverse educational settings and situations, learner populations, proficiency levels, and teaching practices.

Over the past decade, significant economic and political changes have affected language teaching and learning in many regions across the world. In the USA, for example, two issues in particular have drawn attention to the need for improving the language skills and cultural awareness of the population: the events of September 11, 2001, and the impact of globalization (Met). In Europe, the expansion of the European Union has been accompanied by expanded opportunities for language learning, recognition of the rights of regional and minority languages, and greater emphasis on intercultural communication and plurilingualism as policy goals. The European Language Portfolio, an outcome of the project on Language Learning for European Citizenship, takes into consideration the multiple contexts within which languages are used and learned (Broeder and Martyniuk). A final example is South Africa, where postapartheid political and educational reforms are reflected in new language policies, the most visible of which is the New Constitution which recognizes 11 official languages (Kamwangamalu).

The 27 contributions in the present volume reflect the diversity of the field with chapters that represent a wide range of geographic and disciplinary perspectives and present in-depth chapters of current theory and research as well as examinations of methodology and teaching practices. These chapters cover a broad array of innovative approaches across the globe and describe the current state of the art in technology-based second and foreign language teaching and learning. Of the original 22

contributors to the first edition, 5 (Oxford, Gardner, Gunnarsson, Pakir, and Watts) are represented in the second edition of this volume with substantially expanded and updated chapters.

#### THEMATIC ORGANIZATION OF THE VOLUME

The volume is organized into five thematic sections that include theoretical perspectives as well as practical approaches. Each section covers a broad area within the field of second and foreign language teaching and learning, focusing on theory, methodology, learning, teacher training, and technology, respectively.

The first section addresses the *Theoretical underpinnings* of second and foreign language education. Contributions by Kramersch, McKay, Gardner, and Oxford represent the interdisciplinary nature of the field and demonstrate how insights from applied linguistics, sociolinguistics, and psycholinguistics have contributed to our current perspectives on language teaching and learning. Kramersch argues for a more “socially and culturally aware” applied linguistic theory that—within the current context of globalization—must be critically informed by the theoretical perspectives of diverse fields, such as educational, literary, and political theory rather than restrict itself to its traditional focus on second language acquisition and communicative competence. McKay links the theoretical insights from sociolinguistics to language education and lists a number of pedagogical implications for teaching practice, such as creating awareness of language variation within specific linguistic contexts or recognizing the multiple standards of global languages such as English and other major languages. Gardner’s contribution focuses on four classes of variables that have received considerable research attention over the years: language aptitude, attitudes and motivation, language anxiety, and language-learning strategies. Oxford draws upon and critically evaluates a range of linguistic theories from both within and outside the second language (L2) field to outline the major conditions under which L2 learning occurs.

The second section, *Current approaches to second and foreign language education*, focuses on teaching methodologies which are based on recent research findings. While communicative language teaching remains the predominant approach within second and foreign language instruction, its limitations have become increasingly clear over the past decade of research in second language acquisition, sociolinguistics, applied linguistics, and related fields (Kramersch). Specifically, the lack of emphasis on explicit grammar instruction, its primary focus on basic interpersonal communication, and the limited relevance of its pedagogy for learners’ academic and professional goals are among the main objections to the traditional communicative methodology. New approaches

have attempted to address these concerns while maintaining a communicative focus, emphasizing a highly interactive learning environment, and increasingly providing a more authentic context for learning. Pica characterizes task-based instruction as an instructional approach that has had both a theoretical and an empirical grounding since its inception. Firmly grounded in second language acquisition (SLA) research, task-based activities engage learners in meaningful, goal-oriented communication to solve problems, complete projects, and reach decisions.

Stoller and Coyle describe two different models that integrate language and content in the teaching and learning of second and foreign languages. Stoller outlines the field of content-based instruction (CBI) in the broad context of instructional settings across various countries, among diverse student populations, and proficiency levels, and underscores the strong academic orientation of this approach. Coyle discusses the diversity of models and pedagogies for Content and Language Integrated Learning (CLIL) and characterizes this approach as uniquely situated within the European cultural and pedagogical traditions. Gunnarsson's contribution provides an overview of research on communication in professional settings, a field that used to be termed Language for specific or special purposes (LSP), but is now more commonly designated as professional discourse or professional communication. The final chapter in this section is by Freed who discusses language learning in study abroad settings, situating the field within the broader context of research on second language acquisition (SLA).

Section 3, *International Perspectives on second and foreign language learning*, reflects a diversity of learning contexts as well as a broad range of viewpoints on language learning from around the globe. The first three contributions focus primarily on the USA. Met describes the current status of foreign language learning in K-12 classrooms and points to the impetus provided by both the tragic events of September 11 and by the global economic changes that have prompted the USA to support efforts to promote development of language skills and cultural understanding. At the same time, however, she emphasizes the value of learning other languages as part of a well-rounded education. Kagan and Dillon outline the major issues of heritage language learning, a new field that has begun to emerge in the USA within the past decade or so. They emphasize the need for further development of a theoretical base, curricular models, and instructional materials. Closely connected to this is the contribution by Hinton, which details the current situation of the many endangered indigenous languages in North America and describes innovative approaches, such as the Master-Apprentice language program, to teach these languages to new generations as a way to reverse language shift and promote their survival and revitalization.

Clyne and Fernandez provide a comprehensive overview of community language learning in Australia and describe the institutional contexts (e.g., day schools, language schools, and ethnic community schools) in which languages other than English (LOTE) are taught, while Early outlines the trends and initiatives in second and foreign language education in Canada and focuses in particular on (i) integrated language and content programs for English language learner (ELL) students and (ii) Core French programs.

A perspective on language learning in Europe is provided by Broeder and Martyniuk who sketch the main goals of the Common European Framework of Reference (CEFR), a document that includes both a Descriptive Scheme of language competences and a Common Reference Level system detailing language proficiency levels. They also include a discussion of the newly developed European language portfolio (ELP). Kamwangamalu chapters pedagogical issues in second and foreign language learning—in and of themselves highly contested terms in South Africa—against the background of the sociopolitical changes, especially the end of apartheid, that have taken place in that country since 1994. He describes a new pedagogical framework, outcomes-based education (OBE), which is currently in the process of being implemented.

The final three contributions in this section each cover geographically vast and culturally diverse regions. Al-Khatib's contribution deals with the Middle East and North Africa, comprising more than 23 countries, the majority Arab states. He notes that English teaching and learning is gaining importance across the region, in part due to its association with modernization and globalization. Pakir identifies a similar trend in Southeast Asia, a region of half a billion people, and details the situations of four countries in particular: Brunei, Malaysia, the Philippines, and Singapore. Each of these has a long internal history with English, which functions as second language, but in the current context of globalization English has become a lingua franca, a situation which has led to a rethinking of language policies as well as curriculum practice and planning, materials development, and teacher training. Watt's chapter discusses the linguistically complex region of the South Pacific, with over 800 languages spoken in Papua New Guinea and more than 100 in Vanuatu. Among the innovative approaches in this region are distance education initiatives which bring foreign language learning to remote areas, and vernacular education programs. While each of these chapters points to numerous successes and advances in language education across these geographic contexts, they also share concerns about very similar problems, such as the need for adequate language and education policies and greater emphasis on teacher training.

The fourth section of this volume, devoted to *Teacher Preparation and Professional Development*, offers four different perspectives on

the professional preparation of instructors, an issue of critical significance to language learning. Von Hoene points out the heterogeneity among foreign language instructors in postsecondary education and calls for different approaches to their professional development that bring the insights of different disciplinary perspectives to teacher training. The chapter by Kern, Ware, and Warschauer focuses specifically on the pedagogical issues of network-based language teaching (NBLT) within the larger context of computer-assisted language learning (CALL). The final two chapters in this section call attention to the challenges that language teachers encounter in many regions of the world. Tarnopolsky discusses the strengths and weaknesses that nonnative speaking teachers bring to the teaching of English in its expanding global role, while Zavala focuses on the training of teachers in Peru within the complex bilingual context of Spanish and the various indigenous languages, such as Quechua, Aymara, and others.

The last section, *The Role of Technology in Second and Foreign Language Education*, presents a new and exciting direction in the field of language teaching and learning, one which had only begun to emerge when the first edition of the Encyclopedia was issued, and includes contributions that discuss the potential applications of technology to both research and practice. Thorne provides an overview of research in computer-mediated communication (CMC) and describes its educational uses as well as its contexts of use, emphasizing its multimodal nature. He also touches on emerging technologies, such as blogs, wikis, podcasting, etc. The next contribution by Granger outlines the relatively new resource of computer learner corpora (CLC), a branch of corpus linguistics, which offers exciting opportunities for research and innovative pedagogical applications based on analyses of authentic learner data. Winke and Fei focus attention on how recent advances in technology are enabling more sophisticated approaches to assessment of language skills, and describe the ongoing innovations in the emerging field of computer-assisted language testing (CALT). The final chapter by Blake deals with a new mode of delivery of language instruction through distance learning (DL) or online courses. He lists among its potential benefits increased access to the less commonly taught languages (LCTLs) and flexibility in scheduling, but cautions that the technology is still evolving and implementation remains a challenge.

#### MAJOR CROSSCUTTING THEMES

Despite the diversity of perspectives and variety of learning contexts touched on in this volume, a number of common themes emerge from the contributions as increasingly relevant to the field of second and foreign language education. Several authors point out the limitations

of the ways communicative language teaching has been applied as too utilitarian and suggest new perspectives which take into consideration the social and cultural context within which languages are learned, learner identities, and the multiple goals and purposes of language education within plurilingual/pluricultural environments (e.g., Kramsch, von Hoene) New approaches to language teaching and learning include task-based instruction (Pica), models for integration of language and content (e.g., Stoller; Coyle; Early), and language learning for professional communication (Gunnarsson) and crossnational citizenship (Broeder and Martyniuk).

Second, language and educational policies have been created across the world to address the rights of minority language speakers and support the maintenance or revitalization of indigenous and heritage languages. Examples of this can be found in the contributions by Kagan and Dillon, and Hinton (on heritage and indigenous languages in the USA, respectively), Zavala (on the bilingual situation in Peru), Clyne and Fernandez (on community languages in Australia), Kamwangamalu (on South Africa), Watts (on vernacular language programs in the South Pacific), and others. Several of the contributors caution, however, that despite the many positive developments, serious challenges remain, particularly with respect to policy implementation. Clyne and Fernandez, for example, note the “monolingual mindset” in Australia, while Early comments on the inability of policies and pedagogies to “bring into the classroom the heritage languages and cultures of the learners.” Zavala, Al-Khatib, and Watts express concerns about the long-term effects of educational policies on language educational practices and stress the need for more teacher training. Clyne, Watts, and Al-Khatib, however, all point to the increasing opportunities provided by the internet to bring together the language teaching community to exchange ideas and experiences, to create collaborative learning environments, and to promote learning of the smaller and less dominant languages.

This, then, connects to a final theme that is echoed among many of the contributions, the emergence of technology as a tool that is transforming both language pedagogy and teacher and learner roles. Several authors describe its potential applications for classroom practice and curricular innovation (e.g., Thorne, Granger, Al-Khatib), teacher training (Kern, Ware, and Warschauer), testing and assessment (Winke), and its impact on mode of delivery (Blake, Watts). Blake and Thorne note the rapid evolution of new technologies and the shift toward increasingly mediated forms of communication in society, which may provide new opportunities for language teaching and learning.

Underscoring the significance of these themes are a number of new journals that have appeared in recent years which provide a forum for further research and debate in these areas, including the *Journal*

*of Language, Identity, and Education*, the *Heritage Language Journal*, *Language Learning and Technology*, and the *CALICO (Computer-Assisted Language Instruction Consortium) Journal*. Clearly, the field of foreign and second language teaching and learning has established itself as a dynamic academic discipline which shows tremendous vitality as exemplified by the diverse perspectives represented in this volume.

## GENERAL EDITOR'S INTRODUCTION<sup>1</sup>

### ENCYCLOPEDIA OF LANGUAGE AND EDUCATION

This is one of ten volumes of the *Encyclopedia of Language and Education* published by Springer. The Encyclopedia bears testimony to the dynamism and evolution of the language and education field, as it confronts the ever-burgeoning and irrepressible linguistic diversity and ongoing pressures and expectations placed on education around the world.

The publication of this work charts the deepening and broadening of the field of language and education since the 1997 publication of the first Encyclopedia. It also confirms the vision of David Corson, general editor of the first edition, who hailed the international and interdisciplinary significance and cohesion of the field. These trademark characteristics are evident in every volume and chapter of the present Encyclopedia.

In the selection of topics and contributors, the Encyclopedia seeks to reflect the depth of disciplinary knowledge, breadth of interdisciplinary perspective, and diversity of sociogeographic experience in our field. Language socialization and language ecology have been added to the original eight volume topics, reflecting these growing emphases in language education theory, research, and practice, alongside the enduring emphases on language policy, literacies, discourse, language acquisition, bilingual education, knowledge about language, language testing, and research methods. Throughout all the volumes, there is greater inclusion of scholarly contributions from non-English speaking and non-Western parts of the world, providing truly global coverage of the issues in the field. Furthermore, we have sought to integrate these voices more fully into the whole, rather than as special cases or international perspectives in separate sections.

This interdisciplinary and internationalizing impetus has been immeasurably enhanced by the advice and support of the editorial advisory board members, several of whom served as volume editors in the Encyclopedia's first edition (designated here with\*), and all of whom I acknowledge here with gratitude: Neville Alexander (South Africa), Colin Baker (Wales), Marilda Cavalcanti (Brazil), Caroline Clapham\* (Britain),

---

<sup>1</sup> This introduction is based on, and takes inspiration from, David Corson's general editor's Introduction to the First Edition (Kluwer, 1997).

Bronwyn Davies\* (Australia), Viv Edwards\* (Britain), Frederick Erickson (USA), Joseph Lo Bianco (Australia), Luis Enrique Lopez (Bolivia and Peru), Allan Luke (Singapore and Australia), Tove Skutnabb-Kangas (Denmark), Bernard Spolsky (Israel), G. Richard Tucker\* (USA), Leo van Lier\* (USA), Terrence G. Wiley (USA), Ruth Wodak\* (Austria), and Ana Celia Zentella (USA).

In conceptualizing an encyclopedic approach to a field, there is always the challenge of the hierarchical structure of themes, topics, and subjects to be covered. In this *Encyclopedia of Language and Education*, the stated topics in each volume's table of contents are complemented by several cross-cutting thematic strands recurring across the volumes, including the classroom/pedagogic side of language and education; issues of identity in language and education; language ideology and education; computer technology and language education; and language rights in relation to education.

The volume editors' disciplinary and interdisciplinary academic interests and their international areas of expertise also reflect the depth and breadth of the language and education field. As principal volume editor for Volume 1, Stephen May brings academic interests in the sociology of language and language education policy, arising from his work in Britain, North America, and New Zealand. For Volume 2, Brian Street approaches language and education as social and cultural anthropologist and critical literacy theorist, drawing on his work in Iran, Britain, and around the world. For Volume 3, Marilyn Martin-Jones and Anne-Marie de Mejia bring combined perspectives as applied and educational linguists, working primarily in Britain and Latin America, respectively. For Volume 4, Nelleke Van Deusen-Scholl has academic interests in linguistics and sociolinguistics, and has worked primarily in the Netherlands and the USA. Jim Cummins, principal volume editor for Volume 5 of both the first and second editions of the *Encyclopedia*, has interests in the psychology of language, critical applied linguistics, and language policy, informed by his work in Canada, the USA, and internationally. For Volume 6, Jasone Cenoz has academic interests in applied linguistics and language acquisition, drawing from her work in the Basque Country, Spain, and Europe. Elana Shohamy, principal volume editor for Volume 7, approaches language and education as an applied linguist with interests in critical language policy, language testing and measurement, and her own work based primarily in Israel and the USA. For Volume 8, Patricia Duff has interests in applied linguistics and sociolinguistics, and has worked primarily in North America, East Asia, and Central Europe. Volume editors for Volume 9, Angela Creese and Peter Martin, draw on their academic interests in educational linguistics and linguistic ethnography, and their research in Britain and Southeast Asia. And for Volume 10, Kendall A. King has academic interests in

sociolinguistics and educational linguistics, with work in Ecuador, Sweden, and the USA. Francis Hult, editorial assistant for the Encyclopedia, has academic interests in educational and applied linguistics and educational language policy, and has worked in Sweden and the USA. Finally, as general editor, I have interests in anthropological linguistics, educational linguistics, and language policy, with work in Latin America, the USA, and internationally. Beyond our specific academic interests, all of us editors, and the contributors to the Encyclopedia, share a commitment to the practice and theory of education, critically informed by research and strategically directed toward addressing unsound or unjust language education policies and practices wherever they are found.

Each of the ten volumes presents core information and is international in scope, as well as diverse in the populations it covers. Each volume addresses a single subject area and provides 23–30 state-of-the-art chapters of the literature on that subject. Together, the chapters aim to comprehensively cover the subject. The volumes, edited by international experts in their respective topics, were designed and developed in close collaboration with the general editor of the Encyclopedia, who is a co-editor of each volume as well as general editor of the whole work.

Each chapter is written by one or more experts on the topic, consists of about 4,000 words of text, and generally follows a similar structure. A list of references to key works supplements the authoritative information that the chapter contains. Many contributors survey early developments, major contributions, work in progress, problems and difficulties, and future directions. The aim of the chapters, and of the Encyclopedia as a whole, is to give readers access to the international literature and research on the broad diversity of topics that make up the field.

The Encyclopedia is a necessary reference set for every university and college library in the world that serves a faculty or school of education. The encyclopedia aims to speak to a prospective readership that is multinational, and to do so as unambiguously as possible. Because each book-size volume deals with a discrete and important subject in language and education, these state-of-the-art volumes also offer highly authoritative course textbooks in the areas suggested by their titles.

The scholars contributing to the Encyclopedia hail from all continents of our globe and from 41 countries; they represent a great diversity of linguistic, cultural, and disciplinary traditions. For all that, what is most impressive about the contributions gathered here is the unity of purpose and outlook they express with regard to the central role of language as both vehicle and mediator of educational processes and to the need for continued and deepening research into the limits and possibilities that implies.

Nancy H. Hornberger

INTRODUCTION TO VOLUME 5: BILINGUAL  
EDUCATION

The term *bilingual education* refers to the use of two (or more) languages of instruction at some point in a student's school career. The languages are used to teach subject matter content rather than just the language itself. This apparently simple description entails considerable complexity deriving from a multitude of sociopolitical, sociolinguistic, psychological, economic, administrative, and instructional factors. Thus, the goals, implementation, and outcomes of bilingual education programs can be analyzed from a wide range of disciplinary perspectives.

Bilingual education can be traced back to Greek and Roman times and currently a large majority of countries throughout the world offer some form of bilingual education either in public or private school settings. Formal academic research has been conducted on bilingualism and bilingual education since the 1920s and a voluminous academic literature has accumulated on these topics. Since the publication of the first edition of the *Encyclopedia of Language and Education* in 1997, the psychoeducational research on bilingual education has been synthesized and evaluated by several independent research teams (e.g., August and Shanahan, 2006; Cummins, 2001; Genesee, Lindholm-Leary, Saunders, and Christian, 2006) and considerable confidence can be placed in some general conclusions about the outcomes of bilingual education. However, controversy surrounding bilingual education continues unabated in a number of countries.

To take just one example, the level of antipathy towards bilingual education in the USA over a 25-year period is reflected in the views of prominent politicians and social commentators. President Reagan characterized bilingual education in 1981 as "absolutely wrong and against American concepts." Ten years later, historian Arthur Schlesinger Jr. opined that "bilingualism shuts doors" and "monolingual education opens doors to the larger world" (see Cummins, 2001). In early 2007, former Speaker of the House of Representatives, Newt Gingrich, characterized bilingual education as "stunningly destructive" and argued that American civilization will "decay" unless the government declares English the nation's official language.

These conclusions are contradicted by the outcomes of all recent research reviews on the effects of bilingual education, including the

August and Shanahan volume that reported the findings of the National Literacy Panel on Language Minority Children and Youth set up by the US government to evaluate the scientific evidence on this topic. The oppositional hyperbole clearly reflects the sociopolitical and ideological dimensions of bilingual education rather than its educational outcomes. The use of a language as a medium of instruction in state-funded school systems confers recognition and status on that language and its speakers. Consequently, bilingual education is not simply a politically neutral instructional phenomenon but rather is implicated in national and international competition between groups for material and symbolic resources.

Bilingual programs are usually minimally controversial when they are implemented to serve the interests of dominant groups in the society. In Canada, for example, little controversy exists in relation either to French immersion programs intended to support anglophone students in learning French or French language programs intended to help minority francophone students outside of Quebec maintain French. These programs serve the interests of the two official language groups. However, only in the province of Alberta and the territory of Nunavut in the Arctic region has there been widespread implementation of bilingual programs involving languages other than English and French. Similarly, in Europe, there have been very few bilingual programs set up to serve migrant populations in comparison to those that teach the languages of national minorities whose status has been formally recognized within the society.

Thus, the controversy in the USA can be seen in the context of the fact that it is one of the few countries in the world that has implemented bilingual education on a reasonably large scale for minority groups that do not have legally recognized status as national minorities or as official language groups.

#### RESEARCH FOUNDATION

As noted above, there is considerable consensus among applied linguists regarding the outcomes of bilingual programs. The research on bilingual education supports the following conclusions:

1. **Bilingual programs for minority and majority language students have been successfully implemented in countries around the world.** As documented in the reviews in this volume and its first edition predecessor, students educated for part of the day through a minority language do not suffer adverse consequences in the development of academic skills in the majority language. As one example, there are more than 300,000 English-background students in various forms of French–English bilingual programs

in Canada (see Genesee and Lindholm-Leary, *Dual Language Education in Canada and the USA*, Volume 5).

2. **The development of literacy in two languages entails linguistic and cognitive advantages for bilingual students.** There are hundreds of research studies carried out since the early 1960s that report significant advantages for bilingual students on a variety of metalinguistic and cognitive tasks (reviewed in Cummins, 2001). Bilingual students get more practice in learning language resulting in greater attentional control and higher levels of metalinguistic awareness.
3. **Significant positive relationships exist between the development of academic skills in first and second languages (L1 and L2).** This is true even for languages that are dissimilar (e.g., Spanish and Basque; English and Chinese; Dutch and Turkish). These cross-lingual relationships provide evidence for a *common underlying proficiency* (or what Genesee, Lindholm-Leary, Saunders, and Christian (2005) call a *cross-linguistic reservoir of abilities*) that permits transfer of academic and conceptual knowledge across languages. This transfer of skills and knowledge explains why spending instructional time through a minority language entails no adverse consequences for the development of the majority language.
4. **The most successful bilingual programs are those that aim to develop bilingualism and biliteracy.** Transitional bilingual programs provide some L1 instruction as a short-term bridge to mainstream instruction in the dominant language. However, these short-term programs are less successful, in general, than programs that continue to promote both L1 and L2 literacy throughout elementary school. Particularly successful (in the USA) are *dual-language programs* that serve majority-language dominant students in the same classes as minority students with each group acting as linguistic models for the other.
5. **Bilingual education for minority students is, in many situations, more effective in developing L2 literacy skills than monolingual education in the dominant language but it is not, by itself, a panacea for underachievement.** Francis, Lesaux, and August (2006), writing in the August and Shanahan volume, summarize the outcomes of the bilingual programs they reviewed:

In summary, there is no indication that bilingual instruction impedes academic achievement in either the native language or English, whether for language-minority students, students receiving heritage language instruction, or those enrolled in French immersion programs. Where differences were observed, on average they

avored the students in a bilingual program. The meta-analytic results clearly suggest a positive effect for bilingual instruction that is moderate in size. (2006, p. 397)

However, underachievement derives from many sources and simply providing some first language instruction will not, by itself, transform students' educational experience. As outlined in many of the papers in this volume, effective instruction will affirm student identities and build on the cultural and linguistic knowledge they bring to the classroom.

## OVERVIEW

The first ten chapters analyze a range of conceptual issues in bilingual education while the remaining chapters focus on bilingual programs in specific geographical contexts. McCarty and Skutnabb-Kangas initially clarify the terminology, distinctions, and definitions that clutter the bilingual education landscape. They pay particular attention to the ideological underpinnings of terminology evident in the ways in which issues and debates are framed.

May elaborates on some of the relevant types of bilingual education and reviews some of the major research studies supporting the positive outcomes of L1 instruction for minority language students. He cautions, however, that research results cannot be interpreted in a vacuum—the social and educational context is always relevant in determining what types of program will be appropriate and successful.

Lo Bianco reviews some of the early findings that suggested positive cognitive and linguistic effects of bilingualism and which opened the field of discourse to the implementation of enrichment, as opposed to compensatory, bilingual education. He then goes on to examine the intersection of sociopolitical and educational factors in the ways bilingual programs have been implemented in the USA, Australia, and Sri Lanka.

Schwinge focuses on the development of biliteracy within bilingual programs. She adopts Hornberger's (1990, p. 213) definition of biliteracy as "any and all instances in which communication occurs in two (or more) languages in or around writing." The research she reviews is primarily ethnographic in nature, some of which is framed explicitly within Hornberger's (2003) *Continua of Biliteracy* framework. Schwinge's review emphasizes the importance of students' linguistic and cultural funds of knowledge as a basis for learning, the reality of transfer across languages as revealed by qualitative research, and instructional approaches that have shown promise in promoting biliteracy.

Cummins highlights the fact that monolingual instructional assumptions continue to dominate pedagogy in bilingual programs. These assumptions are reflected in the rigid separation of languages in many

bilingual programs and the rejection of translation as a potential instructional strategy (e.g., in the writing and web-publication of dual-language books by students). These assumptions have resulted in minimal teaching for transfer (L1 to L2, L2 to L1) within bilingual programs and lost opportunities to optimize both language accomplishments and academic achievement.

Freeman's paper examines how broader societal power relations among local and global communities shape the forms of bilingual education that are implemented and the teacher–student interactions that occur within bilingual programs. The historical and current power relations operating in any particular society can affect how the term *bilingual education* is perceived by different groups. In New Zealand, for example, the term has negative connotations for Maori educators and communities attempting to revitalize the Maori language through Maori-medium schooling. In this context, bilingual education implies a dilution of the emphasis on Maori language and culture. Freeman points out that student identities are constantly being negotiated and shaped within all forms of schooling and thus different forms of bilingual or monolingual instruction are never neutral with respect to the intersection of student/community identities and societal power relations.

Jessner reviews recent challenges to the implicit conceptualization of the bilingual as a “double monolingual.” The term *multicompetence* has been adopted to highlight the fact that L2 users have a different mental structure than monolinguals. The dynamic model of multilingualism described by Jessner goes beyond just positing an overlap or interdependence between L1 and L2; rather a complete metamorphosis of the cognitive systems of the bi/multilingual individual is involved. This approach adopts a holistic view of L2/L3 users, and argues for the establishment of multilingual rather than monolingual norms within sociolinguistic and educational contexts. This orientation has important implications for both instruction and assessment of L2 users.

Francis presents an alternative approach to conceptualizing the cognitive structure of bi/multilingual individuals. He points out that modular approaches to the study of bilingualism attempt to analyze the cognitive components that make up a person's knowledge of two languages and his or her ability to use them. To what extent are these components autonomous domains and in what ways do they interact with other components? Francis discusses the possibility that there may be degrees of modularity in which some aspects of language development might unfold in a highly modular or “closed” way while others may be more interactive or open-ended. He relates this discussion to the notion of a cross-linguistic common underlying proficiency as well as to a number of practical issues in instruction and testing.

Skutnabb-Kangas analyzes the intersections between language rights and bilingual education. Linguistic minorities are protected by specific language rights in certain countries and, in addition, all are provided with some general protections under various United Nations charters and other conventions. However, there are relatively few binding *positive* rights to mother-tongue medium education or bilingual education in present international law. Most language-related human rights are *negative* rights designed to promote equality by prohibiting discrimination on the basis of language. Skutnabb-Kangas suggests that the resistance by national governments to the implementation of maintenance-oriented mother-tongue education derives from the fact that these programs are capable of reproducing minorities as minorities—in other words, they operate to counteract assimilation and the disappearance of the minority group as a distinct entity.

The final chapter of this initial section illustrates the struggle for linguistic human rights by means of a case study of the implementation of bilingual-bicultural education for Deaf students in Ontario, Canada. Small and Mason point out that the Education Act in Ontario allows the use of American Sign Language (ASL) and Langue des signes quebécois (LSQ) as languages of instruction in schools. However, the legislation is only permissive insofar as it does not *require* schools serving Deaf students to use ASL nor does it require teachers to have ASL proficiency. The Deaf community has mobilized to pressure the province to strengthen ASL regulations and also to ensure that all Deaf children have the opportunity to gain access to a strong first language. Currently, children who receive a cochlear implant are effectively prohibited from learning ASL by provincial regulations despite the fact that there is no research evidence to support this policy. In fact, the research clearly shows that Deaf children who develop strong ASL proficiency perform better in English literacy skills.

The remaining chapters focus on illustrative bilingual education programs and policies in different regions of the world. Obondo reviews the situation in several post-colonial African countries where policy-makers have struggled with the decision of whether to continue with programs that use the colonial language as the medium of instruction in schools or to implement initial mother tongue or bilingual instruction. Research data suggest that significantly better outcomes are attained in mother-tongue medium programs. However, the sociolinguistic complexities of the relationships between local, regional, and national languages in many countries create challenges for implementing mother tongue programs.

Similar multilingual complexities exist in India. Mohanty traces the development of multilingual education from the inception of the “three-language policy” in 1957. This policy envisaged a regional

language or mother tongue as the language of instruction for the first five years of schooling followed by Hindi (in non-Hindi areas) or another Indian language (in Hindi areas) from the sixth to the eighth year of schooling, with English taking over as the language of instruction after that point. This policy has evolved such that currently the majority language of each state has become the first language and medium of instruction in state-sponsored schools with English as the most common second language subject followed by either Hindi or Sanskrit as a third language subject. Mohanty concludes that application of the three-language formula has been erratic and that there has been a lack of coherent language planning in the Indian context.

Yu focuses on recent developments in English–Chinese bilingual education in the Chinese context. Programs have been implemented at the university level and in both public and private schools. At the university level the goal of English–Chinese bilingual education is to meet the challenge of economic globalization and technological expansion by ensuring that Chinese scholars have access to scientific developments which are predominantly published and discussed in English at this point in time. Yu points out that English–Chinese bilingual education is at a very early stage in the Chinese context. For example, the bilingual programs in secondary and primary schools in Shanghai do not have their own curriculum and the teachers who are teaching through English must adapt the regular Chinese-medium curriculum. No guidelines are available for how to improve English proficiency within the context of a bilingual program and thus teachers involved in these recent innovations are faced with multiple challenges.

Pakir provides a historical overview of the development of bilingual education policy in Singapore and evaluates its outcomes in light of international academic comparisons. English is the major medium of instruction in all Singapore schools but the mother tongues of the major groups (Chinese, Malay, Tamil) are also taught. In general, students from the major language backgrounds in Singapore have performed well in international comparisons, not only in mathematics and science but also on measures of English literacy where their scores are at similar levels to several countries where English is the first language of students and the medium of instruction in school (e.g., New Zealand, Scotland).

The chapter by Bahry, Niyozov, and Shamatov reviews the complex sociolinguistic situation in the Central Asian independent states of Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan all of which were republics of the USSR until 1991. The chapter traces developments in the types of schooling provided in Central Asia and outlines current and future challenges for bilingual education as an option for the education systems of this region. Despite the multilingualism that characterizes the entire region, there are relatively few

examples of genuine bilingual education at this point in time. Schools teaching through the major language of the country co-exist with Russian-medium schools and schools operating through the mediums of various minority languages in regions where those languages are spoken. Other languages (e.g., the majority language, Russian) are typically taught as subjects rather than being used as mediums of instruction. The authors point out that these newly independent countries are engaged in complex identity discourses and are likely to experiment cautiously with bilingual programs that might be seen as potentially disrupting a delicate balance in relations between social and ethnic groups.

Within the European context, support for “lesser used languages” within the European Union and the demise of autocratic regimes (e.g., Franco in Spain) have resulted in a variety of bilingual education programs for the languages of groups recognized as national minorities. Huguet, Lasagabaster, and Vila discuss the evolution of bilingual and immersion programs in the autonomous Spanish regions of Catalonia, the Basque Country, Aragon, and Asturias. Extensive research in the Basque Country and Catalonia, and to a lesser extent in other regions, has established the effectiveness of bilingual/immersion programs in developing and reinforcing students’ abilities in the minority language at no cost to their proficiency in Spanish. As in other parts of Europe and North America, however, policy-makers are also faced with the challenge of integrating significant numbers of migrant students into the school system and ensuring that they also have the opportunity to acquire the languages of the society.

In the North American context, McCarty reviews the shift that has taken place in the goals of bilingual programs involving indigenous populations. Whereas previously bilingual programs were seen as helping to maintain the indigenous language while supporting students in developing strong academic English skills, the rapid decline in transmission of indigenous languages in the home has given rise to programs that aim to revitalize and reclaim indigenous languages. Thus, immersion programs involving various languages have been established, often in opposition to restrictive state legislation that mandates English-only instruction. For example, the Navajo immersion program in Window Rock, Arizona, has been engaged in a protracted fight with the Arizona State Department of Education which has attempted to shut it down by withholding funds. Evaluations of indigenous language programs tend to show highly positive outcomes (on English tests) in comparison to monolingual English programs. McCarty notes an increase in activism and confidence among indigenous communities in demanding control over their educational futures.

Genesee and Lindholm-Leary review the outcomes of dual-language education (DLE) in the USA and Canada. They define DLE as

schooling at the elementary and/or secondary levels in which English along with another language are used for at least 50% of academic instruction *during at least one school year*. In other words, the minority language must be used for at least 50% of the time for at least one school year but, in other years, the ratio of English to minority language might be 60:40 or 70:30. This definition also allows for the minority language to be used for 90% or more of the time at some stage of the program. Clearly DLE encompasses many forms of bilingual program for minority groups as well as immersion programs for majority groups. The authors note the convergence in findings across these different programs types and related sociolinguistic contexts. Specifically, within DLE, minority languages can be used as mediums of instruction at no long-term cost to students' proficiency in the majority language.

The two chapters that focus on the Pacific region and Australasia address a wide range of topics and issues. Lotherington notes that the predominant program model in the South Pacific is transitional bilingual education which aims to develop functional proficiency in the second (colonial) language within primary school education. There is a trend in some Polynesian countries away from a purely transitional model towards maintenance bilingual but submersion programs conducted through the former colonial language predominate in polyglot Melanesian societies. Among the barriers to the implementation of more widespread bilingual education are the lack of materials in vernacular languages, the limited support available to strengthen instruction of both the vernacular and international languages, and ambivalent attitudes towards the value of vernacular languages.

Cruikshank focuses on the sociolinguistic situation of the Arabic-speaking community in Australia. He notes that the teaching of Arabic and other community languages was marked by "a dramatic flourishing in the early 1980s, some consolidation and then a period of neglect in the last decade." Currently, Arabic is taught in community schools, in primary and secondary schools and in tertiary institutions. However, relatively few students continue to study Arabic throughout secondary school. Technological changes have exerted a significant impact on patterns of language use in the home. Many families have access to 24 hour Arabic channels such as *Al Jazeera* through cable and satellite television, and children and most teenagers watch videos and various types of television programs in Arabic regularly. There is also regular communication with family members in the countries of origin. Thus, transmission of the oral language is relatively strong despite the limited literacy abilities that most second generation students attain.

The final three chapters address the implementation of bilingual education in Latin American countries. López and Sichra note that

indigenous bilingual education dates from the early 1900s and initially was conceived as an instrument of assimilation. However, large-scale transitional bilingual projects carried out in countries such as Mexico, Peru, Guatemala, Bolivia, and Ecuador showed positive outcomes and reassured communities that use of the indigenous language was feasible and would not adversely affect students' development of Spanish proficiency. This growth in legitimacy associated with indigenous language use in educational contexts resulted in a gradual evolution in the late twentieth century towards more maintenance models designed to help develop the indigenous language as well as Spanish. Indigenous organizations and leaders have assumed a much more prominent role in the planning and implementation of bilingual education and these programs are now seen as playing an important role in recuperating indigenous views and voices.

Hamel elaborates on this general picture with a detailed examination of indigenous education in Mexico. Although the focus has been traditionally on using the indigenous language as a means to better develop Spanish skills, a shift similar to that noted by López and Sichra is evident in some contexts. For example, in 1995 the P'urhepecha (Tarascan) teachers from two bilingual elementary schools in Michoacán, in the central Highlands of Mexico, changed the curriculum so that all subject matter including literacy and mathematics was taught in P'urhepecha, the children's L1. Teachers had to create their own materials and develop a writing system. Comparative research several years later reported that students who had acquired literacy in their L1 achieved significantly higher scores in both languages than those who were taught reading and writing in Spanish.

In the final paper, de Mejia describes developments in enrichment bilingual education in South America. Most of these programs have been implemented in private schools with the same kinds of positive outcomes documented elsewhere. She notes that there have recently been attempts to connect the academic discourse on bilingual education across the majority/minority divide where the principles underlying programs for indigenous communities, Creole speakers, and Deaf communities are linked to those involving majority language speakers. De Mejia argues that there are significant areas of convergence between majority- and minority-oriented bilingual programs in relation to the maintenance of cultural identity, the status and development of the L1, and the importance of contextual factors in the design and modification of all bilingual education programs.

In conclusion, the chapters in this volume complement those in the corresponding volume of the first edition of the Encyclopedia in showing that bilingual education programs are expanding in contexts

around the globe, are highly successful in developing both L1 and L2 proficiency when implemented appropriately, and are always nested in contexts that are ideologically and sociopolitically complex.

GENERAL EDITOR'S INTRODUCTION<sup>1</sup>

ENCYCLOPEDIA OF LANGUAGE AND EDUCATION

This is one of ten volumes of the *Encyclopedia of Language and Education* published by Springer. The Encyclopedia bears testimony to the dynamism and evolution of the language and education field, as it confronts the ever-burgeoning and irrepressible linguistic diversity and ongoing pressures and expectations placed on education around the world.

The publication of this work charts the deepening and broadening of the field of language and education since the 1997 publication of the first Encyclopedia. It also confirms the vision of David Corson, general editor of the first edition, who hailed the international and interdisciplinary significance and cohesion of the field. These trademark characteristics are evident in every volume and chapter of the present Encyclopedia.

In the selection of topics and contributors, the Encyclopedia seeks to reflect the depth of disciplinary knowledge, breadth of interdisciplinary perspective, and diversity of sociogeographic experience in our field. Language socialization and language ecology have been added to the original eight volume topics, reflecting these growing emphases in language education theory, research, and practice, alongside the enduring emphases on language policy, literacies, discourse, language acquisition, bilingual education, knowledge about language, language testing, and research methods. Throughout all the volumes, there is greater inclusion of scholarly contributions from non-English speaking and non-Western parts of the world, providing truly global coverage of the issues in the field. Furthermore, we have sought to integrate these voices more fully into the whole, rather than as special cases or international perspectives in separate sections.

This interdisciplinary and internationalizing impetus has been immeasurably enhanced by the advice and support of the editorial advisory board members, several of whom served as volume editors in the Encyclopedia's first edition (designated here with\*), and all of whom I acknowledge here with gratitude: Neville Alexander (South Africa), Colin Baker (Wales), Marilda Cavalcanti (Brazil), Caroline Clapham\* (Britain),

---

<sup>1</sup> This introduction is based on, and takes inspiration from, David Corson's general editor's Introduction to the First Edition (Kluwer, 1997).

Bronwyn Davies\* (Australia), Viv Edwards\* (Britain), Frederick Erickson (USA), Joseph Lo Bianco (Australia), Luis Enrique Lopez (Bolivia and Peru), Allan Luke (Singapore and Australia), Tove Skutnabb-Kangas (Denmark), Bernard Spolsky (Israel), G. Richard Tucker\* (USA), Leo van Lier\* (USA), Terrence G. Wiley (USA), Ruth Wodak\* (Austria), and Ana Celia Zentella (USA).

In conceptualizing an encyclopedic approach to a field, there is always the challenge of the hierarchical structure of themes, topics, and subjects to be covered. In this *Encyclopedia of Language and Education*, the stated topics in each volume's table of contents are complemented by several cross-cutting thematic strands recurring across the volumes, including the classroom/pedagogic side of language and education; issues of identity in language and education; language ideology and education; computer technology and language education; and language rights in relation to education.

The volume editors' disciplinary and interdisciplinary academic interests and their international areas of expertise also reflect the depth and breadth of the language and education field. As principal volume editor for Volume 1, Stephen May brings academic interests in the sociology of language and language education policy, arising from his work in Britain, North America, and New Zealand. For Volume 2, Brian Street approaches language and education as social and cultural anthropologist and critical literacy theorist, drawing on his work in Iran, Britain, and around the world. For Volume 3, Marilyn Martin-Jones and Anne-Marie de Mejia bring combined perspectives as applied and educational linguists, working primarily in Britain and Latin America, respectively. For Volume 4, Nelleke Van Deusen-Scholl has academic interests in linguistics and sociolinguistics, and has worked primarily in the Netherlands and the USA. Jim Cummins, principal volume editor for Volume 5 of both the first and second editions of the *Encyclopedia*, has interests in the psychology of language, critical applied linguistics, and language policy, informed by his work in Canada, the USA, and internationally. For Volume 6, Jasone Cenoz has academic interests in applied linguistics and language acquisition, drawing from her work in the Basque Country, Spain, and Europe. Elana Shohamy, principal volume editor for Volume 7, approaches language and education as an applied linguist with interests in critical language policy, language testing and measurement, and her own work based primarily in Israel and the USA. For Volume 8, Patricia Duff has interests in applied linguistics and sociolinguistics, and has worked primarily in North America, East Asia, and Central Europe. Volume editors for Volume 9, Angela Creese and Peter Martin, draw on their academic interests in educational linguistics and linguistic ethnography, and their research in Britain and Southeast Asia. And for Volume 10, Kendall A. King has academic

interests in sociolinguistics and educational linguistics, with work in Ecuador, Sweden, and the USA. Francis Hult, editorial assistant for the Encyclopedia, has academic interests in educational and applied linguistics and educational language policy, and has worked in Sweden and the USA. Finally, as general editor, I have interests in anthropological linguistics, educational linguistics, and language policy, with work in Latin America, the USA, and internationally. Beyond our specific academic interests, all of us editors, and the contributors to the Encyclopedia, share a commitment to the practice and theory of education, critically informed by research and strategically directed toward addressing unsound or unjust language education policies and practices wherever they are found.

Each of the ten volumes presents core information and is international in scope, as well as diverse in the populations it covers. Each volume addresses a single subject area and provides 23–30 state-of-the-art chapters of the literature on that subject. Together, the chapters aim to comprehensively cover the subject. The volumes, edited by international experts in their respective topics, were designed and developed in close collaboration with the general editor of the Encyclopedia, who is a co-editor of each volume as well as general editor of the whole work.

Each chapter is written by one or more experts on the topic, consists of about 4,000 words of text, and generally follows a similar structure. A list of references to key works supplements the authoritative information that the chapters contain. Many contributors survey early developments, major contributions, work in progress, problems and difficulties, and future directions. The aim of the chapters, and of the Encyclopedia as a whole, is to give readers access to the international literature and research on the broad diversity of topics that make up the field.

The Encyclopedia is a necessary reference set for every university and college library in the world that serves a faculty or school of education. The encyclopedia aims to speak to a prospective readership that is multinational, and to do so as unambiguously as possible. Because each book-size volume deals with a discrete and important subject in language and education, these state-of-the-art volumes also offer highly authoritative course textbooks in the areas suggested by their titles.

The scholars contributing to the Encyclopedia hail from all continents of our globe and from 41 countries; they represent a great diversity of linguistic, cultural, and disciplinary traditions. For all that, what is most impressive about the contributions gathered here is the unity of purpose and outlook they express with regard to the central role of language as both vehicle and mediator of educational processes and to the need for continued and deepening research into the limits and possibilities that implies.

Nancy H. Hornberger

INTRODUCTION TO VOLUME 6: KNOWLEDGE  
ABOUT LANGUAGE

The study of knowledge about language or language awareness in education has seen important development in the last decades. Even though interest in knowledge about language goes back a long time, the publication of Hawkins' book, *Awareness of Language: An Introduction* (1984) and the Kingman Report in the UK (1988) triggered an intensified focus on reflecting about language and its importance (James, 1999). Nowadays, there is an Association for Language Awareness (<http://www.lexically.net/ala/>) which defines language awareness as '*the explicit knowledge about language, and conscious perception and sensitivity in language learning, language teaching and language use.*' Other indicators of the intense activity in the field organized by the Association for Language Awareness are the journal '*Language Awareness*' which has been published since 1993 and the Language Awareness conference which takes place every 2 years.

There are some terminological problems with the definition of 'knowledge about language' and other related terms such as 'language awareness' or 'metalinguistic awareness.' According to James (1999), there is a strong support to use 'knowledge about language,' 'language awareness' and even 'metalinguistic awareness' interchangeably. In practice, 'knowledge' and 'awareness' are used in the same way by most researchers and at the same time 'knowledge about language' and 'language awareness' are broader in scope than 'metalinguistic awareness.' 'Metalinguistic awareness' usually refers to the more specific conscious knowledge of the formal aspects of language.

The study of knowledge about language or language awareness has focused both on the mother tongue and second and foreign languages and it is clearly interdisciplinary. Some of the work in this area is educational and addresses ways of improving the teaching of languages at school and other educational settings. Another perspective considers the psycholinguistic processes involved in second language acquisition and examines the role of explicit and implicit knowledge, noticing or 'Focus on Form.' Other researchers have looked at the effect of bilingualism and multilingualism on the development of knowledge about language, in particular metalinguistic awareness. Another interesting development is that of 'critical language awareness' which analyses

social practices and language and discusses the role of power and ideology. All these perspectives are discussed in this volume.

The present volume aims at giving a state-of-the-art review of academic work on knowledge about language in education and at showing that language awareness is crucial in education. The chapters included in this volume reflect the breadth of this area and chart its possible development. Most of the reviews examine the more 'classical' areas of language awareness which can be considered as the 'core,' such as language awareness in education, critical language awareness, explicit knowledge and attention in second language acquisition. Other reviews discuss new perspectives related to knowledge about language such as awareness of the linguistic landscape or the role of technology in research on language awareness. The volume is interdisciplinary in perspective and coverage.

The volume includes a special emphasis on multilingualism and language awareness. In addition to a section on bi/multilingualism which discusses the effect of bilingualism, multilingualism and language awareness in multilingual educational contexts, most of the chapters in the volume are on second/foreign language learning and bi/multilingualism. This reflects the situation of many schools nowadays all over the world. In fact, learning a second or additional language is very common in school curricula and the school language is the second or additional language for many children who speak a minority language in the community or are immigrants.

There are 29 chapters altogether, ranging from overviews of theoretical trends and empirical studies about knowledge about language to more specific projects to develop this knowledge. The contributors come from 17 different countries from all over the world and work with different languages. In spite of this diversity, all the chapters discuss in a direct or indirect way the development of knowledge about language in education. They demonstrate that language awareness is certainly necessary for all schoolchildren at all levels.

The first section, '*Knowledge about Language and Theoretical Perspectives*,' includes seven chapters which elaborate different theoretical issues about language awareness and education. The section begins by reviewing the development of the core areas in knowledge about language and critical language awareness and goes on to discuss other related theories and proposals. Van Essen gives a historical overview of language awareness and knowledge about language and goes back to Wilhelm von Humboldt's ideas as a source of inspiration for the study of language awareness. Cots offers a state-of-the-art view of studies on knowledge about language and highlights the two main trends: psycholinguistic and educational. The next two chapters, by Janks and by Locke and Norton, adopt a critical approach to the study

of language awareness by exploring power and identity aspects of the relationship between language and society. Kasper examines the way cognition is addressed in social interaction, from the perspective of ethnomethodology, conversation analysis and discursive psychology. Verspoor provides information about cognitive linguistics and explores its applicability to second language acquisition and second language teaching. Rajagopalan closes the section with a summary of different perspectives on the study of emotion, and draws some implications for language education and second language learning.

Section two looks at '*Knowledge about Language and Language Learning.*' This section discusses psycholinguistic aspects of language awareness, in relation to both first and second language acquisition. Kovacevic explores language awareness in first language acquisition both in the situations of acquiring one single language and early bilingual development. The next three papers by N. Ellis, Robinson and R. Ellis focus on some of the psycholinguistic processes of second language acquisition. These chapters discuss crucial research in knowledge about language in second language acquisition and offer insights into concepts such as explicit and implicit knowledge, noticing, attention and Focus on Form. The next four chapters by Piske, Nation, Sharwood Smith and Alcón and Safont also explore the relationship between language awareness and second language acquisition, focusing on phonetic, lexical, morphological, syntactic and pragmatic awareness. These four reviews give a picture of the role of the specific knowledge about language in the different linguistic levels when acquiring a second language. In the final review of this section, Ranta discusses metalinguistic knowledge in oral production in a second language and elaborates on concepts such as structured input and output practice and corrective feedback.

The third section, '*Knowledge about Language, the Curriculum, the Classroom and the Teacher,*' includes seven chapters which highlight the importance of language awareness in education. Some of the reviews provide specific examples of projects and methodological approaches to foster knowledge about language while others discuss aspects related to the curriculum or the teacher. This section provides a pedagogical focus and can be very useful not only for researchers but also for practitioners. Candelier discusses two European projects to develop an awakening to languages. The idea is to carry out activities with languages not included in the school curriculum so as to develop positive attitudes and knowledge required for individual development in multilingual and multicultural contexts. Marsh discusses 'Content and Language Integrated Learning,' a European approach which uses the foreign language as the medium of instruction, and demonstrates its benefits to develop language awareness. Little focuses on another angle of language awareness, elaborating on learner autonomy understood as a particular instance

of a general human capacity which can be exploited and developed further as learners acquire communicative and metacognitive proficiency in their target second language. The next two entries by Tsui and Fenner focus on the classroom but discuss different aspects of knowledge about language. Tsui reviews research on the linguistic and non-linguistic elements involved in classroom interaction and she highlights the role of the sociocultural context in shaping classroom discourse. Fenner argues that cultural awareness is not an addition to the study of a foreign language but an integral part of second language learning. She highlights the need to develop cultural awareness and to learn a second language 'through' culture. Andrews looks at teacher language awareness understood as the interface between teachers' knowledge about language and their pedagogical practice. He provides an overview of the development of teacher language awareness and its main challenges. In the final review in this section, Sanz and Lado focus on the role of technology in research in second language acquisition and on the advantages of technology in the design of specific treatments in research studies. The use of new technologies in the study of language awareness provides access to new information regarding instruments and data collection techniques.

The fourth section, '*Knowledge about Language, Bilingualism and Multilingualism*,' includes six articles, which take up various psycholinguistic, sociolinguistic, and educational approaches to multilingualism and language awareness. Baker discusses metalinguistic awareness as related to bilingualism, code-switching, interpretation and language brokering and remarks that there are still important limitations in the field. The next two chapters approach the relationship between language awareness and bi/multilingualism from a sociolinguistic and social psychological perspective. Ó Riagáin discusses language attitudes as related to minority languages and the research methods used to assess attitudes in bilingual and multilingual contexts. This chapters shows the complexity of the concept of attitudes and the different roles of minority and majority languages in the solidarity and status dimensions. Gorter and Cenoz focus on the study of the linguistic landscape understood as the study of public and private language signs. They relate linguistic landscape to language awareness and language learning and summarize studies conducted in different multilingual contexts. They also focus on the different research methodologies used in the study of the linguistic landscape and its perception. Jessner goes beyond bilingualism and examines metalinguistic awareness in multilinguals. She highlights the interdisciplinary nature of studies in multilingualism by focusing on contributions coming from linguistics, developmental psychology and educational linguistics. The last two chapters in the volume focus on multilingual classrooms. Helot looks at an applied issue, discussing models of language education that can foster positive attitudes towards multilingualism at primary level.

She considers different ways to promote language awareness in general and also explains the Didenheim project, built on a collaborative approach with parents in an effort to move from monolingual attitudes to a situation in which multilingualism is valued. In the last chapters in this volume, García focuses on multilingual awareness in teacher education and argues that it should be the core of teacher education programs in today's multilingual schools. She describes the different degrees of multilingual awareness and its central role in education.

All in all, these 29 contributions provide an informative introduction to the complexities and controversies in this developing field of knowledge. The collection as a whole covers a broad spectrum of approaches, from educational to psycholinguistic and sociolinguistic including the study of critical language awareness. The volume adopts an interdisciplinary approach and illuminates the crucial role of language awareness in education.

## GENERAL EDITOR'S INTRODUCTION<sup>1</sup>

### ENCYCLOPEDIA OF LANGUAGE AND EDUCATION

This is one of ten volumes of the *Encyclopedia of Language and Education* published by Springer. The Encyclopedia bears testimony to the dynamism and evolution of the language and education field, as it confronts the ever-burgeoning and irrepressible linguistic diversity and ongoing pressures and expectations placed on education around the world.

The publication of this work charts the deepening and broadening of the field of language and education since the 1997 publication of the first Encyclopedia. It also confirms the vision of David Corson, general editor of the first edition, who hailed the international and interdisciplinary significance and cohesion of the field. These trademark characteristics are evident in every volume and chapter of the present Encyclopedia.

In the selection of topics and contributors, the Encyclopedia seeks to reflect the depth of disciplinary knowledge, breadth of interdisciplinary perspective, and diversity of sociogeographic experience in our field. Language socialization and language ecology have been added to the original eight volume topics, reflecting these growing emphases in language education theory, research, and practice, alongside the enduring emphases on language policy, literacies, discourse, language acquisition, bilingual education, knowledge about language, language testing, and research methods. Throughout all the volumes, there is greater inclusion of scholarly contributions from non-English speaking and non-Western parts of the world, providing truly global coverage of the issues in the field. Furthermore, we have sought to integrate these voices more fully into the whole, rather than as special cases or international perspectives in separate sections.

This interdisciplinary and internationalizing impetus has been immeasurably enhanced by the advice and support of the editorial advisory board members, several of whom served as volume editors in the Encyclopedia's first edition (designated here with\*), and all of whom I acknowledge here with gratitude: Neville Alexander (South Africa), Colin Baker (Wales), Marilda Cavalcanti (Brazil), Caroline Clapham\* (Britain),

---

<sup>1</sup> This introduction is based on, and takes inspiration from, David Corson's general editor's Introduction to the First Edition (Kluwer, 1997).

Bronwyn Davies\* (Australia), Viv Edwards\* (Britain), Frederick Erickson (USA), Joseph Lo Bianco (Australia), Luis Enrique Lopez (Bolivia and Peru), Allan Luke (Singapore and Australia), Tove Skutnabb-Kangas (Denmark), Bernard Spolsky (Israel), G. Richard Tucker\* (USA), Leo van Lier\* (USA), Terrence G. Wiley (USA), Ruth Wodak\* (Austria), and Ana Celia Zentella (USA).

In conceptualizing an encyclopedic approach to a field, there is always the challenge of the hierarchical structure of themes, topics, and subjects to be covered. In this *Encyclopedia of Language and Education*, the stated topics in each volume's table of contents are complemented by several cross-cutting thematic strands recurring across the volumes, including the classroom/pedagogic side of language and education; issues of identity in language and education; language ideology and education; computer technology and language education; and language rights in relation to education.

The volume editors' disciplinary and interdisciplinary academic interests and their international areas of expertise also reflect the depth and breadth of the language and education field. As principal volume editor for Volume 1, Stephen May brings academic interests in the sociology of language and language education policy, arising from his work in Britain, North America, and New Zealand. For Volume 2, Brian Street approaches language and education as a social and cultural anthropologist and critical literacy theorist, drawing on his work in Iran, Britain, and around the world. For Volume 3, Marilyn Martin-Jones and Anne-Marie de Mejía bring combined perspectives as applied and educational linguists, working primarily in Britain and Latin America, respectively. For Volume 4, Nelleke Van Deusen-Scholl has academic interests in linguistics and sociolinguistics, and has worked primarily in the Netherlands and the USA. Jim Cummins, principal volume editor for Volume 5 of both the first and second editions of the *Encyclopedia*, has interests in the psychology of language, critical applied linguistics, and language policy, informed by his work in Canada, the USA, and internationally. For Volume 6, Jasone Cenoz has academic interests in applied linguistics and language acquisition, drawing from her work in the Basque Country, Spain, and Europe. Elana Shohamy, principal volume editor for Volume 7, approaches language and education as an applied linguist with interests in critical language policy, language testing and measurement, and her own work based primarily in Israel and the USA. For Volume 8, Patricia Duff has interests in applied linguistics and sociolinguistics, and has worked primarily in North America, East Asia, and Central Europe. Volume editors for Volume 9, Angela Creese and Peter Martin, draw on their academic interests in educational linguistics and linguistic ethnography, and their research in Britain and Southeast Asia. And for Volume 10, Kendall A. King has academic interests in sociolinguistics

and educational linguistics, with work in Ecuador, Sweden, and the USA. Francis Hult, editorial assistant for the Encyclopedia, has academic interests in educational and applied linguistics and educational language policy, and has worked in Sweden and the USA. Finally, as general editor, I have interests in anthropological linguistics, educational linguistics, and language policy, with work in Latin America, the USA, and internationally. Beyond our specific academic interests, all of us editors, and the contributors to the Encyclopedia, share a commitment to the practice and theory of education, critically informed by research and strategically directed toward addressing unsound or unjust language education policies and practices wherever they are found.

Each of the ten volumes presents core information and is international in scope, as well as diverse in the populations it covers. Each volume addresses a single subject area and provides 23–30 state-of-the-art chapters of the literature on that subject. Together, the chapters aim to comprehensively cover the subject. The volumes, edited by international experts in their respective topics, were designed and developed in close collaboration with the general editor of the Encyclopedia, who is a co-editor of each volume as well as general editor of the whole work.

Each chapter is written by one or more experts on the topic, consists of about 4,000 words of text, and generally follows a similar structure. A list of references to key works supplements the authoritative information that the chapter contains. Many contributors survey early developments, major contributions, work in progress, problems and difficulties, and future directions. The aim of the chapters, and of the Encyclopedia as a whole, is to give readers access to the international literature and research on the broad diversity of topics that make up the field.

The Encyclopedia is a necessary reference set for every university and college library in the world that serves a faculty or school of education. The Encyclopedia aims to speak to a prospective readership that is multinational, and to do so as unambiguously as possible. Because each book-size volume deals with a discrete and important subject in language and education, these state-of-the-art volumes also offer highly authoritative course textbooks in the areas suggested by their titles.

The scholars contributing to the Encyclopedia hail from all continents of our globe and from 41 countries; they represent a great diversity of linguistic, cultural, and disciplinary traditions. For all that, what is most impressive about the contributions gathered here is the unity of purpose and outlook they express with regard to the central role of language as both vehicle and mediator of educational processes and to the need for continued and deepening research into the limits and possibilities that implies.

Nancy H. Hornberger

## INTRODUCTION TO VOLUME 7: LANGUAGE TESTING AND ASSESSMENT

This volume addresses the broad theme and specific topics associated with current thinking in the field of language testing and assessment. Interdisciplinary in its nature, language testing and assessment build on theories and definitions provided by linguistics, applied linguistics, language acquisition and language teaching, as well as on the disciplines of testing, measurement and evaluation. Language testing uses these disciplines as foundations for researching, theorizing and constructing valid language tools for assessing and judging the quality of language.

The field of language testing is therefore viewed as consisting of two major components: one focusing on the ‘what’, referring to the constructs that need to be assessed (also known as ‘the trait’); and the other component pertaining to the ‘how’ (also known as ‘the method’), which addresses the specific procedures and strategies used for assessing the ‘what’. Traditionally, ‘the trait’ has been defined by the language testing field; these definitions have provided the essential elements for creating language tests. The ‘how’, on the other hand, is derived mostly from the field of testing and measurement which has, over the years, developed a broad body of theories, research, techniques and practices about testing and assessment. Language testers incorporated these two areas to create the discipline of language testing and assessment, a field which includes theories, research and applications; it has its own research publications, conferences and two major journals, *Language Testing* and *Language Assessment Quarterly*, where many of these publications appear.

An examination of the developments in the language testing and assessment field since the 1960’s reveals that its theories and practices have always been closely related to definitions of language proficiency. Matching the ‘how’ of testing with the ‘what’ of language uncovers several periods in the development of the field, with each one instantiating different notions of language knowledge along with specific measurement procedures that go with them. Thus, discrete-point testing viewed language as consisting of lexical and structural items so that the language tests of that era presented isolated items in objective testing procedures. In the integrative era, language tests tapped integrated

and discursual language; in the communicative era, tests aimed to replicate interactions among language users utilizing authentic oral and written texts; and in the performance testing era, language users were expected to perform tasks taken from 'real life' contexts. Alternative assessment was a way of responding to the realization that language knowledge is a complex phenomenon, which no single procedure can be expected to capture. Assessing language knowledge therefore requires multiple and varied procedures that complement one another.

While we have come to accept the centrality of the 'what' to the 'how' trajectory for the development of tests, extensive work in the past decade points to a less overt but highly influential dynamic in another direction. This dynamic has to do with the pivotal roles that tests play in societies in shaping the definitions of language, in affecting learning and teaching, and in maintaining and creating social classes. This means that contemporary assessment research perceives its obligations as being to examine the close relationship between methods and traits in broader contexts and to focus on how language tests interact with societal factors, given their enormous power. In other words, as language testers seek to develop and design methods and procedures for assessment (the 'how') they become mindful not only of the emerging insights regarding the trait (the 'what'), and its multiple facets and dimensions, but also of the societal role that language tests play, the power that they hold, and their central functions in education, politics and society.

In terms of the interaction of society and language, it is evident that changes are currently occurring in the broader contexts and spaces in which language testing takes place. It is being realized nowadays that language testing is not occurring in homogenous, uniform and isolated contexts but, rather, in diverse, multilingual and multicultural societies and thus posing new challenges and questions with regards to what it means to know language(s) in education and society. For example, different meanings of language knowledge may be associated with learning foreign languages, second languages, language by immersion, heritage languages, languages of immigrants arriving to new places with no knowledge of the new languages, and the languages of those defined as 'trans-nationals'. Knowing the English language, the current world's *lingua franca*, is different from knowing other languages. Similarly, the language of classrooms and schools may be different from that of the workplaces or communities where bi- or multi-lingual patterns are the norm. Each of these contexts may require different and varied theories of language knowledge and hence different definitions, applications and methods of measuring these proficiencies.

In other words, the languages currently being used in different societies in different contexts, no longer represent uniform constructs as

these vary from one place to another, from one context to another, creating different language patterns, expectations and goals, and often resulting in hybrids and fusions, especially with regards to English. Such dynamic linguistic phenomena pose challenging problems to language testers. What is the language (or languages) that needs to be assessed? Where can it be observed in the best ways? Is it different at home, in schools, in classrooms and in the workplace? Should hybrids and fusions be assessed and how? Can levels of languages even be defined? How should language proficiency be reported and to whom? What is 'good language'? Does such a term even apply? Who should decide how tests should be used? Do testers have an obligation to express their views about language and testing policy? What is the responsibility of testers to language learning and language use in classrooms and communities? How can ethical and professional behaviours with regards to tests be maintained?

These are some of the questions that language testers are currently pre-occupied with. Language testers are not technicians that just invent better and more sophisticated testing tools. Rather, they are constantly in search for and concerned with the 'what' and its complex meanings. Going beyond 'general testing', the unique aspect of *language* testing is that it is an integral part of a defined discipline, that of 'language'. In this respect, language testers and the field of language testing are different from the field of 'general testing' in that language testers are confined to a specific discipline and are therefore in constant need of asking such language-related questions as listed above in order to develop valid language assessment tools.

The concern of language testers in the past decade about the use of tests and their political, social, educational and ethical dimensions has made the field even more complex and uncertain and in need of new questions and debates. The current era can be described as the era of uncertainty, where questions are being raised about the meaning of language and the possibilities for measuring this complex and dynamic variable. At the same time, it is an era of an ever more compelling need to ensure that these tests are reliable and valid, where validity includes the protection and guarding of the personal rights of others, as well as positive washback on learning by addressing the diverse communities in which the tests are used. Thus, the current era is not only concerned with a broader and more complex view of what it means to know a language, or with innovative methods of testing and assessment of complex constructs, but also with how these tests can be more inclusive, democratic, just, open, fair and equal and less biased. Even within the use of traditional large-scale testing, the field is asking questions about tests' use: Why test? Who benefits, who loses? What are the impacts on, and consequences for definitions of

language in relation to people, education, language policy, and society? Tests are not viewed as innocent tools, but rather as instruments that play central roles for people, education and societies. Language testers, therefore, are asked to deal with broader issues: to examine the uses of tests in the complex multilingual and multicultural societies where tests are used, not only as naïve measurement tools, but also as powerful educational, societal and political devices.

This is the conceptual premise of this volume of the *Encyclopedia of Language and Education on Language and Assessment*. It aims to cover (and uncover) the multiple versions and perspectives of the ‘what’ of languages along with the multiple approaches developed for assessment of the ‘what’, especially given the multiplicity of languages used by many diverse groups of learners in many different contexts. It aims to focus on the societal roles of language testers and their responsibility to be socially accountable and to ensure ethicality and professionalism. A special focus is given in this volume to the multilingual and diverse contexts in which language testing and assessment are currently anchored, and the difficult task of ‘doing testing’ in this complex day and age.

Accordingly, the first part of the volume addresses the ‘what’ of language testing and assessment. It no longer divides language into neat and clear-cut skills of reading, writing, speaking and listening, but rather examines the ‘what’ of language in the diverse contexts in which it is used. Rather than proposing one uniform way of defining the language construct, the chapters in Part 1 present language from multiple perspectives. It begins with a chapter by Alister Cumming who reviews research and practices of language assessment from the perspectives of oral and literate modes of communication and their meanings in relation to language competencies, language learning and multimodalities. He notes that language assessment needs to be informed and extended by multiple forms of evidence in relation to educational purposes as well as diverse societies. Rama Mathew surveys developments in language assessment from the perspective of multilingual competencies as manifested in the case of India. She highlights the legitimacy of a multilingual reality in many societies nowadays, and emphasises the need to answer this call for different ways of thinking about language assessments. This is demonstrated through a survey of multilingual and multi-dialectal tests for assessing English. She then raises a number of assessment issues that emerge in these complex realities. Heidi Byrnes focusses on the role of ‘content’ as part of language proficiency as it is closely embedded with language. By using a Hallidayan approach to texts and knowledge, she shows how assessment can be interpreted as part of a set of sophisticated text meanings as well as part of knowledge that is relevant to handling content and granting differing

priority to various elements of texts and their contribution to content. These approaches are anchored within multilingualism, mainstream L2 curricula and second language literacy of diverse professional contexts, needed for 'global literacy'.

Jim Purpura applies the 'Communicative Language Ability' framework to the task of defining language and uses it as the basis for test development. By surveying the different theoretical models (and the tests developed based on them), he argues that these models represent targets of assessment that can be adapted for a range of test purposes and contexts, which consist of both grammatical and pragmatic knowledge. Accordingly, tests which are developed based on such models can help to better understand the components underlying communicative language ability, and can also help to provide useful diagnostic information to learners. Kieran O'Loughlin examines language from the angle of the workplace, focussing on language as related to the occupational purposes of professional duties. He provides a review of historical and current practices of performance-based tests related to 'real world' functions and tasks in a number of professional areas. At the same time, he is sceptical of the future of these tests, given the spread of large-scale standardized tests. Stansfield and Winke provide a somewhat different perspective of the language construct by re-visiting language aptitude. They re-define language aptitude by expanding its meaning to include second language learning aspects such as the diagnosis and treatment of L2 learning problems in order to inform curricular design and to examine the relationship between working memory and L2 learning across a range of cognitive abilities. They survey the types of aptitude tests that are in line with these new theoretical constructs and raise questions about the validity of these tests and their uses. Together, these six chapters provide multiple perspectives of the language construct and assessment practices associated with it. As these chapters demonstrate, definitions of language cannot be detached from the diverse contexts in which they are used.

The second part of the volume addresses the diverse methodological issues that language testers face in assessing the complex construct of language: that is, the 'how'. These chapters demonstrate the sophisticated issues and deliberations as well as specific procedures used for assessing language. In the first chapter, Janna Fox reviews the developments in, and outlines the procedures of alternative assessment. She expands the theoretical perspective not only by providing a longer list of 'alternatives', but also by asking whether alternative assessment represents a real paradigm shift or just additional procedures that actually preserve traditional methods of testing. She then expands the notion by incorporating different ways of thinking about testing in alternative modes, including accommodations, dynamic assessment

and ethical, democratic, and equitable values. One of the dominant cases of alternative assessment is that of task and performance, issues that Jill Wigglesworth reviews in a chapter which focusses on the tasks designed to measure learners' productive language skills through performances related to real world contexts (e.g. the workplace). She surveys the vast research literature on this topic, demonstrating the value of certain performance tests, the effect on task quality of certain variables, such as difficulty levels, cognitive demands, type of discourse they produce, as well as the extent to which they indeed represent 'real life'. In continuation with the discussion of the variety of possible assessment methods, Carol Chapelle delineates the new and current methods of utilizing technology in language assessment—(i.e. Computer-Assisted Testing (CAT)) by reviewing tests using Micro computers and the Internet, and analysing them not only in terms of their greater efficiency but also in terms of the serious problems that they pose. She surveys research on multimedia testing and its effects on learners in relation to specific skills such as listening, natural language processing, and written and spoken language. Issues of cost, training, access to infrastructure, and the intersections with construct validity are brought up, along with the question of whether computerized testing has been evolutionary or revolutionary.

While the debates on the appropriate methods of assessment are taking place, large-scale testing continues to be administered with even more force than ever before by governments and educational systems worldwide. In schools, tests are used for diagnostic purposes and to monitor students' progress (through standardized tests); at college and university levels, tests are used for the screening and selection of applicants. Antony Kunnan discusses these issues and raises questions about the advantages of uniformity of tests for the sake of fairness. He reviews the history of large-scale testing and provides safeguards for fairness in the form of descriptive test information, codes of practices, test design and psychometric qualities.

Criteria for language assessment, such as the Common European Framework, have been receiving major attention and gaining dominance over the past decade, especially with regards to their effects on the definitions of language and language policy. Glenn Fulcher provides a comprehensive description of the methods used for examining the quality of language via rating scales, standards, benchmarks, band levels, frameworks and guidelines. He shows the advantages and disadvantages of these tools in terms of validity of progression, equivalence across languages, hierarchies, false claims and their effects on definitions of language beyond serving as criteria for language evaluation.

The field of psychometrics has gone through major changes as it has attempted to accommodate the more complex tests and tasks so that

they will pass criteria of reliability, validity and ethicality. The chapter by Xiaoming Xi provides a comprehensive examination of these issues and updated methods of test validation. She shows how advances in validity benefit from progress in educational measurement, psychometrics and statistics, qualitative methods, discourse analysis, cognitive psychology as well as introspective methods about tasks' complexity. Anne Lazaraton introduces new ways of utilizing qualitative methods for designing, describing and validating language tests, a topic that is gaining acceptance and legitimacy within the field of language testing, especially given the limitations of traditional statistical methods. She demonstrates how qualitative methods can provide indication of the quality of tests both on the process and the product levels. The chapter co-authored by Micheline Chaloub-Deville and Craig Deville examines the common psychometric methods that are used in the field through a review and analysis of language testing research as reported in highly regarded testing journals. They show the multiple and varied methods which are used in testing research.

Margaret Malone introduces the topic of training and teaching about language testing given the vast amount of knowledge available today so that testers can make informed decisions throughout the assessment process about test development, scoring, interpretation, selection and administration of tests. She introduces the term 'assessment literacy' to refer to the required knowledge about testing and its multiple interpretations. Another new topic relates to the emerging field of corpus linguistics. In the chapter by Linda Taylor and Fiona Baker they illustrate how the field of corpus linguistics has become an important and relevant source of accurate language data which is useful for constructing tests based on scientific and empirical language documentation. Together, the chapters in Part 2 present multiple methods of language assessment while responding to current changes in the definitions of language.

Part 3 of the volume addresses issues of language testing as they are embedded in educational systems and contexts, where language tests are so widely used. It is in the educational system that tests and various assessment methods serve as major tools for: assessing language for learning and teaching, making decisions about programmes, teachers and learners, and finally creating changes that lead to school reforms and that bring intended and un-intended washbacks in classrooms and schools. Pauline Rae-Dickins opens Part 3 with a chapter focusing on classroom assessment, an area which is rather overlooked in relation to external high-stakes testing. She makes the distinction between assessment *of* learning (that is focused on achievement and summative in orientation) and assessment *as* learning (formative in its purpose, providing feedback to learners so that they can improve

their learning). She points to the ample progress in the latter area in the past decade and surveys studies of the many uses of different assessment tools in the classroom for feedback and effective instructional methods. Another new topic receiving recognition recently is that of Dynamic Assessment. Lantolf and Poehner introduce the topic in the context of language testing by applying Vygotsky's sociocultural theories to show how testing and learning are closely connected. This approach leads to effective learning *through* testing, as it is revealed that tests are embedded *in* learning and can therefore also contribute to its improvement. Another new development is the increased attention to assessment as part of effective learning and teaching in schools. Ofra Inbar reviews studies that address the topic of 'testing culture', showing how the use of ongoing assessment in schools is an integral part of effective and beneficial learning, as well as of school organization.

It is the realization that current schools are diverse in terms of students' languages and cultural backgrounds that has led to different assessment approaches especially with regards to immigrants and indigenous populations. Using tests in the dominant school languages poses great difficulties for these students who are engaged in language acquisition while attempting to acquire school contents. Several chapters in Part 3 address these issues. Constant Leung and Jo Lewkowicz provide an overview of the types of assessment procedures used in diverse multilingual and plurilingual communities in the context of second language assessment designed to measure language development of linguistic minority students where another language is the majority language. They note that new developments in this area are indicative of more progressive views, which recognize the multifaceted value of language proficiency. Cath Rau discusses assessment strategies for indigenous populations in schools in places where indigenous groups make up a big part of the population, as in the case of the Maōri and other groups in New Zealand. She surveys descriptions of a number of strategies used to practice testing in fairer ways, incorporating existing language knowledge.

Test accommodations refer to strategies used for language learners to assess their content knowledge while compensating for lack of language knowledge in order to create fairer testing conditions for those for whom the language of assessment is their second language. Jamal Abedi reviews the extensive research that has been conducted in the past decade on the topic, examining effective accommodations for language learners, mostly in the context of English language learners in the USA. He brings evidence from research about different types of accommodations in content areas such as Mathematics while being critical of the uses of some accommodations that have no empirical bases.

Issues of washback and impact of large-scale testing on teaching and learning have stimulated ample research and writings in the past decade. The chapter by Liying Cheng surveys the large number of empirical studies that have documented the effects and impacts that tests have on learning, teaching and curriculum development. It is evident that test washback is considered nowadays as an integral part of construct validity since it is incorporated in developments of large-scale tests. Geoff Brindley demonstrates how language tests are used by governments to reform educational systems, pointing to serious problems related to the practice of relying exclusively on tests for educational reform. Alison Bailey addresses methods and techniques used for assessing the language of young learners in schools, pointing to the different strategies of these kinds of tests compared with those used for adults. This topic is gaining major attention nowadays with the growing number of young learners of English worldwide. Taken together, the chapters in Part 3 cover a wide range of topics related to broad issues of language assessment in education, especially amidst the changing realities of school demographics with regards to diverse populations and the use of tests in bringing about educational reform.

The fourth and concluding part of the volume addresses societal, political, professional and ethical dimensions of tests; a topic that has been a major concern in the language testing field over the past decade. Each of the four chapters addresses different aspects of these dimensions. The chapter by Kate Menken illustrates how national language tests, especially those administered by government initiatives (e.g. the No Child Left Behind mandate in the US) affect language policy in schools and societies and deliver direct messages about the significance and insignificance of certain languages and language instruction policies. She shows how language testing and language policy are closely connected, arguing that language tests have a greater effect than is viewed on the surface. This is especially relevant in contexts that include learners for whom the language of the test affects their ability to perform academically. Tim McNamara explains the need for taking into account the social and political dimensions of tests versus the structuralist and psychometric dimensions which have previously dominated academic discussions around language testing. In his chapter, he surveys various social theories of linguistics and their important input into the field of language testing, with special attention to the work of Messick, who described the values and consequences of tests as part of construct validity. He surveys studies and cases where language tests are used unjustly, such as in determining citizenship, employment and the status of asylum seekers. Alan Davies, who has written extensively on the ethical dimensions of tests and especially on the professional aspects related to ethicality, addresses these issues by covering the developments in the language

testing field, showing how the Code of Ethics and Code of Practice, developed by the language testing profession via the International Language Testing Association (ILTA), can lead to the more ethical use of tests. He warns against the use of such codes as face-saving devices, action which, Davies argues, overlooks the real commitment to ethics that is instrumental for the profession itself, for its stakeholders and for the rights of individual test-takers. The final chapter, by Bernard Spolsky, examines the past, present and future of the field of language testing, providing guidance and direction for future vision. He surveys the history of the field with its advances as well as the ample questions and uncertainties that emerge and that need to be addressed in the future, while pointing to the contradictions, problems and difficulties of measuring and assessing such a complex construct as ‘language’. He ends the chapter by stating that he remains sceptical given the role of industrial test-makers in computerizing tests and in reducing multidimensional profiles into uniform scales, and also given that educational systems continue to interpret test scores as if they are meaningful. At the same time, he expects the quality research that has been conducted in the field of language testing to continue—especially that which has been conducted in relation to the ‘nature’ of language proficiency and the diverse approaches to assessing it in defined social contexts.

I would like to thank each and every author of these chapters, which together make up a most valuable contribution to current thinking in the field of language testing and applied linguistics. The authors selected to write these chapters are among the most distinguished scholars and leaders in the field of language testing. The chapters herein reveal that the language testing field is dynamic, striving and vital. It is clear from these chapters that the field of language testing raises important and deep questions and does not overlook problems, difficulties, contradictions, malpractices and new societal realities and needs. While viewed by some as a technical field, this volume convincingly demonstrates that language testing and assessment is above all a scholarly and intellectual field that touches the essence of languages and their meanings. The need to get engaged in testing and assessment forces testers to face these issues head-on and attempt to deliberate on creative and thoughtful solutions.

Finally, special personal and deep thanks to Caroline Clapham who in her 1997 volume on Language Testing in the first edition of the *Encyclopedia of Language and Education* set the foundations and grounds for the field in such insightful and thorough ways that it has now been possible to expand and create this very comprehensive and stimulating volume.

GENERAL EDITOR'S INTRODUCTION<sup>1</sup>

ENCYCLOPEDIA OF LANGUAGE AND EDUCATION

This is one of ten volumes of the *Encyclopedia of Language and Education* published by Springer. The Encyclopedia bears testimony to the dynamism and evolution of the language and education field, as it confronts the ever-burgeoning and irrepressible linguistic diversity and ongoing pressures and expectations placed on education around the world.

The publication of this work charts the deepening and broadening of the field of language and education since the 1997 publication of the first Encyclopedia. It also confirms the vision of David Corson, general editor of the first edition, who hailed the international and interdisciplinary significance and cohesion of the field. These trademark characteristics are evident in every volume and chapter of the present Encyclopedia.

In the selection of topics and contributors, the Encyclopedia seeks to reflect the depth of disciplinary knowledge, breadth of interdisciplinary perspective, and diversity of sociogeographic experience in our field. Language socialization and language ecology have been added to the original eight volume topics, reflecting these growing emphases in language education theory, research, and practice, alongside the enduring emphases on language policy, literacies, discourse, language acquisition, bilingual education, knowledge about language, language testing, and research methods. Throughout all the volumes, there is greater inclusion of scholarly contributions from non-English speaking and non-Western parts of the world, providing truly global coverage of the issues in the field. Furthermore, we have sought to integrate these voices more fully into the whole, rather than as special cases or international perspectives in separate sections.

This interdisciplinary and internationalizing impetus has been immeasurably enhanced by the advice and support of the editorial advisory board members, several of whom served as volume editors in the Encyclopedia's first edition (designated here with\*), and all of whom I acknowledge here with gratitude: Neville Alexander (South Africa), Colin Baker (Wales), Marilda Cavalcanti (Brazil), Caroline Clapham\* (Britain),

---

<sup>1</sup> This introduction is based on, and takes inspiration from, David Corson's general editor's Introduction to the First Edition (Kluwer, 1997).

Bronwyn Davies\* (Australia), Viv Edwards\* (Britain), Frederick Erickson (USA), Joseph Lo Bianco (Australia), Luis Enrique Lopez (Bolivia and Peru), Allan Luke (Singapore and Australia), Tove Skutnabb-Kangas (Denmark), Bernard Spolsky (Israel), G. Richard Tucker\* (USA), Leo van Lier\* (USA), Terrence G. Wiley (USA), Ruth Wodak\* (Austria), and Ana Celia Zentella (USA).

In conceptualizing an encyclopedic approach to a field, there is always the challenge of the hierarchical structure of themes, topics, and subjects to be covered. In this *Encyclopedia of Language and Education*, the stated topics in each volume's table of contents are complemented by several cross-cutting thematic strands recurring across the volumes, including the classroom/pedagogic side of language and education; issues of identity in language and education; language ideology and education; computer technology and language education; and language rights in relation to education.

The volume editors' disciplinary and interdisciplinary academic interests and their international areas of expertise also reflect the depth and breadth of the language and education field. As principal volume editor for Volume 1, Stephen May brings academic interests in the sociology of language and language education policy, arising from his work in Britain, North America, and New Zealand. For Volume 2, Brian Street approaches language and education as social and cultural anthropologist and critical literacy theorist, drawing on his work in Iran, Britain, and around the world. For Volume 3, Marilyn Martin-Jones and Anne-Marie de Mejia bring combined perspectives as applied and educational linguists, working primarily in Britain and Latin America, respectively. For Volume 4, Nelleke Van Deusen-Scholl has academic interests in linguistics and sociolinguistics, and has worked primarily in the Netherlands and the USA. Jim Cummins, principal volume editor for Volume 5 of both the first and second editions of the *Encyclopedia*, has interests in the psychology of language, critical applied linguistics, and language policy, informed by his work in Canada, the USA, and internationally. For Volume 6, Jasone Cenoz has academic interests in applied linguistics and language acquisition, drawing from her work in the Basque Country, Spain, and Europe. Elana Shohamy, principal volume editor for Volume 7, approaches language and education as an applied linguist with interests in critical language policy, language testing and measurement, and her own work based primarily in Israel and the USA. For Volume 8, Patricia A. Duff has interests in applied linguistics and sociolinguistics, and has worked primarily in North America, East Asia, and Central Europe. Volume editors for Volume 9, Angela Creese and Peter Martin, draw on their academic interests in educational linguistics and linguistic ethnography, and their research in Britain and Southeast Asia. And for Volume 10, Kendall A. King has academic interests in sociolinguistics

and educational linguistics, with work in Ecuador, Sweden, and the USA. Francis Hult, editorial assistant for the Encyclopedia, has academic interests in educational and applied linguistics and educational language policy, and has worked in Sweden and the USA. Finally, as general editor, I have interests in anthropological linguistics, educational linguistics, and language policy, with work in Latin America, the USA, and internationally. Beyond our specific academic interests, all of us editors, and the contributors to the Encyclopedia, share a commitment to the practice and theory of education, critically informed by research and strategically directed toward addressing unsound or unjust language education policies and practices wherever they are found.

Each of the ten volumes presents core information and is international in scope, as well as diverse in the populations it covers. Each volume addresses a single subject area and provides 23–30 state-of-the-art chapter of the literature on that subject. Together, the chapters aim to comprehensively cover the subject. The volumes, edited by international experts in their respective topics, were designed and developed in close collaboration with the general editor of the Encyclopedia, who is a co-editor of each volume as well as general editor of the whole work.

Each chapter is written by one or more experts on the topic, consists of about 4,000 words of text, and generally follows a similar structure. A list of references to key works supplements the authoritative information that the review contains. Many contributors survey early developments, major contributions, work in progress, problems and difficulties, and future directions. The aim of the chapters, and of the Encyclopedia as a whole, is to give readers access to the international literature and research on the broad diversity of topics that make up the field.

The Encyclopedia is a necessary reference set for every university and college library in the world that serves a faculty or school of education. The encyclopedia aims to speak to a prospective readership that is multinational, and to do so as unambiguously as possible. Because each book-size volume deals with a discrete and important subject in language and education, these state-of-the-art volumes also offer highly authoritative course textbooks in the areas suggested by their titles.

The scholars contributing to the Encyclopedia hail from all continents of our globe and from 41 countries; they represent a great diversity of linguistic, cultural, and disciplinary traditions. For all that, what is most impressive about the contributions gathered here is the unity of purpose and outlook they express with regard to the central role of language as both vehicle and mediator of educational processes and to the need for continued and deepening research into the limits and possibilities that implies.

Nancy H. Hornberger

## INTRODUCTION TO VOLUME 8: LANGUAGE SOCIALIZATION

Since the late 1970s, considerable research has been conducted on how children and other novices become both communicatively and culturally competent within their homes, schools, and other discourse communities. The research has examined spoken, written, signed, and additional linguistic and semiotic systems people use to convey meanings. It has also studied the identities, stances or values, and practices that characterize membership in a particular cultural group that newcomers are expected to appropriate when learning language.

This eighth volume of the *Encyclopedia of Language and Education*, with its focus on language socialization, has been added to the original set published a decade ago to reflect the burgeoning research in this area, especially since the late 1980s. Language socialization complements research on language acquisition and formal language education by paying particular attention to the social, cultural, and interactional contexts in which language and other kinds of knowledge are learned, both formally and informally, and by examining the role of teachers, peers, siblings, and other more experienced members of the culture who explicitly or implicitly help novices gain expertise in the ways of the community.

Although most chapters in this volume include a section on the early developments of research within the particular learning context that is featured, Elinor Ochs and Bambi Schieffelin, in the first chapter, provide an important 30-year retrospective of the historical and disciplinary roots of language socialization in psychology, anthropology, linguistics, sociology, and education and its development in the USA, particularly, where the majority of scholars doing language socialization research have been educated—many of them by Ochs and Schieffelin themselves. Because of its early and enduring association with American linguistic anthropology, language socialization research has only gradually been taken up by communities of researchers in non-English-dominant societies or approaching similar phenomena from different analytic traditions but also framed as “language socialization.” Unfortunately, Volume 8 has fewer authors from different countries than other volumes do, as a result. Yet the research represented in this volume does include, to the extent possible, work being undertaken in

a wide and diverse range of linguistic, ethnic, and geographical regions of the world, from small-scale and pre-industrialized societies to highly industrialized ones. Samoa, Papua New Guinea, Cameroon, Thailand, Japan, Hungary, Sweden, Israel, Italy, Canada, the UK, Australia, and the USA are just some of the countries whose cultures and languages and socialization routines are examined here.

One crucial aspect of language socialization that is emphasized in each chapter as well as within and across the sections is the following: that gaining competence in new ways of using language and representing meanings, including in our own primary languages, is an ongoing one that occurs throughout one's life, from birth to death. However, whereas many studies of children's language and literacy socialization have been conducted, insufficient research to date has examined the other end of the continuum, namely, communities of the elderly living together or elderly persons functioning within their own multigenerational communities. Too little attention has been paid to aging and, in some cases, the attendant degenerative conditions that necessitate the learning of new ways of speaking, signing, writing, and comprehending texts for geriatric populations themselves and also for their loved ones and caregivers. In view of the quickly aging populations in most industrialized countries, future editions of this volume or similar publications would ideally have a section on language socialization and aging, assuming that sufficient research will be conducted on these topics in the near future: among healthy older individuals learning new languages and literacy practices required for work, leisure, or (im)migration, for example; among older adults learning new communication strategies as their erstwhile "normal" functioning begins to change or deteriorate for a variety of social, psychological, and medical reasons; and among the caregivers who assist these individuals, who must also be socialized into comprehensible new modes of communication, responsive to the needs and conditions of their interlocutors.

In addition to being a lifelong process, language socialization and its accompanying discourse practices vary *across* the activities and communities one participates in at any given age or stage in life. Each community of practice has its own norms, preferences, and expectations about language and literacy practices and ideologies within that local "culture." The chapters in this volume reflect that diversity of experience by noting the different ways in which people may engage in language socialization across activities within the home, or at school, or in youth groups, gangs, gendered groups, in cyberspace and in community organizations, or in higher education or vocational training, across a range of professions, or among people with disabilities affecting their socialization and communication.

Certainly, these are but a few of the communities that could have been included. Missing are accounts of language socialization within religious communities (for indigenous members as well as outsiders seeking entry), in transgendered or other sexual-minority subcultures, in sports clubs, in the myriad professions or vocations not described here, in South Asia, the Middle East, and other underrepresented regions in this volume and their ethnolinguistic populations, and among people across a wider spectrum of disabilities (apart from schizophrenia, which is included) as well as abilities. Thus, the chapters in this volume represent just a partial selection of current scholarship on language socialization. Fortunately, the research surveyed in the other nine volumes in the Encyclopedia complements what is presented here to some extent.

The creation of the sections used in this volume on language socialization, within the home or at school (with a focus on children), among adolescents and adults, or, alternatively, in particular communities where one age group is not being foregrounded, is meant to reflect an organic and situated lifespan approach. However, this clustering of chapters and thus of research approaches, populations, and communities might be construed as too delimited and restrictive. As many authors note, successful engagement in the discourse practices in one context (e.g., at school, in higher education, or at work) typically presupposes prior language/literacy socialization of a particular type in other contexts. Furthermore, acknowledging, as many scholars do, that language socialization is a bi- or multidirectional process in which not only novices but also more experienced community members are being socialized by mutual engagement in language/literacy practices, a focus on children in the home or at school may inadvertently obscure the notion that within those same contexts older siblings, parents, teachers, and others are being socialized into new practices, orientations, and understandings at the same time. Also, language socialization at home, in community groups, and at school is often concurrent and interdependent; it may occur in a very similar, compatible, and complementary manner, or in a completely different, even contradictory, way. Thus, the section divisions are mainly used for heuristic thematizing purposes but readers should think of these sections as layers in multi-layered and heavily textured experiences of lifewide as well as lifelong socialization.

In addition to conceiving of these contexts as different, overlapping and intersecting layers of experience, we must understand the potential for innovation and syncretism within any particular stratum or locus of socialization. Language socialization for many people and communities in the twenty-first century involves the co-existence of more than

one language or dialect, may be mediated by new information and communication technologies, and may entail the development of syncretic linguistic, discursive, and cultural practices and correspondingly hybrid identities. Nowhere is such hybridity and multilingualism more apparent than in some of the transnational, diasporic, immigrant, and postcolonial communities described in this volume, in contrast, perhaps, to some earlier work that focused on primarily monolingual populations and discourse processes. Of course, in many regions of the world, numerous local languages and cultures have co-existed or been in contact for many generations so this is not a new phenomenon (as other volumes in the Encyclopedia demonstrate so well) but it is an important current focus in language socialization. Much research in “foreign-” or second-language learning contexts, as well as in multilingual or diglossic contexts in which a colonial language may be the language of formal education, foregrounds the different language ideologies and norms into which newcomers are socialized and the discontinuities as well as continuities that may exist between home/community and school practices.

This volume is organized around five sections. Section One, the largest section, highlights historical, theoretical, and methodological approaches to language socialization research and the emergence of language socialization as a distinct subfield of linguistic anthropology and applied linguistics with obvious relevance to education. In addition to the previously mentioned overview piece by Ochs and Schieffelin, Claire Kramsch and Sune Vork Steffensen examine theoretical issues in second-language acquisition and socialization in light of current “ecological” perspectives (the primary focus of Volume 9). Betsy Rymes describes the relationship between language socialization and the linguistic anthropology of education, a conceptual and methodological orientation. Matthew Bronson and Karen Watson-Gegeo examine language socialization in contrast with the shortcomings in second-language acquisition research that is uncritical, socially uncontextualized, and unconcerned with issues of learner agency and voice. Next, Geoff Williams presents a Systemic Functional Linguistic approach to language socialization, drawing on the foundational social and linguistic scholarship of Basil Bernstein, Michael Halliday, and Ruqaiya Hasan, in particular. The sixth chapter, by Duanduan Li, examines research on the socialization of pragmatics, such as speech acts and politeness routines, in first- and second-language contexts and among children and adults. Readers are also referred to the chapter by Paul Garrett in Volume 10 on research methods in language socialization, which we have not wanted to duplicate in this volume.

Section Two focuses to a great extent on children in their interactions with family members, siblings, and peers at home and in the

community. Shoshana Blum-Kulka describes studies of language socialization in the context of family dinnertime discussions in the USA, Italy, Greece, and Israel, among other countries. Amy Paugh looks at how children are socialized into understandings about the nature, value, and tensions connected with work as a result of hearing about and observing the working lives of their parents. Kate Pahl highlights language socialization and multimodality (e.g., involving different kinds of juxtaposed images, scripts, and texts) in multilingual urban homes. Delyth Morris and Kathryn Jones focus specifically on minority language revitalization in Europe (and especially Wales) by investigating home language socialization. The last chapter in this section, by Amy Kyratzis and Jenny Cook-Gumperz, describes gendered language socialization among children, critiquing earlier work that examined gender in an overly static, dichotomous, or essentialized manner and presenting currently favored approaches that take context, contingency, and agency into account more fully.

The third section surveys research on language and literacy socialization and schooling. Patricia Baquedano-López and Shlomy Kattan describe general themes in research in schools in the USA and elsewhere in terms of their sociological versus ideological orientation. Leslie Moore presents research on language education (second/foreign and multilingual) in non-Western settings in Africa (especially Cameroon), Asia, and Central Europe and the effects of colonialism, missionization, and globalization on indigenous practices and language ideologies. Examining cross-generational language shift among school-aged children, Kathryn Howard provides examples of research in a similarly broad cross-section of geographical domains, from Papua New Guinea and Thailand to islands in the Caribbean, where vernacular and national Standard languages at home and at school, respectively, may give way to syncretic or hybrid codes and practices or may cross domains (e.g., use of the vernacular language at school or the standard national variety at home). The last chapter in this section, by Agnes He, describes research on heritage language education and socialization, one of the newer domains for language socialization research, particularly in immigrant-receiving countries such as the USA.

In the fourth section, Shirley Brice Heath provides a far-reaching, multi-century perspective on the socialization and apprenticeship of adolescents and young adults into a range of language/literacy practices within their learning communities, both legal—or condoned by society—and not. Daryl Gordon reviews research on gendered second-language socialization among immigrant populations, focusing primarily on adolescents and adults but noting important studies involving children as well. Naoko Morita and Masaki Kobayashi then describe academic second-language discourse socialization at the

postsecondary level mainly. Finally, Patricia Duff examines the relationship between language socialization in higher education contexts, such as universities and vocational programs, and socialization for work in the service sector and in professions such as medicine and law.

Section Five concludes the volume with fascinating accounts of socialization within and across particular communities where the focus is less on childhood versus adolescence versus adulthood, or home versus school versus work domains, but, rather, on the particular languages, language ecologies, as well as modes of communication that are in use or, conversely, may be in decline. Diane Pesco and Martha Crago describe language socialization in Canadian Aboriginal communities, representing both rural and urban, and monolingual and bi- or multilingual groups (e.g., Cree, Inuit, or Algonquin, in combination with French and/or English). Carol Erting and Marlon Kuntze present research on language socialization into Deaf communities—or the “DEAF-WORLD”—both nationally and internationally, which often occurs in late childhood or even adulthood and thus presents a unique context for first-language socialization. Eva Lam describes language socialization and hybrid languages, identities, and textual practices fostered in online communities among diasporic and transnational groups, for example. Haruko Cook documents research on socialization in Japanese as a first and second language in Japan and elsewhere, highlighting how learners of Japanese learn to encode affect, honorifics, gender-appropriate forms, and formal register in their speech. The final chapter, by Irene Walsh, deals with the challenges of language socialization (or resocialization) for people with mental health disorders, such as schizophrenia, and those employed to assist them.

As these chapters reveal, developments in the young field of language socialization are very exciting. The authors included in the volume have approached the phenomenon of language socialization from different but complementary traditions and disciplines, and using a variety of methods: drawing on linguistic anthropology, functional linguistics, psychology, applied linguistics, semiotics, speech and language pathology, and education, for example. As a set, the papers provide compelling insights into the intricacies novices encounter when trying to become proficient in another culture’s or community’s codes and practices.

The conditions for learning vary considerably across the chapters. In some contexts, strong, stable models of the target practices exist (e.g., in longstanding family dinnertime narrative traditions); in others, practices are being contested or are undergoing significant change or innovation, as in communities experiencing language shift, language revitalization, or the development of new communication codes (e.g., in cyber-communication). In yet other contexts, expert models of

communicative competence may be fleeting, inaccessible, or absent from language learners' immediate lives (e.g., for the deaf children of hearing parents who do not have access to signed language in the home, community, or school sometimes for many years); and in quite different cases, the communication skills once possessed by mature, communicatively competent individuals, for complex neurological and cortical reasons, may have regressed dramatically; or, in the case of some autistic individuals, they may never have fully attained a normal repertoire of linguistic and communicative ability and therefore require assistance to gain independence and greater functionality through specialized language-socialization interventions. The co-existence of multiple language codes, orthographies, and symbolic or semiotic systems only increases the possible range of trajectories, experiences, challenges, and epistemologies learners might experience in any of the above contexts.

It is our hope that this volume will contribute meaningfully to current understandings and debates about language socialization and language education and will also catalyze future research in thematic areas recommended by the authors as well as in those ethnolinguistic, geographical, developmental, and other community contexts that have not been adequately represented here or investigated up to now. Further scholarship in language socialization, as demonstrated so well in these chapters, will help illuminate the often taken-for-granted richness and complexity of everyday interactions in the service of human learning, enculturation, and communicative competence, and will also inform effective educational interventions for novices seeking legitimacy, proficiency, and integration in their new discourse communities.

## GENERAL EDITOR'S INTRODUCTION<sup>1</sup>

### ENCYCLOPEDIA OF LANGUAGE AND EDUCATION

This is one of ten volumes of the *Encyclopedia of Language and Education* published by Springer. The Encyclopedia bears testimony to the dynamism and evolution of the language and education field, as it confronts the ever-burgeoning and irrepressible linguistic diversity and ongoing pressures and expectations placed on education around the world.

The publication of this work charts the deepening and broadening of the field of language and education since the 1997 publication of the first Encyclopedia. It also confirms the vision of David Corson, general editor of the first edition, who hailed the international and interdisciplinary significance and cohesion of the field. These trademark characteristics are evident in every volume and review of the present Encyclopedia.

In the selection of topics and contributors, the Encyclopedia seeks to reflect the depth of disciplinary knowledge, breadth of interdisciplinary perspective, and diversity of sociogeographic experience in our field. Language socialization and language ecology have been added to the original eight volume topics, reflecting these growing emphases in language education theory, research, and practice, alongside the enduring emphases on language policy, literacies, discourse, language acquisition, bilingual education, knowledge about language, language testing, and research methods. Throughout all the volumes, there is greater inclusion of scholarly contributions from non-English speaking and non-Western parts of the world, providing truly global coverage of the issues in the field. Furthermore, we have sought to integrate these voices more fully into the whole, rather than as special cases or international perspectives in separate sections.

This interdisciplinary and internationalizing impetus has been immeasurably enhanced by the advice and support of the editorial advisory board members, several of whom served as volume editors in the Encyclopedia's first edition (designated here with\*), and all of whom I acknowledge here with gratitude: Neville Alexander (South Africa), Colin Baker (Wales), Marilda Cavalcanti (Brazil), Caroline Clapham\* (Britain),

---

<sup>1</sup> This introduction is based on, and takes inspiration from, David Corson's general editor's Introduction to the First Edition (Kluwer, 1997).

Bronwyn Davies\* (Australia), Viv Edwards\* (Britain), Frederick Erickson (USA), Joseph Lo Bianco (Australia), Luis Enrique Lopez (Bolivia and Peru), Allan Luke (Singapore and Australia), Tove Skutnabb-Kangas (Denmark), Bernard Spolsky (Israel), G. Richard Tucker\* (USA), Leo van Lier\* (USA), Terrence G. Wiley (USA), Ruth Wodak\* (Austria), and Ana Celia Zentella (USA).

In conceptualizing an encyclopedic approach to a field, there is always the challenge of the hierarchical structure of themes, topics, and subjects to be covered. In this *Encyclopedia of Language and Education*, the stated topics in each volume's table of contents are complemented by several cross-cutting thematic strands recurring across the volumes, including the classroom/pedagogic side of language and education; issues of identity in language and education; language ideology and education; computer technology and language education; and language rights in relation to education.

The volume editors' disciplinary and interdisciplinary academic interests and their international areas of expertise also reflect the depth and breadth of the language and education field. As principal volume editor for Volume 1, Stephen May brings academic interests in the sociology of language and language education policy, arising from his work in Britain, North America, and New Zealand. For Volume 2, Brian Street approaches language and education as social and cultural anthropologist and critical literacy theorist, drawing on his work in Iran, Britain, and around the world. For Volume 3, Marilyn Martin-Jones and Anne-Marie de Mejia bring combined perspectives as applied and educational linguists, working primarily in Britain and Latin America, respectively. For Volume 4, Nelleke Van Deusen-Scholl has academic interests in linguistics and sociolinguistics, and work in the Netherlands and the USA. Jim Cummins, principal volume editor for Volume 5 of both the first and second editions of the *Encyclopedia*, has interests in the psychology of language, critical applied linguistics, and language policy, informed by his work in Canada, the USA, and internationally. For Volume 6, Jasone Cenoz has academic interests in applied linguistics and language acquisition, drawing from her work in the Basque Country, Spain, and Europe. Elana Shohamy, principal volume editor for Volume 7, approaches language and education as an applied linguist with interests in critical language policy, language testing and measurement, and her own work based primarily in Israel and the USA. For Volume 8, Patricia Duff has interests in applied linguistics and sociolinguistics, and has worked primarily in North America, East Asia, and Central Europe. Volume editors for Volume 9, Angela Creese and Peter Martin, draw on their academic interests in educational linguistics and linguistic ethnography, and their research in Britain and Southeast Asia. And for Volume 10, Kendall A. King has academic interests in sociolinguistics and educational

linguistics, with work in Ecuador, Sweden, and the USA. Francis Hult, editorial assistant for the Encyclopedia, has academic interests in educational and applied linguistics and educational language policy, and has worked in Sweden and the USA. Finally, as general editor, I have interests in anthropological linguistics, educational linguistics, and language policy, with work in Latin America, the USA, and internationally. Beyond our specific academic interests, all of us editors, and the contributors to the Encyclopedia, share a commitment to the practice and theory of education, critically informed by research and strategically directed toward addressing unsound or unjust language education policies and practices wherever they are found.

Each of the ten volumes presents core information and is international in scope, as well as diverse in the populations it covers. Each volume addresses a single subject area and provides 23–30 state-of-the-art reviews of the literature on that subject. Together, the reviews aim to comprehensively cover the subject. The volumes, edited by international experts in their respective topics, were designed and developed in close collaboration with the general editor of the Encyclopedia, who is a co-editor of each volume as well as general editor of the whole work.

Each review is written by one or more experts on the topic, consists of about 4,000 words of text, and generally follows a similar structure. A list of references to key works supplements the authoritative information that the review contains. Many contributors survey early developments, major contributions, work in progress, problems and difficulties, and future directions. The aim of the reviews, and of the Encyclopedia as a whole, is to give readers access to the international literature and research on the broad diversity of topics that make up the field.

The Encyclopedia is a necessary reference set for every university and college library in the world that serves a faculty or school of education. The encyclopedia aims to speak to a prospective readership that is multinational, and to do so as unambiguously as possible. Because each book-size volume deals with a discrete and important subject in language and education, these state-of-the-art volumes also offer highly authoritative course textbooks in the areas suggested by their titles.

The scholars contributing to the Encyclopedia hail from all continents of our globe and from 41 countries; they represent a great diversity of linguistic, cultural, and disciplinary traditions. For all that, what is most impressive about the contributions gathered here is the unity of purpose and outlook they express with regard to the central role of language as both vehicle and mediator of educational processes and to the need for continued and deepening research into the limits and possibilities that implies.

Nancy H. Hornberger

## INTRODUCTION TO VOLUME 9: ECOLOGY OF LANGUAGE

Language ecology may be defined as the study of interactions between any given language and its environment . . . The true environment of a language is the society that uses it as one of its codes. Language exists only in the minds of its users, and it only functions in relating these users to one another and to nature, i.e. their social and natural environment. Part of its ecology is therefore psychological: its interaction with other languages in the minds of bi- and multilingual speakers. Another part of its ecology is sociological: its interaction with the society in which it functions as a medium of communication. The ecology of a language is determined primarily by the people who learn it, use it, and transmit it to others. (Haugen, 1972, p. 325)

Since Haugen made this statement, the term ‘language ecology’ has increasingly appeared in the literature, in a range of guises. This literature on language ecology includes discussion related to cognitive development and human interaction, the maintenance and survival of languages, the promotion of linguistic diversity, language policy and planning, language acquisition, language evolution, language ideology, the ecology of (multilingual) classroom interaction and the ecologies of literacy, oracies and discourses. Indeed, it has been noted that there is an ‘infinite world of possibilities’ for language ecology (Barron et al., 2002, p. 10).

This volume collects together chapters concerned with ecologies of language, literacy and learning. The study of language ecology is the study of diversity within specific socio-political settings where the processes of language use create, reflect and challenge particular hierarchies and hegemonies, however transient these might be. It will be at once apparent that all of the themes above (language, literacy and learning) are central to our understanding of education and an ecological perspective demands a particular view of education and classroom practice as situated and localised. However, it also views these schools and classrooms and their interactive practices as part of a bigger and more powerful political state in which ideologies function to reproduce particular balances of power. It is not surprising then that many of the

chapters in this volume start small and describe big with authors reporting on how an ecological perspective provides researchers and practitioners with the means to argue for political rights and challenge prevailing views of knowledge and patterns of schooling. Many of the chapters in this volume are overtly 'political' in arguing for the 'rearrangement of power' (López) in support of minority and indigenous groups. This interest in counter hegemony is also apparent in seemingly less political debates such as new and community literacies where we see how people use new technologies and existing resources to create new diversity in their literacy and oral practices.

An ecological approach does more than describe the relationships between situated speakers of different languages. Rather, it is proactive in pulling apart perceived natural language orders. That is, where a particular language and its structure and use becomes so naturalised that it is no longer seen as construing a particular ideological line, an ecological approach attempts to make this transparent. 'Unnaturalising' these discourses becomes necessary to make clear 'what kinds of language practices are valued and considered good, normal, appropriate, or correct' in particular classrooms and schools, and who are likely to be the winners and losers in the ideological orientations (Heller and Martin-Jones, 2001, p. 2). To take this one step further, Hornberger (2002, p. 30) argues that 'multilingual language policies are essentially about opening up ideological and implementational space in the environment for as many languages as possible'.

The volume reflects major theoretical debates within language ecology. In particular it discusses the usefulness of the metaphor itself and we see running through the chapters different interpretations of the term 'ecology of language' with some claiming its essential place in the human rights agenda and others questioning the metaphor's fundamental usefulness arguing that the term weakens theoretical accounts of diversity.

For the majority of writers in this volume the metaphor offers a space for creativity and extension through connection to the term biodiversity. Today we are very familiar with the concept of biodiversity and its concern with variety of life. We have a better understanding of biological connectivity and the importance of conserving and maintaining the variety of life forms. Many of the writers in this volume use the metaphor of language ecology to creatively and pragmatically describe languages/literacies and their speakers in particular kinds of relationships to one another. An example of this is the ecological approach to multilingual language policies and the continua of biliteracy (Hornberger). Hornberger states that the language ecology metaphor 'captures a set of ideological underpinnings for a multilingual language policy' (Hornberger, 2002, p. 35). In particular, she points to how languages exist and evolve in an ecosystem along with other

languages, and how they [their speakers] ‘interact with their socio-political, economic and cultural environments’. A further example of using the ecological metaphor creatively is classroom ecologies (Creese and Martin, 2003) in which classrooms are described as ecological micro-systems where local interactions are linked to wider socio-political ideologies.

The volume is made up of five sections. The chapters in Section One, Historical and Theoretical Perspectives, reflect on some of the major themes in language ecology which have emerged since Haugen first introduced the term in 1972, and they demonstrate how the discussion of the ecology of language has evolved since Haugen’s seminal work. In the first chapter, Skutnabb-Kangas and Phillipson provide a human rights perspective on language ecology. The authors stress the need for language rights in the present world context where many languages are becoming endangered. Using examples from a range of contexts, Skutnabb-Kangas and Phillipson show how the subtractive learning of dominant languages may violate linguistic human rights and contribute to what they refer to as ‘linguistic genocide’. In the second chapter, Edwards argues for a broader ecological sensitivity but, at the same time, cautions against the ‘new’ ecology of language and its concern with linguistic human rights, particularly the way it is used in educational contexts. His chapter problematises some of the issues associated with linguistic rights in the new ecology of language.

In the third chapter, Blackledge argues that language ecologies can be better understood if they are linked with a discussion of language ideologies. This is particularly salient as language ecology relates to the inter-relationships between speakers of languages, and these relationships are seen in the way in which languages are used, and in the speakers’ attitudes to and beliefs about language. Kaplan and Baldauf, in Chapter Four, provide an ecology perspective on language planning. In their review they emphasise the usefulness of the ecology metaphor, and how it allows for a move away from the traditionally narrow way in which language policy and planning have been seen. Using the Japanese context as an example, Kaplan and Baldauf illustrate the relationships between language ecology and language planning. The final chapter in Section One, by van Lier, explores the ecology of language learning and sociocultural theory. He notes the prominence of sociocultural theory in language education in recent decades, much of it emerging from the work of Vygotsky. In this review, van Lier takes forward the work of Vygotsky by discussing it from within an ecological worldview, placing key ecological themes within a sociocultural theory perspective.

Section Two consists of reviews of the Language Ecologies of Selected Countries and Regions. Each review focuses on some aspect

of the linguistic ecology of the country or region, with specific links to important educational issues. Some reviews focus on the 'whole' language ecology of the country or region while others describe a particular ethno-linguistic group within the wider language ecology of the country or region. Kipp's chapter considers the language ecology of Australia's community languages, focusing on the complexity of the multilingual history of the country, and steps that have been taken to ensure the maintenance of these languages. The review makes particular reference to the position of these languages in the education systems in the country. Chebanne discusses the language ecology of marginalised ethno-linguistic groups in Botswana, Namibia and South Africa within the framework of language diversity as a problem and as a resource. In reviewing the language ecology of these groups, Chebanne illustrates the various difficulties faced by the groups, and the role that education plays for these groups.

Fraser Gupta focuses on the language ecology of Singapore and the way that this has been shaped by educational policy. An important aspect of the language ecology of Singapore is language shift, which according to Fraser Gupta, is motivated by pragmatism and linked to educational policy, which is in turn linked to the politics of race. Tosi reports on the language ecology of multilingual Italy, focusing specifically on the issues of language survival and language death. The chapter provides an historical review of the linguistic transformations in Italy since 1861, including the spread of Italian and the impact of education on the survival and maintenance of languages in the country. Suleiman reviews the language ecology of Jordan as a case study from the Arabic-speaking part of the Middle East. The review concentrates on the dialectal varieties of Arabic with reference to the standard form of the language used in education. In the final chapter in this section, López reports on indigenous contributions to an ecology of language learning in Latin America. He notes the lack of study on indigenous views of language in Latin America and points to the important insights, which would have major benefits for more situated and meaningful language teaching practices in the region.

Section Three, on Language Ecologies of Dispersed and Diasporic Communities, comprises four chapters, which focus on the language ecologies of four communities with specific reference to the dominant language(s) of education in these contexts. The chapter by Collins considers language ecologies in the Malay world, with reference to the languages of education in the area, Malay and Indonesian. He reports on the diversity of language in the Malay/Indonesian world, as well as the myriad varieties of Malay and Indonesian, many of which have never been studied. Wang explores the ecology of the Chinese languages in the USA. She reviews the assimilationist ideologies and

polices in the USA, and the role of Chinese heritage language schools and their contribution to the maintenance of Chinese. Sercombe reports on the language ecology of the Penan, a formerly nomadic group, in northern Borneo (Sarawak in Malaysia and Brunei). The chapter reviews the changing ecology of the Penan, from nomadism to sedentism, and links this to a discussion of educational issues and language shift. The final paper in the section is Nortier's review of the language ecology of the Moroccan communities in the Netherlands. Nortier considers how these communities settled in the Netherlands in the 1960s and 1970s, and the languages that they brought with them. The chapter reviews the history of Moroccan mother tongue teaching and what support has been provided.

Section Four provides five reviews of Classroom Language Ecologies in a range of multilingual contexts. The chapters in this section describe bi/multilingual classroom contexts in which 'concurrent' linguistic practices such as code-switching are usual and language separation strategies are often seen as problematic. Probyn reviews the language ecologies of South African classrooms, with particular emphasis on the issues of policy, practice and power. It is noted how the linguistic ecologies of classrooms in South Africa are embedded in complex local, national and global ecologies, and how this has major implications for access and equity in education. Jaffe reports on classrooms in Corsica in the context of the bilingual education system which is explicitly intended to change the language ecology of the island. The paper reviews the bilingual school practices and ideologies related to regional dialectal diversity of Corsican, and to diversity resulting from language contact, domination and shift. Kanno's focus is language minority education in Japan, with specific reference to the education of non-Japanese speaking children in public schools. She reports on the building of an infrastructure for the education of these children and on the many issues which emerge in these children's education. Saxena reports on the sultanate of Brunei Darussalam and, in particular, on the ideology, policy and practice in bilingual classrooms in the country. The final chapter, by Creese and Martin, provides a case study of the multilingual experiences in one complementary ('community') school in England, where the community language taught is Gujarati.

Section Five explores the Language Ecology of Literacies, Oracies and Discourses.

The chapters in this section explore how the literacy/oracy distinction has evolved and has resulted in an understanding of their connectedness through the local production of discourses. The contexts reported on in these chapters range widely both geographically and temporally. Hornberger's chapter reviews the conceptual origins and practical applications of the continua of biliteracy, an ecological framework in which

to situate research, teaching and language planning in linguistically diverse settings. We see the continua applied in the following two chapters in this section. Lin explores the ecology of literacy in Hong Kong, and begins to unpack youth sub-cultural literacies and the educational potential of these informal youth literacies. She speaks of the need to build bridges between school literacies and the everyday new media literacies of young people. This focus on everyday practice is also taken up in the next chapter, which also speaks of the heuristic importance of the continua of biliteracy. Pahl looks at the ecology of literacy and language, focusing on discourses, identities and practices in homes, schools and communities. She shows how the ecology metaphor provides a lens to reveal webs and connections in social relationships and texts in wider social practice. The final chapter, by Tusting, provides an ecological perspective on new literacies (mainly within the paradigm of New Literacy Studies) and the implications of these new literacies for education. Tusting shows how 'literacy' has extended its meaning in the digital age to encompass the understanding of information presented in many different ways and goes on to outline the debate within the social ecology of education.

In putting together this new volume in the *Encyclopedia of Language and Education*, we hope that the chapters that appear here will provide some indication of how far the study of the ecology of language has moved forward since Haugen used the term in 1972. The volume contains chapters which cover the historical and theoretical perspectives of language ecology, including areas traditionally associated with language ecology and areas such as the language ecologies of literacies, oracies and discourses, which have not normally been the focus of language ecology studies. In addition, the volume provides accounts of communities and geographical areas which are not traditionally covered in the literature on language and education. We believe that the chapters in the volume will contribute to the on-going debate on the ecology of language and its interconnectedness with education and lead to further critical reflection.

GENERAL EDITOR'S INTRODUCTION<sup>1</sup>

ENCYCLOPEDIA OF LANGUAGE AND EDUCATION

This is one of ten volumes of the *Encyclopedia of Language and Education* published by Springer. The Encyclopedia bears testimony to the dynamism and evolution of the language and education field, as it confronts the ever-burgeoning and irrepressible linguistic diversity and ongoing pressures and expectations placed on education around the world.

The publication of this work charts the deepening and broadening of the field of language and education since the 1997 publication of the first Encyclopedia. It also confirms the vision of David Corson, general editor of the first edition, who hailed the international and interdisciplinary significance and cohesion of the field. These trademark characteristics are evident in every volume and chapter of the present Encyclopedia.

In the selection of topics and contributors, the Encyclopedia seeks to reflect the depth of disciplinary knowledge, breadth of interdisciplinary perspective, and diversity of sociogeographic experience in our field. Language socialization and language ecology have been added to the original eight volume topics, reflecting these growing emphases in language education theory, research, and practice, alongside the enduring emphases on language policy, literacies, discourse, language acquisition, bilingual education, knowledge about language, language testing, and research methods. Throughout all the volumes, there is greater inclusion of scholarly contributions from non-English speaking and non-Western parts of the world, providing truly global coverage of the issues in the field. Furthermore, we have sought to integrate these voices more fully into the whole, rather than as special cases or international perspectives in separate sections.

This interdisciplinary and internationalizing impetus has been immeasurably enhanced by the advice and support of the editorial advisory board members, several of whom served as volume editors in the Encyclopedia's first edition (designated here with\*), and all of whom I acknowledge here with gratitude: Neville Alexander (South Africa), Colin Baker (Wales), Marilda Cavalcanti (Brazil), Caroline Clapham\* (Britain),

---

<sup>1</sup> This introduction is based on, and takes inspiration from, David Corson's general editor's Introduction to the First Edition (Kluwer, 1997).

Bronwyn Davies\* (Australia), Viv Edwards\* (Britain), Frederick Erickson (USA), Joseph Lo Bianco (Australia), Luis Enrique Lopez (Bolivia and Peru), Allan Luke (Singapore and Australia), Tove Skutnabb-Kangas (Denmark), Bernard Spolsky (Israel), G. Richard Tucker\* (USA), Leo van Lier\* (USA), Terrence G. Wiley (USA), Ruth Wodak\* (Austria), and Ana Celia Zentella (USA).

In conceptualizing an encyclopedic approach to a field, there is always the challenge of the hierarchical structure of themes, topics, and subjects to be covered. In this *Encyclopedia of Language and Education*, the stated topics in each volume's table of contents are complemented by several cross-cutting thematic strands recurring across the volumes, including the classroom/pedagogic side of language and education; issues of identity in language and education; language ideology and education; computer technology and language education; and language rights in relation to education.

The volume editors' disciplinary and interdisciplinary academic interests and their international areas of expertise also reflect the depth and breadth of the language and education field. As principal volume editor for Volume 1, Stephen May brings academic interests in the sociology of language and language education policy, arising from his work in Britain, North America, and New Zealand. For Volume 2, Brian Street approaches language and education as social and cultural anthropologist and critical literacy theorist, drawing on his work in Iran, Britain, and around the world. For Volume 3, Marilyn Martin-Jones and Anne-Marie de Mejia bring combined perspectives as applied and educational linguists, working primarily in Britain and Latin America, respectively. For Volume 4, Nelleke Van Deusen-Scholl has academic interests in linguistics and sociolinguistics, and has worked primarily in the Netherlands and the USA. Jim Cummins, principal volume editor for Volume 5 of both the first and second editions of the *Encyclopedia*, has interests in the psychology of language, critical applied linguistics, and language policy, informed by his work in Canada, the USA, and internationally. For Volume 6, Jasone Cenoz has academic interests in applied linguistics and language acquisition, drawing from her work in the Basque Country, Spain, and Europe. Elana Shohamy, principal volume editor for Volume 7, approaches language and education as an applied linguist with interests in critical language policy, language testing and measurement, and her own work based primarily in Israel and the USA. For Volume 8, Patricia Duff has interests in applied linguistics and sociolinguistics, and has worked primarily in North America, East Asia, and Central Europe. Volume editors for Volume 9, Angela Creese and Peter Martin, draw on their academic interests in educational linguistics and linguistic ethnography, and their research in Britain and Southeast Asia. And for Volume 10, Kendall A. King has academic interests in sociolinguistics

and educational linguistics, with work in Ecuador, Sweden, and the USA. Francis Hult, editorial assistant for the Encyclopedia, has academic interests in educational and applied linguistics and educational language policy, and has worked in Sweden and the USA. Finally, as general editor, I have interests in anthropological linguistics, educational linguistics, and language policy, with work in Latin America, the USA, and internationally. Beyond our specific academic interests, all of us editors, and the contributors to the Encyclopedia, share a commitment to the practice and theory of education, critically informed by research and strategically directed toward addressing unsound or unjust language education policies and practices wherever they are found.

Each of the ten volumes presents core information and is international in scope, as well as diverse in the populations it covers. Each volume addresses a single subject area and provides 23–30 state-of-the-art chapters of the literature on that subject. Together, the chapters aim to comprehensively cover the subject. The volumes, edited by international experts in their respective topics, were designed and developed in close collaboration with the general editor of the Encyclopedia, who is a co-editor of each volume as well as general editor of the whole work.

Each chapter is written by one or more experts on the topic, consists of about 4,000 words of text, and generally follows a similar structure. A list of references to key works supplements the authoritative information that the chapter contains. Many contributors survey early developments, major contributions, work in progress, problems and difficulties, and future directions. The aim of the chapters, and of the Encyclopedia as a whole, is to give readers access to the international literature and research on the broad diversity of topics that make up the field.

The Encyclopedia is a necessary reference set for every university and college library in the world that serves a faculty or school of education. The encyclopedia aims to speak to a prospective readership that is multinational, and to do so as unambiguously as possible. Because each book-size volume deals with a discrete and important subject in language and education, these state-of-the-art volumes also offer highly authoritative course textbooks in the areas suggested by their titles.

The scholars contributing to the Encyclopedia hail from all continents of our globe and from 41 countries; they represent a great diversity of linguistic, cultural, and disciplinary traditions. For all that, what is most impressive about the contributions gathered here is the unity of purpose and outlook they express with regard to the central role of language as both vehicle and mediator of educational processes and to the need for continued and deepening research into the limits and possibilities that implies.

Nancy H. Hornberger

## INTRODUCTION TO VOLUME 10: RESEARCH METHODS IN LANGUAGE AND EDUCATION

This final volume of the *Encyclopedia of Language and Education* takes a different approach from the others in the set as it focuses less on current theory and findings within particular language and education topic areas, and more on research approaches and methods for investigating and analysing those topics. Together, the 23 contributions compiled here provide insights into how diverse language and education topics have been approached methodologically, highlighting the early developments, recent advances, and current challenges in data collection and analysis within each area. The line between what might be considered discussions of research *findings* and considerations of research *methods* is not always crystal clear. Some overlap between the two is inevitable and indeed, often beneficial. While some of the chapters here include discussion of pivotal findings, a consistent theme across all reviews is the careful consideration of research theory, approaches and methods for investigating these topics.

Since the publication of the first edition of the *Encyclopedia* more than 10 years ago, the broad field of language and education has changed in myriad ways. Many of these shifts are reflected in this latest edition. For instance, the divisive debate, and in some cases polarization, between quantitative and qualitative researchers is now much less prominent than in the 1990s (see Fishman for an overview of the tensions across paradigms within the sociology of language in education). Concomitantly, there is growing recognition of the need to draw on, and in some cases, integrate both quantitative and qualitative approaches in order to gain a more complete understanding, for instance, of the links between narrative skills and literacy development (Melzi and Caspe).

Perhaps even more striking in this new edition is the evidence of the growing salience of particular fields of study within language and education. In some cases, such as language socialization (Garrett), these areas have gained prominence through the adoption of theory and method from other social sciences to the study of language education processes. In other cases, the boundaries and approaches of language and education have been pushed by global developments and pedagogical needs. For instance, with greater recognition of widespread language contact, multilingualism, and in many cases, language shift, researchers have increasingly focused on topics such as third language

acquisition (Sanz and Lado) and language loss and revitalization (Huss).

Like the first edition, co-edited by Nancy H. Hornberger and David Corson (1997), this volume of the *Encyclopedia* is organized into four sections following Hornberger's (1989) quadrant typology. Within this typology, the two axes are defined by micro/macro-linguistic and social levels of analysis, yielding four quadrants (see [Figure 1](#)). These axes reflect that research in language and education encompasses emphases on the linguistic and on the social, and perspectives running the gamut from macro- to micro-levels of analysis. With respect to social context, for example, one might be concerned with the national level, the face-to-face interactional level, or with the level of domains or communities of practice bridging macro to micro. With respect to linguistic issues, questions might revolve around learners' choice of language or use of phonological variant, or around the intermediary levels of discourse bridging macro to micro (McKay and Hornberger, 1996).

As Hornberger observes in her introduction to the previous edition, an important assumption of this typology is that perspectives that bridge micro- to macro-understandings, as well as societal and linguistic analyses, are crucial to understanding most language and education processes. Put another way, in order to gain a complete picture of, for instance, language learning in immersion classrooms, we need not only a macro-level understanding of the development of supporting national and local language education policy, but also fine-grained, micro-level

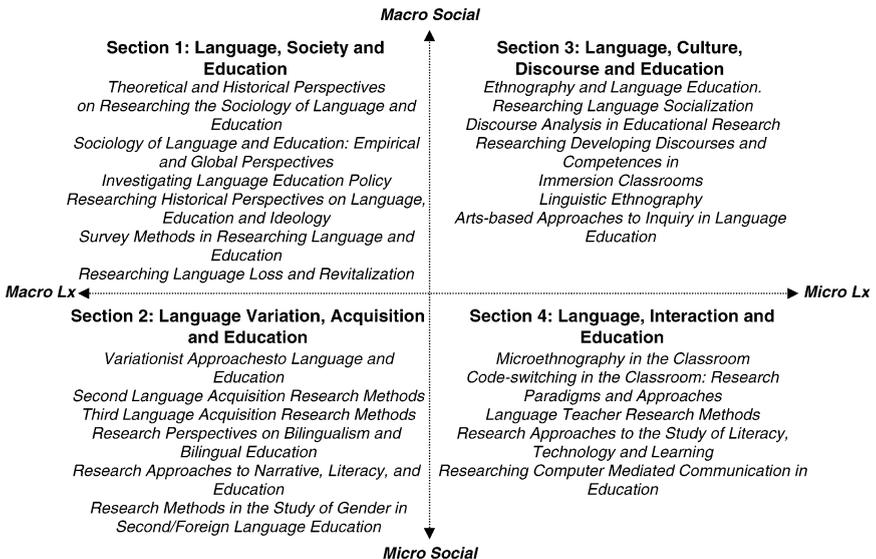

Figure 1 Hornberger's (1989) micro and macro quadrant typology.

analyses of teacher–student and student–student interactional patterns in this context. By the same token, in order to fully understand the classroom role of minority language varieties such as African American English in the USA, we need not only micro-linguistic level, variationist analysis of how different English varieties are employed in classroom contexts, but also larger, macro-language-and-societal level analyses of language contact over time and language ideologies. The aim of the present volume is to provide readers with an overview of the wide range of methodological approaches to language and education across these micro- and macro-axes, as well as the multiple connections between them.

To this end, each of the four sections focuses on a particular sub-area of language and education research methods: ‘Language, Society and Education’ in Section 1; ‘Language, Variation, Acquisition and Education’ in Section 2; ‘Language, Culture, Discourse and Education’ in Section 3; and ‘Language, Interaction and Education’ in Section 4. Again in keeping with the first edition, within each of these four sections, the first three or four reviews represent different broad areas or subfields within that focus. The final reviews, in turn, tend to focus more narrowly on a particular area of research, and in some cases, demonstrate the application of such approaches to a particular context of study.

Section 1, ‘Language, Society and Education’, opens the volume with six chapters that overview recent research approaches to macro-level analysis of the relationship between language, society, and education. Joshua A. Fishman provides a historical perspective on the inception and evolution of the sociology of language as a field of study, as well as key methodological tensions and debates within the field over time. Valerie S. Jakar and Ofra L. Inbar, in turn, focus on more recent trends, and consider how forces of globalization have shaped the field of the sociology of language as it relates to education. Drawing from his experience with minority language planning on three continents, Bernard Spolsky provides an overview of research approaches to language policy, which for him includes the practices of the members of the speech community, their beliefs, and the management of their languages. Next, Thomas Ricento’s review introduces readers to research methods for studying the historical development of language, education, and ideology, focusing on the examination of social hierarchies that are reflected in and produced through ideologies of language. Colin Baker describes the foundations and recent shifts in the use of surveys for researching language and education, and emphasizes in particular surveys that have been influential in shaping educational policy, provision, and practice. The final chapter in this section focuses more narrowly on an important area of macro-level research in the last decade as Leena Huss describes the development of research approaches to studying language loss and revitalization. Her review highlights

on-going research challenges in the field, including defining ‘successful’ revitalization, determining best practices for collaboration across language activists and language researchers, and appropriately incorporating technology into revitalization efforts.

In Section 2, ‘Language, Variation, Acquisition and Education’, the focus shifts to a micro-level analysis of language while keeping a macro-level societal perspective. Kirk Hazen reviews current variationist approaches and how they have been applied to understanding language use in schools, with special attention to how teaching opportunities can be enhanced through teachers’ adoption of a variationist perspective. The next two chapters focus more narrowly on the relationship between interactional context and the processes of language learning. Rebekha Abbuhl and Alison Mackey provide a broad overview of quantitative and qualitative approaches to the study of second language acquisition. Cristina Sanz and Beatriz Lado, in turn, describe the diverse research methods used to answer empirical and theoretical questions within the newly established field of third language acquisition. Li Wei then reviews research on bilingualism and bilingual education from linguistic, psycholinguistic, and sociolinguistic perspectives. His piece highlights both the interdisciplinary nature of this field of study and the dramatic changes in how bilingualism has been conceptualized over the last century. Next, Gigliana Melzi and Margaret Caspe summarize current research approaches to understanding cross-cultural variation in narrative style and development, and how these differences are linked to literacy and education success more broadly. Finally, Aneta Pavlenko considers research approaches to the study of language and gender in education. Her critical review examines the relationship between theory and research method within this area, considers the strengths and weaknesses of current approaches, and suggests promising directions for future work.

The reviews in Section 3, ‘Language, Culture, Discourse and Education’, in turn, focus on the relationship between language, culture, discourse and education, taking a macro-linguistic perspective and micro-societal one. Kelleen Toohey describes the ways in which ethnographic language education researchers attempt to understand learners’ and teachers’ perspectives on how languages are taught and learned. Paul Garrett reviews the inception and development of the field of language socialization. His piece emphasizes the central methodological contours of this approach and spotlights the benefits and challenges of doing language socialization work in multilingual and educational contexts. Next, Doris Warriner examines the historical development of a broad range of approaches to discourse analysis, including conversational analysis, the ethnography of communication, and interactional sociolinguistics among others. Her review highlights how each of these traditions have been productively applied to first language classroom

contexts. Anne-Marie de Mejía, in turn, addresses early and current research approaches to studying second language discourses and competences in language immersion classrooms. Her review traces the development of the field from early work in Canada to the current internationalization of the immersion movement and its varied conceptualizations. Angela Creese describes an emerging subfield of study, linguistic ethnography, which builds on the traditions of interactional sociolinguistics and the ethnography of speaking, and has evolved on the premise that detailed analysis of situated language provides fundamental insights into both the mechanisms and dynamics of social and cultural production in everyday life. Lastly, Misha Cahnmann Taylor draws from ethnographic approaches in her piece, but focuses more narrowly on the newly emerging field of arts-based approaches to language and education research. She describes how researchers in this area are increasingly turning to artistic forms of representation such as poetry, story, theatre, and visual images as means of collecting, analysing, and presenting complex and multidimensional data.

Section 4, 'Language, Interaction and Education', focuses on micro-level linguistic and micro-level societal analyses of language and education. Pedro Garcez describes the evolution and recent developments in micro-ethnography, a research approach typically involving audiovisual machine recordings of naturally occurring social encounters in order to investigate in close detail what interactants do in real time as they co-construct talk-in-interaction in everyday life. His review demonstrates how such an approach has been successfully applied to the study of classroom interaction. Next, Angel Lin describes research methods, ranging from positivist to interpretive, for the study of code-switching in the classroom, drawing many of her examples from her own research in Hong Kong. Manka Varghese then details the research approaches of a relatively new area of investigation: how second language teachers learn to teach, how they teach, and who they are as individuals and professionals. The final two chapters of this volume consider the quickly changing role of technology in language and education classrooms and research: Ilana Snyder describes the evolution as well as more recent and cutting-edge approaches to the study of literacy, technology and learning; Wan Fara Mansor and Mohamad Hassan Zakaria detail the development and current best practices in researching computer-mediated communication in education. Both of these reviews demonstrate the myriad inter-relationships across technological innovation, research methods, and pedagogical practice.

One of the hallmarks of the *Encyclopedia* is its international scope, both in terms of the range of the research reviewed and diversity of scholarly perspectives. The contributors to this volume represent more than ten countries and a total of five continents. More important than

their geographic diversity, however, is their diversity of experience and the resultant breadth and depth of theoretical and methodological research perspective that they collectively bring to the present volume. It is their vast expertise—and their dedicated efforts both to their craft and to their individual contributions here—that makes this volume a unique and highly valuable resource.

## LANGUAGE EDUCATION, PLURALISM AND CITIZENSHIP

### INTRODUCTION

Debates over citizenship in modern liberal democracies have often focussed on the significance of language to both national identity and state citizenship. These debates have addressed, in particular, two key issues:

1. Whether speaking the state-mandated or national language—that is, the majority or dominant language of the state—is, or should be, a *requirement* of national citizenship and a demonstration of both political and social integration by its members (especially for those who speak other languages as a first language)
2. Whether this requirement should be at the *expense* of, or in *addition* to the maintenance of other languages—minority, or non-dominant languages, in effect—within the state. Or to put it another way, whether public monolingualism in the state-mandated language should be enforced upon an often-multilingual population or whether some degree of public as well as private multilingualism can be supported.

Needless to say, how these two issues are addressed has significant implications for the development of language policy and the provision of language education in modern nation-states. In particular, they require modern nation-states to address the balance between social *cohesion*, a key concern of all such states, and the recognition (or lack thereof) of cultural and linguistic *pluralism*. This chapter addresses this important dialectic, although as we shall see, modern nation-states have more often than not actually constructed these two positions in opposition to each other, rather than in tandem.

### EARLY DEVELOPMENTS

#### *The Pluralist Dilemma*

The often-difficult balancing act between maintaining cohesion on the one hand and recognising pluralism on the other within modern nation-states has been termed by Brian Bullivant (1981) as ‘the pluralist dilemma’. The pluralist dilemma, for Bullivant, is ‘the problem of

reconciling the diverse political claims of constituent groups and individuals in a pluralist society *with the claims of the nation-state as a whole*' (1981, p. x; my emphasis); what he elsewhere describes as the competing aims of 'civism' and 'pluralism'. Other commentators have suggested similar distinctions (see, e.g. Dauenhauer, 1996; Edwards, 1994), while also emphasising, like Bullivant, the difficulties of reconciling social cohesion on the one hand with, on the other, a recognition and incorporation of ethnic, linguistic and cultural diversity within the nation-state.

In an earlier analysis, Schermerhorn has described these countervailing social and cultural forces as *centripetal* and *centrifugal* tendencies. As he observes:

Centripetal tendencies refer both to cultural trends such as acceptance of common values, styles of life etc ... Conversely, centrifugal tendencies among subordinate groups are those that foster separation from the dominant group or from societal bonds in one way or another. Culturally this most frequently means retention and presentation of the group's distinctive tradition in spheres like *language*, religion, recreation etc. (1970, p. 81; my emphasis)

How then can the tensions arising from the pluralist dilemma best be resolved in the social and political arena? Drawing on political theory, two contrasting approaches have been adopted in response to this central question, which Gordon (1978, 1981) has described as 'liberal pluralism' and 'corporate pluralism'. Liberal pluralism is characterised by the absence, even prohibition, of any ethnic, religious, or national minority group possessing separate standing before the law or government. Its central tenets can be traced back to the French Revolution and Rousseau's conception of the modern polity as comprising three inseparable features: freedom (non-domination), the absence of differentiated roles, and a very tight common purpose. On this view, the margin for recognising difference within the modern nation-state is very small (Taylor, 1994; see also later).

In contrast, corporate pluralism—now more commonly known by the term 'multiculturalism'—involves the recognition of minority groups as legally constituted entities, on the basis of which, and depending on their size and influence, economic, social and political awards are allocated. Glazer (1975) and Walzer (1992) draw similar distinctions between an approach based on 'non-discrimination'—which involves, in Glazer's memorable phrase, the 'salutary neglect' of the state towards minority groups—and a 'corporatist' (Walzer) or 'group rights' (Glazer) model.

It is clear, however, that for most commentators the merits of liberal pluralism significantly outweigh those of a group-rights or

multiculturalist approach. In effect, the answer to the pluralist dilemma has been consistently to favour civism over pluralism. This is certainly Bullivant, Glazer and Walzer's own conclusion (see also Edwards, 1985, 1994; Rawls, 1971; although for contrasting views, see the Major Contributions sections later). On this basis, the 'claims of the nation-state as a whole'—emphasising the apparently inextricable interconnections between social cohesion and national (including linguistic) homogeneity—have invariably won the day over more pluralist conceptions of the nation-state where ethnic, linguistic and cultural differences *between different groups* are accorded some degree of formal recognition. The resulting liberal consensus is well illustrated by Brian Bullivant:

Certain common institutions essential for the well-being and smooth functioning of the nation-state as *a whole* must be maintained: common language, common political system, common economic market system and so on. Cultural pluralism can operate at the level of the *private*, rather than public, concerns such as use of ethnic [sic] language in the home. . . . But, the idea that maintaining these aspects of ethnic life and encouraging the maintenance of ethnic groups almost in the sense of ethnic enclaves will assist their ability to cope with the political realities of the nation-state is manifestly absurd. (1981, p. 232; emphases in original)

Why is this apparent consensus so strongly in favour of cohesion at the expense of pluralism? In addressing this question, we have to turn to the origins of modern nation-states themselves, and the public role of language within them.

### *Nation-State Organisation and the Role of Language*

Modern nation-state organisation is actually a relatively recent historical phenomenon, deriving from the rise of political nationalism in Europe from the middle of the last millennium onwards. In particular, the French Revolution of 1789 and its aftermath are often credited with establishing the archetypal modern nation-state—a form of political organisation not countenanced before, a polity represented and *unified* by a culturally and linguistically homogeneous civic realm (see Edwards, 1985; Fishman, 1989a, b; May, 2001; Wright, 2000 for further discussion). Previous forms of political organisation had not required this degree of linguistic uniformity. For example, empires were quite happy for the most part to leave unmolested the plethora of cultures and languages subsumed within them—as long as taxes were paid, all was well. But in the politics of European nationalism—which, of course, was also to spread subsequently throughout the

world—the idea of a single, common ‘national’ language (sometimes, albeit rarely, a number of national languages) quickly became the leitmotif of modern social and political organisation.

How was this accomplished? Principally via the political machinery of these newly emergent European states, with mass education often playing a central role. As Gellner (1983) has outlined, the nationalist principle of ‘one state, one culture, one language’ saw the state, via its education system, increasingly identified with a specific language and culture—invariably, that of the majority ethnic group. The process of selecting and establishing a common national language as part of this wider process usually involved two key aspects: *legitimation* and *institutionalisation* (May, 2001; Nelde, Strubell and Williams, 1996). Legitimation is understood to mean here the formal recognition accorded to the language by the nation-state—usually, by the constitutional and/or legislative benediction of official status. Accordingly, ‘la langue officielle a partie liée avec l’État’ (Bourdieu, 1982, p. 27)—the legitimate (or standard) language becomes an arm of the state. Institutionalisation, perhaps the more important dimension, refers to the process by which the language comes to be accepted, or ‘taken for granted’ in a wide range of social, cultural and linguistic domains or contexts, both formal and informal. Both elements achieve a central requirement of the modern nation-state—that all its citizens adopt a common (usually singular) language and culture for use in the civic or public realm.

This establishment of chosen ‘national’ languages, however, usually also occurred alongside an often-punitive process of ‘minoritising’ or ‘dialectalising’ potentially competing language varieties within these same nation-states. These latter language varieties were, in effect, *positioned* by these newly formed states as languages of lesser political worth and value. Consequently, national languages came to be associated with modernity and progress, while their less fortunate counterparts were associated (conveniently) with tradition and obsolescence. More often than not, the latter were also specifically constructed as *obstacles* to the political project of nation-building—as threats to the ‘unity’ of the state. The inevitable consequence of this political imperative is the establishment of an ethnically exclusive and culturally and linguistically homogeneous nation-state—a realm from which minority languages and cultures are effectively banished. Indeed, this is the ‘ideal’ model to which most nation-states (and nationalist movements) still aspire—albeit in the face of a far more complex and contested multiethnic and multilingual reality (May, 2001; McGroarty, 2002, 2006). As Nancy Dorian summarises it: ‘it is the concept of the nation-state coupled with its official standard language. . . that has in modern times posed the keenest threat to both the identities and the

languages of small [minority] communities' (1988, p. 18). Florian Coulmas observes, even more succinctly, that 'the nation-state as it has evolved since the French Revolution is the natural enemy of minorities' (1998, p. 67).

The result of the pre-eminence of this organisational principle of cultural and linguistic homogeneity is that there are only a very few *formal* multilingual nation-states in the world today—India (see Khubchandani, *Language Policy and Education in the Indian Subcontinent*, Volume 1) and Switzerland being two notable examples. Where English is the dominant language, the prospects of formal multilingualism become even more remote, not least because of the additional position of English as the current world language or *lingua mundi* (see also Canagarajah, *The Politics of English Language Teaching*, Volume 1; Phillipson, *Language Policy and Education in the European Union*, Volume 1). In this respect, even nation-states such as Canada and Australia, who have adopted overtly multilingual policies in recent times, still continue to struggle to bring that multilingualism *effectively* into the public domain (see Burnaby, *Language Policy and Education in Canada*, Volume 1; Lo Bianco, *Language Policy and Education in Australia*, Volume 1).

### *Individual Versus Collective Rights*

The ongoing influence of political nationalism, with its emphasis on cultural and linguistic homogeneity—most often via the promotion of public monolingualism—is one key reason why civism continues to be consistently favoured over pluralism in modern nation-states. Another reason is an emphasis in international and national law since the establishment of the United Nations after World War II on *individual* as opposed to *collective* rights (see Kymlicka, 1989, 1995; May, 2001: Chapter 5 for further discussion; see also de Varennes, *International Law and Education in a Minority Language*, Volume 1; Skutnabb-Kangas, *Human Rights and Language Policy in Education*, Volume 1). Such an approach, which may be described as orthodox liberalism, promotes individual rights as the *only* rights that can be attributable in democratic states. An orthodox view of liberalism thus addresses the person only as a political being, with rights and duties attached to their status as *citizens*. Such a position does not countenance private identity, including a person's communal membership (and/or the languages they speak), as something warranting similar recognition. These latter dimensions are excluded from the public realm because their inevitable diversity would lead to the complicated business of the state mediating between different conceptions of 'the good life' (Rawls, 1971). On this basis, personal *autonomy*—based on the

political rights attributable to citizenship—always takes precedence over personal (and collective) *identity* and the widely differing ways of life that constitute the latter. In effect, personal and political participation in liberal democracies, as it has come to be constructed, ends up denying group difference and posits all persons as interchangeable from a moral and political point of view.

This position contrasts starkly with a *communitarian* view of rights, which posits that the strict separation of citizenship and identity in the modern polity understates, and at times disavows, the significance of wider communal (including linguistic) affiliations to the construction of individual identity. As Michael Sandel (1982) observes, there is no such thing as the ‘unencumbered self’—we are all, to some extent, *situated* within wider communities which shape and influence who we are. Likewise, Charles Taylor argues that identity ‘is who we are, “where we’re coming from”. As such, it is the background against which our tastes and desires and opinions and aspirations make sense’ (1994, p. 33–34). Accordingly, individualistic conceptions of the good life may preclude shared community values that are central to one’s identity. Conversely, as Habermas has put it, ‘a correctly understood theory of [citizenship] rights requires a politics of recognition that protects the individual in the life contexts in which his or her identity is formed’ (1994, p. 113). The languages one speaks would also thus be included in this communitarian view. However, communitarian critiques have themselves been widely criticised for privileging the collective over the individual and thus essentialising group identities. In effect, communitarians are charged with operating a model of group membership that is at odds with the complexities of identity in the modern world (for further discussion, see Coulombe, 1995; Donahue, 2002; May, 2001: Chapter 3).

Consequently, an ongoing emphasis on individual rights, and a related scepticism about collective rights, continues to make it difficult for minority language speakers in modern nation-states to argue for group-based language rights (such as the right to be educated in their first language). As the earlier quote from Bullivant indicates, following the principles of orthodox liberalism, the right to continue to speak a language other than the state language may *possibly* be allowed in the private domain, but not in public, since the latter is constructed as undermining personal and political autonomy, and fostering social and political fragmentation.

Closely allied with this position is a view that the ongoing promotion of ethnocultural and/or ethnolinguistic difference is problematic in and of itself. As Joshua Fishman summarises it:

Unlike ‘human rights’ which strike Western and Westernized intellectuals as fostering wider participation in general societal

benefits and interactions, 'language rights' still are widely interpreted as 'regressive' since they would, most probably, prolong the existence of ethnolinguistic differences. The value of such differences and the right to value such differences have not yet generally been recognised by the modern Western sense of justice ... (1991, p. 72)

## MAJOR CONTRIBUTIONS

### *Opponents of Pluralism*

Given the dominance of the nation-state model of public monolingualism, allied with the ongoing ascendancy of orthodox liberalism's emphasis on individual rights, it is not surprising perhaps that opponents of multiculturalism or corporate pluralism are many and various. For the sake of brevity, I will focus here on the often-vituperative debates surrounding multiculturalism and bilingualism in the USA, particularly in relation to education, as broadly representative of this position.

One prominent example is Arthur Schlesinger's *The Disuniting of America* (1992). As his title suggests, Schlesinger, a noted liberal historian, has argued to much public acclaim against the 'disuniting' of America by the 'cult of ethnicity' which, in his view, 'reverses the historic theory of America as one people—the theory that has thus far managed to keep American society whole' (1992, p. 15–16). The result is a 'multiethnic dogma [which] abandons historic purposes, replacing assimilation by fragmentation, integration by separatism' (1992, p. 16–17). In the face of this assault, Schlesinger gloomily wonders: 'The national ideal had once been *e pluribus unum* [out of many, one]. Are we now to belittle *unum* and glorify *pluribus*? Will the centre hold? Or will the melting pot give way to the Tower of Babel?' (1992, p. 18).

The mention of the Tower of Babel is significant here, since Schlesinger directs particular opprobrium towards the bilingual movement in the USA, along with its strong links to various Latino communities there (for further discussion, see also Ricento and Wright, *Language Policy and Education in the United States*, Volume 1). In so doing, Schlesinger rejects out of hand the official recognition of minority languages. As he argues, '[b]ilingualism shuts doors. It nourishes self-ghettoisation, and ghettoisation nourishes racial antagonism ... using some language other than English *dooms* people to second class citizenship in American society' (1992, p. 108; my emphasis). In asserting this position, Schlesinger invokes the rhetoric of national cohesion: 'A common language is a *necessary* bond of

national cohesion in so heterogeneous a nation as America. . . *institutionalised* bilingualism remains another source of the fragmentation of America, another threat to the dream of “one people” (1992, p. 109–110; my emphases).

These arguments have been closely echoed more recently by a number of other prominent US commentators. Samuel Huntington (2005) likewise rails against the apparent threat of Latinos (and Spanish) to a ‘cohesive’ (read: English-speaking) US public culture. While the political theorists Brian Barry (2000), Laitin and Reich (2003) and Pogge (2003) all pursue the line that continuing to promote Spanish in the USA, particularly via bilingual education, amounts to enforced ghettoisation, terminally restricting (in their view) the social mobility of its speakers. Laitin and Reich, for example, argue that the consequence of ‘forcing’ bilingual education on children would be the curtailing of ‘their opportunities to learn the language of some broader societal culture’ (2003, p. 92). And Pogge concludes that a public education *in* English, as opposed to a bilingual approach, is unquestionably in the ‘best interests of the child’ in relation both to developing ‘fluency in English’ and in ‘enabling all students to participate fully in US society’ (2003, p. 118; for a rejoinder, see May, 2003a).

The fact that these views contradict the well-attested research on the efficacy of bilingual education (see Skutnabb-Kangas, *Human Rights and Language Policy in Education*, Volume 1, and May, *Bilingual/Immersion Education: What the Research Tells Us*, Volume 5) highlights how linguistically ill-informed many commentators often are when discussing the role and influence of minority languages, and by extension minority language education, within modern nation-states. What is also strikingly apparent is a lack of any cognisance that linguistic inequality is often a daily experience for minority groups (cf. Sonntag and Poole, 1987), along with an implicit, and often explicit, assertion of the benefits, and inevitability, of linguistic modernisation—a process of modernisation, moreover, that is linked ineluctably with majority languages, and particularly English. Not surprisingly, minority languages come to be constructed in this view as irrelevant, quaint and/or antediluvian, by definition. Relatedly, there is an almost unquestioned legitimacy ascribed to majority languages—particularly national languages—in such discussions, and the similarly unquestioned acceptance of their dominant social and political position and function—their normative ascendancy—within modern nation-states. This ignores, or at best underemphasises, the specific sociohistorical and sociopolitical processes by which these majority languages have come to be created, and accepted as dominant and legitimate, in the first place (Bourdieu, 1982, 1991; May, 2005)—the result, in turn, of the political nationalism of the last three centuries, as discussed above.

*Proponents of Pluralism*

Despite the ascendancy of arguments for civism over pluralism in much academic and political commentary on nation-state organisation, there are still some dissenting voices advocating for a more inclusive, pluralist approach. One of the most prominent of these is the political theorist Will Kymlicka's advocacy of public multiculturalism (1995; see also Parekh 2000; Taylor 1994). Kymlicka's influential thesis involves arguing from within liberal political theory for the ongoing importance of individual rights while, at the same time, developing an understanding of the importance of wider cultural (and linguistic) membership to such rights. In this sense, he does not endorse the communitarian advocacy of collective rights. Rather, he argues for what he terms 'group-differentiated rights'. Crucially, these rights are not necessarily 'collective' in the sense that they privilege the group over the individual—they can in fact be accorded to individual members of a group, or to the group as a whole, or to a federal state/province within which the group forms a majority. For example, the group-differentiated right of Francophones in Canada to use French in federal courts is an *individual* right that may be exercised at any time. The right of Francophones to have their children educated in French-medium schools, outside of Québec, is an individual right also but one that is subject to the proviso in international law 'where numbers warrant' (see de Varennes, *International Law and Education in a Minority Language*, Volume 1; see also later). Alternatively, the right of the Québécois to preserve and promote their distinct culture in the province of Québec highlights how a minority group in a federal system may exercise group-differentiated rights in a territory where they form the majority. In short, there is no simple relationship between group-differentiated rights accorded on the basis of cultural membership and their subsequent application. As Kymlicka concludes, 'most such rights are not about the primacy of communities over individuals. Rather, they are based on the idea that justice between groups requires that the members of different groups be accorded different rights' (1995, p. 47).

A second argument that Kymlicka employs is to highlight that minority rights claims are principally concerned with wanting a measure of 'external protection' from larger groups. External protections relate to inter-group relations where a minority group seeks to protect its distinct identity (including a linguistic one) by limiting the impact of the decisions of the larger society. External protections are thus intended to ensure that individual members are able to maintain a distinctive way of life *if they so choose* and are not prevented from doing so by the decisions of members outside of their community (see Kymlicka, 1995, p.204. n.11). As Kymlicka argues: 'Granting special representation

rights, land claims, or *language rights* to a minority . . . can be seen as putting the various groups on a more equal footing, by reducing the extent to which the smaller group is vulnerable to the larger' (1995, p. 36–37; my emphasis).

Given this, it is possible to argue that the maintenance of a minority language constitutes a legitimate external protection (May, 2001; see also later). After all, if majority group members within a nation-state typically value their own cultural and linguistic habitus, it is clearly unfair to prevent minorities from continuing to value theirs. As Kymlicka concludes, 'leaving one's culture, while possible, is best seen as renouncing something to which one is reasonably entitled' (1995, p. 90).

Stephen May (2001, 2003a, b, 2005) has applied Kymlicka's more general arguments about minority rights to argue specifically for the extension of *ethnolinguistic democracy* in modern nation-states. May argues that the preoccupation of modern nation-state organisation with a single language and culture, and an allied public monolingualism, is both unnecessarily unjust to and exclusive of minority language groups (see also Skutnabb-Kangas, *Human Rights and Language Policy in Education*, Volume 1). Contrary to the assertion by proponents of liberal pluralism such as Schlesinger, the public realm of nation-states is not, nor has it ever been, a neutral or equal linguistic space. Rather, as Fernand de Varennes argues, '[b]y imposing a language requirement, the state shows a definite preference towards some individuals on the basis of language' (1996, p. 86). As de Varennes proceeds to argue, this is so for two reasons:

1. The state's chosen language becomes a condition for the full access to a number of services, resources and privileges, such as education or public employment. . . .
2. Those for whom the chosen state speech is not the primary language are thus treated differently from those for whom it is: the latter have the advantage or benefit of receiving the state's largesse in their primary tongue, whereas the former do not and find themselves in a more or less disadvantaged position. . . . a person faced with not being able to use his primary language [in the public domain] *assumes a heavier burden* (1996, pp. 86–87; my emphasis)

From this, May argues that speakers of the dominant language variety are immediately placed at an advantage in both accessing and benefiting from the civic culture of the nation-state. A dominant language group usually controls the crucial authority in the areas of administration, politics, education and the economy, and gives preference to those with a command of that language. Meanwhile, other language groups are invariably limited in their language use to specific domains, usually

solely private and/or low status, and are thus left with the choice of renouncing their social ambitions, assimilating, or resisting in order to gain greater access to the public realm.

In contrast, May argues, drawing on the work of Kloss (1977; see also Churchill, 1986), that minority groups be accorded not only 'tolerance-oriented' language rights (allowing individuals to continue speaking a language unmolested in the private or familial domain) but also, where appropriate, 'promotion-oriented' rights, which regulate the extent to which minority language rights are recognised within the *public* domain, or civic realm of the nation-state, including its key public institutions such as schools. Two particular contexts are outlined by May where such latter rights might be appropriate.

The first is for national minority groups—a term drawn from Kymlicka's work—who have always been associated historically with a particular territory, but who have been subject to colonisation, conquest, or confederation and, consequently, now have only minority status within a particular nation-state. These groups include, for example, the Welsh in Britain, Catalans and Basques in Spain, Bretons in France, Québécois in Canada, and some Latino groups (e.g. Puerto Ricans) in the USA, to name but a few. They also include indigenous peoples, who have increasingly been regarded in both international and national law as a separate category of peoples (see McCarty, *Language Education Planning and Policies by and for Indigenous Peoples*, Volume 1). Following Kymlicka, May argues that these groups can claim, *as of right*, at least some of the benefits that majority national languages currently enjoy—including publicly funded education in their languages.

A second possibility applies to ethnic minorities, who have migrated from their country of origin to a new host nation-state, or in the case of refugees have been the subject of forced relocation. Here, a promotion-oriented language right cannot be argued as of right, but can still be advanced on the basis of the widely accepted principle in international law of 'where numbers warrant'. That is, in order to avoid language discrimination, it is important that where there is a sufficient number of other language speakers, these speakers should be allowed to use that language as part of the exercise of their individual rights as citizens. Or to put it another way, they should have the *opportunity* to use their first language if they so choose—an opportunity which amounts, in effect, to Kymlicka's understanding of an 'external protection'.

By extension, May's argument questions and discards the requirement of a singular and/or replacement approach to the issue of other linguistic identities which, as we have seen, arises specifically from the nationalist principle of linguistic and cultural homogeneity.

Linguistic identities—and social and cultural identities more broadly—need not be constructed as irredeemably oppositional. Narrower identities do not necessarily need to be traded in for broader ones—one can clearly remain both Spanish-speaking and American, Catalan-speaking and Spanish, or Welsh-speaking and British. The same process applies to national and international language identities, where these differ (see May, 2001, 2003b for further discussion). Such a position more accurately reflects the communicative profiles of multilingual speakers, as well as according with postmodernist understandings of language and multiple linguistic identities (see Pennycook, *Critical Applied Linguistics and Language Education*, Volume 1).

#### PROBLEMS AND DIFFICULTIES AND FUTURE DIRECTIONS

As this chapter has made clear, the issue of granting minority languages some public recognition in modern nation-states continues to remain a highly controversial one, particularly with respect to education. Indeed, Addis has observed that the choice of language in public domains such as education is ‘the most difficult question that a multicultural and multiethnic [and, one might add, *multilingual*] society has to address’ (1997, p. 138). However, an increasing number of scholars within both language policy and language education are beginning to address directly exactly this question. In so doing, they are also increasingly critiquing the limits of traditional nation-state organisation, along with its historical contingency, and the related exclusion of minority languages from the public domain that has resulted. Most notable here are contributions by Tollefson (1991, 1995, 2002, *Language Planning in Education*, Volume 1), Tollefson and Tsui (2004), McGroarty (2002, 2006) and Ricento (2000, 2006). These contributions also accord closely with important related research on the ideological influences of language policy (see, e.g. Blommaert, 1999; Schmid, 2001; Woolard, 1998).

All these contributions, along with the contributions of Kymlicka and May, discussed above, attempt to rethink nation-states in more linguistically plural and inclusive ways. The aim, in so doing, is to foster the prospect of more *representational* multinational and multilingual states by directly contesting the historical inequalities that have seen minority languages, and their speakers, relegated to the social and political margins. As James Tollefson has observed of these developments:

the struggle to adopt minority languages within dominant institutions such as education, the law, and government, as well as the struggle over language rights, constitute efforts to legitimise the minority group itself and to alter its relationship

to the state. Thus while language planning reflects relationships of power, it can also be used to transform them. (1991: p. 202)

On this basis, changing the language preferences of the state and civil society, or at least broadening them, would clearly better reflect the diverse and legitimate linguistic interests of *all* those within them, even if such recognition may also present new organisational challenges for nation-states not used to the public accommodation of diversity (cf. McGroarty, 2002). Not only this, it could significantly improve the life chances of those minority language individuals and groups who are presently disadvantaged in their access to, and participation in public services, employment and education, as a result of restrictive, majoritarian language and language education policies.

And, finally, with traditional nation-state organisation increasingly under attack—both from above, via globalisation (cf. Block, *Language Education and Globalization*, Volume 1), and from below, via the increasing discontent and dissension of minority groups—rethinking the nation-state in more culturally and linguistically plural ways may provide it with a crucial further lease of life in a world where many think it has already passed its useful sell-by-date.

# **Section 1**

## **Social and Policy Contexts**

## LANGUAGE PLANNING IN EDUCATION

## INTRODUCTION

*Language planning* refers to deliberate efforts to affect the structure, function, and acquisition of languages. In education, the most important language planning decisions are about the choice of medium of instruction (Tollefson and Tsui, 2004)—which variety or varieties should be used as the medium (or media) of instruction? In many settings, it is widely assumed that the obvious choice is a standard variety, normally with high prestige and spoken by powerful groups, including the upper-middle class. Particular varieties become standardized as a result of complex social processes in which powerful groups shape language attitudes, and linguistic norms are codified (e.g., in dictionaries and grammar books). When official bodies, such as ministries of education, undertake language planning, the result may be *language policies* in education, that is, statements of goals and means for achieving them that constitute guidelines or rules shaping language structure, language use, and language acquisition within educational institutions. This chapter summarizes research on the role of language policy and planning (LPP) within educational institutions.

## EARLY DEVELOPMENTS

LPP emerged as a distinct field of research in the 1960s. The term *language planning* was initially used in Haugen's (1959) study of the development of standard Norwegian, and referred to both corpus planning and status planning. Corpus planning entails efforts to affect the structure of language varieties, and includes processes such as standardization, graphization, purification, and terminology development. Status planning involves efforts to affect the status of language varieties—which varieties should be used in government, the media, the courts, schools, and elsewhere? The initial period of development in the field of LPP took place through a series of influential publications in the 1960s and early 1970s (Fishman, 1968a, 1972, 1974; Fishman, Ferguson, and Das Gupta, 1968; Rubin and Jernudd, 1971).

Much of the earliest research in LPP focused attention on devising a conceptual framework for LPP and on a limited range of practical concerns, primarily involving corpus planning in newly emerging

nation-states. Thus in its early years, LPP was closely linked with “modernization” and “development” programs in “developing” countries, and it was heavily influenced by modernization theory (Rostow, 1960). Although LPP in education was not a major focus of this initial research, it soon emerged as a central concern, because corpus-planning issues such as language standardization and script reform necessarily involve educational institutions. It was widely believed that LPP in education could play a significant role in the processes of political and sociocultural integration that were crucial for new states formed at the end of colonialism in Africa and Asia (see Fishman, 1968b). Thus, by the early 1970s, LPP research examined such central educational issues as the role of vernacular and standard varieties in schools, bilingualism, teacher training, and the education of linguistic minorities (Spolsky, 1972).

Early LPP in education shared three key assumptions with modernization and development theory. The first assumption was an optimistic belief that LPP in education would benefit ethnolinguistic minorities. The spread of Malay and Indonesian, for example, exemplified the important consequences of LPP in education for newly independent states. A second key assumption was that technical experts in LPP should play a central role in formulating and implementing efficient, rational plans and policies. This separation of LPP from the political process reflected a belief in the skills of LPP specialists and an emphasis on the technical aspects of corpus planning, as well as a failure to appreciate the fundamentally political nature of LPP generally. A third assumption of early LPP in education was that the nation-state should be the focus of research and practice. The main actors in LPP were believed to be government educational agencies at the national level, and thus a top-down perspective dominated early LPP research.

During the 1980s, a critique of early LPP in education focused on the impact of the local context on national policies and the limitations of a technical rather than political context for LPP, as well as the failure of many language plans and policies to achieve their stated goals. Critics argued that the early approach was flawed in several ways. First, it ignored the complexity of sociopolitical systems, in which cause–effect relationships between policies and outcomes are highly complex and social groups often have covert and competing goals (see also May, *Language Education, Pluralism and Citizenship*, Volume 1). Second, by focusing on national plans and policies, early research largely ignored the attitudes and practices of communities affected by LPP in education, particularly the processes by which local communities can challenge or transform national plans. Third, the optimistic belief in the value of LPP in education for integrating linguistic minorities into national political and economic systems could not be maintained in the light of research on contexts such as apartheid South Africa, where

the white minority government promoted mother-tongue instruction and used codification and standardization as tools of apartheid while promoting Afrikaans as the dominant language (de Klerk, 2002; see also Probyn, *Policy, Practice and Power: Language Ecologies of South African Classroom*, Volume 9; Heugh, *Language Policy and Education in Southern Africa*, Volume 1). Similarly, in some states in sub-Saharan Africa, LPP in education helped to overcome the immediate problem of national integration (e.g., in Tanzania), but often the result was an educated elite in control of educational systems that largely ignored the educational needs of masses of the population with limited political power (Mazrui, 2002). Summarizing the impact of this critique, Blommaert (1996) stated that LPP “can no longer stand exclusively for practical issues of standardization, graphization, terminological elaboration, and so on. The link between language planning and sociopolitical developments is obviously of paramount importance” (p. 217).

### RECENT CONTRIBUTIONS

The major achievement of early LPP research was an understanding of the relationship between language structure and language function on the one hand, and various forms of social organization (ethnic groups, nation-states) on the other. This early work in LPP was also linked with microsociolinguistics, particularly research on interaction in educational settings (e.g., Cazden, John, and Hymes, 1972) and the relationship between bilingualism and diglossia (Fishman, 1967). The later critique of LPP shifted attention to questions of ideology, power, and inequality. This research, based on a growing body of empirical studies in widely varying contexts, focused on three key areas in education: language and ideology; the role of nonstandard varieties in education; and monolingual versus bilingual approaches to education. (For an extended discussion of recent work in this area, see Ricento, 2006.)

#### *Language and Ideology*

The term “ideology” refers to implicit or unstated (“common sense”) notions about the nature of language and communication that position individuals and groups within a social order (Woolard, 1992; see also Rubdy, *Language Planning Ideologies, Communication Practices and their Consequences*, Volume 3). Various ideologies of language have been examined, including linguistic assimilation, linguistic pluralism, and internationalization (see Reagan and Osborn, 2002). In LPP, *standard language ideology* (Lippi-Green, 1997) has received particular attention. Standard language ideology refers to a “bias toward an abstract, idealized homogenous spoken language, which is imposed and maintained by

dominant bloc institutions and which names as its model the written language, but which is drawn primarily from the spoken language of the upper middle class” (Lippi-Green, 1997, p. 64). Educational institutions play a central role in imposing standard language ideology, by rewarding users of standard varieties and imposing sanctions against those who use other varieties (Tollefson, 1991). Critical analysis of standard-language ideology raises important empirical questions about the impact of non-standard varieties in education (see also Williams, *Discourses about English: Class, Codes and Identities in Britain*, Volume 3).

### *Nonstandard Varieties in Education*

Nonstandard varieties (also called “stigmatized” varieties) include regional dialects, social varieties used by poor or working-class groups, and pidgins and creoles. In many contexts, medium of instruction policies require standard varieties, whereas nonstandard varieties are blamed for the limited educational and employment opportunities of their users. Policies that exclude nonstandard varieties from the schools are often justified on pedagogical grounds, namely that they interfere with effective instruction in the standard variety. In a review of research on this claim, Siegel (1999) found clear evidence that the use of non-standard varieties has a positive effect on the acquisition of the standard, as well as on students’ participation, self-esteem, performance on standardized tests, and overall academic achievement. Indeed, there is little evidence that using nonstandard varieties as media of instruction interferes with learning of the standard (Corson, 1997, 2000). Despite these research findings, however, language policies in many educational contexts continue to preclude the use of nonstandard varieties, perhaps due to the continuing influence of standard language ideology (cf. Cummins, 1999).

### *Monolingual and Bilingual Approaches to Education*

Emphasis on the use of standard varieties in schools implies a largely monolingual approach to LPP, in which students’ home varieties are excluded from classes. Thus, an important empirical issue for evaluating language policies is a comparison of monolingual versus bilingual approaches in education (see also May, *Bilingual/Immersion Education: What the Research Tells Us*, Volume 5). Auerbach (1993) argues that there is virtually no research supporting the claim that exclusive use of the target (standard) language is the most efficient way to promote language- or subject-matter-learning. Moreover, research on English-only instruction exploring its impact on students’ dropout rates, social isolation, progress in subject-matter instruction, and other variables, finds

significant advantages for the use of students' vernaculars, along with the standard (see Snow, 1990; Watson-Gegeo and Gegeo, 1995). Despite these findings supporting bilingual policies in education, policy makers and practitioners in many contexts continue to favor monolingual approaches (see also Lo Bianco, *Bilingual Education and Socio-political Issues*, Volume 5; May, *Bilingual/Immersion Education: What the Research Tells Us*, Volume 5).

#### WORK IN PROGRESS

The revitalization of interest in LPP since 1990 is due in part to the collapse of the idealized vision of the linguistically and ethnically homogenous nation-state. Indeed, not only is the monolingual state largely impossible in an age of migration, but there is also a growing recognition that language issues are at the core of political and military conflict in a range of settings worldwide, including Spain, UK, Yugoslavia, India, Pakistan, Indonesia, Philippines, Mexico, Guatemala, Uganda, Nigeria, Iraq, Turkey, and elsewhere (see Blackledge, 2004; Christ, 2003; May, 2001). Thus, much of the current research in LPP focuses on globalization and language loss, as well as language maintenance and revitalization. In addition, there is growing interest in language rights.

The impact of globalization on the unprecedented spread of English and on the rapid loss of languages worldwide has received serious attention in LPP (Nettle and Romaine, 2000; see also Block, *Language Education and Globalization*, Volume 1). A central question in this research is the role of planning bodies in the spread of English and in language loss (Philippson, 1992). In addition, programs of language maintenance and revitalization are the focus of research in many settings (Fishman, 2001). Work in the US Southwest is particularly important in this area, as scholars examine efforts to use Navajo as a medium of instruction (McCarty, 2002a). Similarly, policies supporting the Māori language in New Zealand offer an opportunity to discover factors that facilitate successful language revitalization (May, 2004).

Research on language revitalization is closely linked with efforts to develop a critical research methodology that places indigenous groups at the center of the research process, shaping fundamental questions such as: What research questions are legitimate? What research methodologies are acceptable? What forms of evidence are persuasive? What are the ethical responsibilities of scholars engaged in LPP research? Who should benefit from the research? This direction in research methodology is in part a response to criticisms of the research process. For example, Smith (1999, p. 1) points out that "from the vantage point of the colonized . . . the term 'research' is inextricably linked

to European imperialism and colonialism. The word itself, ‘research,’ is probably one of the dirtiest words in the indigenous world’s vocabulary.” Thus, some LPP scholars are developing a “critical method” in which an examination of their relationship to “others” who are the focus of research is at the center of the research process (see Blommaert, 1996; Watson-Gegeo and Gegeo, 1995; see also McCarty, *Language Education Planning and Policies by and for Indigenous Peoples, Volume 1*; Spolsky, *Investigating Language Education Policy, Volume 10*).

Research on language rights in education has also expanded in recent years, fueled in part by the attention to human rights in international organizations such as the United Nations and European Union (see also Skutnabb-Kangas, *Human Rights and Language Policy in Education, Volume 1*). In some settings indigenous groups have been able to invoke a discourse of language rights to win support for community schools in which an indigenous language is the medium of instruction (see also Candelier, “Awakening to Languages” and *Educational Language Policy, Volume 6*). In New Zealand, for instance, the rapid spread of Māori in the schools has been shaped by a renewed discourse of social justice and the effort to confront the legacy of discrimination against the Māori (May, 2003a). Research on the symbolic politics of language suggests that a broad system of language rights may offer significant protections for linguistic minorities in some contexts (Tollefson, 2002; Wiley, 2002). The key question is under what conditions language rights may have such an impact (McCarty, 2002b; Pennycook, 2002; see also Skutnabb-Kangas, *Language Rights and Bilingual Education, Volume 5*). Perhaps research on new forms of citizenship emerging under globalization will help LPP scholars answer this important question (McGroarty, 2002).

## PROBLEMS AND DIFFICULTIES

Despite its many advances, LPP continues to face several problems, among them: disillusionment with the language rights movement in education, an inadequate relationship between LPP and other social sciences, and lack of impact of research on policy and practice in many settings.

### *Disillusionment with the Language Rights Movement*

Some LPP scholars argue that the main impact of the language rights movement in education is “marvelous human rights rhetoric” (Skutnabb-Kangas, 2002, p. 179; see also May, *Language Education, Pluralism and Citizenship, Volume 1*) that has not improved the lives of linguistic minorities. Indeed, “the sad conclusion is that so far, a HRs

[human rights] approach to language planning and policy has not been effective in promoting educational equity for diverse student populations” (Skutnabb-Kangas, 2002, p. 179). Whereas some scholars have concluded that language rights provide an inadequate basis for LPP theory or for practical efforts to reduce the link between language and inequality (Brutt-Griffler, 2002), others argue that language rights should remain central to LPP (Skutnabb-Kangas, 2002). With the importance of language rights in LPP research and practice, this debate will continue (see May, 2003b, 2005).

### *Inadequate Relationship Between LPP and Other Social Sciences*

Both Fishman (1992) and Williams (1992) have articulated the disappointing failure of LPP to be sufficiently influenced by (or to influence) other fields in the social sciences. The paucity of sociological research on language is particularly striking, given the belief among LPP scholars that language is central to many social processes. Nevertheless, some theoretical work in LPP has begun to forge links with other areas in the social sciences. Particularly important is research by Dua (1996) and May (2001, 2003) that connects LPP with political theory. Another connection is between LPP and the local legal framework for plans and policies (Wiley, 2002). For example, the body of law on “free speech” in the USA affects debates about state efforts to restrict languages other than English and the use of stigmatized varieties in schools. Supporters of policies favoring multilingualism and language diversity rely on constitutional protections of speech as a basis for promoting languages other than English in state institutions such as the schools. In the Philippines, ongoing policy debates about the bilingual education program make sense only when viewed within the long history of constitutional regulation of the role of English, Filipino, and other languages. Thus, LPP may increasingly consider local legal frameworks in analysis of plans and policies in education.

### *Lack of Impact of Research on Policy and Practice*

LPP scholars have increasingly expressed frustration about their inability to influence the policy-making process. For example, Cummins (1999) points out that language-policy debates in the USA are characterized by a remarkable disregard for research and “blatant internal contradictions” (p. 13; see also May, *Bilingual/Immersion Education: What the Research Tells Us*, Volume 5). Examining the lack of rational analysis in public discussion of official-English laws in the USA, Donahue (2002) argues that incoherent and unsystematic debate provides opportunity for dominant groups with access to mass media to

manipulate public opinion. He concludes that the resulting “frustrating sense of anomic normlessness” and ideological confusion preserve “an extraordinary advantage for those in power” (p. 138 and p. 159). To some LPP scholars, this situation is a result of the continuing impact of standard language ideology (Lippi-Green, 1997). Others argue that a renewed effort to influence policy making is essential (Tollefson, 2004).

#### FUTURE DEVELOPMENTS

With the recent expansion in LPP research, new and unexpected directions are likely to emerge. Among these, work is likely to focus on LPP and inequality, LPP and identity, the impact of global institutions, and critical pedagogy for social change.

##### *LPP and Inequality*

Much of the research in LPP in the past decade has focused on the role of LPP in education in creating and sustaining inequality. This work is likely to continue, but perhaps with a change in focus. While recent research has amply documented the ways in which LPP in education is used by dominant groups to sustain their systems of privilege, additional work is needed to develop a better understanding of how common institutional practices contribute to inequality, largely without conscious discussion or critical awareness by participants in educational systems. Particularly promising in this regard is work by Pennycook (2002) and Moore (2002) on “governmentality,” which refers to discourses, practices, and patterns of language use as techniques by which individuals and institutions shape public behavior and enact programs of government. This research, which shifts attention away from explicit policies adopted by the state, promises to link LPP in education with work in discourse analysis and various approaches to interaction analysis and microsociolinguistics.

##### *LPP and Identity*

Recent work on language and identity has focused in part on LPP in education. Particularly promising is the effort by some scholars to examine language and identity explicitly within educational institutions. Institutional patterns of language use and the multiple institutional roles played by language users have broad implications for understanding LPP and identity. On the theoretical level, innovative work on language, gender, and language learning should be tied explicitly to research on LPP (see Davis and Skilton-Sylvester, 2004; Norton, 2000; see also Pavlenko and Piller, *Language Education and Gender*, Volume 1).

*The Impact of Global Institutions*

While research on state educational institutions continues, equally important is study of the increasing role of multinational corporations and other global institutions that affect LPP in education (see also Block, *Language Education and Globalization*, Volume 1). Work by Alidou (2004), for instance, on the World Bank's influence on education in sub-Saharan Africa, offers a model for this research. How are some state education ministries constrained by policies of the World Bank and other global institutions? How are decisions of such global institutions implemented at the local level? How can local educators, students, and their families shape the policies that affect them? These are questions for research in this direction.

*Critical Pedagogy and Social Change*

With a growing number of LPP scholars openly advocating involvement in efforts for social change (Nettle and Romaine, 2000; Skutnabb-Kangas, 2000), a focus on critical pedagogy for social change is likely to continue. Particularly influential is seminal work on indigenous schooling in the Solomon Islands (Gegeo and Watson-Gegeo, 2002), in the Southwestern USA (McCarty, 2002a) and in New Zealand (May, 2004). Although some researchers fear that critical pedagogy has politicized scholarship, the crisis of language loss among indigenous people and pervasive economic, social, and political inequalities based on language will continue to motivate LPP scholars to participate in language maintenance and revitalization programs, as well as efforts to develop language policies that further social justice (see also McCarty, *Language Education Planning and Policies by and for Indigenous Peoples*, Volume 1 and Kaplan and Baldauf, *An Ecological Perspective on Language Planning*, Volume 9).

## LANGUAGE EDUCATION AND GLOBALIZATION

### INTRODUCTION: GLOBALIZATION

In his oft-cited book on globalization and modernity, Anthony Giddens defines globalization as:

the intensification of worldwide social relations which link distant localities in such a way that local happenings are shaped by events occurring many miles away and vice versa. (Giddens, 1990, p. 64)

A more elaborate definition, taken from Held, McGrew, Goldblatt and Perraton (1999, p. 15), is as follows:

Globalization can be located on a continuum with the local, national and regional. At the one end of the continuum lie social and economic relations and networks which are organized on a local and/or national basis; at the other end lie social and economic relations and networks which crystallize on the wider scale of regional and global interactions. Globalization can be taken to refer to those spatio-temporal processes of change which underpin a transformation in the organization of human affairs by linking together and expanding human activity across regions and continents.

In these two definitions, globalization is framed as the ongoing process of the increasing and intensifying interconnectedness of communications, events, activities and relationships taking place at the local, national or international level. However, while globalization theorists tend to agree on the general parameters of globalization, there are differing views about when it actually started. Robertson (1995) and Held et al. (1999) acknowledge that globalization is perhaps a pre-modern phenomenon with beginnings in the fifteenth century. According to these authors, it was at this time that the nation-state in Europe was born, and with it the beginnings of international economics and politics. In addition, at this time, the Catholic Church began to spread worldwide and thus became the first global religion. Finally, the fifteenth century was when the European superpowers, such as Portugal, Spain and England, began to spread outwards and colonize the world.

However, other globalization theorists (e.g. Cox, 1996) take a more here-and-now position, situating the beginnings of globalization at the

time of the first major fuel crisis of 1973, the decline of traditional modes of industrial production and the subsequent move towards a demand-led economy. It was at this time that the developed capitalist states began to abandon 'Fordism', the post-World War 2 economic model of rationalized mass production, stabilized work routines, organized labour, wage-driven demand for more products and the welfare state. In its place came what eventually was called the Washington Consensus, which was about the dismantling of Fordism, especially unionized labour and the welfare state.

In the globalization literature, there is also a question of whether globalization is the continued global spread of capitalism, albeit by more sophisticated and technologically advanced means, or if it is indeed something the likes of which humanity has never experienced. For the proponents of the former view (e.g. Smith, 1997; Wallerstein, 2004), we are still at a stage in history that is imminently modern, in which, for example, international capitalism, the nation-state and the national cultures are still very much intact. However, other theorists (e.g. Bauman, 1998) argue that modernity has been left behind and in its wake we live in world in which the nation-state is progressively more and more superfluous as regards its impact on people's lives, and culture is more an ongoing contested process than a solid social structure that withstands pressures from without.

Another issue arising in discussions of globalization is whether or not globalization is hegemonically Western, and above all an extension of American imperialism. For example, Latouche (1996) writes about the 'Westernization of the world' and the progressive 'worldwide standardization of lifestyles'. He and other authors (e.g. Ritzer, 1998) lament how Western ideology and culture, best exemplified in the USA, are becoming the norm around the world. Ritzer in particular argues convincingly that in recent years, there has been a convergence in all aspects of people's lives: how they dress, how they eat, their entertainment preferences, their work habits and so on.

However, other scholars would disagree with the view that globalization is merely US imperialism by other means. Writing in the early 1990s, Giddens acknowledges that '[t]he first phase of globalization was plainly governed, primarily, by the expansion of the West, and institutions which originated in the West' (Giddens, 1994, p. 96). However, he goes on to state:

Although still dominated by Western power, globalization today can no longer be spoken of only as a matter of one-way imperialism ... now, increasingly, ... there is no obvious 'direction' to globalization at all, as its ramifications are ever-present . . . (Giddens, 1994, p. 96)

To capture the great number of potential angles on globalization, some theorists have proposed frameworks that are meant to encapsulate the totality of the phenomenon.

For Held and his colleagues (Held et al., 1999), globalization can be examined from at least eight different angles: global politics and the nation-state; organized violence and military globalization; global trade and markets; global finance; multinational corporations and production networks; globalization and migration; cultural globalization; and globalization and the environment. Held et al.'s attempt to construct a comprehensive model has echoes of an earlier more modest framework developed by Arjun Appadurai (1990). For Appadurai, globalization is a 'complex, overlapping and disjunctive order' made up of five dimensions of cultural flows called 'scapes'. These scapes are listed, defined and exemplified in [Table 1](#).

### EARLY DEVELOPMENTS

The globalization themes discussed earlier are inextricably linked to questions of language, and more specifically to questions of language education. This was realised from the 1950s onwards by the authors of reports produced by international organisations such as UNESCO. For example, in an early publication about vernacular and national languages in these former European colonies, UNESCO (1963) addressed the tension between a desire to strengthen national identity in former

Table 1 Appadurai's (1990) scapes

| Scape         | Gloss                | Examples  |
|---------------|----------------------|---|
| Ethnoscapes   | Flows of people      | Migrants, asylum seekers, exiles, tourists  |
| Technoscapes  | Flows of technology  | Hardware components, technical know-how   |
| Financescapes | Flows of money       | National stock exchanges, commodity speculations  |
| Mediascapes   | Flows of information | Newspapers, magazines, satellite television channels, websites and the images and symbols they create and provide |
| Ideoscapes    | Flows of ideas       | Human rights, environmentalism, free trade movements, fear of terrorism   |

colonies and the continued technical, financial, mediatic and ideological power of former colonisers, in part via the continued predominance of languages such as English and French in education. The link between the global and the local has also been a constant in the work of African scholars such as Ali Mazrui. In his classic book, *The Political Sociology of the English Language*, Mazrui examines the predominance of English in the political, religious and educational spheres of post-colonial African societies, as well as the ambivalent feelings of individuals educated in English who then contest continued post-colonial imperialism (see also, the work of authors such as Chinua Achebe, 1975, and Ngũgĩ wa Thiong'o, 1993). Elsewhere, in collections such as Fishman, Cooper and Conrad (1977) and Kachru (1983), sociolinguists have explored in detail issues such as the spread of English across nation-state and cultural borders.

This is but a small sample of what might be considered early work on language education in globalization. These authors, and others not mentioned here for lack of space (see Pennycook, 1994, and Phillipson, 1992, for more thorough coverage), were focussing on some of the global phenomena identified in the introduction to this chapter, such as flows of people, money, technology and ideas; tensions between the global and the local; and questions of cultural imperialism. However, these discussions of global issues were not carried out according to the models of globalization outlined in the introduction for the simple reason that the latter were not common currency in the social sciences when most of this work was being carried out. For a more direct link between the discussion of globalization in the introduction and language education, one needs to examine research that is more recent. In the next section, I examine what I consider to be three key areas of inquiry.

#### WORK IN PROGRESS AND PROBLEMS AND DIFFICULTIES

##### *The Commodification of Language*

One could argue that disputes in different parts of the world over which of two or more languages are to dominate in different spheres of society have always been fundamentally about economics. Nevertheless, it has traditionally been national and cultural identity, and appeals to the authentic spirit and character of a people, to which language policy makers have appealed when supporting one language over another. This certainly has been the case for well-known minority language contexts around the world, such as French in Canada and Catalan in Spain. It has also been the case for nation-states around the world, which have identified nationhood with official national languages.

Examples include Bahasa in Indonesia and Swahili in Tanzania. However, with the rise of deregulated and hyper-competitive post-industrial economies and the global spread of the new work order—the conditions under which individuals work in these economies (Gee, Hull and Lankshear, 1996)—new ways of framing languages have arisen. Now languages not only are signs of authentic national identities, they are also seen as commodities, the possession of which is a valued skill in the job market.

Two consequences flow from this commodification of language. On the one hand, it changes the rationale for conserving and promoting a language: now it is not only about saving a nation or a people; it makes good economic sense. The second consequence flows from the first: as a commodity, a language comes to be seen ‘as measurable skill, as opposed to a talent, or an inalienable characteristic of group members’ (Heller, 2003, p. 474). In her research over the past decade, Monica Heller (2002, 2003) has explored the shift from ‘an ideology of an authentic nation to an ideology of commodification’ (Heller, 2002, p. 47), which has taken place in Canada with regard to French. Much of this shift is due to changes in the economy in Québec and Canada in general over the past 40 years. When Québécois nationalism began to gather strength in the 1960s, the majority of French speakers were gathered in agriculture, mining, fishing and manufacturing, where their French language skills were not valued and they were economically marginalized. However, since this time, the Canadian and Québec economies have evolved into globalized, post-industrial, services-based markets in which language is a key element and the command of more than one language or language variety is highly valued (see also Burnaby, *Language Policy and Education in Canada*, Volume 1).

In this pro-bilingual climate, Heller’s research has focussed on both public and private sectors in which commodified bilingualism is flourishing. Thus, those working in education, health and welfare, as well as those working in the private sector (e.g. call centres, the tourist trade) must conform to the model of ‘perfect’ bilinguals in both French and English, that is, they are expected to have a command of what are considered standard varieties of both languages. The consequences for education are immense and, as Heller explains, they emerge in ‘debates over when and if to introduce English teaching into French-language schools; over the relative importance of French versus other languages (Japanese or Spanish, for example) in language education in English-language schools; over the value of the vernacular versus standard French; over the very nature of standard French; and over how best to be bilingual; to name just a few of the debates current in Canadian society’ (Heller, 2002, p. 62).

A large part of this commodification process is about framing language as a communication skill that can be taught, a topic that Deborah Cameron (2000, 2002) has researched in detail. Whereas in the past, it was assumed that human beings acquired the ability to communicate with one another through practice and experience, today the view is increasing that formal instruction provided by communication specialists is required. This communication skills revolution has taken place at three general levels. First, in an ever-increasing number of workplaces, communication skills training has become an integral part of staff development and, indeed, communication skills are seen as an essential qualification for many jobs. Second, outside the workplace, advice on the development and the enhancement of communication skills has become a basic element in the ever-growing self-help and self-improvement market. Third and finally, educational authorities in many parts of the world, no doubt with their eyes on what is happening in the job market, have made communication skills training a part of their national curricula.

### *The Spread of English as an International Language*

The commodification process of languages is one thing; quite another is the choice of which language is to be adopted as a country's official language of education or which languages are to be taught as foreign languages in secondary schools. The one language that is the focus of debates at both levels in recent years is English. Indeed, the English language is for many people in the world today, the medium that makes possible what Giddens (op. cit.) refers to as 'the intensification of worldwide social relations'. It seems that there is no part of the world where there has not been at least some contact with English, although, paralleling globalization, the incidence and significance of English is unequal in different parts of the world. About such issues, there seems to be little disagreement.

By contrast, there is disagreement about whether or not the spread of English is a good thing, and in recent years the issues brought to the fore by scholars such as Mazrui (op. cit.) have resurfaced, but this time framed more deliberately within discourses of globalization. Thus, in recent years, Robert Phillipson (1992) has developed the concept of 'linguistic imperialism' to explain how the English language grows continually stronger around the world, at the expense of local languages. For Phillipson, there are economic and cultural powers in the world that prime English over other languages. For example, the business world, headed by English-speaking North America, has propagated the idea that English is the international language of business. In the cultural sphere, English language culture (e.g. Hollywood,

pop music, fast food) is one thing that most inhabitants of the world have in common. Elsewhere, Tove Skutnabb-Kangas has introduced the terms 'linguicide' and 'linguistic genocide' (Skutnabb-Kangas, 2000; see also Skutnabb-Kangas, *Human Rights and Language Policy in Education*, Volume 1) to describe how English has effectively become a 'killer' of less powerful language around the world. The work of Phillipson, Skutnabb-Kangas and other scholars concerned about the spread of English and the death of smaller languages has led to general area of inquiry which May (2003, 2005) terms 'language rights'.

Over the past decade, the issue of English and minority language rights has generated much debate (e.g. Hall and Eggington, 2000; Tollefson, 1995, 2002; special issues of *Journal of Sociolinguistics* in 2003 and 2005), some of which has been quite confrontational. For example, Janina Brutt-Griffler (2002) takes issue with the concept of linguistic imperialism, in particular the suggestion that English was imposed on the colonized peoples of the British Empire. Brutt-Griffler (2002, p. 31) argues that 'the spread of English involved a contested terrain in which English was not unilaterally imposed on passive subjects, but wrested from an unwilling imperial authority as part of the struggle by them against colonialism'. Echoing Bisong's (1995) view of English as a valued language in Nigeria for its communication potential, she also argues that the protection of endangered languages, as proposed by Skutnabb-Kangas in her publications over the years, goes against the wishes of many parents in African and Asian countries, who would like their children to have the opportunity to learn English.

Brutt-Griffler's criticisms have spawned a series of rebuttals and counter rebuttals (see the special issues of the *Journal of Sociolinguistics*, 7/4, 2003 and the *Journal of Language Identity and Education*, 1/3, 2002, as well as the forum section of *JLIE*, 3/2, 2004). They also contrast with the views of other scholars who have framed the debate in different ways. Steering a course between those in favour of Phillipson and Skutnabb-Kangas's theses and those against, Marnie Holborow (1999) makes a clear distinction between what Pennycook (1994) calls 'discourses of colonialism' and what she sees as the material practices of colonialism. For Holborow, one cannot contest discourses, while one can engage with material reality. Adopting a Marxist stance, Holborow is far more attracted to the Phillipson and Sktunabb-Kangas view of the world, although here too she does have her criticisms. For example, she sees the broad contrast between the north and the south and the centre and periphery as over-simplistic, ignoring as it does the roles of ruling local elites, who are complicit in global capitalism. Similarly, she is wary of fostering local nationalism as a defence against imperialism: very often, it is conservative ruling local elites leading the defence of the local against imposition from without.

In addition to steering a course between and among different camps, May (2003, 2005) notes how the framing of language rights strictly in terms of economic prospects, as authors such as Brutt-Griffler (2002) and John Edwards (1985) have done, ignores the way that people often value their affective ties and affiliations to a particular language over the relative 'usefulness' of that language in terms of gaining access to key social and economic resources. Indeed, if abandonment of the minority language and the embracing of English were so obviously the only rational way forward for ethnolinguistic minority groups in established nation-states, then Latinos in the USA would not continue using Spanish; the Québécois, as citizens of Canada, would not have spent as much time and money as they have over the past several decades on the preservation and promotion of French; and the citizens of African countries would have abandoned local languages and vernaculars long ago.

Elsewhere, Pennycook (1994, 1998; Pennycook, *Critical Applied Linguistics and Language Education*, Volume 1) and Canagarajah (1999, 2005a; Canagarajah, *The Politics of English Language Teaching*, Volume 1) take a post-modern view of the world informed by critical theory, framing the spread of English as altogether too complicated to be considered as oppressive and dehumanising as Phillipson and others suggest. Both scholars allow for the capacity of L2 English users around the world to resist (that is, to combat rationally and reflectively) linguistic imperialism (Canagarajah, 1999). This may be done by engaging in what Pennycook (1994), following authors such as Achebe (1975), terms 'writing back', the process by which users of English around the world appropriate English and make it work for their various personal, professional and political purposes. This appropriation may work at the more literary and academic levels in the form of published articles and books for national and international consumption. However, it might also work at the local level, be it the nation-state, community or even neighbourhood.

For example, in the context of post-colonial Tanzania, where Swahili was promoted as the national language from the mid-1960s, Blommaert (2005) notes that English remains an important and extended medium of communication at all levels of society. However, rather than seeing uses of English, such as in business signage, as evidence of 'an invasion of an imperialist or killer language' (p. 404), Blommaert finds it more useful to situate them in a global hierarchy in which small business operators in Tanzania connect with their potential clientele, using English to index their sophistication in taste (e.g. making reference to European norms of consumption), their business knowledge (English sounds business-like) or their connections to international business (English is the international language). For Blommaert, over-simplified essentialist associations of one language or one identity do not survive

the scrutiny of ethnographic research. Neither do de-essentialised approaches that in effect amount to rational choice theory, whereby individuals make interested choices about language affiliations based solely on factors such as economic gain or prestige (for further discussion and critique of this, see May, 2003, 2005). What is needed is an approach to English as an international phenomenon that escapes essentialism but recognises social structures, in particular the unequal access to all semiotic resources, including language, that reigns in the world today.

### *The Effects of Globalization on the Language Teaching Practices*

As Pennycook (1994) and Phillipson (1992) note, inextricably intertwined with the spread of English as an international language is the spread of teaching methodologies that originate in countries like the USA and Britain. From the 1970s onwards, what is known as Communicative Language Teaching (CLT) has been at the forefront of debate about language teaching methodology in different parts of the world. From its beginnings in the Council of Europe (Van Ek, 1975), CLT has become the first truly global method. Thus, while it is not written into every national curriculum in the world today, it is a point of reference in discussions about language teaching around the world. In succinct form, CLT is an approach to language teaching which views language as being about communicative competence (Hymes, 1971), that is, the ability to use the linguistic system appropriately, and language learning as emergent from the use of the target language in interaction as opposed to an explicit focus on grammar (Richards and Rodgers, 2001). A key feature of CLT is the attempt to replicate, in the classroom, the experiences of regular users of the target language. Thus, there is an emphasis on classroom activities that mimic activities in the 'real' world (or in any case, what many language educators and materials writers imagine the world outside the classroom to be like). For its proponents, it represents a positive step forward in the history of language teaching, from more old-fashioned approaches to teaching, which are text-based (grammar translation) or based on generally discredited learning theories (e.g. Audiolingualism and behaviourist psychology).

In Appadurai's (op. cit.) terms, CLT is an example of a pedagogical *ideoscape*, a global flow of ideas about teaching. However, this flow has been neither one-way nor unproblematic, as more and more applied linguists have come to question the spread of CLT in recent years. In sections of their respective books dealing with language teaching methodology and social context, Holliday (1994), Pennycook (1994), and Phillipson (1992) discuss the gap between imported pedagogical principles and local teaching contexts. For example, Pennycook

questions the assumption that learners of English must participate in information gap activities if they are to learn the target language in contexts such as Malaysia. This global exhortation to chat runs up against intercultural walls (Pennycook points out that silence is an integral part of communication in Malay), as well as intracultural walls (the different conversation roles according to gender which exist in some cultures). Following a similar line, Ellis (1996) writes specifically about CLT in East Asian countries such as China and Vietnam, making the point that the focus on process inherent in this approach to language teaching does not sit well in societies in which content is considered important. Kramsch and Sullivan (1996), referring to Vietnam as well, point out that the concept of group might better refer to the entire class as one unit, as opposed to collections of three or four students separated from their classmates.

Other authors have explored the extent to which teachers teach according to the basic tenets of CLT. Mitchell and Lee (2003) compared the teaching of French as a foreign language in a classroom in the UK with the teaching of EFL in a South Korean classroom. They found that in these two classrooms, CLT was not alive and well, as lessons were teacher-centred and there was not much in the way of pair- and group-speaking activities. Elsewhere, Sakui (2004) examined how 30 Japanese teachers defined and implemented CLT, the official methodology of the Japanese Ministry of Education since 1989. She found that while teachers were knowledgeable about pedagogical options, they tended to adopt something akin to grammar translation as their dominant methodology, because this was deemed to be the best way to prepare students for their university entrance exams, which were still grammar-based. Sakui documents a situation in which ministerial methodological dictates have changed while examination structures have not.

The resolution of conflicts arising when the global spread of method collides with local educational cultures has been discussed by many authors over the years (Bax, 2003; Canagarajah, 1999; Holliday, 1994; Kumaravadivelu, 1994; McKay, 2002). While the proposals of these authors vary considerably, they all involve a call for local teachers to work out their own solutions, appropriating what they deem suitable from without, while relying on home-grown strategies that have ecological validity. For example, Holliday (1994) discusses 'appropriate methodology' as a means of breaking away from pedagogical recommendations from without and moving towards approaches that start with the teacher's understanding of classroom activity, which in turn inform future classroom teaching. Starting with teachers' understandings in local context, of course, would mean moving away from the importation of teaching technology from abroad as part of the

global network. Elsewhere, Kumaravadivelu (1994, 2003) discusses the 'post-method' condition, in which the adoption of a particular method has ceased to be regarded as the solution to all problems, and there is no longer a one-way flow of expertise from centre to periphery. As Canagarajah (2002) notes, this state of affairs opens up new opportunities for the knowledge and expertise of local teachers in periphery contexts to be recognized and valued.

### FUTURE DIRECTIONS

The three areas of inquiry discussed earlier all show great potential and promise as regards research and debate in the future. Thus far, research into the commodification and skilling of language has focussed primarily on events in a few select locations. However, as applied linguists adopt a more global agenda, research begins to catch up with other instances of these phenomena around the world. There is a need, for example, for studies of the ways that languages around the world have been commodified. In addition, Cameron's (2000, 2002) research into communication skilling, originally based in the UK, should be extended to other parts of the world.

As regards the spread of English around the world, and concepts such as linguistic imperialism and linguicide, there is little doubt that Phillipson and Skutnabb-Kangas have initiated and helped to maintain on the applied linguistics agenda the issue of the spread of English and English language teaching around the world. And, with authors such as Brutt-Griffler questioning some of the foundational concepts and extensions of their arguments, English as a globalized language will no doubt continue to generate debate and research. However, following authors such as Blommaert, Canagarajah, May and Pennycook, this debate is becoming increasingly nuanced as relatively simple models and frameworks are replaced by even more complex ones.

Finally, the ongoing global-local tension emerging from the spread of CLT as something akin to a global language teaching methodology seems set to continue. Future research needs to be along the lines of the contributions to Canagarajah (2005b) and discussions such as Holliday (2005); while the former explores teacher-generated practices in a variety of local contexts, the latter looks at the difficulties facing native and non-native speakers of English as they reconcile global and local forces in the teaching of English as an international language.

## LANGUAGE EDUCATION AND CULTURE

### INTRODUCTION

No two concepts are more intimately linked than language and culture. In our interactions with others, we use language not only to refer to or represent our sociocultural worlds. It is also the central means by which we bring our cultural worlds into existence, maintain them, and shape them for our own purposes. Long recognized in fields such as linguistic anthropology and sociolinguistics, the interdependent nature of language and culture has been a key premise of a substantial body of research on linguistically and culturally diverse groups. Findings demonstrate in compelling ways the myriad linguistic resources that members of a wide range of sociocultural groups use to both reflect and create their social worlds.

Findings from this rather large body of research have led to new ways of understanding the connections between the linguistic and cultural diversity of learners in educational institutions and the nature of schooling. These new understandings have, in turn, led to the creation of several pedagogical innovations captured under the broadly conceived framework of culturally responsive pedagogy. A primary premise of this pedagogy holds that exemplary teaching builds on rather than ignores the rich reservoirs of knowledge, experiences, and beliefs that linguistically and culturally diverse learners bring to their schooling experiences from their homes and communities. Provided here is a review of some of the more prominent innovations founded on this premise and a brief discussion of possible pitfalls and future possibilities.

### EARLY DEVELOPMENTS

Changing immigration patterns over the latter half of the twentieth century led to an increase in the linguistic and cultural diversity of communities in all corners of the world. Despite apparent good intentions of educational institutions in dealing with the upsurge in linguistic and cultural diversity of their learner populations, the efforts of teachers, administrators, and other institutional authorities were hampered by a widely held belief that linguistic and cultural *differences* reflected linguistic and cultural *deficiencies*. Consequently, differences in levels

of academic achievement between mainstream, i.e. white, native English speaking, learners and nonmainstream learners were attributed to the latter's rearing in home and community settings considered to be linguistically and culturally deprived.

Early research in sociolinguistics and linguistic anthropology sought to counter this belief by detailing the richness of linguistically and culturally diverse learners' worlds outside schools. Studies from the 1960s and 1970s examining the dynamics of varieties of English found in the USA (e.g. Labov, 1972; Wolfram, 1974; Wolfram and Christian, 1976), for example, made apparent the structural soundness and functional importance of different dialects found in American society. Findings from these and other studies demonstrated rather conclusively that rather than a deficient version of some idealized standard, language varieties are systematized, legitimate tools by which members of different sociocultural groups and communities participate in and manage their social worlds.

Also influential in countering the deficit view of linguistically and culturally diverse learners is much ethnographic research from the field of linguistic anthropology. The studies by Shirley Brice Heath (1983) and Susan Phillips (1983) are arguably two of the more influential early investigations. Each study provides rich descriptions of the language practices and larger sociocultural beliefs and values found in communities of learners who are not considered standard or mainstream English speakers. Heath's study examined the practices of two rural US communities, Trackton, a black community, and Roadville, a white community, and one urban, middle-class community comprising both black and white families. Phillips investigated the home socialization practices of a native American community, the Warm Springs Indians. Both studies found that the home practices of these communities comprised a myriad of linguistic and cultural experiences, knowledge, skills and beliefs, which, although different from mainstream practices, were equally rich and of vital importance to these communities.

This early work paved the way for a great deal of subsequent research on language and literacy practices of many different communities and cultural groups around the world (Barton and Hamilton, 1998; Martin-Jones and Bhatt, 1998; Watahomigie and McCarty, 1997). In addition to enriching our understandings of the linguistic and cultural dynamics of these communities and groups, these findings have added greatly to our understandings of the significant connections between the home practices of linguistically and culturally diverse learners and the practices of mainstream schooling contexts. We know, for example, that the linguistic and cultural practices of sociocultural groups and communities who are not considered mainstream often differ from those practices found in schools. We also know that

children who have been reared in nonmainstream practices often do not perform as well academically as those whose practices are more similar to those found in schools do. The differences in performances, however, are not because the home practices of the nonmainstream children are linguistically and culturally inferior. It has to do, instead, with compatibility. Children whose home activities reflect the linguistic and cultural practices of schools are likely to have more opportunities for success because they only need to link to and build on the practices into which they have been socialized at home. On the other hand, children whose home practices are linguistically and culturally different are likely to have more difficulty because they must add new linguistic and cultural practices and create new links to those they already know.

### MAJOR CONTRIBUTIONS

The findings from many studies illustrating the vitality and importance of linguistically and culturally diverse learners' worlds outside schools conducted throughout the last few decades of the twentieth century provided the foundation for the development of several innovative approaches to language education that can be subsumed under the broad framework of culturally responsive pedagogy. This pedagogy is based on a key premise that considers the different worlds that linguistically and culturally diverse learners bring with them to the classroom to be rich reservoirs of resources to draw on rather than sources of deprivation and thus obstacles to overcome. Thus, exemplary educational programs seek to build on rather than replace the languages and cultures that learners bring with them to school.

Several pedagogical innovations grounded in culturally responsive pedagogy deal with matters of curriculum. One innovation is often referred to as *language awareness* or *dialect education* curricula. Drawing directly from the research on language variation, it proposes adding a curricular component designed specifically to raise learners' awareness of the variable nature of language and its link to their cultural identities. One way this is done is by involving learners in the study of the language varieties found in their local communities (Wolfram, Christian, and Adger, 1999). In addition to raising learners' awareness of the importance of their own language variety, such study helps learners to understand the social, political, and historical nature of languages considered standard and against which their own varieties are judged.

A second approach advocating curricular change is *funds of knowledge*, which calls for drawing on learners' diverse worlds outside the classroom to create linguistically and culturally meaningful curricula

and instructional practices in the classroom. It was originally developed by Luis Moll and his colleagues (Moll, Amanti, Neff, and González, 1992) in their work with working-class Mexican-American communities in Arizona in the USA. The purpose of their work was to tap into these communities' funds of knowledge, a term coined to refer to the communities' significant sociocultural practices, bodies of knowledge, skills, and beliefs, and to use the funds to transform the curricula of these communities' schools. A defining feature of the approach is the active involvement of teachers in the ethnographic study of their students' worlds outside the school and in the use of their newfound understandings to redesign or transform their curricula and instructional activities. Most funds of knowledge projects have been conducted by teachers from public schools, primarily at the elementary level, in the USA (González et al., 1993).

Another, more broadly conceived approach calling for curricular changes that draw on learners' home practices is *multicultural education*, a term used by educational institutions primarily to refer to a range of programs and policies developed to address concerns of historically marginalized groups. Originating with the civil rights movement in the USA in the early 1960s, multicultural education was initially conceived to address the concerns of three groups in particular: those identified by race, class, and gender, but more recent articulations address concerns of linguistically and culturally diverse immigrant groups as well, and not just in the USA but around the world (Banks and Banks 1995; May 1999a). Considered one of the pioneers of multicultural education, James Banks (1981) called for a total transformation of schools, including their placement, disciplinary and other policies, and testing and assessment measures in addition to curricula and instructional practices and materials. Early attempts at reform were, for the most part, limited to making slight changes or additions to traditional school practices. These included integrating into the regular curriculum interpersonal activities and textual information about those groups marked as different that were meant primarily to enhance the group members' dispositions and attitudes about themselves.

More recently, education scholars such as Carl Grant and Christine Sleeter (2003), Sonia Nieto (2002), and Geneva Gay (2000) have made visible how longstanding schooling practices such as tracking (streaming) and standardized tests continue to constrain the educational advancement of nonmainstream learners. In response to this, they have called for more profound structural changes grounded in dual concerns with equal educational opportunity and social change. In noting the tendency for multicultural education practices to take accommodation to mainstream culture as its pedagogical goal, Stephen May (1999a, b) has also called for a more critical approach to multicultural education.

The changes he proposes seek to encourage and preserve “a reflexive critique of specific cultural practices that avoids the vacuity of cultural relativism... allows for criticism (both internal and external to the group), transformation, and change” (May, 1999b, p. 33).

A final, broadly conceived approach drawing on the basic premises of a culturally responsive pedagogy is *participatory pedagogy*. This approach has its roots in the work of Brazilian educator Paulo Freire (1972, 1973) who argued for a pedagogy that took into account rather than ignored the social, cultural, and political worlds of learners. In Freire’s model, the teacher becomes a facilitator and the curriculum is organized around experiences, needs, and concerns that learners consider to be central to their lives. Also referred to as critical pedagogy (cf. Morgan, 1998; Pennycook, 2001), participatory pedagogy aims to create classroom environments that help learners first to understand more fully their local conditions and circumstances, and second, to take action toward changing their lives. One way this is done is by helping learners understand the myriad ways in which the contexts of their lives are publicly constructed and the means they have available for recreating their worlds in ways that are meaningful and appropriate for them.

The works of some of the more prominent participatory pedagogy scholars including, for example, Henry Giroux (1997), Ira Shor (1996), and Michael Apple (1996), are more theory-based in that they build on and extend Freire’s philosophy in arguing against what they perceive to be deeply embedded inequities in the educational system and for major reform. The work of other critical pedagogues is more practice-based, in that it attempts to apply these ideas to specific learning contexts. The approaches advocated by Brian Morgan (1998), Elsa Auerbach (1992), and Bonnie Norton Peirce (1995), for example, are geared to community-based adult immigrant language programs, whereas that of Heath and Mangiola (1991) is aimed at school-aged children.

#### WORK IN PROGRESS

The move into the twenty-first century has brought with it myriad models and approaches to language education that are grounded in culturally responsive pedagogy. Although the basic premise of these approaches remains the same, there are some conceptual changes afoot in terms of how we understand language and culture that are having a significant impact on the design of educational programs. The acknowledgment of the intrinsic link between language and culture notwithstanding, it has been the case that most approaches associated with culturally responsive pedagogy have held on to, or, at the very least, have not questioned, a view of language as stable structural

systems and of culture as fixed bodies of knowledge. Moreover, it has taken for granted the idea that the knowledge of both systems is shared equally by all members of a particular group and thus, homogeneous and stable across speakers and contexts.

This traditional view runs counter to contemporary understandings, which consider language to be fundamentally dynamic, provisional, grounded in and emergent from its locally situated uses in culturally framed and discursively patterned communicative activities, which, in turn, are tied to specific sociocultural communities of practice (Hall, Cheng, and Carlson, 2006; see also May, *Language Education, Pluralism and Citizenship*, Volume 1 and Pennycook, *Critical Applied Linguistics and Language Education*, Volume 1). The nature of culture is considered to be equally dynamic, comprising recurring constellations of dispositions and expectations that are continually recreated in the myriad intellectual and practical communicative activities constituting our daily lives. Culture is located then not in accumulated bodies of static knowledge, but in the daily interactions occurring between individuals in particular sociocultural contexts at particular moments of time. Through our participation in myriad, varied activities, we take on and negotiate multiple cultural identities. Cultural identity, then, is not seen as singular and unitary, but rather as multiple and malleable, a dynamic creation of the social, historical, and political contexts of our lived experiences.

One recently developed approach that fully incorporates contemporary perspectives on language and culture is the pedagogy of multiliteracies (New London Group, 1996; see also Kalantzis and Cope, *Language Education and Multiliteracies*, Volume 1). The approach was proposed by a group of ten scholars from the USA, England, and Australia in response to what they consider to be two important challenges to education. The first is the ever-increasing cultural and linguistic diversity of communities around the world. Such diversity, they argue, not only means “that there can be no standard.” (p. 10). It also means “that the most important skill students need to learn is to negotiate regional, ethnic, or class-based dialects. . . hybrid cross-cultural discourses; the code switching often to be found within a text among different languages, dialects, or registers; different visual and iconic meanings; and variation in the gestural relationships among people, language, and material objects” (ibid.). The second challenge is the increasing creation and spread of multimodal means for communicating within and across these communities.

To meet these challenges, they call for a pedagogy whose goal is to develop in learners a critical understanding of how their communicative activities—oral, written, and multimodal—are historically and socially located and produced, along with skills for shaping available

meaning-making resources into new patterns and activities with new meanings. To meet this goal, they propose that instruction be organized around four dimensions of learning opportunities. Situated practice immerses learners in practices that are important to their lives and provides opportunities for them to learn on their own, to figure out what they need to do to make sense in them. Overt instruction helps learners to gain control over and develop a language for describing the resources and patterns by which meaning is made in their activities. The purpose of the third learning opportunity, critical framing, is to help learners understand more fully the historical, social, cultural, political, and ideological perspectives embodied in their activities. The New London Group argues that such reflective explorations will lead to learners' development of a broader perspective of the ways in which locally situated meanings both converge and diverge from the learners' own worldviews. They will also learn to recognize that meanings and rules for the use of communicative resources are arbitrary, tied to their contexts of use in complex, and sometimes contradictory, ways. Such awareness in turn can enable learners to make informed choices about their own participation. The final opportunity, transformed practice, provides learners with opportunities to use their new understandings, knowledge, and skills to try out different voices in familiar contexts, to invent new means and, where possible, create new practices and new goals for self-expression and connecting with others.

The approach proposed by the New London Group differs from earlier approaches grounded in culturally responsive pedagogy in at least two ways. First, it considers all members of educational institutions to be linguistically and culturally diverse and, in doing so, does away with the notion of one language standard and the act of cultural "othering" that has marked earlier approaches. Second, it considers the goal of learning to be not just mastery but also invention. The conditions for learning fostered in each of the four overlapping spheres of opportunities conceptualized by the New London Group not only promote learners' development of a complex range of understandings and perspectives, knowledge and skills, and values and motivations needed for full personal, social and cultural participation in their classroom communities as well as in their larger, social communities. It also fosters in learners the development of an ability to see from multiple perspectives, to be flexible in their thinking, to solve problems creatively and, ultimately, to develop new ways of becoming involved in their worlds. Cope and Kalantzis (2000) provide several case studies of attempts to put the ideas proposed by the New London Group into practice (see also <http://multiliteracies.com/> for samples of current projects undertaken by groups of educators in Australia and Malaysia).

## PROBLEMS, DIFFICULTIES, AND FUTURE DIRECTIONS

The efforts described in this chapter have enjoyed success in transforming language programs and enhancing the academic performances of linguistically and culturally diverse learners in schooling contexts around the world. However, as the diversity of our communities continues to increase, educational institutions face two critical challenges. The first has to do with the issue of linguistic and cultural representation of learners' worlds outside schools. Much of the work cited earlier has indeed helped to raise our awareness of the richness of learners' linguistic and cultural worlds. However, even as understandings of the concepts of language and culture change, too often learners' worlds continue to be treated as stable and homogeneous. Moreover, possibilities for individual identity are often limited to membership in one group only, with boundaries between groups considered fixed and impermeable. So, for example, learners are identified as either Mexican, or African-American, or Caucasian, and are then held accountable for living in ways that reflect particular linguistic and cultural idealizations of these groups. Possibilities for hybridization, for living multiple, heterogeneous, malleable linguistic and cultural lives are too often treated as phenomena to be controlled or ignored rather than explored and celebrated (see also May, *Language Education, Pluralism and Citizenship*, Volume 1).

The second challenge comes from the larger political front. Despite the continued calls for social justice, scholars (Dyson, 2003; Gutierrez, Asato, Santos, and Gotanda 2002; May, 1999b) note that in many cases, current instantiations of culturally responsive pedagogy have become comfortable, neutral, stuck in liberal ideologies that offer few real solutions for effecting change to current structures. As these educational programs stagnate, public resistance to them has begun to grow louder and more insistent. Referred to as "backlash pedagogy" (Gutierrez, Asato, Santos, and Gotanda, 2002, p. 335), this counterattack places blame for the perceived educational crisis on "teachers, so-called 'liberal' pedagogies, and linguistically and culturally diverse and poor children" (ibid.). In educational institutions across the USA, for example, this resistance is reflected in the dismantling of educational programs that were created specifically to improve opportunities for learning for linguistically and culturally diverse groups, as well as in the continued reliance on structures and processes such as tracking students according to categories such as class, culture and language and diluting the curriculum for nonmainstream learners.

These challenges call for movement on at least two planes. On one, we must increase efforts in critically examining how school structures

and processes continue to subjugate those who are linguistically, culturally and in other ways different from the mainstream and constructing a framework for reexamining both schools and society that are both progressive and transformative. As we move forward in these efforts, we must ensure that our discourses “affirm the critical but refuse the cynical, and establish hope as central to a critical pedagogical and political practice” (Giroux, 2000, p. xv). We must also reach to extend the conversation across national boundaries, to create as May (1999a, p. 6) proposes “a cross-national dialectic” and include context-specific efforts from settings that up until now have been largely unexplored territories (Makoni and Pennycook, 2005).

At another level, we need to increase efforts in formulating ways of dealing with, indeed, making possible, the continual reinvention, of learners’ linguistic practices and cultural identities between and across constructed and imagined boundaries, both within and outside our educational institutions (cf. Makoni and Pennycook, 2005). Shields, Bishop and Mazawi (2005), Iddings, Haught, and Devlin (2004), Lin and Luk (2004), and Locke and May (2004) are just a few telling examples from real classrooms around the world of possible directions for these efforts.

Ultimately, calls for transformation will not—and, in fact—cannot lead to the development of a panacea for addressing the myriad issues and concerns with linguistic and cultural diversity, both reflected and created in our educational institutions. As the sociohistorical conditions of our learners’ lives change, so do their needs and concerns, and their linguistic and cultural resources for dealing with them. And so it may be that as we move more fully into the twenty-first century, one mark of effective educational programs will be their ability to remain provisional, always in the state-of-becoming, with their practices and policies tied to the specific historical, social, and political conditions that arise from and in turn help shape the diversity of experiences in ours and our learners’ everyday lives.

## LANGUAGE EDUCATION AND GENDER

### INTRODUCTION

In the past three decades, gender issues have received a wide coverage in the education literature. Working at the intersections of gender, race, and class, education scholars have tried to understand which students are disadvantaged by particular contexts and what can be done to address these inequities. Two areas remain largely invisible in the larger field of research on gender in education, however. One relates to the unique challenges faced by educators working in linguistically and culturally diverse contexts, where learners bring with them distinct and oftentimes conflicting gender ideologies and practices. Second, are those working in foreign Language Classrooms, where students are introduced to the ‘imaginary worlds’ of other languages whose gender ideologies and practices may appear unfamiliar or perhaps even illegitimate. Consequently, the aim of this chapter is to survey research on gender issues in the education of linguistically diverse speakers and in foreign/second language education.

### EARLY DEVELOPMENTS

Early research sparked by Lakoff’s (1975) *Language and Woman’s Place* and Thorne and Henley’s (1975) *Language and Sex: Difference and Dominance* conceptualized the relationship between language and gender through the notions of difference and dominance, and, implicitly, the notion of deficit. In the deficit framework, women were viewed as inferior language users and oftentimes as “the muted group” who speaks a “powerless language.” In the study of linguistic diversity, this view translated into the *linguistic lag* hypothesis, the view of minority women as less bilingual than men, and thus lagging linguistically behind them (Stevens, 1986). In the *dominance* framework, theorized in Lakoff (1975) and Thorne and Henley (1975), “women-as-a-group” were seen as linguistically oppressed and dominated by “men-as-a-group.” In the study of linguistic diversity, this view led to an argument that women lag behind because they are linguistically oppressed by men (Burton, 1994).

In the *differences* framework, introduced by Maltz and Borker (1982) and developed and popularized by Tannen (1990), “women-as-a-group” and “men-as-a-group” were seen as speakers of different “genderlects,” developed through socialization in same-gender peer-groups. In the study of linguistic diversity, this approach explained instances of language shift spearheaded by women (Gal, 1978; McDonald, 1994) as rooted in women’s preference for more prestigious languages and varieties. In the study of second/foreign language education, this approach led researchers to posit that females generally do better than males and to explain their achievement through more positive attitudes and better use of learning strategies (Oxford, 1994).

Beginning in the early 1990s, all three frameworks were criticized by feminist linguists for their essentialist assumptions about “men” and “women” as homogeneous categories, for lack of attention to the role of context and power relations, and for insensitivity to ethnic, racial, social, and cultural diversity that mediates gendered behaviors, performances, and outcomes in educational contexts (Cameron, 1992; Eckert and McConnell-Ginet, 1992).

#### MAJOR CONTRIBUTIONS AND WORK IN PROGRESS

The postmodern turn in educational and gender scholarship (see also Pennycook, *Critical Applied Linguistics and Language Education*, Volume 1) led to a reconceptualization of gender as a socially constructed and dynamic system of power relations and discursive practices, rather than an intrinsic property of particular individuals (Cameron, 1992, 2005; Eckert and McConnell-Ginet, 1992). This means that “women” and “men” are no longer seen as uniform natural categories where all members have common behavioral traits. Rather, these labels function as discursive categories imposed by society on individuals through a variety of gendering practices and accompanying ideologies about “normative” ways of being “men” and “women.” It is these practices, and ways in which individuals adopt or resist them, that are at the center of current research. Gender categories in this inquiry intersect with those of age, race, class, sexuality, and (dis)ability to understand how particular groups of people are privileged or marginalized. They are also placed within the larger context of globalization to examine ways in which social, political, and economic changes affect gender ideologies, relationships, and practices (Cameron, 2005; see also Block, *Language Education and Globalization*, Volume 1).

Consequently, where possible, our discussion will not focus on “men” and “women” per se, but on particular groups of people, such as older immigrant women or working-class men in specific cultural and institutional contexts. We will review four major contributions of

recent scholarship that have influenced the ongoing work in the field. These contributions have advanced our understanding of: (i) gendered access to linguistic resources; (ii) gendered agency in language learning; (iii) gendered interactions in the classroom; and (iv) gender in the foreign and second language curriculum.

### *Gendered Access to Linguistic Resources*

Research conducted since the early 1990s has significantly enhanced our understanding of ways in which gendered practices mediate immigrants' access to educational and interactional opportunities. Studies conducted in North America demonstrate that immigrant women from traditionally patriarchal communities, and in particular older women and women with families, face a range of gatekeeping practices that restrict and at times even prevent their access to English as a Second Language (ESL) classes and to opportunities that would allow them to practice the language (Goldstein, 1995, 2001; Kouritzin, 2000; Norton, 2000; Norton Peirce, Harper and Burnaby, 1993; Tran, 1988; Warriner, 2004).

Gatekeeping practices in the majority community include the lack of daycare, inconvenient locations that make access to classes difficult for women who do not drive, and inconvenient times that make access impossible for women who work or for women who are afraid of being out of the house late at night. Access may also be complicated by economic factors that force women to prioritize immediate employment (Norton Peirce et al. 1993). Gatekeeping practices in some immigrant communities may prevent young women from being in the same classroom as men (Goldstein, 1995) and require that family care be offered exclusively by wives and mothers (Kouritzin, 2000). A study of workplace instruction by Norton Peirce et al. (1993) also revealed that some immigrant women were reluctant to attend ESL classes because their husbands did not want the wives to become more educated than they were. Lack of prior education, together with family responsibilities, was also shown to negatively affect older immigrant women's access to interactional opportunities outside the classroom (Norton, 2000; Tran, 1988).

Other studies in this area document successful attempts to respond to the needs of immigrant women and offer evening and weekend programs, externally funded daycare, and programs centered around these women's needs (Frye, 1999; Norton Peirce et al. 1993; Rivera, 1999). For instance, Rivera (1999) describes a program based in the United States, where all classes, those in Spanish and in English, aim at helping working-class immigrant Latina women acquire literacy skills, improve their basic education, increase English proficiency, and prepare for the high school equivalency exam. The curriculum and the pedagogy implemented

in the program build on the strengths, survival skills, and linguistic and cultural resources of these women and question and challenge the social and economic forces that shape their lives.

Studies by Gordon (2004), Kouritzin (2000), Norton (2000), Pavlenko (2005), and Warriner (2004), also remind us that immigrant women in western countries are not helpless creatures who passively await help from the majority society—rather, they are adults who are able to use their linguistic and cultural resources creatively to deal with everyday challenges of living in a new language and to contest and negotiate their positioning in the labor force. The gendering of household responsibilities may become an advantage to these women as they benefit from linguistic opportunities offered by domestic language events, that is, interactions with social institutions connected to care for children and the home (e.g. childcare, schools, welfare offices, etc.) (Gordon, 2004; Norton, 2000). Greater access to educational and employment opportunities offered to immigrant women in western societies may eventually lead to their empowerment, whereas immigrant men who are not fluent in the majority language may actually experience a loss of power and authority (Gordon, 2004).

### *Gendered Agency in Language Learning*

Recent research has also resulted in a more nuanced picture of ways in which gender ideologies and practices shape learners' desires, investments, and actions with regard to what languages they choose to learn and speak. Perhaps, the best-known finding in this field is that in some contexts girls and women may be more inclined to study foreign and second languages and that they may outperform boys or men in this area (Sunderland, 2000). Rather than a cause for celebration of feminine accomplishments, as it would have been earlier, this finding became an impetus for inquiry into the social and economic factors affecting investments and disinvestments of particular learners.

Studies conducted in Japan show that young Japanese women are more likely than their male peers to study English, train for English-related professions, and travel to English-speaking countries (Kobayashi, 2002; see also Fujita-Round and Maher, *Language Education Policy in Japan*, Volume 1). This trend is most commonly explained by the marginalized status of young women in mainstream Japanese society and their limited choice of employment opportunities; English offers the women an advantage in the marketplace (Kobayashi, 2002), it also becomes a means of empowerment and a lens that offers a critical perspective on their lives and society (McMahill, 2001). Piller and Takahashi (2006) show that this trend is exploited by the booming English language industry in Japan that aims to sell English language to young women as a way to change

their lives, to enter a glamorous western world, to enjoy an emancipated lifestyle, and to form relationships with “chivalrous” western men.

Ideologies that link gender and language may also inspire resistance toward particular linguistic markers or practices. Studies of English-speaking women learning Japanese in Japan show that some women resist certain linguistic features associated with native-speaker competence (e.g., high pitch), because they associate these features with an undesirable gender performance of excessive, “silly” or “fake” femininity (Ohara, 2001; Siegal, 1996).

Overall, the studies to date suggest that it is not the essential nature of femininity or masculinity that shapes language learning trajectories of particular individuals, but rather the nature of gendered social and economic relations, as well as culture-specific ideologies of language and gender that mediate these relations and assign particular symbolic values to linguistic forms and discursive practices (cf., Rampton et al., *Language, Class and Education*, Volume 1).

### *Gendered Interactions in the Classroom*

Recent research has also contributed toward a more nuanced view of ways in which gender shapes interactions in the classroom, asking which participants have the right to speak and to define meaning, and who remains invisible and why. Heller’s (1999, 2001) ethnography of a French-language school in Toronto demonstrated that older immigrant girls had least access to the school’s linguistic resources, in particular, English, whereas academically successful middle-class males were most likely to become bilingual in a way envisaged by school. Girls who are ethnically or racially distinct from the mainstream population are particularly likely to be rendered invisible or inaudible. Miller’s (2003) study of immigrant students in an Australian school shows that blond white-skinned Bosnian girls were easily accepted by their teachers and peers and perceived as competent speakers of English, whereas Chinese girls who arrived in the school at about the same time were oftentimes excluded from social interactions and positioned as incompetent. What is at play here is not gender or race or culture per se, but assumptions made about members of a particular community. The role of assumptions is highlighted in Julé’s (2004) study of a Canadian classroom, where a middle-class white Canadian teacher firmly believed that Punjabi culture was a disadvantage from which the students, in particular girls, had to be rescued. She also ignored Punjabi girls’ contributions in her class, thus contributing to their silencing.

Yet immigrant girls are not necessarily the only disenfranchised group. Heller’s (1999, 2001) study points to another population alienated by the French-language school in Toronto—working-class male

speakers of vernacular Canadian French. Marginalized by the discourses of *francophonie internationale* that devalued their variety of French, these men often stopped speaking French at school altogether.

Studies conducted in kindergartens and elementary schools show that gender ideologies and practices shape access, interactions, and outcomes not only for the older learners, but also for the youngest ones (Hruska, 2004; Willett, 1995). Hruska's (2004) study, for example, shows how a discussion of soccer in a US classroom drew on gendered cultural knowledge and constrained opportunities for participation for girls from Latin America. McKay and Wong (1996) and Kanno (2003) also draw attention to the links between athletic prowess and the "normative" narrative of masculinity, and demonstrate that athletic Chinese and Japanese boys in their studies had an easier time gaining acceptance by the mainstream students and access to interactional opportunities than girls or nonathletic boys.

Together, these studies indicate that, rather than favoring undifferentiated "men" or "women," patterns of classroom interaction marginalize *specific* learners and/or groups of learners, such as immigrant and minority girls, working-class boys or nonathletic boys. Cultures of learning play an important role in this process as learners often hold beliefs about classroom behaviors and patterns of teacher–student interaction that do not fit well with majority classroom discursive practices and may be further alienating the learners. As a result, students whose voices are not being acknowledged in the classroom may lose their desire to learn the language, or even engage in passive resistance to classroom practices and curriculum demands.

### *Gender in the Curriculum*

Recent scholarship has also made a major contribution toward ways in which issues regarding gender and sexuality can be broached in the classroom (Norton and Pavlenko, 2004). Boxer and Tyler (2004) propose scenarios as a way to discuss diverging views of what constitutes sexual harassment in International Teaching Assistant training. Nelson (2004) shows how one ESL teacher incorporated a discussion of gay and lesbian identities into the unit on modal auxiliary verbs. She argues that such discussions offer a relatively safe space in which students could explore their own and others' views of potentially ambiguous gender and sexual identities and acquire new interpretive skills.

Studies conducted in Japan illustrate practical ways in which critical reflection about language and gender can be incorporated in EFL curricula through examinations of gendered vocabulary and discursive practices in English and Japanese, and through discussions of sexuality, sexual harassment, domestic violence, and sexism in textbooks and

the media (Cohen, 2004; McMahill, 2001; Saft and Ohara, 2004; Simon-Maeda, 2004; Toff, 2002). Toff (2002) uses lifewriting to help her female students to discuss and analyze topics that they might otherwise find too difficult or controversial. A reliance on personal narratives is also found in a grassroots feminist class described by McMahill (2001), where the teacher acts as a discussion facilitator, while Japanese women take charge of the learning process and class management, inviting or disinviting instructors and negotiating the class content with them. Both the teachers and the learners approach English as a tool that would allow Japanese women to resist their marginalization and give them an edge in the sexist job market. The class time is used to discuss feminist readings and analyze and critique gender ideologies and practices prevalent in the women's own lives. These analyses are often embedded in personal narratives, where individual experiences are used as a source of knowledge and authority.

Similar practices emerge in Frye's (1999) study that examines implementation of critical feminist pedagogy in a literacy class for immigrant low-income Latina women in the USA. Among the favorite forms of participation in this class were discussions and storytelling where the women could share experiences, give each other advice, and explore differences in age, race, social class, religious background, sexual orientation, national origin, educational background, and the use of Spanish. It is these explorations that engendered most meaningful—albeit heated and at times even angry—conversations, discussions, and activities where the participants learned to negotiate differences and to practice their own new voices. The comparison of their own stories to those of others allowed the women to see commonalities and disparities, to question the oppressive social and cultural forces which shaped their lives, and to perform new critical selves, constructing new possibilities and new visions for the future.

#### PROBLEMS AND DIFFICULTIES

Problems and difficulties in current research on gender in language education often stem from oversimplified assumptions about gender effects, inherited from earlier research. One research area plagued by such problems is the study of gender differences in the amount and quality of classroom interaction (Chavez, 2001; Julé, 2004; Losey, 1995; Shehadeh, 1999). These studies show that in some contexts teachers address boys more than girls, that boys and men may dominate classroom talk and mixed-gender interactions through interruptions and unsolicited responses, whereas girls and women profit more from same-gender group discussions, and that girls may be silenced by the classroom culture. These findings are undoubtedly important and

informative, but they may also be misleading because they are based on problematic assumptions.

The first problematic assumption is the essential nature of men and women: boys and men are assumed to be dominant, whereas girls and women are seen as easily silenced. These assumptions may well hold true for certain contexts, but not without an explanation as to why particular men and women behave in particular ways in these contexts. Second, these studies commonly assume that a high amount of interaction is in itself a positive phenomenon that leads to higher achievement. In reality, it is quite possible that some students may speak up quite frequently but progress very little, if at all, whereas others, who contribute little to classroom discussions, for individual or cultural reasons, may succeed in accomplishing their own language learning goals. For instance, in a foreign language class studied by Sunderland (2004) boys received more attention from the teacher overall, but girls received more academically useful attention. These results suggest that studies of interactional patterns in foreign and second language classrooms should focus on the distribution of interactional opportunities beneficial for language learning, such as speaking practice or requests for clarification and feedback. Even more importantly, we should look beyond “donation” of equal classroom time, as this focus skirts “the structural problematic of who, in schools or universities, has the authority to speak, to critique, and to judge what is worthwhile (student) speech and critique” (Luke, 1992, p. 39).

Another area that often suffers from shortcomings is the study of textbook representations of gender. These studies show that language textbook stereotypes that place men in the public domain and women in the home had continued well into the 1980s, despite the appearance of nonsexist guidelines for educational materials. Since the 1990s, the situation has been steadily improving. Nevertheless, analyses of ESL and EFL texts published around the world (Sunderland, 1994) and of Greek, Russian, and Japanese textbooks published in the USA (Poulou, 1997; Rifkin, 1998; Shardakova and Pavlenko, 2004; Siegal and Okamoto 1996) reveal that many foreign and second language textbooks continue to reproduce gender biases. Siegal and Okamoto (1996) found that Japanese textbooks aimed at American students present highly stereotypical linguistic “norms” based on the hegemonic ideologies of class, language, and gender. Poulou (1997) demonstrated that Greek textbooks reproduce traditional gender roles through discursive roles assigned to men and women in dialogues.

Though important and informative, this line of inquiry is also overly narrow in that it does not document the uptake of materials by the students. Very few studies clarify the link between what is deemed to be gender biases or sexist representations, the role these representations play

in the teaching process, and students' learning outcomes. Consequently, it is possible that biased representations may not affect the students at all. This lack of connection is documented in Pavlenko's (2005) historiographic study of gendered aspects of the Americanization movement in the early twentieth century. The study shows that Americanizers had distinct "hidden curricula" for men and women of different racial and ethnic origins: European-born men were offered instructional support for their citizenship exams, European-born women were offered "pots and pans" English and encouraged to remain at home, and Asian and Mexican immigrants were conceived of as a cheap labor force and were not encouraged to assimilate at all. Using oral histories, immigrant memoirs, and Americanization reports, the study showed that immigrant women mostly ignored Americanizers' messages. Even when they took the classes and used the texts in question, the women did not necessarily adopt the femininities imposed on them—rather, many were appropriating English to join the labor force.

Interesting questions with regard to the impact of perceived gender biases are raised in Durham's (1995) study of the controversy at Yale, where students filed a complaint stating that their textbook, *French in Action*, and the accompanying video were explicitly sexist and offensive. Durham argues that the students engaged in an ethnocentric reading of the text and—since their teachers did not attempt to counteract such a reading—lost an opportunity to access important dimensions of French culture. Their interpretation of depictions of the female body as sexist and of female silence as powerless was consistent with the principles of American academic feminism, but displayed a lack of knowledge and understanding of French discourses of feminism, sexuality, and gender. In other words, argues the researcher, they imposed their own culturally informed beliefs and stereotypes on what could be alternatively perceived as an ironic postmodernist feminist critique of Hollywood's sexual romance narrative and of conventional discourses of masculinity. These concerns are echoed in the work of Kramsch and von Hoene (1995, 2001) who argue that foreign language instruction in the USA promotes a biased and ethnocentric knowledge, or "single-voiced consciousness", and does not allow students to view themselves from the perspective of other cultures and thus acquire intercultural competence, or "multi-voiced consciousness."

#### FUTURE DIRECTIONS

To sum up, we have discussed four focal points where gender issues are central in language education: (i) access to linguistic resources; (ii) agency and (dis)investment into language learning; (iii) classroom interaction; (iv) textbooks and teaching practices. Throughout, we have

tried to highlight studies of educational contexts that respond to the needs of marginalized learners, striving to (i) ensure equal access and equal conditions for participation for all students, (ii) create curricula that legitimize the students' daily realities and multilingual lives, and (iii) approach language teaching from an intercultural and critical perspective which, on the one hand, engages students with cross-linguistic and cross-cultural differences in gender ideologies, constructions and performances and, on the other, allows students to analyze how dominant discourses of gender function to subordinate individuals.

Future research in this area should go beyond the issues of access, interaction, and representation, and consider ways in which changes in the global economy affect linguistic, educational, and labor markets (Piller and Pavlenko, in press; see also Block, *Language Education and Globalization*, Volume 1; Kalantzis and Cope, *Language Education and Multiliteracies*, Volume 1). It also needs to pay close attention to changes in gender ideologies and relationships in particular communities and to ways in which these changes affect learners' investments into particular languages or resistance to them. Studies of foreign and second language pedagogy should engage with the challenging questions raised in the work of Durham (1995), Kramsch and von Hoene (1995, 2001) and Pavlenko (2004), and particularly relevant for North American contexts, often accused of linguistic imperialism: What conceptions and discourses of gender do we aim at reflecting in our texts and classes, the ones accepted in the target language communities or the ones that have currency in our own? And if we aim at avoiding gender biases in our foreign language materials, are we engaged in ethnocentric oversimplification, portraying the world on our own terms and not providing our students with important linguistic and cultural capital? On the other hand, if we are aiming at reflecting gender discourses of other cultures—which may be quite different from our own—what if in the process we offend or upset our students who by now are fairly used to bland and noncontroversial teaching materials? And what if, in our attempt to ensure the students' comfort, we erase differences in cross-cultural understandings of gender—will we simply end up teaching our students to speak English in a variety of languages?

## LANGUAGE, CLASS AND EDUCATION

### INTRODUCTION

The twentieth century saw some significant efforts to redistribute wealth and income throughout most of the century, but over the last 25 years, material inequalities have persisted and in many ways increased. Traditionally, ‘class’ has been a term used to define and analyse identities and relations between groups located at different levels of the national socioeconomic hierarchy. In Britain, for example, class ‘linked together and summarized. . . many aspects of any individual’s life’ (Abercrombie and Warde, 2000, pp. 145–6): family background, main source of income, cultural tastes and political associations. However, in spite of continued inequalities, the analytic utility and the cultural salience of social class have been drawn into question by a number of shifts over the last 30 years: the socioeconomic changes associated with globalisation, the decline of traditional collectivist politics, the emergence of gender, race and ethnicity as political issues and the ascendance of the individual as consumer (Abercrombie and Warde, 2000, p. 148).

Our contribution focuses on the connections between class stratification, education and language. We argue that class remains an important concept in the analysis of stratification and its effects, and suggest that it can be productively extended beyond the nation-state to issues of language and inequality in colonial and post-colonial settings. We begin with some comments on the definition of social class, clarifying its relation to other axes of inequality (race, ethnicity, gender, generation, etc.). Then we provide a sketch of debates about language, education and class leading up to the 1980s, and point to similarities of the dynamics in both ‘First’ and ‘Third World’ countries. After that, we consider processes involved in the ‘retreat’ from class analysis over the last 15–20 years.

### DEFINING SOCIAL CLASS

The term ‘class’ points to a very broad principle of organization in capitalist societies, a principle of inequality (‘stratification’) structuring the distribution of resources, both material and symbolic, a source of domination, conflict and suffering. As with other ‘principles of organization’

(e.g. race, gender), class is lived with varying degrees of awareness and expression. It may be mutely experienced or given full-throated articulation; it may be a key to self-understanding, group mobilization and society-wide struggles for power, or it may be denied and displaced—personally, socially and politically. As lived, class is always entangled with other forms of social being and social consciousness.

‘Social being’ and ‘social consciousness’—terms introduced by Marx and Engels in *The German Ideology*—merit elaboration (cf. Thompson, 1978, p. 18). ‘Social being’ refers to material conditions, ordinary experience and everyday discourses, activities and practices—the ‘primary realities’ of practical activity. ‘Social consciousness’ refers to secondary or ‘meta-level’ representation developed by participants and analysts: ideologies, images and discourses *about* social groups. When focussing on the primary realities of social being/practical activity—the routine interaction of embodied individuals in real world tasks—singling out class as an influence distinct from gender, race and lots of other social categories is likely to be difficult. However, at the level of ‘social consciousness’/secondary representations, there are clear differences between discourses *about* class, ethnicity, gender and generation, etc.—they have different histories and direct attention to different social processes and arenas. Discourses about class, gender, race and ethnicity differ substantially in the kinds of solidarity and opposition they propose, and in the ways in which the inequalities they are associated with are described, challenged and defended. Therefore, while ‘class’ as a social category refers to lived relations surrounding social relations of production, exchange, distribution and consumption, ‘race’ and ‘ethnicity’ are used to explain a highly complex set of territorial relationships involving conquest, migration and the development of nation-states (Bradley, 1996, pp. 19–20). In fact the play between social being and social consciousness, between everyday experience and its secondary representation, is often a central issue in politics, with different interests promoting rival accounts of the processes, relations and identities shaping social life. The ‘being’/‘consciousness’ distinction partly resembles the relationship between objective social structure on the one hand, and subjecthood and identity on the other, the former referring to patterns and processes of stratification, and the latter to claims, attributions and denials around ‘groupness’. The implications of both distinctions are threefold: (i) they provide a rationale for including ‘class’ and ‘race’ in the same discussion, as different ways of construing inequality and domination in (objective) ‘social being’; (ii) they mean that analysis is itself part of the ideological debate and (iii) they remind us that systematic inequalities in the distribution of hardship, pain and pleasure do not disappear just because people stop talking about them in the ways they used to.

EARLY DEVELOPMENTS: CLASS, LANGUAGE AND  
EDUCATION UNTIL THE 1980s*The Industrialized West: the UK and USA*

*Nineteenth and early twentieth centuries:* The 'industrial revolution' of the nineteenth century shaped the modern working classes in much of Western Europe and North America. It coincided with the heyday of nationalism, the period of building and consolidating modern nation-states. And in the nationalist tool kit, schooling and the promulgation of standard languages were important elements, especially through schooled literacy. Standard or 'legitimate' languages were historically resources of metropolitan elites, of reforming middle classes, but in an ideological manoeuvre described by Marx, what was particular—the language of a literate middle class—was presented as universal, as 'the language of the nation'. In Britain and the USA, schooling, literacy and the teaching of Standard English were seen by many education activists and reformers as the means to self-improvement and social harmony—they would ameliorate social differences, replace 'seditious' with 'helpful' literacies, and in general serve as an equalising and unifying influence. However in actuality, the nineteenth- and twentieth-century provisioning of universal education and literacy was the product of struggle, a process of exclusion and hierarchisation much more than equalizing (Collins and Blot, 2003).

Rather late in Britain, universal public education was established in the 1870s, more than half a century after the upheavals of the industrial revolution and much class-based political conflict, and perhaps for this reason, the relation between standard and non-standard languages was always understood in class terms. In the USA in the 1820–1840s, the 'Common Schools' were one of the earliest systems of universal schooling, predating a good deal of the industrializing of the nation as well as the Civil War. However, for much of the nineteenth and twentieth centuries, they were not universal. Before the Civil War, southern states made educating African-American slaves a crime, and after the short-lived reconstruction, they established the infamous Jim Crow system of two-tiered education that lasted until the 1960s. Throughout much of this period, if they were formally educated, Native Americans were not part of the public school system, and with its working-class majorities formed through enslavement (African Americans), through expropriation and containment (Native Americans), through military appropriation (Mexican Americans) as well as the better known immigration, schooling was seen more as a project of ethnic and racial assimilation than of social class harmonizing (e.g. Nasaw, 1979). So typically in the USA, the relationship between standard and non-standard

languages (and the educational problems attributed thereto) has been understood in race and ethnic terms.

*1960s–1980s:* In the decades after World War II, it was clear in Britain that public education had not eradicated class difference, and that non-standard speech had not disappeared. During the 1960s and 1970s, language took over from IQ as an explanation of social stratification and it was analysed by sociolinguists as a constitutive element contributing to class differentiation in education. In the USA, the failure of the school-based equalizing project was seen differently. There were references to ‘disadvantaged’ and ‘low-income’ children, but class was regularly obscured by the prominence of ethnicity and race during the era of Civil Rights mobilization (Collins, 1988). But whether seen as class or race/ethnicity-that-happened-to-be-working-class, there were two major approaches in research on language and inequality in education, one orienting more to ‘social being’ and the other more to ‘social consciousness’.

The former emphasized the role that everyday discourse played in the cultural reproduction of class inequality. In one strand of this work, research focussed on the home and argued that traditional patterns of language use produced communicative dispositions, which influenced people’s performance at school and opportunities in life. The home practices of subordinate groups were seen as leading to subordinate identities/positions in cycles of reproduction (Bernstein, 1971; Bourdieu and Passeron, 1977; Heath, 1983). In the other strand, research focussed on schools and argued that conventional classroom discourse was inhospitable to the speech styles of students from subordinated communities (Philips, 1972).

The second major approach stressed the part that language ideologies and attitudes to grammar and accent played in the production of subordinate identities. Sociolinguists and education researchers argued that teachers picked up on dialect features, that they held lower expectations for children with working-class accents, and that the lower achievement of these children was thus the outcome of sociolinguistically tuned ‘self-fulfilling prophecies’ (Edwards, 1976; Labov, 1972). On another tack, it was argued that the schools’ standard language ideologies made working-class people think that their subordinate position was justified (Bourdieu and Passeron, 1977; Hymes, 1996, p. 84; Labov, 1972).

However particularly when class, rather than race or ethnicity, was in focus, neither of these two approaches attributed any political agency to the subordinate groups they studied. In the first perspective, the working class was the unknowing victim of either its own or the dominant culture, and in the second, it was the victim of class prejudice and standard language ideology. Neither approach recognized the skilful ways

in which people blend dominant and subordinate varieties of language (Gumperz, 1982; Rampton, 1995), or focussed on the ways in which language use was integrated with both family life, morality, sense of person and institutional encounters (Lareau, 2003). This neglect of class agency was partly due to 'class' being treated as a structural category rather than a group identification (Ortner, 1991, pp. 168–169). Structural and statistical notions of class were ascendant in research, and informants were allocated to classes by analysts on the basis of fact-sheet variables like 'occupation' and 'level of education'. When studies used ethnographic methods, class was cast as an abstract and macroscopic process, at some remove from lived cultural experience—for the latter, researchers used other labels and focussed on local networks rather than societal groupings (Eckert, 2000; Ohmann, 1982).

### *Colonial and Post-Colonial Settings*

In some respects, colonial settings resembled the industrialized west. Systems of education-and-language were/are stratified, class-specific linguistic resources were/are presented as the general idiom of nation and modernity, and education was/is meant to improve the lower orders, here seen in race and ethnic terms as 'natives' rather than 'lower classes'. However, there were also substantial differences. The hierarchies were more sharply drawn, education was more clearly exclusionary, and debates about inequality and difference referred to distinct languages rather than to differences within a language.

*The colonial period:* The class analysis of colonial societies came very late and remained the province of left wing movements. That does not mean that there were no class politics or class effects in colonial societies—these were racially organized societies with extremely deep class rifts.

Colonial education systems addressed 'the natives' ('Indians', 'Negroes', etc.) rather than 'the lower classes', and to the extent that emancipatory goals were formulated, colonial education sought to 'civilize the natives', rescuing them from ignorance (and sin), inserting them into the small emergent class of schooled workers and clerks needed to support the colonial administrative, industrial or religious complex. Education was not aimed at self-liberation or self-improvement, nor seen as a tool for making the colonial populations less dependent on the colonial apparatuses. It was a highly selective and exclusionary add-on to the colonial enterprise. There was little formal education beyond primary school levels, there was tight control by the colonial authorities, and this control intensified at higher levels of education (Mazrui, 1978). This created a strongly stratified sociolinguistic market, in which control over particular linguistic resources

was an immediate result of access to higher levels of education—for example, English equalled elite identity. In this way, the colonial system established a class-sensitive linguistic pyramid, in which language pointed towards (non-)membership of particular strata in society and in which the strata became more prestigious the closer they came to the centres of colonial power (Blommaert, 1999).

*The post-colonial context:* After colonialism, the nationalist leaderships consisted of people who had been successful in colonial education, experiencing post-school education in the metropolitan languages and centres of the empire. However, their very real self-interest as a class was generally disguised by nationalist fervor immediately post-independence, and in this atmosphere, a massive expansion of educational access, rather than system change, was often treated as the top priority. In this way, the linguistic hierarchies of colonialism were reproduced and extended, and the retention of colonial languages as media of instruction and literacy was legitimated (i) in terms of national unity in ethnically divided societies, (ii) as the most efficient use of economic resources, (iii) in terms of available teacher resources and printed materials and (iv) as symbolising modernization and progress (Fardon and Furniss, 1994).

At the same time, these leaderships often maximized the opportunities for their own children to acquire prestige varieties of languages like English and French (through their use in the home, at pre-school, and in university education in the former colonial centres), and to become part of a global elite with mobile, well-paid employment. The rest of their populations have either become more or less marginal (depending on the overall wealth of their countries), or have accessed local varieties of the powerful global languages by migrating en-masse to the cities of the former colonial centres where they have joined the low-wage sectors of the economy, becoming members of the local working classes. There, the schooling of their children generates new versions of the old debates on language, class and education, though once again, the class element is normally misread or reconfigured as an ethnic minority problem, with the main emphasis on transition to European languages as the key to educational achievement.

### *Summary of Class, Language and Education until the 1980s*

Language and class were conspicuous educational issues in countries like the UK and USA up until the mid/late 1980s, although racialized stratification in the USA and the distortions of colonialism and the post-colonial system often camouflaged class, replacing it with a pre-occupation with inequalities of race/ethnicity. In the era of the new globalized economy, mass migration and population mobility, analysis

without a sense of class has become both increasingly common and increasingly inadequate. We turn now to reasons for the retreat from class in official, popular and academic discourses.

#### CURRENT DEVELOPMENTS: THE DISCURSIVE ERASURE OF CLASS SINCE THE 1980s

Beginning in the 1980s, Thatcherism in the UK and Reaganism in the USA were successful conservative movements that attacked social democratic (class-oriented) policies and politics (public ownership of housing and transport, social welfare provisions, trade unions) and promoted private ownership, individual choice and ideologies of merit over concerns with equality. By arguing that social position is due to individual merit (or lack thereof), and not to advantages or disadvantages perpetrated by the institutional systems, these 'neo-liberal' movements discursively discredited the notion of class, while themselves being savvy orchestrations of ruling class power and working-class dissatisfaction. At the same time, the 'politics of redistribution' was being displaced by a 'politics of recognition' rooted in the feminist and anti-racist movements of the 1960s and 1970s (Fraser, 1995). These advanced the causes of women and ethnoracial minorities in numerous institutional and public arenas, but did not prioritize the challenge for state power. The politics of redistribution occupied the traditional terrain of class, combating economic inequalities and poverty, but the politics of recognition targeted cultural and legal evaluation structures, stigma and discrimination based on ethnicity, gender and sexuality.

These shifts seemed profound for the popular apprehension of injustice, and workplace exploitation (a basic issue in class politics) became much harder to articulate and oppose. In education in the USA and UK, reports and policies since the 1980s have stressed the importance of 'maintaining standards' and promoting general-purpose literacy skills, but have detached these from any analysis of class inequalities (e.g. the Kingman Report on language awareness in the UK, 1988, and the Reagan-commissioned 'A Nation At Risk', 1983 in the USA). More recently, the UK's 'New Literacy Strategy' and the USA's 'No Child Left Behind' programme share a belief that literacy skills in the standard language can be disseminated by formal pedagogy closely monitored by the national government, but they operate with a very narrow conception of literacy and standard language, and they largely ignore the economic resources necessary to begin the change they prescribe (Allington, 2002; Rothstein, 2004).

In research, class analysis has generally been less prominent in the USA than the UK, for reasons already identified (Bradley, 1996,

p. 75; Ortner, 1991, p. 64). In addition in the USA, anthropology has been much more influential in the study of education than it has been in the UK, where sociology has played a more important role: '[f]or the (American) anthropologist the classroom is the site of cultural differences, often ethnic in origin, and the teacher an agent of cultural imposition. For the (British) sociologist the frame of reference is a class-based social structure, in which teachers and pupils alike are subject to the everyday disciplines of work' (Delamont and Atkinson, 1995, p. 34). However, during the late 1980s and 1990s in Britain, language and education research lost much of this traditional interest in class. This was partly in line with growing social scientific interest in human agency—in the 1960s and 1970s, research had over-emphasized the structural and normative dimensions of class, neglecting the agentive, performative, interactive aspects of class-as-lived (Ohmann, 1982), and as a result, 'class' felt too deterministic a concept for the 1990s. However, at the same time, sociolinguists interested in education refocused on the new populations from the ex-colonies (see earlier), and in doing so, they drew their inspiration from the ethnography of communication in North America, with its anthropological roots and pre-occupation with ethnicity, rather than from the more class-focussed, sociological ethnographies produced in Britain in the 1970s and 1980s (e.g. Willis, 1977). In their socioeconomic positioning, the ethnic minority students they studied might be working class, but theoretical explications tended to dwell primarily on ethnicity and race.

#### FUTURE DIRECTIONS: THE CONTINUING REALITIES OF STRATIFICATION

As is now widely recognized, metadiscourses about social groups and categories form part of the dialectical processes through which specific groups and categories are constituted, reproduced and/or contested. Whether and how class is defined is a significant element in what class is, and this adds to concern about the reification of class in the 1970s and 1980s, about the retreat from class analysis in research in the 1990s, and about the failure to understand the connections between class, gender and ethnicity. In our view, what used to be called 'class' in rather totalizing ways can be usefully seen as the patterns of stratification that emerge in social systems in which a range of differences come to mean inequality within schemes and hierarchies of value linked to the hard economy. Class in this sense is a structuring principle, tied in some way to modes of production and divisions of labor in a social system, but with considerable room for interaction with other structuring principles. Thus, other widely used parameters—gender, race,

ethnicity, linguistic difference—may display the same processes of stratification as what was previously called ‘class’.

The ascendancy of neo-liberal doctrine and governance since the 1980s may have undermined the dominance and legitimacy of discourses of class, but it has been accompanied by a widely acknowledged increase in socioeconomic inequality, both within nations and internationally (Rothstein, 2004). Exactly how we think about that inequality in language and education remains an open question, but to facilitate further reflection, we conclude by listing some of the continuing realities of stratification.

1. Immigrant minority populations often find themselves in run down areas and schools, and situations of relative poverty, and though the public discourse might focus on ethnicity and gender, factors traditionally associated with class still affect educational achievement in the UK (Gillborn and Mirza, 2000).
2. Survey studies of language variation may have suggested that regional difference between non-standard dialects may have diminished in the UK, and there is also evidence that British Received Pronunciation has lost quite a lot of its cultural status. However, no one suggests that style-shifting between standard and vernacular speech varieties has disappeared, and it is this that displays a class-habitus in Bourdieu’s terms. Indeed, what evidence there is suggests that as the children and grandchildren of immigrants grow up using English, they acquire both class-marked features and a style-shifting capacity tuned to the socio-linguistic stratification traditionally linked to class hierarchy (Harris, 2003; Rampton, 2006, Part III).
3. There has been quite a lot of both UK and US work on the ways in which minority speech features are taken up by young whites (Creole, Panjabi, African-American Vernacular English, etc.), but the manner and extent to which this happens is extensively influenced by actual familiarity with the inheritors of these languages, which is itself extensively shaped by socioeconomic positioning (Cutler, 1999; Rampton, 1995).
4. Recent survey research on the stratifying dynamics of class and ethnicity in US education (Rothstein, 2004) demonstrates the cognitive and non-cognitive consequences of basic inequalities in resources such as income, housing, health care and nutrition, as well as linguistic habits and personality traits. This research is complemented by Lareau’s (2003) long-term in-depth ethnographic work on class, race and language socialization, and this concludes that class is the most significant dimension in the ‘unequal childhoods’ of urban and suburban children.

## THE ECONOMICS OF LANGUAGE EDUCATION

### INTRODUCTION

Because the economics of language education, as a field of investigation, differs somewhat from most of the scholarly work on language and education presented in this volume, this entry does not offer a descriptive or historical account of research, but instead emphasises the presentation of analytical concepts along with their meaning, their function and the relationships between them.

The following section “Definitions and Scope” provides a general framework that explains the position of the economics of language education with respect to three closely related areas, namely education economics, language economics and policy evaluation, before introducing key concepts and analytical distinctions. The section on “Major Contributions” presents the application of human capital theory to foreign language (FL) skills, which makes up the bulk of the literature on the economics of language education. The section on “Problems and Difficulties” turns to important issues of resource distribution. The section on “Challenges” addresses a set of unsolved issues in the field. The last section, on “Future Directions” discusses likely developments in the light of policy needs.

We shall not examine the teaching of children’s mother tongue when the latter also is the dominant or official language (e.g. the teaching of French to children of francophone families in France), because the corresponding economic issues are analytically very different from those that arise in the context of foreign language teaching, which is the focus of this entry.

### DEFINITIONS AND SCOPE: ALLOCATION AND DISTRIBUTION OF RESOURCES IN LANGUAGE EDUCATION

The economics of language education is a specific area of inquiry that may be approached from different disciplinary perspectives. Starting out from mainstream economics, one would generally use the well-established conceptual and methodological apparatus of education economics as a stepping stone (Johnes and Johnes, 2004). This strategy, however, may confine the examination to a relatively narrow range of

issues, particularly applications of human capital theory to FL learning. However, FL education raises economic questions that go far beyond human capital investment, because it is also a key component of language policy. For this reason, this entry approaches the economics of FL education through the distinct (and less institutionally established) subfield of language economics (Grin, 1996).

Language economics studies the mutual relationships between linguistic and economic variables. What matters, however, is not their mere co-occurrence, but the fact that they actually influence each other. In this perspective, the use of various languages at work, for example, does not per se constitute a relevant research object unless it has an impact on the economic processes at hand. The focus of attention may be either an economic or a linguistic variable. For example, an economist of language may investigate whether a company can increase its profits (the dependent *economic* variable) by advertising its goods in the local language even on a very small market. Reciprocally, she may examine language maintenance among immigrants (the dependent *linguistic* variable) and assess whether the pattern observed reflects labour market participation. However, particularly since the mid 1990s, language economics has been paying increasing attention to language policy issues (Grin, 2003). Even if none of the variables involved in the selection, design and implementation of a given language policy explicitly refers to economic activity, choosing an appropriate policy requires weighing the advantages and drawbacks of the options considered. This represents a very direct application of economic analysis because it is, at heart, a theory of how choices are made, and this rationale also applies to the economics of language education. Therefore, the economics of language education largely coincides with an in-depth application of policy evaluation techniques to language education, in the broader context of language policy (on the links with language policy, see also Tollefson, *Language Planning in Education*, Volume 1).

The rationale of policy evaluation is straightforward and can be characterised, in the case of *ex ante* evaluation, by the following steps: define policy alternatives, identify their consequences, translate the latter into advantages and drawbacks, compute the 'net value' of each alternative by subtracting drawbacks from advantages expressed in terms of a comparable unit of measurement, and select the policy with the highest net value. Policy evaluation casts the net wide and should in principle take account of advantages (or 'benefits') and drawbacks (or 'costs') in the broadest sense. More specifically, proper policy evaluation is not interested in financial or material advantages and drawbacks only; non-material and symbolic values are just as relevant. This is why the distinction often made in other disciplines between

‘instrumental’ and ‘intrinsic’ values or motivations has little analytical relevance in economics, although it does make a difference at the empirical level, when these effects have to be evaluated (see Major Contributions).

The costs and benefits of each policy option can often be interpreted as inputs and outputs respectively. It is safe to assume that all other things being equal, social actors prefer efficient policies, that is, those that yield more output (benefit) per unit of input (cost). This generates a useful set of criteria for comparing options. In the field of education, however, it is essential to make a distinction between *internal* and *external* efficiency.

Internal efficiency refers to processes that occur *within* the educational sphere. In the particular case of FL education, the FL skills acquired normally play the role of the output, while the inputs comprise all the resources used to teach those skills, taking account of the way in which they are used (teacher and learner time, textbooks, pedagogical approach, etc.). Internal efficiency evaluations are not specific to education economics, and are carried out in various areas of educational research; there is, however, surprisingly little empirical work focusing on the internal efficiency of FL teaching.

External efficiency, by contrast, starts out from the assumption that education is not pursued for its own sake, but in order to secure benefits *outside* of the education system. External efficiency evaluation is crucial (and arguably more important than internal efficiency evaluation) because it addresses the questions ‘what?’ (i.e. ‘what FLs should we teach?’) and ‘why?’ (‘for what reasons?’), whereas internal effectiveness evaluation focuses on the question ‘how?’ (‘how best to teach FLs?’). For this reason, we shall now concentrate on external efficiency evaluation.

Some of these benefits may be *market related*, such as higher earnings, access to more desirable jobs, etc.; other benefits are of the *non-market* kind, such as direct access, thanks to language competence, to other cultures and the people carrying them. In usual practice, however, the external efficiency of FL skills is only assessed in terms of market value (more precisely, through earnings differentials; see section “Major Contributions”), because the necessary data can be collected relatively easily through surveys or, in a favourable statistical context like Canada, retrieved from the decennial census. By contrast, the data required to assess the existence and magnitude of non-market benefits are difficult to collect, and this has apparently never been done in large-scale surveys.

Whether of the market or of the non-market kind, the benefits and costs of education, and hence the more or less efficient relationship

between them, may be evaluated at the *private* or *social* level. The private level reflects the conditions confronting the typical or average person, whereas the social level concerns benefits and costs for society as a whole. In mainstream education economics, defining social benefits and costs as the simple sum, across members of society, of individual benefits and costs, is usually an acceptable simplification. In the case of FL education, however, such a procedure is less satisfactory, because of one specific feature of language, namely, the fact that language learning gives rise to what is known, in economic theory, as ‘externalities’, which are best explained with a hypothetical example. As more people learn a given language (say, language *L*), the value of knowing this language is affected. It is commonly assumed that this effect can only be positive (De Swaan, 2002; van Parijs, 2004) because people who already speak *L* gain additional potential interlocutors. However, the effect can work both ways, because this amounts to an increase in the overall supply of *L*-language skills, which would lower their value on the labour market. Which of the two effects dominates under various conditions remains an unsolved issue, and the attending theoretical difficulties this raises have not been fully explored. Consequently, empirical results on the social value of FL education must be interpreted with caution, even within the better-known market values (see section “Problems and Difficulties”).

Empirical work therefore yields estimates of the labour market value, to the average person and/or to society (under the limitations just pointed out), of competence in various FLs. The standard policy recommendation would be to prioritise the teaching of FLs that give rise to the highest returns, because these are taken as a good indicator of the usefulness of those skills. FL teaching can therefore be seen as an efficient allocation of resources by one generation that pays for it while the beneficiaries are from a younger generation.

However, policy evaluation is not confined to *allocative* efficiency. It also assesses competing scenarios in terms of their respective fairness. Since all policy choices make some people better off and other worse off, they have a *distributive* effect. One important criterion for choosing among scenarios, therefore, is whether these distributive effects are morally and socially acceptable, and if not, if those who ‘win’ from a policy can offer appropriate compensation, in money or otherwise, to the ‘losers’. Such questions tie into discussions of social justice applied to language policy choices (van Parijs, 2002), and are discussed in the section “Problems and Difficulties”.

Combining the four analytical distinctions just made, we can use a diagram to provide of bird’s-eye view of the scope of the economics of language education (Figure 1).

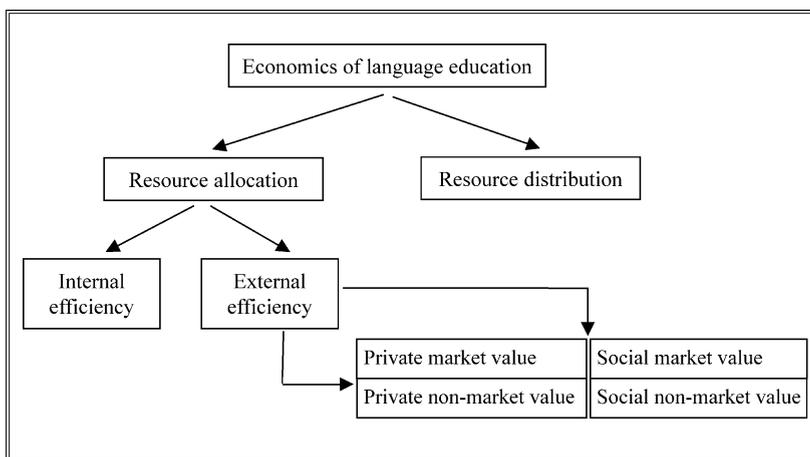

Figure 1 The structure of the economics of foreign language education

#### MAJOR CONTRIBUTIONS: RATES OF RETURN ON FOREIGN LANGUAGE SKILLS

The estimation of the market rates of return on FL skills makes up the main part of published work in the economics of language education even though, as we have just seen, this captures only one side of their value. These rates of return may be estimated at the level of the individual or of society. In either case, two main research orientations can be identified. Let us first discuss them in the case of private returns, which accrue to individuals.

The first orientation studies the value to immigrants of learning the dominant language of their new country of residence. In this case, 'FL' must be understood as a language other than the speaker's mother tongue or L1, although it is the main and/or official language of the country of residence. Most of the empirical work uses samples of immigrants to the USA, occasionally Australia, Canada, Israel, or Germany (see e.g. Chiswick, 1999, 2002; Chiswick and Miller, 1995). In general, their (unsurprising) finding is that competence in the country's dominant or official language yields statistically significant advantages to immigrants, although this gain is less pronounced in so-called language enclaves where immigrants are more concentrated (Bloom and Grenier, 1996).

The second line of research examines the rates of return on skills in a language which, apart from not being the actor's mother tongue, is also other than the main language in the actor's place of residence. This case is therefore closer to the standard notion of FL. A further distinction

can be made between two types of cases. The first is that of the ‘other’ language(s) in multilingual countries with a de facto and/or officially enshrined territorial distribution of languages, for example English in Québec (Vaillancourt, 1996), French in German-speaking Switzerland (Grin, 1999), or Russian in Western Ukraine (Kastoukievitch, 2003). The second is that of truly foreign languages like English in Switzerland (Grin, 1999) or Luxembourg (Klein, 2004).

Across these various situations, results show that FL skills can be highly valuable and significantly add to a person’s labour income, although major variations are observed depending on various elements of context and on the FL concerned. Of course, in any of the situations discussed in this section, it is essential to disentangle the effect of FL skills from that of other determinants of income, particularly when the latter are likely to be correlated with the presence of FL skills. The typical response to this challenge is to apply multivariate analysis to estimate language-augmented earnings equations (Psacharopoulos and Patrinos, 2004), usually with ordinary least squares. Applying this technique generally confirms the profitability of FL skills after even controlling for (at least) education and work experience. This nevertheless requires detailed and reliable individual (as opposed to grouped) data. Suitable databases are rare, which probably explains why this has only been done for relatively few countries. The information needed includes, at the very least, each person’s labour income (often using after-tax earnings), education, gender, age and/or experience, L1 and, of course, FL skills. Depending on the degree of detail of the data base, it is sometimes possible to distinguish the impact of productive versus receptive and of oral versus written skills in the language concerned, and to differentiate between basic, advanced and native-like competence. It is also desirable to include additional information, in particular individual respondents’ economic sector of activity, hierarchical position at work, and geographical location. Interested readers can find more practical detail on the procedure in Vaillancourt (1985) or Grin (1999).

The type of estimates described so far are, in fact, *net earnings differentials*, in the sense that they attempt to single out the effect of FL skills on earnings, *net* of the effect of other variables like education. They are often called ‘rates of return’ because FL skills can be seen, in line with human capital theory, as an investment made at a certain time and yielding a certain return in the form of higher earnings later in life. However, estimating rates of return in the strict sense requires taking account of the time lag between the investment and the reaping of the corresponding benefits. Though this is usually not done in the type of estimates presented so far, it is an essential part of the calculation of *social* rates of return, whose goal is to assess the value, for society as a whole, of teaching FLs through the education system.

Social benefits are generally assumed to be the sum of private benefits; there again, given the absence of data on non-market benefits, calculations are usually confined to market benefits in the form of earnings differentials. However, calculations will be based on pre-tax instead of after-tax earnings. Furthermore, earnings differentials accruing in the distant future are worth less than those that appear immediately, and they must therefore be discounted. FL teaching costs are then deducted from the sum, over a person's lifetime, of discounted pre-tax earnings differentials. This requires additional information on public expenditure on foreign language teaching. Typically, educational statistics do not offer subject-based expenditure accounting, which means that approximations of the expenditure specifically devoted to FL teaching must be derived from data on enrolments, time endowments for FLs, and per capita spending, for successive cycles in the education system. To our knowledge, social rates of return on FL skills have only been estimated for Switzerland, where they are shown to be positive for French (in German- and Italian-speaking Switzerland), German (in French- and Italian-speaking Switzerland) and English (across the country) (Grin, 1999).

The general policy implication of high rates of return (whether private or, if possible, social) on FL skills is that it is efficient to allocate resources to FL education.

#### PROBLEMS AND DIFFICULTIES: LANGUAGE EDUCATION AND LINGUISTIC JUSTICE

The estimation of rates of return responds to a concern for the efficient allocation of resources (even if it focuses on the market dimensions of value, largely ignoring, for lack of data, its non-market dimensions). Let us now turn to matters of resource distribution, which raise questions of social justice.

Any policy choice, including in language of education, will tend to make some groups better off and other groups worse off. Theorists have considered different criteria for deciding whether this redistribution of resources is just or not (Arnsperger and van Parijs, 2003). These effects can be considered socially acceptable if it improves the lot of those who were worst off, if those previously better off enjoyed unjust advantages, or if the policy gives rise to sufficient net gains in the aggregate for the winners to be *able* to offer compensation to the losers (whether such compensation is actually paid being a separate question). We shall not discuss this particular issue further here, but note that one crucial, and generally under-researched dimension of the problem is that of the *criteria* on the basis of which we should define groups between which policies redistribute resources. Most of the literature

on equity or fairness concerns socioeconomic groups defined by income, education, indicators of social class, etc. (see also Rampton et al., *Language, Class and Education*, Volume 1). However, it is also possible to investigate resource redistribution between age groups, men and women, ethnic groups, families and single households, etc. In the case of FL education, peoples' L1 becomes a relevant dimension. This reflects the fact that the cost of FL learning is often borne unequally.

This point is best explained by using the example of international communication, although it could also be illustrated in terms of the respective position of speakers of minority languages who have to adopt a majority language. Consider the case of the 25-member European Union (EU). For a variety of reasons (Graddol, 2005; Phillipson, 2003; Phillipson, *Language Policy and Education in the European Union*, Volume 1), English is currently the most frequently used language between Europeans of different mother tongues. Consequently, non-native speakers of English devote considerable time and effort to learning the language, at a massive cost to the education systems of the countries of about 85% of Europe's residents. By contrast, the United Kingdom has decreased its effort in FL teaching. Current public effort on FL teaching in the UK can be estimated at between one third and one fourth of that of other EU member countries. The amounts thus saved can be invested in other forms of human capital development. In other words, the non-English-speaking countries of the EU are subsidising the UK on this plane as well. Controversy is currently ongoing over the extent of these transfers, and the identification of the best solution to this problem, taking account of both efficiency and fairness; this debate, however, raises questions that go well beyond language education and plugs into wider issues of language policy and macro-level language dynamics (see also Block, *Language Education and Globalization*, Volume 1).

## CHALLENGES

To a large extent, the controversies just mentioned hark back to empirical questions. This also applies to the issue of the actual magnitude of non-market returns to language skills, which have never been evaluated but could, in principle, be estimated by adapting instruments applied in the evaluation of environmental assets. A number of other questions in the economics of language education, however, raise theoretical challenges.

One of the most important is that of the long-term evolution of rates of return. As we have seen, rates of return are estimated at time  $t$ , but language education policy decisions made on their basis will affect learners who already are in the education system or who will enter

it in the future. Suppose for example that high rates of return on competence in a certain FL, say language  $L$ , have been observed at time  $t$ , and that a policy decision is made to increase, from time  $t + 1$ , the endowment for  $L$ -language teaching across the education system. Therefore, those learners who actually receive more  $L$ -language training only arrive on the labour market some years later. There is no certainty that, at that time,  $L$ -language skills will still be as profitable. High rates of return are therefore a relevant, but not a sufficient guide for language education policy decisions.

In order to make reliable policy recommendations to education authorities, it would be necessary to have a robust predictive model of the evolution of the value of FL skills. This, in turn, requires a deeper understanding than the literature currently offers of several interconnected processes, particularly of the ways in which employees' FL skills are exploited by employers. It should be clear that ethnographic accounts (often found in the applied linguistics literature) of how various languages are used in the workplace are of limited usefulness, because what matters is whether FL skills, when appropriately used in specific jobs within a company, have an actual impact on *economic* processes of production and distribution, and can therefore contribute to increased profits, market shares, etc. Only if such impacts do exist will firms have an incentive to recruit people with particular FL skills, thereby driving up the demand for such skills and keeping up, by way of consequence, the rate of return on them. If not, the language learning that occurs in response to earnings differentials observed, at time  $t$ , in favour of persons who are fluent in language  $L$ , will soon erode these very differentials. The incentive to learn language  $L$  will therefore decline, and language spread will continue on a large scale only if other factors come into play—for example, the fact that the social relevance of the language keeps increasing along with the number of learners and users, thereby renewing the incentive for more actors to learn it.

This question is particularly intriguing in the case of English. The reasons for its rapid spread are only partly understood (Graddol, 2005). Circumstantial evidence suggests that a plausible scenario is one of long-term decline in the labour market value of competence in English, as such skills are acquired by more people and become banal (just like the ability to read and write, once the preserve of a numerically small group of literate individuals, has become a basic requirement for all). Competence in English, at least up to a certain level, is likely to keep spreading, but for reasons distinct from labour market value, such as social participation. Consequently, maintaining a competitive advantage in the labour market is likely to constitute an incentive for individuals to learn additional FLs, and competence in Chinese

may become a significant asset for this reason (cf. Lam, *Language Education Policy in Greater China*, Volume 1).

#### FUTURE DIRECTIONS

The economic analysis of language addresses a wide range of questions of considerable social and political significance; many of them also tie into major language policy debates. This is likely to be reflected in research in coming years. We may therefore expect future work to emphasise policy issues and to address both the relative efficiency and the fairness of various forms of multilingual communication. In particular, should policies favour the emergence of one lingua franca (e.g. at the European level) or encourage a partnership between a few major languages? In the former case, is a natural language like English a suitable lingua franca despite the major equity problems that its spread generates, or should some alternative like Esperanto be actively promoted through internationally coordinated action? How extensive should social plurilingualism be, given that linguistic diversity carries benefits and costs (both of the market and non-market kind)? All these questions clearly indicate that language education needs to be investigated, also when using economic analysis, in relation to broader social and political issues. The research needed, however, is not necessarily located entirely at the macro level, and also requires micro-level investigation.

At the same time, there is also work to be done on processes within education systems. Economics may help in the measurement of the respective contribution of school and non-school channels of FL acquisition, or by providing instruments for the systematic comparison of the performance of various forms of FL instruction, such as CLIL, 'inter-comprehension' within language groups, etc., in comparison with more traditional forms of instruction. Empirical results in those areas can help design efficient, yet differentiated FL education curricula appropriate for different language learning contexts.

In all cases, however, it is important to remember that the issues at hand are highly complex. It would undoubtedly be useful for them to receive more sustained attention from economists. At the same time, further research needs to be carried out with a strongly interdisciplinary ethos in order to yield policy-relevant results.

THE MORAL DIMENSIONS OF  
LANGUAGE EDUCATION

INTRODUCTION

Like other kinds of teaching, language education is fundamentally and, some would argue, primarily moral in nature. By “moral,” we mean that it involves crucial yet difficult and ambiguous beliefs and decisions about what is right and good for learners and others. The moral dimensions of teaching inhere in certain key facts. First, all teaching aims to change people; there is an implicit assumption that this change is for the better. Second, there are limitations on the degree to which science, research, and objective facts about teaching and learning can guide teachers in the decisions they make; the great majority of teachers’ work in actual classrooms has to be based on teachers’ beliefs about what is right and good for their learners—that is to say, it is rooted in moral values. Third, like any relations between human beings, relations between a teacher and her students are moral in nature, revolving around key issues such as trust and respect. The innate power differential between teacher and students merely reinforces this basic fact. The moral landscape of the language classroom is rendered even more complex than in other contexts by the fact that the teaching of languages by definition takes place at the intersection between different national, cultural, and political boundaries, representing often radically different sets of values. Furthermore, the different cultures and value systems represented in classrooms, like the individuals taking part in language education, are not equally positioned in terms of cultural capital (see also Kelly Hall, *Language Education and Culture*, Volume 1) but, quite the opposite, are usually in unequal relations in ways frequently involving race, gender, sexual orientation, and other crucial differences.

EARLY DEVELOPMENTS: FINDINGS FROM  
GENERAL EDUCATION

As the preceding paragraph suggests, work on the moral dimensions of language teaching has largely been grounded in work on morality in general education. In this section, we review the principal contributions to this line of research.

John Dewey, in his seminal book, *Moral Principles in Education* (1909), drew an important distinction between the *teaching of morality*—the explicit teaching of specific moral values, and the *morality of teaching*—the ways teaching is imbued with moral significance. Despite the importance of Dewey's early writings in this area, little attention was paid to the morality of teaching until the early 1980s.

The publication of Tom (1984) marked the beginning of a renewed interest in the moral aspects of teaching. Tom critiqued the long-held view of teaching as an applied science, according to which research in the social and behavioral sciences will yield principles and strategies teachers “apply” to the problems they encounter in their classrooms. Tom proposed the metaphor of teaching as a moral craft. For Tom, two aspects of teaching imbue it with moral meaning: the relationship between teacher and student is a moral relationship, and the curriculum, as selectively planned and taught, reflects a desired goal. Craft can be described as an activity involving the application of analytical knowledge, synthetic thinking, and technical skill to a specific situation. By combining the moral aspects of teaching with the notion of craft, teaching as a moral craft is the “reflective, diligent, and skillful approach toward the pursuit of desirable ends” (p. 128).

Noddings' (1984) ethic of caring has been very influential over the past 20 years. Central to Noddings' work is her fundamental premise about teaching: that the relationship between teacher and student is at the core of teaching; concern for students comes before concern for content, assessment, and other aspects of schooling. These aspects are not ignored, nor considered of minor importance; but they are understood first and foremost through their connection to students and their learning.

Palmer (1998) offers another view of teaching and teachers' lives, one that draws primarily on personal reflection with a strong spiritual dimension. His deep explorations of his own work as a teacher and that of other teachers are inspirational rather than academic in tone and intent. While not based upon empirical investigations, his writings have nevertheless greatly influenced a number of researchers.

The ways teachers engage students in activities, indeed, the ways teachers act in all ways in the classroom, was the focus of the Moral Life of Schools Project undertaken by Jackson, Boostrom, and Hansen (1993). Through their extensive observations of K-12 classrooms in the USA, the authors sought to uncover and understand how the moral is present in schools. From their observations, two sets of categories emerged. The first set included five types of activities through which teachers and schools overtly teach moral content or nurture moral behaviors: moral instruction as a formal part of the curriculum, moral instruction as woven into the set curriculum, the use of ritual and

ceremonies, visual displays of moral messages, and spontaneously introduced moral commentary in the flow of classroom activities.

The second set of categories involves practices of teachers and schools that intentionally or unintentionally are of moral significance. This set of three categories include: the moral content of classroom practices and rules; the curricular substructure, a set of assumptions which allow teachers to teach and students to learn; and expressive morality—the moral significance of the many ways teachers act and speak in classrooms.

Hansen (2001) has continued to explore many of these themes. His central premise throughout is that teaching draws its moral significance from the very nature of its practice. Thus, rather than seeking moral meaning from sources outside of teaching, for example from philosophical discussions of virtue, teaching as a practice is itself imbued with moral significance.

For Fenstermacher (1992), the moral in teaching is present in the manner of the teacher. This position is based upon an Aristotelian view of how virtue is acquired by the young: teachers act as models and moral agents in the lives of their students. Teachers who act justly, honestly, and with compassion and tolerance, express these virtues through their teaching, thus instilling these traits and virtues in their students. Manner, then, is seen as separate from a teacher's method of teaching, the behaviors teachers use that promote children's learning.

Sockett (1993) offers a moral basis for teacher professionalism by describing its four dimensions: the professional community, professional expertise, professional accountability, and the professional ideal of service. Yet, Sockett acknowledges that discussions of teaching and teacher professionalism sorely lack any type of moral vocabulary and moral language. Thus, Sockett frames each of the dimensions of teacher professionalism in moral terms through which the descriptions and criteria for the quality of practice are guided by moral rather than technical language.

Another major study conducted by Noblit and Dempsey (1996) examined the ways schools and communities construct values and virtues that often guide their teaching practices and curricula. Through interviews with teachers, students, families, and community members, Noblit and Dempsey uncovered how the virtues and values deemed important by each group were a major moral influence on teachers and children.

More recently, Buzzelli and Johnston (2002) have examined the moral nature of classroom interaction through the lenses of language, power, and culture. The examination of teaching practices through these lenses uncovers the moral significance of various types of classroom discourse, of classroom rules, and of the ways that majority

culture teachers can limit the participation of minority students in classroom learning activities. These findings have implications for how teachers' practices directly and indirectly influence the ways students are represented through curricular materials and subsequently how educational practices contribute to the identities that students construct of themselves and that are attributed to them by peers.

#### MAJOR CONTRIBUTIONS

Two articles in the mid-1990s can be said to have opened up inquiry into the moral dimensions of language education. Edge (1996), in a paper examining what he called the "cross-cultural paradoxes" of the profession of English teaching, identified three such paradoxes of values. These were first, the mismatch that is frequently found between the values of what Edge calls "TESOL culture" (p. 9) and the national educational cultures in which English teaching is conducted. Second, the fact that in any context, English teaching is unavoidably wrapped up with political issues of both "liberation and domination" (p. 17). Third, the paradox between "respect for the right to be different" (p. 21), a value Edge claims that the field of English teaching embraces, and the intolerance sometimes expressed by the students whose views teachers are supposed to respect.

Johnston, Juhász, Marken, and Ruiz (1998) in turn, took a much more "local" and small-scale approach, examining discourse from the classrooms of three ESL teachers at a university-based intensive English program (IEP) to reveal aspects of what they called the "moral agency" of the teacher: that is, the ways in which the teacher's actions and words convey usually implicit moral messages to her learners. Johnston et al. borrowed part of the theoretical framework of "categories of moral influence" proposed by Jackson et al. (1993) (see earlier), and looked at the three categories said to capture the "morality of teaching" in introducing implicit moral messages into teaching: classroom rules and regulations; the curricular substructure; and expressive morality. Johnston et al. (1998) identified examples of all three categories in the classroom data they studied. They argued further that in relatively culturally homogeneous classrooms, such as those studied by Jackson et al. (1993), there is likely to be a large degree of shared understanding between teacher and students about elements such as the curricular substructure. However, in multilingual and multicultural classrooms there may be profound disjunctures between the moral messages sent, usually unconsciously, by teachers and the way those messages are interpreted, also usually unconsciously, by different learners.

Subsequent research in the moral dimensions of language education has partially followed the lead of these two pieces and has concentrated

around certain key topics. These include: the moral dimensions of classroom interaction; values and politics; professional ethics; and the role of religious beliefs in language teaching.

Various aspects of the moral dimensions of classroom interaction have been examined. Ewald (in press) looked at student perceptions of critical moral incidents in a US university Spanish classroom; she found the students highly sensitive to moral messages in the words and actions of their teachers. Johnson (2003) described clashes of values between a white American female mentor teacher and an African Muslim man in a practicum (teaching practice) placement in a US IEP. Buzzelli and Johnston (2002) looked at a range of classroom issues including, in particular, cultural aspects of minority children in mainstream classes.

As Edge's (1996) work indicates, moral values have always been at least implicitly present in the expanding literature on the politics of language teaching (Pennycook, 1994; Phillipson, 1992; see also Canagarajah, *The Politics of English Language Teaching*, Volume 1). Above all, as Edge pointed out, the central moral question that this literature raises for teachers is how to position themselves morally in relation to national and international political realities in which they are implicated, yet with which they may vehemently disagree.

Along with inquiry into morality, narrowly conceived, there have also been several investigations into ethical issues in language teaching, many of which cover similar ground to that found in research on morality. (It is worth pointing out that in philosophy no distinction is usually drawn between morals and ethics, though some authors, e.g., Buzzelli and Johnston (2002), suggest that it can be helpful to use *ethics* to refer to codes of conduct and to behavior, and *morality* to refer to personal beliefs.) Research has looked, amongst other things, at the ethics of testing (Hamp-Lyons, 1998; Shohamy, 2001), and at the centrality of ethical issues in the work of teachers (Hafernik, Messerschmitt, and Vandrick, 2002).

Finally, there have been the beginnings of attention to the vast area formed by the intersection between language teaching and religious beliefs, a domain in which moral values are particularly prominent and often highly contentious. This is an area of central concern in language education, in particular because of the strong connection between English teaching and mission work worldwide, an issue on which moral views are strongly divided in the field. The Christian viewpoint has been put forward by Smith and Carvill (2000) and Snow (2001). On the other hand, there have recently been severe critiques of evangelical involvement in English teaching around the world, amongst others by Pennycook and Coutand-Marin (2003) and Edge (2003). There are also the beginnings of empirical research on evangelical teachers by nonevangelicals (Varghese and Johnston, 2004).

The most extensive examination of the moral dimensions of language teaching to date is probably Johnston (2003). In his book, which focuses specifically on English language teaching while considering examples from different national settings, Johnston looks in particular at five major areas, some of which overlap with the areas outlined earlier: the moral dimensions of classroom discourse and classroom interaction; moral aspects of critical pedagogy and the political dimensions of language teaching; the morality of forms of assessment and evaluation; the moral underpinnings of language teacher identity, including religious identity; and the role of values in various aspects of teacher professional development.

Johnston's work is built around the notion of *moral dilemmas*: that is to say, points at which teachers are obliged to choose between two or more courses of action knowing that any possible choice will have both good and bad consequences, many of which are largely unpredictable. Johnston identifies a number of key moral dilemmas frequently encountered in the field of English language teaching, categorizing them into dilemmas of pedagogy, of teacher–student relations, and of beliefs and values (pp. 145–146). Johnston claims that moral ambiguity and polyvalence are permanent features of all teaching, including language teaching; but he argues that an awareness of the moral dimensions of teaching and of the moral consequences of alternative courses of action is crucial for effective decision-making in classrooms and schools.

In summary, it is clear that inquiry into the moral dimensions of language teaching has extended to numerous aspects of classroom teaching, schools, and educational systems, and has frequently overlapped with areas such as ethics, the politics of language teaching, social responsibility, teacher education and development, and religion. Many of these lines of inquiry continue to be expanded as the following section indicates.

#### WORK IN PROGRESS

A number of projects currently in progress expand on or otherwise develop many of the ideas and topics outlined earlier, and also introduce new fields of interest and new theoretical possibilities.

Research has continued to look at the ways in which moral issues are enacted in classrooms. Johnston, Ruiz, and Juhász (2002) conducted a follow-up study to Johnston, Juhász, Marken, and Ruiz (1998) in which they examined student perspectives on moral critical incidents in an adult ESL classroom. Student perspectives often differed from teacher and researcher perspectives and from each other; but all students perceived the classroom as a place of moral interaction. Zahler

(2003) looked at one nonnative English-speaking ESL teacher in a North American IEP, analyzing his relations with his students in terms of the solidarity-authority distinction.

A number of scholars have followed Johnston's (2003) lead in extending research on the moral dimensions of teaching into language teacher education. For example, Johnston and Buzzelli (in progress) describe a study of two teacher education programs, one of which is an MA program in TESOL and applied linguistics. The authors' goal is to explore real-life moral dilemmas of teaching and teacher education while seeking new theoretical and conceptual lenses with which to understand classroom and program events; they are particularly interested in the moral dimensions of community, ideology, and identity as these play out in the context of teacher education classrooms.

Wong and Canagarajah (in progress), both evangelical Christians, have undertaken to attempt a professional dialog concerning the significant presence of evangelicals in the field of English teaching. Their book contains chapters and responses by both evangelical and nonevangelical (often non-Christian) scholars, in an attempt to find common ground.

Lastly, research on the political dimensions of language teaching has moved beyond the relatively narrow confines of critical pedagogy to take in more varied perspectives. An example of this development is Edge's (2006) edited volume, which offers multiple perspectives on responses in the field of English teaching to US neo-imperialism, especially in the post-9/11 world.

### PROBLEMS AND DIFFICULTIES

The problems and difficulties of research on the moral dimensions of language teaching are both evident and numerous.

First, there is the most obvious matter of how "morality" is understood and defined for research purposes. Conceptual work is still needed to clarify what is meant by basic terms such as "moral," "right," and "good." There is an ever-present temptation to drift toward everyday understandings of these terms, which can be dangerous and misleading.

Second, the location of morality and values at the intersection between the social and the individual makes it hard to attempt valid generalizations about moral dilemmas. Societal values (for example, individualism, collectivism, privacy, solidarity) can be identified, but it is hard to say to what extent particular individuals share them. Working at the intersection of cultures and languages compounds the difficulties of research.

Third, the aspects of morality that are of most interest are also those that are buried deepest and are least available for inspection. For this

reason, speculation is often the only recourse for the researcher. For example, in the study by Johnston, Ruiz, and Juhász (2002) mentioned earlier, looking at student perspectives on critical moral incidents in an ESL classroom, the researchers interviewed the students extensively, yet even so, the interviews themselves still had to be analyzed and interpreted. As with much cultural and psychological behavior, motivations and perceptions are in most cases simply not available for easy introspective access for research purposes.

Fourth, there are considerable barriers to conducting effective research across cultural and linguistic borders. Linguistic and discourse limitations make it very difficult to find stable points of vantage from which to work conceptually and to analyze and evaluate data and evidence. Notions such as “morality” or “right,” for instance, do not translate easily across languages.

Lastly, it is worth noting that in some areas of research, objectivity is hard to come by. A case in point is the topic of religious beliefs in language teaching, in particular that looking at the presence of evangelical Christians in English teaching. The professional discourse on this topic has been marked by extreme polarization, and it remains unclear whether it is even possible to find a common language in which to conduct a debate (Varghese and Johnston, 2004). This seems a reflection of the broader fact that questions of morality and values tend to “push people’s buttons,” and that this can happen even in academic circles and can seriously compromise possibilities for inquiry.

The net result of the problems and difficulties reviewed here is that all work on the moral dimensions of teaching must acknowledge its own limitations, and the field as a whole must move forward cautiously and tentatively. Findings must always be regarded as provisional and subject to change.

#### FUTURE DIRECTIONS

Research on the moral dimensions of language teaching is in its infancy, and numerous important future directions suggest themselves. First of all, a deeper understanding of the moral dimensions of language classroom discourse necessitates discourse-analytic research in a range of contexts and settings. Understandings of moral meanings differ widely across cultural and national boundaries, and it would be a grave mistake to imagine that the moral landscape, say, of North American classrooms can be used to understand that of classrooms in other countries—quite aside from the radical differences from setting to setting within each country.

Second, as pointed out earlier, values differ significantly from one culture to the next, and these differences have a profound impact on

local educational cultures; inquiry into the moral landscapes of language classrooms in different national settings would do much to give this work a fuller international and comparative dimension.

Third, a crucial arena in which moral values and issues are played out is that of curriculum and coursebooks; the moral dimensions of published materials, and the moral consequences of choices about which vocabulary, what form of pronunciation, what grammar, and what pragmatics competencies to teach is an area that is ripe for inquiry (see e.g., Smith and Carvill, 2000, pp. 55–56). This matter also extends to the question of the representation of cultures, individuals, and their values in curricular materials (see Buzzelli and Johnston, 2002, pp. 97–105).

Fourth, the specifically moral aspects of the intersection between language teaching and power also require closer examination (see Janks, *Teaching Language and Power*, Volume 1); whether considering the work of expatriate teachers of English around the world, or the presentation of unfamiliar cultures and peoples in the foreign language classroom, the juncture of individual or communally held moral beliefs and political hegemonies represents a major yet under-investigated aspect of language teaching.

Fifth, and finally, there is still much more work to be done in the area of religious beliefs and their place in language teaching. The work on evangelical Christianity mentioned in the previous sections needs to be expanded to include other forms of Christianity and other religions; there is an ever more pressing need to look closely at the complex moral dilemmas that arise when teachers' personal religious beliefs directly affect classroom instruction and relations with students.

## **Minorities and Education**

## HUMAN RIGHTS AND LANGUAGE POLICY IN EDUCATION

### INTRODUCTION

The United Nation's 2004 Human Development Report (<http://hdr.undp.org/reports/global/2004/>) links cultural liberty to language rights and human development and argues that there is

... no more powerful means of 'encouraging' individuals to assimilate to a dominant culture than having the economic, social and political returns stacked against their mother tongue. Such assimilation is not freely chosen if the choice is between one's mother tongue and one's future. (p. 33)

The press release about the UN report (see web address provided earlier) exemplifies the role of language as an exclusionary tool:

Limitations on people's ability to use their native language—and limited facility in speaking the dominant or official national language—can exclude people from education, political life and access to justice. Sub-Saharan Africa has more than 2,500 languages, but the ability of many people to use their language in education and in dealing with the state is particularly limited. In more than 30 countries in the region, the official language is different from the one most commonly used. Only 13 percent of the children who receive primary education do so in their native language.

One might expect that the report would suggest a positive solution, which not only respects human rights (HRs), but is also based on solid research. Sadly, this is not the case. The report suggests that:

Multilingual countries often need a three-language formula

1. A national or official state language.
2. A lingua franca to facilitate communications among different groups (in some cases the official language serves this purpose).
3. Official recognition of the mother tongue or of indigenous languages *for those without full command of the official language or lingua franca* (ibid.; emphasis added).

The first two, enabling children through education to become fully competent in one or two languages of wider communication, is what a human rights-oriented educational language policy should include. The third suggestion is clearly based on deficit theories and either/or

thinking, characteristic of much of language policy today in indigenous and minority education (see also Kelly Hall, *Language Education and Culture*, Volume 1). Schools often see the mother tongues of minorities as necessary but negative temporary tools while the minority child is learning a dominant language. As soon as he or she is deemed in some way competent in the dominant language, the mother tongue can be left behind, and the child has no right to maintain it and develop it further in the educational system.

This can be seen as a serious HRs violation. It violates the right to education (see Magga, Nicolaisen, Trask, Dunbar and Skutnabb-Kangas, 2004; Tomaševski, 2001; and [www.right-to-education.org/content/primers/\\_rte03.pdf](http://www.right-to-education.org/content/primers/_rte03.pdf)). It may result in linguistic genocide, according to two of the United Nations' definitions of genocide (Skutnabb-Kangas, 2000; see also the section Work in Progress).

### EARLY DEVELOPMENTS

There have been many language rights for dominant language speakers for millennia, without anybody calling them language rights. Additionally, several linguistic minorities have for centuries had some language rights, in some countries even legally formalised. Rights have been formulated pragmatically, and mostly by lawyers. The first bilateral agreements (between two countries), also old, were mostly about religious not linguistic minorities, but often the two coincided. The first multilateral agreement covering national minorities was the Final Act of the Congress of Vienna 1815 (Capotorti, 1979, p. 2). During the nineteenth century, several national constitutions and some multilateral instruments safeguarded some national linguistic minorities (see the historical overview in Skutnabb-Kangas and Phillipson, 1994). The Peace Treaties that concluded the First 'World' War and major multilateral and international conventions under the League of Nations improved the protection. After the Second World War, the individual rights formulated by the United Nations were supposed to protect minority persons as individuals and collective minority rights were seen as unnecessary. A better protection of linguistic minorities only started to develop after Francesco Capotorti, as a UN Special Rapporteur on the Rights of Minorities, published his 1979 report. The protection is still far from satisfactory (see also de Varennes, *International Law and Education in a Minority Language*, Volume 1).

It was only in the early 1990s that the area of linguistic human rights (LHRs) started crystallising as a multidisciplinary research area. Earlier, language rights and human rights were more separated from each other; both were the domain of lawyers, with few, if any, linguists involved. Both areas were driven by practical-political concerns and

the research was mainly descriptive, not analytical. Even today, there is a fairly tight separation. Few lawyers know much about language (some exceptions are Fernand de Varennes, e.g. 1996, *International Law and Education in a Minority Language*, Volume 1; Dunbar, 2001; Fife, 2005) or education. Many of those sociolinguists, political scientists and educationists who are today writing about LHRs, know too little about international law (also here there are exceptions, e.g. May 2001, *Language Education, Pluralism and Citizenship*, Volume 1; Tollefson and Tsui 2003). This is a fast growing area where major concept clarification and multidisciplinary teamwork is urgently needed. It should be clear, though, that those language rights are LHRs, which are so basic for a dignified life that everybody has them because of being human; therefore, in principle no state (or individual) is allowed to violate them. The first multidisciplinary book about LHRs seems to be from the mid-1990s (Skutnabb-Kangas and Phillipson, 1994).

#### MAJOR CONTRIBUTIONS

The world's spoken languages are disappearing fast: pessimistic but realistic estimates fear that 90–95% of them may be extinct or very seriously endangered by the year 2100. Transmission of languages from the parent generation to children is *the* most vital factor for the maintenance of both oral and sign languages. When more children gain access to formal education, much of their more formal language learning, which occurred earlier in the community, takes place in schools. If an alien language is used in schools—i.e. if children do not have the right to learn and use their language in schools (and, of course, later in their working life)—the language is not going to survive. Thus educational LHRs, especially an unconditional right to mother tongue medium (MTM) education, are central for the maintenance of languages and for the prevention of linguistic and cultural genocide. ‘Modernisation’ has accelerated the death/murder of languages, which, without formal education, had survived for centuries or millennia. It is clear, though, that neither LHRs nor schools alone can in any way guarantee the maintenance and further development of languages—they are both necessary but not sufficient for this purpose. There are no miracle cures or panaceas.

Dominant and/or majority language speakers in many cases have most of those rights that can be seen as LHRs, also in education, and most of them seem to take their existence for granted. Indigenous peoples and minorities are the ones whose LHRs need strengthening. The Office of the United Nations High Commissioner for Human Rights website [www.unhchr.ch](http://www.unhchr.ch) is a good place to start finding out what educational LHRs exist today in international or regional HRs instruments. See <http://www.ohchr.org/english/law/index.htm> for texts of the HRs

instruments themselves and <http://www.unhchr.ch/tbs/doc.nsf> for States parties to the treaties; Mercator Linguistic Rights and Legislation web-site is also useful: [http://www.ciemn.org/mercator/Menu\\_nou/index.cfm?lg=gb](http://www.ciemn.org/mercator/Menu_nou/index.cfm?lg=gb).

Minorities have some HRs support for other aspects of using their languages in areas such as public administration, courts and the media (Frowein and co-worker's edited books about minority rights in European States 1993 and 1994 give excellent overviews of Europe). However, international and European binding Covenants, Conventions and Charters provide in fact very little support for LHRs in education, and language is accorded in them much poorer treatment than other central human characteristics such as 'race', gender and religion (see also de Varennes, *International Law and Education in a Minority Language*, Volume 1). Often language disappears completely in educational paragraphs. For instance, the (non-binding) Universal Declaration of Human Rights (1948) paragraph on education (26) does not refer to language at all. Similarly, the UN International Covenant on Economic, Social and Cultural Rights, having mentioned language on par with race, colour, sex, religion, etc. in its general Article (2.2), explicitly refers to 'racial, ethnic or religious groups' in its educational Article (13), but omits reference to language or linguistic groups.

When 'language' is present in Articles on education, especially MTM education, the formulations are more vague and/or contain many more opt-outs, modifications and claw-backs than other Articles; these create obligations and contain demanding formulations, where the states are firm duty-holders and '*shall*' do something positive in order to ensure the rights. Many books and articles on LHRs show this. For some key books on language rights, see: Skutnabb-Kangas and Phillipson, 1994; Kibbee, 1998; Guillorel/Koubi, 1999; Kontra, Phillipson, Skutnabb-Kangas and Várady, 1999; Phillipson, 2000; Skutnabb-Kangas, 2000; May, 2001.

We can see these patterns of vague formulations, modifications and alternatives even in the latest minority or language-specific international and regional instruments. In the Council of Europe's European Charter for Regional or Minority Languages (1998), a state can choose which paragraphs or subparagraphs it wishes to apply (a minimum of 35 is required). The education Article 8, includes a range of qualifications, including 'as far as possible', 'relevant', 'appropriate', 'where necessary', 'pupils who so wish in a number considered sufficient', 'if the number of users of a regional or minority language justifies it', as well as a number of alternatives, as in 'to allow, encourage or provide teaching in or of the regional or minority language at all the appropriate stages of education'. Similar formulations abound in the Council of Europe's Framework Convention for the Protection of National

Minorities (1998). The Article covering medium of education is so heavily qualified that the minority is completely at the mercy of the state:

In areas inhabited by persons belonging to national minorities traditionally or in **substantial** numbers, **if there is sufficient demand**, the parties shall **endeavour** to ensure, **as far as possible** and **within the framework of their education systems**, that persons belonging to those minorities have **adequate** opportunities for being taught in the minority language **or** for receiving instruction in this language (emphases added for modifications).

The Framework Convention has been criticised by politicians and international lawyers, who are normally very careful in their comments. Law professor Patrick Thornberry's general assessment is:

In case any of this [provisions in the Convention] should threaten the delicate sensibilities of States, the Explanatory Report makes it clear that they are under no obligation to conclude 'agreements'. . . . Despite the presumed good intentions, the provision represents a low point in drafting a minority right; there is just enough substance in the formulation to prevent it becoming completely vacuous. (Thornberry, 1997, pp. 356–357)

Of course the balance between binding formulations and sensitivity to local conditions is a difficult one. The Charter permits a reluctant state to meet the requirements in a minimalist way, which it can legitimate by claiming that a provision was not 'possible' or 'appropriate', or that numbers were not 'sufficient' or did not 'justify' a provision, or that it 'allowed' the minority to organise teaching of their language as a subject, at their own cost. Both the European Charter and the Framework Convention (for the latest news about both, see <http://conventions.coe.int/Treaty/EN/v3News.asp>; their treaty numbers are 148 and 157) have monitoring bodies which seem to be doing a good job in trying to stretch the states' willingness to follow more than minimalist requirements—but, again, when it comes to MTM education, these bodies seem to be somewhat ignorant about language-in-education issues (see Skutnabb-Kangas, 2004; Wilson, 2004). The (non-binding) UN Declaration on the Rights of Persons Belonging to National or Ethnic, Religious and Linguistic Minorities ([http://www.unhchr.ch/html/menu3/b/d\\_minori.htm](http://www.unhchr.ch/html/menu3/b/d_minori.htm)) suffers from similar vague formulations.

A recent NGO attempt to promote language rights (a draft Universal Declaration of Linguistic Rights, handed over to UNESCO in Barcelona in June 1996; see <http://www.linguistic-declaration.org/index-gb.htm>; from the index one can go to the Declaration itself), also suffers from similar shortcomings, even if, for several beneficiaries ('language

communities' and, to some extent, 'language groups'), it represents great progress in relation to the other instruments described. Still, indirectly, its education section forces all others except those defined as members of language communities (which roughly correspond to national territorially based minorities) to assimilate. Despite hard work by Catalans (who, together with the Basques, have been extremely active in getting LHRs on a global agenda), the draft Declaration is not going to be accepted by UNESCO member states in its present form.

#### WORK IN PROGRESS

New interpretations (Article 27, discussed subsequently) or enlargement of the scope (linguistic genocide) of older instruments, new instruments under negotiation (e.g. indigenous instruments, see McCarty, *Language Education Planning and Policies by and for Indigenous Peoples*, Volume 1; or LHRs for the Deaf, see Branson and Miller, *National Sign Languages and Language Policies*, Volume 1), and the development of non-binding Declarations or Recommendations (e.g. the Hague Recommendations) in a more binding direction may in time improve the situation.

Article 27 of the International Covenant on Civil and Political Rights (ICCPR) 1966, in force since 1976), still contains the most far-reaching binding protection for LHRs for minority languages (see also de Varennes, *International Law and Education in a Minority Language*, Volume 1). It declares:

In those States in which ethnic, religious or linguistic minorities exist, persons belonging to such minorities shall not be denied the right, in community with the other members of their group, to enjoy their own culture, to profess and practice their own religion, or to use their own language.

Earlier interpretations of this Article did not grant much support to LHRs. It was seen as only granting negative non-discrimination rights and did not place any obligations on states. The linguistic protection of national minorities rests, according to van der Stoel, on two HRs pillars: the right to non-discrimination in the enjoyment of human rights; and the right to the maintenance and development of identity through the freedom to practice or use those special and unique aspects of their minority life - typically culture, religion, and language. The first protection . . . ensures that minorities receive all of the other protections without regard to their ethnic, national, or religious status; they thus enjoy a number of linguistic rights that all persons in the state enjoy, such as freedom of expression and the right in criminal

proceedings to be informed of the charge against them in a language they understand, if necessary through an interpreter provided free of charge. The second pillar, encompassing affirmative obligations beyond non-discrimination... It includes a number of rights pertinent to minorities simply by virtue of their minority status, such as the right to use their language. This pillar is necessary because a pure non-discrimination norm could have the effect of forcing people belonging to minorities to adhere to a majority language, effectively denying them their rights to identity. (OSCE—Organisation for Security and Co-operation in Europe, High Commissioner on National Minorities, 1999, p. 8–9)

In 1994, the United Nations Human Rights Committee (UNHRC) published a General Comment on UN ICCPR, Article 27 (4 April 1996, UN Doc. CCPR/C/21/Rev.1/Add.5). The UNHRC interpreted Article 27 as protecting all individuals on the state's territory or under its jurisdiction (i.e. also immigrants and refugees), irrespective of whether they belong to the minorities specified in the article or not. It stated that the existence of a minority does not depend on a decision by the state, but requires to be established by objective criteria (important in relation to countries which deny having linguistic minorities—e.g. France, Greece, Turkey). It recognised the existence of a 'right', and imposed positive obligations on the states. The revised Human Rights Fact Sheet No. 15 on ICCPR from the Committee (2005) sustains this interpretation.

When the United Nations did preparatory work for what became the International Convention for the Prevention and Punishment of the Crime of Genocide (E 793, 1948), linguistic genocide as a central aspect of cultural genocide was discussed alongside physical genocide as a serious crime against humanity (see Capotorti, 1979, p. 37).

When the UN General Assembly finally accepted the Convention, Article III covering linguistic and cultural genocide was voted down by 16 states (see Official Records of the General Assembly, Third Session, Part I, Sixth Committee, 83rd meeting). It is thus not included in the final Convention of 1948. Denmark, USA and UK were among those who opposed the prohibition of cultural genocide and UK wanted the Convention to be limited in the strict sense to the physical extermination of human groups. The Soviet bloc countries, China, Pakistan and Venezuela, among others, wanted to keep Article 3 in force.

The present Convention has five definitions of genocide. Two of them fit most indigenous and minority education today

- II(e), '*forcibly transferring children of the group to another group*';
- II(b), '*causing serious bodily or mental harm to members of the group*'; (emphasis added).

Assimilationist submersion education, where indigenous and minority children are forced to accept teaching through the medium of dominant languages (see also McCarty, *Language Education Planning and Policies by and for Indigenous Peoples, Volume 1*), can cause serious mental harm and often leads to the students using the dominant language with their own children later on—i.e. over a generation or two the children are linguistically, and often in other ways too, forcibly transferred to a dominant group. This happens to millions of speakers of threatened languages all over the world. There are no schools or classes teaching the children through the medium of the threatened indigenous or minority languages. The transfer to the majority language-speaking group is not voluntary; alternatives do not exist, and parents do not have enough reliable information about the long-term consequences of the various choices. Because of this, disappearance of languages cannot be labelled ‘language suicide’, even if it might at first seem like the speakers are themselves abandoning their languages.

Most children obviously want in their own interest to learn the official language of their country. This is also one of the important LHRs and implies the right to become a high-level bilingual. Most children also want to learn English if it is not one of the official languages. But learning new languages, including the dominant languages, should not happen subtractively, but rather additively, in addition to their own languages. Subtractive formal education, which teaches children (something of) a dominant language at the cost of their first language, is genocidal. This dominant language can be official (e.g. French in France) or semi-official (e.g. English in the USA); it can be the language of a numerical majority (as in France or the USA); often it is an old colonial language, spoken only by a small but powerful numerical minority (e.g. as in many African countries). A false educational philosophy claims that minority children learn the dominant language best if they have most of their education through the medium of it. Many studies have shown that the longer the mother tongue remains the main medium of education, the better the minority children learn the dominant language and other subjects (see, e.g. Thomas and Collier, at [http://www.crede.ucsc.edu/research/llaa/1.1\\_final.html](http://www.crede.ucsc.edu/research/llaa/1.1_final.html); May, Hill and Tiaikiwai (2004), at <http://www.minedu.govt.nz/index.cfm?layout=document&documentid=9712&data=1>, and other articles in Volumes 1 and 5).

Some lawyers claim that the deliberate intention required by the Convention is not there. If minority education has been and is organised against what considerable research evidence proposes, while the authorities (including churches) have (and have had for at least one and a half centuries) solid information about how it should be organised, the prohibition, the mental harm caused and the forcible transfer

must be seen as deliberate and intentional acts on behalf of states (see Magga, Nicolaisen, Trask, Dunbar and Skutnabb-Kangas, 2004).

The (non-binding) Hague Recommendations Regarding the Education Rights of National Minorities ([http://www.osce.org/documents/html/pdf/oh/html/2700\\_en.pdf.html](http://www.osce.org/documents/html/pdf/oh/html/2700_en.pdf.html)) from OSCE's High Commissioner on National Minorities were worked out by a small group of experts on HRs and education. They represent an authoritative interpretation and concretisation of the minimum in present HRs standards. In the section, 'The spirit of international instruments', bilingualism is seen as a right and responsibility for persons belonging to national minorities (Article 1), and states are reminded not to interpret their obligations in a restrictive manner (Article 3). In the section on 'Minority education at primary and secondary levels', MTM education is recommended at all levels, including bilingual teachers in the dominant language as a second language (Articles 11–13). Teacher training is made a duty on the state (Article 14). Finally, the Explanatory Note states that 'submersion-type approaches whereby the curriculum is taught exclusively through the medium of the State language and minority children are entirely integrated into classes with children of the majority are not in line with international standards' (p. 5). UNESCO's 2003 Position paper 'Education in a Multilingual World' (<http://unesdoc.unesco.org/images/0012/001297/129728e.pdf>) follows the Hague Recommendations fairly closely.

#### PROBLEMS, DIFFICULTIES AND FUTURE DIRECTIONS

One problem has been that, even if minorities have been granted the right to found private schools with their own language as the main medium of education, the state has not had any obligation to participate in the costs. This was made clear in a landmark case in Belgium (the Belgian Linguistic Case, <http://www.arts.uwaterloo.ca/MINELRES/coe/court/Belglin.htm>). Few minorities can bear the full cost of primary education while contributing through their taxes to dominant-language-medium education. If the Human Rights Committee's reinterpretation of Article 27 starts having some effect (and new litigation would be needed to test this), the economic hurdles might be solved. After all, it hardly costs the state more to change the language in minority schools, as compared with using the dominant language (see also Grin, *The Economics of Language Education*, Volume 1). This is also pointed out in The Asmara Declaration on African Languages and Literatures, from a conference 17 January 2000 (<http://www.outreach.psu.edu/C&I/AllOdds/declaration.html>) when demanding MTM education.

The Draft United Nations Declaration on the Rights of Indigenous Peoples (contained in the 1994 Sub-Commission annual report, document E/CN.4/Sub.2/1994/56, annexed to resolution number 45; go to it through <http://www.ohchr.org/english/issues/indigenous/declaration.htm>) was, after a decade of careful work, handed over to the UN in 1994 and has been under negotiation ever since. The USA, Canada and Australia seem to be among the countries most prominent in delaying its acceptance. In an interview in PFII's Quarterly Newsletter *Message Stick* 3:2; (<http://www.un.org/esa/socdev/unpfi/en/newsletter.html>; choose Message Stick Vol. 4, number 2), PFII's (UN Permanent Forum on Indigenous Issues) first Chair, Professor Ole Henrik Magga sums up the connections between the concepts in the title of this entry: human rights, language, language policy and education. He sees LHRs in education as a necessary prerequisite for the maintenance of indigenous languages and traditional knowledge. See also Hamel, 1994, 1997; May, 1999; McCarty, 2005; Magga, Nicolaisen, Trask, Dunbar and Skutnabb-Kangas, 2004, for some assessments of the situation.

Without implementation, monitoring and proper complaint procedures, many of the possibilities in the new or emerging instruments are lost. The European Charter is supposed to be an inclusive, positive language rights instrument. Still, it excludes many more languages in Europe than it includes. It excludes explicitly immigrant languages and 'dialects' of languages. Covertly, it has also excluded all Sign languages, using completely false argumentation (see also Branson and Miller, *National Sign Languages and Language Policies*, Volume 1).

The often-appalling ignorance about basic language matters is a serious gap, and it should be the ethical responsibility of researchers to remedy it. False information or lack of information about both research results and details in HRs instruments that the various countries have signed and ratified are also more the rule than the exception when decisions are made about education. Important language status planning decisions are often based on false information, even in situations where the correct information is easily available and has in fact been offered to the decision makers. More transdisciplinary cooperation between HRs lawyers, sociolinguists and educationists is urgently needed (see the Introduction in *Kontra*, Phillipson, Skutnabb-Kangas and Várady, 1999; May, 1999, 2001). Often Western researchers also suffer from ethnocentricity, and lack of knowledge of the languages and cultures of others (see, e.g. Tuhiwai Smith, 1999; *Kontra*, 2000; Hountondji, 2002).

But lack of LHRs is not only an information problem. The political will of states to grant LHRs is the main problem. HRs, especially economic and social rights, are, according to HRs lawyer Katarina Tomaševski (1996, p. 104), to act as correctives to the free market.

She claims (*ibid.*, p. 104) that the ‘purpose of international human rights law is [...] to overrule the law of supply and demand and remove price-tags from people and from necessities for their survival’. These necessities for survival include not only basic food and housing (which would come under economic and social rights), but also basics for the sustenance of a dignified life, including basic civil, political and cultural rights—and LHRs are a part here of cultural rights. The message from both sociologists like Zygmunt Bauman and HRs lawyers like Katarina Tomaševski, and many others, is that unless there is a redistribution of resources for implementing HRs, progress will be limited. It is probably not even of any use to spread knowledge of HRs as a basis for self-directed human development, unless the resources for implementation follow, and that can only happen through a radical redistribution of the world’s material resources.

Why have states not granted LHRs to indigenous peoples and most minorities? The general attitudes behind state policies leading towards diminishing numbers of languages see, falsely, monolingualism as something:

1. Normal and natural; however, most countries are multilingual
2. Desirable, more efficient and economical; however, if citizens do not understand the language they are governed in and if huge talent is wasted because children do not profit and are even harmed by formal education, this is inefficient and wasteful
3. Inevitable; modernisation leads to linguistic homogenisation and only romantics regret it; however, linguistic diversity and multilingualism enhance creativity (see May, *Bilingual/Immersion Education: What the Research Tells Us*, Volume 5) and are necessary in information societies where the main products are diverse ideas and diverse knowledges (see Kalantzis and Cope, *Language Education and Multiliteracies*, Volume 1).

In addition, states seem to see granting of LHRs as divisive. The rationale is that they result in minorities reproducing themselves as minorities. These minorities then supposedly follow the old nation-state thinking and want cultural autonomy, economic autonomy and, in the end, political autonomy: their own state. Thus MTM education for minorities is ultimately seen as leading to the disintegration of nation states. These erroneous beliefs are an important causal factor in linguistic genocide and lack of LHRs in education.

INTERNATIONAL LAW AND EDUCATION IN A  
MINORITY LANGUAGE

INTRODUCTION

While many linguists and educationalists often refer to a “right to language” or to a “right to be educated in one’s own language”, and have done some extremely detailed and well-researched work (Skutnabb-Kangas and Phillipson, 1994, pp. 71–110), the purely legal point of view at the international level has not been so accommodating. Only in the last few years have international legal instruments—those which impose legally binding rules rather than noble aspirations—recognised, strictly speaking, such a right. An increasing variety of documents such as the United Nations’ Declaration on the Rights of Persons Belonging to National or Ethnic, Religious and Linguistic Minorities ([http://www.unhchr.ch/html/menu3/b/d\\_minori.htm](http://www.unhchr.ch/html/menu3/b/d_minori.htm)) and the 1996 The Hague Recommendations regarding the Education Rights of National Minorities (<http://www.minelres.lv/osce/hagrec.htm>), prepared on behalf of the High Commissioner on National Minorities of the Organization for Security and Cooperation in Europe (OSCE), have more recently articulated such a “right” more clearly, but caution must be used in their use since, from a legal point of view, they are not binding in international law (see also Skutnabb-Kangas, Human Rights and Language Policy in Education, Volume 1).

It is nevertheless true that, at least from the point of view of the Council of Europe, two separate treaties—the Framework Convention for the Protection of National Minorities ([http://www.coe.int/T/E/human\\_rights/minorities/](http://www.coe.int/T/E/human_rights/minorities/)) and the European Charter for Regional or Minority Languages (<http://conventions.coe.int/Treaty/EN/Treaties/Html/148.htm>)—have more recently enshrined unambiguously a right to be educated in one’s language, though in both cases this right is circumscribed to particular situations and conditions and is not a right available in all situations.

Additionally, developments in the application of the rights to education and non-discrimination in international law suggest that further clarifications as to the impact of this law on education in a minority language are emerging and will take some time before there is a fuller understanding of the role international law plays in this area.

## EARLY DEVELOPMENTS

International law is mainly found in treaties and international customary law and dealt traditionally with relations between states. There have, however, been throughout history some bilateral treaties—treaties between two states—or multilateral treaties—involving more than two states—which provided for “rights” to individuals belonging to certain ethnic or religious communities (de Varennes, 1996, chapter 2).

Not many of these early examples of bilateral treaties in international law referred specifically to language. The more notable of these were the 1516 Treaty of Perpetual Union between the King of France and the Helvetic state, which contained a provision identifying those who were to receive certain benefits as the “Swiss who speak no language other than German”, and the Final Act of the Congress of Vienna of 1815, which contained certain rights to ensure the preservation of the Polish “nationality”, thus resulting in Poznan Poles retaining the right to use Polish for official purposes.

International law as reflected in bilateral treaties protecting communities also occasionally had linguistic ramifications. For example, in the nineteenth century when the Muslim minority in Greece had largely adopted the Turkish language, the 1881 Convention for the Settlement of the Frontier between Greece and Turkey, guaranteeing the free exercise of the Islamic faith and the maintenance of Islamic courts and other community “structures”, also in practice resulted in the continued use of the Turkish language as part of the Muslim religious and community activities.

At the start of the twentieth century, there appeared the first treaties which were explicit in providing for the right to have schools teaching in a minority language. Thus the Vlach- and German-speaking minorities schools were protected under the Treaty of Peace between Bulgaria, Greece, Montenegro, Romania and Serbia of 1913, as Turkish language private schools were for Muslims living in Serbia under the 1914 Treaty between Serbia and Turkey.

These early developments were however of an ad hoc nature and only affected a very small number of countries. It was not until the advent of the League of Nations at the end of the First World War that there emerged a slightly more generalised, though still not universal, system under which it could be said that there existed—in some situations—a right to be educated in a minority language.

There were a number of so-called “minorities treaties” adopted and subsequently overseen by the League of Nations. Essentially, the provisions for minorities fell into three different types of instruments: first, there were a series of treaties imposed upon the defeated states of Austria, Hungary, Bulgaria and Turkey. The second involved new states

born of the remains of the Ottoman Empire, as well as states whose boundaries were altered under the self-determination principle put forward by American President Woodrow Wilson (namely Czechoslovakia, Greece, Poland, Romania and Yugoslavia). The final category included a number of special provisions relating to minorities in Åland, Danzig, the Memel Territory and Upper Silesia, as well as a series of five unilateral declarations made by Albania, Lithuania, Latvia, Estonia and Iraq upon their admission to the League of Nations. Most of these treaties contained provisions which guaranteed the right of minorities to establish and control their own institutions, including schools using their own language as medium of instruction.

[Those states] have further agreed, in towns and districts where a considerable proportion of nationals of the country whose mother tongue is not the official language of the country is resident, to make provision for adequate facilities for ensuring that, in the primary schools . . . instruction shall be given to the children of such nationals through the medium of their own language, it being understood that this provision does not prevent the teaching of the official language being made obligatory in those schools. (Capotorti, 1979, pp. 18–19)

At that stage, international law seemed to be moving towards accepting a “right of education” in a minority language, though this right could perhaps more accurately be described as including two distinct rights: in the case of private schools, minorities were seemingly to be entitled to create and operate their own schools and use their own language free from any restrictions or obstacles by state authorities, except of course for requirements relating to curriculum content. In addition, they had the right to education in their own language in “adequate facilities” provided by states, as in state schools, though only in town and districts where the minority was present “in considerable numbers”.

That movement came to a rather abrupt end with the disappearance of the League of Nations and its eventual replacement after the Second World War by the United Nations. Following the war, a study by the United Nations Secretariat concluded that the engagements entered into by states after First World War under the minorities system had ceased to exist, except for the Åland Islands agreement. The tentative movement of the League of Nations and international law towards perhaps recognising some kind of eventual right to education in a minority language thus seemed to also come to an abrupt end.

The rhetoric was seen to shift after 1945 to one emphasising universal protection of individual rights and freedoms, an approach which at least at surface seemingly shied away from recognising any rights to specific communities or groups such as minorities. Thus,

discussions leading up to the creation of the United Nations based on a “new covenant” and a “fresh approach” (McKean, 1983, p. 53) were focussed on the principle of individual rights exclusively, no reference being made to the previous minorities treaties.

Indeed, an initial draft outline of what was to become the Universal Declaration of Human Rights proposed that states with “substantial numbers of persons differing in race, language, or religion from the majority of the population, should give such persons the right to establish and maintain out of an equitable proportion of public funds, schools, cultural and religious institutions, and they should be entitled to use their own language before the courts and other authorities and organs of state and in the press and in public assembly” (McKean, 1983, p. 63). This was ultimately rejected, partly because it was seen as inconsistent with the new individualistic approach (see also Skutnabb-Kangas, *Human Rights and Language Policy in Education*, Volume 1).

Thus, most of the early legal developments after the Second World War rejected any reference to minorities having specific rights in relation to education in their own language. There was therefore a fundamental shift in the treatment of the rights of minorities pre- and post-1945: the approach after that date is generally seen as only involving the protection of the human rights and fundamental freedoms of all human beings, and not to favour any measures designed especially to protect minorities (Capotorti, 1979, p. 27).

#### MAJOR CONTRIBUTIONS

As international law is not stagnant, the apparent *tabula rasa* in relation to the rights of minorities in the immediate aftermath of the Second World War was soon to be displaced by the gradual appearance of a number of treaty provisions. These quickly started to acknowledge that there are rights which minorities can invoke in relation to educational rights and language preferences, though there is a noteworthy evolution which can be detected in the actual content of these rights.

Initially, a small number of bilateral peace treaties concluded after the war provided for minority schools to operate and use a minority language in their activities. For example, the 1946 Treaty of Peace with Italy, specifically guaranteed the right of the German-speaking minority in the province of Bolzano (Bozen) to “elementary and secondary teaching in the mother-tongue”.

These localised steps in relation to the rights of minorities in the area of education would however only begin to extend to the global scene a decade later, first with the adoption of a treaty which provided a degree of protection for indigenous and tribal populations (which

may in some states constitute minorities but are not necessarily so) and then with a truly international treaty dealing with discrimination in education. The International Labour Organisation Convention No. 107 of 1957 concerning Indigenous and Tribal Populations provides for protected indigenous populations the right to be taught in their mother tongue or, where this is not practicable, in the language most commonly used by the group to which they belong (see also McCarty, *Language Education Planning and Policies by and for Indigenous Peoples*, Volume 1).

The more significant treaty at the global level for minorities from a legal point of view would be, however, the UNESCO Convention against Discrimination in Education of 1960 which makes it clear, in Article 2(b), that it does not constitute discrimination to establish or maintain, for linguistic reasons, separate educational systems or institutions. The UNESCO Convention also provides in Article 5(1)(c) that it is essential to “recognise the right of members of national minorities to carry on their own educational activities, including the maintenance of schools and, depending on the educational policy of each state, the use or the teaching of their own language”, provided that “this right is not exercised in a manner which prevents the members of these minorities from understanding the culture and language of the community as a whole and from participating in its activities, or which prejudices national sovereignty”.

The wording of these early provisions almost half a century ago does not necessarily grant a right of minorities to be educated in their language. On the one hand, the treaty acknowledges the fundamental entitlement of minorities to have their “own”, meaning private as opposed as to state-operated, educational activities. On the other hand, the UNESCO Convention does not appear to extend this right automatically in terms of the choice of the language of instruction to be used in these private minority schools, as this choice is not left to the parents but is dependent “on the educational policy of each state”. Furthermore, even if a state’s educational policy permits the use of a minority language in these schools, it must never prevent “the members of these minorities from understanding the culture and language of the community as a whole and from participating in its activities, or which prejudices national sovereignty”. It is at the very best a timid, undemanding provision in terms of language requirements (Hastings, 1988, p. 21).

There is therefore some ambivalence in this treaty which impairs the usefulness of Article 5 as a basis for the right of minorities to receive education in their own language: first, Article 5 only deals with the creation of private schools and does not actually require that state authorities establish publicly funded schools for minorities. Second, the treaty does not guarantee that the language used in these schools

actually be the language of the minority. It is permissive rather than mandatory in this regard, meaning that this will only eventuate if the state's educational policy permits the use of a minority language. While some would have thought that a minority should be entitled automatically to freely determine the language of instruction used in its own schools, this early treaty—while not rejecting outright such use—did not go so far as to actually require it of all states from a strict reading of Article 5.

Still, the general tone of the UNESCO Convention is far from antagonistic to minorities being educated in their own language, quite the contrary. Read as a whole, it could be said to actively encourage states to permit minorities to use their language in their own schools, even if not making it a strict legal obligation on states. In this sense, the UNESCO Convention can be seen as an early precursor to later legal developments in international law of the modern post-war period.

The main developments in the last 25 years in terms of international law need to be divided into two parts: those at the truly global level which have been more timid and restrained, and those at the regional level of the Council of Europe that have been very significant in giving a truly legal recognition and structure to an actual right for minorities to be educated in their own language (see also Phillipson, *Language Policy and Education in the European Union*, Volume 1; Skutnabb-Kangas, *Human Rights and Language Policy in Education*, Volume 1).

At the global level, the legal instruments dealing with education in minority (or indigenous) languages are limited to provisions such as Article 27 of the International Covenant on Civil and Political Rights (ICCPR) which provides that “[i]n those states in which. . .linguistic minorities exist, persons belonging to such minorities shall not be denied the right, in community with the other members of their group, to enjoy their own culture. . .or to use their own language” (silent on education but widely believed to at least protect private minority schools), and the International Labour Organisation's Convention (No. 169) Concerning Indigenous and Tribal Peoples in Independent Countries, in relation to indigenous and tribal peoples, which guarantees a right to education in indigenous languages, but only “where practicable” and an entitlement to measures to preserve and promote the development and practice of indigenous languages. Even more recently at the global level, the 1989 Convention on the Rights of the Child asserts in Article 29 that the education of the child shall be directed to the development of respect for the child's parents, his or her own cultural identity, language and values. Here again, however, the wording clearly does not require any use of a minority language as a medium

of education, or even any suggestion that it should be taught: it only requires that states must direct education in a way that develops respect for his or her language, cultural identity and values.

Other documents at the global level often referred to as proving a more direct or general “right” to education in a minority language, such as the UN Declaration on the Rights of Persons Belonging to National or Ethnic, Religious and Linguistic Minorities and the draft UN Declaration on the Rights of Indigenous Peoples, are unfortunately not legally binding instruments (see also Skutnabb-Kangas, *Human Rights and Language Policy in Education*, Volume 1). While they are indicative of a growing trend towards acceptance in international law of the principle that a right to be educated in one’s language should be guaranteed, the fact remains that there is not yet such a general, unambiguous and legally binding obligation. The limitations and vague wording of Article 27 of the ICCPR and Article 29 of the Convention on the Rights of the Child, the small number of ratifications of the Convention (No. 169) Concerning Indigenous and Tribal Peoples in Independent Countries, and subjecting the Article 5 right in the UNESCO Convention to a state’s policy all suggest that there is still, in strictly legal terms at the global level, some difficulty in getting the broad international consensus to make this a legally binding norm.

Developments within the Council of Europe in the last 20 years have been dramatically different and offer a much more solid basis for education in minority languages from a strictly legal point of view. Two legally binding treaties have given definite form and structure to this right: Article 14 of the Framework Convention for the Protection of National Minorities and Article 8 of the European Charter for Regional or Minority Languages both indicate that “in appropriate circumstances” states must make available in schools the teaching of or in a minority language. Although both treaties have been criticised for the various ways states could circumvent the impact of their provisions (such as limiting the treaties’ application to national minorities or traditional languages, the possibility for states to “opt out” from some clauses or even only nominate certain specific minorities as being protected) and the weakness of both treaties’ enforcement mechanisms, it remains that in legal terms they are the clearest expression of a right to not only learn, but in some cases to also receive some part of their education in, their own language.

Some scholars have urged caution in relation to these “European” legal standards (de Varennes and Thornberry, 2005, pp. 426–428). The right as expressed in the two treaties of the Council of Europe is either restricted to undefined “national minorities” under the Framework Convention for the Protection of National Minorities, a category

seemingly different from the more inclusive concept of minorities contained in United Nations treaties, or to “regional or minority languages” as defined in the European Charter for Regional or Minority Languages. Furthermore, even in the case of either a national minority language or a regional language, education in this language is not automatic: it is limited to situations where it is “justified”, “reasonable”, or where the number of students in part of a territory is “substantial” or “sufficient”. It would seem that the extent of the right varies, and that tiny minorities would in practical terms not be entitled to such a right.

Thus, the exact degree of use of a minority language as medium of instruction required varies according to the particular context of each situation: the extent of demand for such instruction, the degree of use of medium of instruction, the state’s ability to respond to these demands and so on.

A national minority or speakers of a regional language would have, under these European treaties, at minimum, the right to be taught their language in schools where practical and justified, even if their numbers are not sufficient for the use of their language as medium of instruction.

The most detailed treaty in this area, the European Charter for Regional or Minority Languages, indicates, for example, that the numbers must be “sufficient” for this purpose. This could suggest that the mere presence of one or a handful of pupils in a district would not automatically give rise to a right to be taught a minority language in a public school. However, in light of the many international and European instruments which generally refer to a state’s obligation to protect and promote the language (and culture) of minorities, it would seem that what is “sufficient” should be interpreted in a generous and flexible way, and that the number of pupils required to be able to claim the right to be taught the minority language should be quite small if a State’s resources make it reasonably practical to accommodate them.

There are, beyond these legal developments, numerous political and other pronouncements which together create an impressive foundation acknowledging the validity of providing education in a minority language. Among the more prominent are of course the UN Declaration on the Rights of Persons Belonging to National or Ethnic, Religious and Linguistic Minorities, the draft UN Declaration on the Rights of Indigenous Peoples, the Organisation on Security and Cooperation in Europe’s Document of the Copenhagen Meeting of the Conference on the Human Dimension, The Hague Recommendations regarding the Education Rights of National Minorities, as well as a very large number of resolutions from bodies such as the European Parliament.

While this corpus may appear as eloquent recognition of the right to education in one’s language, these are not, strictly speaking, legally binding instruments, and thus cannot alone form the basis for such a

right in international law. Confusingly, some writers in this area tend to refer to these documents as evidence of an “implicit” right, not distinguishing the provisions which create clear legal obligations from those which may later form the basis of an emerging standard for “what the law ought to be” (*lege ferenda*) (Thornberry, 1991, chapter VII).

#### WORK IN PROGRESS

The relative youth of the Framework Convention for the Protection of National Minorities and the European Charter for Regional or Minority Languages and other instruments means that there are still a large number of uncertainties as to the exact parameters for the exercise of these rights, and indeed some degree of inconsistency can be noted in the way the monitoring bodies under their supervisory mechanisms interpret the obligations from these two treaties (Weller, 2005, chapter 14).

Much of the earlier work on education in a minority language supposed that there was in international law, somewhere and almost mystically somehow, an implicit “right to identity” which could be used to buttress claims to education in a minority language (Smith, 2003, pp. 130–132), even though no treaty actually spelled this out. Most treaties, with the exception of the two more recent Council of Europe treaties, in fact appear to subject any use of a minority language as medium of instruction, outside of private schools, to the whims of state authorities’ educational policies rather than providing for such instruction as of right under specific conditions.

Interestingly, a perhaps more “traditionalist” stream adopted the completely opposite point of view, claiming on the contrary that there was absolutely no basis for a right to minority instruction, at least in public schools, either because such a right was not specifically spelt out in a treaty provision or the right to education itself (see the European Court of Human Rights comments in the Belgian Linguistics Case, available at <http://cmiskp.echr.coe.int/tkp197/search.asp?skin=HUDOC-EN>, where it stated that the right to education does not automatically or necessarily include the right to education in a particular language), or because once a state has determined an official language, no other language could be used officially in state institutions, including presumably state schools and education provided in these schools (some of the minority views of the UN Human Rights Committee in *Diergaardt v. Namibia*, available at <http://www1.umn.edu/humanrts/undocs/session69/view760.htm>).

The latter views must not be underestimated. Most lawyers, judges and legal scholars in the world were advised during their legal training, and probably still hold the opinion, that “[o]nce a State party has adopted any particular language or languages as official language or languages, it would be legitimate for the State party to prohibit the

use of any other language for official purposes . . .” (Diergaardt v. Namibia, dissident views, par. 5). In other words, there is no obligation for state authorities to use any minority language for any purpose whatsoever, including in public schools, if a State so decides.

A better understanding, somewhere in the middle, is now starting to take shape. In Europe, the presence of specific treaties that enshrine a right to be educated in a minority language, at least where there is a sufficient critical mass to make this practical, means that more and more work from a purely legal perspective is proceeding as to the implementation and a better understanding of these legal obligations (generally de Varennes, 2004; Martín Estébanez and Gál, 1999; Weller, 2005; Wilson, 2002).

At the global level, despite the lack of an international treaty clearly protecting an unambiguous right to education in a minority language, two new trends are appearing: first, the relatively rigid view that no international law is applicable in language matters once a state has chosen an official language is starting to make way for the recognition that rights such as non-discrimination may permit the use of other languages in addition to an official one. In other words, it may be unreasonable and unjustified in some circumstances—such as where a large number of people use a minority language—and therefore discriminatory not to provide for some use of this language by state authorities. This is, in effect, the reasoning which can be extrapolated in the majority position in *Diergaardt v. Namibia*, and a more considered reading of the *Belgian Linguistics Case*. It is only very recently starting to be taken up by jurists (de Varennes, 1996, chapter 4).

Additionally, and surprisingly, the right to education itself is being “revisited” by some courts in a way which directly contradicts the more traditional views. In *Cyprus v. Turkey* (Judgement of 10 May 2001, Grand Chamber, <http://cmiskp.echr.coe.int/tkp197/search.asp?skin=hudoc-en>) the linguistic policies of Northern Cyprus authorities in the area of public education were essentially described as so inadequate in view of the circumstances as to constitute a violation of Article 2, Protocol 1 which deals with the right to education.

The Court noted that children of Greek-Cypriot parents in northern Cyprus wishing to pursue a secondary education through the medium of the Greek language were obliged to transfer to schools in the south, though children could continue their education at a Turkish or English-language school in the north.

On the basis of the court’s previous reasoning in the *Belgian Linguistics Case*, most of the more traditionalist lawyers and experts on the right to education had assumed that this would be the end of the matter, since once a state has an official language, it can choose not to use any

other language for official purposes, including public education. The European Court, however, completely upset that logical edifice when it wrote the following:

277. The Court notes that children of Greek-Cypriot parents in northern Cyprus wishing to pursue a secondary education through the medium of the Greek language are obliged to transfer to schools in the south, this facility being unavailable in the "TRNC" ever since the decision of the Turkish-Cypriot authorities to abolish it. Admittedly, it is open to children, on reaching the age of 12, to continue their education at a Turkish or English-language school in the north. In the strict sense, accordingly, there is no denial of the right to education, which is the primary obligation devolving on a Contracting Party under the first sentence of Article 2 of Protocol No. 1 (see the *Kjeldsen, Busk Madsen and Pedersen v. Denmark* judgment of 7 December 1976, Series A No. 23, pp. 25–26, Section 52). Moreover, this provision does not specify the language in which education must be conducted in order that the right to education be respected (see the *Belgian linguistic judgement*, pp. 30–31).

278. However, in the Court's opinion, the option available to Greek-Cypriot parents to continue their children's education in the north is unrealistic in view of the fact that the children in question have already received their primary education in a Greek-Cypriot school there. The authorities must no doubt be aware that it is the wish of Greek-Cypriot parents that the schooling of their children be completed through the medium of the Greek language. Having assumed responsibility for the provision of Greek-language primary schooling, the failure of the "TRNC" authorities to make continuing provision for it at the secondary-school level must be considered in effect to be a denial of the substance of the right at issue. It cannot be maintained that the provision of secondary education in the south in keeping with the linguistic tradition of the enclaved Greek Cypriots suffices to fulfil the obligation laid down in Article 2 of Protocol No. 1, having regard to the impact of that option on family life . . . .

280. Having regard to the above considerations, the Court concludes that there has been a violation of Article 2 of Protocol No. 1 in respect of Greek Cypriots living in northern Cyprus in so far as no appropriate secondary-school facilities were available to them.

The logic used by the European Court is rather perplexing, to say the least. It admits on the one hand that Article 2 of Protocol No. 1 is devoid of a linguistic component, but then says there is a linguistic component for secondary education because authorities in Northern Cyprus provided Greek-language primary education, and therefore to stop offering it after primary school "negated" the right to education. Indeed, commentators have for the most part remained so unsure on

how to interpret the European Court of Human Rights' seemingly contradictory approaches that most have referred to it without trying to explain it any further (de Varennes, 2004).

Perhaps the European Court intended to say, in line with its previous reasoning in the *Belgian Linguistics Case*, that in light of the circumstances, the restrictions on public education in the Greek language in Northern Cyprus were unreasonable and unjustified because they were so blatantly inappropriate, and therefore discriminatory.

It is probably in this way that the judgement should be properly understood: otherwise, if the main reason—the absence of Greek language secondary education—was in breach of the right to education under Article 2 of Protocol No. 1, it would mean that the authorities of Northern Cyprus could avoid this human rights violation by simply abolishing all education in Greek provided in primary public schools: this is unlikely to be the direction and spirit of tolerance and inclusion the European Court had in mind.

#### PROBLEMS AND DIFFICULTIES

Be that as it may, the above judgement of the European Court of Human Rights raises a new view of the right to education, since it rejects in effect the official language used by authorities in Northern Cyprus as the exclusive language of education at the secondary level, and imposes the use of another language for purposes of public education, contrary to legislation in place. The traditionalist view as expressed by the dissident views in *Diergaardt v. Namibia* thus finds itself also—albeit perhaps implicitly—rejected by the European Court of Human Rights.

Few legal experts have however fully considered, or even acknowledged, the potential ramifications of both of these results. One of the main problems still currently facing most jurists formed along the more traditional lines of international law is that it is not easy to accept that language rights exist, sometimes on the basis of the right to non-discrimination, and require the use of a minority language even if it is not permitted under a state's official language legislation (Stefanescu and Georgeault, 2005, p. 313). For most of them, any language right, including provision of a minority language in a public school, is a "special" or "positive" measure which can only exist if and when specific legislative "permission" is granted by state authorities.

At the other end of the spectrum, jurists who had assumed that the right to education in a minority language in international law naturally had to exist "somewhere" now have another provision which can solidify such claims. The problem here is that even if more reliance may be had on the right to education, in combination with non-discrimination

or the right to family life, it is not an unqualified right to education in a minority language. As shown by the Belgian Linguistics Case and the European Court of Human Rights rather hesitant and contradictory position in *Cyprus v. Turkey*, the exact extent or parameters of a linguistic component for such a right in international law are far from crystal clear, and probably require many more cases before there is a much greater degree of certitude in this area from a legal point of view.

One of the problems with this is that, in the absence of a specific international treaty provision setting out the conditions where a right to education in a minority language in public schools is guaranteed, those two more extreme positions among jurists will probably be battling out this matter internationally for many years to come. It also means that for minorities in most parts of the world, any recourse to the limited remedies and mechanisms available at the international level will likely be fraught with uncertainties and risks.

From a legal point of view at the European level, however, results are likely to be better, at least in states which have ratified one or both of the Council of Europe treaties that impact on the issue of language and education. There are undoubtedly difficulties in terms of the weakness of both implementation mechanisms for these treaties and inconsistencies of interpretation of the rights under the European Charter for Regional or Minority Languages and the Framework Convention for the Protection of National Minorities by the Committees charged with the supervision of these legal obligations. At least from a legal perspective, however, there is a formally recognised right to education in a minority language, where practical, which can be built upon.

#### FUTURE DIRECTIONS

It was never intended in international law that the right to education include the right to education in one's own language (Lebel, 1974, pp. 231–232). While various UN and other documents would frequently laud the benefits of providing some degree of instruction in a minority language, these documents were either not treaties (UN Declaration on the Rights of Persons Belonging to National or Ethnic, Religious and Linguistic Minorities) and therefore not a source of international legal obligations, or they contained ambiguous provisions which in the end seemed to leave the matter of choice of language of education in public schools to the discretion and determination of state authorities (see also Skutnabb-Kangas, *Human Rights and Language Policy in Education*, Volume 1).

For legal traditionalists, this meant that while a state could be generous and provide for education in a minority language if state authorities

decided to take “special positive measures”, it was not a right which anyone could claim.

For jurists seeking to protect and promote minorities and their languages, there were attempts to construct arguments for an implicit, if somehow amorphous, right to identity, or culture, or some other bases in support of an international right to education in a minority language.

While the latter’s methods and arguments cannot be said to have won the day, it would seem that for the most part the direction of international law may be reaching the same ultimate goals in the future.

At the level of the Council of Europe, the legal obligation is now entrenched in two treaties: state authorities in countries having ratified these treaties must provide for education in a minority language where it is practical to do so, though acquisition of the official language must also always be assured. Future clarification of these legal norms is however still needed and likely to focus on the circumstances where it can be said to be practical, or not, for this right to be applied.

At the global level, the absence of a clear legal provision in any international treaty for states to unambiguously having the obligation to provide education in a minority language would seem initially to hamper any further recognition of such a right. There are nevertheless two distinct trends that may have considerable impact in the future: first, the more recent development at the global level of various instruments such as the UN Declaration on the Rights of Persons Belonging to National or Ethnic, Religious and Linguistic Minorities which, while not creating directly any legal obligations, still indicate an acceptance of the validity of an eventual right to education in a minority language. Second, the even more recent re-assessment by legal scholars and adjudicative and monitoring bodies such as the European Court of Human Rights and UN Human Rights Committee of the right to education and non-discrimination may breathe new life into existing legal standards. While not necessarily a view shared by most jurists trained to consider an official language policy in education and other areas of state involvement as exclusive, it would seem that our understanding of international human rights standards such as non-discrimination and education in the area of language is beginning to change. This therefore may be another new frontier that could be increasingly examined and clarified in the years to come, and may well have some potential for minorities and some kind of right to education in their language, where this is reasonable and practical.

LANGUAGE EDUCATION PLANNING AND POLICIES  
BY AND FOR INDIGENOUS PEOPLES

INTRODUCTION

The world's 300 million Indigenous peoples reside in 70 countries and every continent on earth. Identified as Indigenous according to international convention because of their aboriginal occupation of lands before colonization or the establishment of state boundaries, and because they retain some or all of their traditional social, economic, cultural, and political institutions, Indigenous peoples have experienced a history of genocide, the armed invasion of their homelands, and concomitant economic, political, and social disenfranchisement (see the United Nations International Labour Organisation (ILO) Convention 169 Concerning Indigenous and Tribal Peoples, [www.unhchr.ch/html/menu3/b/62.htm](http://www.unhchr.ch/html/menu3/b/62.htm)). Central to these assaults have been official and unofficial policies that simultaneously dispossessed Indigenous peoples of their languages and their lands. A primary tool for achieving both ends has been state-sponsored schooling.

Thus, Indigenous struggles for language rights have been waged in tandem with those for cultural survival and self-determination. In this chapter, I analyze these struggles and the research into them from a framework that views language planning and policy (LPP) not solely as official government action or texts, but as complex modes of human interaction, negotiation, and production, mediated by relations of power (see also May, *Language Education, Pluralism and Citizenship*, Volume 1; Tollefson, *Language Planning in Education*, Volume 1). This framework enables us to examine LPP as *de facto* and *de jure*—as covert and overt, bottom-up and top-down—and to illuminate cross-cutting themes of cultural conflict and negotiation, identity, language ideology and linguistic human rights (see also de Varennes, *International Law and Education in a Minority Language*, Volume 1; Skutnabb-Kangas, *Human Rights and Language Policy in Education*, Volume 1).

Indigenous peoples represent 4% of the world's population, but they speak 60% of the world's languages. The contexts in which Indigenous languages are spoken are as diverse as humankind itself, spanning language situations such as that of Quechua, spoken by 8–12 million people in 6 South American countries; to Aotearoa/New Zealand, where a single Indigenous language, Māori, shares co-official status

with English and New Zealand Sign Language; to diasporic speech communities such as the Garifuna Nation, dispersed across 3 Central American countries, the Caribbean and the USA; to the extraordinary linguistic diversity of Papua New Guinea, where some 760 distinct languages, most spoken by less than 1,000 people, coexist in an area the size of the US state of California. With some exceptions—Guaraní in Paraguay, for example—the viability of Indigenous languages is severely compromised by legacies of language repression and the modern forces of globalization (see Block, *Language Education and Globalization*, Volume 1). Even languages with large numbers of speakers are increasingly being displaced by dominating world languages. Thus, for Indigenous peoples, language revival, revitalization, maintenance and reversal of language shift are key LPP goals. As will be shown in the sections that follow, there are many positive examples of this from around the world.

### EARLY DEVELOPMENTS

Although published accounts of Indigenous language policies have focused on colonial and post-colonial developments, language policies have been operative in Indigenous communities since time immemorial. Kulick, for instance, notes that Papua New Guinea's remarkable linguistic diversity has its roots in widespread language attitudes that emphasized the boundary-marking dimensions of language, cultivating linguistic differences as a way of exaggerating communal identity (1992, p. 2). At the same time, many Papua New Guinean communities placed a high value on multilingualism, with the display of foreign speech varieties viewed as 'one important means of gaining prestige in traditional society' (Kulick, 1992, p. 3). In Native North America, multi-lingualism was always highly valued as a tool of trade and survival in one of the most culturally, linguistically and ecologically diverse regions of the world. And in pre-colonial Africa, according to Brock-Utne and Hopson (2005, p. 3), 'the different ethno-linguistic groups . . . did not have a language of instruction problem', as 'each group used its own language to educate its children'.

Eradicating these language practices has been a prominent goal of every colonial regime. '[Castilian] is a tool for conquest abroad', Antonio de Nebrija, author of the first modern grammar of a European language, told Queen Isabella of Spain in 1492; 'language has always been the consort of empire' (cited in Skutnabb-Kangas, 2000, p. 506). Nearly 400 years later, the same one-nation/one-language ideology (see May, *Language Education, Pluralism and Citizenship*, Volume 1) justified a fierce English-only policy in American Indian boarding schools: 'No unity of community . . . can be established among different peoples

unless they are brought to speak the same language, and thus to become imbued with like ideas of duty', Commissioner of Indian Affairs J.W.C. Atkins wrote in his 1887 report (cited in McCarty, 2004, p. 71).

Linguicidal policies (Skutnabb-Kangas, 2000, p. 222) went hand-in-hand with physical genocide and territorial usurpation. When the British annexed Australia in 1770, 300,000–600,000 Aboriginal people—speakers of at least 250 languages—came under British rule. By the mid-1930s, only 60,000 Aboriginal people remained. Although there are now 300,000 Aboriginal people in Australia, all but 10% have been dispossessed of their heritage language; of the 90 languages still spoken, 70 are seriously threatened. Similarly, in Aotearoa/New Zealand, the Māori population at the time of European contact in 1769 was 100,000. Within a century, it had been decimated to 42,113, and by 1975, only 5% of Māori school children spoke Māori (May, 2004, 2005).

These human rights violations have only recently been confronted by states and international organizations (de Varennes, *International Law and Education in a Minority Language*, Volume 1; Skutnabb-Kangas, 2000, *Human Rights and Language Policy in Education*, Volume 1). In 1919, the International Labour Organisation (ILO) was created to defend the rights of ethnic minorities; this was the first international body to address Indigenous issues in a comprehensive manner. It was not until 1957, however, that the ILO adopted Convention No. 107, the first international instrument setting forth the rights of Indigenous peoples and the obligations of ratifying states. Thirty more years would pass before the United Nations established its Working Group on Indigenous Populations. In 1984, the Working Group began preparing the *Draft Declaration of the Rights of Indigenous Peoples*, calling for freedom from ethnocide and the 'right to revitalize, use, develop and transmit to future generations their histories, languages, oral traditions, philosophies, writing systems and literatures' (Article 14, cited in May and Aikman, 2003, p. 141). The *Draft Declaration* was conveyed to the UN in 1994. In July 2006—22 years after work on the *Draft Declaration* began—this policy was ratified by the UN Human Rights Commission, but it still awaits official UN approval.

In addition to the *Declaration*, perhaps the most hopeful international development has been a shift in discourse from populations to peoples, and the parallel creation, in 2000, of the UN Permanent Forum on Indigenous Issues (PFII). 'The most basic right is to be recognized as peoples', Ole Henrik Magga, first chairperson of the PFII writes; '[t]he principle of self-determination is based on the principle of peoplehood' (Magga, 1995, p. 1). Contemporary LPP activities in support of Indigenous languages and speakers all flow from these principles.

## MAJOR CONTRIBUTIONS

The published literature on language policies by and for Indigenous peoples spans a continuum from actual policy documents, to historical-descriptive accounts, to ethnographic studies and recent work that engages the social justice dimensions of research and the perspectives of Indigenous scholars and practitioners. Heath's seminal (1972) treatise on language policy in Mexico was the first of its kind, providing a description of the cultural contexts for language planning from the time of the Aztec empire (see also Hamel, *Indigenous Language Policy and Education in Mexico*, Volume 1). Romaine (1991) employs a similar comprehensive, descriptive approach to the study of Australian languages (see especially Part I, on Aboriginal and Islander languages and Romaine's introduction). In a recent monograph series, Kaplan and Baldauf examine LPP by and for Indigenous peoples (among others) in polities less well represented in the literature (as one example, see Kaplan and Baldauf, 1999). In complementary counterpoint to these comprehensive treatments are ethnographic case studies such as Hornberger's (1988) research on Quechua bilingual education in southern Peru, King's (2001) research on Quichua language revitalization in two Ecuadorian communities and McCarty's (2002) longitudinal study of Navajo bilingual education and federal Indian policy at Rough Rock, Arizona.

Increasingly, Indigenous and non-Western scholars are leading the way in scholarship on Indigenous LPP. Notable examples include Coronel-Molina's contributions on Quechua (1999; see also, Hornberger and Coronel-Molina, 2004); Kamwangamalu's (2005) analysis of mother tongues and language planning in Africa; Rau's (2005) work on Māori literacy, assessment and corpus planning; López's (2006) study of Indigenous education in Latin America; Magga's (1994) examination of the Sámi Language Act; Mohanty's (2006) studies of language maintenance and education for Aboriginal children in India; Nicholas' (2005) study of Hopi language loss and revitalization and Warner's (1999a, 2001) analysis of the Hawaiian language revitalization movement.

In reviewing more than 30 years of literature on LPP by and for Indigenous peoples, we can see clearly the steady march of linguistic assimilation. The Navajo Reading Study at the University of New Mexico provides a case in point. From 1969 to 1979, Bernard Spolsky directed this study, surveying the language proficiencies of 6-year-old Navajo schoolchildren as a means of informing medium-of-instruction policies. 'Whereas in 1970 some 90 percent of the Navajo children . . . had no preschool experience of English', Spolsky (2002, p. 140) reflects, 'by 1990 the situation had virtually reversed, with six-year-old Navajo children . . . suspected to have little, if any knowledge of the language of their people'.

To the root causes of language shift outlined in this chapter's introduction, we can add the inexorable forces of globalization (see also Block, *Language Education and Globalization*, Volume 1). Writing about Quechua, Hornberger and Coronel-Molina describe the dilemma of many parents who 'believe that bilingual education would deny students access to social mobility' (2004, p. 14). In post-colonial Africa, Brock-Utne and Hopson (2005) outline the LPP challenge faced by Indigenous communities worldwide: How to resolve the tension between languages of wider communication as tools of empowerment and international access, and the desire to maintain local languages as central to Indigenous identities and cultural survival?

These issues dominate recent contributions to the field, as Indigenous peoples work to carve out and protect Indigenous-language-only domains. The task, as Hornberger and King (1996, pp. 299–319) point out, is not bringing the language 'back', but moving it forward into new domains. Hinton and Hale's (2001) *Green Book of Language Revitalization in Practice* provides concrete descriptions of how this is being done through Native-language immersion programmes, the cultivation of Indigenous literacies, media and technology and teacher preparation. Similarly, the chapters in Fishman (2001) outline both the challenges and the possibilities in reversing language shift (RLS) for Ainu, Māori, Navajo, Otomí, Oka, and Australian Indigenous languages. Hornberger's (1996) *Indigenous Literacies in the Americas* contains lessons in grass roots or bottom-up language planning in the Americas; her 2007 volume asks (and provides varied answers to) the question, *Can Schools Save Indigenous Languages?*, on four continents. To these works can be added the PFII's 'Indigenous Children's Education and Indigenous Languages' (Magga, Nicolaisen, Trask, Skutnabb-Kangas and Dunbar, 2005), and a burgeoning corpus of themed journals: Henze and Davis (1999) address authenticity and identity in Indigenous LPP in the Pacific Rim; May (1999) analyzes community-based Indigenous language education by and for Māori, Native Americans, Sámi, Quechua and Australian Aboriginal peoples; May and Aikman (2003) explore possibilities and constraints in Indigenous language education in the USA, Amazon Basin, Norway, central India, Western Australia, Aotearoa/New Zealand and Nicaragua; McCarty and Zepeda (1998) and McCarty, Watahomigie, and Yamamoto (1999) examine Indigenous language use, change and RLS efforts in the Americas and King and Hornberger (2004) and May (2005) address Quechua and Māori, respectively. These LPP themes also have been explored in the series growing out of the annual international Stabilizing Indigenous Languages Conference (for a span of conference activity, see Cantoni, 1996; McCarty and Zepeda, 2006).

This brief overview suggests the diversity and extent of recent LPP research and on-the-ground LPP efforts by and for Indigenous peoples. Yet this listing only scratches the surface; a recent Web search on the topic reveals nearly 5 million sources. Although it is impossible to do justice to all of this activity, we can consider more deeply a few selective examples that illustrate concrete victories as well as the challenges that lie ahead.

#### WORK IN PROGRESS

This section is organized around three commonly used rubrics for LPP: status planning, or decisions surrounding how and where the Indigenous language will be used, particularly with respect to education; acquisition planning, or activities related to who will use the language and for what purposes; and corpus planning, or the development of linguistic norms and forms (see also Tollefson, *Language Planning in Education*, Volume 1). For each rubric, I begin with a brief overview. I then focus on specific illustrations of each type of activity: the Native American Languages Act (NALA) (status planning), Māori and Hawaiian language immersion (acquisition planning) and Quechua/Quichua unification and literacy development (corpus planning).

##### *Status Planning: How and Where Will the Indigenous Language Be Used?*

At the individual level, status planning involves the minute-by-minute choices made by speakers every day. When a bilingual Navajo child hears a request in Navajo from a parent and responds in English, the child is simultaneously responding to wider policy discourses and negotiating the language policy of the home (McCarty, 2004, p. 72). At the societal level, status planning involves some type of official language and/or medium-of-instruction policy. Both types of decisions are implicated in efforts to revive, revitalize, and maintain Indigenous languages and to assert Indigenous linguistic human rights (Skutnabb-Kangas, 2000, *Human Rights and Language Policy in Education*, Volume 1).

Formal, societal-level policies exist for Indigenous languages around the world, although their effects on language use and vitality are not easy to gauge. Māori, for instance, has shared co-official status with English since 1987, although restoring natural intergenerational transmission remains a challenge. At the other end of the continuum is Guaraní, co-official (with Spanish) in Paraguay, and spoken by more citizens than Spanish. In post-apartheid South Africa, a National Language Planning Framework recognizes 11 official languages, including

Indigenous languages. Norway's Sámi Language Act grants Sámi co-equal status with Norwegian in core Sámi areas, and promises to 'safeguard and develop [Sámi] language, culture, and way of life' (Magga, 1994, p. 223). Tribal language policies in the USA make tribal languages official on reservations where such policies have been developed (Zepeda, 1990), but even in these settings, language revitalization and maintenance are ongoing concerns.

These language policies have resulted from long-term, bottom-up struggles to assert Indigenous language rights. NALA provides a case in point. First passed by the US Congress in 1990 and authorized for funding in 1992, NALA vows to 'preserve, protect, and promote the rights and freedom of Native Americans to use, practice, and develop Native American languages', including using Native American languages as media of instruction in school (Sec. 104[4], 104[5], cited in Cantoni, 1996, pp. 70–71; see also [www.nabe.org/documents/policy\\_legislation/NAlanguagesActs.pdf](http://www.nabe.org/documents/policy_legislation/NAlanguagesActs.pdf)). Reversing two centuries of US federal Indian policy, NALA grew out of early Indigenous bilingual education programmes and the grass roots networks that developed around them. In the wake of the US Civil Rights Movement, Native American bilingual education programmes proliferated. One offshoot was the American Indian Language Development Institute (AILDI), a summer programme to prepare Native teachers and bilingual/bicultural teaching materials. As Institute participants grew in number, programme leaders recognized the need for a national policy in support of local efforts. At the same time, the passage in Hawai'i of a bill granting co-official status (with English) to Hawaiian provided a model and the political muscle for a broader initiative. These interests united at the 1988 AILDI, where participants from Native nations throughout the USA drafted the resolution that would become NALA. Although funding for NALA has been meagre, it has supported some of the boldest language revitalization efforts to date, including Indigenous-language immersion, master-apprentice language-learning teams and a growing network of Indigenous language planners and advocates such as those represented by AILDI (see the discussion of AILDI in Hinton and Hale, 2001, pp. 371–383, and [www.u.arizona.edu/~aildi](http://www.u.arizona.edu/~aildi)).

*Acquisition Planning: Who Will Use the Language  
and for What Purposes?*

In any situation of language shift and revitalization, a key goal is producing a new generation of speakers. In Hornberger's (1996, p. 7) LPP framework, this is the cultivation dimension of acquisition planning. Hinton (in Hinton and Hale, 2001, pp. 1–18) describes three strategies for achieving this goal: (1) teaching the endangered language as a

subject—less than optimal but often the only option available; (2) bilingual education and (3) full heritage-language immersion (a strong form of bilingual education; see May, *Bilingual/Immersion Education: What the Research Tells Us*, Volume 5, for further discussion), in which all or most instruction is carried out in the Indigenous language. ‘There is no doubt that [Indigenous-language immersion] is the best way to jump-start . . . a new generation of fluent speakers for an endangered language’, Hinton writes (in Hinton and Hale, 2001, p. 8).

Two well-documented Indigenous-language immersion efforts are Māori and Hawaiian. In both cases, by the 1970s, use of the Indigenous language had declined to the point at which language users were primarily of the parent generation and older. In both cases, Indigenous-language immersion programmes were sparked by grass roots ethnic revival movements that led to recognition of the Indigenous language as co-official with English (see May’s [2004] and Spolsky’s [2003] discussion of this for Māori, and Warner’s [2001] and Wilson’s [1999, 2001] discussion for Hawaiian). Thus, by the time immersion pre-schools were established, formal policies were in place to support the cultivation of younger speakers.

Full-immersion Māori language nest pre-schools or *Te Kōhanga Reo* began in the spring of 1982. Later that year, Dr. Tamati Reedy, then director of the New Zealand Office of Māori Affairs, visited Hawai‘i, where a Hawaiian Renaissance was under way. Reedy encouraged the Office of Hawaiian Affairs to fund Indigenous-language pre-schools similar to the *Kōhanga Reo*. In 1984, the first Hawaiian immersion pre-schools (called *Aha Pūnana Leo* and also meaning language nest) were established (May, 1999, 2004; Warner, 1999a; Wilson, 1999; Wilson and Kamanā, 2001).

The Māori and Hawaiian immersion pre-schools recreate environments in which the Indigenous language and culture ‘are conveyed and developed in much the same way that they were in the home in earlier generations’ (Wilson and Kamanā, 2001, p. 151). The pre-schools are parent-driven and share the goal of developing a high level of proficiency in the Indigenous language (May, 2004, 2005; Warner, 2001; Wilson and Kamanā, 2001). Both pre-school initiatives have followed a similar trajectory, as parents successfully fought for Indigenous-language tracks in mainstream K-12 schools, and for full Indigenous-language immersion elementary and secondary schools.

The Māori and Hawaiian immersion efforts have been highly successful in at least four ways. First, they have dramatically increased the availability of bilingual/immersion education in mainstream schools. Second, they have produced significant numbers of new child speakers. Third, they have demonstrated significant academic gains (May, Hill, and Tiakiwai, 2004; Rau, 2005; Wilson and Kamanā, 2001). Finally,

these programmes stand as powerful exemplars of Indigenous self-determination and the exercise of Indigenous/minority language rights.

*Corpus Planning: What Forms and Norms Will the Language Take?*

Corpus planning includes standardization, unification, modernization and the development of practical writing systems, lexicons, grammars and literacy materials. These activities often are described as internal to the language, but they are far from completely so. As Wong points out, 'There is a constant struggle for the right to influence the language use norms of others, and in that struggle each entity . . . seeks to claim higher authority by promoting its version as superior' (1999, p. 96). The case of Quechua/Quichua illustrates these tensions and suggests that efforts to standardize may have counterproductive results.

Quechua (called Quichua in Ecuador) claims the largest number of speakers of any Indigenous language in the Americas. Despite its numbers and huge geographic spread, Quechua's future is by no means guaranteed. As Hornberger and Coronel-Molina (2004, pp. 9–67) note, in the Andean regions where Quechua is spoken (see also Godenzzi, *Language Policy and Education in the Andes, Volume 1*), Spanish continues to reign as the dominant, high-status and official language, while Indigenous languages are stigmatized and devalued.

In this context, recent corpus planning has confronted two competing goals. On the one hand is the perceived need for linguistic unification—the development of language forms and norms acceptable across diverse speech communities. On the other hand are concerns for authenticity and autonomy involving the valuing and promotion of local varieties and their users. (See Warner [1999a] and Wong [1999] for similar analyses of these conflicts for Hawaiian.)

Hornberger and King (1999) examine these tensions as reflected in the three-vowel versus five-vowel debate in Peru, and for the case of Quichua Unificado (Unified Quichua) in Ecuador (King, 2001). The crux of the three-vowel/five-vowel debate is the fact that Quechua has only three vowel phonemes, yet five vowel sounds are pronounced in speech. Further, five vowels have been used in written Quechua since Spanish colonial times. As Hornberger and King (1999) analyze the standoff between Peruvian linguists and bilingual education personnel (three-vowel advocates) and the Peruvian Academy of the Quechua Language (five-vowel proponents), two deeper issues surface: who has the right to make language planning decisions (the linguists and bilingual education practitioners are not fluent speakers of Quechua, whereas Academy members are) and what constitutes language purity (the five-vowel system reflects Spanish influence) (Hornberger and King, 1999, pp. 162–169).

In Ecuador, Quichua Unificado was created to encourage Quichua literacy and language revitalization (Hornberger and King, 1999, p. 171). The difficulty, as King (2001) illustrates for Saraguros in southern Ecuador, is that two varieties, Quichua Unificado and Quichua auténtico (authentic Quichua) have been pitted against each other. Educated, economically successful Saraguros tend to speak the Unified Quichua learned as a second language in school, whereas older, less-educated and more rural Saraguros speak the authentic variety as a first language in everyday affairs. Paradoxically, authentic Quichua is viewed by users of Unified Quichua as impure because it includes Spanish loan words.

These problems can paralyze language revitalization. A more fruitful strategy, Hornberger and King (1999) suggest, is a transformative, diglossic approach that brings each language variety into new domains for distinct and complementary purposes.

#### PROBLEMS AND DIFFICULTIES

We cannot leave this topic without noting that in many parts of the world, Indigenous LPP goals are overshadowed by ongoing genocide and ethnocide. Further, Indigenous struggles for land rights and economic justice continue to be waged in nation-states around the world, deflecting resources and attention from language issues. Where these human rights violations are not at issue, language repression continues as official government policy, even in allegedly democratic states. In Australia's Northern Territory, for instance, bilingual education programmes were terminated in 1998, putatively because of their 'poor standards of English literacy', although empirical evidence for this claim is questionable (Nicholls, 2005, p. 161). As Nicholls (2005) relates, following the phase-out of bilingual programmes, speakers of Yolngu Matha, one of the affected language groups, organized under the slogan of 'Don't Cut Off Our Tongues'. The same metaphor aptly describes the effects of increasingly ascendant English-only policies in the USA (see also May, *Language Education, Pluralism and Citizenship*, Volume 1; Ricento and Wright, *Language Policy and Education in the United States*, Volume 1). These policies flatly contradict NALA and threaten to end proven bilingual/heritage-language programmes for Indigenous and other language minorities (McCarty, 2004, pp. 85–87).

These struggles expose core issues of social justice that underlie LPP decisions and outcomes. Language is 'the "canary in the coal mine" with regard to the democratic atmosphere in general' Luykx (2004, p. 156) points out; 'rather than flog the canary back to life, we might turn our attention to the air quality in the mine'. Attending to that air quality reminds us that the real challenges in our work lie in dismantling the structures that impede parents from imparting mother tongues

to their children. In this sense, language planning and medium-of-instruction policies are one part of a larger democratizing project to assess and redress the inequities that disable intergenerational language transmission.

### FUTURE DIRECTIONS

Warner (1999a, p. 89) reminds us that LPP by and for Indigenous peoples is not about saving a disembodied entity called language, but rather about bringing about ‘changes in society that would lead to true equality, authenticity in the empowerment of a people, . . . and social justice for all’. As we contemplate a second United Nations Decade of Indigenous Peoples, future directions in this work are both global and local in scale. At the international level, we should expect recent initiatives by the PFII—in particular, the drive to approve the *Draft Declaration on the Rights of Indigenous Peoples*—to bear fruit. This will go a long way towards realizing Corson’s (1997, p. 85) call, published in an earlier edition of this encyclopedia, for all nation-states to ‘designate their aboriginal languages as official’, and to undertake appropriate language planning and teaching activities.

Research in support of these recommendations would address the interface between the local and the global, bottom-up and top-down LPP processes. This involves “studying up”—critically analyzing the actions and responsibilities of dominant national and international agents in promoting linguistic and social justice—as well as examining the development and impacts of LPP processes at the local level. We should continue to probe the academic consequences of LPP decisions, exemplified by the investigation of May, Hill and Tiakiwai (2004) of good practices for Māori education. We also need a much fuller understanding of the language ideologies and practices of Indigenous youth caught up in the process of language shift, a topic currently under investigation in a large-scale study of American Indian language shift and retention (McCarty, Romero-Little, and Zepeda, 2006). The increasing contributions of Indigenous scholars and practitioners to this and related research are crucial.

Finally, it is essential that we widen our analytical lens to focus more fully on out-of-school LPP processes. Warner (1999b), for example, examines community outreach programmes to promote the intergenerational use of Hawaiian language and culture in sports and task-based activities in the home. Programmes and research such as this illustrate Magga’s point that ‘language use is the best language planning and development’ (United Nations Secretariat for the U.N. PFII, 2005, p. 10). Future research and policy activism should heed this advice, thereby assisting Indigenous communities in cultivating a wide variety

of domains in which their languages—and the social bonds they sustain—can grow and thrive.

## NATIONAL SIGN LANGUAGES AND LANGUAGE POLICIES

### INTRODUCTION

On 27 June 1999, 4,000 people marched through London in support of British Sign Language (BSL), demanding its recognition as the language of the British Deaf community and asserting the right of Deaf children to be educated in a bilingual environment with BSL as the language of instruction (*Deaf History Journal*, 1999). While the British Deaf were marching, the Parliament of Thailand was in the process of formally recognizing Thai Sign Language as a fully fledged language, as the first language of Thai deaf people, and as the language through which Thai deaf people should be educated in a bilingual environment. By late March 2005, the British Deaf community were celebrating the fact that the government had recognized the existence of BSL<sup>1</sup> but were fervent about the need to continue agitating to have BSL legalized so that BSL users have the legal right to use it, “bringing years of language discrimination to an end,” indeed for BSL to be recognized as “the UK’s fourth indigenous language” (BDA News/Press Releases for 16 May 2005, <http://www.signcommunity.org.uk/news>). In June 2004, the New Zealand Sign Language Bill went before a Committee of the New Zealand Parliament. On 10 April 2006, Royal Assent was given to the Bill and NZSL became New Zealand’s third official language, along with English and Maori (see <http://www.odi.govt.nz>). On 6 July 2005, the Austrian Parliament voted for the recognition of Austrian Sign Language, giving the language constitutional recognition.

In countries around the world, in the policy-making bodies of the EU and the UN, and in the World Federation of the Deaf (WFD), Deaf people and their hearing supporters have been agitating, with particular intensity over the past decade, for the formal, legal, and constitutional recognition of sign languages as the natural and first languages of Deaf people. It is a struggle that has challenged the firmly socialized prejudices of individuals and governments alike against the so-called “disabled,” and has also eaten away at the very foundations of linguistics

---

<sup>1</sup> BSL was recognized as an official British language by the UK government on 18 March 2003, but it does not have any legal protection.

and the philosophy of language. At its heart has been an ongoing confrontation with the shape and purpose of formal education.

Both the development of national sign languages and the development of formal government language policies associated with sign languages are relatively recent, products of the spread of nationalism and of national and international movements in the fields of human rights and education (cf. May, 2006, *Language Education, Pluralism and Citizenship*, Volume 1; Skutnabb-Kangas, 2006, *Human Rights and Language Policy in Education*, Volume 1). Do national sign languages exist, or are they constructed? This is an issue we will deal in the following sections.

### *Sign Language Policies*

There have always been policies towards sign languages, policies which have overtly or covertly been influenced by wider attitudes towards language in general. These policies have often denied sign languages the status of languages and have in turn denied their users their full humanity. The impact of philosophers of language on these policies towards sign languages has often been profound, especially where speech has been assumed to be synonymous with language (see Wilbur, 1987).

Pre-Enlightenment policies towards sign languages were frequently linked to religious practice. Membership of a community was almost invariably membership of a religious community and that membership hinged on effective religious practice. Where speech was assumed to be central to this practice—for example, saying the creed or taking confession—and where signing was not regarded as the equivalent of speech, the Deaf were often denied full communal membership and thus denied their complete humanity. In the post-Enlightenment period, as detailed later, although the impact of religious groups on the use of sign language has remained important, the primary focus of these language policies has shifted to the sphere of education. Language policies in relation to education have both overtly and covertly impacted on the use of sign language not only in the education of the Deaf but in the wider community. Educational policies have operated at times to accept the use of sign languages and to accord them the status of languages, but have more often than not denigrated these languages either by banning their use altogether or by transforming them radically to serve as manually coded versions of the dominant spoken language (see also Skutnabb-Kangas, 2006, *Human Rights and Language Policy in Education*, Volume 1).

The key political issue in relation to policies on sign languages both in education and beyond, continues to be a battle, on the one hand, between signing and oralism (oralism referring to the position taken by those who believe that all deaf people should learn to speak,

lip-read, and “hear” [through the use of aids such as hearing aids or cochlear implants] in the dominant language to the exclusion of sign language), and on the other between the use of sign language and the use of manually coded versions of the dominant spoken language. It must be added, however, that there are still sign languages which are not affected by these educationally based policies, since one country may have many indigenous sign languages used by communities which have not come under the impact of national or even regional language policies (see, e.g., Branson and Miller, 2004; Branson, Miller, and Marsaja, 1999).

Sign languages, like all fully fledged languages, are natural languages that develop through their use for communication within communal contexts. Signing communities might be residential localized communities or dispersed networks of people, and, since sign languages are unwritten languages, the boundaries of their sign languages are defined by the boundaries of their communal activity. The degree to which sign language users within a nation-state use a common sign language will depend on the effectiveness of national networks within the Deaf community, on the impact of national sign language-based education, and on the impact on Deaf communities of formal research into, and the associated standardization and teaching of, a national sign language.

The promotion and indeed the development of national sign languages, as distinct from more localized community sign languages, is associated with four basic movements: the development of national associations of Deaf people; the drive for the achievement of linguistic rights as an aspect of human rights; the development of formal language policies; and the drive for national education systems with sign language as the medium of instruction. This nationalism is manifested in the drive for the publication of national sign language dictionaries. As the WFD report on the status of sign languages reveals, no country has a dictionary for more than one sign language. Of the 43 countries surveyed, only six did not have sign language dictionaries, but all the rest had only one, a national sign language dictionary. The dictionaries themselves embody not only the symbolic representation of a language and thus its recognition, a vital ingredient in the move to achieve the bilingual education of deaf people with a natural sign language as the language of instruction, but also the standardization of language, the move towards linguistic purity that is a feature of literate languages (see Branson and Miller, 2002; Edwards, 1985, p. 27ff; *Sign Language Studies*, 2003). Assumptions about the unitary nature of national spoken and written languages are transferred to the way that sign languages are in turn conceptualized. National sign languages are not only formally standardized and developed through the publication of dictionaries and sign language teaching manuals but are also assumed to exist. An understanding of the concept of a national sign language and of the social, cultural, and

linguistic dynamics involved in their development, therefore requires reference to literature on nationalism itself. Here the work of Benedict Anderson (1991) is particularly pertinent, with its focus on the forces that have created these “imagined communities.” As Anderson points out, the nation assumes the status of a community, encompassing and transforming traditional communities, claiming the loyalties and orientations that were formerly afforded the village, the lineage, the clan, the tribe, the neighbourhood (cf. May, 2006, *Language Education, Pluralism and Citizenship*, Volume 1). We examine the “problems and difficulties” of the drive for the recognition of “national” sign languages later.

### *Sign Languages and Educational Policies*

As indicated earlier, since the Enlightenment, it has been educational policy which has exerted the greatest influence on policies towards sign languages. The development of national sign languages and the history of language policies associated with those languages is therefore an integral part of the history of the education of deaf people in the West and more recently beyond the West in Asia, Africa, and the Americas, particularly under the influence of Western educators. It is also through an examination of the use of sign languages in deaf education that the impact of dominant hearing communities and their languages on the use of “signing” is revealed, initially in the late nineteenth century through the overt banning of sign language use in school, associated with the denial of the linguistic status of sign languages, as well as later, from the 1960s, through the development and promotion of manually coded versions of national spoken and written languages in formal education. Manually coded versions of national spoken and written languages—such as Signed English, Signed Swedish, Signed French, Signed Thai, and Signed Indonesian—have been, and still often are, promoted as national sign languages, particularly by hearing professionals associated with the education of the deaf, who believe that the acquisition of literacy in the national (spoken and written) language occurs most effectively through the use of manually coded versions of that national (spoken and written) language.

These signed versions of dominant languages are neither fully fledged languages of communication nor natural languages, but rather manual codes based on written forms of language, using “frozen signs”—a single unchanging sign for each word or morpheme—and thus making little use of the dynamic and creative features of sign languages. While some signs in natural sign languages are “frozen signs,” much of the lexicon is a productive lexicon—signs change and develop in response to the meaning being generated, using a range of conventions of transformation based on hand shapes, the use of space, orientation, the

face, and body. These dynamic aspects of sign language lexicons contrast starkly with manually coded versions of sound-based languages.

In those non-Western countries which have developed Western-style educational systems, educational policy has also been the forum in which national policies towards sign languages have been developed. In these cases, policies have often been strongly influenced by Western experts, especially Western teachers of the deaf, who have taken a direct role in the development of national policies towards sign languages, frequently in the development of manually coded versions of the national spoken language, for example, Signed Thai and Signed Indonesian, which are then assumed to be the national sign language.

### EARLY DEVELOPMENTS

Most early policies developed by default. While there is evidence of deaf people being taught through the medium of natural sign languages to read and write, first in Latin and later in the languages of everyday life, from well before the so-called Enlightenment, it is from the sixteenth century that educators emerge throughout Europe intent on teaching “the Deaf and Dumb” (privileged children of merchants and the nobility) not only to read and write but to speak. They paid little attention to existing sign languages but rather developed systems of finger spelling designed for the purposes of speech training. Finger spelling increasingly became associated with the manual representation of the dominant written language, rather than with the normal processes of borrowing between languages.

As the education of the Deaf moved beyond the very exclusive instruction of the nobility to the development of education for the poor deaf, the impact of national languages on the Deaf became more extreme. In the mid-eighteenth century, in 1755, the Abbé de l’Epée established a school for poor Deaf children in Paris (see Lane, 1988). While teaching the deaf children to speak was one of his educational aims, particularly in the beginning, he moved away from speech training as central to the education of the deaf towards the use of signing as a means for teaching the deaf pupils to read and write. But he did not use the two-handed alphabet in use among the Parisian Deaf communities and did not use existing sign languages with their distinctive syntax as the language of instruction. Rather he used the one-handed alphabet and developed a system of signed French. The die had been cast. While other educators in other times and places—Castberg in Denmark, Bébian in France later, and a string of British educators, for example, Charles Baker, Robert Kinniburgh, William Scott, and Drysdale (see Branson and Miller, 2002)—used natural sign languages to a greater

or lesser degree—often with a lot of finger spelling—and did not necessarily develop manually coded versions of the written language, hearing educators constantly tampered with the signing traditions of their pupils, subordinating and severely restricting their lexicon to the demands of spoken and written languages, some insisting on the possibility of signing and speaking at the same time. The widespread use of signing of various kinds throughout the eighteenth and nineteenth centuries gave way on an almost universal scale from the late nineteenth century to the partial or complete banning of signing in schools and a dedication to oralism—teaching deaf people to speak and lip-read the dominant spoken language. In Milan in 1880, an international conference of teachers of the deaf consolidated processes that had been at work for some time by voting overwhelmingly to ban the use of sign language in the education of the deaf (see Branson and Miller, 2002; Lane, 1988). Signing continued to be used in schools for some time, not only in the USA but also in Britain and Australia, but what Milan did mark very clearly was a change in the overall conceptualization of the educational process as it applied to deaf people. The purpose of that education was changing. By removing signing and deaf teachers from the classroom and even the playground, teachers, therapists, and associated experts sought to normalize deaf people, to destroy their difference, and to destroy the cultural aspects of their deafness. As the twentieth century progressed, sign languages were banned by an increasing number of educational authorities. Their linguistic status was denied. The climb back to linguistic and educational rights for the Deaf was a hard one.

From the late 1960s, the use of signing, albeit often manually coded versions of the dominant spoken language, emerged again in opposition to oralism. Today, the drive throughout much, but by no means all, of the world, is for the use of natural sign languages in a bilingual educational system (see in particular Ahlgren and Hylénstam, 1994 and also see the review by Small and Mason, *American Sign Language (ASL) Bilingual Bicultural Education*, Volume 5). These bilingual policies are again linked to the transformation of national policies. Where bilingual deaf education is promoted, the wider national recognition of sign languages as viable communal languages tends to be found. In Sweden, Denmark, Finland, Thailand, Venezuela, and Uruguay, for example, bilingual education with sign languages as the primary mode of instruction are national policy, supported in most cases by state-run programs for the teaching of sign language to preschool children and their families. Comprehensive international data on national policies towards sign languages have yet to be collected and collated. A survey by Gloria Pullen and Lesley Jones (1990) of policies towards Deaf

people in 11 European countries clearly showed that government policies towards Deaf people and their languages were, with the exception of the one Scandinavian country in the survey, Denmark, governed by their perception of Deaf people as disabled rather than as a linguistic minority. Skutnabb-Kangas has provided more up-to-date information for Europe, especially in her discussions of “Arguments to Exclude Sign Languages from the European Charter for Regional or Minority Languages” (see also Skutnabb-Kangas 2006, *Human Rights and Language Policy in Education*, Volume 1).

#### MAJOR CONTRIBUTIONS AND WORK IN PROGRESS

Most of the current research into, and commentary on, national sign languages and language policies is conducted under the auspices of international and national associations of the Deaf. Examples are discussed later. The best known work on the history of policies and practices relating to the use of sign language in the education of the Deaf in Western societies, with a particular focus on France and the USA, is Harlan Lane’s *When the Mind Hears* (Lane, 1988), complemented by the valuable collection of historical documents in Lane and Philip (1984) and by Lane’s treatment of the marginalization of the Deaf in the West in his *The Mask of Benevolence* (Lane, 1992). These works, however, misrepresent the history of the education of deaf people in Britain, characterizing it as “oralist” from the beginning of its history. In contrast to France and the USA, natural sign language was widely and effectively used in Britain, until the American educator Edward Miner Gallaudet and his Irish pupil, Francis Maginn succeeded in forcing natural sign languages from the schools in favour of the “combined method,” the simultaneous use of speech and signing (see Branson and Miller, 2002). Comprehensive linguistic research into sign languages is relatively recent, and is associated with a small but very active international community of scholars, with research results published through a few specialized journals and in books based on international conferences (for a critique of sign language linguistics, see Branson and Miller, 2000). Much current writing on the relationship between language policies and educational policies, as they relate to the Deaf, is found in proceedings of national and international conferences of teachers of the deaf. International Congresses on Education of the Deaf are held every 5 years and although they have moved far beyond the complete intolerance of sign languages evident at their congress in Milan in 1880, they still include very few Deaf people. A large proportion of the papers reprinted in their proceedings are still devoted to papers advocating either pure oralism in deaf education or the use of

manually coded versions of the national spoken and written language (e.g. see Taylor, 1988).

Linguistic research has played an important part in questioning the use of manually coded versions of spoken languages in Deaf education (see in particular Johnson, Liddle, and Erting, 1989), providing support to the demands of Deaf communities for the use of their natural sign languages. Examples of this process are well documented for Sweden in Bergman and Wallin (1990), particularly the interweaving of research and the Deaf community organizations in the development and promotion of Swedish Sign Language. Bilingual education for the deaf with a sign language as the prime medium of instruction is the focus for an increasing amount of research (see in particular Ahlgren and Hylenstam, 1994; Bouvet, 1990; Branson and Miller, 2002, p. 220ff.; Hansen, 1990; Heiling, 1995; Jokinen, 2000; Lewis, 1995; Mahshie, 1995; Skutnabb-Kangas, 2000). Specific discussion of the policies and practices relating to the use of sign languages in Canada, with reference also to the USA, is to be found in Corson and Lemay (1996). For a wide range of well informed papers dealing with the issue of the rights of minority language groups to education through their first language, see the articles in Phillipson (2000).

### *Sign Languages and Linguistic Rights*

The WFD “Fact Sheet” on sign language (<http://www.wfdeaf.org/documents.html>) lists 32 countries in which sign language is formally recognized, constitutionally or in legislation or policy. To this list should be added (at least) Thailand (1999), the UK (2003), and Austria (2005). Today, as throughout much of their history, Deaf communities themselves are the prime movers in the establishment of linguistic rights for the Deaf, particularly in education, and are, in the process, the driving force for the recognition not only of sign languages but of national sign languages (see Jokinen, 2000). These principles and orientations are succinctly stated in the policies of the WFD, specifically their current statement on the “Educational Rights of Deaf Children” ([http://www.wfdeaf.org/pdf/policy\\_child\\_ed.pdf](http://www.wfdeaf.org/pdf/policy_child_ed.pdf)).

The active pursuit of these linguistic human rights is to be seen not only in demands by associations of the Deaf for the formal recognition of sign languages but also in legal action, seeking compensation for the damage caused by the denial of access to education and other services through sign languages. Examples are to be seen in a number of Australian court cases brought on behalf of deaf children by Deaf Children Australia. Evidence of not only the national but international importance of these cases is seen in the following news item circulated in June 2005 by the European Union of the Deaf.

*Court Decision Landmark for Deaf Education in Australia*

The Federal Court of Australia has found that the Queensland government discriminated against a 12-year-old boy by not providing him with a sign language interpreter at school.

The boy who, according to Deaf Children Australia, has the academic skills of a 6-year-old was awarded \$64,000 in compensation for future economic losses as a result of his inadequate education. The implications of this finding could prove to be a landmark decision for Deaf education in Australia as it establishes firmly deaf children's right to an Auslan (Australian Sign Language) interpreter in school.

As James Gray, counsel for the boy's family, asserts any educational authority that does not provide deaf children with an interpreter could be found to be in breach of commonwealth human rights legislation. State governments are not liable to pay compensation in such a situation, he added (*Source*: SIGNMatters, June 2005 [http://www.eudnet.org/update/online/2005/jun05/worn\\_01.htm](http://www.eudnet.org/update/online/2005/jun05/worn_01.htm))<sup>2</sup>.

## PROBLEMS AND DIFFICULTIES

As indicated earlier, most of the dialogue dealing with the linguistic rights of Deaf people continues to be framed in terms of "national sign languages." From 24 January 2005 to 4 February 2005, the fifth session of an ad hoc committee of the United Nations, the Ad Hoc Committee on a Comprehensive and Integral International Convention on the Protection and Promotion of the Rights and Dignity of Persons with Disabilities, met in New York (<http://www.un.org/esa/socdev/enable/rights/ahc5reporte.htm>). Among other documents, they had before them a response from the WFD to proposals about the use of sign languages that had been tabled and reported at earlier sessions of the Ad Hoc Committee.<sup>3</sup> The focus of the WFD response was on article 13 of the Ad Hoc Committee's Draft Report. The chapeau of draft article 13 reads:

States parties shall take all appropriate measures to ensure that persons with disabilities can exercise their right to freedom of expression and opinion, including the freedom to seek, receive and impart information and ideas on an equal basis with others and through sign languages, and Braille, and augmentative alternative communication and all other

<sup>3</sup> See WFD web site (<http://www.wfdeaf.org/>) for their response and for other documents relating to sign languages.

accessible means, modes and formats of communication of their choice . . . (United Nations, 2005, p. 17).

The “means” of concern to WFD delegates was the means contained in subparagraph (h), which, following a submission by Uganda, had read “developing a national sign language.” The WFD listed a range of responses to this subparagraph, which requested the amendment of the phrase “developing a national sign language” to read “recognizing” or “promoting” a “national sign language,” with the WFD proposing the amending of the original to read “recognizing and promoting a national sign language.” In response to this proposal, the fifth session of the United Nation’s ad hoc committee reported that there was no general agreement on how to word subparagraph (h) and therefore that “Subparagraph(h), on which further discussions are required, reads: ‘(h) [Developing/recognizing/promoting] a national sign language.’” (United Nations, 2005, p. 19).

As indicated in our introduction, the majority of statements made about the need to recognize and use sign languages are framed in terms of “national” sign languages. The pressures for the *development* of national sign languages are well illustrated by the example of the *Dictionary of Southern African Signs for Communication with the Deaf* (Penn, 1992). The signs illustrated there come from at least 12 cultural regions, from 12 distinct communities with distinct natural sign languages, and yet, in one of the prefaces to the first volume, Timothy Reagan (2006) states,

A beginning has now been made to record the beauty and diversity of South African Sign Language . . . . Needed as well are studies of the syntax of South African Sign Language in its many forms, . . . . This is a formidable challenge, but it is one that the South African Deaf community is more than capable of meeting (Penn, 1992, p. xi).

The slip from the recognition of the diversity and multilingual nature of the South African Deaf, of the many Deaf communities in South Africa, into a unitary orientation towards “South African Sign Language” and “the South African Deaf community,” both in the singular, is symptomatic of the approach taken by most governments, linguists, and linguistic rights activists alike. Linguists in particular are involved in the standardization of sign languages towards “national” variants—British Sign Language, American Sign Language, South African Sign Language, and so on—each with a dictionary (see Branson and Miller, 2000, 2002; *Sign Language Studies*, 2003).

The drive for the recognition of sign languages as “national” sign languages thus poses a conundrum. The recognition of sign languages involves:

1. the assertion by national Deaf associations of the existence of national sign languages;
2. the drive for formal recognition of these languages as national sign languages; and
3. the demand for and the development of education through these respective languages for all Deaf people nationally.

But the assertion and recognition of national sign languages can lead to the failure to recognize the existence of minority sign languages in precisely the same way as the assertion and promotion of national spoken and written languages lead to the oppression and suppression of minority spoken and written languages. And yet the recognition of the sign languages of the majority is an enormous and vital, even revolutionary, step forward for Deaf communities throughout the world, a conundrum posed by nationalism itself.

In 2003, the European Year of People with Disabilities, the European Union of the Deaf (EUD), in making a statement on sign languages to accompany its mission statement, titled its statement “Sign Languages of (sic) the Right to Use an Indigenous Sign Language.” The statement began:

This is a core tenet of EUD’s working objectives and significant change has occurred over the past years. Successes include the European parliament’s resolutions on the recognition of sign languages in 1988 and again in 1998 and the European Commission sponsored Sign Languages Project (1996–1997) carried out by EUD. These actions have acted as a catalyst for member associations to work with their national governments in securing practical, and in several cases, constitutional or legal recognition of their respective national sign language (<http://www.eudeaf2003.org/en/chapter51.html>).

Although the statement focused on recognition of “national sign languages,” it went on to state that:

EUD continues to strive for full and legal recognition of Sign language/s by the European Union, the Council of Europe and all EU national governments as a minority language, just like they have recognised certain spoken languages as minority and regional languages. There is no ground for excluding sign languages, especially not on linguistic grounds, since research has long since shown that sign languages ARE languages. The major barrier to tear down is the attitude of governments and legal advisers who do not believe that sign languages are real languages and do not realize or understand the importance of sign languages for Deaf people (ibid.).

The EUD statement thus begins to do something that few other statements on sign language rights do, to move away from the assumption that “national sign languages” exist or are the important focus of linguistic rights, to refer to “indigenous sign languages” and to the recognition of “minority and regional languages.” This change is also reflected in the latest WFD statement on the “Educational Rights of Deaf Children” referred to earlier, which states:

To ensure that the educational rights of Deaf learners are fulfilled, WFD . . . :

- Reaffirms its position that all Deaf people, including Deaf children, have the right to full access to quality education through visual modes, including indigenous sign languages.

Reflecting this change, a recent statement by the Parliamentary Assembly of the Council of Europe states (in part):

9. . . . the Assembly recommends that the Committee of Ministers devise a specific legal instrument on the rights of sign language users, and accordingly:

...

iii. consider drafting an additional protocol to the European Charter for Regional or Minority Languages incorporating sign languages into the charter, among the non-territorial minority languages.

10. The Assembly also recommends that the Committee of Ministers encourage member states:

i. to give the sign languages used in their territory formal recognition; (<http://www.eudeaf2003.org/en/counsildocument1.html>).

The move away from referring simply to “national sign languages” is a vital one. It should be noted that one of the few countries without a “national” sign language is overtly multilingual Canada, where American Sign Language (ASL) and Langue des Signes Quebecoise (LSQ) are commonly used. On 11 February 2005, the Canadian Association of the Deaf called for the official recognition of Inuit Sign Language (see <http://www.cad.ca/index2.php?lid=e&cid=9&pid=0> and [http://www.nunatsiaq.com/archives/50204/news/nunavut/50204\\_10.html](http://www.nunatsiaq.com/archives/50204/news/nunavut/50204_10.html)).

## FUTURE DIRECTIONS

The current statements on the linguistic human rights of Deaf people by the WFD and the EUD, show that a solution to the conundrum posed by a focus on “national sign languages” demands the integration of research on sign languages with current research on minority language

rights (see Jokinen, 2000; Phillipson, 2000; Ricento, 2006<sup>4</sup>; Skutnabb-Kangas, 2000; Skutnabb-Kangas and Phillipson, 1994; and see the reviews by Phillipson, *Language Policy and Education in the European Union, Volume 1*; Skutnabb-Kangas, *Human Rights and Language Policy in Education, Volume 1*). Multilingual solutions involving national and local sign languages as well as literacy in the dominant national spoken language must be considered. Moves of this kind are under way in some countries, especially where they are asserting the need for the use of local sign languages in education rather than the use of imported Western sign languages such as American Sign Language, as has frequently been the case (see, e.g. de Carpentier, 1995). Models of bilingual education which assume that a national sign language does or can exist need to be complemented with multilingual models which recognize that sign languages are both natural and face-to-face languages and that it is local languages that must be used. Whether or not national sign languages will emerge is dependent on the networks of effective communication that can also be developed. Towards this end, the sociolinguistics of sign languages is moving towards the study of localized rather than national sign languages, studied within their distinct social and cultural contexts (Branson and Miller, 2004; Branson, Miller, and Marsaja, 1999; Johnson, 1994).

# **Section 3**

**Theory, Pedagogy and Practice**

## CRITICAL APPLIED LINGUISTICS AND LANGUAGE EDUCATION

### INTRODUCTION

Critical applied linguistics (CALx) is an emergent approach to language use and education that seeks to connect the local conditions of language to broader social formations, drawing connections between classrooms, conversations, textbooks, tests, or translations and issues of gender, class, sexuality, race, ethnicity, culture, identity, politics, ideology or discourse. In the following sections I provide an overview of this work as the intersection of different critically oriented domains, such as critical discourse analysis, critical literacy and critical pedagogy, before discussing various problems and difficulties faced by this work, including struggles over the meaning of the term *critical*, the need for work beyond only critique, and the question of its applicability to the majority (non-Western) world. Finally I discuss ways in which CALx opens up many new ways of thinking about applied linguistics, and thus presents to applied linguistics more broadly a fresh array of concerns about language, politics, identity, ethics and difference.

### EARLY DEVELOPMENTS

Although the term CALx itself is relatively recent (see Pennycook, 2001), and related areas such as critical discourse analysis (CDA) only emerged in the 1980s, critical approaches to applied linguistics nevertheless draw on a critical tradition around language and pedagogy that has earlier origins. As Luke (2002) argues, critical language analysis can be seen as dating back to the work of Vološinov (1895–?), and more recently Foucault (1926–1984). Critical literacy and pedagogy have been greatly influenced by the work of Paulo Freire (1921–1997), while postcolonial critics such as Frantz Fanon (1925–1961) have been influential for the development of an understanding of language, identity, race and colonialism. CALx in its contemporary forms can best be understood as the intersection of various domains of applied linguistic work that operate under an explicit critical label, including critical discourse analysis, critical literacy, critical pedagogy, or critical language testing (CLT); as well as work that may have a less explicitly defined banner (critical approaches to translation, for

example) or that defines its critical work more specifically, such as feminist or antiracist pedagogy. By and large, this work can be characterized as starting with the perspective that language is, as Joseph (2006) puts it, political from top to bottom. CALx therefore deals with applied linguistic concerns (broadly defined) from a perspective that is always mindful of the interrelationships among (adapting Janks, 2000) dominion (the contingent and contextual effects of power), disparity (inequitable access to material and cultural goods), difference (the construction of and engagement with diversity) and desire (the operations of ideology, agency and identity).

While some lament the development of CALx as being “dismissive totally of the attempt since the 1950s to develop a coherent applied linguistics” (Davies, 1999, p. 141.), others see it by contrast as a sign of disciplinary maturity: “the very existence of a transgressive critical applied linguistics which attacks the foundations and goals of applied linguistics is perhaps a sign that applied linguistics is a discipline which has come of age” (Elder, 2004, p. 430.). While CALx is concerned with far more immediate social and political concerns than disciplinary coherence, its development does seem to suggest that ALx may have outgrown its infancy. New journals now testify to the emergence of critical work around language and education: *The Journal of Language, Identity, and Education*, for example, includes in its scope “critical studies of literacy policies,” “critical studies of school and community attitudes,” “critical studies about bias in schooling practices” (Contributor information). The newly (2004) established *Critical Inquiry in Language Studies* publishes research on “issues of language, power, and community within educational, political, and sociocultural contexts . . .” And the recent (2004), *Critical Discourse Studies* aims to “publish critical research that advances our understanding of how discourse figures in social processes, social structures and social change” (editorial page).

#### MAJOR CONTRIBUTIONS AND CURRENT WORK

CDA and critical literacy share a concern to understand texts and practices of reading and writing in relationship to questions of power, equity, diversity and change. Norman Fairclough, whose approach to CDA has received wide attention, explains that critical discourse analysis “aims to systematically explore often opaque relationships of causality and determination between (1) discursive practices, events and texts, and (2) wider social and cultural structures, relations and processes; to investigate how such practices, events and texts arise out of and are ideologically shaped by relations of power and struggles over power” (1995, p. 132.). More recently, Fairclough, Graham,

Lemke, and Wodak (2004) locate their approach to critical discourse studies within a broader field of critical social research and the growing awareness that major social issues such as the effects of global capitalism, issues of gender and sexuality, differential relations of power between languages, the need for critical citizenship, discrimination in terms of age or race, changing identities in relation to new transnational structures and changes to new communication media, are “to some significant degree, problems of discourse” (p. 2). They go on to suggest a threefold distinction among ideological critique, which focuses on the “effects of discourse on social structures of power,” rhetorical critique, with its interest in “persuasion in individual texts or talk,” and strategic critique, which looks at how “discourse figures within the strategies pursued by groups of social agents to change societies in particular directions” (p. 5).

Although critical literacy “does not stand for a unitary approach, it marks out a coalition of educational interests committed to engaging with the possibilities that the technologies of writing and other modes of inscription offer for social change, cultural diversity, economic equity, and political enfranchisement” (Luke and Freebody, 1997, p. 1). In some ways, critical literacy may be seen as a form of applied CDA—critical discourse analysis for the classroom—though it also has wider coverage in its focus on literacy in social contexts and practices of writing. Morgan and Ramanathan (2005) describe the contemporary educational task of critical literacy as “cultivating a citizenry that is able to negotiate and critically engage with the numerous texts, modalities, and technologies coming at learners” (p. 152). CDA and critical literacy also come together in the critical analysis of textbooks, showing, for example, how images of gender and race are reproduced in educational contexts (see Dendrinos, 1992; Van Dijk, 1993). CDA and critical literacy can also be seen as two approaches to critical language awareness, the aim of which is to “empower learners by providing them with a critical analytical framework to help them reflect on their own language experiences and practices and on the language practices of others in the institutions of which they are a part and in the wider society within which they live” (Clark and Ivanić, 1997, p. 217).

A further form of critical text analysis that has received less attention is a critical approach to translation, in part because translation itself is a minority focus of applied linguistics. Translation, argues Cronin (2003), nonetheless plays a crucial role within globalization, since one of its primary functions is “to replenish the intertextual resources of a culture” (p. 133). While the responsibility of the translator is conventionally thought of in terms of giving a fair and accurate representation of a source text, this focus on “textual scrupulousness” overlooks the importance of “an activist dimension to translation which involves an engagement with the cultural politics of society at national

and international levels” (p. 134). This notion of activist translation links to Venuti’s (1998) *translingualism*, which aims to disrupt the assimilatory and domesticating tendencies that eradicate difference through translation. Indeed, Venuti’s (1997) approach to translation takes the position that to “shake the regime of English, a translator must be strategic both in selecting foreign texts and in developing discourses to translate them. Foreign texts can be chosen to redress patterns of unequal cultural exchange and to restore foreign literatures excluded by the standard dialect, by literary canons, or by ethnic stereotypes” (pp 10–11).

In addition, focusing on the global hegemony of English and the need to promote diversity, critical work in language policy and planning has opened up new perspectives on language and globalization (see also Block, *Language Education and Globalization*, Volume 1; Tollefson, *Language Planning in Education*, Volume 1). Work in language policy generally has been remarkable for its political quietism, only recently developing more critical theoretical frameworks (Ricento, 2006; Shohamy, 2005). Debates around the global spread of English and the destruction of the world’s linguistic diversity have been at the forefront of this more overt critical agenda. Central here has been Phillipson’s (1992) concept of (English) linguistic imperialism, an argument that English has been spread for the economic and political advantage of the core English-speaking nations. As Tollefson (2000) explains, Phillipson’s work differs markedly from mainstream sociolinguistic work focusing on the global spread of English since he “focuses on the unequal distribution of benefits from the spread of English.” Rather than viewing the spread of English in positive terms and focusing on descriptions of varieties of English, Phillipson’s work “places English squarely in the center of the fundamental sociopolitical processes of imperialism, neo-colonialism, and global economic restructuring” (p. 13). These concerns have then been allied with allegations of “linguistic genocide” and the need for “linguistic human rights” to protect the global diversity of languages (Skutnabb-Kangas, 2000; see also *Human Rights and Language Policy in Education*, Volume 1). While these arguments have raised considerable debate, especially in relation to the need to understand how the global position of English is resisted and appropriated (Canagarajah, 1999; Pennycook, 2001), or how language rights can be understood in a more complex relation to ethnicity (May, 2001), the focus on the politics of language and globalization has become a key concern within CALx.

Sociolinguistics more generally has also been taken to task for lacking a critical dimension, Mey (1985) calling for a “critical sociolinguistics” that can “establish a connection between people’s place in the societal hierarchy, and the linguistic and other kinds of oppression that they are subjected to at different levels” (p. 342). While sociolinguistics

ought to have the tools to take questions of language and power seriously, it has been hampered by liberal social theory and sociologically deficient conceptions of class, gender and race (Williams, 1992). Some of the ways in which a critical sociolinguistics can operate can be seen in critical analyses of workplace settings which aim not just to describe inequitable practices but also to change them. Wodak's (1996) study of hospital encounters, for example, looks not only at the ways in which "doctors exercise power over their patients" (p. 170) but also at ways of intervening in this relationship. Studies of the literacy practices of young men in prison (Wilson, 2003), or of the discriminatory effects when Australian Aboriginal witnesses are silenced by the standard linguistic procedures of the courtroom (Eades, 2000) similarly seek both critical understanding and social restitution.

Critical approaches to language education—sometimes under the rubric of critical pedagogy—can be viewed, like critical literacy, as both a critical research enterprise and a domain of practice. Significant research in the first category, which, as *critical approaches to analysing learner language* (Ellis and Barkhuizen, 2005), has now been acknowledged as adding an important dimension to the often impervious domain of second language acquisition, includes work such as Canagarajah's (1999) critical ethnographies of 'periphery' students' and teachers' forms of resistance to English and English teaching methods: "It is important to understand the extent to which classroom resistance may play a significant role in larger transformations in the social sphere" (1999, p. 196.). Important here has been Norton's work on the ways in which gender, power and identity are interlinked in the process of language learning (2000; see also Pavlenko and Piller, *Language Education and Gender*, Volume 1). Kumaravadivelu (1999) offers a framework for *critical classroom discourse analysis*, which draws on critical ethnography as a research tool, and "seeks to play a reflective role, enabling practitioners to reflect on and cope with sociocultural and sociopolitical structures that directly or indirectly shape the character and content of classroom discourse" (p. 473). A critical turn in second language teacher education has suggested that the notion of *praxis*—the integration of critical reflection and action—can help transform the teaching practicum from a reproduction of prior practice into the teaching *praxicum* as an incessant problematizing of pedagogical thought and practice (Pennycook, 2004).

A focus on awareness of the inequitable conditions of language learning has produced approaches such as Darder's (1991) *critical biculturalism* or Walsh's (1991) *critical bilingualism*: "the ability to not just speak two languages, but to be conscious of the sociocultural, political, and ideological contexts in which the languages (and therefore the speakers) are positioned and function, and the multiple

meanings that are fostered in each”(Walsh, 1991, p. 127.). Kubota’s (2004) *critical multiculturalism* “critically examines how inequality and injustice are produced and perpetuated in relation to power and privilege” (p. 37). Based on a “a critical understanding of culture” (p. 38), such an approach is also both a research tool and a pedagogical approach, involving students “in critical inquiry into how taken-for-granted knowledge, such as history, geography, and lives of other people, is produced, legitimated, and contested in power struggles” (p. 40; see also May, 1999). Turning to forms of critical pedagogy in the second language classroom, Norton and Toohey (2004) explain that “Advocates of critical approaches to second language teaching are interested in relationships between language learning and social change” (p. 1). Morgan (1998) and many others (see Norton and Toohey, 2004; Pennycook, 1999) focus on how critical pedagogy in the classroom may address issues of power and inequality both within and outside the educational context, and how potential for change and resistance may be developed. Dealing with the very specific domain of academic English, Benesch’s (2001) *critical English for academic purposes*, “assumes that current conditions should be interrogated in the interests of greater equity and democratic participation in and out of educational institutions” (p. 64).

In the related domain of language testing, Spolsky’s (1995) history of the development of the TOEFL exam is clear from the outset that “testing has been exploited also as a method of control and power – as a way to select, to motivate, to punish.” So-called objective tests, he points out, by virtue of their claims to scientific backing and impartiality, are “even more brutally effective in exercising this authority” (p. 1). These concerns have been pursued furthest by Shohamy (2001) in her notion of Critical Language Testing (CLT), which “implies the need to develop critical strategies to examine the uses and consequences of tests, to monitor their power, minimize their detrimental force, reveal the misuses, and empower the test takers” (p. 131). Shohamy’s proposal for CLT clearly matches many of the principles that define other areas of CALx: language testing cannot be separated from social, cultural and political concerns; we need greater awareness and an ethical understanding of the effects and uses of tests; and a critical practice seeks transformative action. Doing applied linguistics critically, then, requires an understanding of the relationships between applied linguistic domains and the workings of power (dominion, disparity, difference, desire) as well as an ethical vision and tools for change.

#### PROBLEMS AND DIFFICULTIES

CALx faces four main problems: a rearguard action from the gatekeepers of disciplinary ALx; a tension between a normative political stance and

the need for constant problematization; the need to move beyond critique to reconstitutive action; and the question of relevance to diverse contexts round the world. The emergence of these various critical projects has met with mixed responses. First, then, for some, CALx is little more than a critique of other orientations to applied linguistics; thus, Davies (1999) defines CALx as “a judgemental approach by some applied linguists to ‘normal’ applied linguistics on the grounds that it is not concerned with the transformation of society” (p. 145). As is clear from the previous discussion, however, CALx is far more than a mere critique of normative ALx. A more significant concern is that CALx’s overt political stance on issues of inequality, racism, sexism or homophobia unacceptably “prejudges outcomes” (Davies, 2005, p. 32.). As Widdowson (2001) argues, by taking an a priori critical stance (rather than maintaining a critical distance—to use a different sense of the critical), CALx may impose its own views on the objects of inquiry, taking inappropriate and thus hypocritical stances on the social world because of the impossibility of choosing between different ethical and political concerns. A CALx standpoint, by contrast, while mindful precisely of the ethical dilemmas it opens up, suggests that such views overlook their own *locus of enunciation* (Mignolo, 2000): It is mainstream ALx that is hypocritical if it seeks to maintain a belief in critical distance while ignoring the very real social, political and ethical concerns that inevitably come to bear on any applied linguistic context.

This debate—contrasting a political with an apolitical ALx—unfortunately obscures the more important concern that CALx research does indeed need to be wary of its own political normativity. There is a tendency, second, for CALx research to operate with a normative, static politics based on various forms of neo-Marxian analyses of inequality and emancipation, and an equally static applied linguistic epistemology. To move forward, CALx needs a more reflexive politics, a form of *problematizing practice* (Pennycook, 2001). CALx is not only about relating micro-relations of applied linguistics to macro-relations of social and political power; nor is it only concerned with relating such questions to a priori critical analysis of inequality. A problematizing practice, by contrast, suggests a need to develop both a critical political stance and a critical epistemological stance, so that both inform each other, leaving neither the political nor the applied linguistic as static. From this point of view, then, CALx maintains a consistent focus on issues of dominion, disparity, difference and desire while at the same time maintaining a constant scepticism towards cherished concepts of applied linguistics, from language and ethnicity to identity and discourse.

Third, CALx needs to ensure that on the one hand it goes beyond a language only of critique, and that on the other hand its proposed

interventions are not seen as purely partisan. As Luke (2004) warns, CDA needs to move beyond a mode of critique “towards a reconstructive agenda, one designed towards redress, reconciliation and the rebuilding of social structure, institutional lives and identities.” (p. 151). While CDA locates itself as a project of consciousness raising (critical language awareness) or critical literacy, it is only when this becomes a more active project of critical writing—and thus goes beyond literacy as ideology critique—that it becomes a project aimed at active engagement rather than awareness. Critical pedagogy and other domains of CALx are similarly divided between domains that critique pedagogy, multiculturalism or English for Academic Purposes (EAP), and action-oriented domains that seek processes of change and engagement. There is always a challenge, therefore, to move beyond critique towards transformative and reconstitutive action. While this concern may be what Davies (2005) has in mind when he asserts that CALx “refrains from proposing interventions and explanations” (p. 32), paradoxically CALx has also been taken to task for proposing too many explanations and partisan interventions. Here CALx needs to ensure that the quality and reflexivity of its research, politics, epistemology and agendas for reform are more responsible than those in normative applied linguistics.

Finally, CALx is only useful insofar as it is applicable in diverse parts of the world. While applied linguistics generally has been challenged for its relevance to different contexts of global language use, CALx is equally open to such a challenge, in terms of both its critical and its applied linguistic epistemology. The concern here is that since much of the work that comes under the rubric of CALx is based on minority (‘First’/‘Western’) world contexts and theories, CALx is simply not readily usable in the majority (‘Third’) world. As Makoni (2003) has argued, CALx does not have adequately contextualized strategies for engaging with local communities. Remaining aware of the diverse contexts in which it may hope to be applicable, CALx needs to be wary lest the very terms and concepts of any critical project at the same time inflict damage on the communities with which critical applied linguists wish to work (Makoni and Pennycook, 2007). The challenge here is to ensure that “the research agenda is formulated in collaboration and consultation with local communities” (Makoni, 2003, p. 135) in order not only to develop a relationship between this field of critical scholarship and local knowledge and practice but also to encourage the development of CALx as localized practice.

#### FUTURE DIRECTIONS

The emergence of a different, alternative, transgressive CALx has far wider implications than merely adding a political dimension to applied

linguistics. It has become both a gateway through which new theories and ways of thinking about applied linguistics are entering and changing the discipline, as well as a developing domain that speaks to contemporary work in the social sciences. A newly emergent CALx that is going beyond the normative politics and epistemologies of emancipatory modernist critical approaches is responsive not only to shifts in mainstream linguistic and applied linguistic theory, but also to the linguistic, performative and somatic turns elsewhere in the social sciences. It is only recently, as Canagarajah (2004) points out, that we have come to “understand identities as multiple, conflictual, negotiated and evolving. We have traveled far from the traditional assumption in language studies that identities are static, unitary, discrete, and given” (p. 117).

To this discursive understanding of the subject has been added a conception of identities as *performed* rather than *preformed*. Drawing on Butler’s (1990) insight that “gender proves to be performative – that is, constituting the identity it is purported to be” (p. 25), Cameron (1997) points out that whereas “sociolinguistics traditionally assumes that people talk the way they do because of who they (already) are,” a performative approach to identity “suggests that people are who they are because of (among other things) the way they talk” (p. 49). A performative view of language, sexuality and education, for example, goes beyond a framing of identity in terms of lesbian and gay identification and instead embraces the broader category of Queer (Nelson, 1999; see also Pavlenko and Piller, *Language Education and Gender*, Volume 1), which as Cameron and Kulick (2003) explain “interrogates heterosexuality by dismissing its claims to naturalness, and examining, instead, how it is vigorously demanded and actively produced in specific socio-cultural contexts and situated interactions” (p. 55). Once we take this performative turn in CALx, it becomes possible to explore the ways not only that identities are performed through language but also that languages are performed through acts of identity. Rather than assuming that languages preexist communicative activity, we can start to explore how languages are produced through communication (Makoni and Pennycook, 2007).

In response to a concern that these linguistic and performative turns may overemphasize discourse, text and semiotics at the expense of spatial, corporeal and institutional relations marked by conflictual relations of class, gender, sexuality, race and other forms of difference, a somatic turn (Shusterman, 2000) has reintroduced the body as a site of struggle. Language, as Bourdieu (1991, p. 86.) insists, “is a body technique, and specifically linguistic, especially phonetic, competence is a dimension of bodily hexis in which one’s whole relation to the social world, and one’s whole socially informed relation to the world, are expressed.”

This emergent form of CALx, both responsive to and influential towards the linguistic, performative and somatic turns in the social sciences, rests therefore on principles of performativity, contextuality, and transgression (Pennycook, 2007): a performative understanding of language that opens up an understanding of the contingent nature of identity; a contextual engagement with the competing demands of dominion, disparity, difference and desire; and a transgressive approach to the boundaries of mainstream thought and politics, maintaining a constant scepticism towards cherished concepts and modes of thought. CALx is therefore far more than the addition of a critical/political dimension to applied linguistics; rather it opens up a whole new array of questions and concerns about language, politics, identity, ethics and difference.

## TEACHING LANGUAGE AND POWER

### INTRODUCTION

The teaching of language and power is now a recognised approach to language education in primary and secondary schools, and in some countries, such as Australia and South Africa, is included in state curricula. Critical literacy is an umbrella term for language pedagogies that grew out of the discipline of linguistics (including critical linguistics, critical language awareness (CLA), genre theory, critical discourse analysis) and out of work in the field of adult literacy. This use of the word ‘critical’ signals a view of language as central to the workings of ideology—as a key means of mobilising meaning to sustain or contest relations of domination in society (see also Pennycook, *Critical Applied Linguistics and Language Education*, Volume 1). Critical literacy education seeks to enable students to ask and answer the questions—whose interests are served by the way in which language is used? Who benefits? Who is disadvantaged?—so that out of this understanding, possibilities for change can emerge. It is underpinned by a strong equity and social justice agenda.

The teaching of language and power depends on understanding that language is not a neutral tool for communication but is everywhere implicated in the ways in which we read and write the world, the ways in which knowledge is produced and legitimated, and the ways in which a human subject is constructed as a complex set of identities based on, amongst other things, race, class, gender, ability, age, nationality, sexual orientation.

Research on diversity, difference and othering, often from a feminist, post-colonial or gay and lesbian perspective, has included careful work on language and its power to construct and delimit the ways in which we think the other and ourselves. Although this work has played a formative role in the development of critical literacy, it is not the focus of this review (see Pavlenko and Piller, *Language Education and Gender*, Volume 1). Here the focus is on critical approaches to language and literacy education.

### EARLY DEVELOPMENTS

When Dell Hymes argued in 1974 that in addition to acquiring linguistic competence children also had to acquire communicative competence,

he brought about a fundamental change in language education. He established that language use is a fundamentally social activity and that communicative competence requires an ability to use language appropriately. Such competence includes knowing which language variety and register of a language is most suited to a social occasion; for multilingual children it requires knowing which language to use when, and the complicated social understanding necessary for codeswitching. His work made space for the social in language education.

At the same time, William Labov was doing important work on language varieties. His work demonstrated conclusively that the so-called non-standard varieties of English are fully systematic, rule-governed languages as capable of abstract logical reasoning as so-called standard varieties (Labov, 1972). What sets these varieties apart is their social status, not any inherent linguistic superiority or inferiority. Basil Bernstein's work, although widely misinterpreted at the time, drew attention to the cultural capital that was necessary for success in schools. Part of that cultural capital included having access to both the linguistic and communicative competences valued uncritically by the school.

The communicative approach was the pedagogic realisation of these theories in second language education. Here the emphasis was placed on effective communication and, for the first time, fluency and appropriateness were seen to be as important as accuracy, which had dominated earlier structural approaches to language teaching. Clark, Fairclough, Ivanić and Martin-Jones (1987) in a paper that gave birth to CLA provided the first challenge to approaches to language education that did not question existing social structures (see also Pennycook, *Critical Applied Linguistics and Language Education*, Volume 1). 'Appropriateness', the concept at the heart of the social in language education, came under their critical knife because what is appropriate is decided by social norms, which in contexts of power (institutions, prestigious job interviews, media) are inevitably the naturalised cultural practices of social élites. CLA developed by Norman Fairclough's research group at Lancaster University was one of the early forms of critical literacy in the UK. It was related to the pioneering work on critical linguistics, developed by Roger Fowler, Gunther Kress, Bob Hodge and Tony Trew (1979).

These developments would not have been possible without systemic functional linguistics (SFL), developed by Halliday (1985). SFL established the foundation for understanding language as a 'social semiotic' and for mapping the relationship between language, text and context. This grammar, which is 'a theory of meaning as choice' (Halliday, 1985, p. xiv), has provided the tools for critical discourse analysis, genre theory and multimodal analysis (see also Kalantzis and Cope, *Language Education and Multiliteracies*, Volume 1). It creates the opportunity to include the power-meaning potential when teaching linguistic structures.

So, for example, students learning grammar can simultaneously learn about the relationship between modality and authority, or about the connection between ‘us’ and ‘them’ pronouns and othering discourses, and they can learn to recognise who is a ‘doer’ and who is a ‘done-to’ when they are taught transitivity and voice. This critical approach to linguistic structures has also been effectively applied to the teaching of critical writing.

In the field of literacy, it was Paulo Freire’s work that inspired the idea of critical literacy. His work in Brazil shows how in the process of learning to read both the word and the world critically, adult literacy learners regain their sense of themselves as agents who can act to transform the social situations in which they find themselves. Freire continues to be the main influence on critical literacy in North America, as can be seen in the work of Roger Simon, Carol Edelsky, Vivian Vasquez and Brian Morgan, for example. It was the work of linguists, such as Courtney Cazden, James Gee, Lisa Delpit, Nancy Hornberger, David Corson and Bonny Norton, on discourse analysis, language and diversity and language and identity that forged links between North American versions of critical literacy and developments elsewhere. Freire’s work was extended by ethnographic research on literacy, which generated the New Literacy Studies (Gee, 1990; Street, 1984). Some of the classroom work it gave rise to focuses on situated literacy practices in contexts of power (e.g. Pahl and Rowsell, 2005; Stein, 2004). Under the editorship of Luke and Elkins, *The Journal for Adolescent and Adult Literacy* (1997 to 2002) made the range of critical approaches more available to teachers in North America.

Australia has been at the forefront of developing theorised classroom practice in the area of critical literacy. The theoretical contributions of Allan and Carmen Luke, Carolyn Baker and Peter Freebody, Bronwyn Mellor and Annette Patterson, Pam Gilbert, Bill Green, Barbara Comber, Barbara Kamler and the New Zealander Colin Lankshear laid the foundations for classroom practice. For example, Barbara Comber and her colleagues at the University of South Australia have for more than a decade theorised, supported and showcased the work of classroom teachers who have made a difference to the lives of marginal students. Their work offers some of the most nuanced descriptions of critical practice in the area of language and literacy education. Luke and his colleagues incorporated critical literacy into Queensland’s *New Basics* curriculum. Patterson and Mellor, in Western Australia led the early development of classroom materials.

More recently, the changing communication landscape prompted theorists to re-think literacy in a digital age. Kress and van Leeuwen’s (2001) work has focused attention on multimodal forms of communication which increasingly use forms of semeiosis (image, gesture, sound) other than language. Under the leadership of Cope and Kalantzis

(2000; see also Kalantzis and Cope, *Language Education and Multiliteracies*, Volume 1), the multiliteracies project has worked with the literacies needed for changes in both semeiosis and technology (computers, Internet, digital recorders). Education now has a responsibility to deliver access to print, screen, information and computer literacies, both productive and receptive, across the inequalities created by the digital divide.

#### MAJOR CONTRIBUTIONS TO THE TEACHING OF LANGUAGE AND POWER IN SCHOOLS

The purpose of this review is to consider the practical issues relating to the teaching of language, literacy and power. The major contributions to our understanding of practice are (i) accounts of critical literacy teaching in classroom-based research and (ii) classroom materials.

*CLA* edited by Fairclough (1992), was the first edited collection of CLA as practice and it raises and begins to answer some of the key questions on the teaching of language and power. How are students to be given access to the discourses of power in their educational institutions so that these are not simply reproduced unproblematically? How much language competence do students need before CLA can be taught in second or foreign language classes? What constitutes critical practice in relation to the place of students' own minority languages? What positions on students' access to the standardised variety are compatible with CLA? How does CLA impact on student subjectivities? Is awareness enough? When does CLA become emancipatory?

In these first accounts of CLA practice (Fairclough, 1992) there is little sense of disruption. Clark recognises that decisions 'to conform or not to conform' (p. 117) involve real risks, and Janks and Ivanič close the collection in the final paragraph with a reminder that 'people endanger themselves when they take on the prevailing power structures' (p. 330). But, the accounts themselves are seamless and there is no sense that CLA might impinge on students' and teachers' identity investments and rock the classroom boat.

However, other classroom-based research points to the disruptive potential of a critical pedagogy which disturbs students taken-for-granted discourses and threatens their sense of self. Ellsworth's (1989) critique of critical pedagogy, in which she raises important questions about critical pedagogy's claims to empower students, remains the seminal text. Several examples from South Africa offer accounts of conflict resulting from the teaching of language and power, particularly in heterogeneous classes. Watson's research on the production of a critical literacy comic (Watson, 1994) with students in a rural school highlights the difficulties that teachers confront when they invite

students to generate materials out of their own ideologically constructed commonsense and the responsibilities and dilemmas a teacher faces in moving towards reconstructing students' belief systems. She shows that teaching can only be transformative in situations which allow different voices to enter and be heard, so that students come to understand the interested nature of all reading positions, including their own.

Readings and reading positions form the focus of secondary school critical literacy materials produced in Australia. The Chalkface Press workbooks introduce students to post-structuralist theory for textual deconstruction, focusing on literary texts, and they use innovative activities that teach an understanding of reading positions—how they are produced, regulated and challenged. The US edition of these workbooks by the National Council for Teachers of English in 2002 has further increased their influence. Two workbooks, *From the Margins* (Martino, 1997) and *Changing Places* (Kenworthy and Kenworthy, 1997), develop students' ability to read aboriginality, colonialism and gender from a post-colonial perspective. In the USA, the Rethinking Schools publications are specifically designed to teach students about equity and social justice. *Reading Writing and Rising Up* (Christenson, 2000) focuses specifically on the power of the written word. All these secondary school classroom materials establish a range of methods for developing students' understanding that discourse is implicated in the production of power and that texts are both constructed and interested. At their best, they require students to consider social effects and possible interventions. They focus on critical reading.

The work of Clark and Ivanič (1997), Ivanič (1998), Lillis (2001) and Kamler (2001) stands out for its focus on critical writing and the relationship between writing and subjectivity. Work still needs to be done to develop classroom-based approaches to critical writing.

Australia also pioneered critical literacy work in primary schools. Here the work of Peter Freebody, Allan Luke and Pam Gilbert has been important for its exploration of literacy practices in primary schools and the way these practices are inscribed on students' bodies to produce docile reading subjects. In addition, both Luke and Gilbert have drawn attention to the ideologies which inform the books children are given to read in primary schools. Luke studied early readers and Gilbert concentrated on gender bias. In South Australia, Barbara Comber and Jennifer O'Brien introduced the critical reading of everyday texts—cereal boxes, toy catalogues, mothers' day catalogues—into the early years of primary school. 'Critical literacies in the primary school' (Knobel and Healy, 1998) provides examples of critical literacy research in primary classrooms as does *Why wait? A way into teaching critical literacies in the early years* (Education Queensland, 2000). Vivian Vasquez' award-winning book *Negotiating Critical Literacies*

with *Young Children* (2004) based on her lived critical literacy curriculum with a Grade 1/2 class in Canada, shows conclusively that there is no need to wait. Very young children are more than capable of problematising their world and of taking social action to transform the inequities that they discover.

Vasquez' book echoes intertextually with the edited collection *Negotiating Critical Literacies in Classrooms*, edited by Comber and Simpson (2001). Designed to include examples of theorised classroom practice from both the political north and the political south, this collection shows the different conditions of possibility for critical literacy at different historical moments in different contexts. For example, it was easy to defend critical literacy as a transformative political project in South Africa during apartheid. However, in the USA, where neo-conservatism and fear have produced 'homeland security' measures, language and power is not widely taught in schools. Instead, retrogressive literacy policies, which treat reading and writing as a set of skills rather than as social practices, continue to privilege middle class children in the US despite the 'no child left behind' rhetoric of the Bush administration.

Once Halliday moved to Australia, the University of Sydney became the centre for SFL. Using SFL, the genre theorists described the generic and linguistic features of six dominant factual genres—reports, recounts, procedures, explanations, expositions and discussions—to be able to teach them to students. Genre pedagogy was specifically designed to give marginalised students in Australia access to dominant forms of language and the Disadvantaged Schools Project developed both classroom materials and an explicit pedagogy. This strong position on access to dominant literacy is supported by Lisa Delpit who works with African American students in the USA. Primary English Teachers' Association (PETA) publications have made both Hallidayan grammar and genre theory widely accessible to teachers.

The genre theorists came into conflict with other critical literacy theorists in Australia. While genre theorists want to enable students to access and use the dominant genres, critical literacy theorists want students to deconstruct and reconstruct them. Serious attention to genre is not antithetical to the aims of critical literacy, provided that genres are not reified and taught as static conventions reduced, in some of the more rigid genre positions, to formulae operating according to fixed rules. What students need is an understanding of the historical and social determinants of these forms and an ability to adapt these forms as the conditions change, and to change these conditions.

How this translates into practice is not yet resolved. How *do* teachers work with the contradiction at the heart of educational access? If you provide extensive access to the dominant forms in a society

(e.g. genres/knowledge/languages/varieties) you contribute to maintaining their dominance. If you deny students access, you perpetuate their marginalisation in a society that continues to recognise mastery of these genres as marks of distinction. A critical approach has to find a way of working inside this contradiction. Whole school ethnographic accounts by Stephen May (1994), Mary Kalantzis and associates (1991) and Rebecca Freeman (1998) have done so.

Wallace's (2003) work in the UK focuses on critical reading in second language education and shows how one can use marginality as a resource for criticality. Readers from the margins are frequently not the 'ideal readers' for whom texts are designed and they can learn to use their outsider insights as a resource for critical deconstruction. They can learn to harness their alternative world views as a means for resisting texts. Brian Morgan's (1998) account of his critical practice in his adult ESL classes demonstrates with Freirean panache how critical literacy enabled his immigrant students to read practices in their adopted society with a greater sense of agency. Norton's (2000) research, also with Canadian immigrants, had helped us to understand the relationship between language, identity and power in ESL. While this work is all with adults, it does provide direction for school-based critical ESL. Since 1994, Pennycook's work has provided a theoretical base for considering the politics of second and foreign language teaching. Although his work has focused on English, a powerful global language, it provides a way of thinking about language education in relation to the political economy of languages more broadly. In a challenge to the dominant applied linguistics paradigm in second language teaching and research, (Pennycook 2001; *Critical Applied Linguistics and Language Education Volume 1*) proposes a 'critical applied linguistics'.

Because of the current global power of English, bilingual and marginalised students tend to find critical literacy extremely engaging. Yet many ESL teachers delay engaging with issues of power in texts, arguing that the ability to decode is a prerequisite for deconstruction. Clearly, an understanding of textual positioning does require an understanding of the subtlety and nuances of words, but there are texts of different degrees of linguistic complexity and any text that is suitable for the level of learners to read is suitable for critical analysis at that level. The principles of critical literacy do not change.

The *CLA Series* (Janks, 1993) situates itself expressly across the first language/second language divide and is deliberately written in English that is accessible to students who speak African languages. This series is still the only set of classroom materials specifically designed to translate CLA into classroom practice. The apartheid context in which they were written gives a political edge to these workbooks, which make it clear

that language is both a site and a stake in struggles for a more humane world.

The contributions to critical literacy referred to here have been limited to language education, but critical literacy has been applied across the school curriculum to the analysis of school history textbooks in Austria, to the exploration of the construction of gendered discourses in school geography, and to citizenship education. The Rethinking Schools project has produced resources for teaching geography, history, mathematics and social studies critically. One workbook focuses specifically on rethinking globalization.

#### FUTURE DIRECTIONS: PROBLEMS AND DIFFICULTIES

A central problem in early accounts of critical literacy was the assumption that critical 'awareness' leads to 'emancipation'. While many students report an ability to interrogate texts, to resist being constructed by othering discourses, to recognise and to refuse interpellation, this is too easy. Given that human subjects are multiply affiliated identities, we have no clear idea of what discursive emancipation might look like. A student who learns a feminist discourse at school might be severely punished for it in a traditional patriarchal home, particularly where sexist practices in the home are further underpinned by religious beliefs. Mellor and Patterson (1994) in fact argue that critical literacy is simply a new 'reading regime', requiring a new normativity. This needs to be weighed against Simon's (1992) 'pedagogy of possibility', which ties the critical endeavour to a political project with an ethical social justice agenda. These differing positions have very different outcomes in classrooms. For example, Mellor and Patterson would expect students to be able to produce an antiracist reading of a text whereas Simon would want to go further. He would want students to become transformed human subjects who reject racism.

The work of Vasquez and Comber provides a way forward. Their research highlights the possibilities for social action. Vasquez' 3 to 5-year old students were able to take action to transform unfair, discriminatory practices. Many of their interventions produced change: they challenged and changed school menus that did not include food for vegetarians; they successfully contested their exclusion from school events simply because they were young; they wrote and performed a play about the plight of the rain forests. The teachers that Comber writes about, Helen Grant and Marg Wells, are similarly successful in creating opportunities for their students to assume agency. Marg Wells began working with her students when they were in Grade 2/3. She developed a literacy and social power curriculum unit in which

children were asked to identify aspects of their 'school, neighbourhood and world' that they were concerned about and to imagine how they might be changed for the better. Her children have since successfully campaigned for the planting of trees in their neighbourhood and they challenged and transformed the designs of urban renewal developers for a local park. Helen Grant has created opportunities for migrant children to use their diverse funds of knowledge in the videos that they produce.

Work in critical literacy is now trying to understand and imagine what pedagogies of 'reconstruction' and 'redesign' look like in schools and classrooms. Robert Hattam is working on an international project on 're-conciliation pedagogies'; Jim Martin is working with 'positive' as opposed to 'critical' discourse analysis; Comber, Thomson, Nixon and Janks' research, which focuses on projects that make a material difference to children's lives, is exploring the role played by literacy; Luke recently directed a major research project in Singapore to effect positive shifts in education in Asia (and by example, elsewhere). This influential new direction in the teaching of language and power signals a move from concerns with negative power and forces of resistance to a view that power can be harnessed by teachers and students for transformative projects of reconstruction.

Competing claims in the field of language and power have been counterproductive. One of the strengths of the multiliteracies project (see Kalantzis and Cope, *Language Education and Multiliteracies*, Volume 1) is that it created a space for thinking about links across the specialist interests brought by members of the New London Group: genre theory, discourse theory, language learning in multilingual and indigenous communities, social and citizenship education, feminist linguistics, cultural diversity in schools, language and learning for 'fast capitalist' workplaces. Janks (2000) in her synthesis model of critical literacy argues in relation to critical literacy that the different positions which foreground either domination, or diversity or access or design/redesign are mutually interdependent, and that one without the other produces a problematic imbalance. Critical literacy has to take seriously the ways in which meaning systems are implicated in reproducing domination and it has to provide access to dominant languages, literacies and genres, while simultaneously using diversity as a productive resource for redesigning social futures and for changing the horizon of possibility (Simon, 1992). This includes both changing dominant discourses as well as changing which discourses are dominant. Genre theory without creativity runs the risk of reifying existing genres; deconstruction without reconstruction or design reduces human agency; diversity without access ghettoises students. Domination without difference and diversity loses the ruptures that produce contestation and change.

Finally, critical literacy has still to meet the criticism that it is fundamentally a rationalist activity that does not sufficiently address the non-rational investments that readers bring with them to texts and tasks. Norton's (1970) theory of 'investment' in relation to language acquisition and identity, Janks' work on identification (2002), Lillis' (2001) work on writing and desire and Kenway and Bullen's (2001) work on 'voluptuous pedagogies' are only a beginning. It is in the realm of discourse and the unconscious that the language/power conjunction produces subjects. Undoubtedly, this is why Foucault (1970, p. 110) maintains that 'discourse is the power which is to be seized'.

## LANGUAGE EDUCATION AND MULTILITERACIES

### INTRODUCTION: INITIAL DEVELOPMENT OF THE 'MULTILITERACIES' CONCEPT

In September 1994, the Centre for Workplace Communication and Culture at James Cook University of North Queensland, Australia, initiated an international project to consider the future of literacy teaching: what would need to be taught in a rapidly changing near future, and how it would be taught. The Centre invited some of the world's leaders in the field of literacy pedagogy to come together for a week in the small town of New London, New Hampshire, USA, in order to consider the 'state of the art'.

As it turned out, there were multiple ironies in the very idea of New London. By the end of the twentieth century one billion people spoke that difficult little language, English, spoken four centuries before by only about a million or so people in the vicinity of London, old London. The story of the language, and the story of the last few centuries, including its many injustices, is the story of many new Londons. This issue—how the language meets with cultural and linguistic diversity—was one of our main concerns. Then there was the irony of the postcard serenity of this particular New London, the affluent, post-industrial village which sold little more than its idyllic eighteenth century postcard image. This, in a world where the fundamental mission of educators is to improve every child's educational opportunities—a world which, much of the time, is far from idyllic.

This seemed a strange place to be asking some of the hardest questions we now face as educators. What is appropriate education for women, for indigenous peoples, for immigrants who do not speak the national language (cf. May, *Language Education, Pluralism and Citizenship*, Volume 1), for speakers of non-standard dialects? What is appropriate for all in the context of the ever more critical factors of local diversity and global connectedness (cf. Block, *Language Education and Globalization*, Volume 1)? As educators attempt to address the difficult question of cultural and linguistic diversity, we hear shrill claims and counterclaims about the canon of great literature, grammar and 'back-to-basics'. These debates seemed a long way from the calm hills of a tourist's New Hampshire.

Ten people met and talked for that week in New London. Courtney Cazden from the USA had spent a long and highly influential career working on classroom discourse (Cazden, 1988, 2001), language learning in multilingual contexts (Cazden, 1989) and on literacy pedagogy (Cazden, 1983). Bill Cope, from Australia, had written curricula addressing cultural diversity in schools (Kalantzis and Cope, 1989), and had researched literacy pedagogy (Cope and Kalantzis, 1993) and the changing cultures and discourses of workplaces (Cope and Kalantzis, 1997a). From Great Britain, Norman Fairclough was a theorist of language and social meaning, and was particularly interested in linguistic and discursive change as part of social and cultural change (Fairclough, 1989, 1992). James Gee, from the USA, was a leading researcher and theorist on language and mind (Gee, 1992, 1996), and on the language and learning demands of the latest 'fast capitalist' workplaces (Gee, Hull, and Lankshear, 1996). Mary Kalantzis, an Australian, had been involved in experimental social education and literacy curriculum projects (Cope and Kalantzis, 1993), and was particularly interested in multicultural and citizenship education (Kalantzis and Cope, 1999; Kalantzis, Cope, Noble, and Poynting, 1991; Kalantzis, Cope and Slade, 1989). Gunther Kress, from Great Britain, was best known for his work on language and learning, semiotics (Kress, 1990), visual literacy (Kress and van Leeuwen, 1996) and the multimodal literacies that are increasingly important to all communication, particularly the mass media. Allan Luke, from Australia, was a researcher and theorist of critical literacy who has brought sociological analysis to bear on the teaching of reading and writing (Luke, 1991, 1992a, 1993). Carmen Luke, also from Australia, had written extensively on feminist pedagogy (Luke, 1992b, 1994). Sarah Michaels, from the USA, has had extensive experience in developing and researching programs of classroom learning in urban settings (Michaels, 1986; Michaels, O'Conner, and Richards, 1993). Martin Nakata, an Australian, had researched and written on the issue of literacy in indigenous communities (Nakata, 1993).

Our purpose for meeting was to engage on the issue of what to do in literacy pedagogy on the basis of our different national and cultural experiences and on the basis of our different areas of expertise. The focus was the big picture, the changing word and the new demands being placed upon people as makers of meaning—in changing workplaces, as citizens in changing public spaces and in changing dimensions of our community lives, our lifeworlds.

We decided that the outcomes of the New London discussions could be encapsulated in a single word—'Multiliteracies'—a word we coined to describe two important arguments we might have with the emerging cultural, institutional and global order. The first was the

growing significance of cultural and linguistic diversity (see also May, *Language Education, Pluralism and Citizenship*, Volume 1). The news on our television screens scream this message at us on a daily basis. And, in more constructive terms, we have to negotiate differences every day, in our local communities and in our increasingly globally interconnected working and community lives (see also Block, *Language Education and Globalization*, Volume 1). As a consequence, something paradoxical was happening to English. At the same time as it was becoming a *lingua mundi*, a world language, and a *lingua franca*, a common language of global commerce, media and politics, English was also breaking into multiple and increasingly differentiated 'Englishes', marked by accent, national origin, subcultural style and professional or technical communities. Increasingly, the key communicative challenge was to be able to cross linguistic boundaries, even within English. Gone were the days when learning a single, standard version of the language was sufficient. Migration, multiculturalism and global economic integration daily intensified this process of change. The globalisation of communications and labour markets made language diversity an ever more critical local issue.

The second major shift encompassed in the concept of Multiliteracies was the influence of new communications technologies. Meaning was increasingly being made in ways that were multimodal—in which written-linguistic modes of meaning are part and parcel of visual, audio and spatial patterns of meaning. The New London Group considered the multimodal ways in which meanings are made in places such as the (then very new) World Wide Web, or in video captioning, or in interactive multimedia, or in desktop publishing, or in the use of written texts in a shopping mall. To find our way around this emerging world of meaning required a new, multimodal literacy.

These two developments, the group concluded, had the potential to transform both the substance and pedagogy of literacy teaching in English, and in the other languages of the world. No longer did the old pedagogies of a formal, standard, written national language have the use they once had. Instead, the Multiliteracies argument suggested an open ended and flexible functional grammar which assists language learners to describe language differences (cultural, subcultural, regional/national, technical, context specific, etc.) and the multimodal channels of meaning now so important to communication.

The outcome of the New London meeting was a jointly authored paper—we decided to call ourselves the 'New London Group'—which was later published in the Spring 1996 edition of the *Harvard Educational Review*: 'A Pedagogy of Multiliteracies: Designing Social Futures' (New London Group, 1996) and subsequently, a book, *Multiliteracies: Literacy Learning and the Design of Social Futures*

published in Australia by Macmillan and in the UK and North America by Routledge in 2000 (Cope and Kalantzis, 2000). As one measure of how far the idea has travelled in the subsequent decade, a Google search in 2007 returned 140,000 web pages that mentioned the word ‘multiliteracies’.

#### MAJOR CONTRIBUTIONS: CHANGING SOCIETY AND CHANGING LITERACIES

The changing social worlds of work, citizenship and identities, require a new educational response. This was the core proposition underlying the Multiliteracies agenda from the start.

To take the world of work, the imagery of the old world of work is familiar—the factories with smokestacks piercing the horizon which we used to see as signs of progress. Behind the factory walls was the heavy plant which added up to the fixed assets of industrial capitalism. Geared for long-run mass production of manufactured things, human beings became mere appendages to the machine. Indeed, the logic of the production line minimised human skill requirements, as tasks were divided into smaller and smaller functions—screwing this particular bolt onto the manufactured object as it went past on the conveyor belt. This was the human degradation of the modern factory. It was also its genius, to arrange technology in such a way as to be able to manufacture items of unprecedented technological sophistication (such as Marconi’s radio set, or Henry Ford’s motor car), using an unskilled workforce (Cope and Kalantzis, 1997a).

Old education systems fitted very neatly into this world of work. The state determined the syllabus, the textbooks followed the syllabus, the teachers followed the textbooks, and the students followed the textbooks, hopefully, in order to pass the tests. Henry Ford knew what was best for his customers—‘any colour you like, so long as it’s black’—and the state knew what was best for children. And, in a way, teachers became a bit like production line workers, slaves to the syllabus, the textbooks and the examination system (cf. Wiley, Language Policy and Teacher Education, Volume 1). The curriculum was packed with information in the form of quite definite facts—‘facts’ about history, facts about science and language facts in the form of ‘proper grammar’ and correct spelling. Together, this was supposed to add up to useful-knowledge-for-life. Many of these facts have proven to be less durable than the curriculum of that time seemed to have been promising. Nevertheless, there was one important lesson which ‘good’ students took into the old workplace. From all the sitting up straight and listening to the teacher, from all the rigid classroom discipline, from all the knowledge imparted to them and uncritically

ingested, they learnt to accept received authority and to do exactly as they were told (Kalantzis and Cope, 2001a).

The 'basics' of old learning were encapsulated in the 'three Rs'—reading, writing and arithmetic. The process was learning by rote and knowing the 'correct answers'. 'Discipline' was demonstrated in tests as the successful acquisition of received facts and the regurgitation of rigidly defined truths. This kind of education certainly produced people who had learnt things, but things which were too often narrow, decontextualised, abstract and fragmented into subject areas artificially created by the education system. More than anything, it produced compliant learners, people who would accept what was presented to them as correct, and who passively learnt off by heart knowledge which could not easily be applied in different and new contexts. They may have been superficially knowledgeable (Latin declensions, or the grammar of adverbial clauses, or the rivers of national geography, or the dates of European history), but they did not have knowledge of sufficient depth for a life of change and diversity. It was a knowledge that was appropriate for a time that imagined itself as ordered and controllable (Cope and Kalantzis, 1993).

If the predominant image of the old economy was the factory and the smokestack, the image of the so-called 'new economy' is the worker sitting in front of a computer screen. Information and communications technologies dominate this 'knowledge economy'. Actually, despite the hype, we do not just live on knowledge, as if the economy has suddenly abandoned making things for trading in information and symbols. We cannot live on symbols alone. But symbols are nevertheless everywhere. They are at the heart of new technologies, and especially the technologies of digital convergence—in the areas of communications, automated manufacturing, e-commerce and the media. Even in the manufacturing sector where people still energetically make things, they now make them using screen-based interfaces, and these are linguistically, visually and symbolically driven. The production line is still there, but now robots are screwing on the bolts. These technologies, moreover, are constantly shifting.

The new technologies are software rather than hardware intensive, as well as flexible and open to multiple uses. Software replacements are made far more frequently than was the case for plant replacement in the old economy. This means that technical knowledge has a shorter and shorter shelflife. Upskilling needs to occur continuously. Indeed, contrary to the old economy process of de-skilling, you need to be multiskilled, to be more flexible, more able to undertake a range of tasks, and able to shift from one task to another, as needs be. The key competitive advantage for an organisation, even the value of that organisation, is no longer grounded in the value of its fixed assets

and plant, or at least not in that alone, but in the skills and knowledge of its workforce. Indeed, technology is now very much a relationship between tools and the knowledge of these tools in people's heads. Wealth increasingly has a human-skills rather than a fixed-capital basis.

Meanwhile, diversity is everywhere in the new economy organisation, and working with culture in fact means working with diversity. Instead of Henry Ford's assertion in which individual customer needs are irrelevant because customers are all the same, organisations now want to be close to customers, to find out what they really want, and to service their needs in a way which works for them. Taking customer service seriously inevitably means discovering that people are different, according to various combinations of age, ethnic background, geographical location, sexual orientation, interest, fashion, fad or fetish. 'Serving niche markets', this is called, and systems of 'mass customisation' are created at the point where 'high tech' meets 'soft touch'—such as the e-commerce systems or hotel registration procedures which build up the profile of a customer, and their precise needs and interests.

Then, there is the diversity within the organisation. Teams work with high levels of interpersonal contact, and work best, not when the members are forced to share the same values, but when differences—of interest, association, network, knowledge, experience, lifestyle and languages spoken—are respected and used as a source of creativity, or as a link into the myriad of niches in the world in which the organisation has to operate. This world of diversity exists both at the local level of increasingly multicultural societies, and at the global level where distant and different markets, products and organisations become, in a practical sense, closer and closer (Cope and Kalantzis, 1997a).

We are in the midst of a technology revolution, moreover, which not only changes the way we work but also the way we participate as citizens. From the old world of broadcasting to the new world of 'narrowcasting', consider what has happened to one of the media, television. Instead of the pressures to conformity, pressures to shape your person in the image of the mass media when everybody watched the old 'national networks', we now have hundreds of channels on cable or satellite television. These channels cater, not to the 'general public', but to ever-more finely defined communities: the services in different languages, the particular sporting interests, the genres of movie. Added to this, we are now watching on-demand TV streamed through the internet.

In fact, to take the internet of today, the millions of sites reflect any interest or style you want to name, nurturing a myriad of ever-more finely differentiated communities. Then there is the phenomenon of 'pointcasting' or syndication feeds, where the user customises the

information feed they want—requesting information to be streamed to them only about a particular sporting team, a particular business sector, a particular country of origin. As a part of this process, the viewer becomes a user; transmission is replaced by user-selectivity; and instead of being passive receptors of mass culture we become active creators of information and sensibilities which precisely suit the nuances of who we are and the image in which we want to fashion ourselves.

In fact, digital convergence turns the whole media relationship around the other way—the digital image of a baby which can be broadcast to the world through the internet, or the digital movie which you can edit on your computer, burn on a CD or broadcast from your home page or YouTube. There is simply more scope to be yourself in this technology environment, and to be yourself in a way which is different. The technology convergence comes with cultural divergence, and who knows which is the greater influence in the development of the other? The only thing which is clear is that technology is one of the keys to these new kinds of self expression and community building. It is part of a process of creating new persons—persons of self-made identity instead of received identity, and diverse identities rather than a singular national identity. In this context, senses of belonging will arise from a common commitment to openness and inclusivity.

So what do all these changes in technology, work and community mean for education? The essence of old basics was encapsulated simply in the subject areas of the ‘three Rs’: reading, writing and arithmetic. Actually, the very idea of the basics indicated something about the nature of knowledge: it was a kind of shopping list of things-to-be-known—through drilling the ‘times tables’, memorising spelling lists, learning the parts of speech and correct grammar. This is not to say that multiplication or understanding the processes of written communication no longer have educational worth—they do, but in a different pedagogical form. The problem was with the former orientation to knowledge: first, the assumption that this kind of knowledge was a sufficient foundation; second, that knowledge involved clearly right and wrong answers (and if you were in any doubt about this, the test results would set you straight); and third, that knowledge was about being told by authority and that it was best to accept the correctness of authority passively. If the underlying lesson of the old basics was about the nature of knowledge, then it is a lesson which is less appropriate in a world which puts a premium on creativity, problem solving and the active contribution of every person in a workplace or community setting.

The fancier contemporary words for these old ‘basics’ are literacy and numeracy. And of course, mathematics, reading and writing are

today as important as ever, perhaps even more important. However, literacy and numeracy can either stand as substitute words for the old basics, or they can mean something new, something appropriate to the new learning. When they are merely substitute words for the old basics, they are mostly no more than statements of nostalgic regret for a world which is disappearing, or else they reflect our incapacity as adults to imagine anything different from, or better than, our own experiences as children at school. 'Let's get back to the basics' people say, and the operative words are 'get back'.

When we use the term 'new basics' we are indicating a very different approach to knowledge. Mathematics is not a set of correct answers but a method of reasoning, a way of figuring out a certain kind of system and structure in the world. Nor is literacy a matter of correct usage (the word and sentence-bound rules of spelling and grammar). Rather, it is a way of communicating. Indeed, the new communications environment is one in which the old rules of literacy need to be supplemented. Although spelling remains important, it is now something for spell-checking programs, and email messages do not have to be grammatical in a formal sense (although they have new and quirky conventions which we have to learn-as-we-go—abbreviations, friendly informalities and cryptic 'in' expressions). And many texts involve complex relationships between visuals, space and text: the tens of thousands of words in a supermarket; the written text around the screen on the news, sports or business programs on the television; the text of an ATM; websites built on visual icons and active hypertext links; the subtle relationships of images and text in glossy magazines. Texts are now designed in a highly visual sense, and meaning is carried as much visually as it is by words and sentences (Kalantzis and Cope, 2001a, 2004, 2005).

This means that the old basics which attempt for whatever reason to teach adverbial clauses of time or the cases around the verb 'to be', need to be supplemented by learning about the visual design of texts (such as fonts and point sizes—concepts which only typesetters knew in the past). It also means that the old discipline division between language and art is not as relevant as it once was.

Nor is literacy any longer only about learning so called 'proper usage'. Rather, it is also about the myriad of different uses in different contexts: this particular email (personal, to a friend), as against that (applying for a job); this particular kind of desktop publishing presentation (a newsletter for your sports group), as against that (a page of advertising); and different uses of English as a global language (in different English speaking countries, by non-native speakers, by different subcultural groups). The capabilities of literacy involve not only knowledge of grammatical conventions but also effective

communication in diverse settings, and using tools of text design which may include word processing, desktop publishing and image manipulation.

More than new contents like these, however, the new basics are also about new kinds of learning. Literacy, for instance, is not only about rules and their correct application. It is about being faced with an unfamiliar kind of text and being able to search for clues about its meaning without immediately feeling alienated and excluded from it. It is also about understanding how this text works in order to participate in its meanings (its own particular 'rules'), and about working out the particular context and purposes of the text (for herein you will find more clues to its meaning to the communicator and to you). Finally, literacy is about actively communicating in an unfamiliar context and learning from your successes and mistakes.

Education always creates 'kinds of persons'. The old basics were about that: people who learnt rules and obeyed them; people who would take answers to the world rather than regard the world as many problems-to-be-solved; and people who carried 'correct' things in their heads rather than flexible and collaborative learners. The new basics are clearly things which set out to shape new 'kinds of persons', persons better adapted to the kind of world we live in now and the world of the near future.

#### WORK IN PROGRESS: THE MEANING-MAKING PROCESS

The 'Multiliteracies' idea addresses some of the major dimensions of the change in our contemporary communications environment. Once, literacy could be understood as the business of putting words in sentences on pages, and doing this correctly according to the standard usage. Now literacies, in the plural, are inevitably multiple, in two major ways. The first is the many kinds of English literacy at work in many different cultural, social or professional contexts. As much as English is becoming a global language, these differences are becoming ever more significant to our communications environment. The second is the nature of new communications technologies. Meaning is made in ways that are increasingly multimodal—in which written-linguistic modes of meaning interface with visual, audio, gestural and spatial patterns of meaning.

The starting point for the Multiliteracies framework is the notion that knowledge and meaning are historically and socially located and produced, that they are 'designed' artefacts. But more than artefacts, Design is a dynamic process, a process of subjective self-interest and transformation, consisting of (i) The Designed (the available meaning-making resources, and patterns and conventions of meaning

in a particular cultural context); (ii) Designing (the process of shaping emergent meaning which involves re-presentation and recontextualisation—this never involves a simple repetition of The Designed because every moment of meaning involves the transformation of the Available Designs of meaning); and (iii) The Redesigned (the outcome of designing, something through which the meaning-maker has remade themselves and created a new meaning-making resource—it is in this sense that we are truly designers of our social futures) (Cope and Kalantzis, 2000).

Two key aspects of the notion of Design distinguish it from the approach to the question of teaching language conventions taken by many earlier traditions of literacy pedagogy: variability and agency. Traditional grammar teaching, for example, taught to a single social-linguistic end: the official, standard or high forms of the national language (cf. Tollefson, *Language Planning in Education*, Volume 1). The issue of language variability was barely part of the teaching process. And always closely linked to this issue of variability is the issue of agency or subjectivity. The language experiences students brought to learning traditional grammars, for instance, were irrelevant; the aim was to induct students into the standard written form through a pedagogy of transmission. School was about the reproduction of received cultural and linguistic forms.

The Design notion takes the opposite tack on both of these fronts: the starting point is language variation—the different accents, registers and dialects that serve different ends in different social contexts and for different social groups. And the key issue of language use is agency and subjectivity—the way in which every act of language draws on disparate language resources and remakes the world into a form that it has never quite taken before. The reality of language is not simply the reproduction of regularised patterns and conventions. It is also a matter of intertextuality, hybridity and language as the basis of cultural change. In this sense, language is both an already Designed resource and the ground of Designs for social futures.

What, then, is the scope of the Designs of meaning? One of the key ideas informing the notion of Multiliteracies is the increasing complexity and interrelationship of different modes of meaning, in which language is often inseparably related to other modes of meaning. We have identified a number of major areas in which functional ‘grammars’—metalanguages which describe and explain patterns of meaning—are required: Linguistic Design, Visual Design, Audio Design, Gestural Design, Spatial Design and Multimodal Design, in which meanings are made in the relation of different modes of meaning. Particularly with the rise of new information and communications

technologies, these different modes of meaning are increasingly interrelated—in email, in desktop publishing, in video and in multimedia and hypermedia. This means that literacy teaching has to move well beyond its old, disciplinary boundaries.

As the basis for interpreting and creating meaning in this environment, we might usefully ask the following five questions.

1. *Representational*—What do the meanings refer to?
2. *Social*—How do the meanings connect the persons they involve?
3. *Organisational*—How do the meanings hang together?
4. *Contextual*—How do the meanings fit into the larger world of meaning?
5. *Ideological*—Whose interests are the meanings skewed to serve?

The answers to these questions form the basis for a functional grammar, for naming the ‘what’ of the particular representation of a particular meaning in relation to its ‘why’.

Such questions are not the basis for rules of correct usage that students might learn. Rather, they are concepts that might be used in an educationally useable contrastive linguistics. They are tools which students can use to assess the reasons why particular Design choices are made in particular cultural and situational contexts. They are, in other words, a heuristic by means of which students can describe and account for Design variations in the world of meaning. The aim is to give students a sense of how patterns of meaning are the product of different contexts—particularly, in the changing contexts created by new communications technologies and the diverse and intercultural contexts in which language is used.

#### PROBLEMS AND DIFFICULTIES: TEACHING AND LEARNING

So how does the Multiliteracies view of the changing communications environment and its conception of the process of meaning translate into the pragmatics of pedagogy? The Multiliteracies framework proposes that teaching and learning should be approached from four angles, from the perspective of four orientations. There is nothing terribly surprising in each of these four angles; each is well represented in the history of educational theory and in teachers’ contemporary pedagogical practices. However, all four need to be part of the learning process, though not necessarily in any particular fixed sequence or as neatly separate bits.

Teaching and learning about the Design of meaning, should include a mix of: Situated Practice, Overt Instruction, Critical Framing and Transformed Practice.

*Situated Practice* involves immersion in experience and the utilisation of Available Designs, including those from the students' lifeworlds and simulations of the relationships to be found in workplaces and public spaces. For example, this could involve immersion in Designs of meaning that make 'intuitive' sense, common sense, or at least something more than half sense. In a learning situation this might involve either working with Designs derived from students' own lifeworld experiences, or throwing students in at the deep end with less familiar Designs that will make perhaps only half sense at first, but providing lots of contextual clues. Successful teaching and learning using this pedagogical angle would culminate in a communication problem solved, albeit perhaps intuitively, or with an expert's help, or with scaffolded assistance.

*Overt Instruction* involves systematic, analytical, and conscious understanding. In the case of Multiliteracies, this requires the introduction of explicit metalanguages which describe and interpret the Design elements of different modes of meaning. For example, this involves developing a language that describes the patterns in Available Designs of meaning, how we do Designing and how meaning becomes Redesigned. 'How much does new text express voice and experience?' we might ask. Evidence of successful teaching and learning from the angle of Overt Instruction might be when students have a way to describe the processes and patterns of Design in a meaningful way.

*Critical Framing* means interpreting the social and cultural context of particular Designs of meaning. This involves the students standing back from the meanings they are studying and viewing them critically in relation to their context. For example, how does a Design fit in with local meanings and more global meanings? What is the purpose of the Design? What's it doing? To whom? For whom? By whom? Why? To what effect? What is the immediate social context (localised and particular structures, functions, connections, systems, relationships, effects)? What is the larger social context (culture, history, society, politics, values)? Evidence of successful teaching and learning from this pedagogical angle would be when students show that they know what the Design is for—what it does and why it does it.

*Transformed Practice* entails transfer in meaning-making practice, which puts a transformed meaning to work in other contexts or cultural sites. For example, this might involve applying a given Design in a different context, or making a new Design. It might involve taking a meaning out of context and adapting it in such a way that it works somewhere else. This will inevitably involve students adding something of themselves to the meaning. It will also involve intertextuality (the connections, influences, recreation of other texts and cross-references of history, culture and experience) and hybridity (a Design

has voice, but where does the ring of familiarity come from?). Successful teaching and learning from this particular angle will involve either good reproduction (if that's the game) or some measure of the extent and value of creativity in the transformation and the aptness of the transformation or transfer to another context (does it work)?

These four aspects of pedagogy do not form a rigid learning sequence. Rather, they are four essential elements in a full and effective pedagogy. The Multiliteracies framework aims to supplement—not critique or negate—the various existing teaching practices. In fact, each of the aspects of the pedagogy represents a tradition in pedagogy in general. So, Situated Practice sits in the tradition of many of the various progressivisms, from Dewey to whole language and process writing. Overt Instruction sits in the tradition of many teacher-centred transmission pedagogies, from traditional grammar to direct instruction. Critical Framing is in the more recent tradition of critical literacy. Transformed Practice is somewhat harder to place, but its antecedents are various strategies for transfer of learning from one context to another, turning theory into practice, and so on.

The Multiliteracies case is that all four aspects are necessary to good teaching, albeit not in a rigid or sequential way. And when all four aspects are put together, each is at least softened, and at best transformed by the others. Situated Practice when linked to Overt Instruction is no longer simply situated—in the mindless, populist, commonsense, atheoretical, introspective, liberal-individualist way that many progressivisms are. Overt Instruction when linked to Situated Practice becomes more like teacher scaffolding than teacher-centred transmission pedagogy. Critical Framing when linked to the others becomes more grounded, and less airy-ideological. Yet, the four aspects of the pedagogy do dialogue with the main traditions in teaching, problematic as each of these may be.

The four aspects represent, in one sense, pedagogical universals. The paradox of these universals, however, is their departure point is from the inevitably heterogeneous lifeworlds of Situated Practice. And, to load paradox on paradox, the other three pedagogical angles involve three forms of departure from the Situated, but without ever leaving the Situated behind. The Situated is the realm of the lifeworld, of original 'uneducated' experience, of pragmatic everyday life. Each of the other three pedagogical angles, in its own way, expands the horizons of the lifeworld. Overt Instruction makes implicit patterns of meaning explicit; Critical Framing interrogates contexts and purposes; Transformed Practice takes meanings and subjectivity into new and less familiar domains.

Starting with the cultural phenomena of the lifeworld and always returning to those cultural phenomena, the other three angles add

perspectives of depth and breadth. To take the depth dimension, we need to go beyond our reading of the phenomena of culture and differences and measure these phenomena against the deep structures of everyday life and meaning (which are harder to see when you are immersed in them) and the moral facts of our species being. This involves suspension of belief or 'bracketing': critical thinking, systems thinking, reflexivity, holistic thinking, working through interrelations between apparently separate phenomena, and figuring out paradox and contradiction.

And, on a breadth dimension, we need to undertake the process of crosscultural comparison; how does this particular lifeworld, our lifeworld (or, to be more precise, each of the layers of the multiplicity of overlapping lifeworld sources which constitutes our daily experience), measure up against alternative ways of being human, of doing culture? Nor is this crosscultural breadth simply the view of a disinterested observer, in the manner of a kind of anthropological curiosity. In an era of increasing local diversity and global interconnectedness, this breadth must be the stuff of practice, of learning by constantly crossing cultural boundaries, of shunting between one lifeworld context and another. Both depth and breadth dimensions are processes for 'denaturalising' the lifeworld, of making the everyday strange in order to cast new light on it and so as to have a more informed basis upon which to design both imminent meanings and our larger social futures.

#### FUTURE DIRECTIONS: APPLICATIONS OF THE MULTILITERACIES CONCEPT

In the decade since the first publication of the original Multiliteracies manifesto in the *Harvard Educational Review*, considerable work has been done internationally, including in South Africa (Newfield and Stein, 2000), Malaysia (Kalantzis and Pandian, 2001; Pandian, 1999), and in Greece (particularly in the work of Intzidis and Karantzola). This work has also been represented in a number of overview publications and anthologies (Cope and Kalantzis, 1997b; Kalantzis and Cope, 2000, 2001b; Kalantzis, Varnava-Skoura, and Cope, 2002). There have also been many applications of the multiliteracies notion beyond the original New London Group and the expanded group of international collaborators, including several books (Healy, 2000; Newman, 2002; Unsworth, 2001) and numerous academic articles.

The annual Learning Conference ([www.LearningConference.com](http://www.LearningConference.com)), continues to be a focal point for discussions of Multiliteracies and for presenting the ongoing work of various members of the New London Group. In recent years, the Learning Conference has been held in Malaysia (Penang, 1999), Australia (Melbourne, 2000), Greece

(Spetses, 2001), China (Beijing, 2002), the United Kingdom (London University, 2003), Cuba (Institute of Pedagogical Sciences, 2004), Spain (University of Granada, 2005) and Jamaica (Montego Bay Teachers' College, 2006). The conference now attracts approximately 800 people annually. The conference papers are published in the *International Journal of Learning* ([www.Learning-Journal.com](http://www.Learning-Journal.com)).

Recent work extending and developing the Multiliteracies notions have included Kress's work on images and multimodality (Kress and van Leeuwen, 1996) and contemporary media (Kress, 2003), James Paul Gee's work on video games (Gee, 2003, 2005), Kalantzis and Cope's work on pedagogy (Kalantzis and Cope, 2004, 2005) and a growing literature applying the Multiliteracies concept to the world of digital information and communications technologies (Chandler-Olcott and Mahar, 2003; Cope and Kalantzis, 2003; 2004).

# THE POLITICS OF ENGLISH LANGUAGE TEACHING<sup>1</sup>

## INTRODUCTION

Because of its close association with structuralist and, later, Chomskyan linguistics, English language teaching (ELT) remained apolitical for a long time, treating language learning as the psycholinguistic mastery of value-free grammar for instrumental purposes. The uses of ELT in the process of colonization, the purposes of Cold War cultural hegemony, and the needs of economic globalization could be identified as other historical motivations for the delay in addressing the politics of ELT (see Canagarajah, 2005). It is only fairly recently, in the early 1990s, that issues of power have received sustained attention (see also Janks, *Teaching Language and Power*, Volume 1). Though it was initially treated as another optional school or method under the label critical pedagogy (hereafter CP), a power-sensitive orientation has quickly pervaded all areas of ELT. Although many teachers still find it uncomfortable to directly address the politics of ELT, a social and ideological sensitivity colors everything we do in the profession in unacknowledged and subtle ways. No sensible professional can practice ELT today without being alert to the heterogeneity of English varieties, the conflicting claims of community and identity, the values behind methods and materials, and unequal classroom relationships and roles.

## EARLY DEVELOPMENTS

The early developments of a political orientation were understandably structuralist and Marxist. Phillipson's (1992) *Linguistic Imperialism*

---

<sup>1</sup> Due to limited space, this chapter focuses only on the conceptual debates and theoretical considerations relating to English language teaching. For how these considerations are negotiated in diverse classrooms at the everyday level, see ethnographies such as Canagarajah, 1999; Lin and Martin, 2005, Heller and Martin-Jones, 2001. A comprehensive geographical coverage of scholarship and pedagogy is not attempted here. The works reviewed derive mostly from ESL situations in North America and the postcolonial contexts. For a consideration of issues relating to EFL in Europe, see Phillipson, *Language Policy and Education in the European Union* (Volume 1). There is of course an under-representation of research and pedagogical practices in periphery communities in mainstream journals. Makoni et al. (2005) highlight this problem and also introduce some themes important for such communities.

critiqued the intentions of British Council and other Anglo-American institutions sponsoring ELT worldwide. Showing how the dominant pedagogical assumptions based on monolingualist norms and the methods and materials influenced by Anglo-American interests affected the educational autonomy and socioeconomic development of other communities, Phillipson hoped for a time when the rise of global languages would challenge the dominance of English. Other scholars critiqued the hidden curriculum of ELT in American second language teaching contexts (Auerbach, 1993; Benesch, 1993; Pennycook, 1989). Though Freirean approaches were beginning to inspire a consideration of micro-level instructional relationships, offering the possibility of student empowerment, the early scholarship was still on broad issues of curriculum. It would take a different theoretical lens to address the manifestation of power in more local and personal contexts of language and education.

The next wave of scholarship, informed by the Frankfurt school of critical theory and poststructuralist orientations, opened ELT to issues of consciousness, discourse, and agency (see Canagarajah, 1993b; Peirce, 1995; Pennycook, 1994). The possibility of appropriating English in terms of local interests, and the resultant pluralization of English, shifted the discussion to resistance from within the field of ELT. We did not have to wait for challenges to English from outside—as Phillipson anticipated. The hybridity of English language and postcolonial identity provided a useful construct to complicate the interests of western homogeneity in ELT (see Canagarajah, 1999; Pennycook, 1996). However, the discussion was still couched in terms of national or ethnic considerations (i.e. Sri Lankan Tamils in the case of Canagarajah; East Asians in the case of Pennycook). The world systems perspective of Wallerstein informed the discussion as scholars addressed ELT in terms of a hegemonic English-speaking center and a resistant periphery (see also Block, *Language Education and Globalization*, Volume 1). It would take another wave of theoretical movements to critique the smug multiculturalist discourses fashionable in the West and address power in terms of other variables such as gender, race, and sexual orientation. In adopting constructivist and postmodern perspectives, later scholarship situates teachers and learners in multiple variables and discourses to consider the complex negotiations needed to engage with power in ELT.

Though the beginnings were late, it is remarkable that within a short period the political orientation has become very complex, keeping itself open to critique, rethinking, and paradigm shifts, constituting a vibrant movement in the profession. The CP orientation still maintains a healthy pluralism and openness to new pedagogical questions and research methods.

## MAJOR CONTRIBUTIONS

We can consider the contributions of a political orientation to ELT according to several exemplary areas of critical learning and teaching. While we already have a string of labels with the adjective “critical” attached to it—such as critical contrastive rhetoric (Kubota, 1999), critical classroom discourse analysis (Kumaravadivelu, 1999), critical writing (Canagarajah, 1993a), critical applied linguistics (Pennycook, 2001; *Critical Applied Linguistics and Language Education*, Volume 1), and critical EAP (Benesch, 2001)—we do not have to stop there. A critical orientation has infiltrated many other pedagogical domains, even if no labels may have been coined yet. Here is a sampling of the contributions of CP.

*Learning Processes and Teaching Methods*

In recent pedagogical discourse, a process-oriented, student-centered, task-based approach has been treated as the most effective for teaching/learning. The ELT research and professional circles have treated this as “the optimum interactional parameters within which classroom language learning can take place” (Holliday, 1994, p. 54). Myron Tuman (1988) describes how the change toward process-oriented approaches of writing in the American academy is unconditionally treated as a more progressive pedagogical development. From this perspective, pedagogical cultures in many non-Western communities are denigrated. Not only are they essentialized as product-oriented, teacher-dominated, and passive, they are also considered pedagogically dysfunctional for those reasons. Therefore, teachers have attempted to impose the process-oriented pedagogy on other communities, assuming that it is more democratic and empowering (see Pennington, 1995). CP has complicated this pedagogical ideal with new realizations:

1. The social and psychological complexity of product-oriented learning is evident when we situate it in context. Students who are older (Leki, 1991) or those learning for academic/instrumental reasons (Chen, Warden, Chang, 2005) may thrive from a product-oriented approach. Even in the case of the much disparaged memorization techniques of Chinese students, one has to consider the fresh uses to which others’ words are put (Pennycook, 1996).
2. Product-oriented learning may have oppositional significance. Students sometimes resist the cultural and ideological baggage that accompanies communicative English by resisting active use of the language or just acquiring enough to pass their examinations (Canagarajah, 1993b; Muchiri et al., 1995; Resnick, 1993). Teachers are now more sensitive to the ways in which students might negotiate

the dominant materials and methods to suit their values and interests.

3. The search for the best method is actually a myth (Prabhu, 1990). The periodic popularization of new methods is driven by marketing and power considerations of research centers, publishing houses, and scholarly communities (Canagarajah, 2002; Pennycook, 1989). What is now called the postmethod realization insists that practitioners in the professional periphery should develop teaching strategies that are more relevant to their pedagogical contexts, rather than depending on the center for methods that are considered authoritative. Such an approach is pedagogically empowering.

### *Literacy Practices*

CP has also politicized literacy in English. Literacy was traditionally perceived as the impersonal decoding or encoding of detached texts (in the product-oriented tradition) or the dynamic cognitive strategies that construct personal meaning in the text (in the process-oriented tradition). The pedagogy failed to interrogate the content and genre conventions that shape textual meaning. CP helped inquire how literacy can serve to empower the student and the community. Presently, there are more critical studies relating to macro-textual domains than those on the use of grammar or vocabulary (but see Morgan, 1998). Though we have a well-established critical tradition on orientating to sentence-level rules from the time of critical linguistics (Fowler and Kress, 1979) and stretching to more recent forms of critical discourse analysis (Fairclough, 1995), there are few teachers who use these approaches in the classroom. At the discourse level, CP has corrected the English as an Academic Purposes (EAP) orientation that while academic conventions may be value-ridden and favor dominant ideologies, these are the conventions that students of all languages have to master in order to succeed in the educational setting. Benesch (1993) has taken this pragmatism to task. She has shown that leaving the underlying values and interests of a genre unquestioned is itself an ideological position and is by no means neutral. CP has argued for the need to teach students the ways in which these conventions serve to exclude membership in the academic community. It has shown the ways in which the typical academic posture of detachment and objectivity exclude other ways of knowing that are more empathic and personal, including writings that are more involved and narrative, from women and other minority communities (see Canagarajah, 2002). Benefiting from perspectives of feminism, poststructuralism, and post-colonialism on voice and hybridity, many practitioners have worked

toward enabling ESL writers to negotiate the established conventions in their favor to develop multivocal texts (Belcher and Connor, 2001; Casanave and Vandrick, 2003). CP has also exposed how cultural descriptions of L2 writing suppress the complexity, historical dynamism, and even conflicts *within* cultures and subcultures (Kubota, 1999). In fact, with English enjoying hegemonic status globally, it is naive to treat students from other cultures as employing an uncontaminated “native” discourse. CP has argued for the need to make students critique their own discourses as well as that of English in order to practice a critical writing that negotiates cultures (see Canagarajah, 2002; Ramanathan, 2004).

### *Orientations to Second Language Acquisition*

Traditionally, we have worked with constructs like *integrative* and *instrumental* motivation (see Gardner and Lambert, 1972) or (more recently, as a corrective to them) *intrinsic* and *extrinsic* motivation (Brown, 1991) to understand effective language learning. The first construct in each pair has emerged as accounting for success. That is, learning a language to join the target speech community (integrative motivation) rather than obtaining practical rewards (instrumental motivation), or learning a language for self-accomplishment and personal interests (intrinsic motivation) rather than under institutional compulsion (extrinsic motivation) are the valued forms of motivation. However, both sets fail to take account of issues of power in attaining one’s objectives (see also Janks, *Teaching Language and Power*, Volume 1). These constructs give the impression that just having the right motivation will help succeed in language learning. There are serious socioeconomic constraints that shape one’s motivations and the ability to attain one’s objectives. Furthermore, motivations can be contradictory, multiple, and changing. The strategies one adopts to negotiate the available resources in relation to one’s motivation will shape the mastery of the language.

Taking such realities of power and material conditions into account, Bonny Norton Peirce (1995) has come up with the construct *investment*—which is influenced by Bourdieu’s economic metaphors for language learning and usage. Norton Peirce demonstrates how the investment of some of her adult immigrant students in learning English to achieve important symbolic and economic capital for their own and their family’s survival helps them develop counter-discourses and oppositional identities to transcend silence and marginalization in the new language. One’s social positioning and the alternate identities desired in the new community considerably influence the approaches and consequences in language learning. Influenced by these perspectives, we

now have a burgeoning tradition of research on the ways identity is negotiated by students for acquiring English in relation to their social interests and positioning (see Blackledge and Pavlenko, 2004; Hawkins, 2005; Lin et al., 2002).

Another socially grounded orientation to the process of language acquisition is that of joining a community. The model of *legitimate peripheral participation* has opened some interesting avenues in this regard. According to Lave and Wenger (1991), any learning involves practice in the discourses/activities of the dominant community, to the point where the novice develops the proficiency to be accepted as a full member. For this to occur, novices should enjoy access to the discourses of the community and the possibility of protected and nurturing modes of participation. Many scholars have used this perspective to understand how students develop communities in the classroom to scaffold their language learning (Hawkins, 2005; Toohey, 1998). However, agency is sometimes exaggerated and the power of the community is simplified to the point where ESL students are vested with the ability to join any community they want at their own sweet will (see Zamel, 1997). But Paul Prior (1998) reminds us that ESL students cannot leave their history and values at the door step as they enter into a new community. In what he terms a *sociohistoric approach*, he notes that it is the way students employ their cultural and linguistic resources to inform the new discourse that empowers them. It is in this way that they make a contribution to the activity of the new community, enabling it to revise its discourses and democratize its assumptions. Therefore ESL students have to assume that joining a community involves conflict and struggle. Recent studies explore the critical negotiation involved in becoming members of new language or discourse communities (see Canagarajah, 2003; Kramsch and Lam, 1999; Toohey, 1998).

With studies of this nature, we have come a long way from the dominant psycholinguistic models treating learners as a bundle of nervous reflexes. A political orientation treats learners as complex social beings who must negotiate competing subject positions in conflicting discourse communities to shape their practices of language learning. Also critical researchers/teachers orientate to identities as multiple, conflictual, negotiated, and evolving, shifting from the traditional assumption of learner identities as static, unitary, discrete, and given (see Canagarajah, 2004).

### *Classroom Discourse*

Classroom discourse has implications for ELT as it serves as an input and reinforcement for language acquisition. In any pedagogy, it is important to consider how classroom interactions and discourse are

structured. The two dominant traditions of this orientation—i.e. interactional analysis which quantifies turns, length, and direction of utterances in teacher/student interaction in an ethnomethodological fashion and the Labovian and Hymnsian discourse analytical traditions which describe speech events in relation to broader social and cultural contexts—fall short of addressing issues of power. Critical practitioners have developed interpretive frameworks to consider how the typical speech events and interactions in the classroom enforce unequal relations between the teacher and the student, limit the production of new and critical knowledge, and might work against the social interests relevant to the students (Kumaravadivelu, 1999). Others have identified spaces in the classroom that students and sometimes teachers might use to practice discourses oppositional to the policies in the classroom and the school. Especially in the context of English Only in both US and postcolonial classrooms, multilingual teachers and students might use instructional off-sites to introduce other languages. Labeled variously as classroom underlife (Canagarajah, 2004), safe houses (Pratt, 1991), or institutional interstices (Heller and Martin-Jones, 1996), these sites may find manifestation in deviations from the lesson, passing of notes between students, and unauthorized conversations and topics behind the back of the teacher. In most cases, these sites are constructed in locations outside the surveillance of authority figures. These sites are testament to the agency of the disempowered. However controlled or homogeneous the learning environment, students form spaces where they can develop values and interests that matter to them.

### *Target Language*

The research on classroom underlife shows the desire for students to bring other codes into learning. However, ELT has traditionally insisted not only on an English-only classroom but also treated standard British English or General American English as the target to be achieved universally. In the context of legitimized varieties of World Englishes in postcolonial communities (see Kachru, 1986), there are now new questions to be asked: i.e. Whose norms? How proficient? Despite Kachru's arguments in favor of institutionalized varieties of local Englishes in second language contexts, instruction is still based on the traditional Anglo-American standards. However, globalization and the Internet have served to convince people of the need to be multi-dialectal, if not multilingual. We are now beginning to see research on the ways in which students are developing competence in other varieties of English outside the classroom by their own devices (see Harris et al., 2002; Ibrahim, 1999). We are also beginning to see how students bring in other varieties of English into the classroom to negotiate

dominant varieties or appropriate English in their favor (Canagarajah, 1993b; Gebhard, 2005; Martin, 2005).

Discussions of target language should go further to include the place of the first languages ESL students speak. Gone are the days when we treated the L1 as interfering with and even hindering L2 acquisition. We know from recent research that skills and language awareness developed in L1 can transfer positively to L2 (Cummins, 1991), that a validation of the student's L1 can reduce the inhibitions against English and develop positive affect to enhance acquisition (Auerbach, 1993), and that a multilingual self can be formed of diverse languages without being dysfunctional for the students (Kramsch and Lam, 1999). (See also Skutnabb-Kangas, *Human Rights and Language Policy in Education*, Volume 1.) Skutnabb-Kangas considers it a violation of "linguistic human rights" to teach English in isolation from the first languages of the students. She argues that an ELT pedagogy based on English-only can lead to the gradual devaluation of L1 and subtractive bilingualism among students (cf. May, *Bilingual/Immersion Education: What the Research Tells Us*, Volume 5). This unequal relationship of languages can lead to the vernacular declining in currency and English continuing its global hegemony.

In this context, it is important to consider how ELT can foster skills of linguistic negotiation that enable students to move across languages. Teaching English without reference to their first language may handicap students for life in the postmodern multilingual world. Multilingual speakers may use their proficiency in languages for critical English expression. Even teachers who may not have a proficiency in the languages spoken by the students can adopt certain pedagogical strategies to help negotiate codes. These pedagogies have been developed by classroom ethnographers from the surreptitious uses of L1 they detect in the language classroom (see Canagarajah, 2004; Lucas and Katz, 1994). Pairing an English-proficient student with someone less proficient for interaction in their own language, grouping students speaking the same language for collaborative tasks, writing journals in the L1, and translating material in both languages are ways in which L1 can be accommodated in the ESL classroom to assist in critical English expression.

#### WORK IN PROGRESS

Although the work discussed earlier treats identity largely in terms of unitary constructs, such as nationality, race, or ethnicity, recent studies have started exploring how diverse subject positions interact in the learning experience. Gender is an important area of emerging research and pedagogy—as one can note from recent special topic issues in the *TESOL Quarterly* (in Autumn 2004) and the *Journal of Language*,

*Identity, and Education* (in December 2004). Though late to arrive in the field of ELT, research on gender has fashioned a complex framework integrating scholarship in other fields (see also Pavlenko and Piller, *Language Education and Gender*, Volume 1). Researchers attempt to move gender beyond deficit, difference, dominance, and dual-culture perspectives (see Langman, 2004) to treat gender as negotiated and constructed. In doing so, they move away from treating gender as an essentialized or overdetermined construct. Crucial to this shift is the way gender interacts with aspects like immigrant or “non-native” status in ELT (see JLIE articles). In some cases, while women’s chances of learning a second language are curtailed by their lack of opportunities outside the home, in other cases their immigrant status enables them to suspend home cultural expectations and negotiate new competencies and identities effectively. There is, however, a felt need to analyze the constructivist orientation in the light of structural constraints. Lin et al. (2004) examine how gender interacts with diverse institutional hierarchies in ELT (e.g., teacher-trainers vs. teachers). Yet, Langman (2004) is correct to say that current research is tilted toward adult learners and immigrant women in United States, ignoring other identities, and limiting the ability to form generalizations about gender politics in ELT.

Race too is gaining importance in ELT. Researchers are adopting a constructivist orientation and exploring the way race interacts with other constructs like non-nativeness or gender (see the special topic issue of *TESOL Quarterly* in September 2006). The way race complicates native speaker status has been well studied so far. Ironically, speakers of English as a dominant language with non-white traits are stereotyped as non-natives by teachers and students, though they might have been born in the West. Within non-native speakers, on the other hand, those with ‘white’ traits have better prospects of “passing” as native speakers and developing confidence in their use of English, compared to those from non-white backgrounds (see also Pavlenko and Piller, *Language Education and Gender*, Volume 1). Black scholars have also articulated how their status is marginalized, though they are “native” to English (Romney, 2004). The recent publication of an ESL textbook that features Black English, and narratives and images from the Black community, attempts to pluralize ELT (see Romney, 2004).

Research is also underway outside the classroom, in sites such as the Internet and popular culture, to consider the prospects for language learning. Though the Internet has been presented as helping diversify English and providing authority to non-native speakers as it features the global English speech community (Murray 2000; Warschauer, 2000), others see discourses, conventions, and images that are biased

(Selfe and Selfe, 1994). We need more studies that consider how technology is used by learners to negotiate the power inequalities and achieve communicative proficiency (see also Kalantzis and Cope, *Language Education and Multiliteracies*, Volume 1). Similarly, music and popular culture that form the postmodern “transcultural flows” (Appadurai, 1996) are being studied for how they help learners gain new identities and resources for English acquisition. Consider the multidialectal facility students display and the more desirable identities they take up in the hip-hop culture (Ibrahim, 1999; Pennycook, 2003).

As we turn to constructivist research on the ways English provides new, often empowering, identities to English language learners, there is a need to align this with structural and material considerations. It is true that ELT shifted from the earlier political perspective that focused on structural and geopolitical factors to consider the fluid construction of identities at microlevel sites. There was a concomitant ideological shift from overdetermined analyses to volitionist perspectives on empowerment. Scholars now see the need to conduct a more nuanced reading of the interface between the macro and micro, mind and matter, classroom and society as they interact in language learning (see Gebhard, 2005; Hawkins, 2005).

#### PROBLEMS AND FUTURE DIRECTIONS

The politics of ELT must be always sensitive to the changes in social conditions. Power is not a zero-sum game. Power is negotiated, shifting, and constantly reconstituted. As students and teachers address power in ELT contexts, power finds newer and subtler manifestations in the field. There might arise a need to abandon earlier analytical frameworks and construct more relevant ones (see also Janks, *Teaching Language and Power*, Volume 1).

The tension between two broad historical movements is upon us, raising new questions about the place of ELT in all communities. Although non-Western communities were busy working on the decolonization project, the carpet has been pulled from under their feet by another movement, globalization (see Block, *Language Education and Globalization*, Volume 1). It is as if one historical process subsumed another before the first project was complete. There are significant differences in the project of both movements: decolonization entails resisting English in favor of building an autonomous nation-state; globalization has made the borders of the nation-state porous and reinserted the importance of English language for all communities (see Canagarajah, 2006). Apart from the pressures the nation-state is facing from outside, it is also facing pressures from within (as the claims of diverse social groups and ethnic communities within the nation have become more assertive).

Postmodern conditions have also created certain significant changes in discourse, calling for a different orientation to ELT planning. People are not prepared to think of their identities in essentialist terms (as belonging exclusively to one language or culture), their cultures as monolithic (closed against contact with other communities), and their knowledge forms as pure (uniformly local or centralized). It is fair to ask whether these fuzzy constructs, defined in more fluid and hybrid terms, can be used anymore as reliable frameworks for policy statements. On the other hand, increasing multilingualism, cultural pluralism, and the vernacularization of English bring into question the dichotomous ways in which language policies have been formulated: i.e. English or mother tongue? Individual rights or group rights? Mobility or preservation? (For recent debates, see Modiano, 2004). While we respond to these changes with suitable modification in the ways we articulate language rights, we mustn't simplify the significance of power differences between languages and communities, the continued importance of identities and groups in policy making, and the need for protecting minority interests.

In the midst of all this, scholars of the emerging school of *Lingua Franca English* find that there are new communicative norms developing as English is used for international communication by multilingual speakers (see, e.g., Seidlhofer, 2004). Studying how non-native speakers in the expanding and outer circle interact in English, researchers find that they do not defer to native speaker norms, as used in the inner circle. The scholars have started identifying a *lingua franca* core that seems to facilitate communication among speakers of different varieties. Would English as an international language benefit from the teaching of this *lingua franca* core, rather than the grammar of a specific dominant variety? Furthermore, as there is a need to shuttle between communities in the postmodern world, we have to teach students to negotiate diverse varieties of English in their everyday life. Since teaching one variety at a time is impractical, we have to consider a paradigm shift (for work along these lines, see Holliday, 2005). We have to move away from the traditionally valued "target language" to developing proficiency in a repertoire of Englishes needed in the postmodern world; from our traditional focus on joining a community to shuttling between communities; from the focus on rules of the grammatical system to strategies of negotiation; from an obsession with correctness to negotiating appropriate usage for diverse contexts. Proposals have ranged from teaching language awareness to developing sociolinguistic sensitivity or developing pragmatic strategies for negotiating codes (see McKay, 2005; Seidlhofer, 2004). Still, we have to be careful not to nurture the view that *Lingua Franca English* is a neutral language that all communities can use without inhibitions. Modiano

summarizes the pedagogical dilemma raised by the new status of English in the following way: “Retaining our indigenous cultures and language (s) while reaping the benefits of large-scale integration via a language of wider communication is the challenge many of us will no doubt have to come to terms with in the years to come” (Modiano, 2004, p. 225; see also Phillipson, *Language Policy and Education in the European Union Volume 1*).

## CONCLUSION

The political orientation has left an indelible mark in the field of ELT. It has challenged the dominant discourses of objectivity, pragmatism, and efficiency that characterized the field for a long time. Now we are sensitive to the fact that ELT is an interested activity. We have adopted an ecological orientation that situates language learning clearly in the social context (Phillipson and Skutnabb-Kangas, 1996). Knowledge in the field is now more multilateral, and open to experiences and views from the instructional and geopolitical peripheries. Even research and reporting are influenced by a political perspective (see Canagarajah, 1996). Researchers are now open to questions of ethics, subjectivity, and power as they break away from the positivistic tradition and bring in more diverse methodologies. Similarly, ELT journals are breaking away from the traditional IMRD (i.e., Introduction, Method, Results, Discussion) structure to represent knowledge through narratives, reflection, dialogue, drama, and other genres. Such developments assure us that teachers and researchers will continue to ask questions that relate to issues of power and difference, shaping a more democratic disciplinary discourse.

## LANGUAGE POLICY AND TEACHER EDUCATION

## EARLY DEVELOPMENTS

Language policy in education as an instrument for the promotion of hegemony has been utilized by nation-states over the course of the past five centuries. The scholar Antonio de Nebrija, through the promotion of his Castilian Grammar, was among the first to advocate for overt instruction in a standardized language as a means of advancing the interests of the state (Illich, 1979; Mignolo, 2003). François I of France, shortly thereafter likewise saw the importance of language policy in the interest of national hegemony (Christ, 1997). With the rise of common public schooling during the nineteenth century in a number of Western European countries, as well as in the USA, language policy has been at the core of teacher education, even though teachers have rarely received explicit subject matter preparation in language policy as a subject area. Similarly, with the onset of the 1868 Meiji period, language policy became a major focus of mass education in Japan (Carroll, 2001; Weinberg, 1997). Teachers had to keep pace with reforms in the writing system and the unification of spoken and written language, as well as the incorporation of new concepts into the Japanese language from abroad (Coulmas, 1990; cf. Fujita-Round and Maher, *Language Education Policy in Japan*, Volume 1). The use of vernacular and script reforms became a focus of Chinese educators throughout much of the twentieth century, as the spread of standard Mandarin continues to be a focus of educational policy currently into the twenty-first century (Peterson, 1997; see also Lam, *Language Education Policy in Greater China*, Volume 1). Long in the domain of missionary educators and colonial powers in Africa, educational language policies and the need for professional preparation of teachers of Africa's multilingual populations are ongoing needs in its postcolonial states (see also Heugh, *Language Policy and Education in Southern Africa*, Volume 1). Similarly, teacher education for indigenous language minorities in rural Central and South America represents a major need if educational opportunities are to expand to indigenous populations (see also Godenzzi, *Language Policy and Education in the Andes*, Volume 1; Hamel, *Bilingual Education for Indigenous Communities in Mexico*, Volume 5).

## PROBLEMS AND DIFFICULTIES

Although language policy may be a topic in teacher preparation courses, like other areas of applied linguistics, it is rarely a required area for in-depth study. Teacher preparation curricula place strong emphases on language and literacy education in which policies are prescribed or mandated. With specific reference to language minority student populations, teachers are asked to implement policies that either promote, accommodate, or restrict languages. In dealing with language policy in teacher education, it is necessary to distinguish among language policies that are intended to (1) promote literacy and education in national and/or official languages, (2) accommodate or promote mother tongues and community languages, and/or (3) promote foreign languages and/or languages of wider communication.

The United Nations holds that education is a basic human right without which the rights of citizenship and civic participation cannot be fully enjoyed (Daudet and Sigh, 2001). The promotion of national and common languages is often the primary focus of public or state-supported schooling, given that it allows access to social, economic, and political participation necessary to benefit from the rights of citizenship. The right to an education in one's mother tongue, heritage, or community language(s), was endorsed by the United Nations in a 1953 UNESCO resolution, which called for children to have the right to attain literacy in their mother tongue. The reality is that many nation-states have not seriously engaged this matter (Skutnabb-Kangas, 2000, 2002, *Human Rights and Language Policy in Education*, Volume 1; Wiley, 2002).

The language of the school may be mutually intelligible with the language of the home and community, but often it is not. Thus, a major consideration in teacher education is the extent to which language differences between the child's and the school's language is acknowledged and reflected in instructional and educational policies and instruction. Unfortunately, in many states, educational policy approaches are based on deficit views of language minority status (Churchill, 1986; May, 2001, Chapter 5).

Given that there are around 6,000 languages in the world as well as many social and regional varieties of languages, many children enter schools in which there are differences between their language variety and that used by the school. When instruction is provided in the language of home and community, there typically are fewer "language problems." Children acquire spoken languages naturally based on their interaction with their parents and local speech communities. However, because there are far fewer standardized languages of literacy than spoken ones, and given that few languages have achieved the status of

school languages, promoting literacy may be a problem, particularly if teachers have not been prepared to recognize and accommodate differences between the language of the home and school. Many educators tend to be influenced more by the political climate and common discourse related to citizenship and language diversity than they are informed by theory and research (McGoarty, 2002; see also May, *Bilingual/Immersion Education: What the Research Tells Us*, Volume 5). Moreover, because many teacher educators view language varieties of the community or home as deficient, they do not believe that children should even have a right to instruction in their own language (Smitherman, 2005).

Although, the 1953 UNESCO resolution is supported by constructivist theory and research on the need for students to identify positively with their home and community languages, support for linguistic human rights in education has been mixed. In some countries, there has been gradual recognition of the rights of national minorities to promote their languages based on historical claims (May, 2001). In many countries, however, policy makers have rejected the use of minority languages for other groups, or have lacked the resources or will to promote instruction through them. Similarly, minority languages and “nonstandard” varieties of language have often been rejected, even when they are only to be used to accommodate schooling for language minorities (Ramírez, Wiley, de Klerk, Lee, and Wright, 2005).

Teacher education in many countries involves setting professional standards which may include accreditation of professional programs, licensing via examinations, or certification based on set coursework. Teachers may receive initial or preservice instruction, apprentice preparation, such as student teaching, and ongoing or in-service professional development. Countries such as France, Japan, and Mexico have centralized departments of education whereas the USA uses a federal model, in which states have responsibility for teacher licensing. US states began assuming this responsibility during the late nineteenth century (Darling-Hammond, 2001). Across the various states, however, programs are not uniform.

In some countries, teacher preparation may consist of only the most rudimentary levels of higher education, if even that. Teachers of rural language minority populations in Guatemala, for example, may receive only 1 year of teacher preparation. In 2000, in China, gaps in public education were filled by over 50,000 nonstate educational institutions, with much variation in quality of instruction and teacher preparation (Zhou and Ross, 2004). Despite officially stated requirements for teacher preparation, in some developing nations rural teachers may be only several years ahead of their students, and may be struggling along with their students to attain proficiency in the dominant and/or national language (cf. Heugh, *Language Policy and Education in Southern*

Africa, Volume 1). In certain countries, teachers may be required to receive four or five years of preparation, whereas in other countries they may receive graduate degrees either before or after their certification. Despite these differences internationally, there have been many similarities regarding teacher preparation and expectations for teacher performance with respect to language instruction.

How professional knowledge is conceptualized and presented in practitioner journals is a major concern in teacher education (Darling-Hammond, 2006). Despite their struggles for professional status, in many countries teachers have been viewed as instruments of the state, whose role is to implement national/state policies, rather than to critique or question such policies. In countries where market forces have strong influence, teachers have been viewed more as technicians of instruction, wherein preparation is viewed as a form of apprenticeship. They often lack control over the selection and adoption of materials and may not be able to control or influence instructional policies that would be more equitable for linguistically diverse populations. As Darling-Hammond argues, "Whereas professions typically assume responsibility for defining, transmitting, and enforcing standards of practice, teachers have historically had little or no control over most of the mechanisms that determine professional standards" (2001, p. 260).

Where professional goals and standards were addressed in second and/or foreign language teacher preparation, traditionally they focused on the relationship between language and a "target" culture. Mainstream and second language teachers were taught to teach to an idealized "native-like" competence, foster the ability to speak, and write like a "native speaker," develop insider cultural knowledge of rules of appropriateness so that students could pass, or nearly pass, as a native speaker in accent and articulation; and help students try to blend or assimilate into the target language community. In such preparation programs, there has been little consideration for the maintenance or loss of the learner's first language(s).

Beginning in the late 1990s, US teachers in the English-only states of California, Arizona, and Massachusetts were restricted in the range of program and instructional options they could employ for language minority students (see also Ricento and Wright, *Language Policy and Education in the United States*, Volume 1). The content of teacher preparation programs was constrained and specified approaches to basic literacy education, such as phonics, were prescribed. In cases such as these, political prescription has overridden professional judgment in teacher preparation. Thus, from the perspective of promoting equitable educational language policies, despite these obstacles, teacher preparation programs need to inform teachers about ways in which they may become conflicted by, and complicit in, promoting policies that

disadvantage or discriminate against language minority children (see also Janks, *Teaching Language and Power*, Volume 1).

Some detrimental educational language policies are officially prescribed, but many more are likely to be implicit. Rather than being derived from formal policies of the school, they result more from institutional practices and teachers' folk theories about the importance of language learning and language in learning. Haas (1992) has examined how institutional practices involving language can contribute to institutional racism, which involves systematic practices that have the effect of advantaging some and disadvantaging others, even if such practices were not intended to do so. In his analysis of the state of Hawaii, Haas found a number of language-related school practices that adversely affected language minorities. Historically, oral language tests during the first half of the twentieth century in Hawaii were used to track or segregate "nonstandard" language speakers into separate schools from those with "standard" accents. Language performance also correlated with the ethnic and racial backgrounds of the children. Haas noted that this practice was abolished only after many children of color acquired "mainland sounding accents" (p. 191).

Other examples of biased schooling practices noted by Haas included insufficient use of language minority languages to communicate with parents; unequal grade distributions by race/ethnicity/language background; under-identification of students in need of language assistance; under-serving students needing language assistance; inappropriate staff composition to provide language assistance to language minority students; and discriminatory requirements for language certification among teachers (see pp. 191–214 for elaboration). To this list, other practices can be added: disallowing language minorities equal access to core academic curricula because of their proficiency in the dominant language, holding unequal expectations for the success of language minority children based on their language backgrounds, and failing to provide language minority communities with choice of the language of instruction (Wiley, 1996).

Language assessment policy is another area that needs attention in teacher preparation. Among the more enduring educational practices which needs scrutiny, is the use of language tests as one of the primary means of sorting children into special instructional tracks based on their proficiency, as measured by language tests, in the language of instruction (Hakuta, 1986). Valadez, MacSwan, and Martínez (2002) found misassessment and misclassification to be a major problem among some 6,800 students who allegedly lacked proficiency in both their purported first language and the language of instruction. On a linguistic assessment of 23 grammatical variables, drawn from natural speech samples rather than school-based assessment measures, the students

who were held to be “low achievers,” because of their alleged low levels of language proficiency, were found not to “differ linguistically in any interesting way from other children” (p. 246).

#### MAJOR CONTRIBUTIONS: THEORETICAL AND PROFESSIONAL PERSPECTIVES

Concurrent with the rise of state licensing in the USA, curriculum reformers began placing emphasis on formal language education. Prescriptive notions of standard language were emphasized for college admission. Teachers increasingly were seen as the guardians of “proper” language (Wright, 1980). In classrooms they were admonished to use a formal register for questioning, and their students were expected to answer in a formal recitation register. Children and speakers of nonstandard varieties of language quickly learned that “their oral performance was inadequate even if they did not understand why” (Wiley, 2005, p. 151). The expectation for standard language became a school-based language policy in which use of a standard register, modeled after formal writing, was expected for both oral and written communication.

As Christ (1997) has correctly noted: “Hardly any research has been conducted thus far on language policy in teacher education” (p. 224). Some of the reasons for this relate to the relatively negligible impact that applied linguistics has had on mainstream teacher education and to the perception of teaching as a profession and teacher knowledge more broadly. The applied linguistic knowledge base for second language, foreign language, and bilingual instruction is more developed, teachers may be required to do some foundational work in theory and methodology and some relevant materials are noteworthy (e.g., August and Hakuta, 1998; Baker, 2001; Baetens-Beardsmore, 1993). Moreover, Corson’s (1999) discussion of language policies in schools provides an excellent foundation for considering the range of policies that might be more explicitly addressed in teacher education.

In recent decades in Europe, advances in foreign language theory and instructional methodology drew from work done on the teaching of English as a foreign/second language. During the 1990s, teacher preparation efforts such as the LINGUA project, sought to move beyond that dependency by using learner-centered approaches in in-service training for secondary teachers of German, Spanish, Modern Greek, as well as English (Gewerh, 1998). Other recent work (e.g., Hawkins, 2004) has focused on teaching language as socially situated and variable rather than as merely “the sum of all its grammatical parts” (p. 4). A greater emphasis is placed on the need for teachers to understand the politics of discourses.

Professional organizations have been able to exert some influence on the direction of teacher preparation and ongoing professional development. Associations such as the National Council for Accreditation of Teacher Education (NCATE) in the USA, and the International Reading Association (IRA), exercise considerable influence on setting standards for teacher preparation. In recent years, these organizations have become more attuned to issues of cultural and linguistic diversity, at least within the context of the ideology of accountability, which has manifested itself in the educational standards movement (Wiley, 2005).

Given the push for higher educational standards for all students, this question may be asked: To what extent do educational standards adequately take into consideration and reflect the language needs of all students? Advocates of educational standards contend that standards provide an explicit foundation for measuring student progress against national expectations as well as for cross-national educational comparisons. Student demographics, resources, and materials, however, vary greatly between countries and within them. Language minority students can be disadvantaged by educational standards, particularly when their home and community languages are ignored or held in low regard by teachers. Therefore, in order for educational standards to be equitable, teachers must have an understanding of the specific linguistic and cultural resources all students bring with them to school (Wiley, 2005).

In the USA, the IRA and the National Council on the Teaching of English (NCTE) have created standards for the English language arts, which have become influential guides for teachers, most of whom will teach some language minority students, even if they are not ESL specialists. In a positive sense, these help to underscore the need for equitable treatment for language minority students who are increasingly a major portion of the student population. In theory, the standards can be adapted creatively to special populations. From the perspective of equity, IRA/NCTE notes that to ensure "equal educational opportunities and meet high expectations for performance" (IRA/NCTE, p. 9), students must have access to school resources, adequately trained and knowledgeable teachers, and safe, well-equipped schools (IRA/NCTE, p. 9).

For teachers of language minority students, IRA/NCTE standards underscore the importance of helping students develop "an understanding of and respect for diversity in language use, patterns, and dialects across cultures, ethnic groups, geographic regions, and social roles" (p. 9). The importance of home language is noted: "Students whose first language is not English make use of their first language to develop competency in the English language arts and to develop understanding of content across curriculum" (p. 9). These are important acknowledgments; however, there is a risk that a standard such as these may

become empty slogans unless teachers are provided with appropriate training to work with linguistically diverse students. This is necessary because language use at home can be very different from expectations for language use in the school (cf. Heath, 1983). In a related effort, the international association of Teachers of English to Speakers of Other Languages (TESOL) has likewise taken steps to promote its own ESL Standards for Pre-K-12 Students (1997).

According to TESOL, its standards were drawn from research on first and second language acquisition. Its principles for language teaching are based on the assumptions that (1) language is functional; (2) language is not monolithic but varies in many ways by skill area and social and regional variety; (3) learning language involves cultural learning; (4) language acquisition is a long-term process; (5) language acquisition occurs through meaningful use and interaction; (6) language processes develop independently; (7) native language proficiency contributes to second language acquisition; and (8) bilingualism is an individual and social asset (TESOL, 1997, see pp. 6–8).

TESOL put forth broad goals for instruction whereby students would learn to use language for social and academic purposes in culturally appropriate ways. In particular, TESOL's standards call for teachers to emphasize appropriate use of language variety, register, and genre according to audience, purpose, and setting; use nonverbal communication appropriately according to audience, purpose, and setting; and use appropriate learning strategies to extend students' social and socio-cultural competence. This emphasis implies a target cultural and linguistic standard against which language performance could be assessed. Given that English is an international language of wider communication with competing standards and multiple cultural contexts for "appropriate" language use, contextualizing standards would appear to be problematic (cf. McKay, 2002). Which standards, or more directly, "whose" standards based on notions of cultural, class, or national norms for behavior should prevail? This is not a trivial question when considering how language policies should relate to teacher preparation. Are teachers to be the gatekeepers of rules of appropriateness, be referees, or consultants? Thus, considering the role of standards as a guide to language policy in teacher education, there is room for caution.

The history of curriculum accountability movements suggests that the push for standards often results in overly prescribed curricula, which can result in implicit biases for language minority students (Wiley and Wright, 2004). Thus, care is needed to clarify why standards are being selected and 'whose standards' they reflect. As Tumposky (1984) has noted, the "equation of the knowledge of a language with the mastery of isolated, discrete items would seem to have been disproven by the acknowledged failure of certain methods . . . which

focused almost exclusively on the minutiae of language's building blocks" (p. 303). Thus, to a degree, this perspective suggests limits to overly prespecified language planning in teacher education. John Dewey (1963) noted long ago that the challenge for the teacher is to achieve through conscious planning what nature does naturally. No matter how much the language curriculum is overtly planned by teachers, curriculum designers, and textbook writers, it is still experienced differently by the learners. Students interpret, reconstruct, and even resist those plans (cf. Canagarajah, 1999). To facilitate student learning, instructional standards, or plans must be sensitive to how those plans are understood and reconstructed by the students (for a more elaborated discussion of the standards for language minority instruction, see Wiley, 2005, Chapter 9).

Unfortunately, analyses of the content of mainstream language arts texts books indicate that many teacher preparation materials treat these topics generically and without enough depth to adequately prepare teachers (Berdan and Wiley, 1992). By acknowledging language diversity, the IRA/NCTE and TESOL standards represent an advance over previous organizational guidelines, but more is needed to provide in-depth guidance for teachers about policies and practices that would enhance the education of language minority learners. Some recent efforts, however, are more clearly directed at helping novice and in-service teachers develop language awareness in instruction (see Trappes-Lomax and Gerguson, 2002).

#### FUTURE DIRECTIONS

Around the world, the demand for English, and increasingly Spanish, Mandarin, Arabic, and other global/regional languages of wider communication presents challenges. First, these and other major languages are needed for access to the kinds of knowledge mediated through schools, which is necessary for social, economic, and political participation. Unless specific educational policies are put in place to promote and maintain minority languages, they may not have the resources or vitality to thrive or even survive. Second, as the demand for global and regional languages increases, so does the need for adequately prepared teachers of these languages, as well as teachers who must use these languages to teach.

As English and other major languages spread, they are used for many purposes by many types of learners, and these languages are changed by them. The globalization of English, in particular, is forcing changes in conceptions of the role of teachers and of language goals and policies in teacher preparation. Corson (2001) has suggested three things that could be done at the school and local levels: (1) creating

better patterns of communication regarding language goals; (2) negotiating policies between the school and local communities; and (3) promoting “critical language awareness” within the school “through a language curriculum that promotes social awareness of discourse . . . variety, and consciousness of practice for change” (p. 34; cf. May, 1994).

Increasingly, we can expect that languages will be learned for specific purposes including trade, business, and international communication, as well as to enhance personal knowledge and educational opportunities. The need to communicate with others in global contexts will require that language teachers better understand the need for languages to function as bridges in multilingual contexts, that some learners may resist implicit cultural discourses, and that languages will be indigenized and code-mixed for local or regional communicative purposes without following the conventions of the so-called target cultures (see Canagarajah, 1999; McKay, 2002; Sridhar, 1996). Thus, successful program models for promoting foreign language fall into three broad categories: (1) those that are designed to meet specific learner needs, (2) those that promote general communication strategies, and (3) those that are needed for educational enhancement.

Given the negative legacy of discriminatory language policies in education for language minorities, some focus on the history of educational language policies to the detriment of language minority students should be a part of teacher preparation. Beyond that, there is a need for teachers to become familiar with positive examples of culturally and linguistically responsive schooling (see for example, May, 1994).

Some teacher training in the ethnography of communication and on expectations for language usage is needed when languages are being taught for purposes of wider communication. With the expansion of economic interdependence and globalization, it is reasonable to assume that language teachers, within local contexts, will increasingly need a variety of methods and approaches to meet learner needs (cf. Block, *Language Education and Globalization*, Volume 1). There will be increasing demand for instruction in foreign or additional languages of wider communication, both for academic and specific purposes, as well as for wider communication. As this occurs, teachers of English and other global/regional languages should not be surprised by the appropriation of these languages by learners who are not native speakers. Moreover, in the expanding circles of global and regional languages of wider communication, there will likely be an increased need to prepare bilingual teachers. Already, the majority of the world’s teachers of English, for example, are “nonnative” speakers. Given the variety of learner needs and local contexts for learning and using English and wider and regional languages of communication, there is a variety of appropriate methods that range from Communicative

Language Teaching, focused on target inner circle discourse practices, to more locally congruent cultural expectations.

Increasingly, however, in the global age, English is being used as a medium of instruction in schools, as well as for the purpose of acquiring and conveying information in local contexts. Thus, the relationship between language and culture may increasingly be one where there will be a need for scrutiny and negotiation of instructional language policies, especially when the goal of instruction is communication rather than assimilation.

#### ACKNOWLEDGEMENT

The discussion on standards is based on Wiley (2005), with permission from the Center for Applied Linguistics, CAL. See Chapter 9, "The Standards Movement: Considerations for Language Minority Students" for an elaborated discussion.

## SCHOOL LANGUAGE POLICIES

### INTRODUCTION

This chapter considers developments in school language policies in the last decade. Such policies are often developed at a national level using mechanisms such as those discussed by Sue Wright (2004). However, these same policies may not always find their way to implementation at the school level. Stephen May (1997) defined a school language policy as “a policy document aimed at addressing the particular language needs of a school” (p. 229). Such a document should therefore centralize language in learning and address the relevant diverse language needs of its student population, especially if, as May argues, it is developed in consultation with the wider school community. How that consultation should or might take place, or what constitutes the wider school community, is not explained. Once complete however, the policy should identify “areas within school organisation, curriculum, pedagogy and assessment where specific language needs exist” and indicate directions and methods for dealing with specific issues, “within a discretionary and flexible framework” that also includes mechanisms for review and monitoring (May, 1997, p. 299).

Corson (1999), who was influential in initiating this school-based language policy research, endorsed this view of the role and purpose of a language policy. He argued that a language policy provides schools with a specific direction in dealing with the issues, challenges, and possibilities that diversity and disparate learning needs pose. His work (see also Corson, 1990, 1993) explored the role of language policies in schools, and how they might serve the needs of diverse students. Such policies, he noted, were often accompanied by professional development to influence teachers’ practices and beliefs.

School language policies can also be centrally and politically driven. Coady and O’Laoire (2002) document this as they explain the mechanisms of the resurgence of Gaelic in the Republic of Ireland, where it became “a subject taught to bolster the government’s aim of fostering an Irish-speaking identity on behalf of the nation” (p. 143).

*Language Policies and Literacy*

The aspirations described earlier for school language policies can now be viewed in relation to the extent of their success in being a mechanism for dealing with disparity, diversity, literacy, and learning, particularly in Western contexts, the main focus of this chapter. Midway through the United Nations Decade of Literacy (2003–2012), it is pertinent to briefly examine links between language policies in specific countries and literacy actions at the school level. As May noted a decade ago, the prevalence of language policies at the school level in addressing these was not particularly widespread.

As Ager (2001) has observed, the world has, in the last decade, experienced some major upheavals: Yugoslavia is now a number of separate nations, the two Germanys have reunited and the European Union legislates for member countries on a number of practices normally the preserve of individual nations, such as currency and food standards. This is reflected in other international federations and treaties, which increasingly standardize economic and social practices stemming from corporate and political influences, highlighting the role of language and languages in standardization processes. Phillipson's chapter (*Language Policy and Education in the European Union*) in this volume is indicative of the issues involved (see also Block, *Language Education and Globalization*, Volume 1).

And while some countries persist in creating or adapting political language policies that privilege some languages or language practices over others, other practices aim to support diverse languages, such as the European Union's Charter for Regional or Minority Languages, one ramification of which, is the mandating in Britain at least, of a literacy hour in primary schools.

Concurrently, in countries like New Zealand, which has witnessed sustained revival in an indigenous language, there has been a review of literacy and languages provision in schools. In New Zealand's case, precipitating factors include the growth of Maori medium schools and the graduation of fluent Maori speakers from total immersion primary (elementary) schools to secondary schools, coupled with a rise in the number of foreign-fee-paying students and new migrants in schools. New Zealand's experience supports Hornberger's (2002) assertion that until the 1980s, language planning tended to be governed by the belief that linguistic diversity was a problem. Now, however, a conceptual shift in the country appears to recognize that it is an asset. Other factors relate to Progress in International Reading Literacy Study (PIRLS) and Programme for International Student Assessment (PISA) research findings (New Zealand Ministry of Education, 2001, 2003), which continue to be used to illustrate and inform government policy direction.

This chapter considers the last decade and reviews the extent to which the ideals of national language policies have been implemented in schools in ways in which Corson (1999) advocated, or moved on from May's (1997) description of the mismatch between national level and school level policies.

### EARLY DEVELOPMENTS

May's (1997) review of the genesis and international spread of school language policies does not need reinventing, but it is useful to restate some of its key ideas, and subsequent additions. As described, the major tenets of language across the curriculum (LAC) were that:

1. Language plays a central role in all learning.
2. Students must be actively engaged in meaning-making processes. Concomitantly, teachers must facilitate active student-centered learning rather than adopting didactic and transmissionist approaches to teaching.
3. Active student learning involves the four principal modes of language: listening, talking, reading, and writing.
4. Students should be encouraged to use their own language in these various modes as the principal tool for interpreting and mastering curriculum content (May, 1997, p. 230).

Wright (2004) noted that language policy and planning operated on three key levels of planning: status (as in political and governmental levels, identified by Ager (1996, p. 54) as "constituent policies"); corpus (as in the institutional level, such as schools or universities, and as outlined by Fishman, 2000, implicated in corpus agendas); and acquisition (i.e., both learning a language and the processes and management of programs that facilitate this). This builds on Cooper's (1989) three levels explored in relation to language policy and social change. Wright suggested that a focus on the role of language is "an integral part of nation building" (p. 9), and that language planning is an "organizing principle and mobilizing force" (p. 13). This implies that the development of language policy and planning at the status level at least, has had a long political history, longer than the history of school language policies as intimated by May (1997), whose focus necessarily centered on the corpus level, where national expectations for implementation concentrated on schools. A recent addition is the international focus on literacy, and the way in which countries interpret and politicize this aspect of learning in schools.

In New Zealand for instance, the four principal modes of language (reading, writing, speaking, and listening) were transformed into eight in the late 1970s—listening, speaking, reading, writing, moving, shaping, watching, and viewing—partly as a result of the international

influence of the 1966 Dartmouth conference, and to accommodate the development and influence of visual media. Later, these were adapted for the national curriculum document, *English in the New Zealand Curriculum* (Ministry of Education, 1994). This change recognized the existence of more visual texts, such as film and the Internet (see also Kalantzis and Cope, *Language Education and Multiliteracies*, Volume 1). This curriculum, now a decade old, has undergone further review, simplification, and paring—indicating something of the rapidity of change in coping with political, social, economic, and technological imperatives.

Alongside this, the 1994 curriculum reoriented primary school teachers' views of what had traditionally been labeled "reading" and "language" as "English." With a current national (and, it would seem, international) focus on literacy, there is a tendency for primary (elementary) teachers to call these same lessons "literacy," thus again affecting perceptions about what constitutes this kind of learning. However, "literacy" as a concept and focus has not been widely debated in New Zealand (as is also often the case elsewhere), nor has its meaning been explored; instead, its meaning seems to be taken for granted—that it is a synonym for both reading/language and English in primary schools. In New Zealand secondary schools, which have been exploring literacy as a focus for learning across the curriculum, subject specialists have been encouraged to reexamine their pedagogical practices and engage in more cross-curricular conversations about literacy and learning: a relatively new situation for such teachers, but one which Corson (1999) considered was imperative for more cohesive thinking about language.

Interestingly, very few of the schools heavily involved in this literacy professional development have developed language and literacy policies to support this endeavor. Instead, schools generally create systemic mechanisms to embed it, such as individual staff appraisal goals, or as mandated elements in departmental plans and programs. An overarching attempt to examine literacy and its implications in the wider school has not generally taken place, particularly in relation to language's role in learning and thinking. Long term, the effects of this omission are unknown, and may affect aspects of accommodating diversity, since it is literacy *in English* that is emphasized: the default position. New Zealand's case demonstrates ways in which political changes and policy developments can become reflected in the practices of schools, without recourse to the language policy debates advocated by Corson and May.

Another example is Spain, which has been examining the implications of multiple language learning in education as a response to some European Union membership ramifications. It has wrestled with ways

of acknowledging and fostering multilingualism through policy directions (Madrid-Fernandez, 2005). This examination includes: how to improve language learning from primary to tertiary levels; what that means for staff expertise and resources; and the role of technology in implementing this language policy at the school level. Spain's attempts to develop processes for implementation suggest some of the complex struggles between "a spreading lingua franca and global networks" and a likely "growing desire to conserve community and traditional ways of meaning through attention on what happens at the school level" (Wright, 2004, p. 246).

Conversely, in countries where nationalism or "national state ideology" (Wright, 2004, p. 247) has become more prominent, language policy and planning can impose exclusionary practices on schools, effectively suppressing language diversity (see also May, *Language Education, Pluralism and Citizenship*, Volume 1). Some educational policy decisions in the USA suggest this possibility, especially in relation to both schools' abilities to provide first language support and maintenance (Meyer, 2004; Skutnabb-Kangas, 2002; see also Ricento and Wright, *Language Policy and Education in the United States*, Volume 1), and what counts in literacy and language (Gerstl-Pepin and Woodside-Jiron, 2005). Freeman (2004) engages with some of these issues in accounting for efforts to establish school language policies in some of Philadelphia's bilingual schools.

#### MAJOR CONTRIBUTIONS

A major contributor to the whole area of school language policies and language planning has been David Corson (1990, 1993, 1999). As May indicated, Corson extended "the conception of language to include not only the four conventional language modes, but also the additional activities of moving, watching, shaping, and viewing" (1997, p. 232), which can be directly related to educational developments in places like New Zealand from the 1970s to 1990s.

May also contended that Corson extended the original LAC focus to "include second language, bilingual, foreign language and wider social justice issues" (1997, p. 232). This extension, May argued, is "crucial" for it begins to acknowledge the greater multiethnic nature of many schools worldwide. In countries where addressing cultural differences in educational settings is important, this broader application of language planning and policies is significant, providing school-based educators with researched evidence to draw on.

Recent works on exploring multiculturalism and ethnic diversity (May, Modood, and Squires, 2004) in relation to wider political,

social, and educational imperatives complement both Corson's (1999) work and Ager's (2001) examination of motivation in language planning and policy in international contexts. These broader understandings of the potential of language diversity to affect positions and hierarchies of identity and power highlight possible roles for language policy and planning in any country. The encompassing of linguistic difference in the design of language policies at national as well as local school levels can have wide ramifications on both students' achievement and the fabric of the society they live in. Ignoring these may indeed encourage continued subjection of language to the international power of others (see Skutnabb-Kangas's views on these issues in *Human Rights and Language Policy in Education*, Volume 1). Goldstein's (2003) work identified complexities inherent in teachers' work as they attempt to enact the intentions of diverse school language policies in North American contexts. This work may be even more difficult in the current educational climate of *No Child Left Behind* (Abedi, 2004). Wright (2004), in examining similar ideas at the political nation-state level, drew similar conclusions to Goldstein, whereas Marley's (2004) review of the political and national changes in language policy in Morocco, where they moved from a monolingual approach to a bilingual one, demonstrate some possible positive effects on attitudes at the local school level.

#### PROBLEMS AND DIFFICULTIES

At the school level, the desired outcomes for language policy development tend to remain somewhat idealistic. Sergiovanni, Burlingame, Coombs, and Thurston (1999) suggest that political demands, constraints, and choices can impinge on desirable educational goals and policy provisions, recognizing the influence of status planning requirements as Fishman (2000) intimates. Escamilla (1994) cited some of the difficulties with school language policies having the desired effect. Her study investigated the relationship between policy and practice in a Californian elementary school that promoted bilingualism. She found that the perception and reality were somewhat different. English was, in practice, the privileged language, even though the school's policy espoused an equal footing with Spanish. Perhaps this exemplifies Suarez's (2002) assertion that, "linguistic hegemony exerts and legitimates power by presenting the dominant language as an instrument, or tool to be used by those who acquire it in whatever way they choose" (p. 514). This highlights May's (1997; see also 1994) cautions regarding the efficacy and prevalence of school language policies, and is illustrative of New Zealand's focus on literacy in English as the default.

Perhaps these cautions illustrate the distance between the desire and detail; that schools seem unable to “walk the talk” for a range of reasons, not the least of which include some constraints imposed by external policy makers, coupled with the complex nature of teachers’ work. Other constraints include: staff changes—including leadership, competing priorities, difficulties in coordinating, and sustaining consistent language-oriented professional development (PD) for staff, and restricted opportunities for cross-curricular internal debate about the key elements of school language policy issues. Although language-oriented PD may be relatively easy to initiate in elementary (primary) schools, the same cannot be said for secondary schools, where subject silos still exist, alongside a heavy emphasis on content at the expense of language processes that support and sustain access to learning. National secondary literacy projects (such as in New Zealand), which explore the relationship between language and learning in secondary schools, highlight these problems (see Wright, Smyth, May, Whitehead, and Smyth, 2005). May (1997) alluded to these issues when he noted that, “the *process* of implementing LAC within the school is crucial to gaining and maintaining teacher support. A school language policy needs to be both carefully thought through and carefully managed if *all* staff are to be convinced of its merits” (p. 234).

May’s (1997) further observations about the necessity for school leaders to be involved along with sufficient time and other resourcing (such as designated personnel) to effect change, coupled with staff development, is borne out in the New Zealand experience, a researched 3-year-pilot study implementing literacy across the curriculum in secondary schools. The pilot clearly illustrated the importance of those factors. The researchers noted two additions—the value of a theorized approach and the value of a school developing and sustaining a literacy community of practice involving teachers in ongoing high-quality professional talk about language, literacy, and thinking. Both are likely to produce successful and positive changes in attitudes and teachers’ practices in this regard (Wright et al., 2005). Another factor not addressed in May’s (1997) synthesis was the importance of external agents to both precipitate awareness about and provide support and guidance in addressing literacy and language pedagogy and policy issues. Developing school language policies destined to have a robust shelf life, is thus a complex and long-term undertaking.

#### FUTURE DIRECTIONS

The model developing in New Zealand to support a concerted focus in secondary schools on literacy, language, and learning is useful to compare with May’s (1997, p. 235) list of requirements for schools

wanting to implement language policies successfully. Schools, he asserted, need to be “more democratic.” In other words, aspects of teacher buy-in, decision-making processes, and collaborative pedagogy are implicated in any efforts to design and implement a language policy. Second, he indicated that “critically reflective” practices are vital so that teachers’ attitudes, values, and beliefs about language and learning are challenged. Third, a “whole-school” orientation is required, although this may take some time to effect.

The New Zealand research (Wright et al., 2005) suggests that focusing pedagogical change on language and literacy has a better chance of long-term success if it is begun with a group of volunteers willing to alter their beliefs, attitudes, and practices regarding language and learning across the curriculum. This initial awareness-raising and trial period may take as long as 3 years to achieve. From there, wider buy-in and engagement is possible, especially if a nurtured literacy and language community of practice is fostered. A community of practice is, therefore, an umbrella under which these elements can combine to develop capacity and critical mass. This research, conducted nationally, may provide some insights for other jurisdictions to consider.

Mitchell and Sackney (2001) identified key capacities that should be nurtured if successful learning communities are a desirable cultural element in a school. They noted that if the personal, interpersonal, and organizational are acknowledged and developed, then there is a good chance that a language policy can be positively implemented. The personal aspect relates to a teacher’s sense of agency and self-critique. Should teachers not engage in this, then any concerted professional development is likely to be ineffective. As Corson (1999) observed, “. . . changing teacher attitudes seems best achieved by changing teacher behavior first” (p. 91). The interpersonal factor is also important. Relationships with professional peers can have profound effects on the quality and rate of pedagogical and attitudinal change, as Reeves, Turner, Morris, and Forde (2005, p. 253) have indicated. They noted that for school leaders to change, “there was a complex dynamic involved . . . where the conceptual development of individuals was closely related to their experience of enacting new behaviours in the social setting of the workplace. . . . Change and development on their part was closely bound to the capacity and willingness to change on the part of others.” And significantly, they observed that, “for established practitioners, changing practice transformatively involves both desisting from some of their habitual behaviours and enacting new ones, thus, to some extent, reinventing themselves within the same work setting” (2005, p. 255).

Finally, if May’s (1997, p. 238) hope that developments in critical pedagogy and the centralizing of language will support the

“successful incorporation of school language policies” is ever to come to fruition, a clear understanding of school change processes, plus the roles leaders and teachers play in this, is imperative.

**Focus on Selected Regions of the World**

## LANGUAGE POLICY AND EDUCATION IN THE EUROPEAN UNION

### INTRODUCTION

Language policy is acquiring increasing importance in an age of intensive political and cultural change in Europe. Among the key educational language policy issues in contemporary Europe are ensuring the continued vitality of national languages, rights for minority languages, diversification in foreign language learning, and the formation of a European Higher Education Area (the Bologna process). English, due to its role in globalisation and European integration processes, impacts on each of these four issues in each European state. The role of the European Union (EU) is a second cross-cutting factor, because of its declared commitment to maintaining linguistic diversity and to promoting multilingualism in education. On the other hand, it is arguable that the dominance of English in many forms of international activity, the erosion of national borders by changes in communication technology, and the hierarchy of languages that exists *de facto* in EU institutions and EU-funded activities (such as student mobility) may be serving to strengthen English at the expense of other languages.

### EARLY DEVELOPMENTS

The EU began life as an economic community in 1958 with six member states: Belgium, France, the Federal Republic of Germany, Italy, Luxemburg, and the Netherlands. Small enlargements occurred over the following four decades, bringing the total in the mid-1990s to 15 member states. Eleven languages had equal rights as the official and working languages of EU institutions. A major enlargement in 2004 brought in ten additional states (post-communist eastern European states, Cyprus and Malta). Nine languages were added to the world's largest translation and interpretation services. The EU is an immensely complex business: interpretation is provided for an average of 50 meetings each working day, and over 70% of national legislation entails enacting measures that have already been agreed on at the supranational level. European integration significantly affects economic, political, social and cultural life. Whether the present EU is a United States of Europe in the making is unclear. The rejection of the draft EU

Constitution in 2005 confirmed the gap between citizens with a strong national identity and the European project of political leaders and a remote unaccountable bureaucracy. The EU has been decisively influenced by a trans-Atlantic corporate neoliberal agenda (Monbiot, 2000), which the constitution would have consolidated. It also covered 'fundamental rights' as a potential counter-balance to the workings of the market, but the provisions on cultural and linguistic rights are weak.

'Europe' is a fuzzy concept. Depending on context, Europe may be a toponym (territory, geography), an econonym (a common market with a common currency, one that some member states have not yet adhered to), a politonym (an amalgam of independent states in a complex new unit with some traits of a federation), or an ethnonym (cultures with shared cultural traits that stress a common Christian past, which some see as excluding Islamic Turkey as a member). Linguistically, Europe is diverse: many languages in the Romance and Germanic families of language derive from Indo-European sources, others are Finno-Ugric, Basque is neither, and many languages currently in use in Europe, often in substantial numbers, are of more recent diverse immigrant or refugee origins.

Europe is emphatically not synonymous with the EU, though this distinction is frequently blurred. The Council of Europe has twice as many member states as the EU, among them Norway, Russia, Switzerland, and Turkey, which are not members of the EU. It has played a key role in promoting human rights, and political and cultural collaboration. It has also coordinated a significant number of measures to strengthen foreign language learning, including, notably, the Common European Framework of Reference for Languages (Council of Europe, 2001; Trim, 2002). It is taking on a more proactive role in language policy formation ([www.coe.int](http://www.coe.int)).

Many European languages have been consolidated as a dominant state language over the past two centuries. Domestic functions have been carried out in the key 'national' language, Danish, Estonian, French, Greek, etc. Promotion of a single national language occurred both in states with an ideology of ethnolinguistically uniform origins (with Germany as the archetype) and those with a republican statist model (typically France). Local minority languages were suppressed, but have gained increasing support in recent decades in several countries (Catalan, Welsh, Sámi, etc). Foreign languages were learned for external communication purposes and familiarity with the cultural heritage associated with 'great' powers. Since 1945, and more intensively in recent years, there has been a gradual shift towards English becoming by far the most widely learned foreign language on the continent of Europe, taking over space, both in western and eastern Europe, occupied earlier by other foreign languages, French, German and Russian in particular.

While it used to be primarily elites and those professionally concerned with trade or travel who learned foreign languages, these are now part of the curriculum for all. The advance of English in a range of key societal domains, commerce, finance, research and higher education, the media, and popular culture means that English in the modern world no longer fits into the traditional mould of a foreign language (which are referred to as ‘modern’ or ‘living’ languages in some countries). There are obvious instrumental reasons for learning the language. European citizens are massively exposed to Hollywood products (whereas in the USA the market share of films of foreign origin is 1%): ‘70–80% of all TV fiction shown on European TV is American . . . American movies, American TV and the American life-style for the populations of the world and Europe at large have become the lingua franca of globalization, the closest we get to a visual world culture’ (Bondebjerg, 2003, pp. 79, 81). These US products are transmitted with the original soundtrack in the Nordic countries and the Netherlands, which strengthens the learning of English, and are generally dubbed elsewhere.

#### MAJOR CONTRIBUTIONS

Foreign language education is embedded in national education systems and their distinct traditions (making generalisation perilous). There has been a progressive shift to more communicatively oriented foreign language learning, and starting ever younger, though the traditional focus on literature often remains at the upper secondary and university levels. Many European university language departments are less concerned with teacher education than with general academic development, literature being supplemented by an increasing focus on the cultures of English-speaking countries, particularly the USA and the UK. The diversity of approaches to foreign language teacher training is captured and summarised in a survey commissioned by the EU (Grenfell, Kelly and Jones, 2003). It sums up relevant theory and key variables, and highlights foreign language teacher competences and the reflective practitioner, bringing in examples from different countries ad hoc. It also presents 15 case studies that demonstrate innovative good practice, exemplified by various types of bilingual education, including the limited type, Content and Language Integrated Learning (see [www.eurocllc.net](http://www.eurocllc.net)), which is currently regarded as more likely to achieve success than traditional methods. This study of language teacher training is not an isolated project, but rather a symptom of the way the EU is coordinating interaction between representatives of member states with an agenda of reform. Thus the ‘Education and training 2010’ programme (<http://www.europa.eu.int/comm/education/policies/2010>) is

elaborating ‘Common European principles for teacher competences and qualifications’, with language learning as 1 of 12 ‘key objectives and areas of cooperation’.

Even in this professional field, where the goal is multilingual competence, English is much the most widely used language at European conferences and publications from them, although English and French are the working languages of the Council of Europe. In some regional European forums, multilingual competence is assumed (e.g. Danish, Norwegian and Swedish, with or without English), in others, receptive competence in a second language, such as German. German is the EU language with by far the largest number of native speakers, and has functioned as a lingua franca in many central and eastern European countries, a role which English is progressively taking over. The French government invests heavily in the promotion of French throughout Europe, and has been instrumental in persuading its EU partners to articulate discourses and policies that proclaim the value of linguistic diversity and language learning. However its efforts tend to be more aimed at preventing further erosion of the status of French as an international language than at ensuring linguistic human rights and equality for speakers of all languages (Phillipson, 2003, pp. 45–46 and pp. 133–134).

Teacher qualifications are of decisive importance, and there is evidence from most parts of Europe that many teachers of foreign languages are under-qualified. This in part explains differing degrees of success in foreign language learning, and why figures on the number of learners (data are collected by the EU educational information service [www.eurydice.org](http://www.eurydice.org)) are not revealing on outcomes. Even if most European schoolchildren are now exposed to English in school, most of their elders have not been (for analysis of EU Eurobarometer self-report data on capacity to communicate in a foreign language, see Phillipson, 2003, pp. 8–9). It is therefore wishful thinking to suggest that English is a universal lingua franca in continental Europe.

#### WORK IN PROGRESS

Schoolchildren in the demographically small European countries have often been taught two foreign languages in school. This policy has been recommended since the 1980s by the Council of Europe, and became EU policy in the 1990s. One factor influencing this policy has been the fear that English represents a threat to the languages and cultures of EU member states, hence the goal of learners developing competence and familiarity with two foreign languages and their cultures. The EU Commission document *Promoting language learning and linguistic diversity: An Action Plan 2004–2006*, of July 2003 is designed

to curb an excessive focus on English in continental education systems and the wider society. It states: 'learning one lingua franca alone is not enough . . . English alone is not enough . . . In non-anglophone countries recent trends to provide teaching in English may have unforeseen consequences on the vitality of the national language' (pp. 4 and 8). The policy statement advocates life-long foreign language learning, including two foreign languages in the primary school. It strives to bring language policy higher up on national agendas, and to raise awareness of linguistic diversity. It endorses the notion of an inclusive 'language-friendly environment', and states that this openness should include minority languages, those of both local regions and recent immigrants.

These laudable goals are a far cry from the reality, but representatives of member states are requested to attend meetings in Brussels and to describe implementation of the Action Plan and obstacles to it. Such activity is reported on the EU website (<http://europa.eu.int/comm/education>), invariably in English, less often in French, and virtually never in any of the other 18 EU official languages. Two major proposals by the Commission in 2005, a New Framework Strategy for Multilingualism, and a 'common European language indicator'—that is Europe-wide language testing—are aimed at inducing member states to adjust their language policies along the lines of the Action Plan. The policy statements, and comparable ones from the Council of Europe, may or may not influence national policy formation, but the very existence of international pressure of this kind can serve to force states to address language policy issues that they would prefer to ignore.

Both the EU and the Council of Europe are involved in policies to accord rights to regional minority languages (Council of Europe, 2004). Minority language policies differ widely in each EU member state, and are well documented (Williams, 2005). There are three EU-funded centres with a specialist role: Mercator Media at the University of Wales Aberystwyth (UK) researches the media, defined broadly to include the press, book-publishing, archives and libraries as well as broadcast media and the new media; Mercator Legislation at the CIEMEN foundation, Barcelona (Spain) is concerned with language legislation and language in public administration, whereas Mercator Education at the Fryske Akademy, Ljouwert (Netherlands) studies education at all levels.

One pressure that cannot be ignored is the expanding role of English in higher education, especially in northern Europe (Ammon, 2001; Phillipson, 2002, 2006; Wilson, 2002; Wilkinson, 2004). This is one dimension of the 'Bologna process', the formation of a European Higher Education Area, which has been underway since 1999, and to which the governments of 45 European states are committed. There

are bi-annual meetings at which national and university policies are coordinated. The EU has largely set the agenda for the Bologna process, which entails implementing a uniform undergraduate and graduate degree structure, internal and external quality control, student exchanges, double degrees, joint study programmes, etc. While the initial Bologna text stressed university autonomy, and respect for the languages and cultures of Europe, the most recent policy statement, from Bergen in 2005 ([www.bologna-bergen2005.no](http://www.bologna-bergen2005.no)), appears to conflate internationalisation and ‘English-medium higher education’, and does not refer to multilingualism or language policy.

It is no surprise that the only countries which are ‘observers’ in the Bologna process, and take part in the conferences, are the USA and Australia, since higher education for them is big business. According to a British Council study in 2004, the UK economy benefits by £11 billion per annum directly, and a further £12 billion indirectly, from ‘international’ education. The British goal is 8% annual growth across the sector, and to double the present number of 35,000 research graduates contributing to the UK’s knowledge economy by 2020 ([www.britishcouncil.org/mediacentre/apr04/vision\\_2020\\_press\\_notice.doc](http://www.britishcouncil.org/mediacentre/apr04/vision_2020_press_notice.doc)). In addition, over 500,000 attend language learning courses each year. A primary goal of the Bologna process is to make higher education in Europe as attractive to students worldwide as in the USA and Commonwealth countries. There is thus a commercial rationale behind English-medium higher education, as well as cultural and political dimensions. (Related but rather different issues are whether the expansion of the intake of foreign students, mostly from Asia, and primarily China, in ‘English-speaking’ countries has created institutional dependence on them for financial reasons, and whether the testing and teaching of such students has been appropriate.)

The quality of education is a key parameter if, say, Finnish or German institutions teach through the medium of English to attract foreign students. Research in Norway indicates that the reading skills in English of Norwegians entering higher education, when measured by the British-Australian IELTS tests, are not adequate for academic course books in English (Hellekjaer, 2004). The picture is probably similar in the other Nordic countries, where virtually all higher education degrees require reading proficiency in English. The Norwegian government is acting to strengthen both English teaching and the learning of a second foreign language through a comprehensive Strategy Plan for 2005–2009.

A related issue is whether continental European academics are qualified to teach as well through the medium of English as through the mother tongue. A few definitely are, but the trend since the early 1990s to expect many academics to do so, without professional

support, has not been studied. Academics and researchers in virtually all fields are also expected to publish in English, either exclusively or in the local language, depending on disciplinary pressures and the discourse communities that scholars contribute to. University administrators in the Scandinavian countries are being encouraged to address the language policy implications of English being used more, and to formulate explicit policies for multilingual universities. The Swedish and Danish governments have set a target of 'parallel competence' in English and Swedish/Danish. Finland has invested considerable resources in research and higher education, and seems to have established an impressive infrastructure for strengthening multilingualism, see, for instance, the language policy of the University of Jyväskylä ([www.jyu.fi/strategia/JU\\_language\\_policy.pdf](http://www.jyu.fi/strategia/JU_language_policy.pdf)). This document is in English. It stresses the need for all educators to be aware of their responsibilities for the way language is used, the duty of a Finnish university to strengthen Finnish, as well as English and other languages. Mention is also made of Swedish, the mother tongue of 5.8% of the population, a language that most higher education subjects can be studied in at other Finnish universities. The University of Jyväskylä also offers a 5-year teacher training MA through the medium of Finnish Sign language. Doctoral theses are written in a variety of languages (for figures for the country as a whole, see the article on Finland in Ammon, 2001).

In southern and eastern Europe, English is much less firmly entrenched. In some countries the decision was made to teach a foreign language, mostly English, in the primary school, but with inadequate attention to teacher qualifications. In France, the Ministry of Education has implemented measures to ensure the learning of two foreign languages, and to monitor a diversification of the languages learned, so as to promote plurilingualism (a term the Council of Europe uses for personal competence in more than language, by comparison with societal multilingualism). There is also lively public debate about whether there is an excessive focus on English.

#### PROBLEMS AND DIFFICULTIES

Developments in language education at national and subnational levels are influenced by wider processes of globalisation and Europeanisation, such as the adoption of English as a corporate language in many of the larger businesses based in continental Europe and the way hierarchies of language are perceived as operating in international collaboration. This holds both for official contacts in EU institutions and for the informal channels of the internet, leisure interests, and travel. What is unclear in continental Europe is whether the learning and use

of English remains an additive process, one that increases the repertoire of language competence of individuals and the society, or whether English threatens the viability of other languages through processes of domain loss and linguistic hierarchisation. In theory there ought to be no problem, because of the strong position of national languages such as German, Italian and Polish, and because of the declared policies of the EU. Article 22 of The Charter of Fundamental Rights of the EU, which represents principles that all member states are committed to, states: 'The Union shall respect cultural, religious and linguistic diversity' (also in the rejected draft Constitution, Articles I-3 and II-82). In reality there are fundamental paradoxes.

The first is that although the EU is essentially a Franco-German project, since France and Germany were founding member states and have continued to occupy the political high ground in shaping the integration of Europe, the use of English is expanding, and the French and German languages are on the defensive both at home and abroad. English is increasingly the dominant language both in EU affairs and in some societal domains in continental European countries.

The second paradox is that EU rhetoric proclaims support for multilingualism and cultural and linguistic diversity in official texts, and the equality of all official and working languages in the EU, but in practice there is *laissez faire* in the linguistic marketplace (Phillipson, 2003). At the policy-making supranational level of EU institutions (the European Parliament, Commission and Council), there is paralysis on broader language policy issues, apart from some support for regional minority languages, channelled through the European Bureau for Lesser Used Languages. The proportion of the European budget (representing only 1% of national budgets) allocated to cultural concerns is modest, as compared with agriculture, infrastructure and regional development. The rhetoric of diversity and linguistic equality is pitted against the unfree market and the forces that strengthen English. Young people are hugely exposed to US cultural products, but have little familiarity with the cultures of their partner states.

In the management of the internal affairs of EU institutions (European Parliament, Commission, Council of Ministers), there is equality between the 20 EU languages in some respects: all legislation is promulgated in parallel in all languages, and at the most important meetings, interpretation is provided between all languages. On the other hand, in day-to-day affairs, French and English dominate, and English is increasingly the language in which documents are drafted and discussed. Some governments are keen to save money by not insisting on the use of their languages, which has led interpreters for Danish and Swedish to fear that these languages will disappear as languages

spoken in EU institutions within a decade. Many users of the EU language services see languages as serving purely instrumental purposes, whereas there is no doubt that the French (earlier) and British (now) regard use of their language as the default language as giving them a political competitive advantage. The language services are subjected to internal reviews of quality and efficiency, but there has never been an in-depth survey of how equality between speakers of different languages might be ensured in a variety of types of communication. This is a crucial issue of access and legitimacy in dealings between a European institution and citizens in each member state. It becomes more important as more languages are added (with Irish an official language and Spanish regional languages accorded restricted rights in 2005), and when pragmatic, economic considerations weigh more heavily than ensuring transparency and living up to a democratic ideal of equality irrespective of mother tongue. Within the EU, the language issue has been described as ‘explosive’ (French Members of the European Parliament) and as ‘the most emotional topic in the EU’ (German head of mission in Brussels), but work has begun to promote coordination between the European Federation of National Institutions for Language, [www.eurfedling.org](http://www.eurfedling.org). When there is this much uncertainty at the level of decision-makers, it is not surprising that *laissez-faire* policies serve to strengthen the position of English.

#### FUTURE DIRECTIONS

A third paradox is that foreign languages have traditionally been learned in conjunction with cultural familiarisation, and although English is in countless ways a feature of British and US culture and globalisation processes, it is increasingly used by non-natives for purposes that have nothing to do with Anglophonic cultural norms. This has led to research into ‘English as a Lingua Franca’ in order to chart how this type of communication departs from native speaker norms (Seidlhofer, 2004). This might at some point have pedagogical implications, but analysis of ‘lingua franca’ English is still exploratory. The term ‘lingua franca’ is also deceptive if it refers to asymmetrical interaction between first and second language users of English. To a large extent foreign language learning is being expected, like much of education, to produce a European ‘Knowledge society’ serving economic needs, but there is some critical foreign language pedagogy (Guilherme, 2002). Dendrinos and Mitsikopoulou (2004) argue persuasively for a paradigm shift in foreign language education, with a different target than native speaker competence: contemporary realities necessitate a ‘multilingual ethos of communication’, reflecting and

constituting a world that gives voice to different discourses, one that acknowledges that discourses, not least on language policy and foreign language education, are neither ideologically nor politically neutral.

## LANGUAGE POLICY AND EDUCATION IN BRITAIN

## INTRODUCTION

The importance of being able to communicate effectively has been seen traditionally as a necessary outcome of the educational process. Much of this relates to the fact that literacy, language and communication represent a potent form of cultural capital, which can be exchanged within the labour market. Language in education plays a significant role in individual development whilst, at the same time, also providing a vehicle for *economic and social development* (cf. Grin, *The Economics of Language Education*, Volume 1). As the medium through which teaching and learning takes place, language plays an important role also in the transmission of culture through the literary canons and knowledge base sanctioned by educational policy. As such, it has potent *hegemonic cultural value*. In having the potential to provide the linguistic skills and knowledge that underpin democratic society it also has significant *cultural power* (cf. Hall, *Language Education and Culture*, Volume 1).

Language-in-education policy is integral to social policy and thus it is constituted in power relations. Hierarchies of languages generally reflect sociocultural, economic and political stratification within society. Languages that are excluded from or feature in a limited way in formal education, lack social status and have limited exchange value within the labour market (cf. Rampton, Harris, Collins and Blommaert, *Language, Class and Education*, Volume 1). Taking account of these complexities this chapter provides an historical overview of key issues related to language and education in Britain. The main argument presented is that cultural and linguistic landscapes are not static; they evolve as societies undergo political, economic and demographic changes. Therefore, whilst the chapter seeks to highlight the inherently multilingual basis of British society involving *autochthonous* language groups, it also documents language in education struggles and debates centred on *immigrant groups* as these have evolved over the past five decades. In addition, it also highlights the influence that changes taking place within the global cultural economy have had on language-in-education policy within the UK.

## EARLY DEVELOPMENTS

Britain has been a multicultural and multilingual society throughout its history with various social groups including the Irish, Picts, Welsh and English farmers living here since before the Norman Conquest (Lewis, 1980). Although bilingualism has been an everyday experience for different social groups living in Britain throughout the centuries, bilingual education followed a long process of struggle against English language domination, and assimilation into English culture. Historically, education has provided a primary arena in which the dominance of English has been hegemonized. Equally, language historically has represented a primary arena of struggle for control over meaning as well as cultural resources.

*Wales*

In the struggle for an English-dominated British nationhood, Celtic culture became commonly represented as inferior, and the speakers of the Celtic languages as 'wild' and 'savage'. Despite this, the Welsh language has remained a living language and has featured as an important identity variable in the history of nationalist struggle in Wales. Bilingual education was introduced into Welsh schools through the Church during the 1700s when a clergyman, Griffith Jones, set up circulating schools in which parents and children in the community were taught to read and write in Welsh. This was aimed at enabling more people to read the Bible. The British state's initial response to bilingual education in Wales was negative; it was regarded as being detrimental to the moral progress of the people. As late as 1847, the Report of the Church Commissioners on Schools in Wales 'viciously attacked the Welsh language on the grounds that it isolated 'the masses' from the 'upper portions of society', denied its speakers access to the top of the social scale and kept them 'under the hatches' (Alladina and Edwards, 1993, p. 3). Children caught speaking Welsh in school were forced to wear the notorious wooden halter called a 'Welsh not' as punishment (ibid.).

The first positive state support came from Sir James Shuttleworth who, as Secretary of State for Education in 1849 indicated that the government would enable several members of the community who were fluent speakers, and could read and write in Welsh, to become inspectors in schools. The implicit understanding was that Welsh represented the medium of education. A major development came with the appointment in 1907 of Owen Morgan Edwards, as the first Chief Inspector of Schools for Wales within the newly established Welsh Education Department. Edwards played a key role in securing Welsh

language education in schools throughout Wales. His struggles were continued later by his son Ifan ab Owen Edwards, who founded the Aberystwyth Welsh School (*Ysgol Gymraeg Aberystwyth*) in 1939. This was the first Welsh primary school; the first Welsh language secondary school (*Ysgol Glan Clwyd*) was established in Rhyl in 1955.

### *Irish*

Irish Gaelic represented the most widely spoken language throughout the entire island (including what is now Northern Ireland), at least until the mid-nineteenth century when the state-funded primary education system was introduced. At this time, the use of the Irish language in schools was prohibited and English was taught by the Order of the British Government. As was the case with Welsh, Irish was associated with 'backwardness' as against English which was seen as representing the language of progress and modernization. The association of English with better life chances contributed to the fact that parents also discouraged their children from using Irish. Incorporated through this into the hegemony of English, they were complicit in committing what Bourdieu (1999) refers to as 'symbolic violence'. That is to say, in choosing English over their own languages in education they colluded in their own cultural subordination (cf. May, 2001, Chapter 4). Large-scale emigration, as a result of the potato famine during the 1845–1850 period, contributed further to the long-term decline of the Irish language.

The late-nineteenth century saw the beginnings of a language revival mainly amongst the Irish Unionists, reinforced later by the linguist and clergyman William Neilson. The Gaelic League (*Conradh na Gaeilge*) was founded in 1893 by Douglas Hyde and Eionn MacNeill. Irish language as a key cultural identity variable was central to the growing radicalism of Irish politics at the time (O'Reilly, 1997). Although there are arguments that this largely represented the cultural project of the elite, this particular nationalist revival with its emphasis on de-anglicization had a major impact on Irish social life. It played a significant role in placing Irish in a central position within the national school system.

The newly independent Irish national state adopted Irish as the *national language* in the Constitution in 1937 with English as the *language of administration*. Thus the high status of English within society, as well as its exchange value within the labour market, was retained. The compulsory introduction of Irish in schools, and the fact that it was often badly taught, was ultimately counter-productive since it alienated many school children. Irish again went into long-term decline, and it has remained a minority language.

In Northern Ireland the Irish language has always had political connotations and has been associated mostly with Irish Republicanism, although, as is discussed later, current debates prevail within Unionist circles about the need to reclaim Irish as a national language (Pritchard, 2004). Although the Parliament of Northern Ireland prohibited the use of Irish in public life, including schools until the early 1990s, Irish medium schools (*gaelscoileanna*) have existed in Belfast and Derry since at least the 1970s (see also later).

Another important minority language central to contemporary debates about education and nationhood includes Ulster-Scots (*Ullans*), which is associated mainly with the Protestant community of Northern Ireland. Most Ulster-Scots speakers reside ‘along the Antrim coast line and in areas congruent with what the Ulster Defence Association call the “retainable homeland”, the territory that they define as theirs’ (Nic Craith, 2000, p. 399). Much controversy surrounds the status of Ulster-Scots as a distinct language; whether it is a separate language from Scots, or a dialect of Scots (Mac Poilin, 1999); moreover, whether it can be distinguished from Ulster-English dialect, or whether it is essentially a rural Ballymena accent (Coulter, 2004; see further discussion later).

### *Scotland*

Gaelic first arrived in what is now known as Scotland at the end of the Roman Empire, with the Irish colonists who established their Kingdom of *Dàl Riada* in south-west Scotland—‘the coastland of Gael’ (O Maolalaigh and MacAonghuis, 1996) by merging with the Pictish Kingdom of *Fortui*. Scots-Gaelic, traditionally, has been associated with the people of the Highlands and Hebrides, the *Gaidhealtachd*, or Gaelic-speaking community. Many Scots-Gaelic speakers were displaced during the eighteenth and nineteenth centuries, some moving to places such as Nova Scotia and Cape Breton Island. There are small bilingual communities using Gaelic and local dialects as everyday languages, particularly in the Western Isles (*Na h-Eileanan an Iar*), parts of the Highlands (*a’ Ghaidhealtachd*), cities such as Glasgow (*Glaschu*), Edinburgh (*Dùn Eideann*) and Inverness (*Inbhir Nis*) (Robertson and Taylor, 1993). Since at least the nineteenth century, there have been organizations involved in promoting Gaelic, notably, the educational pressure group *An Comunn Gaidhealach*, established in 1891, which became the first language-loyalty movement.

The place of Gaelic in Scotland has been ambiguous. That is to say, although it is widely represented as a key identity variable in the ideological construction of the Scottish nation, it, nevertheless, has had to struggle to obtain official status (Oliver, 2005). For example, the

Statutes of Iona in 1609 placed emphasis on the diffusion of English (Campbell, 1950). The status of Gaelic is closely linked with the development of education in Scotland; schooling provided by the *Society in Scotland for Propagating Christian Knowledge*, started in 1709, played a major role in the diffusion of English through education. In 1710 the school master on St Kilda was instructed to 'be diligent not only to teach them to read English but also to write and lay it on such as profite by you to do all they can for the edification of others and teach them their duty to their superiors' (cited in Withers, 2000). Although the Education Act of 1872 made education compulsory for all Scottish children, it also marked the period when the use of Gaelic in education was, unofficially, but actively discouraged in schools (Shevlinn, [<http://simplyscottish.com>]). This was achieved in part by the appointment of English-speaking, and English teachers as well as the punishment of children caught speaking Gaelic by having to wear the 'stick on a cord' device, the *maide-crochaide*. This practice prevailed until the 1930s (Shevlinn, [<http://www.simplyscottish.com>]).

More recent transmigration has also impacted on the linguistic landscape of the UK, with its implications for educational policy and provision.

### *Language Diversity: Social Class and Immigrant Groups*

**Deficit Theory.** Major debates about language in education in the UK occurred during the 1960s and 1970s when the notion of 'communicative competence' (Hymes, 1972) in education first came to prominence in academic debate. Much of this debate centred initially on the educational underachievement of working class children, and later, children from immigrant groups living, largely, in inner-city areas (cf. Rampton, Harris, Collins and Blommaert, *Language, Class and Education*, Volume 1). The debate revolved around the argument that social stratification between different socioeconomic groups was reflected in the hierarchies attached to different patterns of language use, and that this had an impact on the relative ability of children to succeed in school (Carby, 1982). Much of this debate was influenced by a strong form of the Sapir-Whorf hypothesis, supporting the theory that language use determines the ways in which people perceive, interpret and experience the world. In other words, thinking is determined by language, and that people speaking different languages perceive and interpret the world differently. Basil Bernstein (1971), a key contributor to the educational debate on language and social class in the UK, advanced the theory that different class groups had access to different language interaction patterns, or codes. Though not intended as such,

his unfortunate use of the terms 'elaborated' and 'restricted' codes to describe middle class and working class language interactions respectively led to a deficit construction of the latter. On this view, middle class people spoke an 'elaborated code', which comprised a wide vocabulary, had the ability to use complex sentences, was not context-bound, was analytical and could express logical and abstract thought. Middle-class language was associated with the formal written word and therefore was imbued with power. Working class people, on the other hand, used a 'restricted code' that was context-tied, relied on descriptive concepts, and because it represented the language of close-knit groups was not deemed capable of expressing logical and abstract thought. Social and educational barriers between different classes in society were ascribed to language barriers; working class children, because of their language 'deficit', were disadvantaged in education. Consequently, this deficit construction, (mis)using Bernstein's notion of codes, had a major impact on language education and research at the time.

The general argument in education revolved around the idea that the ability to switch linguistic codes controlled speakers' ability to switch roles; therefore, if working class speech could be 'remedied', learners would be able to have equal access to the curriculum and subsequently have better life chances. This gave rise to welfare intervention programmes in schools centred on remediating cultural and linguistic 'deprivation' to alleviate working class underachievement. Working class children were to be socialized through language into the values and belief system of the dominant culture to enable them to have equal life chances with their middle class peers. The deficit theory applied to education was critiqued as adopting a sociopathological approach of 'blaming-the-victim', without addressing the structural determinants of inequality in a class-stratified society, how these affect power and knowledge in society, and influence working class expectations and aspirations.

The debate stimulated major research projects such as the Schools Council Communication Project, which centred on the relationship between talk and learning in the classroom, and the different experiences of talk between home and school (Tough, 1976). Ethnographic research during this period focused on the ways in which family discourse and literacy practices in the homes of different ethnic groups and social classes influenced children's progress in school (Cummins, 1979, Edwards, 1976, Skutnabb-Kangas and Toukoma, 1976). These studies showed that early socialization into the literacy and discourse practices that prevailed in classrooms increased children's potential to achieve in school. Middle-class children therefore have an advantage within the formal contexts of the school and classroom.

**Difference Theory.** By the mid-1970s the *different-but-equal debate* informed by earlier anthropological and linguistic research (Labov, 1973), expounded the view that all languages, although different, are equal with regard to their ability to communicate and convey meaning. In other words, all languages are structured, rule-governed and have the capacity for abstract thought. Educational research conducted at this time rejected notions of cultural deprivation or deficit and placed emphasis on the validity and expressiveness of working class and 'black' languages and cultures. The argument was presented that schools needed to respect different cultures as being equal, and value their contributions to classroom learning culture. Being able to use non-standard English in classrooms would allow working class children to regain their self-confidence and sense of worth in their background. Thus their relative failure would be overcome, whilst also contributing to the cultural enrichment of classrooms; together this would facilitate equality of opportunity. Applied to immigrant language groups this framework supported multicultural education centred on the celebration of ethnic and religious differences.

The problem with this perspective was that it did not take account of the fact that whilst all languages may be equal in terms of the ability to communicate, they do not all have the same social, economic, cultural, symbolic and political power. Thus, it failed to take account also of the speakers of the languages and their relative power and status within society. It also did not acknowledge the predominance of Standard English (SE) as the language of teaching and learning which would impact on equality of access to knowledge in the curriculum. Moreover, it did not offer an analysis of power and class conflict reflected in language conflicts, for example, the use of slang and Black English Vernacular (BEV) (currently this would also include Rapping) as forms of cultural resistance.

### *Multicultural Language Debate*

Social discourse centred on language in education as this relates to immigrant children first gained prominence within the aftermath of mass immigration policies in the 1950s when, during a period of economic boom, workers were recruited from former colonies, and particularly, the Caribbean to work in the service industries (see Modood and May, 2001). Other significant migrations included those from Southern Europe, Cyprus, the Indian sub-continent as well as the Hong Kong Chinese working predominantly in the catering industry (Linguistic Minorities Project, 1985). This was followed during the late 1960s by the arrival of large groups of second and even third generation 'Asians' from East Africa. Among these were refugees who had

been expelled by the Ugandan regime at the time, as well as Vietnamese Chinese refugees (Plowden Report, 1967; Linguistic Minorities Project, 1985). The languages of immigrant children, notably the dialects spoken by Afro-Caribbean pupils (then generally referred to as 'West Indians') and the lack of fluency in English amongst those from the Indian subcontinent became widely regarded as a major challenge presented to teachers. Concerns about underachievement amongst children of Afro-Caribbean origin were based largely on notions of 'communication failure' in classrooms (NFER, 1966). 'West Indian' Creole was regarded as the cause of problems of listening, interpreting, reading and writing. As was the case with working class native British children during the 1960s, language deficits, associated with cognitive, cultural and social deficits became key signifiers of immigrant children's imputed ability, or inability, to succeed in school and later in society (Carby, 1982). Such representations of the intrinsic inferiority of minority languages provided a pedagogical rationale for the imperative to learn Standard English with an emphasis on oral language (Ministry of Education, 1963). As a result of the assimilationist ideology that prevailed at the time, new arrivals were accommodated in language reception centres where pupils would be 'inducted' into the language and culture of the host society for a period of at least a term. Second language teaching within this context largely followed the pedagogic principles of English as a Foreign Language (EFL).

In many local education authorities (LEAs), cultural and linguistic differences were catered for within the framework of multicultural education. Language provision for children from ethnic minority groups took place mainly in withdrawal classes, which denied pupils access to the mainstream curriculum for a significant part of the school day. Immigrant languages became rooted in the celebration of language diversity and the need to value minority cultures without recourse to the social experience of the speakers of these languages.

## MAJOR CONTRIBUTIONS

### *Welsh*

Until very recently, provision for Welsh education depended on the linguistic character of the region, since there are areas in Wales that are predominantly English speaking. Parents had the right to choose the language in which their children would be educated. A transitional model of bilingualism prevailed in Welsh-speaking areas, with English introduced later. Five types of bilingual education schools were introduced, including the designated bilingual school, the 'natural' bilingual school, the bilingual school with linguistic streaming, bilingually

mixed schools and Welsh schools. The number of teaching hours per week for Welsh varied amongst different boroughs (Lewis, 1980). Welsh was not a prerequisite for university or college entrance, although bilingual programmes and teaching in Welsh did exist at this level. Until the 1980s, the main concerns revolved around teaching approaches and textbook availability.

The introduction of the National Curriculum in England and Wales in 1988 represented a landmark development in the teaching of Welsh in schools (see May, 2000). Since then, all students between the ages of 5–16 are required to learn Welsh either as a first or second language and also expand their knowledge of Welsh culture. The latter is referred to as the *Cwricwlwm Cymreig* (UK Report to the European Charter for Regional or Minority Languages, 2004). The Welsh Language Act (1993) established the Welsh Language Board, which has responsibility for promoting the Welsh language in culture and society including business and the administration of justice in Wales. Public organizations are required to develop a Welsh language scheme to facilitate the adoption of Welsh within public institutions. Section 32 of the Government of Wales Act (1998) stipulates that the National Assembly has the freedom to take the necessary steps to support the Welsh language.

### *Irish and Ulster-Scots*

In Northern Ireland, the Education Order (1989) provides for the teaching of Irish as a modern language in the curriculum. The North/South Language Body (*An Foras Teanga*) came into being the following year (1999) and comprises two separate agencies, namely, the Irish Language Agency (*Foras na Gaelge*) and the Ulster-Scots Agency (*The Boord o Ulstèr Scotch*). The Good Friday Agreement signed on 10 April 1998 resulted in a move towards a unified approach with Ireland in supporting linguistic diversity (UK Report to the European Charter for Regional or Minority Languages, 2004).

### *Scots-Gaelic*

As a result of pressure from groups such as *An Comunn Gaidhealach*, politicians, churchmen and Highland societies, Gaelic received statutory support in the Scotland Education Bill of 1918, supporting its teaching at all levels of education. This was reinforced by the Education Act of 1945 supporting bilingual education. Nevertheless, Scots-Gaelic has been in decline for a number of years. According to the 2001 Census there are 58,552 Scottish Gaelic speakers (about 1% of the population of Scotland)—a decline from 65,978 Scottish Gaelic speakers in the 1991 census and 79,000 in the 1981 census.

Two Gaelic-medium primary schools were established in 1985 in Inverness and Glasgow; this has now increased to 60 schools with approximately 2000 students. However, at secondary school there are fewer numbers of both Gaelic-medium schools and students. A Further and Higher Education College was established in 1972 and degree-level courses have been available at the university of the Highlands since 1998 (MacKinnon, 1993). Whilst students can be educated across the different phases through the medium of Gaelic, this seldom happens.

Support for regional languages in the UK has been given new impetus by the European Charter for Regional or Minority Languages (1992). Whilst this is undoubtedly a very positive development as this relates to *autochthonous* languages, the situation regarding educational support for languages of *immigrant groups* in the UK remains unresolved.

### *Immigrant Language Communities*

Concerns about the issue of ‘mother tongue’ education regarding migrant workers in Northern Europe had been raised formally first within the context of UNESCO and the Council of Europe during the 1970s. These concerns related mainly to the need to facilitate the re-integration of the children of migrant workers into their culture of origin once their work permits have expired. This culminated in the introduction of the EC Council Directive on the education of children of migrant workers (77/486/EEC) which required member states to teach the languages of migrant groups living within their boundaries, for part of the school day. The Directive met with considerable ambivalence within the UK where concerns were expressed initially about costs, the difficulty in providing adequate numbers of ‘mother tongue’ teachers, as well as the fact that the situation regarding Britain’s immigrant groups was different to those of other member countries such as Germany and Sweden who had, predominantly, migrant workers. In schools, provision for the teaching of English as a Second Language (ESL) pupils was allowed under Section 11 of the 1986 Local Government Act.

Projects funded by the Department of Education and Science (DES) included: (a) the Rosen and Burgess study (1979–1980) *Languages and Dialects of London School Children*. The study identified 55 languages and 24 overseas-based dialects spoken in London, drew on earlier integrationist definitions, and stressed the ‘vitality’ and ‘strength’ of the languages and dialects of London’s immigrant population groups. The report highlighted the significance of dialect culture and advocated bilingualism to be advanced within the framework of multicultural

education; (b) *Linguistic Minorities Project (LMP)* 1979–1980: The LMP Project aimed to assess the range of diversity of the languages spoken in Britain, patterns of bilingualism, as well as the educational implications of societal bilingualism. It was hoped that the data collected would inform educational assessment and policy formulation in different parts of the country. The LMP conducted several surveys: The Adult Learning Survey (ALUS); Schools Language Survey (SLS); Mother Tongue Teaching Directory (MTTD) in collaboration with the National Council for Mother Tongue Teaching and the Secondary Pupils Survey (SPS). (c) The Bradford *Mother Tongue and Teaching Project (MOTET)* (1978–1981): The sample study focused on the implementation, monitoring and evaluation of a bilingual teaching programme in the children's first year at school (d) The *EEC/Bedfordshire Pilot Project* (1976–1980) focused similarly on a bilingual teaching programme but was abandoned by Bedfordshire LEA when the EC funding grant ran out (Tosi, 1983).

The Swann Committee's report *Education for All* (1985) was published in the aftermath of racialized urban unrest throughout Britain. The Swann Report located its views on the education of black immigrant pupils within the ideological framework of cultural pluralism, which underlines the importance of the need to socialize ethnic minority groups into the belief system of mainstream culture, whilst simultaneously maintaining links with their culture of origin. However, although the Swann Report provided a useful overview of the language debate during the previous two decades, it was unclear on the issues of language diversity and bilingual education and opposed separate educational provision for 'mother tongue' teaching (Modood and May, 2001).

By the late 1980s, in a discourse structured mainly within the framework of neo-conservative 'think tanks' such as the Centre for Policy Studies, the Hillgate Group and the Salisbury Review, the New Right attack on education centred on the issues of multicultural/antiracist education and bilingual education. These, it was argued, challenged the national cultural and linguistic heritage and also contributed to 'falling standards' in schools (see Honeyford, 1984; Scruton, 1985). In spite of the marginalizing discourse taking place within the New Right ideological framework, in-class support as opposed to withdrawal classes for second language learners was incorporated into Section 11 funding within the framework of Home Office Circular 78/90. Under the new Educational Support Grant (ESG) system, projects requiring schools to engage in teacher partnership were now funded for a period of 3/5 years. Bids for ESGs also had to be detailed in terms of specific needs addressed, objectives, quantified targets, time scale, monitoring

of results and consultation with community groups (Circular 78/90). This resulted in good examples of practice with a more coherent and coordinated approach within LEAs—and which was centrally monitored through funding requirements.

By November 1993, an overall restructuring of Section 11 funding arrangements took place. The Home Office transferred 55% of Section 11 funds to a new funding scheme, the Single Regeneration Budget (SRB) to be co-ordinated by the Department of the Environment and administered within nine local regions. The SRB involved the amalgamation of 20 separate budgets, from five different departments. LEAs falling within the ambit of identified Urban Priority Areas (UPAs) now had to apply for the funding of ethnic minority projects to the SRB.

### WORK IN PROGRESS

#### *Linguistic Diversity and Regional Languages*

The European Union has provided an important context within which debates about linguistic diversity can take place (see Phillipson, *Language Policy and Education in the European Union*, Volume 1). One of the most significant developments in this regard has been the EU Charter for Regional or Minority Languages (1992) introduced under the auspices of the Council of Europe (see de Varennes, *International Law and Education in a Minority Language*, Volume 1). The Charter requires systems to be put into place within member countries to support minority languages (see later). Moreover, the importance of English as a global language in international business and public administration has meant that issues related to linguistic pluralism have become signally important within countries in Europe. It is argued that the EU Charter for Regional or Minority Languages represent a response to pressures from member states to support the development of their languages (O'Reilly, 2001). The Charter requires member states to make educational and institutional provision for regional or minority languages 'traditionally used within a given territory of a State by nationals of that State who form a group numerically smaller than the rest of the State's population; and different from the official language(s) of that State' (Council of Europe, 1992). Thus, focusing on languages having both a territorial and historical base within these societies, it excludes the languages of recent immigrants. Underlying this is the aim to support the principles of democracy and cultural diversity 'within the framework of national sovereignty and territorial integrity' (Council of Europe, 1992, p. 1). As is discussed earlier, this has had a major impact on support and provision for Irish, Ulster-Scots, Scots-Gaelic and Welsh at all levels of the education system through

the establishment of Language Boards. With regard to Northern Ireland, the latter was established following the Belfast Agreement of 1998 (Good Friday Agreement). This Agreement stated that:

All participants recognize the importance of respect, understanding and tolerance in relation to linguistic diversity, including in Northern Ireland, the Irish language, Ulster-Scots and the languages of the various ethnic communities, all of which are part of the cultural wealth of the island of Ireland.  
[<http://www.ullans.com>]

The drive for children to be educated in Irish has gained momentum and is reflected in the growth of Irish language immersion schools and the establishment of All-Irish Medium Primary Schools (*Gaelscoileanna*). Most children attending these schools are from the middle classes. Irish language education is a developing issue; at the moment Irish is still a minority language with low levels of fluency.

In Northern Ireland, the Irish language speaking community is relatively small. The 1991 Census data indicate 'functional Irish-speakers of the order of 40,000 to 45,000, with some 13,000 to 15,000 possessing fluency in the full range of language skills' (Mac Giolla Christ, 2000, p. 3). Moreover, this group is dispersed in different locations throughout the region. Irish gained support and acknowledgement in the Belfast Agreement of 1998, and involved a 'statutory obligation on the Department of Education to encourage and facilitate Irish medium education in line with current provision for integrated education' (Crowley, 2005, p. 201).

There is an emergent debate about the significance of Ulster-Scots in developing a cohesive nationhood in Ireland, including Northern Ireland (McCoy, 1997). The Belfast Peace Agreement (1998) supported the development of Ulster-Scots and in 2000 the British Government signed the European Charter for Lesser Used Languages, and in doing so formally recognized Ulster-Scots as a variety of Scots (Crowley, 2005).

The Welsh Language Act of 1993 for the first time placed English and Welsh on an equal basis in public life in Wales. Section 5 of this Act requires every organization that receives public funding to provide a language scheme, including a system put in place to support its implementation.

In Scotland, the *Gaelic Language (Scotland) Act 2005* recognized Gaelic Scots formally as an official language of Scotland having equal status to English. The Act established the Scottish Language Board (*Bòrd na Gàidhlig*) which is responsible for the creation of a national plan for the development of Gaelic. The Act provides guidance on Gaelic education. By 2004, there were 1,972 pupils in Gaelic medium primary schools, 284 in Gaelic medium secondary and 2,513 secondary

learners; in the pre-school phase there were 1,236 pupils in Gaelic medium pre-school education (Kidner, 2004).

### *Immigrant Languages*

In 1998, the Ethnic Minority Achievement Grant (EMAG) replaced Section 11 funding. EMAG is allocated to LEAs on a formula basis as part of the wider Standards Fund. The grant is aimed at raising the standards of school-based achievement of ethnic minority pupils, especially those whose first language is not English. The emphasis is on providing support for teaching English as an Additional Language (EAL; see Canagarajah, *The Politics of English Language Teaching*, Volume 1). Accordingly, many LEAs are allocating a major percentage of this money to supporting the cost of employing teachers and bilingual classroom attendants to teach EAL in schools. Despite good practice, including bilingual support in some LEAs (see Tikly et al. in DfES, 2002), the general emphasis on raising standards in education effectively means that an ESL approach to facilitate access to the National Curriculum would be a priority for schools under pressure to achieve their set educational attainment targets. Thus, the grant ultimately sustains a monolingual educational policy. The work by Bourne (2001) highlights pedagogical issues related to the use of bilingual assistants in the support of curriculum learning.

## PROBLEMS AND DIFFICULTIES

Except for Wales where bilingual education throughout education is well-established, language diversity in education in the UK represents an evolving situation. In the case of Irish and Ulster-Scots, language in education remains a highly political issue in relation to contesting power interests amongst different political fractions, on the one hand, and the move towards political devolution within the national terrain, on the other. Further tensions prevail with regard to the potential use of these regional languages within the formal institutions of the European Union, as well as the ascendancy of English as an international lingua franca. The major problem in Scotland is a shortage of Gaelic medium and Gaelic subject teachers; this has implications for teacher education course provision.

Issues related to educational provision for the languages of immigrant groups, particularly those from ex-colonial countries, remain unresolved. Much of this relates to the implicit threat that these languages pose to the hegemony of British 'nationhood'. British citizenship now requires fluency in English language. Whilst for some immigrant groups the struggle for language maintenance programmes

has continued, for others, language shift has taken place with support from parents keen for their children to integrate into British society. Recent research has shown that second generation ‘immigrant’ pupils have developed complex language repertoires and have the ability to switch amongst different languages and dialects depending on the context of interaction (Rassool, 2004). It signifies a need to have a more nuanced approach to issues related to minority language rights—a need to move away from a rigid rights-based framework to one that takes account of the role of agency in shaping identities, multiple identities, as well as the discursive nature of power within the global cultural economy and its organic relationship with language. For further discussion on the development of critical debate and discourse on multicultural/multilingual education in relation to the role of agency in the shaping of identities, as well as issues related to power and contestation see the work of May (2000, 2001), Modood and May (2001) and Rassool (2000).

#### FUTURE DIRECTIONS

Language plays a major role in the interactive, technologically driven global cultural economy (see also Block, *Language Education and Globalization*; Kalantzis and Cope, *Language Education and Multiliteracies*, Volume 1). Within this context, language barriers represent barriers to progress. The complex linguistic demands of the global cultural economy stimulate the need for educational support for the development of flexible language users as an important aspect of human resource development. With regard to language choice, the emphasis now shifts to communicative and linguistic competence. That is to say, there is an acknowledgement that different languages, registers and discourse strategies are choices that language users will need to be able to make—and in which they would need to have a considerable degree of competence. Within this interactive terrain effective communicative competence does not only involve choice of language suited to the context of use, it also includes knowledge of different discourse styles and cultural conventions.

Differential linguistic markets at local, regional, national and international levels suggest a balanced approach towards maintaining local and regional languages as media of instruction alongside the creation of opportunities to develop international lingua franca within both formal educational and community contexts. This includes not only informal arenas of instruction but also the identification of the normal contexts in which people use different languages for different purposes. In the UK, this has implications for bilingualism in relation to Welsh, Gaelic-Scots, Irish and Ulster-Scots—and English, and within the

broader framework of the European Union, also the acquisition of Modern European Languages. Moreover, within the context of the interactive global cultural economy it would also suggest that learning languages of major trade and business partners would represent an important strategic policy choice. Whilst bilingual education programmes do not exist in mainstream schools for immigrant groups, some of the major languages such as Bengali, Urdu, Cantonese and Punjabi have been integrated into the Modern Languages Curriculum within some inner-city schools. In the UK, as is the case elsewhere in the contemporary world, there is growing awareness that linguistic and communicative competence represent an important economic, cultural and political resource to enable the country to participate effectively within the global cultural economy. Nevertheless, these meanings do not yet feature in language in education policy (see also the Nuffield Languages Inquiry, 2000).

## LANGUAGE POLICY AND EDUCATION IN THE UNITED STATES

### INTRODUCTION

The purpose of this review is to provide a balanced description of the important aspects of language policy in the USA as they relate, either directly or indirectly, to educational practices in the USA. Language policies derive from official enactments of governing bodies or authorities, such as legislation, executive directives, judicial orders or decrees, or policy statements; voter-approved initiatives; and nonofficial institutional or individual practices or customs. Policies may also evolve as a consequence of actions governments do *not* take, for example, by not providing support for the teaching or learning of a particular language, or language variety, or by designating and promoting an official language and ignoring other languages, or by failing to provide adequate resources to ensure that all groups have equal opportunities to acquire the official language in educational settings. Policies may also evolve from grassroots movements and become formalized through laws, practices, or some combination of both. In this review, theoretical perspectives on language policy and education will be addressed only briefly (for background information, see Wiley, 2005).

### EARLY DEVELOPMENTS

The focus of much of the earliest work in language policy in the USA was on the status of English versus non-English languages from the colonial period through the mid-nineteenth century (Kloss, 1977/1998). Conklin and Lourie (1983) described the history of languages in North America, beginning with the arrival of the first Europeans in the sixteenth century; Heath and Mandabach (1983) describe the British legacy of tolerance toward the use of non-English languages, coupled with an aversion to rigid standardization of English prevalent in the USA until the mid-nineteenth century. However, tolerance was limited to speakers of European languages. Native American languages and cultures were stigmatized, and government policy, beginning in 1802, was to separate Indians from their cultures (Leibowitz, 1971; see also McCarty, *Language Education Planning and Policies by and for Indigenous Peoples*, Volume 1). Colonies, such as Virginia and

South Carolina (and later, many states) passed “compulsory ignorance laws” which made it a crime to teach slaves, and sometimes free-blacks, to read or write (Crawford, 1992). Beginning in the 1850s, the development of a common public school system, coupled with a nativist movement beginning in the 1880s, led to the imposition of English as the sole language of instruction in public and most parochial schools by the 1920s (Heath, 1981). Before 1889, only three states had laws prescribing English as the language of instruction in private schools, whereas by 1923, 34 states required English (Leibowitz, 1971, p. 7). In Hawaii (1920) and California (1921), a series of laws were passed aimed at abolishing Japanese language at schools; by 1923, 22 states had laws prohibiting the teaching of foreign languages in primary schools. In *Meyer v. Nebraska* (1923), the US Supreme Court found a 1919 Nebraska statute that forbade teaching in any language other than English to be unconstitutional, and in 1927, the Court upheld a ruling by the Ninth Circuit Court of Appeals (1926), which had found laws prohibiting the teaching of non-English languages in 22 states to be unconstitutional (Tamura, 1993). Moreover in 1927, the US Supreme Court ruled in *Farrington v. Tokushige* that Hawaii’s efforts to abolish private Japanese (Korean and Chinese) language schools were unconstitutional, and thus upheld the right of language minority communities to organize after-school and weekend heritage language programs.

The period 1930–1965 was relatively uneventful with regard to federal intervention in language policy issues, with several notable exceptions, such as the continued intrusion of US influence in language-in-education policy in Puerto Rico (Resnick, 1993), and restrictive policies toward the use of Japanese and German in public domains from the 1930s through World War II. In a more positive vein, oppressive boarding school policies for Native Americans were relaxed and the linkage of language minority status with segregation in political access was significant, anticipating major policy shifts culminating in federal legislation in the 1960s supporting bilingual education and voting ballots, which was expanded in the 1970s. However, despite these important policy initiatives that supported the learning and use of languages other than English in education and civic life, federal and state governments have been generally reluctant to address the educational needs of language minority students and other historically marginalized groups unless compelled to do so in reaction to political pressure brought by such groups.

#### MAJOR CONTRIBUTIONS

Beginning in the 1960s, the federal US government took an active role in accommodating and, in some cases, promoting non-English

languages in education. The federal role increased in two ways—increased expenditures for students identified as lacking proficiency in English under the Elementary and Secondary Education Act (ESEA), and an increased role in the enforcement of civil rights laws in education (Macias, 1982). The first major federal involvement in the area of status planning was the Bilingual Education Act (BEA) of 1968 (Title VII of the ESEA) which authorized the use of non-English languages in the education of low-income language minority students who had been segregated in inferior schools, or had been placed in English-only (submersion) classes (Lyons, 1992, p. 365). However, the BEA came to an end following the passage of the No Child Left Behind Act (NCLB), which reauthorized the ESEA in 2002. All references to “bilingual education” were stripped from the law. Nevertheless, under Title III “language instruction for limited English proficient and immigrant Students,” federal funds for “language instruction education programs” which “may make instructional use of both English and a child’s native language” are available, and state education agencies may use these funds to support bilingual education programs if they choose (Wright, 2005a, b). In addition, Title I of NCLB calls for accommodations for “limited English proficient” (LEP)<sup>1</sup> students on state academic tests, including, “to the extent practicable,” testing students in their native language for up to the first 5 years of enrollment. Other federally supported programs which deal with language and education include the Native American Language Act of 1990, which endorses the preservation of indigenous languages, and requires government agencies to ensure that their activities promote this, and the National Literacy Act of 1991, which authorized literacy programs and established the National Institute for Literacy.

Title VI of the 1964 Civil Rights Act and the Equal Educational Opportunities Act of 1974 have provided the statutory bases, whereas the equal protection clause of the Fourteenth Amendment of the US Constitution has provided the constitutional rationale for expanding educational opportunities for language minority students in a number of important court cases (see Fernandez, 1987). Among the most significant of these was the *Lau v. Nichols* (1974) decision, in which the US Supreme Court, relying on sections 601 and 602 of Title VI of the 1964 Civil Rights Act, found that the San Francisco School District had failed to provide a meaningful educational opportunity to Chinese ancestry students due to their lack of basic English skills. The Court did not specify an appropriate remedy; however, soon after the ruling the Office for Civil Rights of the Department of Education wrote

---

<sup>1</sup> The term preferred by scholars and researchers is ELL (English Language Learner); we use LEP only because it is the acronym used in NCLB.

guidelines (the Lau Remedies), which instructed school districts how to identify and evaluate limited and non-English-speaking children, identified instructional “treatments” to use (including bilingual education), and established exit criteria and professional teacher standards. At the time the Lau Remedies were in force, strong political opposition to one remedy, so-called maintenance bilingual education programs, led to increased federal support for transitional bilingual education programs, in which students are exited to English-only classrooms after 3 years in bilingual classrooms, as well as for alternative English-only instructional models. Currently, federal education policy under NCLB does not specify any instructional approach; it simply requires that states offer “language instruction education programs,” which ensure that “LEP” students attain and develop English language proficiency, and meet challenging state academic content and achievement standards (Wright, 2005a).

Before 1978, children of Native American backgrounds were not eligible for admission to federally funded bilingual programs because English was reported as their dominant language. However, linguists and educators concluded that the variety of English used (“Indian English” code) creates difficulties in the English-only classroom (see also McCarty, *Language Education Planning and Policies by and for Indigenous Peoples*, Volume 1). By 1986–1987, only about 11% of BEA grants were designated for Indian children (about \$10 million). In 1992, the Indian Nations at Risk Task Force reported to the Secretary of Education on its goals for the year 2000 for American Indian and Alaska Native students. They recommended that: (1) all schools serving Native students provide opportunities for students to maintain and develop their tribal languages; (2) all Native children have early childhood education, providing the needed “language, social, physical, spiritual, and cultural foundations” for school and later success; (3) state governments develop curricula that are “culturally and linguistically appropriate,” and implement the provisions of the Native American Language Act of 1990 in the public schools (Waggoner, 1992a, p. 3). Title VII of NCLB (2002) focuses on support for “local educational agencies in their efforts to reform elementary school and secondary school programs that serve Indian students to ensure that such programs (1) are based on challenging State academic content and student academic achievement standards that are used for all students; and (2) are designed to assist Indian students in meeting those standards.” There is no language in Title VII about opportunities for students to develop and maintain their tribal languages. Despite the relatively modest federal support for Native American languages over the past 15 years, a number of tribes adopted official language policies in the 1980s, including the Navajo, Red Lake Band of Chippewa, Northern Ute, Arapahoe, Pasqua Yaqui, and Tohono O’odlam (Papago) (Crawford,

1989, p. 246; see also McCarty, 2002; McCarty, *Language Education Planning and Policies by and for Indigenous Peoples*, Volume 1). However, tribal leaders and Native American educators have expressed grave concerns over NCLB, claiming its mandates are making it extremely difficult for reservation schools to focus on Native American language and cultural revitalization programs (Senate Democratic Native American Leadership Forum, 2005).

Policy for English as a second language education has been subsumed under a variety of federal and state programs, including: NCLB, the Head Start Program, the National Literacy Act of 1991, the Immigration Reform and Control Act (IRCA) of 1986, the Adult Education Act (AEA) and the Carl D. Perkins Vocational and Applied Technology Education Act (Perkins Act). According to the 2000 Census, nearly 47 million people (5+ years of age) speak a language other than English at home, and of these 7.2% reported that they had no proficiency in English; of the total US population, 4.9% report speaking English “not well” or “not at all” (Wiley, 2005, p. 16). Data from other surveys, such as the National Adult Literacy Survey, confirm that the number of adults requiring ESL services is somewhere between 12 and 14 million (Chisman, Wrigley, and Ewen, 1993). Despite the demonstrated need for English language programs for adults, there has been little coordination among the various federal, state, or private funding sources, and no overarching policy approach to meet this population’s educational needs (Wrigley and Ewen, 1995). Prior to NCLB, limited federal funds to support specialized bilingual and ESL programs were available to schools through competitive grants. In the 1990–1991 school year, only about 15% of roughly 3 million eligible children were enrolled in BEA programs. Under NCLB, funding for LEP students has increased and funds are technically available to all schools with LEP students. Nevertheless, these funds are now more thinly spread (Crawford, 2002), meaning less money per eligible student.

According to the results of a survey of public schools in the USA conducted by the American Council on the Teaching of Foreign Languages, nearly 7 million students were enrolled in foreign language courses in grades 7–12 in Fall (Autumn) 2000—an increase of about 1 million students since 1994. Among high school students (grades 9–12), slightly more than 6 million students (43.8% of all public high school enrollees) were studying a foreign language in 2000, the highest enrollment rate since 1928, and an increase of ~2% over 1994 (Draper and Hicks, 2002, p. 1). Among elementary schools (based on data from 19 states), 5% of students in grades K–6 were enrolled in nonexploratory foreign language courses in 2000; this represents a decrease from 6.4% (24 states reporting) in 1994 (Draper and Hicks, 2002, p. 1). Spanish continues to attract the greatest number of students, accounting

for 68.8% of all language enrollments, 7th–12th grade; French accounts for 18.3% (a decrease of 1.3%) and German for 4.8% (a decrease of less than 1%) of foreign language enrollments. Japanese and Italian are increasing in popularity, representing 8% and 1.2% of total foreign language enrollments in 2002, respectively. Data on foreign language enrollments in postsecondary institutions for Fall 2002 have been compiled by the Modern Language Association (Welles, 2003). The data are based on the results of a questionnaire sent to the registrars of 2,781 institutions, with 99.6% of the institutions responding. The 12 most studied languages, followed by total number of enrollments and percentage of total foreign language enrollments, are: Spanish (746,267) (53.4%); French (201,979) (14.5%); German (91,100) (6.5%); Italian (63,899) (4.6%); Japanese (52,238) (3.7%); Chinese (34,153) (2.4%); Latin (29,841) (2.1%); Russian (23,921) (1.7%); Ancient Greek (20,367) (1.5%); Hebrew (Biblical and Modern) (22,802) (1.6%); Portuguese (8,385) (0.6%); and Arabic (10,584) (0.8%). Enrollments in each of these languages have increased since 1998, with the largest increases observed for Arabic (92.3%), Biblical Hebrew (55.9%), Italian (29.6%), and Modern Hebrew (28%). Although study of a number of languages has grown in the past decade, increases in the number of students attending college (university), along with fluctuations in enrollments among various languages, have resulted in fairly steady registrations in modern foreign languages per 100 college students since 1977, ranging from 7.3–8.6.

According to Census 2000 data, among the nearly 47 million people in the USA aged 5+ years who speak a language other than English at home—an increase from 32 million in 1980—over 28 million (60%) speak Spanish (Wiley, 2005, pp. 10–11). Chinese is now the third most commonly spoken language in the USA, after English and Spanish, with slightly over 2 million speakers (replacing French in 1980). Languages with over 1 million speakers include French, German, Tagalog, Vietnamese, and Italian, whereas Korean, Russian, Polish, Arabic, Portuguese, and “Asian Indian Languages” (Gujarati, Hindi, and Urdu) were reported as having over half a million speakers (Wiley, 2005, pp. 11–12).

#### WORK IN PROGRESS

Issues which have received attention in the literature in recent years include the education of speakers of minority (non-English) languages and nonstandard varieties of English, education for the deaf, literacy, preparation of teachers for an increasingly diverse range of students, problems with NCLB’s mandates for testing LEP students, and anti-bilingual education state ballot initiatives.

Despite significant within-group gains in educational achievement, many language minority (LM) students perform less well academically than their majority peers (see Genesee, 1994). Although the population of LM students is greatest in selected states (California, Texas, New York, Florida, Illinois, New Jersey, Arizona, and Pennsylvania), LM students reside in all 50 US states, and many states are experiencing unprecedented growth among their LM student populations (e.g., Alabama, Georgia, South Carolina, North Carolina, Tennessee, Kentucky, Idaho, and many others). Current federal law (NCLB) requires that LM students be identified and appropriate instructional programs be implemented to ensure LEP students learn English and meet state academic standards. Furthermore, the law mandates the full inclusion of LEP students in state high-stakes testing programs, and individual schools are held accountable for ensuring that LEP students meet the same “adequate yearly progress” goals as all other students (Abedi, 2003). Despite NCLB’s call for accommodations, the vast majority of LEP students are tested in English with little to no accommodations. Amidst rising concerns about the validity of scores for students not yet proficient in the language of the test, schools nonetheless face threats of sanctions and eventual state or private takeover if too many LEP (or other) students fail the test each year (Abedi, 2004). In addition, each state is required to have a statewide English language proficiency test, and school districts are held accountable for ensuring that a growing percentage of students make progress in learning English each year. Given the pressure to raise test scores, the lack of tests in students’ native languages, the lack of encouragement and financial support for bilingual programs, and the heavy emphasis on English, many view NCLB as an implicit (or covert) language policy encouraging English-only instruction (Crawford, 2004; Wiley and Wright, 2004; Wright, 2005b).

Given that the education system in the USA has generally been decentralized, NCLB’s mandates are unprecedented. Nonetheless, with the absence of clearly defined instructional approaches in the federal law, US states are given flexibility to define what constitutes effective instruction for LEP students (Freeman, 2004), and thus can withhold federal funds from schools which do not meet state criteria (Wright, 2005a). This has been particularly problematic in three states that have passed anti-bilingual education voter initiatives: California (Proposition 227), Arizona (Proposition 203), and Massachusetts (Question 2). Together, these states are home to 36% of the nation’s LEP student population. Despite federal allowances for native language instruction, the law in these states mandates that LEP students be placed in structured English immersion (SEI) classrooms, and makes it very difficult for schools to provide bilingual education as an option (de Jong, Gort, and Cobb, 2005; Wiley, Castro, and de Klerk, 2005; Wright, 2005c).

The lack of a coherent (explicit) national language policy reflects, in part, broader social divisions about the role of education, and especially language(s), in society (see Arias and Casanova, 1993). For example, pluralists favor maintaining immigrant and indigenous non-English languages and argue that all students—majority and minority—benefit cognitively, as well as socially, by educational programs that develop two languages; assimilationists, on the other hand, believe maintenance of non-English languages is a private matter, and that the most important measure of success for bilingual programs is how fast children acquire English, not the long-term academic achievement of students. Ramirez et al. (1991) and Thomas and Collier (2002) provide the best evidence to date that late-exit (maintenance or developmental) bilingual education programs are superior to most early-exit or so-called English immersion (submersion) programs in terms of students' long-term academic achievement in English-mediated instruction (see also May, *Bilingual/Immersion Education: What the Research Tells Us*, Volume 5). However, explaining underlying causes of student success (and failure) is extremely complex, and cannot be undertaken without reference to issues of language and identity, and socioeconomic status, among many other variables. For example, members of some LM groups are able to acculturate to the mainstream (English-speaking) society very rapidly, regardless of whether their non-English native language is included in the curriculum, and without losing their cultural (even linguistic) identity; on the other hand, members of other groups, with different histories in the USA, often including segregated and inferior public schooling, have come to believe that full socioeconomic access to the dominant (English-speaking) culture is not a viable option, and as a result are more at risk of school failure, regardless of the curriculum they are exposed to in school. Groups also vary in group adhesion, often displaying wide intragroup variation in members' attitudes toward language maintenance and cultural assimilation (Paulston, 1994, p. 16).

The publication of *A Nation at Risk* in 1984 rekindled a national debate on the "literacy crisis." The 1992 National Adult Literacy Survey (NALS), a comprehensive survey of English literacy in the USA, found, among other things, that 40–44 million adults (21–23% of the adult population) performed at the lowest levels in tasks involving prose literacy. The fact that 21% of the respondents were immigrants still acquiring English who were unfamiliar with US culture complicates the findings. Moreover, the findings do not indicate how well respondents, both native English and nonnative English speakers, are able to cope with literacy challenges on a daily basis. Recent reports have attempted to correct some of the errors in the original findings. Matthews (2001) claims that only 5% of those surveyed should be considered illiterate because they failed to answer any questions (cited

in Wiley, 2005, p. 85). In addition, based on the analysis of test items, concerns about the validity of the survey have been raised (Berliner, 1996; Matthews, 2001). Nonetheless, these reports and concerns about American competitiveness in the global economy have led, in recent years, to the creation of programs for workplace and family literacy. In school settings, policy and curricula have tended to focus on the acquisition of literacy in Standard English, with little attention paid, until recently, to the acquisition and maintenance of non-English literacies, or to the effects of Standard English policies on speakers of so-called nonstandard varieties of English, such as African American Language (AAL) (Ramirez, Wiley, de Klerk, Lee, and Wright, 2005).

In recent years, a movement has emerged within the Deaf community in the USA to promote the teaching of American Sign Language, rather than English, as the first language of deaf persons, preferably in bilingual (ASL/English)–bicultural programs. This recommendation is based on research which shows that the acquisition of English literacy by deaf students instructed in sign systems, such as Manually Coded English (MCE), is less successful than it is for students who have had access to ASL during their formative language acquiring years (see also Branson and Miller, *National Sign Languages and Language Policies*, Volume 1). Critics, who oppose removing deaf children from their hearing parents to learn ASL and become acculturated into the deaf community, argue that this will result in permanent separation and rejection of English. Proponents of ASL as a first language view this as a language rights issue, since policies promoting oralism and restricting the use of sign language, usually developed by hearing persons, have historically oppressed the deaf community and limited their social and economic advancement (see Reagan, 2006).

An important policy issue, given the increasing diversity of the school age and adult population in the USA, concerns the preparation of teachers. State credentialing authorities have, in recent years, modified requirements for teacher certification to include courses in second language acquisition, culture, and methods and materials appropriate for linguistically and culturally diverse populations (see also Wiley, *Language Policy and Teacher Education*, Volume 1). Professional teacher organizations have lobbied state and federal agencies for greater funding and recognition of the specialized training required for teaching in multilingual and multicultural classrooms and schools. Many states now offer a certificate or endorsement in Bilingual Education (in various non-English languages), ESL and/or SEI. Publications integrating theory and practice in the education of LM students include Echevarria, Vogt, and Short (2003); Freeman (2004); Garcia and Baker (1995); Genesee (1994); Milk, Mercado, and Sapiens (1992); and Peregoy and Boyle (2004).

## PROBLEMS AND DIFFICULTIES

The role of the US federal government in expanding educational opportunities for minorities, including language minorities, has been challenged in recent years on a number of fronts. Since the inception of the BEA to its demise in 2002, opposition to Bilingual Education led to changes each time the bill was reauthorized, typically resulting in greater focus on transitioning students to English as quickly as possible, and designating greater percentages of funds for English-only approaches (Ricento, 1996; Wright, 2005b). Nonetheless, in the final reauthorization of the BEA (1994), the benefits of bilingualism were recognized, and funds were allowed for maintenance of bilingual and dual-language programs. In contrast, under NCLB, the term “bilingual education” no longer appears in the federal law, and funds no longer target specific bilingual or other program models.

The biggest attacks on bilingual education, however, have occurred at the state level. A wealthy software engineer from California seeking political name recognition sponsored and funded anti-bilingual education ballot initiatives in four states: California (Proposition 227), Arizona (Proposition 203), Massachusetts (Question 2), and Colorado (Amendment 31) (Crawford, 2004). Although the initiative was soundly defeated in Colorado, the measure was approved by wide margins in the other three states. Under the deceptively simple and misleading title of “English for the Children,” the initiative’s sponsor placed educational language policy-making in the hands of uninformed voters, many of whom likely based their votes on their discomfort with growing immigrant populations (primarily Hispanic) in their states (Wiley and Wright, 2004). These state initiatives have made it difficult to secure new or continued support for bilingual education from legislators at the federal level (Wiley and Wright, 2004).

Groups that oppose bilingual education, such as US English, also tend to oppose other types of federal accommodations to non-English speakers, such as bilingual ballots and the publication of government documents, forms and brochures in non-English languages (although a study by the US General Accounting Office found that 99.4% of the documents produced by the federal government are in English, excluding documents from the State and Defense departments). Such provisions and programs are often cited by opponents as examples of “ethnic-based” entitlements (see, e.g. Imhoff, 1990). These groups also strongly advocate the establishment of English as the official language of the USA, or of governmental entities at all levels. This movement began in the early 1980s under the leadership of the late US Senator S.I. Hayakawa, who introduced a constitutional amendment (S.J. Res. 72) in 1981 declaring English the official language of the USA.

Although the bill was never reported out of committee, by 2000, 27 states had adopted laws or amended their constitutions declaring English the official state language (US English, 2005). On August 1, 1996, the US House of Representatives, under Republican leadership, passed for the first time in US history a bill declaring English the official language of the US government (H.R. 123, The English Language Empowerment Act). Provisions of the bill include repeal of federal bilingual ballots and a prohibition against federal employees communicating in writing in non-English languages, although they may communicate orally in languages other than English. The Senate failed to act on a similar bill in the 104th Congress, thereby preventing the 104th Congress from enacting an official English law. The issue has frequently returned in subsequent sessions of Congress, including a proposal in 2006 amidst major debates over immigration, to declare English as the “national and unifying language,” but to date none of the proposed bills has passed.

Although, research in second language acquisition has provided clear evidence of the benefits of late-exit bilingual education programs (Ramirez et al., 1991; Thomas and Collier, 2002), of the effectiveness of second language immersion programs for monolingual English speakers (Lambert and Tucker, 1972), of the transferability of conceptual knowledge learned in one language to another language (Cummins, 1979), and of the social and affective benefits of programs and curricula which value the culture and language of the so-called nonmainstream students (Baker, 1993), these findings have been distorted and politicized by opponents (cf. May, *Bilingual/Immersion Education: What the Research Tells Us*, Volume 5). Professional education organizations, such as Teachers of English to Speakers of Other Languages (TESOL), the National Association for Bilingual Education (NABE), the Modern Language Association (MLA), and the National Council of Teachers of English (NCTE), among many others, have offered their expertise on language education matters to policy makers at the state and federal level in the USA. However, the issues surrounding language in education policy—the use of non-English languages as the medium of instruction, the teaching of foreign languages from kindergarten through college, the maintenance of non-English languages through education, the valuing of non-English—as well as English—literacy among immigrant populations, the development of bilingual-bicultural language programs for the Deaf—have histories which extend back to the mid-nineteenth century. For example, the effects of the Americanization campaign (roughly 1914–1924) (McClymer, 1982), which saw severe restriction of non-English languages in public and private domains at the same time the teaching of English to adults through civics classes was promoted by the states and the federal

government, continue to influence and shape attitudes, and hence policy, with regard to the learning and teaching of languages (Ricento, 2003, 2005).

#### LIKELY FUTURE DIRECTIONS IN RESEARCH AND PRACTICE

Research in language policy and planning is subsumed under three general headings: processes, agents, and goals. Under processes, researchers investigate the mechanisms by which and through which language policies are developed, implemented, and evaluated. Examples of possible research topics in the coming decade include the implementation of federal language policies at the state and local level; the role played by grassroots organizations in articulating policy and influencing legislative processes; the evaluation of policies by different constituencies; the implementation and evaluation of specific program types in specific educational settings; the interplay of the various components which collectively, and individually, determine language policies. Agents refer to the public and private individuals and collectivities which promote various policies. Examples of areas likely to be researched include: who controls language policy agendas, and by what means; what are the sources of authority for those agents who argue for particular policies; what are the characteristics of various interest groups that promote particular policies; what role do the media play in promoting particular policy views? Goals refer to sociopolitical and/or economic objectives sought by particular language policies. Examples of research topics in this area include: assessing the differences between stated and unstated goals; investigation of language in education policies from sociohistorical perspectives; articulation of alternative societal goals and the development of specific policies to achieve those goals; comparative analysis of language policy goals among polities. A good sampling of new directions in language policy research is found in Hornberger and Ricento (1996) (see also Ricento, 2006).

Regarding changes in practice, as federal involvement in the policy arena has decreased in recent years (at least in certain areas), the states are likely to play a greater role in policy development and implementation. Second, despite significant opposition to specialized language programs for LM and mainstream students, a number of states and localities have created innovative programs involving two-way bilingual programs in languages as diverse as Mandarin and Portuguese (even in states with anti-bilingual education initiatives). A growing number of states have increased foreign language requirements in elementary and secondary schools. Professional language and education organizations have, in many cases, been successful in influencing the legislative

process at the state and federal levels. As more research in language policy becomes available to US decision-makers, and as more trained scholars enter the field, the impact on language policy development, implementation and evaluation could be significant.

INDIGENOUS LANGUAGE POLICY AND  
EDUCATION IN MEXICO

INTRODUCTION

The policies which nation-states, and their societal majorities, apply to their ethnic and linguistic minorities have become a touchstone to evaluate the quality of democracy, pluricultural commitment and the construction of modern states in almost any part of the world. Therefore, educational and language policies for the minorities can no longer be dismissed as marginal components of state policy that may be dealt with outside the domains of mainstream power relations and the state. Mexico is a paradigmatic case in point. At least in America it represents the probably most-centralized, all-embracing and vertical case of nation-state building. It did not, however, achieve its historical goals of creating a homogeneous nation (cf. May, *Language Education, Pluralism and Citizenship*, Volume 1) and fully assimilating the indigenous peoples in the 500 years since the beginning of Spanish colonization. On the contrary, the Mexican indigenous population is the largest in the continent, although language shift advances in many language groups. During the twentieth century the indigenous population, measured as speakers of the 62 surviving languages by the Mexican national census, has grown steadily in absolute numbers, but declined as a percentage of the total population from 2.2 million in 1930 (=16%) to 7.2 million (=7.2%) in 2000 (INEGI, 2000).

To understand the apparent paradox in Mexico between present overt policies that support diversity and indigenous language maintenance on the one hand, and covert pressure for assimilation on the other, we have to revise historical and present-day ideological orientations in language policy. In the following section, I briefly outline the history of language policy for indigenous peoples from colonial times to the present day in Mexico. Next, I consider the central problems of general language and culture orientations and the use of the languages in indigenous education. I then refer to recent changes in legislation and discuss to what extent a linguistic rights perspective developed over time. In this chapter, the focus is on general language policy and linguistic rights issues, which relate to indigenous education in Mexico. I deal

with concrete programmes of bilingual education and their outcomes in the corresponding chapter on 'Bilingual Education for Indigenous Communities in Mexico' in Volume 5.

#### EARLY DEVELOPMENTS: LANGUAGE POLICY FROM COLONIZATION TO THE TWENTY-FIRST CENTURY

Education and language as instruments of state building and control have played a major role ever since complex states emerged on Mexican territory. The Aztecs developed their own educational system, an Academy of Science and a selective language policy to govern their vast empire (Heath, 1972). Throughout nearly three centuries of Colonial Empire (1519–1810) the Spanish Vice Kingdom attempted to build a hierarchical society modelled on Spain with the King, the Church and the Spanish language at the top. After independence in 1810, the new Mexican-born bourgeoisie pursued the construction of a unified, homogeneous nation-state as the main overall objective of state policy (cf. May, *Language Education, Pluralism and Citizenship*, Volume 1) up until the present (Cifuentes, 1999, 2002; del Valle and Gabriel-Stheeman, 2002; Hidalgo, 1994).

In which language(s) should public administration, exploitation and the saving of souls be accomplished? Two basic strategies of language policy for indigenous peoples established continuity between the two regimes (Hamel, 1994; the classical work is Heath, 1972; see also Nahmad Sitton, 1982). The first and generally dominant strategy considered the assimilation, that is dissolution, of indigenous peoples in Mexico and the suppression of their languages to be a prerequisite for building the new polity (see also McCarty, *Language Education Planning and Policies by and for Indigenous Peoples*, Volume 1). A second position favoured the preservation of indigenous languages and cultures in this process, without giving up the ultimate aim of uniting nation and state. The first strategy imposed direct Hispanicization (castellanización) through submersion programmes: the national language was considered to be the only target and medium of instruction. Transitional programmes reflecting the second strategy applied diverse bilingual methods where the indigenous languages played a subordinate, instrumental role as the languages of instruction and initial alphabetization. The complex process of implementing political, spiritual and cultural domination developed full of contradictions and advanced at different speeds in different phases of history (Hamel, 2006).

The century from independence in 1810 to the Mexican Revolution (1910–1920) meant a time of devastating destruction of indigenous organization and communities, a severe reduction of its population and the period when Spanish became the majority language in the

country (83% by 1895, Cifuentes, 2002). Different from most other Latin American countries, however, the turn into the twentieth century saw a national bourgeoisie that explicitly constructed a new national identity based on the Mestizo as the new prototypical citizen, the symbiosis of the two high cultures, the European and the Aztec-Mayan that Mexico inherited. The new national ideology was significantly reinforced after the Mexican Revolution. It allowed Mexico to create distance and at the same time weave multiple alliances along a triple cultural and linguistic borderline to foster its own nationalism:

1. Mexico encompassed the mystical indigenous identity founded in the high pre-Colombian indigenous civilizations, which distinguished the new nation from Spain, the USA and most other Latin American countries;
2. As part of the New World, Mexico forged a unity of American countries and contrasted them to Europe, especially to Spain;
3. At the same time, as inheritor of the Spanish colonial tradition, Mexico established bonds of solidarity with the other Spanish speaking countries and built a barrier against US cultural and linguistic hegemony.

Throughout the twentieth century, a paradoxical process developed: on the one hand, indigenous language loss accelerated dramatically, as in many other parts of the world; on the other, a contradictory state discourse emerged to preserve the indigenous languages. At first, homogenizing policies prevailed. The Mexican Revolution consolidated the Mestizo ideology as the racial, ideological and linguistic basis of the post-revolutionary society. Assimilationist education using direct methods of Spanish teaching dominated in indigenous areas (Garza Cuarón, 1997). The establishment of the new Federal Ministry of Education in 1921, an institution that by 1990 would employ some 1.5 million teachers and bureaucrats, propelled an education that aimed to ‘overcome the evolutionary distance which separates the Indians from the present era, transforming their mentality, orientations and customs, to incorporate them into civilized modern life ...’. (SEP, 1927, p. 35; all translations are mine)

By the mid-1930s, Franz Boas’ cultural relativism hypothesis gained ground through his teaching and research on Indian languages and cultures in Mexico. It helped to counterbalance evolutionary theories of the previous period with their linguistic and cultural hierarchies. The concept of *Indigenismo* emerged, which, similar to *Orientalism* in the British and French tradition, could be sketched as ‘the whole set of ideas about Indians in the heads of non-Indians’ (Villoro, 1950). Given the failure of assimilationist policies and Spanish-only programmes of education, a new recognition of the role of vernacular languages emerged. New pilot projects of mother tongue education were

launched, among which was the well-known *Proyecto Tarasco* in central Mexico (Aguirre Beltrán, 1983; Barrera-Vázquez, 1953; see Hamel, *Bilingual Education for Indigenous Communities in Mexico*, Volume 5).

#### MAJOR CONTRIBUTIONS: LANGUAGE POLICY AND INDIGENOUS EDUCATION

In 1978, the Federal Ministry of Education in Mexico concentrated previously scattered programmes for K to grade 6 indigenous primary education in a new subsystem, the General Department of Indigenous Education (DGEI). The indigenous schools had to follow the same federal syllabus and to use the compulsory textbooks as the Spanish primary schools in the country. The main difference between the latter and the indigenous schools consisted in the important fact that all teachers in the bilingual programmes were indigenous and spoke a native language as their mother tongue. Since many, if not most, pupils entered primary school with little or no knowledge of Spanish, the teachers used the vernacular language as a means of communication and instruction as long as necessary, together with the primers in Spanish. Teachers improvised their work and used both languages in a non-systematic way. Literacy and most relevant content matters were in fact developed in Spanish. This *de facto* curriculum could be framed as a mixture of a submersion and a non-systematic transitional bilingual syllabus (Hamel, 1994).

In the 1980s, the official programme was labelled 'bilingual and bicultural'. Given very poor achievement and ongoing language shift among indigenous students, the department designed a new approach based on L1 medium instruction and the teaching of Spanish as L2 (see May, *Bilingual/Immersion Education: What the Research Tells Us*, Volume 5). However, these programmes were never put to work beyond pilot projects, given political opposition in many communities, within the bureaucracy and the teachers' trade union. The most significant activity of the department consisted in the development of primers in the 40 most widely spoken indigenous languages of the country. Again, implementation lagged behind, and these teaching materials were rarely used in the classrooms.

A decade later, the label 'bicultural' was substituted by a new one, 'intercultural'. The argument, which was imported from South America without any debate or development of its own in Mexico, maintained that the term 'bicultural' implied a dichotomous worldview that separated cultures inappropriately. The new intercultural bilingual perspective in turn would propel the recognition, knowledge and integration of both cultures in a pluralistic enrichment perspective (for a critique, see

Muñoz Cruz, 2002). Both languages should now be the medium and object of instruction (DGEI, 1999). In 2001, a newly elected conservative government created a new Coordination in Intercultural Bilingual Education (CGEIB) within the Federal Ministry of Education, which developed a great number of projects, studies and proposals. The main thrust was put on the development of an intercultural orientation of knowledge and respect of indigenous cultures in mainstream education. Implementation, again, did not occur with the same intensity and speed. By the end of the administration in 2006, practically none of the proposals or even the new debates had reached the classrooms.

Contrary to what many authors (e.g. Modiano, 1988) had argued about indigenous education in Mexico in the past, systematic alphabetization in vernacular languages is not a real, general practice in public Indian education, although official policy established since the 1980s asserts that indigenous education should be carried out through the medium of L1. At present, a range of pedagogical practices are in use in the indigenous educational system in Mexico. The most widespread practical model propels transition to Spanish:

1. Indigenous schools have to apply the general primary school curriculum designed for monolingual Spanish speaking pupils; indigenous teachers and schools are expected to make minor adjustments to fit the needs and conditions of their pupils.
2. The national compulsory primers and textbooks are used as the main pedagogical tool; they are designed to teach the subject matter and literacy in Spanish as L1; in no way are they appropriate to learn Spanish as L2. The existing official materials in indigenous languages are rarely used alongside the Spanish textbooks.
3. Although most pupils have little knowledge of Spanish at entrance level, there is no specific place in the curriculum for Indian language and culture. Moreover, no systematic teaching of Spanish as L2 is provided.
4. The indigenous language serves a subordinate function as a language of instruction, and only as long as necessary. Depending on the general language distribution patterns and levels of proficiency in Spanish, instruction in L1 may cease by grade 4 or 5.
5. No culture and language domain separation is practiced or envisaged. Thus, the dominant culture in its material, social, linguistic and cognitive dimensions invades the domains of the indigenous culture and contributes to general culture and language shift among indigenous students.

Generally speaking, low levels of proficiency and achievement obtain for indigenous students in Mexico, as elsewhere (Bertely Busquets, 1998; Citarella, 1990; see also McCarty, *Language Education Planning and Policies by and for Indigenous Peoples*, Volume 1). A systematic

mismatch can also be observed between the sociocultural, linguistic and educational needs of the indigenous student population on the one hand, and the curriculum, materials and language use at school on the other. From the point of view of both the individual and the community, these modalities of schooling tend to reproduce subordination, very often accompanied by traumatic effects for the psychological and cultural development of the pupils. As a matter of fact, the inappropriateness of the school system as such severely violates the indigenous students' educational and linguistic rights (Hamel, 1997).

Three important innovations characterize present-day linguistic dynamics in Mexico that have important consequences for indigenous education: First, the process of democratization over the past 20 years and the expansion of indigenous movements and demands, particularly since the Zapatista upsurge in 1994, have broken down the previous hegemony of multicultural and assimilationist positions within an authoritarian state. Second, Mexico's indigenous peoples are leaving behind their status as a relatively passive population, as targets of governmental programmes to combat poverty and educational backwardness. They have increasingly placed themselves as actors on the political and educational scenes. Third, the 'Indian question' could no longer be considered a marginal problem for the state that could be kept confined to indigenous rural areas. On the contrary, the most prominent claims put forward by the indigenous movement concern fundamental questions of constitutional law, of collective rights and the very essence of a pluralistic nation-state (see also May, Language Education, Pluralism and Citizenship, Volume 1).

#### WORK IN PROGRESS: LANGUAGE POLICY AND LINGUISTIC RIGHTS

In contrast to indigenist and language *policies*, legislation on languages has been much less explicit in Mexican history. Linguistic rights, usually conceptualized as linguistic human rights, have only become a concern since the late 1980s. They have to be considered in the intersection of language policies and general indigenous policies. In Mexico, linguistic human rights (LHR) have always been discussed in the larger context of indigenous rights (see also McCarty, Language Education Planning and Policies by and for Indigenous Peoples, Volume 1; Skutnabb-Kangas, Human Rights and Language Policy in Education, Volume 1).

Let us consider the development of the corresponding Mexican legislation for indigenous education and languages over the period since the early 1990s, until the general Amendment on Indigenous Rights in 2001 and the 2003 General Law on the Linguistic Rights of

Indigenous Peoples. As we shall see, legislation moved from a fairly weak tolerance orientation to a more specific and overt promotion orientation regarding the role of indigenous language (Hidalgo, 2006; Nahmad Sitton, 2001; Pellicer, 1998; cf. May, *Language Education, Pluralism and Citizenship*, Volume 1). Experiences in many parts of the world show that laws and other legal dispositions need to contain very clear and specific definitions to protect minority rights effectively. Otherwise they can be easily perverted or simply not be applied, given the prevailing asymmetric power relations (see Skutnabb-Kangas, *Human Rights and Language Policy in Education*, Volume 1).

Nowhere in the colonial, republican, or post-revolutionary constitutions did the Mexican constitution recognize the existence of Indian peoples until 1991, when an amendment to Article 4 of the Constitution was passed in Congress:

The Mexican nation has a pluricultural composition which is based originally on its Indian peoples. The law will protect and promote the development of their languages, cultures, usages, customs, resources, and specific forms of social organization. . . .

This amendment was severely criticized as too limited to indigenous *cultural* rights in isolation, without granting at the same time their economic, social, political and territorial rights. After the outbreak of the indigenous Zapatista Army's (EZLN) rebellion in southeast Mexico in 1994, followed by extended peace negotiations with the government (Díaz-Polanco, 1997), a proposal for the constitutional recognition of indigenous cultural rights was finally sent to Congress in 2001. However, the amendment of Article 2 that was passed contained considerable changes in relation to the peace agreements; it left unsatisfied the Mexican indigenous movement far beyond the Zapatista Army and most partisan sectors of civil society. The legal text centres on the autonomic competence to regulate their internal social, political, economic and cultural life. Language and education are dealt with in passing. The indigenous peoples are granted the right to:

A. IV Preserve and enrich their languages, knowledge and all the elements that constitute their culture and identity.

The state in turn will

B. II Grant and increment the levels of education, favouring bilingual and intercultural education, literacy, completion of basic education, vocational training, secondary and tertiary education. Establish a system of grants for indigenous students at all levels. . . . Stimulate the respect and knowledge of the diverse cultures that exist in the nation.

On the whole, indigenous peoples in Mexico are granted the right to preserve and enrich their ancestral knowledge, languages and cultures.

Within the state programmes, bilingual intercultural education is mentioned but not made obligatory; it ranges among a series of other non-indigenous types of education with an assimilationist perspective.

In 2003, the Mexican Congress approved a new General Law of the Linguistic Rights for the Indigenous Peoples. It contains four chapters, including general provisions, the rights of the speakers of indigenous languages, the obligations and competencies of public institutions in this matter, and the foundation of a National Institute of Indigenous Languages, which started activities in 2005. The most significant dispositions and definitions are the following:

The object of the law is

... to regulate the recognition and protection of the indigenous peoples' and communities' individual and collective linguistic rights, as well as the promotion of the use and development of the indigenous languages. (Article 1)

The indigenous languages (IL), along with Spanish, are defined as ... national languages due to their historical origin, and have the same validity en their territories, locations and the contexts where they are spoken. (Article 4)

The IL are declared valid to carry out any public business and to access public services in them (Article 7), and the speakers are granted the right to communicate in them in private and public spheres (Article 9). Furthermore, the state grants the indigenous peoples and communities the right to access the state jurisdiction in their languages, that their customs and culture be taken into account (Article 10), and that, if necessary, they will be provided with a translator.

In Article 11, access to bilingual and intercultural education is granted, and in secondary and tertiary (university) education, interculturalism, multilingualism and the respect for diversity and linguistic rights will be promoted.

#### PROBLEMS AND DIFFICULTIES

In their political fight, the Zapatistas developed strategies that integrated specific claims (territory, resources, justice, education and language) into the overarching target of local and regional autonomy as the specific modality to exercise the right of self-determination as indigenous peoples and nations. From this perspective, language related policies and legal regulations are most likely to succeed if they are incorporated into an attempt to create the necessary conditions, including resources for language maintenance and bilingual education.

Three issues that integrate language policy, linguistic rights and curriculum should be discussed. They relate to the legal basis of the indigenous languages, to the intercultural and bilingual (IB) curriculum, and the control over indigenous education. All these topics will have to be confronted with current implementation and its future perspectives.

As we can see, legislation of linguistic rights and indigenous education in Mexico went through significant changes in the time span of little more than a decade, from a first reference to the existence of indigenous people in the 1991 revision of the constitution to a specific body of linguistic rights and the creation of a National Institute of Indigenous Languages in 2005. The status of indigenous languages has no doubt improved. Although their definition as ‘national languages’ assigns no specific legal status to them, as would have been the status as ‘official languages’, the law established the speakers’ right to use indigenous languages in public institutions and the obligation of the state to create the conditions for their successful use. In spite of significant improvement, the legal foundations of indigenous language status and, above all, of bilingual education still lack more specific definitions to protect and promote indigenous languages and enrichment bilingual education efficiently. Since intercultural bilingual education is nowhere defined in the law, the indigenous children’s right to receive education, including the acquisition of literacy and other content matters in their mother tongue, remains unprotected (cf. Skutnabb-Kangas, *Human Rights and Language Policy in Education*, Volume 1). Such L1 instruction is considered a fundamental component of any enrichment bilingual curriculum for subordinated minority children.

The next question refers to the nature of the curriculum and control over indigenous education in Mexico. During recent years, a number of local innovations and creative initiatives have emerged to find new ways to develop alternative models of indigenous education, although their margins are narrow (Bertely Busquets, 1998; Bertely Busquets and González Apodaca, 2003). The most radical alternative experiments occur in the areas under Zapatista control.

In general terms, however, submersion and transitional programmes based on multicultural, assimilationist perspectives still prevail in Mexico. From the perspective of recent debates about autonomy and intercultural education, the question arises as to what extent the government is prepared to grant relative autonomy to the system of indigenous education in terms of alternative curricula and indigenous control over administration. Since the end of the 1980s, we observe an increasing disposition to grant the teaching of literacy and other content matters in the native languages where appropriate and wanted; but *content*

as such has to be kept more or less homogeneous and must follow the national compulsory curriculum for Spanish-speaking children. In other words, different from previous periods, bilingualism is now accepted and even encouraged to a certain extent; yet pluriculturalism, i.e. real diversity based on an enrichment perspective, is not. Nowhere within the public school system are the school communities entitled to propose and put into practice a syllabus that diverges significantly from the official curriculum.

In spite of its vagueness in key issues (i.e. mother tongue education) and a narrow margin for structural change, the new legal framework in Mexico has moved from prohibition to tolerance and to an albeit weak promotion of indigenous languages and cultures. It opens up new spaces and opportunities for new experiences and innovations. Unfortunately, resistance against changes remains strong within mainstream society and the indigenous communities themselves. Five hundred years of domination has left profound traces in the subordinated peoples' culture, organization and worldview. Most indigenous schoolteachers have settled for some kind of transitional bilingual programme. They themselves have interiorized a diglossic ideology, which leaves no room for their languages as the vehicle for the development of academic skills such as literacy or, in a broader context, for the development of their communities. As in many other contexts of ethnolinguistic minorities in the world, resistance to mother tongue education stems not so much from legal or curriculum constraints, but is due to interiorized barriers and social pressure from inside and outside the indigenous communities themselves. In principle, the legal framework would allow for much greater indigenous language use and related enrichment bilingual education programmes than that currently practiced by the system and its indigenous actors. Given this contradictory situation, the growing numbers of successful initiatives that show alternative ways of education (Podestá Siri and Martínez Buenabad, 2003; see examples in Hamel, *Bilingual Education for Indigenous Communities in Mexico*, Volume 5) can play a significant role in the attempt to bring about more fundamental changes on a broader basis.

#### FUTURE DIRECTIONS

The future perspectives of indigenous bilingual and intercultural education in Mexico are difficult to foresee. Neo-liberal economics and North American integration through the NAFTA Trade Agreement have to a large extent eroded the agricultural subsistence in Mexico as the territorial base for indigenous survival. 3.4 million of peasants, many of them indigenous, were forced to migrate to other areas of

Mexico or to the USA during the past administration. Although many migrants maintain close connections with their home communities, the territorial base, the density of the ancestral habitat and other fundamental components for cultural and linguistic reproduction are at risk. Given ongoing asymmetric conflict relations between Spanish (and English in the USA) and the indigenous languages (IL), the rapid reduction of monolingual IL speakers, and the severe weakening of intergenerational mother tongue transmission may all serve as indicators that rising bilingualism may only be transitional in the ongoing process of language shift.

Maintenance perspectives will rely on the growing number of indigenous organizations and grassroots initiatives, on a more profound acceptance of pluriculturalism by the dominant society, and significant changes in the economic model to re-establish social and economic sustainability in the indigenous territories.

In terms of research and academically guided development and implementation, individual ethnographic case studies abound (see an overview in Bertely Busquets, 2003). More research based on scientific approaches that permit national and international comparison is needed, however (cf. May, *Bilingual/Immersion Education: What the Research Tells Us*, Volume 5). In the last resort, changes will depend on the political forces and movements within both subordinated and mainstream society that are able and willing to incorporate major innovations in the construction of a new pluricultural and plurilingual Mexican nation-state.

## LANGUAGE POLICY AND EDUCATION IN THE ANDES

### INTRODUCTION

Language policy in the Andes appears as a set of dissimilar and rivalling constituents. There are some explicit constitutional provisions and legal dispositions declaring the protection of national language diversity and linguistic rights. However, in reality, there is a strong implicit imposition of Spanish as the sole national language of administration, subordinating and weakening indigenous languages (cf. Hamel, *Indigenous Language Policy and Education in Mexico*, Volume 1). Facing this contradictory situation is an emerging critical awareness as well as remonstrative efforts that demand the empowerment of indigenous languages and the effective exercise of linguistic rights.

Taking into consideration the interactions of those competing elements, this chapter examines recent developments in language policy, language planning, and education in Ecuador, Peru, and Bolivia, since these countries host the largest percentage of indigenous language speakers in the Andean region. It is believed that 34% of Ecuadorians, 37% of Peruvians, and 62% of Bolivians belong to indigenous communities speaking different languages. Besides Spanish, the languages most spoken are Quechua (more than 10 million speakers) and Aymara (2.5 million speakers). There are other vulnerable languages spoken by minorities, particularly in the Amazon area: 15 languages in the jungle region of Ecuador, 40 in Peru, and 34 in Bolivia.

### EARLY DEVELOPMENTS

The Andean region, marked by colonialism and asymmetrical relations of power, is a site where European and Indigenous cultures meet and struggle, influencing each other in different ways. In this context, language policy and the entire political spectrum in the Andes have been suffused with social domination and assimilationism (Mannheim, 1991, p. 78).

Under Spanish colonial rule, language policies could not count on immediate or even short-term hispanization—except in a few areas along the coast. Therefore, they were oriented toward Quechua, raising its potential as a vehicle of communication. A process thus started in

the Andes, characterized by the following trends: (i) hegemony of Spanish, associated with groups in power; (ii) spread of Quechua, and on a smaller scale Aymara, through widespread, impoverished areas along the Andes Mountains; and (iii) weakening or extinction of numerous languages that formerly showed signs of vitality (Torero, 2002). Although during this period Quechua enjoyed a relative prestige and was used as a literary language, during the post-independence republican period a hard-line linguistic assimilation took place. Gradually, Spanish expanded at the expense of the indigenous languages, becoming the language of the majority in Ecuador, Peru, and Bolivia. However, owing primarily to heavy migration from rural areas to cities, this Spanish is strongly marked by Quechua and Aymara linguistic features. Even if Spanish has subjugated the Andean indigenous languages, these languages are transforming Spanish. Consequently, linguistic conflict is being unleashed not only between languages, but also between the Andean and non-Andean varieties of Spanish.

Throughout the twentieth century, diverse efforts to standardize indigenous languages were made. The first officialization of a Quechua alphabet in Peru dates to 1946. In 1954, the Third Inter-American Indigenist Congress, held in La Paz, proposed an alphabet based on the International Phonetic Alphabet. During General Velasco's Peruvian government (1968–1975), Quechua was recognized as an official language, and an alphabet was produced for Quechua and Aymara. This alphabet, based on phonologic criteria and typographic simplicity, served to write dictionaries and grammars in six major varieties of Quechua. Later, in 1983, this alphabet was revised with the intention of negotiating a greater pan-Andean orthographic unity. The principal change consisted in ceasing to use the five vowels borrowed from Spanish. Instead, three vowels (a,i,u,) corresponding to the three vocalic and structurally functional phonemes in Quechua and Aymara were adopted. This change unleashed the “war of the vowels.” The Academia Mayor de la Lengua Quechua, headquartered in Cuzco, along with other allied institutions, such as the Summer Institute of Linguistics (SIL), did not accept the measure in spite of it being the result of a joint negotiation (Itier, 1992). Since then, and for nearly 20 years, this impassioned quarrelling between linguists and members of the Quechua academy in Cuzco has diverted attention and energy that should have been directed toward an effective revitalization of indigenous languages. Amid these conflicts, in 1985, the revised alphabet of 1983—including punctuation and orthographic rules—acquired official status and, ever since, has been used in Intercultural Bilingual Education (IBE), both in Peru and Bolivia. Furthermore, its use goes beyond the academic sphere, having become present in the fields of communication media and literary production. Regarding

the Amazonian indigenous languages with larger number of speakers, general agreements on alphabet and writing norms have been achieved and have included the active participation of indigenous leaders.

In the education domain, one must signal that the introduction of schooling in Andean communities in Ecuador, Peru, and Bolivia has been a slow and painful process (Fell, 1996, p. 191). Indigenous movements, while struggling to defend their lands, demanded their right to education. Andean communities succeeded in their fight to obtain schools, but more often than not, these schools were not what they expected, since they turned out to be spaces where the devaluation of indigenous languages and local knowledge took place. The first initiative of an education that took into consideration the students' language appeared as individual and isolated projects, at the beginning of the twentieth century. That is the case of Manuel Z. Camacho, founder in 1902 of the Private School for Indigenous People; of Daniel Espezúa Velasco, Alfonso Torres Luna, and María Asunción Galindo, in the Aymara area of the Peruvian South Andes; of Elizardo Pérez, founder in 1931 of the Warisata School in Bolivia; of Dolores Cacuango, in the Cayambe region in Ecuador, who promoted schools in which indigenous teachers would teach their courses in Quechua (Albó and Anaya, 2004; Fell, 1996).

The first official indigenous educational activities in Peru took place in 1945, when the Peasant School Nuclei program was started, developed in association with Bolivia. One of the program's characteristics was the recognition of Quechua and Aymara as languages of alphabetization. Even though the nuclei were widely known and accepted, indigenous language alphabetization did not receive enough support, and was soon abandoned. In 1987, the Bureau of Bilingual Education was created. Unfortunately, this Bureau was dismantled a few years later. Several experimental projects emerged, primarily with funding from international cooperation agencies. Some of the most interesting and successful were the Quinua, Ayacucho, Spanish-Quechua Bilingual Project; the Peruvian Amazonia Bilingual Teachers Training Program in Iquitos (Trapnell, 1996); and the Puno Experimental Bilingual Education Project (PEEB). This last program, started in 1977, was focused on implementing bilingual education with Quechua and Aymara children, and then evaluating the experience to validate the program for its general use by the Ministry of Education. In 1996, the National Office for Bilingual Intercultural Education (UNEBI in its Spanish acronym) was created, and in 2001, it was transformed into the National Bureau of Bilingual Intercultural Education (DINEBI).

In Bolivia, the 1952 National Revolution brought the first official intent of educational democratization. In 1983, the "Elizardo Pérez" National Alphabetization and Popular Education Service (SENALEP

in its Spanish acronym) was initiated. The aim of this program was to support adult bilingual education and coordinate efforts with those of the Workers' Confederation and with the Rural Teachers' Confederation. After reaching a basic consensus on normalization and officialization of the Quechua and Aymara alphabets in 1985, the state program "Rural Bilingual Intercultural Education: Plan and Politics" was launched. In the period between the end of the 1980s and 1994, the Ministry of Education (in collaboration with UNICEF) and indigenous organizations developed the Bilingual Intercultural Education Project (PEIB) as a pilot program. This project, designed to cover the first 5 years of basic education, was successful. It had important repercussions, its curricular proposals serving as precursors to a state policy of IBE as part of the Educational Reform initiated in 1996 (Albó and Anaya, 2004, pp. 41–55; Luykx, 1999; Muñoz, 1997; also Hornberger and López, 1998, for a comparative treatment of Peru and Bolivia).

In Ecuador, there were several individually run projects, such as Shuar Centers' Federation, Runacunapac Foundation, and Zumbahua Bilingual Schools. Political and ideological awareness on the part of indigenous peoples allowed them to bring pressure for an education articulated with their cultures (King and Haboud, 2002). In 1984, the PEIB started, oriented toward basic schooling within the framework of an agreement between the Ministry of Education and Culture and the German Technical Cooperation Agency (GTZ). The Education Law was enacted in 1985, recommending the generalization of IBE projects in the country. That same year, and due to the requests of the Ecuadorian Indigenous Nationalities Confederation (CONAIE in its Spanish acronym), the National Bureau of Intercultural Bilingual Education (DINEIB) was created. By 1990, 1,200 schools had joined the DINEIB and were managed by both the Ministry and the CONAIE (Fell, 1996).

## MAJOR CONTRIBUTIONS

### *Indigenous Organizations as Protagonists*

Indigenous organizations have actively participated in gaining cultural and linguistic recognition and in consolidating alternative ways of teaching and agency (see also McCarty, *Language Education Planning and Policies by and for Indigenous Peoples*, Volume 1). In some cases, they demanded with increasing impetus the right to their territories, to their own development, and to a self-managed bilingual and intercultural education. A particularly notable role was played by the Shuar Federation and CONAIE in Ecuador, the Guarani People's Assembly in Bolivia, and the Association for the Development of the Peruvian Jungle (*Asociacion Interétnica de la Selva Peruana*, AIDSESP) in

Peru. This enhanced indigenous peoples' protagonism takes place in the context of major international concern about indigenous issues, represented by the ILO 169 Agreement, among other international statements (López and Küper, 2002). The role of the media should not be overlooked, especially that of the Internet, in the sharing of experiences and in the articulation of programs that defend indigenous peoples' interests.

### *New National Legal Provisions*

Legal provisions have been modified, opening up positive trends toward linguistic diversity and its educational impact (Moya, 1999). In Bolivia, the 1994 constitutional reform recognized the multiethnic and pluricultural character of the nation. The 1994 *Educational Reform Law* institutionalized intercultural education for the entire education system and IBE for all students who speak an indigenous language. The *Popular Participation Law* and the *Decentralization Law* complement the educational reform law and strive for administrative decentralization. In Ecuador, the 1992 Constitution established Spanish as the official language, and adds "Quechua and other aboriginal languages are an integral part of national culture" (art. 1). Regarding education, it declares "... in areas where indigenous populations are predominant, the main language to be used in education will be Quechua or the language of the respective culture; Spanish will be used as intercultural relations language" (art. 27). Also, in 1992, Ecuador's *Education Law* was reformed, granting DINEIB technical, administrative, and financial autonomy to develop IBE.

In Peru, the 1993 Constitution establishes that every person has the right to an ethnic and cultural identity. It also asserts that the state recognizes and protects the nation's ethnic and cultural plurality, as well as "promotes Bilingual Intercultural Education in accordance with the characteristics of each area, preserving the diverse cultural and linguistic expressions in the country" (art. 17). The 1993 Constitution also declares Spanish as an official language, along with Quechua, Aymara, and other aboriginal languages in the areas in which they are predominant (art. 48). To a similar end, the 2003 Aboriginal Languages Protection and Dissemination Law (*Ley de Preservación y Difusión de las Lenguas Aborígenes*) declares as official languages, in the areas in which they are predominant, Quechua, Aymara, and the aboriginal languages accounted for in the map of "Linguistic and Cultural Patrimony of Peru, Linguistic Families and Peruvian Languages." The law places the Ministry of Education in charge of updating the said map. Likewise, it affirms that the denominations and the toponymy of indigenous languages will be promoted and preserved. The 2002

Bilingual Intercultural Education Law (*Ley para la Educación Bilingüe Intercultural*) entrusts the Ministry of Education with incorporating, by appointment or contract, indigenous teaching staff into educational institutions (art. 4). The law also obliges the ministry to promote the elaboration and employment of course outlines and curricular content that reflect the nation's ethnic and cultural diversity (art. 5). Likewise, it asserts that the state will make a priority of promoting indigenous peoples' access to state and privately owned social communication media, to ensure the development and the preservation of the nation's cultural diversity (art. 7). The 2003 General Law of Education (*Ley General de Educación*) establishes that Bilingual Intercultural Education should be offered in the entire education system. This would guarantee the pupils the use of their mother tongue for learning, the teaching of Spanish as a second language, as well as the subsequent learning of foreign languages (art. 20).

#### *Advances in Language Planning Research*

Statistical and cartographic work in the Andes has proven to be of crucial importance to political decision-making and linguistic planning. Two contributions stand out in this field: *The Linguistic Atlas of Peru* (Chirinos, 2001) and the guide and maps of plurilingual Bolivia (Albó, 1995). In addition to the wealth of data presented, these two studies offer interpretations of Andean sociolinguistic situations and yield orientations for planners and educators. Regarding research in Andean sociolinguistics, Cerrón-Palomino (2003) examines Spanish in contact with Quechua and Aymara, analyzing borrowing and transference phenomena. Sichra (2003) analyzes Cochabamba Quechua variants, and cases of code-switching between Quechua and Spanish. A series of papers on Quechua sociolinguistics was published in a special issue of the *International Journal of the Sociology of Language* (King and Hornberger, 2004). Howard's (2007) research offers empirical data proving that linguistic contact effects (code-mixing, code-switching) have a permanent presence in everyday interactions. In general, new data from recent research indicate that the multilingual subject makes diversified and flexible use of his/her linguistic repertoire to represent, identify, and relate himself/herself with those in his/her surroundings.

Concerning the research on *bilingual language acquisition*, Sanchez's work (2003) focuses on the issue of interference and convergence in the functional features associated with the direct object system among Quechua-Spanish bilingual children. It provides a formal account of the linguistic mechanisms that operate in cases of syntactic cross-linguistic influence. It further postulates that this interference plays a role in

the creation of syntactic changes, and suggests that convergence “delineates the conditions under which a fusion of functional features takes place in the bilingual mind” (p. 1). Attention is drawn to the following phenomena found among the results: (i) in bilingual Quechua: SVO word order (instead of the canonical SOV word order), dropping of the accusative marker *-ta*, emergence of an indefinite determiner; (ii) in bilingual Spanish: gender-neutral specification of clitics and the emergence of null objects as continuing topics; (iii) in Quechua–Spanish bilinguals: clitics and determiners that are affected by functional convergence. The originality of this study rests on its contribution to the debate on bilingual language acquisition and on syntactic acquisition in children. It is also distinctive for the data it acquired in the Andean region where Spanish is in contact with Amerindian languages.

Other studies deal with IBE programs: Muñoz (1997) and Albó and Anaya (2004) show the evolution of a Bolivian project that developed into state policy; King (2004) on Ecuador, focused on the IBE Saraguro local development; López (2002) confirms, on observing the Peruvian context, initial IBE changes in rural bilingual schools. From a broader perspective, in López’s (1998) review, indigenous children participating in those programs exhibit better linguistic competencies in their first language (Hornberger, 2003). They also show better performance in other subjects, better affective balance, and a more active participation in the learning process. In the *ethnographic research* field, there are important conclusions in Aikman’s (2003) research on the San José Arakmbut community in south-eastern Peru. Aikman shows the contrast between an intercultural education, which takes place within the school under authoritarian pedagogy and an intercultural education as conceived and demanded by the Arakmbut. The epistemological conceptions of the school and of the community are differentiated: the first (official) model fragments knowledge and strives for progress, whereas the second (Arakmbut) integrates knowledge and strives for balance between the visible and the spiritual worlds. This study illuminates local knowledge, practices, and processes that challenge theoretical developments and question policies for educational change.

### *IBE Programs of National Scope*

The introduction of indigenous languages in schools, as well as the developments of bilingual education projects, have ceased to be isolated initiatives or pilot projects supported, in general, through foreign funding. They have turned into programs that, in varying degrees, are now part of national education systems. The most daring program in the region is that of Bolivia. The chosen perspective is that of maintenance bilingual education (Albó and Anaya, 2004, p. 76). Some of the

Bolivian achievements were realized in a little more than 8 years. Following these reforms, the First Peoples' Educational Boards (CEPO in its Spanish acronym) were formed, which created the conditions for IBE expansion and massive IBE coverage: between 1996 and 2001, IBE reached 2,375 schools and 115,000 indigenous children (Albó and Anaya, 2004, p. 87).

In Ecuador, the IBE program is administratively and financially autonomous. It is carried out from within and with the participation of indigenous peoples through the Bilingual Intercultural Education System Model—MOSEIB. This model, developed by 1993 by the National Bureau for Bilingual Intercultural Education (DINEIB), in coordination with their indigenous organizations, is oriented toward the satisfaction of indigenous peoples' educational needs. Its purpose is to foster the use of indigenous languages as a means of oral and written communication in all areas of knowledge, as well as teaching Spanish as a second language. It should be mentioned that this program is highly significant in the region since it treats IBE as a right of indigenous peoples to organize and manage their children's education (King and Haboud, 2002).

In Peru, the program is run by DINEBI. Two official documents orient their actions. The first, *Bilingual Intercultural Education Policy Outline* (Ministerio de Educación, 2004a), states that its aim is to attain additive bilingualism (for further discussion of additive bilingualism, see May, *Bilingual/Immersion Education: What the Research Tells Us*, Volume 5), taking into consideration differentiated sociolinguistic contexts. The second document, *National Bilingual Intercultural Education Plan* (Ministerio de Educación, 2004b), indicates that the general objective of IBE is: "to contribute to the achievement of educational quality and equity while offering an education which considers diversity as a resource capable of generating educational proposals and experiences, at all levels and modalities of the system." Some of the program's achievements as of 2004 include: reaching around 127,000 indigenous children; training over 6,300 bilingual teachers; preparing and publishing textbooks in indigenous languages in communications and mathematics; and preparing materials and a handbook in support of teaching Spanish as a second language.

#### WORK IN PROGRESS

The political empowerment of indigenous languages is a work in progress. Let us consider some recent symbolic shifts. Quechua is the first language of Hilaria Supa and Maria Sumire, who are from rural Cuzco. Recently they were elected to Peru's Congress. These women have engaged in speaking to the legislature in Quechua, a move that is meant

to bring visibility to Andean culture and to gain public space for a secularly discriminated language. This symbolic gesture, which irritated most members of the Congress and forced them to hire translators, is symptomatic of changes in the political and cultural arena (*El Comercio*, Peru, August 9, 2006; *The Economist*, August 17, 2006). Also, Google recently launched a Quechua version of its search engine, and Microsoft, in agreement with the Peruvian Ministry of Education, translated its Windows and Office software into Quechua. The formal introduction of this material took place in a high school in Pisac, a village near Cuzco and the former Inca capital, where the students already had begun to use these programs in their mother tongue (*El Comercio*, Peru, June 17, 2006; *The Economist*, August 17, 2006). Bolivia has followed this example and further included the Aymara language. In the same vein, some canonical works, such as *Le petit prince* or *Don Quijote*, have been translated into Quechua. The Quechua edition of *Don Quijote*, translated by Demetrio Tupac Yupanqui, is the first translation of this work into an Amerindian language. During the book's presentation at the *Casa de América de Madrid*, it was emphasized that the first chair of Quechua was created in Peru in 1570, 2 years before a chair of Dutch and 4 years before a chair of English. All these political gestures are contributing slowly to changing the prejudices, opinions, and racist opinions about indigenous languages.

A law that modifies the penal code on discrimination was recently passed in Peru (August 9, 2006). The purpose of this law is to counteract racism and exclusion for linguistic reasons. The modification explicitly includes a penalty of up to 3 years in prison for those who discriminate "for reasons of race, religion, sex, genetic factors, age, disability, language, ethnic, cultural and indumentary identity, political opinion, or of any character or economic condition, with the purpose of depriving or impairing the recognition, enjoyment or exercise of the rights of the person" (art. 1). In Bolivia, the recently elected president, Evo Morales, has announced that all Bolivian civil servants will have 2 years to learn an indigenous language to keep their jobs. In this way the state will become an inclusive entity and also a representative of those who have been secularly excluded. Likewise, the Bolivian state has decided to give indigenous people access to careers in the military, access that previously had been prohibited.

Another work in progress is the formulation of a new constitution in Bolivia, in view of a possible state restructuring and national refoundation, based on the principles of equality and nondiscrimination. This has stimulated the elaboration of a *Linguistic Rights and Politics Law* project, currently in review. This legal project aims to declare all existing languages in Bolivia as the "Intangible Historic and Cultural Oral Patrimony" of the Bolivian state. Its objective is to recognize, protect,

promote, and regulate the individual and collective linguistic rights of all Bolivians. Similarly, in Ecuador, initiatives have emerged to incorporate the linguistic rights of indigenous peoples and nationalities into the legal order of the Ecuadorian state. A proposal has been elaborated, with the participation of UNESCO, called the "Operative plan of the rights of the nationalities and indigenous peoples of Ecuador." This plan aims to create the Institute of Ancestral Languages, which will promote scientific research on languages as well as the design of policies directed toward promoting the use of indigenous languages in radio-diffusion, the press, publications, cinema, theatre and performances, and sound and image production (<http://www.ildis.org.ec/old/planddh/plan02te.htm>).

Another issue being discussed is the relationship between *gender*, *ethnicity*, and *education*. Research papers edited by Sichra (2004) serve as an introduction to this debate, and to the study of the symbolic construction of gender in historic and social contexts (see also Pavlenko and Piller, *Language Education and Gender*, Volume 1). This type of research contributes to the understanding of the double marginalization suffered by many people in the region who are both women and indigenous. The subjects of *orality and writing* have also been under discussion recently. The book edited by López and Jung (1998) includes sociolinguistic studies on reading and writing within Amerindian cultures. Zavala's (2002) research focuses on the presence and effects of writing in an Andean community. Some of the contributions gathered in Zavala, Niño-Murcia, and Ames (2004) deal with literacy in Quechua-speaking Andean areas, and of their connections to education. The multiple use of literacy in a communal and familiar setting is seldom accounted for by the school, which usually focuses on the decontextualized development of literate abilities.

One of the instruments devised to facilitate debate on language policy and education issues is the organization of Latin American IBE congresses. Six of these meetings have already taken place: Ciudad de Guatemala, 1995; Santa Cruz de la Sierra, Bolivia, 1996; Quito, Ecuador, 1998; Asunción, Paraguay, 2000; Lima, Peru, 2002, Santiago de Chile, 2004; and finally, Cochabamba, Bolivia, 2006 (<http://viiieib.proiebandes.org/conclusiones.html>). A recently published document offers a review and summary of these events (Programa de Educación Bilingüe Intercultural, 2004). The Lima conference proceedings are already available (Zariquiey, 2003). The importance of these congresses lies in the participation of officers from the Ministry of Education, along with indigenous leaders, academics, experts, and others responsible for IBE policy design. They met with the purpose of producing and exchanging knowledge that will transform teaching practices while also having a wider impact on the construction of multilingual and intercultural societies.

## PROBLEMS AND DIFFICULTIES

Ethnic, cultural, and linguistic differences often naturalize profound social inequalities. There is still strong resistance to and prejudice against the public use of indigenous languages (see also May, *Language Education, Pluralism and Citizenship*, Volume 1, and McCarty, *Language Education Planning and Policies by and for Indigenous Peoples*, Volume 1). Usually efforts to revitalize languages are neither accompanied by an effective recognition of the human and collective rights of indigenous peoples, nor do they tend to bring about concrete reforms that make way for social equality. Indigenous communities of the Amazon basin, for instance, are denouncing oil companies for the pollution of river water, which is causing serious physical and mental health problems, including cancer and genetic deformities. There is much work to be done to create the economic and political conditions that favor the development of a social bilingualism in the Andes.

Some legal provisions for native languages exist, but they are usually not implemented (cf., Skutnabb-Kangas, *Human Rights and Language Policy in Education*, Volume 1). According to an established custom that dates back to the colonial era, laws are accepted, but not adhered to. To break with this tradition is an Andean political challenge.

In addition, existing research on language variation, language contact, and sociolinguistic processes is insufficient. Further research is needed as a condition for coherent and adequate language planning.

Regarding the use of languages in education, an indigenous first language tends to be used as an instrument of learning, but its development is seldom reinforced and almost no discussion about the language itself takes place (López, 2002, pp. 159–164). It is not used to cultivate other dimensions of the culture it belongs to (Albó and Anaya, 2004, pp. 161–168). Another problem relates to materials written in some indigenous languages that have not developed alphabetic writing or whose alphabet has not been consolidated in a common written norm. Linguistically based selections turn out to be arbitrary or strange for prospective readers.

Even though it is true that IBE in the Andean region has been achieving official recognition within educational systems, its social legitimation is still an ongoing task. Another unresolved problem, affecting all programs, is the teaching of Spanish as a second language. As reports of López (2003) and Albó and Anaya (2004, pp. 171–181) indicate, official Latin American schools cannot speak of any major success in this task. Other problems are posed by budget cuts, by conflicts between pedagogical advisors and teachers, and by filling teaching positions with personnel untrained in IBE strategies.

## FUTURE DIRECTIONS

The implicit imposition of Spanish as the state's only language in the Andes has been questioned and challenged during the past decades. The recent top-down constitutional provisions and laws have opened new spaces of negotiation between the indigenous organizations and different state sectors. These advances could be directed toward a more pluralistic, interactive, and creative language policy, which would help build responses in accordance with global and local contexts. A key issue in this process is the provision for popular participation, such as the Bolivian First Peoples' Educational Councils. From the time of their inception, these councils have been able to defend IBE's perspective when the Government had doubts about its importance (Albó and Anaya, 2004, p. 259). A process of decentralization, delegation, and devolution of power to all agents of cultural policy and educational activity is of utmost importance. Only then can a linguistic plan be generated.

It is crucial to acknowledge socio-educative and linguistic circumstances before making decisions on language policy and education. It is still necessary to promote new studies about the linguistic reality in the Andes, about the situation of rural and urban bilingualism and language contact, and about the effectiveness of indigenous language-in-education implementation.

From a Latin American perspective, intercultural proposals aim at changing the conditions and modalities in which exchanges take place. That is, they are directed toward a profound social and state transformation. As an ethical-political category, emerging from indigenous peoples' demands and projects, *interculturality* can be defined as an interlocutive modality of interactions and exchanges—between individuals and/or collective instances—consisting in negotiating, arriving at agreements, and making decisions to create basic material and symbolic conditions for the existence of pluralist societies and inclusive states. Real dialogue could take place horizontally; and, mutually enriching experiences could take the place of exclusion and violence. Interculturality is the proposed axis of educational systems in the Andean region, and in many Latin American countries (Godenzzi, 1996; Hornberger, 2000). The challenge is to make this concept operative in a creative way so that it will not remain as an empty rhetorical declaration (García, 2004, 2005). Rather it should transform social interactions and pedagogical practices. A theoretical-methodological instrument was elaborated by Walsh (2001), but needs to be adapted to the particular situation of each specific context. To accomplish this project, specialists need to continue doing research on indigenous categorizations (Valenzuela, 2000), on ways of transmitting knowledge and on

the learning processes of indigenous peoples (Stobart and Howard, 2002; see also McCarty, *Language Education Planning and Policies by and for Indigenous Peoples, Volume 1*). The aim is to make intercultural inclusion not only social but also epistemic.

In the IBE domain, some actions have to be reinforced: to generate a bottom up form of IBE (López, 2002, p. 169); to consolidate the passage of IBE from project to state policy; to develop interculturality for all; and to decentralize educational systems (Albó and Anaya, 2004, p. 264; López and Küper, 2002, pp. 63–68).

In sum, a future language policy agenda in the Andes will include the effective officialization and revitalization of indigenous languages (Hornberger and King, 2002), the development of a new public idea about language and its diversity, the task of sensitizing public opinion to overcome racial and linguistic discrimination, and political and economic measures aiming toward social, ethnic, and cultural equity. The fulfillment of these points in the agenda will enhance participation in a plural society in which everyone recognizes the right to cultural creation and democratic coexistence. Therefore, a very well understood and implemented language policy could become an important tool for building the foundation upon which to rethink and renew Andean public life.

## LANGUAGE POLICY AND EDUCATION IN CANADA

### INTRODUCTION

This sketch of Canadian language legislation and policies touches on background information, French and English as official languages, official and minority language policies for immigrants, and policies on Aboriginal languages.

Canada, a large country with a relatively small population (30 million), has a parliamentary democracy. Created legally in 1867, it now has ten provinces and three territories. Inter alia, the federal government has jurisdiction over Aboriginal matters and the territories, the provinces over education; responsibility for immigration is shared.

In about 1500 A.D., Aboriginal people lived across what is now Canada, speaking about 450 languages and dialects from 11 language families. Immigration, starting with colonization by Britain and France, has since increased the population and changed its ethnic or racial mixture. Although immigration from northern and western Europe predominated earlier, the proportion of immigrants from other continents has increased, particularly since the 1960s. In 2001, 59% of the population reported English as mother tongue, 23% French, less than 1% Aboriginal languages, and 17% other languages (Statistics Canada, 97F0007XCB2001001).

#### *French and English as Official Languages*

Struggles first between France and Britain, then Francophones and Anglophones dominate Canada's recorded history. In the 19th century, Canadian legal rights for the 'English' and 'French' populations focussed on religion rather than language (Neatby in Commissioner of Official Languages, 1992, pp. v–ix). Legislation specifically on language was rare. However, in the early 20th century, increased secularism, industrialization, national attention on Canada's role in the British Empire, and massive immigration encouraged a movement to 'Angloconformity', especially through legislated use of English as the language in schools in most provinces. Francophones in Québec were isolated in a French-language, church-run school system and in the social and political use of French in some areas of Québec. Only superficially did the Canadian federal government recognize the constitutionally equal status

of French with English in parliament, in federal courts and in the legislature and courts of Québec.

After 1945, industrialization, immigration, and a low birth rate among Francophones threatened the critical mass of French, even in Québec (Neatby in Commissioner of Official Languages, 1992, p. vii). Most non-French immigrants to Québec chose English as their second language, English being the dominant language of large business in Québec, centred in Montreal. Being ethnically Québécois and unilingually Francophone was a severe economic disadvantage up to the early 1960s (Wardhaugh, 1983, pp. 74–80). In the 1960s, Francophones in Québec, through the ‘Quiet Revolution’ movement, acted to gain more control. In 1963, the Québec government created a ministry of education, replacing the parochial education system.

Such pressures moved the federal government to take the constitutionally equal status of the French language seriously. It established the Royal Commission on Bilingualism and Biculturalism (1963–1971), which made an elaborate study of political, cultural and economic use of all languages in Canada except the Aboriginal languages. The impact of its research began in 1964 with language training for public servants, leading, in 1973, to measures to make English and French equitably the languages of work in the federal civil service (Beaty, 1989, p. 186; Commissioner of Official Languages, 1992, pp. 14–17).

From 1967, some provinces, anticipating the commission’s impact, changed their education acts towards more use of French as language of instruction (Commissioner of Official Languages, 1992, pp. 14–15). In a Montreal suburb, a group of Anglophone parents in 1965 persuaded a school board to teach their children through the medium of French so that the children would learn it as a second language faster and more effectively (Lambert and Tucker, 1972). This launched the now popular ‘French immersion’ programmes across the country. In virtually every part of the country, various versions of these programmes are now a significant part of Canadian public education (see Lapkin, 1998; May, *Bilingual/Immersion Education: What the Research Tells Us*, Volume 5).

The main outcome of the Royal Commission’s Report was the *Official Languages Act* of 1969, making English and French Canada’s official languages. In addition to declaring that English and French are to have ‘equality of status and equal rights and privileges’ for all the purposes of the Parliament and Government of Canada, the Act specifically imposes duties on all federal institutions to provide their services in either English or French: in the National Capital Region and in such ‘bilingual districts’ as might be subsequently designated, at their head offices, and in any other locations where there was ‘significant demand’ for such services. The Act also created the position of

Commissioner of Official Languages to oversee its implementation and generally act as official languages ombudsman (Beaty, 1989, pp. 185–186).

Beaty summarizes the main programmes supporting the *Official Languages Act* as encouraging ‘a more general climate of respect and support for Canada’s official languages in other jurisdictions and in Canadian society as a whole’ by:

1. supporting minority groups [English in Québec and French elsewhere] in their attempts to achieve provincial recognition of their legal rights and their special linguistic needs
2. fostering and helping to finance minority language education. . .
3. giving similar financial encouragement to the effective learning of English and French as a second language country-wide and
4. supporting the efforts of national, private and voluntary organizations to develop their own capacity to do business in both official languages (Beaty, 1989, pp. 190–191).

However, implementation of various provisions early on involved controversy, for example, the choice of language to be used in air traffic control.

In 1970–1971, the federal government began its Official Languages in Education (OLE) Program. Education being a provincial responsibility, the federal government could not legislate on it directly but could encourage compliance by offering funding. Following the Royal Commission’s recommendation that the federal government support the provinces in providing English education for Anglophones in Québec and French education for Francophones in the other provinces, and in improving second official language instruction, the OLE has made transfer payments to provinces, monitored by the Commissioner of Official Languages. Although the enrolment in English schooling in Québec and French schooling elsewhere has not changed substantially since 1971, numbers of children in second official language programmes have, especially French immersion programmes (Canadian Education Association, 1992, p. 3; Canadian Parents for French, 2004).

The province of New Brunswick declared itself bilingual in 1969, and most provinces legislated more status for French in the next few years. A series of actions in Québec, especially relating to parents’ rights to have their children educated in languages other than French, provoked controversy. Separatism became a driving force in the province, but the Québec government in 1980 (and in 1995) lost a referendum for a mandate to negotiate ‘sovereignty association’ (Québec nationalism within the Canadian state) with the federal government (Commissioner of Official Languages, 1992, pp. 9–22; Labrie, 1992, pp. 30–32). In this climate, the nation made a number of efforts in the 1970s to prevent a total rift with Québec.

In 1980, the federal government ‘patriated’ the constitution, providing a major opportunity for constitutional changes. Canada’s constitution was an act of the British Parliament; patriation meant enacting some form of it through the Canadian Parliament. The 1982 *Constitution Act* left the major structure, such as the responsibilities of the federal and provincial governments, the same. It added an amending formula, as well as the *Canadian Charter of Rights and Freedoms*, which included central developments on language since the early 1960s, such as the official language status of English and French for the governments of Canada and New Brunswick. Citizens can now challenge all legislation and policies in court against the *Charter* provisions.

Crucially, Québec did not agree to the *Constitution Act* because of concerns about its amending formula. Despite attempts at resolution, federal relationships remain uneasy, with the inclusion of Québec in the constitution unresolved. As for language in education, the *Act* precipitated many legal actions to align mother-tongue education provisions for Francophone children in English Canada and Anglophone children in Québec with the *Charter* (Foucher, 1985; Martel, 1991). The Commissioner of Official Languages noted recently that only half the students from Francophone minority communities, who are entitled to attend Francophone schools do so (Commissioner of Official Languages, 2003, p. 10). Official second language programmes for Anglophones and Francophones have been relatively uncontroversial. Nevertheless, for example, an ongoing source of tension in Québec has been rulings about the role of English and French on commercial signage.

The evolution of English and French as official languages and languages of education, work, commerce and so forth during the past 40 years provides no perfect model for language relations, especially since it has not yet satisfied either party. However, it has set a certain standard for some other language minorities in the country. The intense negotiations between Québec and the rest of Canada still dominate discussion at the national and provincial levels.

### *Language Issues for Speakers of Non-Official Languages*

Reading official statements, one would scarcely believe that Canadians speak languages other than English and French. Federal statements carefully refer to speakers of non-official languages as other *cultural* groups. However, given the important role of immigration in Canada, to say nothing of the special position of the Aboriginal peoples, non-official languages are very much in evidence. This section discusses language issues for speakers of non-official languages other than

Aboriginal ones. It refers to 'immigrants' even though non-official language issues often continue well into the second and third generations after immigration.

*Official Language Training for those Who Speak Neither Official Language*

Canadian federal legislation covers official languages for those who speak an official language already; no federal legislation even suggests that speakers of neither English nor French have the *right* to support in learning one of those languages. However, some programmes address language for residents of Canada who do not speak either official language. Federal policy on OLE for Anglophones or Francophones refers almost entirely to children's education, but official language training for non-official language groups mainly targets adults, largely because the federal government strongly links immigration to the labour force.

The *Official Languages Act* (1969) makes no provisions for the learning of official languages by residents of Canada who do not speak either language (well). However, in 1971, the federal government declared itself by policy multicultural. Clearly aimed at calming backlash among non-English and French groups over the declaration of official languages, the multiculturalism policy pledged to promote respect and support for all of Canada's languages and cultures. The original policy stated that 'the government will continue to assist immigrants to acquire at least one of Canada's official languages in order to become full participants in Canadian society' (Saouab, 1993, p. 4). The policy passed through various stages, none including direct support for official language training for immigrants, and evolved into the present *Multiculturalism Act* (1988), which mainly fosters non-English and French cultures, antiracism and affirmative action in support of visible minorities.

Since about 1970, the *Immigration Act* has increasingly made knowing one official language an advantage in admissibility for certain classes of immigrants, but only some applicants are assessed this way. To become a Canadian citizen applicants must demonstrate a 'reasonable' knowledge (undefined) of either official language. From the early 1970s to the late 1980s, the federal department responsible for the *Citizenship Act* made agreements with most provinces for partial funding of provincial language and citizenship training for adults.

However, the federal government emphasized more the economic impact of immigration. The federal agency responsible for employment included language training for immigrants 'bound for the labour force' under its large programme of employment (re)training from the late 1960s to about 1990. The provinces' community colleges did

the training (to accommodate education as a provincial responsibility) but federal officials chose the students. This programme provided about 24 weeks of full-time training with a training allowance. Controversy surrounded this programme, especially concerning decisions on who was destined for the labour force. Meanwhile, since the 1960s, provinces, local authorities, and non-governmental organizations (NGOs) have provided a wide variety of language training to immigrants.

Since 1991, the employment-related federal programme has been replaced by one serving immigrants who do not yet have Canadian citizenship, regardless of their labour market intentions. This includes individual assessment against nation-wide language standards, counselling and recommendations on local programmes. Canadian Language Benchmarks and Standards linguistiques canadiens, assessments of English and French language ability, including task-based level descriptors, provide the standards for assessment and curriculum (Centre for Canadian Language Benchmarks, 2005). Private and public institutions bid annually for contracts to provide training, either generic or targeted (e.g. for immigrants with low levels of education). Childminding and transportation may be provided, but no training allowances. Criticisms of this programme include that: newcomers who have obtained Canadian citizenship are not eligible; federal authorities have left provinces and NGOs with the main language training burden; and the 1-year contract bids stress the bidding agencies (Burnaby, 1992, 1996).

ESL for schoolchildren is simpler than adult programmes only in being delivered almost exclusively by school boards. In areas where there is little immigration (e.g. the Atlantic provinces), immigrant children may be unevenly served, if at all; however, in high-immigration regions, they usually get at least minimal attention, such as special classes, withdrawal from regular classes for part of the day or sensitization of regular teachers to their needs (Ashworth, 1992, pp. 36–40). There are no bilingual programmes to help orient children to Canadian schooling. Some part-time classes for immigrant women have been funded as ‘parents and preschoolers’ programmes so that the children get some language training too. A series of articles in *The Globe and Mail* (September, 2004) by Andrew Duffy indicated increasing stress points for non-English speaking students in English Canadian schools as well as some extraordinary programmes to address their needs (Duffy, 2004).

### *Teaching of Non-Official Languages as Ancestral Languages*

Clearly Canada greatly values its official languages. But what of the value of other languages that immigrants bring to Canada? In the era of greatest Anglophone power, the system viewed languages other than

English with suspicion, and encouraged immigrants, especially children, to forget their mother tongues. From the nineteenth century, some immigrant communities organized and funded non-official language classes for their children. Until the early twentieth century, when provincial education acts were changed to prevent them, there were some publicly supported bilingual schools. Some religious groups struggled long into this century against compulsory English schooling (Ashworth, 1992, p. 40). Some immigrant groups have continued to fund private multilingual schools or classes in non-official languages.

The *Official Languages Act* of 1969 provoked a climate of linguistic uncertainty for non-official languages; the 1971 policy of multiculturalism hinted at some recognition of them. In 1977, under that policy, the federal government created the Cultural Enrichment Program. It included support for the teaching of non-official languages, primarily to children of communities where the target language was a 'heritage language' (the mother tongue or ancestral language of the children). Extensive and vitriolic resistance to the establishment of heritage language classes at public expense developed (Cummins and Danesi, 1990, Chapter 3; d'Anglejan and De Koninck, 1992, pp. 100–101; Fleras and Elliott, 1992, pp. 155–159). Since 1977, some programmes have been associated with the schools and at least partially publicly funded, and new ones have been created in the schools, but most remain non-academically recognized add-ons (Ashworth, 1992; Canadian Education Association, 1991; d'Anglejan and De Koninck, 1992; Toohey, 1992). Although the multiculturalism policy and *Act* encouraged learning of official languages, heritage language programmes were never associated with *fiscal* support for official language training programmes (i.e. linked to issues of children at risk concerning the learning of English or French).

### *Language Policies for Aboriginal Peoples*

Official policy has largely considered Aboriginal peoples and their languages as outside the debates outlined earlier. Since Confederation in 1867, Aboriginal people—'Indians' in the *British North America Act* of 1867 and 'Eskimos' by a court ruling in 1939—were constitutionally the federal government's responsibility for all services. The Royal Commission on Bilingualism and Biculturalism excluded them on the grounds that their issues were more properly dealt with elsewhere. They have not been included, largely by their own choice, in subsequent definitions of cultural minorities. Administrations kept them isolated from the rest of the population. Such separate treatment left open opportunities for special policies suited to their unique needs; unfortunately, most of these opportunities have been wasted in racist and

assimilative ways (National Indian Brotherhood, 1972; Royal Commission on Aboriginal Peoples, 1996).

Comparison of the proportions of mother-tongue speakers of Aboriginal languages among the Aboriginal population from the censuses of 1951 to 2001 dramatically illustrates a decline of Aboriginal languages. In 1951, 87.4% of the Aboriginal population had an Aboriginal language as a mother tongue whereas in 1981 it was 29.3% (Burnaby and Beaujot, 1986, p. 36) and in 2001, it was 21% (Statistics Canada, 97F0011XCB2001048). Clearly, Aboriginal languages in Canada are at great risk (some much more than others).

Although Aboriginal languages were sometimes used in Aboriginal education in the nineteenth and early twentieth centuries, more often draconian Aboriginal education policies forced Aboriginal children to speak English or French in school, even to the extent of severe physical punishment for speaking an Aboriginal language (cf. McCarty, Language Education Planning and Policies by and for Indigenous Peoples, Volume 1). Until about the 1950s, schooling for Aboriginal children was mostly contracted to Christian groups; a later policy moved to integrate all Aboriginal children into provincial schools or, in remote areas, to establish federally run schools. Today, those federal schools are nominally run by local Aboriginal authorities. Since the 1960s, Aboriginal languages have increasingly been taught in Aboriginal and provincial schools as subjects of instruction (Assembly of First Nations, 1990; Kirkness and Bowman, 1992). In addition, Aboriginal languages have been introduced recently as medium of instruction up to the third grade in some schools in the territories and Québec, where the children begin school speaking only or mainly their Aboriginal language. Aboriginal language immersion programmes have begun in several southern communities, where the children start school speaking only or mainly an official language. Nine Aboriginal languages have been made official languages in the Northwest Territories, together with English and French, and the new (1999) territory of Nunavut, having declared Inuktitut, Inuinaqtun, French and English as its official languages, is actively developing policies for extensive use of these languages in many domains (Government of Nunavut, 2005). A recent Task Force on Aboriginal Languages and Cultures (2005) has surveyed a variety of aspects of language use among Aboriginal peoples and strongly recommended measures to support Aboriginal language development, including the use of Aboriginal language immersion programmes.

Despite improvements in Aboriginal language programming in schools, Churchill's (1986) findings that policies for indigenous groups cluster at the lower levels of his scale of policy development—in that most programmes are for the youngest children, only for a few years, inadequately funded, and seen to be transitional to fluency in an official

language—still stands. Language issues contribute to a continuing gap between Aboriginal children and all other Canadian children in terms of school success. The Office of the Auditor General of Canada (2004) stated: ‘We remain concerned that a significant education gap exists between First Nations people living on reserves and the Canadian population as a whole and that the time estimated to close this gap has increased slightly, from about 27 to 28 years’ (Section 5.2). Although there are many more Aboriginal languages and culture programmes in the early twenty-first century, current survey data (Burnaby, 2002) give the same impression that Clarke and MacKenzie (1980) found in their study of Aboriginal language programmes—namely, that Aboriginal language programmes give only lip service to pluralism and are actually assimilationist in intent. A significant recent development is the creation of an extensive Aboriginal language and culture curriculum, adopted by Manitoba, Saskatchewan, Alberta, British Columbia and the three territories (Western Canadian Protocol, 2000).

### CONCLUSIONS

Canada’s largest minority, Francophones, have challenged Canadian Anglo-dominance to the point of constitutional crisis. Smaller linguistic groups unfavourably compare the resources supporting official language services for English and French speakers with those available to them even to learn a first official language, much less enhance their own languages. Aboriginal groups, many of whose languages face extinction, struggle particularly about priorities between language efforts and political and economic recognition. A needs assessment of language resources in the new global order might recommend a reorganization of Canada’s language emphases. Much sophisticated thinking in Canada about language policy (e.g. Fettes, 2003; Kymlicka and Patten, 2003) does not seem to be taken very seriously in Canadian language policy development overall, except in the territories.

## LANGUAGE POLICY AND EDUCATION IN AUSTRALIA

### INTRODUCTION

As an immigrant, post-colonial and trading nation, Australia has inherited a complex linguistic demography with multiple language policy needs and interests and diverse language education challenges.

As a result, administrators, politicians and educators have needed to address a diverse range of language categories across several policy settings and in response to often conflicting language ideologies.

First, English, the national and de-facto official language that arises in Australian policy history under several guises. Originally conceptualised in its British norms and character as symbol and link to British Empire loyalty and civilisation, English was later challenged by evolving Australian variations and local ideologies of communication (Leitner, 2004, Volume I; Ramson, 2002; Turner, 1997). Today, English is increasingly discussed either as a key tool for integrating minorities or commercially as a commodity traded in the delivery and accreditation of internationally oriented higher education. In wider political discussions, English also arises sometimes as a feature of modern science, technology and commerce; i.e. a component and feature of economic globalisation.

Second, Australian indigenous communication, comprising essentially three groups: (i) the original 270 Australian languages (Dixon, 1980; Walsh, 1991), (ii) the remaining languages of today (Lo Bianco and Rhydwen, 2001) and (iii) the various creoles and varieties that have emerged through the dislocation and oppression of indigenous language speakers and the mixing of their language forms with English (Mühlhäusler, 1991). Indigenous speech forms, and how Australian communication has been influenced by them, feature in education and integration discussions of Aboriginal and Torres Strait Islander people (Nakata, 2000; Nicholls, 2001), but also, though less commonly, in consideration of national cultural directions.

Third, immigrant languages other than English that comprise a substantial demographic presence in both urban and rural settings (Clyne and Kipp, 2002). Known as “community languages,” these are often intergenerationally vibrant though evolving local speech forms.

The local settings and contexts of their use support networks of social, religious, educational, recreational and economic institutions. The visible presence that community languages forge within the wider society gives rise to complex relations between the linguistic norms that have evolved in Australia, the 'source' country authoritative norms and shifting language policies (Clyne 2005; Leitner, 2004, Volume II).

Fourth, foreign languages with dramatic shifts in language choices over time, originally reflecting British geography and a selection of the intellectual heritage of Western civilisation, more recently stressing Australia's proximity to Asian countries, economic regionalism and geopolitical interests (ASAA, 2002; COAG, 1994; Fitzgerald, 1997; Lo Bianco, 1987; Milner, 2002; Scarino and Papademetre, 2001).

Restricting the present discussion to education we can say that, broadly speaking, the aspirations of language policy can be divided into two.

First has been the goal of ensuring all Australian permanent residents gain access to the dominant language of the society, English in both its literate and spoken dimensions. Literacy extends to all children and among adults to disadvantaged sections of mainstream society, as well as to many immigrants, and as the critical medium for accessing employment, progressing through education and participating in the entitlements and duties of citizenship. Universal literacy (Lo Bianco and Freebody, 2001) is possibly the widest reaching language policy aim.

The second aspiration of language education policy refers not to state or public official action, but to the vigorous community-based efforts invested in the maintenance of minority languages, seeking essentially to secure their intergenerational transmission. Since this goal depends on establishing community-controlled institutions, and since these are by definition beyond the control of the dominant social structures, they have from time to time encountered opposition and hostility as well as encouragement and toleration.

Although it has only been in recent decades that these twin ambitions have been brought together in coherent policy statements emphasising complementarity, the divergent tendencies they represent have always been implicit policy. This is a consequence of Australia occupying a vast territory by a small population; of having European origins and but being located within an Asian geography, and of having a historically disputed process of settlement and national formation, particularly of relations between all newcomers with the indigenous inhabitants, the oldest continually surviving cultures in the world, which are strongly language based (Frawley, 2001; Leitner, 2004, Volume I).

For the bulk of the colonial (1788–1900) and national (post-1901) phases of Australian history, the language consequences of colonialism,

settlement, development and modernisation, immigration, nation building, diplomacy, geography, education, trade, war and culture have been dealt with not as language planning but as matters resolved in the interplay of power, representative democracy, Federation and federalism, and mostly within the overarching control of social attitudes, themselves reflective of the relationships among the component parts of the population (indigenous, settler, immigrant). Language attitudes are most evident as ideologies of esteem or stigma attached to various kinds of speech or writing (see also Tollefson, *Language Planning in Education*, Volume 1).

Where formal policies have been promulgated, for the most part, these are found in rules and procedures that have regulated immigrant recruitment (such as the notorious 'dictation' test and country of origin biasing via subsidised transportation), the mostly assimilative biases of compulsory education and their literacy pedagogies (House of Representatives, 1992; Schmidt, 1993), foreign relations (such as diplomatic and strategic officer training) and the shifting curriculum status of foreign language teaching.

From 1987, however, Australia embarked on a process of explicit language planning, formulating sociolinguistically informed language decisions, making explicit declarations of aims and objectives, setting in place evaluation and research programmes. Often this has aimed to bring about deep change in the national language 'habitus', especially by fostering community-accepted multilingualism, unique among English-speaking nations (Romaine, 1991, p. 8). Initially very successful, then strongly contested, pluralistic language policy remains part of the policy framework of Australian language planning but with its immediate fortunes dictated by wider sociopolitical arrangements (Moore, 1996). The new national imaginary invoked by pluralism in language planning was wide-reaching and deep, shaping the notion of nation underlying wider policies (Macquarie Encyclopedia, 1997, p. 634), premised on intergenerationally stable multilingualism, in which divergent language interests would be accommodated in complementary relationship with an uncontested, society-unifying status for English.

Unlike the USA, where there has been a long and often bitter struggle over the official designation of English (Crawford, 2000; see also Ricento and Wright, *Language Policy and Education in the United States*, Volume 1), Australian multilingual and multicultural advocacy has always been premised on the secure status and shared use of English. The so-called mainstream has long had relatively permeable boundaries. Though social and ethnic barriers to inclusion are ever-present, over time an inbuilt dynamic of social mobility in a relatively new society often leads to boundary expansion (O'Farrell, 1986).

In such ways, English has undergone transformation responding to local communicative practices (Horvath, 1991), in turn changing language and national identification. This change within English has had an ambivalent relation with the social presence of a range of languages from diverse origins which have also claimed public recognition (Lo Bianco, 1997).

#### EARLY DEVELOPMENTS

Clyne (1997), citing his long-standing documentation of language policy, has argued that from earliest times Australian sociolinguistic history is marked by tension. The three nodes of tension are: 'English monolingualism as a symbol of the British tradition, English monolingualism as a marker of Australia's independent national identity, and multilingualism as both social reality and part of the ideology of a multicultural and outreaching Australian society' (p. 127).

This long-term tension of sociolinguistic relations has been punctuated by phases whose ideological underpinnings can be described (Lo Bianco, 2004) as follows:

1. *Britishism*: This is marked by preference for Australian national language norms to reflect prestige English models (with stigma attached to Australian forms of speech), mainly as a marker of identification with England (the local playing out of language-carried social distinctions), but also aspiring to broader Australian national monolingualism, permitting only a limited and elite enterprise of foreign language teaching, and bolstered by legal restrictions on community language institutions.
2. *Australianism*: This is marked by literary and even sociopolitical assertion for evolving Australian norms of English, as a marker of independent national identity; this Australianist language ideology had ambivalent relations with domestic multilingualism, sometimes interpreting language diversity as part of producing a distinctive Australian communicative culture, at other times seeing multilingualism as dangerous and divisive.
3. *Multiculturalism*: This contains two streams, indigenous and immigrant, marked by a common discourse of asserting language rights for community language speakers; invariably multiculturalism's effect on Australian language policy has involved advocacy for English as a second language (ESL) teaching, for multicultural policy and for public language services, and therefore for wide-ranging cultivation of language 'resources'.
4. *Asianism*: This is marked by an assertion of priority for the teaching of the key languages of select Asian countries, tied specifically to the North and South East regions of Asia, and accompanied by

economic, diplomatic and strategic justifications; sometimes Asianism invokes wider social and cultural changes for Australia itself, at other times it is a more restricted discourse embedded within short-term thinking about strategic and economic calculations of national interest; Asianism has had ambivalent relations with domestic multilingualism.

5. *Economism*: This is marked by an emphasis on English literacy tied to arguments about links between education, the labour market, a discourse of human capital, sometimes including arguments about English in globalisation, especially the competition for international full-fee paying students in higher education (Marginson, 1997).

Societies have distinctive national policy styles (Howlett, 1991) and in some ways Australian language education policy has evolved a distinctive 'language problem-solving' approach, characterised by low-ideology pragmatism (Ozolins, 1993).

Perhaps, the clearest example is the Adult Migrant English Program (AMEP; Martin, 1999) established in 1947, initially as ship-board English tuition for post-war displaced and refugee populations, and continually funded for almost 60 years. AMEP represents a pragmatic acceptance that intolerable communication and citizenship problems would result if immigrants were not assisted to acquire English, an apparently straightforward claim, widely held, but that in societies opposed to state intervention in social planning becomes untenable.

Of course, at one level, this is also an ideology, an ideology of social pragmatism and interventionism, one responding to community expectations that state measures are warranted so that minorities do not form ongoing, economically marginalised, linguistic enclaves. Policy making of this kind has received support from all political streams in Australia, and is therefore not sharply aligned politically, and represents low-ideology pragmatism, a shared project of 'problem amelioration'. AMEP has come to represent a major public investment, possibly the measure most responsible for facilitating the relatively high rate of economic, residential and social mobility characterising Australian immigration.

Other examples of language education pragmatism are 1970s schemes for interpreting and translating in community languages, alongside accreditation and certification procedures to encourage professionalism (Ozolins, 2001).

#### MAJOR CONTRIBUTIONS

At the Federal level, there have been five decisive policies for language education in Australia. These formally adopted policies, in chronological order, are:

1. Report on Post-Arrival Programs and Services for Migrants (Galbally, 1978)
2. National Policy on Languages (Lo Bianco, 1987)
3. Australian Language and Literacy Policy (Dawkins, 1992)
4. National Asian Languages Strategy (COAG, 1994)
5. Commonwealth Literacy Policy (embodied in various reports, media statements and funding programmes since 1997).

Although not identical in remit, scope or style, these five policies are the key formally adopted and implemented language education programmes of the past 25 years: receiving government endorsement, disbursing public finances, leading to implementation and monitoring processes. Each is a complex of discursive, textual and rhetorical components, an amalgam distinctive of the national policy style in societies lacking legalistic policy-making traditions (Howlett, 1991; Kagan, 1991; Lo Bianco, 2001).

It is important to recognise that many other reports and investigations have informed, guided or influenced policy; and to acknowledge the policy-influencing impact of lobbying and pressure from key interest groups; and occasionally from academic research (Lo Bianco, 2001); but these are materially different from actual policy. The five listed policies represent therefore the explicit and implemented language policy frameworks in the 25-year period between 1980 and 2005 in the near quarter century from 1980 (Lo Bianco, 2004).

The Galbally report was a government-commissioned review of services, not addressing indigenous, mainstream English, literacy or foreign relations issues. Nevertheless it represents a major language education policy, signalling the acceptance of multiculturalism by Australian conservative political forces. As a result, for the entire 1980s a broadly shared political programme among policy elites prevailed. Galbally led to public funding for part-time ethnic schools; and by extension to part-time indigenous language programmes; and large increases in funding for all multi-lingual services. Via the Galbally report, the previous association of multicultural policy with reformist social democratic Labour Party factions was extended to conservatives, who devised a distinctive political interpretation of pluralism.

Over time, the shared programme of support for a pluralist interpretation of Australian society was seen to comprise three principles: *social cohesion*, *economic benefits* and *cultural diversity*. Language education policy epitomised these principles.

The *National Policy on Languages* was the first comprehensive national language policy; also bi-partisan receiving public endorsement from all political parties. NPL operated four key strategies: '(i) the *conservation* of Australia's linguistic resources; (ii) the *development and expansion* of these resources; (iii) the *integration* of Australian language teaching and language use efforts with national economic, social

and cultural policies; and (iv) the *provision* of information and services understood by clients' (Lo Bianco, 1987, p. 70, emphasis in original). The NPL was fully funded, and produced the first programmes in many areas: e.g. deafness and sign language, indigenous, community and Asian languages, cross-cultural and intercultural training in professions, extensions to translating and interpreting, funding for multilingual resources in public libraries, media, support for adult literacy, ESL, and co-ordinated research activity, e.g. the National Languages and Literacy Institute of Australia (NLLIA).

Although the 1992 ALLP positioned itself as a policy re-authorisation (claiming to 'build on' and 'maintain and develop' NPL), it was widely interpreted (Herriman, 1996; House of Representatives, 1992; Moore, 1996; Nicholls, 2001; Scarino and Papademetre, 2001; Singh, 2001) as restricting its scope and ambition, of directing policy emphasis away from pluralism and towards a more 'foreign' and less 'community' orientation and inaugurating a return to divisive prioritising of language needs. Still, the ALLP drew heavily on its predecessor, continued funding many of its programmes (often changing only titles and procedures), and was far more comprehensive than policies which followed it. Despite its shortcomings, ALLP was supportive of extensive language learning efforts and boosted adult literacy tied to workplace education.

The National Asian Languages scheme made available extensive funding; Federal outlays on its targeted languages, Chinese, Indonesian, Japanese and Korean, were over \$220 million by the programme's termination in 2002. This vast investment in Asian language teaching was based on shared funding commitments with state, territory and independent education jurisdictions. The programme accelerated growth of a small number of Asian languages, surpassing school and university enrolments in European languages, but also distanced the focus of domestic community language contexts in language education.

From 1997 (see Lo Bianco, 1998a, b, 2001), however, a strong turn towards making English literacy a priority focus for educational intervention occurred. There is no single policy document in which this 'policy' was announced as a 'turn', its antecedents in the electoral platforms of the political parties lack specificity, essentially what took place was a dramatic elevation in political discourse of concern about English literacy standards, rhetorically a 'national crisis' (Freebody, 1998). Arising out of interpretation disputes of research data on children's assessed English literacy performance in 1996, all Ministers of education since have made solving the problem of literacy underperformance a prominent goal. The flow-on effects of elevating spelling and paragraph cohesion measures in primary school English literacy has been manifold: continuing media debates about categorical superiority

of 'phonics' or 'whole language' literacy teaching, disputes about what counts as literacy, about the place of critical and technological literacy, with effects for adult sectors, non-English languages, indigenous education, teacher education, ESL, literacy pedagogy and teacher professionalism.

#### PROBLEMS AND DIFFICULTIES

Policies and practices have often had to compromise among competing demands, sometimes opting for wide coverage of languages producing difficulties of continuation between sectors and levels of schooling, issues of comparability, syllabus and programme design, evaluation and assessment. One consequence of this is the proliferation of ab initio language courses at higher education level.

The Australian Federal system can also be cumbersome and difficult for language planning, although there are only 6 states and 2 territories, these comprise 27 separate education jurisdictions.

A recurring difficulty is the 'third language' issue. Large numbers of immigrant children who are learning English as a second language are expected to study an additional language, the school's 'foreign' language offering, which in effect becomes a third language for them. Debate about the efficacy, and fairness, of this arises often as some teachers and parents request exemption from language study for these students.

A further difficulty has been the closing down of the NLLIA. Perhaps the boldest experiment of language education policy in Australia, in its heyday the Institute co-ordinated research in all areas of language and literacy, English and languages other than English, all linked to education, across 32 separate sites and other implementation domains. A change of political direction in 1996 led to a reduction and then complete removal of public funding for the NLLIA (later Language Australia), and ultimately its closure. Although formally independent of government NLLIA operated from 1990 to 2003 with both state and self-generated revenue, establishing an internationally recognised research, publications and consultancy profile. The loss of NLLA removes the key national and independent professional voice on language education policy.

The final difficulty, perhaps an amalgam of the others, relates to the loss of direction in language and literacy policy, the loss of the formerly collaborative nature of language policy. The sequence of policy changes discussed earlier highlights two key problems of language education policy 'Australian style'.

The first is the rapidity of change, the chopping and changing, of policy frameworks and ideologies. Although the effects of policies can be felt long after their termination, a consequence of distributed

implementation arrangements, and of the power of positive discourses, the relatively short duration of formal policies produces problems of coherence, continuation and articulation across education sectors, and rapid changes are ultimately damaging to effective implementation.

The second problem is how policies undertaken in one area impact, whether by accident or design, on contiguous areas. Policy changes in English literacy, for example, impact on the teaching of indigenous languages, even if unintended; and policy measures for Asian languages impact on community language teaching, whether Asian or not, and other programmes, even if these are unintended.

The inability to quarantine the effects of policy suggests an inter-linked language education ecology, and highlight the benefits of comprehensive and co-ordinated policy, but governments in Australia appear to have lost interest in this kind of policy making at present.

#### FUTURE DEVELOPMENTS

It has been widely recognised that Australia is unique among English dominant nations for its efforts to develop a comprehensive approach to language and literacy policy (e.g. Romaine, 1991). Despite the difficulties noted earlier, comprehensive policy making has proved very productive with many positive and lasting outcomes.

One result has been that, unlike many other societies, Australia, which used to be steadfastly monolingual in its educational orientation has near-universal coverage of schools teaching languages other than English, in some states, and possibly the largest number of languages other than English supported in formal and compulsory education than comparable countries.

Language education generally enjoys public esteem, even when related issues of immigration and multiculturalism are embroiled in often-bitter debate and contest.

LANGUAGE POLICY AND EDUCATION IN  
SOUTHERN AFRICA

INTRODUCTION

Language policy and education in Southern Africa has evolved, as it has elsewhere in Africa, through several stages: pre-colonial, colonial, early independence and developments since UNESCO's 1990 Education for All Conference in Jomtien (see Alidou, 2004). The partition of Africa, accelerated after the Berlin Conference of 1884–1885, resulted in a division of linguistic communities, often exacerbated by a renaming of 'cross-border' languages in order to make further distinctions. While communities in Africa readily add to their informal multilingual repertoires, postcolonial language policies often reflect a tension between the use of indigenous languages and the language/s of colonial rule. The majority of countries in this region experienced British colonial rule for much of the first half of the twentieth century, if not longer, and hence English has come to occupy a significant position in: Tanzania, Zambia, Zimbabwe, Malawi, Botswana, Swaziland, Lesotho, South Africa, Mauritius, the Seychelles and even in Namibia which was never under British rule. Several countries experienced a succession of different (partial) occupations from the fifteenth century onwards and the region also includes more recent colonies of: Portugal (Angola and Mozambique), Belgium (Democratic Republic of Congo), France (Madagascar) and Germany (South West Africa/Namibia and Tanzania). Thus the influence of French, Portuguese and German is evident in education and language policy within the region.

The use of mother tongue (L1) education for primary education to the mid twentieth century in most countries was replaced by English only (Zambia) or early-transition to English after independence in several countries. Tanzania, South Africa and Namibia for different political reasons, retained and extended the use of the African languages, to the end of primary school. Malawi retained one local language as medium for 4 years. Political changes since the early 1990s, however, have resulted in a similarly diminished use of African languages, coupled with an accelerated transition to English medium in Namibia and South Africa. A convergence towards an early transition to a second language (L2) education system is not compatible with contemporary education research, which illustrates the interdependence of second

language acquisition (SLA), cognitive development and academic achievement. Early transition does not, in African settings, facilitate the requisite competence in the L2 which is necessary for meaningful access to the curriculum. L2 education, therefore, does not offer equity with L1 education and it cannot deliver quality education. The focus of this chapter is on language education policy developments in the 'anglophone' countries of the region, paying particular attention to South Africa.

#### EARLY DEVELOPMENTS: (PRE-)COLONIAL PRACTICES

Discussions of language practices in Africa often neglect the historical use of local languages in education. The rediscovery of the Malian Timbuktu manuscripts has drawn recent attention to extensive and sophisticated pre-colonial literary use of African languages for mathematics, science, economics and religion at university mosques from the twelfth century onwards (e.g. Timbuktu Education Foundation, 2002). Various nineteenth century missionary groups which traveled through Southern Africa believed that their evangelical work would be advanced through the transcription of local languages, translation of the bible, the introduction of mother tongue literacy and primary education. Schools, established by missionaries for a small percentage of children in British colonies, used L1 medium for 4–6 years (e.g. Gorman, 1974). This practice suited the British colonial administration's general policy favouring segregation, thus education was left largely to the missionaries. Education in the French and Portuguese colonies, however, did not include the use of African languages. From the early twentieth century, various education commissions recommended the maintenance and use of indigenous languages alongside the addition of an international language (e.g. Gorman, 1974). Missionary education in 'anglophone' countries was compatible with these recommendations, particularly those of the influential Report on the Use of Vernacular Languages in Education (UNESCO, 1953).

The linguistic credentials of the missionaries and the consequences of their activities have, however, been criticized. Missionary groups favoured different orthographic conventions and their expertise in linguistics was uneven. They often mistakenly identified close varieties of one language as separate languages and this, coupled with different orthographic systems, contributed to what Msimang (cited in Cluver, 1996) has termed a 'linguistic balkanization' of Africa; or a 'misinvention' of African languages (Makoni, 2003). The net result has been to inflate, artificially, the number of languages, and establish different orthographies for the same or related language/s (e.g. for Sesotho as

written in Lesotho vs. Sesotho as written in South Africa). Several arguments—including the apparent costs of such ‘multiplicity’, and, more recently, the ‘artificiality’ of languages—are advanced by post-colonial governments as reasons why African languages cannot be used in education. Schmied (1991), Obanya (1999), Bamgbose (2000) and Ouane (2003), nevertheless, offer detailed rebuttals to these arguments.

There are also positive aspects of early missionary transcriptions and production of texts in African languages. Together, with the rediscovery of the Timbuktu manuscripts, they demonstrate the feasibility of materials’ production in, and education through, African languages. Language committees established in the late 1920s in South Africa built on earlier missionary linguistic work. The limitations of earlier divergent processes were recognized, and linguists sought even then to resolve orthographic differences and re-route developments along a convergent path (Cluver, 1996).

#### MAJOR CONTRIBUTIONS: POSTCOLONIAL PREOCCUPATION WITH INTERNATIONAL LANGUAGES

Postcolonial developments in the second half of the twentieth century in most African countries were accompanied by the identification of official languages for use in the political, economic and educational domains. Invariably, English came to be selected for high status functions in the former British colonies.

The end of the colonial period came rapidly. Tanzania, Malawi and Zambia gained independence in 1964, Botswana and Lesotho in 1966 and Swaziland in 1968. Under Julius Nyerere, Tanzania opted for a single African language, Kiswahili, as the official language and medium of instruction throughout primary school. Although Kiswahili was not a dominant L1 of any particular group it had been advanced under both German and British rule as a language of trade and lingua franca. In Malawi, President Banda’s home language was declared an official language alongside English, and renamed Chichewa (although it continues to be known as Nyanja in Zambia and Mozambique), after independence in 1964. Chichewa was used until recently as the medium of instruction for the first 4 years of school with a switch to English medium thereafter. Zambia opted for English-only education after independence, ostensibly to avoid inter-ethnic rivalry (Tripathi, 1990). The educational development and use of Kiswahili in particular (see Blommaert, 1997; Brock-Utne, 2005; Rubagumya, 1994), and to a lesser extent Chichewa (Williams, 2001), illustrates that African languages can and do offer viable educational opportunities. Unfortunately, however, the advancement of only one African language in Tanzania, Malawi,

and Botswana may result in the marginalization of linguistic minorities (e.g. Nyati-Ramahobo, 2000). This is particularly the case for the fragile San communities of Botswana which have effectively been 'invisibilized' (Skutnabb-Kangas, 2000) by the political dominance of Setswana. Zambia's English-only policy, adopted to avoid such ethnolinguistic inequities, has had other consequences. It has arrested further development and production of texts in African languages. It has resulted in neither high levels of English language proficiency nor educational success. It has also not arrested sociopolitical discontent, since those who are proficient in English and access higher education are resented as part of a political elite, impervious to the needs of those on the fringes of society (Tripathi, 1990).

In each case, the 'multiplicity' of African languages was seen as a threat to national unity in the postcolonial years (Bamgbose, 2000; Obanya, 1999; cf. May, *Language Education Pluralism and Citizenship*, Volume 1), and language policy reflected a tendency to marginalize most indigenous language communities. Missionary development of languages other than Kiswahili, Chichewa/Nyanja and Setswana, lost momentum or ceased altogether. Inevitably, this meant declining literacy activities and a gradual loss of literary resources in many languages.

Similar postcolonial developments were delayed by political events and sizable European settler communities in South Africa, Zimbabwe, Namibia and Mozambique (Schmied, 1991). South Africa occupied 'German' South West Africa (now Namibia) during World War 1 and retained control until independence in 1990. Language policy and practices changed, in both countries, with a new government in 1948. Policy was marked by a two-pronged approach: official Afrikaans-English bilingualism (with special consideration for German in Namibia) and development and use of African languages to reinforce separatism. An earlier British colonial ideology of separate development, infused with the European fascism of the 1930s, was refined into 'grand apartheid'. Convergent approaches to linguistic development amongst African languages were replaced by deliberate divergence. Apartheid logic included separate ethnolinguistic education systems. This meant 8 years of mother tongue/L1 education for African children, followed by a transition to an equal number of subjects in Afrikaans and English in secondary school. The use of mother tongue/L1 education under such circumstances tainted its educational legitimacy amongst African communities.

With the exception of apartheid's expanded use of African languages, and the development of Kiswahili and Chichewa, the range of mother tongue options in education shrank across most of the region during the first decade of independence. Initial mother-tongue/L1 education was replaced either by a single African language followed

by transition to English, or English-only. Political events were soon to alter the trajectory in South Africa and Namibia as well. Resistance to the compulsory use of Afrikaans medium for half of the subjects in secondary school for African students culminated in a student revolt in Soweto in 1976. Government was forced to make Afrikaans-medium optional and mother-tongue education was reduced from 8 to 4 years of primary. All the while, L1 speakers of Afrikaans and English continued to enjoy mother-tongue education, plus the other of these languages as a subject, to the end of secondary school. At no point were Afrikaans or English speakers compelled to learn an African language.

At the time, heated political debates deflected attention from the de facto achievements of mother-tongue education in South Africa. The secondary school leaving pass rate for African students rose to 83.7% by 1976. The English language pass rate improved to over 78%. Within a few years of the reduction of L1 education to 4 years, and earlier transition to English, the school leaving pass rates declined to 44% by 1992, with a parallel decline in English language proficiency (Heugh, 2002). Macdonald (1990) was to show that students could not become sufficiently proficient in English by the end of the fourth year to facilitate a successful transition to English medium in grade 5. Although African parents imagined that extended and earlier access to English in school would deliver higher level proficiency in English and education success, the educational gap between speakers of African languages and speakers of Afrikaans and English, who have L1 education throughout, has widened. The knock-on effect of this is that those leaving school and going into the teaching profession are now less well-equipped for teaching and there is a downward spiral of teaching competence across the entire system. The gap in educational achievement of African children vis à vis children of European descent is more noticeable in South Africa than in other countries because of the size of the 'settler' community and the analytical scrutiny which followed apartheid.

The implications of a significant longitudinal study, the Six Year Primary Project, in Nigeria in the 1970s, in a politically more neutral environment, were debated at length across the continent. This project demonstrated the educational and linguistic efficacy of extended use (6 years) of mother tongue medium in conjunction with expert teaching of English as a subject (e.g. Bamgbose, 2000). Other investigations into the use of African languages in education continued and were reported on through various education channels. In 1986 the OAU committed itself to the language plan of action for Africa (Mateene, 1999), which included the extended and expanded use of African languages in education. Subsequent and similar declarations regularly support this line of argument. Even though these debates were not

tainted by the association of apartheid ideology with mother-tongue education, none of the declarations or statements of intent has materialized in practice. Postcolonial debates in Africa (e.g. Alexander, 1999; Bamgbose, 2000) and beyond (e.g. May 2001; Phillipson, 1992) demonstrate the resilience of ideological conditioning which reproduces earlier, inequitable government practices. International aid agencies have also been reluctant to support the development and use of African languages in education (e.g. Schmied, 1991). Alidou (2004) points out that since 1990 most African states have committed themselves to greater use of African languages, yet most continue to implement early transition models. In essence, the continued privileging of the international language, and sometimes one of many African languages, reproduces inequality and educational failure for those who receive education in an unfamiliar language (cf. May, *Bilingual/Immersion Education: What the Research Tells Us*, Volume 5).

Ironically, by accident rather than design, apartheid education offered optimal opportunity for first and second language development alongside cognitive and academic development from 1955–1976. Despite the intention of separate and unequal education, an unintended consequence was greater educational success than other education policy in the region. The feasibility of using several African languages to the end of primary school was demonstrated. Seven South African and several Namibian languages were elaborated for educational use and textbooks were translated from Afrikaans and English into these languages for the duration of primary school. Most significantly, this was accomplished with minimal costs: the expenditure per capita on African education was a fraction of that for other population groups at the time (cf. Grin, *The Economics of Language Education*, Volume 1; Heugh, 2002).

A common thread across Southern Africa, however, is that education is expected to deliver access to high-level competence in an international language, which is English in eleven of the fifteen countries of the region. Frequently this is presented as feasible in a predominantly second language education system. It is seldom advanced through a complementary process of extending the use of local languages with the systematic addition of (rather than replacement by) English (i.e. additive bilingual models of education; see May, *Bilingual/Immersion Education: What the Research Tells Us*, Volume 5).

#### WORK IN PROGRESS

During the 1990s, political changes across the region, especially in South Africa, brought renewed attention towards education and language policy. Apartheid rule gave way to a democratically inspired

dispensation in 1994. The finalization of a new Constitution (RSA, 1996) introduced the principles which would guide new language policy developments. Two official languages, Afrikaans and English, were complemented by the bold addition of a further nine African languages. A new language education policy re-introduced the principle and right of L1 education within the context of 'additive bilingual and multilingual' models of education (DoE, 1997). Discriminatory linguistic practices of the past were to be jettisoned. The language education policy went further, to declare South African Sign Language a twelfth official language for educational purposes (cf. Branson and Miller, *National Sign Languages and Language Policies Volume 1*) and it made strong recommendations regarding the promotion of languages for trade and diplomacy in the school system. This promised to position South African language education policy as one of the most progressive in international contexts. The profiling of multilingualism in this framework was specifically supported during Nelson Mandela's presidency. After new elections in 1999, implementation of the new language policy was arrested. A default to apartheid-like ethnolinguistic parallel and separate development (e.g. Heugh, 2003), under the guise of 'language rights', scuppered an integrative approach to multilingualism. Parallel and equal development of eleven languages, including Afrikaans and English, separately, was not only a fruitless exercise; it facilitated a default to English, whenever in doubt, option.

Language education policy was kept separate from, rather than integrated into curriculum transformation. By 2002, it became clear that the language education policy had been subsumed by curriculum revision, and of the six aims of the original policy, only two had been partly included in the curriculum, viz. a tacit reference to the use of 'additive bilingualism' and a minimalist compulsory learning of an African language for 3 years. South African Sign Language and languages for trade and international communication were simply not mentioned in the curriculum. Language policy is either explicit and implemented through transparent means; or it is implicit, and implemented through default processes. In the case of the Revised National Curriculum Statements (e.g. DoE, 2002), opaque reference is made to the 1997 language policy, and additive bilingual education is misrepresented as premature transition to the 'first additional language' (i.e. to English for 75% of students). Preparation of education officials, in 2004, who were to train teachers for new curriculum implementation, included only one language education model for grades 4–6, viz. transition to English. A device, the repetition of a key clause referring to students 'who will learn in their first additional language', normalizes transition in the documentation. The curriculum reveals no understanding of the interdependence of (second) language acquisition, academic and cognitive development.

This example of a promising language education policy which undergoes systematic editing or revision to an unrecognizable form has also had its parallels in Mozambique, Zambia and Malawi since the mid-1990s. In each of these countries, concern regarding underachievement in literacy and general education led to proposals for new language education policy supportive of extended use of African languages and additive bilingual principles. In each case, however, through a process of redrafting and revision of policy, there have been compromises in regard to the period of time afforded L1 education. Zambian language policy revision has finally accommodated literacy in the mother tongue for grade 1 (extended to grade 2) but the medium of instruction remains English from grade 1 (Muyeeba, 2004). In Malawi, the proposed expanded use of African language medium, in languages other than Chichewa, for 4 years has been whittled down to 2 years. Mozambique has begun implementation of 3 years of L1 education. Namibia has similarly opted for 3 years of L1 medium. Each example demonstrates early transition to English or Portuguese; not one is attempting an additive bilingual option.

#### PROBLEMS AND DIFFICULTIES

Attempts to transform education and achieve equitable provision and outcomes for students in South Africa are disappointing. Systemic assessments of literacy and numeracy in grades 3, 4 and 6 since 1998 are alarming. Since 1995, South Africa has been placed last in the Third (now Trends in) International Mathematics and Science Study (TIMSS) (Reddy, 2006; UNESCO, 2000). A common thread across these and other studies shows a correlation between students who are studying in their L2, English, and the lowest levels of achievement. Students studying through their L1, Afrikaans and English, have the highest levels of achievement. These findings are predictable when viewed through the prism of psycholinguistics and SLA theory, especially the interdependence of language, cognition and academic achievement (e.g. Doughty and Long, 2003; Macdonald, 1990; Thomas and Collier, 2002; see also May, *Bilingual/Immersion Education: What the Research Tells Us*, Volume 5).

The language model used in South Africa, early-exit from the L1 and transition to English for African children, is one which is used across most other countries in sub-Saharan Africa, and it is designed for educational failure. The question is: why since 1990 has there been an accelerated convergence towards this model when there is no evidence that it can offer success? Spolsky (2004) argues that blame cannot be directed at governments only, and that there needs to be an introspective examination of the role of advisors and experts. Postcolonial

literature and debates referred to earlier may explain macro-level constraints which impel developments away from democratic principles. Less frequently documented are meso-level issues involving experts and advisors. Some of these are presented below.

Terminological slippage, as shown in the South African example, where an 'early-exit transitional bilingual' model is passed off as 'additive bilingual' education; or where the concept of cognitive 'transfer' as used by Cummins (e.g. since 1984) and others, is confused with 'transition to L2', has become commonplace. Documents and second language programmes currently circulated in African countries increasingly contain terminological slippages and rhetorical devices similar to those in the South African curriculum. The influence of early-exit literacy/L2 programmes, designed in Europe and South Africa, and accompanied by such textual inaccuracies are currently advanced in Malawi, Zambia, Uganda and Ghana, for example. Independently, similarly erroneous terminology has been found in recent advisory documents supplied to the governments of Sierra Leone and Ethiopia. The extent to which the slippage is intentional obfuscation or genuine error is not always clear. An unfortunate consequence of information technology is that theoretically flawed documentation is circulated along with more academically rigorous material.

As Schmied (1991) and others point out, there are several donor organizations concerned with L2 programme delivery in African countries. Evaluations for the donors of initial L1 literacy and early-exit transitional (L2) programmes, however, are often flawed. Firstly, control groups are selected from a usually dysfunctional mainstream system, thus any intervention will look promising in comparison. Secondly, as the research of Thomas and Collier (2002) shows, evaluations of most types of bilingual programmes show similarly positive results during grades 1–3. The differences start emerging during grade 4 and are increasingly obvious from grades 5 onwards, where it is clear that students from early-exit programmes do not develop strong foundations in literacy and numeracy and their academic progress is on the decline. Evaluations of programmes seldom reflect longitudinal effects of the transition to L2, so claims of success prior to an analysis of grade 5 data are premature (Alidou et al., 2006).

In the meantime, participation in several cross-national studies: the Southern Africa Consortium for Measuring Educational Quality (SAC-MEQ), Monitoring Learning Achievement (MLA), and TIMSS show disturbing signs of poor achievement in literacy, mathematics and science, in the L2, across the region (UNESCO, 2000).

An adequate explanation for the reproduction of a flawed language model, one based on a language unfamiliar to teacher and student alike, includes both macro- and meso-level reasons. The long-term effect of

the wrong language model has been opaque or difficult to recognize in most countries where universal primary education has not yet been achieved and through rate to secondary education has been low. In South Africa, however, the evidence has been readily available, but obscured by the political-ideological aversion to apartheid and its education system.

#### FUTURE DIRECTIONS

Political developments since the early 1990s, coupled with new international frameworks, especially UNESCO's Education for All and the Millennium Development Goals, have brought about a reassessment and realignment of education priorities in the region. There is a greater awareness of the need for and possibilities of regional cooperation, and sharing of expertise. The Southern Africa Development Community specifically encourages regional educational cooperation. The Association for the Development of Education in Africa (ADEA) and the UNESCO Institute for Education recently commissioned a study of mother-tongue and bilingual education in sub-Saharan Africa (Alidou et al., 2006). Recommendations from studies like these are presented to the Education Ministers in Africa every 2 years, and are weightier than individual country studies. Cooperative agencies, such as the Association for the Development of African Languages in Education, Science and Technology (ADALEST), and ADEA emphasize that language education experts should not await new government decisions.

The need for strengthening research capacity has been identified in two areas: the economics of language education; and the relationship between language and cognition. Early-exit transitional models exacerbate repeater and drop-out rates and these are costly and wasteful. If the apartheid government could fund African language development and education on a minimal inequitable budget, then there is little reason why a post-apartheid government, intent on equal distribution of resources cannot afford this now. Contemporary advances in information technology and human language technology promise to render multilingual education far less costly than was the case during the apartheid period. They expedite cooperative (cross-border) language development activities (e.g. of the University of Malawi's Centre for Language Studies, or Department of Arts and Culture, South Africa).

There is growing recognition amongst the organizations mentioned above, that teacher education programmes are anachronistic and require fundamental reconceptualisation. Second language programmes, based on flimsy SLA theory, or from European-North American contexts, have little validity in Africa. Teacher education in Southern Africa requires: a strengthening of the teachers' own academic language

development in relevant African languages; bilingual/multilingual methodology; SLA and enriched curriculum content training, for all teachers. Literacy theory and teaching methodology, responsive to the reality of 'print-poor' and large-class African settings is essential for early primary teachers. Those who continue to teach in the students' L2, cannot do this unless they have (near) native-like proficiency themselves.

The 2005 Education for All Global Monitoring Report identifies 'learners' cognitive development as the major explicit objective of all education systems' and the primary condition for quality education (UNESCO, 2004, p. 19). Education developments in Southern Africa which match language policy and implementation with this objective could turn around the socioeconomic development of the continent.

## LANGUAGE POLICY AND EDUCATION IN THE INDIAN SUBCONTINENT

### INTRODUCTION

The ideology of language in school is interwoven with the ideology of education in society. Education planners in the contemporary South Asian context have, by and large, committed themselves to *education for all*, but they have not yet been able to totally discard the elitist framework of *selective* education inherited from the colonial setup (prevailing till 1947).

In India, with a multilingual population and a federal polity, one finds a wide variation in different states as far as the medium, content, duration and nomenclature of educational stages are concerned. The decadal census enumerates 200 odd languages, spoken by the population exceeding 1 billion, spread in 30 states and 5 Union territories (Nanda, 1993). Over 80 languages are used as medium of instruction at different stages. About 18 of them are counted as principal medium languages, comprising 2 pan-Indian languages—Hindi and English; 2 languages without a specific region—Urdu and Sindhi; and 14 languages concentrated in different regions—Assamese, Bengali, Gujarati, Kannada, Kashmiri, Konkani, Malayalam, Manipuri, Marathi, Nepali, Oriya, Punjabi, Tamil and Telugu. Distinct scripts, based on Brahmi, Perso-Arabic and Roman systems of writing, are in vogue for these languages (for details, cf. Khubchandani, 2001).

The Constitution of India, passed in 1950, vests authority in its constituent states to choose a language or languages in a region as official language(s) (Article 345). It also allows linguistic minority groups to receive education in their mother tongue and to set up institutions of their choice for this purpose (Article 30). In the Indian federal setup, the Constitution originally listed the domain of education as a ‘State’ subject. However, since 1980, it has been shifted to the ‘Concurrent List’, allowing both the Union and state governments to initiate legislation on education policies.

Other countries in the South Asian region, known as SAARC—Bangladesh, Pakistan, Sri Lanka, Nepal, Bhutan and Maldives Islands—are also characterized by varied milieu where, apart from locally dominant languages, pan-regional languages such as Hindustani and English play a significant role in overall education structure. Bangladesh consists of a relatively homogeneous Bengali population. Pakistan is

composed of nearly half of its population speaking Punjabi (48%): other prominent languages are Pashto (13%), Sindhi and Siraiki (12% each), Urdu (8%) and Baluchi (3%) (Rahman 1996, see also, Rahman, Language Policy and Education in Pakistan, Volume 1). Sri Lanka is going through the trauma of adjustments between two Sinhalese and Tamil-speaking populations.

#### EARLY DEVELOPMENTS

Before the consolidation of British rule on the Indian subcontinent at the turn of the nineteenth century, there were two competing systems of education: the *pathashala* (school) and *gurukul* (residential school) system of Brahmins; and the *maktab* (school) and *madrashah* (college) system of Muslims (see also, Rahman, Language Policy and Education in Pakistan, Volume 1). Two patterns, shaped by vocational relevance, were prominently recognized: *ordinary* tradition for providing practical education to administrators and merchants to cope with the day-to-day needs of society through locally dominant languages; and *advanced* tradition for providing education to the elites (sons of priests, the ruling class and high officials) by reading of scriptures and historical texts, through the classical languages—Sanskrit or Arabic-Persian.

The ‘Great Debate’ between Orientalists and Anglicists over the treatment of classical languages, contemporary indigenous languages (termed ‘vernaculars’) and the advent of ‘imperial’ English during 150 years of British rule has left a deep imprint on the role of language for plural societies in the region. The rival British education system known as *schools* soon eclipsed the traditional *pathashala* and *maktab* education systems in most parts of British India. The British administration could not resolve the three basic issues of education: the content, the spread and the medium (Dakin, 1968). Macaulay’s hard line, recommending a policy of ‘imparting Western knowledge through a Western tongue (English) and then only to a minority’ (cf. the famous Minute of 1835, cited in Sharp, 1920), echoed in education programmes of the British throughout their stay in the subcontinent. During a later phase, the 1854 Wood Despatch suggested the use of vernacular medium ‘to teach the far larger class who are ignorant of, or imperfectly acquainted with, English’ (Naik, 1963; Richey, 1922). However, the introduction of vernacular education was extremely slow, and Macaulay’s commandment ‘of *first* developing Indian vernaculars to qualify them for use in education and administration’ prevailed. This predicament has constrained the extension of Indian languages as medium of instruction beyond the secondary level to a great extent; thus, effectively postponing their introduction in formal domains (Khubchandani, 1981). This assumption is uncritically accepted as a cornerstone of language

planning in India in post-colonial times as well (for further discussion, see Khubchandani, 1997, 2001; Pennycook, 1998).

During the long struggle for Indian Independence, the selective education structure was vehemently criticized by national leaders—Gohkale, Gandhi, Tagore and other intellectuals—who saw the need for universal elementary education and also put forward pleas for the use of mother tongue in administration (Saiyidain, Naik and Hussain, 1962). Mahatma Gandhi in 1938 proposed a scheme for *Basic Education*, which was practically the antithesis of the rulers' elitist moorings concerning the question of content, spread and medium (Zakir Hussain, 1950). It attempted to resolve the conflict between quality and quantity in education by laying stress on integrating education with *work experience* through 'down-to-earth' vernaculars (mother tongues/local lingua francas), and language acquisition with *communicability*.

In actual terms, three patterns of education emerged during the British rule:

1. the vernacular medium, in rural areas for primary education
2. the English medium, in urban centres for education of the elite, right from the primary stage
3. the two-tier medium, vernacular medium for primary education and English medium for the advanced stages, in towns.

The politicization of the language issue in India during the struggle for independence focussed on the *medium* controversy, pushing into the background the ideological issues concerning the *content* of education. The demand for vernacularization by the native elite was associated with the cultural and national resurgence, and eventually with the growth of democracy promoting equality of opportunity through education (Gandhi, 1916; Tagore, 1906). In post-independent India, regional languages have been getting a wider acceptance as far as the primary education is concerned (INDIA, 1993; Khubchandani, 2001, 2003a; Koul, 2001).

Today, educational infrastructure in South Asia, by and large, still shows the signs of bearing the distortions of colonial legacies, characterizing the struggles where the control is shifted from outside colonizers to the *creamy layer* of the society. In recent years Indian rulers, with opposing ideological orientations, have been taking proactive interest in modifying *content* of school curriculum and textbooks, contradicting one another. In public debates, such attempts of presenting Indian culture in school curriculum are labelled as:

1. Universalization, emphasizing global issues and modern patterns of life
2. Secularization, without partiality or prejudice against any one faith

3. Saffronization, idealizing the glory of ancient Indian heritage
4. Detoxification, removing distortions of colonization and other biases that have crept into Indian history.

#### MOTHER TONGUE EDUCATION

Many modern education experts during the twentieth century advanced several educational, psychological, sociopolitical and historical arguments in support of the axiom that the *best* medium for teaching a child is their mother tongue (UNESCO Report, 1953, p. 11). These pedagogical claims did not take into account the *plural* character of Indian society at large, which reveals apparent ambiguities in defining the concept of mother tongue itself. In linguistic and educational accounts, the terms “mother tongue” and “native speech” are often used indistinguishably. The term *native speech* can be distinguished as ‘the first speech acquired in infancy, through which the child gets socialized: it claims some bearing on “intuitive” competence, and potentially it can be *individually* identifiable.’ The term *mother tongue* is mainly ‘categorized by one’s allegiance to a particular *tradition*, and it is *societally* identifiable’ (Khubchandani, 1983, p. 45).

During the initial years after gaining independence, different expert bodies on education such as the 1948 Central Advisory Board of Education, 1949 University Education Commission, and 1956 Official Language Commission put a greater weight on the *broad* interpretation of mother tongue—i.e. regarding all minority languages not having a written tradition as “dialects” of the dominant language in the region. This interpretation amounted to an implicit denial of equal rights to linguistic minorities on the ground of practicability, similar to the French view of treating minority languages (such as Provençal, Breton and Basque) as dialects of the dominant French. But ultimately the linguistic minorities succeeded in getting the authorities to accept the *narrow* interpretation of mother tongue, which is closer to the definition of native speech: ‘the home language of child, the language spoken from the cradle’ (1951 Census of India, 1954).

A recent UNESCO Report (2003) supports mother tongue medium as an ‘essential component of inter-cultural education and linguistic diversity so as to ensure respect for fundamental rights’, asserting self-esteem, identity, dignity and power by smaller groups through language (cf. Godenzzi, *Language Policy and Education in the Andes*, Volume 1). One sees an inevitable measure of fluidity in mother tongue claims in many plurilingual regions in India and Pakistan (see also, Rahman, *Language Policy and Education in Pakistan*, Volume 1). In such situations, one’s total repertoire is influenced by more than one normative system. Many speech groups command native-like control

over more than one language, with traits of diglossic complementation between languages for intra-group communication in the same space. Mother tongue *identity* and its *image* in this context do not necessarily claim congruity with *actual usage*, and these are again not rigidly identified with specific language *territories*, as is the experience of most European countries either in the past or in the present.

One notices a super-layered homogeneity in communication patterns on the “cline of urbanization” in the entire Hindi–Urdu–Punjabi region divided between north-central India and Pakistan. The highbrow registers of Hindi and Urdu are sharply marked by the polarization in the patterns of borrowing (Sanskritic or Perso-Arabic), whereas at the low-brow level, distinction between the two is not regarded as so significant. In a communication paradigm, the split between Hindi, Urdu and Punjabi traditions is more ideological than linguistic (Khubchandani, 1983, 1997). In this context, the issues concerning the facility of expression in mother tongue get highlighted in somewhat simplistic terms—i.e. juxtaposing mother tongue against the colonial language English.

A child’s earliest first-hand experiences in native speech do not necessarily show semblance with the formal “school version” of his/her mother tongue. The elitist system of education does not account for the complexity of speech variation across dialects in flux (and in plurilingual societies, often across languages), at the grassroots level. The heterogeneity of communication patterns in many regions of the Subcontinent, the unequal cultivation of different languages for use as medium of instruction, the demands of elegant versions of mother tongue for formal purposes, the non-availability of personnel with adequate command over the *textbook* language, and the switching over to another medium in the multi-tier medium system without adequate preparation are some of the difficulties faced by the learners who are initiated into education through the mother tongue medium. These ground realities have led to the re-examination of the supremacy of the mother tongue medium stretched over the *entire* education career.

#### EDUCATION NETWORK

Education being a “concurrent” subject in federal multilingual India, there is inevitable flexibility in the weight assigned to different languages in educational programmes, in the framing of language curricula, in selecting textbooks, and so on. The National Council for Education Research and Training (NCERT) conducts a periodic survey to gather information about the spread of educational facilities, and various issues of content and medium of instruction at different levels. In addition, state councils of education, and many NGOs are also engaged in attending to the problems of designing and evaluating the position

and functions of mother tongue and non-native language mediums as learning strategies.

The Sixth Survey (INDIA, 1993) records a total of 765,000 schools in the country at the Primary level (Classes I–V). On average, there is one primary school available for every 1,096 of the population. In the midst of a wide variation in different states, elementary education has acquired a distinct pattern in choosing the following as medium of instruction:

1. dominant regional languages
2. pan-Indian English/Hindi
3. neighbouring regional languages
4. newly cultivated languages (mostly tribal and other minority languages), as *preparatory* medium.

Dominant regional language schools account for 88% (672,000 in 1991) at the Primary level in the country. There are 17 such languages spread in respective states and Union territories, listed in order of the numerical strength of their speakers: Hindi, Telugu, Bengali, Marathi, Tamil, Urdu, Gujarati, Kannada, Malayalam, Oriya, Punjabi, Assamese, Kashmiri, Sindhi, Konkani, Nepali, and Manipuri. In addition, three tribal languages—Khasi and Garo in Meghalaya, Mizo in Mizoram—are also introduced as principal medium at Primary level. English is claimed as a dominant medium in northeastern states—Sikkim, Arunachal Pradesh and Nagaland (Khubchandani, 2003b).

Though many states prefer to promote the *exclusive* use of respective regional languages as the medium of instruction, in practice many students experience a *shift* in language medium at one or another stage, depending on context, domain and channel such as: students listen to one language and write answers in another; formal teaching in the classroom is conducted in one language but informal explanations are provided in another. This milieu promotes a good deal of code-switching and hybridization of two or more contact languages.

In a multi-tier medium system, a student initiates education through the mother tongue. But as they move upward on the education ladder, they shift to a more “cultivated” medium. The 1974 NCERT Survey enumerates 80 languages being used as medium of instruction at different stages of education (Chaturvedi, 1976). The emergence of cultural regionalism in recent years has led to more and more minority languages being utilized for literacy programmes in the rural hinterland. It has stimulated considerable creative literature in different tribal languages, and has helped in creating a vast body of textbooks and original writings in these languages. English, however, continues to dominate the scene as a *developed* medium, and Hindi and regional languages as *emerging* medium at the tertiary stage (Khubchandani, 1978; Sridhar, 1988).

## BILINGUAL MEDIUM

Although many political and academic agencies lend their support to the claims of imparting education through a single *dominant* language in the region, in recent years there has been a growing demand for selective *bilingual* medium so as to keep pace with the socioeconomic demands of rapid modernization. As per the revised education policy, formulated in 1996, a flexible approach has been adopted for making differential provision when choosing medium of instruction in different types of schools such as: *state government* schools, *central* and *sainik* (military) schools, *navodaya* schools (as model schools for rural rich), *public* schools (managed by public registered bodies, usually catering to the needs of rich and urban areas—called “convent schools”), and *private* schools (run by NGOs—non-government organizations—with or without a grant from the State).

Apart from 17 prominent regional languages, listed earlier, and English, the Survey records 14 additional languages utilized as *partial* medium of instruction in bilingual schools: Maithili, Santali, Kurukh, Nicobarese, Tibetan, Limboo, Bhutia, Bodo, Kakborok, and five Naga languages (Ao, Sema, Angami, Lotha, Zeliang). A large number of schools in Bihar (approximately 21,000—i.e. 31%) have been experimenting with Sanskrit, a classical language, as *partial* medium. With the thrust for modernization, schools with major languages as medium of instruction have been increasing, and the number of ethnic schools has been decreasing.

There are three major contact languages—Hindi, Urdu, and English—spread with varied intensity, utilized as medium of instruction throughout the country (for a detailed review, see Khubchandani, 1978). The 1993 Survey records nearly 7% bilingual schools at Primary level (approximately 51,000 schools, out of the total 765,000). The proportion of bilingual schools is higher in urban cosmopolitan areas with their more heterogeneous populations.

The pan-Indian distribution of Hindi and Urdu schools, spread across 24 states out of 32, with a formidable total of nearly 324,000 schools (Ratio 424 schools out of 1,000), plays a prominent role in the Primary education network of the country. Hindi-medium facilities are provided in nearly 2,900 schools spread outside the north-central Hindi-Urdu belt. Urdu has a significant presence as a minority language medium in Hindi-dominant states, with nearly 7,200 schools; it is also spread in 10 states of the southern and western regions (over 8,000 schools).

A few multilingual states, mostly in eastern India, have introduced bilingual education as a state policy, in which a developing language is used as a *complementary* medium, together with English, Hindi, or

the regional language as the principal medium. In this context, “composite” courses are developed by combining a tribal language and elementary Hindi as a single course (for details, see Khubchandani, 1983, pp. 127–128).

English-medium public schools, a dominant colonial legacy, also form a vital part of the Indian education system, starting from the Primary education itself. After Independence in 1947, English medium schools, numbering over 35,000 (Ratio 46/1000), continue to be identified with urbanity, status, power and career specialization. There are more English schools, more English teachers and learners, along with a flourishing English press, than when the British left the country. The base for English education has been expanding. English schools have become a regular feature of the education system available in almost all states (Koul, 2001). Until recently, the preference for English-medium education was confined to urban populations. Now this trend is extending to the countryside as well. Different types of schools, mentioned earlier, have been supportive of extending English as medium of instruction in rural areas.

It is essential that bilingual and bicultural education is introduced with a degree of planning, encouraging a proficiency in the language of the classroom and in the languages (vernaculars) of learners, and a high level of skill in teaching, apart from developing positive attitudes to speech variation in multilingual repertoires.

#### PROBLEMS AND DIFFICULTIES

At this juncture, the aspirations of the wider public and of educators are at a crossroads, and many diverse claims are being made for bringing radical transformation in the education structure. One of the serious handicaps in implementing language education policies by different education agencies at the central and state levels in India is the continuance of the inherited dichotomies of *Ordinary* and *Advanced* tradition, discussed earlier, and the urban-biased system of education as shaped during the colonial rule. Requirements of elegance in education (such as obsession with ‘highbrow’ standardized speech) have created a wide gap between the language(s) of home and that of school, leading to a large number of school dropouts in the country.

In multilingual societies, the *ideal* claim and the *real* function of a language might be at variance. One notices a wide gap between the language policies professed and actual practice in a classroom. It is not unusual to find in many institutions anomalous patterns of communication where the teacher and the taught interact in one language, classes are conducted in another, textbooks are written in a third and answers are given in a fourth language/style. In this process, one is not surprised

to find that the public agenda of preserving language diversity and favouring mother tongue education serves the purpose of *justification*, but the hidden agenda of pressure groups pushing dominant languages motivates *implementation* when carrying out medium policies in schools (Tollefson and Tsui, 2004; see also Tollefson, *Language Planning in Education*, Volume 1). In the absence of political will, many proponents of the status quo try to walk on a tight rope. They adopt a *minimalist* approach to providing opportunities for mother tongue education with vague commitments and qualifying clauses which are, in turn, a result of negotiating with contradictory agendas of market forces, serving the interests of the elite, and succumbing to the demands of ethnic pressures.

Multilingual repertoires play a significant role in cultivating many Indian languages for their increasing use in higher education. Different educational subjects require a different type of preparation for a shift in the medium. Demonstration-oriented subjects of hard sciences and technology stress the autonomous, well-formulated and unambiguous use of language, utilizing language structures at the rudimentary level, accompanied by non-linguistic systems (such as mathematical formulae). In abstract subjects dealing with human phenomena (most of the arts, creative writing, religion and social sciences), language needs mature expression but the content tends to be less vigorously formulated, the likelihood of ambiguity is greater, and interpretations are relatively less precise than in hard science subjects. There is another category identified as meta-subjects, where the object of interpretation is language itself, such as law, logic, philosophy, semiotics, and linguistics. These subjects develop a kind of meta-language by exploiting subtleties of the language structure for sophisticated and well-formulated communication.

### THREE LANGUAGE FORMULA

Amid sharp controversies concerning the role of different languages in Indian education, a broad consensus was arrived in the Three Language Formula around the 1960s, which provided a basis of policy for a minimum requirement of languages in school education. In 1966, the Education Commission recommended a liberalized version of the Formula; it expected a student to acquire sufficient control over *three* languages by the time he/she completes the Lower Secondary stage (Class X): mother tongue and two non-native modern languages, broadly, Hindi as an *official* medium and a link language for the majority of people for inter-state communication, and English as an *associate official* medium and an interface language for higher education and for “sophistic” and international communication.

In the course of time, the Formula has been differently interpreted by different states. The choice of determining the second or third place for Hindi or English was left to individual states. Hindi states, by and large, provide classical Sanskrit as the third language in place of a modern Indian language, whereas a few non-Hindi states (West Bengal and Orissa) favour Sanskrit at the cost of Hindi as the third language. For several linguistic minorities, it has become virtually a four-language formula, as many states insist on the compulsory teaching of the respective regional language.

#### ORALITY AND LITERACY

In the contemporary world, the uncritical pursuits of modernization promulgate our current perceptions of literacy as a universal truth. The government-sponsored Literacy Mission targeted universal literacy by the Millennium-end. The 2001 Census records nearly 74% literacy in India (compared with the 1991 literacy rate 52% and 1981 literacy rate 44%).

In the Oriental tradition, both oral and literate traditions have played a vital role. Indian heritage rejects the supremacy of one culture over the other. There is now a growing understanding of the assets of oral tradition among illiterate communities transmitted from generation to generation through varied forms of folklore, festivals, rituals and artefacts. In an oral milieu, both thought and expression tend to be aggregative and concrete—i.e. context-determined, whereas in a written tradition they aim at precision and abstraction—i.e. context-independent. As a backdrop to this, it is necessary to focus on the *continuum* between oral tradition and written culture, and to consider strategies of incorporating the characteristics of *mass* culture into the literate culture (Bright, 1988). Under the spell of contemporary radical thinking in education, there is a greater awareness of the need to make education *relevant* to the environment and learners' aspirations and needs, and to diversify it in regard to the medium, curriculum, teaching and learning methods and materials.

Formal education is initiated by literacy and streamlined through certain time-bound stages in a credential-based system; whereas non-formal education is enmeshed in the cultural milieu of the society, as a part of life-long education through literacy or *without it*. Traditional societies such as India, while relying heavily on the implicit mechanisms of oral tradition for the transmission of knowledge, assign literate groups (or individuals) certain essential liaison/intermediary functions; literacy in these societies, no doubt, forms an important asset and accomplishment for an individual, but *not a necessary condition* of his/her survival and dignity.

In this endeavour, diverse approaches of transmitting literacy skills on a universal basis have emerged on the Indian scene: (i) Conventional educators profess strict adherence to the *standard* language prevailing in the region; (ii) Liberal educators recommend a *bi-dialectal* approach of gradual phasing in time from home dialect to the standard speech; (iii) Some educators plead for a *dichotomous* approach by accommodating diversity of dialects/speech varieties at the spoken level, but at the same time insisting on the uniformity of standard language at the written level; (iv) Those supporting a grassroots approach endorse a *pluralistic* model of literacy, by which variation in speech is regarded as an asset to communication; thus cultivating *positive* values for the diversity in response to the demands of situation, identity and communication task. In this scheme, literacy in the standard variety is, no doubt, promoted for economic-oriented situations and communicative tasks; at the same time, learners are educated to question the pejorative attributes to other than standard varieties that still prevail in the society.

#### FUTURE DIRECTIONS

The grassroots approach emphasizes making education more meaningful, useful and productive to work-experience. Sensitivity to speech variation and a grasp over the communication ethos prevailing in Indian society is, no doubt, enhanced by 'doing' verbal events in natural settings. An elaboration of Gandhi's thinking concerning Basic Education could provide a sound basis for launching the schemes concerning education for all, as discussed earlier.

Various constraints in the spread of education are attributed to the multiplicity of languages, whereas the real issues to cope with are the confrontation between *tradition* and *modernity* concerning the role of language in education, and the dogmatic rigidity in claiming privileges and parity of different languages in the thrust for autonomy. It is necessary to adopt a pragmatic approach to linguistic usage in education and to take into account the mechanism of standardization of languages in plural societies. When dealing with plural societies, we would do well to realize the risks involved in *uniform* solutions.

## LANGUAGE POLICY AND EDUCATION IN PAKISTAN

### INTRODUCTION

Pakistan is a multilingual state with six major languages—Punjabi (spoken by 44.15% out of a population of 153 million in 2003); Pashto (15.42); Sindhi (14.10); Siraiki (10.53); Urdu (7.57); Balochi (3.57)—and about 57 minor ones. Urdu is the national language and English the official one (Census, 2001). The 1973 constitution of the country, which was suspended in part both during the military rule of Generals Zia ul Haq (1977–1988) and Pervez Musharraf (1999–), is again in force. It provides the following guidelines on language policy:

1. The National language of Pakistan is Urdu, and arrangements shall be made for its being used for official and other purposes within 15 years from commencing day.
2. Subject to clause (1) the English language may be used for official purposes until arrangements for its replacement by Urdu.
3. Without prejudice to the state of the National language, a provincial Assembly may by law prescribe measures for the teaching, promotion and use of a provincial language in addition to the national language (Article 251).

This further relates to education policy and practice, as well as employment prospects of educated people, because the medium of instruction and the language of the domains of power—government, bureaucracy, military, judiciary, education, media, research, the corporate sector, commerce, etc.—are the languages desired by individuals to empower themselves and their children.

### EARLY DEVELOPMENTS

Pakistan inherited certain policies relating to language and education from British India of which it was a part from 1846 till 1947. The language of the domains of power in this part of South Asia was Persian ever since the eleventh century (Alam, 2004, pp. 116–117). The Islamic seminaries (*madrassas*) taught in Persian though most of the texts were in Arabic. Very rarely, some texts were taught in the indigenous languages of the people. Some of these texts in Sindhi, Punjabi, and Pashto are referred to in Rahman (2004, p. 326, 384, 355). When the British conquered Sindh (in 1846) and the Punjab (in 1849), they allowed the

*madrassas* to remain in the hands of the Muslim *ulema* (the equivalent of clergymen though Islam formally has no clergy). They were financed by local feudal lords or merchants. Public funds were used to create a chain of schools in which Urdu was the medium of instruction in the Punjab, the North West Frontier Province (NWFP), parts of British Baluchistan and some of the princely states now in the boundaries of Pakistan. In Sindh, however, they used Sindhi in schools as well as the lower domains of power, and this tradition continues to date.

In short, the British left behind a legacy of three streams of education roughly divided along socioeconomic class lines: the *madrassas* catered for rural and very poor children; the vernacular-medium schooling was for working and lower-middle class children; and the English-medium schools were for the middle and the upper classes. Those who overcame the obstacle of English joined their privileged counterparts in the college because that is where the vernacular-medium and the English-medium streams met. This system continues to date and the few changes in it are described in detail later.

#### MAJOR POLICIES

The Pakistani state has embarked upon a number of policies ever since the birth of the country. These were expansion of education and literacy (modernization); dissemination of Urdu (vernacularization); ideological socialization; and privatization. Let us take each of them in turn.

##### *Modernization*

All education policy documents of the state emphasize the link between modernization and an educated work force (Bengali, 1999). Thus, achieving 100% literacy was an avowed aim of all governments. This aim has not been achieved even now, though literacy increased from 16% in 1951 to 54% of the population in 2004 (GOP, 2004). School enrollment at the primary (classes 1 to 5) is 40%; secondary (6 to 12) is 19%; and tertiary (13 to 16—i.e. BA and MA which are both of 2 years duration each) is 5% of the population (Lahmeyer, 2004). In short, despite increases in all types of schools, the population growth of 2.5% per year, combined with an expenditure of about 2.7% of the GDP in 2004 (GOP, 2004) and an average of about 2% for many years, has prevented the achievement of the aim of full literacy.

##### *Vernacularization*

The Pakistani state embarked on a policy of disseminating Urdu as it was considered an identity symbol, next only in significance to Islam itself,

of the Muslims of India during the movement for the creation of Pakistan. Official thinking was that Urdu would be an antidote for language-based ethnic movements, which could break up the new state. However, Urdu was opposed in this antiethnic role by ethnonationalists, seeking identity through their indigenous languages (Rahman, 1996). However, despite this opposition, people have learned Urdu for pragmatic reasons all over Pakistan, as it is the language of wider communication within the country. As all literate and many illiterate people (over 50% of the population) understand and speak it, it is much more widely known than the percentage of its native speakers (7.57) would suggest. It is disseminated through the government schools, the government colleges, and universities, which teach all except technical and scientific subjects in Urdu, the print media, radio, and the television. Even illiterates, who come in contact with urban people for providing services, as well as all city dwellers, know Urdu. As Indian films and songs are very popular and they are in a language which is very close to Urdu in its spoken form, Urdu is also spreading through the entertainment industry. The National Language Authority (*Muqtadra Qaumi Zaban*), the Urdu Science Board, and a number of institutions have created both bureaucratic and technical lexicons in Urdu and it is being used by certain provincial governments as well as the lower courts for all purposes. It is also available for use via the computer. Moreover, it is associated with Islam, being the language of examination for all the registered *madrassas* as well as the medium of instruction and of sermons for most of them. In short, Urdu is officially associated with the nationalist Pakistani identity and unofficially with urbanization and the Islamic identity in Pakistan (for both associations see Abdullah, 1976; Kamran, 1992).

“Urduization” is not only opposed by the language-based ethnonationalists. It is also resisted, though covertly and not through declared policy statements, by the Westernized English-using elite. Vernacularization has affected higher education more than school education, which was already in the vernaculars by the time Pakistan was established. Colleges taught the higher secondary classes (11 and 12) as well as the bachelor’s level (13 and 14) in English, as did the universities at the master’s level (15 and 16). This started changing as more and more of the nonscientific subjects came to be taught in the vernaculars (Urdu, except in parts of Sindh where Sindhi was used). Nowadays, all subjects except the sciences, engineering, and medicine are taught in the vernaculars.

### *Privatization*

Though it is only recently that the Ministry of Education has officially recognized the trend toward the privatization of education at all levels,

there have been private, expensive, elitist schools in the country ever since its inception. When controlled by the Christian missionaries they were said to be necessary in the name of religious tolerance (though they catered more for the Pakistani Muslim elite's children than for Christians), whereas those administered or controlled by the armed forces (public schools and cadet colleges) were said to be necessary for a modernizing country since they prepared leaders. The armed forces now control or influence—through senior military officers who are on their boards of governors or principals—most of the cadet colleges and elitist public schools in the country. Although the education policy documents declare that these institutions are financed by the fees paid by their pupils, the state subsidizes the elitist cadet colleges (public schools) (Rahman, 2004, pp. 147–148). The armed forces also control federal government educational institutions in cantonments and garrisons (GHQ, 2003), run their own schools and colleges (MOD, 2003) as well as a huge educational network through their philanthropic services, run mostly by retired military officers (Rahman, 2004, pp. 53–54).

Besides the armed forces, elite schools are run as business empires with campuses in most big cities of Pakistan. These schools charge exorbitant tuition fees and prepare their students for the British O' and A' level examinations. There are also a large number of nonelitist English-medium schools in all cities and even small towns of the country. They cater to those who cannot afford the elitist schools, but want to give their children better chances in life by teaching them English. Their fees, though far less than those of their elite counterparts, are still forbidding for their impecunious clientele. Ironically, they do not teach good English, as efficiency in that language is a product of exposure to it at home and in the peer group, which are available only to the Westernized, urban elite.

Privatization is now taking place in the field of higher education. There were 55 public and 51 recognized private sector universities in 2005 whereas there were only 7 public and no private ones in 1971 when Bangladesh became a separate country and the area now called Pakistan carried the name of the country (HEC, 2005). The first private university, the Aga Khan University in Karachi, was established in 1983. It taught only medicine and created two trends: first, that private entrepreneurs could establish a university; and second, that an institution of that name could teach only one subject. Soon universities teaching lucrative, market-oriented subjects like business studies, computers, and engineering proliferated. They charge very high fees, thus making them unaffordable for even the middle classes, which undergo much self-sacrifice to have their children in these institutions.

The armed forces, despite being organizations of the state, entered the business of higher education as entrepreneurs. There are at present five universities controlled directly or indirectly by the armed forces. While some cater primarily for the needs of the armed forces themselves, allowing civilian students to study only if there are places after their own students are accommodated, most function like private institutions catering primarily for civilian students who can afford their high fees.

All private sector universities attract students because they use English as a medium of instruction for all subjects and provide the kind of elitist infrastructure and facilities, which distinguish the elite from the masses (such as air conditioning).

### *Ideological Orientation*

The state uses education to create a cohesive national identity, transcending ethnic identities in which Urdu and Islam are used as unifying symbols. Textbooks of social studies, history, and languages are informed by this theme. The other major theme informing them is that of creating support for the garrison state, which involves glorification of war and the military. Islam, the history of Muslim conquests and rulers, as well as the Pakistan movement, are pressed into legitimating these concerns. Although General Zia ul Haq's 11-year rule strengthened Islamization of the curricula, these trends were manifested in the early 1950s when the first educational policies were created. The text books of government schools, and especially the subject of Pakistan Studies, carry the major part of the ideological burden.

### MAJOR CONTRIBUTORS AND WORK IN PROGRESS

There is not much scholarly work on language and education in Pakistan. Histories of education do, however, refer to language without problematizing the issue in terms of class, ideological polarization, ethnicity, and the divisive potential of these variables (Quddus, 1979; Zaman, 1981). For a Sindhi nationalist point of view see Kazi (1994). The only scholars who have dealt in detail with the relationship between language and education are Sabiha Mansoor and Tariq Rahman. Mansoor points out in her survey of students from Lahore how they rank English highest for efficiency, modernization, and prestige, with Urdu following and Punjabi at the bottom (Mansoor, 1993). In her doctoral thesis, she reviews the place of English in Pakistan, concluding that it is desired by students, parents, and teachers and has a significant role to play (Mansoor, 2002). Rahman (1996) examines the relationship between ethnicity and language and argues that

language texts are used to support the hegemony of powerful elites, and change when the system of the distribution of power changes (Rahman, 2002, pp. 488–528). He specifically links the role of language as medium of instruction with socioeconomic class and the polarization in world view leading to different levels of religious tolerance and militancy in different educational institutions such as English-medium schools, Urdu-medium schools, colleges, and *madrassas* (Rahman, 2004, pp. 163–188; cf. Rampton et al., *Language, Class and Education*, Volume 1).

In the last few years, a number of liberal social activists and scholars have pointed out the anti-India bias and militancy inculcated in the textbooks of the social sciences and history and have recommended changes (Aziz, 1993; Nayyar and Salim, 2003; Saigol, 1995). Urdu, which is taught to all students, is the main ideology-carrying language (Rahman, 2002, pp. 520–522). An important contribution, which provides the model on which a number of studies are based, is that of the historian Aziz who pointed out that history books taught in schools were inaccurate, wrong, and biased (Aziz, 1993). Rubina Saigol (1995, 2000) a sociologist, pointed out the gender bias in favor of males and how the female identity was marginalized and suppressed, as were values of peace and tolerance, which inform feminist writings on education. In March 2004, the debate came to a crisis with the liberals arguing for a change in the textbooks in keeping with General Musharraf's recent policy of peace with India and controlling religious militancy whereas the conservatives, along with the militant nationalists, insisted on retaining nationalistic, pro-war, and pro-military lessons in the name of Islam and national identity or fear of India.

A trenchant critique of liberal, secular education comes from the revivalist Islamist leader Sayyid Abul Ala Maududi in his book *Taleemat* (1974). His work is carried on by the Institute of Policy Studies in Islamabad, as well as intellectuals of the Jamat-I-Islami such as S.A. Khalid, who has recently written a book defending the Islamic educational system, arguing that it is the only one resisting the intellectual hegemony of the West (Khalid, 2002).

Government reports are generally silent about both the *madrassas* and the English-medium schools. However, there are some reports on the *madrassas* (GOP, 1988) and at least one survey of private schools (GOP, 2001). The Higher Education Commission (HEC) also publishes figures about private and public sector universities, but none of these publications links language and educational policies to socioeconomic class, ideological polarization, intolerance of the religious "Other" and militancy in foreign policy. Similarly, there is no analysis of the effects of the policies on the weaker languages of the country, nor on language rights and social justice through education, or the maintenance of

ethnic identity, or the rights and perceived injustice connected with such issues.

Recently some Non-Governmental Institutions (NGOs) have started taking an interest in educational matters and especially in creating gender-sensitive textbooks, but these efforts are concentrated in major cities and, being in English for the most part, do not affect the majority of students in the country.

#### PROBLEMS AND DIFFICULTIES

While discussing developments in the fields of education and language policy, the problems and difficulties have been touched upon already. It may, however, be useful to repeat that the policy of promoting Urdu at the cost of the indigenous languages of the people has increased the ethnic opposition to Urdu on the one hand whereas creating contempt for the indigenous identity on the other. This is most pronounced in the Punjab where Punjabi is regarded as a sign of rusticity, lack of sophistication, and lack of good breeding. The ethnic activists of the other languages—Sindhi, Pashto, Balochi and to some extent Siraiki—have managed to create a sense of pride in their identity and language, but they too acknowledge the pragmatic value of Urdu and remain impressed with English. This increases the pressure of English, which being the language of globalization, already threatens most of the world's languages (cf. Phillipson, *Language Policy and Education in the European Union*, Volume 1; Skutnabb-Kangas, *Human Rights and Language Policy in Education*, Volume 1). As the concept of language rights has not emerged in Pakistan and the demand for indigenous languages is seen only as part of ethnic resistance to the Center, the languages of the country do not have the chance of being written down, taught even at the elementary school level, or promoted in the media. This may make some of the minor languages obsolete and, though the major languages will probably survive as spoken mother-tongues because of their size, even the larger languages may become so intermingled with Urdu and English as to lose their present identity.

Another consequence of privatization and the elite's support of and investment in English is to increase the ideological polarization between the different socioeconomic classes. In two surveys of school students from the *madrassas*, the vernacular-medium schools and the elitist English-medium schools, one taken in 1999 and the other in 2003, it was found that the *madrassa* products were most intolerant of religious minorities in Pakistan and most supportive of a militant policy toward India in relation to Kashmir. The first survey is more detailed (Rahman, 2002, Annexure 14) but does not cover the views

of teachers, whereas the second one is confined only to the urban parts of the Punjab and the NWFP but does reflect the opinions of the faculty which are close to, and sometimes less liberal than their students (Rahman, 2004, Annexures 1 and 2).

Other problems are linked with increasing computerization and globalization. As the language of both is predominantly English, with Urdu being in the experimental stages, most Pakistani students have yet to learn anything from computers, which, indeed, are not widely available to them either at home or in their schools, colleges, and even universities. Urban males do, however, encounter computers in internet cafes where they are seen as devices for playing games or gaining access to pornography. Students from English-medium institutions do, however, have access to computers both at home and in their educational institutions. They use them for gaining knowledge but even more so for integrating with the globalized (mostly American) culture, which distances them even more from their vernacular-educated and *madrassa*-educated counterparts than ever before. In short, the English-vernacular divide, which is also the class divide, is now also expressed as the digital divide (see Rampton et al., *Language, Class and Education*, Volume 1; Kalantzis and Cope, *Language Education and Multiliteracies*, Volume 1).

The pedagogic side of education is also divided according to socio-economic class and medium of instruction. The *madrassas* follow a modified form of the traditional, eighteenth century curriculum called the *Dars-I Nizami* (Robinson, 2002, p. 53.) in which the canonical Arabic texts, which are memorized, are symbolic of valorized cultural memory and continuity. They also have polemical texts in Urdu to refute what they see as heresy and Western ideas. The emphasis on *bellum justum* (*Jihad*), which is blamed for terrorism in the press, does not come from the traditional texts but from extra-curricular pamphlets in Urdu and, even more importantly, from warriors back from Afghanistan, Kashmir, or other battlefields in the Islamic world.

Both vernacular and English-medium schools emphasize rote learning because of the formal examinations after each course, but nowadays practical work and projects are given, especially in private institutions of higher learning, so that some move toward analysis and practical work is evident.

#### FUTURE DIRECTIONS

Language policy and education, as we have seen, are subordinated to the class interests of the urban, professional, English-using elite in Pakistan. For its political interests this elite has been using the name of Islam, and has strengthened the religious lobby, in the last few years.

This policy is said to have been reversed, but it may be revived by a future government. The rank and file needed to carry it on, especially if it takes the form of a low-intensity conflict with India over Kashmir, will come from the *madrassas* which will probably increasingly cater for more young males as the state shifts spending from the education sector to others. Given the state's encouragement of privatization in the recent past, this seems to be a future trend which can have negative consequences for peace in South Asia and the world.

Privatization, with its concomitant strengthening of English as an elitist preserve, may lead to "ghettoization" in Pakistan—i.e. the weak and the marginalized sections of society will remain underprivileged because the education system creates obstacles for them, which they may find difficult to transcend. This may have several consequences. First, the most educated people may lose faith in the country and give up on it. Second, the ideological polarization between the different socioeconomic classes might increase even further. And, above all, the incentive for reforming Pakistan's educational system and making it more conducive to creating a tolerant and peaceful society might also decrease.

Another trend may be to strengthen the power of the military in Pakistan. As more and more elitist schools and universities pass into the hands of the military, the number of teachers, administrators, and business concerns under the patronage of the military will increase. More students will also be influenced by them. This will probably privilege the military's views about national interest, the future of the country and economic priorities. This, in turn, may further dilute ideas of civilian supremacy, which underpin democracies, and jeopardize the chances of lasting peace in South Asia.

Most of these possibilities do not bode well for the future of the country, but it is only by recognizing them that potentially negative language and educational policies may be reversed.

## LANGUAGE EDUCATION POLICY IN JAPAN

### INTRODUCTION

The formulation of language education policy is normally guided by a combination of needs and needs-discourse: a new 'vision' of the state, economic shift, talk of 'crisis in education', residual loyalties to the past or, conversely, to what Raymond Williams (1977) termed 'emergent ideological assemblage'. Japan's educational governance is no less a tangled composite of needs than other nations. New social factors are emerging. A demographic 'big bang' (a declining population and the prospect of large-scale immigration) now hangs skyward over Japan. It threatens to shake old educational certainties, former ways of doing and talking. We always knew what to do about this and what to do with that but now we have 'the Other'.

In the imagined community in which language policy emerges in Japan, two geographical beacons are visible: Japanese (*Nihongo*) is the (sole) national language (*kokugo*) and English is pre-eminently the vehicle of internationalization. A straightforward ideological system underpins this stance which, *mutatis mutandis*, informs large tracts of policy-making at various educational levels. Its underpinning is the familiar modernist trope that Japan is remarkable as a 'monolingual' and 'monocultural' nation. The truth, of course, lies elsewhere. Japan has been, for many centuries, multilingual and multicultural (Maher and Yashiro, 1995, Maher and Macdonald, 1995, Yamamoto, 2000, Sugimoto, 2003) due to migration to and from Japan, cultural flows, geographical realignment (Okinawa, Hokkaido), the (Asian) colonial experience and so on. Likewise, the growth of non-Japanese nationalities is a real and emerging demographic tsunami given the decrease of the Japanese population and the need for a new (imported) labour force to maintain the present social and economical system.

The diversity of multilingualism in Japan entails geographical location. The northern border of the Japanese archipelago faces Sakhalin and the Russian Far East whilst the southern islands border the Korean peninsula, China and further Taiwan. Japan has roughly 3,000 islands and a population of 127 million in 2006. The largest number of native speakers are Japanese. There are 961,307 residents overseas with Japanese nationality (Ministry of Foreign Affairs, 2004) and thousands of older speakers of Japanese in the former imperial colonies of

Taiwan and Korea. Apart from Japanese, there are minority languages: Japanese indigenous languages, such as Ainu (or Ainu Itak) and Ryukyuan (or Okinawan), old immigrant languages such as Korean and Chinese and newer immigrant languages such as Portuguese, Spanish and Filipino languages brought by foreign workers. All these speakers constitute the multilingual hybridity of twenty-first century Japan.

## COMPULSORY EDUCATION IN JAPAN

In Japan, compulsory education (*gimu kyoiku*) is organized along public and private lines for children from elementary school to junior high school (aged 6 and 15); 6 years in elementary school (*shogakko*) and 3 years in junior high school (*chutogakko*) in which English is formally introduced as a school subject. Three-year senior high schools are classified as regular (*kotogakko*) or vocational (*koto senmon gakko*). In higher education, vocational schools (*senmon gakko*) provide a vocational or technical education, and junior colleges (*tanki daigaku*) are 2-year courses. Universities (*daigaku*) comprise an undergraduate level (4-year course) and postgraduate schools (*daigakuin*), 2 years for an MA degree and 3 years for a Doctoral degree. All schools follow a three-semester system starting in April.

Foreign nationals can send their children to public elementary school and junior high school during Japanese compulsory education, regardless of the child's level of Japanese proficiency. We repeat 'can send'. Under Japanese law, there is no obligation for such children to attend school. This has created serious 'leakage' in many *gastarbeiter* families who may or may not understand the educational system and whose children thereby fail to attend school or drop out. Language support for foreign children in Japanese varies considerably by locality. Alternatively, foreign nationals can choose international schools. The majority are English medium and/or ethnic schools: American, Brazilian, British, Canadian, Chinese, French, German, Indonesian, Korean, Peruvian schools. However, most of these schools are private and fees are very expensive. English-medium international schools are often assumed to be prestigious as they provide elite bilingual education.

## EARLY DEVELOPMENTS

### *Early History*

Drastic social change followed the Meiji Restoration (1868) and its nation-state enterprise. In national language policy a new Japanese government adopted a *hyojungo* (standard language) policy for the

nation (Carroll, 2001, p. 52). For the implementation of this policy, a centralist approach to the issue of standardization was applied (Gottlieb, 2005, p. 8). The policy-makers and intelligentsia of Japan adopted the formula of language and nationalism employed by the empires of Europe and pressed this into service in the colonies of Taiwan and Korea (Lee, 1996, p. 117)

The Ministry of Education, Culture, Sports, Science and Technology (MEXT) was founded in 1871 and the Japanese school system started thereafter. In 1886, the first school education policy (*gakko-rei*) was published, setting the curricula for universities (education-for-the-elite) and for teacher education colleges, elementary and secondary schools. In this period, educational diglossia prevailed, whereby schoolchildren bound for the social elite were drilled in *kanji* (Chinese characters) and *kango* (Chinese literature). Meanwhile, the masses possessed only elementary school diplomas.

The backbone of the postwar education system was formulated in 1947, with an increasing number of students at senior high school; 59% in 1960, 82% in 1970, 90% in 1975 and 96.3% in 2004. This increase illuminates two basal changes in Japanese society: (i) the economic success of the 1970s and 1980s enabled families to spend more on education, (ii) the Japanese economy needed quality workers to lead its competitive economy in a globalizing world. These factors led to a call to 'internationalize the Japanese people'.

#### MAJOR ISSUES FOR LANGUAGE EDUCATION POLICY

'Internationalization' remains a pre-eminent, long-term goal of the Japanese Ministry of Education. This goal comprises the following policy strategies:

1. To improve teaching methods in foreign language classes, the goal of which is to provide children with a better understanding of the distinctive history and culture of other nations in the world;
2. To promote international exchange in the field of education, culture and sports;
3. To promote student exchange, with the aim of accepting 100,000+ students in Japan at any one time;
4. To improve programmes for the teaching of Japanese as a foreign language, thus responding to the growing enthusiasm for learning Japanese;
5. To improve educational programmes both for Japanese children living overseas and for 'returnees' (children who re-entered the educational system after prolonged stay overseas) to maintain the language and knowledge which they acquired abroad.

Returnees, with their various bilingualisms, were initially regarded as 'a problem' since they could not adjust themselves to the monolingual ethic of Japanese schools in the 1960s and 1970s. Social change in the 1980s, however, saw returnees re-classified under 'internationalization' (Goodman, 2003, p. 184); a convenient policy shift based not upon an awareness of emergent multiculturalism but rather political ideology and the need to avoid chaos in school.

On the surface, 'internationalization' seemed to stimulate foreign language education (cf. Wiley, *Language Policy and Teacher Education*, Volume 1). Regarding the fifth revised 'Foreign Language Policy' in 1989 (junior and senior high school), Otani et al. (2004, p. 163) noted the extension of communication-based activities to promote English oral expression in reading and writing. At the same time, the Ministry of Education promoted 'petit nationalism' by centralizing school management and enforcing the new patriotism of compulsory singing of the national anthem and 'honouring the flag'. The logic of internationalization in the Japanese context might mean educating Japanese people to 'be Japanese' and merely equipping them with the linguistic armour to compete outside Japan. At this point (2006), the current alarm in the language education community is that foreign language education is becoming subsumed under a quasi-nationalistic and ideologically encumbered policy of the central government called, ironically, 'internationalization'.

### *Diversity of Language and Education in Japan*

The problematic of twenty-first century national language policy in Japan emerges subtly in the designation of actual language subjects in education. In the domain of compulsory education Japanese is termed '*Kokugo*' ('nation-language'), and the *Kokugo* class is for Japanese native speakers whereas '*Nihongo*', ('language of Japan'), is taught to non-Japanese native speakers.

Since the postwar period, foreign language policy for secondary education level has been revised six times and until the latest revision, foreign language education at secondary schools was elective and included French and German in addition to English. In 2002 for junior high school, and in 2003 for senior high school, foreign language education became compulsory. This altered the choice of foreign language subjects; at junior high schools, it was effectively limited to English. Some private schools and state schools specializing in foreign languages offer, electively, Chinese, French, German, Korean, Spanish, Russian, Italian, Portuguese (Otani, 2001, p. 166).

**English.** In the landmark 'Commission on Japan's Goals in the twenty-first Century' (2000), the Prime Minister's committee recommended

the goal of ‘global literacy:’ to enable Japanese citizens to freely and efficiently exchange information with the world. The basic elements were: (i) mastery of information-technology tools (computer, internet) and (ii) mastery of English—the international lingua franca. The Commission also flew the kite that English might be designated an official second language of Japan. This latter proposal caused shockwaves and outrage, accusations that national identity was under attack and the Japanese language at risk.

From the standpoint of Japanese business, the notion of English as an official language makes sense since language policy as formulated in Japanese industry has made English the *de facto* language of business. In the mid-1980s many Japanese firms accelerated the transfer of production lines to other countries in Asia and elsewhere. Consider the following example. Matsushita Electrical Industrial Co., headquartered in Osaka, has about 230 overseas affiliates and routinely uses English test scores (TOEIC—Test of English for International Communication) for promotion in Japan. It employed 245,922 people in fiscal 2004–2005, only 28% of whom were Japanese, while 2,300 Japanese employees were working on assignments overseas lasting an average of 5 years (Matsushita Human Resources Development, 2005). As globalization and competition among multinationals intensifies, the operating system of Japanese commerce is English and English-speaking employees find themselves in demand.

There are two recent trends in bilingual education: English in the state elementary school curriculum from 2002, and partial-immersion schooling (i.e. schools in which 50% or more is conducted in Japanese and the rest in English). In principle, the latter partial-immersion education (English-Japanese) is circuited into the official education system by means of the so-called *tokku* programme, established by the Japanese government in 2003. These are special structural reform zones that are eligible for preferential deregulation. In such a programme, integrated bilingual education is offered in elementary, junior and senior high school: a full 12 years of education. In addition to regular subjects taught in Japanese, pupils receive several classes per week in English. Although the numbers of such schools are still limited, the first private bilingual school that applied for this *tokku* programme started in April 2005 (MEXT website). Prior to this government programme, one private immersion school had started a Japanese/English programme in 1992 (Bostwick, 2001).

The government’s push to increase fluency in English for schools is spearheaded by such measures as the designation of Super English High Schools (SELHi) where English appears prominently in the curriculum and in the massive JET (The Japan Exchange and Teaching Programme) programme which annually provides native English teachers for state schools nationwide.

**Korean.** The immediate postwar period saw an explosion of Korean-medium schools. By 1946, there were 525 Korean schools in Japan (serving a population of 647,006 Koreans). However, Koreans were obliged to register as aliens and in 1948, the Ministry of Education ordered all Korean children to receive Japanese public education. The route to bicultural/bilingual education was thus effectively closed. Their children—*nisei*, *sansei* and *yonsei* (second, third and fourth generation) comprise a substantial minority in Japan, approximately 1 million (including those that have naturalized as Japanese). The large majority are now (monolingual) native Japanese speakers (Maher and Kawanishi, 1995).

The majority of ethnic Korean children attend local state Japanese schools, there these Korean children are ‘invisible’, ethnically unmarked, compared to the ‘visible’ Brazilian or Peruvian students. Okano (2006, p. 351) argues that Japan-born ethnic Koreans need no JSL (Japanese as second language), but that their ethnic language and culture does need support, as much as that of ‘visible’ newcomers.

In contrast, Korean as a foreign language is the fastest growing foreign language of study in Japan. Several factors contribute to this: the 1988 Seoul Olympics, 2002 World Cup in Korea and Japan, more print media in Korean, stabilization of trade-economic relations between Japan and Korea, leading to increased confidence among Korean-Japanese, and municipal interest in supporting Korean resident communities.

In an attempt to maintain the Korean language and culture and avoid the historical bias against minorities found in the school curriculum in Japanese schools, the General Association of (North) Korean Residents in Japan (*Sooren*), and to a lesser extent the Korean Residents Union (*Mindan*), run their own system with the provision of textbooks on Korean language or history. A mixed bilingual curriculum in Japanese and Korean is employed in 120 *Sooren* elementary and secondary schools throughout Japan, whereas the Union (*Mindan*) has far fewer (4) schools (Shin 2005).

**Chinese.** Chinese is found in the various Chinese communities with a total population of approximately 50,000 found in the urban centres of Tokyo-Yokohama, the Kansai region, and parts of southern Kyushu. There are five Chinese ethnic bilingual (Japanese-Chinese) schools in Tokyo, Yokohama, Osaka and Kobe. Kanno (2003) reported that at the ethnic Chinese school she observed there are fourth and fifth generations of ‘old timer’ students; the demographic of the school consists of 60% ‘old timer’, 30% ‘new comer’, and 10% ‘mainstream’ Japanese.

In Maher and Kawanishi’s (1995) study of Korean students, discussed earlier, they noted the strong link between Korean ethnicity and language,

as well as with the traditional refusal of (North) Korean residents to take Japanese nationality. In contrast, Chen (2005, p. 179) in a recent study of the Chinese community in Tokyo-Yokohama notes the more ‘fluid and loose connection between language and Chinese identity’. The ‘fluidity’ in the language awareness of the overseas Chinese community seems to derive from some basic principles: (i) language learning (Japanese) is essential (ii) some language affiliation with Chinese is desirable, (iii) code-mixing is normal, (iv) learning English as an international language is essential for the community (see also Lam, *Language Education Policy in Greater China*, Volume 1).

**Ainu.** The United Nations’ declaration on language rights in the Year of the Indigenous Peoples, 1993, was a landmark in the history of language maintenance among the peripheral language communities in Japan, particularly the indigenous Ainu. Supported by overseas language minorities, the Ainu have achieved significant progress in their struggle for language protection. In Hokkaido, where 23,767 identified themselves as Ainu in a Hokkaido Government Survey in 1999, there are now universities in the northern prefectures that offer Ainu language instruction. Local community groups also now operate *Ainugo Kyoshitsu* (Ainu language classes) in community centres in Hokkaido (DeChicchis, 1995; Komatsu, 2000).

Placing Ainu within Fishman’s theory of ‘reversing language shift’ Maher (2001, p. 323) has pointed out that ‘Ainu has a powerful symbolic resonance since it recalls the sociopolitical landscape of the past, the good old days and bad old days, colonialism, forced-removal from land, schooling in Japanese and prohibition of the Ainu language’. Language education for the historic community of the Ainu turned a further corner with the Ainu Culture Promotion Act of 1997. This removed older laws such as the 1901 Education Code, which aimed at the complete linguistic conformity of the Ainu and de facto elimination of the Ainu language. Whilst the provisions of the new law have not met all the demands of the Ainu people, the renewed language becomes a defining characteristic of Ainu culture (cf. Siddle, 1996 for a critique of the new legislation.)

**Ryukyuan.** The Ryukyuan group of languages—part of the typological system of Japanese—are spoken as a vernacular in the Okinawa prefecture. While these languages are also called ‘Okinawan’, Matsumori (1995, p. 20) argues that Ryukyuan is more appropriate as the group of dialects that also includes some islands which are part of Kagoshima-ken.

The return of the islands to Japan from United States’ control in 1972 accelerated the decline of Ryukyuan. Standard Japanese is the medium

of instruction throughout the Ryukyuan school system while Standard Japanese is employed in all media, magazines, books, official documents, public signs, etc. Ryukyuan plays no official role in public education in the Okinawan education system and its use has traditionally been discouraged in schools. Attitudes are changing though, owing to increased awareness of language endangerment and regional pride. There is increasing local interest in the language and its ethnolinguistic maintenance (reported by Ryukyuan speakers in Kotoba to Shakai Henshuuin, 2004) although no policy proposal exists to reintegrate Ryukyuan into the school system.

**The Deaf People and Japanese Sign Language.** In no other language community are the prospects for policy change more real than in Japan's Deaf Community (cf. Branson and Miller, *National Sign Languages and Language Policies*, Volume 1). Japanese sign language (JSL) is a generic term for a cluster of deaf language varieties is used by a cross-section of an estimated 400,000 hearing-impaired people and is subject to dialectal and sociolectal variation. Major strides in sign language activity have been made in recent years. These include the guarantee of sign language interpreting in court, local-government initiated sign language services and television broadcasting in sign. The sticking point is school education. With the inauguration of the Kyoto Prefectural School for the Blind and Deaf in 1873, Japanese Sign Language was adopted as a means of instruction. However, when oralism was introduced in 1925, this resulted in the dissolution/prohibition of JSL in Japan's schools, where hearing teachers were required to teach 'signed Japanese' based upon Spoken Japanese word order and expression (Honma and Kato, 1995; see Branson and Miller, *National Sign Languages and Language Policies*, Volume 1). This has been the policy up to the recent past. In 1993, a memorandum on special education policy was issued by the Japanese Ministry of Education, acknowledging the use of sign language in deaf schools. Hailed in the popular press as the first statement in the history of educational policy to recognize language diversity in schools, the document was frankly invidious and immediately attacked by many language rights activists in the deaf community. The reason was obvious. The definition of sign language adopted by the government was Signed Japanese (based on the structure and lexis of standard Japanese) and not Japanese Sign Language, the indigenous language of the deaf community (Honma and Kato, 1995; Ichida, 2004).

**Portuguese and Spanish.** The economic upturn associated with the 1980s, the period of the so-called 'bubble economy', created a labour shortage, particularly in the construction and manufacturing industries. This drew in *gastarbeiter* to work in what was termed, ironically, the

*san-K* (3-K) type of jobs: work that was considered *kitsui* (hard), *kitanai* (dirty) and *kiken* (dangerous). From the 1980s, the influx of Vietnamese-Chinese and Cambodian refugees, followed by foreign workers from Asia and South America (speakers of Portuguese and Spanish) in the 1990s, settled in Japan. Several commentators have pointed out the urgent need to deal with the problem of the children of recent immigrants who do not have Japanese language ability and who find it difficult to function in public schools (Ota, 2000). According to a survey by the Ministry of Education, the numbers of foreign national children with Japanese language support in Japanese state schools were 20,692 in 2005. Speakers of Portuguese (7,562), Chinese (4,460), and Spanish (3,156) as their mother tongue comprised more than 70% of the total (MEXT website).

In addition, 33 Brazilian language maintenance schools are approved by the Brazilian government, mostly in the industrial cities of central Japan between Tokyo and Nagoya. The rapid expansion in the number of immigrant language speakers both in urban and rural areas has focused serious attention on the dynamics of family bilingualism and language maintenance in the next generation of Japanese citizens.

**Japanese as a Second Language.** The steady increase in the number of foreign students enrolled in educational institutions impacts on the growing field of the teaching of Japanese as a foreign language. In 2004, the number of foreign students stood at 117,302. This compares with 45,000 in 1995 (Ministry of Education and Culture 2005). That two-thirds of the foreign student population come from mainland China, and the bulk of the rest from South Korea and Taiwan, points to the ‘Asianization’ of the foreign student body. The majority of students are enrolled in the social sciences, humanities or engineering. This population shift as well as its subject-specific orientation contrasts with the immediate post-war period, when a very small number of foreign students, mostly from North America and Europe, came to Japan for Japanese language-culture training.

Popular culture is crucial to the validity and pedagogical success of Japanese language teaching. This has long been recognized (Kishimoto, 1992) and will continue as twenty-first century students in Japan learn about Japanese society and practice TV drama, film, popular songs, *manga* (a generic term for comics and animation) and *anime* (animation) manga. However, recent social pressure, particularly ‘frenzied’ reports of criminal activity by foreigners (murder cases, various forms of crimes), have led to the Japanese government tightening the immigration laws. As a result, the number of foreign (especially Chinese) students is likely to decrease from 2007.

PROBLEMS AND DIFFICULTIES; FUTURE  
DIRECTIONS

The ethnic hybridity of Japan's towns and cities, the new 'imagining' of minority communities, cultural crossover in lifestyle, the arts and education, and the furious globalization of the Japanese economy and business, are among the many factors that impact upon language policy in twenty-first century Japan. However, these dynamic interfaces are an old story. We may recall that writing systems employed in Japan are mixed and diverse: two phonemic syllabaries arranged in Sanskrit phonetic order and adapted from *kanji*, Sino-Japanese *kanji* (Chinese characters), romaji (Romanized letters), European alphabet borrowing and Japanese Braille. A large percentage of spoken and written Japanese across most genres includes foreign words, loan words, now mostly English (Honna, 1995, p. 45). The fact that the Japanese language developed by internalizing such non-Japanese elements has caused tension between two contrastive viewpoints; progress towards the desired reforms and subsequent regression (Gottlieb, 1995, p. vii). Over the past century, language and language education policies have struggled at this interface, now hyper-accelerated by globalizing society.

The central government's push for 'internationalization' lacks an adequate framework based upon multilingualism and multiculturalism. However, at the local level, Japanese cities are increasingly multicultural and bring forth new expectations for educational change to meet the present increasing number of foreign national residents. At the national level, language education policy is predicated upon the concept 'internationalization', but nowhere does internationalization include support for regional and community or indigenous languages. The reality, the critically declining population of Japanese society, led the government to sign an agreement in 2004 to import Filipino nurses and care workers to look after the Japanese elderly. Such social changes will also change the demographics of foreign nationals and language policy (including the nature of Japanese as a foreign language education).

Whither Japan's minorities and language communities? Tracing the 'ethnic boom' of the 1980s–1990s, Maher (2006) has theorized that Korean and Ryukyuan, in particular, are now subject to 'metroethnicization:' a hybridized 'street' ethnicity deployed by a cross-section of people with ethnic or mainstream backgrounds who are oriented towards cultural hybridity, cultural/ethnic tolerance and multicultural lifestyle in friendships, music, the arts, eating and dress . . . Metroethnicity is bored with sentimentalism about ethnic language.. involved cultural crossings, self-definition made up of borrowing and bricolage. Its desktop cultural expression is 'Cool'. The historic struggle of Japan's

language minorities may be giving way to a new metroethnic generation. Its performative style is based upon and derives simultaneously from the symbols of both disaffiliation and association. (Maher, 2006, p. 24)

Language education in Japan is in flux. It is neither revolutionary change nor planned incremental policy shift. Rather, flux occurs here and there: in schools, in companies and as the result of the government's now aging mantra of 'internationalization'. The prospect for a nation's language education policy is most influenced by the needs of its citizen-public: the younger generation will live with the emerging social realities. The absence of creative government responses to these realities is marked and the powerful question remains, turning itself over, repeatedly, in the public mind: in what manner will the next generation come to terms with Japan's new identity as a multilingual and multicultural society?

## LANGUAGE EDUCATION POLICY IN GREATER CHINA

### INTRODUCTION

The invasion of China by various nations in the nineteenth century exposed the ineptitude of the Qing Dynasty and precipitated the 1911 revolution to establish the Republic of China (ROC) in 1912. This was followed by rule by military factions and civil strife between the Guomindang (GMD, or the Kuomintang, KMT, or the Nationalist Party), created in 1911 and the Chinese Communist Party (CCP), founded in 1921. The two parties cooperated to withstand Japanese aggression (1937–1945) but resumed their conflict when the Japanese surrendered at the end of World War II in 1945. In 1949, the CCP established the People's Republic of China (PRC) in Beijing whereas the GMD retreated to Taiwan to establish its government there. Before this separation, in 1842, Hong Kong was ceded to Britain after China lost the Opium War, sparked off by China's attempt to halt opium trade under a British monopoly. In 1997, Hong Kong was returned to China. In 1557, the Portuguese were first permitted to settle in Macao, which reverted to Chinese rule in 1999 (see Dillon, 1998, p. 48, 130, 206, pp. 237–238, 305–307). The PRC currently consists of the China mainland, Hong Kong and Macao and wishes to achieve peaceful reunification with Taiwan. All four territories are included in the term 'Greater China'. This chapter introduces the language policies in each of these territories, relating their developments to their histories and identifying their major achievements, current circumstances and future directions.

### THE CHINA MAINLAND

On the China mainland (area: 10 million square kilometres; population: 1,265,830,000; see Hook and Twitchett, 1991, p. 17; National Bureau of Statistics, PRC, 2001), many languages and dialects are spoken. The Han Chinese people, the majority population, speak several Chinese dialects falling into two main groups, the northern dialects and the southern dialects, but share the same writing script of about 3,500 years old. The national language, Chinese, is also known as Hanyu (Han language). The standard dialect for oral interaction is Putonghua (common language), a northern dialect mapping well onto Baihua, the written

variety of Standard Chinese close to everyday spoken Chinese and promoted from around 1920. In addition, among the 55 officially recognized non-Han ethnic minorities making up 8.4% of the mainland population, over 80 to 120 languages are used; they belong to language families such as Sino-Tibetan, Altaic, Austronesian, Austroasiatic and Indo-European (Zhou, 2003, pp. 23–26). Two minority groups, the Huis and the Mans (Manchus), have largely acculturated to Chinese. Another 29 groups now have officially recognized writing scripts; some groups, such as the Chosen (Korean) group, use minority languages which have speakers beyond China's borders; other groups such as the Kazaks (using the Arabic alphabet) use a writing script also used by speakers of other languages outside China; still others, such as the Dongs, use a Roman alphabet newly designed or revised for them after 1949.

Since the establishment of the PRC in 1949, to unify and strengthen the country, China has implemented three language policies: the standardization of Chinese, the development of minority languages and the propagation of foreign languages. The standardization of Chinese was aimed at enhancing literacy and took a two-pronged approach from the 1950s: the simplification of the writing script and the development of a phonetic alphabet, Hanyu Pinyin, to aid pronunciation. From 1956, all primary and secondary schools in Han Chinese regions were required to begin to include the teaching of Putonghua in Chinese classes. Putonghua was also propagated among the Han Chinese living in minority regions. At the same time, from around 1951, linguistic analysis of the minority languages was initiated with the aim of enhancing literacy among the minorities. To this end, some minority language writing scripts were affirmed, revised or created. In terms of foreign language learning, in line with the PRC's early political affinity, Russian was initially promoted as the most important foreign language. When relations with the Soviet Union did not develop as expected in the late 1950s, English regained importance.

By the early 1960s, China was ready to further ties with the West. Unfortunately, events within China developed into the Cultural Revolution (1966–1976), cultural in the sense of enforcing a political culture to continue the revolution. During that era, schooling was extremely irregular and the promotion of Putonghua suffered a severe setback. The local offices for promoting Putonghua were largely disbanded but propagation work was not entirely halted. By comparison, the work on minority languages suffered much more. In fact, even before the Cultural Revolution, from around 1957 to 1965, the attitude towards minority languages was vacillating between egalitarian respect and Han chauvinistic disdain. During the Cultural Revolution, minority languages were suppressed and some minority parents enrolled their

children in Han Chinese schools, resulting ironically in more bilingualism among minority learners. Likewise, foreign language learning was considered unpatriotic during the Cultural Revolution, particularly before the 1970s. In 1971, the PRC replaced Taiwan as a member of the United Nations and Richard Nixon's visit to China as President of the USA in 1972 paved the way for further exchange between China and the West.

After the Cultural Revolution, China began to implement the Policy of Four Modernizations (to modernize agriculture, industry, science and technology as well as defence) from 1978. In parallel, the work on all three language policies resumed. The 1982 revised Constitution of China reaffirmed that Putonghua should be promoted and 1986 saw the confirmation of the Character Simplification List originally publicized in 1964. Likewise, particularly important for the minorities, the 1982 Constitution reaffirmed that 'every ethnic group has the freedom to use and develop its own language and script' (National People's Congress, 1999, p. 6). Codification work on some minority languages was revived and some new scripts were officially recognized from 1977 to 1990. In the same period, policy directions concerning curriculum development in English Language Teaching (ELT), particularly at university level, attracted much support from ELT professionals in China and from overseas.

In 1991, the disintegration of the Soviet Union provided the political space for China to adopt an increasingly international stance. China joined the World Trade Organization in 2001 and will host the Olympics in 2008. The language education effects of this international orientation are twofold: more foreigners are interested to learn Chinese; the Chinese also need to develop greater competence in English. With more foreigners wishing to learn Chinese and the spread of Putonghua throughout the mainland, especially the urban areas, China's current concern is to aim for quality assurance in Chinese language competence. Proficiency tests like the Putonghua Shuiping Ceshi (PSC or Putonghua Proficiency Test) for Han Chinese learners and the Hanyu Shuiping Kaoshi (HSK or Chinese Proficiency Test) for non-native learners of Chinese are accorded much importance. Currently, over 2,100 universities in 85 countries offer courses in Chinese as a Foreign Language (CFL) and the HSK is considered the standard test for CFL. Where ELT is concerned, in the new school syllabus publicized from 2001, the learning of English is conceived of as a continuous process from primary school to university. The current requirement is to start teaching English from Primary 3 but some schools in coastal areas may even do so from Primary 1. Han Chinese learners are increasingly encouraged to be bilingual in Chinese and English. International trends in content-based instruction (or learning a target language while

acquiring new knowledge in other subjects through that language) have also been incorporated into bilingual education models or curricular goals such as the cultivation of foreign language majors who excel both in foreign language competence as well as knowledge of a profession such as foreign relations, trade, law, management, journalism, education, technology, culture or military affairs.

The Soviet Union's disintegration might also have prompted China to subtly adjust its policy towards its ethnic minorities, perhaps to prevent separatist tendencies. In the decades before 1991, the policy vacillated between non-assimilation and total suppression. From around 1991 onwards, the state has tried to promote a bilingual solution more overtly instead. Minorities are encouraged to learn Chinese and also to retain their own languages, which seems to be the linguistic ideal in line with the Constitution reaffirmed in 1982. At the local level of implementation, however, it has been observed that this central policy translates into several scenarios from promotion of minority languages to permission to learn minority languages or mere tolerance of minority languages (Zhou, 2005).

To summarize, for the Han Chinese, the majority population, the policy directions are now clear: competence in Putonghua and English are both educational goals while the use of their own Chinese dialects at home or in other informal situations is not forbidden and hence is often retained. Foreign language majors also learn a second foreign language such as Japanese, German, Russian or French. At the implementation level, ELT on the mainland has already attracted much scholarly attention and will continue to do so. It is CFL and the teaching and learning of other foreign languages by Chinese learners that will need to be further researched. Where minority learners are concerned, the policy is more ambivalent. The state encourages them to be bilingual in Chinese and their own minority language; however, 24 of the minority groups are still without an officially recognized writing script. Some of these groups (the Blangs, the Dairs, the Dongxiangs, the Nus and the Pumis) have had writing scripts designed (Zhou, 2003, pp. 126–127) or in use even before 1949 (the Uzbeks) (Zhou, 2003, p. 104), but the official status of their scripts is uncertain. In the absence of writing scripts and hence formal education in and through their own languages, the tendency for these minority groups to shift to Chinese is almost uncontested. Meanwhile, competence in English is also vital for all minority learners' educational and occupational advancement. Surmounting these circumstances is clearly a challenge for both the Chinese government and the minority learners. Research into the relative efficacy of different models of bilingual education for these learners as well as the intercultural effects that may result should prove particularly pertinent (this section is based on Lam, 2005. ## TAIWAN

The official language in Taiwan (area: 36,000 square kilometres; population: 22,610,000) is Mandarin, also known as Guoyu (national language) or Huayu (Chinese language). There are four main groups in Taiwan: the Fujianese (or Minnanren-speaking Minnanese, a Chinese dialect also known as Taiwanese), the Hakkas (speaking the Hakka dialect, another Chinese dialect), other Han Chinese from the mainland (or mainlanders, many of whom arrived with the GMD around 1949) and other Austronesian minorities falling into 12 major groups. The Fujianese and Hakkas together make up 85% of the population (with about three Fujianese to one Hakka person); the mainlanders make up another 13% and the minorities, less than 2% (Taiwan Government Information Office, 2004, p. 9, 21, 23; see also Kaplan and Baldauf, 2003, p. 51; Tsao, 2000, p. 61).

Taiwan's early inhabitants were Austronesian peoples. It first came under Chinese rule in 1662 when the Dutch who had occupied Taiwan from 1624 were defeated by Zheng Chenggong, a Ming loyalist escaping from the Manchus, who had overthrown the Ming Dynasty (1368–1644) to establish the Qing Dynasty (1644–1911). Zheng's family ruled Taiwan till they surrendered to the Manchus in 1683. Under Manchu rule, though Chinese emigration to Taiwan was forbidden till 1875, many mainland Chinese moved to Taiwan. The Manchus ruled Taiwan till 1895 when they ceded Taiwan to Japan after the Sino-Japanese War. Feeling betrayed by the Manchus, the Taiwanese established the Taiwan Republic on 16 May 1895 but were defeated by the Japanese after 148 days (Tsao, 2000, p. 96). During their 50-year rule, the Japanese made a sustained effort to develop Taiwan as their colony by building infrastructure, introducing modern financial institutions and forcing all schools to use Japanese. By the time they returned Taiwan to China, most Taiwanese elites spoke Japanese and Taiwanese fluently (see Taiwan Government Information Office, 2004, pp. 33–43; Zhang, 2003, pp. 20–38).

It was to GMD troops that the Japanese surrendered in 1945. So when the GMD lost its war with the CCP, it established its government in Taiwan. The GMD traced the legitimacy of its rule to the 1911 revolution and adopted the name: ROC (Taiwan). In language education as well, the GMD tracked the continuity of its policy to early developments on the mainland soon after the 1911 revolution when the need for a standard dialect to unify and strengthen the country came to the

forefront. The main language policy of the 1912 ROC and of Taiwan from 1949 had been the propagation of the standard dialect, Mandarin (Guanhua or Court Officials' Language). In 1913, a Commission on the Unification of Pronunciation was established. By 1918, the Mandarin Phonetic System (MPS), consisting of symbols resembling parts of Chinese characters, was promulgated. In 1919, the Preparatory Committee for the Unification of the National Language (PCUNL) was established and Mandarin was made the medium of instruction in primary and secondary schools. The MPS was revised in 1932. Another system, Gwoyeu Romatzyh (or the National Phonetic Symbols II), a romanization system, was propagated in 1928 and its modified form was adopted in 1984. The latest system, Tongyong Pinyin, was recommended by the Educational Reform Council in 1996 and adopted in 2002 (Taiwan Government Information Office, 2004, pp. 27–28).

The use of Mandarin in Taiwan and Putonghua on the mainland could both be connected to the early codification work on Chinese on the mainland soon after the 1911 revolution; both dialects were codified using the Beijing dialect. Their current phonetic representation systems, Tongyong Pinyin in Taiwan and Hanyu Pinyin on the mainland, are both romanization systems, though some sounds are represented by different letters (Luo, 2003). For the writing script, while the PRC developed simplified Chinese characters, Taiwan has continued to use traditional complex characters (also retained by Hong Kong and Macao). Another measure facilitating the learning of Chinese in Taiwan and the PRC (including Hong Kong and Macao) also originated from language reform soon after 1911; it was the PCUNL's recommendation in 1920 that the subject, Chinese Literature, should be changed to Chinese language in primary school. This represented a radical departure from traditional Chinese studies, which compelled learners to memorize Classical Chinese texts, making it difficult for them to master Chinese. With the PCUNL's recommendation, the learning of Chinese in primary school would focus instead on Chinese texts written in Baihua, closer to everyday spoken Chinese (Tsao, 2000, p. 69). It should be mentioned though that literature written in this style in the 1930s and 1940s was banned from the school curriculum in Taiwan because of its empathy with Communist ideology; hence the Chinese curricula in secondary schools and universities in Taiwan were heavily based on Classical Chinese rather than Baihua. This imbalance was somewhat redressed in 1997 (Tsao, 2000, pp. 89–90).

The adoption of Mandarin in Taiwan was politically contentious. Unlike on the mainland, where there are several dialect groups and a genuine need for an interdialectal means of communication, in Taiwan, Minnanese is spoken by about 70% of the population (Taiwan Government Information Office, 2004, p. 28). It was the GMD immigrants to

Taiwan in 1949 who needed Mandarin as a lingua franca because they consisted of speakers from various dialect groups. The GMD made Mandarin the language of government and education and also banned the use of Japanese, by then the working language of many educated Taiwanese, thus depriving them of access to power. The first GMD troops sent to Taiwan were also undisciplined and their seizure of personal property and profiteering angered the original residents in Taiwan. In 1947, the tension between the original residents and the mainland newcomers erupted into the February 28 Incident with much loss of life (Tsao, 2000, p. 72). Martial law was imposed soon after and not lifted till 1987; under the rhetoric to withstand a Communist take-over, dissent was not tolerated and the use of native dialects or minority languages was considered unpatriotic.

After the end of martial law in 1987, the government has adopted a more pluralistic approach towards the learning of native languages and dialects (Taiwan Government Information Office, 2004, p. 27). A study conducted in the wake of this policy change reports that although shift to Mandarin has occurred to some extent, particularly among the Hakkas, some knowledge of the native dialects has been maintained and attitudes to native dialects are generally positive (Chang, 1996). Native languages and dialects are now more used in public domains (Mo, 2000). In 1997, they were first introduced in primary school as electives. From 2001, primary school students must be taught one of the three major native dialects or languages (Minnanese, the Hakka dialect and Yuanzhuminyu or original residents' language). Mandarin continues to be the medium of instruction at all educational levels (Kaplan and Baldauf, 2003, pp. 57–59) and remains the lingua franca of interethnic or interdialectal communication (Li and Lee, 2004, p. 759).

For several decades, English had been taught as a foreign language in Taiwan only from Secondary 1 but, from 2001, it has been a required subject from Primary 5. Japanese, banned earlier, was revived in the late 1970s for trade purposes. Recently, the Ministry of Education has also implemented a 5-year programme (1999–2004) to promote the learning of a second foreign language such as Japanese, French, German and Spanish in senior secondary school (Taiwan Government Information Office, 2004, p. 31).

In summary, Mandarin has been predominant in Taiwan for too long for it to lose its preeminence as a result of the current revitalization of the native languages and dialects. As on the mainland, English is also needed as a global language. It is the learning of the native languages and dialects that might prove unpredictable and needs to be more immediately researched. A study of the differential effects of the revival of the Chinese dialects and the Austronesian minority languages in Taiwan should prove particularly illuminating.

## HONG KONG

The Hong Kong Special Administrative Region (HKSAR) (area: 1,100 square kilometres; population: 6,708,389; see Hong Kong Census and Statistics Department, 2003, 2005) consists of Hong Kong Island (ceded to Britain in 1842), the Kowloon Peninsula (ceded to Britain in 1860) and the New Territories and some outlying islands (leased to Britain in 1898 for 99 years). With the return of Hong Kong to China, the Basic Law of the HKSAR allows it autonomy in internal affairs such as education for 50 years from 1997. The population consists of: Chinese (95%), Filipinos (2%) and other ethnic groups (3%) (Hong Kong Census and Statistics Department, 2003). Cantonese is the native dialect spoken by the majority of the population. The official policy is to encourage competence in Cantonese, English and Putonghua.

From 1842 to 1974, although the British did not repress the use of Chinese overtly, English, as the language of government and the law courts, was the language of power. The Official Languages Ordinance passed in 1974 ushered in a period of equal legal status for both languages. From 1997, the Basic Law upholds Chinese as the official language in Hong Kong but also permits the use of English as an official language by the executive authorities, legislature and judiciary (People's Republic of China, 1992, p. 7). The Basic Law does not specify whether Chinese means Putonghua or Cantonese. In practice, Cantonese is usually used in spoken interaction whereas Baihua is the target variety in written expression. The official use of English is permitted even after 1997 because Hong Kong is an international city and many among the local elite, educated under the colonial regime, are professionally more competent in English than in Chinese (compare this to the banning of Japanese in the early decades of GMD rule in Taiwan).

Regardless of what the law specifies, a controversial issue in language education in Hong Kong has been what language to adopt as the medium of instruction, what effects this will have on the learning of Chinese and English, and whether teachers are competent enough to support educational plans. Though English is taught as a subject from Primary 1, most primary schools use Cantonese as a medium of instruction across the curriculum. The contention about the language of instruction is mainly in the secondary school sector. Of the two streams of education, English-medium and Chinese-medium, which have been carried over from colonial times, English-medium education is more favoured by parents, not only because English is an international language but also because it is often the language of higher

education in Hong Kong, particularly in the more competitive programmes. Generally speaking, the British government took a rather *laissez faire* attitude to this issue and many schools were claiming they were English-medium to attract more students, though instruction might actually be conducted in a mixture of Chinese and English. In 1997, the HKSAR government took a firmer line and required public secondary schools to show evidence that they were capable of teaching in English before they were allowed to do so from 1998 (Sweeting, 2004, pp. 524–525). About a quarter of the schools met the requirements. Later, other schools were allowed to switch to using English as a medium of instruction from Secondary 4 onwards if they could recruit competent teachers. To ensure that teachers of both English and Chinese (including Putonghua) have the competence needed, from 2004, new English and Putonghua teachers are required to pass language assessment before joining the profession while serving teachers should do so by 2006 (Bray and Koo, 2004, pp. 146–147).

The teaching of and in Putonghua is a relatively recent phenomenon in Hong Kong. In the years leading up to 1997, Putonghua was already available as an additional lesson within the Chinese curriculum. In 1997, it was announced that Putonghua would become a core subject from Primary 1 from 1998. Given the goal of acquiring competence in Cantonese and Putonghua, an emerging issue is whether it is educationally more expedient to teach Chinese in Putonghua rather than Cantonese since exposure to Cantonese is already readily available in the community. Some schools have adopted this pedagogical approach recently, even without being required to do so. A few schools have gone even further by using Putonghua as a medium of instruction for subjects other than Chinese (Bray, 2004, pp. 147–148). Pragmatic principals and parents may well decide on this matter in a market-driven place like Hong Kong, even before a policy is formulated.

To summarize, the statuses and functions of Cantonese, Putonghua and English in Hong Kong education are now fairly stable, at least for the foreseeable future. But the Hong Kong post-primary educational system is undergoing a major change from a 5+2+3 system (5 years of secondary school, 2 years of pre-university and 3 years of university) to a 3+3+4 system (3 years of junior secondary school, 3 years of senior secondary school and 4 years of university), akin to that on the mainland. The first cohort under the new system was accepted in September 2006. These students are expected to compete for university admission in September 2012. English curricula both at the senior secondary level and the university level are undergoing revision to accommodate this change. Related research is likely to be a major focus in language education work in Hong Kong in the next decade.

## MACAO

The Macao Special Administrative Region (area: 27.5 square kilometres; population: 465,300; see Macao Census and Statistics Department, 2005), formerly spelt as Macau, was a trading post of the Portuguese from 1557. In 1582, the Portuguese began to pay an annual rent to China for the lease of the Macao peninsula. In 1887, Portugal assumed sovereignty over Macao (Cheng, 1999, p. 3). The Basic Law of Macao allows it autonomy in internal matters such as education for 50 years from 1999. Around 96% of the population is Chinese (Berlie, 1999, p. 76). Cantonese is widely spoken but immigration from the mainland to Macao has resulted in a sizable population of Putonghua speakers. Both Chinese and Portuguese have been official languages since 1987. As in Hong Kong, even after Macao reverted to Chinese rule, Portuguese, the colonial language, can still be used as an official language. Competence in English is also an educational goal.

For centuries, the Portuguese government left education in Macao in the hands of the Catholic Church, apparently in line with their practice in Portugal. The Diocese of Macao was founded in 1576 (Cheng, 1999, p. 5) and led the development of education in Macao. The Chinese community also established some private Chinese schools. English-medium education developed from the second-half of the nineteenth century. By 1988/1989, Macao primary school students were studying in Chinese (84%), English (9%), Portuguese (5%) and both Chinese and Portuguese (2%). The educational gap was in the university sector. Only from the late 1980s did the government promote higher education in Macao. In 1988, it bought the University of East Asia, a private English-medium university founded in 1981 teaching some courses in Chinese, redeveloped it to offer programmes in all three languages: English, Chinese and Portuguese, and renamed it the University of Macau in 1991. Four other institutions using Portuguese as one of the teaching languages were also established in the 1990s (Bray and Koo, 2004, p. 151).

Although some form of higher education is now locally available in all three languages, the school sector has seen an increase of students in Chinese-medium education to about 93%, partly because of the immigration from the mainland in the last 20 years. New tertiary institutions, such as the Macao University of Science and Technology, established in 2000, are more likely to use Putonghua as the main medium of instruction (Bray and Koo, 2004, p. 153). While Putonghua and English (now usually taught from Primary 4 or 5 in non-English-medium schools) will continue to grow in educational prominence in Macao, competence in Portuguese, even if acquired only by a very small minority, is still

considered valuable for Macao's positioning within the PRC and China's relations with the Latin world.

Compared to the other three territories, Macao has a very small population, which makes its language education problems relatively easier to manage. The fact that much of its educational development was historically led by the church has also given rise to a certain peaceable ethos in attempts to negotiate educational solutions. In terms of research, an interesting issue is whether the development of Portuguese competence, particularly within a trilingual educational model, can continue to be maintained.

### CONCLUSION

In bilingual or multilingual settings, the choice of what language to teach or to use as a medium of instruction is always difficult (see also Tollefson, *Language Planning in Education*, Volume 1). On the China mainland, the propagation of Putonghua for Han Chinese is now widely accepted and requires only further quality assurance and materials development. However, the bilingual policy for minority learners needs to be carefully monitored and perhaps developed into a range of bilingual or multilingual education models to match a possible continuum of minority learner choices. It is fortunate that the language rights of minorities have been protected by the PRC constitution, even if insufficient educational opportunities or pragmatic choices by some minority learners may still result in greater competence in Putonghua and lesser competence in their own languages.

In Taiwan, the supremacy of Mandarin is now less controversial; as a medium of instruction for over half a century, it will probably remain the language of government and mainstream education while Minnanese, the Hakka dialect and the aboriginal languages continue to enjoy some revitalization as heritage languages and as alternative media of instruction perhaps in basic education. Bidialectalism and bilingualism (Mandarin and a native dialect or language) is a possible outcome. Total reverse language shift in Taiwan is unlikely as economic and educational benefits are now already attached to competence in Mandarin.

In Hong Kong and Macao, bidialectalism between Cantonese and Putonghua may be achieved by more and more learners. But it is unlikely that Putonghua will become the first dialect of the majority of the population in these two regions, unless there is massive immigration from the mainland, which the PRC will discourage, given the high population densities of the two territories. CFL around the world will grow in scope and this may, in turn, make competence in Putonghua

even more valuable in Hong Kong and Macao. In market-driven Hong Kong, in particular, as Putonghua competence becomes desirable even to foreigners, more schools may convert to teaching Chinese in Putonghua, even in the absence of any specific government directive.

In all four territories, English will retain its pre-eminence as the language of international trade and educational advancement; hence, issues concerning enhancing competence in English will continue to be prominent in educational considerations, particularly in the transition to higher education, academic research and international interaction. Other foreign languages such as Japanese (especially in Taiwan), Russian (especially on the mainland), French, German, Spanish or Portuguese (in Macao) may also enjoy a revival as China opens up even more to the world. Given the complexities of the circumstances in each of the territories, Greater China offers tremendous opportunities for developing and testing new models of bilingual or multilingual education involving both domestic and international languages in a comparative context.

THE MORAL DIMENSIONS OF  
LANGUAGE EDUCATION

INTRODUCTION

Like other kinds of teaching, language education is fundamentally and, some would argue, primarily moral in nature. By “moral,” we mean that it involves crucial yet difficult and ambiguous beliefs and decisions about what is right and good for learners and others. The moral dimensions of teaching inhere in certain key facts. First, all teaching aims to change people; there is an implicit assumption that this change is for the better. Second, there are limitations on the degree to which science, research, and objective facts about teaching and learning can guide teachers in the decisions they make; the great majority of teachers’ work in actual classrooms has to be based on teachers’ beliefs about what is right and good for their learners—that is to say, it is rooted in moral values. Third, like any relations between human beings, relations between a teacher and her students are moral in nature, revolving around key issues such as trust and respect. The innate power differential between teacher and students merely reinforces this basic fact. The moral landscape of the language classroom is rendered even more complex than in other contexts by the fact that the teaching of languages by definition takes place at the intersection between different national, cultural, and political boundaries, representing often radically different sets of values. Furthermore, the different cultures and value systems represented in classrooms, like the individuals taking part in language education, are not equally positioned in terms of cultural capital (see also Kelly Hall, *Language Education and Culture*, Volume 1) but, quite the opposite, are usually in unequal relations in ways frequently involving race, gender, sexual orientation, and other crucial differences.

EARLY DEVELOPMENTS: FINDINGS FROM  
GENERAL EDUCATION

As the preceding paragraph suggests, work on the moral dimensions of language teaching has largely been grounded in work on morality in general education. In this section, we review the principal contributions to this line of research.

John Dewey, in his seminal book, *Moral Principles in Education* (1909), drew an important distinction between the *teaching of morality*—the explicit teaching of specific moral values, and the *morality of teaching*—the ways teaching is imbued with moral significance. Despite the importance of Dewey's early writings in this area, little attention was paid to the morality of teaching until the early 1980s.

The publication of Tom (1984) marked the beginning of a renewed interest in the moral aspects of teaching. Tom critiqued the long-held view of teaching as an applied science, according to which research in the social and behavioral sciences will yield principles and strategies teachers “apply” to the problems they encounter in their classrooms. Tom proposed the metaphor of teaching as a moral craft. For Tom, two aspects of teaching imbue it with moral meaning: the relationship between teacher and student is a moral relationship, and the curriculum, as selectively planned and taught, reflects a desired goal. Craft can be described as an activity involving the application of analytical knowledge, synthetic thinking, and technical skill to a specific situation. By combining the moral aspects of teaching with the notion of craft, teaching as a moral craft is the “reflective, diligent, and skillful approach toward the pursuit of desirable ends” (p. 128).

Noddings' (1984) ethic of caring has been very influential over the past 20 years. Central to Noddings' work is her fundamental premise about teaching: that the relationship between teacher and student is at the core of teaching; concern for students comes before concern for content, assessment, and other aspects of schooling. These aspects are not ignored, nor considered of minor importance; but they are understood first and foremost through their connection to students and their learning.

Palmer (1998) offers another view of teaching and teachers' lives, one that draws primarily on personal reflection with a strong spiritual dimension. His deep explorations of his own work as a teacher and that of other teachers are inspirational rather than academic in tone and intent. While not based upon empirical investigations, his writings have nevertheless greatly influenced a number of researchers.

The ways teachers engage students in activities, indeed, the ways teachers act in all ways in the classroom, was the focus of the Moral Life of Schools Project undertaken by Jackson, Boostrom, and Hansen (1993). Through their extensive observations of K-12 classrooms in the USA, the authors sought to uncover and understand how the moral is present in schools. From their observations, two sets of categories emerged. The first set included five types of activities through which teachers and schools overtly teach moral content or nurture moral behaviors: moral instruction as a formal part of the curriculum, moral instruction as woven into the set curriculum, the use of ritual and

ceremonies, visual displays of moral messages, and spontaneously introduced moral commentary in the flow of classroom activities.

The second set of categories involves practices of teachers and schools that intentionally or unintentionally are of moral significance. This set of three categories include: the moral content of classroom practices and rules; the curricular substructure, a set of assumptions which allow teachers to teach and students to learn; and expressive morality—the moral significance of the many ways teachers act and speak in classrooms.

Hansen (2001) has continued to explore many of these themes. His central premise throughout is that teaching draws its moral significance from the very nature of its practice. Thus, rather than seeking moral meaning from sources outside of teaching, for example from philosophical discussions of virtue, teaching as a practice is itself imbued with moral significance.

For Fenstermacher (1992), the moral in teaching is present in the manner of the teacher. This position is based upon an Aristotelian view of how virtue is acquired by the young: teachers act as models and moral agents in the lives of their students. Teachers who act justly, honestly, and with compassion and tolerance, express these virtues through their teaching, thus instilling these traits and virtues in their students. Manner, then, is seen as separate from a teacher's method of teaching, the behaviors teachers use that promote children's learning.

Sockett (1993) offers a moral basis for teacher professionalism by describing its four dimensions: the professional community, professional expertise, professional accountability, and the professional ideal of service. Yet, Sockett acknowledges that discussions of teaching and teacher professionalism sorely lack any type of moral vocabulary and moral language. Thus, Sockett frames each of the dimensions of teacher professionalism in moral terms through which the descriptions and criteria for the quality of practice are guided by moral rather than technical language.

Another major study conducted by Noblit and Dempsey (1996) examined the ways schools and communities construct values and virtues that often guide their teaching practices and curricula. Through interviews with teachers, students, families, and community members, Noblit and Dempsey uncovered how the virtues and values deemed important by each group were a major moral influence on teachers and children.

More recently, Buzzelli and Johnston (2002) have examined the moral nature of classroom interaction through the lenses of language, power, and culture. The examination of teaching practices through these lenses uncovers the moral significance of various types of classroom discourse, of classroom rules, and of the ways that majority

culture teachers can limit the participation of minority students in classroom learning activities. These findings have implications for how teachers' practices directly and indirectly influence the ways students are represented through curricular materials and subsequently how educational practices contribute to the identities that students construct of themselves and that are attributed to them by peers.

#### MAJOR CONTRIBUTIONS

Two articles in the mid-1990s can be said to have opened up inquiry into the moral dimensions of language education. Edge (1996), in a paper examining what he called the "cross-cultural paradoxes" of the profession of English teaching, identified three such paradoxes of values. These were first, the mismatch that is frequently found between the values of what Edge calls "TESOL culture" (p. 9) and the national educational cultures in which English teaching is conducted. Second, the fact that in any context, English teaching is unavoidably wrapped up with political issues of both "liberation and domination" (p. 17). Third, the paradox between "respect for the right to be different" (p. 21), a value Edge claims that the field of English teaching embraces, and the intolerance sometimes expressed by the students whose views teachers are supposed to respect.

Johnston, Juhász, Marken, and Ruiz (1998) in turn, took a much more "local" and small-scale approach, examining discourse from the classrooms of three ESL teachers at a university-based intensive English program (IEP) to reveal aspects of what they called the "moral agency" of the teacher: that is, the ways in which the teacher's actions and words convey usually implicit moral messages to her learners. Johnston et al. borrowed part of the theoretical framework of "categories of moral influence" proposed by Jackson et al. (1993) (see earlier), and looked at the three categories said to capture the "morality of teaching" in introducing implicit moral messages into teaching: classroom rules and regulations; the curricular substructure; and expressive morality. Johnston et al. (1998) identified examples of all three categories in the classroom data they studied. They argued further that in relatively culturally homogeneous classrooms, such as those studied by Jackson et al. (1993), there is likely to be a large degree of shared understanding between teacher and students about elements such as the curricular substructure. However, in multilingual and multicultural classrooms there may be profound disjunctures between the moral messages sent, usually unconsciously, by teachers and the way those messages are interpreted, also usually unconsciously, by different learners.

Subsequent research in the moral dimensions of language education has partially followed the lead of these two pieces and has concentrated

around certain key topics. These include: the moral dimensions of classroom interaction; values and politics; professional ethics; and the role of religious beliefs in language teaching.

Various aspects of the moral dimensions of classroom interaction have been examined. Ewald (in press) looked at student perceptions of critical moral incidents in a US university Spanish classroom; she found the students highly sensitive to moral messages in the words and actions of their teachers. Johnson (2003) described clashes of values between a white American female mentor teacher and an African Muslim man in a practicum (teaching practice) placement in a US IEP. Buzzelli and Johnston (2002) looked at a range of classroom issues including, in particular, cultural aspects of minority children in mainstream classes.

As Edge's (1996) work indicates, moral values have always been at least implicitly present in the expanding literature on the politics of language teaching (Pennycook, 1994; Phillipson, 1992; see also Canagarajah, *The Politics of English Language Teaching*, Volume 1). Above all, as Edge pointed out, the central moral question that this literature raises for teachers is how to position themselves morally in relation to national and international political realities in which they are implicated, yet with which they may vehemently disagree.

Along with inquiry into morality, narrowly conceived, there have also been several investigations into ethical issues in language teaching, many of which cover similar ground to that found in research on morality. (It is worth pointing out that in philosophy no distinction is usually drawn between morals and ethics, though some authors, e.g., Buzzelli and Johnston (2002), suggest that it can be helpful to use *ethics* to refer to codes of conduct and to behavior, and *morality* to refer to personal beliefs.) Research has looked, amongst other things, at the ethics of testing (Hamp-Lyons, 1998; Shohamy, 2001), and at the centrality of ethical issues in the work of teachers (Hafernik, Messerschmitt, and Vandrick, 2002).

Finally, there have been the beginnings of attention to the vast area formed by the intersection between language teaching and religious beliefs, a domain in which moral values are particularly prominent and often highly contentious. This is an area of central concern in language education, in particular because of the strong connection between English teaching and mission work worldwide, an issue on which moral views are strongly divided in the field. The Christian viewpoint has been put forward by Smith and Carvill (2000) and Snow (2001). On the other hand, there have recently been severe critiques of evangelical involvement in English teaching around the world, amongst others by Pennycook and Coutand-Marin (2003) and Edge (2003). There are also the beginnings of empirical research on evangelical teachers by nonevangelicals (Varghese and Johnston, 2004).

The most extensive examination of the moral dimensions of language teaching to date is probably Johnston (2003). In his book, which focuses specifically on English language teaching while considering examples from different national settings, Johnston looks in particular at five major areas, some of which overlap with the areas outlined earlier: the moral dimensions of classroom discourse and classroom interaction; moral aspects of critical pedagogy and the political dimensions of language teaching; the morality of forms of assessment and evaluation; the moral underpinnings of language teacher identity, including religious identity; and the role of values in various aspects of teacher professional development.

Johnston's work is built around the notion of *moral dilemmas*: that is to say, points at which teachers are obliged to choose between two or more courses of action knowing that any possible choice will have both good and bad consequences, many of which are largely unpredictable. Johnston identifies a number of key moral dilemmas frequently encountered in the field of English language teaching, categorizing them into dilemmas of pedagogy, of teacher–student relations, and of beliefs and values (pp. 145–146). Johnston claims that moral ambiguity and polyvalence are permanent features of all teaching, including language teaching; but he argues that an awareness of the moral dimensions of teaching and of the moral consequences of alternative courses of action is crucial for effective decision-making in classrooms and schools.

In summary, it is clear that inquiry into the moral dimensions of language teaching has extended to numerous aspects of classroom teaching, schools, and educational systems, and has frequently overlapped with areas such as ethics, the politics of language teaching, social responsibility, teacher education and development, and religion. Many of these lines of inquiry continue to be expanded as the following section indicates.

#### WORK IN PROGRESS

A number of projects currently in progress expand on or otherwise develop many of the ideas and topics outlined earlier, and also introduce new fields of interest and new theoretical possibilities.

Research has continued to look at the ways in which moral issues are enacted in classrooms. Johnston, Ruiz, and Juhász (2002) conducted a follow-up study to Johnston, Juhász, Marken, and Ruiz (1998) in which they examined student perspectives on moral critical incidents in an adult ESL classroom. Student perspectives often differed from teacher and researcher perspectives and from each other; but all students perceived the classroom as a place of moral interaction. Zahler

(2003) looked at one nonnative English-speaking ESL teacher in a North American IEP, analyzing his relations with his students in terms of the solidarity-authority distinction.

A number of scholars have followed Johnston's (2003) lead in extending research on the moral dimensions of teaching into language teacher education. For example, Johnston and Buzzelli (in progress) describe a study of two teacher education programs, one of which is an MA program in TESOL and applied linguistics. The authors' goal is to explore real-life moral dilemmas of teaching and teacher education while seeking new theoretical and conceptual lenses with which to understand classroom and program events; they are particularly interested in the moral dimensions of community, ideology, and identity as these play out in the context of teacher education classrooms.

Wong and Canagarajah (in progress), both evangelical Christians, have undertaken to attempt a professional dialog concerning the significant presence of evangelicals in the field of English teaching. Their book contains chapters and responses by both evangelical and nonevangelical (often non-Christian) scholars, in an attempt to find common ground.

Lastly, research on the political dimensions of language teaching has moved beyond the relatively narrow confines of critical pedagogy to take in more varied perspectives. An example of this development is Edge's (2006) edited volume, which offers multiple perspectives on responses in the field of English teaching to US neo-imperialism, especially in the post-9/11 world.

### PROBLEMS AND DIFFICULTIES

The problems and difficulties of research on the moral dimensions of language teaching are both evident and numerous.

First, there is the most obvious matter of how "morality" is understood and defined for research purposes. Conceptual work is still needed to clarify what is meant by basic terms such as "moral," "right," and "good." There is an ever-present temptation to drift toward everyday understandings of these terms, which can be dangerous and misleading.

Second, the location of morality and values at the intersection between the social and the individual makes it hard to attempt valid generalizations about moral dilemmas. Societal values (for example, individualism, collectivism, privacy, solidarity) can be identified, but it is hard to say to what extent particular individuals share them. Working at the intersection of cultures and languages compounds the difficulties of research.

Third, the aspects of morality that are of most interest are also those that are buried deepest and are least available for inspection. For this

reason, speculation is often the only recourse for the researcher. For example, in the study by Johnston, Ruiz, and Juhász (2002) mentioned earlier, looking at student perspectives on critical moral incidents in an ESL classroom, the researchers interviewed the students extensively, yet even so, the interviews themselves still had to be analyzed and interpreted. As with much cultural and psychological behavior, motivations and perceptions are in most cases simply not available for easy introspective access for research purposes.

Fourth, there are considerable barriers to conducting effective research across cultural and linguistic borders. Linguistic and discourse limitations make it very difficult to find stable points of vantage from which to work conceptually and to analyze and evaluate data and evidence. Notions such as “morality” or “right,” for instance, do not translate easily across languages.

Lastly, it is worth noting that in some areas of research, objectivity is hard to come by. A case in point is the topic of religious beliefs in language teaching, in particular that looking at the presence of evangelical Christians in English teaching. The professional discourse on this topic has been marked by extreme polarization, and it remains unclear whether it is even possible to find a common language in which to conduct a debate (Varghese and Johnston, 2004). This seems a reflection of the broader fact that questions of morality and values tend to “push people’s buttons,” and that this can happen even in academic circles and can seriously compromise possibilities for inquiry.

The net result of the problems and difficulties reviewed here is that all work on the moral dimensions of teaching must acknowledge its own limitations, and the field as a whole must move forward cautiously and tentatively. Findings must always be regarded as provisional and subject to change.

#### FUTURE DIRECTIONS

Research on the moral dimensions of language teaching is in its infancy, and numerous important future directions suggest themselves. First of all, a deeper understanding of the moral dimensions of language classroom discourse necessitates discourse-analytic research in a range of contexts and settings. Understandings of moral meanings differ widely across cultural and national boundaries, and it would be a grave mistake to imagine that the moral landscape, say, of North American classrooms can be used to understand that of classrooms in other countries—quite aside from the radical differences from setting to setting within each country.

Second, as pointed out earlier, values differ significantly from one culture to the next, and these differences have a profound impact on

local educational cultures; inquiry into the moral landscapes of language classrooms in different national settings would do much to give this work a fuller international and comparative dimension.

Third, a crucial arena in which moral values and issues are played out is that of curriculum and coursebooks; the moral dimensions of published materials, and the moral consequences of choices about which vocabulary, what form of pronunciation, what grammar, and what pragmatics competencies to teach is an area that is ripe for inquiry (see e.g., Smith and Carvill, 2000, pp. 55–56). This matter also extends to the question of the representation of cultures, individuals, and their values in curricular materials (see Buzzelli and Johnston, 2002, pp. 97–105).

Fourth, the specifically moral aspects of the intersection between language teaching and power also require closer examination (see Janks, *Teaching Language and Power*, Volume 1); whether considering the work of expatriate teachers of English around the world, or the presentation of unfamiliar cultures and peoples in the foreign language classroom, the juncture of individual or communally held moral beliefs and political hegemonies represents a major yet under-investigated aspect of language teaching.

Fifth, and finally, there is still much more work to be done in the area of religious beliefs and their place in language teaching. The work on evangelical Christianity mentioned in the previous sections needs to be expanded to include other forms of Christianity and other religions; there is an ever more pressing need to look closely at the complex moral dilemmas that arise when teachers' personal religious beliefs directly affect classroom instruction and relations with students.

## **Literacies and Social Theory**

## NEW LITERACIES, NEW TIMES: DEVELOPMENTS IN LITERACY STUDIES

### INTRODUCTION

This chapter attempts to survey briefly some of the new directions evident in literacy studies. I begin with an outline of the current theoretical frameworks in particular work in New Literacy Studies, in multimodality, and in theories of technology and artefact before considering some of the educational responses evident in different countries as they come to terms with the challenges posed by new literacies. I also make some suggestions as to why it is that policy in some countries—notably the USA and UK—seems to be facing in the opposite direction to that which this research base tells us is needed.

### EARLY DEVELOPMENTS: LITERACIES ACROSS CULTURAL CONTEXTS

#### *New Literacy Studies (NLS)*

What has come to be termed New Literacy Studies (NLS) refers to a body of work that for the last 20 years has approached the study of literacy not as an issue of measurement or of skills but as social practices that vary from one context to another. In policy circles, on the other hand, dominant voices still tend to characterize local people as illiterate (currently media in the UK are full of such accounts, cf. Street, 1997), while on the ground ethnographic and literacy-sensitive observation indicates a rich variety of practices (Barton and Hamilton, 1998; Heath, 1983). When literacy campaigns are set up to bring literacy to the illiterate—light into darkness, as it is frequently characterized—those adopting the more ethnographic and culturally sensitive perspective of NLS first ask what local literacy practices are there and how do they relate to the literacy practices of the campaigners (see chapters in Volume 2 of this encyclopedia). In many cases, the latter fails to take; few people attend classes and those who do drop out (cf., Abadzi, 2003) precisely because they are being required to learn the literacy practices of an outside and often alien group. Even though in the long-run many local people do want to change their literacy practices and take on some of those associated with western or urban society, a crude imposition of the latter that

marginalizes and denies local experience is, from an NLS perspective, likely to alienate even those who were initially motivated.

Research, then, has a task to do in making visible the complexity of local, everyday, community literacy practices and challenging dominant stereotypes and myopia. Much of the work in this ethnographic tradition (Barton and Hamilton, 1999; Collins, 1995; Gee, 1999; Heath, 1993; Street, 1993) has focused on the everyday meanings and uses of literacy in specific cultural contexts and linked directly to how we understand the work of literacy programs, which themselves then become subject to ethnographic enquiry (Robinson-Pant, 2005; Rogers, 2005).

In trying to characterize these new approaches to understanding and defining literacy, I have referred to a distinction between an autonomous model and an ideological model of literacy (Street, 1984). The autonomous model of literacy works from the assumption that literacy in itself, autonomously, will have effects on other social and cognitive practices. The autonomous model, I argue, disguises the cultural and ideological assumptions that underpin it and that can then be presented as though they are neutral and universal. Research in the social practice approach challenges this view and suggests that, in practice dominant approaches based on the autonomous model are simply imposing western (or urban) conceptions of literacy onto other cultures (Street, 2001). The alternative, ideological model of literacy offers a more culturally sensitive view of literacy practices as they vary from one context to another. This model starts from different premises than the autonomous model. It posits instead that literacy is a social practice, not simply a technical and neutral skill, and that it is always embedded in socially constructed epistemological principles. The ways in which people address reading and writing are themselves rooted in conceptions of knowledge, identity, and being. Literacy, in this sense, is always contested, both its meanings and its practices, hence particular versions of it are always ideological; they are always rooted in a particular world-view often accompanied by a desire, conscious or unconscious, for that view of literacy to dominate and to marginalize others (Gee, 1990). The argument about social literacies (Street, 1995) suggests that engaging with literacy is always a social act, even from the outset. The ways in which teachers or facilitators and their students interact is already a social practice that affects the nature of the literacy learned and the ideas about literacy held by the participants, especially new learners and their positions in relations of power. It is not valid to suggest that literacy can be given neutrally and then its social effects only experienced or added on afterwards.

For these reasons, as well as the failure of many traditional literacy programs (Abadzi, 1996; Street, 1999), academics, researchers, and

practitioners working in literacy in different parts of the world have come to the conclusion that the autonomous model of literacy, on which much of the practice and programs have been based, was not an appropriate intellectual tool, either for understanding the diversity of reading and writing around the world or for designing the practical programs this diversity required, which may fit better within an ideological model (Aikman, 1999; Doronilla, 1996; Heath, 1983; Hornberger, 1997, 2002; Kalman, 1999; King, 1994; Robinson-Pant, 1997; Wagner, 1993). The question this approach raises for policy makers and program designers is, then, not simply that of the impact of literacy, to be measured in terms of a neutral developmental index, but rather of how local people take hold of the new communicative practices being introduced to them, as Kulick and Stroud's (1993) ethnographic description of missionaries bringing literacy to New Guinea villagers makes clear. Literacy, in this sense, is then already part of a power relationship and how people take hold of it is contingent on social and cultural practices and not just on pedagogic and cognitive factors. These relationships and contingencies raise questions that need to be addressed in any literacy program: What is the power relation between the participants? What are the resources? Where are people going if they take on one form of literacy rather than another literacy? How do recipients challenge the dominant conceptions of literacy?

Before addressing educational responses to these new perspectives I would like to signal two other theoretical frameworks that are helpful in considering the issues associated with literacy practices in the new conditions in which they operate in the contemporary. One perspective known as Multimodality is particularly associated with the work of Günter Kress in the UK and concerns technology and cultural artefacts.

## WORK IN PROGRESS

### *Multimodality*

Kress (2003) argues that educational systems in particular and western societies more broadly have overemphasized the significance of writing and speech as the central, salient modes of representation. It has been assumed that language is the primary site for meaning making and that therefore educational systems should concentrate on speech and writing in training new generations. The work of Kress and his colleagues (cf., Jewitt, 2006; Kress and van Leeuwen, 1996; Kress, Jewitt, Bourne, Franks, Hardcastle, Jones, and Reid, 2005) has attempted to redress this emphasis in favor of a recognition of how other modes—visual, gestural, kinaesthetic, three-dimensional—play their role in

key communicative practices. As he and I say in the Foreword to a book significantly entitled, *Travel Notes from the New Literacy Studies: Case Studies of Practice* (Pahl and Rowsell, 2006):

So one major emphasis in work on Multimodality is to develop a “language of description” for these modes that enables us to see their characteristic forms, their affordances and the distinctive ways in which they interact with each other. [Just as] those in the field of New Literacy Studies (NLS) have attempted to provide a language of description for viewing literacy as a social practice in its social environments [so, in Multimodality] there is an intent to change many emphases of the past – especially in educational contexts of the most varied kinds—from literacy as a static skill and to describe instead the multiple literacy practices as they vary across cultures and contexts. (Kress and Street, 2006, p. viii)

Kress explicitly links his theoretical and research interest in the nature of signs and the shift towards more multimodal understandings, with concern for the kinds of social changes signalled by Luke in the opening quotation. He argues that there is now a burning need to link ‘issues in representation and communication with the profound changes in the social, cultural, economic and technological world, issues for which there are as yet no answers’. (Kress and Street, 2006, p. ix)

The kinds of questions this approach opens up for those interested in education and its role in these new times include: What *is* a mode, how do modes interact, how can we best describe the relationship between events and practices, and how do we avoid becoming the agents producing the new constraints of newly described and imposed grammars? These questions are different from those often being asked in schools, as we shall see later, but they may be more relevant to the age we live in than the kinds of questions that arise from the autonomous model of literacy. On analogy with Literacy Studies, then, those working with different modes may need likewise to develop an ideological model of multimodality. It is in this sense that I am suggesting the present Chapter is concerned with the kinds of questions we ask and the way we frame them rather than, at this stage, to posit definitive answers. If we can begin to find answers that will serve us for educational purposes then, I argue, they will arise from having posed the questions in this way.

There is one further set of questions and of new concepts that I would like to address before looking at the ways in which educationists are responding to the demands of new times. These I characterize as artefacts in our cultural activity.

*Globalization, Technology, and Literacy*

One response to the growing role of technologies of communication in our lives is to overstate their ability to determine our social and cultural activity. This tradition has been evident in earlier approaches to literacy, where overemphasis on the technology of literacy (cf., Goody, 1977) has led to assumption about the ability of literacy in itself, as an autonomous force, to have effects, such as the raising of cognitive abilities, the generation of social and economic development, and the shift to modernity. All of these features of the autonomous model were rooted in assumptions about technological determinism that the ideological model and new social practice approaches to literacy have challenged and discredited. And yet, we now find the same array of distorting lenses being put on as we ask, what are the consequences of the present generation of new technologies, those associated in particular with the internet and with digital forms of communication? While these forms evidently do have affordances in Kress's (2003) sense, it would be misleading and unhelpful to read from the technology into the effects without first positing the social mediating factors that give meaning to such technologies. How, then, can we take sufficient account of the technological dimension of new literacies without sliding in to such determinism? A range of literature from different intellectual traditions has begun to provide answers which, I suggest, if linked with the frameworks provided by New Literacy Studies and by Multimodality, may begin to help us see the new literacies in a fuller and more rounded way (see Schultz and Hull, *Literacies In and Out of School in the United States*, Volume 2; Leander and Lewis, *Literacy and Internet Technologies*, Volume 2; and Mahiri, *Literacies in the Lives of Urban Youth*, Volume 2, for rich attempts to address exactly these issues).

*Artefacts and "Figured Worlds"*

One such way of seeing is put forward by Bartlett and Holland (2002) who, like Kress, link their account to the social dimension of literacy practices already being developed in New Literacy Studies. They "propose to strengthen a practice theoretical approach to literacy studies by specifying the space of literacy practice, examining in particular the locally operant figured world of literacy identities in practice, and artefacts" (p. 12). Drawing upon Holland's earlier work on figured worlds, they ask us to think about technology and artefacts as resources for seeing and representing the world, for figuring our identities in cultural worlds that, as Brandt and Clinton (2002) reminded us, may exist before we enter them:

Figured worlds are invoked, animated, contested, and enacted through artefacts, activities, and identities in practice. Cultural worlds are continuously figured in practice through the use of cultural artefacts, or objects inscribed by the collective attribution of meaning. An artefact can assume a material aspect (which may be as transient as a spoken word or as durable as a book) and/or an ideal or conceptual aspect. These objects are constructed as a part of and in relation to recognized activities. Artefacts meaningful to the figured world of literacy might include blackboards or textbooks (in the classroom), reading assessment scales, road-signs or signing ceremonies (in public space). Such artefacts “open up” figured worlds; they are the means by which figured worlds are evoked, grown into individually and collectively developed. . . . Cultural artefacts are essential to the making and remaking of human actors. (Bartlett and Holland, 2002, pp. 12–13)

If, then, we think of artefacts as tools of self-management and as ways of figuring who we are and what is going on, then when we enter, say, a classroom we will see the artefacts available there—blackboards or textbooks—as not only functional but also symbolic in their ability to evoke the habitus of that social environment. The work of the classroom, its establishment of particular kinds of social relationships amongst participants—the role of teacher, the assumptions about being a learner, the rights to speaking and writing inscribed in situ—is partly done through artefacts. Not only do we enact all of these social practices through personal, human interaction but we also call upon objects that we, or others, have placed there to help stabilize and assure us of what kind of social practice is required. Brandt and Clinton (2002) make this point very clearly with respect to another such social space of literacy practice, a bank:

. . . if you enter a bank to arrange for a loan, your interaction with the loan officer is framed by a number of objects, beginning with the building itself; the furniture, and so on, proceeding to forms, files, documents, contract, calculator, computer, data bases, the presence of which enables you to interact as loan applicant to loan officer in a focused way. The objects help to stabilize a piece of reality so that even if the two of you engage in friendly banter about some other subject there is still no confusion about what the two of you are doing. Things hold you in place. (Brandt and Clinton, 2002, pp. 344–345)

One might apply similar analysis to the classroom and consider how the objects there help stabilize pedagogic interaction so that, for

instance, even if teacher and pupils talk socially about last night's game or about some local gossip as part of their binding and stabilizing social relations, they all know the frame within which this social discourse takes place. The objects help assure them, as in the bank, that the underlying framing discourse is that of teaching and learning within specific institutional settings. Brandt and Clinton (2002) link this local use of objects to their interest in the broader, global features of literacy, using the bank example in ways that again we might extend to schooling:

Moreover, these same objects—forms, files, contract, calculator, computer, data base—aggregate your loan transaction for use in other settings; you become part of somebody else's calculations—at the local bank, in a regional clearinghouse, maybe eventually (we hope not) in bankruptcy court, etc. Eventually, perhaps, your transaction, aggregated, enters into decisions by a distant stockholder or makes its way into a debate on the floor of the U.S. Senate. . . . the interest rates, the disclosure language, the reporting mechanisms, the counting machines all will transform this local literacy event into somebody else's meaning and send it into somebody else's setting where the meanings of the original context will not matter. Objects especially provide for and speak to connections beyond the here and now. . . . Our objects are us but more than us, bigger than we are; as they accumulate human investments in them over time, they can and do push back at us as "social facts" independent and to be reckoned with. We find this an accurate description of literacy in its historical, material, and especially technological manifestations. (pp. 337–356)

Similarly in the classroom the artefacts, including those of literacy, signify not only immediate and local purposes but also bring in messages from outside. The equivalent to the clearinghouse and the floor of the Senate may be the local educational authorities and the national ministries as well as broader, even more global notions of the role of education in new times, exactly the theme with which we are here concerned. These accounts of literacy as artefacts, and the references to habitus, practice and discourse can, then, provide us with a language of description, as Kress and van Leeuwen (1996) call for, in articulating and clarifying what is going on in new literacy practices and how they are linked to new social practices on the global stage. The language of phonics and of decoding may be helpful in helping children learn immediate aspects of the letter code (cf., Adams, 1993; Snow, 1998) but cannot provide much help in locating such activity in the broader frames that are continually impinging on our local practices.

PROBLEMS AND DIFFICULTIES; IMPLICATIONS  
FOR EDUCATION

One of the most recent summaries of the literature in the field of New Literacy Studies and the responses to it that we have been discussing here provides a helpful link between these academic studies and their application, or take up, in educational circles. Reder and Davila (2005) comment

As . . . theories of context and literacy continue to develop, it is important that they connect with issues of educational policy and practice. Ethnographically-based literacy studies have inspired many teachers and literacy practitioners with their accounts of the diversity of learners, literacy practices, and contexts and with their insights about the ideological content of school-based literacy. But such literacy studies are open to criticism that they have not developed a practical alternative pedagogy for literacy . . . Teachers may be convinced by the insights of NLS, but they must work within the increasingly narrow constraints of the school system . . . while sociolinguists argue that varieties of literacy are structurally equal and practice theorists decry the arbitrary dominance of one form of literacy over another, practitioners must decide whether and how to teach dominant literacies without becoming complicit in the reproduction of power (Kim, 2003, pp. 182–183).

This is a major challenge for literacy educators, whether teaching in K-12 schools or adult education programs, as contributors to this volume make evident. Better theories about how contexts shape literacy practices should help teachers to see the literacy events in their classrooms and programs in relation to the multiple contexts in which they are situated, including the local classroom context and the broader and more distant contexts of home, community, and beyond. Insights derived from such research and the theory-building it would drive can help educators to develop new models of language and literacy education with applications to improved curricula and programs.

*Educational Responses*

How, then, have schools responded to both these insights and the social changes that accompany them? Amongst the many studies of the links between ICT and literacy, Abbott's (2002) study for the UK: National Centre for Language and Literacy; in the UK, and Jim Gee's (2004) work on video games and what they teach provide models for future research and practice. One rather negative example of how schools

are responding is provided by Leander (2005), another of the leading researchers in this field. He describes a US high school that appeared to adapt to the new technologies by making available wireless access to the Internet and giving laptops to all of its pupils. The difficulties such a strategy can cause, as traditional pedagogies clash with new frames of reference and new literacy practices, provides a case study for many such encounters:

Ever since it had implemented its laptop program, Ridgeview struggled with a number of contradictions between traditional schooling and ubiquitous Internet access. As one teacher put it, "We have opened Pandora's box." Even as Ridgeview had heavily invested in providing Internet access to its students, it has also structured, over three years' time, an array of implicit and explicit means of closing this access. In short, Ridgeview was a contradiction of social spaces: on the one hand it presented itself and technically structured itself to be an "open" wired social space for 21st Century girls, while on the other hand, official school practices and discourses domesticated, or pedagogized (Street and Street, 1991), potential openings of space-time provided by the wireless network. In official school practice, the wireless network was "rewired" or closed off and anchored in ways that reproduce traditional school space-time (Leander, 2005, p. 1)

He wants to make it clear that it is not his intent to simply offer a researcher critique of teachers. It is not that researchers understand what is needed and schools are behind the times. The Ridgeview example precisely shows that schools are indeed aware of the needs of new technology for their pupils. What the example brings out is the complexity of working with the contradictions such approaches entail. Drawing upon the kinds of theorizing developed in the earlier part of his paper, Leander tries to understand and explain those contradictions. He notes how artefacts located in specific time-space contexts may bring with them associations and identities that figure other worlds than those with which many participants are familiar. And then, as the many writers who refer to the notion of habitus make clear, those participants draw upon cultural and epistemological values with which they are familiar to handle these new worlds. It is these conflicting worlds and their associated habitus that create the contradictions we see in this example and the many others like it with which readers will be familiar. This chapter, like Leander's (see also Leander and Lewis, *Literacy and Internet Technologies*, Volume 2, and Schultz and Hull, *Literacies In and Out of School in the United States*, Volume 2), is about trying to understand and describe these issues rather than claiming already to have answers. In this case, the questions circle around the meanings

of new technologies in time-space contexts accustomed to other values and practices. How will change come about?

These approaches to literacy and learning present a dilemma for those in policy circles, such as the “No Child Left Behind” framework in the USA (see critiques in Larson, 2003) or aspects of the National Literacy Strategy in the UK. Marsh (2004), a researcher at Sheffield University in the UK has done considerable research on issues of gender, social use, and Multimodality in UK schools. In the passage quoted here, she exposes the limitations of the official strategy on learning literacy in that country in contrast with what such rich and detailed accounts of social literacies might tell us:

... the National Literacy Strategy Framework privileges particular types of texts and producers of texts. All references to producers of texts use the words “writer”, “author” or “poet”, and there is no mention of producers, directors or creators. It could be argued that the term “author” is used in a generic sense to include authorship of televisual and media texts, but the word is most frequently used in conjunction with terms that relate to the written word. This privileging of the written word is clearly stated in supporting documentation. The *Teachers’ Notes on Shared and Guided Reading and Writing at KS2* (Department For Education And Employment [DfEE], 1998b) suggest that, “Although the emphasis in the Literacy Hour is upon books, children should have plenty of opportunity to read a range of media texts” (DfEE, 1998b, p. 7). This marginalisation of media texts can also be identified in the current National Curriculum (DfEE/QCA, 1999). Media texts are not mentioned at all in the key stage 1 orders [ages 5–7] [and only marginally] at key stage 2 [ages 8–10]. . . . [There] is a clear prioritisation of print-based texts, with media texts used merely to support children’s understanding of the former. (pp. 249–262)

Marsh calls upon much of the literature cited here, such as Kress, NLS etc to propose an alternative approach to the literacy curriculum. She asks; “How might we identify the kind of popular, “socio-cultural literacy practices” evident in children’s everyday lives and build upon themes in developing educational curriculum and pedagogy?”

### *New Directions*

In this chapter I have suggested that the ethnographic approach adopted by many researchers and practitioners in the New Literacy Studies could fruitfully link with work in the field of Multimodality and of

new technologies to inform policy and practice in education that could help us see and then build upon such practices. The development of an ideological model of multimodality may enable those working in these fields, with different modes and new technologies, to build on the insights developed in the literacy field, starting with the rejection of an autonomous model that might otherwise lead to mode or technical determinism. Drawing upon the rich insights by researchers and practitioners signalled earlier and evident in the chapters in this volume, we might begin to see how we could learn and teach the new (and the old) literacies we will need for the developing century.

## CRITICAL RACE THEORY

### INTRODUCTION

Critical race theory (CRT) is the latest iteration of the struggle by people of color in the USA for freedom. It builds upon earlier efforts of political and social activism by César Chavez, Anna Julia (Haywood) Copper, Frederick Douglass, Martin Luther King, Rosa Parks, W. E. B. Du Bois, Sojourner Truth, David Walker, Carter G. Woodson, Malcolm X., and many unsung heroes of all races, but especially those from the US Black Power and Chicano Movements. CRT can be characterized as a modern day response to Walker's (1830) charge that African Americans develop "a spirit of inquiry and investigation respecting our miseries and wretchedness" in this *Republic Land of Liberty* (p. 5, emphasis in the original). Long before CRT emerged, African American scholars and educators (Cooper, 1892; Douglass, 1845; DuBois, 1899, 1903; and Woodson, 1933) critically examined relationships among race, law, and education to reveal the oppression under which African Americans suffered in US society. These scholars offered alternative perspectives of their humanity that challenged the legal system and dominant and racist ideas promoted in science and education. CRT is not limited to individual acts of prejudice; activists and scholars have long believed that it is equally important to address epistemological and ideological racism along with psychological and emotional effects of racism situated in US social and political systems and institutions. A review of the extant literacy research reveals that scholars are using CRT to form a body of literature that, collectively, is in opposition to the traditional, sanctioned, and celebrated research that so often forms the core body of knowledge in the field. To understand the nexus of CRT and literacy, it is imperative to review the genesis, definitions, basic concepts, and tenets of CRT from legal studies, followed by its evolution in educational and literacy research.

## EARLY DEVELOPMENTS

CRT scholars acknowledge that there is no definitive starting point of CRT. They note that it began in the late 1960s and 1970s, in part as a response to the slow and deliberate enforcement of civil rights legislation; as a response to the fledging critical legal scholarship (CLS) movement that sought to redress civil rights legislation, and, in part the failure of the CLS to address issues of race from the perspective of people of color. Crenshaw, Gotanda, Peller, and Thomas (1995a) describe its evolution in a chain of events, beginning with protests of Harvard Law students over the University's response to Bell's teaching of his Alternative Course in 1981, a course designed to interrogate race and the law. Next, they point to Delgado's article in which he reviewed and critiqued civil rights and antidiscrimination law. Then, after scholars of color began to participate in the Critical Legal Studies (CLS) conferences—established by white male left-leaning legal scholars—they found CLS members did not explicitly address issues of race and discrimination or their intersection with the law. Crenshaw, Gotanda, Peller, and Thomas (1995b) argue that both movements “reject the prevailing orthodoxy that scholarship should be or could be neutral and objective” (p. xiii). The CLS conferences of 1986 and 1987 were turning point years for the genesis of CRT as more scholars of color voiced their concerns over the lack of racial consciousness in the proceedings. Finally, in 1987 at a CLS conference, Crenshaw organized the Critical Race Theory Workshop marking a pivotal point of departure from CLS. It was during this workshop that the name critical race theory emerged as a moniker for the theoretical orientation and movement among the scholars who sought to “reexamine the terms by which race and racism have been negotiated in American consciousness, and to recover and revitalize the radical tradition of race-consciousness among African-Americans and other peoples of color” (Crenshaw, Gotanda, Peller, and Thomas, 1995b, p. xiv). Another meeting outcome was a themed issue of *Harvard Civil Rights—Civil Liberties Law Review* entitled *Minority Critiques of the Critical Legal Studies Movement* (Delgado and Stefanic, 2000, p. xviii). Thus, the genesis of CRT began in contemporary CLS, and, perhaps unwittingly, takes up the charge of Walker as it demystifies the intersection and complicity of law and racism that are so deeply ingrained in all aspects of US society.

Derrick Bell is recognized as the intellectual founder of CRT. Tate (1997) traces Bell's development from Charles Hamilton Houston's rebuilding of Howard University's Law school, to the hiring of Thurgood Marshall (director-counsel of the NAACP legal defense fund), who subsequently hired Derrick Bell (director of a branch of the NAACP in Pittsburgh). Bell's journey as an opponent of racism

helped to inform his thinking about CRT. Other early adherents include John O. Calmore, Kimberlé Williams Crenshaw, Richard Delgado, Alan D. Freeman, Neil Gotanda, Angela Harris, Cheryl I. Harris, Charles R. Lawrence, III, Mari Matsuda, and Patricia J. Williams.

### MAJOR CONTRIBUTIONS

Crenshaw, Gotanda, Peller, and Thomas (1995a) in their text, *Critical Race Theory: The key writings that formed the movement*, declare that CRT does not draw from a singular doctrine or methodology; instead it adopts an interdisciplinary approach that is informed by Black feminist theory, critical theory, CLS, feminism, liberalism, Marxism/neo-Marxism, poststructuralism, postmodernism, and neopragmatism. According to these editors, CRT scholarship is premised on two foundational ideas:

The first is to understand how a regime of white supremacy and its subordination of people of color have been created and maintained in America, and in particular, to examine the relationship between that social structure and professed ideals such as the “rule of law” and “equal protection.” The second is a desire not merely to understand the vexed bond between law and racial power but to change it (p. xiv).

They posit that race is “‘real’ in the sense that there is a material dimension and weight to the experience of being ‘raced’ in American society” (p. xxvi). However, CRT does not rest in a black/white binary; it includes Latino/a, Asian, and Native American groups (Parker and Lynn, 2002). Solórzano and Yosso (2001) suggest that CRT is informed by CSL, Cultural Nationalism, Ethnic and Women’s Studies, Internal Colonialism, and Marxist/Neo-Marxism and has inspired Latino/a Critical Studies (LatCrit), Asian American critical studies (AsianCrit), and Native American critical studies. It has spawned other critical studies: feminist race critical studies (FemCrit), queer critical studies, and whiteness studies (WhiteCrit). Latino/as and Asian Americans as cocreators address language rights, ethnicity, national origin discrimination, and immigration. Native American scholars also interrogate the law over land sovereignty (Lawrence, Matsuda, Delgado, and Crenshaw, 1993, p. 6). CRT centers on race, yet acknowledges intersectionality or multiple forms of oppression—class, gender, sexual orientation, nationality, ethnicity, language, and immigration rights—exist and are experienced among people of color.

Descriptions and definitions help illustrate the evolving nature of CRT. Bell (1995) observes that CRT takes a “hard-eyed view of racism as it is and our subordinate role in it . . . the struggle for freedom is, . . . a manifestation of our humanity which survives and grows stronger through

resistance to oppression, even if that oppression is never overcome” (p. 308). Lawrence, Matsuda, Delgado, and Crenshaw (1993) write that CRT emerged as part of an effort to “confront and oppose the dominant societal and institutional forces that maintained the structures of racism while professing the goal of dismantling racial discrimination” (p. 3). Calmore (1995) situates CRT within oppositional scholarship while emphasizing that CRT is unique as it “challenges the universality of white experience and judgment as the authoritative standard that binds people of color, and normatively measures, directs, controls, and regulates the terms of proper thought, expression, presentment, and behavior” (p. 318). Additionally, Delgado and Stefanic (2000) posit that the CRT movement

considers many of the same issues that conventional civil rights and ethnic studies discourses take up, but places them in a broader perspective that includes economics, history, context, group- and self-interest, and even feelings and the unconscious (p. 3).

Each of the earlier definitions pertains to the use of CRT in legal studies; however, these definitions, or revised versions, have been extended to the social sciences, including education. For example, Solórzano (1997) defines CRT as “a framework or set of basic perspectives, methods, and pedagogy that seeks to identify, analyze, and transform those structural and cultural aspects of society that maintain the subordination and marginalization of People of Color” (p. 6).

Lawrence, Matsuda, Delgado, and Crenshaw (1993) identify six defining elements that capture basic themes in CRT legal scholarship: (1) CRT recognizes that racism is endemic to American life, (2) CRT expresses skepticism toward dominant legal claims of neutrality, objectivity, color blindness, and meritocracy, (3) CRT challenges ahistoricism and insists on a contextual/historical analysis of the law, (4) CRT insists on recognition of the experiential knowledge of people of color and our communities of origin in analyzing law and society, (5) CRT is interdisciplinary and eclectic, and (6) CRT works toward the end of eliminating racial oppression as part of the broader goal of ending all forms of oppression (p. 6). Their work extends beyond theorizing to working to change society through political activism.

CRT is built on a number of foundational concepts that are important to understand. Drawing on the legal scholarship of three of the key leaders in the field, Bell, Delgado, and Crenshaw, select concepts are described

next. Bell's theories include (a) *constitutional contradiction*—an analysis of property rights and human rights as viewed through federal laws and where whiteness is valued as a property, both in terms of identity and privileges; (b) *interest convergence or material determinism*—racial equality is achieved as long as it does not threaten the status of whites; and (c) *price of racial remedies*—the cost, in terms of what whites must give up for racial redress of historic oppression.

Delgado's (1995) review of civil rights scholarship reveals that white scholars (1) exclude the scholarship of minority scholars and focused on one another's work; (2) share a limited ideological and perceptual understanding of the lives of people of color; (3) depend on their limited understandings of the lives of people of color, historically and contemporaneously to situate racial problems and solutions; (4) suggest solutions that failed to account for the past oppressions and did little to ameliorate the present for people of color; and (5) support and sustain notions of white racial superiority (pp. 47–51).

Crenshaw (1995) observes two conflicts in the idea of equality under antidiscrimination law: the expansive view and the restrictive view. The expansive view seeks outcomes from the courts that truly affect the lives of African Americans. By contrast, yet complementarily, the restrictive view is process oriented, it does not recall past injustices or seek immediate outcomes for all forms of subordination, but places its hope in the future on selective forms that do not impinge on the interests of whites (p. 105). Crenshaw acknowledges that some people may experience oppression from more than one source, race and gender, for example. She labels the site of multiple oppressions, intersectionality: structural, political, and representational. Each form is distinctive: *structural intersectionality* refers to structures within society that help maintain domination; *political intersectionality* focuses on politics that surround domination; and *representational intersectionality* addresses how the dominated are represented (Tate, 1997, p. 231). In the latter form, Crenshaw (1995) addresses the racist discourse that supports notions of color blindness and "Othering" that instills, instantiates, and nourishes the use of stereotypes and myths to describe the alleged inferiority of nonwhites (pp. 112–116).

CRT legal scholars acknowledge that the concept of race is socially constructed and is not a biological or scientific fact while simultaneously understanding that this construct operates as "fact" within the USA. Their goal, in part, is to critique race, racism, and power especially as it is used to support and maintain an ideology of racism within the rule of law. They maintain that racial categories are built on the acceptance of two fundamental untruths: people can be distinguished based on phenotype (as well as physical markers) and Whites are the superior racial group and Whiteness is the norm.

Delgado and Stefanić (2001) explain many of the earlier concepts under slightly different labels: interest convergence (material determinism and racial realism), revisionist history, critique of liberalism, and structural determinism (tools of thought and the dilemma of law reform and the empathic fallacy). In addition, they acknowledge two camps among CRT theorists, the idealists and the realists. Idealists acknowledge that race is a social construct and focus on matters of ideology and discourse (words, mental images, thinking, perceptions) held by individuals as well as sustained by institutions. Realists also acknowledge race as a social construction and the power of words to perpetuate the idea of race and racism; however, they hold that racism is a dominating influence that is sustained through societal, political, and legal structures.

More recent scholarship by Ladson-Billings and Tate (1995) and Tate (1995) has explored these ideas as well as Latina/o scholars, Fernandez (2002), Solórzano and Yosso (2001), and Villenas (1996), to name a few. Likewise, Smith (1999) in her groundbreaking work, *Decolonizing Methodologies: Research and Indigenous Peoples*, presents a guide for thinking about and pursuing research among Indigenous peoples. She observes, however, that the very word “research” is problematic among Indigenous folk in part because their life ways have been so misunderstood and misinterpreted by outsiders. Grande (2000) also adopts an Indigenous perspective that dictates research among indigenous peoples must acknowledge “a cultural orientation, a set of values, a different conceptualization of such things as time, space and subjectivity, different and competing theories of knowledge, highly specialized forms of language, and structures of power” (p. 42). Collectively, these scholars argue that critical theorizing must be disemboweled from Eurocentric perspectives if it is to be useful in education and literacy research. CRT’s more explicit interdisciplinary nature continues to evolve and its influence offers scholars alternative epistemological concepts and methods to address the history and contemporary use of privileged paradigms and institutional structures and practices. For example, Pendergast (2002) adopts CRT in her review of the intersection of literacy, race, and federal law. She offers a legal time line to consider these issues using primary source documents to illustrate sociohistorical contexts, legal arguments, and biographies of the major stakeholders. Much like Crenshaw, Gotanda, Peller, and Thomas (1995a), she claims “civil rights . . . has been sacrificed for property rights . . . and that White identity has been legally recognized as having property value” (p. 208). Further, Pendergast demonstrates how the U.S. Supreme Court adopted a framework that equated Whiteness and literacy as property of Whites. She opines, “the ideologies of literacy supporting the *Brown* decision may have propelled the Court to condemn segregation, but the goal of ensuring equality of education

remained elusive and the true character of racial discrimination remained unrecognized” (p. 216). Pendergast concludes that situating the (reoccurring) idea of a national “literacy crisis” is a blind that has help stall the Civil Rights Movement.

### PROBLEMS AND DIFFICULTIES

From the onset CRT has been beset with critics that have attacked theorizing about the intersection of the law and race. General themes emerged that include (1) challenges to the use of narratives or storytelling as nonobjective and nongeneralizable, (2) questions about whether “playing the race card” is being too negative, and (3) objections to alleged essentialism and exceptionalism. Similarly, CRT’s legitimacy is questioned in education and literacy research because it challenges the basic assumptions that have been used to define and normalize language and literacy as reflective of Eurocentric beliefs and values. CRT threatens to disrupt power and unshackle voices that espouse alternative ideas. To underscore this idea, Brookfield (2003) acknowledges theorizing in education suggests an “unproblematic Eurocentrism . . . [that] reflects the racial membership of ‘official’ knowledge producers in the field” (p. 497). By contrast, CRT exposes how race (as a social construct and lived experience) is central to understanding the deep relationship within privileged paradigms. Darder and Torres (2005) appreciate the role of race, but opine that as race punctuates the CRT literature there is resistance to engage in discourse around race, a resistance that has effectively hampered CRT’s use. They suggest that classism is a more powerful determiner of status and by explicitly addressing classism discussions of social justice and equity issues in the USA can be occur. It is important, however, to avoid constructing a hierarchy of oppression and focus, instead, on challenging the basic assumptions that have been deliberately used in education research to shield their role and power to shape how language and literacy are used, understood, and assessed.

There are countless literacy studies that focus on participants of color, from beginning reading to achievement gap differences to transactions with text; however, few scholars have applied CRT theorizing, methods, or analysis. Specific reoccurring themes occur as problematic when race is used as a descriptor and when its social construction and lived realities are not acknowledged or addressed, or deconstructed. First, the language used to describe race centers on color imagery (associated with skin color) and code words that consistently, and unfavorably, identify students of color. Code words typically associated with students of color are: at-risk, lazy, low expectations, ignorant, urban, unmotivated, underachievers, struggling, and low income. By contrast,

code words typically associated with white students are: high achievers, high expectations, knowledgeable, suburban, exceptional, industrious, motivated, hardworking, and middle income. Many white literacy researchers claim the words are race-neutral or color blind and merely used to identify students and student performance. CRT deconstructs the discourse of color imagery, code words, and euphemisms, as it situate and clarify the unstated presumptions about people of color that underpin their use.

Second, although literacy scholars have used critical lenses to explore issues of equity and social injustice, few have explicitly adopted a race consciousness. Many literacy researchers have characterized race as a variable, identity, pathology, and cause célèbre, but seldom as a framework for research. Morrison (1992) observes that in this sense, race is a metaphor, “a way of referring to and disguising forces, events, classes, and expressions of social decay and economic division far more threatening to the body politic than biological ‘race’ ever was” (p. 63). Likewise, Grande (2000) notes that race/ethnicity as one form of difference and more fluid, postmodern descriptions of hybridity. She criticizes theorists who “aim to explode the concretized categories of race, class, gender, and sexuality and to claim the intersections the borderlands—as the space to create a new culture—una cultures mestiza—in which the only normative standard is hybridity and all subjects are constructed as inherently transgressive” (p. 47). Such positioning creates a veneer of difference as it resists identification while simultaneously seeking to expose the lives of oppressed or marginalized people whose use of popular culture reflect their race/ethnicity, class, gender, sexual orientation, religion, and geography.

Third, some literacy researchers seek to normalize narratives or storytelling of people of color by foregrounding and retelling the stories of oppression and racism within a Eurocentric frame. Brookfield (2003) characterizes this stance as a “heroic narrative of White alliance-building” (p. 519) that seeks to neutralize the oppression of nonwhites by pointing to similar circumstances undergone by whites. Some literacy researchers, for instance, use an immigrant analogy to suggest that standards, merit, and benchmarks are colorblind, thus the lack of academic accomplishment among students of color is their own failing (while dismissing a history of educational inequality and racist theories and practices).

#### WORK IN PROGRESS

For decades, educational researchers have embraced critical theory to address inequalities and social justice. Their work is grounded in variations of Marxist theory and cultural studies, inspired by generations of

Frankfurt School scholars, Paulo Freire, Stuart Hall, and others. They seek to expose the ideological and cultural hegemony used by dominant groups to maintain power over others. They believe that explicating the assumptions that have been used to uphold positivism are important before reform and change in education can occur. They do not believe that positivism or empirical science holds the only key to change in education; in fact, they envision change as an outgrowth of more critical conscious awareness and the valuing of all cultures and languages. Further, they reason that social and institutional structures must be dismantled and rebuilt in a more humane manner and where critical theory is translated into praxis. Educational researchers who have adopted CRT have done so because they believe that critical theory has failed to adequately address the historical and present-day contexts of race, racism, and power, in much the same way that CRT legal scholars questioned the intersection of race, racism, and the law. Education scholars that embrace CRT call for race, racism, and power to be squarely addressed, beyond the emphatic fallacy that abounds in education. Their work uses theory(ies), methods, and analyses to comprehend and explain the realities of the lives and experiences of people of color living in racialized societies.

In educational research, CRT is located in theoretical essays, reviews of research, and identity and pedagogical studies. For over a decade, several scholars have adapted CRT as a lens in their work: Ladson-Billings and Tate (1995), Tate (1996, 1997), Solórzano (1997), Solórzano, Ceja, and Yosso (2000), Solórzano and Yosso (2001, 2002), and Parker and Lynn (2002). Tate's (1997) comprehensive review, for example, describes the history and major themes of CRT, draws implications from legal scholarship, and extends the goal of CRT to eliminate all forms of oppression to education (p. 234). He also envisions applications of CRT's themes and methods in his recommendations for education research.

Solórzano, Ceja, and Yosso (2000) stress that CRT in education "simultaneously attempts to foreground race and racism in the research as well as challenge the traditional paradigms, methods, texts, and separate discourse on race, gender, and class by showing how these social constructs intersect to impact on communities of color" (p. 63). Drawing on these concepts, Solórzano and Yosso (2001, 2002) adapted the tenets of CRT for education as follows: "(a) the centrality of race and racism and their intersectionality with other forms of subordination, (b) the challenge to the dominant ideology, (c) the commitment to social justice, (d) the centrality of experiential knowledge, and (e) the transdisciplinary perspective" (p. 63).

Ladson-Billings and Donnor (2005) extend current understandings of CRT to include, more explicitly, the moral and ethical epistemologies

espoused and used by scholars of color. They call for researchers to adopt an antiessentialist stance toward a unified or common experience among people of color and within any one racial group and move toward human liberation and activism. Further, they describe the work of a growing number of scholars of color from multiple racial/ethnic groups in the USA whose work centers on race, racism, and power as they resist racial and social injustice. Importantly, they point to how CRT's use of multiple consciousnesses is being embraced globally through the use of post/de/colonial theories that resituate the fight against oppression and the struggle for freedom beyond US borders, by acknowledging that imperialism exists in developing nations and unstable 'hot spots,' where the struggle for freedom continues.

Moreover, Landson-Billings and Donner reveal how CRT clarifies that all researchers speak from their own perspectives (gender, race/ethnicity, class, sexual orientation, religious, and geographical), however scholars of color also "must know the intellectual antecedents of their cultural, ethnic, or racial group. . . . for combating the persistent ideology of white supremacy that denigrates the intellectual contributions of others" (p. 292). They also call for the replacement of ideas, i.e., universality, objectivity, generalizability, and empirical, with an engagement in "moral and ethic research and scholarship" (p. 298). They believe that research should address the lived reality of people in a racialized society and seek to eliminate the reproduction of myths, assumptions, and stock stories. They promote CRT as a theoretical position that "ultimately will serve people and lead to human liberation" (p. 291). Finally, they call for educational research that is more openly political and activist.

Solórzano and Yosso (2002) argue CRT methodology is theoretically grounded research that:

- a. foregrounds race and racism in all aspects of the research process;
- b. challenges the traditional research paradigm, texts, and theories used to explain the experiences of people of color;
- c. offers a liberatory or transformative solution to racial, gender, and class subordination;
- d. focuses on the racialized, gendered, and classed experiences of students of color;
- e. uses the interdisciplinary knowledge base of ethnic studies, women's studies, sociology, history, humanities, and the law to better understand the experiences of students of color. (p. 24)

Literacy scholars have used critical lenses to explore issues of equity and social injustice, but few have explicitly adopted a race consciousness. There are a number of literacy studies that focus on participants of color, from beginning reading to achievement gap differences to transactions with text; however, few scholars have applied CRT theorizing, methods, or analysis. The application of CRT in literacy research encourages a

more proactive advocacy role for researchers as they develop understandings about race, racism, and power that move beyond stereotypical assumptions to understand how race and privilege pervade literacy research from conceptualization to implementation.

A review of the extant literacy research reveals that scholars are using CRT to form a body of literature that, collectively, is in opposition to traditional or mainstream literacy, research. CRT scholars draw from multiple racial/ethnic epistemologies to situate their work (Delgado Bernal, 1998; Duncan, 2002, 2005; Fernandez, 2002; Gonzalez, 2001; Villenas, 1996). Significantly, they ask questions that challenge preconceived notions about the beliefs, values, knowledge, and ways of making meaning held by people of color. A CRT framework reveals the importance of literacy in the lives of people of color and how literacy use is multidimensional, multitextual, and multifaceted. This body of research explicates the multiple consciousnesses and multiple literacies that people of color use in their lives, and, most importantly validates that people of color are “holders and creators of knowledge” (Delgado Bernal, 2002, p. 108).

Equally important is acknowledging intersectionality in the lives of people of color, which helps to clarify how multidimensional identities are formed and needful for survival within and outside of our communities. For example, Gonzalez (2001) argues in support of a critical raced-gendered epistemology because it permits researchers to “bring together understandings of epistemologies and pedagogies to imagine how race, ethnicity, gender, class, and sexuality are braided with cultural knowledge, practices, spirituality, formal education, and the law” (p. 643). CRT offers original and authentic lenses, detailing lives in which literacy is essential.

A Literacy scholar who has adopted a CRT framework in his research is Duncan, 2002. CRT is not racially limiting as some white scholars also have used CRT in their research (Blackburn, 2003; Pendergast, 2002). Together these scholars also challenge traditional theories of literacy as neutral, objective, and color blind and expose assumptions of white superiority in theories, methods, and analysis. Duncan addresses theoretical, methodological, pedagogical and gender issues; Fisher reveals the literacy connections within the African Diaspora; Blackburn focuses on intersectionality of race, class, and sexual orientation, and Pendergast tackles the intersection among law, whiteness, and literacy. Duncan (2000) makes a case for the use of transdisciplinary theories as in his work as he posits that literacy research should include intersectional analyses where racial/ethnic epistemologies are central to understanding and appreciating the culture, language, and meaning making of their participants.

## FUTURE DIRECTIONS

To use CRT in literacy research means that we must “re-imagine the role that race—as a structural not just individual problem—has played in our thinking about success and failure. We need to begin to see the relationship between success and community; between failure and the absence of community” (Guinier, 2004). To do less is to continue to privilege an ideology of whiteness in literacy research.

Literacy scholars can envisage CRT’s emancipatory and transformative positioning with an emphasis on racial/cultural and experiential knowledge through narratives and voice, a more adequate approach to examine race, racism, and power in literacy research. CRT scholars produce their own narratives that are counterstories to the way culture, lives, and experiences of people of color are depicted. They use autobiography, biography, parables, stories, *testimonio*, and voice and allegory (infusing humour) to expose hidden truths and to explicate and situate race, racism, and power within the experiences of people of color without the need for interlopers, interlocutors, or interpreters of the “Other.” Their narratives are exceptionally detailed to help capture the richness of contexts and include revisionist historical information, experiences, and explanations. Scholars also use storytelling to analyze and dispel myths, assumptions, and unfounded beliefs about people of color (Delgado and Stefanic, 2000, p. xvii). They produce stories told from the position of people of color living under racial oppression that contradict or oppose the assumptions and beliefs held by many whites about people of color. Inherent in the narrative forms are voice; that is, the ability of a group to articulate their experience in ways unique to them (Delgado and Stefanic, 2001).

The idea of voice carries with it the notion that individual and group voices of people of color are especially qualified to tell their own stories, without essentializing experiences to all group members. Testifying to the quality of experience does not mean that whites are excluded from research. CRT scholars maintain that some subjects “are often better addressed by minorities” (Delgado and Stefanic, 2001, p. 92). For example, literacy research is dominated by studies that identify participants by race/ethnicity, gender, class, language, and immigrant status. In some cases, white researchers also self-identify by race, gender, or class, although they seldom deconstruct what these markers mean to them and how identities shape their research, their view of the participants, and their findings and recommendations. These white researchers position themselves and their roles as transparent “the ability of whiteness to disguise itself and become invisible” (Delgado and Stefanic, 2001, p. 156), whereas CRT scholars believe that race is

visible, tangible, and omnipresent although racism can be overt, dysconscious, or unconscious.

Finally, literacy researchers seek to understand the power of CRT in a more global sense. Some are exploring critical consciousness in African and Asian cosmology and how people draw on these ideas in their language and literature. Others are drawing on the work of Frantz Fanon, replacing the primacy of Freire and Hall, to expose how dominant groups use language and literacy to defend alienation, colonialism, imperialism, isolation, and the oppression of people of color in democratic countries and developing nations.

LANGUAGE, LITERACY AND KNOWLEDGE  
PRODUCTION IN AFRICA

INTRODUCTION

This contribution assesses the state of language and literacy studies in Africa. It traces the extent and record of African scripts and debates issues of literacy development in African societies. It poses questions regarding the challenges ahead in literacy enhancement on the continent, and initiates the discussion with an examination of the question of numbers of African languages.

EARLY DEVELOPMENTS

The issue of how many languages exist in Africa, is a complex consideration. Estimates vary very widely. They range from Lord Hailey's figure of 700 to Grimes's figure quoted by UNESCO of "about 2000" (Grimes, 2000; Hailey, 1938, p. 68). Gregersen wrote that, "the nearly 300 million people in Africa speak something over 1000 languages—with only about 40 spoken by more than a million people. Language communities with 1000 or fewer speakers are not rare, and at least 20 languages are reported with fewer than 100 speakers" (Gregersen, 1977, p. 200). Heine notes "the bewildering multiplicity of roughly one thousand languages and several thousands of dialects" (Heine, 1993, p. 1). In *The Languages of Africa* (1970 edition), Greenberg lists 730 languages in his index. The author admitted that, "in the present state of our knowledge, any listing of languages is necessarily unsatisfactory in many respects." Greenberg's listing is inaccurate and displays some of the problems the Center for Advanced Studies of African Society (CASAS) research project is clearing up. For example, dialects of Luo like Shilluk, Anyuak, Acholi, and Lango are listed as separate languages. Bari, Mondari, Fajelu, Kakwa are listed as separate languages when they are in fact simply dialects of the same language. Under Akan, it is suggested that "see individual languages." In the guide to his entry of languages on sectoral maps he explains that,

“languages spoken in a number of areas are only entered once on the map.” Thus Fulani is only indicated in one of the main West Atlantic areas and not elsewhere. When reference is made to some other language, the number of the language itself is not to be found on any of the maps. The reason for this may be that it is merely a variant name, that the group is too small to be indicated on a map or that they live within the speech area of another people. Whatever the case may be, this way of representation is misleading. Fulani-speakers are to be found in at least 11 countries in the area Dalby calls “fragmentation belt” (an area of extreme linguistic fragmentation), which covers the latitudinal space of the area as far north as the Senegambia basin, to Ethiopia, and down to Northern Tanzania. Fulani is easily one of the largest languages in Africa, spoken by about 50 million people as either first, second or third language; and it named variously as Pulaar, Fulful, Fulfulde, Peul, Tuclour, Fula and Fulani. Greenberg’s manner of presentation obscures such important facts about the language and its demographics. These weaknesses have been largely carried into the work of Fivaz and Scott (Fivaz and Scott, 1977).

Mann and Dalby’s, *The Thesaurus of African Languages* poses other problems. The authors indicate in their introduction that, “the approach we have adopted is to treat as a ‘language’ each speech-form whose speakers claim a separate linguistic identity, reserving the term dialect for cases where speakers explicitly acknowledge both a wider and narrower linguistic identity. Linguistic identity is generally manifested in a common name, so that crudely it may be said we have distinguished as many languages as there are names used by communities to refer to their language.” (Mann and Dalby, 1987, p. 1) This is unfortunate. A great deal of self-identification in Africa as in many parts of the world is more political than linguistic/cultural in any serious sense. In Africa, many of these identities have been created by a convergence of colonial administrative and missionary activity (particularly with reference in the latter instance to bible translations) (Mann and Dalby, 1987, p. 1).

This confusion of numbers plays into the hands of those who then argue that because there is such a profusion of languages in Africa; since Africa is a Tower of Babel, it is not realistic to envisage the use of African languages as languages of education and development.

What is not easily recognized by many observers is that most of what in the literature, and classificatory schemes, on African languages pass as separate languages in an overwhelming number of cases are actually dialectal variants of “core languages.” In other words, most African languages can be regarded as mutually intelligible variants within large clusters (core languages). Indeed, almost all African languages are trans-border languages, and the majority of them cross more than one state border.

## MAJOR CONTRIBUTIONS

What the Centre for Advanced Studies on African Society's (CASAS) research has revealed is that over 80–85% of Africans, as first, second and third language-speakers, speak no more than 15 to 17 core languages, based on our clustering on the basis of mutual intelligibility. Africa, for its size is hardly a *Tower of Babel*. If the total population of Black Africa is between 600 and 700 million, (as first, second and third language speakers) the Fula, Pulaar, Peul, Tuculor, Fulful, Fulbe, Fulani cluster alone would account for about 50 million, Hausa and its varieties bring up another 40 to 50 million, Oromo, Igbo, Bambara, Amharic, KiSwahili, Yoruba, the Gbe, would produce another 35–40 million in each instance, the Nguni dialects, the Sotho Tswana, the Akan, the Eastern and the Western inter-lacustrine Bantu (Kitara) languages, Luganda/Lusoga and Luo, Gur, Lingala, Kikongo are between 20 and 30 million per set. Other languages, of much smaller size, but which enjoy preponderance within existing states include, Fang, Nyanja-Cewa, Wolof, Ovambo-Herero, Sango and Somali-Samburu.

Babatunde Fafunwa, basing his viewpoint on David Dalby and UNESCO sources suggests that 120 language clusters have been identified. 85% of the languages are concentrated in the “fragmentation belt.” (Fafunwa, 1989, p. 99 & 102) Arguably, the figure for language clusters is actually very much lower. It has been estimated that 75% of the languages in the “fragmentation belt” belong to the two groups of Hamito/Semitic/Afro-Asiatic and the Niger Congo.

Actually, Afro-Asiatic is generic to Hamito/Semitic. In any case the Meinhofian Hamitic theory which suggests that Hamites entered Africa through the Horn area is discredited and enjoys little standing today. Furthermore, whether the Niger-Congo phylum is an offshoot of Proto-Afro-Asiatic or more immediately related to Chadic is evidentially contestable. Fafunwa has reproduced a UNESCO table on, *Languages Used Across National Boundaries* which is rather poor. For example, if Setswana is understood in its narrow sense (that is that it is not a dialectal variant within the Sotho/Tswana cluster but a totally unique language), it features in Namibia, Botswana and South Africa, not two countries as the UNESCO table suggested. In a wider and more significant sense Setswana is part of the wider Sotho-Tswana cluster which includes Lozi in Barotseland. Somali is spoken in five countries but does not appear on the table. Evidence indeed suggests that well over 95% of African languages are spoken across borders.

Another example would be that if Luo is used as a restricted descriptive category it covers parts of three countries (Kenya, Uganda, and Tanzania). In generic usage, in the sense in which it has been used by Crazzolara or Okot Bitek, its coverage will include in geographical

scope an area as wide as parts of the Sudan, Ethiopia, Uganda, Kenya, and Tanzania (Crazzolaro, 1938). Proximate and mutually intelligible dialects of the Luo language in Eastern Africa for example are sometimes referred to under various designations as Jur (Sudan), Anyuak (Sudan and Ethiopia), Shilluk (Sudan and Ethiopia), Acholi (Sudan and Uganda), Langi (Uganda), Alur (Uganda), Chopadholla (Uganda) and Luo (Uganda, Kenya, Tanzania). Kikuyu, Embu, Meru, Akamba in Kenya are closely related dialects. The Bari-speaking people in the Sudan have been “analytically chopped up” into Mondari, Bari, Nyangbara, Fajelu, Kakwa (Uganda, Sudan, Zaire), and Kuku (Uganda and Sudan). Kipsigi, Nandi, Pokot, Elgeyo Marakwet are not separate languages, but rather dialects of Kalengin. Muerle, Boya, Lopit, Tenet in the Sudan are mutually intelligible. In Ghana, the Akan have been in the anthropological literature referred to as Ashanti, Fanti, Agona, Kwahu, Akim, Akuapim, Nzema, and even sub-units of these like Ahanta, Gomua, Edina etc. The Gbe/Ewe-speaking people can be found in communities all along the West African Coast from Ghana through Togo, Benin and to the Nigerian border area. This cluster which has been orthographically harmonized by the Labo-Gbe Center in Benin and CASAS includes Aja in Badagry/Nigeria, Aja in Benin, Gun in Benin, Mina in Benin, Fon in Benin, Mina and Ewe in Togo, and Ewe in Ghana. In East Africa, the Teso, Kumam, Karamojong, Nyangatom, Dodos, Jie, Turkana, Toposa, Donyiro collectively cover areas in Ethiopia, Kenya, Uganda and the Sudan. The Nguni are found in Tanzania where they closely relate ethno-linguistically to the Nyamwezi, Ngoni, and Konde. They are also located in Malawi. Nyanja in Zambia and Cewa in Malawi are practically the same. In Mozambique, Shangaan/Tsonga/Ronga, are mutually intelligible Nguni variants. But they have phonologically and morphologically grown away from the other languages in the cluster. Nguni in Swaziland is called Swati, Kangwane in northern Natal/Zululand, Zulu in South Africa, Xhosa in South Africa, Ndebele in South Africa and Matabeleland in Zimbabwe. Some classifications even would count as separate languages narrow dialectal sub-forms of Xhosa like Bomvana, Cele Baca, Gcaleka/Ngqika, Hlubi, Mpondo, Mpondomise, Ntlangwini, Tembu and Xesibe. The Sotho-Tswana cluster is to be found as Tswana in Namibia, Tswana in Botswana, Lozi in Barotseland/Zambia, Sotho in Lesotho, and Pedi in South Africa. Again in East Africa, the Interlacustrine Bantu have a high degree of mutual intelligibility. They include the Nyoro, Toro, Haya, Ganda, Ankole, Rwanda. Rendille-Somali and Oromo and Borana are literally closely related pairs. Maasai and Samburu are equally close.

Heine has identified four key objectives, which motivate the classification of African languages. These are, firstly, the need to bring some

order to the multiplicity of African languages (*referential classification*); secondly, a search for origins of these languages (*genetic classification*); thirdly, the inter-linguistic influences between these languages (*areal classification*); and fourthly, the establishment of the structural convergencies and divergencies between African languages (*typological classification*). Heine argues that these different types of classification serve different goals and functions, and that indeed, “non-awareness of the different functions of these classifications may lead to scientifically untenable results.” A good example of the pitfalls of this methodological mess is provided by Malcolm Guthrie who “confused two different types of classification by grafting and superimposing a genetic classification on a referential one—with the effect that his reconstruction of Bantu pre-history turned out to be at variance with the historical facts he had intended to describe” (Heine, 1993, p. 1).

#### WORK IN PROGRESS

The role of language and literacy in contemporary African social life depicts peculiarities which are increasingly unique in the post-colonial world. There is a fairly decisive difference between the languages of the elites and the languages of the broad societal majorities. The elites continue to be social constituencies which utilize erstwhile colonial languages; French, English and Portuguese. The technical instrument required for social performance in the culture of African elites is literacy in the language of the former colonial power. The masses of African countries have little or no facility in these languages. In African societies, the colonial languages are social symbols of power (Brock-Utne and Holmarsdottir, 2003, p. 80). All public business and governmental matters are transacted in these languages, and therefore those that have skills in these languages control all public and government business. These realities are considerably different from the experience of post-colonial Asia.

#### *Indigenous and Colonial Languages and Literacies*

About 35 years ago, Gerald Moore made a number of perceptive observations which bear on the considerations here. He wrote that; “In the British West Indies, as successive waves of African, Indian and Chinese immigration spent themselves upon the shore, forgetting in a generation or two the very provinces whence they had come, English in a variety of dialect forms gradually established itself as the unique language of the region. In Asia and Africa it became, at least temporarily, the language of government, of higher education and, more important still, of higher status. In Asia, however, the withdrawal

of imperial control revealed how precarious the situation of the language really was. Their volume of literary activity in languages such as Bengali, Tamil, Gujarati, Malay and Urdu, together with the gradual decline of English usage in public life, suggests that ultimately the imperial language may prove as marginal as the English presence itself; whilst in tropical Africa only the recent spread of mass education has offered it the possibility of escape from an equally marginal role.” (Moore, 1969, p. xi) In the third of a century, which has passed since these points were made, the role of English in Africa has not gone beyond the narrow elite which is able to use the language with any degree of accomplishment.

By and large, mass literacy education campaigns in Africa have had little impact in effectively spreading the English language. What can however be said is that its role as the linguistic basis for the exercise and the administration of power in former British colonial Africa remains entrenched. Moore added that; “. . . historical experience confirms that a language which remains the property of a small elite cannot provide the basis for a national culture. A recent parallel would be the use of French by polite society in nineteenth century Russia.” (Moore, 1969, p. xi) Similarly, Latin could not provide a basis for national cultures in Roman Europe. In contemporary Africa the development of even outlines of national cultures after almost a half-century of post-colonialism continue to be elusive.

Two decades ago, Jack Goody made insightful remarks on this issue. He wrote that; “indeed part of the phenomenon called neo-colonialism has to be seen in terms of this very openness which is associated with the absence of a strong, written tradition that can stand up against the written cultures of the world system.” (Goody, 1989, p. 86) Goody’s judgement here is persuasive but the additional point has been made that while a written culture has made the resistance against cultural neocolonialism of parts of Asia more successful, what has perhaps been most central in this cultural resilience has been the standing of the world religions of the Near East and Asia proper. Western cultural penetration of the non-western world never successfully undermined the status of the major religions of Asia the way they successfully did in Africa (Prah, 2001, p. 125).

The process of knowledge production in Africa is represented in two histories. There is the indigenous knowledge which precedes the colonial encounter and which has been the result of the age-long transmission of knowledge from generation to generation. The language base of this knowledge in Africa has largely been orally constructed. For this reason as a knowledge depository it irredeemably leaks. Collective memory cannot be held and transferred as integer knowledge with any reliability. With the establishment of western presence and institutions,

the processes of knowledge production in Africa were superseded by western modes of knowledge production built into the introduction and use of western languages. This latter form of knowledge production ignored the preceding processes of knowledge production founded on African languages. In effect, two parallel processes for the construction of knowledge were established.

### *Record of African Scripts*

For the most part, until a century ago African societies were preliterate. Literacy based on the Roman alphabet is no more than a century and a half old for the majority of African societies. There are, however, some languages with a long tradition of writing and which employ scripts other than the Roman. The Arabic script has been used to write a number of African languages. Such usage is described as *ajami* in Arabic. They include languages like Swahili, Hausa, Wolof, Fulfulde, Kanuri, and Bambara and others. In all these cases, in more recent times, Roman letters have replaced the Arabic script. The earliest Afrikaans scripts (South Africa) were written as *ajami*. This goes back to the historical record of the early Malay Moslem slaves who were brought into the Western Cape of South Africa from Java by the Dutch colonists. Ethiopic, the old Semitic script from antiquity, is still used to write Geez, Amharic, and Tigrinya, and the Greek alphabet in a revised and adapted form was used for writing Coptic and Nobiin (Old Nubian). Hunwick informs us that; Mansa Musa historically was the best known ruler of the Mali empire. After his return from pilgrimage to Mecca in 1325 he ordered the construction of the Great Mosque of Timbuktu. The construction of the great mosque established Timbuktu's status as an Islamic city, and over the next 200 years Muslim scholars were drawn to it, so that by the mid-fifteenth century Timbuktu had become a major center of Islamic learning under African cultural conditions.

Timbuktu's most celebrated scholar Ahmad Baba (1564–1627) claimed that his library contained 1600 volumes, and that it was the smallest library of any of his family (Hunwick, 2003, p. 2). Libraries supporting the Timbuktu manuscript tradition have for centuries been numerous. There are in Timbuktu alone today some 20 private manuscript libraries and about 100 in the sixth region of Mali (Hunwick, 2003, p. 2). In effect “Arabic was to Muslim Africa what Latin was to medieval Christian Europe (Hunwick, 2003, p. 2).

Over and above all these “imported” scripts, Africa has a few indigenous examples of written forms. Until 1972 when the latin script was adopted by the Siad Barre administration, Somali was unofficially, but popularly rendered in the Osmania script devised by Osman Yusuf

Keenadiid. While it was in form a good part Ethiopic, it had also Arabic and Italian influences.

The Vai script, strictly speaking a syllabary or a catalogue of characters, each of which denotes a syllable rather than a single sound, was created in the 1830s by Momadu Bukele. It remains popular in Liberia, particularly among the Vai, where it is mostly used in informal correspondence. More recently, in the sub-region, Mende (A purely phonetic Mende script from Sierra Leone was devised around 1920 by Kisimi Kamala), Loma, Kpelle and Bassa, have developed related script, which lean on the Vai example. All of these, like the Vai example are syllabaries. An alphabet, Nko was devised by Souleyman Kante in 1949. Till today, it is used very restrictedly and primarily by speakers within the Mandingo, Malinke, Bambara, Dioula, Kasonke cluster, especially in Guinea, Mali and Ivory Coast. A Bambara “Ma-sa-ba” syllabary was devised by Woyo Couloubali in the Kaarta region of Mali in 1930. Between the decade spanning 1920 and 1931, syllabaries had appeared for Mende, Bassa, Loma, Kpelle, Efik-Ibibio. An earlier esoteric alphabet has been in use for about a century among the Efik in southeastern Nigeria. Better known, perhaps, and historically better widely studied is the Bamum script (Shūmon) invented and developed under the direction of King Njoya of southern Cameroon. It was originally conceived as a logographic system, and was gradually changed by successive royal edicts first to a syllabary and subsequently to an alphabet (Berry et al. 1970, p. 88). After 1910, his scribes began compiling the chronicle of the Bamum Kingdom. This was finished during the 1920s in the closing years of Njoya’s reign (Dugast and Jeffreys, 1950). In sum, specifically in West Africa, over the past century a number of indigenously conceived writing systems have been produced. Most of them have from the start been largely esoteric and invariably religious in inclination. There is also the particularly interesting case of *Oberi Okaimé* a language which was created by members of a millenarian sect based in the village of Ikpa in the Itu Division of Calabar Province in 1931. The sect was founded in 1927, but the language emerged in 1931. There is no evidence that the language and script survived beyond the 1930s. None of these African scripts has been effective competition to the colonially introduced Roman alphabet. None seriously moved outside the narrow confines of small exclusivist groups, often semireligious. It is interesting to note that this religious dimension of literacy and scripts is shared by religious communities as historical entities in other parts of the world.

Apart from Ethiopian clericalism, Coptic priesthood and African muslim scholarship, literacy as a sociological phenomenon, in old Africa, never fully emerged. The developers and custodians of the African scripts referred to here like the Efik, Bassa, Vai, Loma and Bamum never

formed a composite and coherent priesthood to consolidate, protect and elevate the scripts. This fact may be important in our attempt to understand the absence of literacy in large parts of old Africa.

#### PROBLEMS AND DIFFICULTIES

When modern literacy came to Africa through the western encounter, the principal agents for its spread were missionaries. Literacy in Africa therefore first made an impact as a way in which the Christian traditions of the west could be transferred to the mind of the African. For this very reason, literacy in Africa introduced by the missionaries was undertaken in African languages, close to the hearts and minds of the people and the first book that was invariably translated was the Bible. Thus literacy for the missionaries was meant in the first instance to serve purely Christian ideals. But rivalries between various Christian church groups and sects were transferred into the forms of orthographies adopted by competing missionary groups. Very frequently rival missionary groups would for the same language, indeed the same dialect translate the Bible using totally different orthographic and spelling systems.

The colonial administrators, especially in the early stage of the establishment and consolidation of colonial rule largely left the tasks of education in the hands of missionaries. The first schools and some of the most prominent schools in Africa today remain missionary schools or schools with distinct Christian affiliation. Slowly as colonial administrations became entrenched, economic, social and political interests move more prominently to the fore in the organization of colonial societies. The administrations were anxious that the products of missionary education could serve the intentions of the colonial administrations. Like Macaulay's intended product which he described in his *Minute on Indian Education, (1835)* for the British Raj, colonialism created "a class who may be interpreters between us and the millions whom we govern; a class of persons, Indian in blood and colour, but English in taste, in opinions, in morals, and in intellect."

Frequently, in the early stages of the introduction of western literacy and education Africans would resist, but with time almost all acquiesced. In British colonial Africa schools like King's College (Budo, Uganda) King's College (Lagos, Nigeria), Achimota College (Achimota, Ghana) quickly acquired reputations for the English literacy proficiency of their pupils. These schools, organized along British public school lines, reproduced in colonial Africa literacy standards in English which permitted pupils to transit from these colonial schools to British universities with relative ease. For as long as colonialism lasted these standards held. Currently in the post-colonial situation from all parts of

Anglophone Africa reports suggest that the literacy skills of students in English are rapidly falling. This is a phenomenon, which is also noticeable in French-based universities in Francophone Africa.

In post-Apartheid South Africa, at university level, poor English communication skills are particularly noticeable amongst African language-speaking students. However, these constraints are by no means exclusive to them. Some lecturers have also pointed out that, the quality of written Afrikaans is also deteriorating. This is happening in a society in which the governmentally engineered supremacy of Afrikaans under Apartheid has over the past ten years been popularly reversed. It is observable that in post-apartheid South Africa, English is fast gaining ground over all the other languages. Although the government on paper has elevated the status to equality of all eleven official languages, in practice there appears to be little use of the African languages for official tasks. In a conversation held with the African National Congress (ANC) parliamentarian Duma Nkosi on the 11 October 2000, he suggested that even in Parliament there are members who battle to express themselves effectively in English. Sometimes the inadequacies of their linguistic expression distort the meaning they wish to convey.

#### FUTURE DIRECTIONS

Literacy estimates for Africa generally stand at around 50%. But literacy figures for Africa are notoriously unreliable. Apart from the problems of certifiable counting methods, there is the more serious problem of frequently not counting literacy in African languages. Strikingly, literacy in African languages, where it exists, in the absence of literature is tenuous. Literature in African languages continues to be predominantly religious. In many areas, the Bible is the most available text in African languages.

Tanzania is possibly the most successful country in sub-Saharan Africa with regard to literacy in African languages. It is the only country where more newspapers in African languages are sold than English, French or Portuguese newspapers. But even then it is a success story built on one language, Kiswahili. Indeed, on the whole continent newspapers in Kiswahili constitute the overwhelming majority of papers in African languages.

The challenges of democracy and underdevelopment can only be met when Africans begin to work as literate societies in African languages. To do this there is need for the harmonization of mutually intelligible languages so that on the economies of scale the production of literature becomes profitable and cost-wise within reach for the masses. African development must mean the development of literacy in African languages.

## LITERACY MYTHS

### INTRODUCTION

Literacy Myth refers to the belief, articulated in educational, civic, religious, and other settings, contemporary and historical, that the acquisition of literacy is a necessary precursor to and invariably results in economic development, democratic practice, cognitive enhancement, and upward social mobility (Graff, 1979, 1987). Despite many unsuccessful attempts to measure it (Inkeles and Smith, 1974), literacy in this formulation has been invested with immeasurable and indeed almost ineffable qualities, purportedly conferring on practitioners a predilection toward social order, an elevated moral sense, and a metaphorical “state of grace” (Scribner, 1984). Such presumptions have a venerable historical lineage and have been expressed, in different forms, from antiquity through the Renaissance and the Reformation, and again throughout the era of the Enlightenment, during which literacy was linked to progress, order, transformation, and control. Associated with these beliefs is the conviction that the benefits ascribed to literacy cannot be attained in other ways, nor can they be attributed to other factors, whether economic, political, cultural, or individual. Rather, literacy stands alone as the independent and critical variable. Taken together, these attitudes constitute what Graff (1979, 1987) has called “the Literacy Myth.” Many researchers and commentators have adopted this usage.

Contemporary expressions of the Literacy Myth are evident in cities’ sponsorship of book reading, celebrity appeals on behalf of reading campaigns, and promotions by various organizations linking the acquisition of literacy to self-esteem, parenting skills, and social mobility, among others. Individuals are seen to be “at risk,” if they fail to master literacy skills presumed to be necessary, although functions and levels of requisite skills continue to shift (Resnick and Resnick, 1977; Brandt, 2001). In stark, indicting versions of the myth, failures to learn to read and write are individual failures. Those who learn to read and write well are considered successful, whereas those who do not develop these skills are seen as less intelligent, lazy, or in some other way deficient (St. Clair and Sadlin, 2004). These and other versions of the Literacy Myth shape public and expert opinions, including policy

makers in elementary and adult education, and those working in development work internationally.

Such attitudes about literacy represent a “myth” because they exist apart from and beyond empirical evidence that might clarify the actual functions, meanings, and effects of reading and writing. Like all myths, the Literacy Myth is not so much a falsehood but an expression of the ideology of those who sanction it and are invested in its outcomes (see, e.g., Goody, 1968, 1986, 1987; Goody and Watt, 1968; Havelock, 1963, 1976, 1986; Olson, 1977, 1994); for contrasting perspectives, see Akinasso, 1981; Collins and Blot, 1995; Graff, 1995a; Graff and Street, 1997). For this reason, the Literacy Myth is powerful and resistant to revision. This chapter examines the scope of the Literacy Myth, considering its varieties, its meanings, and its implications for policy makers in education and other fields who would use literacy in the service of large-scale social and economic transformations.

#### DEFINITION AND MEASUREMENT ISSUES

Problems inherent in the “literacy myth” begin with confusions over the meanings of the word “literacy” and efforts to measure it. Literacy has been defined in various ways, many offering imprecise and yet nonetheless progressively grander conceptions and expectations of what it means to read and write, and what might follow from that practice. For example, literacy has been defined as in terms of standardized test scores such as the Scholastic Aptitude Test or the Armed Forces Qualifying tests; the completion of a specified grade-levels in school; and a generalized form of knowledge (Pattison, 1984) such as “computer literacy,” “financial literacy,” “civic literacy,” neologisms as facile as they are inexact. In other contexts, literacy may be conflated with its desired ends, as when it is represented as “an agent of change,” a formulation that confuses relationships of cause and effect.

The vagueness of such definitions allows for conceptions of literacy that go beyond what has been examined empirically, thus investing literacy with the status of myth. Since mythos is grounded in narrative, and since narratives are fundamentally expressions of values, literacy has been contrasted in its mythic form with a series of opposing values that have resulted in reductive dichotomies such as “oral-literate,” “literate-pre-literate,” “literate-illiterate,” and other binaries that caricature major social changes. In such hierarchical structures, the “oral,” “preliterate,” and “illiterate” serve as the marked and subordinate terms, whereas “literate” and “literacy” assume the status of superior terms (Duffy, 2000). Such hierarchies reinforce the presumed benefits of literacy and so contribute to the power of the myth (for detailed

examples, see Finnegan, 1973, 1988; Goody, 1986, 1987; Havelock, 1963, 1976, 1986; Ong 1967, 1977, 1982).

We define literacy here not in terms of values, mentalities, generalized knowledge, or decontextualized quantitative measures. Rather, literacy is defined as basic or primary levels of reading and writing and their analogs across different media, activities made possible by a technology or set of techniques for decoding and reproducing printed materials, such as alphabets, syllabaries, pictographs, and other systems, which themselves are created and used in specific historical and material contexts (see Graff, 1987, pp. 3–4). Only by grounding definitions of literacy in specific, qualified, and historical particulars can we avoid conferring on it the status of myth.

#### EARLY DEVELOPMENTS: HISTORICAL PERSPECTIVES

In contrast with its presumed transformative “consequences,” literacy historically has been characterized by tensions, continuities, and contradictions. In classical Greece, where the addition of characters representing vowel sounds to Semitic syllabaries is seen by some as the origin of the first modern alphabet (Gelb, 1963), literacy contributed to the Greek development of philosophy, history, and democracy (Harris, 1989; Havelock, 1963, 1986). Yet literacy in classical Athens was a conservative technology, used to record the cultural memories of an oral civilization in a society based on slavery. Though achievements in the development of popular literacy in fifth-century Rome were substantial, they resulted neither in democratization nor the development of a popular intellectual tradition (Graff, 1987). Neither did the invention of the printing press in fifteenth-century Europe lead to swift or universal changes in prevailing social, political, and economic relationships. These came more slowly.

By the eighteenth and nineteenth centuries in Europe and North America, literacy was seen as a potentially destabilizing force, threatening the established social order. Conservative elites feared that the widespread acquisition of reading and writing skills by the masses—workers, servants, and slaves—would make them unfit for manual labor and unwilling to accept their subordinate status. Education for the popular classes was often discouraged, in fear it might lead to discontent, strife, and rebellion. In some settings, reading and writing instruction was legally withheld, as was the case with slaves in the south USA. Implicit in these views was the suspicion that literacy was a precondition of intellectual, cultural, and social transformation, by which individuals might redefine themselves and challenge existing social conditions.

The reactionary view of literacy was largely trumped in the last decades of the eighteenth century and the first half of the nineteenth century by reformers. These reformers grasped the potential of schooling and literacy as a means for maintaining social control. In their view, education—whether in public or private institutions—was a means through which to instill discipline and prepare the working class for their places in an increasingly urban, industrial society. This meant that literacy lessons in the schools were offered not for their own sake, as a means for promoting intellectual and personal growth, but were instead taught as part of a larger project of instilling generally secular moral values and faith in commercial and industrial capitalism. The destabilizing potential of literacy remained, but it was moderated by education that emphasized discipline, good conduct, and deference to authority. In this way reformers seized on literacy as a central strategy for maintaining social control.

The roots of this perspective are found in religious groups and secular reformers who competed to uplift and save the souls of the poor, and who also competed to influence expanding school systems. Religion, especially but not only Protestantism after the Reformation, was the impetus for learning to read. The Bible served as both the repository of spiritual salvation and an important primer for new readers.

Building on the foundation of the Enlightenment, the second half of the nineteenth century witnessed the emergence of a synthesis of major influences on social thought—idealism, scientism, evolutionism, positivism, materialism, and progressivism—that encouraged belief in the eventual if not inevitable improvement of human beings and society. Literacy was seen to be intrinsic to these advances, a technology through which faith in the progress of civilization and human improvement might be validated. The preferred venue for managing literacy was mass popular education.

This association of literacy with ideology, values, and a stable social order provides a historical basis of the literacy myth.

## MAJOR ELEMENTS OF THE MYTH

### *The Myth of Decline*

In contemporary popular discourse, literacy is represented as an unqualified good, a marker of progress, and a metaphorical light making clear the pathway to progress and happiness. The opposing value of “illiteracy,” in contrast, is associated with ignorance, incompetence, and darkness. Advertisements run by the National Center for Family Literacy in USA, for example, show an adult and a smiling child accompanied by a text that reads in part: “Because I can read. . . I can understand. . . live

my life without fear, without shame.” Given such sentiments, it is hardly surprising that discussions of literacy would be characterized by persistent fears of its decline. Indeed, much of the contemporary discourse on literacy evokes what John Nerone (1988, Introduction, *Communication* 11,1 qtd. in Graff, 1995a, xvii), has called “a sense of the apocalypse.” In this discourse, the decline of literacy is taken as an omnipresent given and signifies generally the end of individual advancement, social progress, and the health of the democracy. Such associations represent a powerful variant of the Literacy Myth.

The narrative of decline extends beyond literacy to encompass the state of education generally, both higher and lower, as well as the state of society, morality, and economic productivity. In USA, the decline of tests scores in reading assessments is said to represent one “crisis”; the rise in reading “disabilities” another; the movement away from sound reading and writing pedagogy yet another (McQuillan, 1998; see also Graff, 1995a). Where the evidence does not support a decline in literacy rates among the general population, there is a perceived crisis over the kinds of literacy that are or are not practiced—for example, the crisis of declining numbers of people reading “good” literature, said to represent a threat to the ideals of participatory democracy (see, for example, NEA, 2004).

That the myth of decline is largely unsupported by empirical evidence has done little to reduce its potency in contemporary discourse. Rather, the myth is argued by anecdote, often rooted in nostalgia for the past. Moreover, protestations over the decline of literacy are often a prologue for a more sustained argument for a “back to basics” movement in schools. If literacy has declined, it is because schools have strayed from teaching the fundamentals of reading, arithmetic, and other subjects defined, indistinctly, as “the basics.” However, as Resnick and Resnick (1977) illustrate, expectations concerning literacy have changed sharply over time, as standards have been applied to large populations that were once applied only to a limited few. It may prove difficult to go back to basics, Resnick and Resnick have written, if “there is no simple path to which we can return” (p. 385).

The myth of decline also neglects the changing modes of communication, and in particular the increasing importance of media that are not wholly reliant on print. Developments in computer technology and the Internet have combined to change the experience of what it means to read, with print becoming but one element in a complex interplay of text, images, graphics, sound, and hyperlinks. The bias toward what Marcia Farr (1993) called “essayist literacy,” or formal discursive writing characterized by strict conventions of form, style, tone, both resists and fails to comprehend such changes. Such resistance and failures also have historical antecedents; changes in the technologies of

communication have always been accompanied by apprehensions of loss. Plato's notorious distrust of writing was itself a rejection of a technology that threatened the primacy of dialectic in favor of a graphical mode of communication (see, for example, Havelock, 1963).

The myth of decline, then, is an expression of an ideology in which a particular form of literacy is seen to represent a world that is at once stable, ordered, and free of dramatic social change. More than nostalgia for a nonexistent past, the myth of decline articulates a conception of the present and the future, one in which specific forms of literacy practice exemplify an ideological commitment to a status quo that may have already past.

### *The Myth of the Alphabet*

Perhaps the strongest claims concerning literacy have been those attributed to the alphabet, whose invention in classical Greece was said to herald a great leap forward in the progress of human evolution. The "alphabetized word" was said to release human beings from the trance of tribalism and bring about the development of logic, philosophy, history, and democracy. To its proponents, the development of alphabetic literacy brought about profound changes in the very structure of human cognition, as the written word, liberated by its material nature from the "tyranny of the present" (Goody and Watt, 1968), could be objectified, manipulated, preserved, and transmitted across time and distances, leading to the development of abstract thought. Pictographs, hieroglyphs, and other forms of representing speech were seen as prior and inferior to alphabetic literacy, which could more easily represent concepts—justice, law, individualism—and thus engendered the beginnings of philosophical thought.

The bias toward the alphabet resulted in what its proponents called a "great divide" (Goody and Watt, 1968; see also Havelock, 1963, 1976, 1986; Olson, 1994, 1977), with rational, historical, individualistic literate peoples on one side, and "nonlogical," mythical, communal oral peoples on the other. Among other things, such conceptions led to serious misunderstandings of non-Western writing systems, such as those of the Chinese and the Japanese, which were erroneously thought to be inferior to the Western alphabet (Finnegan 1973, 1988; Gough, 1968; Street, 1984, 1995). In the most extreme versions of the myth, the alphabet was seen to represent the beginnings of civilized society.

In the nineteenth century, the myth of the alphabet was an element of the broader narrative of Western history and worked to ratify the educational, moral, and political experiences of colonial Western powers with the cultures of the colonized, especially those that did not practice literacy. To the extent that the alphabet was identified with civilization,

its dissemination to nonliterate, nonindustrial, supposedly “primitive” cultures was intrinsic to the larger project and rhetoric of colonial expansion. These attitudes were not confined to colonial contexts but applied, as well, to minority populations in schools, workplaces, and communities, all of which might be “improved” by learning the literacy practices of the dominant group. In this way literacy, and alphabetic literacy in particular, has served as what Finnegan (1994) called the “mythical charter” of the dominant social and political order. The great debates of the past two centuries over reading pedagogy and instructional methods—for example, phonics, phonetics, “look-see” methods, and others—continue to reflect questions about the uses and powers of alphabets. In contemporary debates, they reflected divisions over order and morality as well as pedagogy (Graff, 1979).

#### WORK IN PROGRESS

##### *Literacy and Economic Development*

The assumed link between literacy and economic success is one of the cornerstones of Western modernization theories. Literacy or at least a minimal amount of education is presumed to be necessary and sufficient for overcoming poverty and surmounting limitations rooted in racial, ethnic, gender, and religious differences. Implicit in this formulation is the belief that individual achievement may reduce the effects of social and structural inequalities, and that economic success or failure corresponds at least in part to the quality of personal effort.

On a collective scale, literacy is thought to be a necessary precondition of modernization, a cause and correlate of economic growth, productivity, industrialization, per capita wealth, gross national product, and technological advances, among other advances (Graff, 1979, 1987; Levine 1986). Literacy in this view becomes a commodity to be exported by the developed areas to so-called “developing nations,” enabling individuals and nations to participate in the ongoing processes of globalization and partake of their presumed rewards.

Despite such expectations, there is little evidence that increasing or high levels of literacy result directly in major economic advances. Indeed, historical scholarship suggests that in the short run, at least, industrialization may be incidental to literacy development or vice versa, or even work to the detriment of opportunities for schooling. Literacy among the workforce was not a precondition to early industrialization in England and North America, for example. Schofield (1973) found that the literacy rates of textile, metal, and transport workers declined in the late eighteenth century, as these occupations did not require advanced reading and writing skills. Additionally, the demand for child labor

disrupted education, as children in the factories had fewer opportunities to attend school. Industrial development may have depended on the inventiveness or innovativeness of a relative few, and thus stimulated their literacy development. It may equally have been disruptive to the lives of many other individuals, their families, their customary work and relationships, and their environments including arrangements for schooling (Furet and Ozouf, 1983; Graff, 1979; Levine, 1980).

It is possible that in nineteenth-century England and elsewhere, to a significant extent, training in literacy was not so much for the purpose of developing skills to promote social, cultural, or economic advancement as it was “training in being trained” (Graff, 1979, p. 230, paraphrasing R. Dore, 1967, *Education in Tokugawa Japan*, Routledge and Kegan Paul, London, p. 292). Schooling and literacy education were the first steps in reordering the values and customs of rural populations entering the Industrial Age, instilling in them the industry, thrift, order, and punctuality required for the successful operation of the factory and a new social order beyond it. Literacy was not primarily or by itself a vehicle for economic advancement, but rather a means of inculcating values and behaviors in the general population that made large-scale economic development possible.

Recent scholarship does not support the assumption that literacy leads directly to economic advancement. Brandt (2001), for example, found that the value of literacy to individuals in the twentieth-century US was influenced by more general social, political, and technological transformations that sometimes elevated the importance of literacy skills but at times undercut or undervalued them. Farmers, teachers, and others in Brandt’s study, for example, found that literacy skills learned in the early part of the century were made less valuable or even obsolete by technological, institutional, and economic transformations of the latter part of the century. New forms of literacy training, specific to the needs to changing workplaces and communities, were required to advance or simply maintain one’s former status. Literacy, in sum, did not change society. Rather, literacy itself was changed—its forms, uses, and meanings—in response to its environment. Such observations make clear that literacy’s and schooling’s contribution to economic development merit further detailed study, and that the presumptions of the Literacy Myth demand even more careful qualification.

## PROBLEMS AND DIFFICULTIES

### *Democracy, Literacy, and the Social Order*

One of the central tenets of the democratic state is that an educated, informed, and participatory voting public is necessary for the

functioning of democracy. In this perspective, one must be able to read and write to understand the issues of the day and think critically about the choices required in a democracy. While that formulation is undoubtedly true, it is also incomplete. It requires the further recognition that literacy and education are necessary but not sufficient conditions of a functioning democracy, which also relies on participation, debate, and a diversity of viewpoints. Although literacy and education can and have been used to stimulate democratic discourse and practices, it is equally true that literacy has been used to foster political repression and maintain inequitable social conditions.

History helps us to understand such tensions. Nineteenth-century schoolbooks stressed the doctrines of order, harmony, and progress, while ignoring or justifying social conflicts and inequities (Graff, 1987, p. 326). Beyond the economic imperatives discussed previously, the purpose of literacy in these contexts was self-consciously conservative, a means for imposing morality, reducing criminality, lessening diversity, and encouraging deference to the established social order, especially in difficult times of change. Literacy was not a means for promoting democracy but rather an instrument for imposing social control. Yet literacy could be and was appropriated by groups and organizations promoting radical social change, for example, among Chartists in nineteenth-century Great Britain and skilled labor organizers more widely. In the shop, meeting hall, and street, oral and written media came together. National literacy campaigns such as those in Cuba and Nicaragua also reflect the dialectical tensions of the literacy myth. Such movements propel literacy workers to action, raise literacy rates significantly, and allow for individual and group development. But literacy remains under the direction of political ideology and doctrine (Arnové and Graff, 1987). Only in the literacy myth does literacy operate as an independent variable.

The functioning of a mature democracy depends on political structures and economic conditions that make participation possible for citizens. Literacy and education are important to the extent that they emphasize critical thinking, open debate, and tolerance for opposing views. Literacy by itself is not a cause for freedom and a guarantee of a working democracy. It is instead one of the many important variables that influences the lives of citizens and their relationship to their governments.

## FUTURE DIRECTIONS

### *Lessons of the Literacy Myth*

Myths can be expressions of collective desires, of the many and the few, of their differential agency and power. Perhaps the Literacy Myth

expresses a hope that literacy alone is enough to end poverty, elevate human dignity, and ensure a just and democratic world. A less benign reading is that the Literacy Myth is a means through which to obscure the causes of social and economic inequities in Western society at least by attributing them to the literacy or illiteracy of different peoples. In such a reading, literacy is a symptom and a symbol. Either way, the consequences of accepting uncritically the Literacy Myth are continuing to misunderstand the nature of literacy, its development, uses, and potentials to foster or inhibit social and economic development.

To argue that literacy has been accorded the status of myth is not to discount the importance of reading and writing, or to suggest that these are irrelevant in the contemporary world. That is clearly not the case. However, we may contrast the Literacy Myth, and its seamless connections of literacy and individual and collective advancement, with the more complex and often contradictory lessons that are consistent with historical and recent literacy development and practice.

One critical lesson is that literacy is not an independent variable, as in the Myth. It is instead historically founded and grounded, a product of the histories in which it is entangled and interwoven, and which give literacy its meanings. Ignorance of the historical record, in which crucial concepts, notions, arrangements, and expectations about literacy have been fashioned, severely limits understanding. Related to this, second, we must grasp the fundamental complexity of literacy, the extent to which it is a product of the intersection of multiple economic, political, cultural, and other factors. This realization mandates rejecting the simple binaries of “literate–illiterate,” “oral–written,” and others that have been used to postulate a “great divide.” These constructs have been used to sort individuals and cultures in ways that are as damaging as they are conceptually inadequate. The legacies of literacy point instead to connections, relationships, and interactions.

In the Literacy Myth, reading and writing are a universal good and ideologically neutral. However, in a third lesson, the history of literacy and schooling demonstrates that no mode or means of learning is neutral. Literacy is a product of the specific circumstances of its acquisition, practice, and uses, and so reflects the ideologies that guide these. School literacy, in particular, is neither unbiased nor the expression of universal norms of reading and writing; it reflects the structures of authority that govern schools and their societies.

Finally, despite the apparent simplicity of the literacy myth, the historical record points to a much richer and diverse record. It underscores the multiple paths to literacy learning, the extraordinary range of instructors, institutions, and other environments, of beginning “texts,” and of the diversity of motivations for learning to read and write. While mass public schooling today presents the most common route for

individuals learning to read and write, the diversity of learners, including adult learners, in Europe and North America demands flexible understandings and pedagogies for literacy development. There is no single road to developing literacy. Different societies and cultures have taken different paths toward rising levels of literacy. This suggests that the presumed “consequences” of literacy—individual, economic, and democratic—will always be conditioned by the particulars of time, situation, and the historical moment.

Such reflections offer a more complex narrative than that of the Literacy Myth. They may also point toward new and different ways of understanding, using, and benefiting from the broad and still developing potentials that literacy may offer individuals and societies (Graff, 1995a,b).

## LITERACY AND INTERNET TECHNOLOGIES

### INTRODUCTION

A review of research in literacy and Internet technologies, broadly speaking, reveals as much about the current theoretical and ideological paradigms operating in any time period as it does about technology's relationship to literacy. Thus, prior to beginning our discussion, it seems important to bracket our own concerns and investments about literacy and Internet technologies. First, following distinctions regarding information and communication technologies made by Lankshear and Knobel (2003, pp. 72–73), our treatment of technology is particularly invested in interactive and networked computing media, in contrast to stand-alone and noninteractive media. Second, we are chiefly concerned with literacy learning as not merely involving encoding and decoding, but rather, participating in particular sociocultural practices and discourses leading to one's competent handling of texts as an insider. Third, our understanding of relations between literacy and Internet technologies destabilizes conventional understandings of literacy as fundamentally concerned with alphabetic print. While print remains important to practices involving literacy and Internet technologies, print functions increasingly along with other semiotic modalities in order to make meaning, including sound, icons, graphics, and video.

In addition to bracketing literacy–technology relations as networked, as sociocultural, and as multimodal, our discussion is focused on how networked technologies fundamentally change the relationships of literacy to social relations, including one's relations to one's own identity. For example, while purpose and audience have very long histories in rhetoric, assumptions and configurations of purpose and audience are transformed through dynamic use of Internet communication, and purpose and audience may be continuously remixed through chains of distribution and exchange (Kress and Van Leeuwen, 2001). Moreover, social relations, through texts that may have worldwide distribution, are articulated through the local and global in new ways. We describe how such formations are beginning to be practiced and researched within literacy studies, in and out of school contexts, and future directions that such work might take.

## EARLY DEVELOPMENTS

The pre-history of the Internet is disputed and multifaceted, as is the relationship of the Internet's pre-history to literacy practices. For instance, if we decide to focus on the development of graphical World Wide Web browsers (e.g., NCSA Mosaic in 1993), which led to the rapid public explosion of Internet activity, then we would bracket out earlier literacy environments opened up by local area networks (LAN's), modems, and the like. Yet the picture is still more complicated than the technological story permits. For instance, an important date noted in on history of MUD's (multiuser dungeons) is the writing of Tolkien's *Lord of the Rings* (1937), a fantasy world that "formed the basis for most early gaming systems" (Burka, 1995). Over 40 years later (1978), the first MUD was developed at Essex University, where the acronym was associated with "Multiple Undergraduate Destroyer" due to its popularity among college students (<http://en.wikipedia.org/wiki/MUD>.) Thus, a decade and a half before the early web browsers, gamers were engaging in a text-driven world that combined elements of role-playing games with social chat. An extended history of literacy and Internet technologies, as they are related to education, would certainly include early practices in these pre-Internet environments.

Additionally, Minitel was launched in France in 1982 and quickly became a highly successful online service on which customers could make purchases, chat, check stock prices, make train reservations, access databases, and participate in other information and communication practices. As early as 1986, widespread access to Minitel (or Teletel) terminals resulted in several forms of educational practice in homes, schools, and university settings, including homework help lines, databases with model answers to national examination questions, and online registration for university courses (Guihot, 1989).

In the USA, an early paper, "Microcomputer Communication Networks for Education," (Laboratory of Comparative Human Cognition, 1982) describes the use of "non-real time" messaging (p. 32), in which teachers and students could write messages on microcomputers during the day and then send them overnight by telephone lines, saving the high cost and scheduling problems associated with real-time messaging. This group of developers and researchers described a pilot network connecting a classroom in San Diego with a classroom in rural Alaska, using Apple II computers. Early research interests included studying the complexity of discourse structures of multiple threads in online communication, and the problem of the quantity of messages ("electronic junk mail") received in such media. The group expressed the anxiety that unless teachers and students were given means to address such issues that Internet technologies might be abandoned as

a learning environment. They also initiated what is likely to be one of the earliest teacher education courses on literacy and ICT (information and communication technology), "Interactive Media for Education," offered at the University of California, San Diego, in the summer of 1982.

A parallel project to the research at UCSD introduced in Alaska in 1983 involved the creation of a computer program called QUILL whose purpose was to help upper elementary students develop as writers (Bruce and Rubin, 1993). Rather than teaching writing skills directly, QUILL contained tools through which teachers and students could create literacy environments in their own classrooms, including an electronic mail program. Bruce and Rubin's (1993) research documents how writing, through an electronic network, created cooperative learning conditions for teachers as well as students as well as particular effects through new, networked constructions of audience and purpose.

Two other areas of early work most relevant to literacy and Internet technologies include studies of reading hypertext and multimedia. Much of this work reflects the cognitive traditions that informed it in the 1980's to early 1990's. In their meta-analysis of hypertext studies from 1988 to 1993, Chen and Rada (1996) considered measures of effectiveness and efficiency for several different cognitive styles, and found a generally small overall effect size. However, Leu (2000) noted that early hypertextual studies contained relatively few multimedia resources than are currently available, and also may not have carefully teased out the interaction of prior knowledge with specific searching and learning tasks (p. 755). From early work on multimedia, we have some evidence that learners with limited prior knowledge tend to learn better with multimedia than with print, as do learners deemed to be "visual" or "auditory" in their learning styles (Kamil et al., 2000, p. 775). Daiute and Morse (1994), reviewing much of the multimedia research, concluded that appropriately combined images and sound might enhance both the comprehension and the production of text. However, Reinking and Chanlin (1994) also review problems with multimedia research, and Lankshear and Knobel (2003, p. 77) note how most multimedia research privileges print rather than studying how learners interpret and create multimodal meanings.

Early research on literacy and technology has been critiqued on a number of levels, and much of this criticism remains of relevance today. A primary critique is of the lack of research, especially in the early years of development. Kamil and Lane (1998) examined 437 research articles appearing in four major journals of reading and writing research during the period of 1990 to 1995 and discovered that only 12 of them were focused on issues of literacy and technology. With a focus on early childhood education, Lankshear and Knobel (2003, p. 64) expanded this type of research review to include journals from

Britain, the USA, and Australia for the years 1996–2002, and note the “extreme marginalization” within specialist reading and writing journals of research articles on technology and literacy.

### MAJOR CONTRIBUTIONS

We have organized our discussion to focus on major contributions in three categories that are foundational to understanding the changing nature of literacy in relation to Internet technologies: multimodality, sociality, and the intersection of the global and local.

#### *Multimodality*

Early work on the relationship between technology and literacy tended to focus on how technology transformed literacy. By way of example, leading literacy researchers in the influential volume, *The Handbook of Literacy and Technology: Transformations in a Post-Typographic World* (Reinking et al., 1998), considered the changing nature of literacy in a digital age. Interested in the shift from print to multimodal representation, the authors nonetheless were careful to underscore continuities as well. Lemke (1998), for instance, argued that

All literacy is multimedia literacy: You can never make meaning with language alone; there must always be a visual or vocal realization of linguistic signs that also carries non-linguistic meaning (e.g. tone of voice or style of orthography) (p. 284).

Although literacy has always been multimodal, contemporary literacy practices rely on an increasingly complex range of modalities. Conceptual work on technology has considered the relationship between the visual and linguistic modes, noting the shift to complex images and simpler texts that contain fewer embedded clauses (Kress, 2003). Communication technologies, which, as Leander (2004) argues, have received less attention in schools than information technologies, often blur distinctions between speech and writing, depending on aural modalities in unprecedented ways.

Many scholars have argued that reading and writing practices change with these changes in textual form and function (Leu, 2000; New London Group, 1996). They point out that Internet technologies require readers and writers to make meaning laterally across modes, sampling the multimodal resources available to them and interpreting an array of surface features and combinations of texts, genres, and modes. In this move from page to screen, reading practices associated with print, often described as linear or deep, can be viewed as *one* way of reading, rather

than *the only* way to be a competent reader (Kress, 2003). Kress and Jewett (2003, p. 16) claim that as the “logic of the image” replaces the “logic of writing,” there will be “far-reaching effects on the organization of communication, not just on the screen but also on the page, and on the mode of writing.” If this is true, then it follows that the reading and writing instruction common to most classrooms may be inadequate to prepare students for a wide range of reading and writing purposes and practices.

In contemporary youth culture, Mp3 players, such as the iPod, are having a significant impact in shaping multimodal literacy practices. As of 2006, the fifth generation of iPod, with its bundled software, iTunes, can store, transfer, and play most audio, photo, and video files of most popular formats. “Podcasting was coined in 2004 when people combined the words “iPod” with “broadcasting” to refer to the uploading and “posting of audio files online in a way that allows software in a person’s computer to detect and download new podcast automatically” (Lenhart, Madden, and Hitlin, 2005).” The rising popularity of podcasting lies in how it enables individuals to distribute their own “radio shows,” but it is also being used in various ways, including school’s distribution of course recordings as podcasts on iTunes. Flanagan and Calandram suggest that podcast’s multimodal affordances make it integrate naturally in auditory-dependent and humanities courses, supports field research, and enables multimodal presentation of student work. By complementing traditional media, podcasting may create different pathways for understanding and learning (Bull, 2005).

Since late 2004, new generation podcasts based on video, or “vodcasts” are joined by an array of online video activity (e.g., video blogs or “vlogs”) that signals something of the rapid increase in multimodal production and distribution by everyday users. Youtube.com, founded in 2005, is a “consumer media company” that offers free hosting for videos. With “Broadcast Yourself” as slogan, Youtube is designed to enable simple, fast, and free sharing and viewing of videos online. Among more than 12 million videos uploaded each day, many are personal, original productions, such as home movies, video blogs, and amateur film works. Others, in spite of site policy against copyright infringement, are often short clips from traditional media, including music videos, commercial, news broadcasts, and dubbed parodies of such.

### *Sociality*

New technologies shape and are shaped by social relations and practices. Since they are socially mediated, particular kinds of Internet technologies afford particular types of social relations. In a large-scale study

conducted by researchers in the United Kingdom, Livingstone and Bober (2004) investigated uses of the Internet among young people (9–19) in order to find out how the Internet is shaping family life, peer cultures, and learning. Related to Internet communication, these researchers found that a third of the young people found chatting with friends online, more often than not local friends, to be at least as satisfying as talking face-to-face. Distinctions between offline and online worlds fall away as people shift seamlessly from digital to face-to-face contexts (Leander and McKim, 2003). In fact, the maintenance of offline relationships is a documented feature of online communication (Holloway and Valentine, 2003; Lewis and Fabos, 2005; Valentine, Holloway, and Bingham, 2000; Wellman, 2004). Based on a large-scale study of children's access to and use of computers in the home and at school in the South-West of England, Facer (2004) found that the line between home and school uses of Internet is not sharply drawn. For instance, home Internet use involved 'formal' learning with the difference being that young people were often the teachers (instructing parents in computer use, for instance). School Internet use, on the other hand, was, at times, a place for informal learning with Internet technologies serving to fuel social relationships that then were enhanced through Instant Messaging and other Internet technologies taken up at home.

Once a technology becomes commonplace, people tend not to think of it as technological. As Herring (2004) points out, young people with Internet access have come to naturalize particular kinds of Internet technologies, such as text messaging, as an ordinary part of their lives. Bolter and Grusin (2000) use the term "remediate" to describe the process by which new technologies incorporate elements of established technologies. IM incorporates elements of phone exchanges and note passing, for instance, but its status as a "new technology" is already evolving. It is not the computer or the Internet itself that is central to literacy, but the way that these tools of technology shape social relations and practices.

Internet technologies have been found to hold potential for the development of new social linguistic identities and relationships (Alvermann, 2002; Chandler-Olcott and Maher, 2003; Thomas, 2005). In a study of adolescents' uses of Instant Messaging, Lewis and Fabos (2005) found that participants manipulated the tone, voice, word choice and subject matter of their messages to fit their social communication needs. They designed their practice to enhance social relationships and statuses across contexts, circulated texts across buddies, combated unwanted messages, assumed alternative identities, and overcame restrictions to their online communication. These functions revealed that the technological and social affordances of IM gave rise to a performative and

multivoiced social subject. Digital technologies, according to some researchers, foster affinity group connections related to common interests and shared norms over common class and race affiliations (Gee, 2002). Others, however, point to the potential for online communication to perpetuate, even exacerbate, inequitable social relations and limiting social roles (Warshauer 2002).

New problems and issues for research on sociality, literacy, and Internet technologies are emerging as new media and technologies rapidly develop, as becomes clear by considering the popularity and complexities of wikis and weblogs. Invented in 1995 by Wart Cunningham, Wikis are a type of digital writing space that allows collaborative revision and editing of texts by multiple users (Leuf and Cunningham, 2001). An exemplary example is Wikipedia, a free content, multilingual, web-based encyclopedia project created volunteers. Wikipedia has become the third most popular information source on the Web (Hafner, 2006). Some argue wikis solicit and store individual's knowledge as a means of "knowledge management" (KMwiki, 2006), others argue that wikis function as a purposeful means of collaboratively discussing or addressing an issue or problem (Ferris and Wilder, 2006). Wikis can be used in the classroom for collaborative writing projects, for example creating reference manuals or glossaries, a class statement or letter to the editor, a WikiBook textbook or handbook on the topic they are studying, or a service learning/inquiry-project report (Barton, 2004).

Weblogs or "blogs," are a type of websites created in web journal format and used by individuals to express opinions, describe experiences, build relationships, and exchange information within digital space. Importantly, the creation and maintenance of blogs demands little in terms of technical knowledge, unlike early web page construction. Blogs are interactive in that each entry links to possible comments from readers, and the page includes links to other online resources. Blogging is considered a powerful digital writing tool that can serve as a useful platform to collect, organize, and share personal writing. Blogs value personal and dialogic expressions that are "spontaneous, subjective, exploratory, and even contradictory" (Anson and Beach, 2005). Two websites that draw on features of blogs and extend them for purposes of social networking are MySpace and Facebook. MySpace is among the most popular English websites, with over 106 million accounts (as of September, 2006) and growing rapidly (wikipedia.org). First created as a campus face book within Harvard University in 2004, Facebook has become highly popular in college, university, and even high school communities. Both MySpace and Facebook afford participants the ability to post texts, photos, links and other media to perform and shape their identities, and also to

search for friends and classmates, form and join groups, develop common textual areas, and create social events through internal messaging.

*Local and Global Intersections and Tensions*

Karaidy's (1999) use of the term "glocal" aptly characterizes how the Internet is a social space where the global and local intersect. To capitalize on this feature of Internet space, projects such as Euro-kids, a partnership among schools across five European countries, uses Internet technologies to enable communication about local citizenship as well as participation in the wider European community (Euro-kids, 2006). Another ambitious project, European Schoolnet, connects learning communities of teachers across the European Union and uses Internet resources to build student awareness of diverse cultures and European citizenship.

As new technologies become integrated in young people's school days and daily lives, creating spaces for communication and identity construction, we need to consider what it means that they are owned and controlled by corporate interests, and have been since 1995 when the Internet became a fully privatized medium (Fabos, 2004). As such, commercial interests are fed by young people's seemingly agentic participation. For example, in a study of an online community for adolescent females, Duncan and Leander (2000) found that while the commercially owned website may have provided a space for girls to display some sense of power and self-definition, its primary purpose was to produce consumer identities and serve commercial interests.

Many chat rooms and bulletin boards, in the guise of enabling young people to create content and speak their minds, are commercially sponsored sites where marketers monitor teens' postings to gather information about popular trends and products. The separation of content from advertising erodes on the Web, targeting teens as a prime market, through chat spaces in which trendy brand-name companies create clubs with 'free membership' that include chat spaces, email newsletters, fashion tips, and so on. Thus, online users become not only *subjects in*, but also the *objects of*, the new global capitalism.

PROBLEMS AND DIFFICULTIES

The "glocalized" space of the Internet presents a particular set of research problems for researchers using ethnographic tools. For researchers who study cultural production in local contexts, the challenge is to figure out how to study online activity from both a local and global perspective, how to study the activity up close using the

usual ethnographic tools of participant-observation, interview, video, and local artifacts and also trace this activity as it distributed across sites (Leander and McKim, 2003) and global flows. The “hypersociality” (Ito, 2005, p. 3) and everyday online practices of local peer groups shape and are shaped by “pervasive mass-media ecologies” (2) that flow transnationally. The fact that AOL corners the market for Instant Messaging interfaces, and users must have AOL in order to chat with buddies whose families use AOL, is one example of how transnational flows of capital shape local activity.

Moreover, as Ito (2005) suggests, “the real is being colonized by the virtual” (3) in ways not directly connected to the political economy of the Net. Young people’s everyday offline interactions are shaped by their interactions online, and, in turn, reshape their online social worlds. This is true not only in terms of their online conversations, but also in terms of how they market their online personas across sites by carefully crafting profiles that become part of local and global flows. Ethnographers accustomed to site-specific participant-observation need to design new methods to meet the challenges of researching online communities. This is perhaps even more the case as new forms of communication become pervasive that merge the mobile telephone with Internet-related media. Text messaging, for instance, also known as short message service (SMS) and highly popular in Asia and Europe, permits the exchange of concise, text-based messages between mobile phones. Embedded into the pervasive technologies of everyday life and not separated out as a “computing event,” text messaging is indicative of the increasing methodological challenges presented for researching literacy as mobile social practice.

Tracing the relationship between the local and the global is an important skill to develop in users as well as researchers. Several British researchers have found that UK-based chat users generally assume that other users are American (see, for instance, Livingstone, 2002). The economic and linguistic dominance of the US presence on the Net makes such assumptions commonplace yet rarely interrogated by US users. Building users’ awareness of commercial interests and transnational flows is no easy matter. As a step in this direction, new-media scholars argue for careful, critical readings of Internet sites and texts to uncover the politics of representation and commercial sponsorship. Rather than viewing print as less important than graphical elements to this enterprise, analytic reading of print online will remain important in order for people to thoughtfully examine, critique, and filter extensive amounts of information. However, critical analysis on the screen is different than the page in that it requires skillful intertextual reading, not only across texts but also across genres and modes (Myers et al., 1998).

Teaching strategies for intertextual reading in online environments is important, yet teachers often feel that they lack the knowledge to do so. Literacy that incorporates Internet technologies is generally left up to teachers who themselves have not been trained to read across genres and modes. Moreover, Internet technologies present the additional challenge of interactivity as part of the reading process. Although all reading involves readers interacting with texts, interactive reading is intensified online as a material feature of the reading process. Readers make decisions about text construction and organization through selection of links and modes, among other elements of website design. In so doing, readers can be viewed as participants in the critical processes of production and analysis. On the other hand, website architecture can also seduce readers to take up particular positions and ideologies even as it appears to allow space for readers to ‘create’ the reading experience. Reconceptualizing reading instruction in ways that address these new forms of critique and participation is a challenge schools have yet to meet.

Writing instruction also needs to change in the wake of Internet technologies. The multimodality and sociality of the technology landscape has resulted in changes in writing processes and identity representations. The writing process for many digital writers does not occur as a set of stages—even recursive ones. Nonetheless, most schools and teacher education programs remain wedded to the stages of the writing process as they were established for pen and paper. Voice is another writing concept that is in flux as researchers and educators begin to understand how it functions in online writing environments. Often presented in schools as something unitary and authentic, voice in digital writing can be purposefully unstable, shifting moment-to-moment for many different audiences. Perhaps students would benefit from learning strategies to negotiate the performance of self in writing online for multiple audiences. Audiences in online writing are rarely the remote academic audiences of school assignments. Communicating more often across space in real-time means that ‘remote’ audiences become more immediate in online writing. Students need to be prepared to make effective rhetorical choices given such changes. Moreover, because online writing circulates widely, beyond the intended audience of the writer, writers need to consider the possible routes through which their writing may circulate. Finally, writing online is often most effective when it is most conversational. Thus, students may benefit from invitations to practice conversational writing for particular purposes rather than admonishments that conversational writing will cause academic writing skills to deteriorate.

In light of the persistence of the digital divide between low-income and middle-income families, it is important for schools to take up these

new challenges related to reading and writing. Neglecting to do so may further advantage the ‘haves’ at the expense of the ‘have nots’, who will have fewer opportunities outside of school to practice digital forms of reading and writing. The substantial growth in teen Internet use in recent years suggests a trend that should move those of us in the field of literacy to take seriously the changes that are afoot. It is inevitable that young people will continue to increase the amount and range of their online activities, thus changing their writing practices and processes in ways that schools will increasingly need to address. In the next section, we highlight new studies of young people’s digital practices that we believe will have implications for literacy as it relates to Internet technologies in and out of school.

### WORK IN PROGRESS

In the summer of 2005, a multidisciplinary conference on digital culture was held in Taiwan, sponsored by the Taipei Institute of Ethnology and Academia. The purpose of the conference was to “place emerging Asian digital cultures in the context of both local cultural traditions and globalization,” including how uses of digital technologies are transforming “local experiences, aesthetics, and social formations” (Asian Digital Cultures Conference, 2005). The purposes and discourse of this event, which would have surprised scholars just 5 years ago, is indicative of how quickly diverse fields are moving toward interpreting Internet technologies in relation to social formations and global/local dynamisms. Cultural theorist Arjun Appadurai (1996) uses the metaphor of “scapes” to describe contemporary global movements, including the flows of media (mediascapes), technology (technoscapes), people (ethnoscapes), ideology (ideoscapes) and money (financescapes). In the following consideration of works in progress we feature research that is addressed toward understanding literacy and Internet technologies as related to an increasingly mobile world.

#### *Flows of Learning in and out of School*

“Kids’ Informal Learning with Digital Media,” under the direction of Peter Lyman, Diane Harley (both of UC Berkeley), Mimi Ito (University of Southern California), and Michael Carter (Monterey Institute for Technology and Education) is a major, multisited ethnographic study that involves diverse youth between the ages of 10 and 18 in four physical sites and up to 20 virtual spaces, including online games, web logs, messaging, and online interest groups (<http://groups.sims.berkeley.edu/digitalyouth/>). While not directly addressed to literacy learning, such

work in media studies and education has significant implications for understanding how the social practices of literacy are pivotal to everyday cultural production by youth (Ito, in press). The research considers the gap in engagement between learning in school and online learning online out of school, moving toward the transformation of schooling and software. In related work, Rodney Jones, together with Co-PI David Li, completed in 2005 a 2-year funded study in Hong Kong on the communication and literacy practices of 40 youth, in and out of school. One of Jones' motivations for engaging in the study was to understand why Hong Kong schools seemed so out of step with the wired culture of Hong Kong outside of schools. Broadly, Jones also wanted to give youth an opportunity to reflect on what they were doing online and share their online knowledge and practices with teachers and parents. Currently, as Jones analyzes and reports from his data, he is becoming increasingly interested in broader issues, such as the relationships of online and offline practices to time and space (Jones, 2004; Jones, forthcoming).

### *Flows of Identity and Discourse*

The work of Sarah Holloway and Gil Valentine and collaborators in the UK provides an important argument for taking a socially dynamic and connective approach to practice rather than bracketing social spaces such as "home," "school," "online," and "offline," in advance. The researchers reconceive the problem of access to Internet technologies as a problem of identification. Across home and different school settings, Holloway and Valentine (2001) have documented practices of identification with technology by youth, including how they negotiate their technical competence to be more or less visible. Technology emerged as a signifier of social inadequacy for some boys in school, who risked being marked as "geeks" or "homos," while skills in particular computer games, which were acquired at home, carried cultural capital into the school setting. Moreover, while some girls received praise from parents for technical competency at home, they strategically used technical practices sparingly at school to "win social popularity as well as the grudging respect of their peers for their technical skill" (2001, p. 36). Rather than documenting a stable set of meanings and practices "within" contexts, this research traces a complex, dynamically shifting articulation of techno-literacy practices, social spaces, and identity. In another study (Valentine, Holloway, and Bingham, 2002) the researchers analyze how three different schools discursively constituted the Internet as a very different kind of object. These three discourses on Internet technologies included "ICT for all," which included access for the wider community, "ICT as a life skill," and

“ICT in terms of academic achievement” (p. 312). These discourses helped to structure different types of access and surveillance of Internet technologies practices not only within, but also outside of school.

*Flows of People and Culture: Immigration and Transnationalism*

Eva Lam is developing a program of research investigating how immigrant youth in the USA use digital literacy practices, and the relationships of these practices to their English learning, social networks, and identities (Lam, 2000, 2004). Lam’s work is pushing beyond a learning perspective informed by acculturation, prevalent in ESL literature, and moving rather toward a perspective informed by transculturation. She traces how immigrant youth engage in multiple forms of cultural belonging, including online communities that traverse national boundaries and hence cannot be described by a nation-centered discourse or methodology. In a series of case studies, Lam documents how immigrants, segregated within school settings, develop literacy practices online that contribute to their English learning and perspectives on their social futures. For example, code-mixing between English and Romanized Cantonese in a “Hong Kong Chat Room” was considered normative for some students online and was used to index social alignments and cultural assumptions, while such mixing or social alignments were absent in the school context. In the next phase of Lam’s work which began in the spring of 2005, she is planning to study language development and modes of literacy participation of 30 immigrant students over the course of a year.

Fanfiction communities are the focus of research conducted by Rebecca Black, another scholar who is interested in the online literacy practices of immigrant youth and English language learners (2005; in press). Black’s work examines adolescent English language learners’ uses of fanfiction to represent and enhance their cultural and linguistic identities as well as their social and intellectual capital as writers and knowledgeable participants in this form of popular culture. The fanfiction writing produced by these youth draws on school literacy practices as well as deep knowledge of the conventions of fanfiction as a popular genre. In a chapter on feedback in an online fanfiction community (in press), Black gives the example of an “author’s note” that prefaced the Internet technologies of a writer whose first language is Japanese., announcing her anxiety about not writing clear English prose. Demonstrating affinity with the writer, and perhaps an insider’s knowledge, the feedback of two readers included Japanese terms. Black is completing a book that examines the identity work accomplished for adolescents who are English language learners through their participation in online fanfiction communities.

*Creating Zones of Mobility for Underserved Youth*

While early research and program development with literacy and Internet technologies has been disproportionately oriented to privileged, white, and middle-class students, an increasing amount of work in progress is beginning to focus on children and youth who are underserved by schooling. Some of this work, under the direction of Theresa Rogers and Andrew Schofield at the University of British Columbia (<http://www.newtonliteracies.ca/>) is using new multi-media genres, such as digital storytelling, to engage working class and minority youth in meaningful literacy learning. Another recent large-scale project recently underway focuses on helping low-achieving readers develop higher-level comprehension skills demanded by the Internet. This project (<http://www.newliteracies.uconn.edu/iesproject/index.html>) directed by Don Leu (University of Connecticut) and David Reinking (Clemson University) is developing an adaptation of reciprocal teaching and a series of learning contexts in which students identify problems and then solve them only by locating, evaluating, synthesizing, and communicating information.

## FUTURE DIRECTIONS

As research on Internet technologies and literacy continues, and its production level increases, an important future direction for this area of work will be the development of interdisciplinary approaches that benefit from insights from not only literacy studies but also media studies, cultural studies, information science, feminist studies, human and cultural geography, sociology, anthropology, and a host of other areas. Literacy scholars have much to add to conversations in these other areas as well as glean from them. For instance, returning to Appadurai's (1996) "scapes" of modern life, as literacy studies are beginning to take up issues of migration and Internet technologies, the analysis of literacy practices could be enriched through an analysis of flows of economic capital.

Another enduring need for ongoing research involves the development of theoretical and methodological frames that will enable us to understand changing relations of power, changing constructions of identity, and changing uses of literacy. If the meaning of literacy is deictic, or regularly redefined with respect to new technologies (Leu, 2000), then part of what follows from this insight is that studies of individual tools (e.g., wikis, MySpace pages, weblogs), however helpful, must also avoid parochialism and provide theoretical conceptions that contribute to a broader picture of literacy/ICT coproductions. An example of a theoretical insight that might traverse specific tools is the manner in which new literacy practices mediated by Internet technologies

are reshaping the experience of time and space. While schooling may often construct literate activity as monochromic (temporally linear, tangible, and divisible), youth often use Internet technologies in ways that treat it as polychromic (fluid, layered, and simultaneous) (Jones, forthcoming). This difference has implications for research as well, challenging researchers' assumptions about a single dominant temporal frame or spatial situation of literate activity.

Further, while the social turn in literacy studies (e.g., Street, 1984) has done much to help us understand literacy as imminently social rather than purely individual, in the area of Internet technologies and literacy we have much to understand concerning how literacy is used to create social effects, or do work in social and cultural worlds. One promising area of study in this vein is work in Internet technologies and political activism, such as taken up by Brian Wilson in Ontario, Canada (Wilson, forthcoming). Little work has been done in media studies, and perhaps less in literacy studies, concerning how youth also organize forms of social critique and activism through online venues. Wilson critiques how youth have been infantilized and apoliticized by the popular media and previous research. In his current work, Wilson traverses online and offline contexts of social action, interpreting how online communications and texts become embedded, interpreted, and realized among youth activist networks.

Another high potential area of investigation concerning how literacy and Internet technologies is used to create social effects is the area of video game research. Video games are fast becoming a pastime of choice among many youth across the globe, involving multimediated experiences in which participants take on new identities, fight battles, go on collaborative virtual missions, take on new textual and visual identities, built art objects, and create new forms of sociality. Gee (2003) has authored a widely read and provocative early work on video games as venues of learning and literacy, drawing on a wide swath of current learning theories to develop 36 learning principles informing video game play as learning activity. Unlike much of contemporary schooling, with its division of knowledge into isolated bits, Gee argues that video games are semiotic domains that one slowly learns and can master. While online game research already has developed its own conferences and publication venues, game research in literacy studies is yet very early in development. Within this area, Constance Steinkueler's (2006) work is developing an analysis of online gaming, discourse, identity, and a host of literacy practices that gamers engage in during gaming and in support of their participation in the discourses and cultures of gaming. Leander and Lovvorn (2006) have developed a comparative analysis of literate practices in online gaming and schooling, drawing on Actor Network Theory in order to trace the circulations

in various forms of classroom and game-related literacy practices. What presents a particular challenge in research on gaming is not only that games are rich multimodal environments, but also that that game texts-in-use challenge our ontological separations of texts from objects, bodies, and identities.

## BICS AND CALP: EMPIRICAL AND THEORETICAL STATUS OF THE DISTINCTION

### INTRODUCTION

The distinction between *basic interpersonal communicative skills* (BICS) and *cognitive academic language proficiency* (CALP) was introduced by Cummins (1979, 1981a) in order to draw educators' attention to the timelines and challenges that second language learners encounter as they attempt to catch up to their peers in academic aspects of the school language. BICS refers to conversational fluency in a language while CALP refers to students' ability to understand and express, in both oral and written modes, concepts and ideas that are relevant to success in school. The terms conversational fluency and academic language proficiency are used interchangeably with BICS and CALP in the remainder of this chapter.

Initially, I describe the origins, rationale, and evolution of the distinction together with its empirical foundations. I then discuss its relationship to similar theoretical constructs that have been proposed in different contexts and for different purposes. Finally, I analyze and respond to critiques of the distinction and discuss the relationship of the distinction to the emerging field of New Literacy studies (e.g. Barton, 1994; Street, 1995).

### EARLY DEVELOPMENTS

Skutnabb-Kangas and Toukomaa (1976) initially brought attention to the fact that Finnish immigrant children in Sweden often appeared to educators to be fluent in both Finnish and Swedish but still showed levels of verbal academic performance in both languages considerably below grade/age expectations. The BICS/CALP distinction highlighted a similar reality and formalized the difference between conversational fluency and academic language proficiency as conceptually distinct components of the construct of "language proficiency." Because this was a conceptual distinction rather than an overall theory of "language proficiency" there was never any suggestion that these were the only important or relevant components of that construct.

The initial theoretical intent of the BICS/CALP distinction was to qualify Oller's (1979) claim that all individual differences in language

proficiency could be accounted for by just one underlying factor, which he termed *global language proficiency*. Oller synthesized a considerable amount of data showing strong correlations between performance on cloze tests of reading, standardized reading tests, and measures of oral verbal ability (e.g. vocabulary measures). Cummins (1979), however, argued that it is problematic to incorporate all aspects of language use or performance into just one dimension of general or global language proficiency. For example, if we take two monolingual English-speaking siblings, a 12-year old child and a 6-year old, there are enormous differences in these children's ability to read and write English and in the depth and breadth of their vocabulary knowledge, but minimal differences in their phonology or basic fluency. The 6-year old can understand virtually everything that is likely to be said to her in everyday social contexts and she can use language very effectively in these contexts, just as the 12-year old can. In other words, some aspects of children's first language development (e.g. phonology) reach a plateau relatively early whereas other aspects (e.g. vocabulary knowledge) continue to develop throughout our lifetimes. Thus, these very different aspects of proficiency cannot be considered to reflect just one unitary proficiency dimension.

CALP or academic language proficiency develops through social interaction from birth but becomes differentiated from BICS after the early stages of schooling to reflect primarily the language that children acquire in school and which they need to use effectively if they are to progress successfully through the grades. The notion of CALP is specific to the social context of schooling, hence the term "academic." Academic language proficiency can thus be defined as "the extent to which an individual has access to and command of the oral and written academic registers of schooling" (Cummins, 2000, p. 67).

The relevance of the BICS/CALP distinction for bilingual students' academic development was reinforced by two research studies (Cummins, 1980, 1981b) showing that educators and policy-makers frequently conflated conversational and academic dimensions of English language proficiency and that this conflation contributed significantly to the creation of academic difficulties for students who were learning English as an additional language (EAL).

The first study (Cummins, 1980, 1984) involved an analysis of more than 400 teacher referral forms and psychological assessments carried out on EAL students in a large Canadian school system. The teacher referral forms and psychological assessment reports showed that teachers and psychologists often assumed that children had overcome all difficulties with English when they could converse easily in the language. Yet these children frequently performed poorly on English academic tasks within the classroom (hence the referral for assessment) as

well as on the verbal scales of the cognitive ability test administered as part of the psychological assessment. Many students were designated as having language or communication disabilities despite the fact that they had been in Canada for a relatively short amount of time (e.g. 1–3 years). Thus, the conflation of second language (L2) conversational fluency with L2 academic proficiency contributed directly to the inappropriate placement of bilingual students in special education programs.

The need to distinguish between conversational fluency and academic aspects of L2 performance was further highlighted by the reanalysis of language performance data from the Toronto Board of Education (Cummins, 1981b). These data showed that there was a gap of several years, on average, between the attainment of peer-appropriate fluency in English and the attainment of grade norms in academic aspects of English. Conversational aspects of proficiency reached peer-appropriate levels usually within about two years of exposure to English but a period of 5–7 years was required, on average, for immigrant students to approach grade norms in academic aspects of English (e.g. vocabulary knowledge).

The differential time periods required to attain peer-appropriate L2 conversational fluency as compared to meeting grade expectations in academic language proficiency have been corroborated in many research studies carried out during the past 30 years in Canada (Klesmer, 1994), Europe (Snow and Hoefnagel-Hohle, 1978), Israel (Shohamy, Levine, Spolsky, Kere-Levy, Inbar, Shemesh, 2002), and the United States (Hakuta, Butler and Witt, 2002; Thomas and Collier, 2002).

The following example from the psychological assessment study (Cummins, 1980, 1984) illustrates how these implicit assumptions about the nature of language proficiency can directly affect the academic trajectories and life chances of bilingual students:

*PR (289)*. PR was referred in first grade by the school principal who noted that “PR is experiencing considerable difficulty with grade one work. An intellectual assessment would help her teacher to set realistic learning expectations for her and might provide some clues as to remedial assistance that might be offered.”

No mention was made of the fact that the child was learning English as a second language; this only emerged when the child was referred by the second grade teacher in the following year. Thus, the psychologist does not consider this as a possible factor in accounting for the discrepancy between a verbal IQ of 64 and a performance (nonverbal) IQ of 108. The assessment report read as follows:

Although overall ability level appears to be within the low average range, note the significant difference between verbal and nonverbal scores . . . . It would appear that PR’s development has not progressed at a normal rate and

consequently she is, and will continue to experience much difficulty in school. Teacher's expectations at this time should be set accordingly.

What is interesting in this example is that the child's English communicative skills are presumably sufficiently well developed that the psychologist (and possibly the teacher) is not alerted to the child's EAL background. This leads the psychologist to infer from her low verbal IQ score that "her development has not progressed at a normal rate" and to advise the teacher to set low academic expectations for the child since she "will continue to experience much difficulty in school."

During the 1980s and 1990s in the United States exactly the same misconception about the nature of language proficiency underlay the frequent early exit of bilingual students from English-as-a-second language (ESL) or bilingual programs into mainstream English-only programs on the basis of the fact that they had "acquired English." Many of these students experienced academic difficulties within the mainstream class because no supports were in place to assist them to understand instruction and continue their development of English academic skills.

The relevance of the BICS/CALP distinction is illustrated in Vincent's (1996) ethnographic study of second generation Salvadorean students in Washington DC. Vincent points out that the children in her study began school in an English-speaking environment and "within their first two or three years attained conversational ability in English that teachers would regard as native-like" (p. 195). She suggests, however, that this fluency is largely deceptive:

The children seem to have much greater English proficiency than they actually do because their spoken English has no accent and they are able to converse on a few everyday, frequently discussed subjects. Academic language is frequently lacking. Teachers actually spend very little time talking with individual children and tend to interpret a small sample of speech as evidence of full English proficiency. (p. 195)

BICS/CALP made no claim to be anything more than a conceptual distinction. It provided a way of (i) naming and talking about the classroom realities that Vincent (1996) discusses and (ii) highlighting the discriminatory assessment and instructional practices experienced by many bilingual students.

#### EVOLUTION OF THE THEORETICAL CONSTRUCTS

The initial BICS/CALP distinction was elaborated into two intersecting continua (Cummins, 1981a) that highlighted the range of cognitive demands and contextual support involved in particular language tasks or activities (context-embedded/context-reduced, cognitively

undemanding/cognitively demanding). Internal and external dimensions of context were distinguished to reflect the fact that “context” is constituted both by what we bring to a task (e.g., our prior knowledge, interests, and motivation) and the range of supports that may be incorporated in the task itself (e.g., visual supports such as graphic organizers). This “quadrants” framework stimulated discussion of the instructional environment required to enable EAL students to catch up academically as quickly as possible. Specifically, it was argued that effective instruction for EAL students should focus primarily on context-embedded and cognitively demanding tasks. It was also recognized, however, that these dimensions cannot be specified in absolute terms because what is “context-embedded” or “cognitively demanding” for one learner may not be so for another as a result of differences in internal attributes such as prior knowledge or interest (Coelho, 2004; Cummins, 1981a).

The BICS/CALP distinction was maintained within this elaboration and related to the theoretical distinctions of several other theorists (e.g. Bruner’s [1975] communicative and analytic competence, Donaldson’s [1978] embedded and disembedded language, and Olson’s [1977] utterance and text). The terms used by different investigators have varied but the essential distinction refers to the extent to which the meaning being communicated is strongly supported by contextual or interpersonal cues (such as gestures, facial expressions, and intonation present in face-to-face interaction) or supported primarily by linguistic cues. The term “context-reduced” was used rather than “decontextualized” in recognition of the fact that all language and literacy practices are contextualized; however, the range of supports to meaning in many academic contexts (e.g., textbook reading) is reduced in comparison to the contextual support available in face-to-face contexts.

In later accounts of the framework (Cummins, 2000, 2001) the distinction between conversational fluency and academic language proficiency was related to the work of several other theorists. For example, Gibbons’ (1991) distinction between *playground language* and *classroom language* highlighted in a particularly clear manner the linguistic challenges of classroom language demands. She notes that playground language includes the language which “enables children to make friends, join in games and take part in a variety of day-to-day activities that develop and maintain social contacts” (p. 3). She points out that this language typically occurs in face-to-face situations and is highly dependent on the physical and visual context, and on gesture and body language. However, classroom language is very different from playground language:

The playground situation does not normally offer children the opportunity to use such language as: *if we increase the angle by 5 degrees, we could cut the circumference into equal parts.*

Nor does it normally require the language associated with the higher order thinking skills, such as hypothesizing, evaluating, inferring, generalizing, predicting or classifying. Yet these are the language functions which are related to learning and the development of cognition; they occur in all areas of the curriculum, and without them a child's potential in academic areas cannot be realized (1991, p. 3).

The research of Biber (1986) and Corson (1995) also provides evidence of the linguistic reality of the distinction. Corson highlighted the enormous lexical differences between typical conversational interactions in English as compared to academic or literacy-related uses of English. The high-frequency everyday lexicon of English conversation derives predominantly from Anglo-Saxon sources while the relatively lower frequency academic vocabulary is primarily Graeco-Latin in origin (see also Coxhead, 2000).

Similarly, Biber's (1986) factor analysis of more than one million words of English speech and written text from a wide variety of genres revealed underlying dimensions very consistent with the distinction between conversational and academic aspects of language proficiency. For example, when factor scores were calculated for the different text types on each factor, telephone and face-to-face conversation were at opposite extremes from official documents and academic prose on Textual Dimensions 1 and 2 (Interactive vs. Edited Text, and Abstract vs. Situated Content).

Conversational and academic language registers were also related to Gee's (1990) distinction between *primary* and *secondary* discourses (Cummins, 2001). Primary discourses are acquired through face-to-face interactions in the home and represent the language of initial socialization. Secondary discourses are acquired in social institutions beyond the family (e.g. school, business, religious, and cultural contexts) and involve acquisition of specialized vocabulary and functions of language appropriate to those settings. Secondary discourses can be oral or written and are equally central to the social life of nonliterate and literate cultures. Examples of secondary discourse common in many nonliterate cultures are the conventions of story-telling or the language of marriage or burial rituals which are passed down through oral tradition from one generation to the next. Within this conception, academic language proficiency represents an individual's access to and command of the specialized vocabulary and functions of language that are characteristic of the social institution of schooling. The secondary discourses of schooling are no different in principle than the secondary discourse of other spheres of human endeavor—for example, avid amateur gardeners and professional horticulturalists have acquired vocabulary related to plants and flowers far beyond the knowledge of

those not involved in this sphere of activity. What makes acquisition of the secondary discourses associated with schooling so crucial, however, is that the life chances of individuals are directly determined by the degree of expertise they acquire in understanding and using this language.

Other ways in which the original BICS/CALP distinction has evolved include:

- The addition of *discrete language skills* as a component of language proficiency that is distinct from both conversational fluency and academic language proficiency (Cummins, 2001). Discrete language skills involve the learning of rule-governed aspects of language (including phonology, grammar, and spelling) where acquisition of the general case permits generalization to other instances governed by that particular rule. Discrete language skills can sometimes be learned in virtual isolation from the development of academic language proficiency as illustrated in the fact that some students who can “read” English fluently may have only a very limited understanding of the words they can decode (see Cummins, Brown, and Sayers, 2007, for an analysis of discrete language skills in relation to current debates on the teaching of reading in the USA).
- The embedding of the BICS/CALP distinction within a broader framework of academic development in culturally and linguistically diverse contexts that specifies the role of societal power relations in framing teacher–student interactions and determining the social organization of schooling (Cummins, 1986, 2001). Teacher–student interactions are seen as a process of negotiating identities, reflecting to varying degrees coercive or collaborative relations of power in the wider society. This socialization process within the school determines the extent to which students will engage academically and gain access to the academic registers of schooling.

#### CONTRIBUTIONS OF THE BICS/CALP DISTINCTION TO POLICY AND PRACTICE

Since its initial articulation, the distinction between BICS and CALP has influenced both policy and practice related to the instruction and assessment of second language learners. It has been invoked, for example, in policy discussions related to:

- The amount and duration of funding necessary to support students who are learning English as an additional language;
- The kinds of instructional support that EAL students need at different stages of their acquisition of conversational and academic English;

- The inclusion of EAL students in nationally mandated high-stakes testing; for example, should EAL students be exempt from taking high-stakes tests and, if so, for how long—1, 2, 3, 4, or 5 years after arrival in the host country?
- The extent to which psychological testing of EAL students for diagnostic purposes through their L2 is valid and ethically defensible.

The distinction is discussed in numerous books that aim to equip educators with the understanding and skills required to teach and assess linguistically diverse students (e.g. Cline and Frederickson, 1996, in the United Kingdom; Coelho, 2004, in Canada; Diaz-Rico and Weed, 2002, in the USA) and has been invoked to interpret data from a range of sociolinguistic and educational contexts (e.g. Broome's [2004] research on reading English in multilingual South African schools).

### CRITIQUES OF THE BICS/CALP DISTINCTION

The BICS/CALP distinction has also been critiqued by numerous scholars who see it as oversimplified (e.g. Scarcella, 2003; Valdés, 2004), reflective of an “autonomous” rather than an “ideological” notion of literacy (Wiley, 1996), an artifact of “test-wiseness” (Edelsky et al., 1983; Martin-Jones and Romaine, 1986) and a “deficit theory” that attributes bilingual students’ academic difficulties to their “low CALP” (e.g. Edelsky, 1990; Edelsky et al., 1983; MacSwan, 2000).

In response to these critiques, Cummins and Swain (1983) and Cummins (2000) pointed out that the construct of academic language proficiency does not in any way depend on test scores to support either its construct validity or relevance to education. This is illustrated in Vincent’s (1996) ethnographic study and Biber’s (1986) research on the English lexicon discussed above. Furthermore, the BICS/CALP distinction has been integrated since 1986 with a detailed sociopolitical analysis of how schools construct academic failure among subordinated groups. The framework documents educational approaches that challenge this pattern of coercive power relations and promote the generation of power and the development of academic expertise in interactions between educators and students (Cummins, 2001; Cummins, Brown, and Sayers, 2007).

The broader issues in this debate go beyond the specific interpretations of the distinction between conversational fluency and academic language proficiency. They concern the nature of theoretical constructs and their intersection with research, policy and practice. Theories must be consistent with the empirical data to have any claim to validity. However, any set of theoretical constructs represents only one of potentially many ways of organizing or viewing the data. Theories frame phenomena and provide interpretations of empirical data within particular contexts and for particular purposes. However, no theory is

“valid” or “true” in any absolute sense. A theory represents a way of viewing phenomena that may be relevant and useful in varying degrees depending on its purpose, how well it communicates with its intended audience, and the consequences for practice of following through on its implications (its “consequential validity”). The generation of knowledge (theory) is always dialogical and just as oral and written language is meaningless outside of a human communicative and interpretive context, so too theoretical constructs assume meaning only within specific dialogical contexts. (Cummins, 2000).

Thus, the BICS/CALP distinction was initially formulated to address certain theoretical issues (e.g. whether “language proficiency” could legitimately be viewed as a unitary construct, as Oller [1979] proposed) and to interpret empirical data related to the time periods required for immigrant students to catch up academically. It spoke directly to prejudicial policies and practices that were denying students access to equitable and effective learning opportunities.

Much of the criticism of the distinction derives from taking the constructs out of their original dialogical or discursive context and arguing that they are not useful or appropriate in a very different dialogical context. This can be illustrated in Scarcella’s (2003) critique. She argues that the dichotomous conceptualization of language incorporated in the BICS/CALP distinction “is not useful for understanding the complexities of academic English or the multiple variables affecting its development” (p. 5). Both BICS and CALP are more complex than a binary distinction implies. She points out that some aspects of BICS are acquired late and some aspects of CALP are acquired early. Furthermore, some variables such as phonemic awareness (sensitivity to sounds in spoken words) are related to the development of both BICS and CALP (e.g. in helping readers to access difficult academic words). She concludes that the distinction is “of limited practical value, since it fails to operationalize tasks and therefore does not generate tasks that teachers can use to help develop their students’ academic English . . . . the BICS/CALP perspective does not provide teachers with sufficient information about academic English to help their students acquire it” (p. 6).

Scarcella goes on to elaborate a detailed framework for conceptualizing academic language and generating academic tasks that is certainly far more useful and appropriate for this purpose than the notion of CALP. What she fails to acknowledge, however, is that the BICS/CALP distinction was not formulated as a tool to generate academic tasks. It addresses a very different set of theoretical, policy, and classroom instructional issues. Scarcella’s critique is analogous to rejecting an apple because it is not an orange.

Related to Scarcella’s critique are concerns (Valdés, 2004; Wiley, 2006) that the conversational fluency/academic language proficiency

distinction reflects an “autonomous” view of language and literacy that is incompatible with the perspective of New Literacies theorists that language and literacy represent social and cultural practices that are embedded in a context of historical and current power relations (e.g. Barton, 1994; Street, 1995). As expressed by Valdés (2004, p. 115):

The view that there are multiple literacies rather than a single literacy, that these literacies depend on the context of the situation, the activity itself, the interactions between participants, and the knowledge and experiences that these various participants bring to these interactions is distant from the view held by most L2 educators who still embrace a technocratic notion of literacy and emphasise the development of decontextualised skills.

There is nothing in the BICS/CALP distinction that is inconsistent with this perspective on language and literacy practices. It makes no claim to focus on any context other than that of the school. Furthermore, the pedagogical practices that have been articulated to support the development of academic expertise (CALP) are far from the decontextualized drills appropriately castigated by numerous researchers and educators. They include a focus on critical literacy and critical language awareness together with enabling EAL and bilingual students to generate new knowledge, create literature and art, and act on social realities, all of which directly address issues of identity negotiation and societal power relations (Cummins, 2001; Cummins, Brown, and Sayers, 2007).

One can accept the perspective that literacies are multiple, contextually specific, and constantly evolving (as I do) while at the same time arguing that in certain discursive contexts it is useful to distinguish between conversational fluency and academic language proficiency. To illustrate, the fact that the concept of “European” can be broken down into an almost infinite array of national, regional, and social identities does not invalidate the more general descriptor of “European.” In some discursive contexts and for some purposes it is legitimate and useful to describe an individual or a group as “European” despite the fact that it greatly oversimplifies the complex reality of “Europeanness.” Similarly, in certain discursive contexts and for certain purposes it is legitimate and useful to talk about conversational fluency and academic language proficiency despite the fact that these constructs incorporate multiple levels of complexity.

Clearly, theorists operating from a New Literacies perspective have contributed important insights into the nature and functions of literacy. However, this does not mean that a New Literacies perspective is the best or only way to address all questions of literacy development. For example, highlighting the social and contextually specific dimensions of cognition does not invalidate a research focus on what may be

happening inside the heads of individuals as they perform cognitive or linguistic tasks. There are many important questions and research studies associated with first and second language literacy development that owe little to New Literacy Studies but have played a central role in policy discussions related to equity in education. Research studies on how long it typically takes EAL students to catch up to grade norms in English academic proficiency have, within the context of the research, focused on literacy as an autonomous skill measured by standardized tests but have nevertheless contributed in substantial ways to promoting equity in schooling for bilingual students.

### FUTURE DIRECTIONS

The BICS/CALP distinction was not proposed as an overall theory of language proficiency but as a very specific conceptual distinction that has important implications for policy and practice. It has drawn attention to specific ways in which educators' assumptions about the nature of language proficiency and the development of L2 proficiency have prejudiced the academic development of bilingual students. However, the distinction is likely to remain controversial, reflecting the fact that there is no cross-disciplinary consensus regarding the nature of language proficiency and its relationship to academic development.

The most productive direction to orient further research on this topic, and one that can be supported by all scholars, is to focus on creating instructional and learning environments that maximize the language and literacy development of socially marginalized students. Because academic language is found primarily in written texts, extensive engaged reading is likely to be a crucial component of an effective learning environment (Guthrie, 2003). Opportunities for collaborative learning and talk about text are also extremely important in helping students internalize and more fully comprehend the academic language they find in their extensive reading of text.

Writing for authentic purposes is also crucial because when bilingual students write about issues that matter to them they not only consolidate aspects of the academic language they have been reading, they also express their identities through language and (hopefully) receive feedback from teachers and others that will affirm and further develop their expression of self (Cummins, Brown, and Sayers, 2007). Deeper understanding of the nature of academic language and its relationship both to conversational fluency and other forms of literacy will emerge from teachers, students, and researchers working together in instructional contexts collaboratively pushing (and documenting) the boundaries of language and literacy exploration.

## READING: ATTITUDES, INTERESTS, PRACTICES

## INTRODUCTION

The social psychology, or sociology, of reading remains a relatively small part of a vast literature largely concerned with skills acquisition and development. This is curious for two reasons. First, it is obvious that both teachers and researchers do not want merely to facilitate reading ability—they hope to form and maintain reading habits. Second, there are regular laments—as perennial as grumblings over the inadequacies of the younger generation—about low levels of reading, poor attitudes, lack of enthusiasm and so on. Indeed, surveys often suggest a gulf between reading ability and reading practices; in many contemporary societies, the essential problem seems to be *aliteracy* rather than *illiteracy* (see later). On both counts, then, questions of what people read, how much they read, and the purposes and effects of their reading surely assume central importance.

Attention to the social psychology of reading is even more timely in a post-modern era that has reinterpreted the roles of author and reader. Nell (1988) touched upon the ‘new criticism’ underpinned by a relativism that suggests that the book is essentially created by the reader (Tinker, 1965), that a book is ‘a relationship, an axis of innumerable relationships’ (Borges, 1964, p. 13), that ‘the reader makes literature’ (Fish, 1980, p. 11). The degree to which this criticism has taken hold in academe is indicated by even more modern attempts to reclaim ground for the ‘common reader’, to re-establish the centrality of the aesthetic qualities of (fiction) reading, to cast aside those professional ‘isms’ that have turned reading into a job requiring doctoral qualifications (see Bloom, 2000; Edmundson, 2004).<sup>1</sup>

---

<sup>1</sup> Both the ‘professionalisation’ of literature, and arguments against it, have quite a long history. The teaching of English literature, for example, was generally resisted by the academy until the mid-nineteenth century (later still in Oxford and Cambridge)—on the grounds that it was of insufficient depth, but also because of apprehensions about the baleful influence of ‘experts’. On the other hand, as early as 1927, Forster heaved a regretful sigh that ‘the novel tells a story . . . I wish that it was not so’. The story ‘runs like a backbone—or may I say a tape-worm’ supporting other ‘finer growths’ (p. 45). Here we have the disdain for the obvious—and the obviously appealing—that has so distressed the ‘common reader’ ever since; see also the Leavis influence, later.

The book itself has also been defended in recent years, in the face of challenges from the electronic media, and arguments for a digitised and book-less chiasm (see Negroponete, 1995). Thus, for example, Birkerts (1994) defended the more traditional pleasures and values of the text. Of course, words on computer screens, like words in books, are *read*—but it is fair to say that the act of reading, constant for many centuries, is undergoing considerable change, and the essence of this change is social and psychological. (It is interesting to note here that the pervasiveness of the ‘e-book’ has turned out to be less than complete: see the commentaries by Max, 1994, 2000.)

Although the proportion of illiterate people has been in steady decline for some time, an increase in absolute numbers means that one-third of the world’s population can still neither read nor write. In ‘developed’ societies, however, the problem of illiteracy *tout court* is less significant than that of so-called ‘functional literacy’, some socially meaningful ability that goes beyond elementary skills (see Oxenham, 1980). Several surveys have suggested that, in Europe and North America, as much as a quarter of the population may have difficulty with mundane but important tasks like understanding road signs or product-warning labels (Creative Research Group, 1987; Edwards, 1991; Kozol, 1985; OECD, 2000).

In many modern societies, *aliteracy* (Maeroff, 1982; Neuman, 1986) is as much an issue as functional literacy. It is certainly more compelling in a social-psychological sense, because the question here is why some of those who *can* read *don’t* read. The term may be new but the phenomenon (as implied earlier) is old, and if television is the modern villain of the piece, other distractions once came readily to hand (Edwards, 1981). It is true, of course, that many of the commentators here have had particularly snobbish axes to grind—thus, when Queenie Leavis observed (in 1932) that ‘the reading capacity of the general public . . . has never been so low as at the present time’ (p. 231), she was reflecting the higher Leavisite criticism. The real problem for such self-appointed arbiters is not that people don’t read; it’s that they don’t read anything worthwhile. This attitude can still be detected, wherever debate rages over issues of reading ‘quality’, and there is a double psychological import here: on the one hand, such *de haut en bas* attitudes are, in themselves, worthy of analysis; on the other, questions of reading ‘quality’, of whether *all* reading should be encouraged, of whether early tastes for ‘popular’ literature can be expected to refine themselves over time, and so on—these are real enough matters.

#### EARLY DEVELOPMENTS

Some early work has been unjustifiably neglected—possibly because the area has yet to achieve much theoretical coherence. Waples and

Tyler (1931), for example, made a fairly comprehensive examination of topics of reading interest, and a subsequent publication (Waples, Berelson and Bradshaw, 1940) dealt with the complexity of adult reading responses. The authors also advocated the use of the case-study method to probe more deeply into reading practices, habits and attitudes, and this was taken up by Strang (1942). Leavis's very personal study (1932) has already been referred to; when it first appeared, it evoked a large critical response. Interested in developments in fiction and its readership since the eighteenth century, Leavis proceeded with what she termed an 'anthropological' method. Few would describe it that way today, but Leavis did conduct a survey of sorts, as well as examining library and bookshop choices (see also Rose, 2001). A more systematic, if drier, approach is that of Link and Hopf (1946), who considered who reads, what kinds of books are read, what competitors for readers' attention exist, and how (and why) people go about choosing their books. Beyond these—and beyond the highly personal commentaries of literary critics and authors—some of the most useful early insights are to be found in general treatments of the intellectual and leisure habits of the 'masses' [Hoggart's work (1957, 1995) immediately comes to mind, but the later overview by Rose (2001) is particularly recommended].

#### MAJOR CONTRIBUTIONS AND WORK IN PROGRESS

In the late 1970s, Greaney and his associates began to pay rather more systematic attention to the social aspects of reading. Greaney (1980), for example, found that the amount and type of leisure reading were related to such variables as basic ability, sex, socioeconomic status, family size and primary-school type (see also Greaney and Hegarty, 1987). Greaney and Neuman (1990) also investigated the functions of reading, in a study of children in more than a dozen countries: utility, enjoyment and escape were the three recurring motivations, and it was found that girls rated the second factor more positively than did boys (sex differences, particularly in the early years, are a consistent finding in the literature). The survey work of Anderson and his colleagues (Anderson, Hiebert, Scott and Wilkinson, 1985), particularly that dealing with children's reading habits vis-a-vis other leisure-time activities (see also Anderson, Wilson and Fielding, 1988), draws upon the investigations by Greaney and others, and suggests low levels of leisure reading. In terms of intervention, Neuman (1999) has adapted the 'book flood' idea (see Ingham, 1981) from primary schools in England to day-care centres in the USA. The concept is straightforward—make a large number of books available to economically disadvantaged children—and the results encouraging. (The advantages of what Neuman calls the 'physical proximity' of books, coupled with appropriate adult

support and guidance, are borne out in most reading surveys—and well-understood by all enlightened parents.)

Nell's (1988) interesting investigation of 'ludic' (i.e., pleasure) reading has been reasonably criticised for its psychoanalytic bent and its methodological difficulties while, at the same time, praised as establishing a base from which further study of ludic reading might proceed (see Venezky, 1990). Nell's most important contribution is his documentation of 'escapist' reading (reading 'fever', as one respondent put it): in one of the families he studied, the father claimed to read 30 books a month, the mother read 25 and the two daughters, 18 and 28.

Large-scale survey work has also continued. In 1993, the Roehampton Institute in London launched the pilot phase of a survey of 8,000 British children's reading habits: a report on the pilot project (involving 320 children) was published in 1994 (Children's Literature Research Centre), and the full report appeared in 1996. Among the important findings: boys read less than girls (particularly as they get older), patterns of reading interests (boys like adventure stories more than romances; girls prefer animal stories to science fiction) are remarkably resilient, and it is much too simplistic to blame television and computer games for depressed levels of reading (indeed, the study endorses earlier suggestions that 'voluntary readers tend to be active in other pursuits' [p. 116]—and these can include television viewing). Hall and Coles' (1999) survey of about 8,000 English 10- to 14-year-olds—in some ways an updating of earlier investigations by Whitehead, Capey, Maddren and Wellings (1974, 1977)—also illustrated the relationships between family socioeconomic status and reading, between pleasure reading and television viewing (while those who read most watch least, some of the 'heaviest' readers are also avid viewers), and between gender and reading (girls read more than boys, have more positive feelings about reading and enjoy their reading more). Broadly similar results were reported by McKenna, Kear and Ellsworth (1995) in their study of more than 18,000 American primary-school children. Worrying age and gender gaps in reading were also revealed in a province-wide survey in Ontario: at the third-grade level, 69% of boys and 83% of girls said they enjoyed reading; by the sixth grade, these proportions had decreased to 55% and 71%, respectively (EQAO, 1999).

Some of the most recent findings illustrate the continuing difficulties in assessing reading habits. In its dourly-titled *Reading at Risk* (2004), the (American) National Endowment for the Arts reported that book reading had declined over the previous twenty years, and that this decline was sharpest for 'literary reading'—the report speaks of 'imminent cultural crisis' and a 'rising tide of mediocrity', arguing that 'at the current rate of loss, literary reading as a leisure activity will virtually disappear in half a century' (p. xiii). The word 'literary' is key here,

since the NEA survey only concerned itself with fiction, plays and poetry (not counting, that is to say, the apparently growing taste for non-fiction); as well, no weighting was made for 'quality' (see also Bauerlein, 2005). A Canadian government-commissioned report found that the amount spent on books (in 2001) was exceeded only by that on newspapers and cinemas; however, the average annual outlay was less than \$200—not very much for, say, a family of four and when a new book can easily cost \$40—and fewer than half of all Canadian households bought any books at all (Hill Strategies, 2005). Another Canadian survey (Créatec, 2005) has recently found that—although the ratio of reading to television viewing is about 1:5—almost 90% of adults reported themselves as regular readers. A perceptive commentator (Taylor, 2005) asked how one could reconcile this percentage with the fact (noted earlier) that one in four people lack full functional literacy—and two main points suggest themselves, one substantive, the other methodological. First, there is again the matter of 'quality'. This is not simply a question of trying to argue that Charles Dickens should count while Danielle Steel should not; Taylor notes, for instance, that comics and joke books can qualify as reading material. Second, most surveys depend upon self-reported data and, in many instances, the 'interview' is a matter of a brief telephone call. These two issues are, in fact, common across survey findings.

There are relatively few investigations that have combined large respondent numbers with detailed assessment instruments. Some recent work in Nova Scotia, however, falls into this category. (Simple statistics on gross levels of magazine, newspaper and book reading have shown that Nova Scotia is a good reflection of the larger Canadian picture—which, in turn, is broadly similar to that in other 'developed' countries: see e.g. Ekos, 1991.) In a pilot survey of university students and teachers, Walker (1990) found that, overall, reading for pleasure was not a generally favoured leisure activity, and that material read was largely of a 'light' or ephemeral nature. There was a small group of very active, or 'core', readers, and significant sex differences emerged with regard to both the quantity and the type of reading done. Walker also reported that the presence of books at home, being read to as a child, and parental value placed upon reading *per se* were important determinants of reading habits.

The more comprehensive follow-up study (Edwards, 1999) involved some 875 students (from the upper grades in both primary and secondary schools), 1,700 parents and 625 teachers. The questionnaires administered to these three groups, while not exactly the same, were designed to produce complementary and interlocking information; the questions asked reflected a close reading of the existing literature. Teachers and parents were asked for information about their own reading

habits and attitudes and, as well, to give us their perceptions of children's reading practices. The information elicited on the questionnaires dealt with demographic factors (age, sex, family size, income level and occupation), with overall school achievement patterns and subject preferences, and with focussed probing of reading ability, attitudes and practices (involving such variables as time spent reading, quantity and type of material read, factors influencing reading choices, home and school encouragement of reading, home reading practices, reading related to other leisure-time pursuits and so on). Beyond categorical and scaled responses, qualitative data were also elicited (e.g. lists of favourite books, magazines and authors). Allowing for multiple-section questions, each respondent answered well over 100 queries.

I will touch here upon some of the findings from the children's survey. It is of course impossible to delve at all deeply into them, but they do broadly confirm trends noted earlier. Thus, for instance, girls report greater ability and more favourable attitudes towards reading than do boys—and they do more of it. Primary-school children apparently enjoy reading more than do those in secondary school, and the amount of reading decreases with age. As to type of leisure reading: girls prefer biographical and 'romance' fiction, as well as books about travel and animals; boys say they like to read adventure, sports and science-fiction books. Across the board, there is more television viewing than reading (as much as three hours daily at the lower grade level), but girls say that they watch less than the boys, and they are as twice as likely to prefer reading to television. When we asked children to rank-order their preferences for ten common leisure habits, their answers suggested four categories: the most favoured activity was simply being with friends, then came music, movies and television, sports and hobbies comprised a third grouping—and reading appeared in fourth and final position. Books and television were more popular among the younger children; and, again, girls were more likely than boys to prefer reading.

#### FUTURE DIRECTIONS

Despite a reasonable amount of data, and despite some very robust findings—having to do with age, gender, attitudes, and amount and type of reading—we are still largely at descriptive levels. There is much of interest that we have learned about reading in the electronic age, and there have also been occasional attempts at stimulating the reading habit. We still require, however, theoretical perspectives to unite and augment existing data, to treat such matters as the underlying factors influencing reading motivation and development, the rewards and consequences of reading, and the establishment and

maintenance of leisure-time activities.<sup>2</sup> It is readily apparent that a coherent and comprehensive social psychology of reading is a very large undertaking—necessitating, for example, hitherto untried marriages of the ‘technical’ and the sociological literature.

Along the way, as it were, useful work can be done under a large number of headings. One example is the longstanding concern about reading ‘quality’, a current manifestation of which involves teenagers’ preferences for horror stories—the ‘most popular genre for adolescents’ according to the Roehampton survey (Children’s Literature Research Centre, 1996, p. 210; see also Hall and Coles, 1999). The consumption of such material predictably attracts a variety of opinion. In some schools, teachers use these juvenile shockers on the grounds that, after all, they are of obvious interest and (it is hoped) will lead to ‘better’ things. The general assumption seems to be that almost any reading is better than nothing. Others, however, strongly disagree, arguing that reading books produced to a formula—endlessly recycled plots peopled by wooden stereotypes [‘flat’ characters, as Forster (1927) styled them]—only induces the sort of non-progressive escapism that Nell (1988) has discussed at length. Another aspect of current debates about ‘quality’ that cries out for further analysis is the resurgent interest in banning some books altogether; a group in Virginia (Parents Against Bad Books in Schools) would have removed from study such authors as Atwood, Doctorow, Eco and Morrison (see the pabbis.com website). A third contemporary avenue into the sociology of reading is provided by another resurgent phenomenon: the book club. Freeman (2005) provides a brief overview—from the mid-nineteenth century to Oprah—and Hartley (2001) raises some interesting questions: why, for example, are women more attracted to such groups than are men? And finally here, I suggest that larger issues of print versus screen, of shelf versus computer, constitute an increasingly important part of the contextualisation of reading (see Schonfeld, 2003, for an illuminating account of the rapid growth of electronic information storage; see also Arms, 2000—and, for the most sustained and highly charged defence of the paper media, Baker, 2001).

However, we approach the matter, any meaningful social psychology of reading should concern itself primarily with aliteracy: why don’t some readers read? Valpy (2001) has recently reported what we already

---

<sup>2</sup> We might consider following the lead of Hall and Coles (1999) a little more closely. They asked children how *they* accounted for gender differences in reading. Girls, it was reported, are more mature and sensitive than boys, they are not as physically active, they have more patience; boys see reading as ‘sissy’ or ‘square’, they can’t sit still long enough to read, reading is neither ‘cool’ nor ‘tough’, and so on. In effect, these children were constructing a theory that related socialisation in general to reading in particular.

knew: questions of reading motivation, attitudes and practices have been relatively ignored, largely because of current emphases upon achievement, testing and assessment. Thus, 'there is much more interest in whether children can read than in whether they do'. It is apparent that an area that pays vastly more attention to the development of skills than to their application is neglecting ends for means.

## GENDER AND LITERACY

### INTRODUCTION

This article reviews the ways in which gender and literacy have been linked in educational contexts, and the different patterns of intervention this has led to. In particular it will highlight the switch in the literature from a focus on the formation of (girls') gendered identities to a focus on (boys') gendered patterns of attainment within the literacy curriculum. The emergence of boys' underachievement in literacy as a policy problem will be linked to the current dominance of performance-management cultures within governments, and the accompanying processes of large-scale education reform which they have led to around the globe. Often such interventions are designed with the aim of securing maximum homogeneity in outcomes from education. This provides a new context in which to consider the range of social explanations for inequalities in educational performance, their currency, and the challenges this new more managerial landscape in education poses for a feminist politics.

### FEMINISM, GENDER AND LITERACY

Historically feminist work on gender and literacy can be grouped under two main headings. On the one hand there is a well established tradition of feminist textual analysis that focuses on text content, and examines the meanings texts hold for their readers or writers (Ang, 1985; Moss, 1989; Radway, 1984). This work has largely arisen out of a broader feminist concern for the social construction of gendered identities and has followed a similar trajectory from a primary interest in the ideological constraints which produce femininity to an understanding of girls' appropriation and reworking of a range of cultural resources for a wider and often more oppositional set of purposes (Hey, 1997; Williamson, 1981/1982). The judgements made are about the value of the text and the contribution the text makes to the formation of gendered identities (Cherland, 1994; Christian-Smith, 1993; Gilbert and Taylor, 1991).

This kind of attention to the relationship between gender and literacy attracted most interest through the seventies and eighties. One of the most hotly contested issues within the literature during that time was whether genres which were strongly associated with female readers,

such as the romance and soap operas, should be condemned as part of the ideological apparatus which constrained women's sphere of action. Or whether they pointed to contradictions in the ideological construction of femininity which their readers could potentially exploit (Moss, 1989). Radway's study of women romance readers provides a good example of the tensions within this literature as these issues increasingly sought resolution through direct study of the texts' readers as well as of the text itself (Radway, 1984).

By contrast the second and, until recently, much smaller strand of work has focused more closely on literacy learning. Using ethnographic perspectives this work has tracked how literacy has come to stand for a social good which enables full and meaningful participation in the broader society as well as access to the world of work. This literature has considered both the acquisition and distribution of the competencies associated with the literacy curriculum in this light and has used this emphasis to draw attention to gender inequalities in patterns of illiteracy. Early work in this area explored women's unequal access to education and the promise of literacy it brought with it (Horsman, 1991; Rockhill, 1993). The work centred on marginalised social groups such as adult women who were the target of basic skills courses or women or girls in the developing world who had been denied equal opportunities to learn to read or write. Much of the literature drew attention to the social constraints which shaped women's lives and in the process restricted their participation in education (Mace, 1998). This became part of the backdrop to the study of illiteracy more generally (see Robinson-Pant, *Women, Literacy and Development: Overview*, Volume 2).

Although these two strands of work were in many ways quite distinct, nevertheless they shared a common concern for social justice, and were grounded in a feminist analysis of the difficulties both women and girls face in a world shaped often in disregard of, if not positively against, their own interests. From this point of view they are complementary approaches in a longer campaign designed to bring about greater gender equality. There were some notable successes. The persistent attack on sexism in children's books did lead publishers to review and modify their output. Whilst literacy campaigns in the developing world increasingly recognised the importance of reaching women and girls as well as boys and men and resources were retargeted accordingly. Despite this, many of the structural inequalities which relegated women to second place economically and socially remain in place. Although the precise focus of debate in these two areas has shifted over time, neither literature considered that gender equality had been achieved by the point in the mid-nineties when the discourse over gender and literacy suddenly began to change.

GENDER AND LITERACY AS A POLICY PROBLEM:  
SHOULD BOYS DO BETTER?

By the mid-nineties, gender differences in performance in the school literacy curriculum had begun to attract a new kind of attention. Whether in official reports based on outcomes from the education system, in media coverage of the same data, or in the academic literature, boys' underachievement in literacy began to surface as a strong topic in its own right (Barrs and Pidgeon, 1993; Gilbert and Gilbert, 1998; Millard, 1997; Ofsted, 1993; QCA, 1998; Rowan et al., 2002). In the UK, the government's school inspection agency, Ofsted, summed up the available evidence in the following trenchant terms:

Boys do not do as well as girls in English in schools. There are contrasts in performance and attitudes towards the subject. The majority of pupils who experience difficulty in learning to read and write are boys. Boys' results in public examinations at 16 are not as good as girls', and many more girls than boys continue to study English beyond 16. (Ofsted, 1993 p. 2 quoted in Millard, 1997, p. 15)

Yet the curious thing about this summary is that it actually reports a state of affairs that had been known for a long while. The picture is entirely consistent with the evidence for literacy attainment available for at least the previous fifty years within the UK school system. On this basis, boys' test scores were adjusted up in the 11+ exam that was used to determine entry to grammar schools in order to even out the gender balance of those going forward from the higher end of the ability spectrum (Millard, 1997). Elsewhere, the advantage girls have over boys in standardised reading tests had been sufficiently well established for long enough for many such tests to adjust girls' scores downwards as a matter of routine (Barrs, 1993). The difference in the nineteen nineties is therefore not the evidence itself but rather its salience at this time and the changed conditions which make it capable of being read in new ways.

Feminist commentators account for why boys' performance has emerged as such a high profile problem within education discourse in different ways (Epstein et al., 1998; Foster, Kimmel and Skelton, 2001; Rowan et al., 2002). Certainly boys' underachievement in literacy acquired a new resonance from the broader educational picture which had begun to show substantial improvements in girls' attainment in a range of subjects, such as Maths and Science, where traditionally they had lagged far behind boys (Arnot et al., 1999). For some feminists this sudden focus on boys' comparative failure in the education system looked like evidence of an anti-feminist backlash which would be used to rebuild boys' competitive advantage (Epstein et al., 1998;

Foster, Kimmel and Skelton, 2001; Hallman, 2000). The media discourse which accompanied the initial reporting of the data certainly justified this response, as commentators were able to demonstrate using headlines or articles which had appeared in the US, in Australia and in the UK at that time, all of which presented boys' failures as a direct corollary of girls' success (Cohen, 1998, p. 19; Gilbert and Gilbert, 1998, p. 4–5; Mahoney, 1998, p. 46; Rowan et al., 2002, p. 15). By contrast, many feminists treated the data with caution, and argued instead for the need to pay much closer attention to how gendered attainment was intersected by both ethnicity and social class. Not all boys were doing badly, just as not all girls were doing well (Epstein et al., 1998).

But feminists also began to generate an alternative explanation for this sudden turn of affairs. The increased prominence given to boys' educational underachievement can be construed less as evidence of a straightforward strengthening of patriarchal values than as a new twist in a more complex relationship between education and the economy (Arnot et al., 1999; Mahoney, 1998). From this perspective, what marks out the nineteen nineties are changes in the economy, the rise of new managerialism and the increasing economisation of social life that happens as a response to the pressures of a globalisation (Kenway and Kelly, 1994). Governments increasingly expect education to demonstrate its value in economic terms. They export to education the kinds of systems for tracking production used in the commercial sector, and the tools of quality control associated with this (Morley and Rassool, 1999). In this context, children's performance in examinations increasingly counts as output data.

As new technologies make tracking and managing such data on a large scale easier so governments increasingly put in place more extensive testing regimes which can generate more detailed information about pupil progress. This has happened worldwide. As one example, in the UK, the introduction of a National Curriculum in 1988 was accompanied by the introduction of mandatory testing at 7, 11 and 14. These assessment points have now been supplemented by further optional tests in English and Maths for the intervening year groups which are administered annually. The wide-scale use of performance data in the education system produces the conditions in which boys' relative underachievement in literacy becomes much more publicly visible.

It has been in the interests of many governments to both collect and then make such data public as part of a broader discussion over the value of public services. They want to know and to demonstrate how well the education system is doing, as part of their contract with the voters. Being able to demonstrate that the system is working well operates as a means of winning consent for continuing support for a

publicly funded system of education. Equally, publicising apparent failures applies more pressure to that system to improve and deliver better value for the money spent. A new dynamic is put in place. Boys' underachievement in literacy gains its charge from this context.

Of course, any anomalies that surface in the performance data can be used to steer education policy, not just differences in girls' and boys' attainment. In the UK performance differences between schools and between LEAs (school districts) have exerted most influence on the direction of policy as a whole. In this sense social class trumps gender. Nevertheless, as successive governments have taken increasing control over the content of the literacy curriculum in England, a series of official publications have continued to flag up the discrepancies in boys' and girls' attainment in both reading and writing and to suggest ways in which schools might address this issue (Ofsted, 2003; DfES, 2003; QCA, 1998). Yet gender and literacy in this context is contained by a broader discourse of improving educational performance in which the school and its effective delivery of the curriculum take centre stage, rather than the feminist goal of achieving greater gender equity. As an indication of this, the most recent materials designed to support boys' writing and issued to English schools by the Primary National Strategy, the body charged with improving performance in primary schools, took as their main topics talk for writing; visual texts; purpose and audience; and feedback on learning. The advice they offer underwrites a particular view of what constitutes good literacy pedagogy, and is premised on the value of carefully structured and explicit support for writing. In important respects it is gender neutral. Indeed, this is in line with government policy-making in education which eschews advocating strategies that might benefit boys at the expense of girls for the simple reason that this would not help put results up across the board (Ofsted, 2003). That would not fit with a managerialist impulse which insists on greater homogeneity of outcomes. In this new policy context, the kind of affirmative action that was put in place in response to the same kind of data fifty years before seems unimaginable.

#### SUCCESS AND FAILURE IN THE LITERACY CURRICULUM: REWORKING FEMINIST IDEAS IN A NEW CONTEXT

As unskilled manufacturing jobs have moved abroad, many governments have committed to building a high-skill, knowledge-based economy at home. This aspiration has brought with it changed assumptions about the levels and spread of achievement in reading and writing required in the workforce. Demands for an improvement in boys' performance in the literacy curriculum happen within this context (Mahoney, 1998).

The aim of fixing performance outcomes increasingly acts as the backdrop to the discussion of gender and literacy. Yet it is not yet clear what the best solutions to the problems demonstrated in the data might be. Review of the available data show that when girls are not prevented from enrolling or regularly attending school, then as a group they achieve higher scores in reading and writing than boys. The pattern is consistent across many countries (OECD, 2003). Yet by no means all girls do better than all boys. Rather the distribution patterns for attainment vary between the genders, with boys' demonstrating a far longer tail of underachievement.

In exploring the data, feminists have looked for possible explanations which make sense in a context where girls' competitive edge in the literacy curriculum does not always lead on to better educational achievement overall or better employment prospects in the wider society. This kind of disconnection has to be taken into account. As a first step, this has often meant returning to earlier understandings about the causes of girls' educational disadvantage and assessing whether and how they might apply to boys. This is not a simple matter of translation (Gilbert and Gilbert, 1998, p. 21). By and large the most common assumption is that boys' underachievement in literacy is created by a dissonance between aspects of masculinity and aspects of schooling. There is less consensus over precisely which aspects of masculinity or schooling matter most in this respect. This leads to different proposed solutions to fixing literacy attainment. In each case the potential impact on girls is weighed as carefully as the consequences for boys. The following examples from the literature represent three different ways of addressing these issues.

### *Fixing the Content of the Literacy Curriculum*

Elaine Millard's *Differently Literate* examines the differences between boys' and girls' interests in reading and writing and their respective fit with the content of the literacy curriculum in the secondary school (1997). Her work draws on studies of genre preferences. She proposes that the prominence given to specific kinds of narrative fiction and the emphasis on character and personal response in the study of literature in the secondary school present difficulties for boys because they do not match with their interests. She comments:

(boys') favoured genres are less in harmony with the English curriculum and the choices made for them in class by their teachers. The largest contrast is between boys' interest in action and adventure and girls' preference for emotion and relationships. (Millard, 1997, p. 75)

In her view, the fact that the curriculum lines up with girls' not boys' existing interests matters because it reduces boys' full participation

within the literacy curriculum. Many of them switch off reading. Outside school, boys unlike girls commit their time to other pursuits. They associate reading at home with female members of the household. If they have interests in reading then they rarely share them with their peers. Overall this means that they gain less familiarity with the structures of written language. They are less adept at dealing with the kinds of tasks the literacy curriculum sets them. The picture Millard paints is of girls and boys acting as relatively self-contained communities of practice each constructed on gendered terrain. Rather than continue to allow one group's interests to dominate over the other's, her solution is to try to rebalance the English curriculum so that it embraces a wider range of reading material, non-fiction as well as fiction, and a greater range of media texts. She argues that such an expansion in the range of texts taught would extend girls' repertoire with beneficial outcomes for them too whilst 'draw(ing) boys in to the classroom community of story book readers and writers' (ibid, p. 180).

### *Fixing Boys (and Girls Too)*

Rowan et al's *Boys, Literacies and Schooling* occupies rather different territory (2002). It draws more closely on feminist post-structuralist work on the formation of gendered identities. The authors are more circumspect about polarising gendered interests, pointing out that there are different ways of doing masculinity and femininity, and that consequently there may be as many differences within as well as between these two categories. One of their case studies sets out to challenge the easy supposition that boys will show a keen interest in new technologies, and will be relatively skilful in this domain whilst girls will not (ibid, p. 137). They argue that this supposition does not provide a sufficient basis for re-engaging boys with the literacy curriculum. Instead of seeking to identify and then incorporate boys' existing interests into the curriculum as a way of improving literacy attainment, they set their sights on the transformation of gendered assumptions about what and who both boys and girls can be. This means working with and against the grain of teachers' and pupil's expectations about their own and others' place within the curriculum. They describe this as a 'transformative project' which seeks to re-make gender identities.

If we keep looking inwards to this same set of characteristics in order to come up with a solution to the "problems" produced by traditional discourses around masculinity, we run the risk of reproducing rather than critiquing those discourses that produce the problem. From a transformative perspective we need . . . to be able to imagine the new: new possibilities, new masculinities, new ways of being and performing as a 'boy' (ibid, p. 71).

They consider that the English curriculum is a good place for this kind of political project to unfurl because of the relative fluidity of the subject domain and its ability to incorporate new kinds of texts and practices that can help develop new kinds of stories. The English curriculum is already under pressure in this way precisely because of the emergence of new technologies. They consider that the practical interventions that they document act as templates for explorations of the dominant mindsets on gender and on literacy pedagogy rather than as specific recipes for reform. There are no hard and fast answers here, rather attempts to get things right. By placing the transformation of gender identities at the heart of their work they hope that they can begin to re-gear the curriculum towards a more equitable and expansive future.

### *Fixing Literacy Pedagogy*

By contrast, Judith Solsken's *Literacy, Gender and Work* focuses on the social interactions that surround learning how to read and write (1993), rather than with the construction of gender identities per se. She draws primarily on literacy as social practice perspectives to demonstrate that in both home and school literacy learning can be variously construed as self-directed play or adult-sponsored work, a distinction which she maps onto Bernstein's categories of visible and invisible pedagogies (ibid, p. 60, see also Bourne, *Official Pedagogic Discourses and the Construction of Learners' Identities*, Volume 3). She argues that these contradictory orientations to the process of becoming a reader or writer present children with a series of dilemmas which they then have to resolve. The way they respond influences their development as readers and writers in school and at home:

Both Luke and Jack seemed to define literacy as a particular kind of work in the sense that it was an activity required and overseen by adults, rather than one engaged in for their own purposes or pleasure. . . . While Luke played a mischievous 'bad boy' role in resisting most literacy activities (except those he defined as play), Jack played a 'good boy' role by treating literacy activities as chores to be completed (ibid, p. 36).

For Solsken, the positions children adopt in relation to literacy interact with their understanding of gender relations in the home. Solsken argues that this in part happens because more women than men shoulder the burden of preparing children for the work of learning literacy at school and find themselves responsible for ensuring a successful outcome to that process. The high stakes involved in making a smooth and successful entry into the literacy curriculum provide part of the backdrop against which children negotiate over what literacy means for them and the position they will adopt as literacy learners. Solsken concludes

that gender does not of itself determine whether children will align themselves with play-based or work-based pedagogies. Rather gender identities interact with and coalesce around children's experience of literacy learning. The consequences of the positions they adopt develop over time and in relation to the pedagogic culture of the classroom. Gender matters in this context.

Gemma Moss has followed up this focus on literacy and gender in a study of the literacy events which make up the school curriculum for pupils aged 7–10 (Moss, 1999). She has highlighted the particular salience that teachers' judgements of their pupils' proficiency at reading has in classrooms. The ways in which children are seated in class, the kinds of books they are expected to read, and the choices they are allowed to exercise over their reading both construct and make visible the categories of 'able' and 'poor' readers. More than any other group, boys labelled 'poor readers' show the most consistent preference for non-fiction texts. The precise texts they choose are visually rich but with a print size normally associated with adult not children's texts. Moss argues that these design characteristics enable this group to act as experts whether they have read the text or not, thus allowing them to escape others judgements about their proficiency as readers (Moss, 1999). She suggests that boys' genre preferences are created in response to not ahead of the literacy curriculum and the hierarchy of readers it constructs. Girls and boys labelled 'poor readers' react differently to this designation. Girls are more willing to accept that label and work within it, but may underestimate what they can do. Boys are more inclined to resist. This leads to different profiles of underachievement, which require different remedies.

#### CURRENT PROBLEMS AND FUTURE DIRECTIONS

Can the approaches outlined in brief above address the distribution problem within the performance data, namely why different proportions of boys and girls struggle to do well within the literacy curriculum whilst others sail through? Are they specific enough about which boys (and girls) struggle most? Does it make sense to try and search for these latter categories, so that their problems can be fixed? Solsken's work certainly suggests that outside of the context of the curriculum this may be an elusive quest. That the problem does not lie so much with a certain kind of boy (or girl) who stands apart from the content of the literacy curriculum, as with the demands that the literacy curriculum places on all children. Her work re-orientates debate away from consideration of the literacy curriculum as the place where gendered tastes are arbitrated and gender identities made to an examination of the conflicting modes of social control such a curriculum instantiates.

This turn in analysis from what the curriculum says directly about gender to how the curriculum orders its knowledge base and regulates knowers is in line with Bernstein's theory of pedagogic discourse (Bernstein, 1996). It may well be that this is the best direction in which to turn at a time when education itself is being re-shaped and made accountable for what it does in new ways, and when gender politics struggles to find a place in a managerialist culture.

CRITICAL LITERACY EDUCATION: ON LIVING WITH  
“INNOCENT LANGUAGE”

INTRODUCTION

*Attacks on the basic rights of the people are invariably  
couched in innocent language.*

Nelson Mandela, to the Constitutional Court of  
South Africa, 1995.

The starting point for critical literacy education is this: Societies strive toward convergence in the interpretive practices of their members—toward the production of a culture. Socialization entails, among other things, using language as if its relation to material and social realities were innocent and natural—transparently determinable, fixed, singular, and portable (Siegel and Fernandez, 2000). Controlling interpretation, securing both the fact of its determinacy and its particular contents, is thus an ongoing political project, profoundly connecting the individual to public interests. A core concern of critical literacy education is interrupting and naming that project, finding principled, teachable ways of affording a productive ideological appreciation of social organization, human conduct, and language. Appreciating the potentially multiple ways in which language can be used to understand, act in and on, and appraise the world calls for explicit educational effort, and affording these ways constitutes a core component of any mature form of acculturation into literate society. Such an education effort, however, is always contentious in contemporary, schooled societies, because the organizational features that perform the regulatory functions of schooling militate against the “ability to think ‘critically’ in the sense of understanding how systems and institutions inter-relate to help and harm people” (Gee, 2001, p. 2).

EARLY DEVELOPMENTS

Janks (2000) has identified four interrelated lines of work in critical literacy education, focusing on (i) the role of literacy education in analyses of cultural and political domination, (ii) access to powerful ways

of knowing and communicating, (iii) understanding the significance of linguistic, dialectical and cultural diversity, and (iv) learning the role of literate communication in the design of personal and social futures. These preoccupations have evolved in distinctive ways in various disciplinary and professional sites. Advocates and practitioners have included writers, teachers, and policy makers in universities, colleges, and schools, grouped generally under the banners of social, linguistic, humanities, and cultural studies. Active as well have been policy makers, curriculum developers, and evaluators in education-oriented civil-service units.

The key realization at the core of the distinctive problem of literacy is not new:

*You might suppose that [written words] understand what they are saying, but if you want to know something and you ask them a question, they simply give you the same answer over and over again . . . nobler by far is the serious pursuit of the dialectician.* (Socrates in Phaedrus, Sections 275e–277a, Plato, 360 BCE)

Several millennia later, Smith (1999) made the problem of the implacability of written language, in contrast to the coordinated agency afforded by interaction, a centerpiece of a feminist analysis of contemporary conditions:

*For the reader . . . the text pursues its remorseless way, unresponsive to the impassioned marginal notes, the exclamation points, the question marks . . . It scripts her part in the conversation, . . . she has no choice* (1999, pp. 146–147) . . . *The practice of ruling involves the ongoing representation of the local actualities of our worlds in the standardized general forms of knowledge that enter them into the relations of ruling. It involves the construction of the world as texts, whether on paper or in computer, and the creation of a world in texts as a site of action. Forms of consciousness are created that are properties of organization or discourse rather than of individual subjects.* (Smith, 1987, pp. 2–3)

Although the term *critical literacy education* mobilizes different forms of advocacy and practice around these ideas on different sites, it has a specific provenance dating from the 1960s. The originator of the term, and of an orientation to its role in understanding and practicing teaching, was Paulo Freire. Freire was a politically active adult educator who worked with Brazilian peasant farmers whom he characterized as living in structures, including interpretive structures, that made them not marginal to society but rather embedded in it as beings for others (1970, p. 55). His aims (see Freire and Macedo, 1987) were to have his students/coworkers:

1. able to make critical readings of the social practices and relations, and the institutional and governmental procedures that are made possible and sustained by certain literacy practices;
2. see how texts are socially situated, intelligible only via an understanding of their sources, purposes, and interests, the conditions that make them possible and materially available; and
3. have a critical perspective on literacy as an educational phenomenon, a market commodity, a talisman of modernity, and a source of both liberation and oppression.

Connecting with the lines of work related to of Freire were developing ideas about critical pedagogy (e.g., Bernstein, 1971; Bourdieu, 1974; Bowles and Gintis, 1976; Giroux, 1981). These theoreticians were examining the socio-economic and cultural reproductionist functions of schooling, and pointing to the particular role of literacy materials and interpretive practices in the prosecution of those functions.

Much of this early work has been criticized for, essentially, being itself too determinate in its interpretation of the reading and writing conditions of people and the role of literacy in clarifying and challenging those conditions, specifically, for ignoring (i) socio-political dimensions other than class, (ii) the new industrial and pop-cultural conditions in the midst of which young people live, and (iii) the post-modern, postcolonial features of contemporary experience. These themes inform discussion in the following sections.

#### MAJOR CONTRIBUTIONS AND WORK IN PROGRESS

The expression *critical literacy education* points to a loose affiliation among theories, research methods, practices, and dispositions. It is convenient for the purpose at hand, if not entirely inclusive, to cluster contributions under the headings of anthropological, sociological, linguistic, and pedagogical traditions. These distinctions are, of course, blurred and constantly traversed partly because any given educational practitioner may draw on ideas and methods from among these and other traditions. Each orientation has a distinct view of what constitutes the critical aspects of critical literacy education, and each deploys different forms of data, analysis, and argument to support that view.

Anthropological contributions have used observational, cross-cultural, and documentary methods to expand on two key ideas about literacy: first is a theoretical focus on understanding literacy as coordinated and shared sets of practices and events (Street, 1984). That is, literacy activities, as they are conducted and learned formally and informally, are taken to be primordially social activities, best understood in terms of the qualities of various literacy events and practices, and the relationships among them. A *literacy event* is taken to be “any occasion

in which a piece of writing is integral to the nature of the participants' interactions and their interpretive processes" (Heath, 1982, p. 23). These events provide the social experiential bases for the development of *literacy practices*—ways of using written language that people display routinely, including commonly shared ideas, literacy's part in relationships and identities, and the ideological assumptions that underlie those ideas (Street, 2001). This emphasis on interactional qualities stands in direct opposition to cognitivists' focus on individuals' strategies for reading and writing, psychometricians' focus on measurable abilities of reading and writing, and those linguistic accounts that attend largely to the clause- and text-level grammatical demands of text management and production.

A second key motivation of anthropological approaches is to document literacy activities in homes, schools, and workplaces. One aim is to highlight the diversity of literacy activities among subcultural groups. The documentations generally show school-based literacy events and practices to be restricted in contrast with those found in homes and workplaces (e.g., the collection edited by Anderson, Kendrick, Rogers, and Smythe, 2005, esp. chapters by Gregory, and Prinsloo and Stein). But they also show that certain patterns of literacy events and practices are consequential in that they can act systematically to exclude people of certain cultural and economic backgrounds from access to the practices that make up literacy work in schools and elsewhere (Freebody, Forrest, and Gunn, 2001; Purcell-Gates, 1995). The argument is that it is a failure to realize or act on this diversity that makes for the durability of uneven access to and facility with important literacy practices.

Anthropological orientations point to the need to reconstitute schooling in general and literacy education in particular in light of postmono-conditions: the diversity and hybridity of cultures and languages in most school settings and workplaces in the world, of the socio-economic and socio-political formations and life trajectories facing young people, and of the ways of knowing that have conventionally been over-written by colonized forms of education (e.g., Cope and Kalantzis, 2000). Such reconstitutions range from pedagogies that restore marginalized language and experience to a legitimate place in school literacy learning, to those approaches that are more specifically directed at the use of literacy education for explorations of gender, race, or other socio-political dimensions through reading and writing practices (e.g., Lewis, 2001).

While anthropologists of literacy generally favor neither explicit ideological critiques of social structures that privilege certain interest groups, nor the explicit recommendation of normative pedagogical

strategies, they offer nonetheless bases in theory and research for the mounting of a diversity-based critique of the unproductively narrow ideologies and repertoires of practice through which much contemporary schooling does ideologically reproductionist work (e.g., Gregory and Williams, 1998). Barton (1994, p. 218), for instance, in concluding a major study of community literacy, made a case for the centrality of socio-economic, gender, and racial inequality in an understanding of these patterns of connection:

*Ultimately Literacy reflects inequalities in society: inequalities of power, inequalities in the distribution of wealth, and inequalities in access to education. . . . Literacy can only be fully understood in the context of these social relations.*

But the distinctive contribution of anthropologists of literacy resides in their attention to documenting the details of how these patterns arise and are conveyed, valued, and devalued. They begin with the everyday empirics of how people do things with texts, day in, day out, and with how much of this remains unrecognized or misrecognized in the settings of modern public institutions (as many of the chapters in this volume illustrate, see especially Robinson-Pant, *Women, Literacy and Development: Overview, Volume 2*; Kalman, *Literacies in Latin America, Volume 2*; Richardson, *African American Literacies, Volume 2*).

While anthropologists may arrive at such understandings about the macro-structures that build and are built by social order, it is the phenomenon of social order itself that constitutes the starting puzzle for sociologists. For our purposes, that means developing critical understandings of the social orders that sustain certain types of literacy education, and, simultaneously, of the ways in which certain types of literacy education sustain social orders.

Sociological approaches to critical literacy education have their roots in critical theories, mostly Marxian or poststructuralist, and have developed to address questions from within sociology and political economy concerning schooling as a social, cultural, economic, and political formation. These have included the critique that the features of schooling correspond at a number of levels (system, individual institution, individual classroom) to the occupational systems in a society, and that, conversely, school systems actively reproduce the material distribution evident in that occupational system. Literacy education is also taken to play a key role in schools' ability to shape social structures via the targeted distribution of the varying life chances and trajectories of groups and individuals by selectively providing the skills and cultural capital that legitimate the material orders of society (Bourdieu, 1991), culturally and economically reproductive processes by which material

and cultural gifts are systematically mistaken for academic or intellectual gifts.

Sociological accounts that inform critical literacy education also point specifically to all the machineries of remediation, policy, and curriculum development that support them, and inquire into the ways in which this ensemble of ideas and practices actively sustain the interests of ruling groups in a society. The argument is that these ideas and practices do not just passively maintain a *status quo*, but actively and persistently divert, disrupt, and militate against the distributive and meritocratic rhetorics of contemporary educational policy. Conventional forms of literacy education do this partly by attaching young members of a society to textual forms of social organization: That is, it is argued that literate societies, radically unlike others, recruit textual print and digital materials, relying upon specific forms of reading and writing among their members, to continually reestablish relations of ruling (Smith, 1987). So passive, compliant, or dehistoricized forms of the human disciplines and paradigms that inform education (psychology, developmentalism, constructivism) actively conjure particular ontologies that appear to crystallize ruling interests, through discourses about: children as literate citizen-learners (see A. Luke, 1988), and competent, functioning citizen-workers (see, e.g., Gee, Hull, and Lankshear, 1996; Lankshear, 1987).

With respect to educational practice, these accounts have provided pedagogies that build on the critical pedagogy movement more generally and upon understandings about the particular role of literacy education in transmitting and legitimating the cultures and interests of dominant groups. Specifically, these accounts include critiques of:

- the masculinism of contemporary pedagogical practices, including some forms of critical pedagogy as conventionally understood (e.g., Luke and Gore, 1992);
- the failure of most pedagogical treatments of race-based issues to make visible the enduring white privilege that under-writes much multicultural and pluralism-based approaches to teaching, curriculum, and assessment (e.g., Allen, 2004, for an account of critical race theory); and
- the systematic production of strong correlations between family affluence and literacy learning, and the significance of powerful pedagogies in reshaping that relationship (e.g., Comber and Simpson, 2001).

Applied linguists with an interest in the critical literacy education program, most prominently those drawing on Halliday (1985) and his colleagues, have contributed a variety of analytic means, generally

collected under the title critical discourse analysis, to form the bases of pedagogic approaches to texts. A central contributor has been Fairclough (1989, 2003), who has argued that semiotic resources such as language are caught up in the production of social life because they provide us with ways of (i) representing reality, (ii) providing modalities for acting and relating socially, and (iii) building social, communal, and individual identities (see Wallace, 2003, for classroom applications). Cultures build and transmit flexible, recognizable, and durable ways of representing (which Fairclough termed discourses), (inter)acting (genres), and being (styles). With respect to education, Fairclough has described the how elements of one socially situated practice (e.g., the conduct of professional history) are selectively recruited into another (e.g., doing History in and for school). This process of recruitment, or appropriation, involves the reshaping of how reality is represented, dealt with, and embedded in and as part of institutionalized teacher–student relations; the argument is that an understanding of literacy in school must begin with an analysis of these appropriation processes.

Applied linguists have contributed to the critical analysis of texts made without verbal content or with ensembles of different semiotic contents (e.g., Lemke, 1998). The argument has been that it is increasingly the case that language is no longer central or even significant to many print- and digital-based meaning events in educational settings. Important here is the distinction Lemke drew between typological (meaning by kind) and topological (meaning by degree). Different semiotic resources are differentially good at, or organized around, one or the other of these types of meaning:

*Language, as a typologically oriented semiotic resource, is unsurpassed as a tool for the formulation of difference and relationship, for the making of categorical distinctions. It is much poorer . . . [in its] resources for formulating degree, quantity, gradation, continuous change, continuous co-variation, non-integer ratios, varying proportionality, complex topological relations of relative nearness or connectedness, or nonlinear relationships and dynamical emergence. (Lemke, 1998, pp. 87, 92, insert added)*

Thus, the distinction is made between writing, which materializes activity, causation, and agency in the world, and other semiotic activities such as drawing or graphing, which materialize the states stasis, correlation, and co-incidence (Kress, 2001). The critique of contemporary schooling that motivates these analyses is clear: the epistemologies and logics of these semiotic systems are different (the materiality of images is space; the materiality of language is time and causality)

and thus they lead to different ways of knowing about and interacting with knowledge. The danger is that schools remain artificially isolated from the cultural and communicational transitions currently underway from fixed book-words to digitally manipulable screen-images as dominant meaning-making systems.

In contrast to the emphasis, found especially in most sociological approaches on the effects of the consumption of official school texts, applied linguists have emphasized the transformative effects of the production of texts by students (Martin, 1999). This focus offers one possible productive positive thesis—"how the different strands of work in language and social justice can be brought together to emphasise power as productive" (Janks, 2000, p. 184)—for critical literacy education: the remaking of knowledge. This brings with it an appreciation of the restrictiveness of conventional assessments in educational settings. Learning, the argument goes (e.g., Kress, 2001, 2003), is not primarily an acquisitional activity or the traces of developmental tracks. It entails students' developing ways of demonstrating sequences of principled changes in their material capacities and, significantly, showing how those capacities have changed their understanding of the world and how to act in and upon it.

Arising from their critical perspectives on literacy education, anthropologists, sociologists, and applied linguists have provided, or at least implied, a range of distinctive transformations for educational policy, pedagogy, assessment, and curriculum, all aimed generally at productive and responsible appreciations of the noninnocent relation between language and reality. One major set of implications concerns the assessment of literacy capabilities in schools: one outcome of the effortful preoccupation displayed by some institutions with measuring *how much* basic technical proficiency in script recognition and production that individuals or groups possess has been to draw attention away from the considering the particularities of *how* people are acculturated and apprenticed into literacy, and the moral, civic, and ideological implications of those particularities. The kinds of transformed practices recommended by critical literacy educators involve not just ways of challenging the assumptions and effects of school texts by teaching the technical procedures for making these visible; they involve as well ways of understanding more broadly the consequences of different forms of literacy education for the naturalizing, interrupting, or challenging of system in social organization and human conduct; they offer researchers, teachers, and learners ways of reflecting on their own understandings of equity, social justice, and critical transformation as potentially the products of power and ruling interests, and on practical regimens for re-writing and re-directing those understandings.

## PROBLEMS AND DIFFICULTIES

Problems encountered in the affiliations that constitute the domain of critical literacy education are of two kinds: problems facing critical theories generally and their particular expressions in different disciplines, and tussles between these disciplines for the ownership of the essence of the critical literacy education project.

In the first case, three central challenges face the critical project. The first concerns the unclear relationships among socio-political formations (such as class, gender, and race), strategies of governance (such as educational policies and practices), and the prosecution of particular social and economic interests via these strategies. Accounts of critical literacy education often offer tenuous connections between these constructs, and one practical consequence of this is that researchers, teachers, and policy makers interested in advocating or practicing critical literacy pedagogies are vulnerable to challenges of subjectivity or bias. Such practices need to be based in a firm theorization that locates critical literacy in a collection of skills, understandings, and dispositions urgently needed by students to face the contemporary and future vocational, civic, and domestic experiences lying in wait for them.

Second is the question of which approach to language and semiotic analysis best inform a critical literacy education program. This discussion notwithstanding, the disciplines of anthropology, sociology and applied linguistics are, of course, no less driven by conceptual and methodological divisions than any other site of academic or professional practice.

Practitioners of the various disciples that inform critical literacy education disagree primordially on what the critically literate teacher and learner look like. Anthropologists object to the preemptively normative practices that emanate from sociological and most linguistic accounts; sociologists object to the absence of a theorization of power in anthropological and most linguistic accounts; applied linguists object to the lack of ideological agency attributed to learners in sociological versions of critical literacy education, and to the lack of appreciation or use of durable ideological formations as explanatory devices in anthropology.

These difficulties are not trivial or, worse still, merely academic: They present significant problems to teachers, educational policy makers, and curriculum developers. They make available too many options, the most comfortable of which amount to versions of reader response theory with its teeth showing, a conservative resort to critical or higher-order thinking that personalizes and authenticates the very interpretive determinacy against which the project originally set itself. In this way, the life

cycle of an educationally transformational project can be seen to repeat itself: emergence, enthusiasm, orthodoxy, institutional recruitment, and residualization as yesterday's product.

### FUTURE DIRECTIONS

Texts are integral to the operation of many everyday settings, such as people's contractual, civic commitments and their dealings with government and other public institutions; because of that, along with everyday practical work, texts are used simultaneously to organize social relations, and, thereby, are put to ideological, moral, and political work. Further, texts do not just accompany or comment on social organization: They materially constitute relations of power, embody those relations, and can naturalize or legitimate them, just as surely as they can adapt, challenge, or refashion them. They can, therefore, be systematically analyzed to show the structure and consequences of the work they are put to in embodying, reproducing, inflecting, adapting, or challenging prevalent and dominant practices and assumptions about social life. To conduct this work in schools is to foreground contestation, and the discomfort, disruption and criticism that this can attract call for principles that are both intellectually and pedagogically defensible. If critical literacy education is to have a reputable and enduring future, then more work will center on the need to develop and empirically examine the consequences of such principles.

The tensions and polarities traversing the study and application of critical literacy education include:

- text-in-and-of-context (how should students be shown that texts are both the products and elements of their context of interpretation?);
- language-in-and-for-society (a form of the "access paradox: how can the powerful interpretive and productive textual resources be made available to students without over-writing the students" own local forms of representation, interaction and knowledge?);
- the possibility of a dissenting mainstream in school and as a resource for understanding literacy for school (can dissenting literate practices emanate only from demographically, socio-economically marginal groups, from linguistic and cultural hybridities/minorities—beings for others—and what is the *educational* place of, for example, white, middle-class males in mobilizing the critical literacy project?);
- critical literacy curriculums (pedagogies, assessments, materials; what can be sustained in the face of schooling that is increasingly accountable via test scores?);
- how can studies of literacy in *educational* settings go beyond both humanist progressivism and a liberal acknowledgement of diversity? and

- how can theoretical and empirical work offer a justification for critical literacy education that goes beyond the marketplace's needs for proactive workers and the enhanced literacy performance of critical thinkers, readers, and writers?

There is a positive thesis at the heart of critical literacy pedagogies, methodologies, and practices: interpreting and producing texts is a way of rendering experience more understandable, of transforming experience through the productive application of epistemological, ideological, and textual resources, thereby revisiting and reunderstanding experience through active work on articulating the stuff of experience and on rearticulating the experience of others. This project includes articulating how to build alternative paths for self- and social development, an attitude toward one's self as in and of history, and usable, against-the-grain ways of knowing, feeling, and interacting, actively informed by, rather than silently determined by, the socio-economic histories of victories and defeats that have produced that self.

## BILITERACY AND GLOBALIZATION

## INTRODUCTION

The confluence of biliteracy and globalization is somewhat uncharted water. What text types and practices does one find at the lifeworlds of this confluence and what implications do they have for the bilingual classroom? Who are the main players at this meeting place of texts (as in biliteracy) and processes (as in globalization): markets, policy-makers, teacher practitioners or finally the consumers and producers of languages? What does a biliterate text in our globalizing world look like both inside and outside the classroom? This chapter explores some of the answers to these questions.

The fields of biliteracy and globalization are highly specialized within their broader disciplines. Hornberger (*Continua of Biliteracy*, Volume 9) has provided an updated review on the field of biliteracy, which goes back to the 1970s. Thus, this chapter will not repeat what Hornberger has already provided for us, instead it will concentrate more on the nexus of biliteracy and globalization. The data herein come from the two countries where I conduct research—India and Singapore. Research in the former, which is ongoing since 1999, is an ethnographic analysis of a Hindi–English dual medium government school (Rajkiya Sarvodaya Kanya Vidyalaya), which follows the three language formula (TLF), India’s language in education policy. In the case of Singapore, data come from the Sociolinguistic Survey of Singapore (SSS, 2006), a project undertaken by the Centre for Research in Pedagogy and Practice.

## EARLY DEVELOPMENTS

*Globalization*

The literature on globalization can be considered to be somewhat bounded by two massive trilogies: Wallerstein’s (1974, 1980, 1989) *World Systems Analysis* and Castells’ (1996/2000, 1997/2004, 1998/2000) *The Information Age*. Both sets of work are brilliant in their analyses of the ways the globe is networked into congeries of empires, corporations, communities and pan national organizations. However, Wallerstein’s Marxist perspective is now dated due to the demise of

communism as an enduring political alternative. Though Castells' early writings are Marxist, his later work is more applicable to the world in which we live today. The shortcoming of his trilogy is that the work does not make India a major focus as it does China, thus excluding not only a globalizing country of 1 billion people but also one of the dominant cultures of our world.

Globalization has been defined somewhat differently by economists (Bhagwati, 2004), sociologists (Castells, 1996/2000, 1997/2004, 1998/2000) and anthropologists (Appadurai, 1996) but they all agree on the high level of connectivity in this phenomenon between nations, corporations and individuals. Pieterse, the cultural anthropologist, gives a definition that encompasses many of these views. He writes that globalization 'is an objective, empirical process of increasing economic and political connectivity, a subjective process unfolding in consciousness as the collective awareness of growing global interconnectedness, and a host of specific globalizing projects that seek to shape global conditions' (Pieterse, 2004, pp. 16–17). As a phenomenon, Friedman (2005) points out that globalization is not new; in fact it is a process that started around 1492 and has manifested itself in three phases so far. In the first phase, 1492–1800, globalization was about imperial forces acquiring colonies by brute force; the second phase, 1800–2000, saw the rise of multinationals and the early version of the World Wide Web; and finally, since 2000, globalization is about individuals participating in the global economy leading to what Friedman calls a 'flat world' or level playing field.

### *Biliteracy and Related Terminology*

Hornberger (Continua of Biliteracy, Volume 9) points out that in the 1970s the word 'biliteracy' carried connotations of fluency or mastery in the reading and writing of two or more languages. Her own definition of biliteracy, on which this chapter is based, is 'any and all instances in which communication occurs in two (or more) languages in or around writing' (Hornberger, 2003, p. 35). This definition includes varying levels of competencies, text types (traditional and multimodal) and verbal and symbolic communication. It thus encompasses biliteracy as exhibited in the lifeworld of the bilingual, and not as confined only to the classroom through school-related texts. Hornberger's model is a way of analyzing what is taught (content of biliteracy), in which languages it is taught (media of biliteracy), where it is taught (contexts of biliteracy) and what is the outcome of the teaching (development of biliteracy). The nestedness of these four sets of continua emphasize that for optimal biliterate development the learner should be allowed to access as many points on the continua as possible.

Related terms that have currency today are multimodal literacy (Kress, 2003), which is literacy based on the affordances of a web page, gesture, sound and other semiotic symbols including script, new literacies that one finds in cyberspace or workplace (Lankshear and Knobel, 2003) and finally multiliteracies (Cope and Kalantzis, 2000). None of these terms is about multiple languages and scripts as directly as is the term 'biliteracy', though all these terms are based on linguistic and cultural diversity. The term that comes closest in meaning to biliteracy is 'multilingual literacies' used by Martin-Jones and Jones (2000). Recently Pahl (2006) has edited a book that ethnographically links New Literacy Studies to multimodality in an age of globalization. However, the multimodality inherent in the diverse scripts and languages in which a bilingual has competence is not the major focus of this otherwise excellent volume.

#### MAJOR CONTRIBUTIONS

The themes that emerge from the field of biliteracy and globalization are changing media of instruction in national school systems, new literacies required in the workplace, the threatened linguistic ecology of the globe and finally biliterate textual practices influenced by the Internet. Each of these will be briefly described in this section. Let me begin with changing media of instruction and new literacies. Block and Cameron (2002, p. 5) point out that 'globalization changes the conditions under which language learning takes place' by commodifying languages and creating new literacies required by the workplace that schools are expected to teach. This is definitely true of India. TLF, which offered English as a second language only in secondary schools, is being transformed by globalization because the urban disadvantaged are demanding earlier access to the linguistic capital of English. This demand is linked to new sectors of the economy which are opening up since India started globalizing in 1991, like the mushrooming of call centres all over New Delhi. Consequently, government schools have initiated dual-medium programmes, which offer English as one of the media of instruction along with Hindi from nursery itself.

The spread of global English is perceived as threatening the linguistic diversity of the globe. Using the metaphor of biodiversity Skutnabb-Kangas (2003, p. 34) argues that not only can the world's linguistic diversity be documented in the same way as biodiversity there is also a correlation and even causal connection between the two. She writes that 'Maintenance of diversities . . . is one end of the continuum where ecocide and linguistic genocide are at the other end'. Skutnabb-Kangas' main point through these arguments is to raise awareness about language endangerment of small languages from the threat of big killer languages, like English. In a similar vein, Phillipson (1992, 2006) sees

globalization, Americanization and Englishization as part of one process. He finds that English has retained its hold in former colonies and that it remains a divisive tool with which socio-economic strata are separated into the haves and have-nots. This view has been critiqued by Canagarajah (1999) who shows how English has been appropriated in Sri Lanka and Vaish (2005) who finds an agentive demand for and use of English in India.

Contesting the well-known view that globalization homogenizes languages is the not so well-known literature documenting the rise of non-English languages due to globalization. Dor's (2004, p. 98) thesis is that 'the forces of globalization do not have a vested interest in the global spread of English. They have a short-term interest in penetrating local markets through local languages and a long-term interest in turning these languages into commodified tools of communication'. He predicts that the Internet 'is going to be a predominantly non-English-language medium'. In 2004, there were 280 million English users and no less than 657 million non-English users and this gap is widening in favour of the latter. A similar view is expressed by Indrajit Banerjee, Secretary-General of the Asian Media Information and Communication Centre (AMIC), who comments:

One would think that globalization in Asia would mean going English but that's not the case . . . The diasporic market means you can have international newspapers, international TV and radio channels which are completely based on local languages. This is what I call the globalization of the local (p. 29).

In keeping with Dor's view, Warschauer (2002) and Warschauer, El, Ghada and Zohry (2002) point out that though in the Internet's history and design English and Romanized languages are privileged, this is changing due to the increasing online usage of languages like Arabic. For instance, the website of CNNArabic.com is a biliterate text that uses both Roman and Arabic scripts. Interestingly it is also a multi-modal text because it has photos, videos and sound. Also in informal e-mails, colloquial Arabic is extensively used in the Roman script—a type of biliterate text that is becoming very common on the Internet.

This is also found in data from India where Hindi–English bilinguals use similar biliteracy practices to communicate. The following e-mail, which was sent to me by one of the young students in my study in India, is a case in point. Here the sender uses Romanized Hindi (bolded) and English to communicate:

Hi Mam

**Main Bahut Khus Hua Apki E-Mail Pakar**

*(I was very happy to receive your e-mail)*

& Thanks for my reply.

Finally, English is not the only language to claim a global status. Goh (2000) stakes a similar claim for Mandarin saying that like English it is used in inner, outer and expanding circles. Goh's claim is based on the increasing economic power of the inner circle (China) and the increasing number of Mandarin learners in the outer circle.

Goh also points to the rising use of Mandarin on the Internet through sites like the Chinese Google and Chinese Wikipedia. Thus, the emergence of languages like Arabic and Mandarin in cyberspace and the mingling of scripts with diverse languages in informal communication point to new biliterate practices that are yet to be explored in depth.

#### WORK IN PROGRESS

Broadly speaking, work in biliteracy tends to fall into two discrete domains—either the research is in the classroom or on the linguistic landscape of a site. A project of the former type is 'Signs of Difference: How Children Learn to Write in Different Script Systems' undertaken by the Institute of Education in the UK (Kenner, 2004; Kenner and Kress, 2003). This was a year-long study of 6-year-olds in London learning Chinese, Arabic and Spanish along with English. The methodology involved asking the case study children to teach their peers how to write Chinese, Arabic and Spanish using their own work. They found that in this biscriptal experience each script is a different 'mode' and the child organizes the Chinese and the Arabic scripts in terms of spatiality and directionality.

A recent issue of the *International Journal of Multilingualism* has focused on the concept of 'linguistic landscape'. An illustration of such research is Cenoz and Gorter (2006) who compare 975 signs on two streets in the Netherlands and Spain, respectively, on the basis of type of sign, number and names of languages on the sign, order of languages, type of font and whether the sign represents top-down language policy or bottom-up language use. Such literature perceives biliteracy as semiotic texts, which are not just found in the classroom, but also in the lifeworld of advertising, newspapers, comics, television, movies and other textual practices that influence school-going children.

In similar studies both Bhatia and Ritchie (2004) and Ladousa (2002) write about Hindi–English advertising in India. Bhatia and Ritchie (2004, p. 513) hypothesize: 'The economic forces of globalization together with the rise of global media have set the stage for a dramatic, exponential rise in global bilingualism,' thus challenging Phillipson's idea of English language hegemony. Ladousa's data come from the city of Banaras where she finds that the English-only advertisements in the Roman script signal a global language of the centre, whereas the Hindi ones in the Devanagari script index either a powerless periphery or an emerging Hindu–Hindi power that resists the linguistic colonization of English.

The literature on linguistic landscape does not use the term ‘biliteracy’ preferring ‘bilingualism’ as a catch all that accommodates speech and text. However, changes in the linguistic ecology of the globalizing world and medium of instruction demand a closer look at biliteracy so as to define it in terms of specific texts and practices as well as enrich existing theory. Vaish (forthcoming) suggests that biliterate texts can be categorized as traditionally biliterate or hybrid. A biliterate text is an artefact, for instance a road sign, piece of writing in the classroom, an advertisement on the street or graffiti and finally an English textbook that has been glossed and annotated in Hindi, in which there is written or symbolic (as in an image) evidence of two or more languages or cultures. A hybrid text is a subset of biliterate texts in that it has an aesthetic, creative nature, is usually not grammatically acceptable and is popular in sites like advertising and public culture. Specifically a hybrid text represents symbolically or through a comingling of scripts, what a bilingual does through code switching. While the former may be accommodated inside the bilingual classroom the latter is proscribed.

Figure 1 may be considered a biliterate text. It is a page from the English textbook of a girl in grade 10 of the dual-medium Rajkiya Sarvodaya Kanya Vidyalaya in New Delhi.

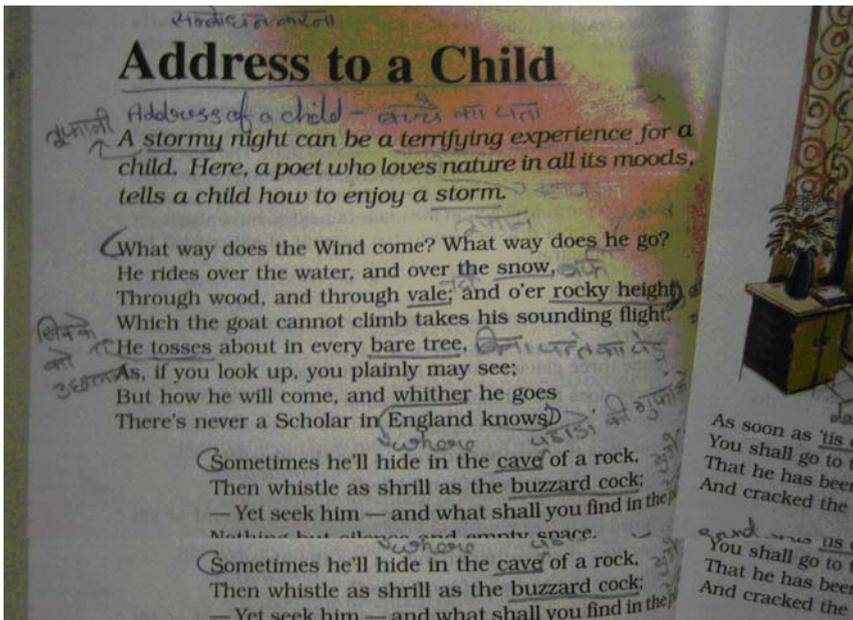

Figure 1 A biliterate text.

This poem by William Wordsworth appears in the English textbook for class 10, which is used in the government school system in India. The student to whom this textbook belongs has underlined all the words she has found difficult and written their meanings in Hindi. For instance:

Bare tree: बरिना पत्ते का पेड़

Cave: पहाडों की गुफा

In some cases, the student has made annotations in English; for instance she has written ‘address of a child’ and glossed this phrase in Hindi as बच्चे का पता so as to make a distinction between the two meanings of the noun ‘address’.

The teachers in the Rajkiya Sarvodaya Kanya Vidyalaya actively encourage the creation of biliterate annotations in the texts because they use L1 as a resource in the classroom. One of them, Mrs Shobhana Gulati, explained to me (Field notes, October 16, 2005) that the Devanagari script is a great way to teach pronunciation in English. This is because Devanagari is a phonetic script and the words are pronounced exactly the way they are written. There are no silent letters or two pronunciations of a single letter like /s/ and /k/ for the letter ‘c’. Thus if there are difficult pronunciations in the English lesson she makes the children write the exact pronunciation of the English word in Devanagari.

On the other hand the advertisement under Hindu–Muslim is a hybrid text (see [Figure 2](#)).

The first word under Hindu–Muslim is in Sanskrit: शुभमंगलम्, which means ‘blessed marriage’. The main text under ‘Sorry Sir, We don’t have non-quality proposals’ reads:

जो लाखों प्रपोजल्स की बात करते हैं वे आपको obsolete व settled या e-mail वाले पते व फोन रहित proposals की भीड़ में ढकेल देते हैं.. We show you the ‘Quality Proposals’ then constantly work for you. हम उनकी तरह ‘member ID’

देकर अलग नहीं हट जाते हैं | निर्णय आपको करना ह | Prof. and Personalised.

*(Those who talk of lakhs (this is 1,000,000 in India) of proposals give you obsolete or settled or e-mail addresses and push you in the crowd of non-phone number proposals. We show you the ‘Quality Proposals’ then constantly work for you. Like them we don’t just give a ‘member ID’ and move away. The decision is yours. Professional and personalized)*

This advertisement mixes languages and scripts with dazzling flexibility. The pragmatic force of this advertisement is that it is written very much like a Hindi–English bilingual would speak. Such biliterate and hybrid texts are becoming increasingly common in the lifeworld of a bilingual as the world globalizes.

Figure 2 A hybrid text.

## PROBLEMS AND DIFFICULTIES

One of the main problems in this field is what implications these new texts and practices have for the bilingual classroom. In countries like Singapore, the mother tongue classroom, where children are taught Tamil, Malay and Mandarin according to their ethnic group, is an enunciative space where the use of English is proscribed. There are even mother tongue classes where children are fined if they use English. In such a classroom, where even code switching is not encouraged, the nested nature of the variables on the *Continua of Biliteracy* are not acknowledged leading to biliterate development which is not optimal.

However, data from SSS (2006) show that the children are creating such texts on their own. This project is a large-scale survey of 1,000 10-year-olds linked to 24 follow-up studies. One of the girls in the follow-up studies who is biliterate in Cantonese, Mandarin and English enjoys the Dreamworks movie *Chicken Little* with Mandarin subtitles. The screen of this movie, not possible to replicate on paper, is a fine illustration of a multimodal biliterate text situated in a culturally globalizing world. Figure 3 is a biliterate page from the language log of this Chinese girl in which she has used both Mandarin and English to show her TV-watching practices.

Globalization has created hybrid textual forms that are proscribed in the bilingual classroom. However, these are the texts that children encounter in their multilingual lifeworlds. The challenge is for teacher education in the field of bilingualism to include an understanding of

| Day | Title             | Language | Time                          | Comments  |
|-----|-------------------|----------|-------------------------------|-----------|
| 星期三 | Chicken Little    |          |                               |           |
| 星期四 |                   |          |                               |           |
| 星期五 | Kids Central ch.8 | English  | 下午 6:30 pm                    | very nice |
|     |                   | 中文       | 6:30 <sup>pm</sup> - 10:00 pm | 很女子香      |
| 星期六 |                   |          |                               |           |

Figure 3 Biliterate text from child’s language log.

these changing textual practices and use them as a resource in the classroom. Hornberger and Vaish (2006) show, through a comparison of bilingual classrooms in India, Singapore and South Africa, how teachers use linguistic resources that the children bring to the classroom to teach the language of power. For instance, in the classroom in India the teacher uses Hindi to explain to the student that 7 times 2 is not 13, though the medium and textbook of instruction for Mathematics is English.

#### FUTURE DIRECTIONS

Globalization has created new workplaces, like the call centre, where biliterate skills, especially 'English-knowing bilingualism', a term originally used by Kachru (1982), are critical. In call centres in New Delhi though the computer screen is in English, the agent working on it might seek clarification of something on the screen in Hindi and English. There is an emergent literature on bilingualism (Roy, 2003) and identity (Shome, 2006) in the worksite of call centres. Roy discusses issues of linguistic racism where employees are punished for incorrect accents as what they are selling is a service packaged in a particular kind of language. Shome's article on identity is linked to Castells' idea about globalization, though she herself does not make this link, creating an opposition between the Net and the Self. By the Net, Castells means a networked society that has replaced traditional social structures of family and human behaviour. On the other hand, the Self refers to reaffirming identity in a landscape of change. There is a need to explore issues of identity and biliteracy practices.

The field of biliteracy would also benefit from research projects, which backward map from the workplace what biliterate skills are valuable in a globalizing economy. Are schools in multilingual countries able to provide these skills? For instance, in Singapore's bilingual education policy Mandarin has both an instrumental value, in that it can promote business with China and a symbolic value in maintaining Chineseness. How do young Singaporeans make use of biliteracy in the workplace? Do they value what the nation's bilingual policy has given them? A host of such questions about biliteracy and globalization are waiting to be researched in our changing communicational landscape.

### **Literacies and Social Institutions**

## INFORMAL LEARNING AND LITERACY

## INTRODUCTION

Interest in informal learning has been strong for many years, but it has rarely been applied to the learning of literacy by adults which is usually seen as a formal learning process. This paper first reviews some of the developments in our understanding of informal learning, discusses some new findings from research into adult literacy learning in developing societies and suggests some applications of this to literacy learning programmes in the future.

## EARLY DEVELOPMENTS AND MAJOR CONTRIBUTIONS IN INFORMAL LEARNING

Although there has been discussion of informal learning for many years (e.g. Archambault, 1974; Dewey, 1933; see also Lucas, 1983), it has played a minor role compared with studies of formal learning (see e.g. Davies, 1971). However, there has been a significant rise in interest in informal learning in the last few years (Bjornavold, 2000; Carter, 1997; Colardyn and Bjornavold, 2004; Livingstone, 2001; Marsick and Watkins, 1990; Richardson and Wolfe, 2001). The recent discourse of lifelong learning/education has encouraged wider recognition that learning goes on ‘outside formal educational establishments’ (Straka, 2004, p. 3)—that it is lifewide as well as lifelong. Many writers, especially those concerned with workplace learning and self-directed learning through new technologies (Rose, 2004), are exploring ‘notions of learning in everyday life and how everyday strategies of learning can be taken into educational settings’ (see Papen, 2005, p. 140; Hager, 2001; Imel, 2003; Visser, 2001).

It is however an area with many different definitions, often contested, and there is no space here to explore the many dimensions of this debate (Coffield, 2000; Colley, Hodgkinson and Malcolm, 2003; Eraut, 2000; McGivney, 1999).

Most however would agree that learning is a natural activity which continues at all times. Learning is the way in which the experience of the external is internalised and utilised for growth, a way of drawing from the natural and human environment the sustenance for living. Much of it is making sense (meaning) of experience and using that

for dealing with new experiences. Part of it is the building up of funds of cultural knowledge (Moll, Amanti, Neff and Gonzalez, 1992). A good deal of learning is intentional, planned and directed, but most learning from infancy until the end of life is unplanned, unintended and often unconscious, learning through tasks or play/imagination or social engagement; and this kind of learning results in tacit or implicit (unrecognised and unacknowledged) knowledge, understandings, skills and attitudes (Polyani, 1966; see Reber, 1993). As with literacy, there are learning events and learning practices; and there are throughout life 'learning episodes' (Rogers, 2002, pp. 120–125)—incidents when individuals decide and engage in more systematic learning for specific purposes, using all the perceived resources which their nature and the society within which they are situated provide. There is thus a continuum ranging from what I have called elsewhere (Rogers, 2003) 'task-conscious learning' (where learning is not conscious but takes place while engaged in some activity and where achievements are measured not in terms of learning but of task fulfilment) and 'learning-conscious learning' (where learning is intended and conscious and achievements are measured in terms of learning).

The use of the word 'informal' to describe these natural learning processes has created the demand to search for 'formal' learning, and the creation in the 1960s of the term 'non-formal' to represent hybrid forms of learning (Rogers, 2004) has reinforced this search. A further distinction is sometimes made between 'informal learning' and 'incidental learning' (Enslin, Pendlebury and Tjattas, 2001; see Rogers, 2003, pp. 14–15). One way of representing these distinctions is through the analysis of the exercise of power and control: thus 'incidental learning' is sometimes seen as that learning which takes place without anyone being in control, 'informal learning' as that learning which the learner controls, 'non-formal learning' as that learning where control is shared between learner and a 'teacher' (learning support agent), and 'formal learning' as that learning which is controlled by the learning opportunity provider.

Rather than see incidental, informal, non-formal and formal learning as categories, it would seem more satisfactory to view these as positions on a continuum; there are many shades of learning between these positions. Such distinctions are tied up with contemporary value systems. Despite the fact that 'the majority of human learning does not occur in formal contexts' (Eraut, 2000, p. 12), modern Western societies tend to value formal learning above informal. The emphasis on formal learning (education) however can lead to the ignoring, demeaning or even denial of the existence of informal learning. Recent surveys (e.g. NIACE, 1996) have shown that many people, when asked, would assert that they have done no learning since leaving school—identifying

'learning' with formal learning in educational establishments and ignoring all the learning they have done through their work, their families, their social interactions, their build up of capital, property and skills, etc. And this has implications for identities—both those ascribed by others and self-ascribed: 'If we simply picture learning as something that happens in the classroom, then we can see many . . . literacy learners as poor learners. If we see it [learning] as bound up in social activity we see something different' (Fowler and Mace, 2005, p. 31; see Lave and Holland, 2001).

Nevertheless, some distinction may be drawn between the various positions on the continuum. A useful example of this distinction can be seen in language learning (Krashen, 1982). The first language is learned through what Krashen calls 'acquisition learning', through the *use* of language without any structure, learning through tasks of communication and through play with sounds, experimentation, learning through errors with social scaffolding for reinforcement and correction until the cultural means of communication are more or less mastered. It is a process that has no 'formal' end. On the other hand, a later language is usually learned through more carefully structured, time-bound and controlled processes, through sequenced teaching-learning materials and designed practice, with pre-determined goals and measures of achievement. These two approaches can be taken to represent the distinction between informal learning and formal learning. Formal learning is seen as governed by rules outside of the learner. Informal learning is unplanned, non-linear, applied, contextualised and therefore limited (it ceases when the learner perceives that the task is completed rather than when the teacher determines). Informal learning involves 'ways of social and psychological functioning which explicitly differ from practices to be seen in formal educational environments' (Llorente and Coben, 2003; see Rogers, 2003, pp. 14–43 for a discussion of the two kinds of learning).

'Informal learning' (the natural learning process) then takes place in the home, in the community, at work (Garrick, 1998; Marsick and Watkins, 1990) and leisure (Enslin, Pendlebury and Tjattas, 2001, p. 62), in engagement with social movements (Foley, 1999; Mayo, 2005; Welton, 1993), in all of life's experiences. It needs to be distinguished from informal education, which implies intention and planned and assisted learning. Informal education is usually seen as self-directed and self-controlled learning (Boekaerts, 1999; Imel, 2003; Smith, 2002). (Apprenticeships which some writers identify with informal learning is often put by others among the 'non-formal' learning strategies; indeed, there is much confusion between informal and non-formal learning programmes which may be seen as programmes which combine elements of both contextualisation and learner control on the

one hand and standardisation and teaching agency control on the other; see Jeffs and Smith, 1990; Rogers, 2004).

One of the important elements of informal learning is analogous learning. Much meaning-making and problem solving relies on the identification of analogies, the application of what has already been learned elsewhere (formally and informally) to new situations. As we engage in new learning, so the fund of prior experiential learning, including tacit knowledge (Polyani 1966; Reber 1993) which may be called upon or reconstructed to enable analogous learning, increases.

Thus the natural learning which we all do, far from being unimportant, is in fact the foundation of all new learning and all education (planned and assisted learning). It is like breathing which is also a natural process relating the individual to the environment which she/he inhabits, and which is also usually unconscious but at times a conscious process, capable of improvement (e.g. for singing, swimming, sports etc). Despite this continual learning process, because much of it is unconscious, the learner may feel ignorant, incompetent and lacking in confidence; and the recognition of this learning is often the first stage of assisting someone with their intended and planned learning.

It would however be a mistake to assume that informal learning is the same across all sectors of life; and what is needed is an investigation into the ethnography of learning in relation to different areas. This paper seeks to examine one such area, informal learning and literacy<sup>1</sup>.

#### WORK IN PROGRESS IN INFORMAL LEARNING AND LITERACY

The current application of the concepts of informal (natural) learning to literacy seems to lie in three main fields: the perceptions of literacy, the acquisition of literacy skills, and the practice of literacy. Such understandings will affect the ways in which formal literacy learning can be assisted.

##### *Perceptions of Literacy*

It can be argued that in today's world, there is no person (except perhaps some very young children) who has never directly or indirectly come across written forms of communication in some context or other. Even in so-called less developed society contexts, literacy practices lie embedded within many daily life activities—shopping and the market,

---

<sup>1</sup> Recent studies of the ethnography of numeracy suggest that this important area is a field which needs specialist treatment (see Street, Rogers and Dave, 2006) and it has been omitted from this article.

farming or other livelihoods, community relationships, the family (e.g. a calendar) etc. Both formal and informal literacy practices are an essential part of the social practices of health care, policing, religion, politics as well as schooling. There are displayed texts in most environments—in shops on packets, in street signs, advertisements, notices and graffiti on walls etc, although the frequency of such texts within the overall literacy environment (GMR, 2005, pp. 207–213; see Doronila, 1996) will vary. Such literacy material is often concentrated at certain points in most living contexts (post offices, clinics, police stations, churches, schools, shops, etc.) and not in other places, and from this, literate and non-literate alike will learn (informally) where literacy is appropriate and where it is not, to whom literacy belongs and to whom it does not belong, who is excluded, which kinds of literacy practices belong to which contexts and kinds of people. Informal learning teaches each of us our place in the society we inhabit.

Thus, although some people encounter writing fairly frequently and others more rarely, for all, ‘literacy’ in some form or other has entered their experience. And this calls for meaning-making—the establishment of a relationship between the experience and the sense of self. That is, literacy in today’s world helps to create identities. So that everyone has built up some picture of literacy, what it means, and its practices in relation to themselves. For some, it may be a sense that such practices belong to other persons (communities of practice of the educated, the religious, the professionals, the rich etc.), that literacy is ‘not for me’, that it is out of their reach, beyond their capabilities or status. This informal learning is not confined to the so-called ‘illiterate’. It applies also to those educated and literate persons who nevertheless feel excluded from certain communities of practice—those for example who find it difficult to handle computer manuals, insurance documents and technical papers or other languages and scripts. Perceptions of literacy include or exclude people from certain literacy practices.

But in fact the so-called illiterate are not in practice excluded from engaging in literacy practices. They will engage in these literacy practices, sometimes unconsciously, sometimes more consciously. Some of this engagement will be through mediation, getting someone to help them (Kalman, 1999; Mace, 2002); or they will find their own way of coping with literacy communications, ‘develop their own strategies to make meaning from [and engage in] literacies that extend beyond their current abilities to process written language’ (Ewing, 2003: cited in Papen, 2005, p. 139).

This is important, for (as we shall see) some of these persons have developed some form of literacy which neither they nor the society they inhabit recognise as ‘literacy’. Thus, they will describe themselves as ‘illiterate’ even when engaged in some form of literacy practices. And in relation to the formal schooled literacies which form the content

of most literacy learning programmes for both children and adults, they will continue to feel ignorant, incompetent and unconfident.

### *The Acquisition of Literacy Skills*

Just as with language communication skills, so with literacy communication skills, there are two more or less distinct ways of learning—through informal acquisition learning (task-conscious learning) or through formal learning (learning-conscious learning).

Recent studies have shown that ‘adults who . . . are regarded as having serious literacy deficiencies are in fact not only involved in numerous literacy and numeracy events throughout their lives, but may possess a range of informally acquired literacy and numeracy skills’ (Papen, 2005, p. 131); they have acquired these without going through primary school or adult literacy class. Investigations of the ways in which such skills have been developed have revealed that they come through engagement in some activity or other. The Vai learned their script ‘outside of school’ (Scribner and Cole, 1981) as do other language groups where the local language is not used in school (Aikman, 1999 etc.). Similarly, a car mechanic develops knowledge of reading and writing texts related to that trade; a tailoress keeps a notebook of her clients’ measurements and requirements; a carpenter possesses a wall full of material cut out from catalogues and scribbles on them names and dates of work to be completed; a shopkeeper writes the names of customers, goods, prices and credit extended on his hand each day for someone else to write up more formally in the evening—all of them at the same time protesting that they are ‘uneducated, illiterate’ because they cannot read a newspaper (Rogers and Uddin, 2005; see Uddin, 2006). This is not confined to so-called ‘developing societies’: in more industrialised societies, hotel staff can cope with the informal texts of their particular hotel but not with discursive texts (Rogers, Hunter and Uddin, 2007; Rose, 2004); a restaurant waiter learns through ‘looking over people’s shoulders at the menu’ (Fowler and Mace, 2005, p. 101). Much of this informal learning has been unconscious but a good deal comes from the adult learner seeking out personal assistance, from relatives, friends and work colleagues, from community members and religious leaders, even informally from the formal teacher of literacy at meetings held outside of the class sessions (Uddin, 2006). And much of what has been learned is not perceived as ‘literacy’. What is and what is not literacy has thus been learned from the context: ‘He did not really view what he did in his daily life as using literacy; to his mind, literacy meant learning, and learning took place in a classroom’ (Fowler and Mace, 2005, p. 32).

Study of the processes involved in such informal learning of literacy shows that they are not linear, starting with simple words and moving to more complex words; rather they move from the known to the unknown. Informal literacy learning is always purposeful, associated with existing or changing identities, seeking identity confirmation, joining in a community of practice (Barton and Tusting 2005; Lave and Wenger 1991). Rather than learning literacy leading to change, it is change which leads to learning literacy. Such informal learning is always applied in a particular context, but it is almost always limited to that context and the activity in which it is embedded. In some cases, it may lead on to the development of further more discursive schooled literacies, but in other cases it does not (Uddin, 2006).

### *The Practice of Literacy*

It is often assumed that a person, once having acquired a pre-set 'level' of literacy skills through formal (schooled) means—completing the literacy textbook, for example,—can apply those skills to any text, that literacy learning has ceased. But every new text form which is encountered calls for new learning. Again much of this is unconscious informal learning—new ways of writing and new formats of reading. Some people are conscious of this fact—like the adult literacy class member in Nepal who said that she could now read the literacy primer (textbook) but not read anything else like a newspaper or health booklet (field notes of author 1993). Learning to read a newspaper in columns and following the text from page to page; learning to fill in a bank or driving licence form; learning the format of poetry, of hymns and religious texts, of letter writing, of bills and invoices and of price lists; learning to distinguish the meaning of advertisements, the writing of formal papers and academic literacies (Mahiri, 2004)—all this calls for further learning. And almost all of this learning is informal. Who taught young people how to write text messages on their mobile phones? How do most people learn to send e-mails? Some formal instruction in computers is available, but even here, most of the learning each day is informal learning. 'In everyday life we not only use literacy . . . but we also learn new literacies' (Papen, 2005, p. 140). Meeting and coping with new genres requires further learning: 'The processes of informal learning through which we learn to deal with unfamiliar types of texts, learn to adapt our style of writing to the requirements of new technologies, or learn to navigate the literacy environment of unfamiliar institutional settings' (Papen, 2005, p. 24) are often unconscious or semi-conscious. Making meaning and transmitting meaning are constantly being learned and relearned, most of

this informally although formal courses are sometimes available. The view that primer literacy learning will equip the learner for the universal use of literacy is simply false.

#### FUTURE DIRECTIONS: INFORMAL LEARNING AND THE FORMAL LEARNING OF LITERACY

The recognition of the informal learning of literacy (both perceptions and skills) and of the need for continued learning of literacy practices has important implications for the design and implementation of literacy learning programmes for both children and adults. Four main areas call for attention but more work needs to be done on this interaction between informal and formal learning (see Fowler and Mace, 2005; Larson and Marsh, 2005; Pahl and Rowsell, 2005; Papen, 2005).

First, the learned belief systems about literacy and the self will affect the motivation and confidence of the potential literacy learner. Simply casting him/herself as a learner of literacy is itself a major step calling for emotional investment and determination, and is not lightly to be brushed aside with an emphasis on deficits. The view that 'literacy is not for people like me' is often strong—in the case of children, because of an over-emphasis on age-related learning and stereotyping by adults, in the case of adults through years of experience. Non-literate adults are members of a number of over-lapping communities of practice in which literacy practices may be relatively weak or confined to a small number of members of those communities; and perceptions of 'literacy' developed through informal learning over many years often leads to a sense of exclusion from such practices (Barton and Tusting, 2005).

Thus with adults it is important to try to bring the unconscious informal learning of many years into consciousness. As with the Assessment of Prior Experiential Learning (APEL), one needs to recognise and give value to the informal learning acquired through adult life and build on it to make progress in further learning (Weil and McGill, 1989); so with literacy, it is important to give recognition and value to the informal learning about literacy, both the perceptions of literacy which help to create the learner's identity, and the strategies which have been built up. This is increasingly being recognised in formal education where home-school linkages are being closely studied. In some cases, this will involve the recognition of the informal literacy skills which have been acquired to enable non-literate persons to engage in their own literacy practices, which the potential literacy learners bring with them, not to ignore or 'correct' these, not to compartmentalise them but to help all (teacher and learners alike) to give them value and to build on them. Such background understandings need to be developed by the teacher through ethnographic-style research (Street, Rogers and Dave, 2006).

Secondly, there is much informal learning going on even *within* formal literacy learning groups or classes. The scaffolding of learning by teaching agents (Greenfield 1984) brings with it many implications which literacy learners are not slow to recognise and internalise—who is important and who is not; what kinds of literacy are acceptable and what are not, what one can and cannot write or read (the notes some children send round the class under the desks are often forbidden rather than built upon; see Camitta, 1993). Many textbooks contain hidden messages—that poverty, for example, is the fault of the poor who need to change to become prosperous; that sickness can be avoided by hygiene; that gender inequalities can be remedied without the change of male dominance; etc. A climate is built up in a classroom and the literacy learners are being asked to engage with that; and such participation ‘shapes not only what we do but also who we are and how we interpret what we do’ (Wenger, 1998, p. 4). But unfortunately the literacy classroom is often an inappropriate context for learning, hierarchical and dictatorial. ‘Learning to be literate is [or should be] like learning to be an artisan in a guild, to play an instrument in an ensemble, like acquiring a craft within a community whose art and forms of life are dynamic, rather than robotic acquisition and automatization of core skills’ (Luke, 2005, p. xi). Learning literacy through apprenticeship may be a more appropriate model for both child and adult than formal schooling (Overwien, 2005; Collins, Brown and Newman, 1989).

Thirdly, the fact that informal learning of literacy continues after the initial learning period indicates that a ‘single-injection’ model of adult literacy learning programmes will always be ineffective. Learning literacy skills is not a simple matter of a short course (3 years, 2 years, 9 months or even, as in Pakistan, 3 months) which will transmute the ‘illiterate’ into the ‘literate’. Learning to read a primer (textbook) may lay the foundation for learning to read a newspaper but it does not necessarily mean that everyone who completes an adult literacy learning programme will be confident enough to go on to read a newspaper or magazine or to write other forms of texts.

Fourthly, the methods by which the informal learning of literacy has been developing throughout the life of the adult and the methods by which the child is learning their first language and learning about texts could with profit be used in the literacy class: ‘the everyday strategies of learning can be taken into educational settings’ (Papen, 2005, p. 140). The need to bring the everyday literacy practices of the learners—whether children or adults—into every planned learning programme has been emphasised several times (Cole and Scribner, 1974; Lave, 1988; Rogoff and Lave, 1984). This is as true of literacy learning as of other learning activities. And this means that a one-size-fits-all literacy learning programme can never be successful: each literacy

learning group needs its own learning programme based on the informal literacy learning of the learners.

Task-related learning; cyclic rather than linear learning (the progression from simple to complex, while useful in some circumstances, can be ignored when engaged in task-related learning, for the task provides the parameters of the learning); collaborative learning rather than individual; real literacy activities and texts drawn from the literacy learners themselves rather than imposed from outside (Rogers, 1999); critical reflection on both the literacy learning tasks and the contents of the teaching-learning materials; changed relationships of the teacher and learners where the teacher becomes a literacy mediator and scaffold/mentor rather than instructor – these are some of the implications of informal literacy learning for formal literacy learning.

SECOND LANGUAGE ACADEMIC LITERACIES:  
CONVERGING UNDERSTANDINGS

INTRODUCTION

Increasingly schools and universities in many parts of the world are expected to serve ethnically and linguistically diverse students. Scholarly discussions on language and literacy education have, however, tended to maintain either a first language or a second language stance in some mutually insulating way. This intellectual divide was perhaps fostered by the educational and intellectual climate that prevailed in an earlier historical period. In the past 30 years or so, however, public educational institutions have been made progressively more conscious of the need and the obligation to serve diverse student populations under the aegis of marketization of education provision for international students, and/or social integration for all students, irrespective of their language backgrounds. It is recognized that many linguistic minority students find the use of their second language for academic purposes problematic (Cummins, 2000; Leung and Safford, 2005; Mohan, Leung and Davison, 2001; Scarcella, 2003). The ability to communicate informally for social purposes in a second language, even at high levels of lexico-grammatical accuracy and pragmatic familiarity, does not automatically translate into effective academic use, particularly in relation to reading and writing. A good deal of discussion in second language curriculum and pedagogy is focussed on this ‘problem’. In this discussion, my main focus is on the use of second language in academic discourse (with particular reference to written discourse) because it highlights a profound conceptual issue in the prevailing notions of second language competence. I explore this not just as a teaching issue, but also as a conceptual and research issue.

In this chapter, I use the terms ‘second language pedagogy’ and ‘academic literacy’ in a broad sense and refer to relevant teaching and curriculum literature covering a range of educational settings (e.g. school, college and work-based programmes) and students (e.g. school-aged and adult).<sup>1</sup> Perhaps it would be useful to point out that there are

---

<sup>1</sup> Traditionally in the English-speaking education systems, the term ‘English as a second language’ (ESL) is often used to refer to a context of use and/or learning where English is the medium of communication for at least some public or government

some discipline-specific ways in which the terms ‘language’ and ‘literacy/literacies’ are interpreted. In the second language literature the term ‘language’ has tended to be used as a general catch-all label to include the development and use of language for listening, speaking, reading and writing (the so-called four basic skills); the second language lexico-grammar system and (often generalized) pragmatic rules of use form the basis of most curricular specifications. Concerns for ‘literacy’ development tend to be subsumed under the banner of reading and writing; specialist branches of English as a second language teaching such as English for Academic Purposes (EAP) often prioritize reading and writing. In the field of academic literacies, language use is assumed to be part of students’ lived experience and the use of the lexico-grammar of ‘language’ itself is seen in relation to observed socio-cultural and pragmatic conventions in discourse. A basic familiarity with lexico-grammar is generally assumed to be in place, irrespective of students’ first or second language background. There is relative little explicit discussion on the different trajectories in first and second language developments and the impact these may have on literacy development (see Davison, 1996 for a further discussion). The plural form ‘literacies’ is preferred by some writers (Lea, 2004; Street, 2003, 2005) and it will be used in this discussion where appropriate to signal the existence of a literature which acknowledges the multiple ways language and other semiotic means are used for meaning-making in academic contexts. Although the second language in this discussion is English, the conceptual issues raised are not necessarily language specific.

#### MAJOR CONTRIBUTIONS: SECOND LANGUAGE IN COMMUNICATION

A, if not *the*, major influence on English as second language teaching (ELT) in the past three decades has been the advent of the concept of communicative competence, which in turn has spawned a broad set of theoretically linked principles and classroom practices now commonly known as Communicative Language Teaching (CLT). The concept of

---

functions (e.g. English in Singapore and India, and for some minority language communities in countries such as the USA and the UK); and the term ‘English as a foreign language’ (EFL) is used where English is not used/learned for public communication. English as an additional language (EAL) is sometimes used to refer to contexts in which English is used by ethnolinguistic minority students, e.g. Polish-mother tongue children in school in England. Recent developments in the use of English in different contexts have made these terms increasingly difficult to apply. For instance, the use of English as a preferred common language of communication in European political and business organizations have blurred the traditional distinctions. In this article, author uses ‘second language’ as a general label to signal a contra-distinction to first language.

communicative competence, built on Hymes' work on ethnography of communication (1972, 1977), was elaborated and recontextualized for second language pedagogy by Canale and Swain in a series of papers (Canale 1983, 1984; Canale and Swain, 1980a, b). An essential tenet of CLT is that second language learning and teaching should be concerned with both rules of grammar (all aspects of lexico-grammar for speech and writing) and social rules of use. Historically this represented an intellectual move away from an earlier tendency to treat grammar as the main focus in second language pedagogy. Teachers and curriculum designers are expected to take both formal linguistic properties and context of use into account. For instance, Yalden (1983, pp. 86–87) suggests that the designer of a communicative curriculum has to attend to the following:

1. ... the *purposes* for which the learners wish to acquire the target language
2. some idea of the *setting* in which they will want to use the target language ...
3. the socially defined *role* the learner will assume in the target language, as well as their interlocutors ...
4. the communicative *events* in which the learners will participate ... [emphasis in original]

This approach to building up a picture of communication needs quite clearly draws on Hymes' discussion on components of speech (1977, 1994). The purposes, settings, roles and events were, at least in principle, established by carrying out student needs surveys. This empirically oriented approach to the drawing up of learning content is generally accepted in all areas of CLT. The curriculum designer is meant to use this kind of contextual information to identify socio-culturally and pragmatically appropriate language for learning. So particular grammatical forms for requests such as 'would you ...', 'could you ...' and 'will you ...' will be selected according to students' projected purposes and contexts of use. Likewise, students are inducted into a range of different text types such as formal reports, informal accounts and study notes in accordance with the identified needs. This socio-culturally alert approach is applicable to every aspect of curriculum development. Furthermore, CLT eschews formal didactics and it is in favour of hands-on classroom activities. In other words, the CLT classroom is where students are encouraged to engage in the actual use of the language through purposeful participatory communication activities such as role play and simulated games. This combination of socio-culturally sensitive curriculum development and activity-oriented classroom pedagogy has held sway in popular course books and teacher training manuals (Brown, 2001; McDonough and Shaw, 2003; Morrow, 1981). For instance, Brown's (2001, p. 43) characterization of CLT includes the following:

- a focus on ‘the components (grammatical, discourse, functional, sociolinguistic and strategic) of communicative competence’;
- the use of language teaching techniques and student tasks ‘to engage learners in the pragmatic, authentic, functional use of language for meaningful purposes’;
- the positioning of the teacher as ‘a facilitator and guide . . . Students are therefore encouraged to construct meaning through genuine linguistic interaction with others’.

In an authoritative account of the nature of English for Academic Purposes (EAP), an expanding specialist branch of ELT traditionally associated with higher education, Hyland and Hamp Lyons (2002, p. 2) state that

English for Academic Purposes refers to language research and instruction that focuses on the specific communicative needs and practices of particular groups in academic contexts. It means grounding instruction in an understanding of the cognitive, social and linguistic demands of specific academic disciplines. This takes practitioners beyond preparing learners for study in English to developing new kinds of literacy: equipping students with communicative skills to participate in particular academic and cultural contexts.

In general, CLT attempts to approximate conditions of ‘real communication’ in the classroom. The extent to which this commitment to an empirically grounded approach can be seen in pedagogic practice will be discussed in the next section.

Perhaps it should be pointed out that CLT is not the only influential theoretical framework in second language education. In a psychocognitively oriented body of work directly concerned with the second language development of linguistic minority school students, Cummins (1984, 1992, 1996, 2000) also takes communication in context as a point of departure. He proposes that language proficiency in a curriculum context can be seen in terms of basic interpersonal communicative skills (BICS) and cognitive/academic language proficiency (CALP). BICS is understood to mean ‘the manifestation of language proficiency in everyday communicative contexts’; CALP is conceptualized as ‘manipulation of language in decontextualized academic situations’ (Cummins, 1992, p. 17). BICS is generally held to occur in situations where the meanings communicated are broadly familiar to the participants and/or the immediate context or action provides supportive clues for understanding; social greetings and ordering food in a student canteen are examples of context-supported BICS. A science class teacher-led discussion on the production advantages and environmental pro-

blems of the use of pesticides in farming, without any supporting print, sound, visual or video materials, can be regarded as an example of context-impooverished and cognitively demanding CALP. These two conceptual categories do not yield precise linguistic descriptions, nor do they map on to any specific area of the curriculum directly. But they can be used to estimate the language complexity and cognitive demands of a variety of communicative situations in school. Teachers can, with this analytical insight, help students acquire proficiency in spoken and written academic language by judiciously increasing or reducing contextual support and cognitive demand as their needs change and develop in different areas of the curriculum. This framework has been particularly influential in education systems where second language students are mainstreamed without a dedicated second language curriculum (e.g. England). There are other second language pedagogic frameworks such as the Cognitive Academic Language Learning Approach (CALLA) (Chamot and O'Malley, 1992) and the Topic Approach (Evans, 1986). Focus and scope preclude a full account of all of them here. Suffice it to say that in one way or another, these frameworks tend to be built on the assumption that active communicative use is fundamental to the development of academic English. (For a further discussion, see Leung, 2005.)

#### PROBLEMS AND DIFFICULTIES: PEDAGOGIZING ACADEMIC COMMUNICATION IN SECOND LANGUAGE

It would seem that the literature on second language pedagogy in general has in place developed conceptual frameworks for assisting second language students in navigating and developing the complex ways in which language is used in academic settings, particularly in terms of writing. However, it is also the case that the use of language for academic purposes remains a major challenge for many second language students. The existence of a specialist literature and research tradition (e.g. EAP), and language centres or similar units designed to support second language academic language proficiency in English-speaking universities across the globe readily bears witness to this widespread 'problem' (see Gee, 2004; Scarcella, 2003; Schleppegrell and Colombi, 2002, for further discussion). Scarcella (2003, p. 1), for instance, illustrates the issues vividly by citing an email request for information written by a second language student to a professor in an American university:

How do you do? ... I am a student currently on the freshman level. I am going to be attend Biology 5C next

year . . . Although my major is in Social Science, I am consider to have Biology as my second major. I am currently attending Professor Campbell lecture. He suggested to me that maybe I should seek around to for research projects . . . He suggest that maybe I should contact you to see would it be possible for you to provide me with some information. As I have understand that you are currently conducting a research on the subject of plasma, and I would like to know more about it, that is, if I am not costing any convenience. Thank you very much, and have a good day.

This student did not succeed in getting the desired assistance from the biology professor who commented on this text to a colleague thus: ‘Syntax, spelling, whew!’ (loc.cit.). Over and above the grammatical infelicities, this message is uncomfortable as a piece of formal student–teacher communication in a number of ways—the informal opening and closing, the possibly unwarranted assumption that a first-year student might be granted access to work-in-progress research, the lack of specificity in terms of the type of information requested and so on. These are instances of agentive meaning-making that are at odds with conventionalized assumptions informing institutional student–teacher relations and the associated communication practices. So a legitimate question at this point is: would it be possible for the kinds of social rule flouting (as seen by the professor) displayed in the email text shown above to be addressed by CLT? The answer is potentially yes but a good deal of further conceptual and theoretical work would have to be done first.

Despite its ethnography-inspired conceptual origin, CLT practice has not generally privileged the type of information and data discussed by Hymes, i.e. how communication is performed and what patterns of meaning-making and meaning-taking occur in specific contexts (although see Belcher, 2006, for an exception). Curriculum developers tend to be concerned with determining students’ projected communication purposes and contexts, e.g. learning English as a school subject or learning to use English in an English-speaking work environment. The general idea here is that once the students’ purposes and contexts of use are established—by means of needs surveys, in-course discussions, analyses of model texts and student language performance (e.g. written texts) and scrutiny of academic programme requirements—curriculum designers can draw on their knowledge of language teaching/learning (i.e. theory and practical know-how) and ‘typical’ language use (i.e. the ‘what’ and the ‘how’) to specify the teaching content with respect to the various parts of the overall competence to be taught (Hutchinson and Waters, 1987; Nunan, 1988). The language learning content is thus built on idealized typifications of what abstracted ‘competent’ native

speakers may say and do in projected contexts.<sup>2</sup> In ELT textbooks it is not unusual to find advice such as this:

Today's way of conducting business is informal so that's what we should aim for in our business writing too – a friendly, conversational style. We should use short words and simple expression, short sentences and paragraphs ... (Cunningham, Moor and Carr, 2003, p. 34)

In a not too dissimilar way, Scarcella (2003, p. 9), drawing on her observations that school teachers tend to work with strong assumptions about the sort of language children should use on the one hand, and that they (school teachers) often do not actively help children develop this language repertoire on the other, argues that university students (particularly second language students) need to learn to use academic English:

Academic English is a variety or a register of English used in professional books and characterized by the specific linguistic features associated with academic disciplines. The term 'register' refers to a constellation of linguistic features that are used in a particular situational context ... Academic English tasks include reading abstracts, getting down the key ideas from lectures, and writing critiques, summaries ... It includes a wide range of genres ... I define genre as a discourse type having 'identifiable formal properties, identifiable purposes, and a complete structure ...

On the strength of this perception (and description), Scarcella goes on to provide an account of the components of academic English in terms of phonology, lexis, grammar, sociolinguistic and discourse conventions. At a general level, this kind of expert advice sounds very convincing and helpful. But the extent to which such advice is of any use to the hapless university student whose email was negatively judged is open to question.

This approach privileges the expert knowledge and intuition of the curriculum designer and the teacher. I have argued elsewhere that the pedagogizing of communicative competence in this way has put the original ethnographical interest in communication practices through an epistemic transformation, which reifies real-life language practices. The consequence is that the so-called student needs analysis and assessment now function as a clutch mechanism linking a more or less recognized range of student language needs (e.g. a student writer in Business Studies) to sets of typified options of how language is used in projected language use situations. (For further discussion, see

---

<sup>2</sup> Perhaps it ought to be pointed out that in ELT curriculum discussions the 'competent' speaker is often tacitly assumed to be a native speaker (although see Jenkins, 2000, 2002, 2006; Prodromou, 2005).

Canagarajah, 2002; Dubin, 1989; Finney, 2002; Leung, 2005). This reification represents a somewhat ironic turn in the development of CLT whose pedagogic principles and practices are validated largely by a claim that they enjoy close correspondence to 'real' language use by 'competent' native speakers. As Wolfson (1990, p. 3) points out, native speakers are not good at describing their own rules of language use with any degree of accuracy:

... speakers do have strong and well-formed ideas about what they *should* say, but this is not at all the same as knowing what they *do* say. Speech norms, or community ideals concerning appropriate speech behaviour, is not at all the same as actual speech use which is the behaviour itself ... native speaker intuitions are very limited and do not provide a valid basis upon which to build a description of the actual patterns that exist in the day to day speech of community members.

One might add that English language teachers, including native speaking ones, often cannot claim direct knowledge of the community- and discipline-based language norms and practices of their students' subject disciplines. It is improbable that any language teacher can claim first-hand knowledge and expertise in the language practices of a full range of academic disciplines that stretches from Accounting to Zoology. Relying on generalized teacher professional knowledge and intuition to specify what second language students need to learn in terms of academic language (and literacies) in specific contexts is at best a hit-or-miss affair. One would need a more close-up view.

#### WORK IN PROGRESS: COMMUNICATION IN ACADEMIC LITERACIES

All this is not meant to suggest that CLT is inescapably locked into an exercise of unsafe expert description and prescription. The epistemological and theoretical foundations of CLT have provided intellectual spaces for a concern for the dynamics of lived experiences at a local level, even though this strand of enquiry has not always found its way into the popular textbooks. For instance, in a theoretical discussion on language-in-culture and culture-in-language in second language curriculum development Candlin (1989, p. 6) argues that there is a 'need for teaching and learning of language-in-culture to move beyond the descriptive ...' and '... to focus on ... [the] ways of organizing our world in language ... [and] to explore how speakers and hearers (and writers and readers) categorize and interpret their own experience, how they process information and structure their reference' (op.cit.: 8). This foregrounding of the dynamic meaning-making

process argues for a focus on the always emergent ways of using language; it acknowledges individual teacher and student volition and agency in language teaching and learning activities which existing target community-based speech norms and practices (however defined) can shape but cannot completely pre-determine. (See Berwick, 1989, and Brindley, 1989, for further discussion in the formative period of CLT in the 1980s.)

The conceptual argument for attending to actual participants' own perceived needs is not just a point of epistemological refinement. At a practice level, Uvin (1996, p. 43) shows the value of this conceptual approach when he, as a language course designer, shadowed a group of ethnic Chinese health workers in their work place in Boston in an attempt to verify their English language needs. He made these observations:

I had addressed only the work-related needs of learners [in the course design], and my perception of those needs had guided my initial decision making about what to include and leave out. I learned quickly, however, that learners wanted more than just the language to perform their jobs. As many of the learners in the programs were recent arrivals, they had language needs that went beyond the workplace and so demonstrated resistance, inconsistent attendance being the major one. I had also failed to accommodate the affective, social, cultural, cognitive, and metacognitive needs that learners expressed . . .

These observations signalled the need for an emic perspective on students' assessment of their communication needs and learning priorities.

For CLT in general not to be constitutionally closed off to an orientation anchored in 'live' real settings (as opposed to 'abstracted' real contexts), it would seem that ethnographic sensitivities and sensibilities need to be foregrounded and be made more prominent both in theory and in practice. This general requirement also holds in the particular case of second language academic English. Belcher's (2006) reflexive account of English for Specific Purposes (ESP), another branch of ELT generally associated with teaching adults or university students, notes that there have been attempts to encourage students to understand that academic language use is not just about following fixed rules, and that it is important to see how different texts work in different contexts. Indeed both ESP and EAP appear to be adopting a more ethnographic outlook (Belcher, 2006; Hyland and Hamp-Lyons, 2002). At this juncture it would be useful to look at some examples of research in another field of research, academic literacy, which have focused on aspects of participant practices.

One way of getting closer to what is said and how language is used in academic activities is to investigate how participants, teachers and students, engage with one another. Lillis (1999, 2001) looks into the ways in which the content selection of the academic essay, a predominant format for organizing and presenting knowledge, is played out in a British university setting. In one of the case studies presented by Lillis, a student, Nadia, wanted to make use of what she learned from a previous course in her essay on ‘Working class children are underachieving in schools. How much of this may be attributed to perceived language deficiencies?’ (Lillis, 1999, p. 134). This is the opening section of Nadia’s draft essay:

Throughout this essay I will be focusing on the types of underachievers. Firstly the working class bilinguals and the misleading intelligence tests, of which bilingual children are expected to do. Secondly the working class monolinguals which are underachieving. Thirdly I will seek information on how much of this may be attributed to perceived language deficiencies. (Loc.cit.)

And this is the tutor’s comment:

Your beginning section moves away from essay title. Need to organize your thoughts more carefully and adhere to the essay title more clearly. (Loc.cit.)

In a subsequent seminar discussion, it became clear to Nadia that her tutor did not consider the case of bilingual children an appropriate issue for the essay. Nadia reported the exchange in this way:

She didn’t like it *one bit* . . . She said not all bilingual kids are working class . . . (Loc.cit.; original emphasis)

The tutor’s view on what constituted legitimate content for discussion appeared to be firmly fixed in advance. But it was not communicated in the essay title. This particular instance is indicative of the difficulties students may have in understanding what is expected of them. The ‘essay’ is in fact a very complex package of established ways of argumentation, culturally sanctioned principles for content selection, subject or discipline-informed ways of using language, text format and prose. Given the generally limited amount of direct contact between students and staff, much of this staff-engendered complexity is not immediately obvious to students. Lea and Street (1998, p. 161) studied the experiences of 47 students and 23 staff members in 3 disciplinary areas (humanities, social sciences and natural sciences) in two universities in England and report that

As students switch between . . . disciplines [e.g. physics and anthropology], course units, modules and tutors different assumptions about the nature of academic knowledge and

learning, are being brought to bear, often implicitly on the specific writing requirements of their assignments . . . it is frequently very difficult for students to ‘read off’ from any such context what might be the specific academic writing requirement of that context.

Woodward-Kron (2005) finds that on a teacher education course, particularly in the advanced stages of the degree programme, the exposition genre (texts presenting a sequenced argument in favour of a judgement) appeared to be more valued than the discussion genre (texts examining different sides of an issue and making an informed recommendation) by faculty. Creme and Lea (1997, p. 15) describe academic knowledge and uses of language in higher education metaphorically as ‘. . . a foreign country, far away from you and your familiar setting . . .’ where there is a ‘gap between what you came with and a different way of thinking and speaking’. The volumes of published guidance books on how to write essays and dissertations would testify to the complexity involved. Worse, this complexity is not fixed and static. The conventions and practices are subject to interpretation by tutors. Lillis (1999, p. 143) observes that ‘[t]he socio-discursive space which is inhabited by student-writers and tutors . . . is predominantly monologic: it is the tutor’s voice which predominates . . .’; and there is evidence that tutor expectations and requirements vary within and across different disciplines (Lea and Street, 1998). Yet in a good deal of discussion on uses of language for academic purposes ‘there is denial of real participants, that is, actual tutors and student-writers with their particular understandings and interests . . .’ (Lillis, 1999, p. 143). In other words, there is an assumption that local and particular academic language practices are part of a universal order of things. All of this can be seen as a form of what Lillis calls the ‘practice of mystery’, particularly from a student’s point of view. This particular instance shows the importance of going beyond formal descriptions of what students are expected to do with language for academic purposes.

#### FUTURE DIRECTIONS

Our knowledge of academic conventions and practices in specific contexts cannot be complete without knowing something about how students understand and respond to the demands placed on them, how they make use of prevailing conventions and models, and how they insert their own selves in the use of English for academic purposes. Ivanič (1997) offers an analytical framework of indices of self and identity in student writing, which can be extended to examine spoken language discourse, that taps into the different aspects of what one

might call ‘authorial space’. Three inter-related authorial selves are of particular interest to this discussion<sup>3</sup>:

- Autobiographic self—‘[t]his is the identity which people bring with them to any act of writing’ (op. cit.: 24). This aspect of self is not fixed; it is continuously developing as part of a person’s life history and their perception of their life experience. This aspect of self surfaces when an aspect of a person’s past experience is used or invoked in an effort to respond to a task.
- Discourse self—This aspect of the self is ‘constructed through the discourse characteristics of a text, which relate to values, beliefs and power relations in the social context in which they were written’ (loc.cit.). Different text types carry different kinds of authorial presences. Laboratory notes may convey greater technical authorial presence than an informal account of an experiment.
- Self as author—this is concerned with the extent to which students see and explicitly insert something of themselves in their writing. In academic writing this aspect of self is particularly significant because ‘writers differ considerably in how they claim authority as the source of the content of the text, and how far they establish an authorial presence in their writing.’ (op.cit.: 26; also see Hyland, 2001).

The kind/s and the amount/s of authorial space that are allowed, or disallowed, in academic language use can be seen as detection indicators of Lillis’ ‘practice of mystery’. For instance, Nadia’s use of her previous learning (autobiographic self) was clearly not welcome; not much authorial space was afforded in this aspect of the written assignment. Using this analytic framework to investigate how student texts are evaluated can begin to help identify relevant directions for further enquiries. I will use a piece of writing by a student to illustrate the potentials.

In England university applicants are required to include a ‘personal statement’ in their applications. This statement plays an important role in an applicant’s claim to a university offer of a place, especially when there are many more or less equally qualified candidates. And yet there does not appear to be any system-wide shared evaluation criteria as to what constitutes a ‘good’ personal statement beyond generalities such as ‘showing the right qualities for being a university student’. Individual admission tutors in effect operate their own evaluation criteria, although there is an assumption that they share a broad set of common expectations. The mock ‘personal statement’ below was written by a 17-year-old second language student, Naseem, who attended an

---

<sup>3</sup> There is a fourth aspect of self in Ivanić’s (1997) discussion. For reasons of focus and scope, this aspect—possibilities for self-hood—is not discussed here.

academic language development course to improve his use of English for academic purposes.<sup>4</sup>

*I want to study a degree in Computer Science because I am interested in the role that computers play in society now and in the future. Now-a-days each and every organisation uses IT. Currently I am studying ICT, Mathematics, Physics and Urdu which I hope will help me to be successful in Computer Science degree. Apart from studying I also have some experience of fixing computer hardware wiring problems. What I find most interesting about the computer is that it is helping humans in many aspects of life. Where will computers go in the next 15 or 20 years? What will be the reaction of humans to the increasing use of them? My ambition is to be a computer engineer either in relation to hardware problems, software problems or both. Perhaps I will be able to be involved in solving hardware design difficulties or in devising better software solutions in the areas of databases or spreadsheets ...*

When this statement, alongside other student statements, was presented to a university admission tutor it triggered, *inter alia*, the following comment:

*... I am ... a bit wary of kind of massive, banal, generalisations ... OK this person is saying 'where will computers go in the next 15–20 years?... What I find most interesting about the computer is that it is helping humans in many aspects of life' my reaction to both of those comments is ... big deal ... you know ... say something a bit more precise about you and why you want to do this course and what is it about computers which interests you in a more specific sense ...*

This admission tutor's comment is clearly related to the presentation of self and the kind/s of information associated it. More specifically, it suggests that in this case the tutor was looking for the author's unique reasons for wanting to study computing, i.e. a stronger presence of the autobiographic self, not a pre-fabricated student profile composed of 'banal' statements on the importance of computers culled from what might be regarded as platitudes. Naseem's chosen presentation of himself is also reflected by the kind of presence of the discourse self in the text. The 'public good' discourse (e.g. '*... helping humans ...*')

---

<sup>4</sup> This academic language development course was part of a community outreach programme run by a university in London. It provided non-fee-paying specialist language literacy tuition for linguistic minority 16/17-year-olds from local schools to enhance their chances of achieving high grades in their matriculation examinations.

extolling the virtues of (depersonalized) contribution to society was, in this case, not highly rated by the tutor. The somewhat depersonalized 'public good' discourse self did not provide sufficient authorial personal presence (despite the presence of self as author expressions such as 'My ambition is ...' and '... I will be able to ...' which are propositionally oriented towards technical problems). The tutor's negative evaluation of these statements also indicates that certain kinds of information are preferred. It would also be reasonable to suggest that in this case more self-declarative (self as author) statements indicating personal goals and plans would be welcome (e.g. I would like to make use of my knowledge in mathematics ...).

This informal account of a tutor's response to a short piece of student writing shows that the three authorial selves in Ivanič's framework can be used not only to analyse student interpretation of and responses to academic tasks, but also to investigate tutors' expectations and requirements. Perhaps it ought to be said that this admission tutor's evaluation criteria, and that of Nadia's tutor seen earlier, are not just random instances of local decision-making; they also represent an interpreted version of institutional or discipline-based requirements. In this sense the focus on the local is connected to wider linguistic and social expectations at work (see Brandt and Clinton, 2002, for a wider discussion on this point). Earlier in this discussion, it was noted that conceptually CLT has a strong interest in empirically-based accounts of actual language use in context, but it has tended to rely on expert description and prescription for social and pragmatic rules of use. It is argued here that by using the three authorial selves as analytic devices, it is possible to regard actual instances of student language use, in speech and/or writing, as a site of investigation into what meaning students have taken from an academic task and how they have responded to it, and what tutors require by their tasks and what they expect from their students. Seen in this light, the three authorial selves are not just about aspects of a speaker/writer's past experience and current personal disposition that are allowed or disallowed in academic tasks. The particular kind and the amount of authorial presence sanctioned by the tutor are also simultaneously about the kind and the amount of substantive content (disciplined-related and/or discursive) that are required, as the tutors' response to Nadia's and Naseem's work clearly demonstrate. Conceptually the authorial selves are useful detection devices capable of revealing a whole host of tutor-, discipline- and context-specific requirements concerned with substantive subject content, in addition to genre and style selection.

This chapter has focused on a particular conceptual issue in second language academic language research and pedagogy: the need to pay attention to how language is actually used in academic settings. A good

deal of the recent discussion on second language curriculum has tended to specify teaching content in terms of inventories of needs built on surveys and expert knowledge. This approach has produced the basis of a socio-culturally sensitive approach to enumerating the linguistic elements for teaching. But the actual (language and other forms of semiotically mediated) meaning making and meaning taking in specific academic settings remain a 'mystery', as Lillis puts it. It is suggested here that some of the research approaches in the field of academic literacy studies which directly engage with academic practices can be helpful in reducing the ontological abstractness at the heart of the prevailing communicative approaches. For second language students, who are grappling with the 'mystery of practice' in academic settings, to understand how things are expected to be done through language discourse, they would need to have a sense of the expectations or criteria of judgment at work. The Hymesian origins of the communicative turn in second language pedagogy are theoretically compatible with, indeed built on, an ethnographically oriented needs assessment. Drawing on Ivanič's (1997) analytic framework, the three authorial selves can be developed as 'local' indices of (a) students' actual use of language discourse, and tutor (*qua* rater) criteria for discipline-based content selection, and genre and pragmatic preferences, and (b) the extent of fit between the two. The emphasis on 'local' signals an epistemic insistence on taking account of the actual ways in which students and tutors do things with language in context. The ethnographic lacuna in CLT can, in principle, be filled with empirical investigations of texts and practices.

## FAMILY LITERACY

### INTRODUCTION

There is little doubt that family literacy has emerged as an increasingly dominant area of language and literacy research over the past 30 years. Any search for studies on family literacy would yield countless citations in which researchers and practitioners outline a range of activities—from parent-child book reading programs to family learning in home, school, and community settings. However, as a formal area of inquiry in language and literacy research, family literacy has a relatively recent history. A tension that has persisted in the field centers on disjunctures between research that emphasizes multiple literacies, sociocultural contexts, and social change in understanding families' learning and the policy push for instructional programming for parents and children that assumes universality of interests, needs, and backgrounds of learners. This tension is linked to family literacy's historical focus on low-income and minority families and to ideological and theoretical perspectives that have drawn heavily upon deficit models. Using selected works representing broad areas of inquiry in family literacy, this review focuses on the ways that the debates in the field have been shaped and on problems and possibilities for the field in (re)constructing its identity within current and emerging discourses of language and literacy theory, research, and practice.

### EARLY DEVELOPMENTS

The concept and accompanying research and practice in family literacy can be traced to three different, though overlapping, themes: parent-child literacy, in which the nature of parent-child interactions is examined and the implications for children's school achievement are studied; home literacy practices, in which families' ways of communicating with each other are investigated; and intergenerational literacy which initially focused on the transmission of literacy practices in two generations but has come to denote the pathways and patterns of literacy learning and practices in families over time and multiple generations.

Although family literacy's roots are in the USA, family literacy is cited often in international discussions. In these discussions, family literacy definitions vary, based on factors unique to a particular country: e.g., the country's history of commitment to literacy education for men

and women, the placement of literacy within political hierarchies, the availability of funding, the severity of poverty and social need within the population, access to schooling for boys versus girls, geographic constraints, and diversity among family structures and cultures. A common definition used in the USA and the UK describes family literacy as “encompassing a wide variety of programs that promote the involvement of both parents and their children in literacy enhancing practices and activities” (Ponzetti and Bodine, 1993, p. 106). Attached to this apparently innocuous definition is a more purposeful and arguably problematic intent: “to improve the literacy of educationally disadvantaged parents and children, based on the assumption that parents are their child’s first and most influential teachers” (p. 106).

It is the simplicity of this definition and the universalism implicit in its description of children and families that contribute to family literacy’s status as a contested area of study. On the one hand, the field has struggled to situate itself in broad conceptualizations and critical discourses of literacy. For example, a series of rich ethnographic studies from the 1980s to present, described later in this chapter, pointed to multifaceted and complex relationships within home, school, and community contexts. These contexts were thought to influence how children and adults engage in formal literacy instruction, draw upon diverse linguistic and cultural practices to communicate within and across different settings, and make meaning of literacy. On the other hand, some would argue that the field has not moved far enough outside of autonomous models (Street, 1984), in which literacy as a technique is applied across all social and cultural contexts with uniformity, to embrace more expansive models (e.g., critical literacy or new literacy studies) (Barton and Hamilton, 1998; Street, 1997, 2001).

Family literacy programs date from the mid-1980s, however, research on parent–child literacy as it relates to current-day discussions began in the 1960s and 1970s in the USA, during a time of social upheaval when the issues of educational access, equity, and quality were at the center of public discussions and when reading researchers were being asked to explain the poor school achievement of minority children from low-income homes. Many of the studies focused on the influence of verbal language—that is, nonstandard dialects such as black or African-American Vernacular English (AAVE)—on children’s reading development, specifically the reading of poor, urban minority children. In many of these studies, reading problems were attributed to “deficits” in the linguistic and literacy experiences of children resulting from their “disadvantaged” families and low-income communities (e.g., Deutsch, 1965) while other studies (e.g., Baratz, 1969; Labov, 1968, 1972) proposed a “difference” theory, in which AAVE was viewed simply as one dialect among many spoken dialects

and was examined to determine whether (or the degree to which) it interfered with reading development (see also the early work of Durkin, 1966). Still others (e.g., Goodman and Buck, 1973) argued that the reading failure of African-American children was largely due to their teachers' problematic attitudes about their dialect.

Two broad types of responses emerged from the field. One focused on the sociolinguistic, cultural, and contextual factors that influenced children's literacy. It challenged existing cognitive frameworks used to teach reading and to study children's oral and textual literacies and urged a more critical analysis of how language and literacy learning occurs within and across diverse settings. The second reversed a trend from the 1960s, during which time parents' and families' low literacy, among other characteristics, was described as the major problem facing children in low-income homes (Coleman, 1966; Moynihan, 1965). Policymakers were encouraged to invest directly in children's school experiences, particularly their early learning, as a way to change the attitudes, beliefs, and practices of these families in subsequent generations. One successful program that emerged was Head Start, which included a parent involvement component. In the new programs, teachers and schools, representing the public sphere, were taking on the full responsibility of shaping the next generation of learners, with relatively little attention to integrating home and family practices.

Hence, the second response shifted this role and responsibility, identified in the 1960s and 1970s as the purview of schools, back to parents and the preparation of parents to use school-like practices with their children. Children's literacy achievement in school was seen as inextricable from parents' capacity to engage in school-like interactions and communications with their children. Although there has been little research that shows a causal relationship between reading to young children and their textual language knowledge, book reading routines, in which middle-class families were found to engage, were highlighted as a significant divide between poor and middle-class children. This view—that poor and undereducated parents are restricted in their ability to promote their children's literacy—did not account for those children whose parents could not read but who, nonetheless, achieved in school (Schieffelin and Cochran-Smith, 1984).

From the mid-1970s to the 1980s, literacy itself took on a much broader definition, embracing more than reading and writing and extending to problem-solving and ways of engaging and functioning in the world through culturally grounded and context-specific practices and skills. However, at one and the same time, the fledgling field of family literacy was advancing competing purposes: i.e., opening up discussions about the ways in which learners representing diverse cultural, ethnic, and class backgrounds approached, used, and valued

literacy while creating an educational policy and practice context that shifted the responsibility of children's literacy performance in schools to parents—in other words, from the public to the private (Tett and Crowther, 1998).

As questions about the meanings of literacy were being raised and the privileging of linear and school-based literacies was being challenged, family literacy emerged as a research-based concept, with the publication of Denny Taylor's seminal work (1983), *Family Literacy: Young Children Learning to Read and Write* changing the text and context of discussions about children and parents learning. Her work provided insights into the processes of literacy learning within diverse homes and into ethnography as a viable approach to unearthing the range and diversity of patterns in households. Focused on six middle-class white families and their children, all of whom were successfully learning to read, the study's findings questioned accepted ways of thinking about who succeeds in formal literacy learning and the contexts for their success, the practices that contribute to learners' success, the ways that children and families construct acts and processes of literacy learning, and the inherent danger of limited perspectives on teaching and learning literacy.

A second critical work, Heath's (1983) *Ways with Words*, also raised questions about the (dis)continuity of literacy practices from home to school and the (bi)directionality of learning between these two contexts. Based in a Black working class community, a white working class community, and a white middle-class community in the Piedmont Carolinas, the study found that the practices of the middle-class families and the school matched, but that the practices of both the white working class and Black working class families did not match the schools' practices. Moreover, there were differences in the practices of the white and black working class communities, demonstrating the multidimensionality of class within and across different groups. Heath found that teachers expected all children to enter school with the same home experiences and predispositions to engage in school literacy activities as those of middle-class children; teachers were unable to use the knowledge, literacy practices, and the cultural experiences of the children sitting before them to create engaging and open spaces for dialogue and meaning-making for and with them.

In these works, both Taylor and Heath demonstrated the role of race, class, and family cultural practices in constructing classrooms as sites that engage all students for learning; they uncovered some of the dissonance created by cultural and home differences when students' experiences are not familiar to or valued in the school setting. Their studies and subsequent work by others in the 1980s, including Teale

and Sulzby's (1986) study on emergent literacy, began to revise some of the deficit perspective and to argue for a more in-depth analysis of the relationship between home interactions and children's academic achievement. Several other studies focused on specific issues that helped to frame the theoretical and research context for the field.

For example, Taylor and Dorsey-Gaines' (1988) study examined the literacy contexts of poor, inner-city African-American families, determining that these homes were steeped in rich practices and traditions with oral and written texts. In another study on children's narrative processes that demonstrates the disconnectedness of home, culture, and teacher pedagogies and classroom practice, Michaels (1981) posited that teachers understood the topic centeredness of white children's stories and responded positively but did not understand the underlying structure of black children's topic associative stories. A few years later, Gee (1989) argued that the topic associative stories were more linguistically complex in the literary structures. Delgado-Gaitan's (1987) work on the continuity between home and school for immigrant children and families pointed to the linguistic diversity and integration of oral and written texts in the daily lives of Mexican-American families. Auerbach (1989) in a review of ethnographic research on poor and language minority families concluded that rather than being literacy impoverished, the homes of linguistic minority students were typically literacy-rich, with parents and families who held high expectations for the possibilities that literacy would create for their children.

These widely acclaimed works attested to the richness of cultural and social contexts and urged a critical examination of children's and parents' experiences in them to build responsive pedagogy. However, policymakers often interpreted the findings of these and other studies to be evidence that poor and minority families were caught in a web of low aspirations, restricted to limited facility with oral and textual literacies, destined for school failure, and by extension were a drain of public resources. Without assuming responsibility for the inequity of access to quality schooling and limited economic resources available to these families, policy efforts were directed at building programs that would give parents the necessary knowledge, awareness, beliefs, and attitudes to support their children.

To make the point, these efforts drew from educational and psychological studies which have historically used mothers' education as the best predictor of children's school achievement. In other words, children's whose mothers had low formal literacies were seen as putting their children at risk for school failure. Adult literacy efforts were increasing as well, reinforcing this point by highlighting the persistence of low literacy within low-income and minority communities. Family

literacy was seen as one alternative to stem the tide of low literacy and came to be driven by policymakers' interpretations of the need, with relatively little literacy research to inform the interpretations.

By 1990, several programs were being established in response to the national call. The Kenan Model developed by the National Center for Family Literacy became the most widely known of the programs created. In addition, other curricular models were created: e.g., the Edwards' Parents as Partners program (1995) the Missouri Parents as Teachers program (Winter and Rouse, 1990), and the Home Instruction Program for Preschool Youngsters (HIPPY). In addition, parent-child reading curricula and on-site programs were being developed (e.g., Handel and Goldsmith, 1989; Nickse, Speicher, and Burchek, 1988). These and other programs drew selectively from research, with most reinforcing policy expectations informed by deficit models and others building upon some combination of approaches.

#### PROBLEMS AND DIFFICULTIES
