

International Encyclopedia of Education

3rd Edition

Editors-in-Chief:
Penelope Peterson, Eva Baker and Barry McGaw

INTERNATIONAL ENCYCLOPEDIA OF EDUCATION

THIRD EDITION

How to go to your page

This eBook set contains 8 volumes. Each volume has its own page numbering scheme for front matter and body.

The pages are labeled with the Volume number and page separated by a colon.

For example, to go to page x of Volume 1, type '1:x' in the "page #" box at the top of the screen and click "Go".

To go to page 203 of Volume 6, type '6:203' in the "page #" box... and so forth.

PREFACE

A preface usually provides a brief introduction to a work, intended to set the stage, provide some background insight, and whet the appetite of the reader. In our case, however, this preface has to address a fundamental question, one that was in our minds at the time we were recruited as Editors-in-Chief for the International Encyclopedia of Education. The question was “Why do we need an Encyclopedia? Its subtext was inspired by the ever-growing, ever-popular Internet. We believe that *this* Encyclopedia is desperately needed and will become a valued resource in education and associated social sciences and arts. The reasons are intellectual and procedural. Anyone with a modicum of knowledge knows that finding and trusting information gleaned from the Internet are two separate actions. The reliance on browsers to help discover references and comments result in resources based on popularity not quality. Pithy titles catch the eye and references rise in the ranks of browser searchers. Related to this is the “editing” in the Internet realm of populist efforts at encyclopedia, references, and other compilations. Once again, after removing offensive material, the accuracy, completeness, lack of bias, and other provenance for entries simply do not exist. Experienced researchers in education can sort through and make intelligent choices. Novices and many journeyman, or practitioners, parents, and policy makers cannot. Contrast how this Encyclopedia was built. Key domains of educational research were identified, and a tentative list of sub-domains or useful applied areas was posited. Then the Editors-in-Chief (apologies for the awkwardness of the term) identified the leading researcher in a particular domain, and with surprisingly little effort, recruited them to participate. They in turn identified the two best researchers in a sub-domain, such as formative assessment or the training of pre-school teachers. The authors of the sections of the Encyclopedia do not represent a collective group of friends and acquaintances, although friendships have been made. Rather they embody a deep and broad scholarly community. The difference from compiled Internet resources is the built-expertise and intellectual engagement of the authors. The summary of the developments and futures in their personal areas of scholarship have been filtered through their years of experience, both as scholars and communicators. Quality, then, is endemic to each piece, developed through this top-down identification of expertise, and made indelible by the bottom-up application of high standards from people leading the sub-domains – the authors, and the domains themselves, the section editors.

On a procedural level, the publishers early committed to the notion that this Encyclopedia would also be an online resource, and access would be available through print, for those with strong bookcases and the persisting love of turning real pages. The Internet version will allow multiple prisms through which the reader may access articles and provide, as it were, an emulation of the Internet in our field, albeit bounded by expertise and high quality.

What must be underscored in the assessment of this effort are the Editors-in-Chief and the publishers’ commitment to find excellence worldwide. We tried very hard to persuade notable scholars from all parts of the world to make contributions. Less than to fulfill the title of “International,” we were on the hunt for perspectives that would enrich the scope and depth of the sections. Our section editors put in enormous time attempting to find the best in the field, wherever they resided. Yet, not everyone is in the volume. Some were overcommitted. Many were not fully confident of their English, and the automated translation software has not yet met standards for technical writing. We believe that such writing and editing tools will make the outreach to an even broader International group of scholars possible in future revisions, or online updates. Furthermore, the birth of the World Educational Research Association (in 2009) will provide a better set of interlocking networks to find and evaluate scholarship from any place on the globe.

Finally, the scope of the effort must be acknowledged: 28 section editors, 926 articles were commissioned, drafted, reviewed, redrafted, edited, and put together in the space of four years. The publishers underwent some internal changes, and alterations in management. We as Editors-in-Chief, changed roles, moved, and also had to keep our own research and development enterprises afloat. Deadlines wobbled; authors dropped from view and had to be replaced.

Yet, at times frustrating as all development is, we find the final product exhilarating. We are enthusiastic not simply because it came into being at all, but because the collective light of the minds that wrote have left a bright resource for the future, one that will impact the way our colleagues understand and experience the educational knowledge, improvement, and impact in the future.

HOW TO USE THE ENCYCLOPEDIA

The International Encyclopedia of Education is intended for use by students, research professionals, and interested others. Articles have been chosen to reflect major disciplines in the study of education and common topics of research by academics in this domain. Each article serves as a comprehensive overview of a given area, providing both breadth of coverage for students, and depth of coverage for research professionals. We have designed the encyclopedia with the following features for maximum accessibility for all readers.

The contents of the encyclopedia are arranged alphabetically by section, and within sections, alphabetically by article. The Subject Index is located in Volume 8. Some topics are covered in a multitude of articles from differing perspectives, while other topics may have only one entry. We encourage use of the index for access to a subject area, rather than use of the Contents list alone, so that a reader has a full notion of the coverage of that topic.

The articles include cross-references to other related encyclopedia articles, suggested further readings where applicable, and many contain relevant websites for additional information. We encourage readers to use the cross-references to locate other encyclopedia articles that will provide more detailed information about a subject.

The Further Reading sections include recent secondary sources to aid the reader in locating more detailed or technical information. Review articles and research articles that are considered of primary importance to the understanding of a given subject area are also listed. These suggested further readings are not intended to provide a full reference listing of all material covered in the context of a given article, but are provided as next steps for a reader looking for additional information.

VOLUME 1

A

Adult Education

Adult Education Overview	<i>K Rubenson</i>	1
--------------------------	-------------------	---

Adult Education – Adult Learning, Instruction and Program Planning

Adult Learning	<i>S B Merriam</i>	12
Adult Learning and Instruction: Transformative Learning Perspectives	<i>P Cranton</i>	18
Adult Learning in a Biographic Perspective	<i>L West</i>	25
Adult Learning, Instruction and Programme Planning: Insights from Freire	<i>P Mayo</i>	31
Characteristics of Adult Learning	<i>K Illeris</i>	36
Informal Learning: A Contested Concept	<i>P Hodgkinson</i>	42
Organizational Learning	<i>P-E Ellström</i>	47
Program Planning	<i>A L Wilson and R M Cervero</i>	53
Workplace Learning Frameworks	<i>S Billett</i>	58

Adult Education – as a Field of Study

Class Analysis in Adult Education	<i>T Nesbit</i>	64
Gender Analysis	<i>J Stalker</i>	70
Race and Ethnicity in the Field of Adult Education	<i>J Johnson-Bailey and D Drake-Clark</i>	77
Trends in Workplace Learning Research	<i>T Fenwick</i>	83

Adult Education – Concepts

Lifelong Learning	<i>J Field</i>	89
Rewriting the History of Adult Education: The Search for Narrative Structures	<i>B J Hake</i>	96

Adult Education – Domains and Provision

Adult Basic Education: A Challenge for Vocational Based Learning	<i>R Höghelm</i>	102
Adult Literacy Education	<i>L Tett and R St.Clair</i>	107
Citizenship and Immigrant Education	<i>D Schugurensky</i>	113
Community Based Adult Education	<i>B Connolly</i>	120
Continuing Professional Education: Multiple Stakeholders and Agendas	<i>R M Cervero and B J Daley</i>	127
Financing of Adult and Lifelong Learning	<i>Å Sohlman</i>	133
Labor Education	<i>K Forrester</i>	139
Learning Cities and Regions	<i>C Duke</i>	144
Museums as Sites of Adult Learning	<i>R S Grenier</i>	150
Overview of Lifelong Learning Policies and Systems	<i>D-B Kwon and C H O Daeyeon</i>	156
Popular Adult Education	<i>S Tøsse</i>	162
Provision of Prior Learning Assessment	<i>P Andersson</i>	169
The Age of Learning: Seniors Learning	<i>P Jarvis</i>	175
University Adult Continuing Education: The Extra-Mural Tradition Revisited	<i>M Slowey</i>	183

Adult Education – Economy and Society

Adult Education and Civil Society	<i>J Crowther and I Martin</i>	191
Adult Education and Nation-Building	<i>S Walters</i>	198
Economic Outcomes of Adult Education and Training	<i>A Ferrer and W C Riddell</i>	204
Health and Adult Learning	<i>P Bélanger and M Robitaille</i>	211
Modernization Processes and the Changing Function of Adult Learning	<i>H S Olesen</i>	217
The Political Economy of Adult Education	<i>G Rees</i>	223
Wider Benefits of Adult Education	<i>R Desjardins and T Schuller</i>	229

Adult Education – Participation

Barriers to Participation in Adult Education	<i>K Rubenson</i>	234
Participation in Adult Learning	<i>R Desjardins</i>	240

C**Comparative Education**

Comparative and International Education: English-Language Scholarly Publications	<i>D Post and M Fedri</i>	251
Comparative Education: Philosophical Issues and Concepts	<i>M Mason and C W Evers</i>	257
Comparative Education: Societies and Associations	<i>M Bray</i>	266

Curriculum Development

Curriculum and Religion	<i>C Kapitzke and P Graham</i>	272
Gender and Curriculum	<i>J Marsh</i>	277
Local Teacher-Based Curriculum Development	<i>M D Osborne and H B Barker</i>	283

Curriculum Development – Contexts

Curriculum and Human Rights	<i>C Lohrenscheit</i>	287
Curriculum and the Education of Cultural and Linguistic Minorities	<i>S May</i>	293
Curriculum in Postcolonial Contexts	<i>A Hickling-Hudson</i>	299
Curriculum, Economic and Cultural Development	<i>A Rampal</i>	307
Globalization and Curriculum	<i>R Dale</i>	312
Popular Culture	<i>K Schultz and R Throop</i>	318

Curriculum Development – Evaluation and Research

An Overview of Research in Curriculum Inquiry	<i>F M Connelly and S J Xu</i>	324
Curriculum Evaluation: Approaches and Methodologies	<i>V Klenowski</i>	335
Curriculum Studies, Discourse Analysis, and the Construction of Historical Time	<i>J Laspina</i>	342
Curriculum Use in the Classroom	<i>M Ben-Peretz and B Eilam</i>	348
The Roots and Routes of Teacher-Based Action Research and Curriculum Inquiry: An Historical Perspective	<i>L G Putney and J L Green</i>	355

Curriculum Development – Planning and Development

Curriculum and Syllabus Design	<i>A Woods, A Luke, and K Weir</i>	362
Curriculum and the Publishing Industry	<i>J Larson, A-R Allen, and D Osborn</i>	368
Curriculum and Teacher Change	<i>J G Ladwig</i>	374
Curriculum Governance and Planning	<i>B Levin</i>	379
Curriculum Planning and Systems Change	<i>Z Deng</i>	384
Curriculum, Digital Resources and Delivery	<i>Y Zhao, G Zhang, and C Lai</i>	390
Textbook Development and Selection	<i>P Shannon</i>	397

Curriculum Development – Subject Matter

Curriculum and Globalization: Higher Education	<i>K H Mok</i>	403
Curriculum Development as Subject Matter: Social Studies	<i>J Brophy and J Alleman</i>	411
Curriculum Development in the Area of Reading	<i>C L Madda and T E Raphael</i>	415
Curriculum in the Arts	<i>C M Thompson, L Bresler, and T E Costantino</i>	423
Curriculum: Foreign Language Learning	<i>Angel M Y Lin</i>	428
First Language Learning	<i>T Rogers and L Moffatt</i>	435
Learning a Second Language in First Language Environments	<i>E Bernhardt and D J Tedick</i>	441
Literature	<i>S Hynds</i>	447
Mathematics	<i>B Kaur and C P Vistro-Yu</i>	453
Physical Education and Sports	<i>D Kirk</i>	459
Primary and Elementary/Middle Grades Reading	<i>D E Alvermann and C A Mallozzi</i>	464
Science	<i>Y Kali and M Linn</i>	468

Curriculum Development – Theory

Bilingual Learning (Learning L1 and L2 in an L1 and L2 Environment)	<i>D Schwinge</i>	475
Curriculum and Complex Systems Theory	<i>W-M Roth and J Thom</i>	481

Curriculum and Constructivism	<i>B Davis and D Sumara</i>	488
Curriculum and Critical Theory	<i>L Yates</i>	494
Curriculum and Poststructuralist Theory	<i>J L Miller</i>	499
Curriculum and Structuralist Sociology: The Theory of Codes and Knowledge Structures	<i>J Muller and J Gamble</i>	505
Curriculum Reform	<i>R Gilbert</i>	510
Early Childhood Curriculum and Developmental Theory	<i>S M-Y Lim and C Genishi</i>	514

D

Demography and Social Change

An Evaluation Framework for E-Learning Effectiveness in the Arab World	<i>W AbuSneineh and M Zairi</i>	521
Globalization and Social Justice in Higher Education	<i>E Kimura-Walsh</i>	536
Racial Inequality and the Economic Payoffs of Higher Education	<i>S A Lachtman</i>	542
School Health Education	<i>J S Yang</i>	547

Demography and Social Change – Demography

A Paradigm of Contradictions: Racism and Science Education	<i>B A Brown and J W Mutegi</i>	554
Africana Studies: Past, Present And Future	<i>B R Hare, A Young, J B Stewart, and D P Aldridge</i>	565
Beyond Black Nationalism to Black Internationalism: The Compelling Case for Examining Black Educational Challenges Globally	<i>K Freeman</i>	573
Beyond Racial, Ethnic, and Gender Bias in Education Statistics	<i>J T Lott and C Bennett</i>	581
Caste and Education in India	<i>G G Wankhede</i>	589
Demography, Community, and the Education of Asian American and Pacific Islander Students	<i>R T Teranishi</i>	595
Educational Attainment and Mortality Differentials	<i>H D Horton, L Hixson, and S M Monnat</i>	602
Educational Opportunity and Latino/Chicano College Choice: New Findings, and Theoretical Perspectives	<i>M A Ceja and P A Pérez</i>	610
Ethnic Minority Identity and Educational Outcomes in a Rising China	<i>G A Postiglione</i>	616
Ethnic Studies and Women's Studies: From the Past to the Present, Providing a Space in the Academy for Scholarship Focused on the Histories and Experiences of Marginalized People	<i>C A Brown</i>	623
Gender Equity in Higher Education: Challenges and Celebrations	<i>L Morley</i>	629
Locating Space and Place in the College Access Debate: New Tools for Mapping and Understanding Educational Inequity and Stratification	<i>B Cantwell and J F Milem</i>	636
Public Policy and Inequality in Postsecondary Opportunity: Educational Statistics and the Failure of Education Reform	<i>E P St. John, K Williams, and K Moronski</i>	649
The Education of Indigenous Students	<i>J W Tippeconnic and S C Faircloth</i>	661
The Health Advantages of Educational Attainment	<i>G Y Dinwiddie</i>	667
To Go or Not to Go: Access and Barriers to Ethnic Minority Participation in Higher Education within the United Kingdom	<i>P Brug and T L Oliver</i>	673
Universal Secondary Education and the Two-Tiered School System in the English-Speaking Caribbean	<i>P Anderson and J Devonish</i>	679
Women of Color in Science, Technology, Engineering and Mathematics (STEM): Refining the Concepts, Reframing the Issues	<i>C B Leggon</i>	686

Demography and Social Change – Social Change

Educational Diversity in U.S. Law Schools	<i>C E Daye, A T Panter, W R Allen, M E Deo, and L F Wightman</i>	691
Educational Reform	<i>F Lopez-Segrera</i>	698
Emergence of For-profit Higher Education	<i>X Li</i>	705
Engaged Education: Experiential Learning, Intensive Field Experiences, and Social Change	<i>T R Rone</i>	711
Higher Education and Social Change in Mexico	<i>A Mungaray, G Estrella, P Moctezuma, and M Ramírez-Urquidy</i>	719
The Changing Role of the State in Higher Education	<i>K Gürüz</i>	728
The Role of the State in School Reform: Responding to Increasing Ethnic Diversity in Britain	<i>P Ratcliffe</i>	737
Transforming Mindsets Through Education for Sustainable Development	<i>V M Segovia</i>	746

Demography and Social Change – Sociology

Achievement Motivation in Ethnic Minority Youth	<i>S Graham and E Bryant</i>	753
Affirmative Action and Higher Education in Brazil	<i>J T dos Santos and D M Queiroz</i>	760
Black in White: Black Students at White and Black Colleges	<i>L Evans and J R Feagin</i>	767
Bologna Process: On the way to a Common European Higher Education Area	<i>A V Rezaev</i>	772
Critical Race Theory in Education Research	<i>R Vue and C B Newman</i>	779
Cultural Diversification and Japanese Education: Social Constructions of the New Diversity	<i>R Tsuneyoshi</i>	787
Education in War Countries: A Disempowerment of Society	<i>J L Nkata</i>	793
Educational Attainments of U.S. Black Males and Females: 1971 to 2003	<i>F B Bonner, M-C Jipguep-Akhtar, and R J Harrison</i>	799
Educational Preparation: Fostering the Self-Efficacy and Resilience of Urban Adolescent Youth	<i>M B Spencer and B Tinsley</i>	806
HIV Education for Low-Literate People: Transforming Students and Communities through Paulo Freire's Praxis and the Pedagogy of Action	<i>N Z Haniff</i>	814
How Are Discussions of Interdisciplinary Studies Linked to Diversity Discourse?	<i>C N Spence</i>	823
Identifying Patterns of Doctoral Attrition Across Academic Fields	<i>A James, K J Fosnacht, E B Stolzenberg, and D Thirumalai</i>	827
Male Underachievement in Education Across the Globe: A Shift in Paradigm for Gender Disparities Regarding Academic Achievement	<i>J F L Jackson, J L Moore III, and R A Leon</i>	838
Noncognitive Measures for Higher Education Admissions	<i>W E Sedlacek</i>	845
Peace Education	<i>J Page</i>	850
Remote Control: Africa's Development and Outflow to Developed Nations of Technical Talent	<i>F Haniff</i>	855
Scholar-Baller®: Student Athlete Socialization, Motivation and Academic Performance in American Society	<i>C K Harrison, S Bukstein, J Mottley, E Comeaux, J Boyd, C Parks, and D Heikkinen</i>	860
Service-Learning and Diversity as Mediums to Foster Civic and Community Engagement in Undergraduates	<i>L Oseguera</i>	866
Success and Failure in Education and Criminal Justice: Identifying Common Mechanisms	<i>S Ramirez and A Harris</i>	874
The History of Education: Race and Education	<i>J O Jewell</i>	881

VOLUME 2**E****Early Childhood Care and Education Theory**

- Early Childhood Care and Education: The Family, The Market, and The State *S B Kamerman and M J Neuman* 1
- Gender Issues in Early Childhood Education and Care *B Pocock* 11

Early Childhood Education and Care Governance

- Early Childhood Risk, Protection and Abuse Prevention *E Khoo* 17
- Evaluating Early Childhood Education and Care Programs *M Janus and S Brinkman* 25

Early Childhood Education and Care Investment

- Investing in Early Childhood Education and Care: The Health and Wellbeing Case *T Moore and F Oberklaid* 32
- Cost-effective Early Childhood Programs from Preschool to Third Grade *A J Reynolds, J A Temple, and B White* 38
- Early Childhood in Post-Modern Cultures: Thoughts and Some Concerns *P Gammage* 49
- Investing in Early Childhood Education and Care: Some Policy Implications *J Bennett* 55
- Investing in Early Childhood Education and Care: The Economic Case *G Cleveland and M Krashinsky* 63

Early Childhood Education and Care Programs

- Early Care and Education Programs for Infants and Toddlers *B Nyland* 69
- Literacies in Early Childhood: The Preschool Period *M Flear and B Raban* 75
- Participation in Early Childhood Education and Care Programs: Equity, Diversity and Educational Disadvantage *M Vandenbroeck* 81
- Teaching in Early Childhood Centers Instructional Methods and Child Outcomes *I Siraj-Blatchford* 86

Early Childhood Education and Care Provision

- Early Childhood Education and Care in the People's Republic of China *Zeng Xiaodong* 93
- Home-Based and Institutional Early-Childhood Education and Care Services *R Fukkink and H Blok* 98
- Integrated Early Childhood Education and Care Services – Care, Upbringing, Education and Health *S Colley* 104
- Issues of Access and Program Quality *J T Hustedt and W S Barnett* 110
- Kindergarten Transitions and Linkages to Primary School – Readiness Re-conceptualized *A Petriwskyj* 120
- Parent Support in Early Childhood – Approaches and Outcomes *K S Howard, K A Beckmann, and J Brooks-Gunn* 126

Early Childhood Education and Care Research

- Development and Implementation of Early Learning Standards in the United States *C Scott-Little* 132
- Global Status of Early Learning and Development Standards *P R Britto and S L Kagan* 138
- Rethinking Early Childhood Education and Care: Implications for Research and Evaluation *K Thorpe, D Cloney, and C Tayler* 144

Early Childhood Education and Care Theory

- Child Rearing and Early Education: Parents and Professionals: Theoretical and Historical Influences *H Penn* 151

Early Childhood Education and Care Workforce

- Early Childhood Education and Care Professional Profiles in the United Kingdom: Multiagency Teamwork and Transdisciplinary Challenges *A Anning and P Calder* 157
- Early Childhood Education and Care Staff Support: Mentoring and Professional Development in Finland *P Lindberg* 162

Economics of Education

- Education and Health *P Muennig* 169
- Data *M Perez and M Socias* 178
- Empirical Research Methods in the Economics of Education *P J McEwan* 187
- Theoretical Concepts in the Economics of Education *D J Brewer, G C Hentschke, and E R Eide* 193

Economics of Education – Costs and Financing of Schooling

- Cost–Benefit Analysis and Cost–Effectiveness Analysis *C Belfield and H M Levin* 199
- Economic Approaches to Adequacy *J Imazeki* 204
- Economic Approaches to School Efficiency *L L Taylor* 210
- School Finance Reform *T Downes* 216
- School Finance: An Overview *J K Rice, D H Monk, and J Zhang* 222
- The Economics of Tuition and Fees in Higher Education *R G Ehrenberg* 229

Economics of Education – External Benefits of Schooling

- Education and Civic Engagement *T S Dee* 235
- Education and Crime *L Lochner* 239
- Education and Economic Growth *E A Hanushek and L Wößmann* 245
- Parental Socioeconomic Status, Child Health, and Human Capital *J Currie and J Goodman* 253
- The External Benefits of Education *W W McMahon* 260

Economics of Education – Labor Markets, Education and Earnings

- Education and Inequality *J Blanden and S Machin* 272
- Human Capital *E R Eide and M H Showalter* 282
- Race Earnings Differentials *M Carnoy* 288
- Returns to Education in Developed Countries *M Gunderson and P Oreopoulos* 298
- Returns to Education in Developing Countries *H A Patrinos and G Psacharopoulos* 305
- School Quality and Earnings *J R Betts* 313
- Signaling in the Labor Market *M E Page* 321
- The Economics of High School Dropouts *R W Rumberger* 325

Economics of Education – Markets, Incentives and School Choice

- Competition and Student Performance *A A Payne* 331
- Educational Privatization *C Belfield and H M Levin* 337

Student Incentives	<i>E R Eide and M H Showalter</i>	342
The Economic Role of the State in Education	<i>D N Plank and T E Davis</i>	347
The Economics of Catholic Schools	<i>W Sander and D Cohen-Zada</i>	354
The Economics of Charter Schools	<i>R Zimmer and R Buddin</i>	360
The Economics of Parental Choice	<i>R Chakrabarti and J Roy</i>	367
The Economics of School Accountability	<i>D N Figlio and H F Ladd</i>	374
The Efficacy of Educational Vouchers	<i>R Zimmer and E P Bettinger</i>	380
Tiebout Sorting and Competition	<i>T J Nechyba</i>	388

Economics of Education – Production of Schooling

Desegregation, Academic Achievement and Earnings	<i>S Rivkin</i>	394
Education Production Functions: Concepts	<i>D N Harris</i>	402
Education Production Functions: Developed Country Evidence	<i>E A Hanushek</i>	407
Education Production Functions: Evidence from Developing Countries	<i>P Glewwe and S Lambert</i>	412
Family Environment in the Production of Schooling	<i>R Rothstein</i>	423
Neighborhoods and Peers in the Production of Schooling	<i>J Vigdor and J Ludwig</i>	431
Teacher Quality in Education Production	<i>I Pelayo and D J Brewer</i>	438
The Economics of Class Size	<i>D W Schanzenbach</i>	443
The Economics of Early Childhood Interventions	<i>M Nores</i>	450

Economics of Education – Teaching Labor Markets

An Overview of Teacher Labor Markets	<i>H Lankford and J Wyckoff</i>	456
Compensating Differentials in Teacher Labor Markets	<i>J Chambers</i>	465
Economic Approaches to Teacher Recruitment and Retention	<i>S Loeb and J Myung</i>	473
Teacher Incentives	<i>L Santibañez</i>	481
Teacher Supply	<i>P Dolton</i>	489
Teacher Training and Preparation in the United States	<i>M Podgursky, M G Springer, and R Hutton</i>	498
Teachers in Developing Countries	<i>F H Rogers and E Vegas</i>	504
The Economics of Teachers' Unions in the United States	<i>K Strunk</i>	512

Education of Children with Special Needs

Adapted Physical Activity for Students with Special Needs	<i>S R Hodge</i>	519
Assessment Accommodations for Children with Special Needs	<i>R J Kettler and S N Elliott</i>	530
Assistive Technology and Educational Practice	<i>H P Parette and G R Peterson-Karlan</i>	537
Augmentative–Alternative Communication	<i>C Mason and K M Chinn</i>	544
Community Integration and Employment of Youth with Special Needs	<i>B A Ford and A W Daviso III</i>	550
Cooperative Learning for Children with Special Needs	<i>E A Dooley and K R Kossar</i>	555
Co-Teaching	<i>E D Cramer</i>	560
Cultural and Linguistic Diversity and Children with Special Needs	<i>J M Patton, N Day-Vines, and A McSwain</i>	565
Curriculum-Based Assessment and Students with Special Needs	<i>D J O'Shea and J D Katsafanas</i>	571

Diagnosis and Classification	<i>M Sapp</i>	577
Direct Instruction and the Education of Children with Special Needs	<i>T Mehring</i>	584
Disabilities and Gifted Education	<i>V I Daniels and M J McCollin</i>	588
Early Childhood Special Education: Birth to Eight Years Old	<i>T S Lovelace, R Gardner III, J B Axe, and D M Sainato</i>	594
Early Intervention for Students with Special Needs	<i>P A Grant</i>	608
Early Transition of Children with Special Needs	<i>S A Fowler</i>	613
Educating Children Who are Deaf-Blind	<i>J Wood and K M Chinn</i>	621
Educating Children with Deafness and Hearing Impairments	<i>G M Mukuria and C J Eleweke</i>	628
Educating Children with Other Health Impairments (ADHD)	<i>G M Mukuria and F E Obiakor</i>	634
Educating Children with Physical Disabilities	<i>Z P Nkabinde, F E Obiakor, M T Ofor, and D J Smith</i>	640
Educating Children with Specific Learning Disabilities	<i>P A Grant and P B Grant</i>	646
Educating Children with Speech and Language Disorders	<i>S L Green and C D Qualls</i>	654
Educating Students with Autism and Related Disorders	<i>T T Dyches</i>	661
Educating Students with Cognitive Disabilities	<i>J P Bakken</i>	669
Educating Students with Emotional and Behavioral Disorders	<i>S W Smith and G G Taylor</i>	678
Educating Students with Special Needs: An Overview	<i>F E Obiakor, M K Harris, P Harris-Obiakor, and G M Mukuria</i>	688
Educating Students with Traumatic Brain Injury	<i>S Burkhardt and A Rotatori</i>	695
English Language Learners with Special Needs	<i>R Rueda and G Ragusa</i>	701
Functional Behavioral Assessment	<i>J P Bakken</i>	708
History of Special Education	<i>L M Garrick Duhaney and S J Salend</i>	714
Inclusion of Students with Special Needs in General Education Classrooms	<i>M A Prater</i>	721
Instructional Accommodations for Children with Special Needs in Inclusive Settings	<i>A L Yurick, S Musti-Rao, and G Cartledge</i>	727
Interagency Agreements	<i>L A Owens</i>	733
Interdisciplinary Collaboration in Early Childhood	<i>N File</i>	739

Workforce Issues in Special Education <i>E Carlson and B Billingsley</i>	886

VOLUME 3

Education of Professionals

An Overview of Accreditation, Certification, and Licensure Processes <i>J J Norcini and M van Zanten</i>	1
Educating America's Military Officers <i>M H Adamshick</i>	7
Education for Architecture in the United States and Canada <i>S Schreiber</i>	13
Education for Medicine <i>M B Anderson</i>	19
Education for the Legal Profession <i>J W Wegner</i>	25
Education of Clergy <i>D O Aleshire</i>	31
Framing Professions Education <i>P S O'Sullivan</i>	37
Issues in Accounting/Business Education <i>W H Gijsselaers and R G Milter</i>	39
Professions – Engineering <i>J Heywood</i>	45
Professions – Health-Related <i>G M Jensen and C B Royeen</i>	51
Professions – Pharmacy <i>D E Beck</i>	58
Teaching for the Complex Practice of Nursing <i>P Benner and M Sutphen</i>	65
Veterinary Education <i>K M Edmondson</i>	71

Education Research Methodology: Quantitative Methods and Research

Abductive Research Methods <i>B D Haig</i>	77
Field Experimentation in Education <i>M A Constat</i>	83
Internal Validity <i>M H Clark and S C Middleton</i>	90
Methods for Approximating Random Assignment <i>B Schneider and S-K McDonald</i>	97
Methods for Approximating Random Assignment: Regression Discontinuity and Propensity Scores <i>L M Scheier</i>	104

Multitrait–Multimethod Designs	<i>M Bong and S Hong</i>	111
Multivariate Longitudinal Data Analysis	<i>H Liu and L Chang</i>	120
Quasi-Experimentation: Two Group Design	<i>E Hong</i>	128
Regression Discontinuity Designs	<i>A Kelava, S Rohrmann, and V Hodapp</i>	134
Sampling	<i>R S Brown</i>	142
Statistical Conclusion Validity	<i>P L Busk</i>	147
Survey Research Methods	<i>A Fink</i>	152

Educational Assessment

An Overview of Educational Assessment	<i>M James</i>	161
Assessment and the Evaluation of Institutional Effectiveness	<i>S M Thomas</i>	172
Assessment in Schools – Dispositions	<i>R D Crick</i>	181
Assessment in Schools Related To Literacy: Reading	<i>K J Topping</i>	189
Impact of Assessment on Students' Learning Strategies and Implications for Judging Assessment Quality	<i>M Segers, F Dochy, and D Gijbels</i>	196

Educational Assessment – Assessment Activities

Alternative Assessment	<i>G Stobart and C Gipps</i>	202
Classroom Assessment Tasks and Tests	<i>J Phelan and J Phelan</i>	209
Dynamic Assessment	<i>J G Elliott, E L Grigorenko, and W C M Resing</i>	220
Instructional System Provided Feedback	<i>H F O'Neil, S Chuang, and T Huang</i>	226
Peer and Self-assessment	<i>C Harrison</i>	231
Portfolio Assessment	<i>V Klenowski</i>	236
Records of Achievement: Beyond Traditional Tests	<i>P Broadfoot</i>	243

Educational Assessment – Assessment in Domains

Assessment in Higher Education	<i>D R Sadler</i>	249
Assessment in Schools – Affective Domain	<i>M Ventura, R D Roberts, and M Zeidner</i>	256
Assessment in Schools – Creative Subjects	<i>T E Costantino and L Bresler</i>	262
Assessment in Schools – Learning to Learn	<i>A Hautamäki, J Hautamäki, and S Kupiainen</i>	268
Assessment in Schools – Literacy Writing (Extended)	<i>J M Parr and L Earl</i>	273
Assessment in Schools – Mathematics	<i>M Brown and J Hodgen</i>	279
Assessment in Schools – Oracy	<i>A L Bailey</i>	285
Assessment in Schools – Primary Science	<i>W Harlen</i>	293
Assessment in Schools – Secondary Science	<i>J Shemwell, A Fu, M Figueroa, R Davis, and R Shavelson</i>	300
Assessment in Schools – Technology Education and ICT	<i>A Jones, B Cowie, and J Moreland</i>	311
Assessment in the Early Years	<i>M J Drummond</i>	316
Assessment in the History, Civics and Social Studies Domains	<i>P G Avery</i>	323
Assessment in the Workplace of Performance, Developing Expertise and Competence	<i>A J Brown</i>	330
Assessment in Vocational Education	<i>K Ecclestone</i>	337

Educational Assessment – Concepts and Issues

Assessing Group Work	<i>M Galton</i>	342
Assessment and the Regulation of Learning	<i>L Allal</i>	348
Challenges of Developing and Implementing Formative Assessment Practices in Schools	<i>R Sutton</i>	353
Formative Assessment	<i>P Black</i>	359
Formative Assessment and Instructional Planning	<i>B Marshall</i>	365
Progression and Assessment: Developmental Assessment	<i>M Forster and G Masters</i>	369
Students' Rights in Assessment and Evaluation	<i>J Gardner and B Holmes</i>	378
Summative Assessment by Teachers	<i>R Daugherty</i>	384
The Multiple Purposes of Assessment	<i>P E Newton</i>	392
The Relationship between Assessment and the Organization and Practice of Teaching	<i>L B Resnick, D William, R Apodaca, and E S Rangel</i>	397

Educational Assessment – Enhancing Quality and Use

Assessment Conversations: Reading and Writing Conferences with Students and with Parents	<i>M Barrs</i>	403
Assessment: Pre-service and In-service Teacher Education	<i>A Davies</i>	410
Classroom Assessment in Policy Context (Australia)	<i>J J Cumming</i>	417
Classroom Assessment in Policy Context (England and France)	<i>M Osborn and M Raveaud</i>	425
Classroom Assessment in Policy Context (French Sources)	<i>D Laveault</i>	432
Classroom Assessment in Policy Context (Hong Kong)	<i>D Carless</i>	438
Classroom Assessment in Policy Context (New Zealand)	<i>T J Crooks</i>	443
Classroom Assessment in Policy Context (Sub-Saharan Africa)	<i>S J Howie, L Zimmerman, and K Draper</i>	449
Moderation of Student Work by Teachers	<i>G S Maxwell</i>	457
School Policies and Practices to Support Effective Classroom Assessment for Learning	<i>D Pedder</i>	464
Student Assessment: Policy and Practice in Eastern Europe	<i>G Bethell</i>	472

Educational Assessment – Key Relationships

Assessment Practice in Policy Context: Latin American Countries	<i>F M Rizo</i>	479
Impact of Assessment on Learner Groups (Boys/Girls)	<i>J Elwood</i>	486
Impact of Assessment on Learner Groups (Disabilities)	<i>M Rouse</i>	492
Impact of Assessment on Students' Test Anxiety	<i>P Buchwald and C Schwarzer</i>	498
Impact of Assessments on Classroom Practice	<i>J L Herman</i>	506
Social Practices in School Assessment and their Impact on Learner Identities	<i>A Pollard and A Filer</i>	512

Educational Evaluation – Concepts, Practice, and Future Directions

Educational Evaluation: Concepts, Practice, and Future Directions	<i>Y J Ni</i>	518
---	---------------	-----

Educational Evaluation – Contemporary Themes in Evaluation

Evaluating E-Learning	<i>D D Williams and C R Graham</i>	530
Evaluating Schools as Learning Communities	<i>S M Thomas</i>	539
Evaluation of Adult Education and Training Programs	<i>G McNamara, P Joyce, and J O'Hara</i>	548
Evaluation of Integrated Health Programs in School	<i>T M Franke</i>	555

Formative Assessment in Teacher Education and Teacher Professional Development	<i>H Tillema</i>	563
Informal Education and Evaluation	<i>T Jeffs</i>	572
Methods to Evaluate Technology	<i>W L Bewley</i>	578

Educational Evaluation – Contexts of Educational Evaluation

Cost Analysis in Evaluation Studies	<i>J D Fletcher</i>	585
Cultural Issues that Can Affect the Validity of Educational Evaluations	<i>R P Durán</i>	592
Evaluation and Accountability	<i>E Sato and S N Rabinowitz</i>	600
Evaluation Governance and Planning	<i>R Picciotto</i>	607
Evaluation Use	<i>V G Thomas</i>	614
Moral and Ethical Issues in Evaluation	<i>M Morris</i>	622
The Role of Stakeholders in Educational Evaluation	<i>S Taut and M C Alkin</i>	629

Educational Evaluation – Evaluation Domains

Curriculum Evaluation	<i>T Levin</i>	636
Evaluating Education in Three Policy Eras	<i>M A Peters, R Britez, and S M Weber</i>	645
Evaluation of Mathematics Education Programs	<i>J Cai</i>	653
Evaluation of Science Education Programs	<i>G Berberoğlu</i>	660
Evaluation of Social Studies and Civic Education Programs	<i>S G Grant</i>	667
Evaluation of Teacher Quality and Practice	<i>W Robinson and J Campbell</i>	674
International Evaluations	<i>A Schleicher</i>	681
National Assessment Programs: The Example of the U.S. National Assessment of Educational Progress	<i>M Schneider</i>	690
Principal Evaluation: Concepts, Needs and Realities	<i>N S Glasman and L D Glasman</i>	698
Program Evaluation	<i>C A Christie and L A Fierro</i>	706
School Based Evaluation: Purposes, Protocols and Processes	<i>J MacBeath</i>	713
School Inspection/External School Evaluation	<i>C Chapman and P Earley</i>	719
The International System for Teacher Observation and Feedback: A Theoretical Framework for Developing International Instruments	<i>L Kyriakides, B P M Creemers, C Teddlie, and D Muijs</i>	726

Educational Evaluation – Evaluation Methods

Evaluation Methodology	<i>M Chatterji</i>	735
Evaluation Reporting and Communicating	<i>R T Torres</i>	746
Longitudinal Evaluation Designs	<i>X Ma</i>	757
Meta-evaluation: Purpose, Prescription, and Practice	<i>L A Wingate</i>	765

Educational Evaluation – Purposes and Models of Educational Evaluation

Defining Quality in Evaluation	<i>P Dahler-Larsen</i>	775
Internal and External Evaluation	<i>D Nevo</i>	781
Needs Assessment in Education	<i>J W Altschuld and T L Lepicki</i>	786
The Purpose of Educational Evaluation	<i>S Mathison</i>	792
Understanding Approaches to Evaluation	<i>A J Love</i>	798

VOLUME 4**Educational Measurement**

Ability Testing	<i>P B Tymms</i>	1
Admissions Testing	<i>R Zwick</i>	7
Appropriateness Measurement: Person Fit	<i>R R Meijer and A M Weekers</i>	15
Automated Essay Scoring: Writing Assessment and Instruction	<i>M D Shermis, J Burstein, D Higgins, and K Zechner</i>	20
Classical Test Theory Reliability	<i>M D Miller</i>	27
Criterion-Referenced Measurement	<i>S A Shrock and W C Coscarelli</i>	31
Differential Item Functioning	<i>M D Hidalgo and J Gómez-Benito</i>	36
Educational Measurement: Overview	<i>R L Linn</i>	45
Equating and Scaling	<i>A A von Davier</i>	50
Fairness	<i>C Gipps and G Stobart</i>	56
Generalizability Theory	<i>R L Brennan</i>	61
Impact of Assessment on Classroom Practice	<i>J L Herman</i>	69
Intelligent Systems	<i>V J Shute and D Zapata-Rivera</i>	75
Item Response Theory	<i>W J van der Linden</i>	81
National Assessments	<i>T J Crooks</i>	89
Norm-Referenced Measurement	<i>H D Hoover</i>	95
Progress Monitoring	<i>L S Fuchs and D Fuchs</i>	102
Rasch Models	<i>D Andrich</i>	111
Scoring Rubrics	<i>J A Arter</i>	123
Second Language Assessment	<i>L F Bachman</i>	140
Self Adaptive Testing	<i>J Revuelta</i>	148
Student Test Results in School Accountability	<i>L S Hamilton</i>	153
Test Development	<i>S M Downing</i>	159
Test Translation and Adaptation	<i>A Allalouf and P Hanani</i>	166
Testing Creativity	<i>M A Runco</i>	170
Testing in History	<i>S Wineburg and B Fogo</i>	175
Validity	<i>R L Linn</i>	181
Validity of Achievement Gains on High-Stakes Tests	<i>D Koretz</i>	186
Validity of Educational Indicators	<i>B P M Creemers and L Kyriakides</i>	193

G**Globalization of Universities and Institutions**

Globalization, Universities and Medium of Instruction	<i>J Lo Bianco</i>	201
The Washington Accord on Engineering Curriculum	<i>E Ko</i>	209

H

Higher Education

Higher Education: An Overview	<i>P Scott</i>	217
-------------------------------	----------------	-----

Higher Education – Management, Leadership and Governance

Academic Managers – Heads of Departments/Schools	<i>S Marshall</i>	229
Leading and Managing the University – Presidents and their Senior Management Team	<i>R Middlehurst, T Kennie, and S Woodfield</i>	238
Management of and in Higher Education Institutions	<i>B Sporn</i>	245
Managerialism and Collegialism in Higher Education Institutions	<i>M Shattock</i>	251
Strategic Planning in Higher Education	<i>L Zechlin</i>	256
The Changing Role of University Presidents, Vice-Chancellors and Rectors	<i>M F Green and P D Eckel</i>	264
The Changing Roles of University Governing Boards and Councils	<i>J Fielden</i>	273

Higher Education – Research and Scholarship

Funding of University Research	<i>G Harman</i>	279
Mobility of PhD Students and Scientists	<i>S Avveduto</i>	286
National Science Policy and Universities	<i>M Henkel and U Kogan</i>	294
Research Commercialization	<i>S Slaughter</i>	300
Research Quality Assessment	<i>I McNay</i>	307
The Management of University Research	<i>J Kirkland</i>	316
The Training of New Scientists	<i>R Neumann</i>	322

Higher Education – Society

Academic Freedom	<i>S F Macintyre</i>	328
Access and Equity in Higher Education	<i>G Baldwin and R James</i>	334
Boundaries of Institutional Autonomy and their Impact on Higher Education	<i>V L Meek</i>	341
Diversity of Higher Education	<i>U Teichler</i>	347
Employability of University Graduates and Graduate Outcomes	<i>J Brennan</i>	354
Higher Education and the Knowledge Society	<i>J Välimaa</i>	360
Higher Education and the Labor Market	<i>J Enders</i>	365
Higher Education and the Transformation of Society	<i>P Scott</i>	370
Quality Assurance in Higher Education – Practices and Issues	<i>D Dill</i>	377
The Role of Accreditation of Higher Education Institutions	<i>J S Eaton</i>	384
Universities and Regional Development	<i>J Goddard and J Puukka</i>	390
Universities' Engagement with Society	<i>D Watson</i>	398

Higher Education – Teaching and Learning in Higher Education

Distance Education and Open Universities	<i>A Kanwar and J Daniel</i>	404
Education Development in Higher Education	<i>Y Ryan and K Fraser</i>	411
Effective Use of Technology in Teaching and Learning in HE	<i>D Laurillard</i>	419

Facilitating Students' Success – Student Support and Learning Resources in Universities	<i>E Woodberry and C Barnes</i>	427
Faculty Values and Expectations and Their Implications for Teaching, Learning and the Organization of Higher Education Institutions	<i>K Harman</i>	433
Flexible Learning in Higher Education	<i>S Alexander</i>	441
Innovation in Teaching and Curriculum Design	<i>J M Dearn</i>	448
Productivity of University Faculty Staff	<i>S Kyvik</i>	455
Promoting Effective Student Learning in Higher Education	<i>K Trigwell</i>	461
Student Attrition from Higher Education Institutions	<i>M Hayden</i>	467
University Students' Experiences of Higher Education	<i>C McInnis</i>	473
What Do University Students Learn?	<i>G D Kuh and B K Bridges</i>	479

Higher Education – Tertiary Education in a Globalized World

Associations of Universities	<i>G F Moodie</i>	485
Collective Bargaining in Higher Education	<i>C Allport, K McAlpine, and S Roberts</i>	491
Financing of Higher Education	<i>B Chapman and P Tulip</i>	499
Higher Education Crossing Borders	<i>J Knight</i>	507
Higher Education in Post-Conflict Societies	<i>M Daxner</i>	514
Higher Education in the New Economies	<i>J Fielden</i>	520
Human Resource Issues in Higher Education	<i>E El-Khawas</i>	527
International Accreditation in Higher Education	<i>A Stella and D Woodhouse</i>	533
Internationalization of Higher Education	<i>M van der Wende</i>	540
National and International Rankings of Higher Education	<i>S Marginson</i>	546
Steering of Higher Education Systems – The Role of the State	<i>K Yokoyama and V L Meek</i>	554
Student and Faculty Transnational Mobility in Higher Education	<i>U Lanzendorf and B M Kehm</i>	559
The Bologna Process in European Higher Education	<i>D Rich</i>	566
The Economics and Finance of Higher Education	<i>A Wolf</i>	573
The Role of the OECD in the Development of Higher Education in a Globalized World	<i>R Yelland</i>	584
Transforming Higher Education in Developing Countries: The Role of the World Bank	<i>J Salmi and R M Bassett</i>	590
UNESCO's Role in the Development of Higher Education in a Globalized World	<i>S Uvalić-Trumbić</i>	597

Higher Education – The Organization and Financing of Higher Education

Higher Education in Federal Systems	<i>M A M Cortés and U Teichler</i>	603
Pathways and Articulation into Higher Education	<i>G F Moodie</i>	609
Unitary, Binary and other National Systems of Higher Education	<i>L Goedegebuure</i>	616
Viewing Private Higher Education: How Much, Where, Why, and What?	<i>D C Levy</i>	622

I

Immigration

Children of Migrant Populations	<i>M M Suárez-Orozco and C Suárez-Orozco</i>	629
Third Culture Kids	<i>R E Van Reken</i>	636

International Comparisons

IEA Studies in ICT	<i>N Law</i>	644
IEA Studies in Mathematics and Science	<i>F K S Leung</i>	650

L**Leadership and Management**

Leadership and Management Overview	<i>B Mulford</i>	695
------------------------------------	------------------	-----

Leadership and Management – as a Field of Study

Contexts for Leadership at the Beginning of the 21st Century	<i>M Bottery</i>	704
Educational Leadership: Philosophical Issues	<i>C W Evers</i>	710
Ethical/Moral Issues in Educational Leadership	<i>R J Starratt, L Langlois, and P Duignan</i>	717
History of Educational Leadership/Management	<i>R Bates</i>	724
Educational Leadership as a Field of Study: Professional Journals 1994–2006	<i>A R Thomas</i>	731
Research on Educational Leadership – Approaches/Promising Directions	<i>W A Firestone and V M J Robinson</i>	740

Leadership and Management – Leader Preparation

Leaders for Productive Schools	<i>J Murphy, S N Elliott, E B Goldring, and A C Porter</i>	746
New Approaches in Preparing School Leaders	<i>S G Huber</i>	752
Research for Leaders: The National College for School Leadership	<i>G Southworth</i>	762
School Leadership Standards	<i>L Ingvarson</i>	768

Leadership and Management – Leadership Issues

Effective Leadership in Challenging Schools	<i>A Harris</i>	777
Esthetics, Educational Leadership and Management	<i>R Bates</i>	783
Leader Mistreatment of Teachers	<i>J Blase and J Blase</i>	790
Leadership and Gender	<i>J Blackmore</i>	797
Leadership and Student Voice	<i>C Lanskey and J Rudduck</i>	803
Leadership and Urban Education	<i>K A Riley</i>	809
Leadership for Learning	<i>J MacBeath</i>	817
Leadership in Diverse Cultures	<i>A Walker and P K Yu-kwong</i>	824

Leading Diverse Schools	<i>J Ryan</i>	832
Supervision and Personnel Administration	<i>P D Tucker and D G Pounder</i>	839
The Big Challenge: Leadership for Inclusion	<i>M Ainscow and A Sandill</i>	846
The Educational Leader's New Work	<i>P Gronn</i>	852

VOLUME 5

Leadership and Management – Leadership Types

A Distributed Perspective on School Leadership and Management	<i>J P Spillane</i>	1
Leadership: Authentic	<i>P T Begley</i>	7
Leadership: Democratic	<i>J Møller</i>	12
Leadership: Instructional	<i>P Hallinger, K Leithwood, and R H Heck</i>	18
Leadership: Transformative	<i>C M Shields</i>	26
Strategic Leadership	<i>B Davies and B J Davies</i>	34
Teacher Leadership and Organizational Development	<i>A Harris</i>	40
Understanding How Leadership Influences Student Learning	<i>K Leithwood and B Levin</i>	45

Leadership and Management – Politics and Governance

Equity and Educational Effectiveness	<i>P Sammons</i>	51
Leading/Managing Schools in Communities Made Poor	<i>P Thomson</i>	58
Principals Role in Restructuring Schools	<i>G M Crow and K D Peterson</i>	66
School Reform and Restructuring: Self Managing School	<i>B J Caldwell</i>	72
System Leadership	<i>D Hopkins and R Higham</i>	78

Leadership and Management – School and Community

Educational Leadership and Social Capital	<i>J West-Burnham</i>	85
Networked Learning Communities School-to-School Collaboration as an Essential Component of a System Reform Strategy	<i>D Jackson</i>	92
Networks and Communities of Knowledge	<i>T Schuller and H Theisens</i>	100
School Community Relations	<i>R L Crowson and E B Goldring</i>	106
Social Capital, Educational Institutions and Leadership	<i>S Kilpatrick, S Johns, and B Mulford</i>	113

Leadership and Management – School Effectiveness and Improvement

Leadership and Technology	<i>C F Webber</i>	120
Leadership in the Implementation of Innovations	<i>I E Bogotch, T Townsend, and M Acker-Hocevar</i>	128
Leadership: School Improvement	<i>R H Heck and P Hallinger</i>	135
Organizational Learning in Schools	<i>B Mulford and H Silins</i>	143
Professional Learning Community	<i>L Stoll</i>	151
Transformational School Leadership	<i>K Leithwood</i>	158

Learning and Cognition – Issues and Concepts

Attention in Cognition and Early Learning	<i>M Heimann, T Tjus, and K Strid</i>	165
Concept Learning	<i>S J Unsworth and D L Medin</i>	172
Cooperative Learning	<i>R E Slavin</i>	177
Intelligence	<i>R J Sternberg</i>	184
Learning from Multiple Information Sources	<i>H I Strømsø and I Bråten</i>	191
Memory	<i>S Magnussen and T Brennen</i>	197
Metacognition	<i>L Baker</i>	204
Personal Epistemology in Education: Concepts, Issues, and Implications	<i>I Bråten</i>	211
Piaget: Recent Work	<i>L Smith</i>	218
The Adult Development of Cognition and Learning	<i>E A L Stine-Morrow and J M Parisi</i>	225
Vygotsky and Recent Developments	<i>J V Wertsch</i>	231

Learning and Cognition – Issues and Concepts – Focus on Cognition

Cognition and Emotion	<i>F Pons, M de Rosnay, and F Cuisinier</i>	237
Cognition: Overview and Recent Trends	<i>J Wiley and B D Jee</i>	245
Development of Creativity	<i>M A Runco</i>	251
Knowledge Domains and Domain Learning	<i>L Maggioni and P A Alexander</i>	255
Problem Solving and Human Expertise	<i>T J Nokes, C D Schunn, and M T H Chi</i>	265
Problem Solving and Reasoning	<i>R E Mayer</i>	273
Reasoning, Moral and Social	<i>N S Jampol, C B Richardson, and M Killen</i>	279
Remembering as Social Activity	<i>D Middleton</i>	285

Learning and Cognition – Issues, Concepts, Types

Computer-Supported Collaborative Learning: Basic Concepts, Multiple Perspectives, and Emerging Trends	<i>S R Ludvigsen and A I Mørch</i>	290
Learning as Inquiry	<i>S R Goldman, J Radinsky, S Tozer, and D Wink</i>	297
Learning Through Narrative Socialization	<i>A Fasulo</i>	303
Neuroscience Bases of Learning	<i>M H Immordino-Yang and K W Fischer</i>	310
The Neuroscience of Reading	<i>U Goswami</i>	317

Learning and Cognition – Issues, Concepts, Types – Focus on Learning

Learning Strategies	<i>C E Weinstein, J Jung, and T W Acee</i>	323
Learning Through Play	<i>K Aronsson</i>	330
Situated View of Learning	<i>A Collins and J G Greeno</i>	335
The Neuroscience of Aging and Cognition	<i>W J Hoyer and B Bessette-Symons</i>	340

Learning and Cognition – Language, Literacy and Subject-Related

An Overview of Language and Literacy in Educational Settings	<i>V G Aukrust</i>	345
Bilingualism and Learning	<i>L S Verplaetse and E Schmitt</i>	355
Classroom Discourse and Student Learning	<i>L Hemphill</i>	361
Early Writing	<i>B E Hagtvet</i>	367

First Language Acquisition	<i>N B Ratner</i>	375
Foreign Language Learning	<i>C Kinginger</i>	382
Learning Science	<i>J Leach and P Scott</i>	387
Learning to Read	<i>M S Burns and J K Kidd</i>	394
Mathematics Learning	<i>L Verschaffel, B Greer, and E De Corte</i>	401

ADULT EDUCATION

Adult Education Overview

K Rubenson, University of British Columbia, Vancouver, BC, Canada

© 2010 Elsevier Ltd. All rights reserved.

Introduction

In the introduction to the second edition of the *International Encyclopedia of Adult Education and Training*, the editor points out that adult education is heuristic, multidisciplinary, eclectic in orientation, and that its knowledge base is diffuse and incomplete (Tuijnman, 1996, xv). If anything, this is even truer a decade or so later. Other disciplines and fields of study (such as economics, political science, psychology, sociology, and organizational sciences) increasingly take an interest in adult learning and contribute crucial knowledge to its theoretical and empirical knowledge base. So, it increasingly becomes difficult to precisely define what constitutes the core of adult education and learning. With this in mind, the adult education section of this encyclopedia attempts to present an overview of the still-emerging field of adult education. The 39 articles that make up the section provide insight into the historical development of the field, its conceptual controversies, domains and provision, perspectives on adult learning, instruction and program planning, outcomes, relationship to economy and society, and its status as a field of scholarly study and practice.

Toward a Field of Adult Education

Although J. H. Hudson's 1851 *The History of Adult Education* identified it as a unique field, only in the last 60 years has adult education been recognized as a distinct field of practice and study. Organized forms of education serving very limited elite groups of adults have been noted since ancient time. Plato's *Republic* presents a well-laid-out structure of what we today would call lifelong learning for the ruling class and outlines in detail what kind of education would be required at various stages in life from childhood up to

middle age. Similar examples are available from early civilizations in Egypt, China, and India where the technological advancements and complex administrative systems relied on education and training of a small leading segment of the adult population (Kidd and Titmus, 1989: xxiv). A different and later form of adult education has its roots in the Protestant reformation in Northern and Central Europe during the latter part of the sixteenth century and the first-half of the seventeenth century. During this period, adult education was influenced by translations of the Bible and invention of the printing press that among other things supported Bible-study groups and a reading public. The modern forms of adult education and learning have their roots in the modernization of industrial processes and the resulting far-reaching changes to society taking place in the late nineteenth and early twentieth century. Thus, the historical evolution of educational movements, the rise and fall of celebrated adult-education institutions as well as policies and reforms have to be seen in the context of the broader dynamics of social change and conflict. Presently, we can observe how regionally different models of lifelong learning policies are emerging as a response to changes in relatively unique cultural, economic, and political contexts.

The second part of the nineteenth and first part of the twentieth century saw a marked increase in educational activities for adults in Europe and North America. However, as Kidd and Titmus (1989: xxiv), note, these were perceived as discrete activities rather than part of a coherent field of adult education. By the early twentieth century, adult education had become the fastest-growing educational sector in the USA. This highlighted the urgency to form national associations of adult education and saw a gradual move to a professionalization of the field. The first study of adult education in the United States, initiated by the Carnegie Corporation in 1924, resulted

in the formation of the American Association for Adult Education (AAAE), in 1926. The purpose of AAAE was to advance lifelong learning, serve as a central forum for a variety of adult-education interest groups, influence local, state, and regional adult-education efforts, monitor legislation, conduct special studies, and maintain a speakers' bureau. One of the first activities of the AAAE was to start the publication of a *Handbook of Adult Education* series, the first being released in 1928. Since then, nine handbooks have been published, including the latest edition that is to be published in 2010.

In Europe, the formation of adult-education associations originally had less to do with developing a professional orientation but was instead aimed at bringing adult education to the working class and others, for example, women previously denied access to education. The primary examples of this are the mechanics institutes and the Association for the Higher Education of Working Men formed in 1903, and renamed as the Workers' Educational Association (WEA) in 1905. The WEA movement quickly spread to Australia, Canada, and New Zealand where adult education became seen as an essential tool for encouraging new immigrants to contribute to their new society. Folk high schools and study associations tightly connected to the labor movement and other social movements appeared in the Nordic countries. Germany and some other continental and Eastern European countries saw the development of various forms of *Volksbildung*. However, it was not before the later part of the 1960s that a more discernable and cohesive academic field of adult education started to take shape.

One sign of a maturing field of adult education has been the mushrooming of local, national, regional, and world organizations. From its early beginnings, a defining character of the evolving field has been its strong international dimension built around shared values and aspirations. This has positioned adult education as an international movement promoting adult education as a way to combat inequalities, support democracy, and promote cultural and social, democratic development (Duke, 1994). The first United Nations Educational Scientific and Cultural Organization (UNESCO) International Conference of Adult Education (CONFITEA) took place in 1949, and was followed by additional conferences in 1960, 1972, 1985, 1997, and 2009. The growth of the field can be illustrated by attendance at these conferences. In 1949, at the conference in Montreal, there was attendance from 25 countries, and in 1997, in Hamburg, the figure had increased to 130 and is expected to reach 175 at the 2009 conference.

Concepts

Since adult education began to emerge as a field, there have been constant discussions about what terminology to

use to describe the enterprise as well as about its definition and boundaries. The understanding of what constitutes adult education has not only changed over time, but also varied depending on cultural and institutional context. Up to the 1920s, the tradition had been to talk about specific activities like literacy for immigrants, university extension, mechanic institutes, workers' education, etc., but not to group these under an overall umbrella labeled adult education. As part of the professionalization of adult education taking place in the USA, in the first two decades, the term adult education came to be commonly used as a composite term to denote different activities relating to the education of adults. However, in most other parts of the world, the professionalization process came later and it was not until the 1960s that the generic term adult education was more broadly used. In many European countries, it had up until then been customary not to refer specifically to the education of adults but more generally to popular enlightenment as in France or the Nordic countries or *Volksbildung* as in Germany.

While the term adult education steadily won ground, there remained a lack of agreement on its definition and boundaries. Selman and Dampier (1991: 2) note that different terms are used for the same thing and people doing similar work may refer to this as community education, continuing education, adult training, literacy, extension, or adult education. Similarly, the terminology differs between country and country depending on historical circumstances. In fact, the organization of articles in this encyclopedia reflects the idiosyncrasies of what to include or not to include under the term adult education. Thus, to many in the field, several entries that are now presented in the volume on vocational education and training ought to have been included in the adult-education section and similar argument could be made for moving entries from the adult-education section to the one on vocational education and training.

Over the years, different definitions of the term adult education have appeared (see e.g., Bryson, 1936; Houle, 1972; Verner, 1962). The most commonly used definition presently is the one adopted by UNESCO in 1976 (UNESCO, 1976: 2) and reads in abbreviated form:

The term "adult education" denotes the entire body of organized educational processes, whatever the content, level and method, whether formal or otherwise, whether they prolong or replace initial education in schools, colleges and universities as well as in apprenticeship, whereby persons regarded as adult by the society to which they belong develop their abilities, enrich their knowledge, improve their technical or professional qualifications or turn them in a new direction and bring about changes in their attitudes or behavior in the two fold perspective of full personal development and participation in balanced and independent social, economic and cultural development;

adult education, however, must not be considered as an entity in itself, it is a sub-division, and an integral part of, a global scheme for lifelong education and learning.

Critical in the UNESCO definition, like in most other attempts to outline adult education, is how the term adult is best understood. Building on (human-development) stage theory, Darkenwald and Merriam (1982: 9) state: “adult education is a process whereby persons whose major social roles are characteristic of adult status undertake systematic and sustained learning activities for the purpose of bringing about changes in knowledge, attitudes, values and skills.” Thus, adult education refers to “activities intentionally designed for the purpose of bringing about learning among those whose age, social roles, or self-perception define them as adults” (Merriam and Brockett (1997: 8). According to this view, it is not age as such that defines someone as an adult, but the social roles that the person is carrying out. The second key dimension in the UNESCO definition relates to the special educational organization of the education for adults. It is in this context that adult education refers to “its own peculiar organization, methods and curriculum, which distinguishes adult education from any other field of education.” In the words of Verner (1964: 1), “... the term adult education is used to designate all those educational activities that are designed specifically for adults.” However, it has become increasingly difficult to maintain this kind of definition. First, not all adults taking part in adult education are adults in the terms of social roles and functioning. Second, it is commonly pointed out that participation in adult education is not always a volunteer act but it is more commonly becoming something an adult has to do to keep her work or become eligible for certain benefits like unemployment insurance. Third, attempts to separate adult learners from first-time students attending regular school or university are also becoming more blurred. The traditional pattern of study has changed and with an increasing number of students moving in and out of the educational system and the labor market, it is difficult to identify who is in the first cycle of studies and who is a recurrent learner.

While recognizing the problems of defining who is an adult learner, various pragmatic solutions are being sought. So, for example, recent studies like the International Adult Literacy Survey and the Adult Literacy and Lifeskills Survey (OECD, 2003, 2005) allow for the exclusion of all regular, full-time students, except the following: full-time students subsidized by employers; full-time students over 19 enrolled in elementary or secondary programs; and full-time students over 24 enrolled in post-secondary programs. While this approach may be pragmatic, it is evident that in the emergent learning society, the traditional distinctions between initial education, particularly higher education, and adult education are becoming increasingly blurred.

The 1976 UNESCO definition reflects the strong and growing calls to see adult education as a segment within an overall principle of lifelong learning. Ideas of lifelong learning are today having strong influence over adult-education policy and different regional models are developing (ibid). In this perspective, it is of interest to note that the UNESCO Institute of Education changed its name to UNESCO Institute of Lifelong Learning. This use of the concept departs from the fundamental principle of lifelong learning as put forth by transnational organizations like the European Union (EU), the OECD, and the UNESCO which proclaim that the concept of lifelong learning is based on three fundamental attributes:

- it is lifelong and therefore concerns everything from cradle to grave;
- it is lifewide recognizing that learning occurs in many different settings; and
- it focuses on learning rather than limit itself to education.

In adult-education circles, particularly in the Anglo Saxon countries, lifelong learning is given a more restrictive understanding and has increasingly come to be used interchangeably with just one segment of lifelong learning, namely adult learning. This is, for example, the case in the UK where departments of adult education have been renamed departments of lifelong learning. Similarly, one of the leading scholarly journals in adult education is named *International Journal of Lifelong Education* focusing almost exclusively on adult learning.

The embracement of lifelong learning, in its broad or restrictive meaning, is resulting in a shift from the concept of adult education to adult learning resulting in a further proliferation of the terminology in use. So, for example, today a distinction is being made between three basic categories of settings where purposeful learning activity takes place (European Commission, 2000):

1. *Formal learning.* This learning typically takes place in an education or training institution, it is structured (in terms of learning objectives, learning time, or learning support) and leading to certification. Formal learning is intentional from the learner's perspective.
2. *Nonformal learning.* It is learning that is not provided by an education or training institution and typically does not lead to certification. It is, however, structured (in terms of learning objectives, learning time, or learning support). Nonformal learning may be provided in the workplace and through the activities of civil-society organizations and groups. It can also be provided by organizations or through services that have been set up to complement formal systems, for example, arts, music, and sports classes. Nonformal learning is intentional from the learner's perspective.

3. *Informal learning.* It is learning resulting from daily life activities related to work, family, or leisure. It is not structured (in terms of learning objectives, learning time, or learning support) and typically does not lead to certification. Informal learning may be intentional but in most cases it is nonintentional (or incidental/random).

While policy documents overwhelmingly subscribe to definitions of adult learning that broadly correspond to those presented by the European Communities' policy documents, the scholarly literature contains many different and competing definitions and questions the advisability of trying to seek clear definitional distinctions between the three concepts. Others warn that the tendency to substitute learning for education can de-politicize the field and move the focus away from broader issues like equity, the role of the state, policy, and resources which are central when addressing issues of democracy and equality (Duke, 1994; Rubenson, 2006). In this respect, it is of interest to note that the CONFINTEA VI meeting in 2009 uses the label adult learning and education (ALE), a concept that may become prevalent in the years to come.

As the debate over how to delimit education continues, many students of the field will likely agree with Duke (1994: 8) when he states:

The important point about the concept field and scope of adult education is that it is necessarily broad, diffuse, multi-locational in terms of research sites and academic identities. It reflects the diffuseness and weakly bounded nature of adult education (and learning) itself.

To some, the concerns over a breakdown of the traditional boundaries of adult education and adult education as a profession are misplaced. Instead, they recommend that the focus should be on practitioners working professionally with adults whoever and wherever they may be (Usher *et al.*, 1997: 27).

Adult Education Domains and Provision

While the structure and provision of adult education vary considerably from country to country, some main sectors are discernable:

- adult basic education including adult literacy and numeracy;
- immigrant and citizenship education;
- adult higher education;
- workplace education and training (see section on vocational education and training);
- community education;
- popular adult education; and
- museums, radio, and TV and libraries.

When the AAAE was formed in 1926, adult education was generally understood in a narrow sense and expected to fulfill two main purposes. First, it was to teach English to immigrants and to prepare them for American citizenship, and second, to provide a second chance for those that had been deprived of education in their earlier years. These two purposes have remained central to adult education. As immigration spread more and more, countries started to devote significant human and material resources to citizenship and immigrant education. From focusing almost exclusively on preparing the new immigrants for the labor market and assimilating into the prevailing culture, programs are increasingly having the dual purpose of stimulating unity and diversity. In the 1960s and 1970s, the expansion of educational opportunities for the young, in combination with rising skill demands in the economy, brought basic adult education and literacy onto the policy agenda. With the emerging knowledge economy, functional adult literacy and the national pool of human competencies have gained a renewed interest by policymakers (OECD, 2005). In the developing world, adult literacy is promoted as central to development as well as to address issues of human immunovirus/acquired immunodeficiency syndrome (HIV/AIDS). Adult basic education and particularly adult literacy education display a great variation in terms of structure, provider, and philosophy. It can be found in churches, schools, colleges, community settings, workplaces, and libraries and offered by professional or unqualified staff.

The structure of the current university adult and continuing-education programs reflect their historical roots. In the UK and the Commonwealth, these are to be found in the adult and extra-mural tradition with its special centers or departments dedicated to offering university courses to adults. In the USA, on the other hand, the tradition emanated from the Land Grant universities with their explicit mission to support the local community and rural development. Reflecting an acceptance of the principle of lifelong learning, adult learners now make up a large proportion of students in higher education – in some countries they even constitute a majority. A large number of these are enrolled in regular courses or programs while others take a continuing-education course. Among the latter, an increasing number is found in continuing professional education which has increased dramatically with rising demands for mandatory continuing education in several professions. As with any educational system, continuing professional education has many stakeholders with multiple agendas that are being shaped by professional and social, institutional, and educational considerations (OECD, 2005). A new growing clientele for the university are older adults who take advantage of courses offered by continuing-education departments or specialized programs like Elderhostel or the University of the Third Age.

Information on enrolment in different forms of adult education reveals a dramatic shift in provision over the last

three decades. In the OECD countries, this is primarily caused by a remarkable increase in employer-supported activities that have radically altered the landscape of adult education (Bélanger and Valdivieso, 1997; Desjardins *et al.*, 2006). The data reflect the broader changes that have occurred in the labor market, which, among other things, forces people to participate because they are ordered or feel pressurized to undergo some form of adult education and training linked to their work (Carré, 2000). This education and training is being offered by a multiplicity of providers from different sectors including: formal educational institutions, commercial schools/private training providers, and employers and suppliers of equipment. The range and diversity of providers of workplace-related education contributes to the uncertainties about the reach and impact of public policy decisions on the structure of adult education and training.

Another distinct sector involves popular adult education where we today can find two dominant traditions; one Nordic and one Latin American though each have some followers in other parts of the world. Folk high schools and adult-education associations with roots in the classical social movements are a vital part of the adult-education sector particularly in the Nordic countries. In the latter countries, it is free and voluntary, despite considerable state and municipal subsidies; it lies at the crossroads between civil society and the state and has three major roles: it acts as an agency of popular movements, it is an adult educator, and it is a supporter of culture. It does not primarily cater to individuals' careers and job needs, but broadly responds to their role as citizens, parents, and/or personal development. In many parts of the world, popular adult education, while less structured than in the Nordic countries and lacking state subsidy, plays an important role in the life of various social movements. The Latin American tradition is closely associated with the work and pedagogy of Paulo Freire. Working closely with oppressed groups, the focus is often on improving their literacy and consciousness raising with an aim to inspire solidarity and collective political awareness and action. This tradition of popular adult education draws heavily on popular culture traditions, dance, song, drama, and storytelling. Its vitality can be seen in other areas of educational activity as well. For example, labor education, which can take many different forms, is sometimes an important avenue for popular education. Community education is a form of locally funded educational and recreationally program that can be seen to occupy a space between the formal educational system and popular adult education. This form of provision is particularly well developed in the UK, Ireland, Australia, and parts of the USA and also in several African countries, for example, South Africa. Traditions and structure of community education vary between countries and at times the role of the state in setting direction is more direct while in other traditions, for example, the so-called Wisconsin model, it follows a hands-off approach.

However, a common denominator is the rootedness in the community and the focus on preparing the community and its inhabitants to respond to structural and educational disadvantage.

The section on domains and provision has addressed actual structures of adult education, but in addition to these, it is worth mentioning a recent idea that focuses not on specific providers but considers a city or region as a learning entity. The concept can be seen as a political and social utopia that expresses what a city or region wants to become in the emerging knowledge society. Another current development is the general idea of prior learning assessment (PLA), which is about acknowledging and giving formal recognition to prior learning, irrespective of when, where, and how learning has taken place. PLA can be seen as a natural consequence of the acceptance of the principle of lifelong learning and breaks with the tradition of defining adult-education activities in term of provider and instead recognizes learning in whatever form it takes.

Adult Learning, Instruction, and Program Planning

The literature on adult education has primarily focused on what and how adults learn, instructional methods appropriate when working with adults, and how to design and organize educational activities for adults.

A hotly debated issue has been whether or not adult learning should be understood as a distinctive process that significantly differs from how children learn. In *The Modern Practice of Adult Education: Andragogy versus Pedagogy*, Knowles (1970) argues that adult learning differs fundamentally from how children learn. The book, which contains a set of principles that should guide adult learning practices, quickly became somewhat of a Bible for practitioners. Facing extensive criticism for the sharp division he had drawn between how adults and children learn, Knowles changed his position and suggested that rather than see a dichotomy between andragogy and pedagogy, they constituted a continuum. Consequently, in the 1980 edition of *The Modern Practice of Adult Education*, the subtitle was changed to read *From Pedagogy to Andragogy*. To many, even this softening of the original position does not go far enough and they challenge the idea of trying to build an academic field focusing distinctly on adult learning. This is the case among scholars working in the biographic perspective on adult learning who stress the continuities between early life and adult experience (Knowles, 1970). Others, while recognizing that adults' and children's learning from the point of psychological functioning may not differ, maintain that this position only holds for some very basic features of learning. Their key point is that in the planning of adult-education practices, one has to recognize that adult learning, in

contrast to children's learning, is principally selective and self-directed.

Andragogy, like two other dominant perspectives on adult learning, self-directed learning and transformative learning, is informed by humanistic psychology and focuses on the individual adult learner. Following the general developments in learning research, scholars in adult education have become more skeptical to the traditional strong individual orientation and have increasingly adopted a situated-cognition orientation. This is particularly noticeable in writings on workplace learning, an area that is prominent in recent adult education learning literature. The research on the situated nature of learning at work has helped shed light on why there often is less of a transfer between what has been learned in a school situation and the application of this knowledge and experiences at the workplace. The focus on workplace learning has stimulated an interest to understand not only how individuals learn but also how organizations themselves might hinder or encourage learning. A learning organization is being promoted as an ideal form of organization that fosters continuous organizational renewal through encouraging the learning of its members (Knowles, 1970). With the interest in organizational learning and situated-cognition workplace learning, scholars have embraced a network and community of practice traditions, more recently a co-participation model that encourages combined micro- and macro-level analysis of workplaces.

Outcomes of Adult Education

With increased public and private investment in adult education, there is a growing interest in developing a more comprehensive understanding of how adult education and learning can contribute economically and socially to the well-being of the individual and society. The two central questions are: who is participating in what kind of adult education and learning, and what benefits does this learning have for the individual and society.

Existing research shows that participation rates vary substantially across countries and that there are marked differences between countries with quite similar economies too. Regardless of overall participation rate, participation patterns are very similar. In all countries, older adults, the poor, and unemployed, low-skilled workers, migrants, ethnic minorities, and rural inhabitants report a reduced tendency to participate (Desjardins, *in press*). Gender inequalities vary between countries with some reporting a higher rate of participation among women and the others a lower. However, despite similar patterns of exclusion, the degree of inequality varies substantially among countries. Comparative findings suggest that policy does matter and that political commitment to high

standards of equity, and willingness to address market failures through sustained public policy efforts affect participation patterns. Thus, government intervention can affect a person's capability to participate through fostering broad structural conditions relevant to participation and construct targeted policy measures that are aimed at overcoming both structurally and individually based barriers (Rubenson and Desjardins, 2009).

The main individual outcomes of participation in adult education that have been examined are labor-market outcomes such as wages, employment, and earnings. For employers, the key outcome of adult education and training is worker productivity (44). The literature suggests that while there may be unaccounted-for factors, returns to training, particularly employer training and off-the job training are generally positive.

Further, there seem to be interesting differences between countries (*ibid*). Most studies tend to focus solely on skills and competencies for economic outcomes and neglect the relationships between various forms of adult learning and quality of life as well as overlook the synergy between formal, nonformal, and informal learning. Naturally, the impacts of adult education and learning extend beyond various economic outcomes and during recent years, there is a growing interest in the wider benefits of adult learning, particularly health and civic engagement. The work carried out so far suggests positive impact on health civic and political participation, but it has also identified a range of difficult methodological issues. One general problem is that situating outcomes of adult learning in the broader context of lifelong learning requires measures that allow comparisons across formal, nonformal, and informal learning settings, so that substitution and complementarity between the various forms of adult learning can be assessed. While participation in organized learning is quite restricted, almost everyone seems to be engaged in purposeful informal learning activities – but so what? What consequences flow from being involved in particular forms of adult learning? The shift in focus from adult education to lifelong learning has moved the attention away from inputs toward outputs.

As part of the professionalization process of adult education, scholars and practitioners began to pay serious attention to designing and organizing adult educational activities. Over time, the program planning literature in adult education, predominantly from the USA, has come to provide a rich body of competing models and theories on decisions and actions about what is to be learned, how the learning is to take place, who the learners and the teachers are, and what the education is for. Despite the great number of models developed for specific programs over the years, there seems to be more uniformity than could be expected, which has made some scholars to suggest the existence of a generic model (*ibid*; Sork and Cafarella, 1989). These reviews have also identified a

sense of a growing gap between what is prescribed in the theories and what practitioners actually do when planning programs. The explanation for this is to be found in the fact that the proposed planning theories are limited in their understanding of what actual planning practice is required, and instead are rooted in a form of instrumental rationality that privileges normative prescriptions of what planners should do.

Adult Education, Economy, and Society

A full appreciation of adult education and learning requires that they be seen in their socioeconomic, political, and cultural contexts. In a historical perspective, the idea of modernization provides an insight into the changing institutional realities and conceptual meanings of adult education and learning. For example, literacy education was needed to enable modern societies and a condition for socioeconomic development while popular and community education have had a perspective of social, cultural, and political self-articulation as well as social and political struggle (ibid). Further, recent stress on continuing-skills upgrading reflects changes in the reproduction of labor. Traditionally, skills upgrading occurred when younger more skilled workers replaced retiring workers. In the new economy, this is no longer a sufficient process to secure economic survival. Thus, contemporary policies on and approaches to adult education are driven by the expected role of adult learning in human-capital formation, particularly for the so-called knowledge economy.

While considering how different societies are responding to the stress of a globalized knowledge economy, we should remember Martin Carnoy's point that there are crucial differences in what adult education attempts to do and can do in different social-political structures. He states (Carnoy, 1995: 3):

Ultimately, these differences depend heavily on the possibilities and limits of the state, since it is the state that defines adult education and is the principal beneficiary of its effective implementation. These possibilities and limits of the state are, then, a key issue understanding the form and content of adult education.

Carnoy's point helps understand the importance of situating the present discussion on skills in the political economy of adult education and to take account of the social construction of skills. It also foregrounds the political purpose of adult education which becomes evident when juxtaposing adult education and nation building. The region of the Southern African development community provides an illustrative example of how adult education and nation building is influenced by local regional and global developments (Carnoy, 1995).

The political will of government is reflected in the extent to which, as well as how, adult education gets funding, the balance between public and market-driven funding mechanisms, and how this reflects on the social justice and distributional aspects of adult education and learning. Concerned about the latter, adult educators have critiqued the dominance of a strong market approach and governments' reluctance to address market failures in the learning market. In response to the dominant political economy, driving adult education there has been a revival of adult education for civil society which further illustrates of how socioeconomic, political, and cultural context inform the formation of adult education. Adult education, for civil society, can in Gramscian terms (Adamson 1980; Boggs 1976), be understood as a struggle to build a counter hegemony to the dominant discourse on adult education and learning. In countries affected by the collapse of the totalitarian communist states, or being freed from other forms of dictatorship, it is also a response to the need for a new form of citizenship.

There are particularly three aspects of justice with regard to adult education that concern adult-education scholars, class, gender, and race and ethnicity. Understandings of class have been central in explaining inequalities of opportunities, standards of living, and widening disparities between rich and poor. From an adult-education perspective, two issues stand out. First, how are adult education and learning practices linked to the globalized nature of capitalism and second, the operation of a distinctive working-class learning style (ibid). Similar questions are asked by feminist scholars engaged with gender analysis. Gender analysis that can reflect different theoretical perspectives is shaped by its history and provides a strategy for research process and strategic initiatives to address inequalities (ibid). Like class and gender, race and ethnicity play a major role in structuring society and the opportunities it provides. Reviews of the literature reveal somewhat surprisingly that the way race has been socially constructed has remained stable over the last 50 years. Further, it is noted that it was not until the last 15 years that the issue of race was given an in-depth analysis in the adult-education literature (ibid).

Field of Study

Since adult education began to emerge as a field of study in the late 1920s, it has undergone three quite distinctive phases. These phases are most noticeable in the USA, which to a large extent has come to define the nature of the scholarly field, but they are also clearly discernible in Europe and to a lesser extent in some other parts of the world.

As the demand for trained instructors to teach the large number of immigrants grew, a few US universities

began offering specific courses on how to teach adults, starting with the University of Columbia in 1922 (Milton *et al.*, 2003). Quite soon, graduate programs began to emerge. The first began at Teachers College at Columbia University in 1930, and by 1964, 16 universities in the USA offered master and doctoral programs in adult education (Houle, 1991). A similar development took place in the UK, in departments of extra-mural studies offering university courses, where adults developed an interest in adult-education research and in 1926, the first chair in adult education was established at the University of Nottingham (Hake, 1994).

With a small but growing number of adult-education programs, faculty started to focus on how to generate a body of knowledge that would help in the growth of the evolving field. Guided by funding from the W. K. Kellogg Foundation, the Commission of Professors in the USA set out to define the conceptual foundations of adult education (Jensen *et al.*, 1964). Officially titled, *Adult Education: Outlines of an Emerging Field of University Study* and published in 1964, their work has come to be known as the Black Book. This publication can be seen as ushering in the second phase of adult education, characterized by a major expansion of graduate programs and the coming of age of adult education as a field of study. Between the release of the Black Book and the publication of its follow up, *Adult Education: Evolution and Achievements in a Developing Field of Study*, in 1991, the number of adult-education graduate programs in the USA increased from 16 to 124 (Houle, 1991). Another indication of the growing knowledge base of adult education was the launch in 1969 of the yearly American Adult Education Research Conference (AERC) and the development of *Adult Education Quarterly* – arguably, the preeminent journal in the field.

Similar developments took place in Canada and in parts of Europe. In the former, the first graduate program was established at the University of British Columbia in 1957 and by the late 1980s, there were ten graduate programs in the country (Selman and Dampier, 1991: 255). In the UK and Germany, the number of departments of adult education increased, first slowly in the 1950s and 1960s, and thereafter more frequently in the 1970s and 1980s. Sweden, with a very long tradition of adult education, introduced special funding for adult-education research at the end of the 1960s, and university programs and chairs sprang up in Finland, the Netherlands, Germany, France, Poland, the former Yugoslavia, and somewhat later in several other European countries. In 1991, the European Society for the study of adult education was formed.

In other parts of the world, particularly in the developing countries, the process begun later and many countries are in what can be seen as the first phase. This is the case in several African and Latin American countries. In some instances, like in Brazil, there is an

acceleration of programs and departments specializing in adult education. In China, the first MA program was launched at East China Normal University in 1993 and a PhD program in 2004. In 2008, China reports to have some 100 specialized institutions for adult-education research and is moving into what can be seen as the second phase.

The 1991 review of the evolution and achievements in the developing field of adult education (Peters and Jarvis, 1991) can be read as a summary of situation in North America and Northern Europe at the end of phase 2. The book paints a very positive picture noticing the significant expansion in the knowledge base, lessened dependency on related disciplines, broadening of research methodologies, exponential growth of graduate programs, and that the field has become more internationalized. Based on the achievements so far, the book ends on a positive outlook and with expectations of continuous growth and solidifying of the field of adult education over the coming 25 years. While there does not exist any comprehensive review of what has happened, since the 1991 book, there are several indications that the field of study has not progressed as anticipated and that it has entered into a new phase in its development. In North America and those parts of Europe where the field had expanded and matured during the second phase, the last two decades have not seen a continuing growth in specialized adult-education departments. Instead, the trend has been to amalgamate adult-education programs with other areas into larger departments or in some instances to close them down. These developments have been driven by a combination of forces external and internal to the field of adult education. First, the amalgamations have been part of a general restructuring of university departments into larger structures, which tends to hamper the building of a field of adult education as foreseen under phase 2. Second, the embracement of the principle of lifelong learning also weakens the ambition of building a separate field of adult education. Third, with workplace learning being by far the fastest-growing area of adult-education practice, adult-education researchers have increasingly come to be engaged in research on workplace learning. Over the last decade, workplace learning has increasingly taken on the shape of an alternative field with its own journals and scholarly conferences. While this development can weaken the field as adult educators break out of the traditional boundary of their discipline, it also provides an opportunity to strengthen the field as researchers from other disciplines are encouraged to break into adult education. The focus on the so-called knowledge economy has stimulated other disciplines, economics, sociology, organizational sciences, etc. to engage with issues that traditionally would have been seen to fall under adult education. Fourth, as in other fields of education, there is a general shift away from more pure fields and disciplines

and a move to organize the knowledge-generation process around cross-cutting themes like gender, immigration, etc. that are approached from an interdisciplinary or multidisciplinary stand. In this environment, adult-education scholars increasingly develop multiple alliances housed in different academic fields.

Tensions Within the Field of Study

Since adult education embarked on expanding its knowledge base, two issues have continued to cause tension: its relationship to other disciplines and link between practice and theory.

The Black Book was organized around the understanding that:

Adult education develops a unique body of knowledge suited to its purposes through two methods of procedures:

- (1) Experiences gained from coping with problems of practice lead to the formulation of principles or generalizations which provide guides for future practice.
- (2) Knowledge which has been developed by other disciplines is borrowed and reformulated for use in adult education. (Jensen, 1964: 105)

The Black Book allocates a chapter each to scrutinize how adult education can borrow and adopt knowledge, theory, and research traditions from the disciplines of sociology, social psychology, psychology, history, and organization and administration. As the field matured, the position presented in the Black Book began to be questioned. Instead of relying on other disciplines, the trend, particularly in the USA, was to primarily rely on adult-education literature (Boshier and Pickard, 1979). To build too closely on other disciplines was seen by some as a threat to the development of an adult-education knowledge base (Boyd and Apps, 1980; Kranjc, 1987). Some went as far as Plecas and Sork (1986) who argued against copying scholars in other disciplines and for adult-education scholars to remain focused on research that is closely related to well-established definitions of adult education. However, while warning adult educators to be cautious in their borrowing, it was generally recognized also within the US adult-education community that much could be learned from other disciplines (Peters, 1991). Outside the USA, the push toward a clearly defined field of adult education was, with a few exceptions like the former Yugoslavia, less strong. Here, the dominant position has been that other disciplines can provide the conceptual apparatus for a better understanding of the structure, the functioning, and problems of adult education as scholars worked to strengthening research on the education of adults rather than building a distinct field of study. A good example of this can be found in the German series *Handbuch der Erwachsenenbildung* where the first

volume appeared in 1974. Of special interest are vol. 3, *Anthropologie und Psychologie des Erwachsenen* (Zdarzil and Olechowski, 1976) and vol. 6, *Sociologie der Erwachsenenbildung* (Eggers and Steinbacher, 1977).

The second issue in the field of study stems from the fact that knowledge production in adult education has overwhelmingly been shaped by a stress on practicality. Consequently, the dominant view has been that theory is deemed useful only to the extent that it improves practice. Using this criterion, there has been a constant criticism of the limited relevance of the research enterprise for the practice of adult education. There are very varied views on the cause and remedy of the problem. One camp of adult-education scholars has argued that research has been influenced too much by the rituals of science and not enough by the needs of the learners, while others take a diametrically opposite position seeing the lack of influence being a consequence of research having concentrated too much on applied problems (Cevero, 1991: 26). Sork and Cafarella (1989) suggest that the gap, which has been present since the outset of adult education becoming a field of study, was widening rather than shrinking. This could be an outcome of the calls, during the late 1970s, for the field to become more theoretically sophisticated so that it might gain more respect in the scholarly world. In a response to this call, university departments of adult education began recruiting new faculty, into adult education, who often had less connection to the field of practice than the outgoing faculty.

Concern about the usefulness of adult education research is still flourishing today. However, not only practitioners in the field but also policymakers voice their disappointment. Thus, it is interesting to note that the criticism of adult-education research for a lack of usefulness is a dominant theme in the national reports from developing as well as developed countries prepared for the 2009 UNESCO CONFITEA meeting. Developing countries point to the need for research to more directly support initiatives focusing on reducing poverty, addressing HIV, and the strengthening of women's role, while developing countries talk about the need for knowledge to support evidence-informed policy agendas. The European summary report to CONFITEA speaks of the need "for a research interface to promote the use of research results in policy development and implementation" (Keogh, 2008: 10). The Arabic Summary report notes the lack of research dealing with literacy (Yousif, 2009) while the report from Latin America (Torres, 2009) speaks of the lack of dissemination of adult-education-research results outside academic circles. While we have to remember that the national reports have been produced by governments, in many cases in cooperation with the adult-education community, they reflect a special understanding of the relationship between research and practice and policy.

Concluding Comment

As evident from this wide-ranging overview of theories, policies, practices, institutions, and scholarship in adult education and learning, the field is very broad and does not allow itself to be neatly organized within strict boundaries. While scholars are engaged in heated debates on what constitutes the field of adult education and/or how the scholarly field should evolve, adult learning has become a way of life for one-third to 50% the population in the industrialized world and is increasingly spreading in the developing world. When responding to these challenges, practitioners, policymakers, as well social activists can fall back on a rich history of practice and scholarship in adult education.

Adult learning is a phenomenon at once deceptively simple, yet enormously complex. It is simple because we know that learning “is of the essence of everyday living and of conscious experience; it is the process of transforming that experience into knowledge, skills, attitudes, values, and beliefs” (Jarvis, 1992: 11). However, it is also complex because there is no one definition, model, or theory that explains how adults learn, why adults learn, or how best to facilitate the process. Yet the learning of adults is the key theme that unites the otherwise widely disparate field of adult education. Whether in community-based literacy classes, training sessions in corporate settings, or continuing professional education seminars, practitioners share the common goal of facilitating adult learning. Rather than a single definition or description of adult learning, what we have is a colorful mosaic of theories, models, sets of principles, and explanations that, when combined, form the knowledge base of adult learning.

Until the mid-twentieth century, what we knew about adult learning was embedded in studies by behavioral and cognitive psychologists, studies that focused on problem solving, information processing, memory, intelligence, and motivation. Much of this research was conducted in laboratory settings, and if adults were included, what was of interest was how advancing age affected the learning activity. Thorndike *et al.*'s (1928) *Adult Learning* published in 1928 is an example of this early research. This book reports the results of adults being tested in a laboratory under timed conditions on various learning and memory

tasks. The authors concluded that adults aged between 25 and 45 could learn “at nearly the same rate” as 20-year-olds (p. 178). Research in the 1940s found that when time pressure is removed, adults up to age 70 did as well as younger people.

Adult learning from a psychological, and in particular a behaviorist perspective shaped adult learning research and theory building in North America until the late 1960s when other traditions and European influences broadened inquiry. We now know quite a bit about the individual adult learner, how context shapes adult learning, and how noncognitive factors play a role in adult learning. This article is thus organized into three sections, in a loosely chronological order, reflecting our growing understanding of adult learning. The first part of this article explores the foundational adult learning theories of andragogy, self-directed learning, and transformational learning. A second strand of theory building represents a shift in the focus of learning from the individual to the context in which learning takes place. The third section of this article presents the most recent additions to our understanding of adult learning. These perspectives go beyond the cognitive and include the role of emotions, body, and spirit in learning.

The Individual Adult Learner

By the mid-twentieth century, adult education was a recognized field of practice with its own professional

associations, journals, and conferences. Rather than extrapolating from research with children or research that placed adults under the same conditions as children, adult educators began to consider how learning in adulthood could be distinguished from learning in childhood. Humanistic psychology provided the philosophical underpinnings for three theories of adult learning, which have become foundational to the field of adult education – andragogy, self-directed learning, and transformational learning.

Andragogy

The European concept of andragogy was introduced by Knowles (1968) as “a new label and a new technology” distinguishing adult learning from children’s learning or pedagogy (p. 351). Probably the best-known set of principles or assumptions to guide adult learning practice, andragogy actually tells us more about the characteristics of adult learners than about the nature of learning itself. Knowles originally presented the following four characteristics or assumptions about adult learners:

1. As a person matures, his or her self-concept moves from that of a dependent personality toward one of a self-directing human being.
2. An adult accumulates a growing reservoir of experience, which is a rich resource for learning.
3. The readiness of an adult to learn is closely related to the developmental tasks of his or her social role.
4. There is a change in time perspective as people mature – from future application of knowledge to immediacy of application. Thus, an adult is more problem centered than subject centered in learning. (Knowles, 1980: 44–45).

In later publications, Knowles also suggested a fifth and sixth assumption:

5. The most potent motivations are internal rather than external (Knowles *et al.*, 1984: 12).
6. Adults need to know why they need to learn something (Knowles, 1984: 12).

Working from these assumptions, Knowles (1980) proposed a program-planning model for designing, implementing, and evaluating educational activities with adults. For example, with regard to the first assumption that as adults mature they become more independent and self-directing, Knowles suggested that the classroom environment be one of adulthood, both physically and psychologically. Adults who plan and direct their family, work, and community lives can also participate in their own learning by assisting in diagnosing their learning needs, planning and implementing learning activities, and evaluating those experiences.

At first heralded as the explanation of adult learning, andragogy underwent intense examination by educators

of both adults and children. It was recognized, for example, that some children and adolescents are independent, self-directed learners while some adults are highly dependent on a teacher for structure and guidance. Further, adults may be externally motivated to learn as when an employer requires attendance at a training program, and some children may be motivated by curiosity or the internal pleasure of learning. By 1980, Knowles had acknowledged that the dichotomy between andragogy and pedagogy was not as stark as originally drawn. A clear indication of his rethinking is represented in the subtitles of the 1970 and 1980 editions of *The Modern Practice of Adult Education*. The 1970 subtitle is *Andragogy Versus Pedagogy*, whereas the 1980 subtitle is *From Pedagogy to Andragogy*. He came to believe that there was a continuum ranging from teacher-directed (pedagogy) on the one end, to student-directed learning (andragogy) on the other, and that both approaches are appropriate with children and adults, depending on the situation.

Andragogy has been most severely critiqued for its assumption that the individual adult learner is autonomous and in control of his or her learning. Lacking is any recognition that both the learner and the learning that takes place are shaped by a person’s history and culture in conjunction with the institutional context where it occurs. Despite these critiques, practitioners who work with adult learners can intuitively connect with Knowles’ characteristics of adult learners and can see how they translate into concrete suggestions for program planning, instruction, and evaluation. More than 40 years after it was first proposed in North America, andragogy enjoys widespread recognition as one understanding of adult learning and a tested guide to working with adults in practice.

Self-Directed Learning

Appearing in North America about the same time that Knowles introduced andragogy, the concept of self-directed learning (SDL) also helped distinguish adult learners from children. The major impetus for this model of adult learning came from Tough’s (1971) research with Canadian adult learners. He found that 90% of the participants in his study had engaged in an average of 100 h of self-planned learning projects in the previous year and that this learning was deeply embedded in their everyday lives. The uncovering and documenting of SDL – learning that is widespread, that occurs as a part of adults’ everyday life, and that is systematic yet does not depend on an instructor or a classroom – has been a major contribution toward understanding and defining adult learning.

More than 35 years of research in North America and Europe on SDL has verified its widespread presence among adults, documented the process by which it occurs, and developed assessment tools to measure the extent of

individual self-directedness. Of these foci, the process of SDL speaks most directly to adult learning. How one actually moves through an SDL experience has generated a number of models of the process. The earliest models proposed by Tough (1971) and Knowles (1975) are the most linear, moving from diagnosing needs to identifying resources and instructional formats, to evaluating outcomes. Models developed in the late 1980s and 1990s are less linear and more interactive in which not only the learner, but the context of the learning and the nature of the learning itself are also considered. In the Danis (1992) model, for example, learning strategies, phases of the learning process, the content, the learner, and the environmental factors in the context must all be taken into account in mapping the process of SDL. The Spear and Mocker (1984) model considers the opportunities for learning found in one's environment, past or new knowledge, and chance occurrences. These opportunities cluster into the "organizing circumstance" which in turn, structures the SDL activity, and the "circumstances created during one episode become the circumstances for the next" (p. 5).

Yet another application of SDL is in instruction in formal educational settings. The most popular is the Grow (1991) model. He presents a matrix showing how four types of learners and four types of facilitators intersect with appropriate instructional methods. For example, a dependent learner (one who is not at all self-directed) is a good match with an authority or expert, and lecture and drill are appropriate instructional strategies. At the other extreme would be a highly self-directed learner, matched with a facilitator or delegator and instruction would be embedded in independent projects and discussions.

As with andragogy, SDL has proven to be a mainstay of adult learning theory. Recent applications of SDL include its role in lifelong learning and continuing professional education, how SDL can be acknowledged and incorporated into the workplace, and how being self-directed is one criterion for success in online learning environments (Merriam *et al.*, 2007).

Transformational Learning

The third contribution to adult learning that helped define what is different about learning in adulthood is transformational learning. Rather than focusing on the learner as andragogy and, to a large extent, SDL do, transformational learning is about the cognitive process of meaning making. It is particularly an adult learning theory because transformational learning is dependent on adult life experiences and a more mature level of cognitive functioning than found in childhood. The essence of transformational learning is that through sudden or dramatic experiences, people are changed in ways that they themselves and others can recognize.

Mezirow (2000) is considered the primary architect of transformational learning, although he readily acknowledges being influenced by the Brazilian educator, Paulo Freire. Freire (1970) emphasized the need for this type of learning to deal with oppression and to bring about social change. Mezirow (2000) focuses more on the process of individual transformation, a process that is personally empowering. Learning in adulthood is not just adding on to what we already know, although that is part of the story. It is also, according to Mezirow (1996: 162), "the process of using a prior interpretation to construe a new or a revised interpretation of the meaning of one's experience in order to guide future action." In short, learning is also making sense of our experiences. Learning can result in a change in one of our beliefs or attitudes, or it can be a change in our entire perspective. A perspective transformation is key to transformational learning.

Mezirow (2000) delineated a 10-step transformational learning process that is initiated by a disorienting dilemma – a life experience that cannot be accommodated by one's present worldview. This leads the adult to examine and critically reflect on the assumptions and beliefs that have guided meaning making in the past, but now are no longer adequate. From an examination of current beliefs, the learner moves to exploring new ways of dealing with the dilemma, often in conjunction with others confronting a similar crisis. It is in dialog with others that the learner tests out new assumptions, understandings, and perspectives. A plan of action is then formulated and put into motion. The new or transformed perspective is more inclusive and accommodating than the previous perspective.

Since the 1990s, transformational learning has moved center stage in terms of the volume of research and writing. Transformational learning conferences occurring every 2 years, with the most recent in 2007, have also contributed to the burgeoning knowledge base about this type of learning. Further, connections between transformational learning and adult development (Merriam and Clark, 2006), and transformational learning and spirituality (Tolliver and Tisdell, 2006), have expanded our understanding of adult learning and the meaning-making process.

In summary, andragogy, SDL, and transformational learning have come to define much of adult learning today. Both andragogy and SDL were instrumental in distinguishing adult learning from childhood learning at a time when the field of adult education was defining itself. They remain dominant in the real world of practice, perhaps because of their humanistic foundations and the fact that they capture what is popularly and intuitively understood about adult learning. Transformational learning, though powerful and emancipatory when it occurs, is more difficult to plan for, implement, and assess.

The Context of Adult Learning

Andragogy, SDL, and especially transformative learning theory focus on the individual learner; indeed, each has been critiqued for not recognizing how the context where this learning occurs also shapes the learning. Attention to context became prominent in the later decades of the twentieth century and remains central to understanding adult learning today. One perspective that attends to context draws from critical social science and related perspectives such as Marxism, critical theory, multiculturalism, critical race theory, queer theory, and feminist theory. What this literature has in common is the relentless questioning of power relations embedded in the structures of society. The focus is on the context of learning, not the individual learner. Through questioning and critique, the *status quo* is challenged, leading hopefully to social change.

More congruent with educational psychology is a second perspective that also shifts the focus from the individual to the context where learning takes place. Emerging from cognitive psychology and known loosely as situated cognition or contextual learning, learning cannot be understood as simply an individual, internal cognitive process; rather, learning is what is constructed by the interaction of people in a particular situation with particular tools or artifacts (including technology, language, signs, and symbols). Research (Lave, 1988; Lave and Wenger, 1991) has demonstrated that the context in which learning takes place is crucial to the nature of the learning, as are the tools in that setting, and the social interaction with others. Understanding human cognition means examining it in situations of authentic activity in which actual cognitive processes are required, rather than the simulated ones typical of school. Lave's (1988) experiments with grocery shoppers is a good example of the difference. Comparison pricing was found to be considerably more accurate in the activity of shopping (98% error-free) than in doing identical calculations on a paper-and-pencil test in the classroom (59% error-free).

The notion of situated cognition resonates well with what we already know about adult learning. Fenwick (2003) points out that one cannot separate the learning process from the situation in which it takes place. Knowledge is constructed in the context; it is "part of the very process of *participation* in the immediate situation" (Fenwick, 2003: 25; italics in the original). Learning takes place when people interact with the community (including its history and cultural values and assumptions), "the tools at hand," and the activity itself (Fenwick, 2003: 25). For example, in a recent study of Korean older adults in an intermediate computer literacy course, questions were asked about the cultural context of the course, the social-interaction patterns of the participants, the tools of the

setting, and how learning is constructed through the interaction of these elements (Kim, 2008).

Locating learning in the real-life experiences of adults has long been promoted as a good adult education practice. Schon (1987, 1996), for example, is noted for promoting contextually based reflective practice. Knowledge gained in school is not enough to make a reflective practitioner. One must also engage in the actual practice. Others recommend apprenticeships, internships, and practicums where one can learn through modeling, coaching, and trial and error.

An important component of situated cognition is entering into relationships with other learners, thereby becoming a member of a learning community. This learning community can be considered a community of practice (Lave and Wenger, 1991; Wenger, 1998). Communities of practice are groups of people who share insights and ideas and who help each other solve problems and develop a common practice. All people belong to communities of practice, whether through formal learning environments, civic organizations, or family structures. While most communities of practice do not have a name, they are quite familiar to us. We know who belongs. The concepts of practice are both explicit and tacit. It includes the language, documents, images, symbols, roles, procedures, regulations, subtle cues, rules of thumb, sensitivities, embodied understandings, underlying assumptions, and shared worldviews that are crucial to the success of the community. In a study of a community of practice of Wiccans, an earth-based faith group, it was discovered that learning was embedded in the rites and rituals of their practice; learning in practice was experiential, combined formal and intuitive knowledge, and was spread across the group (Merriam, *et al.*, 2003).

Communities of practice as a learning theory has extended the work on situated cognition. Situated cognition posits that learning is context bound, tool dependent, and socially interactive. These factors suggest looking at this type of learning from the perspective of a bounded system. A family, a classroom, a profession, an online community, a town, and a corporation can all be thought of as a community of practice, or a learning community. This approach contextualizes learning, uncoupling it from a preoccupation with the individual learner.

Emotions, Body, and Spirit in Adult Learning

The mind/body split so ingrained in Western notions of learning has dominated adult learning. In addition, learning has become so connected with schooling that the activity of learning is almost always framed from a rational, cognitive perspective. We learn through processing information in the brain. By the time we are adults, learning that is valued,

formal, and systematic is devoid of anything emotional or physical. However, some of the most recent research and theory building in adult learning are based on the premise that knowledge construction and learning can be through pathways other than those that depend on the mind. Scholars are now trying to explain and legitimize the role played by emotions, body, and spirit in learning.

Emotions and Somatic Knowing

Knowledge construction is more than a cognitive process of meaning making. In fact, there is little cognitive about this – rather, we know through our emotions and our physical body. Dirkx (2001) argues that learning itself is inherently an imaginative, emotional act and that significant learning is inconceivable without emotion and feelings. It is through emotions that deeply personal, meaningful connections are made so that really significant learning can take place. These connections are of two kinds. First, there is the connection to one's own inner experiences; "emotions are gateways to the unconscious and our emotional, feeling selves" (p. 69); second, "emotions and feelings can connect to the shared ideas within the world as well and are reflected in big words or concepts, such as Truth, Power, Justice, and Love" (p. 69). We learn to understand or make meaning of our experience through engagement with these emotions and the images they evoke.

Somatic or embodied learning is closely related to emotional responses in learning. In somatic knowing, we can learn through our bodies, as we do when we connect physical manifestations of stress to our psychological situation. Pert (1997) in fact argues that since receptors are found in the body's nerves of all kinds, it would then follow that emotions could be stored and mediated by parts of the body other than just the brain. "These recent discoveries are important for appreciating how memories are stored not only in the brain, but in a *psychosomatic network* extending into the body" (p. 141). In fact, the interconnectedness of body, brain, and emotions is itself receiving attention through the neuroscience of learning (Johnson and Taylor, 2006).

It is clear that a false dichotomy has been created by the Western philosophical bias that dissects the whole person into mind and body, limiting knowledge construction to what goes on in one's mind. Even physiologically, the mind, body, and emotions cannot be separated. Certainly, in our own real-life experiences of living and learning, we involve our emotions and our body at least as much as our intellect.

Spirituality and Learning

Part of the difficulty in considering spirituality in learning has been definitional. There is little consensus about the

boundaries of its meaning; the most writers can do is to define it as they are using the term. All agree that spirituality is not the same as religion, which is an organized community of faith; rather, spirituality is more about one's own beliefs and experience of a higher power or higher purpose. Spirituality is "about how we construct meaning, and what we individually and communally experience and attend to and honor as sacred in our lives" (Tisdell, 2003: 29).

Spirituality is connected to adult learning through the construct of meaning making. Aktouf (1992: 415) argues that "the human being is, by definition and necessity, a being whose destiny is meaning, intentions, and projects, a subject whose being is meaning and which has need of meaning." We are inveterate meaning makers. Tisdell (1999) makes several points about the relationship between spirituality, meaning making, and adult learning. First, educators should recognize that a search for or an acknowledgement of the spiritual in the lives of adult learners "is connected to how we create meaning in our relationships with others. It is in our living and loving. It is also connected with how we understand a higher power or a transcendent being" (p. 93). Second, adults come into our classroom with this agenda (meaning making), whether or not it is articulated. Third, meaning making is knowledge construction that uses images and symbols, "which often emanate from the deepest core of our being and can be accessed and manifested through art, music, or other creative work" (p. 93).

Those writing from this more holistic perspective on learning are not about promoting a particular form of embodied or spiritual learning. Rather, they are "committed to learning that makes a difference in learners' lives and increases their sense of knowing the content of the course in their heads, their hearts, their souls, and their entire being—that has meaning to them and makes a difference in the world" (Tolliver and Tisdell, 2006: 45). Journal writing, poetry, storytelling, myths, symbols, images, and even dreams can be used in an adult learning environment to foster a more holistic learning experience. Indeed, an entire volume of *New Directions for Adult and Continuing Education* is devoted to 'Artistic ways of knowing' (Lawrence, 2005). In this volume, authors speak to the use of art, music, poetry, photography, and drama to "extend the boundaries of how we come to know" (p. 3).

Summary

Learning in adulthood defies a simple explanation, and it is highly unlikely that there will ever be a single theory or explanation that encompasses all that we know now about adult learning. There is a substantial body of research and literature dating back to the early decades of the twentieth century where adult learning was conceived of as problem solving, memory, and information processing. From that foundation, adult educators began to differentiate adult

learning from pre-adult learning, a move that led to a focus on the adult learners themselves. Andragogy, SDL, and, more recently, transformational learning are the major distinguishing aspects of adult learning today.

In addition, our understanding of adult learning has been expanded to include consideration of the larger sociocultural and political context in which it takes place, and how the context itself both shapes and is an integral part of the learning transaction. The analytical tools of situated cognition and critical perspectives have allowed us to uncover how context shapes learning, as well as to critically assess and challenge the disparities in adult education and learning in particular social contexts. Finally, an even more holistic conception of adult learning acknowledges the role of emotions, body, and spirit in learning. These as well as other approaches to adult learning will continue to be investigated, contributing to our understanding of the complex nature of learning in adulthood.

Adult Learning and Instruction: Transformative Learning Perspectives

P Cranton, Penn State University at Harrisburg, Middletown, PA, USA

© 2010 Elsevier Ltd. All rights reserved.

Although adult education practice has a long history, the area only became recognized as a field of study and theoretical development in the 1930s. Lindemann's (1926) book was the first to have adult education in the title; he described adult education as cooperative, nonauthoritarian, and informal. Around the same time, the first adult education professional association was established, and we saw the beginning of the quest to understand adult learning as a distinctive process and efforts to develop teaching methods unique to working with adults. Transformative learning theory (first labeled in the mid-1970s and more fully developed by the 1990s) is described as the first comprehensive theory of adult learning.

Characteristics of Adult Learning

Throughout the 1970s and 1980s, considerable effort was put into describing adult learning as a distinctive process – different from children's learning in important ways. Tough (1979) conducted his classic survey in which he discovered that over 90% of adults engage in sustained independent learning projects. Cross (1981) and others worked to determine why adults participated (or not) in educational programs. Brundage and MacKeracher (1980) outlined the characteristics of adult learning and what those characteristics meant for program planning. Knowles (1975) presented his foundational work on adults as self-directed learners – a point of view which continues to influence our understanding of how adults learn.

At least seven broad themes can be drawn from the research and theory from those two decades – themes which are still relied upon today by adult educators in many and diverse settings: (1) Adult learning is often described as voluntary. Individuals choose to become involved in informal and formal activities in order to develop personally or respond to a professional or practical need. (2) Based on Knowles' influential work, adult learning is usually described as self-directed. Knowles (1975, 1980) saw self-directed learning as a process by which people identify their learning needs, set goals, choose how to learn, gather materials, and evaluate their progress; however, many other definitions and conceptualizations developed over time (e.g., see Candy, 1991). (3) Adult learning is seen as practical or experiential in

nature. This notion can be traced back to Dewey (1938) who, though not an adult educator himself, had a lasting and profound impact on the way we think about adult learning. (4) Adults are portrayed as preferring collaborative and participatory learning, largely due to the early influence of humanism on adult education practice (via the client-centered approach of Rogers (1961) and then Knowles who was a student of Rogers). (5) Adults bring rich experiences and resources to their learning – one of Knowles' (1980) defining characteristics of adult learning. (6) Since adults have often been away from formal schooling for some years (though this is less true today) and may have had negative early experiences with school, they are seen as reentering learning with anxiety and low self-esteem. (7) Adults have a variety of learning styles and preferences. One of the most influential theorists in this area has been Kolb (1984) who delineated the converger, diverger, assimilator, and accommodator learning styles.

In the 1990s and early 2000s, the trend in adult education toward critical theory, postmodernism, and poststructuralism has led researchers and theorists away from what is now seen to be overly simplistic and even stereotypical understandings of adult learning. Nevertheless, this foundational work permeates adult-education practice and continues to influence our theory development and research. Transformative learning is voluntary and under the direction of the learner, based on making meaning out of experience, collaborative (especially through dialog or discourse), and empowering.

Instruction for Adult Learning

Early adult education had social change as its goal (Lindemann, 1926). The Highlander Folk School in the United States and the Antigonish Movement in Canada are examples of approaches to working with adult learners to promote social action. Freire (1970), following in the radical tradition of adult education, proposed that dialogic and problem-posing strategies replace the banking model of education in which information was transmitted to the learner. However, in the 1970s and 1980s, humanistic approaches to teaching adults dominated the field and still maintain a strong influence on how we think about instruction for adult learning today.

Just as adult learning is seen to be distinct from children's learning, teaching adults is seen to be different from teaching children. Knowles (1980) distinguished between pedagogy and andragogy, first describing them as being diametrically opposed and later modifying his view to place them on a continuum. Essentially, pedagogy was seen to be more teacher-centered and andragogy more learner-centered. How-to books on teaching adults abound. Following Knowles' lead, most of these books take a humanist approach to teaching adults. Elias and Merriam (2005) outline six basic assumptions underlying humanism:

1. human nature is naturally good;
2. human beings strive for freedom and autonomy;
3. the individuality and uniqueness of each person is valued;
4. working toward self-actualization is an innate human goal;
5. each person perceives the world in his or her own way; and
6. people are responsible for developing their potential to the fullest.

Teaching from a humanist perspective puts the educator in the role of a facilitator rather than a provider of information. She creates the conditions in which learning can occur and trusts the learner to take responsibility for learning. This sets up a student-centered environment in which the growth of the whole person (the development of self-actualizing persons) is a goal. Learning is a personal process; motivation is intrinsic. Yet, self-development and learning do not occur in isolation. Humanist educators value collaboration and group work over competitive endeavors, or put another way, connected knowing over separate knowing (Belenky and Stanton, 2000).

Moving into the 1990s and 2000s, humanist approaches to teaching adults remain strong, especially in practice, but are being challenged primarily as a result of the increasing popularity of critical theory as a foundation of adult education. Brookfield (2005) calls on us to unmask power, challenge ideologies, and radicalize criticality. Although ideology critique originated in the 1970s in the Frankfurt School of Critical Social Theory, it is more recently that it has been brought to bear on teaching adults. Ideologies are values, beliefs, and assumptions that have been uncritically assimilated and believed to be true without question. They appear in our social norms and expectations and in the way we use language.

Teaching for transformation stands in both perspectives. It is humanist in its goals of self-development and freedom from constraints and oppression, and it is critical in its goal of ideology critique. Brookfield (2000) writes that an "act of learning can be called transformative only if it involves a fundamental questioning and reordering

of how one things or acts. If something is transformed, it is different from what it was before at a very basic level" (p. 139). Newman (2006) writes about teaching rebelliousness, defiance, and action. He describes critical learning (transformative learning) as both a personal endeavor and a political act. It helps us see "through ourselves" and "through others," as we become "less susceptible to hegemonic control" (p. 239). Newman rejects the teaching of what he calls domesticated critical thinking and proposes that we teach people how to resist (pp. 9–10).

Transformative Learning: Overview of the Theory

Transformative learning theory had its beginning in 1975 when Mezirow conducted a study of 83 women returning to college in 12 reentry programs. He described a process of personal-perspective transformation that included ten phases:

1. experiencing a disorienting dilemma,
2. undergoing self-examination,
3. conducting a critical assessment of internalized assumptions and feeling a sense of alienation from traditional social expectations,
4. relating discontent to the similar experiences of others,
5. exploring options for new ways of acting,
6. building competence and confidence in new roles,
7. planning a course of action,
8. acquiring the knowledge and skills for implementing a new course of action,
9. trying out new roles and assessing them, and
10. reintegrating into society with the new perspective.

It was Mezirow's 1991 book, *Transformative Dimensions of Adult Learning*, that brought the theory to the forefront of the adult-education literature. Since then, Mezirow and others in the field have continued to elaborate on and provide alternative explanations of transformative learning. Here, an overview of the basic theory from Mezirow's (1991, 2000, 2003) perspective is provided, and then in the following section, other theorists' points of view are presented. The author's own writing is drawn upon (Cranton, 2006) in this discussion.

Transformative learning is a process by which previously uncritically assimilated frames of reference (assumptions, expectations, and habits of mind) are questioned and revised to make them more open, permeable, and better justified. Experiences are seen through the lens of our frames of reference, which include distortions, prejudices, stereotypes, and unexamined beliefs. When we encounter a perspective that is different from the one we hold, we may

be provoked into critically questioning our current thinking. This can happen as a product of a single event or as a gradual cumulative process. The learning only becomes transformative when we make a deep shift in how we see ourselves and/or the world around us and act on the revised perspective.

Several types of meaning structures come into play in this process. A frame of reference is a meaning perspective, the structure of assumptions and beliefs that provide a lens through which we make meaning of our experiences. A frame of references has two dimensions: a habit of mind, which is composed of broad, generalized, predispositions for interpreting experience; and a point of view, which is comprised of sets of immediate, specific expectations and beliefs that shape a specific interpretation (Mezirow, 2000).

Mezirow (2003) sees discourse as central to transformative learning. Discourse is defined as a form of dialog that involves the assessment of beliefs, feelings, and values. The ideal conditions of discourse are that participants have accurate and complete information, are free from coercion, are able to weigh evidence, are open to alternative perspectives, are able to engage in critical reflection, have an equal opportunity to participate, and are able to accept informed consensus as valid.

Habits of minds can be of different types. Originally, Mezirow (1991) wrote about epistemic perspectives, those that have to do with knowledge and the way we acquire knowledge; sociolinguistic perspectives, related to social norms, cultural expectations, and the way we use language; and psychological perspectives, which have to do with how we see ourselves – self-concept, needs, inhibitions, anxieties, and fears. Later, he added three more types of habits of mind: philosophical, which can be based on a worldview, philosophy or religious doctrine; esthetic, including values, attitudes, tastes, and standards about beauty; and moral–ethical, which incorporates conscience and morality (Mezirow, 2000).

Beliefs, assumptions, values, and habits of mind can be undeveloped or unquestioned. We absorb the way we think about ourselves and the world around us from our family, community, peers, and from the social world we live in. In each of the types of habits of mind, unexamined perspectives are insidious and often do not even appear as questionable. We may become aware of unexamined perspectives through a disorienting dilemma – an experience which contradicts our assumptions. As discussed in the last section of this article, educators may consciously create learning experiences that are potentially transformative.

Critical reflection and critical self-reflection are central to transformative learning. Critical reflection involves objective reframing of the assumptions of others, and critical self-reflection involves the subjective reframing of our own assumptions. Reflection alone is not enough to label learning as transformative. It must lead to revised frames of reference upon which individuals act.

Perspectives on Transformative Learning

Mezirow's theory of transformative learning was criticized on several grounds: for its failure to address social change (Collard and Law, 1989), the neglect of power issues (Hart, 1990), the disregard for the cultural context of learning (Clark and Wilson, 1991), the overemphasis on rational thought (Dirkx, 1997), and the prominence of separate or autonomous learning (Belenky and Stanton, 2000). These critiques and others that followed, along with Mezirow's call for people to contribute to and elaborate on the theory, led to the development of a variety of perspectives on transformative learning.

Connected Knowing and Transformative Learning

Relational or connected learning and knowing are often associated with women's ways of learning (e.g., see Hayes and Flannery, 2000). Belenky and Stanton (2000) use connected knowing as a basis for adding to transformative learning theory. They describe six developmental stages of knowing for women: silenced, received knowers, subjective knowers, separate knowers, connected knowers, and constructivist knowers. They suggest that Mezirow's approach to transformative learning places separate knowing (following lines of reasoning and looking for flaws in logic) in a central role and argue that connected knowing also serves well to describe transformation. Connected knowers suspend judgment and struggle to understand others' points of view from their perspective. They look for strengths, not weaknesses in another person's point of view. The goal is to see holistically rather than analytically.

Social Change as Transformative Learning

Social reform has long been a goal of adult education, and those critics who see Mezirow as neglecting the social change aspect of transformation suggest that social reform needs to precede individual transformation. Mezirow (2000) distinguishes between educational tasks (helping people become aware of oppressive structures and learn how to change them) and political tasks (forcing economic change). It is his goal to help individuals learn how to create social change rather than to create social change himself. Others see this differently.

Brookfield (2003) proposes that the purpose of transformative learning is ideology critique, a process that helps "people uncover and challenge dominant ideology and then learn how to organize social relations according to noncapitalist logic" (p. 224). He holds that transformation includes not only the individual's structural change, but also structural change in the social world. Similarly,

Newman (1994) emphasizes that we should study not the oppressed, but oppression itself. Writers and theorists who advocate social change as a goal of transformative learning (and adult education as a whole) do not dismiss individual learning and transformation, but see it as the educator's goal to address the social context within which individuals live and learn.

Group and Organizational Transformation

The idea that groups and organizations could transform in a collective way began with the notion of a learning organization in which organizations are perceived as living entities that can learn. Watkins and Marsick (1993), in their now-classic work on learning organizations, made the link to transformative learning. Yorks and Marsick (2000) have continued with this line of thinking, basing their work on action learning and collaborative inquiry. Action learning involves teams working on real problems within the organization, and collaborative inquiry consists of repeated episodes of reflection and action in a group context. In this way, organizations transform in relation to the nature of the environment, the vision or mission of the organization, products and services of the organization, management styles and procedures, organizational structure, and individual organization members' perception of their roles.

Groups other than organizations are also seen to have the capability to transform. Kasl and Elias (2000) suggest that individuals, groups, and organizations all share common characteristics and that there can be a group mind. In this approach to transformation, frames of reference are transcended rather than analyzed through critical reflection, and transformative learning becomes an expansion of consciousness that is collective as well as individual. The notion of group transformation does not supplant individual transformation, but simply adds another possible dimension to it.

Intuition, Imagination, and Soul in Transformative Learning

One of the most popular elaborations on Mezirow's cognitive and rational approach to transformative learning is the addition of intuition, imagination, and nurturing soul. Many of the new writers in the field are drawn to this way of understanding transformation as can be seen in the large proportion of paper presentations and experiential sessions, at the International Transformative Learning Conference (Wiessner *et al.*, 2003), that are based on artistic, creative, and imaginative points of view.

This perspective began with the work of Boyd (Boyd, 1991; Boyd and Myers, 1988) who used Jungian psychology to explain transformative learning. Rather than reflection, they described discernment as the central

process in transformation. In this view, transformation is a personal inner journey of individuation – learning through the psychic structures that make up the self.

It is Dirkx's (1997, 2001) writing that has carried this approach forward into the current literature on transformative learning, providing a theoretical foundation for the many people who use drama, art, music, images, poetry, and symbols to promote transformation in their practice. In Dirkx's view, transformative learning involves personal, spiritual, emotional, and imaginative ways of knowing – the way of mythos rather than logos. Mythos is a facet of knowing that we see in symbols, images, stories, and myths. We experience soul through art, music, and film; it is that magic moment that transcends rationality and gives depth, power, mystery, and deep meaning to learning. In nurturing soul, we pay attention to the small, everyday occurrences in life, understand and appreciate images, and honor the complex, multifaceted nature of learning.

The extrarational perspective on transformative learning can exist side by side with the rational perspective. When Dirkx and Mezirow discussed their approaches at the 2005 International Transformative Learning Conference, they agreed that their perspectives are "similar with respect to [their] mutual concern for transforming frames of reference that have either lost their meaning or usefulness or have in some way become dysfunctional. [They] are both interested in fostering enhanced awareness and consciousness of one's being in the world" (Dirkx *et al.*, 2006: 137).

Ecological View

Some theorists broaden the scope of transformative learning to span individual, relational, group, institutional, societal, and global perspectives (O'sullivan, 2003). The Transformative Learning Centre at the Ontario Institute for Studies in Education promotes this point of view as does the Holma College of Integral Studies in Sweden (Gunnlaugson, 2003). Transformative learning is a deep, structural shift in the basic premises of thoughts, feelings, and actions. It dramatically and permanently alters our way of being in the world and involves not only our understanding of ourselves but also our relationship with all of humanity and the natural world. Through transformative learning, we strive for a planetary community, learn to love life in all forms, and move out to universal horizons. Gunnlaugson proposes that we need to consider "our collective evolutionary destiny from the vantage point of the history of planet Earth" (p. 324).

Teaching for Transformation

Less has been written about how to teach in such a way as to promote transformative learning than has been written about the learning process. It is proposed that there are

three fundamental aspects to teaching for transformation: empowering learners, fostering critical reflection and self-knowledge, and supporting learners (Cranton, 2006).

Empowering Learners

Empowerment is both a product of and a precondition of transformative learning. As Mezirow (2000) says, “Hungry, homeless, desperate, threatened, sick, or frightened adults are less likely to be able to participate in discourse to help us better understand the meaning of our own experience” (pp. 16–17). Those educators hoping to promote transformative learning need to be conscious of helping learners feel empowered. There are at least three aspects to consider: (1) exercising power responsibly, (2) encouraging discourse, and (3) involving learners in decision making.

As Brookfield (2006) reminds us, teachers have power, and we cannot deny its existence or think we can give it away. Exercising power responsibly and consciously serves to create learner empowerment – power is to be shared and acknowledged among those present in the teaching environment. A variety of practical strategies can be used, for example, avoiding being in the position of providing right answers, making sure that there is equal access to all resources, including self-evaluation in graded courses, involving students in managing the learning environment, and being open and explicit about what is happening and why.

If discourse or dialog is central to transformative learning, helping learners be empowered needs to include this element of the process, especially as equal participation in discourse may not occur naturally. Educators need to find provocative ways to stimulate dialog from different perspectives, encourage learners to take on different roles in the dialog, be careful not to regulate the discussion or dismiss learners’ contributions, and provide time for reflection.

Involving learners in decision making, a strategy which harks back to Knowles’ and others’ advocating self-directed learning, enhances feelings of empowerment. Educators can use participatory planning in which learners decide on some or all of the topics, provide choices of methods to be used in the learning, encourage self-evaluation, ask learners for their perceptions of the experience, and keep the decision-making process open and explicit.

Fostering Critical Self-Reflection and Self-Knowledge

The most an educator can do is to set up an environment and conditions in which learners are able to engage in critical reflection and critical self-reflection. Entering into this process is voluntary; to approach it otherwise is

ethically questionable. A variety of ways are suggested to create such an environment, all of which are based on the goal of opening up new perspectives, challenging existing assumptions, or presenting information from a different point of view (Cranton, 2006).

Asking questions is the most basic strategy for fostering reflection. Educators can ask learners to help them see what assumptions they are making and to challenge the premises underlying their assumptions. Questions can center on the content of individuals’ beliefs, how they came to hold those beliefs, and why they value what they value (content, process, and premise-reflection questions, as suggested by Mezirow (1991)).

Journals are often suggested as a means of promoting critical reflection, but guidelines need to be given to learners to prevent the journal from being a simple log of what happened. Proffitt’s (1992) extensive work on journal writing is helpful. He suggests a variety of formats including writing a life history; engaging in a dialog with a person in the writer’s life or a historical figure; incorporating metaphors, dreams, and images; and writing from the perspective of another person.

Experiential learning through practicums, field trips, service learning, job shadowing, and any other real-life experience that can be incorporated into a course can stimulate critical reflection if the learner encounters perspectives that are different from those he or she holds. To further the possibility of critical reflection, the educator can hold discussions before and after the experience, suggest students write about the experience, encourage critical questioning among students, and emphasize any discrepancies between learners’ prior experience and the new experience.

Art-based activities promote imaginative and intuitive transformative experiences. Learners can either engage in the creation of art or they can view art. Some strategies the educator can consider are: creating collages as a group; encouraging students to make art as a project in a course; using film, fiction, and photography to present alternative points of view on an issue; or going to an art gallery or concert as a group.

Supporting Transformative Learning

In transformative learning, people are letting go of assumptions, beliefs, and perspectives that they may have held for a lifetime. Scott (1997) writes about the grieving involved in letting go of our way of seeing the world. The educator who fosters transformative learning has a moral responsibility to provide and arrange for support. He or she needs to establish relationships with learners and be conscious of what is happening in their lives when they engage in transformative learning.

This is not to say that the educator is solely responsible. Encouraging learners to support each other by

helping to establish a cohesive group and setting up learner networks (formal or informal, with or without technology) are helpful strategies. However, it is also important to be there when an individual learner comes to the educator for advice and support. Even after a course is over, there are occasions when someone needs assistance in deciding how to act based on a transformative learning experience or simply needs to talk about his or her experience.

Summary

Since Mezirow (1975) first proposed his notion of perspective transformation more than three decades ago, transformative learning theory has developed into a comprehensive theory of adult learning. In recent years, with the addition of several alternative perspectives, it has become a holistic and integrated way of understanding how adults experience deep shifts in perspective. In this article, transformative learning theory has been set in the larger context of adult education. The original theory as presented by Mezirow (1991, 2000) is described and the major ways in which other theorists have elaborated on his work are presented. It concludes with a discussion of how educators can facilitate and promote transformative learning.

Adult Learning in a Biographic Perspective

L West, Canterbury Christ Church University, Canterbury, UK

© 2010 Elsevier Ltd. All rights reserved.

Glossary

Auto/biographical – Being aware of the extent to which we use other's stories to make sense of our own biographies as well as how we use our own to make sense of others' lives and experiences.

Biographic perspectives – Using other people's lives as a basis for understanding processes of learning, and so on.

Lifewide and lifelong learning – The idea that learning, in and across all dimensions of experience, past and present, can interconnect. Learning, in these terms, may be conceived as a psychological orientation to experience, the tendency to be relatively open to new experience, or, at another extreme, to fear and resist it. This can be rooted in early experience and the quality of our interactions with others.

Narratives – These are important in a biographic perspective. We experience our lives through some conception of past, present, and future. Such frames help bring some coherence to the fragments of experience. Biographic researchers often pay great attention to the qualities of people's narratives.

Poststructuralist – The emphasis here is on what is seen to be the pervasive power of language and power-knowledge formations to shape how we think and make sense of the world, including of ourselves.

Psychosocial – An interdisciplinary perspective in studies of adult learning, which is not only sensitive to how society and culture can structure the way we think and feel about the world, but also how our psychologies have a life of their own. There is an interest in how psychoanalytic insights can contribute to an understanding of inner and outer dynamics in people's encounters with learning.

Introduction

This article focuses on the biographic perspective and how this can illuminate the nature and processes of adult learning in unique ways. It draws on a rich body of international research and scholarship, over two decades and more, which constitutes, in fact, a major turn to biography and life history in the study of adult learning.

This is part of a broader trend across the social sciences (West *et al.*, 2007). The trend is partly a reaction against forms of research (such as behaviorism) which tended to marginalize the perspectives and subjective experiences of learners themselves or reduced learning to overly abstract entities. It has also been a reaction to theories of learning that neglected the role of meaning making and the importance of agency in human development.

The label biographic is used, for present purposes, to encompass a family of research and scholarship, which can be known in varying ways; examples are narrative or auto/biographical research, which may have common yet distinct meanings. Terms like biography or life history can be used interchangeably and may also be understood in differing ways. In Denmark, for instance (West *et al.*, 2007), a distinction is made between biography as the told life, and a life history, in which the researcher brings his or her interpretations and theoretical insights into play. In this article, biographic perspective is used inclusively to encompass different members of the family, while remembering that each can have distinct as well as related characteristics.

Some History

Feminism and oral history have been important in the emergence of biographic perspectives on adult learning, especially in North America and parts of Europe. In continental Europe, however, influences vary: in Denmark, for instance, critical theory has played an important part in the development of biographical perspectives into learning processes, alongside psychoanalysis and feminism. For many biographical researchers, the biographic perspective, methodologically, reaches back to the Chicago School of sociologists and social psychologists of the 1920s. The Chicago School developed the notion of symbolic interactionism to capture the dynamic, malleable, constructed, and also learned quality of human identity and social formation. Symbolic interactionism treated the things that members of society do as being performed by them as actors, rather than as if done by something called the system itself. The social order, in short, is dynamically learned through and from the interactions of its members. This finds renewed resonance in contemporary ideas about the role of reflexivity or biographical learning being of central importance in the contemporary world.

Second-wave feminism in the 1960s was also important in the development of the biographic perspective in adult

learning, particularly in the United Kingdom, North America, and also in the French-speaking world (Dybbroe and Ollagnier, 2003). Feminism was concerned with the pervasive influence of gender in people's learning lives in positioning both women and men in particular ways. Feminism and feminist research were committed to the idea of giving voice to women previously hidden in educational research. An early biographic focus, unsurprisingly, was on women's experiences of education (Merrill and West, 2009). Writers and researchers were often mature women students themselves and brought gender and the personal directly into accounts of learning as part of a wider political project.

The biographical perspective has slowly increased in importance in the literature of adult learning and education. By the early 1990s, the proportion of papers at the Standing Conference of University Teachers and Researchers in the Education of Adults (SCUTREA, which is Britain's preeminent professional network for researchers in the field of adult and lifelong learning), concerned with life stories, narratives, transformations of selves, and struggles over identity, was increasing. In 1988, only two papers had used a biographical or narrative perspective – broadly defined – as a method; however, this was to become a mainstream preoccupation in the 1990s. There was evidence of a similar trend in the increased number of papers devoted to biographic perspectives in meetings such as the North American Adult Education Research Conference (AERC). The trend has continued (West *et al.*, 2007).

Notwithstanding, there has been resistance to the perspective too. Among researchers, for instance, who considered that such work lacked observational rigor and objectivity in its preoccupation with internal experience and meaning-making processes. For some historians, the perspective has been criticized for being overly obsessed with the detail of learners' lives, and insufficiently focused on big educational and social questions around, for instance, the nature of educational opportunity in a capitalist economic order. From a poststructuralist perspective, the preoccupation with learners' stories, as a basis for understanding adult learning, risks neglecting the way in which stories – of learning, but of lives more widely – are penetrated by powerful discourses that individuals may barely be aware of. The biographic perspective, in this view, carries the danger of neglecting how we are storied as well as storytellers in learning lives (Merrill and West, 2009).

Mapping the Field

Nonetheless, there is a rich range of biographic scholarship providing, as suggested, not only many unique insights into processes of adult learning, but also some

new theoretical developments and challenges to received wisdom. Researchers have focused not only on learning in traditional contexts, such as higher and adult education, but also on learning and identity building in professional and workplace settings as well as other diverse locations for informal learning. These include learning in families, community development settings, trade union engagements, relationships, and even cyberspace. Researchers are busy exploring the impact of learning on health and its place in therapeutic processes. The biographical perspective is being used to examine the relationship between learning, class, ethnicity, and gender. Researchers have also addressed many criticisms, which include the capacity of people in biographic research to be aware, reflexively, of how they may be positioned by dominant social structures and or discourses (Frosh *et al.*, 2005).

Biographic perspectives developed strongly in the Francophone and German-speaking as well as the Anglo-Saxon world. In French-speaking communities, the literature reaches back to the work of a preceding generation, such as Paulo Freire, Bertrand Schwarz, and Jack Mezirow. The biographic perspective here adopted critical approaches to recognize the adult learner on the basis of his or her life trajectory and personal story. He or she was conceptualized as an authentic knower, deserving respect for her/his learning efforts and her/his relationship to knowledge. There has been a fundamental challenge to the banking concept of learning and a celebration of human agency, not least in questioning a deeply patriarchal social order, through biographic forms of enquiry (Dybbroe and Ollagnier, 2003).

Pineau (2000) has explored the link between life history, autobiography, and self-directed learning. He has worked with homeless people and used the biographic perspective to build a fuller understanding of learning paths in such contexts. Guy de Villers, a psychoanalyst as well as an educator, has recently edited a book on the boundaries between life history and therapy, which is a source of major debate in the French-speaking life history networks in adult education and, for that matter, more widely (Niewiadomski and de Villers, 2002). For Pierre Dominicé, the biographic perspective has an educational function in its own right and can be used to analyze and better understand the experiences of learners. He stresses, through his concept of educational biography, how the biographic perspective potentially has great occupational importance in helping people understand their professional work and interactions with others: as adult educators and trainers, for instance (Dominicé, 2000).

Learning: Lifewide and Lifelong

At the heart of the biographic perspective, as noted, is a shift in focus from an exclusive preoccupation with

education in formal settings to learning in many and diverse places: formal, nonformal, and informal, and toward an engagement with the interplay between these different dimensions of learning. There has been movement from the idea of a distinct field of adult education, in defined settings, to a more diverse terrain of learning in many locations. Adult education as a field tended to be preoccupied with postcompulsory education and with particular categories of learners and learning. By contrast, the biographical perspective encompasses processes of knowing and skills acquisition, affective transformation, and experiential learning beyond the walls of schools, colleges, and universities. It includes informal, tacit, and emotional learning, alongside cognitive processes and encounters with more formal bodies of knowledge. It covers learning in intensely intimate as well as more public space, and the connections between these. Formal learning is but one part, if important, of a complex tapestry.

The biographic perspective has helped to reveal some of the complex interplay between formal, nonformal, or informal processes of learning. Conventional distinctions between public and private experience, or learning in schools and families, or between structured and everyday learning, tend to unravel. This has been illuminated, for instance, in studies of professional learning (West, 2001; Olesen, 2007). Linden West has focused on family physicians learning and working in difficult and demanding innercity contexts. Thus West is concerned to understand how informal processes of learning may interact with more formal aspects of a doctor's training as well as the culture and subcultures of the profession. He notes a continuing neglect, for instance, in medical culture of learning about self and emotionality in doctor's professional training and how doctors can come to feel emotionally on the edge when working in difficult social contexts. Disturbance in others – including mental illness – can come to disturb a doctor and incidents of stress, alcoholism, mental health problems, as well as suicide have been increasing among doctors. The sample of doctors in the biographic study, which lasted for 4 years, emphasized the importance of supportive relationships as well as of self-knowledge and cultural learning alongside scientific knowledge when working in multicultural, innercity environments. The study documented the subtle interplay of learning in personal life with professional practice, and how the particular subcultures of the doctor's surgery and interactions with colleagues can be vital in creating space to learn from difficult experiences with patients. Learning, in such a biographic perspective, is understood more holistically.

A New Paradigm of Learning?

The biographic perspective, in fact, may have helped forge a new paradigm of learning (Alheit and Dausien, 2007).

Learning, viewed biographically, seems conceptually close, for instance, to the idea of reflexivity, which has become a central preoccupation of mainstream social science. This is set within a postmodern awareness of the uncertainty and rapidity of social and technological change. Here is the territory in which the self becomes a reflexive project. The globalizing tendencies of the present have been regarded as ushering in profound changes in social life and personal experience, which require constant efforts to construct and sustain the self through narratives of self-identity, in a kind of perpetual process of learning.

Biographies themselves, from such perspectives, in their unpredictability, become essential, often profound sites for learning. The capacity to compose a biography and develop reflexivity (or what Peter Alheit calls biographicity; Alheit and Dausien, 2007) is considered to be a survival necessity in a more individualized, perpetually changing, paradoxical, risk-inducing culture. This is a culture, it is argued, of new opportunities, but those that coexist with biographical fragility: in a world that fuels the necessity and/or desire to compose ourselves in new and distinct ways while generating intense anxieties about our capacity to cope. Ours is a period that offers enticing opportunities to live more autonomous lives while generating doubt about the sustainability or even desirability of such a project.

People, it is suggested, are confronted with new knowledge and the need to make choices (e.g., about what we eat or in response to illness) almost everyday, without reference to undisputed sources of authority. Science, often considered the means by which we can seek guidance, is itself a site of dispute and contestation. This is a liquid, shifting world in which we have to learn to learn, in the sense of needing to be open to new and diverse possibilities, rather than rely on a past consumption of fixed bodies of knowledge, also remembering that many of the economic, social, and familial scripts which historically shaped people's lives have weakened. Existentially, we are more on our own and inherit a world of diverse competing versions of how we should live or be. Learning becomes, in these terms, a biographical necessity. On the other hand, we can retreat into a kind of antilearning: into fundamentalism in which we seek complete answers in a body of doctrine, yet close ourselves off to the complexities of experience and their potential as a source for learning, including from the other and otherness.

Peter Alheit and Bettina Dausien identify some distinct learning imperatives in such a world. First, the need to learn from biographical crises: the processes of individualism referred to above bring considerable risk of crises-ridden biographical development. The experience of the modern world, they suggest, can turn personal meaningfulness into a problem of principle. People may have to negotiate periods of unemployment alongside

employment; returning to school alongside participation in the labor market, as well as constant questions about who they are and might want to be in situations where relationships, at work or in private life, may be transient. Adult learning, in such a context, moves closer to therapeutic processes. Meaning, in Alheit and Dausien's perspective, is less and less guaranteed by an unquestioning participation of individuals in culture and society. Generating meaning, and meaningful lives, has become the province of subjects who may feel, structurally, thrown into the deep end. Learning, of necessity, takes on a quasitherapeutic dimension, as does the work of many educators.

Another dimension of adult learning is brought into sharper relief by the biographic perspective: the importance of composing life stories and of telling stories more generally. As intergenerational continuities weaken, it becomes more important to find ways to work out how we might want to live our lives, and on what terms, including which values to choose. Stories are critically important to this end. The biographic perspective, forged out of experiences in the women's movement, has constantly emphasized the importance of finding voice in struggles to learn, for agency and meaningfulness.

The biographic perspective may also problematize overly rigid notions of developmental stages in learning and human life. A well-known variant is the midlife crisis, which draws on Jungian ideas of how men, of certain ages, once competitive career-building pressures have abated, may seek more feminine, artistic, and expressive forms of learning. However, when predictable linear trajectories of school–work–retirement break down, the notion of quasifixed stages becomes questionable. Desire for and resistance to learning across the lifecycle may become much more complex and variable as we are forced, for instance, to relearn or radically change our identities in unexpected, undesired ways.

An Interdisciplinary Imperative

The biographical perspective has also engendered new forms of interdisciplinary, psychosocial understanding of learning and learners. These new developments seek to transcend old style disputes between structuralist sociology and essentialist psychology in the literature of adult learning. Adult learning was conceived, on the one hand, as a largely internal psychological process, dependent on dispositions, inherent motivations, and objectively measurable intelligence. The social and historical could largely be excluded from the frame (Tennant, 1997). On the other hand, there was great resistance to such ideas, especially in more radical and oppositional theories of adult learning. In the British tradition, for instance, there was criticism of what was seen to be a mainly North American tendency to overly psychologize the human

subject and learning processes, and to reduce sociocultural forms of oppression to matters of individual pathology (Tennant, 1997). On the other hand, more radical, structural perspectives on adult learning have lacked any convincing theory of how the sociocultural translates into diverse internal states and why some people, more so than others, in objectively similar situations, are able to transcend oppression and become life spacers.

There is a considerable momentum in the biographic research family to bridge the conceptual gap, as defined above. There are a number of psychosocial studies – often drawing on psychoanalytic ideas – which explore the interplay of inner and outer worlds, psyche, and society: of learning in families or in working contexts, for example (West, 2007; Weber, 2007). Psyche is perceived to be a product of our intersubjective experiences, which are shaped, in turn, by the structuring and discursive processes within a given society, such as of class, race, or gender. However, psyche is no longer reduced, as in an overly structuralist sociology, to a kind of epiphenomenal or determined status: the inner world has a dynamic and power all of its own. If culture and society shape even in the most intimate of spaces – through poverty or the gendered distribution of emotional labor – such processes are mediated through the intimate relationships in which we are embedded. They can encourage relative emotional openness or closedness to experience and others. If curiosity, desire, and wholehearted engagement with the world are repressed or profoundly inhibited, because of our most significant others, then learning, in a psychological sense, easily becomes something to be avoided rather than embraced.

Such processes have been mapped, biographically, in studies of young mothers in parenting projects, like Sure Start in the United Kingdom (similar to Head Start in the United States) (West, 2007). One project was designed to support young single mothers who lived on a run-down public housing estate, suffering badly from deindustrialization, demoralization, and poverty. The particular project provided the base for a university and a community arts collaboration to utilize the visual arts to stimulate creativity and build confidence among hard-pressed single young mothers. The project was located in a youth center and the disaffected young mothers were to be recruited through outreach. The arts, it was hoped, would boost participants' confidence, planning and parenting skills, as well as broaden horizons. The young mothers would be encouraged to progress toward structured educational achievement or into work.

One particular case study chronicles, in detail, how a young woman, Gina, could retreat defiantly to the edge of any group of learners. This was part of a pattern in a life riddled with abuse, hard drugs, and ridicule. Yet, providing a creative artistic space, in the context of the strong relationships that Gina forged with tutors and

youth workers over time, gradually enabled her to take some risks. Her messy feelings about her pregnancy, for instance, were projected into a sculpture, made of chicken wire and plaster of Paris, which became a narrative of her pregnancy. She was able to work on the story artistically and, to an extent, transform her relationship to the experience and to her life more widely, through new narrative understanding. Her progress depended on the quality of interactions between people (the social context) and the extent to which she felt encouraged and able to play, imagine, think, and perceive herself differently, as a learner, mother, and person, and to relate to her toddler in new ways. There was a shift in her internal psychological drama, as new characters and symbolic objects, in the language of psychoanalysis, entered the stage. We are witnesses, in work of this kind, to how experience can stifle the desire to learn, and can psychologically close us down to new possibilities. However, new transitional spaces for learning and people coming alongside and tolerating our ambivalence – with sufficient self-knowledge, patience, and love, in a non-narcissistic sense – can reinvigorate creativity and the capacity to learn anew.

Other biographical researchers have used psychosocial ideas to explore learning processes from a gender perspective. Weber (2007), for example, focuses on gender and the learning processes of adult men training for work in the caring professions. Drawing on what she terms critical psychodynamic theory, she reveals learning in the workplace as a gendered battlefield where learning subjects' basic orientations can manifest themselves along gendered lines. These processes are partly theorized with reference to classic psychoanalytic insights into male struggles with intimacy. However, this is not to neglect culture, language, or material conditions. In this view, gender is inherent in social structures, stemming from historic divisions of labor, and is reproduced or changed within the scope of the accessible choices that people can make. Yet, in understanding reproduction and change processes, Weber observes that girls tend to identify with and separate from a model of their own gender while boys' paths to autonomy involve separation from a first intimacy. These patterns of early interaction are reinforced by language as symbolic representation, all of which serves to define what she calls gendered subjectivity. (Weber, building on the work of others, distinguishes gender subjectivity – the processes by which a person becomes a psychological subject – and gender identity, which refers to sexuality and cultural conceptions of gender.) Gendered subjectivity can find expression in what can be the differing responses of men and women to new kinds of training opportunities in which learning a capacity to care for others is required. Men, mirroring earlier patterns, tend to achieve this by experiencing and demonstrating degrees of autonomy first, whereas women tend to seek intimacy as a prerequisite of autonomy.

Weber stresses that these distinctions are far from absolute, but there are patterns nonetheless. We are given glimpses, through such biographical research, of the defended as well as social subject at the heart of learning.

Adult and Lifelong Learning: A Reconfiguration?

Finally, the biographic perspective can challenge received wisdom on adult learning in another, quite basic sense. The work of Knowles (1984) and others helped build the case for an academic discipline focused, distinctly, on adult learning. Knowles was reacting to the derivation of theories of adult learning from an understanding of how animals (especially rodents and pigeons) behaved, followed by observations of children. Adults and their experiences were neglected. The attempt to refocus research and scholarship, and the emergence of the associated idea of andragogy, Knowles argued, was premised on notions of a more dynamic culture of learning than pedagogy allowed. Learners should be actively involved in diagnosing their learning needs, in planning their experiences, and in developing a suitable learning environment.

Yet, from a biographic perspective, the continuities between early and adult experience are also important. The study of learning, as noted above, can reveal how past and present often intertwine. Even very confident people can feel helpless and overcome in new and demanding situations, such as entering a new course in higher or adult education. Such moments may link back to earlier feelings of inadequacy or failure, as past and present elide. Melanie Klein, a psychoanalyst, termed this memory in feeling, expressed in bodily and emotional states, rather than conscious thought. Such embodied memory can be especially intense for those taught, from earliest times, that they are of little consequence, are inadequate, or authority cannot be trusted. A range of psychological defenses may come into play, including withdrawal and denial of needs (that something may be important or desirable). There can be constant glimpses of defensiveness in adult learner narratives: early experience is never simply transcended and past and present can constantly elide (West, 2007).

Conclusion: The Biographic Perspective

It is suggested that learning, from a biographic perspective, is seen as more of a piece: social and psychological; informal and formal; and lifewide and lifelong, forged in a dynamic interplay of past and present and even future (without a sense of a future, the past cannot really be embraced). The biographical perspective, in fact, encompasses an idea of learning that echoes the humanistic and imaginative spirit associated with Wright Mills (1970) in

his work on biography. Biography, he argued, was situated at a meeting point between historical imperatives, social structures, and the inner worlds of human beings. His interest was in notions of human agency and how people, even in the most oppressive of situations, can find the resources, individually and collectively, to build better worlds. We could add learn their way to better worlds: a process requiring an eclectic, interdisciplinary understanding of people in their resilience and also vulnerabilities. Moreover, the biographic perspective encourages us to engage with ourselves when engaging with others and their learning: in making sense of the other, we draw on our own experience, and in making sense of self, we can make more sense of another. This has been termed the auto/biographic perspective in adult learning. Turning to biography challenges many and varied boundaries.

Adult Learning, Instruction and Programme Planning: Insights from Freire

P Mayo, University of Malta, Msida, Malta

© 2010 Elsevier Ltd. All rights reserved.

Introduction

Paulo Freire (1921–97) was one of the most influential educationists of the twentieth century. It is from a Freirean perspective that this article on adult learning, instruction, and program planning is written.

Argentinean scholar Daniel Schugurensky says, with reference to adult education, that: “in Latin America, Paulo Freire constitutes a watershed. There is before and after Freire” (Schugurensky, 1998: 344). Several years earlier, another Argentinean scholar, Carlos Alberto Torres, remarked: “We can stay with Freire or against Freire, but not without Freire” (Torres, 1982: 94). In addition, although Freire was undoubtedly one of the most heralded educators of the twentieth century, who inevitably has his detractors, his influence extends beyond the field of education to be felt in a variety of areas, including sociology, political theory, development studies, theology, philosophy, cultural studies, anthropology, language studies, and communications.

Paulo Freire suffered imprisonment and exile for his efforts in planning what was perceived as being a subversive approach to literacy in Brazil in the early 1960s. Freire subsequently worked, as a person in exile, in Chile, Massachusetts, and Geneva. During his 16-year period of exile, he was frequently called upon by revolutionary governments to assist them in developing and evaluating educational projects. He also engaged in projects with a variety of groups in different parts of the world. After his return to Brazil from exile, which, on his own admission, he had to relearn, he entered the complex domain of municipal educational administration in São Paulo, one of the world's largest cities.

Freire was most prolific as a published writer, with many of his works having been translated into English and other languages. Freire's better-known work, *Pedagogy of the Oppressed*, is regarded by many to be exemplary in the way it provides reflections on his many worlds of social action in a process that also involves constant recourse to theory, with Freire drawing on many sources in this regard, including Marxism, phenomenology, Christian personalism, liberation theology, and postcolonialism.

Praxis

Knowledge of the Community

Freire's pedagogy emerged from the Latin American tradition of popular education which incorporates a strong

degree of nonformal education. Nonformal education is not *laissez faire* pedagogy, but includes a certain degree of planning and organization. In the classic Freirean approach, the entire process of planning involves an intimate knowledge of the community in which the learning is to take place. The team of educators and project organizers, and other project participants, were allowed to mix with community members in a variety of settings, including their most informal settings, listen to their speech patterns and concerns, as well as identify some of the thematic complexes of the community itself. This approach was repeated and reinvented by Freire within the context of public educational administration when he served as educational secretary in the municipal government of São Paulo in his native, Brazil (O'Cadiz *et al.*, 1998).

Codification

Once the information was gathered, the team worked together and consulted community members, besides other persons connected with the locality, to draw up a plan of action that focused on the reality gleaned from the research carried out in the locality. Important aspects of this reality were thus codified in the form of pictures, subjects for discussion, plays, generative themes, and other pedagogical approaches. The material connected with the participants' framework of relevance, but was codified in such a way that it allowed the participants to gain some critical distance from the matter being discussed. This process of gaining critical distance is referred to as praxis. Praxis is a key concept in the Freirean approach to education.

Praxis has a long history dating back to the time of the ancient Greeks and at least Aristotle. It involves reflection upon action for transformative learning and action. This is how Freire defines praxis in *Pedagogy of the Oppressed*:

But human activity consists of action and reflection: it is praxis, it is transformation of the world. (Freire, 1970a/1993: 125)

Exile as Praxis

Freire goes on to say that the whole process involved needs to be enlightened through theory. It is praxis that lies at the heart of Paulo Freire's notion of critical literacy. Freire and other intellectuals, with whom he has

conversed in talking books, conceive of different learning situations in their life as forms of praxis. This applies to adult learning in its broadest contexts including learning from life situations – informal learning. These situations are viewed as moments when people can gain critical distance from the context they know to perceive it in a more critical light. For instance, Freire and the Chilean Antonio Faundez considered exile a form of praxis (Freire and Faundez, 1989). Freire also makes statements to this effect in a book with Betto and Freire (1986). He refers to the period of exile as one that provided a profoundly pedagogical experience, thus echoing Frei Betto, who also presented, in the same discussion, his 4-year experience of imprisonment under the military dictatorship as one that had a strong and important pedagogical dimension. Freire's period of exile is presented as a time during which he gained distance from Brazil and began to understand himself and Brazil better. It was a case of obtaining distance from what he had carried out in Brazil to prepare himself better to continue being active outside his context.

Antithesis of Praxis: Empty Theorizing and Mindless Activism

Freire relates the whole process of action and reflection to theory and practice (ibid.). Freire's work underscores the point that action on its own, isolated from reflection, constitutes mindless activism. Likewise, reflection on its own, divorced from action, constitutes empty theorizing. It is for this reason that Freire, in keeping with the Marxist tradition, regards one's material surroundings as the basis for the development of one's consciousness. In the words of Marx and Engels, "Consciousness is, therefore, from the beginning a social product, and remains so as long as men (sic.) exist at all" (Marx and Engels, 1970: 51). The notion of praxis that lies at the heart of Freire's pedagogical approach and which informs learning contexts developed on Freirean lines is akin to Marx and Engels' notion of revolutionizing practice as expressed in the *Theses on Feuerbach*.

Dialectical Relations

The action–reflection–transformative action process is not sequential, but dialectical (Allman, 1999, 2001). In the introduction to the special issue of *Convergence* dedicated to Freire, Allman *et al.* (1998) state:

Dialectical thinkers understand the internal relations among all phenomena. In the case of human beings or groups, this is a social relation which could be harmonious but which, thus far in history, normally has been antagonistic, resulting in various social relations that Freire collectively refers to as the oppressor-oppressed relation (e.g., class relations, gender, race, colonial, etc.) The antagonism is often so great that nothing short of

abolishing the dialectical relation will improve the situation. When there are no longer the two opposing groups, the possibility emerges of human beings uniting in love, with a commitment to social justice and to care for all of our social and natural world (Allman *et al.*, 1998: 10).

Teacher Student and Student Teachers

Learners can be assisted in this process of praxis, of coming to understand their reality in a more critical light, through a process of what Freire calls authentic dialog and participatory learning, as well as collective learning. The educator learns from the learners in the same way that the latter learn from her or him, the roles of educator and learner becoming almost interchangeable. In what has become a classic formulation, Freire wrote about the teacher student and students teachers. The educator is therefore regarded as a person who, while engaging in dialog with the learners, is also being taught by them. The learners, for their part, are also teaching while being taught (Freire, 1970a/1993: 80). In a dialog with Ira Shor, Freire states that:

Liberatory education is fundamentally a situation where the teacher and the students *both* have to be learners, *both* have to be cognitive subjects, in spite of their being different. This for me is the first test of liberating education, for teachers and students both to be critical agents in the act of knowing. (Shor and Freire, 1987: 33)

Learner as Subject

The educator would therefore transcend the boundaries of his/her social location to understand and act in solidarity with the learners, no longer perceived as other. In adopting a Freirean approach, one would regard educators and learners as subjects in a humanizing relationship. Solidarity is the hallmark of this pedagogical relationship. The learner's reality constitutes an integral part of the subject matter that, therefore, becomes a mediator between the two subjects in question, that is, the educator and learner. Freire goes on to state that the dialogical process of education marks "the sealing together of the teacher and the students in the joint act of knowing and re-knowing the object" (Shor and Freire, 1987: 100). Borrowing from this conversation between Freire and Shor, one can argue that anything that the educator already knows is relearned when studied again with the learners, a point confirmed by Freire in the same conversation (ibid.).

Learners and Educators Not Equal

However, and here comes the apparent contradiction, a Freirean approach to learning based on dialog is one wherein educators and learners are not on an equal footing.

Obviously, we also have to underscore that while we recognize that we have to learn from our students . . . this does not mean that teachers and students are the same. . . there is a difference between the educator and the student. (Freire, 1985: 177)

Much depends on the specific situation in which the adult learning process occurs; however, it would be amiss to celebrate learner voices uncritically since they are never innocent (Aronowitz and Giroux, 1991: 130–131). They contain various manifestations of the oppressor consciousness which ought to be challenged. Dialog, as conceived by Freire, also involves educators allowing themselves to be challenged and to constantly undergo self-reflection and scrutiny to confront the oppressor consciousness within. In short, both educator and learner need to address their contradictions in an ongoing process of gaining greater coherence. The educator needs to help create the conditions whereby the learners develop the confidence necessary to challenge him or her where necessary in a situation of mutual respect and trust. This is part of the humility which, according to Freire, all critical educators must show.

Directive Approach

The directive nature of the educational process is affirmed (see, e.g., the discussion with Moacir Gadotti and Sergio Guimarães published in Brazil in 1989 – Gadotti *et al.*, 1995: 50). Guarding against the perceived danger of a *laissez faire* pedagogy, resulting from a misconception of his particular notion of dialog, Freire emphasizes this directivity in the conversation with Ira Shor and elsewhere: “At the moment the teacher begins the dialogue, he or she knows a great deal, first in terms of knowledge and second in terms of the horizon that he or she wants to get to. The starting point is what the teacher knows about the object and where the teacher wants to go with it” (Shor and Freire, 1987: 103).

Freire makes it clear that he believes that the educators’ pedagogical action is guided by a particular political vision and theoretical understanding. Freire, after all, considers education to be a political act, there being no such thing as a neutral education, with educators having to answer the question “for whom and on whose behalf they are working” (Freire, 1985: 180). Freire once stated that the learning experience entails a process of research and curiosity with all the elements involved – teacher, student, knowing object, methods, and techniques – providing direction (Fabbri and Gomes, 1995: 96). He argues that it is for this reason that every form of educational practice is directive, but not necessarily manipulative, and that every educational practice cannot be neutral; a directive practice cannot be neutral – no one is neutral when facing an objective to be reached (Fabbri and Gomes, 1995).

Authority and Authoritarianism

Educators therefore have a directive role; they need to exercise their authority, an authority derived from their competence as pedagogs. Freire, however, draws an important distinction between authority and authoritarianism. It is imperative that the authority derived from one’s pedagogical competence does not degenerate into authoritarianism: “. . . the democratic teacher never, never transforms authority into authoritarianism” (Shor and Freire, 1987: 91; on this, also see Horton and Freire, 1990: 181). This authoritarianism would render the difference that exists between educator and learner antagonistic (Gadotti *et al.*, 1995: 50). The educator exercises what Ira Shor calls democratic authority (Shor, 1992: 156–158).

What we have, therefore, in Freire’s nuanced concept of dialog is a paradox rather than a contradiction. Freire provides a complex notion of learning and instruction, based on dialog. Freire (1974) feels that the traditional educator regards the knowledge he or she possesses, often captured in the lesson plan, as complete. The Freirean-inspired educator regards knowledge as dynamic, an object of co-investigation and unveiling that necessitates the participation of co-knowing subjects – the learners. The process of knowing involved, with respect to the object of knowledge, is considered by both educator and learner as incomplete (see Allman, 2001).

Tact and Prudence

Freire has even advocated tact and prudence when engaging in a dialogical approach, conceding that people who have been conditioned by many years of exposure to banking education do not immediately do away with this conditioning to embrace dialog. They often resist attempts at dialog, perhaps even misconstruing a dialogical approach for lack of competence on the educator’s part. Freire concedes that some instruction is necessary at times. It is for this reason that he once stated that an educator can alternate between traditional and progressive teaching. It is as though he seems to be saying that, in such difficult circumstances, dialog should be introduced only gradually (see Horton and Freire, 1990: 160). Elements of the old pedagogy can coexist with the new in an overall context that, however, privileges democratic relations.

Given the strong relationship between knowledge and the learner’s existential situation in Freire’s approach, one assumes that the participant has a repository to draw on. This repository consists of one’s life experience. The participant is therefore encouraged to draw on this experience in order to arrive at new knowledge and at a new awareness. In drawing on this experience, one is able to relate to the codified material. The educator enables this process to occur not by depositing knowledge, but by

engaging the learner's critical faculties. Rather than being a dispenser of knowledge, the educator poses questions and problematizes issues. In this problem-posing education, the pedagogy applied is primarily not that of the answer, but that of the question (Bruss and Macedo, 1985).

Collective Dimensions of Learning

In adopting a democratic, dialogical approach, the circle or learning setting serves as a microcosm, indicating the potential that can exist within contexts characterized by democratic social relations. Furthermore, knowledge itself is democratized and is therefore not presented any longer as the preserve of a privileged minority. In addition, the knowledge disseminated is in itself democratic in that its starting point is the life experienced by the participants and it serves their interest. Finally, it is group knowledge that emerges from this experience that emphasizes the collective dimensions of learning and of action for social change. Freire argued that one engages in the task of becoming more fully human not on one's own (it is not an individualistic endeavor), but in solidarity with others (Freire, 1970a/1993: 85–86). This having been said, one eventually moves beyond the here and now to gain a greater level of awareness. "Educands' concrete localization is the point of departure for the knowledge they create of the world" (Freire, 1994: 85). It is just the point of departure; for the here and now represents only the starting point of an ongoing adult learning process and not the endpoint. Remaining within the here and now constitutes, according to Freire, a case of populism or *basismo*. In remaining there and not moving beyond (through co-investigation of the object of inquiry), one would be engaging in basism, the romanticization (or mythification) of the vernacular (see Freire, 1994: 84).

It is this aspect of a Freire-inspired theory of instruction, learning, and curriculum planning that renders it quite different from the more liberal notion of learning through dialog which, often, erroneously passes off as Freirean.

The insights we derive from Freire, with regard to program planning, learning, and instruction in adult education, are described in the following section.

Planning Together

One should not enter the community and impose a program on its members, but should, on the contrary, engage with a team of researchers, preferably including people with different disciplinary backgrounds and certainly including both educators and potential project participants (the adult learners), in studying the community, where the learning setting is to be developed, at close hand. This process of study or research comprises informal

meetings with community members. The planning of materials occurs on the basis of the insights and information gleaned from the research.

Learning and Instruction

Learning Based on Action and Reflection

The approach throughout is one based on praxis involving critical reflection on the area of action, which also involves recourse to theory, but which entails an authentic notion of dialog in which the subject of enquiry is the focus of collective co-investigation. The research leads to insights which are to form the basis of the codified learning material whereby the educator enables the learners to gain critical distance from the community they know to be able to perceive it in a different, hopefully more critical, light. The same applies to the adult educator herself or himself who also gains critical distance from the object of co-investigation and can come to perceive it in a more critical light. We have seen how even exile is viewed by Freire and co-authors, engaged in dialog with him, as a form of praxis, of gaining critical distance.

Adult educators working with migrants in this ever-growing context for adult education can take a leaf out of Freire's book. One of the challenges for critical pedagogical work with migrants, to emerge from this Freirean insight, is that of enabling the migrants to read not only the world they now inhabit as immigrants, but also the world they left through a process of obtaining critical distance from their context of origin. This can hopefully lead to a greater understanding of the politics of their own dislocation.

Dynamic Knowledge

Through this process of praxis, based on reflection on action, knowledge is conceived as dynamic rather than static. The approach to learning is directive since learning is conceived as a political act. The roles of adult educator and adult learner are almost interchangeable, as all learn from each other, but this is not to say that the adult learner and adult educator are on an equal footing. The latter must have a certain amount of authority which should not be allowed to degenerate into authoritarianism lest the spirit of genuine dialog be destroyed.

Starting with the Learners' Existential Realities

Only through dialog does the group collectively learn to unveil the contradictions that underlie the reality on which it is focusing. Adult educators are encouraged to show tact when promoting dialogical relations and there are moments when they temper dialog with a certain degree of instruction, especially on consideration that people exposed to

banking education for years do not embrace dialog easily. The starting point of co-investigation is the learner's existential reality which is, however, not the be all and end all of the learning process, lest one be guilty of populism or *basismo*. Adult educators must demonstrate the humility necessary to be disposed to relearn that which they think they already know through their dialogic interactions with the rest of the learning group or community.

Characteristics of Adult Learning

The slogan of lifelong learning basically involves the simple message that learning can and should be a lifelong occupation. This poses the fundamental question of whether the processes of learning are the same irrespective of age. In the traditional psychology of learning, there are no age-conditioned differences. Learning was considered to be a common phenomenon in which researchers endeavored to discover the decisive and basic learning mechanisms, and research and tests were often performed to observe animals and humans in constructed laboratory situations.

Many scholars and researchers have claimed that adult's learning, as a psychological function, is basically similar to children's learning. This was, for instance, the underlying assumption behind the massive resistance to American Malcolm Knowles' launching of a separate discipline of andragogy, dealing with adult education and learning, and at the same time limiting pedagogy to the area of children's upbringing and schooling (e.g., Knowles, 1970; Hartree, 1984; Davonport, 1993). More recently, Alan Rogers, from Britain, in connection with his description of adults' learning, has deliberately maintained, "that there is nothing distinctive about the kind of learning undertaken by adults" (Rogers, 2003: 7). However, this position is only valid in relation to some very basic features of learning. As soon as the question is examined a little deeper or related to concrete learning courses or events, there are obviously substantial life-age differences, partly because some biological capacities of learning only mature gradually during childhood and youth, and partly because learning is also a social and an emotional process, and people's social and emotional situations change with their age (Illeris, 2004, 2007).

In the following section, some of the most important fundamental features of learning that are independent of life age are outlined; the special features of adult learning are discussed subsequently.

Some Fundamental Features of Learning

Human learning is a very complex matter that has been understood and conceptualized in many ways. However, for a structural analysis, three kinds of fundamental features can be pointed out: (1) the basic processes and dimensions of learning, (2) the different types of learning, and (3) the types of barriers to learning (Illeris, 2007).

Basic Processes and Dimensions of Learning

A fundamental aspect of learning is that it always includes two integrated but very different processes: the external interaction process between the learner and the social, cultural, and material environment; and the internal psychological process of elaboration and acquisition in which new impulses are connected with the results of prior learning.

The criteria of the interaction process are of a social and societal character, that is, they are determined by time and place. The individual interacts with an environment that includes other people, a specific culture, technology, etc., which are characterized by their time and society. In the late-modern globalized world, this is blended into a giant and rapidly changing hodgepodge that offers almost unlimited possibilities for learning.

No matter how dominant and imperative the interaction process has become, in learning there is also always a process of individual acquisition in which the impulses from the interaction are incorporated. As discussed by scholars such as Piaget (1952) and Ausubel (1968), the core of this process is that the new impressions are connected with the results of prior learning in a way that influences both. Thus, the outcome of the individual acquisition process is always dependent on what has already been acquired, and ultimately the criteria of this process are of a biological nature and determined by the extensive, but not infinite, possibilities of the human brain and central nervous system to cope with, structure, retain, and create meaning out of impressions as perceived by our senses (cf. e.g., Solms and Turnbull, 2002).

Learning, thinking, remembering, understanding, and similar functions are not just cognitive or content matters, although they have generally been conceived of as such by traditional learning psychology. Whether the frame of reference is common sense, Freudian psychology, modern management, or brand new results of brain research, there is much evidence that all such functions are also inseparably connected with emotions and motivation. The Austrian-American psychologist Hans Furth (1987), by combining the findings and theories of Piaget and Freud, has unravelled how cognition and emotions during the preschool years gradually separate out as distinctive but never isolated functions. The Portuguese-American neurologist Antonio Damasio (1994) has explained how cognition and emotion work in our brain and what disastrous consequences there are when the connections between

the two are cut by damage to the brain, even when neither of the functions in themselves has been affected. Thus, the acquisition process necessarily always has both a cognitive and an emotional side or, more broadly speaking, a content and an incentive side.

Consequently, all learning always includes three dimensions: the content dimension of knowledge, understandings, skills, abilities, attitudes, and the like; the incentive dimension of emotions, feelings, motivation, and volition; and the social dimension of interaction, communication, and cooperation – all of which are embedded in a societally situated context. The learning processes and dimensions are illustrated in **Figure 1**.

Different Types of Learning

Another fundamental aspect of learning has to do with the different character and scope of different types of learning processes. A very basic distinction was made by the well-known Swiss biologist and psychologist Jean Piaget (1896–1980) when he distinguished between assimilation and accommodation as two essentially different ways of learning (Piaget, 1952; Flavell, 1963). Later, other researchers found that each of these can be further differentiated into two, so that altogether four basic learning types emerge (Illeris, 2007).

As already mentioned, the acquisition process implies a linking between new impulses and the results of prior learning. These results cannot be thought of as merely an unstructured mass of knowledge, emotions, abilities, etc. One of Piaget's most fundamental assumptions was that to learn something means to mentally structure something, that is, to incorporate it in a mental scheme, and it

is the difference in which this incorporation takes place that constitutes the learning types. From modern brain research we know that such schemes have the character of dispositions to reactivate specific electrochemical circuits between brain cells that represent the content and incentives in question (Damasio, 1994). When a scheme or pattern is established, it happens by the type of learning called cumulation, a kind of mechanical process, establishing an isolated formation characterized by a form of automation that means that it can only be recalled and applied in situations mentally similar to the learning context. This is, for instance, how learning by conditioning functions.

The most common type of learning is, assimilation, or learning by addition, meaning that the new impulse is linked to a scheme or pattern already established in such a manner that it is relatively easy to recall and apply when one is mentally oriented toward the field in question.

Sometimes situations occur where we receive impulses that are difficult to immediately relate to any existing scheme or pattern. This can then take place by accommodation or transcendent learning, implying that one breaks down (parts of) an existing scheme or pattern and transforms it so that the new situation can be linked in. Thus, one both relinquishes and reconstructs something, a process that can be experienced as something demanding and even painful. The result can be recalled and applied in many different, relevant contexts.

Finally, there is also a far-reaching type of learning, which the American adult educator Jack Mezirow termed as transformation, and involves simultaneous restructuring in all three learning dimensions. This very demanding type of learning implies changes in the organization of the learner's self or identity and typically occurs as the result of a crisis-like situation caused by challenges experienced as urgent and unavoidable (e.g., Rogers, 1951; Engeström, 1987; Mezirow, 1991).

It is important that none of the learning types can be said to be better or more valuable than the others, as the more complex types of learning always presuppose that other and more basic learning has provided the preconditions that make them possible.

Barriers Toward Learning

Finally, as the third basic area of learning, it is important to deal with the different types of barriers that can prevent, reduce, or distort possible learning (Illeris, 2007).

In the content dimension, barriers will typically be about something that is not acquired, grasped, or taken in as intended. This may be generally termed mislearning, implying that the impulse or message does not come through, for instance, because of insufficient involvement or concentration, a lack of necessary prior learning, or due

Figure 1 The processes and dimensions of learning. Adapted from Illeris, K. (2007) *How We Learn: An Introduction to Human Learning in Schools and Beyond*. London: Routledge).

to inadequate communication or teaching. The barriers to learning may also be rooted mainly in the incentive dimension. If so, it will typically be a case of some kind of mental defense. In our late-modern society, such defense mechanisms are no longer primarily the result of personal inhibitions as described by Freud a century ago, but are rather a general and necessary societally rooted defense against the overwhelming number and complexity of impulses and influences. Such defense either rejects or distorts the majority of impulses, preferably those that we dislike or are less interested in, but often those that we might profit from but do not immediately categorize as worth dealing with. Many also create learning defenses against the radically increased number of changes, the feeling of powerlessness experienced when authorities encroach on our life conditions, or the demands for change of identity, which the changing conditions impose on us.

Finally, nonlearning may be rooted mainly in the interaction dimension and have the nature of mental resistance. This can be inappropriate and annoying in many situations, but nevertheless constitutes symptoms of strong personal forces and engagement, which can lead to very important accommodative or transformative learning.

Adult Learning

In order to see what the characteristic of adult learning is, it may be useful to start by pointing out some basic features of children's learning.

Differences in Relation to Children's Way of Learning

In general, learning in childhood could be described as a continuous campaign to capture the world. The child is born into an unknown world and learning is about acquiring this world and learning to deal with it. In this connection, two learning-related features are prominent, especially for the small child: First, children's learning is comprehensive and uncensored. The child learns everything within her grasp, throws herself into everything, and is limited only by her biological development and the nature of her surroundings. Second, the child places utter confidence in the adults around her. She has only those adults and the ways in which they behave to refer to, without any possibility of evaluating or choosing what she is presented with. The child must, for example, learn the language these adults speak and practice the culture they practice.

Throughout childhood, the child's capturing of its surroundings is fundamentally uncensored and trusting as she endeavors, in an unlimited and indiscriminate way, to make use of the opportunities that present themselves. Of course, late-modern society has led to growing complexity and

even confusion of this situation as older children receive a lot of impressions from their pals and especially from the mass media, which go far beyond the borders of their own environment. But still the open and confident approach must be recognized as the starting point.

In contrast to this stands learning during adulthood. Being an adult essentially means that an individual is able and willing to assume responsibility for his or her own life and actions. Formally, our society ascribes such adulthood to individuals when they attain the age of 18 years. In reality, it is a gradual process that takes place throughout the period of youth, which as we see it today, may last well into the 20s or be entirely incomplete if the formation of a relatively stable identity is chosen as the criterion for its completion at the mental level (which is the classical description of this transition provided by Erikson, 1968).

As concerns learning, being an adult also means, in principle, that the individual accepts responsibility for his or her own learning, that is, more or less consciously sorts information and decides what he or she wants and does not want to learn. The situation in today's complicated modern society is after all such that the volume of what may be learned far exceeds the ability of any single individual, and this is true not only concerning content in a narrow sense, but it also applies to the views and attitudes, perceptions, communications options, behavioral patterns, lifestyle, etc. that may be chosen. Thus, a sorting of input must be made.

As a general conclusion it is, however, important to maintain that in contrast to children's uncensored and confident learning, adult learning is basically selective and self-directed, or to put it in more concrete terms:

- adults learn what they want to learn and what is meaningful for them to learn;
- adults draw on the resources they already have in their learning;
- adults take as much responsibility for their learning as they want to take (if they are allowed to); and
- adults are not very inclined to learn something they are not interested in, or in which they cannot see the meaning or importance. At any rate, typically, they only learn it partially, in a distorted way or with a lack of motivation that makes what is learned extremely vulnerable to oblivion and difficult to apply in situations not subjectively related to the learning context (Illeris, 2007).

In the following section, the nature of adult learning is discussed in relation to the three dimensions and other basic features of learning described earlier.

Adult Learning in the Content Dimension

For many years, it was a general understanding among learning theorists that humans acquire their full cognitive

learning capacity at about the age of 11–13, when they, as described in Jean Piaget's theory of learning stages, reach the so-called formal operational level, which makes logical–deductive thinking possible as a supplement to the forms of thinking and learning acquired at earlier stages (see, e.g., Flavell, 1963).

However, during the 1980s, this understanding began to be questioned from several quarters. On the one hand, it was pointed out that not all adults are actually able to think formally and operationally in the logical sense inherent in Piaget's definition. Empirical research pointed out that in England, it was actually less than 30%, but at the same time it was confirmed that at the beginning of puberty, a decisive development takes place in the possibilities for learning and thinking in abstract terms, so that, all in all, distinguishing a new cognitive phase was justified (Shayer and Adey, 1981). On the other hand, it has been maintained that, at a later age, significant new cognitive possibilities that extend beyond the formally operative may develop (e.g., Commons *et al.*, 1984). British-American adult education researcher Stephen Brookfield summarized this criticism by pointing out four possibilities for learning that are only developed in the course of adulthood: the capacity for dialectical thinking, the capacity for applying practical logic, the capacity for realizing how one may know what one knows (metacognition), and the capacity for critical reflection (Brookfield, 2000).

Recent brain research seems to indirectly support Brookfield's claims. Whereas it is a well-established understanding that the brain matures psychologically and neurologically for formal logical thinking in early puberty, evidence has been found that the brain centers of the frontal lobe that conduct functions such as rational planning, prioritization, and making well-founded choices, do not mature until the late teenage years (Gogtay *et al.*, 2004). This finding seems to provide some clarification of the differences between the capacity of formal logical and practical logical thinking and learning as well as between ordinary cognition and metacognition in adolescence and early adulthood.

At any rate, the general conclusion of all this must be that during puberty and youth, a physiological and neurological maturing process takes place that makes possible new forms of abstract and stringent thinking and learning, so that an individual becomes able to operate context-independently with coherent concept systems and manage a balanced and goal-directed behavior. Teenagers' determination to find out how things are structured and to use such understanding in relation to their own situation could be seen as a cognitive developmental bridge signifying the difference between children's and adults' ways of learning.

It is thus at one and the same time the longing for independence and the longing for coherent understanding of how they themselves and their environment function and why things are the way they are, which in the

content dimension separate adult learning from childhood learning. Up through the period of youth, individuals themselves increasingly assume responsibility for their own learning and nonlearning, make choices and rejections, and in this context understand what they are dealing with and their own roles and possibilities. However, all this has been enormously complicated by the duality of late modernity between, on the one hand, the apparently limitless degrees of freedom and reams of information, and on the other hand, far-reaching indirect pressure for control from parents, teachers, youth cultures, mass media, and formal conditions and possibilities. The transition from child to adult has thus, in the area of learning, become an extended, ambiguous, and complicated process, with blurred outlines and unclear conditions and goals.

Finally, it should be added that the possibility of transformative learning as well as the general defense systems in relation to learning seem to be developed along with the described cognitive development during the teenage years, and that the full development of the body and thereby the possibilities for bodily skills is also a process that is not fulfilled until about the age of 20 years.

Adult Learning in the Incentive Dimension

Learning in the incentive dimension is fundamentally aimed at helping the learner to control and direct emotions, feelings, motivation, and volition and thereby maintain an appropriate mental balance in relation to the complexity of life. In late-modern society, this process is concentrated on the development and maintenance of a self-understanding or identity that can secure the experience of being oneself, that is, of being the same person across the diversity of situations and challenges we meet and deal with. It is mainly in this dimension that the selective regulation and the defense mechanisms of adult learning are directed, which, in everyday life, is a mainly unconscious process and only taken up consciously in case of more important decisions. The identity, which, as mentioned, is developed during the teenage years, functions as the superior director of all this. On the more concrete level, adults typically have a range of life projects, subprojects, interests, and preferences to which the direction and regulation are related.

Most adults have a family project that concerns creating and being part of a family; a work project that concerns a personally and financially satisfying job; perhaps a leisure-time project concerning a special interest or a hobby; and sometimes a fulfillment or conviction project that may be religious or political in nature. All these projects result in many even more specific activities and attitudes that in this connection, serve as the measure for all the conscious as well as unconscious decisions about what to learn, with which kind of motivation and

investment to learn, and what not to learn or not to invest so much in that the learning process becomes demanding (which usually implies a weak and superficial kind of learning).

When dealing with adult learning, it is very important to realize that adults have and practice these conscious and unconscious ways of being selective in relation to their own learning. This is why and how adults, as stated before, “are not very inclined to learn something they are not interested in, or in which they cannot see the meaning or importance.” In contemporary adult education and lifelong learning, authorities and teachers very often do not sufficiently understand and respect these fundamental conditions of adult learning and many human and financial resources are wasted on programs and courses with limited or no possibilities of success (cf. Illeris, 2004).

Adult Learning in the Interaction Dimension

The general aim of learning in the interaction dimension is integration. Humans want and need to be integrated in their social environment, to communicate and collaborate with others, and this is a fundamental part of existence. But for adults, this side of life is highly selective: we have strong social preferences, and there are also communities which we do not want to be a part of. As to learning, this ambiguous attitude implies that the basic nature of our learning in the interaction dimension varies in relation to different learning spaces. In present society, five main types of spaces of adult learning can be pointed out.

Everyday life is the general and basic learning space in which a lot of learning takes place, as we are moving around and not participating in any specifically defined activities. This kind of learning is therefore mainly informal, multifarious, personal, and related to the cultures and subcultures in which the person is integrated, and it constitutes the general socialization and many patterns, norms, attitudes, general understandings, etc.

Workplaces have formed another very important learning space for adults ever since work was separated from everyday life. Here, of course, several professional qualifications are trained, but a lot of general learning takes place more or less incidentally as an inseparable part of work activities and communication (Marsick and Watkins, 1990). However, this learning is fundamentally different from general learning in everyday life, because it is marked by basic workplace conditions such as effectiveness, profit-orientation, and, not least, job stability. On the other hand, workplace learning may also include more formalized learning, which is usually accepted as relevant and meaningful, at least if the learner has a positive identification with the job. It is worth noting that even such goal-directed workplace learning is often restricted by the immediate needs of production or service and

therefore tends to lack theoretical understanding and overview (Illeris *et al.*, 2004).

Special interests or convictions are the basis of another type of learning spaces including, for example, communities, associations, hobbies, and grassroots movements. Learning here may be understood as a goal-directed kind of everyday learning in which incidental and informal features are replaced by a clear motivation and resolution, which generally make this type of learning space very effective.

Schools and other educational institutions form the type of learning space which society has established to secure a lot of learning that is today considered to be necessary for all of us to maintain the material and structural level we have reached. Originally, this type of learning space was mainly set up for children and youth, but it is significant for late modernity that such institutions are now also established for adults and the slogan of lifelong learning covers a massive upgrading of such learning. However, it is important to realize that school learning is by nature formal, rational, and externally directed. Although it is officially aimed at goals outside the educational system, it is usually experienced as directed by internal measures such as the school subjects and exams. Although adult schooling is not compulsory, many adults are brought into situations where they more or less have to undertake such formal learning. Low-skilled workers often oppose or are very ambivalent about going back to school as they have for so many years experienced that they are no good at school learning (Illeris, 2003, 2006).

Finally, it must be mentioned that computers and the Internet have opened a new learning space of rapidly growing importance, not least for adults. Computer learning has its own characteristics, advantages, and disadvantages. Net-based learning is very flexible, because it can be practiced independently of time and to some extent also of place. It also seems to have an advantage in that it forces the learner to express oneself in writing and thereby to make points, understandings, and opinions more clear than generally needed in face-to-face conversation. The disadvantage is the lack of direct social contact, but this can to some extent be eliminated by frequent classes or meetings, during a Net-based course, of some duration. Yet, so far we know very little about the transfer of Net-based learning onto the different spaces of reality.

As most adults today are involved in all or most of the main described types of learning spaces, the transitions and transfer of learning between them become increasingly essential and complex. The transition and transfer between school and education on the one side and workplaces and everyday learning on the other side forms a challenge to contemporary adult learning. Net-based learning may relate to either of these sides, whereas interest-based learning has a kind of independent position

from which transfer can often be made to any other learning space.

Conclusion

Learning in late-modern society is a very complex and at the same time very important issue, and the slogan of lifelong learning strongly indicates that this also includes adult learning. However, adult learning is very different from children's learning and much of the traditional learning theory and teaching practice does not apply very well to adults. Whereas childhood naturally is time for learning and development, adulthood traditionally has been the age for applying the acquired competencies. Today, this situation has changed, and learning in adulthood has become a necessary demand. This causes many challenges and expenses, but also new possibilities of a rich and expanding adult life.

It must be remembered and respected that in free and democratic societies, adults have the right to direct their own learning. Therefore, the typical patterns and processes of childhood learning cannot just be overtaken, and the idea of lifelong learning can only be practiced successfully if sustainable ways to meet the needs of the adult learners can be developed and practiced.

Informal Learning: A Contested Concept

P Hodkinson, University of Leeds, Leeds, UK

© 2010 Elsevier Ltd. All rights reserved.

Although the term informal learning has been widely used for a long period of time, its precise meaning remains elusive and contested. The term is normally invoked in opposition to formal learning and/or formal education, and has, therefore, much in common with the terms nonformal learning and nonformal education. In its common sense usage, informal learning is that learning which takes place outside educational institutions, such as schools, colleges, and universities. The confusions around its meaning and usage arise from three interrelated problems. They are:

- differences between the research and political developments of the term;
- confusion and disagreement over the boundaries between formal and informal learning; and
- contrasted and contested theoretical ways of understanding all learning.

The Research Development of Informal Learning

Over the last 30 years, researchers have rediscovered the fact that much learning takes place in everyday life, without the interventions of teachers or educational institutions. The importance of everyday learning had been largely lost sight of, after the decline of behaviorism, as cognitive psychologists focused most attention on learning in schools. Reinforced by liberal humanist views of education as major root of civilization, schooling came to be seen as normally the best way for people to learn. The debates in the early 1970s focused mainly on how to make schooling better.

Scribner and Cole (1973) wrote one early seminal piece pointing out that much successful learning took place outside school. They explicitly used the term informal learning and juxtaposed it with formal learning, which was what schools were supposed to be good at. Since then, there has been much research showing informal learning in a wide range of contexts, including families, communities, and workplaces. It was not just the contexts of formal and informal learning that were different. Their processes and the nature of what was learned were also different. From this perspective, formal learning is planned and organized and assessed by teachers and others, while informal learning is incidental and ubiquitous in everyday practices. Formal learning is concerned with high status, mainly propositional knowledge, which, the argument goes, is generalizable, not

situation specific. Informal learning is concerned with low-status knowledge and skills, and much of it is assumed to be situation specific.

Within this strand of literature, most writers are either concerned with formal learning and education, or with informal learning. One result of this polarization is a sometimes vehement debate about whether formal or informal learning is more efficient. As schooling developed in the twentieth century, they were the places where Enlightenment ideals of science and rationality could be applied to learning. Schools were where learning was taken seriously, and were an improvement over simple and primitive everyday learning. On the other hand, researchers into informal learning argued that it often worked better. Thus, for example, children learn language very effectively in everyday life, compared with the ways in which at least British and American children struggle to learn a foreign language in school.

The Political Development of Nonformal Education and Nonformal Learning

Whereas recent usage of informal learning grew up in opposition to formal learning, usage of the term nonformal learning grew out of the older term, nonformal education. The first use of the term nonformal education was probably a United Nations Educational, Scientific and Cultural Organization (UNESCO) report on education in what was then termed the underdeveloped world (Hamadache, 1991). The essence of nonformal education was a central desire for empowerment, through democratization. In the 1940s, this was associated with post-World War II growth of anti- and postcolonialism. Tutors could be centrally involved, working with underprivileged groups, helping them achieve their own objectives. Thus, informal education was opposed to formal education, which was seen as elitist, and primarily concerned with social reproduction, rather than emancipation. However, for those writing about informal learning (see above), this struggle was between two different forms of formal learning.

Colley *et al.* (2003) argue that since 1947, a broadly nonformal educational movement has ebbed and flowed, growing in strength for short periods of time, interspersed with longer periods of the dominance of formal education. In what they term the second wave, in the 1970s, the term nonformal learning first appears. These second-wave movements were found, for example, in Brazil led by

Freire and others, and in Tanzania. This time, partly through Freire's (1972) work, the movement spread into the developed world, for example, in feminist, antiracist and working-class movements.

When nonformal learning surfaced again, from the late 1980s onward, it became more formalized, under the influence of free-market capitalism and human-capital theory. Funding in most parts of the world is increasingly focused on economic production. The formalization of much nonformal and informal learning can be seen, for example, in the growth of the competence movement, whereby the outcomes of work-related learning are specified, measured, and potentially accredited, regardless of where that learning took place. The radical and emancipatory agendas of the previous waves had been largely lost.

As these two quite different origins of the concept of informal learning converge, the usage and meaning of that concept becomes further confused. What both traditions share in common is a sense of informal learning being other than formal education. This leads directly to the next problem. Informal learning is seldom clearly defined in its own right. Almost always, it is formal learning/education which is defined, leaving informal learning as its opposite.

The Blurred Boundaries Between Formal and Informal Learning

Colley *et al.* (2003) analyzed a range of texts which had explicitly set out the differences between informal learning and formal learning. What their analysis showed was that, although there was significant overlap between them, each author defined the differences in significantly different ways. Colley and coworkers identified a list of 20 criteria, all of which had been used by at least one author. This meant that learning which would be classified as informal by one group of writers would be seen as formal by another group. More tellingly, there was no small group of criteria that were universally used by all writers. Thus for some, in the informal-education tradition, informal learning could be seen as part of, say, an adult-education course, provided that course was run upon democratic lines. For many others, informal learning only took place outside educational institutions. Similarly, many agreed that formal learning was assessed and accredited. However, others did not see, say, accredited workplace learning as formal, and much learning in schools, which most would describe as formal, is often unaccredited. Marsick and Watkins (1990) suggest that formal learning is deliberative and planned, while informal learning is incidental, which cuts right across divisions based on location and both types could be accredited, for example, within the competence movement. These boundary confusions are bad enough if the focus is

on formal learning, but when informal learning is the focus, there is a further problem. This is because it is often formal learning that is defined. Informal learning is all the rest.

Further confusions arose when some authors tried to distinguish between three categories: formal, nonformal, and informal learning. Traditionally, nonformal and informal had been used almost interchangeably. More recently, as we have seen, nonformal learning has been invented as a third category, possibly as a means of resolving some of the confusions in the distinctions between formal and informal learning. However, there is even less clarity and agreement between the boundaries of informal and nonformal learning than between formal and informal. Colley *et al.* (2003) concluded that the distinctions between informal and nonformal learning were largely meaningless. However, the threefold classification used by the European Union (European Commission, 2001) has become influential in relation to policy and practice in Europe. In this classification, nonformal learning was seen as a midway point between informal and formal: learning that is not provided by an education or training institution and typically does not lead to certification, but is structured (in terms of learning objectives, learning time, or learning support). Nonformal learning was defined as intentional from the learner's perspective. That is, nonformal learning is part of what was defined as formal learning by Marsick and Watkins (1990), but could equally be seen as an attempt to divide informal learning in workplaces and communities into the purposive (nonformal) and the incidental (formal).

Colley *et al.* (2003) argued that rather than distinct types of learning, termed formal and informal, there were many attributes of informality and formality in learning, and that most if not all learning contained a mixture of both. They suggest that these various attributes of formality and informality relate to four areas: the location of learning, the purposes of learning, the processes of learning, and the content of learning. Thus, the content of learning could be, say, mainly formal – perhaps academic history, the purpose relatively informal, in that the history is being learned from a TV program, watched for interest, in which case the process would also be largely informal, as would be the location, if the TV was being watched in the home, rather than as a planned part of an educational course. Multiple other combinations are possible.

Theoretical Differences

The third source of confusion around the term informal learning arises from deeper disagreements about the nature of learning itself. A full analysis of these debates lies beyond the scope of this article, although some relevant reading has been included, for those who want more detail. In essence, two radically different ways of understanding learning each

has very different implications for what we take the concept of informal learning to mean.

On the one hand, much of the research on learning from a cognitive psychological perspective implicitly adopts what Sfard (1998) terms an acquisition metaphor for learning. That is, learning is understood as the process whereby knowledge, skills, understanding, etc. are acquired by the learner. Within this intellectual tradition, there has always been a concentration on learning as a cognitive mental process, and on the nature of learning either in relation to early childhood, or within educational institutions. Thus, there is an implicit switch from what might be termed informal learning in childhood, to formal learning at school. However, even in relation to early childhood, a major emphasis has been on how tutoring or teaching (by the parent and others) can improve that learning. As tutor control is an often-cited criterion for formal learning, this way of understanding learning has traditionally neglected many informal attributes of learning.

Western policymakers often implicitly adopt an extreme and oversimplified version of learning as acquisition, which sees what is learned as a commodity, to be inserted into the heads of learners. Here, and in many of the more sophisticated versions of learning as acquisition, there is a tendency to see learning processes and learning outcomes as separate – with one leading to the other. Learning is also seen as separate from the context in which it takes place, so that a major objective of education (and also a major problem) is to facilitate the transfer of what was learned on one place (such as a school) to another (such as work). When informal learning enters the acquisition perspective, it is often as an alternative method to formal learning, whereby desired outcomes are/can be achieved. Often, it is seen as of secondary importance to formal learning.

Situated-learning theories, in their various guises, see learning differently. Here, as Sfard (1998) shows, the metaphor is not acquisition, but participation. That is, people learn through participating in practices and/or activities, including those of schooling, as well as, say, those in the family, at work, or in the local community. There has been work done on learning in education from this perspective, but arguably most of the major developments in situated learning have come from focusing on other places where people learn – perhaps, especially the workplace. Perhaps, the most radical and most significant claim of situated-learning theorists is that there is no separate process, called learning. Rather, learning happens as part of the practices of participating. Thus, in a workplace, work itself, and the various social processes involved in it, embrace learning. This sort of participatory learning is inherently social, and far from being separate from its location, is an integral part of the situation where it takes place. That is, the nature of learning varies significantly from one situation to another. Within any

situation, learning processes and learning outcomes are also integrated. Furthermore, for many writers, learning is embodied, involving the practical and affective as well as cognitive. Often such learning is tacit, in the sense that people are not really conscious of learning.

It follows that situated-learning theorists naturally focus on what is often termed informal learning. This is seen as the natural and therefore most common form of learning. If formal learning is thought of as different, then it is as a minor variation, not the major learning form. Thus, when researchers write about formal education, a common thrust is that we should make it more like informal learning.

If the boundary between formal and informal learning is contested and imprecise at best, from the situated-learning perspective, there is a different boundary problem with the concept. The logical conclusion from a situated-learning position is that learning is ubiquitous in life. Not only is learning ever-present, but as there is no separation between any social practices and learning, there is no clear division between learning and life. This definition problem leads to two contrary positions in the literature. On the one hand, some writers call for a return to seeing education as the main concept for analysis, rather than learning. For them, informal learning is just too vague and broad to be meaningful. The opposite view is that we have to accept that learning is ubiquitous, and it follows that learning is everywhere and that much of it cannot be measured. Rather than worry about this imprecision, we should ask different questions about learning (including informal learning), which relate to its value and its purposes, rather than its effectiveness. At the time of writing, situated-learning theories are in ascendance over cognitive theories, but a resolution to the implications of the ubiquity of learning is not in sight. More recent work is also seeking to build back an individual perspective on learning, for example, by finding ways of blending metaphors of participation with those of construction. Most of these approaches focus on learning as broadly undifferentiated into formal and informal, implicitly or explicitly adopting a similar stance to Colley *et al.* (2003), in this respect. However, there remain a significant number of cognitive researchers who are unconvinced.

Informal Learning in Educational Courses

If we adopt the situated-learning perspective when looking at learning in classrooms, schools, and colleges, it becomes apparent that there is much informal learning in such places too. As early as 1961, Jackson pointed out that while in school, the hidden curriculum was at least as important as the official curriculum. By that, he meant that pupils learned about how to behave in school, and more seriously, being in school reinforced a sense of

failure and inadequacy in many. Although he never used the term, informal learning, it can be applied to this still underestimated part of what is learned at school. His use of the term hidden is telling. Most of the literature on learning at school focuses on how well or badly the official curriculum is learned, ignoring the extensive informal learning that goes alongside it. Furthermore, the two are not separate. Some situated-learning theorists argue that learning to be a pupil in a school interferes with the learning of, say, physics. For example, pupils learn how to stay out of trouble, how to do well with minimal effort, how to pass tests rather than master a subject, and how to get on with their peers, for example, to avoid being labeled a teachers' pet. In relation to some recent research done on learning in an English college, Hodgkinson and Colley (2005) analyze the complex interrelationships between formal and informal learning in three very different courses. In each case, they claim that it makes little sense to see formal and informal learning as different. To do so, risks leaving a very partial understanding of the learning taking place. In arguing this way, they are taking a situated-learning view of what learning is.

Formal Learning at Work

Billett (2002), writing mainly about learning in the workplace, also argues that formal and informal learning are not distinct from each other. In fact, he argues, all learning is formal in several respects. Writing from a situated-learning perspective, he argues that the practices and activities through which learning takes place are themselves partly formalized, through formal structures of, say a workplace. Thus, work hierarchies, rules, and procedures interpenetrate all workplace learning, which is thus structured, controlled, and deliberative – that is, formalized. Whether his argument is accepted or not, it is clear that there are increasing amounts of planned, taught (or tutored), and assessed learning in modern workplaces, for example, through performance-management schemes, or managerial requirements for specific training – in health and safety, in using new technology, etc.

Is Informal Learning Becoming More Formalized?

As informal learning attracts more and more attention from researchers, policymakers, and others, those who still believe in the clear distinction between it and formal learning face a paradox. For, the more we discover about the importance of informal learning, the more we try to specify, measure, and control it. To use the terminology of Colley *et al.* (2003) we are attaching more and more of the

attributes of formal learning to it. That is, we are making informal learning more formal.

This increasing formalization can be seen in a number of places. Quantitative researchers are searching for better and more-encompassing measures of or proxies for informal learning, so that they can assess how widespread it is, who has access to it, etc. In many adult- and higher education contexts, there is a growing use of accreditation of prior experience and learning (APEL). That is, having recognized that people learn a lot informally, the drive is on to find formal evidence so that such learning can also be accredited, and can be counted toward a qualification. In the workplace-learning arena, there has been a widespread growth of competence-based qualifications. Their purpose is to record, verify, and ultimately accredit learning which has taken place during the everyday practices of work. Another example is the growth of performance-management schemes at work, where employees agree learning targets with a line manager.

For those whose tradition is the radical politics of non-formal adult education, this trend to formalize the informal is deeply worrying, even though some of these initiatives, such as APEL, may be of benefit to some disadvantaged learners. The trend brings dangers of increasing hierarchical control and increasing surveillance of workers and other relatively disadvantaged groups. Moreover, if and when it is discovered that even the most disadvantaged have lots of informal learning in their lives, this can provide an easy excuse for policymakers not to provide, say, additional access to adult-education classes, because these people have enough learning anyway.

Another set of concerns about this trend relates to whether or not it is inherently counterproductive. There are subtly different arguments here. First, if informal learning is different from formal learning, and if it is also beneficial, then there are dangers that in making it increasingly formal, some of its very advantages are lost. An extension of this line of argument is that this formalization is actually the reason for increased interest in informal learning, rather than it resulting from such interest. This raises suggestions that the focus on learning rather than education has political purposes, in focusing attention and responsibility on individuals, rather than the state. It also marginalizes older debates about the purposes of education and over what people should learn or should be encouraged to learn.

The second very similar argument comes from the line taken by Colley *et al.* (2003). They argue that the interrelationship between formal and informal attributes of learning is very important. It follows that when we choose to alter the balance between such attributes, it is necessary to think carefully about what any such changes do to the nature of the learning itself. The problem is that in most cases of increased formalization, this is not done. Rather, there are assumptions that (1) we are measuring what is

already there without changing it, or (2) we can simply improve what already happens, by managing it better.

The third argument links the two. If most learning is informal, and if learning is ubiquitous in everyday activity, attempts to measure it or to accredit it may miss a larger point. It is not whether people have learned or not, or how much they have learned that matters. What matters more are important questions about the value and purposes of what is being learned, and to whom. In other words, much of the growing formalization of informal learning has technical concerns, directly relating to the needs of those in power – employers, educational institutions, governments, etc. More important are questions of value – questions of why and for what purpose, rather than what or how. Of course, value questions are always contested and contestable, and raising this question about informal learning would place the contested nature of learning at the center of the debate.

Conclusion: The Value of Contestation

Ever since the first usages of the term, informal learning has been contested, and there are two dimensions to that contestation. There are theoretical and research-driven arguments about what the concept means, what its boundaries are, and how useful it is. There are political arguments about its purposes and about who can, should, or does control it.

At a practical level, all this makes the concept of informal learning difficult to use well. Too many writers are unclear about their own uses of the term, and appear unaware that many other writers use it in different ways to them. On the other hand, the concept has such widespread usage that, at least in English, it is almost impossible to avoid it. Some of its essence can be captured in alternatives, such as everyday learning, but each such alternative brings its own definitional problems and metaphorical baggage. Writers need to use informal learning and its alternatives with care, and should make clear the sense in which they are using the term.

However, if contestation and complexity bring problems, they also bring opportunities. The debates and arguments about informal learning lie at the heart of the ongoing search for better and clearer ways to understand learning *per se*. For our understanding of learning to advance, we need to keep these contestations firmly in mind, as we work to address them and find better ways forward. The political debates about the purpose of informal learning relate directly to arguably even more important concerns for

educational researchers and practitioners. These concerns are the extent of inequality and disadvantage in education and learning, related to social class, gender, ethnicity, poverty, etc. Despite the fears from some quarters that a focus on informal learning is part of a broader move to place responsibility and blame on individual learners, such issues of social and educational inequality concern all forms of learning in all aspects of people's lives. The trick is not to focus solely either on formal education or informal learning, but to see both as often related parts of a larger picture.

Organizational Learning

P-E Ellström, Linköping University, Linköping, Sweden

© 2010 Elsevier Ltd. All rights reserved.

Although organizational learning has been a subject of research within management and organizational studies at least since the early 1960s, interest in this concept has grown considerably since the late 1980s. Important driving forces for this development have been the globalization and growing corporate competition, and thereby, an increasing interest in finding alternatives to established forms of organization. This development was mirrored not least in the movement to abandon traditional Tayloristic and bureaucratic models of work organization in favor of allegedly more flexible and integrated work systems, that is, what has been characterized as high-commitment work systems. The performance of these types of new work systems is assumed to critically depend on their capacity to create favorable conditions for organizational learning.

Today the concept of organizational learning has become established not only within economic and management disciplines, but also within behavioral and social science disciplines such as psychology, education, and sociology. Considering empirical research on organizational learning, it is clear that there is and has been a predominance of studies within private companies. This is the case in spite of the fact that many of the early studies by researchers such as Argyris, Cyert, and March were also carried out in governmental agencies and educational institutions. However, over the last decade there has been an increase in the number of studies of organizational learning in, for example, schools, military organizations, public administration, political organizations, and unions. Considering education specifically, the interest in organizational learning is presently clearly visible in at least three areas of educational research: school development and innovative schools, human resource development (HRD), and workplace learning.

The Field of Organizational Learning

The field of organizational learning is characterized by an increasing diversity and specialization. In order to map key topics within the field of organizational learning, Easterby-Smith and Lyles (2003) distinguish between four subfields within the general field of organizational learning: organizational learning, the learning organization, organizational knowledge, and knowledge management. The first of these four subfields, organizational learning, refers to descriptive and explanatory studies of learning processes of and within organizations. That is, studies of organizational learning largely from an

academic knowledge interest, aiming at an understanding and critique of what is.

In contrast to this, the learning organization subfield is characterized by more practical and normative knowledge interests. A learning organization is viewed as an ideal type of organization (or a vision of an organization), which has the capacity not only to facilitate the learning of its members, but also to transform this learning into continuous organizational renewal. The literature within this subfield focuses on how to create and improve the learning capacity of an organization through different types of intervention. One of the most well-known contributions to this subfield is the book on learning organizations by Peter Senge in 1990.

Turning to the remaining two subfields, the subfield called organizational knowledge refers to attempts to understand the nature of knowledge and processes of knowledge production within and between organizations. Within this subfield, there are studies of not only what has become known as knowledge work, but also studies of knowledge creation and the sharing and integration of organizational knowledge and competence. A key contribution to this subfield is the book by Nonaka and Takeuchi (1995) on knowledge creation through transformations of tacit and explicit knowledge. The subfield of knowledge management has a focus on issues related to the use of information and communication technology (ICT) to facilitate and support the acquisition, storage, sharing, retrieval, and utilization of knowledge in order to improve organizational performance.

As underlined by Easterby-Smith and Lyles (2003), it is not possible to make clearcut distinctions between these four subfields of organizational learning. For example, a critical study of processes of organizational learning within an alleged learning organization would belong to the subfield of organizational learning. Furthermore, studies of organizational learning interventions could belong both to the subfield of organizational learning and that of the learning organization depending on which knowledge interest predominates. As will be clear in the next section, it is also difficult to make clear-cut distinctions between the two subfields of organizational learning and organizational knowledge. In fact, in recent years, these two subfields have tended to merge.

Dimensions of Organizational Learning

In spite of the large number of studies on organizational learning that have been published during recent years,

there is little consensus on how to define the concept of organizational learning. It is also, to say the least, a very difficult task to try to formulate a definition that could adequately cover the many meanings of organizational learning that can be found in the literature. On a general level, however, it is possible to distinguish a number of dimensions along which many definitions vary. In the text below, three such dimensions are dealt with.

Levels of Analysis

A first dimension is what is considered as the proper level of analysis, and thus, as the locus of learning. Many definitions and studies of organizational learning focus on an individual level of analysis, that is, on the learning by individuals in an organizational context (Huber, 1991; Simon, 1991). A main argument behind this approach is that basic concepts in the literature on organizational learning, for example, the concept of memory, only apply to individual subjects. In line with this, it is assumed that organizational learning is mediated through individual learning, conceived as an interplay between processes of cognition and action. Furthermore, organizational learning is assumed to imply individual learning, but not vice versa. Thus, individual learning is viewed as a necessary, but not sufficient condition for organizational learning. In relation to this view, questions arise concerning what it means when an organization learns, and how to understand the links between individual and organizational learning.

Other definitions of organizational learning focus on a collective subject, that is, on the group (the team) or the organization as the locus of learning. The basic assumption is that the group or the organization is more than a collection of individuals, and thus, that learning at a collective level is different from and not only the sum of each individual's learning. For example, Senge (1990), in his book on the learning organization, argues that the team is the fundamental level of learning in an organization. It is typically argued that the learning process of a group closely parallels that of an individual and that it can be described as cycles of cognition, action, feedback, and reflection (Edmondson, 2002).

When it comes to studies that focus on the organization as the proper level of learning, the notion of learning is typically used in a more metaphorical sense. That is, groups or organizations are assumed to learn in a way analogous to individual learning, and concepts found in theories of individual learning are extended to the group or organizational level (Hedberg, 1981). This approach has raised criticism of anthropomorphism. However, some would argue that this criticism is irrelevant, and that the notion of learning should be understood as something qualitatively different when applied to a collective entity like an organization compared to individuals. More specifically, it has been argued that organizational

learning should be interpreted from a cultural rather than from a cognitive perspective, and that the notion of organizational culture would be useful for conceptualizing the collective aspects of organizational learning, and thereby, for understanding learning at an organizational level (Cook and Yanow, 1993). Accordingly, learning is assumed to be embedded in collective assumptions and interpretative systems, routines, technologies, and cultural practices. This view comes close to what below is called a sociocultural approach to organizational learning.

A fourth level of analysis is the level of inter-organizational learning. Much research on organizational learning has concerned learning within or of organizations, where the organization has often been treated as a self-contained system with fixed boundaries that operates to a large extent independently of other organizations in the environment. Today, there is a growing interest in new forms of organization at an inter-organizational level. Networks, clusters, innovation systems, and partnerships are a few such examples. Other examples include multinational corporations and joint ventures. A number of new issues of organizational learning are raised at this level of analysis, for example, issues concerning learning and innovation, or learning under conditions of competition and cooperation. At the same time, many of the issues dealt with above are also highly relevant to this level of analysis. Presently, there are few systematic studies of learning processes and outcomes at an inter-organizational level of learning.

Although there are a lot of studies that treat organizational learning as a process that should be analyzed and studied on one or the other of the four different system levels distinguished above, there are also studies that emphasize organizational learning as an interplay between different system levels or as a multilevel process. The latter position is taken, for example, by Crossan *et al.* (1999) in an article that emphasizes that a theory of organizational learning needs to consider the individual, group, and organizational levels. The latter authors also develop a framework including four subprocesses of organizational learning that link the individual, group, and organizational levels.

Organizational Learning as Change and/or Stability

According to many definitions, organizational learning is defined as an experienced-based process of change. It is sometimes also stated or implied that organizational learning means improvements of the actions or the performance of the learning subject, whether this is an individual, a group, or an organization. However, this kind of definition raises a number of issues that need to be addressed. First, observations of changes and adaptations to environmental events do not automatically mean that

these changes are the result of a learning process. On the contrary, changes in actions and improved performance may occur for a number of reasons that have little or nothing to do with learning, for example, situational factors that trigger certain changes in behavior. Second, learning processes are not always, for a number of reasons, mirrored in observable behavior. There may, for example, be situational factors such as a lack of sufficient resources or adequate tools that constrain behavior. In line with this, some scholars have defined organizational learning in terms of changes in potential behaviors rather than actual behaviors (Huber, 1991).

Third, observed changes in action may not be positively related to the performance of the individual, the group, or the organization. On the contrary, we may, in some instances, talk about negative learning in the sense that the learning outcomes may for some reason be undesirable, or in fact, negatively related to performance. That might happen if, for example, the members of a team acquire a form of learned helplessness and an accompanying lack of self-confidence. Thus, the learning process may under some conditions unintentionally result in a deterioration of individual or organizational performance. Furthermore, learning processes, whether they result in positive or negative outcomes from a performance perspective, are in many cases neither conscious nor intentional. Thus, processes of learning, change, and improvement in performance may be totally different processes that need to be clearly distinguished both conceptually and empirically.

While recognizing that learning and change may be two different processes, many researchers have defined levels of learning in terms of the character of the individual and/or organizational changes that are implied by the concept of learning. For this purpose, distinctions have been made between: (a) changes that occur within a given framework, for example, within a given set of beliefs or values or within a given organizational structure or situation, and (b) changes that represent a break with and something that goes beyond the given (Ellström, 2001). Perhaps the most well-known version of this distinction is the one made by Argyris and Schön (1978) between single-loop and double-loop learning. More recently, related and in some respects parallel distinctions have been proposed between first- and second-order learning; adaptive (reproductive) and developmental (innovative) learning; incremental and radical learning. While the former type of learning in each pair has a focus on improving or refining existing procedures or capabilities, the latter type of learning has a focus on the more radical change of institutionalized practices and the development of new capabilities.

Learning as refinement of existing structures and processes may be viewed as a way of reproducing or stabilizing an organization or a social system over time. In a sense, then, reproduction and change (transformation) of a social

system may be viewed as two sides of the same coin. In line with this, arguments have been raised to the effect that it is important to find a balance between radical and incremental change or between the exploration of new alternatives and the exploitation of existing knowledge and technologies, and that the returns to fast learning and change are not all positive (March, 1991). Others would take a further step, and argue – from a cultural perspective – that organizational learning is not just about change, but also about organizational stability and the maintenance and preservation of an organization's activities and cultural practices (Cook and Yanow, 1993). Thus, organizational learning could be seen as a means for cultural reproduction as well as a means for transformation.

Content and Processes of Organizational Learning

The third dimension distinguished here concerns the content and processes of organizational learning. While content refers to what is learned (e.g., knowledge), the process of learning refers to how learning takes place. For present purposes, the following three main approaches may be distinguished with respect to the content (outcomes) and processes of organizational learning: the cognitive-behavioral approach, the sociocultural approach, and the knowledge-creating approach (cf. Paavola *et al.*, 2004).

The cognitive-behavioral approach – an approach strongly anchored in the work of James March and his associates (e.g., March, 1991; March and Olsen, 1976) – has had a strong influence on theory and research on organizational learning for several decades. A basic assumption underlying this approach is that organizational learning is about the development and change of routines through the accumulation of experience. The key term routine includes rules, norms, procedures, strategies, and technologies that are assumed to guide actual behavior in and of organizations and their subunits. In some studies, the notion of routine is treated as explicitly formulated prescriptions. Other studies apply a broader definition and view routines as distributed procedural knowledge (knowing-how), skills, or habits. Still others broaden the view of the products of organizational learning to also include declarative knowledge (knowing-that) and mental models at the individual level, and at the organizational level interpretative systems or shared mental models and frameworks (Kim, 1993; Hedberg, 1981). Organizational learning is conceived of as a process where routines, beliefs, and actions adapt incrementally to past experience through feedback from organizational actions and their outcomes in relation to targets. Specifically, March and Olsen (1976) depict organizational learning as a cycle comprising four stages, including individual beliefs, individual action, organizational action, and environmental outcomes (responses).

The sociocultural (or situated) approach to organizational learning focuses on culture as a core concept. Rather than conceiving learning as a process of knowledge acquisition through experienced-based changes in cognition or action, there is a focus on learning as participation in work practices and activities. Furthermore, what is learned is assumed to be in a fundamental sense connected to the conditions under which it is learned, that is, it is in this sense situated. In line with this, a main tenet is that learning cannot be separated from working and other social practices where it is assumed to take place or be used (Brown and Duguid, 1991). On the contrary, learning is defined as a matter of participation in practices, and indeed, as an aspect of “legitimate peripheral participation” in “communities of practice” (Lave and Wenger, 1991). In line with this focus on participation, learning about practice is less central than learning to become a practitioner. Thus, processes of identity formation are viewed as important aspects of learning. Furthermore, learning and processes or activities (knowing) rather than content or products (knowledge) are emphasized. The sociocultural approach has received considerable attention in recent years as an alternative to the cognitive-behavioral approach, which has been criticized for a decontextualized view of knowledge, and for separating individual and organizational learning. However, critics of the sociocultural approach have, to some extent, reversed these arguments. Thus, it has been criticized for a tendency to reduce learning to an aspect of participation, thereby making it impossible to analytically separate learning and other organizational processes.

The knowledge-creating approach is based on the view that the production, transformation, and utilization of knowledge are fundamental for understanding organizational learning (Paavola *et al.*, 2004). Learning is viewed as an interplay between intra- and inter-individual (social) processes of knowledge creation. The content of learning is knowledge or competence and mechanisms (processes) of learning are typically conceptualized as cyclical processes of problem-solving and knowledge transformation. Perhaps the most well-known framework within this approach is the model proposed by Nonaka and Takeuchi (1995). This model assumes that knowledge creation could be understood as a cyclical process of knowledge conversion based on the interaction between tacit and explicit knowledge. Four modes of knowledge conversion are distinguished: socialization, externalization, combination, and internalization. Another example of a model within this approach is the model of expansive (innovative) learning proposed by Engeström (1999). This model, based on activity theory, views learning as a cycle of epistemic or learning actions starting with the questioning of prevailing practices in an organization. The learning cycle proceeds through an analysis of the existing situation and the creation, testing, and implementation of a

conceptual model of a new idea that is assumed to explain and provide a solution to the problematic situation that initiated the learning process. This model has also been used as an intervention method for facilitating innovative learning in organizations. A third example is the knowledge evolution cycle proposed by Zollo and Winter (2002) based on the evolutionary process of variation, selection, replication, and retention. Underlying this model is a distinction between three learning mechanisms called experience accumulation, knowledge articulation, and knowledge codification.

Conditions and Practices of Organizational Learning

Although organizational learning is sometimes viewed as a natural, continuous process of adaptation in response to internal or external events – processes that may not be conscious or intentional – there is much evidence that indicates that processes of learning are easily interrupted by different kinds of barriers or constraining factors. A conclusion drawn from such observations is that organizational learning needs to be consciously facilitated and supported by consciously planned interventions. Thus, it is assumed that organizations need to learn to learn. This could mean to learn to carry out processes of deliberative inquiry and reflection, and thereby, develop new routines, new knowledge, or new ways of handling a certain organizational problem or task. In accordance with such an interventionist view of organizational learning, a wide range of organizational learning interventions have been developed based on different conceptions of learning. Examples of organizational learning interventions include: project-based learning and action learning interventions based on notions of reflective practice; process consultation; dialogue meetings; open space technology; and different types of learning laboratories (Dierks *et al.*, 2001; Easterby-Smith and Lyles, 2003).

Most organizational learning interventions are, implicitly or explicitly, based on assumptions concerning factors that are likely to constrain or facilitate organizational learning. The purpose of the intervention is of course to attempt to create favorable conditions for learning. What then, does available research tell us about conditions for organizational learning? What factors are assumed to constrain or facilitate learning? One answer to this question is the influential theoretical model proposed by March and Olsen (1976). These authors distinguish between different types of interruptions or blockages that result in restricted or incomplete learning cycles. Others distinguish between conditions related to structural factors, subjective and cultural factors, and factors related to leadership. Among structural factors, many writers underline the importance of the characteristics of the tasks that the organization

is attempting to handle (e.g., task complexity and frequency). Other studies emphasize that centralized and hierarchical structures, as well as too high a degree of formalization and standardization of work processes, are likely to impede learning; in particular, when such structural conditions are combined with limited opportunities for organizational members to participate in organizational decision making. However, there are radically different views concerning the meaning and consequences of these factors for organizational learning.

Although many organizations are structured by gender, there are a few studies of gender aspects in relation to organizational learning. Rather, organizational learning has been studied as a gender-neutral process. This is the case in spite of the significance of gender in relation to other organizational processes. Considering this research, it is quite likely that organizational demographics with respect to gender – as well as in other respects – would be significant for processes of organizational learning. For example, organizations dominated by men could be expected to provide different conditions for learning compared to organizations dominated by women (Berthoin Antal *et al.*, 2001).

It is also possible to identify a number of factors with respect to subjective and cultural issues. In the analyses proposed by Argyris and Schön (1978), and in later studies, so-called defensive routines developed by individuals for protection from threatening situations are viewed as major obstacles to learning. Many writers also focus on anxiety and fear as barriers to organizational learning, and emphasize the need to create psychological safety and trust in order to counterbalance the feelings of threat and anxiety that may be provoked by organizational learning interventions. A factor that many assume is likely to facilitate learning is the extent to which the organizational culture encourages questioning and critical reflection on what is taking place in the organization. Other characteristics of an organizational culture that are considered by many as supportive of learning would include issue orientation, openness, trust, and norms that emphasize initiative and risk-taking, tolerance toward disparate views, and tolerance for admitting errors. Although conflict is assumed by some to be an obstacle to learning, many researchers would agree on the importance of conflicts as driving forces for organizational learning. An equally important factor is how conflicts are handled and resolved as part of an organizational learning process.

A recurrent issue in the literature on organizational learning is the importance of leadership as a condition for organizational learning and, conversely, the lack of adequate leadership support as an obstacle to organizational learning. Leadership support for organizational learning includes the design of an enabling learning environment in the organization, that is, an environment which has many of the structural and cultural features mentioned

above. Other important leadership tasks would include the provision of organizational resources (e.g., time) for learning and the facilitation of learning on the part of organizational members both individually and collectively, for example, by asking challenging questions, stimulating intellectual curiosity, and acting as a coach or mentor (Sadler, 2001).

Power and Politics

As observed by many writers on organizational learning, issues of power and politics in relation to organizational learning have, to a large extent, been neglected in the past. This is somewhat astonishing considering that power and politics for quite a long time have been recognized as important areas within the more general field of organizational studies. The relative neglect of these issues within the field of organizational learning is also astonishing, given that many writers in this field emphasize the importance of conflicts and contradictions as essential for learning in organizations.

However, the lack of emphasis on power and politics is not uniform across the field of organizational learning. In particular, many writers, from what was previously described as a sociocultural approach and a knowledge-creating approach to organizational learning, emphasize the importance of power relations for understanding organizational learning. In line with the practice orientation of these approaches, and the view of learning as integral to everyday work practices in organizations, it is emphasized that learning practices are embedded in and are enabled or constrained within relations of power (Contu and Willmott, 2003). Consistent with this position, it has also been argued that access (or lack of access) to specific learning practices, as well as the division of labor, and thereby, available opportunities for learning, is shaped by prevailing relations of power in the organization and in society at large. The issue, then, becomes one about who participates and who is not allowed to participate in specific learning practices. Another important issue from a political perspective concerns what is valued as knowledge, and whose knowledge and ideas are recognized in an organization. Power differences between different groups in an organization, for example, between different departments or between groups with different status may be assumed to influence whose learning is recognized and acted upon.

Other important issues that have been raised and debated from a political perspective on organizational learning relate to control and ideology in organizations. According to one position, organizational learning represents the ideology of particular power groups (e.g., the management of an organization, but also different groups of experts) and it is used to mask and legitimize the

interests of these groups. In addition, organizational learning is seen as a mechanism and a methodology of control that aims to discipline members of an organization (Gherardi and Nicolini, 2001). Thus, according to this view, organizational learning is a practice for the management of meaning, and a soft means for the subjugation of employees. More specifically, the latter could mean increasing the legitimacy of the organization in the eyes of the employees as regards its goals, fundamental ideology, and power structure, and thereby, contributing to increased employee loyalty with and support for the goals and values of the business. Although there are a number of articles and books that deal with these and related issues, there is a notable lack of empirically substantiated knowledge concerning these matters.

Program Planning

A L Wilson, Cornell University, Ithaca, NY, USA

R M Cervero, University of Georgia, Athens, GA, USA

Those who study and practice adult education have tended to be more interested in questions about what and how adults learn than in questions of how to organize adult education. Yet adults intentionally decide to learn something in some sort of organized fashion that typically requires some individual or group to take on the responsibility of designing and organizing educational activities. Such educational responsibilities have been called different names – program planning, program development, curriculum and instructional design, program organizing, and program design – but regardless of the label such activities typically constitute decisions and actions about what is to be learned, how the learning is to take place, who the learners and the teachers are, and what the education is for. From the beginning of the formal organizing of the study and professional practice of adult education, there has been an interest in developing program planning theory as an aide to those organizing education for adults. As Sork and Newman (2004) note, this theoretical pursuit seems more peculiar to academics in North America than elsewhere. Nevertheless, there has been a continuing effort, both as a result of academic interest as well as practitioner inquiry, to develop principles and procedures – that is, theories and methods – for designing and implementing programs for the education of adults.

Beginning in the 1920s in the United States, such effort has produced literally hundreds of program planning theories in adult education (Sork and Buskey, 1986; Wilson and Cervero, 1997). Two observations have emerged as a result of this proliferation. First was the growing sense that amidst such variety there was actually more uniformity than was apparent which Sork and Caffarella (1989) demonstrated when they developed their generic model of program planning. Second was a sense of a growing gap between what theorists prescribed in planning theories and what practitioners actually did when planning programs (Cervero and Wilson, 1994; Sork and Caffarella, 1989). That gap is a function of many factors, chief of which is the failure of planning theorists to develop adequate theories of context and practical action (Cervero and Wilson, 2006). Our view is that theory should be able to both explain and enable practical action (Foley, 1999). Most adult education planning theory, until fairly recently, represented only one main tradition for understanding and enabling practical planning action. Yet most of that theory was limited in its understanding of what actual planning practice required and instead depended

upon normative prescriptions of what planners should do, which tended to be a highly idealized form of instrumental rationality (Cervero and Wilson, 2006).

The value and utility of program planning theory lies in its ability to provide plausible accounts of actual planning practice, interpretations of what is practically possible when planning programs for adults, and politically strategic practices that foster ethically informed goals (Bernstein, 1976; Forester, 1989). The purpose of this article is to review three traditions of planning theory – conventional, deliberative, and critical – in terms of how each answers the questions of what do planners do when planning programs, what really matters when planners plan programs, and what is good planning. Addressing these questions will enable us to examine the different understandings of context and action that each tradition depends upon in order to provide its theoretical accounts and practical prescriptions. We conclude with a discussion of the challenges facing adult education planning theory and practice.

Conventional Planning Theory

As is often the case with education more generally, planning theorists in adult education have tended to think of planning ahistorically (Wilson, 2005), yet it sometimes helps to see what is now by looking at what has been. There is one tradition that has dominated historically and theoretically, and continues to dominate planning discussions. Sork and Newman (2004) call this tradition the conventional which also has been described as the classical (Cervero and Wilson, 1994). Although clearly evident since near the beginning of the twentieth century (Pinar *et al.*, 1995), conventional planning theory is best landmarked by the appearance of Ralph Tyler's basic principles of curriculum and instruction in 1949. In his book, Tyler (1949) codified the essential conventional planning logic and method: "if an educational program is to be planned . . . it is very necessary to have some conception of the goals that are being aimed at. These educational objectives become the criteria by which materials are selected, content is outlined, instructional procedures are developed and tests and examinations are prepared" (p. 3). This is Tyler's rationale: that without objectives no other planning decisions can be made and that each decision logically induces the next, hence the numbering of his four famous questions (and the beginnings of decades of debate in

curriculum theory). This sequential logic driven by the definition of objectives is the underlying thought – theory – of all conventional planning theory, which Malcolm Knowles in his 1950 book *Informal Adult Education* made so clear and nearly all the adult education planning theory since has personified (Sork and Buskey, 1986; Wilson and Cervero, 1997). Conventional theorists in adult education have elaborated and refined conventional logic by adding steps such as analyzing planning contexts and administering programs but have not fundamentally altered the prescribed “sequentially and logically ordered set of tasks in which educational planners first assess learning needs, then develop learning objectives from assessed needs, next design learning content and instructional formats to meet learning objectives, and finally evaluate learning outcomes in terms of whether the objectives were achieved” (Wilson, 2005: 525). The proliferation of conventional planning theory that Sork and Buskey (1986) first identified and Sork and Caffarella (1989) codified has continued without abatement (Cervero and Wilson, 2006; Sork and Newman, 2004).

According to the conventional view, what do planners really do? Planners follow the steps. What really matters? Following the steps in order, for if they are not followed in order, then logic of the rationale breaks down and the resulting planning for education is not good. What is good program planning then? Following the sequence in the prescribed order? According to the conventional view, principally and practically the systematic process of planning always starts with objectives, proceeds through multiple design and implementations steps, and concludes with the evaluation of whether the objectives have been obtained. The efficacy of conventional theory depends upon following its internal logic. If the logic is violated, then consequences are moot. What really matters in conventional planning theory is the understanding of context and practical action that drive such theories or, perhaps more accurately, the lack thereof. These planning theories represent a form of professional scientific logic that promotes “instrumental problem solving made rigorous by the application of scientific theory and technique” (Schon, 1983: 21), or, as more commonly known today, technical rationality or instrumental reasoning. The critique of technical rationality as a limited basis for the performance of professional activities like education is now well developed. Its attempt to adopt rigorous, rational problem solving as the basis for professional practice dims in the face of the actual interactive complexities of humans and organizations that planners really have to address in order to plan. So a serious limitation of conventional planning theory is the assumption that rational planning procedures will work equally well in any circumstances and that practical action is defined by and limited to the execution of procedures. Rational planning, however, does not work the same in every situation and, indeed, can actually disguise the workings of power in certain circumstances (Cervero and

Wilson, 2006). The rational planning of conventional theory typically does not eliminate but routinely ignores the noise of context and people (Forester, 1989). So conventional planning theories provide neither a plausible account of practice nor ethical standards for practice, so they therefore provide no way of imagining the need for politically strategic planning action. Within its instrumental frame, has conventional theory provided a set of principles and procedures to which planners need to attend? Certainly it has, because planners who do not know the differences between needs assessments and instructional design, between evaluation and objectives, between administrative plans and curriculum plans will be of little use to their organizations. Not only do planners need to know these concepts and principles, they likewise need the wealth of technical methods so abundantly provided by conventional theory for conducting needs analyses and audience surveys, curricular organization and site management, evaluation and organizational analysis. Yet to rely solely on conventional planning principles and instrumental technique runs the risk of ignoring the exigencies of real people planning real educational programs in real organizational settings. To get a sense of efforts to understand and enable action in such conditions, we turn now to a related but distinct tradition called the deliberative.

Deliberative Planning Theory

If Ralph Tyler personified the logic of the conventional tradition, Joseph Schwab (1969) named its major limitations: it failed to understand the way in which people made planning decisions and the conditions in which such decisions were made. Practitioners for decades have routinely indicated that although the conventional principles and techniques are helpful, they rarely represent how actual planning decisions get made in the complex human and organizational contexts that planners work. In critiquing the procedural emphasis of conventional planning theory, particularly the requirement to always begin with objectives, proponents of the deliberative traditions (Schwab, 1969; Walker, 1971) argued that planning was best understood as a process of practical (as opposed to instrumental) reasoning. Practical reasoning as a deliberative process requires analyzing the context and then making the best judgments possible about what to do, given the restrictions and possibilities of the specific set of circumstances. Another major insight of this tradition is that planners may neither need to complete all the steps of the conventional tradition nor address them in the sequentially prescribed order. Houle’s (1972, 1996) insight was that planning was better understood as decision points (rather than steps) that could occur at any time and often simultaneously undermined the preferred sequential logic of the conventional view. Despite decades

of producing planning models, the only significant theoretical debate in the adult education planning literature has been about whether the steps have to be followed in order (Wilson and Cervero, 1997). Planning theory has moved steadily from a discounting of the preferred sequential enactment of planning tasks to an iterative understanding of planning human decision making within the constraints of specific contexts (see Caffarella, 2002; Sork, 2000; Sork and Newman, 2004). This theoretical move is believed to diminish the acknowledged theory–practice gap characterizing conventional theory. While promising in that the deliberative tradition does bring acting people into variable settings, “this tradition’s invocation of ‘deliberation’ . . . is actually similar to what the conventional view holds as rational problem solving . . . because deliberation essentially represents the decision-making aspects of implementing rationalist problem-solving steps” (Cervero and Wilson, 2006: 246).

According to this tradition, planning practice is best understood as people deliberating about the best course of action to follow given the constraints of the circumstances. This is what planners do. In addition, what matters in this view are the specifics of situational constraints, the values of the planners deliberating about what to do, and the judgments about courses of action that ultimately obtain, given the confluence of constraints and values. So good planning is defined by defensible judgments that justify action in terms of constraints and values (Schwab, 1969; Walker, 1971). Such an understanding of planning does begin to provide a plausible account of practice because it adds to the proceduralism of conventional theory the actual people who deliberate about and enact the decisions on planning as well as including the understanding that such decision making is always constrained and/or enabled by the context. Bringing people and settings into the equation is a promising advance on understanding practical action in context. Where this view is limited, however, in naming more precisely how people act in context, what defines context and how it works to constrain or enable, or whose values should matter. To see what more precision might look like in terms of practical action and context, we turn next to critical traditions.

Critical Planning Theory

Whenever people have sought to change oppressive social, political, and economic conditions, there have usually also been people who have organized education to facilitate such change. With antecedents in the nineteenth century and before, and throughout the twentieth century and beyond, there have been people who have organized adult education for settlement houses, in labor movements, at workers colleges, in civil rights movements, for anti-war movements, in anti-globalization efforts, and whenever and wherever

people have needed to learn in order to seek change. Places like Hull House, Highlander, and Antigonish, and people like Jane Addams, Myles Horton, and Moses Coady plus scores of lesser-known but no less involved people and places provide a lengthy history of educators working to redress social and political injustice. There has been very little planning theory in adult education to explain and enable this kind of educational work; indeed, it may well be that movement, union, and civil rights educators rarely even thought or think of themselves as educators. Nevertheless, there has evolved various critical theories of planning. Perhaps most prominent in terms of planning theory would be Paulo Freire. Sometimes implications for planning theory are noted in his *Pedagogy of the Oppressed* (Sork, 2000); others are explicit in naming it as planning theory (Boone *et al.*, 2002; Wilson and Cervero, 1997). Specific chapters in *Pedagogy* describe organizing and implementing strategies to foster critical transformation and social change. John Forester (1989) has developed a theory of planning based on and directed toward fostering Habermasian communicative ethics and participatory practices. Cervero and Wilson (1994, 2006) have been described as beyond the conventional (Sork and Newman, 2004: 112) because of their theory’s focus on fostering democratic planning by negotiating interests in relations of power.

Planners in the critical traditions typically understand the world to be structured with inequitable power relations and seek to organize possibilities for changing those relations by using education to enhance democratic participation in the planning, implementation, and consequences of educational actions. Education is thus a political and ethical activity whose purpose is to promote social justice and emancipation through a restructuring of society’s cultural, political, and economic relations – this is what really matters. Good critical planners anticipate the structural distortion caused by inequitable power relations and seek to counteract such distortion by fostering democratic participation. Critical traditions fully incorporate the insights of the conventional planning theories such as the need for a professional repertoire of technical procedures and deliberative insights concerning decision making and the influence of context. But in the critical traditions the context is described specifically as power relations and practical action as tactics to enhance participation. Thus, the value positions underlying critical planning are starkly articulated. While value positions of planners and organizations are allegedly neutralized by the deployment of rational problem solving in the conventional view (the faith in the efficacy of rationality is the value position), in the deliberative traditions values are clearly acknowledged to be a formative force in shaping decisions about planning, but no values are specified. The quest for social justice and democratic participation are the platform values for planning thought and action in the critical. Overly celebrated as well as routinely ignored, there is a wealth of historical accounts

and present-day examples that exemplify the plausibility of this tradition, which indicate that its interpretative stances are practically possible, and that the traditions represent ethically informed and politically strategic visions of what should be.

Conclusion

Sork and Newman (2004) have noted that most theoretical writing about program planning has emanated from North America, and we, as they, wonder what a genderized, feminized, colorized, or other-culturalized understanding of planning might be. Until the 1990s, almost all theoretical discussion represented just one tradition – the conventional (Sork and Buskey, 1986; Sork and Caffarella, 1989). That discussion tended to debate the details but not the underlying formative assumptions and structures of thought that enabled their proliferation. Because of the dominance of the conventional tradition (and probably because of who has been writing theory), there has been little awareness of possibilities of rethinking what has been the norm. Even so, as we have indicated here, there are at least three traditions of planning theory that purport to understand and enable practical planning thought and action: the conventional, the deliberative, and the critical (Cervero and Wilson, 1994, 2006; Sork, 2000; Wilson, 2005).

There are a number of challenges we could recount by way of conclusion. Knowles (1950) argued that it was time to get beyond trial and error and make adult education planning theory more scientific, by which he invoked the instrumental problem solving of the Tyler rationale. In one of the few studies of actual planning practice, Pennington and Green (1976) demonstrated empirically the deliberative tradition's understanding of planning as contextually bound decision making; Houle (1972) had already developed a theory of adult education planning defined by decisions points. Pennington and Green (1976) asked questions which we are still asking: what do planners really do and why is there a theory–practice gap. They concluded we need better planning theory because actual planning was “superficial at best” and planners often planned by “the seat of their pants” (p. 20). But even as their investigations illustrated the insights of the deliberative tradition, Pennington and Green advocated for the conventional in order to “strengthen the operational aspects of those decisions” (p. 23). Sork and Caffarella (1989) likewise sought a “firmer foundation” for planning theory because the planning literature promoted an “idealized process” that did not take “into account the exigencies of day-to-day responsibilities of practitioners” (p. 243). They concluded that the gap between theory and practice might be widening because theory was becoming “increasingly irrelevant to practice” (p. 243). Such irrelevancy might be because planners took “shortcuts” in their

planning work and because context does influence planning practice considerably, as Pennington and Green's investigations showed. Sork (2000), in noting the selective origins of most planning theory, asked whether we could develop planning theory that would “both explain the complexities of planning and guide those involved” (p. 179). Although he remained skeptical of success of accomplishing that, he nonetheless proposed his question-based approach to planning as a way to understand and guide thought and action in planning practice. Sork and Newman (2004) again questioned the narrowness of the male, North American view on planning theory and noted the perhaps not-so-coincidental dominance of technical rationality in planning theory that tries to make such theory more scientific. They invoke Malcolm Knowles's injunction about andragogy to argue that “it may be more accurate to say that program development can be thought of as *either* an art or a science, but might more productively be considered a bit of both” (p. 97; original emphasis).

The greatest challenge to planning theory remains the continuing “split between what theorists prescribe and practitioners do” (Wilson, 2005: 528). It is, no doubt, the case that there are those who are responsible for developing programs for adults do so by the seat of their pants, as Pennington and Green once characterized much adult education planning. Even so, there are many experienced practitioners who are well aware of the political, ethical, and technical dilemmas and opportunities that face them daily. Because of the dominance of the conventional theory, too many theorists continue to recommend rationalist problem-solving sequences as the only response set to the practical choices practitioners must routinely make. The consequence is the continuing theory–practice gap: “The practical, empirical, and theoretical question remains: how to integrate the technical, political and ethical dimensions of planning practice in order to better understand and act in the contexts planners actually work in” (Wilson, 2005: 528; see Caffarella, 2002; Cervero and Wilson, 1994, 2006; Sork, 2000, for integrating efforts). The gap continues because we have yet to develop the theoretical understandings of human action in context that represents plausible accounts of practice that provide politically strategic practices that foster ethically informed goals. We believe planning theories should explain and enable action and have described three related but different traditions by discussing them in terms of how they understand practical action in context.

In closing, we would like to make the following points. Each tradition contributes to creating the theory–practice gap by how they understand practical action in context while each also contributes to resolving that tension. The conventional creates the widest gap because of its rationalist assumptions and its contention that rationality neutralizes the effects of context. Yet its bountiful supply of

technical planning procedures is crucial to actual planning practice although procedures cannot be mistaken for practice itself as if often the case. The deliberative promisingly attempts to understand the unavoidable interaction of people and context yet its view of practical reasoning is but a variant on technical rationality. The critical gets closer to providing an understanding of practical action in context with its view of a world saturated with power relations and planners as politically strategic and ethically charged organizers. It is closer but not exhaustive. Clearly planning theory needs more empirical investigations of actual planning in many different settings if we are to further develop the insights and injunctions of the three traditions. While there has been a plethora of theoretical modeling and an abundance of technical prescriptions, there has been relatively few investigations of actual planning practice. While the discipline of adult education has emphasized adult learning, it has depended upon an assumed professional ethos of the planner as technical facilitator of planning processes. There is certainly merit to this conception but it is quite limited as the deliberative and critical traditions would suggest. Clearly planners represent and take sides when planning programs and we need to learn more about which sides we should take and how best to take them.

Workplace Learning Frameworks

S Billett, Griffith University, Brisbane, QLD, Australia

© 2010 Elsevier Ltd. All rights reserved.

Glossary

Duality – Two related phenomena who enjoy some degree of interdependence (i.e., the opposite of a dualism).

Educational purposes – The kinds of goals, aims, and objectives to which educational efforts should be directed.

Integrating experiences – Drawing on and reconciling experiences from different settings to assist secure the contributions from both settings and thereby.

Learning environments – Social and/or physical spaces that afford experiences and activities, that by degree invite and are supportive of individuals' learning.

Personal epistemologies – The bases by which individuals initiate, direct, monitor, and evaluate their processes of thinking and acting, and learning, not the least through how they construe and construct what they experience.

Rich or robust learning – Learning that is not restricted in its applicability to the circumstances of its generation.

Socially rich environment – Social settings that provide close guidance, by expert or more experienced social partners as well as opportunities to observe and imitate the performances of more expert counterparts.

Emerging and Growing Interest in Workplace Learning

There is a growing interest in workplace learning. This seems set to continue as the securing of skills throughout working life becomes, globally, an important priority for governments, industry, and workers themselves. Currently, workplace experiences are acknowledged as playing important roles in preparing for working life. These include assisting individuals identify preferred occupations, experiencing and understanding the world of work, and most commonly, contributing to the initial preparation of their skills for paid work. Yet now, and in their own right, these experiences are seen to offer an effective means for maintaining skill currency right

across working lives, meeting enterprises' special needs, and maintaining the effectiveness of older workers. Together, these represent important social and economic purposes and in ways that are often tightly intertwined.

In effect, recently, workplaces have moved from being seen as providing experiences to support learning in educational institutions, to providing important social and economic purposes. These are associated with developing further and maintaining occupational competence, enterprise-specific skills, government economic imperatives for a competitive economy, including assisting workers resist redundancy, enhancing learning occurring in educational institutions and individuals' needs to develop and maintain skilfulness. Such an array of expanded purposes warrants adequate frameworks for understanding about how these kinds of learning might be provided for through workplace experiences.

There has also been a growth in scholarship about learning through work providing conceptual and procedural accounts of adults' learning in and throughout working life. These developments can inform both the kinds of pragmatic and strategic concerns outlined above, as well as those about learning in general, and how learning can be supported through activities in workplace settings. These include understanding the central role of the negotiations between the personal and social contributions to that learning. It is through a consideration of such purposes and these conceptual and procedural developments that frameworks for considering, organizing, promoting, and evaluating adults' learning through work can be best advanced.

Such frameworks need to be informed by a consideration of the purposes for this learning, conceptions of the processes of learning through work, and in what ways these experiences might be better ordered to secure particular kinds of learning for these purposes. This includes identifying what kinds of practices have demonstrated efficacy in supporting learning and the potential to guide workplace experiences toward particular outcomes. Moreover, there are perennial issues about the worth and legitimacy of the purposes, circumstances, and processes of workplaces as learning environments. Rather than accepting their worth, contributions and legitimacy in terms of a site for learning that predates educational institutions as we know them today, workplaces are seen as being inferior and subordinate to those institutions.

In advancing bases for a framework for workplace learning, this article first outlines some purposes for and

conceptions of learning through work. Then, it discusses procedural and conceptual developments that shape and reshape workplace-learning frameworks. It concludes by offering some parameters for such a framework principally comprising a duality between what the workplace affords learners in terms of opportunities and support, and how individuals engage with these affordances as they learn through their experiences.

Purposes of Learning Through Workplace Experiences

There are three broad categories of purposes for the provision of workplace-learning experiences. The first is contributing to educational processes about preparation for work and working life. This includes assisting individuals understand the requirements for working life and to identify which occupation they are suited to and interested in. For those in the structured program of occupational preparation in schools, universities, and college, workplace experiences are also used to practice, augment, and extend learning secured in educational institutions. Second, for many entering work or occupations, there is no available or accessible education provision. Hence, workplaces are the only source of learning experiences, to develop the capacities for performing that work. Third, as foreshadowed, beyond initial preparation, there are growing imperatives of governments, employers, and workers themselves to maintain skills throughout working life in order to resist redundancy, make effective work transitions as occupational requirements change, and contribute to the workplace's continuity and development and to the economic prosperity of their communities. Added to these are growing concerns about older workers and others who are marginalized groups (e.g., disabled, nonnative speakers, etc.) who often need to maintain their employment viability with limited assistance from their employers.

The prospect for realizing these purposes through learning in workplaces was granted legitimacy and buoyed by the situated-cognition movement of the late 1980s and early 1990s (Brown *et al.*, 1989; Collins *et al.*, 1989). This movement emphasized the particular contributions to learning from the settings in which practice occurred and evidence that strategic as well as situationally specific learning can be realized through such experiences (Raizen, 1991). Yet, the key motivation behind this research was to improve experiences in educational institutions (Resnick, 1987), by understanding processes of transfer from one setting or activity to another. Considerations of situationally distinct goals for practice and contributions for learning through practice offered an explanation for the paucity of the transfer of learning from educational institutions to circumstances and practices beyond educational

institutions (Newman *et al.*, 1984, 1989). Indeed, research into the situated nature of learning often looked to workplaces as sites of authentic practices and how learning arose through participation in work activities. However, more recent accounts have now focused on the learning potential of workplaces, and include not just a consideration of their physical and social settings, but also on those who engage in and learn through work.

Occupation preparation for both the professions and trades has long engaged students in extensive periods of occupational practice in workplaces. Concerns about postschool pathways and transitions are also now leading to schools providing workplace experiences to assist students understand the world of work beyond schools. Moreover, concerns about the transition from university and the applicability of what is learned there to practice in employment is motivating universities in a growing number of countries to engage their students in professional experiences, and finding ways of integrating these experiences with those within higher education programs. Although long exercised in teacher, nurse, and medical education, these kinds of experiences are now being extended across university programs preparing graduates for professional occupations. The cooperative education movement of North America is a longstanding response to this education concern. Yet, even so, genuine efforts to integrate the learning experiences, such as these, are until now the exception, yet are important for securing rich learning from the contributions of both settings.

Therefore, the purposes for considering workplaces as learning environments in their own right and as making distinct and legitimate contributions to educational institutions' programs and curriculum stand as important bases for understanding and appraising workplace learning.

Conceptions of Workplaces as Learning Environments

To understand workplaces as worthwhile places to learn in, it is necessary to capture their qualities, demonstrate their legitimacy, and advance ways in which their contributions can be fully engaged. Certainly, there has been long-held acceptance of the value of learning through practice and through workplaces. Plato describes the process of learning to become artisans and artists as that occurring through association, imitation, and practice, starting with play, within the family of artists and artisans and in the circumstances of practice. As Lodge (1947) notes "... at first, the imitation would be playful and childish, carried out with such toy tools as a child could handle. Later it would become more deliberately purposive. Practice produced technical proficiency in detail and

the growing boy would act first as his father's 'helper', then as his associate, and would eventually himself become the head of a family, and the centre from which further training in the family craft would radiate" (Lodge, 1947: 17). Yet, far earlier, similar processes were used in ancient Babylonia (Bennett, 1938). Subsequently, traditions of learning through practice for occupational purposes extended well into the medieval times, buoyed by the practices and power of guilds (Deissinger, 2002). Indeed, most of the buildings, structures, and artifacts from these times, and at which we now marvel, were the product of learning through work practice. The skills for constructing the great European cathedrals progressed in similar ways to those which Plato described in Hellenic times (Gimpel, 1961).

Therefore, long before education institutions were created for these purposes, generations of skilled artisans across Europe and elsewhere learned their skilled work through work-related learning experiences alone. Indeed, it was the impact of the decline of the guilds and the erosion of work-based experiences in some European countries that created the need for specific educational institutions. However, despite the growth of educational institutions for such purposes, experience of practice has been sustained to this day in the trades and the professions. Indeed, they are now being enacted more widely across countries and educational sectors. Yet, there is often a parsimonious acknowledgement of the quality of learning processes and outcomes that arise through these practice experiences. Typically, they are still seen as experiencing practice, rather than important sites for learning and as being less desirable and potent than learning through participation in educational institutions. Even in programs for the trades and professions, these experiences are often seen as primarily to apply or practice what has been learned in educational institutions. For instance, rarely are these components explicitly integrated into the curriculum or assessed, in ways that are commensurate with their contribution to student learning.

So, despite these traditions and now-emerging imperatives for workplace-learning experiences, their status still stands as being inferior, rather than different from what is provided and experienced in educational institutions. A significant barrier is legitimating learning through practice in an era where strong associations between teaching and learning have become embedded through universal compulsory and lengthy education, and in which teaching is seen as the way in which important learning is best mediated. While those who have learned occupational practice invariably report the importance of learning through practice, it still lacks the broader legitimacy, standing, and credibility of certified learning through participation in educational institutions. This seems to be the case across all education sectors, including those whose purpose is to develop specific vocational

knowledge (i.e., schools, colleges, and universities). Indeed, institutions express concern that their academic standing may be jeopardized through the inclusion of work-based experiences. In addition, there are fears that some educational norms, such as a liberal and critical education are being threatened by such inclusions (Boud *et al.*, 2001). Not surprisingly, in the discourses of educational institutions and practice, teaching is privileged over learning. Therefore, as (Marsick and Watkins, 1990) identified earlier, the absence of written curriculum, qualified teachers, and experiences purposely focused on individuals' learning, may lead to workplace experiences as being inevitably inferior.

However, such claims do not stand scrutiny. As studies from anthropology have found, robust (i.e., transferable) learning can arise as much through experiences outside of those organized and enacted in educational institutions, as in other settings (Rogoff and Gauvain, 1984). Indeed, anthropological literatures have provided helpful accounts of this kind of learning and evidence of their efficacy (Lave, 1990; Pelissier, 1991; Rogoff, 1990; Rogoff and Lave, 1984). So, experiences in educational institutions are not necessarily better at developing these kinds of knowledge. More likely, it is the kinds and combinations of activities and interactions that are afforded learners and how they engage with them that are central to the development of this knowledge, and not where these experiences occur. These then suggest a need to understand and appraise workplace learning through a consideration of both personal and social contributions to the processes and outcomes of that learning.

It seems that frameworks for understanding learning through work in contemporary times are well-served by a long tradition of learning through practice. These accounts also characterize workplaces as environments for learning, not just for experiencing and trialing and refining knowledge learned elsewhere. They refer to contributions such as activities, interactions, artifacts, and others as being pedagogic and purposive for learning, thereby offering frames for pedagogies and curriculum models for the workplace. Importantly, rather than didactic and school-like accounts of supporting learning, indirect forms of guidance and highly active roles for learners emerge as key qualities of these learning environments. The organization of learning through activities and interactions, and the active process of observation and rehearsal stand as central elements of the workplace curriculum and pedagogic practices as identified in these accounts.

Therefore, much of a first generation of recent research was directed at understanding how workplace experiences might improve learning experiences in educational institutions (i.e., schools, colleges, and universities). However, building on these accounts, a second generation of

research is now giving more attention to the particular attributes of sites and circumstances of practice (e.g., work and workplaces) as places to both participate and learn. For instance, theoretical and procedural considerations of the pedagogic qualities of different kinds of work (Colin, 2004; Nerland and Jensen, 2006), learning through errors (Bauer and Mulder, 2007), the active role of the learner (Billett, 2006b), their subjectivity and sense of self (Somerville and Abrahamsson, 2003), and the complex entanglements between personal interests and capacities and those of the workplace (Fenwick, 2004) have arisen from quite different traditions than mainstream education.

Conceptual and Procedural Advances

Conceptual advances associated with learning through work are aligned to those associated with the processes of learning more generally. Central among these are the greater emphasis on learning, instead of teaching, as is consistent with the growing purchase of constructivism, and the acknowledgement of situational contributions, in ways analogous to social constructivism. The former indicates acceptance of an expansive and active role for the learners, and positions them as being central mediators of what they experience and how and what they learn, thereby emphasizing personal epistemologies. Here, central to individuals' participation, mediation, and learning is their agency, capacity, and subjectivity. These are central to how they construe and construct their knowledge. The later acknowledges how the tasks, activities, and settings in which learners participate afford particular kinds of contributions, which in terms of workplace learning can be understood as pedagogic qualities of work settings. Both of these emphasize participation in work and learning as a dualistic conception comprising the contributions of social setting and the person. These advances are now discussed briefly in turn.

Self and Agency of Learners

The need for learners to be actively engaged in the process of learning is widely accepted within many, and probably most, contemporary theories and concepts of learning. This includes how they construe, construct, and interact with what they experience. However, this is particularly salient to considerations of learning through work and in workplaces. In provisions for learning offered through educational institutions, the teacher has a key mediating role in assisting the learner and guiding his/her development. However, while a range of guidance is available in work settings, including close guidance by more expert others, although usually on an intermittent basis, learners will necessarily mediate much of their own learning (Fuller and Unwin, 2003). This is also likely to be true of provisions that seek to integrate that learning in

both the educational and workplace setting, such as in apprenticeships, and now increasingly for professional preparation. This is because it is the learners who will have experiences in both kinds of settings and others' role are to assist them maximize their learning through integrating the contributions of both kinds of experiences.

So, the interests, intentions, and direction of learners come to the fore here and their agency will shape the potential to realize rich outcomes through these experiences. Moreover, the self and subjectivities as driving their learning in setting and securing rich learning outcomes will not be limited to workplace-learning experiences of this kind. A key basis for ongoing learning throughout working life will likely be directed by what motivates, directs, and focuses individuals' efforts at learning through work. For instance and in particular, it seems for older workers, semiskilled, those of color or with a disability, personal agency will be central in managing their learning through work, as the evidence suggests these workers are those least likely to be afforded workplace support for their learning.

To this end, there needs to be a greater decentering of the focus of learning through work from the physical and social attributes of the setting to accommodate the contributions of learners to workplaces as learning environments. Helpful accounts of personal epistemologies and learner agency have been generated in recent work (Hodkinson and Hodkinson, 2004). Many of these emphasize the relations and negotiations between individual workers' and their workplaces' (i.e., the personal and the situated) contributions to learning workplace practices, techniques, norms, etc. Such accounts illuminate how individuals likely elect to respond to governmental imperatives and employer requests to learn continually throughout working life. For instance, they advise governments and employers that their ambitions for lifelong workplace learning are unlikely to be realized unless more consideration is given to the needs, interests, and personal trajectories of those who they are exhorting to learn. Consequently, frameworks for workplace learning need to include considerations of the salience of personal epistemologies and the need to develop these for learning throughout working life, and in ways consistent with accommodating individuals' occupational trajectories. Yet, these epistemologies comprise more than personal strategies; they are central to and shaped by individuals' subjectivities and sense of self. This means that engaging the learners' interest is more than a nicety; it becomes an important imperative for efforts aligned with lifelong learning.

Pedagogic Qualities of Workplaces

Earlier socially orientated accounts of the contributions to learning of physical and social settings, such as

communities of practice (Lave and Wenger, 1991) and activity systems (Engestrom, 1993), advanced the pedagogic qualities of workplaces in terms of shared premises for participation and learning, and social system that shape participation and learning. However, recent accounts of the social contributions to learning through work have provided more elaborated accounts of the pedagogic qualities and potential of workplace settings. Some of these detail the pedagogic qualities of particular kinds of work and workplaces, while others provide more detailed considerations of the artifacts and practices in workplaces that contribute to learning, including the kinds and qualities of interactions, that lead authors to refer to their epistemic qualities. These are helpful as they lend finesse and refine earlier accounts. This then permits more comprehensive and detailed accounts of how the contributions of workplace settings can work to shape learning and how these might best be exploited to achieve particular kinds of learning outcomes.

Moreover, as considerations of workplace as learning environments have matured, the range of procedural responses has also grown. What is distinct about these provisions is that they center on the provision of workplace as learning experiences in their own right and not to augment or extend learning from other sources (i.e., educational programs). These include learning from work errors – how both qualities of workplace environments and workers' personal dispositions shape the prospect of learning purposively through workplace errors (Bauer and Mulder, 2007), learning projects (Poell, 2006), critical reflections through work experiences (van Woerkom, 2003), guided learning in the workplace (Billett, 2001), expanding learning opportunities (Fuller and Unwin, 2004), and the development of a workplace curriculum (Billett, 2006a). In different ways, these kinds of approaches open up considerations for the means by which workplace pedagogies can be developed, which stand as a key premise for framing workplace learning.

Yet, there are important conceptual and procedural goals still to be secured. For instance, much conceptual developments is premised on learners being in socially rich circumstances that provide models, guidance, etc. However, many workers are physically and socially isolated and therefore do not engage in or learn through these kinds of socially rich environments. Therefore, much needs to be known about learning in these relatively socially weak environments. Contemporary and emerging occupational and workplace practice is such that workers may be only afforded access to particular kinds of workplace experiences, those related to their occupation alone, and possibly not those that are sufficient for the comprehensive development of the workplace. So, understanding further how these kinds of knowledge can be developed stand as important goals. Then, there is the need to learn symbolic forms of knowledge and those that are not

opaque (Bresnahan *et al.*, 2002; Zuboff, 1988) or easy to learn, thereby requiring intentional pedagogic practices that can make this knowledge accessible and comprehensible. Moreover, a key concern about learning through practice is that uncritically accepting practices of the past and present may not assist the learning requirements for the future. More needs to be done to assist improving the equity of the affordances of opportunity, considering how workplace-learning opportunities are asymmetrically distributed on the basis of age, gender, language, and educational-achievement levels. Hence, there has to be a critical and questioning element to a framework that advances learning through work. Therefore, frameworks supporting and extending learning through work, need to constantly and critically examine the kinds and processes of learning that arise through participation in work and how these forms of learning can be aligned with the array of purposes to which they are directed (e.g., rich occupational knowledge).

Workplace-Learning Frameworks

At a macro level, frameworks for organizing adult learning in workplaces or pedagogies for the workplace have commonalities with those for other settings, albeit manifested in conceptions of epistemology, curriculum, and pedagogy in ways that reflect the particular kinds of social practices that comprise workplaces. These are premised on a set of practices that support learning that predates those of schooling. Overall, the commonalities include considerations of what is provided by the setting to support learning (i.e., its affordances) and how individuals elect to engage with, participate, and mediate in what is afforded them by the setting. These framing considerations are equally applicable for adults' learning across a range of social institutions (e.g., universities, colleges, communities, and workplaces). In curriculum terms, each of these has purposes (i.e., intentions for learning), enactments (e.g., means of supporting that learning), individuals who can support learning (e.g., teachers and coworkers), and learners (e.g., students and workers) that mediate how and what they learn through what they experience in these settings. Yet, there are some distinctions in the particular kinds of experiences, workplaces, and educational institutions afford, ways in which learners identify themselves and elect to participate in learning and for what purposes. The premises of workplace curriculum and pedagogy will be founded on practices being enacted in workplaces (the provisions of goods or services) as directed toward learning occupational knowledge as per the workplace's particular requirements. This may be distinct from the stated aim of educational institutions – intentional learning for an occupation. The identity and bases for participation by

workers, some of who will be guiding the work and learning of others (e.g., more experienced workers), is likely to be distinct from those who see themselves as teachers and students in educational institutions, and feature a strongly agentic role for learners. Yet, these are largely minor distinctions, thereby holding that learning through work can be informed, legitimated, and understood and appraised through orthodox curriculum concepts and pedagogic practices, and that there are also distinct features and characteristics that can be accounted for in these frameworks.

Therefore, in all, a framework for understanding learning through work can be founded on the dualities of what the workplace affords to those employed within them and how those individuals elect to engage with what is afforded them. Learning through practice, through errors, and by processes of observation and imitation, practice, and the direct guidance of experienced coworkers all stand as key elements of that framework. Besides, the kinds of work practices, and personal values and bases of identity, shape these dualities and the relations between them. In addition, the purposes of learning and the desired outcomes of that learning also stand as important foundations for making judgments about the value of that learning and how it might best be enhanced. These enhancements may well be realized through work activities or require particular and targeted intervention as perhaps increasingly, components of work-related knowledge become inaccessible and need to be made explicit.

Class Analysis in Adult Education

The concept of class is indispensable but elusive. Notions of class are deeply embedded within broader beliefs about society and history and preserved by the need to explain continuing inequalities in opportunities and standards of living or the social divisions that they foster. However, it remains an ambiguous concept, challenged by the lack of a generally accepted definition, new forms of social stratification, and identity and other subjective politics. Also, the political and cultural changes of recent times – accelerating globalization, the rise of neoliberalism and free-market capitalism, a shift from manufacturing to service economies, the decline of an industrial working class, increased militarization, greater concern for the environment, the promotion of individualism and consumerism, and widening disparities between rich and poor – have witnessed diminishing public interest in the concept of class. Some commentators have even gone so far as to proclaim its demise or at least that it has outlived its relevance. Yet, class stubbornly fails to disappear and remains an important analytic concept for examining the structural causes and manifestations of inequality and power.

Class, however, means different things to different people: a theoretical device for analyzing the social world; shared social conditions; or a set of particular orientations, beliefs, and life practices. Popular understandings still describe class in terms of occupation, income, wealth, education, mobility, lifestyle, taste or ownership and the power that accrues from them. Others see class less as a possession than a dynamic – a relationship made between different people and groups divided along axes of power and privilege. As class differences play out in power relations, adult education can play a critical role in forming and mediating these relations.

Generally concerned with identity and personal and social change, adult education seeks to provide the knowledge, skills, and attitudes for people to engage more fully in and shape their individual and social worlds. Yet, such

worlds are not continually created anew but shaped by the past. So, adult education provides opportunities for personal mobility but within systems already marked by social inequality. Whatever its particular focus, approach, or clientele, adult education is essentially a sociopolitical endeavor with struggles for power – who has it, how they use it, and in whose interests – at its heart (Cervero *et al.*, 2001).

Adopting a class analysis of adult education does three things. First, it draws clear links between adult learners, educational institutions and processes, the social worlds of work, family, and community, and the economic systems that underpin them. Second, it makes visible the struggles of those who are variously poor, excluded, or dispossessed and the educational resources they can draw upon. Third, it highlights how educational institutions and processes function to inculcate and maintain dominant ideologies and values. As adult education is a moral and political endeavor as much as it is a technical practice, it is affected by its role in maintaining or challenging the social order. Do educational policies and practices reproduce existing relations of dominance and oppression? Alternatively, do they contribute to lasting social as well as personal change?

In general, adult education is intended to ameliorate the personal and social disadvantages created by circumstance and background. So, social divisions and the tensions they bring about are commonly seen as critical issues for adult educators. In fact, the educational approaches, structures, and activities that perpetuate the silence and invisibility of marginalized and disenfranchised groups are a regular feature of the adult education literature. This literature is permeated with regular exhortations to consider class, race, and gender as prime markers of social division. Yet, in comparison with its counterparts, the study of class has tended to be underexplored by adult education researchers. To examine why this might be so, several of the relationships between class and adult

education are outlined. First, some differing perspectives on class are provided before exploring how they inform and illuminate various areas of adult education practice.

Perspectives on Class

In capitalist societies, all aspects of peoples' lives and social relations are subjected to market requirements which are then normalized and made to seem natural. People's prestige and status are related to their productive ability; society values people by how much they earn or own. Basic aspects such as where we live, how we earn a living, who our friends are, and what access we have to healthcare and education are all dependent on our ability to produce wealth and other resources. Of course, these attributes are not fixed permanently; because the distribution of resources is unequal, people strive to maintain or enhance their own share. Thus, people's struggle for access to and control of resources is dynamic. Capitalist societies are stratified into classes, hierarchies of power and privilege related to the ownership and control of various forms of capital. Capitalist systems of structured inequality continue because society portrays them as normal or inevitable: the system encourages its victims to blame themselves for their failure to be successful. In this way, dominant groups are able to maintain the status quo and the hegemony of their own ideas without facing too strong a challenge from those less powerful.

Although ideas about class have been in use since Roman times, its current articulation stems from the Industrial Revolution. By the middle of nineteenth century, Marx used class as the foundational concept for explaining social organization in terms of understanding the ownership, means, and control of work processes. He claimed that societies consisted of two main classes: the bourgeoisie (who owned and controlled the mills, mines, and factories) and the proletariat (workers with only their labor power to sell). For Marx, the relationship between these two classes is essentially unequal and exploitative. The working class generates surplus wealth but does not profit from it as much as they might because the bourgeoisie disproportionately appropriates and accumulates it. He regarded all social life as marked by the struggles and conflicts over the generation and distribution of wealth and the status attached to it. Societal transformation was only possible when workers developed class consciousness about the sources of exploitation: a sense of a shared predicament, awareness of the capitalist class as their common enemy, and a realization of their common strength and destiny (Marx and Engels, 1845/1970).

Not everyone regards class in such materialistic terms. Weber, for instance, argued that class is better defined by also including notions of culture, politics, and lifestyle. People who fall within the same economic class may

nevertheless occupy different social class positions and have differing opportunities for work, income, developing skills, obtaining education, and owning property. For Weber, one's class is based more on these life chances, cultural background, status, and life outside of work than it is on one's relationship to the ownership and control of the means of production. Rather than see society as a two-class system, Weber posited a system of social stratification of many different classes that sometimes overlap. This less-deterministic approach can also be seen in the work of Bourdieu for whom a class is any grouping of individuals sharing similar conditions of existence and tendencies or dispositions. Equally important as one's location in an economic order is the possession of various forms of capital – economic, cultural, social, or symbolic – which can constellate differently in different societies. Bourdieu's concept of class thus takes into account other stratifying factors, such as gender, race, ethnicity, place of residence, and age. Finally, these class structures are not predetermined or imposed from without but subtly reproduced by people acting within preexisting contexts. Although both Weber and Bourdieu allowed more scope for human agency than did Marx, they still regarded external class structures as fundamental and quite constant. In other words, class relationships transcend the individuals who occupy the positions: people may move around (or stay put) but they still divide into exploiters and exploited.

These two broad views have shaped current understandings of class. Throughout the social upheavals of industrialization, definitions of class in Europe continued to be affected by older ideas of rank. The lower orders, laboring classes, and the middling ranks of society (such as merchants or teachers) existed alongside the aristocracy and the gentry. However, as the stratification of industrial society became more rigid, these definitions settled into the familiar classification of working, middle, and upper class. This depiction treats class as essentially static. Although it underlines the essentially economic nature of class, such a definition ignores the dynamic and shifting nature of the relationships between those who possess wealth and power and those who do not. More recently, class has come to be regarded as a relation that is constantly changing. As one major British historian puts it, "class is not a category. . . but rather an historical relationship between one group of people and another. . . . It is defined by men [*sic*] as they live their own history" (Thompson, 1971: 9–10).

Non-European countries – many still affected by the legacy of colonization – regard themselves as relatively free from the archaic categories of class distinction. For example, in the United States, one commonly hears either that class has ceased to exist or, alternatively, that everyone is middle class. Instead, the ethics of self-reliance and mobility and the ideologies of individualism,

egalitarianism, and meritocratic achievement have been more powerful forces than class solidarity. Nowadays, existential rather than social factors tend to influence who people think they are. For example, it is far more common for people to define themselves as black, gay, Jewish, Latino, lesbian, or age- or mobility-challenged than to refer to themselves in terms of class. In some countries, the historical legacy of slavery and its lingering consequences have shaped a more complicated system of stratification – one kept in place by ideological as well as economic factors (Levine, 1998). Older depictions of class are now regarded as too simplistic for heterogeneous countries such as the USA. This has been further confounded by the rise of movements specifically identified with racial, women's and gay equality, environmental concerns, and various manifestations of religious, national, and ethnic rights. Nowadays, constructs such as class, race, and gender are commonly seen as interrelated and overlapping (Collins, 1993; Wood, 2002); social class is recognized as both gendered and racialized and viewed as but one part of a wider and interlocking system of oppression and domination (Rothberg, 1998).

With these different and competing notions of, and perspectives on, class, discussing it can be difficult. Wright (1979) identifies four major approaches to understanding class: a functional differentiation of positions within a society, groups unified by their common position in a hierarchy of power or authority, groups with different market capacities that result in different life chances, and a shared location in the social organization of production. However, whatever one's orientation, an attention to class and class analysis reveals several general principles. First, a class analysis focuses on materialist concepts regarding the production and reproduction of social life and the importance of human activity in shaping both material subsistence and consciousness. Second, a class analysis highlights the fundamental and dynamic relationships between economic and social structures, the ideologies that frame our world, and the ways we experience, understand, and shape the world. Third, a class analysis suggests that we cannot explain social phenomena by their surface manifestations nor by the ways that individuals experience them, but as, instead, representations of external divisions of power. Fourth, a class analysis provides a basis for explaining why people organize themselves into collective forces to resist injustice and exploitation. Finally, for those with a commitment to social justice, a focus on class also raises several important questions: How do we negotiate or internalize dominant ideologies and relations of ruling? How might alternative ones develop? How can marginalized people, silenced by social, economic, and cultural relations of power, recover their voices and the right to be heard? These questions are often central to the practice of adult education, and I now turn to exploring the relationships between it and class.

Class and Adult Education

Various forms of adult and continuing education are now firmly established as central to the smooth functioning of economic systems and societies. As concepts such as life-long learning and the knowledge or learning society have gained prominence, various forms of adult education and training have become key vehicles for preparing people to be adaptable to economic and cultural changes in society. Prevailing educational practices tend to inculcate dominant values rather than confront them and, because most educational institutions are generally a middle-class domain, their policies and practices are weighted strongly in favor of middle-class values. So capitalist societies, in which class operates as a primary structuring of social inequality, usually ignore or bury class perspectives. As such, many adult educators are uncertain about how their work reflects underlying political structures, let alone economic systems. Observing the effects of power and privilege is far easier than determining their causes.

A number of studies explore how education can reproduce existing patterns of power. Economists Bowles and Gintis (1976) demonstrated how educational systems are part of a system of broader capitalist class relations. Their correspondence theory explains how, in general, schools reproduce the social relations that capitalist production requires. As Bowles and Gintis describe, capital requires two things: workers of specific types and relative social stability and ideological acceptance of class relations. The capitalist class thus has a broadly shared set of interests pertaining to educational systems and the capacity to promote such interests.

Some find the correspondence theory too mechanistic or reductive; it allows little agency for those involved. One less-deterministic approach suggests that education serves the interests of the privileged by structuring learners' access to and uses of various forms of social and cultural capital (Bourdieu and Passeron, 1977). Others have introduced notions of struggle and resistance into this process. For example, Willis (1977) showed how several working-class teenage boys consciously resisted and rebelled against school and classroom authority. Tellingly, however, this resistance worked better within school than outside it: when the boys left school, they remained unable to find anything but unskilled and unstimulating jobs. McLaren (1995) and Apple (1996) also show how individuals can resist and contest social and cultural oppression in educational settings. They document the complex relationships between cultural reproduction and economic reproduction and explore how class interrelates with the dynamics of race and gender in education.

These studies indicate the essential role of education in promoting and maintaining the social relations required for capitalist production. Adult education is far

from immune from these trends. Although we now recognize that the relationships between educational practices and political structures are much more complex than correspondence theory suggests, adult educators who work in areas such as adult basic education, literacy, vocational and workplace education, and welfare-to-work, and other social programs will recognize how often their work, the policies about it, and the textbooks and curricula they use are still much more closely tied to employers' needs than to their adult or working-class students' interests (Boughton, 2006; D'Amico, 2004; Kincheloe, 1999; Rose, 1989).

Much of the published research on class in adult education explores the consequences or experiences of class and examines issues such as the participation, access, and attainment of different groups. In documenting how social class affects participation in adult education programs, such studies consistently underscore how far social class remains a key determinant of adult participation in organized learning. To give just one recent example, Sargent and Aldridge (2002) indicate that upper- or middle-class adults are twice as likely to engage in some sort of learning activity than those from the working class.

However, although such studies detail how class remains a major factor affecting adult education participation, most do not really explore either the constitutive dynamics of class or how it operates in practice. From a conceptual perspective, they add little to London's classic study (London *et al.*, 1963) which explored the important contribution that adult education makes to larger society, specifically for those deemed less educated and less skilled. London and his colleagues found a strong connection between social class and people's abilities to prosper in a rapidly changing world. Class not only affected participation in adult education activities but was also closely related to other facets of social life such as jobs, vocations, and leisure pursuits. Anticipating subsequent debates about lifelong learning, London's report called for adult education and training to "become a continuing part of everyone's life" (p. 148), providing "both education for work and education for leisure" (p. 153).

Perhaps more seriously, too few published studies further class awareness or address what Allman *et al.* (2007) describe as the chasm between class as social inequality and class as a constitutive element of the world of struggle. Instead, the published studies linking class and adult education concentrate on the results rather than the causes or workings of class. This is understandable. Individuals tend to internalize the conflicts within hierarchical systems, especially those individuals without much power. Also, people usually closely experience class at the same time as other, more recognizable forms of oppression. These factors, when combined with the scarcity of class scrutiny, ensure that people do not always have readily available concepts to identify – let alone

analyze – the class aspects of their experiences. So scholars prefer to focus on more obvious markers of social division and overlook class in their theoretical lexicon. Class is also difficult to discern: we can only examine it through its consequences or outcomes. And, as it is not easy to identify or operationalize on an individual level, it is much better suited to macro- rather than micro- analyses. Even when it is acknowledged, class still tends to be regarded as an individual characteristic or an entity rather than a constituent social relationship. So, the tendency of many adult education researchers to assume a strong individual orientation tends to further divert attention away from class perspectives.

Yet, sophisticated and theoretical explorations of class and adult education do exist – generally emanating from countries with a more prominent appreciation of class relationships. For example, Allman (2001), Livingstone (1999), Stromquist (1997), Thompson (2000), Walters (1997), Welton (1995), and Youngman (2000) all provide rich empirical and theoretical examinations of how adult education practices are linked to social class and the increasingly globalized nature of capitalism. Appreciating that class is understood and experienced differently around the world, Nesbit (2005) gathers several adult educators from different countries to explore how class affects adult education and to examine how the complex relationships between class, gender, and race play out in its policies, practices, and discourses. Discussions of the relationships between adult education and social class are also more noticeable on the margins of the established adult education literature. To give a flavor of such work, I now explore how class has been used to analyze several different arenas of adult education practice: approaches to learning, its role in social movements, and the related fields of higher education and working-class studies.

One distinguishing feature of adult education is its close attention to learning. In their studies of working people's intelligence and learning, both Rose (2004) and Sawchuk (2003) provide two of the best recent analyses of the interrelationships of class and adult learning. Both identify a distinctive working-class learning style that operates independently of formal training and centers around informal workplace and community networks. This learning style is collective, mutual, and solidaristic: people exchange knowledge and skills, hardware and software, and draw upon each other's different expertise to develop group resources for anyone to use. So they develop an expanding learning network – a powerful working-class resource that stands opposed to the trajectory of dominant forms of workplace and institutionalized education that individualize and commodify learning. Although most research on adult education and class focuses on how working-class people are excluded and help to exclude themselves from formal education,

Rose and Sawchuk show that working-class adults can bring rich cultural resources to their learning.

Adult education deliberately seeks to link the personal with the social and much of its historical development and traditions are linked with movements for social justice and equity. A class perspective on adult education's role in social movements underscores that lasting social change comes about through people acting together to challenge inequality and oppression. For example, Altenbaugh (1990), Schied (1993), and Walters (2005) provide compelling accounts of the ways in which class affects the educational activities of those who are active in labor and workers' movements or who struggle for social justice in South Africa. As Walters shows, learning about and discussing earlier battles for social justice can provide resources and hope to those involved in current struggles. Other discussions of the role of adult learning and education in social movements are provided by Holst (2002) and Foley (1999). Basing their work on the ideas of Freire, Gramsci, and Marx, they each explore the idea that radical adult educators can help build civil society through social movements. Two aspects of their work are particularly important to a class-based appreciation of adult education. First, "learning in such situations is tacit, embedded in action and often not recognized as learning" (Foley, 1999: 3). Second, the notion of learning in and through struggle: "people's every day experience reproduces ways of thinking and acting support which support the, often oppressive, status quo, but [can also] enable people to critique and challenge the existing order" (ibid, pp. 3–4).

The related field of higher education also provides analyses of how universities treat adult learners from different class backgrounds and how such students experience university-level education (Ball, 2003; Tokarczyk, 2004). Other studies explore how curricula and pedagogy in different disciplines reflect class-based interests (Margolis, 2001), how the pedagogical status quo might be challenged and classroom practices democratized (Shor, 1996), and how class shapes the identity and teaching of educators (Malcolm, 2005). The emerging field of working-class studies has also reinvigorated discussion of the intersections of class, adult learning, and institutional practices (Roberts, 2007; Zandy, 2001). Acknowledging that working-class learners now constitute a significant proportion of students enrolled in institutions of higher education, this body of work incorporates a sensitivity to students' working-class roots while suggesting curricular and pedagogic innovations informed by an awareness of class culture.

Conclusion

Class analyses of adult education highlight the unexamined patterns of behavior through which society produces and reproduces social classes in the dynamics between

educational activities and the wider cultural politics of societies. They show how capitalism is not just an economic system but rather a totalizing system of social relations. They also expose the superficiality of a variety of currently prescribed educational reforms: instrumental outcomes, the individualizing of educational opportunities, increased competition, accreditation, and commercial involvement, privatization of post-secondary institutions, a return to so-called basics, the streaming of learners into cultural or functional literacies or core competencies, the increasing pressures to work harder and longer, and the tendency to disregard or downplay social and collective notions of identity and action.

Despite overwhelming evidence to the contrary, too many still claim that the idea of class has outlived its usefulness and that focusing on it and other forms of oppression is misguided and unnecessary. Instead, educational approaches seem generally more committed to the management of inequality rather than its elimination and often encourage people to accept rather than challenge their place in society. Yet, adult educators need not be bystanders to political contexts but vital and essential members of them. A class analysis of adult education raises important and challenging questions that build upon learners' lived experiences about how inequalities play out in communities, lives, and workplaces. It also confronts any approach to confine adult education to the production and maintenance of human capital or advances the political and economic interests of the powerful at the expense of the poor. Finally, it helps adult educators and their learners resist what has been called the postmodern condition of "skepticism, uncertainty, fragmentation, nihilism, and incoherence" (Allman, 2001: 209).

Gender Analysis

J Stalker, University of Waikato, Hamilton, New Zealand

Introduction

Gender analysis is a useful tool which adult educators can use in their struggles for social justice. It is a complex activity which basically represents an optimistic attempt to end disparities and disadvantages among different genders. At its most expansive, it aims to create a paradigm shift to a world of an enduring, healthy environment and global peace.

Some might argue that the field of adult education has a strong track record of undertaking gender analysis. For decades theoreticians, researchers, and practitioners have explored women's participation and nonparticipation in various forms of adult education, the preferences and learning styles of women adult learners, the shifting roles and responsibilities of women, the different possibilities and consequences of development for women, formations of women's identities, and so on. Often, these were examined in relation to men's responses in the same contexts. However, although for many decades adult educators have theorized, researched, and practiced adult education in relation to both women and men, that is not the same as conducting the complex task of a gender analysis.

Given the above, the purpose of this article is to explore the complexities and possibilities of gender analysis for adult educators. First, this article presents the concept in terms of its interwoven theoretical positionings. Second, the article explores it as a research process of data collection, analysis, and strategic initiatives. Third, it briefly explores some benefits which accrue to gender analysis. Fourth, it examines the challenges which face adult educators who undertake gender analysis in the future. Finally, the article concludes with a summary and invitation to adult educators to make a commitment to gender equality.

Theoretical Positionings of Gender Analysis

In the industrialized world, our current understandings of gender analysis are shaped by its several theoretical positionings across the previous decades. Strictly speaking, gender analysis would encompass analyses of men, women, trans-genders, trans-sexuals, transvestites, homosexual lesbians, bisexuals, woman-born-woman, woman-born-man, man-born-woman, and inter-sexuals. Gender, after all,

is the culturally ascribed roles given to the sexual identities of women and men.

In reality, we ascribe the term gender analysis contemporarily and retrospectively to several kinds of analyses and these in turn guide our current approach to the task. Thus, below, the basic theoretical positionings, or strands, which shape adult educators' present understandings of the concept of gender analysis, are identified. Although it is tempting to present these as linear and developmental, these approaches are actually dynamic, unstable, interactive, and cyclical.

The first strand is driven by an oppositional approach and it has a long history. In this approach, analyses focus on women's situations in relation to men's situations. Such an approach rests on the evidence that women are missing from the data. As a result, its subsequent analysis and any resultant theory, research, or practice address only half the world's population. Solutions for this dilemma emphasize the notion of equality, that is, the same treatment of women and men in the hopes of creating equal outcomes.

This oppositional approach juxtaposes women with men, and positions them through their sexual identities as unique and distinctive. Those differences most often seem to be expressed dichotomously as women against men, feminism against patriarchy, powerless against the powerful.

This approach is not new, since for centuries the major religions of the world have analyzed and defined separate roles for women and men. In the wider context, as the industrialized world evolved, these definitions tended to be increasingly extrapolated and debated in terms of women's and men's relative and different economic roles as producers, reproducers, and consumers (Dimand *et al.*, 2004).

The second strand takes a diverse approach. Basically, it challenges the oppositional positioning of women and men, and values complexities and multiplicities. It argues that women, and men, do not belong to homogeneous groups. Rather, there are multi-faceted definitions of gender and many masculinities and femininities which theoreticians, researchers, and practitioners should acknowledge. The emphasis shifts to equitable treatment and outcomes within groups of women and of men, as well as between women and men, with a view to co-creating a new, more equitable, and sustainable world.

This strand has been strengthened by three forces. In the first instance, as the postmodern discourse in academe intensified, the oppositional positioning of women and

men came under close scrutiny. It became obvious that women and men were complex and not so tidily separated from each other into two groups. The rigid stereotypes and assumptions associated with each sexual identity were challenged. The clear, all embracing, distinctive divisions between the two groups were redefined as constructs with many overlaps and congruencies, influenced by context and culture. There was an awareness that women and men can make unique, yet also similar, complementary contributions. The emphasis changed to the need for both women and men to change patterns of the past.

In the second instance, women who did not see themselves in the oppositional discourse challenged it. Women from a wide variety of classes, colors, races, ethnicities, abilities, ages, and sexual orientations argued that the approach and analyses did not include the realities of their lived experiences. Rather, they suggested that the analyses were most often based in the lives of white, middle-class, heterosexual, able-bodied women. Ironically, the discourse they generated also has oppositional and diversity approaches.

Finally, it became clear that a dichotomous positioning of men against women could work to the disadvantage of women. Such a framework lent itself to straightforward comparisons between women and men. In patriarchal environments, this led too easily to a definition of men's values, abilities, and actions as the preferred norm and women's values, abilities, and actions as deficient relative to men.

In sum, the second strand has a stronger focus on gender and broader understandings of women and men. Notions of social construction, de-construction, identity formation, context, and culture merge to create a more complex, dynamic picture which is reflected in the term gender. The more static notions of reified, strongly categorized women and men are broadened to embrace wide diversity within those terms.

These two strands can be traced in the adult education literature in the publications of industrialized nations. As the selected exemplars below illustrate, the strands are simultaneously contemporary and historical. Publications in the first strand treat women as a unique phenomenon absent from our history (Hugo, 1990) and deserving of special study (Lewis, 1988; Stalker, 2005; Thompson, 1985). Often the latter publications make reference to the classic work by Belenky *et al.* (1986). Publications in the second strand reflect a view of 'woman' and 'man' as complex and diverse categories (e.g., Hayes and Colin, 1994; Graveline, 1994; Hill, 1995; Johnson-Bailey and Cervero, 1996; Luttrell, 1989; Tisdell, 1993; Walters and Manicom, 1996).

A third hybrid approach to gender analysis also exists. This is a complex strand which attempts to acknowledge the first strand's focus on women without losing the second strand's emphasis on complexity. It focuses on the

category of women yet also values the differences among and within the category. It argues that the stories, experiences, and knowledge of all women are needed in order to achieve their genuine empowerment and sometimes, it includes the role of men of multiple gender identities in the analysis and locates them as potential allies.

It is difficult to undertake gender analyses from within this strand. It requires a negotiation of space and power in new ways (Medel-Anonuevo, 1997). It is a conceptually very complex task to keep a useful balance between a dichotomous approach and a diverse approach. What often happens is that theoreticians, researchers, or practitioners give a brief acknowledgment to either approach and then proceed with a strong preference for one or the other. In other words, a truly hybrid, balanced approach to gender analysis is still in the process of evolution.

This is, in part, because the hybrid strand has struggled to survive in a sharpened global context in which those in developing, majority nations deal with cruel realities. Particularly in the late twentieth century, it seemed that their poverty flourished, war raged unabated, and environmental disasters increased in number. Even in more comfortable nations, the neo-liberal agenda thrived and the negative impacts of its capitalist focus on privatization, competition and globalization were keenly felt.

Against this backdrop, adult education activists around the world came and continue to come together at international conferences to demand increased participation and decision-making power for women. Although it is sometimes referred to as the Gender agenda, the essence of their arguments often is captured by the observation that "Women hold up half the sky." This exemplifies the hybrid positioning which hints at a more diverse approach yet has a strong, irrefutably oppositional stance. It illustrates that despite its critics, oppositional positioning continues to influence our theorization, research, and practice of gender analysis. This happens for several reasons.

First, the adult education agenda has become more globalized. It now includes the voices of many who come from contexts in which the situation of women is explicitly and irrefutably horrific. Adult educators in these contexts often argue that women's (and girls') continuing, persistent, and unrelenting oppression are the result of men and their patriarchal systems. These ensure that the effects of poverty, war, environmental disasters, and neo-liberalism are most severely experienced by women. They contend that disestablishing patriarchal systems is the real key to national progress, economic development, and self-reliance.

The voices and experiences of these educators seem to be particularly powerful and poignant. The media have helped to strengthen those voices through their increased exposure of appalling violences against women worldwide. In addition, adult educators in industrialized nations, perhaps valuing diversity, seem to have a will

to value the lived experiences of their majority nation colleagues and to accept their judgments about how to interpret and resolve gendered issues.

At the same time, the adult education global agenda has been shaped by the World Bank and International Monetary Fund. As the major global players for aid and development programs, they now incorporate women into many of their priorities. They and other international aid agencies see the inclusion of gender and in particular women as an efficient and effective way to increase national stability and improved, sustainable economic outputs. In other words, women are key to improving the lives of all citizens, men included. Significantly, education and adult education are identified as strategic devices to engage women and girls in these goals.

A second factor that encourages the oppositional approach to gender analysis concerns the criminalization and/or condemnation of sexual minorities. Numerous industrialized and majority nations reject the idea that multiple gender identities are possible. Many have explicit legislation that makes it illegal to either identify as, or practice as, any identity other than man or woman. Other nations are more subtle, but equally hostile to the idea. These forbidden identities can include trans-gender, trans-sexual, transvestite, homosexual lesbian, bisexual, woman-born-woman, woman-born-man, man-born-woman, and inter-sexual. Within these contexts, data collection is restricted to the categories of male and female. When international comparisons are planned, this then also impedes the research agenda of more liberal nations.

Finally, readily available historical, and also contemporary, databases are shaping the approach to gender analyses. Although these provide a logical foundation for further analyses and comparisons, they often used male–female categories. When these become the base for further research, the pattern of dichotomous positioning is entrenched and difficult to disrupt.

These databases have also kept alive the oppositional approach because, as some data have been collected for global projects, they have revealed boy's educational underachievement. Two arguments that revolve around these data further the oppositional discourse. Some argue that women's and girls' concerns have been largely solved and that boys and men must now become the priority. Others argue a preoccupation with establishing policies, practices, and funding for girls' and women's education has undermined boys' and men's achievement. Both arguments place women/girls and men/boys in competing opposition to each other.

Global publications reflected this persistent oppositional approach when women's nongovernment organizations and feminist activists organized internationally to put women, and increasingly girls, on the agenda and in their published documents (UNIFEM and UN/NGLS, 1995). The International Women's Decade (1976–85)

played an important role in this process as did policies generated at Women's World summits (e.g., 1975, Mexico City; 1985, Nairobi; and 1995, Beijing). Significant, clear resolutions and publications devoted to the advancement of women and girls were promulgated around the world (e.g., 1979, Convention for the Elimination of all Forms of Discriminatory Against Women, CEDAW) (REPEN, 1996).

Publications generated at summits not devoted entirely to women's issues also began to highlight the role of women (Scampini, 2001). Typical of their tone is a resolution included in the *1995 Copenhagen World Summit for Social Development* document. It stated specifically that social and economic developments were unlikely to be achieved in the long term if the full participation of women was not achieved.

Similarly, world summits focused specifically on education established global legislation, clear commitments, and specific goals related to women's and men's education. Key among these were *Education for All (EFA)* (launched in 1990), *CONFINTEA V* (1997 adult education global UNESCO conference), and the *Millennium Development Goals (MDG)* (signed by the United Nations in 2000). These summits committed, and continue to commit, signatory nations to many education-related goals and include the promotion of gender equality and empowerment of women and girls and more recently, men and boys. Significantly, the MDG's stated aim was to address these issues preferably by 2005, and in a worse case scenario by 2015. These tight and specific deadlines are propelling much of the current analysis.

In summary, this section has examined how gender analysis is shaped by its theoretical positionings. Clearly gender analysis is a complex concept – and made all the more muddy by the seemingly random use of the term gender. What we name concurrently and retrospectively as gender analysis can display oppositional, diverse, and/or hybrid approaches.

As the agenda of adult education becomes more globalized, sexual minorities continue to seek legal identities, and historical databases are used, the oppositional approach has re-emerged. However, simultaneously, there is a robust underlying discourse which acknowledges the complexity of gender and seeks equitable outcomes within groups of women and of men, as well as between women and men. In the end, the exposure of explicit differences between women and men, enhanced by this more complex view, creates the base for rich analyses. In the discussion which follows, the terms gender equality, women, and men will be used to represent that richer meaning.

A Research Process

It is against this vibrant, dynamic background that gender analysis is undertaken as a research process. Researchers

collect, measure, manipulate, and interpret data in systematic ways to provide evidence of the comparative situation between women and men. Gender analysis reveals, interprets, revises, monitors, and evaluates in a continuous, cyclical process which moves toward gender equality. The research process is the foundation of gender analysis and is composed of three interwoven elements: data collection, data analysis, and strategic initiatives.

Data Collection and Analysis

Data collection in gender analysis can be understood through an examination of the approach, focus, and technique. In terms of approach, data are collected systematically through both quantitative and qualitative approaches.

An increasingly popular and powerful quantitative approach used in gender analysis involves the use of indicators for monitoring. This is a kind of social watch which examines the extent to which nations have achieved the goals to which they committed at international conferences. Quantitative indicators related to the goals are identified so that "concrete aspects of reality can be observed and measured" (ICAE, 2003: 12). This allows the adult educator to collect rich data on a nation's real commitment to issues like: general policies on adult learning, adult literacy and basic education, promotion of active citizenship, awareness of discrimination, culture of peace and human rights, work-related adult learning, health education, involvement of civil society in environmental and development problems (ICAE, 2003). The data expose the increase, decrease, or lack of movement in these areas. They have the added advantage of being comparable across nations and this means that they can expose the relative commitments of nations.

A qualitative approach is particularly important at two levels. First, it is useful to supplement the limited representation of reality yielded by quantitative data. It provides a more multi-dimensional and complex account of the social facts and processes within which they develop (ICAE, 2003). Second, a qualitative approach is useful to uncover the subtle, murky yet powerful historical and cultural obstacles to equality. It can reveal these barriers through the study of peoples' views of gender disparities in a wide range of areas. It can reveal respondents' assumptions and allow for a more flexible probing of their beliefs to reveal their subjective interpretations of their lived experiences.

In both the qualitative and quantitative approaches, data may be collected from already-existing databases and may also be generated by new research. It can be a snapshot of a moment, frozen in time. To give more depth to the findings, those data can then be compared to previous, baseline data, or collected continuously over time to give a longitudinal picture of the situation.

The second important element in data collection is the focus. It is concerned with the domains of investigation and the way in which the data are framed. Data can be gathered from the microlevel of day-to-day household differential responsibilities and from more complex levels of policies, programs, service delivery, and political/economic/social/cultural elements of institutions and structures. It can be gathered on an endless number of variables such as employment, unemployment, violence, health, education, housing, sanitation, safe water, nutrition, property rights, literacy, social mobility, and so on.

Whatever the domain, a priority for gender analysis is that the approach is gender sensitive, and as we might expect from the theoretical discussion above, often it is framed from women's perspectives. However, gender analysis goes beyond the mere collection of data on women to men ratios. For example, in relation to participation, a key domain of gender analysis, one might begin by examining the women to men ratios in recruitment, involvement, and completion. Although those data are revealing in and of themselves, gender analysis would also include the study of the gendered nature of access to, and control and management of resources, production, reproduction, decision making, benefits, gendered roles, responsibilities, knowledge, skills, and activities. Gender analysis thus brings a greater depth of understanding to the issue of women's inequality because it emphasizes issues of women's relative power, control, and management.

Similarly, in relation to work, research traditionally focuses on paid work. Research based in gender analysis, however, acknowledges the reality of women's lives and reframes it as an issue of the gendered division of labor in both the public/paid and private/unpaid spheres. In the same way, traditional research often presented women as the victims and passive recipients of their situations. However, gender analysis research tends to present them as agents of resistance and change despite their oppressive contexts.

The technique of collection is the third important element in the data collection process. Adult educators undertaking gender analysis strive to ensure that the process is participatory and based in sound relationships. Ideally, the rights and needs of grassroots communities drive it and data are given back to those whose lives they effect so that they increase peoples' understandings of gender discrimination and foster their agency. These civil society relationships are strengthened by healthy partnerships with other key stakeholders. These are at the local, national, and international levels and include relationships with government departments, women's offices/leaders/organizations/networks, religious/educational/media organizations, think-tanks, corporations, businesses, and academics. This participatory, relationship-based approach to collection permeates gender analysis, including the process of data analysis.

Data analysis is not a summative activity which occurs only after data collection is completed. Rather, it is ongoing process which begins at the very first steps of the collection and measurement of data. Data analysis is a process of manipulating and interpreting the collected data so that it makes sense. It highlights and prioritizes patterns, trends, and relationships and is based in the search for differences and gaps, in the first instance, between women and men but also within those groups. It tells us what exists by providing a dense, information filled picture of the situation. It helps us to understand why it happens by exposing crucial links between components of the data.

In summary, data collection and analysis are dynamic, interactive, and ongoing elements of the research process. Both are done with rigor and are shaped by a focus on gender equality.

Strategic Initiatives

Gender analysis does not stop with the collection and analysis of data. It includes the creation of strategic initiatives which are interventions to foster equality between and within groups of women and men. It is important to note that data collection and analysis are strategic initiatives in and of themselves. The very process of beginning a gender analysis is a strategy which begins to reveal barriers to women's full participation in decision making. The initial activities of collection and analysis can provide us with new understandings of our worlds and, by placing women's and men's inequalities at the center of the research process, expose oppressive attitudes, systems, and structures.

The summative outputs of gender-sensitive data collection and analysis projects are equally important in shaping strategic initiatives. Like the initial collection and analysis, they can focus on inequalities embedded in a wide range of areas from day-to-day household differential responsibilities to the policies, programs, service delivery, and political/economic/social/cultural elements of institutions and structures. Strategies can be immediate and practical, as well as sustained and long term. As in the processes of data collection and analysis, strategic initiatives seek to be participatory. Ideally, civil society and key stakeholders together create collaborative strategies aimed at gender equality.

In brief, strategic initiatives are part of a sustained, ongoing, dynamic, cyclical process of planning, implementation, monitoring, and evaluation. They are neither tidy, final, nor definitive solutions and they need to be designed with a view to the particular contexts within which they will exist. Nonetheless, there are some important strategies which are worth mentioning.

First, as an adult educator might expect, gender training is a frequently used strategy. This training gives

communities, organizations, networks, and the people within them the time and space to engage with the concepts and issues of gender equality. It seeks to strengthen the capacity of women and men within the organization or network so that they can address gender inequalities. Ideally, the training is a process of both capability building and politicization. In the first instance, the objective is to build a solid information, skills and knowledge base and the self-confidence of the participants. In the second instance, the objective is to enable advocates to work collectively to claim equality at all levels.

A second example of a common strategic initiative is the reform of gender architecture, that is, the creation of structures within organizational structures to ensure that gender is a key consideration of every process, goal, and output. Often a gender unit is created to undertake a gender watch for the organization and acts in an advisory capacity to ensure that gender is mainstreamed. Gender training is frequently an important part of the unit.

A third initiative is gender-based budgeting. It uses a gender lens to assess and guide local, national, and international financial decisions about funds so that women and men can benefit equally. Such a lens reviews the allocation of funds for women-centric schemes, the incorporation of women into the decision-making processes of budget creation, the reflection of the concerns of women, and the assessment of the budget in relation to any commitments made to women and girls at international conferences.

In sum, there are many strategic initiatives which are part of the research processes of gender analysis. They must be responsive to their contexts, but there are some contemporary, exciting examples of global initiatives. It is worth noting too that essentially all initiatives seem to share the goal of gender mainstreaming. In other words, gender is irrefutably, irrevocably at the center of every consideration at every level. Women's views and their priorities are integral to every process, with the goal of achieving gender equality.

Benefits

Given the complexity of the concept and the intensity of the research process, one might well ask if the benefits which accrue to gender analysis are worth the effort. There are several responses to this. First, from an altruistic point of view, one might argue that the rights of women and men to lead full and satisfying lives is a worthwhile outcome for us all. It is a humane response to counter the asymmetric impact on women of fundamentalisms, wars, and neo-liberalism.

The second, and frequently presented, argument for gender analysis is an economic one. The basic line of reasoning is that, as 51% of the world's population,

women are a largely untapped reserve of labor which nations need to support their economic objectives. It is simply a matter of investing in people. Fuller participation of women, created by the insights of gender analysis and related strategic initiatives, can remove women from unproductive labor and engage them more fully in the paid labor market. Associated with this is the notion that women, once part of the paid labor market, can then become consumers – a role which also creates more demand for the production of goods.

An associated economic argument is that gender analysis allows for a more efficient allocation of resources. By exposing inequalities across a variety of variables, nations and funding aid agencies can see how to better utilize their funds. For example, gender analysis can reveal that participation of women in educational programs is low and that is because women travel miles to collect safe water. The problem can then be redefined as an infrastructure rather than educational problem and resources directed into drilling local wells to remediate the underlying problem.

The final economic argument is a very muted one, for it suggests that women have unique knowledge, skills, and experiences which will help achieve economic objectives. A gender analysis, for example, can reveal that women have longstanding practices which can better serve economic growth than ones introduced from other contexts.

Challenges for the Future

Gender analysis has a strong potential to address the oppression between and among groups of women/girls and men/boys. However, it faces several challenges. The first challenge is to create a global gender agenda to further the struggle for equality. It would be naive to believe that uncoordinated gender analysis projects, by themselves, are effective. They cannot effectively resist or indeed defeat the globalized neo-liberal agenda which impacts more harshly on women than on men. Lacking a global gender agenda, it is questionable if gender equality can ever be achieved.

The second challenge is to engage industrialized nations in the search for gender equality. Although many have ratified conventions like CEDAW, their operationalization of that commitment is often minimal. They too often seem to see gender analysis as an activity which needs to be undertaken in the nations to which they give aid rather than in their own backyards. They seem reluctant to expose the gender inequalities which so clearly still exist in their own industrialized nations. This reluctance also subverts the global gender agenda and is a major stumbling block to the realization of gender equality.

The third challenge is to extend the existing networks and alliances in the global struggle for gender equality. Currently, the movement is driven primarily by nongovernment organizations and women. Gender is related to

issues of the environment, peace, sustainability, and partnerships by gender activists with those issues are essential. In addition, men must be made accountable for women's ongoing disadvantage. This is particularly important since men continue to hold the majority of decision-making positions in the world. Although there are men who are allies in the struggle for women's equality, there are many more who, through their silences, allow women's oppression to continue.

Fortunately, adult educators are able to face these challenges with optimism. In the adult education sector, there are global organizations of women and men committed to gender analysis. They have been active for decades and have driven the global gender agenda with unfailing enthusiasm and commitment. These include the Gender Education Office (GEO) of the International Council for Adult Education, Development Alternatives with Women (DAWN) and Red de Educacion Popular entre Mujeres (REPEM). Our support for their work is a key to gender equality.

Conclusion

In conclusion, it is clear that gender analysis is neither a tidy concept nor exact research process. It is equally clear that there are individual and global benefits which accrue to gender equality. Despite the challenges, gender analysis is a useful tool to move us toward gender equality.

We know from history that the advancement toward women's equality is an uneven and precarious progress. However, the field of adult education is well located to play a key role in leading the struggle for gender equality. We have the expertise and experience to promote and undertake gender analysis. Adult education is, by definition, involved in the processes of teaching and learning so integral to that analysis. The final factor will be the extent to which the field makes an authentic, energized commitment to achieve gender equality. That is the ultimate challenge which confronts us all.

Race and Ethnicity in the Field of Adult Education

J Johnson-Bailey and D Drake-Clark, The University of Georgia, Athens, GA, USA

© 2010 Elsevier Ltd. All rights reserved.

Race and ethnicity are factors that act in major ways in determining how our society functions. Whether you divide the world into South and the North, East or West, or look within national cultures with diverse peoples, race can be tied to one's social and economic status. At present, the Northern Hemisphere is the site of unprecedented economic growth, while the Southern Hemisphere struggles with hunger, malnutrition, and preventable diseases. Within the North's multicultural nations, such as the United States, Canada, and the United Kingdom, race remains a more predictable marker of wealth, class, and poverty than educational level.

While ethnicity and other terms such as multiculturalism and diversity are identifiers and qualifiers often used more broadly than the term race, these descriptors not only denote racial groups, but the cultural aspects associated with racial groups and with groups that can be distinguished by religion, language, and traditions. There is no one correct way to define ethnicity since its usage varies across the world with different connotations specifying race, national origin, and tribal and clan membership. Over time, these terms came to be used interchangeably. Although race and ethnicity are socially constructed phenomena, herein, race and ethnicity will be used to refer to both genotypic and phenotypical differences.

Quite often societal customs, traditions, and norms conceal how one race is privileged over another or how a group of people is disadvantaged because of their racial or ethnic membership. The ordering of our society around race and ethnicity does not disappear at the classroom door; it continues to operate within our educational systems. Race is not the only positionality that categorizes or impacts the social order; however, race is an important factor in the rankings that regulate societal hierarchy. The effects of how race and ethnicity are viewed in the world are embedded in our educational fabric and the field of adult education is no exception.

There are historical and contemporary understandings of race in adult education and these views have framed the practical educational responses of adult educators. Race is a social construct that has no basis in biology (Frankenberg, 1993; Gregory and Sanjek, 1994; Winant, 1994) as anthropologists and biologists have long recognized that the human form cannot be examined through visual or scientific inspection to definitively determine a person's race. It is, at best, a fleeting notion established by an arguable set of physical characteristics. Although race

is a social construct, its effects are real in terms of social power and privilege (Giroux, 1997). Race has a major role in determining how our society functions. This ordering of the world along set queues occurs because, as people are categorized as belonging to a race, those persons are accorded all the rights, privileges, and baggage that accompany the classification (McIntosh, 1995). Therefore, to be of Asian ancestry has a different meaning than to be of White ancestry. And these meanings change depending on geography. So to be White in France carries a different set of connotations than does being Asian; and to be Asian in Malaysia carries yet another set of implications.

To discuss race and ethnicity in adult education is to confine the discussion largely to the West (as in North America, the United Kingdom, and Europe) and to limit the analysis to what is referred to as the North (highly industrialized nations located primarily in Europe and North America) simply because race and ethnicity are not widely acknowledged in adult education literature in the South. The adult education literature from the South tends to bound their discussions along the lines of nationality with national and regional parameters. Therefore, the discussion herein will focus unevenly on the North due to its availability of programs where an analysis of race and ethnicity are more possible. This article first presents a discussion of how race operates in the larger society and in the educational system. This introduction is followed by the discussions of adult education in the North and South.

A Historic Perspective of the West and the North

Adult education as a field was established in the early 1920s and its primary mission was the education and the continuing education of adults. From its inception, the field held that being an educated adult allowed one to participate fully as a citizen, to contribute materially to the well-being of society, and to develop as a person capable of striving toward self-actualization. Therefore, one of the primary purposes of adult education was to teach adults throughout their lifespan so that they could lead more fulfilling and productive lives. An American example of how the field worked toward the democratization of society through the education of adults was the Highlander Folk School (now called the Highlander Research and Education Center), an organization

established in 1932, whose adult education programs contributed significantly to two of the most important Western social movements of the twentieth century: the workers' rights and the Civil Rights movements.

While the stated goals of adult education have consistently been set forth as aspiring toward leveling the playing field for all adults, especially those lacking a basic education, and as desiring to empower learners so that they might engage in full citizenship, just the opposite often occurs. Since Western society is a place replete with hierarchical systems that privilege some and deny others, its academic systems are designed to reproduce the *status quo*. And as an academic discipline, adult education has also mirrored society by functioning like other areas of education. The major portion of adult education programs today in the United States, Europe, Australia, Japan, and in other heavily industrialized settings, involve continuing education, particularly continuing professional education, and human resource development programs in business and industry. Literacy, citizenship, and adult basic education programs in such settings have been largely relegated to federally and community-funded programs.

As a field, how we define race is reflected in how we write, research, and teach. For the most part, adult education literature has encompassed an implicit cultural hegemony, regardless of intentions, that centers the dominant White majority as the norm and empowers one group while disempowering others. In our major texts and publications, data on people of European descent is always present, making it therefore logical to assume that Whites have done the most or certainly have made the more significant contributions. The concealed message is that other groups have not done the same. In addition, in an educational setting, membership in a disenfranchised group translates into direct inequities: sub-standard education, tracking, and unequal opportunities for higher education. In society at large, such inequities have negative economic outcomes that construct barriers to the opportunities that are set forth as the ideals for all people in a democratic and prosperous society. Without naming it as race, or more accurately racism, in our educational arena, the underlying ideas of whiteness as superior and non-whiteness as inferior or deficient are ever present.

Other than the grassroots activist programs, which are bounded by their locale, the field of adult education in both practice and programming has been somewhat quiet on issues of race and ethnicity in that research by and about peoples of African, Asian, and Hispanic descent has been essentially absent from the adult education literature. Throughout the years, on the few occasions when race and ethnicity have been topics in the North American adult education literature, the discussion has been confined mostly to a dialog about Blacks or African Americans. Race and ethnicity in contemporary Western society are

used to refer primarily to people of color; Whites are treated as if they have no race.

In examining race in the West, the conversation in the United States has been more overtly framed in racialized terms, while European and British examination of difference have been framed by discussions of class. In the 1930s and 1940s in the United States, there was a strong conversation in the literature on Blacks in adult education that was led by Alain Locke, the first Black president of the American Association for Adult Education (an organization which exists today as the American Association for Adult and Continuing Education). It was under his direction that national conferences on African American adult education issues were held in 1938, 1940, 1941, and 1942, and it was his leadership that led to the chronicling of African American adult education national efforts in the 1948 yearbook issue of *The Journal of Negro Education*. However, these efforts waned after the publication of the 1948 yearbook.

The historical documents that define North American and European Adult Education are the nine *Handbooks* published from 1934 through 2000, which provide comprehensive overviews of the field's major issues and concerns. Given the importance of these texts in the field, the ways in which race is addressed or not addressed is informative. Although race is a central location for the negotiation of power and privilege in education and in society, this topic never formed the focal point of a single chapter until the 2000 handbook. While the 1934 (Rowden, 1934) and both handbooks of 1936 (Locke, 1936a, 1936b) had chapters on adult education for Negroes, and the 1948 handbook (McCurtain, 1948) had a chapter on adult education of American Indians that offered descriptions of programs for these groups, no chapter dealt with race and ethnicity as a topic by addressing the central role that race was playing in Western society during this period of legal segregation in the United States. This absence of discussion about race and ethnicity continued in subsequent handbooks, even in the face of major social upheavals such as the Civil Rights movement and the American desegregation of public schools and other public institutions that provided adult education. The 1989 handbook returned to the trend of the 1930s and 1940s by having a chapter on racial and ethnic minorities and adult education (Briscoe and Ross, 1989). In addition to this chapter on specific racial groups, a discussion of race in the context of the social setting for adult education appeared in two handbooks (London, 1970; Rachal, 1989).

The way race has been socially constructed in the literature of North American and European adult education over the past half-century has been remarkably stable. This view is that the White race is the norm against which all other races are to be compared. This perspective, which is the colorblind perspective (it is not seen and it is not discussed) is so deeply embedded in the social

fabric that there has been little discussion of adult education for Whites even though the White race has constituted the vast majority of the population for adult education. Whenever race is discussed in the handbooks, then, it is conceptualized as non-White. Of course, when one group is normative, then the others are viewed as abnormal. This leads to the obvious conclusion that separate chapters would be needed to discuss the specific educational efforts being made to address the needs of these special populations.

Starting in the 1980s, there was a renewed interest in issues of race and ethnicity in the adult education literature. These contemporary perspectives on race in adult education fall into two major categories: multiculturalism and social justice. The terms multiculturalism and cultural diversity are used interchangeably throughout adult education literature, with the latter being the more current term. However, multicultural scholars distinguish a difference between multiculturalism and cultural diversity. They explain that cultural diversity is a view of society as a collection of varied cultures whereas multiculturalism is a particular political and ethical stance toward cultural differences. Globalization, the process where goods move freely among nations without regard to national borders and national identity, is also included under the multiculturalism umbrella and routinely offers an analysis of the place of disenfranchised or indigenous cultures in the shrinking world economy. A central idea that is shared by all types of multiculturalism is that one culture is seen as dominant and therefore the educational need is to teach the importance of values and beliefs that are held by other cultures. Thus, from its inception, multicultural education has called for recognition and inclusion of the contributions of other cultures in the literature, research, and praxis. Multicultural education was first introduced in the adult education literature by Horace Kallen in 1915 and expanded on by Alain Locke in 1925. Locke, one of the few leading Black adult educators of the early 1900s, represents a segment of the field that champions the multicultural argument by making known the causes and worth of certain groups. He expressed a belief in the redemptive powers of multiculturalism and this view remains constant in the contemporary adult education literature.

The social justice perspective can be divided into two categories. One social justice outlook states that there is indeed a right and moral position that should direct our society. Proponents of this position, like contemporary noted adult educator Phyllis Cunningham, the Presidential Teaching Professor at Northern Illinois University, ask adult educators to remember and live by the mission of the field, which is to equip adults to be full participants in a democratic society. This message has remained constant since the field's inception in the early 1920s, when writings by Alain Locke suggested that adult education could

equalize the wrongs of society by providing an education to an adult populace that did not receive the basics through traditional education. This position continues in current writings by many adult education scholars.

The second trend in the social justice movement is not only to state the right and moral imperative of what should occur in the field but also to add an activist component, addressing the differences between groups and highlighting how power is exercised in favor of one group and to the detriment of others. The contemporary writings in this category use this approach not only for issues of race but also for all societal hierarchies constructed to serve one group while disenfranchising another. For example, scholars of critical race theory, such as Derrick Bell, explore how the systems and structures of White supremacy that subordinate people of color have been created and are maintained in American society as well as how to change the relationship between the law and racial power. An important part of fostering diversity and multiculturalism in adult education means discussing the elements of power and privilege accorded along the positionalities of race and ethnicity and the effects of this privilege on those from such marginalized positionalities. In the last decade, another important aspect of discussing race and ethnicity has been an examination of how Whites construct their racial identity and how the social construction of Whiteness affects educational systems.

When the discourse on Whiteness or privilege occurs in the adult education literature, it usually involves the following: recognition of privilege and of under-privilege, an examination of classroom practices, examples of curriculum and/or texts that reproduce privilege, and various anecdotal examples of how privilege operates in society. A large segment of the literature in social justice deals with the interlocking nature of race, gender, and class. Even though this area of research and writing acknowledges that the power lies in the hands of a dominant White majority, it stops short of saying that the concentration of power is deliberate and that the intent is to retain the present balance of interests. Instead, the social justice literature asks for a renegotiation of the balance of power.

Several factors contributed to the return of race and ethnicity in the 1980s as a focus in the adult education literature, research, and praxis. This specific focus was a direct outgrowth of two changes in perspective that were introduced in the 1970s: Freire's work around class and adult student empowerment, and the emergence of critical theory. In addition, the influx of people of color as students and instructors affected the attention given to issues around race and ethnicity. The impact of this new presence became evident in the 1980s as race and ethnicity emerged in the literature and at research conferences, as well as in curriculum and program planning.

The field's elite measure of acceptance, refereed journals, began to show an increase in the number of articles that could be classified as directly related to race and ethnicity. In 1991, a landmark article, *Needed: A multicultural perspective for adult education research*, by Ross-Gordon on the subject of race and ethnicity in adult education research, appeared in *Adult Education Quarterly*, one of the field's most prestigious journals. Ross-Gordon analyzed the status of racial and ethnic research and found 15 articles on race and ethnicity published between 1985 and 1990. A subsequent article in 2001 by Johnson-Bailey in the *International Journal of Lifelong Education*, examining the period between January 1990 and December 1999, revealed that 94 articles were published on issues, concerns, or prominent historical figures pertinent to ethnic or racial groups: 20 on African Americans; ten on Native Americans; ten on Asians; nine on Hispanics; and 45 on multiculturalism or cultural diversity. Interestingly, the articles pertaining to Asians only looked at Asian groups existing within their national homelands, and without exception, the works did not focus on 'Asian-ness' as otherness.

Research conferences, which provide a unique opportunity for the exchange of ideas among colleagues, have also demonstrated a surge of interest in race and ethnicity. The proceedings of major adult education conferences reveal a developing public discussion on race and ethnicity at the Adult Education Research Conference (AERC) and Standing Conference on University Teaching and Research in the Education of Adults (SCUTREA), two of the premier conferences in the field. With a small degree of variance, approximately 3–7% of the research presented at AERC and SCUTREA in the late 1980s through 2005 focused on ethnic and racial diversity and an increasing 2–3% on social justice issues such as gender and sexual orientation.

Only one adult education conference has research on race and ethnicity as its focus and unifying theme. The African Diaspora Adult Education Research Conference (formerly the African American Research Pre-Conference) was founded 1993 and has historically been attached as a pre-conference to the larger AERC. The African Diaspora Adult Education Research Conference debuted at Pennsylvania State University in May 1993, accompanying the 34th annual AERC. The theme of that first conference, *A Link for Community Development and Empowerment*, was suggestive of the conference's perspective and is now a consistent ideology connecting the subsequent conferences to the first.

The field of adult education in the North has enjoyed two distinct time periods relevant to focusing on race and ethnicity. During the discipline's formative years, beginning in the 1920s, issues of race and ethnicity were examined in a summative fashion through descriptive writings that related what was transpiring within various communities. The second and contemporary phase of

adult education began 60 years later and reflects both a more open, analytical, and a growing discussion of race and ethnicity with a definite focus on multiculturalism and social justice.

A Southern Focus of Adult Education

To speak of adult education in the Southern Hemisphere is to speak of nationality, indigenous peoples, poverty, globalization, and literacy, more so than to speak of race and ethnicity. However, race and ethnicity are tied to these issues and are especially linked to poverty and low levels of literacy in the South. Literacy and literacy initiatives dominate the Southern adult education literature, followed only by indigenous peoples' knowledge as a topic of discussion. The topic of indigenous knowledge includes honoring the oral traditions and languages of native populations amidst the emerging push to use Western languages to accommodate commerce.

The focus on literacy in the South seems driven by the global economic market as African nations, India, and China, the fastest growing and more populous world areas, are thought to lag behind industrialized nations due in part to the fact that large segments of their citizens are undereducated. So the literacy exchange is twofold, with the idea being that both sides win from the effort regardless of the impetus: for the purpose of advancing economic initiatives for the South and for the purpose of developing and advancing a labor pool for the North. However, it must be noted that when economics drives the market and dictates policies, individual nations and therefore groups of people are inevitably disenfranchised because the idea of equality and other democratic ideals are inextricably tied to governments and social movements and not to economies. The capitalistic process and the phenomenon of globalization disempower countries, their people, and any claims for rectifying any social ills that might have occurred within set national borders.

The countries that comprise the Southern Hemisphere are more homogenous populations than the North, thus minimizing the necessity to focus on race. Migration patterns show a movement of people from the South to the North. Much of the diversity in the North derives from voluntary migrations and involuntary relocation of peoples of color from the South. However, since many Southern Hemisphere countries have been subjected to colonization by Europeans and those of European descent, the presence of race-based privilege is still a factor in the South. This factor perhaps encouraged Bostwana scholar, Youngman, to ask about the role that adult education plays in the reproduction or contestation of race-ethnic domination (Wangoola and Youngman, 1996). In addition, globalization, which is driven by the Northern countries of the United States, Japan, Germany, and the United

Kingdom, is the new face of colonialism. The complex global-connectedness phenomenon, a result of globalization which deemphasizes borders, also weakens cultural ties to home and place. To this end, it is theorized that modern racism has been exported with capitalism (Wangoola and Youngman, 1996).

Although race and ethnicity are not as generally discussed in international forums as they are in the West, the United Nations Educational and Scientific Cultural Organization (UNESCO), which was established in 1945, adopted a *Declaration on Race and Racial Prejudice* in 1978. The preamble noted that racism, racial discrimination, colonialism, and apartheid continue to afflict the world in ever-changing forms and the United Nations declared a desire to play a vigorous and constructive part in implementing the program of a *Decade for Action to Combat Racism and Racial Discrimination*, as defined by the General Assembly of the United Nations at its 28th session. The ten articles of the declaration encouraged the countries of the world to eliminate discrimination, adopt policies to improve the lives of its citizens of color, and to respect cultural differences.

For the most part, any discussion of adult education in the South occurs against the backdrop of UNESCO, its conferences, and programs. For many nations in the South, adult education is a matter of redress as many Southern nations did not have free mandatory children's education and/or because of an agricultural base, experienced low participation in formal schooling as farming necessitated the involvement of all members of the family, including children. The United Nations' *Literacy Decade*, 2003–2012, emphasizes the importance of honoring indigenous knowledge as a means of promoting education. Important adult education enterprises spearheaded by UNESCO are Education for All (EFA) and International Adult Learners' Week. Adult Learners' Week was first held in the United Kingdom in 1992 and was formally endorsed by UNESCO in 1999. Since then, over 40 countries have joined in the annual participation of Adult Learners' Week. The Week's purpose is to impact policy, promote access to the existing adult education programs, and increase literacy. Another cornerstone program that addresses issues of redress is the EFA movement that began in 1990 at the World Conference in Jomtien, Thailand, setting as its universal goal, education for all children and adults and pledging a 50% reduction in the 1990 rate of illiteracy by 2000. By the 2000 World EFA Conference in Dakar, Senegal, 180 countries had signed on to promote basic education for all citizens.

The region of Southern Africa provides an opportunity to look at adult education in a Southern setting. Prior to the emancipation of many nations in Southern Africa, adult education was recognized by the 14 nations in the region as an essential and necessary part of liberation struggles. This is aptly illustrated by the underground educational plan that was laid by the Black South Africans

interned at Robben Island. The literate and educated prisoners worked in secret during their lunch breaks to tutor the less literate and undereducated inmates.

Southern African nations came together to form the Southern African Development Community (SADC) in 1992. This coalition of 14 countries, which includes Botswana, South Africa, Zambia, and Mozambique, expresses the importance of educating the citizenry as a means of encouraging full participation and exercising of rights, with most countries in the pact spending 20% of their budgets on education. Given the homogeneity of its countries and the legacy of colonization, SADC members focus on indigenous knowledge as a bridge between organic knowledge and formal knowledge. The concept of knowledge from the people is particularly important in health education. The low life expectancy of the region has been compounded by the HIV/AIDS pandemic. While championing the importance of local knowledge, the adult health educators are faced with the challenge that at times religious, gender, cultural, and tribal-based behavior, practices, and traditions may conflict with modern medical practices.

Summary

In conclusion, it is noted that the North has a perspective on race and ethnicity that is bound by genotypic and phenotypical differences. However, the South's viewpoint regarding difference is based more on nationality and culture. In addition, the adult education needs of the two regions are determined more by economic forces than by the races of its people. For example, the South's focus on literacy is driven by the North's need for a readily available and cheap workforce and the South's desire to become an economic competitor. Despite this commonality, within each of the two regions, the poor and disenfranchised are the colored peoples of the area, whether they are the majority Blacks of South Africa or the African Americans or Hispanics of the United States. Further, the breakdown of national borders by globalization is replacing national adult education initiatives with corporate initiatives. The North is experiencing a tremendous growth in the human resource development sector of adult education, while literacy efforts are relegated more to the non-profit sector and to being a low priority for the underfunded public sector.

Trends in Workplace Learning Research

T Fenwick, University of Alberta, Edmonton, AB, Canada

© 2010 Elsevier Ltd. All rights reserved.

The nature and organization of work has changed so rapidly in the past decade with the introduction of new technologies and the effects of globalization that learning has become a lightning rod, attracting all sorts of new attention outside educational debates. Change in organizational structure and culture is now a learning issue. Innovation, now considered critical for competitive positions in the knowledge economy, is linked to learning. The increasing need to integrate migrant workers, along with attendant issues of inclusion, equity, gender, and race politics in the workplace, all have infused the workplace learning agenda. Therefore it is not surprising that research in workplace learning has accelerated since the mid-1990s, expanding into a wide assortment of fields including, besides adult education, organization and management studies, human resource development, sociology of work, economics, feminist studies, and industrial relations.

Definitions and Different Perspectives

The effect of this expansion has been to both enrich the existing perspectives and methods of understanding learning in work, and to blur categories. Across different fields, definitions of terms (such as learning, skill, empowerment, critical, and workplace) are multiple and often contradictory. Work can be paid or unpaid, based in organizational action or individual reflection. Work activity and learning varies widely depending on public, private, or not-for-profit sector, or on whether we are referring to a trades-worker or manager, self-employed professional, farmer, or domestic worker. Indeed, assertions about a generic workplace are inappropriate.

In some attempts to categorize different perspectives and definitions, the term workplace learning has been limited to individual change, with organizational learning reserved for groups. This is an arbitrary and rather unhelpful division, particularly when so many perspectives of learning in work refuse to separate the individual from the collective in examining learning processes. So in this article, workplace learning will refer to relations and dynamics among individual actors and collectives, along with group practices, tools, objects, cultural discourses, histories, and environmental forces that are all entwined with the behaviors of individuals and collectives. Workplace learning in this discussion refers not to formal planned training but to informal learning, that which is embedded in everyday material action and social interaction. Learning is defined not as

the product of change but as the process of generating new knowledge in activities and contexts of work; in particular, knowledge that expands human possibilities for flexible and creative action.

Overall, workplace learning research is a relatively new field characterized by multiplicity and vibrant debate, one that resists neat categories and typologies. This will become clear through the following discussion of three topics in workplace learning research, all prominent in current debates particularly in adult education: processes of learning, issues of identity and literacy, and power and politics in learning. These topics are not comprehensive, but illustrate key issues and point to future directions in workplace learning research.

Researching Processes of Learning in and Through Work

A review conducted of workplace learning literature published in nine scholarly journals between 1999 and 2005 identified various distinct perspectives of learning process (Fenwick, 2008). These can be distinguished according to the view of the individual relative to the collective, the role of reflection, and the role of action in learning. For example, some theorists see clear distinctions between the autonomous single individual and the environment, while others do not separate individual from collective or privilege the individual human over the complex mix of tools, cultural practices, and joint action of the system. Six perspectives are summarized here with the greatest attention accorded to the final theme of co-participation and co-emergence, as this appears to be a dominant direction emerging in workplace learning research.

Individual Knowledge Acquisition

Learning used to be understood primarily as acquisition: where individuals are believed to acquire and store new concepts and skills/behaviors as if knowledge were a package that didn't change as it transferred from its source to the learner's head. Learning tends to be valued according to the extent of its contribution to the organization's performance and productivity. Learning workers are therefore understood to be acquiring intellectual capital, increasing the organization's resources and return-on-investment on training. Research tends to focus on how to harness, draw out, and use the individual's acquired

knowledge. Preoccupations include transferring acquired knowledge to practice, measuring competency (reliable valid measures and competence definitions are identified as problematic), and narrowing the gap between training investment and results. While this perspective appears to have declined since about 2001, it still appears in certain human resource development and management/organization studies of learning.

Reflection and Human Development

Here the emphasis is on sense-making. Learning is viewed as individual and collective construction of (new or altered) meanings: to identify problems, emerge solutions, or engage in collective inquiry. The general base is constructivist learning, for example, through reflection, which is affected by both the individual's history and unique perspectives, and by the meanings and language shared among the collective. Two directions have emerged in the research. One focuses on developing knowledge and practice of individuals; the other focuses on developing the organization's processes and culture. In both directions, workplace learning is viewed as fundamentally driven by reflection-on-action, in the swamp of uncertain, ambiguous, and contradictory dilemmas of practice. Reflection during and after the doing supposedly transforms experience into knowledge, which can then be represented and generalized to new contexts.

In research focused on the individual, studies have examined how to promote self-directed learning capability of individuals, and illuminate the relation of work to individual developmental processes and learning styles. In research focused on the group, studies have explored the nature of group reflection, and what factors influence particular meaning constructions at work. However, researchers who are critical of sense-making ideas show the rarity in practice of group critical reflection, dialog, and inquiry. Individuals are disillusioned with such practices, and the notion fails to sufficiently account for power relations in workplaces and knowledge hierarchies – including those created by researchers. Some critics have maintained that the emphasis placed on reflection is simplistic and reductionist, overemphasizing rational thought, and understating the unpredictable social tangles of everyday practice in which people develop.

Network Utility Model

Here, learning is portrayed as individuals and teams sharing useful strategies through networks within and across organizations, often electronically enabled, primarily for purposes of improving others' performance. Learning is thus information access. The key research preoccupations are improving diffusion: capturing, managing and organizing content, removing network barriers, and generally

facilitating efficient, effective information flow or knowledge transmission (just-in-time) through a network. Learning networks are reported to take different shapes related to contexts, work characteristics, interactions, actor dynamics, and strategies; interorganizational networks are the most complex and take long time-periods to develop.

Most other research explores sociocultural issues, such as barriers and enhancements to knowledge sharing. For example, individuals and teams have been found to be willing to share if sharing is valued and supported and if the organization restructures payoffs for contributing, increases efficacy perceptions, and makes employees' sense of group identity and personal responsibility more salient. Overall, sociopolitical dynamics have been found to affect network effectiveness far more than technology.

Levels of Learning

Here the organization and individual (and team) are viewed as separate, distinct levels and forms of learning. This static layer-cake depiction is similar to the network utility model, but goes beyond linear transmission of information to acknowledge practices and politics. Research focuses on what happens at different levels, how different levels affect one another, how to link the levels in practice, and how/when to balance the exploratory (knowledge-creating) with the exploitive (knowledge-diffusion) dynamics. Learning levels might be depicted as units of people (individual, group, and organization) or as phases of learning (innovation, sharing, and routinizing). The link between levels is conceptualized rather mechanistically as cross-fertilization, diffusion, pipeline-sharing, and motoring.

Communities of Practice Model

This model, based on ideas first conceived by Jean Lave and Etienne Wenger, has been widely taken up since the publication of Wenger's (1998) book *Communities of Practice*. Learning is viewed as situated participation, embodied in the joint action evident in a community of practice (CoP). Individuals learn as they participate *in situ*: by interacting with a particular community (with its history, assumptions and cultural values, rules, and patterns of relationship), the tools at hand (including objects, technology, and language), and the moment's activity (its purposes, norms, and practical challenges). Knowing and learning are defined as engaging in changing processes of human participation in a particular CoP. A CoP is any group of individuals who work together for a period – such as a sports team, a workplace department or project group, a class, or club – developing particular ways of doing and talking about things that their members come to learn through action. The objective is to become a full participant in the CoP, not to learn about the practice. The community itself defines what constitutes legitimate practice.

Research seeks to explain the adaptation and reconfiguration of practices to meet changing pressures, and identify ways to facilitate these dynamics. Community learning is found to be affected by relational stability (trust), variety (new ideas, risk), and group structure (networks, competence). Learning is constrained by time pressure, deferral, and centralization within and across projects. Billett (2001) developed a useful model of guidance (direct, indirect, and environmental) that moves workers toward fuller participation in workplace activity, and hence to more comprehensive and critical knowledge as actors in their CoP. Critics of the CoP model of learning have pointed out its weak analysis of politics and solidarities within the community, including those which determine what counts as legitimate knowledge and expertise, and what knowledge (and identities) become marginalized. The CoP does not shed much light on how innovation occurs or how to develop specialized knowledge, especially during rapid change.

Co-Participation or Co-Emergence Model

In this orientation, individual and social processes are viewed as unique but enmeshed, and deserve examination at micro and macro levels of analysis. Learning is knowledge creation through social participation in everyday work. The conception is of mutual interaction and modification between individual actors, their histories, motivations and perspectives, and the collective (including social structures, cultural norms and histories, and other actors). Radical versions expand the collective to include environmental architecture, discourses, and objects, as in actor–network theory where knowledge circulates and is translated in each interaction of one agent mobilizing another. Cultural–historical activity theory views the individual and organization in dialectical relationship, where learning is occasioned by questioning practices or contradictions of the system, and is distributed among system elements: perspectives, activities, artifacts, affected by all contributors and clients. Complexity theory treats learning as inventive/adaptive activity produced continuously through action and relations of complex systems, occasioned in particular through disturbance. Most agree that learning is prompted by particular individuals (guides or mentors), events (conflict or disturbance), leaders (e.g., encouraging inquiry, supporting improvisation), or conditions (learning architecture).

Long popular in Nordic research of workplace learning but just recently emerged in North American research is cultural–historical activity theory (CHAT). Here, learning is viewed as change in a community's joint action. The community's activity is shaped by its rules and cultural norms, division of labor and power, and mediating artifacts (language, tools, and technologies) that

it uses to pursue the object – a problem at which activity is directed. Learning occurs as the collective construction and resolution of tensions or contradictions occurring within this activity system. Unlike other practice-based systemic perspectives of workplace learning, CHAT retains its Marxist influences in its recognition of the inherent contradictions in capitalist work systems based on labor exchange, and in its analysis of the historical emergence of particular practices and ideologies (see Chaiklin *et al.*, 2003).

In organizational studies and increasingly in educational study in Canada, complexity theory is also gaining acceptance as a useful way to understand how activity, knowledge, and communities emerge together in the process of workplace learning. Individual interactions and meanings form part of the workplace context itself: they are interconnected systems nested within the larger systems in which they act. As workers are influenced by symbols and actions in which they participate, they adapt and learn. As they do so, their behaviors, and thus their effects upon the systems connected with them, change. The focus is not on the components of experience (which other perspectives might describe in fragmented terms: person, experience, tools, and activity) but on the relationships binding them together. Workplace learning is thus cast as continuous invention and exploration in complex systems.

Critics suggest that such practice-based studies of workplace learning bypass questions of politics and power relations: who is excluded from the construction of knowledge in a CoP, what dysfunctional or exploitative practices are perpetuated in communities of practice, and what hierarchical relations in the workplace reproduce processes of privilege and prejudice. Issues raised include accreditation and assessment of learning when it's buried in co-participation, distinguishing desirable from undesirable knowledge development, accounting for changing notions of what is useful knowledge, and differentiating influences of particular groups in the co-participational flux (positional, generational, gendered, etc). At issue is the extent to which sociocultural learning theories including notions of communities of practice, complex adaptive systems, or even CHAT suppress or enable core questions about the politics and purposes of workplace learning.

Researching Identity and Literacy in Workplace Learning

Work communities are powerful sites of identity, practices, and knowledge systems in which individual workers' desires for recognition, competence, participation, and meaning are both generated and satisfied. Identity is ultimately a representation or mental conception that we ascribe to ourselves and others: our conception of who we are, our

identity, is constituted by the power of all of the discursive practices in which we speak, which in turn speak us, so to say (Chappell *et al.*, 2003: 41).

People's sense of their own knowledge in work, and the knowledge valued by the group to which they see themselves belonging, form a critical element of their sense of identity. Further, their participation in work practices is entwined with the identities they come to inhabit within a particular community. Identity work itself involves learning. Workers figure out how to position themselves in an organization, how to perform identities that are acceptable to their immediate peers but also that allow themselves freedom and some autonomy and control. In work environments of rapid change where people must transform their practices, they understand their knowledge as more mutable and fluid; they are adopting shifting identities: they literally learn to perform different selves and knowledge in different environments. Yet at the same time, people often employ deliberate strategies to anchor their identities.

Researchers have explored how particular identities are constituted among these varied coordinates, and how learning processes are implicated in individuals' subjections, negotiations, assertions, and shifts of subjectivity (see Billett *et al.*, 2007). One case studied miners compelled to transform their work from manual labor in heavy equipment operation to computerized manipulation of equipment using joysticks in an office. At issue was the men's macho-masculine identities, which were no longer relevant. Overall, adult education researchers are interested in how people come to recognize the limitations of their current work identities, how they recognize possibilities for new identities, and what strategies they learn to cope with repressive constraints on their work identities.

Language and literacy are closely related to identity and learning: people's sense of who they are and what they know and can do at work are embedded in the language and textual practices they use. One area of workplace research examines how learning is shaped by particular written texts in changing workplace environments such as documents, policies, record-keeping forms, or employee growth plans. Such texts standardize what counts as knowledge, thus controlling the work practices and working relations of people employed. As people are pressed to learn new literacies in their work, their sense of self shifts along with their ways of conceptualizing and doing their work. Globalizing forces, such as standardization, are introducing new texts and literacies into work such as the massive form-filling required to demonstrate compliance with ISO-9000 standards, or the accent training given in call centers to make Indian workers sound American on the telephone. New literacy practices have been engendered by the shift to post-Fordist work arrangements such as self-directed teams. Workers used to hierarchical communication pipelines have had to learn how to participate

productively in team meetings: how to set goals, analyze, and assess collective work through leaderless reflective team dialogs.

A concern for technological upskilling, or developing worker literacy in new technologies, has prompted many training programs as well as research to explore exactly how people learn to work with technologies. On this theme, Sawchuk (2003) studied technology learning practices of workers, integrated with everyday life and mediated by artifacts such as computer hardware and organizational settings. He presents a "working-class standpoint" that opposes even while it accepts managerial control, and often copes through subversion. Sawchuk found that for working-class people, computer technology is a "key signifier" for workers' deepest class-based desires and fears: the sense of losing control and being left behind in an inevitable techno-obsessive world, the frustrations of trying to figure out capricious computer processes, or the trials of purchasing the right computer on limited incomes. Yet working-class learning thrives in informal networks, what Sawchuk calls "solidaristic networks" (p. 123): where mutuality and group orientations within stable working-class communities produce knowledge in everyday computer learning. It is here that Sawchuk found an "enormous surplus" of knowledge production capacity as well as emancipatory potential for working-class people.

Researching Power and Politics in Workplace Learning

Calls for greater attention to research examining power relations in workplace learning have not resulted in much empirical research. In the literature review of nine journals 1999–2005 (Fenwick, 2008), only about 15% of published articles touched upon power or politics, and these were almost exclusively theoretical in nature. Five different perspectives of power appear to be represented among these. In the radical view, organizations are viewed as sites of central contradictions and ideological struggle between those who control the means of production and those whose labor and knowledge are exploited. In the discursive view power is viewed as circulating through regimes of knowledge and discursive practices. Power is not possessed by particular people or institutions, but is constantly created and readjusted through relations among people and practices, notions of what is normal and what is valuable. Workers participate in and help to sustain the very regimes that discipline and repress their identities and opportunities. In the identity politics view, power relations consolidate a dominant workplace culture whose practices and beliefs actively marginalize or even persecute individuals by virtue of their gender, race, religion, sexual orientation, or conformance to the ability-norm valued by the dominant. The micropolitics view analyses power

relations as confined to individual strategies to improve their own advantage, such as gamesmanship. Finally, the community view avoids a critical analysis of structures, knowledge politics or even interpersonal politics: power is viewed as benign energy, exercised mainly in mobilizing individuals around shared vision, mutual engagement, and sense of belonging.

Adult education analyses of work tend most to feature the radical and identity politics views of power, so further discussion of these two is warranted to show their links to learning. In the radical view, workplace learning is often envisioned as radical transformation among workers: empowerment purposed towards workplace reform. Radical or emancipatory learning involves workers first in critically analyzing existing repressive conditions of work, including mechanisms in place for controlling knowledge and the means of production. Then strategies for resistance and change are generated collectively, in a learning process that builds solidarity, individual and collective agency, and workers' capacity to defend their rights. This learning process of transformation is often positioned in opposition to reproduction, where workers learn to accept and even support exploitative, hierarchical structures that subjugate them and reproduce existing (inequitable) power relations. However, some have argued that this traditional dualism may be overly simplistic, that research needs to examine how reproductive and transformative learning are entwined in everyday work and with what workers themselves want to learn.

In critical workplace learning research, adopting an identity politics view of power, issues of race, disability, sexual orientation, and religion are almost completely absent despite their growing importance in other areas of adult education. Gender, on the other hand, has received substantial attention. Studies show that women continue to confront gendered work knowledge and training structures in organizations based on patriarchal values, male-oriented communication patterns, and family-unfriendly schedules. New expectations for continuous learning related to learning organization initiatives, self-directed teams, technological upskilling and development of new literacies, all create work overload that poses particular burdens for women who still carry the double-duty bulk of domestic and childcare work at home. Women in particular are often expected to nurture the close relationships and community that organizations want, to mentor others, and to display cheerfulness (Mojab and Gorman, 2003). Yet the learning valued and supported most in organizations tends to be related to leadership development, knowledge creation, and organizational growth, in professional/managerial jobs where women continue to be underrepresented. Meanwhile, women who are new immigrants and women of color are overrepresented in precarious, contingent employment such as call centers, food service, and home-based work where there are few learning

opportunities or communities offering the rich sort of participation and learning networks to help women obtain better-paying, more secure employment.

Future Directions

As is clear in this discussion of learning process, identity, and power in workplace learning research, perspectives range widely according to fundamental understandings of what constitutes knowledge, how it is constructed, how workers are connected to one another and to their environments, and how action and reflection are related. Furthermore, different researchers and educators propose very different purposes for workplace learning, and these tend to influence the way learning is understood. Some focus on individual human development, some on building solidarity and political consciousness among workers, while others are more interested in upskilling workers or changing organizational culture to increase productivity. Labor educators tend to focus on enabling workers to obtain control of their own knowledge. Management and human resource theorists tend to focus on increasing human performance. Other differences in perspective arise from the unit of analysis. Those who focus on the individual might explain processes in acquiring concepts, developing expertise or practical intelligence, or transforming beliefs. Those who focus on the system might examine social learning processes, construction of cultural narratives, or forms of knowledge production and change occurring in the group. These different perspectives are not necessarily irreconcilable, but neither do they nest neatly into one another. Clearly, workplace learning is contested terrain filled with fundamental tensions related to what knowledge counts most and who says so. No single model for workplace learning is acceptable in the face of such distinct positions.

Three emerging perspectives described in this article may become particularly important in guiding future research. One is what is here referred to as co-participation/co-emergent views of learning in work, including cultural-historical activity theory, actor network theory, and complexity theory. These approaches work at both micro and macro levels to help analyze the workplace mix of actors, objects, and culture and how forms of knowledge emerge and become adopted in this mix. Another is the area of new textual/literacy practices engendered by globalization, and their influence on people's work identities and knowledge. The third is analysis of power relations, particularly to address issues of disability, race, religion, and sexual orientation where significant workplace stigma and discrimination has been observed but surprisingly little research has been conducted, particularly connecting these issues to workplace learning. Overall, there continues to be great need for in-depth empirical research that traces

what people actually do and think in everyday work activity, and for research methods that can help illuminate the learning that unfolds in everyday work. Of all the ideas currently afloat in adult education literature addressing work issues, these trends seem most likely to influence future perspectives, program design, and pedagogical practice in workplace learning.

Lifelong Learning

J Field, University of Stirling, Stirling, UK

© 2010 Elsevier Ltd. All rights reserved.

Lifelong learning has become a dominant theme of education and training policies across the advanced industrial nations. Besides a wide range of national governments, it is endorsed by a wide range of intergovernmental policy actors, including the Organisation for Economic Co-operation and Development (OECD), the European Commission (EC), the United Nations Educational, Social and Cultural Organisation (UNESCO), the World Bank and the International Labour Organisation (ILO) (Schemmann, 2007). For governments, lifelong learning is an overarching policy framework which offers solutions to a number of common economic and social challenges; globalization and competitiveness often dominate the policy discourse, but promoting lifelong learning is also seen as relevant to social cohesion, demographic change, active citizenship, migrant assimilation, and public health.

Lifelong learning therefore has broad application across a variety of policy domains. It is also widely discussed by educational professionals and by academic researchers. Some claim that lifelong learning is such a broad concept that it has virtually no practical value (Gustavsson, 1995: 92). While its meanings are many and varied, they usually emphasize learning as a ubiquitous process, which takes place throughout the lifespan, and across a variety of life contexts. The recent focus among policymakers, educationalists, and researchers on the ability to learn continuously after the phase of initial education, and across a variety of contexts of which educational institutions are one among many, distinguishes the debate over lifelong learning from more conventional policy discussions of education and training as levers across a range of economic and social policy domains.

From Social Optimism to Economic Survival?

In recent years, lifelong learning has moved steadily toward the center of the policy stage. International governmental

bodies have played a particularly significant role in popularizing lifelong learning as a policy concept. While the term was in occasional use before the mid-1990s, it received huge impetus when the European Commission declared 1996 to be the European Year of Lifelong Learning, an idea first floated in the Commission's White Paper on competitiveness, employment, and growth (Commission of the European Communities, 1994). This context neatly exemplifies the way in which it is economic concerns that dominate policymakers' interest in lifelong learning. Particularly in the older industrial nations, policymakers argue that successful adjustment to a knowledge economy and society requires a highly skilled, knowledgeable, and flexible workforce as a key to sustained national and corporate competitive advantage; individuals equally need to invest continuously in their own competence in order to maintain their employability in an ever-changing labor market. This reflects and is expressed through a policy discourse that is centered on a human-capital approach to social inclusion and economic growth (Borg and Mayo, 2005; Coffield, 1999; Gustavsson, 1995).

This strong economic bias distinguishes the current debate over lifelong learning from earlier policy attempts to promote learning in adult life. Superficially, the idea of lifelong learning closely resembles notions of lifelong education, which were widely discussed in the 1970s. The idea of lifelong education was promoted particularly actively by UNESCO, who in 1972 published *Learning to Be*, a report by an international expert panel chaired by Edgar Faure, a former politician who had served in France as Minister of Education and Prime Minister (Faure, 1972). Faure's report was essentially humanistic in nature, arguing in favor of wider access to higher levels of education and greater support for and recognition of informal and non-formal learning in order to encourage personal fulfilment and development. Faure's report was enormously influential in stimulating debate, and in infusing that debate with an optimistic view of educational innovation and reform (Knoll, 1998). Its core ideas were taken up by the

OECD, which developed a parallel debate over recurrent education, the aim of which was intended to provide governments with practicable means of realizing the overarching goal of lifelong education (OECD, 1973).

In practical terms, the activities undertaken by UNESCO and OECD mainly helped focus policy attention on the educational needs of those who had benefited least from the front-loaded approach to initial education. In industrial nations, this often involved developing educational entitlements for workers, with laws on paid educational leave in a number of countries. In some, there was a broad entitlement to leave for general purposes (as in Sweden, and in state-level laws on *Bildungsurlaub* in Germany); in other cases, educational leave was guaranteed for specific purposes, such as vocational training under the French law on *congé de formation* or British laws on health and safety and workplace representation. Many more countries experienced a growth of adult basic education, with particularly impressive innovations in adult literacy provision and women's basic education.

By the 1990s, a concern with personal development, or worker participation as public policy goals, had not disappeared altogether, but was found far less frequently. Much more common has been a primary concern with lifelong learning as a means of underpinning economic competitiveness and growth. In a globalized economy, where material resources are more or less ubiquitous, skills and knowledge are said to be the only sustainable sources of competitive advantage (Commission of the European Communities, 1994; Reich, 1993; Thurow, 1994). Insofar as policymakers also share an interest in equity and social cohesion, lifelong learning's importance is often valued primarily as a means of re-insertion of vulnerable individuals or inactive workers back into the labor market, leading in turn to improved income and security for individuals from disadvantaged backgrounds.

The current debate over lifelong learning is therefore distinctive in a number of ways. It is characterized by the breadth, and sometimes vagueness, with which the concept is used; it is derived more from the policy domain than from the educational field; and its dominant usage tends to be primarily economic. Yet, more positively, the concept can also be taken to emphasize and recognize the many ways in which people build up new skills and capacities throughout the lifespan and across different life spheres, including workplaces, communities, homes, and voluntary associations. It gives a central place to people's learning, as opposed to education, teaching, and institutions. To use what has become a common abbreviation, current policy concerns are with education that is lifelong, and also life-wide. For these reasons, it has often become more or less synonymous with adult learning; however, it has powerful implications for all phases of the lifespan.

Initial Education as a Platform for Learning through Life

Initial education, including early-years development, is important in its own right. From a lifelong perspective, though, it is additionally important because it provides a platform for learning later in life. A number of commentators argue that family and neighborhood influences in the early years are particularly significant in determining patterns of learning across the lifespan. From this perspective, high-quality education during the earlier years is important primarily because of its role in providing the abilities and motivation to engage effectively in learning later in life (Hargreaves, 2004; Gillies, 2005; OECD, 2004). Sociologically, many of the factors that are associated with adult well-being are already present in the early years. One recent longitudinal analysis of adult learning in Wales demonstrated that most of the factors that affected the probabilities of participation in adult life were present by the time that the child entered primary school for the first time (Gorard *et al.*, 1999).

Education and well-being have often been associated. The idea that education can promote individual well-being indirectly, by improving earnings and promoting social mobility, is an old one; so are notions of education helping to promote the good society by contributing to economic growth and equality of opportunity. Recent debates about the wider benefits of learning have added a new dimension to the relationship, linking education to other facets of individual and collective well-being, such as health (including mental health), security from crime, and political tolerance (Schuller *et al.*, 2004). Through strengthening self-identity, learning is also said to help people develop a sense of authorship over their own biographies and take responsibility for their life choices (Côté, 2004).

Theoretical Perspectives

The 1970s debate over lifelong education was a broad one. While OECD's work on recurrent education was primarily concerned with the balance of resource distribution as between secondary and tertiary education, combined with an interest in worker participation in enterprise management, the work of UNESCO was profoundly influenced by the radical educational thinkers of the 1960s, along with the concerns of liberation theology and Third World development. The dominant voices in the 1990s debate, by contrast, came primarily from writers on globalization and economic change, and were almost entirely based in the economically advanced nations of the West. In a global knowledge economy, these new growth theorists argued, sustainable competitive advantage could only come from an ability to innovate continuously, and in turn this required a highly

skilled and flexible workforce (e.g. Porter, 1990; Reich, 1993). Neo-Schumpeterian concerns with innovation as a basis for economic growth came to be aligned with human-capital perspectives on skills development, as well as with an interest in regional and national innovation capacities. More organizationally focused analyses have tended to emphasize the importance of organizational learning and knowledge management as strategic responses to complexity and change (Smith and Sadler-Smith, 2006).

The dominant theories of lifelong learning, then, tend to be concerned with developing workers' abilities to innovate and respond to change, and therefore contribute to sustained economic growth. Many governments, particularly those led by social democratic or Christian democratic parties, also see lifelong learning as a means of promoting equity and inclusion. Again, this is associated with a strong focus on employability as an important active measure to promote social cohesion, and equity concerns are therefore closely related to economic goals. Finally, this dominant view takes a capitalist economic order as a given; lifelong learning is not seen as a way of changing society, but at most as a way of including the least advantaged in the existing order. Particularly in its most recent phase, which may be conveniently marked by the European Commission's *Memorandum on lifelong learning* of 2000, it is a highly pragmatic concept (Schreiber-Barsch and Zeuner, 2007: 693; Commission of the European Communities, 2000). However, there are also significant critical voices, albeit from a range of differing perspectives.

Some take a broadly radical, anti-globalization stance. Thus the Maltese writers Carmel Borg and Peter Mayo suggest that the primary economic focus of dominant theories is tied to a neoliberal agenda for welfare reform (Borg and Mayo, 2005). Others have asked whether the whole concept is not associated with Western interests, and question whether, at least in its current manifestations, lifelong learning presents opportunities for or is a distraction from adult basic education as a force for development and democratization in the majority of the world (Torres, 2003). Certainly, the current policy climate tends to assume that individual workers must assume at least partial responsibility for ensuring their own employability and invest in new skills in order to maintain their labor-market value. However, this is often accompanied by incentive regimes, which seek to encourage workers to invest in new competences and improve existing skills; in some cases, workers' own organizations have promoted skills improvements as a way of protecting collective security (Payne, 2005). It is also possible to see welfare regimes as themselves bureaucratic and unresponsive to diverse needs; even in adult education, devolution and autonomy may be viewed as a form of privatization, but some will also experience it as emancipatory. In other words, there is no necessary connection between an emphasis on continuous learning and the dismantling of the welfare state, but radical perspectives do

draw attention to both global and local inequalities that are material and structural, and which may be perpetuated by current lifelong learning policies.

Feminist writers have also made a significant contribution to critical debates over lifelong learning. From a feminist perspective, the radical expansion of post-compulsory education since the 1960s has brought rather ambivalent consequences. On the one hand, considerable growth in women's access to higher education has formed part of the remarkable transformation in the role of work in women's biographical trajectories (Spano, 2002). Like many radical writers, feminists tend to be sharply critical of policies and forms of provision that are driven primarily by market forces, though they go beyond the majority of radicals in identifying clear and practicable ways in which education and training might better meet the needs of women (Gouthro, 2005; Burke and Jackson, 2007).

From a feminist perspective, the invisibility of gender in a patriarchal society masks the fact that women face particular barriers to participation in learning, and much provision fails to address the diversities of women's identities; working-class women in particular are trapped in a cycle of low-paid and low-status jobs, whose skill content is barely acknowledged in public discourse about a learning society (Fenwick, 2004; Jackson, 2003). Gouthro goes rather far, suggesting that the language and ideas of lifelong learning represent a major incursion of public policy into the private sphere, as the identification of the homeplace as a site of learning is little more than a colonization of part of the lifeworld that has particular resonance for women (Gouthro, 2005).

A third alternative body of theory derives from post-structuralist and post-modernist writing. In particular, a number of writers have drawn on the thinking of Michel Foucault, the French philosopher/historian, to frame their analyses of power and knowledge and the construction of the learning citizen. Foucault's influence can be particularly seen in studies which treat knowledge as a social practice, governed by relations of power that may be expressed through various classificatory schema and their institutional manifestations. This might be seen as a relatively superficial reading of Foucault's work, and it has been supplemented more recently by studies that take Foucault's radical decentering of the human subject as their starting point. Here, instead of studying learners as agents, the focus is on studying the specific practices that constitute learning, the discourses produced by and producing these practices, and the different subject positions that are made available through these discourses and practices. These subject positions usually include the other, and discourses of nonparticipation and nonlearning are therefore analyzed as processes of othering, so that practices and discourses of lifelong learning always constitute subject positions that are excluded from the dominant framing (Fejes, 2006; Nicoll, 2006).

Finally, a number of writers have explored connections between lifelong learning and sociological theories of reflexive modernization. Ulrich Beck and Anthony Giddens both take human agency as the core of their accounts of late modernity (Beck, 1992; Giddens, 1991). There are distinct parallels between theories of reflexive modernization and core elements of the debate over lifelong learning. Beck and Giddens lead us to explore the socio-cultural forces that are shaping the demand for continuous learning, rather than seeing lifelong learning as an expression of economic forces alone. Their work also draws attention to learning and change in everyday life; people may well be confronting experiences of globalization and technological change, but they are also required to take an active approach to their own biographies, including the ways in which they negotiate intimate relationships and construct identity and social resources (Alheit, 1990; Field, 2006: 68–73).

Institutional Structures for Lifelong Learning

Lifelong learning is a highly complex area for policy, yet its current prominence is largely due to the interest of policy-makers. This paradoxical position reflects the challenges that current economic, social, cultural, and political changes pose to the policy community, particularly in the Western nations, which therefore require new approaches to governance (Field, 2006: 29–43). While policymakers are still able to resort to direct intervention of the traditional kinds, the most important actors in lifelong learning are usually non-governmental – primarily enterprises and individuals, but also trade unions, families, voluntary associations, and neighborhoods. Even within government, lifelong learning policies span the interests of a range of ministries, and a variety of layers from local and regional to national and supra-national. Lifelong learning therefore poses serious challenges of coordination of a range of actors of different kinds, besides bringing risks of unintended consequences. It also poses challenges to many of the existing institutions, particularly those providing opportunities in adult learning.

Although the current debate over lifelong learning has only been underway since the mid-1990s, governments have not had to write policies on a clean sheet of paper. Rather, they have sought to modernize and systematize existing patterns of provision of adult learning, and review existing institutional structures, with a view to raising levels of participation and attainment, usually right across the lifespan but with a strong concentration on learning in and for working life. Comparative researchers have identified a number of variations in post-compulsory education and training structures, in spite of the convergent pressures of globalizing economic forces and the modernization of

education systems. Particular attention has been paid to the roles of three distinct components of the lifelong learning systems:

- systems of transition between initial education and the labor market;
- higher education systems; and
- arrangements for adult education and training.

These components have attracted attention from policy analysts as well as academic researchers (see, e.g., the OECD's thematic reviews (OECD, 2005)).

The three institutional dimensions of national lifelong learning systems differ significantly from each other. The most complex, from both a policy and an analytical perspective, is the adult learning system, which involves a variety of actors and stakeholders, including a wide range of non-government organizations as well as individual citizens. Youth transition systems are only slightly less complex, as well as institutions, which may or may not be publicly funded; the key stakeholders generally include employers and sometimes trade unions, as well as varying degrees of state provision and regulation. Some national studies note that military service may also affect youth transition processes (e.g., Tsai, 1998), and schools are also often influential actors in their own right. Initial education systems at first seem relatively unproblematic from a policy perspective; the major players are usually publicly funded schools and the state itself (though policy implementation is often influenced by teachers, particularly where the latter are able to exercise a significant degree of professional autonomy). However, initial education is often less straightforward than it first appears; particularly in early years, nongovernmental providers are often involved in nursery-level education, and families and communities exercise significant influence over children's cultural capital and social capital.

Green *et al.* (2006) identify three distinct regional models of lifelong learning and the knowledge economy. Two of these – the Anglo-Saxon, neoliberal model, and the continental European, social market model – are relatively well established, and are clearly based on conventional social policy models of welfare regimes. Green and his colleagues add a third, Nordic model, which combines high levels of social cohesion with strong support for economic competitiveness. The Nordic model has recently been subjected to particular scrutiny because of its perceived relative success in combining comparatively equal participation with high overall participation in adult learning (Tuijnman, 2003; Rubenson, 2006; Milana and Desjardins, 2007). Overall participation rates in all the Nordic countries are consistently close to or over 50% of the population of working age (OECD, 2000). Further, Nordic participation rates are high both for job-related adult education and training and for non-job-related learning (Eurobarometer, 2003).

The roots of this pattern have been traced back to the 1960s, when governments and the social partners identified

adult education as a distinct and significant field of policy, linked closely to labor market policy, which itself was geared primarily to securing full employment and industrial consensus (Rubenson, 2006; Milana and Desjardins, 2007). Typically, the Nordic countries have a wide range of providing institutions, including well-established non-statutory providers (such as trade unions) and community-based providers accountable to local government. Rather than seeking to restructure the institutional system, public policy instruments since the 1960s in the Nordic nations have increasingly included targeted-funding measures aimed at engaging disadvantaged groups in the adult education system (Rubenson, 2006).

These measures have had some success in terms of overall participation. Nevertheless, despite high overall participation, and relatively high participation by disadvantaged groups, Milana and Desjardins (2007) note in a systematic review of international survey data that the same broad distribution is found in the Nordic countries as in other nations. The least likely to participate are older workers, those with lower skills levels, unemployed people, migrant workers, and those with weak initial educational qualifications. Nevertheless, on the basis of data from the International Adult Literacy Survey and a survey conducted by the EC in 2003, published by Eurobarometer, they conclude that the Nordic nations have created popular adult education systems that have led to “the attenuation of differences among these otherwise disadvantaged groups”, particularly older adults of working age and less-educated workers (Milana and Desjardins, 2007: 3). They further analyze Eurobarometer data to show that although adults in the Nordic countries reported similar constraints on participation as did respondents in other European Union (EU) member states, the average incidence of the constraints was generally lower in the Nordic countries, and adults in the Nordic countries were more likely to participate even if they faced these constraints (Milana and Desjardins, 2007: 6). Interestingly, this was true for dispositional barriers as well as for more material and institutional constraints.

Milana and Desjardins conclude that public policy has been particularly significant in producing high levels of overall participation, first by maintaining a strong public adult education system, and second by adopting special targeting measures to ensure that an open and broad system of provision is not simply colonized by the already well educated (Milana and Desjardins, 2007: 14–15). In addition, Nordic economies are typically characterized by forms of organizational networking that are likely to promote informal learning. Peter Maskell and his colleagues have demonstrated that high levels of informal exchange of information, techniques, and skills are critical to the competitiveness of Nordic enterprises, particularly those who are affected by high labor costs and low levels of technological development and must therefore compete on grounds of quality and added value (Maskell *et al.*, 1998).

Supplementing various studies of national policy, Michael Schemmann has conducted a detailed systematic analysis of the policies developed by inter and supranational government bodies such as the World Bank, UNESCO, EC, and OECD (Schemmann, 2007). Of these, the EC has been most influential in practice, since it is responsible for implementing policies directly, while UNESCO and the OECD exercise a more indirect influence. Nevertheless, Schemmann traces a number of common themes, as well as marked differences, across these four bodies; above all, he believes that they have established a global lifelong learning discourse with a number of shared reference points. In turn, of course, these common themes reflect the dominance of a neoliberal policy agenda at national level, with governments seeking similar solutions to similar problems. This includes a marked trend toward employer involvement with delivery, in order to promote responsiveness to economic demands, and the adoption of active approaches to labor-market training, particularly through welfare-to-work measures.

Schemmann also notes a pronounced tendency for international governmental bodies to seek to influence national policy by compiling comparative indicators and promoting policy borrowing and transfer, trends that he finds typical of the new governance that is being applied to complex policy areas like lifelong learning (Schemmann, 2007: 246). Both the OECD and the EC publish benchmarking data, compiled on the basis of selected indicators of educational activity; the OECD's publications usually attract high levels of media coverage. In 2003, the EC set its member states the target, by 2010, of at least 12.5% participation in learning by adults aged 25–64, though the Commission has few powers to enforce such targets other than by publicizing the results. The EC has also been charged by the European Parliament with developing a European-qualifications framework covering all areas of lifelong learning. Such developments have led some commentators to question whether there are tendencies toward an international standardization process in adult learning, particularly within the EU (Schreiber-Barsch and Zeuner, 2007: 699–700).

Conclusions

Since the mid-1990s, ideas of lifelong learning have been widely debated in policy and research circles. The idea itself rose to prominence in the mid-1990s when it was embraced by a number of international policy bodies and by several countries. While there were often exaggerated claims both for the novelty of the policies, and for the likely contributions they would make to a whole plethora of economic and social challenges, these policies did indeed mark a shift in policy focus, away from instruction toward learning and away from childhood and youth toward

learning through the life span. This shift reflected policy-makers' preoccupations with the consequences of globalization and rapid economic and technological change, as well as business leaders' recognition of the contribution of upskilling to competitive strategies. However, it also reflected wider sociocultural factors which were also leading to a new emphasis on continuous learning as a way of coping with the demands of everyday life in a risk society.

Conceptually, the idea of lifelong learning appears neatly to parallel influential sociological conceptions of institutionalized reflexivity and risk. The task of lifelong learning, it has been argued, is therefore to enable people to regain a degree of control over their existence, and develop a learning elective biography:

When flexibility constitutes the crucial capacity that work organizations and the unpredictability of life demands, having a stable identity can be a disadvantage. . . Questions such as 'Who am I?' and 'Whom do I want to be?' can become quite haunting existential questions (Glastra *et al.*, 2004: 294).

Others, however, view such a concern with promoting flexibility as potentially damaging and negative to the individual and community, and at worst as collusion with the excesses of globalized capitalism.

Policies for lifelong learning have tended to concentrate on learning in and for working life. Yet, particularly when compared with the innovations of the 1970s debate, most governments have notably shied away from the challenging and difficult issue of policies aimed at increasing the skills and knowledge content of jobs, especially in sectors and regions that rely on low relative labor costs as a basis for competition. Some attention has been paid to the implications for initial schooling as a preparation for learning in later life, as well as to the development of parenting skills, usually for mothers, with a view to raising their capacity for supporting their own children's learning (Gillies, 2005). Relatively little attention has so far been paid to support for learning in later life, even in countries like Scotland where population aging presents acute social and economic challenges. Patterns of participation in adult learning, even among people of working age, tend to mirror existing educational and socioeconomic inequalities. There is therefore a risk that market-led approaches to lifelong learning will simply accentuate and help to entrench the social hierarchy, as the knowledge-poor lag ever further behind in the shift to a knowledge economy. While no policy models have successfully combined uplifts in overall adult participation with a marked impact on inequality, the Nordic societies have been relatively successful in moderating the impact of existing patterns of disadvantage.

Lifelong learning is, then, a rather ambiguous concept which has been used for a range of policy purposes, mainly economic in nature. Yet, it is at heart extremely simple and – from a normative point of view – potentially rather

attractive. The vision of a society where people have broad opportunities to learn across and throughout their lives is an attractive one for many educationalists – particularly those with a background in adult education. More to the point, the broad social and economic trends that have brought lifelong learning to centerstage are not short-term ones. At least in the medium term, then, the debate is likely to continue.

Rewriting the History of Adult Education: The Search for Narrative Structures

B J Hake, University of Leiden, Leiden, The Netherlands

© 2010 Elsevier Ltd. All rights reserved.

Introduction

In collections of university libraries worldwide, one can locate relatively small sections of volumes pertinent to the history of adult education. Such volumes may include monographs and edited volumes with reference to the broad picture of the history of adult education and specific periods in the development of adult education, studies of particular institutions and organizations at national and local levels, biographies of important individuals, and the celebration of specific institutions in jubilee volumes. Essentially, these volumes will relate to the history of the country where the library is located. A much smaller number of volumes will relate to the history of adult education in other countries, while comparative histories will indeed be relatively scarce items. Even rarer will be volumes in foreign languages about the history of adult education in other countries.

Irrespective of their geographical scope or the period covered, the core question with regard to all histories of adult education involves the structure of the historical narratives which endeavor to tell the story of the development of the institutions and practices regarded as constituting adult education. There are two key issues with regard to the structure of historical narratives, namely: (1) the circumscription of the field of study in terms of the social and cultural phenomena recognized as comprising adult education, and, (2) the delineation of important eras or formative periods in the development of adult education.

Circumscription of the Area of Study

The definitions of adult education used in historical narratives raise fundamental questions with regard to the phenomena which are included in or excluded from historical studies of adult education. National histories tend to be constructed in terms of some sense of an adult education movement which is regarded as a clearly definable social system comprising the individuals, institutions, and associations which have been responsible for the development of adult education through time. This perspective views adult education as a field of readily recognizable activities which constitute the national system of institutional providers which emerged within a sequential process of historical development. These historical

narratives take three major forms. First, they may trace the emergence and development of organizations and practices in the form of institutional histories at national, regional, and local levels. Second, they may be organized around significant individuals who are regarded as the great innovators and reformers in adult education. Third, they may narrate the development of successive periods of philanthropic initiatives, intervention by governments, legislation, and public funding of the provision of adult education. Such narratives are constructed in terms of institutional success which tends to result in an unproblematic narrative of the development of well-known institutions or practices. In this manner, historical studies tend to comprise the selective construction of a lineage for the growth of remembered institutional forms of adult education. These selective historical narratives are often recorded in terms of those forms of adult education which constitute the national tradition of adult education practices. Consciously or unconsciously, these selective accounts of successful and enduring institutions actively exclude the unremembered, the inconvenient, and the historically embarrassing.

Historical narratives of adult education as the story of successful formal institutions, however, actively exclude a vast range of social and cultural phenomena in the more diverse spheres of nonformal and informal adult education. Although historical research must necessarily devote considerable attention to the detailed study of the institutions, significant historical actors, and the development of public policy, historical accounts of the development of adult education must necessarily lead out to the general history of society. Such an approach must lead away from the specific and historically bounded contexts of institutional history into the broader economic, political, social, and cultural history. One of the most striking features of the literature on the history of adult education, for example, is the widespread evidence of the significant contribution made by social, political, and cultural movements to the development of adult education practices. It is necessary, therefore, to identify historical studies which analyze the historical relationships between social movements and the development of adult education in terms of the broader patterns of economic, social, political, and cultural change beyond the institutional realms of adult education.

The broader and more diverse range of social and cultural phenomena identified here as the legitimate

object of study for the historian of adult education can be best understood in terms of the social organization of communication and learning. The term social organization refers here to the complex range of institutions, social movements, and groups which were involved in the historically specific development of adult education. This opens up the field of historical description and analysis of adult education practices in terms of the social organization of communication and learning in which adults were either organized by others or organized themselves for the purposes of disseminating and acquiring knowledge, skills, and sensitivities. Some of these institutions, movements, and groups will be recognized immediately as adult education, while others were embedded in the economic, political, or cultural dimensions of social life. Reconstruction of the ideas, institutions, and practices associated with adult education has, thus, to be pursued in terms of the social relationships involved in the social organization of communication and learning. The historical development of adult education institutions and practices is a socially structured process within societies, and this is a question of dominance and dependence in the history of social, political, economic, and cultural relationships. Innovation is sometimes undertaken by dominant social groups, but it may also be carried out by alternative or oppositional social groups and movements. This results in a more inclusive understanding of the range of nonformal and informal adult education at a distance from adult education institutions.

Periods in the History of Adult Education

Historical narratives are characterized by the marked consistency with which they relate the development of adult educational institutions and practices in terms of a number of specific eras or formative historical periods. The standard institutional histories tend to be formulated in terms of the notion of eras which describe periods of major changes in the institutional development of adult education. Such eras can also be regarded as formative periods of high levels of activity in the development of adult education institutions and practices. In terms of evidence-based empirical indices of activity, such formative periods are characterized, first, by high rates of innovation associated with the development of new institutions and practices; second, the significant expansion in the numbers of adults involved in organized learning activities; third, the opening up of participation in organized learning to new social groups or publics; and, fourth, significant levels of interest in developments taking place in other countries. The latter phenomenon was expressed in reports of visits, translations of foreign texts, and articles in contemporary journals. Formative periods were interspersed, however, with periods with a low conjuncture in

terms of innovation and change. This indicates the need to recognize the historical reality of breaks and shifts in historical development rather than the gradual unbroken line of the development of institutions and practices.

European and Anglo-Saxon literatures, for example, tend to reconstruct the history of adult education in terms of four significant formative periods.

The first of these periods was associated with the Protestant Reformation in northwestern and Central Europe during the second half of the sixteenth century and the first half of the seventeenth century. Development of the organization of adult learning activities in this period was influenced by the invention of the printing press, the translation of the Bible into the vernacular, Bible study groups, and high levels of adult literacy. A reading public emerged which gave rise to the demand for books, new literary forms such as devotional books, books of manners, and the first encyclopedias of knowledge. This was associated with new forms for the distribution of the printed word by colporteurs, booksellers, circulating libraries, and reading circles. In the Catholic areas of Southern Europe, however, the Counter Reformation was marked by the Baroque rejection of the promotion of literacy among the general population and the emphasis upon visual imagery rather than the written word. This geographical division between Northern and Southern Europe was expressed in very different dynamics in the development of adult education. These dynamics subsequently exerted their influence in the different strands of European expansion and colonialism in other continents. They continue to exert their influence in contemporary problems of illiteracy in many countries throughout the world.

From the mid-eighteenth century onward, a second formative period in the development of organized adult education throughout Europe and in the American colonies can be identified. The so-called Enlightenment movement, which marked the start of the European modernization process, was in effect a transnational social and cultural movement which gave priority to education, for both children and adults, in the improvement of society together with an emphasis upon virtue and individual moral behavior in the service of the common good. Historical research provides evidence of the activities of the state and voluntary societies and associations in the development of elementary education; the advancement and diffusion of knowledge; encouragement of the rational improvement of commerce, manufactures, and agriculture; the stimulation of literature, poetry, and drama; the organization of lectures and scientific demonstrations; circulating and lending libraries. The first adult schools were established in this period. The development of an active publishing trade and the further growth and diversification of the reading public was expressed in the periodical press, newspapers, and the growth of a political press.

One of the most manifest consequences of this period throughout Europe and the American colonies was the development of radical political movements, often organized in the form of corresponding societies. These movements demanded democratic rights and freedom of speech on behalf of both the commercial middle class and the artisan class in opposition to the closed oligarchies of dominant regimes. Such radical groups and their adult education activities were frequently repressed through the prohibition of the printing and selling of books and pamphlets in the vernacular. Banned books in French, such as the *Encyclopaedia* by Diderot and d'Alembert, were printed in The Netherlands and smuggled to France, while books in the Greek language were banned by the Ottoman authorities and were secretly imported from the printing presses of Budapest. This phenomenon of underground adult learning has remained a significant dimension of adult education in later periods of repression. The long-term repercussions of the French Revolution in 1789, which in itself fueled radical movements throughout Europe, resulted in the emergence of nation-states in the early nineteenth century. The cultivation of national identity led to the emphasis upon the development of national systems of elementary education and the organization of improving educational activities for adults. This was associated with the need to exert more rigorous control upon the self-organized learning undertaken by the common man, and the need to instruct adults in their rights and duties as responsible citizens of the new nation-states. In the longer term, this formative period, throughout Europe, experienced its nemesis in the revolutions of 1848 and their subsequent repression throughout Europe. This resulted in the emigration of many radicals together with the active export of many forms of self-organized adult education, from German in particular, to the other European countries and the United States.

The period between the 1870s and 1930s has been designated in the literature as a third important formative period. This period was characterized by industrialization and urbanization which contributed to the emergence of the organized working class, a militant women's movement, and the struggle for the right to vote. This resulted, on the one hand, in the development of independent adult educational activities organized by socialist, communist, and anarchist political parties, together with the trade unions and the women's movement. The period witnessed a significant expansion of independent working-class forms of provision such as the workmen's associations, Workers' Educational Association, workers' houses, workers' book clubs, workers' travel associations, Lenin and Marx houses, and the diverse range of educational initiatives associated with the Second Communist International. On the other hand, there was a range of educational responses to this challenge by conservative and liberal parties, together with the hierarchies of the Catholic and

Protestant churches. This resulted in the development of new institutional forms for the provision of adult education such as university extension, university settlements or co-called Toynbee work, the arts and crafts movement, folk houses, popular universities, public libraries, together with the folk high schools in Scandinavia, and other forms of residential education elsewhere. These forms of adult education provision were largely intended to provide educational solutions to the social question of the emergent working class, and they promoted reformist solutions to widespread concerns with urban housing, family life, working conditions, sanitation and health, prostitution, and alcohol abuse. Inherent to this conflict between adult education sponsored by independent working class and middle class was the issue of educating citizens to make use of the extension of the right to vote following World War I. Civic education became a key theme in adult education provision as was clearly demonstrated in the institutionalization of University Extension in the English-speaking world and the development of adult education institutions throughout Europe. These institutions placed the emphasis upon liberal adult education and also focused upon new didactic methods, such as reformist pedagogy in Weimar Germany and elsewhere.

This period also witnessed the development of concern of well-intentioned employers with new forms for the dissemination of scientific and technological knowledge to their employees. From the 1851 Great Exhibition onward, there had been efforts to bring employers and workers together in continuing education, learning in the workplace, and putative forms of vocational education and training. On the one hand, employers sought to establish industrial museums, perhaps badly named, which were intended to make new technological knowledge and production methods available to the working population by way of public demonstrations and short courses. Universities became involved in this process with the development of University Extension services devoted to the needs of agriculture and industry. On the other hand, elementary forms of vocational education and training developed with an emphasis upon technical drawing so that skilled workers could gain insights into the working of new machinery and production processes. At the same time, there was a growing concern with the changing employment patterns of women's participation in paid work. Initiatives by the women's movement in the 1890s were enhanced by the experience of World War I when women took the places in factories of men who were at the front. This often resulted in vigorous debates about the occupations which were appropriate to women and their needs for vocational training beyond the traditional domestic spheres of caring, cooking, sewing, and nursing. Following the Civil War in Finland, for example, there were attempts to retrain women as electricians and plumbers rather than as weavers and seamstresses.

Of particular significance later in this period were the consequences of the Russian Revolution in 1917, the end of World War I, the national independence movements following the peace treaties, and the rise of Fascism and National Socialism during the 1930s. The first All-Soviet conference on adult education was held in 1918 and the keynote address was given by Lenin, who did not fail to name the enemies of the revolution. The carnage caused by World War I resulted in significant interest worldwide in the role of adult education in the promotion of peace and international solidarity. The 1920s witnessed the establishment of numerous international associations, the first world conferences on adult education, and the establishment of international institutions such as the International Peoples' College in Ellsinore. The peace settlements of Versailles and Trianon broke up the territories of the Tsarist Russian, Austro-Hungarian, and Ottoman empires and granted national independence to many countries in the Baltic region, Central Europe, and the Balkans. In these newly independent nations, adult education became a battleground during the 1920s and 1930s between democratic and nationalist political factions. Fascist and National Socialist regimes were responsible during the 1920s and 1930s for the reorganization of adult education in the service of the state in Portugal, Germany, Italy, and Spain, together with other countries in Central Europe and the Balkans. This latter development had fundamental consequences for the organization of adult learning throughout Europe, which included the development of settlements and work camps for the ideological socialization of movement adherents, in particular, the emphasis upon youth movements, together with the so-called re-socialization of recalcitrant radicals such as intellectuals, social democrats, and communists. The first concentration camps established in Germany in 1933 were intended to re-socialize the recalcitrant through hard labor. At the same time, many refugees took their reformist pedagogy with them to other countries and became innovative forces within other adult education systems.

The period between the late 1950s and the present day can be regarded as the fourth and significantly complex formative period which has fundamentally reshaped the organization of adult educational institutions and practices, especially in the global context. On the one hand, the end of World War II led, in the longer term, to the emergence of national independence movements in the remnants of the British and French empires in Africa and Asia. This process of contested decolonization involved the recognition of a new role for adult education in nation building and economic development in the Third World which was driven by United Nations Educational, Scientific and Cultural Organization (UNESCO) and its institutes. A series of world conferences, namely Ellsinore (1949), Montreal (1960), Tokyo (1972), Paris (1985), and

Hamburg (1997) focused on the role of adult education in postcolonial nations. The emphasis upon the importance of literacy for development gave rise to the repression of emancipation movements in many countries in South and Central America. On the other hand, the end of World War II gave rise in Europe to the Soviet hegemony in the Baltic, Balkan, and Central European countries. Adult education was put to work there in the service of the communist revolution and priority, especially in terms of the access of adults to higher education, was given to party members, women, the military, workers, and farmers.

In Western Europe, and elsewhere in the English-speaking world, the late 1960s and the 1970s were marked by the development of compensatory educational opportunities for adults. This involved second-chance and second-way adult education, with an emphasis upon outreach work to the nonparticipants in adult education, which was associated with the development of nonformal and informal community-based forms of adult learning. In addition to the rapid expansion of evening and day institutes for adults during this period, there was a major expansion of distance learning for adults and in particular the establishment of open universities worldwide. Important policy concepts at international and national levels during this period referred to lifelong, permanent, and recurrent education in terms of the redistribution of educational opportunities throughout the life span.

From the mid-1980s onward, however, this largely social-democratic-driven reform agenda to expand educational opportunities for adults was displaced in Europe, indeed worldwide, by the resurgence of neoliberal ideologies. There emerged a renewal of interest in vocational education and training for adults as the core learning message of the global economy. The resurgent interest in lifelong learning has been largely informed by the need to ensure the competitiveness of national economies in the global market, employability of the workforce, the integration of immigrants, demographic change, and the graying of populations in postindustrial societies. This has resulted worldwide in policy narratives which talk in terms of a learning for earning ideology, which is focused on developing the competences required by individuals in order to survive in volatile economic markets. Traditional priorities in adult education, such as the promotion of citizenship and social capital, have been increasingly marginalized. The individualization of learning has increasingly replaced the collective acquisition of knowledge, skills, and attitudes via social movements, community education, and regional development. Individual survival, rather than collective learning to improve the quality of life of communities, now dominates lifelong learning policies. Key policy issues now emphasize individual learning rather than the political economy of promoting structures of opportunity for disadvantaged groups in society.

On the one hand, learning in the workplace has now become the dominant understanding of the development of adult education in the early twenty-first century. The retreat of the state, as the motor of the welfare state and the public responsibility for the redistribution of educational opportunities for adults, has led to the withdrawal of subsidies for many traditional forms of adult education and the privatization of many forms of provision, while the emphasis has shifted toward individual responsibility for investments in adult learning. This now often results in the negation of the very real educational needs of the indigenous unskilled proletariat who is left to fend for itself, or who is encouraged to participate in the commercial learning marketplace and Internet. On the other hand, global mass migration has more recently contributed to the core question of the integration of immigrants and the challenge of Islam as the educational issue in multicultural societies. A largely unresearched area of this multicultural context is the role of the mosque as a learning environment for immigrants in Western societies.

Conclusion

The larger question raised here is the degree to which histories written from Anglo-Saxon perspectives is relevant to the larger canvas of the global dimension of the development of adult education. This raises the almost un-investigated area of the dynamics of empires, colonialism, and postcolonialism in the worldwide development of adult education. The available standard works on the history of adult education have been largely written in terms of selective national histories, which in some small measure examine the colonial tradition of European expansion. Postcolonial understandings of the development of adult education are only now emerging as narratives of resistance in the old empires together with the processes of decolonization, national independence, and indigenous identities. There are many more such examples of adults learning in difficult circumstances, whether above ground or underground, whether in adult education institutes, on the barricades, or in prison. Indeed, the phenomenon of underground adult education, often organized by the learners themselves in the face of oppressive forces remains a recurrent, but inadequately researched, theme in the history of adult education in most countries.

Historical description and explanations of the development of the social phenomena commonly known as adult education need to be more firmly rooted in the conscious use of theories and concepts from the social sciences and cultural studies. This is not an argument for the deconstruction and marginalization of the reform discourses which have dominated historical narratives about the development of institutions and practices

associated with adult education in most countries. It is a critique of the strong element of celebration, the search for genealogies, and the construction of lineages in historical narratives about adult educational institutions and practices. The history of adult education is not real history when its narratives produce collections of the valued national antiques of institutionalized adult education from the past. It is necessary to recognize the complex levels at which critical historical analysis and interpretation can enter the debate and reconstruct dominant narratives. If the history of adult education is about the pioneers and their reputations, it is also about the forgotten and the defeated, even the uncomfortable and inconvenient reminders of the past. If it is about social reformers and formal institutional provision, it is also about social and cultural movements and their contributions to the social organization of nonformal and informal learning. If it is about the latter, it is also about ideologies and struggles between social groups to control communication and learning in the public sphere. If it is about ideologies and struggles in the public sphere, it is also about the formation of publics, popular expectations, and responses. If it is about the latter, it is also about the experiences of the autodidact and the learning biographies of resistance. All these aspects have to be provided with a theoretical perspective in order to achieve more insightful understandings of the construction of historical narratives. The history of adult education in its broader social and cultural contexts still has to be written. This will be the history of the individual and collective learning activities undertaken by adults in order to survive in difficult times and struggles to change society.

Adult Basic Education: A Challenge for Vocational Based Learning

R Höghjelm, Stockholm University, Stockholm, Sweden

© 2010 Elsevier Ltd. All rights reserved.

Two recent European Community policy documents on adult education raise the need for a changing role of adult basic and vocational based learning (VBL) in the context of the evolving knowledge society and knowledge economy (EC, 2006, 2007). Further, the Council of Europe has, in 2009, adopted a new strategic framework for cooperation among European Union (EU) member states to reform their education and training systems so as to better prepare people to find jobs and to help businesses find the staff they need to succeed and innovate in the face of global competition. Similar discussions can be found, for example, in the USA, Canada, and Mexico, where one is looking for a closer connection between traditional adult basic education (ABE) and workplace learning. In this article, we analyze the new demands from society on ABE. While the discussion primarily draws on what is taking place in Sweden, the underlying issues and potential developments are of universal interest.

National Developments in ABE

During the 1960s, ABE was primarily an equality issue in developed countries. However, the emergence of a knowledge economy – with its demand of a more qualified workforce – has affected the role of ABE.

Looking at the development of ABE in the USA, it should be noted that it is an umbrella term used to describe a range of educational services for adults – from basic literacy (including English as a foreign language) and numeracy to high school equivalency (general educational development (GED))/adult diploma programs (ADPs). The program is federal – originating from the Economic Opportunity Act (20 August 1964), which created the first ABE program as a state grant. During the 1960s and 1970s, several studies focused on the ability of the program to fulfill its goals (see, e.g., Firoza, 1966 and the classical study by Mezirow *et al.*, 1975). Thereafter, the program dropped into the background. However, with changes taking place in the economy and the demand for a better-qualified workforce, it once again came into the focus of policy-makers and the Adult Education Act was repealed and replaced with the Workforce Investment Act, in 1998. In this change, the focus gradually moved from literacy to vocational education and training (VET).

In Australia, where ABE has its roots in the British-extension movement, the program has traditionally been quite broad – encompassing literacy, numeracy, communication skills, basic science, humanities, and social sciences up to the equivalent of year 10 of compulsory schooling. Further, it includes survival skills linked to personal health, social action, problem solving, and conflict resolution. With vocational training and skills

formation having become the Australian government's highest priority, there is now a strong focus on using ABE to upgrade the skills of the existing workforce. This has resulted in an emphasis on narrower vocational training over the traditionally broader ABE. Australian adult educators have strong reservations with regard to the narrow focus on job skills and the vocational/nonvocational distinction underlying recent policies.

In Finland, the 1975 Adult Education Committee argued for an ABE characterized by a close connection between liberal adult education and vocational education. It is worth noting that, at the time, over 60% of the workforce in Finland lacked a vocational education. During the following decades, a number of reforms were undertaken by the Finnish government to implement the Committee's intentions and preserve the tradition of a close connection between general adult education and vocational education.

Two things stand out from this brief overview. First, it is evident that changing skill requirements have raised demands for ABE to be more closely aligned with VET. Second, different models are being developed where one is characterized by a narrow focus on training, which – as with the Finnish example – tries to combine liberal and vocational traditions. To further explore this tension, I take a closer look at the development of ABE in Sweden with a focus on the link between labor-market demands and the nature of ABE.

The Link Between Education and Work in the Original Swedish Model of Komvux

While the early groundwork for establishing comprehensive schools was being laid, the issue of the older generation – who in their youth did not have the opportunity to continue beyond 6 or 7 years of education – was raised. The school reforms of the 1950s and early 1960s led to a rapid expansion of the Swedish educational system. The result of this expansion was an ever-widening gap between the older generation – who received a minimal education – and the new generation – who benefited from 9 years of compulsory education and increasingly chose to continue on to secondary school. As a consequence, the argument that the people who paid for the increase in primary and secondary education should have their share of the growing educational resources grew stronger. However, it was not only the rights and demands of the older generation but also contemporary human capital ideology that were behind the introduction of a municipal adult education (Komvux), which would offer education equivalent to that offered by primary and schools with the purpose of providing a platform for future studies or working life.

When looking at the target group of the new municipal ABE, it is important to note that the 1967 adult education

reform had its roots in an elitist concept of equality. The basic idea informing this strategy was that everyone should have an equal right to an education irrespective of social background, gender, or place of residence, and the mandate for ABE was to offer it to those who aspired to it and were able to benefit from such an education. Traditional evening-class students served as models for the target group of the newly introduced municipal adult education. These students belonged to the so-called pool of talent – they had a high level of aspiration, were motivated to study, and were often successful in their self-tuition. This was a very different target group than what has been traditionally associated with ABE. Looking at the link to labor markets, it is evident that what was being offered was an adapted form of what was regularly offered in comprehensive and secondary education and that no adjustments were made to make the program specifically vocation oriented. The economic benefit was seen coming from having more people with a solid basic education that would allow them to pursue postsecondary studies. The only direct reference to employment was that Komvux courses were mainly available as part-time studies so as to avoid production losses.

Komvux Economic Crises and Changing Demands on Competence Development

During the economic crises of the early 1990s, the debate on Komvux shifted from a focus on education discourse to its role in a labor-market strategy. The response was to introduce the Adult Education Initiative (Sweden Government Bill 1995/97: 222). It was not introduced as an educational bill, but rather as a cornerstone in a bill titled 'Special strategies introduced in order to half unemployment by year 2000.' The adult education initiative (AEI) was a massive 5-year program for adult education in which all municipalities participated. The project comprised some 110 000 new educational places per year for adults, mainly in municipal adult education. Over the 5 years, it aimed to reach 550 000 adults – roughly 15% of the labor force. The AEI signaled a fundamental broadening of the Swedish tradition of active labor-market policy. Instead of expanding traditional labor-market training programs, the AEI attempted to raise the general level of education in unemployed adults. Another goal of the AEI was that it would act as a vehicle for reforming the adult-education sector both in terms of content and working methods. Over the 5-year period, adult education was reformed and developed so as to better meet the challenges that the individual, working life, and society would face in the new millennium.

Two things stand out in the AEI strategy: the first is the use of general education as a labor-market strategy; and the second is that the content and teaching methods of

ABE in Sweden more directly began to be considered in the context of labor-market needs. Further, it is worth noting that, in view of the apparent danger of having a growing cadre of unemployed facing increasing obstacles in getting back into the labor market, the AEI contained several measures aimed at helping to reach adults who traditionally do not participate in adult education and training. A special education grant was introduced at the same time as the AEI, which was primarily intended for unemployed persons who had not completed a 3-year upper secondary program. Further, in order to reach persons with little or no experience of adult education and help them to start studying, more targeted recruitment and information activities were put in place. In a broader international perspective, the AEI that was replicated in other Nordic countries is of interest, as it illustrates an ABE strategy that combines an economic agenda with strong equality ambitions.

The new demand for continuing VET also set off a broad debate in Sweden – as in other countries – on how to develop new models of ABE that would be appropriate in the emergent knowledge economy.

New Forms of VBL in Formal Adult Education

Many providers of VET in EU countries are using a system in which theoretical and practical activities are mixed. A criticism has been that they are too often organized from a school perspective, focusing on how students' workplace activities match theoretical courses provided by the school. The transition from knowledge produced at school to the work situation has been recognized as a major problem. However, as discussed in several recent studies, this is a misconception. In this context, it is of interest to look a bit closer at the empirical findings from the so-called People Project funded by the European Social Fund, where unemployed adults participated in VET courses at the adult secondary school level. An alternative pedagogy was developed based on the idea that the foundation of a vocation is rooted in vocational culture, vocational praxis, and vocational knowledge. Traditional school-based VET does not recognize dimensions that are linked to each other like a Chinese box, see **Figure 1**.

The study reveals that when organizing VBL, it is preferable to consider this picture. This conclusion is

Figure 1 The Chinese Box of VET.

based on the fact that the People Project was very successful in two respects – first, because the unemployed participants managed to find jobs, and, second, because the training provided a foundation for lifelong learning (Höghelm, 2005).

The root of the problem of traditional vocational education within the school system is the existence of two different cultures, each with its own logic. Within school culture, subjects should be organized in a sequencing way – from the simple to the complex – and based on this logic, skills are supposed to be generated from basic to more specific. Working life has a different logic, with a number of occupations at the same workplace constituting a community of practice.

Figure 2 shows how the two different logics emanate from the two cultures and cause problems for the participant. In this context, the vocational adult teacher can be regarded as a broker, developing new connections across communities of practice, facilitating coordination and opening possibilities for new meanings. Vocational adult-educational students are in a unique position to act as mediators, bringing insights from work experience to school and vice versa. The vocational adult teacher has an important role in encouraging the development of this process.

The figure shows the sequential logic of school subjects illustrated as ladders, while working life has a more coherent structure – where acquiring vocational knowledge is characterized as a movement from the periphery toward the center. The concept of VBL relies on the idea of situated learning – a well-known concept since the beginning of the 1990s (Lave and Wenger, 1991; Wenger, 1998). Lave and Wenger have managed to phrase, in an attractive way, an old idea that has always been present within VET – going back to medieval times when the apprentice system was established in Europe. They also elucidated how modern educational systems and VET, in particular, have an ongoing discussion on the difference between practice and theory. Thus, the VBL concept has a socio-cultural approach going back to the ideas of Vygotsky (1987).

Traditional VET programs have a school perspective – implying students' workplace experiences can be organized to fit in school activities. VBL has a reversed perspective, that is, programs are organized in such a way that students' workplace experiences guide when theoretical school subjects are supposed to enter. This different way of organizing VET adult programs will also facilitate the vocational adult participant's boundary crossing between school and work (Tuomi-Grön and Engeström, 2003). Further on, vocational based adult learning can be a more powerful tool for organizing VET compared to a more traditional, organized, apprentice-based education. Applying the VBL concept implies that adult students must spend half of their time at a workplace, visited by teachers.

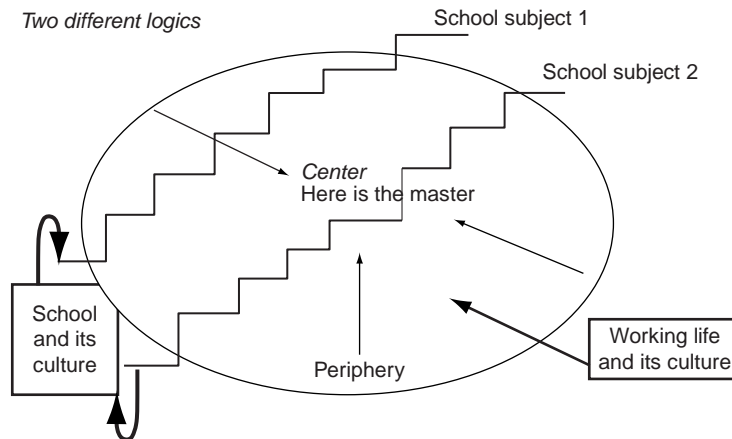

Figure 2 The relation between the two different logics emanated from school culture and working-life culture.

Concerning the demand on the European workforce to increase competitiveness and the ongoing demographic change within the EU, research of the kind discussed here suggests a need to develop a new way of organizing VET – which makes it necessary to relinquish the predominant, but obsolete, approach. By using a VBL approach, there will be a quicker and more obvious connection between practice and theory. The concept has similarities to the professional education of nurses and medical doctors practiced at the McMaster University medical school in Canada since 1967. Between 2005 and 2007, a major European Science Foundation (ESF) project in Sweden used the experiences from the municipality of Söderhamn, and VBL was applied in 29 municipalities. The study also involved 275 companies, 197 teachers, and a large number of principals (Höghi, 2005, 2009).

Future Directions of ABE

ABE – as it is being practiced and organized around the world today – is still heavily influenced by how it was originally set up in the 1960s. While there is an impetus in most countries for greater skills-oriented training, these programs have not adapted to the changing realities. First, demographics have changed and educational attainment has risen dramatically in the population. Second, educational attainment plays an increasingly important role for entering the labor market. Third, there is a rising demand for continuing VET. Fourth, there has been – as discussed above – a shift in the very understanding of VET and a movement to think of vocational education in terms of VBL. Consequently, there are growing demands for a major overhaul of ABE as we have known it.

Starting from the latter, one can think of a form of ABE that takes the individual and his/her vocational background as its point of departure. Traditionally, adult education theory has been considered as a basic guideline for

educational planners and trainers wanting to pursue a reflective approach to adult learning. Based on recent research on VBL, this seems to be too narrow a perspective if the ambition is to include the learner in the process of reflection. Instead of a general curriculum, there is a need for an individual study plan for each participant. In developing this plan, one has to take into account how the individual has been trained in order to manage both previous and new-found knowledge through a validating process that takes into account both general and personal skills from a VBL perspective. (For an interesting discussion of different models of validation see OECD (2005) report *Promoting Adult Learning*.) The purpose of this form of ABE is to allow participants to have the opportunity to develop specific skills linked to civil and working life as well as for pursuing their own educational/vocational project. The dialog with others makes the learner test out new assumptions, understandings, and perspectives (see Mezirow, 2000). This form of VBL would avoid the dilemma of the narrowness of the skills-driven training that is being promoted in some countries as well as the general education lacking vocational connections that can be found in other countries. A development in the direction of VBL can take place within a network organization. The location of such an activity would not be built around a traditional adult-education school such as Komvux, but could be a flexible learning center such as Centre for Flexible Learning (CFL) Söderhamn (Ekelöf, 2009). This form of structure has an opportunity to meet the dual and interconnected needs for a de-schooling version and a schooling-up version of ABE. Examples of this form of organization of ABE can be drawn from different regions in Sweden where municipalities have organized themselves into flexible learning centers. The slogan in these contexts is flexibility or flexible learning – where providers organize learning centers or networks and plan and implement teaching with the primary purpose of supporting student communication and learning (Holmberg, 2004).

Such a development could suggest a return in ABE to the andragogical ideals that were in the foreground of the initial ABE debate.

Adult Literacy Education

L Tett, University of Edinburgh, Edinburgh, UK

R St.Clair, University of Glasgow, Glasgow, UK

© 2010 Elsevier Ltd. All rights reserved.

The last few years have seen growing interest in the field of adult literacy education, also known as adult basic education and adult literacy and numeracy, with increased attention at national and international levels. This has been partly inspired by the International Adult Literacy Survey of the mid-1990s (and the less influential Adult Literacy and Life Skills Survey (ALL) of the following decade), which allowed adults' skills to be compared across countries for the first time. This coincided with the move toward an information economy, allegedly making information management skills such as literacy the bedrock for success. At the same time notions of human capital (where education is the fundamental key to prosperity) were gaining favor with agencies such as the World Bank and UNESCO (Wickens and Sandlin, 2007) so adult literacy education became seen as a central and critical educational sector.

Adult literacy education is marked by a high level of diversity in terms of structure, delivery, and philosophy and performs different roles in different parts of the world, whether industrialized Europe or a developing country. It can take place in church basements, further education colleges, universities, community settings, workplaces, and libraries. It can be delivered by professionally qualified staff, or staff who are qualified in other forms of teaching or unqualified volunteers. Learners can be employed or unemployed, men or women, refugees or indigenous people, full time students, or people who study part-time. Each of these presents a unique context for literacy education, and it is important not to generalize across settings without taking great care.

What Is Adult Literacy?

There are a number of ways of conceptualizing what is meant by adult literacy. These definitions contain assumptions that matter to the focus of education because they imply different understandings of learning (Papen, 2005). Three concepts have been particularly influential: the functional, critical, and liberal concepts of literacy (Table 1).

Functional Literacy

In this view literacy is seen as a skill that is required for a broad range of activities associated with the individual's

participation in society. There is an assumed correlation between individual skills and the overall performance of the nation in terms of modernization and economic productivity. This is particularly so in the OECD (1997, 2000), where a focus on improving literacy skills as the key to unlocking the benefits of globalization is dominant. Literacy is conceived as a set of neutral, technical skills with little to do with culture and society. Its assumed benefits are believed to include enabling access to information, developing thinking, and improving the individual's chances of finding employment and income. Reflecting this view, the ALL assessed skills against a suitable minimum for meeting the demands of daily work and life (UNESCO, 2005). The functional model emphasizes individual deficits and sees literacy as a set of discrete skills believed to be universal and transferable to all kinds of situations that require the use of written language (Barton, 1994).

Critical Literacy

The concept of critical literacy is associated with the Brazilian educator Paulo Freire and refers to the potential of literacy for not only reading the word but also reading the world (Freire and Macedo, 1987). It moves away from the functional model, toward a pedagogy intended to allow participants to understand their world in terms of justice and injustice, power and oppression, and how to transform it. Contrary to the functional model, primary purpose of critical literacy is not to help the individual to move up the existing social ladder, but to build a radical critique of the dominant culture and the existing power relationships between social groups (Shor, 1993). This model is often linked to democratic citizenship and the role that education plays in supporting people's participation in society (Crowther and Tett, 2001). People need the ability not only to decode the literal meanings of texts, but also to read between the lines and to engage in a critical discussion of the positions a text supports.

Liberal Tradition of Literacy

The third view of literacy is informed by a humanist view of education that emphasizes personal development and individual goals. It argues for the right of all citizens to education and goes beyond the functional-skills approach to include areas such as creative writing and access to

Table 1 Three views of literacy education

	<i>Functional</i>	<i>Critical</i>	<i>Liberal</i>
Reason for literacy education	Skills Survival/work	Understanding Empowerment	Tools Development of person
Participant group	(Potential) workers	Marginalized groups	Everybody

literature (Papen, 2005). Participants in programs are not limited to the working population but include older people or those who are not part of the workforce.

These different definitions present competing ideologies of literacy with associated assumptions, values, and standards that need to be questioned. However, in much of the world there is an unquestioning emphasis on the functional, vocational approach such as Welfare to Work in the US (Sandlin & Cervero, 2003), resulting in a discourse of literacy as a technical skill and vocational competence.

Social-Practice and Skills Models of Literacy

In addition to diverging perspectives on the purpose of adult literacy education, there are a number of theoretical positions on how people actually use literacies. A functional-skills-based approach focuses attention on the autonomy of the text and the meanings it carries. It searches for universal features of adult literacy and other semiotic sign systems. It leads to narrow definitions of reading, writing, and calculating, and ignores aspects of learning that cannot be dealt with at the individual or cognitive level. It excludes many issues that are important for understanding learner responses. All too often it can support a deficit view of literacy, where those with limited literacy engagement are seen to be lacking in some way, whether in ability or in education.

One approach has moved away from the individually focused cognitive skills model to include the social practices associated with number, reading, and writing (Hamilton *et al.*, 2006). In this view literacy is not seen as a purely individual activity – instead, it sees literacy and numeracy as being historically and socially situated and part of wider cultural and media engagement. The focus of the social-practices approach shifts away from literacy as something learners lack toward the many different ways that people engage with literacy. Social-practices approaches recognize difference and diversity, and challenge how these differences are valued within our society.

Street (1995) describes this as a shift from seeing literacy as an autonomous gift to be given to people to an ideological view of literacy that places it in the wider

context of institutional purposes and power relationships. From this perspective adult literacy is part of a range of social practices that are observable in events or moments and are patterned by social institutions and power relationships. Attention is focused on the cultural practices within which written and spoken words are embedded. Not just reading but also speaking and writing, as well as the use of new technologies, become central to the definition of literacy. The social-practices view requires that connections are made between the classroom and the community in which learners lead their lives; with a notion of situated learning; between learning and institutional power; and between print literacy and other media.

There is not just one social-practices theory of adult literacy, numeracy, and language, but a number of different versions. The social-practice approach that has characterized the new literacy studies (NLS) draws mainly on ideas and methodologies from sociology, sociolinguistics, and anthropology rather than the more psychological approach of active problem-solving theory rooted in the work of Vygotsky and others. The NLS involves looking beyond formal educational settings to informal learning, and to the other official settings in which literacies play a key role. Learning does not just take place in classrooms but in everyday life, with meanings, values, and purposes located within a broader literacy framework than the texts themselves.

There are two important principles underlying the implementation of a social-practice approach to literacy. First, a two-way dialog and movement between formal learning and the everyday world is essential. Everyday, situated cultures and practices cannot simply be acknowledged and imported into classroom settings. The boundaries between in and out of education must be blurred so that contexts become permeable.

Second, active learning is assumed by this approach. It characterizes the process of becoming literate as one of taking hold of the tools of writing and language. This has important implications for relationships within the learning process and for reflective and questioning activity on the part of both learners and teachers (Hamilton *et al.*, 2006). The ways in which teachers and learners participate in decision making and the governance of the organization in which learning takes place are crucial, whether through management committees, consultative bodies, and research and development activities. Citizenship is modeled and enacted within such arenas.

Reconciling the Skills and Social-Practices Perspectives

The social-practices approach recognizes the importance of learners' motivations, goals, and purposes; every literacy task is done for a reason and in specific contexts, hence the challenge to concepts of universal sets of literacy skills.

Skills and knowledge acquisition are, however, intrinsic to learners' purposes and enhance many different aspects of their lives. For example, improving skills for employment may not appear to serve social practices, but skills that are gained in the pursuit of employment or promotion can be applied in other domains of people's lives, such as helping children with homework, managing the household, or pursuing further learning. Both enhancing skills and recognizing their role within learners' lives are important and both aspects should be developed in good teaching.

How far might it be possible to reconcile the functional-skills approach and the social-practices approach within policy and practice? Could social practices be seen as encompassing and extending the narrower focus of skills? The idea of two opposing broad approaches is an oversimplification and there are other ways of characterizing the guiding philosophies people bring to literacy, particularly in everyday cultural settings (see Barton *et al.*, 2000). Freebody and Lo Bianco suggest (1997: 26) that effective literacy tuition draws on a repertoire of resources that allow learners to: break the code; actively interpret the meaning of the text; use texts functionally; analyse texts critically. This is a dynamic process as represented in **Figure 1** that is an attempt to acknowledge that both skills and critical practices are enmeshed in working with texts.

In the middle circle is the process of actually understanding the words as they are written on the page, and interpreting the meaning. The outer ring represents the social uses of that meaning, which can range from functional to critical. A literacy process that is missing any of these components can be considered as only a partial engagement with the text.

Research in the US is also providing new insights on the interrelations between skills and practices. The 5-year Longitudinal Study of Adult Learning (LSAL) in Portland, Oregon has revealed that both program participation and

self-study have positive, time-specific effects on literacy practices (Reder, 2008). The research showed that self-study was prevalent among adults of all literacy levels as a means of basic skills development, whether or not they also participated in classes. Self-study appears to act as a bridge between periods of program participation and to facilitate persistence. The mixed mode of learning identified by LSAL seems to bridge social-practices and skills-based approaches. It suggests that learners use a range of resources to enhance the social practices associated with literacy, and that programs are one resource, with the specific role of providing skills to underpin the practices. As we suggest with the diagram above, skills and practices form a self-reinforcing cycle of engagement with literacy and literacy education.

The broad mode of participation suggested by LSAL brings together social-practice and skills approaches. On the one hand, it recognizes that learning involves learners actively using resources as well as programs delivering services. On the other, it indicates that literacy programs appear to have the most direct and immediate impact on literacy practices, underlining the role of skills enhancement.

The Role of Adult Literacy Education

Throughout the world, adult literacy education fulfills a variety of roles. For those in industrialized countries, one common perception is that adult literacy learners are people who have not fully benefited from compulsory education. There are a number of possible reasons, ranging from sociological explanations concerning the tendency of schools to push out certain learners to psychological rationales involving learning difficulties. Overall, the common factor is the view that adult literacy education has an ameliorative role, improving literacy engagement and compensating, to some degree, for the failure of initial schooling (St. Clair and Priestman, 1997).

The ameliorative view assumes that learners have had an opportunity to learn literacy practices, and that this opportunity has not been effective. This can lead to a deficit view of learners, where they are assumed to have some kind of problem that has led to reduced literacy abilities.

One of the reasons that adult literacy education has experienced such variability in funding and policy interest is that it can be viewed as an optional form of provision within the ameliorative perspective. After all, if people have already had a chance to learn about literacy surely giving them a second chance is an act of generosity? It follows that the most effective argument for supporting literacy education is often a moral one. This can lead to a panic about literacy education (or more often illiteracy) with dramatically increased funding followed by gradual withdrawal of support until the next moral panic (Quigley, 1997). Ameliorative perspectives can be unhelpful for the general health and stability of the field.

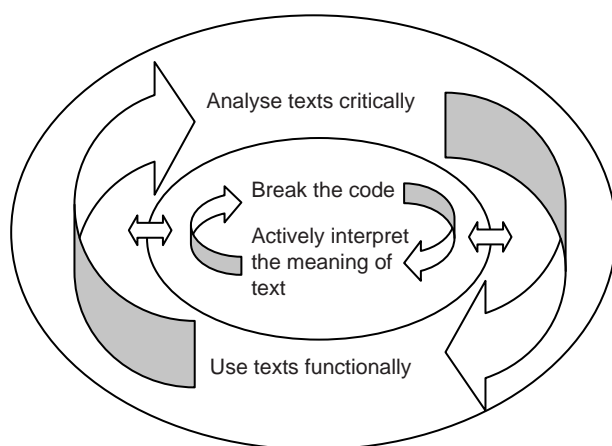

Figure 1 An approach to literacy instruction reconciling the skills and practices approaches.

Despite the dominance of some version of an ameliorative perspective in the industrialized world, there are two other roles that literacy education can play. Each of these roles is particularly relevant to groups with little access to mainstream education. The first is an adaptive role, where individuals from one language and literacy community enter another. This might include economic migrants or refugees, as well as people who have been displaced from one job or life situation into another with different demands, such as older adults attending college for the first time or farm workers following seasonal crops.

In the United States many literacy programs are going beyond people with English as their first language and working to develop initial language skills with speakers of other languages. This is particularly evident in Texas, where more than half the population are Spanish speaking. In the United Kingdom, some adult literacy agencies are working with substantial numbers of refugees to provide initial English language instruction.

Many of these learners will have well-developed literacy and numeracy practices in their first language – in the case of Texas many learners have an excellent Mexican secondary school education, and in the UK refugees are frequently academics, doctors, engineers, and other highly educated professionals. The provision of language education alongside literacy education in programs is generally not widely acknowledged. This can place unpredictable and occasionally unrealistic demands on instructors, resources, and learners themselves. The emphasis on the ameliorative role of literacy education can obscure the adaptive application of literacy learning, perhaps resulting in less appropriate services for this group of learners.

The final role of adult literacy education is foundational. Many countries throughout the world do not have the universally accessible, and generally compulsory, primary education found in the industrialized nations. While UNESCO (2005) has committed itself strongly to literacy as the core of education for all, many people around the world do not gain access to any form of literacy education until later in life. The gross enrolment rate in primary school is below 60% in some African countries, and the age of the child at enrolment may be considerably higher than usual for primary school (UNESCO, 2005). In addition, there is a degree of gender imbalance in school attendance in around 40% of countries, though this is generally reducing quite rapidly (UNESCO, 2005).

For learners in countries without universal access to schooling the ameliorative approach, with its assumption that the conventions and application of education are understood, is inappropriate. New adult learners in this context will be entering classes with little understanding of the nuances and expectations of education, and often will be motivated by economic or instrumental concerns about the care of their family.

There is also a danger of well-meaning aid agencies establishing projects that inadvertently create situations of neo-colonialism, where Western models of literacy education are applied to situations very different from the Western countries. This can easily come to be seen as the most valuable form of learning, displacing local approaches to text and traditional forms of numeracy. An example is drilling learners in rows, teaching literacy practices that then fall into disuse because of irrelevance (Wickens and Sandlin, 2007), or the use of English in post-Colonial settings (Robinson, 2007).

Given the different roles that adult literacy education can fill, some care must be taken when thinking about each situation. It is more complex than assuming that every literacy learner has somehow missed out on elementary schooling, and it is critical to avoid seeing learners as having some deficit.

Accountability and Assessment

There has been a general increase in the resources committed to adult literacy education throughout the world over the last two decades. It remains unclear how long this will last, or what the final results will be, but it has profoundly affected the conceptualization and delivery of literacy education. These changes have resulted in more attention being paid to the outcomes of literacy education. Historically, literacy programs for adults have rarely been strongly concerned with measuring the progress of learners, or indeed the efficiency and effectiveness of the agencies delivering the programs. This is no longer the case in the industrialized countries, resulting in profound transformations of the field.

In thinking about assessment and accountability, it helps to be clear about the two central ideas. Assessment is measurement of learner progress through standardized tests, individual progress reports, or some combination of these and other methods. Accountability is the requirement for programs to demonstrate that they are having a positive impact on the literacy use of learners. There is some confusion around these concepts because assessment data are often taken to be a straightforward measure of effectiveness. In this case, the best strategy for the program is to recruit only very competent learners, meaning they can easily show learners leaving the program with strong results. The issue of assessment leading recruitment and instruction has been tackled very rarely – all too often programs produce what they are asked to measure, potentially at the cost of meaningful learning (Merrifield, 1998).

One recent study (St. Clair and Belzer, 2007) looked at the accountability and assessment systems tied into adult literacy education in the United States, Scotland, and England (the latter have separate educational systems). The study suggested that there are two important dimensions to national accountability and assessment systems.

Table 2 Alignment and standardization in three national literacy systems

	<i>Weak alignment</i>	<i>Strong alignment</i>
Strong standardization	United States	England
Weak standardization		Scotland

The first is the degree of standardization in the system, meaning the extent to which tests, curricula, and methods are shared among all the programs surveyed. The second is the degree of alignment, meaning the extent to which philosophy, ideas, and approach to literacy are shared among the programs. It is possible to have one without the other, or to have both strong standardization and strong alignment (Table 2).

In the United States legislation of the late 1990s required the creation of a national reporting system, which collates results from across the country. To allow this to happen, a standard reporting approach has been developed, defining the preferred instruments and desired achievement while still allowing the state governments some latitude. This is a weakly aligned but strongly standardized system. In England, the adult literacy system has been standardized in outcomes in a way similar to the US, but in addition the curriculum and tests have been centralized to reflect a single approach to literacy education. This system is both standardized and aligned. In Scotland, there is strong alignment around the social-practices model of literacy discussed earlier, but very little standardization – programs are encouraged to develop their own approaches and resources.

Each of these approaches has its strengths and weaknesses. With high standardization, it is all too easy for programs and instructors to feel limited in responding to local circumstances, whereas low standardization can lead to uncertainty about the quality of the services learners are receiving. A single hierarchy of tests and exams and a requirement that learners demonstrate a certain amount of progress for a certain investment of time and money is not compatible with a social-practices view of literacy. High alignment is most effective where there is genuine commitment to a particular conception of literacy education, and that may be hard to maintain across a national system over any length of time. Despite recognition of the importance of locally tailored programs maintaining effective, learner-led practice may prove to be a significant challenge for literacy educators in the future.

Changes in the Literacy Education Workforce

The last few years have also seen a move toward professionalization of literacy instruction in the industrialized countries. This development, which is supported by many instructors and administrators, is generally accompanied

by pressure for adult literacy education to more closely resemble the established educational professions – school teaching in particular. This suggests that a specific qualification for teaching adult literacy may be developed, and that there would be some attention given to providing professional development for core staff. While professionalization would fit well with the agenda of accountability and quality control, it would also raise a number of problems.

One implication of any move to a professionalized workforce would be the loss of volunteers, who currently perform a central role in many systems. If they and part-time workers were expected to undergo substantial training before being able to work with learners, there is a danger that it would be more difficult to recruit. There is also the question of what workers should be taught – if they are only provided with a basic introduction to the field, it is unclear that they would be necessarily be able to deliver better-quality instruction. There is a real possibility that a straightforward, standardized curriculum would be developed for delivery by semi-trained staff, reducing the diversity of practices in the field.

Conclusion

Adult literacy education takes place in a wide range of settings where learners engage in a variety of ways with texts of all kinds. It is critical for effective instruction that both the method and the content of instruction recognize this diversity and that deficit approaches, where the learner is assumed to have something wrong with them, are avoided. Instead, a variety of outcomes of literacy instruction should be valued.

The recent structural changes in the field throughout the world have been substantial, with issues to do with accountability and professionalization rising up the agenda. These changes have tended to move adult literacy education closer to school-based education. At the same time, the importance of having a system that is highly aligned around values and ideology is being more widely recognized, perhaps as a response to the trend for managerialism. Finally, there is real interest in bringing skills and social-practices perspectives together to create a more nuanced understanding of teaching and learning that enables literacy education to be more closely aligned to the practices used in people's everyday lives.

Glossary

Citizenship – The status of being a citizen; membership in a community; the quality of an individual's response to membership in a community.

CONFITEA (Conférence internationale sur l'éducation des adultes (International Conference on Adult Education)) – A series of international meetings, which takes place every 12 years since 1949, organized by United Nations Educational, Scientific and Cultural Organization (UNESCO).

Immigrate – To enter and usually become established; to come into a country of which one is not a native for permanent residence.

Jus sanguinis – Latin for right of blood, a social policy by which citizenship is determined by having an ancestor who is a national or citizen of the state.

Jus soli – Latin for right of the soil, a right by which citizenship can be recognized to any individual born in the territory of the related state.

Naturalization – The acquisition of citizenship by individuals who were not citizens of that country at the moment of birth.

UNESCO (United Nations Educational, Scientific and Cultural Organization) – A specialized United Nations agency founded in 1945.

Introduction

In the field of adult education, it is possible to identify two separate areas of research, theory, and practice that are often related: citizenship education and immigrant education. Generally speaking, citizenship education aims at preparing individuals to become citizens in a particular political community. Typically, citizenship-education initiatives focus on the teaching of citizens' rights and duties, as well as the legal system and the functioning of government institutions. In some cases, it also includes the nurturing of critical analysis of social reality and engagement in civic and political activities. Immigrant education aims at enhancing the integration of new immigrants in the economic, social, cultural, and political life of the receiving countries through a variety of services and programs. These include programs such as second-language acquisition, special language

courses for immigrant professionals, entry-level job-skills development, entrepreneurial training, financial literacy (from basic banking to investment classes), and information about local culture, laws, and regulations. Services include employment counseling and job-search strategies, settlement assistance, and access to computers.

In many countries, citizenship education and immigrant education are offered to children, youth, and adults by a variety of governmental agencies, nonprofit organizations, private institutions, and community groups. The intersection between citizenship education and immigrant education can be found in the area of citizenship education for immigrants. This area focuses on preparing newcomers to become citizens in the host country. By and large, the size and importance of this area in a given country is directly correlated to the size and history of immigration. In other words, those countries with higher immigration rates and with longer traditions as recipient societies are more likely to have established programs and pedagogical materials on citizenship education for immigrants and to devote significant human and material resources to this area. In the past, the main impetus behind those initiatives was an interest to quickly assimilate immigrants into the prevailing culture and values of the host society, and particularly to incorporate them as soon as possible into the labor market. More recently, some countries established immigration policies and programs aiming at balancing the integration of immigrants into the host society and the respect for the immigrants' cultural identity, that is, promoting simultaneously, both unity and diversity.

Before addressing general trends related to adult citizenship education and immigration education, it is useful to discuss some conceptual and historical issues related to citizenship and to immigration.

Citizenship

As noted above, citizenship education includes all those educational programs and initiatives that have as their main purpose preparing individuals to become citizens. Although at first glance this seems like a straightforward proposition, it is pertinent to ask: What does it mean to become a citizen? There is no easy answer to this question because citizenship is a dynamic, contextual, contested, and multidimensional concept. It is dynamic because its meaning, characteristics, and scope have changed throughout history. For instance, in a not-so-distant past, there were

many countries that excluded slaves, women, nonwhites, and illiterates from citizenship. It is contextual because, even in the same historical moment, citizenship is a term that has interpretations and applications in different societies. Indeed, at any historical moment, many countries have applied – and still do – different criteria to determine who is a citizen and who is not, who can become a citizens and who cannot, what the traits of a good citizen are, and so on. Moreover, citizenship is a contested term because, even in the same time and space, in the same nation-state, and there are profound disagreements about what citizenship is and what it should be. In each society, different groups have different perspectives on the criteria for inclusion and exclusion, and different ideas about the qualities of good citizenship.

The term citizenship is also multidimensional because it encompasses four different dimensions that are frequently conflated: status, identity, civic virtues, and agency. Status relates to issues of membership to a particular political community. Identity relates to issues of feelings of belonging and loyalty to that political community. Civic virtues refer to the dispositions, values, and behaviors that are expected from citizens, and agency refers to the capacity to act as a citizen, that is, to engage actively in civic and political life with the possibility of making a difference. Since these four dimensions influence the approaches adopted by adult-citizenship-education programs, it is pertinent to elaborate on them.

In the most common understanding of the term, citizenship is a status bestowed on those who are full members of a community, which means that those who possess the status of citizens are equal with respect to the rights and duties endowed by it (Marshall, 1949). In modern times, that community is the nation-state, to the extent that citizenship is often equated with nationality. Noncitizens are usually known as foreign aliens. However, at this moment it is also possible to be a citizen of a supranational political entity like the European Community. Citizenship as status distinguishes between citizens, who are full members of a particular political community, and thus can have a passport, are eligible to vote and to be elected, and so on, and noncitizens (or aliens), who have limited rights or no rights at all. Today, citizenship status is usually granted by birthplace (*jus soli*), descent (*jus sanguinis*), or naturalization, although in the past it was often granted and denied on the basis of factors like class, gender, or race. For instance, in many countries it was not until the first half of the twentieth century (in some even later) that women were recognized as full citizens with equal rights. Even in the twenty-first century, some population groups are denied certain rights. For instance, only a few countries allow gay couples the same right to marriage that is granted to the heterosexual population, and although the Universal Declaration of Human Rights states that everyone has a right to a nationality, today

there are more than 15 million stateless people who have no citizenship status in any state, either because they never acquired it in their birth country or because they lost it. In considering the notion of citizenship as status it is pertinent to distinguish between formal and real citizenship: formal equality is largely irrelevant if it is contradicted on a daily basis by economic, social, political, and cultural inequalities. For this reason, any discussion on citizenship as status that is also concerned with real membership in a particular political community must consider the dynamics of inclusion and exclusion of that community.

Identity relates to feelings of belonging that a person has toward a community. This feeling as a full member of a community is independent of the formal citizen status of that person. The distinction between status and identity can be found everywhere, but it is more clear in multiethnic, multilingual, multicultural, and multireligious states, and particularly in nation-states that are multination states (Dean, 2004; Kymlicka, 2001; Wilkinson and Hebert, 1999). In these cases, identity is rooted in factors like a common history, language, religion, values, traditions, and culture, which seldom coincide with the artificial territory of a nation-state. This should not be surprising, because nation-states are imagined communities whose boundaries change over time due to invasions, wars, annexations, conquests, and separations (Anderson, 1983). Hence, it is not surprising that some cultural and linguistic minorities as well as aboriginal groups may not feel part of the nation-state in which they are legal citizens. In the same vein, immigrant communities may hold a legal citizenship status in two or more nation-states but feel allegiance to only one of them. Moreover, there are cases of immigrants who are eligible for citizenship in their host country but do not take it in order to keep a feeling of belonging to their home country, even if they never return to it. Another example of a mismatch between status and identity can be observed among people with internationalist inclinations who are legal citizens of nation-states but define themselves as citizens of the world, even if planetary citizenship is not a legal condition.

Civic virtues refer to the values, attitudes, and behaviors that are expected of good citizens. However, there is no universal agreement on the ideal of a good citizen. For some groups, the main civic virtues of a good citizen are patriotism, obedience, honor, diligence, and religiosity. Others emphasize compassion, respect, tolerance, honesty, solidarity, and individual responsibility, and others relate civic virtues to a critical analysis of social reality, interest for the common good, community participation, and political engagement. All these and many other civic virtues could be chosen, organized, and ranked according to the moral preferences of those who create the list. Moreover, the ideal of good citizen promoted by the state varies according to historical, ideological, and political contexts. For instance, the model of good citizen and

the virtues cultivated by the Nazi regime were different from the model and the virtues promoted in Germany in the nineteenth century or today.

Agency refers to the state of being in action or affecting change; thus, the dimension of citizenship as agency invokes the idea of citizens as social actors. The exercise of citizenship, individual or collective, does not occur in a vacuum, but in concrete social relations mediated by power. Indeed, social circumstances determine to a large extent what citizens can do or feel allowed to do, but at the same time, citizens have some degree of agency to change those circumstances and make history. Hence, the notion of citizenship as agency recognizes that social action – which varies both in the intensity and orientation of citizen actions – occurs in a context marked by a constant interplay of limits and possibilities, domination and autonomy, and control structures and liberating forces. Although the literature often refers to passive and active citizenship, in real life these constitute end points of a continuum rather than dichotomous categories.

Immigration

While human migration has existed throughout human history, immigration is the movement of people from one nation-state to another, and involves long-term permanent residence (and eventually citizenship) in the host country. Although short-term visitors are not considered immigrants, seasonal labor migration is often considered as a special form of immigration.

According to estimates from the United Nations, in 2005, the total number of migrants amounted to 190 million people, to which can be added an undetermined number of undocumented or irregular migrants, currently estimated as 30 million people. Typically, migration is driven by two simultaneous dynamics. On the one hand, push factors such as economic, political, or social problems in the country of origin; on the other, pull factors such as economic, social, and cultural opportunities in the destination country. Globally, the large majority of migrants flow from South to North, that is, from Latin America, Asia, and Africa to Europe and North America, but in recent decades, there has been an increase of South–South migration (often due to political instability or generalized violence) and even North–South migration, usually older people who seek retirement in countries with lower costs of living and better climates than their own home countries.

Many immigrants, particularly those who migrate from South to North, often face a great variety of problems, which range from emotional issues arising from leaving relatives, friends, and a known environment to issues related to legal barriers, moving expenses, uncertainty about the future, lack of familiarity with the new culture and language, difficulties in finding decent employment,

and in many cases also exploitation, discrimination, and racism. The acquisition of legal citizenship status in the host country may not necessarily translate into the enjoyment of full citizenship on the same foot as other social groups. In many instances, the discrepancy between legal and real citizenship status has more to do with language, race, gender ethnicity, country of origin, and social class than with the formality of official citizenship papers. As Banks (2004: 5) noted, “becoming a legal citizen of a nation-state does not necessarily mean that an individual will attain structural inclusion into the mainstream society and its institutes or will be perceived as a citizen by most members of the dominant group within the nation-state.”

From the perspective of the host societies, particularly those that regularly receive large numbers of immigrants, challenges include providing services, educational programs, and infrastructure to the new immigrants, making an effort to understand and respect different cultures, beliefs, and practices, and creating an environment that nurtures dialog, tolerance, and fairness. Countries with high international demand for immigration tend to establish specific selection criteria and admission policies. Whereas in the past those criteria were often based (sometimes explicitly) on racial or ethnic prejudices, presently they are likely to be based on factors such as schooling, occupation, wealth, and language proficiency, usually expressed in a point system. Such system gives preference to professionals and businesspeople, and discriminates against unskilled workers. This situation creates problems in the labor market due to unmet demand for workers in certain areas of the economy (e.g., construction, agriculture, and janitorial services), which in turn provokes a growth in undocumented migration. Another issue that has increased significantly as a result of the emphasis on professional immigrants is the limited recognition of foreign credentials and work experiences by certain professional colleges. This, in turn, creates a lose–lose situation. The home country suffers brain drain after considerable investment in human-resource development, the host country misses the opportunity of brain gain by forcing immigrant professionals to earn a living delivering pizza or driving taxis, and the professional immigrants lose the possibility of developing their full potential in their chosen field by taking jobs unrelated to their training.

Moreover, countries with large and diverse immigration populations often face the double challenge of ensuring a successful social, economic, political, and cultural integration of newcomers and at the same time reducing tensions that may arise across ethnic, national, or racial lines. In the past, most of these countries (known as settlement countries) favored the strategy of forced assimilation. This strategy, usually referred to with the metaphor of a melting pot, had as its main goal that immigrant groups

adopt the language, traditions, attitudes, and values of the dominant culture as fast as possible. In recent times, some settlement countries have adopted a different integration strategy through multiculturalism. Whereas assimilation approaches perceive diversity as a threat and tries to suppress ethnic identities, multiculturalism understands diversity as a resource and seeks to accommodate differences. Hence, multiculturalism tends to promote the celebration of cultural diversity and the management of such diversity through specific policies, programs, and initiatives in different levels of government. Kymlicka and Banting (2006) identify eight frequent policies that are emblematic of a multicultural approach to immigrant integration: (1) constitutional, legislative, or parliamentary affirmation of multiculturalism; (2) adoption of multiculturalism in school curricula; (3) inclusion of ethnic representation and/or sensitivity in the mandate of public media; (4) exemptions from dress codes, Sunday-closing legislation, etc.; (5) allowance of dual citizenship; (6) funding of ethnic-group organizations to support cultural activities; (7) funding of bilingual education or mother tongue instruction; and (8) affirmative action for disadvantaged immigrant groups. They point out that the first three policies celebrate multiculturalism, the middle two reduce legal constraints on diversity, and the last three represent forms of active support for immigrant communities and individuals.

Multicultural approaches have advocates and detractors. Detractors argue that multiculturalism and liberal democracy are fundamentally incompatible, and that the emphasis on diversity and difference undermines the sense of common national identity and nurtures resentment between minority and majority cultures (Sniderman and Hagendoorn, 2007). In some instances, the tension between the values and practices of immigrant groups and the prevailing values and practices of the host society have been addressed through initiatives of reasonable accommodation that generated much public controversy and political and juridical debate. Advocates argue that multiculturalism is an effective strategy to facilitate the full integration of immigrants into the host society while preserving their identity, balancing the principles of cultural distinctiveness and equality. They also argue that multiculturalism helps immigrants to keep their culture and language, reduces discrimination, enhances cross-cultural understanding, and promotes institutional change aimed at equalizing opportunities.

Citizenship and Immigrant Adult Education: Main Orientations

Citizenship and immigrant-education programs tend to address simultaneously the four dimensions of citizenship discussed above, but frequently they emphasize just one.

Those programs that focus on citizenship as status often emphasize formal membership to a particular political community, usually a nation-state. Beyond introductory content dealing with settlement challenges (e.g., language acquisition, resumé writing, and job-searching strategies), these citizenship programs concentrate on facts about national history and geography, government institutions, and the law. In some countries, the content of these programs is codified in textbooks that immigrants seeking naturalization must memorize in order to pass a citizenship test. More often than not, these textbooks tend to promote the official story of a nation's development, with limited coverage of controversial issues (Joshee and Johnson, 2007; Derwing *et al.*, 1998). These programs also describe the rights and duties of citizens, although seldom distinguishing between formal and real membership, or encouraging a critical analysis of the *status quo*. In the margins, however, there are some critical programs – usually carried out by nongovernmental organizations – that contrast the official perspective with the views of peoples that suffered conquest or discrimination. These programs also question taken-for-granted rules of inclusion and exclusion, interpret the law in the context of social dynamics of power and emancipatory struggles, and emphasize the fulfillment of human rights.

Education programs emphasizing citizenship as identity have tended for a long time to stress nation building and the assimilation of minority groups to the dominant group. Often, this has meant the mainstreaming and the malestreaming of curriculum content, and the elevation of the hegemonic language, religion, and culture to the higher level of a hierarchy. The main purpose (sometimes explicit, sometimes implicit) of many of these programs was identity conversion, that is, reshaping the identity of the recent immigrants in a way that corresponds less with their old world and more with their new world. This certainly included attitudes of loyalty and allegiance to the host country, its religion, and its political leaders. For instance, one of the main textbooks for immigrant citizenship education used in Canada during the first part of the twentieth century stated that the good citizen should love God, the Empire, and Canada (Fitzpatrick, 1919). Today, in the twenty-first century, new immigrants to Canada must pass a civics test and pledge allegiance to the Queen of England in order to become Canadian citizens. Interestingly, Canadian-born people are not required to take this oath or to pass a test as a condition for citizenship, even though 60% of Canadians fail a citizenship exam similar to the one taken by immigrants (Dominion Institute, 2007). Some citizenship-education programs strive at developing a planetary consciousness and an identity as world citizens. These programs are usually known as global education, and are often connected to peace education and environmental-education approaches.

Programs that focus on civic virtues tend to emphasize the development of a set of values, attitudes, dispositions, and behaviors that are expected from good citizens. Paraphrasing the Archbishop of York, who said that the true purpose of education is to produce citizens, Eleanor Roosevelt argued that the purpose of education is to produce good citizens. However, there is no universal agreement about the values and dispositions of good citizenship. Certainly, some values have more universal appeal than others, but the set of values privileged by official-education programs change from country to country and from time to time, and range according to factors like the ideological orientation of the government in power and the prevailing beliefs in a given society. From a pedagogical perspective, citizenship-education programs that focus on civic virtues follow two main approaches. One approach consists of instilling a particular set of values and dispositions through exhortations and inducements. The other approach aims at helping learners develop their own values by examining ethical dilemmas and examining different perspectives in a democratic environment.

Finally, programs that focus on citizenship as agency tend to promote the development of an active citizenry. However, this could take different forms and directions. Westheimer and Khane (2004), for instance, identify three implicit models of active citizenship: responsible, participatory, and justice oriented. Responsible citizens are expected to avoid littering, pick up litter of others, donate blood, recycle, volunteer, pay taxes, exercise, stay out of debt, and the like. Participatory citizens are expected to take active part in the civic affairs and social life of the community, and assume leading roles in neighborhood associations, school councils, or political parties. Justice-oriented citizens are expected to be able to critically analyze structures of inequality, consider collective strategies to challenge injustice, and, whenever possible, address root causes of social problems. Although the three models are important for the development of agency among learners, justice-oriented programs arguably have more potential for building a democratic and just society, as this requires nurturing political subjects who have a critical understanding of social structures and the capacity (and willingness) to participate actively in society. This tradition of citizenship education for transformative social action is grounded in the work of many adult educators, including Jane Addams, N. F. S. Grundtvig, Moses Coady, José María Arizmendi, Paulo Freire, and Myles Horton.

Regardless of their particular orientation and foci, most adult-citizenship-education programs tend to emphasize – often in theory, sometimes also in practice – the importance of nurturing an informed, purposeful, critical, caring, and active citizenship. This requires the development of certain attributes that include knowledge on a variety of areas (from political ideologies and societal structures to government institutions and democratic governance), skills

(from information seeking and analysis to conflict resolution and public speaking), attitudes (from self-confidence to respecting other people's opinions and cooperation), and practices (from participating in local associations to voice ideas and voting in municipal, provincial, and federal elections). These attributes can be learned through different programs, although those programs that include an experiential component (e.g., allowing learners to experiment with participatory democracy) tend to be more successful (Merrifield, 2001; Benn, 2000; Annette and Mayo, 2008).

Concluding Remarks: Adult-Citizenship Education in Immigrant Societies

In recent times, some countries with large-scale, continuous, and heterogeneous immigration patterns have established a variety of educational programs to promote successful integration processes and mutual understanding. These programs are usually inspired by two main approaches. The first one, known as multicultural education, focuses on familiarizing learners with different cultures in order to reduce stereotypes and ethnocentric attitudes. Multicultural education emphasizes the teaching of history, traditions, and customs of different cultures. More often than not, this is done superficially and uncritically, focusing almost exclusively on the three Fs of folklore, food, and festivities. However, occasionally multicultural education programs also encourage a deeper social analysis that includes examining dynamics of inequality, discrimination, and racism.

The other approach, known as intercultural education, is about proactive interaction among different ethnic groups. Intercultural education is not so much about acquiring knowledge about other cultures but about promoting communication, cooperation, and regular relations among groups. Although both multicultural and intercultural education programs have similar aims (e.g., promoting understanding, tolerance, and respect among different cultures), the former emphasizes the cognitive dimension whereas the latter puts more emphasis on skills and attitudes. In theory, intercultural education is a two-pronged project that includes working with both the immigrant and the nonimmigrant population. Theoretically, intercultural education is expected to assist immigrant groups in their integration process and at the same time it should help the nonimmigrant society to accept immigrants as equals, with the overall purpose of building a more democratic, inclusive, and egalitarian society premised on an intercultural and active citizenship. In practice, however, many intercultural education initiatives tend to concentrate their efforts on compensatory pedagogical interventions with minority groups rather than on projects that involve all groups in society (Rodríguez Izquierdo, 2009).

Related to this are the debates on the most appropriate pedagogical strategies to cultivate the habits of democracy in diverse societies. The most common approach is to avoid open discussions about controversial topics among participants. Many instructors fear conflict, and hence tend to implement a safe curriculum that reduces the possibility of risk. Others, however, believe that the best way to nurture civic virtues is to welcome controversial topics and hard questions, as well as to encourage participants not to get along. This implies recognizing the plurality of viewpoints among participants and facilitating a respectful dialog among them (McLaughlin, 2004; Hughes and Sears, 2004). As Dewey (1916) pointed out, one of the most effective ways to learn democratic values is to practice democracy in a democratic community.

In closing, the potential of adult education to contribute to a more democratic society is reflected in the first theme of the agenda for the future approved at the fifth International Conference of Adult Education (CONFINTEA) in Hamburg, where it was noted that the challenges of the twenty-first century “require the creativity and competence of citizens of all ages in alleviating poverty, consolidating democratic processes, strengthening and protecting human rights, promoting a culture of peace, encouraging active citizenship, strengthening the role of civil society, ensuring gender equality and equity, enhancing the empowerment of women, recognizing cultural diversity (including the use of language, and promoting justice and equality for minorities and indigenous peoples) and a new partnership between state and civil society” (CONFINTEA, 1997: 1). The agenda adds that to reinforce democracy, it is essential to strengthen learning environments, encourage citizen participation, and create contexts where a culture of equity and peace can take root.

To achieve these goals, CONFINTEA asks adult educators to make four commitments: to create greater community participation; to raise awareness about prejudice and discrimination; to encourage greater recognition, participation, and accountability of nongovernmental organizations and local community groups; and to promote a culture of peace, intercultural dialog, and human rights. Adult citizenship and immigrant-education programs can assist these efforts by addressing issues of status, identity, civic virtues, and agency. This can be pursued through a variety of pedagogical/political strategies that adapt and reinvent the contributions of twentieth-century adult education to the realities of the twenty-first century. Adult education can play an important role in improving the conditions for learning, in increasing the sharing of this learning along the lines of intercultural education, and in equalizing opportunities for learning and for meaningful participation among all members of society.

Community Based Adult Education

B Connolly, National University of Ireland, Maynooth, Republic of Ireland

© 2010 Elsevier Ltd. All rights reserved.

Glossary

Consciousness raising – An increasing of concerned awareness especially of some social or political issue.

Empowerment – The promotion of self-actualization or influence.

Praxis – In the context of community education, praxis connotes the synergy of activism and reflection, in order to bring about a more just and equal society.

Really useful knowledge – This concept was developed in the nineteenth century to critique dominant forms of knowledge, and to contribute to changing all forms of domination while simultaneously promoting democracy and social amelioration. Really useful knowledge underpins the reflection in praxis.

Really useful methods – These include ways of working with learners to enhance democracy, participation, and equality. These methods underpin the activism in praxis.

Introduction

Any discussion on community education must take into account that perspectives vary from context to place. Community education may be seen as an extension of a pragmatic education service designed to target hard-to-reach people, and integrate them into the mainstream, through employment, further education, or rehabilitation. It may be interpreted as a dimension of community development empowering powerless people to address their own educational and social needs. It also may be perceived as an adjunct to civil society, in which citizenship and participation are enhanced and strengthened. It may be named and understood in different ways too. Terms such as nonformal adult education, outreach, extra-mural, liberal adult education, locally based adult education, lifelong learning, training, and informal adult education are also used as synonyms for community education in different circumstances. Further, community education, positioned within the meanings of community, may be construed as a caring process, with a big emphasis on relationship and interpersonal connection, with the attendant focus on processes and

methods shaped to enhance these caring qualities. This article discusses these myriad dimensions, in the context of exploring differing perspectives and contexts. The historical foundations are discussed before looking at the different facets of community education. A wide breadth of concrete examples of community education is then considered in the context of inherent differences and ambiguities. Finally, the discussion is appraised to establish common ground for deepening critical democracy in these changing times.

Historical Foundations

The story of community education is somewhat elusive, but this section outlines that story to provide a backdrop to its scope and some concrete examples on the ground. Lynn Tett documented the development of community education in Scotland, identifying the recommendations of the Alexander Report as the milestones of the current practice of community education. These recommendations led to the Community Education Service, to examine nonvocational adult education. The recommendations were strongly influenced by the understanding that adult education should help address social disadvantage endured by several groups, such as lone parents, unemployed people, early school leavers, and minority ethnic groups. Further, the report recommended that community education ought to nurture a pluralist democracy, by managing the tensions between state policies and community politics. These landmarks were congruent with the historical sources of adult education for working-class people. Crowther (1999) traces the lineage of community education with the radical working-class organizations of the eighteenth and early nineteenth centuries. This source was hard fought, and wrested from the grip of the mainstream schooling and education. In Denmark, Grundtvig founded the folk high schools with the explicit objective of providing space for learning for citizenship. The legacy of the folk high schools included a strong linkage with social movements, particularly with the cooperative movement, contributing to the foundations for the welfare society in the Nordic regions. Further, the model is one of nonformal education, elevating the value of education *per se* (Smith, 2007).

In Northern Ireland, the part that community education played in the development of the peace process is yet to be assessed fully, but Lovett's earlier work in England

was influential at practical as well as theoretical levels when he moved back to Northern Ireland. In Lovett (1971) he reflected on his early community-based practice, maintaining that adult and community education must be much more than the provision of classes, in that it must also be integral to the whole community and must also be a communal activity.

In the Irish Republic, women's community education developed within a setting of difficulties, from the isolation of new suburbs, high unemployment, and emigration, coupled with the destructive war in Northern Ireland and the improvement of the status of women. The literature on the sphere is sparse due to the growth in a nonformal, nonacademic manner, probably unique in education initiatives in that it was created, fostered, and supported by noneducationalists (Connolly, 2003). Slowey noted the early days of adult education in the community, especially the adult education organized and conducted by women on the ground, (Slowey, 1985). Bassett, *et al.* (1989), made the case for adult education and emancipation, emanating from the work of Irish National Association of Adult Education (AONTAS), when it became more apparent that adult education was changing enormously through the phenomenon of the women's community-education growth and development. By the time the author did a small study looking at her own experience of women's community education, it was clear that women's community education was totally different from the traditional provision of night classes in empty-ish schools or universities, based on liberal studies and leisure courses, in three specific aspects: the processes and methods, which she named really useful methods, relating this concept to Thompson's really useful knowledge, which underpinned the content, in addition to the total learning environment. Women's community education offered programs of non-formal and formal adult education, but it also provided the space for informal learning, plus, vitally, childcare within caring, supportive settings (Connolly, 1989). That is, community education, whether supported by educational institutions, sponsored by communities, or arising from difficult life worlds, provides a way of responding to oppression and discrimination, particularly by building the capacity of the learners, in their own personal development and, crucially, in their communal and social development.

Thus, these historical foundations locates community education within the milieu of community concerns, including the very difficult, deep divisions in Northern Ireland, or the almost intractable issues around suburban isolation, early school leaving, drug addiction, environmental concerns, and unemployment.

While this historical overview is scant, and elides numerous milestones, it serves the purpose of illuminating the rootedness of community education in the social agenda of liberation, problem solving, and self-determination.

The next section looks more closely at the facets of community education that help to illuminate the flexibility and resourcefulness that enables it to respond to the breadth of issues.

Facets of Community Education

This section endeavors to explore the facets of community education and to discuss the implications. The understandings of the term community is discussed in greater depth later on, but as a marker, community in this context is used in the sense of the physical location in which people live, that is, place, or in the sense of the community of interest, the social network of people who share a common interest, such as the Irish in the USA. Or community may be applied to the group of practitioners, a quasi-functional meaning, such as the community of educators, social workers, doctors, or the like. The principles of community education, identified by AONTAS (2004), the national adult learning association, in Ireland, include the rootedness of community education in social justice and the process of empowerment, which aims to build the capacity of local people to respond to educational and structural disadvantage and to participate in decision making and policy creation (AONTAS 2004: 18). That is, AONTAS aligns its perspective with the ideological positioning of working toward addressing the causes of disadvantage and inequality. On the other hand, Smith (2009) draws a thumbnail definition – education for the community within the community. He views that community is not just the place, or context of the education program – building the community is also a central concern. Thus, the overlap between AONTAS and Smith is this core concern with community. Implied in building community is the process of working on relationships between members of the community, in order to enhance their lived experience.

Thompson delineates the ways of working in community education as specific and purposeful. She includes formal education, that is, adult education with credentials; informal adult education that occurs within social networks, such as the breaks between classes; and nonformal adult education, with no credentials. She holds that the processes work with people's life experience and it connects issues, ideas, and understanding to political action. These processes also foster practical skills, which help people to overcome alienation, as well as increase their capacity for employment and participation. Finally, she contends that community education helps to build self-esteem as well as enables people to understand others' perspectives (Thompson, 2002: 9–11). That is, Thompson builds the ground in community education between the person and the communal, the individual and the social. By including credentials, she sides conclusively with the

contention that community education can embrace the full range of education, from basic literacy and numeracy to certificates, diplomas, and degrees.

Community education may also straddle the divide between institutionally sourced adult education and the kind of education that arises from the people themselves. McGivney (2000) in her study of outreach adult education for marginal groups, for example, unemployed men, traces the factors which underpinned its success. These factors included the ways of working with the learners, relationships, and methods, the response to community issues and support for community groups. Outreach in this sense comprised the provision of programs from universities or other education providers, but the processes and methods are not those of institution-centered provision; rather they are responsive and relevant to the learners' lives. McGivney's research echoes closely with the experience in Ireland, with women's community education.

Figure 1 endeavors to capture the facets of community education, including the contradictions and ambiguities. It revolves around the centrality of the learners, a key component of community education, not just in terms of

the processes and methods, but also in terms of meaning, experience, and responsiveness.

These myriad facets demonstrate the breadth of community education, and these dimensions are reflected in concrete examples on the ground. The next section discusses cases of community education in specific exemplary contexts.

International Examples

A rudimentary review of community education reveals concrete examples in many contexts throughout the globe. This section provides a summary of these examples, in order to illuminate the ways in which societies engage with community education.

Community education is found in contexts as diverse as a middle-class, affluent city in the USA to a rural childbirth project in Kenya. These diverse examples include content-centered education, with the focus on information and resources; process-centered, with the focus on participative creative methods; or a combination of both,

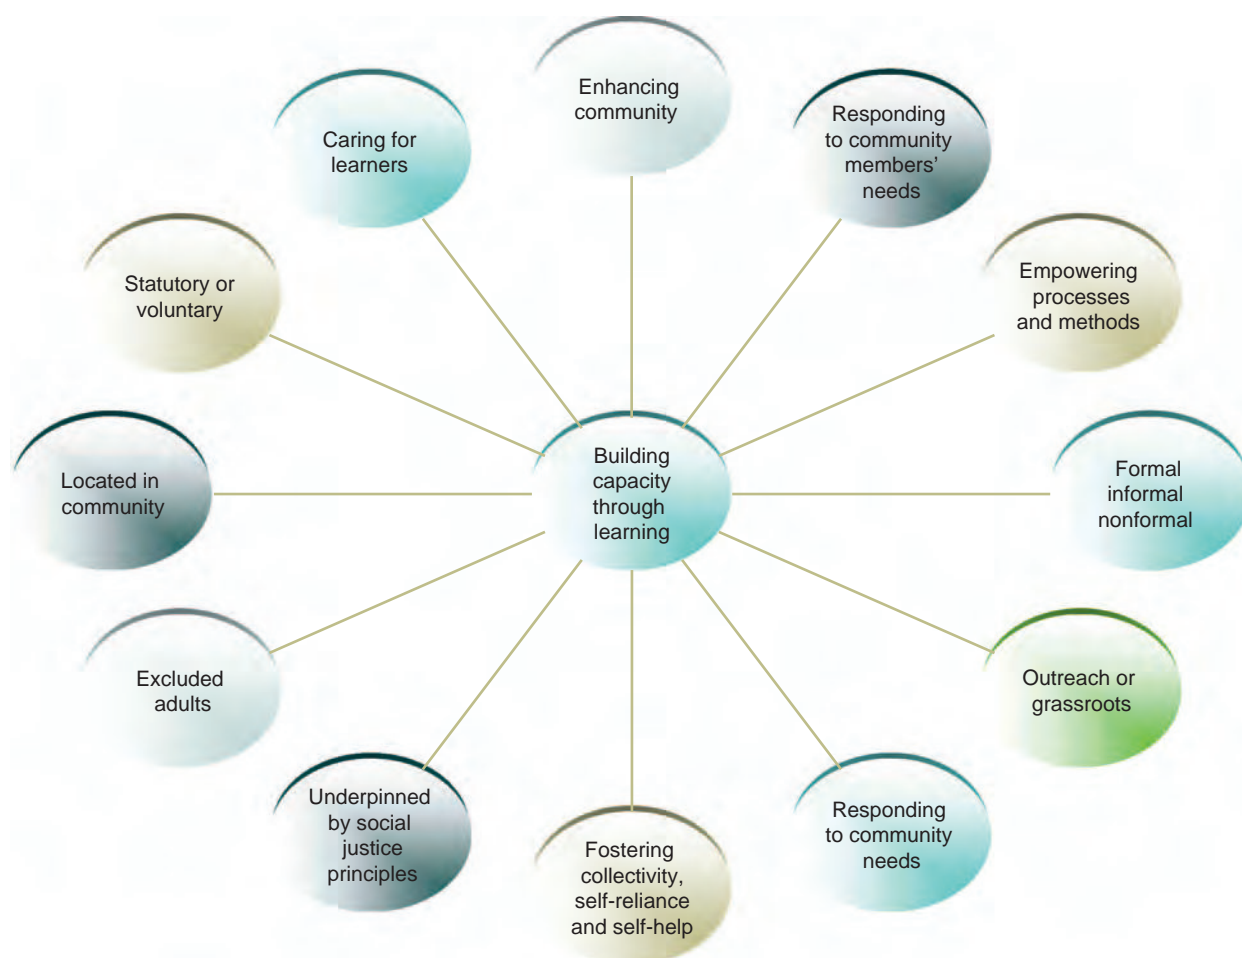

Figure 1 Facets of community education and the breadth of scope.

depending on the circumstances. They are also practiced in groups, in e-learning and in one-to-ones, employing basic resources on the one hand, and technology on the other, by a variety of educators, from peers to outsider professionals.

United Nations Educational, Scientific and Cultural Organization (UNESCO) has been at the forefront of the harnessing of community education for community, cultural, social, and personal development. The aim of meeting the learning needs of adults as well as children and youth, by 2015, is addressed through programs and targets on adult literacy, gender, and equality, human immunodeficiency virus/acquired immuno-deficiency syndrome (HIV/AIDS) education, and so on. This commitment to the use of community education as the means of addressing extremely difficult issues is evident in the examples outlined below.

In terms of the approach, the Australian agency, the Public Interest Advocacy Centre focuses on the use of information as the medium for community education. They supply a series of information leaflets, what Thompson (1996) terms really useful knowledge in their human rights community education. These information fact sheets are designed to reach out to people on the ground with background and strategies on civil, political, and human rights. The audience/learners include people from new communities, people who have come to Australia as refugee and asylum seekers, and other vulnerable people. They can access the information even from distant places, through the website.

In contrast, the indigenous community is the subject of another concrete example of community education, this time in Canada, in the Kehewin Community Education Centre. The overall objectives include the raising of awareness about the culture and practices of the Native Americans, in order to enhance the lives of both Native and non-Native communities. They undertake this through dance, theater as well as education. That is, the knowledge base is drawn from the traditional wisdom and practices within the Native community, and the learners are engaged in face-to-face creative processes.

The Grassroots Alliance for Community Education (GRACE), with its headquarters in the USA, works as a nongovernmental organization (NGO) in Africa, in a number of countries, with the objective of building the capacity of local people to take control over their own lives, by improving household health and welfare. Their processes include peer-educator training, which enables members of communities to relate to one another in an educational way, forming networks with local organizations. The agency trains local people, who use their knowledge to improve the health and welfare of families and households. Their interventions range from HIV/AIDS awareness, and consciousness raising about the illegality of female genital mutilation (FGM), to work with traditional birth attendants. That is, GRACE works in

specific African countries, at once removed from the grassroots, empowering local educators in order to gradually change traditional beliefs which endanger lives. Africa is also the source for the materials that many community educators have worked with for over 20 years, *Training for Transformation* (Hope and Timmel, 1985). These resources were inspired by the work of Freire, and are balanced between the really useful knowledge of social analysis on the one hand, with the creative methods and processes that have characterized community education ever since. These texts were located firmly in the grassroots of community participation, and this work parallels the educational initiatives in Latin America.

In Latin America, popular education fulfills the role of community education for adults, that is, education for grassroots, fundamental social change. Freire's work is evident in popular education and social movements, hinged on participative processes together with political and social analysis. For example, Gadotti (1992) shows the role of participation in popular consciousness raising, and also in the strengthening of community control over the state. This role for popular education/community education is a key conduit in bringing democracy to the continent with its troubled relationship with the USA. Interestingly, the GATEWAY project in the Washington DC area uses the community-education approach to enable recent immigrants from Latin America to the USA connect with people who have experienced multiple barriers such as lack of education and low income, using the full span of community-education-method processes to motivate and empower the learners on the issues around HIV/AIDS. That is, the purposeful intervention of community education is designed to sensitively address traditional beliefs in new communities in order to enable them to stay safe and healthy, through small group or one-to-one educational settings. The use of community education in the USA ranges from the life-and-death issue of health and welfare, to community problem solving.

With regard to problem solving, when community education was reviewed on the Internet, one of the first references to community education led the author to the Government of Wisconsin website. The Wisconsin Department of Public Instruction outlines its perspective, with a set of principles which underpins its version of community education. These principles include the principles of self-determination, self-help, social inclusiveness, and formal and informal learning, in order to meet the needs of local people, provided as close as possible to those who want it. This focus on self-determination and self-help also features in a community-education initiative in South East Asia, which straddles the Wisconsin principles, but with an environmental dimension that protects the earth's resources for the benefit of humanity, that is, macro-micro integration. Further, while many community-educational objectives include the sensitive challenge to

traditional beliefs, especially with regard to health, child-birth, and FGM, the Southeast Asia regional initiatives for community empowerment (SEARICE), promotes traditional knowledge of farming communities to protect them from the recent trends in agricultural production, with the attendant limiting of genetic diversity, and the copyrighting of seeds. The processes used in this community empowerment focus on information, lobbying, and advocacy. In contrast to the Wisconsin model, whereby the principles denote that community is a self-contained entity, a sub-set of the state, but autonomous and self-regulating rather than state controlled or supported, SEARICE sees the community as an integral dimension of the state – and the planet – but which needs to empower itself against the onslaught of the market. That is, the environmental concerns are held by the community, a huge burden in both the micro-sense of making a living, and also in the macro-sense of saving the planet.

On the other hand, the Scottish government locates the responsibility for community education firmly with the state, defining it as informal learning and social development, to strengthen communities by improving the capacity and knowledge of the community members. Further, it has prioritized community learning with the commitment not only to raise the educational attainments of adults, particularly literacy and numeracy, but also to support young people and to promote involvement with the planning and delivery of local services. Thus, the term community education is applied to the hands-on version of the Scottish government, to enhance democracy and participation, while the Wisconsin principles imply a hands-off approach, promoting self-sufficiency and independence. The Scottish Executive overtly locates community education within the social justice agenda, while Wisconsin government perceives community education as enhancing the community, improving services, and facilities, and applying not just to adults, and also schooling for children.

This overview of examples of community education on the ground, while superficial, illuminates the breadth of the field. It also shows the differences and contradictions, indicating the problem of delineation. The next section discusses these differences in order to establish the common ground in community education.

Contradictions and Ambiguities

Specific cases of community education have underlying contradictions, indicating the ideological understandings that underpin the practice. Tett (2002) discusses these inconsistencies with her discussion on the advantages and disadvantages of the hands-on state promotion of community education, with her reflections on the experience in Scotland. The key difficulty in the implementation of government policy is the high expectations of

community education to solve deep structural inequalities. This imposes unrealistic burdens on community educators and the communities they serve. Community educators are faced with a deep ambiguity. On the one hand, they are left with the responsibility for driving change at the most grass-roots levels, sometimes underfunded and undervalued, in comparison to other educational institutions. On the other hand, they remain quite invisible in the overall perception, seen as facilitators of change rather than actors and agents. Further, Tett contends, community educators cannot attain the same professional standards for their work that other educators can, because their role is diffuse, unspecified, and undefined (Tett, 2002: 12). This is all the more the case when the educators are members of the communities, subject to the barriers that the other members endure. The task of addressing social inequality is contingent on the re-distribution of power and resources, underpinned by the clarity of vision of the just society. Teaching egalitarianism also needs access to the body of knowledge that illuminates the causes of inequality, what Thompson (1996) calls really useful knowledge, that is, knowledge that enables people to understand the social forces that shape society. As the case studies show, sometimes the knowledge is traditional and honored, while at other times, traditional knowledge is dangerous, especially with regard to gendered health and welfare. Thus, access to really useful knowledge is problematic, and can be controlled according to the beliefs of the animators.

Moreover, with such high expectations of community education, the responsibility for fundamental change is also problematic. When the responsibility for justice-based change is left with the most powerless, it has very little prospect for success. For political leaders, advocating and supporting community education does convey the appearance of concern with addressing inequity, but in effect, the *status quo* prevails.

Further, in relation to the continuum between the local and the global, the globalized influences of economic and cultural capital impinge in an incalculable way on the individual, the community, and community educator. That is, the needs which communities identify, for example, drug misuse, unemployment, or environmental degradation or appropriation may have sources completely outside the control of the local level. The solutions to these issues reside at the global level; yet, there is an expectation that community education can armor people against them, say, by drug education, community enterprise, or ecological activism, on the one hand, or animate the people to act against them. Community education advocates indicate that local people, if they corral resources, if they network with like-minded groups, and if they develop leadership, can work to overcome the deep structural divisions of race and ethnicity. As a principle, the vision of the inclusive society is commendable; yet, the causes of divided communities are not just endemic

racism, ageism, and other discriminations, destructive as they are, but also globalized economic and cultural trends.

Thus, community education reaches difficult-to-reach people and communities, but not just that: it reaches difficult issues and trends, and as such, bears the burden of high expectations that it can actually resolve quite intractable social problems, as well as deal very effectively with other social issues. This raises the question about the nature of community, in which the community education operates. The next section discusses the connotations of community in this context.

Community Connotations

The term community is ambiguous and loose. Mayo (1994) contends that it is notorious for its shiftiness; yet, it is very useful for application to smaller sub-sets of society and to collectivities and communal dynamics. Williams (1976), in his discussion on the meanings and connotations of the term, traced the usage, originally referring to the common people, that is, peasants rather than people of rank. However, the connotation changed eventually to meanings closer to current usage, that is, the sharing of common characteristics and identity, and underpinned by relationship. Further, when the word is used, it conveys warm and persuasive sentiments. Thompson (2002) agrees with Williams that community has a feel-good factor associated with it that is difficult to undermine or challenge. She regards that community as a concept provides the space for security and common understandings. But she adds that community is frequently applied to others, that is, to poorer people, ethnic groups, and so on.

Toennies (1957) provided the discussion on *Gemeinschaft* and *Gesellschaft* which helped to develop insight into the characteristics of smaller social groups and looser associative relationships. These characteristics, though drawing on the contrasting traditional rural society versus urban industrialized society, nevertheless, enable the appreciation of experience of the postmodern city, and the large, isolated suburban enclaves in which huge populations endeavor to find common ground with the neighbors and common identities with like-minded people, to overcome alienation and loneliness.

The term community can also convey a more caring dimension than the larger institutional or social entity. Thus, in finding commonality, human relationships and constructions move into the central position, together with the sense of having some level of control over the immediate milieu. Harvey (1989) contends that different classes construct their sense of territory and community in radically different ways. He gives the example that middle classes can focus on tone, that is, control the status of the locality by ensuring that undesirable residents or developments are kept out. On the other hand, working

classes protect relationships, characterizing the quality of the community in terms of good, supportive, and present neighbors. Harvey is obviously concerned with class, primarily, but additional analysis shows that there are other differences including gender, race, and ethnicity. For example, Irish travelers refer to themselves as a community, with a strong emphasis on kinship, custom, and tradition, with a distinct culture that differentiates them from the rest of the populations. This is not static of course, but the influences from modern Irish society are mediated through the filter of the culture, rendering them encultured so that any new phenomenon takes on a distinct traveler flavor.

However, the term is very useful in community education, as it conveys its small-scale nature; the close relationships, including those of caring, inclusion, and supporting; its flexibility and shifting nature, particularly with regard to its responsiveness; the closeness of its provision to the learners and their contexts; and the ways in which it overcomes the estranging language that was more typical, such as outreach and extra-mural, liberal adult education, locally based adult education, or more critically orientated versions, such as emancipatory, popular, or empowering education.

Government of Ireland (2000) evaluates these characteristics, and endeavors to encompass the scope of community education by acknowledging that it reaches large numbers of people, often in disadvantaged settings. Community education also pioneers new ways of working with learning groups, in nonhierarchical processes. Finally, the lived experience of the learners provides the starting point for the learning. Thus, community education is framed as educational, in terms of processes and methods; communal, in terms of groups, both learning groups and community groups; and egalitarian, in terms of organization and responding to the needs of disadvantaged communities.

Conclusion

This article endeavored to capture the dimensions and facets of community education, not only delineating it, but also illuminating the demands and stresses that shape the practice on the ground. While the origins have a diffuse lineage, from the concern with workers' rights, to the desire to strengthen civil society, community education is subjected to a series of dialectical pulls and pushes, which ensures the dynamic, process-oriented development of the field.

Community education evolved with this complex, dynamic interaction of grass roots organic growth, and statutory or pioneering animation. However, regardless of the provision, the ownership of the process remains with

the participants. The community-centered approach ensures that learners participate freely, and the subjective experience of the participants is considered vital and transformative. Community education is located within the community and of the community.

Egalitarianism, which is very complex in itself, enables the learners to raise their consciousness about their own lives as well as the lives of other, engaged in the analysis of inequality. Freire's (1972) praxis connects the learning with activism, in a continuous cycle. The content of really useful knowledge (Thompson, 1996) contributes to the potential for societal transformation.

Continuing Professional Education: Multiple Stakeholders and Agendas

R M Cervero, The University of Georgia, Athens, GA, USA

B J Daley, University of Wisconsin – Milwaukee, Milwaukee, WI, USA

© 2010 Elsevier Ltd. All rights reserved.

The leaders of professions and the public have always assumed that professionals would maintain their competence by continuing to learn throughout their careers through reading, discussions with colleagues, and educational programs. Since the 1960s, one of these educational forms, formal educational programs, has increased dramatically. Most professions now embrace the importance of lifelong professional education. In the rapid growth of continuing education (CE), educational leaders have generally relied for guidance and models on the distinctive knowledge base and structure of their own profession. However, many observers (Houle, 1980; Cervero, 1988; Brennan, 1990) noted the similarities of the CE efforts of individual professions in terms of goals, processes, and structures. Thus, the concept of continuing professional education (CPE) began to be used in the late 1960s. Various terms are used throughout the world referring to this concept, including continuing professional development, staff development, and professional learning. The rationale for this movement is that the understanding of similarities across the professions would yield a fresh exchange of ideas, practices, and solutions to common problems.

As with any educational system, CPE has many stakeholders with multiple agendas. The purpose of this article is to chart the expansion of CPE and three agendas that are shaping its present and future: professional and social, institutional, and educational agendas. Although the growth of CPE is a worldwide phenomenon, the most articulated systems exist in the nations of the Global North, such as Canada, Europe, Australia, and the United States. As such, CE and training have been addressed in global contexts such as the World Trade Organization and the General Agreement on Tariffs and Trade (GATT) (Lenn and Campos, 1997). This article accordingly focuses on the development of CE efforts in these regions of the world.

Systems of CE for the Professions

A central feature of societies in the twentieth century was the professionalization of their workforces. One estimate is that nearly 25% of the American workforce, for example, is classified as professionals (Cervero, 1988). These professionals include teachers, physicians, clergy, lawyers, social workers, nurses, business managers, psychologists, and accountants. Educational systems

have been a key feature of this professionalization project (Larson, 1977). An incredible amount of resources, financial and human, is used to support 3–6 years of professionals' initial education. Until recently, however, little systematic thought was given to what happens for the following 40 years of professional practice. Many leaders in the professions believed that these years of preservice professional education, along with some refreshers, were sufficient for a lifetime of work. However, with the rapid social changes, the explosion of research-based knowledge, the growing emphasis of evidenced-based practice, and spiraling technological innovations, many of these leaders now understand the need to continually prepare people for 40 years of professional practice through CE (Houle, 1980). Beginning in the 1960s, we started to see embryonic evidence for systems of CPE. Perhaps the first clear signal of this new view was the publication in 1962 of a conceptual scheme for the lifelong education of physicians (Dryer, 1962). The 1970s saw the beginning of what is now a widespread use of CPE as a basis for relicensure and recertification (Cervero and Azzaretto, 1990). By the 1980s, organized and comprehensive programs of CPE were developed in engineering, accounting, law, medicine, pharmacy, veterinary medicine, social work, librarianship, architecture, nursing home administration, nursing, management, public school education, and many other professions (Cervero, 1988). During this decade, many professions also developed their systems of accreditation for providers of CPE.

At the present time, the picture of an instructor updating large groups of professionals about the most recent theories and findings is easily recognizable as the predominant form of CE. We do not yet have a similarly recognizable picture of a system of CE in any profession. The major reason for this lack of a unifying picture is that the professions are in a transitional stage, experimenting with many different purposes, forms, and institutional locations for the delivery of CE. These systems, as such, are incredibly primitive and can be characterized as: devoted mainly to updating practitioners about the newest developments, transmitted in a didactic fashion by a pluralistic group of providers that does not work together in any coordinated fashion.

Relatively speaking, systems of CE are in their infancy. By way of analogy, CPE is in the same state of development as preservice education was at the beginning of the twentieth

century. It is unlikely that anyone in 1910 would have predicted the structure of medical education today. Likewise, systems of CPE are likely to grow through this transitional period to achieve an equivalent coherence, size, and stature as the preservice stage of professional education. While these systems of CPE are in a grand historical transition (Young, 1998), it is quite unclear what form they will take in the future.

Social and Professional Agendas

Within every profession, there are segments using knowledge for different social purposes. As Schon (1983: 345) argues, professionals' "special knowledge is embedded in evaluative frames which bear the stamp of human values and interests." It is not surprising that the professions have conflicting values about their role in society because professions are "loose amalgamations of segments pursuing different objectives in different manners and more or less held together under a common name at a particular period of history" (Bucher and Strauss, 1961: 326). For example, many social workers deliver services by means of individual casework. However, within the profession, some argue that casework is a form of conservative politics that reinforces institutions, processes, and ideologies that are destructive to human well-being (Galper, 1975). In this view, social work is considered conservative because its basic assumption is that nothing is wrong with societal arrangements, but rather with individuals who need to adjust to the status quo. The existence of internal dissension and value conflict is not new. For example, Perrucci (1973) found 18 radical movement organizations in 12 professions, including medicine, engineering, law, and psychology. These movements share the perspective that the professionals' role is to ask for whom and for what ends their expertise should be used. As professionals' knowledge can serve conflicting social purposes, CPE likewise can and does serve many different purposes.

CPE is being used more frequently to regulate professional practice. One of the major changes of the past 20 years has been the incorporation of CE into accountability systems for professional practice. As regulatory bodies struggled to develop accountability mechanisms, participation in CE was often the method of choice. However, these new requirements have been critiqued for "promoting the appearance of accountability but [doing] little or nothing to address the underlying issue of competence" (Queeney, 2000). In spite of this lack of demonstrable connection between CE and competent practice, the use of professionals' participation in CE to regulate their practice has not abated for the past two decades. Perhaps the most obvious example is the growth of state use of CE as a basis for relicensure. What started in the 1970s is now widespread such that every profession uses some form of

mandatory CE. The number of states requiring CE for relicensure has risen consistently for the past two decades. More professions are likely to follow the example of the Royal College of Physicians and Surgeons of Canada who have developed the Maintenance of Competence Program for recertification. This system allows physicians to use activities such as participation in audits of practice and a personal learning portfolio, which is a database of items of new learning recorded during the past year.

Institutional Agendas

Institutions develop the second part of the agenda, shaping present and future systems of CPE. Many different kinds of institutions have a stake in the growth of CPE systems, and each of these different institutions may have different goals and different methods by which CPE is provided. In discussing institutional agendas for CPE, four components are considered:

1. multiple goals,
2. multiple providers,
3. multiple modes of delivery, and
4. Collaboration among providers and professions.

Often the primary factor in determining the institutional agenda is the goals of the organization in which CPE is provided. Institutions tend to view CPE in different ways and most often these views are linked to the overall mission, vision, and values of the institution. For example, some institutions may view CPE as a method of employee development. Within these institutions it is believed that an educated and well-trained workforce is essential to the services provided by the institution. Healthcare, for example, most often focuses on employee development as a way to provide high-quality client care. The view here is that education assists employees to provide services that clients need. Thus, education or CPE is an essential link in the provision of institutional service.

Other institutions may see the provision of CPE as a method by which they can generate revenue. CPE is big business, especially in those states, countries, or territories that require CPE for recertification or relicensure of professionals. Higher education and professional schools, for example, are institutions that often rely on CPE as a way to generate revenue to support the overall mission of the institution. In these institutions, CPE is offered to large populations of professionals (often alumni) within the institutions' service area rather than to employees from one institution. As such, the revenue generated from day-long conference, multi-day conferences, or short courses returns to the more centrally managed CPE unit within the university or school.

The providers of CPE include the workplace, professional association, higher education, and for-profit companies. The workplace is by far the largest provider

of training and education for professionals and often this is accomplished through human resource development (HRD). Yet, each of these different providers offers unique CPE programs for specific audiences.

Dirkx and Austin (2005) help us understand the integrated nature of the multiple providers in CPE and the multiple goals of these providers. In their model of theoretical orientations in continuing professional development (Dirkx and Austin, 2005), they propose that the aims of professional development (based on Habermas, 1972) can range from technical, to practical, to emancipatory. Within the technical domain instrumental action, the scientific method and the hard sciences are addressed. In contrast, within the practical domain communicative action or human interest is most often the focus. Finally, the emancipatory domain focuses more on power and understanding our actions through self-reflection and self-knowledge.

In addition, Dirkx and Austin indicate that the goals of professional development are met in four primary contexts: HRD, CPE, faculty development, and staff development. Basically, these contexts represent the various areas in which professional development is most often provided. For example, HRD is usually provided as training in the workplace; CPE is most often provided through professional associations and higher education; faculty development is accomplished within colleges and universities; and staff development is associated with schools. What is evident in the Dirkx and Austin (2005) model is that the contexts of HRD, CPE, faculty development, and staff development may also overlap with different types of institutions. Finally, Dirkx and Austin (2005) indicate

that the focus of professional development may be individual or organizational. In their view, offerings are not exclusively individual or organizational but they tend to predominately focus on one or the other.

In analyzing developing systems of CPE, Dirkx and Austin (2005) offer a model that focuses on the multiple and overlapping providers and goals. Their model, depicted in **Figure 1**, demonstrates the complexity of currently developing systems of CPE. As Dirkx and Austin (2005) indicate, professional development can be conceptualized around “the overall aim of or purpose for professional development; the context of professional development; and the primary focus of the professional development activity” (p. 3). The model, depicted in **Figure 1**, promotes a new understanding of institutional agendas in CPE. Each cell in this model could be considered a different type of CPE offering. Dirkx and Austin indicate:

It is possible to take any particular context and identify different kinds of professional development that represent the different cells within that overall context. For example, one kind of faculty development program (context) might seek to develop specific skills (technical aim) in the use of a particular online software, so the professors can design and delivery more independently their own online courses (focus). This might be driven either by the organization’s need to develop additional revenue in budget-tight times (organizational focus), or individual professors may freely elect to develop this new expertise as part of a re-directing of their careers (individual focus) (Dirkx and Austin, 2005: 8).

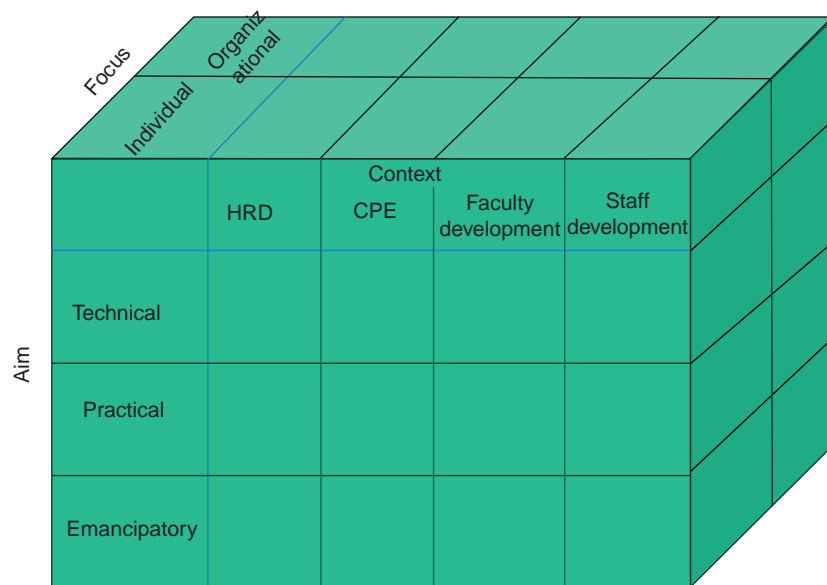

Figure 1 Dirkx/Austin model of theoretical orientations in continuing professional development. From Dirkx, J. and Austin, A. (2005). Making sense of continuing professional development: Toward an integrated vision of lifelong learning in the professions. Presented at the *Academy of Human Resource Development Continuing Professional Education Preconference*, Estes Park, CO, p. 8. 23 and 24 February, 2005, with kind permission from Dirkx and Austin.

Institutional agendas for CPE are also shaped by the multiple modes of delivery. CPE is predominately offered as limited, short-term educational programs presented in real time in a face-to-face format. These programs range from 1-day conferences, to multiday conferences, to short courses (i.e., 1–5 weeks). Most often, the mode of delivery for CPE focuses on an update of technical information so that the professional can return to their worksite with an increased understanding of new knowledge. However, increasingly distance education technologies are being incorporated into CPE programming. These technologies range from video-conferencing across multiple sites, to Internet-based courses, to Internet-based conferences, to online group discussion forums. Additionally, a relatively new form of distribution in CPE is learning objects. According to Lehman (2007) learning objects are “digital chunks of information” (p. 57). These digital chunks of information can be developed in the form of text, video, audio, or multimedia and they can be used to present case studies, new procedures, self-directed learning modules, or simulations. These smaller learning units can then be downloaded to hand-held devices making them easy to access and to share with other professionals.

Finally, collaboration among provider and professions is essential to present and future systems of CE. Collaborative arrangements among providers and across professions can not only help increase learning and understanding, but they can also help decrease the cost of providing CE. However, collaboration can raise issues within institutions and among providers. For example, providers of CPE at times feel that too much collaboration can demonstrate that their program is not needed. Once again, Dirkx and Austin (2005) offer us a way to consider collaboration. Within their model presented in **Figure 1**, areas of collaboration become evident. For example, if a healthcare employer decides that the aim of their educational programming will be technical, conducted within an HRD context at the organizational level, they may realize that they need to collaborate with universities and professional schools who can provide more emancipatory, CPE at the individual level. In this manner, different providers and different professions can analyze their own strengths and then collaborate with other providers offering different kinds of education using different methods. This type of analysis may draw on the strengths of organizations, prevent overlapping offerings, and streamline competition.

Educational Agendas

Building on professional/social agendas and institutional agendas, the educational agenda also impacts the continuing development of systems of CPE. However, for the educational agenda to be truly effective, we must include a model of learning (Cervero, 1988) at the center

of these educational agendas. As Eraut (1994) explained, behind “professional education lies a remarkable ignorance about professional learning” (p. 40).

Early models of professional learning have relied on the ideas of technical rationality (Houle, 1980), transfer of learning (Broad and Newstrom, 1992), and adoption of innovation (Rogers, 1995). In these views, knowledge for professional practice was created in one location, often a university setting, disseminated through CPE programs, and then transferred to or adopted in professional practice.

In the 1980s however, Cervero (1988) proposed a model for learning in the professions based on an understanding of how professionals “develop knowledge through practice” (p. 39). Cervero (1988) advocated that CPE providers develop a critical model of the learner that integrates the development of two forms of knowledge – technical and practical. Within this model, he incorporated components of cognitive psychology, reflective practice (Schon, 1987), and studies of expertise (Benner, 1984; Dreyfus and Dreyfus, 1985).

As systems of CPE continue to be developed, expanded models of learning will need to underlie educational offerings. Recent research (Daley, 2001a, 2001b) indicates that professionals construct a knowledge base for themselves in the context of their practice by linking concepts from new knowledge learned in education programs with their practice experiences. At this point, they actively make decisions on how to incorporate new knowledge into the context of practice based on their interpretations of the environment. What this newer research adds is an enhanced understanding of how learning in CPE occurs when professionals actively link new knowledge with the context in which they work and professional practice in which they engage.

As systems of CE continue to be developed, it is essential that education providers recognize this process of knowledge construction. Professionals do not simply take information from a learning situation and incorporate it in a practice context. They go through a much more complex process of taking in the new information, analyzing the context of their work site (including the politics and the people with whom they work), and then they decide if the new information is a good fit for their work based on the nature of their professional practice. This is a much more involved and sophisticated process than early professional learning models indicated. It requires that the educational agenda of CPE providers changes to incorporate a more active and integrated type of learning.

Additionally, an area that needs further development within professional learning is the question: How does the nature of professional practice connect to the educational agenda? We know that professionals construct a knowledge base for their practice and also know that the context of their work environment impacts the process. However, in addition, we need to understand how the nature of their

professional work impacts learning. For example, do social workers learn in a fundamentally different manner than lawyers? Recent work by Donaldson (2002) indicates that individuals within different professions fundamentally think in distinctive ways. Therefore, this raises the question: Does the nature of the professional's work drive the thinking and learning process? If this is the case, then how does that shape the educational agenda of CPE in the future?

Finally, the overall purpose of learning within the professions is designed to develop expert practitioners who provide high levels of service to clients. The study of professional expertise has grown from an understanding of serial problem solving (Newell and Simon, 1972) to an understanding of the stages of career development within specific professions such as physicists (Chi *et al.*, 1980), pilots (Dreyfus and Dreyfus, 1985), nurses (Benner, 1984), and physicians (Groen and Patel, 1988). These studies identified that as professionals gain experience they move from a novice to an expert practitioner. As professionals move from novice to expert, they develop the ability to think more abstractly and to see holistic patterns within their clients. They develop a sense of salience with the context that allows them to move from seeing individual issues to seeing systems and the integrated nature of professional problems. The study of expertise is now moving toward developing an understanding of the connections between learning and expertise. For example, Daley (1999) found that novice nurses tend to learn in a contingent manner, while expert nurses learn in a more constructivist manner. This type of research has implications for the educational agenda of CPE and necessitates that program planners consider the level of professional development of their audience. Finally, studies of expertise that focus on development of collective expertise across various contexts and disciplines are also needed. The idea of collective expertise within a profession or at a workplace is an area that will again shape the educational agenda of the future and will need more research.

In addition to professional learning models, evidence on the effectiveness of CPE is an important consideration in the educational agenda for CPE systems. When professionals attend CPE programs and learn new information, the question exists "Does it make a difference in the service provided to clients?" Early studies showed mixed results in response to this question, with some studies indicating little impact and other indicating great impact. To clarify this variability in the results of evaluation studies, Umble and Cervero (1996) conducted a meta-analysis of 16 studies that provided a synthesis of impact studies in CPE. A major purpose of this review was to analyze and critique the methodologies of the studies, but in addition they found that a first wave of syntheses studies existed that demonstrated a general causal connection between

CPE and impact on professional practice. Umble and Cervero (1996) found that CPE had an impact on knowledge, competence, performance and outcome.

In addition, Umble and Cervero (1996) found that a second wave of studies had begun to demonstrate a number of variables that moderate the impact. This second group of studies began identifying the types of programs that can promote performance change within the professions. Umble and Cervero (1996) indicate that as the development of CPE systems moves forward, more work is needed in understanding the impact of CPE on practice. They advocate for more experimental studies, more qualitative and mixed-methods studies, and the use of action research (Brooks and Watkins, 1994) as both a programming and evaluation methodology.

The educational agenda in current systems of CPE is thus shaped by the model of professional learning incorporated in education practice, by an understanding of the nature of expertise, and by the overall effectiveness of the impact of CPE programs. In the future, CPE systems will continue to be shaped by ongoing and expanding research in all three of these areas.

Conclusion

The task of building systems of CPE is fundamentally more complex than what faced leaders as they built the existing systems of preservice professional education. First, whereas preservice education takes place in a relatively short period of time, CE must help professionals for 30–40 years of professional practice, which is characterized not only by constant change, but also often by competing values. Second, while preservice education is predominately controlled by universities and professional schools, there are multiple institutions that offer CE, all of which stake a claim to being the most valid and effective provider. The leaders of workplaces, professional associations, universities, and governments have both a tremendous opportunity and a clear responsibility to further develop the systems of CE for the professions. As with any humanly constructed system, the building of a coordinated system of CE for any profession is a political process. While we cannot predict what these systems will look like, this process will be marked by fundamental struggles over the educational, institutional, and professional agendas and the competing interests of the multiple stakeholders for CE. As a political process, then, it is crucial that all of the stakeholders participate in a substantive way in negotiating these agendas for CE. The immediate and long-term negotiation of these struggles will define whether CE can make a demonstrable impact on the quality of professional practice.

Financing of Adult and Lifelong Learning

Å Sohlman, Ministry of Employment, Stockholm, Sweden

© 2010 Elsevier Ltd. All rights reserved.

Adult learning is a wide-ranging phenomenon and accordingly its financing. It engages individuals, organizations, communities, and nations. It is pursued for a wide variety of purposes and in a wide variety of ways.

Theoretical foundations for principles of financing adult learning, as well as other types of activities, will be found in the literature of economics. In that literature, market failures are often highlighted as a motive for government funding of learning. However, a more fundamental concern has been social justice and distributional aspects. The market approach has been criticized for being too restrictive.

While economic principles may remain unchanged over time, political practice has to focus on the varying problem areas as they turn up, more recent adaptations to globalization, the knowledge economy, new information and communication technologies, and global warming. Therefore, in empirical practice and studies, different financing mechanisms will eventually be brought to the fore.

This article offers a few introductory comments on financiers and funding statistics. Financing principles and mechanisms are reviewed. In addition, the development of practical financing experiences in the Organization for Economic Co-Operation and Development (OECD) countries is described as an illustration to general funding problems in many countries.

Financiers and Funding Statistics

In most countries, the government is an important financier of adult learning. However, in federal states, not only will there be national governments, but also regional and local governments, each with its special financial responsibilities. Furthermore, within a government often several ministries are involved in the financing of adult learning, typically the Ministry of Education (formal learning including literacy), the Ministry of Labor (training for the unemployed), and the Ministry of Social Affairs (training for other disadvantaged groups).

Most of the public funds have traditionally been channeled to public learning institutions or sometimes to nongovernmental organizations (NGOs). The latter often receive funding from many different sources, public and private, including fees from participants. This sector includes much nonformal learning as exemplified by the folk high schools and study circles in the Scandinavian countries.

The social partners influence adult learning in different ways. An important factor can be collective agreements which regulate employee training possibilities, as in Germany and Austria. Besides that, employers, of course, engage in training their employees often purchased from private providers.

Needless to say, fundamentally, individuals remain responsible for their own education and training, not least the self-directed learning.

Some Statistics

Comparative statistics of expenditure on adult learning are not available. Not even for individual countries do complete statistics exist. (For participation in adult learning comparative statistics do exist (cf. e.g., Kailis and Pilos, 2005 for European Union (EU)-25 participation in both formal, nonformal and informal learning, and the OECD 2006 for nonformal job-related education and training). The most developed financing statistics concern labor market training and private enterprise training (OECD, 2006; EU-RA, 2004). The EU is preparing an adult education survey for 2008, including private costs for formal and nonformal adult education (SCB, 2007). Still, two financial aspects will be illustrated in this section: to what extent are individuals interested in financing their learning, and do governments fund adult training for the labor market.

Private financing

In 2003, the lifelong learning Eurobarometer charted the attitudes of individuals toward financing their own learning. The survey was directed to individuals aged 15 plus in the old EU-15, Iceland, and Norway (Ramprakash *et al.*, 2005).

Overall, 43% of the respondents were willing to pay for their own education and training. This average varied from 33% to 68%. The awareness of the importance and utility of adult learning thus greatly differs even between these European countries. Respondents in Denmark and Iceland were most prepared to invest in learning. Other countries with high figures were Germany, Sweden, and the United Kingdom. In contrast, respondents in Belgium, France, Spain, and Portugal were less willing to pay for their training.

Making a distinction between education for work-related and nonwork-related purposes, on average, there were no great differences. The same countries came out with high figures for work and nonwork training: Iceland,

Norway, and Luxemburg. In case of nonwork, Sweden and Denmark should also be added to this group. For both purposes, a middle group included Germany and Ireland (and Sweden for work purposes). Low investors in both cases were again Belgium, Spain, and Portugal.

Judging from these financial statistics, much more of a learning culture seems to exist in some countries, such as the Nordic countries of Iceland, Denmark, Norway, and Sweden, than in other countries, such as Belgium, Spain, and Portugal, with Germany, the United Kingdom, and Ireland in an intermediate position.

Public financing

For public financing of adult learning, there are OECD statistics for employment training. In 2001, the OECD (2004) concluded that the funds for adult education would, in view of their comparable small share of total education enrolments, at best equal labor market training expenditure. In the late 1990s and 2000, expenditure in support of labor market training ranged from 0.20% to nearly 1.00% of gross domestic product (GDP) in 9 of 25 countries for which data were available.

The 2007 edition of *OECD Employment Outlook* contains financial statistics for as many as 28 countries for the years 2003–05. The figures for public expenditure on training as a percentage of GDP are now spread over:

a low range 0.01–0.05;
a middle range 0.10–0.25; and
a high range 0.30–0.54.

Overall, the financing is now lower than in the 1990s. Moreover, if there are any changes over the 3 years covered in these data, they point in the direction of a lowering of expenditure.

In the low range, we find not only the Central and Eastern European countries such as Poland, the Slovak Republic, the Czech Republic, and Hungary, but also Mexico, Greece, Australia, Japan, Korea, and the United States. In the middle range are not only a number of European countries such as Luxemburg, the United Kingdom, the Netherlands, Spain, Belgium, Italy, and Ireland, but also Canada and New Zealand. On top of the list are the Nordic countries: Finland, Sweden, Norway, and Denmark. Other countries with rather high expenditures are Switzerland, Germany, Austria, France, and Portugal.

Many people seem to be interested in financing their adult learning – in some countries even a majority. Whether they do so or could be stimulated to do so we do not know. However, private interest in financing adult learning and actual government spending on training seem to go hand in hand (cf. the Nordic countries), but at a rather low expenditure level. Only a very small share of GDP is devoted to public spending on learning for the labor market.

Few aspects of the funding of adult learning are covered by statistics. This lack of financial statistics must be a drawback for the development of rational adult learning policies.

Efficiency Principles and Financing Mechanisms

In economic literature, there are two main reasons for government funding of adult learning: distribution and efficiency motives (Barr, 2001; Bohm, 1987). Arguments for governments to support a social infrastructure, including one for adult learning, have also been added (North, 1981; Rosenberg and Birdzell, 1986).

Efficiency

The efficiency, or allocation and economic growth motive, for public funding of adult learning, through individuals, institutions/organizations, or employers, is based on the idea of market failures. For a number of reasons – positive external effects, uncertainty, lack of information, and competition – individuals and firms acting on their own on markets would not achieve enough learning from a socioeconomic point of view. These market failures are often supposed to be more difficult when it comes to basic skills and less so for higher-level competences.

The government may consider financing socially profitable learning investments, that is, investments that are profitable when also social benefits are included. Privately profitable investment might be left to private investors. For tertiary education and certain adult training for the labor market, the arguments in favor of public funding are thus not so strong. Individuals and employers, to a large extent, reap the benefits from such training and should therefore bear at least part of the costs. For basic skills, the opposite is true; the main benefits of having a basically trained and trainable population and labor force are largely social.

Education and training for the unemployed, disabled, and other groups that have problems getting a foothold on the labor market can also be motivated by efficiency reasons. It may be better for society to help unemployed people to find a job. In this case, there are no opportunity costs in terms of foregone production during training.

Some arguments have also been put forward to motivate government funding of training in small- and medium-sized enterprises (SMEs). Much similar to individuals, they may not be aware of the benefits of training and existing learning opportunities and have problems financing training.

Sometimes governments also have to handle market distortions they have created themselves. Taxes introduced for financial reasons may, for example, inadvertently hamper investments in learning. Besides, the government has to

carefully choose financing mechanisms not to introduce new distortions, efficiently targeting disadvantaged groups, not crowding out private investments, and avoiding fraud. Selective measures may target specific groups and be cost efficient, while general, more all-inclusive measures are more costly but leave no one out.

Distribution

The distribution motive, for one thing, is also associated with basic learning. In a democratic society, all children should have access to at least primary schooling and in modern societies secondary education is also more or less a prerequisite for citizenship. In the same vein, it can be argued that public funding of second-chance education for adults at these levels is motivated.

In addition, a democratic society should arguably aim at making cultural and humanistic values accessible to all citizens.

From a viewpoint of social justice, investing in young and old people would be valuable. From an efficiency perspective, the government had better focus funding on the learning of young people with a longer time period for reaping the benefits of training.

Infrastructure

The importance of the infrastructure for economic transactions has been highlighted, generally and also in case of learning. It includes basic laws and regulations as well as attitudes and institutions. If one is to rely on markets, there has to be market regulations and surveillance of competition fostering economic security and efficiency in adult learning markets. Information about learning opportunities has to be available. To be able to develop certificates, a national qualification framework may be necessary. Teacher training as well as research and development are also important.

This is not to say that the government itself has to provide all these services. The duty of the government is to ensure that they are available and adequately provided.

The economic literature has produced arguments for certain learning activities to be financed by the government but no exact amounts are prescribed. How to balance investments motivated by social justice, distributional, efficiency, and infrastructure effects against each other and against other types of public expenditure is a fundamentally political or even philosophical question.

Financing Mechanisms

Whatever the purpose of the spending, financing mechanisms have to be carefully chosen according to efficiency properties (OECD, 2000, 2001, 2004, 2005).

Increasing efficiency in direct public funding of institutions

Traditional public service relies on bureaucratic hierarchies, confidence, and consensus. The mechanisms that have recently been introduced in public education and training services to increase efficiency belong:

- different types of incentives, for example, in the form of output-based funding to gain more value for money;
- decentralization of financial decisions, giving more autonomy to education and training institutions that are supposed to have better knowledge about local conditions; and
- competition for government contracts or stimulation of public institutions to rely on tenders – the requirement to buy education and training services from different providers may be linked to infrastructure in terms of lists of publicly accredited institutions and programs.

Education and training institutions may also be permitted to use fees to finance their provision. This can be a way of testing individual demand for learning. For distributional reasons, however, some types of courses may be exempted from fees and some groups of individuals may have a right to tuition-free courses.

Efficiency through partnership and co-financing

Financial co-sharing arrangements can be an efficient way to investigate whether there is any private demand and willingness to pay for certain services. At the same time, the public sector can benefit from private information as to production and distribution alternatives for these activities. Examples are requirements of co-financing from individuals, employers, or municipalities for subsidies to be paid to education and training projects, and formal public private partnerships (PPPs) to finance investments.

Voluntary co-financing schemes can also be introduced mainly to raise private funds for learning, then normally requiring a subsidy element. There may be three-party versions – government/employer/individual – or two-party versions – government/employer or government/individual. Examples are individual development accounts (IDAs) and individual learning accounts (ILAs) with matched contributions by individuals, employers, and the government and publicly supported train-or-pay systems for employers.

Employers can also be stimulated to create sector- or branch-specific funds to finance common training. Such pooling of employer resources for training can be of special interest to SMEs and also an efficient way to handle poaching (in addition, or as an alternative, to pay back clauses in employment contracts).

Parafiscal funds are compulsory measures to raise funds and may, for example, be created by payroll levies on employers, eventually combined with public funding; they are an alternative to taxes. Some part of the funds

may be used by the employer himself and some collectively (such as the levy/grant schemes). An additional purpose for such funds may be to raise awareness as well as to stimulate employer interest in training.

Individuals

For individuals, two types of learning costs are involved: direct costs and costs of living. Public incentives for individuals to train – to make up for market failures and handle distributional problems – take many different forms in addition to co-financing schemes:

- *Individual drawing rights, entitlements, or training vouchers.* In these cases, both direct and indirect costs may be covered. These incentives can be targeted and constructed so as to stimulate competition among education and training providers. Such arrangements are often combined with an infrastructure of information, advice, and counseling services sometimes at learning centers where the individual also can have access to accreditation of prior learning, a library, and education at a distance.
- For direct training costs, tax exemption and tax brakes can be used to stimulate participation though, of course, only individuals with a taxable income can profit from such measures.
- For indirect costs, grants and loans, mixed loan–grant models, or income-contingent loans (ICLs) are often available. The ICLs mean that the repayments of the loans are related to future incomes, which reduce individual risks.
- A legal right to training leave where the costs (direct and/or indirect) are supported by the government and/or the employer (with or without tax brakes for employers) also exists in some countries. Training leave without at least (partial) funding may not be very successful in raising participation.

Training for unemployed people is often free of charge while the individual can live off his or her unemployment benefits. Such training may be compulsory though the individual can have some choice as to actual training.

Employers

Public incentives for employers to undertake training resemble those for individuals. Vouchers, tax exemptions, tax credits, profit tax deductions, and subsidies have been used to stimulate employers to train their employees or make them benefit from training leaves. The idea is that this type of government-supported education and training should have wider purposes than the training the employer would normally be responsible for – basic skills training, non-work-related training, and general rather employer-specific training. The government may pay both training cost and wage compensation to the employers.

Aspects of the learning infrastructure that may interest the employers are easy access to information about training alternatives and flexible training providers.

Historically, government funding of adult learning has been supply oriented, that is, directed toward learning providers in various segments (e.g., further education, labor market training, and culture). Aspects of demand-led, market-oriented learning have been introduced to make the public providers more efficient and involve private providers in traditionally public education and training.

The market-oriented measures are supposed to increase efficiency through a better match between demand and supply and lower costs. Such measures, however, risk introducing segmentation and creaming in training markets reduce access to learning. In tendering, it may be difficult to balance equity, quality, and efficiency.

However, private co-financing has also been introduced to stimulate an overall growth in adult learning investments in light of shrinking public funding.

Learning markets rely on individual choice and competition. On the one hand, this means empowerment for individual actors. On the other hand, it means an alienation from an idealistic search for learning based on a public learning infrastructure.

Policy and Practice in OECD Countries

In 1996, the OECD launched the concept referred to as lifelong learning for all (OECD, 1996). It was motivated by major trends such as globalization, trade liberalization, the aging of the population, the growing ethnic and cultural diversity, the impact of information and communication technologies, and the changing nature of work. It was to address the fundamental objectives: personal development, social cohesion, and economic growth.

Closing the Gaps

A first analytical step was to try to estimate the existing gaps and the costs involved in closing them (OECD, 1996). For adults, this proved to be very difficult but a few examples were given. Scenarios for extending lifelong learning to adults with low literary proficiency, based on the literacy surveys of International Adult Literacy Survey (IALS) and available figures for training costs, were used. For Sweden, the costs were estimated to be around 4% of GDP, in the Netherlands 5%, and in Germany between 6% and 12%.

More cost calculations were produced later on (OECD, 2000). This time they were based on country reports and participation targets. The Netherlands came up with a well-documented assessment. Now closing the participation gaps for adults was estimated annually to require public costs corresponding to 0.3% of GDP.

Hungry made calculations both for public and private costs. For public costs, they were estimated annually to reach the level of 2.8% of GDP and, for private cost, 7.6% of GDP.

There seemed to be something like a natural progression. When targets for initial, primary or pre-primary, secondary, and tertiary education had been reached, lifelong learning for adults might be a reasonable target. For countries that had not achieved that stage, the challenges were daunting. For the central and eastern countries, these were also newly (re)discovered needs in response to the transition to a market economy.

Financing Lifelong Learning

Later OECD (2001) publications concentrated on how to make strategies for lifelong learning for adults affordable. Different ways of reducing costs, increasing benefits, and putting incentives to work were scrutinized. Still, the OECD ministers were convinced that the targets could be reached and in 2001 they declared that more resources had to be raised (OECD, 2004).

A project Financing Lifelong Learning was started. Participating countries submitted background reports, were visited by OECD review teams that wrote country reports, and produced material for further discussion.

However, by the mid-1990s it was evident that, although formal education systems were expanding, they were not able to ensure lifelong learning for all. One important shortfall, besides provision for young children, concerned adults, in particular those with low levels of qualifications.

The recurrent education of the 1960s and 1970s had never become a widespread practice. Training markets had not developed adequately in spite of government initiatives to stimulate supply and demand for adult learning. Neither training levies or collective agreements had spurred supply nor had vouchers for individuals or levy-exemption schemes for employers, noticeably stimulated demand.

Co-Financing

Now the OECD narrowed down the perspective. Lifelong learning for adults should not be financed but co-financed (OECD, 2003b, 2004).

Fiscal pressure in the era of global competition made for less public resources and they alone could not provide the necessary funding for lifelong learning. A consequent search for new models of financing investment revolved around the issue of co-financing by individuals, governments, and employers. Various co-financing mechanisms are available for different aspects:

1. *For reducing direct costs to individuals.* ILA and IDA (with matched contributions by individuals, employers, and the government), loans and vouchers to individuals and/or employers (subsidized by the government), and tax policy (deductions, credits, tax-sheltered savings supported by the government).
2. *For reducing individual foregone earnings.* Direct income support (from the government), ILA and IDA (with matched contributions), loans to individuals (subsidized by the government), collective agreements, and time accounts (with or without subsidies by the government).
3. *For sharing risks.* ICLs to individuals (subsidized by the government).

Much of the co-financing discussion centered around ILA and IDA (OECD, 2004). A special network, the European Learning Account Partners (ELAP), prepared a catalog of recent lifelong learning co-financing initiatives (OECD, 2004). The ILA was to be used only for learning purposes, while the IDA could be used for different purposes, including education and training. There were two main arguments in favor of ILA and IDA. On the one hand, they made for three-party co-financing, and thus the possibilities to raise resources might improve. On the other hand, they fitted a desired development away from supply-driven toward demand-driven learning, a strategy with individual needs at center that might motivate poorly qualified and disadvantaged learners to participate in learning.

Besides co-sharing arrangements, another concept was also launched and much discussed at this time, a whole-of-government approach. If resources were to be used efficiently, adult learning policy had to be developed in a coordinate way and government ministries cooperate. The Swedish Adult Education Initiative was mentioned as an example of both co-financing and cooperation as these important learning projects were co-financed by different ministries (OECD, 2004).

However, the ILA never left the preparatory stadium. In the United Kingdom and the Netherlands, they were tried but abandoned. In Sweden, the government had set aside funds for their financing, but in the end no decision to introduce them was taken. In the United States of America, some states have introduced IDA, but they have not become general government policy. (A private insurance company tried to make a product out of competence insurance (OECD, 2004) but it failed.)

There were many concurring problems attached to the ILA. As they generally were supposed to have a wide coverage, they were expensive to governments and at the same time only contained marginal subsidies to individuals. Employers also seemed reluctant to invest in savings accounts that they did not fully control; and as regards less qualified individuals, would they really be interested in these accounts and stimulated by them to undertake training?

Promoting Adult Learning

Parallel to the upcoming failures of co-sharing arrangements, the OECD initiated the Thematic Review of Adult Learning. It ran over the years 1999–2004 and resulted in two publications (OECD, 2003a, 2005) with the telling titles, *Beyond Rhetoric* and *Promoting Adult Learning*. Here, we are back to basics: how to stimulate adult learning especially for the least qualified. This now seemed to be the most pressing challenge in response to globalization and new technologies, given the restrictions to public spending. Equal distribution of skills has a strong impact on overall economic performance, making the labor forced more productive.

The focal point is on:

- financial incentive mechanisms and on policies to increase the participation of low-skilled adults;
- financial constraints to participation by low-skilled adults; and
- institutional arrangements that are conducive to investment by firms and individuals.

Structural preconditions for learning – visibility of rewards, recognition of prior learning, national qualification systems, information, advice and counseling, flexible providers, and one-stop centers – are important to increase the participation of low-skilled adults.

Still, the context of policy fragmentation and the need for an integrated approach to adult learning policies, of course, have to be kept in mind. However, a more realistic aim might be advisory bodies and coordinators suggesting priorities rather than actual whole-of-government policy-making bodies.

The grand vision of lifelong learning for all, where adult learning was identified as an important missing link, was an overarching government approach to achieve everything from social cohesion and inclusion of marginalized groups, to jobs for the unemployed and continuous upgrading of the workforce, to competitiveness in response to globalization and cultural and democratic development, including a responsible reaction to global warming. For adult learning, it has turned into a more realistic, piecemeal approach. Reforms cannot advance ahead of institutional prerequisites, political support, and coherent strategies.

The lessons learned by the OECD countries have proved to be relevant to the post-communist countries in Central, Eastern and Southeast Europe (Gunny and Viertel, 2006) and are certainly also relevant to countries such as Brazil, India, China, and middle-income developing countries. Adult learning has to be tackled to reduce underemployment and informal employment (OECD, 2007).

Labor Education

K Forrester, University of Leeds, Leeds, UK

© 2010 Elsevier Ltd. All rights reserved.

Introduction

For many hundreds of thousands of people around the world, learning through their trade union has been an important, and occasionally, pivotal experience in their development and understanding as workers and citizens. Whether as a form of occupational socialization, self-improvement, or as a vehicle of social mobility, union education has been and remains, an important albeit uneven feature of trade union activity around the world. While most studies and reports focus on worker education's engagement with the knowledge, skills, and capabilities seen as necessary to survive within late capitalist economies, other (less-documented) recent experiences can be found of the union learning necessary in the challenge to apartheid regimes (South Africa) and forms of political injustice, authoritarianism, and dictatorship (Central Africa or South Korea). In the case of post-communist countries, union members are learning once again, to create organizations that defend worker interests within the workplace.

Paradoxically, the nature and organization of this educational activity remains an under-researched and documented area, barely visible within the voluminous literature centered on labor organizations. Few people would disagree with the Croucher (2004) view that "Education is often viewed as a key instrument for effecting change in trade unions" (p. 90). Despite such sentiments, labor education remains as a minority research concern and a marginal policy focus within labor organisations themselves (see, e.g., the recent country studies in the volume *Organised Labour in the 21st Century* (Jose, 2002) by the International Labour Office). Other commentators interested in union engagement with neoliberal globalization, such as Novelli (2004: 165), report that while "education and learning appear crucial . . . they are largely absent in the literature". To some extent, this absence is understandable (and prudent) given the formidable conceptual, organizational, and research complexities inherent in any overview of union learning activities. Labor, union, and education, for example, all remain the focus of considerable debate and contestation. Empirically and analytically capturing this education is fraught with difficulties especially in the rapidly changing nature of this provision as unions make and remake themselves in different historical settings and in response to changes in the employment relationship and wider societal context.

Despite these substantial methodological caveats, this article provides a selective flavor of the conceptual

schemas and organizational variety of union education in different parts of the world. It is suggested that recent labor education initiatives can be seen as being informed by one or more of three interrelated concerns, namely, the possible contribution of education toward union renewal and revitalization strategies, the emergence of lifelong learning as a key policy focus and third, changes in regulatory regimes resulting from more intensive capital-accumulation strategies.

The first section situates the peculiarities of worker education. Unlike most other forms of knowing, union education is characterized by its contradictory nature – its simultaneous promotion of resistance and of cooperation. Analytically grasping this tension at the center of worker education has proved difficult and controversial. A brief review of the formulations and conceptual frameworks used commonly in discussions of union education is provided. In contrast to these formulations, it is suggested that in recognizing the nature and extent of worker learning, union education needs to be situated within the wider societal context. This is the focus of the second section in the article. This wider societal approach provides the analytical focus for contextualizing particular initiatives at particular times in particular circumstances. Examples of concerns within union education are used to illustrate the argument developed in this section. The final part briefly considers the educational implications for unions within at least rhetorically, the information society, knowledge economy, or the post-industrial society.

The Peculiarities of Union Education

Trade unions are best understood as institutions that primarily mediate between their members and opposing social interests such as the state and employers. As a condition of their survival, they are required to navigate the material structural contradictions between capital and labor. In seeking to defend and further the interests of their membership, union relationships and practices are characterized simultaneously not only by struggle and conflict but also by cooperation in the maintenance of an orderly employment environment and favorable societal contexts. The effectiveness of worker "resistance to capitalism . . . also makes this resistance more manageable and predictable and can even serve to suppress struggle" (Hyman, 1989: 230). It is this key contradictory characteristic of unionism that not only unlocks understandings of

unionism but also provides a rich interpretative basis for framing union education. As such, it provides a start to overcoming static institutional categories commonly used in discussion of education in general. Situating union learning within this wider societal context provides the critical dimension intrinsic to this type of education.

Scholarly attempts to situate analytically, trade union education or more broadly, worker education within the general literature acknowledges the difficulties inherent in such an ambition; there is wisely a strong cautionary element. Hopkins in his international survey of workers' education, for example, warns of the historical variety and culturally contested understandings of education, workers, and trade unions: there "are grave dangers of over-simplification and confusion" (Hopkins, 1985: 8). Newman agrees and notes that "the world of union affairs, of workplaces, of industrial relations is a complicated and confusing one. No two unions, no two workplaces are the same. No issues are identical" (Newman, 1993: 11). The International Labour Office (ILO) recognizes the complexities and offers a broad understanding. "Worker's education", it suggests, "is designed to develop the workers' understanding of 'labour problems' in the broadest sense of these words" (ILO, 1976: 10). It "should always be regarded as a means to useful action. In many cases the education will make clear both the need for action and the best forms the action can take" (ILO, 1976: 10). Spencer (2002: 17–18) in his collection on labor education provided by trade unions goes further when distinguishing between tools or role courses (those preparing members for active roles in the union), issue or awareness courses (linking workplace to societal issues such as racism, union campaigns, or new management techniques) and labour studies courses (examining union contexts through historical, economic, and political perspectives). Such a taxonomy – common in the Anglo-Saxon literature – approximates to Hopkins' longer fivefold classification of the major components of the curricula of worker' education. These he sees as basic general skills; role skills; economic, social, and political background studies; technical and vocational training; and finally, cultural, scientific, and general education (Hopkins, 1985: 43). The situating of trade union education or workers' education within perspectives that focus on curricula, program design, and pedagogy (worker-centered) has contributed toward framing important discussions about the particularities of this type of learning. Implicit within many of the discussions are a number of distinguishing features that shape not only the content but also the language, values, pedagogy, relationships, objectives, and nature of the learning experienced in the education. Although not always made explicit in the written learning materials, the examination and linkages between union experience, discussion, knowing, and action in programs occur within a number of sensibilities that are powerfully

shaped by notions of social justice. More recent commentators on union education have attempted to move beyond the classificatory approach and explicitly incorporate wider societal concerns within definitions and understandings of union education. Burke and her Canadian union educators, for example, identify a number of threads which "hold together the fabric of our work: community, democracy, equity, class-consciousness, organisation-building, and the greater good" (Burke *et al.*, 2002: 3). Other commentators such as Salt *et al.* (2000) distinguish between transformatory and accomodatory education in their discussion of worker education and neoliberal globalization (p. 9).

These more recent attempts to adequately capture the complexities of union education have been accompanied by the exploration of understandings of education and learning. In doing so, it has been recognized that becoming a trade unionist involves much more than a consideration of formal educational categories, as any historical account of trade unionism demonstrates. An emphasis solely on curricula considerations risks privileging institutionally driven categories at the expense of cultural and material considerations. An unproblematic view of education emphasizes education as a product to be passively acquired or consumed and transferred. For some trade unions, education assumes this quality of technical rationality, as Schon (1983) puts it. By contrast, more recent approaches to understanding education such as sociocultural approaches (Lave and Wenger, 1991) and activity theory (Engestrom, 2001) stress the contextualized, mediated, and participative processes of, in this instance, becoming a trade unionist. Livingstone and Sawchuk for example, recognize the extensive and varied circumstances and complex processes within which union learning occurs. "Studies of adult education", they argue "have often ignored the actual array of learning activities of working people and generally implied inferior learning capacity" (Livingstone and Sawchuk, 2003b: 111). Studies by these authors have focused on union activity at the local workplace in different occupational settings in Canada in the exploration and documentation of "distinctive working-class learning practices across multiple spheres of activity, including paid employment, housework, both union-based and community volunteer work as well as private learning concerned with general interests". Using a conception of learning informed by a cultural-historical perspective, the authors analytically distinguish between formal education, continuing education, and informal learning (see also Sawchuk, 2003; Livingstone and Sawchuk, 2003b).

Novelli's (2004) study of social movement learning shares a similar concern with exploring and developing expanded understandings of worker education and learning. His analysis of the public service trade union SINTRAECALI in the south west of Colombia outlines the recent successful campaigns against privatization of

public utilities. Employing the notion of strategic learning, Novelli portrays the transformation of the union from a narrow corporate trade union focused on the defense of members' particular interests, to a social movement union that linked workers and local communities in the defence of public services (Novelli, 2004: 161). The union's occupation of the company's 17th-floor administrative building in Cali is conceptualized as an educational outcome which resulted from several years of "strategic learning through social action" (Novelli, 2004: 162–163). The study illustrates the benefits of questioning dominant understandings of education and of situating these understandings within a particular material and societal context.

Situating Union Education

Uncovering the significance of the learning experienced by union members or educational participants then, can be helped through the contextualizing of the learning within the particular political, cultural, and societal circumstances at a particular time and in particular parts of the world. Stirling (2002) uses such an approach in his survey of union education in Europe. In the Nordic countries, Germany and the UK for example, the settlements with social democratic governments provide the basis for historically understanding the comparatively extensive provision, institutional and financial support for union education. In other European countries such as Belgium and Netherlands, these settlements and support have been riven by cultural, linguistic, and religious divisions resulting in marked ideological differences to the education of the rival centers. In these instances where rival confederations are characterized by their socialist, catholic, or communist perspectives, "education programs are needed to reinforce the identity of particular Confederations as against others and to transmit an ideology to leading cadres" (Stirling, 2002: 27).

Situating union education and the unions themselves within this wider political context helps in addressing issues of significance, relevance, and purpose of the learning. Ost (2002) uses the example of unions in Poland to rebuke gently, Western commentators for reaching generalizations about union development and education based on their own particular circumstances, concerns, and frameworks. As he points out, in a number of countries, the new eastern-European unions energetically campaigned for the creation of a capitalist system and played an important role in educating workers about their responsibilities and obligations as wage employees. The early years of Solidarity in Poland in the 1980s, for example, were almost exclusively concerned with large successful mobilizations around societal issues to the exclusion of workplace concerns. The success of these Solidarity activities in Poland led to other unions, for

example, in Bulgaria and Hungary, seeking to replicate this model. However, the lack of attention given to the workplace by Solidarity resulted in dramatic membership losses in the 1990s. Withdrawal by Solidarity from the governing coalition in 2001 together with a greater emphasis on old-fashioned workplace unionism (recruitment, education courses, employer agreements, and workplace representation) is expected to reverse the period of decline experienced in the 1990s.

Unions, where possible, have always engaged educationally with employability concerns such as occupational training and apprenticeships. Although such role courses have not figured significantly in Anglo-American discussions of union education due to the frequent involvement of employers and state agencies, Lopez's account of the Brazil unions' struggle and development for the Programa Integrar (the integration program) is illustrative. Occupational training is used to include wider cultural and societal concerns by the national unions in the struggle against neoliberal initiatives. Civil society involvement and alternative economic plans are pursued through the establishment of local development forums (Lopez, 2002). In other instances such as Eastern Europe, mainstream educational courses have been designed and used to effect fundamental qualitative change (Croucher, 2004: 92) within the unions themselves. Focusing on particular trade unions in Moldova, Ukraine, and Belarus, Croucher reports on educational initiatives to assist union development in the move from Soviet-style organizations to organizations able to meet new demands in new circumstances.

The continuous search by unions through negotiation, struggle, and industrial and civil conflict for a possible and politically acceptable settlement with the state and employer agencies provides a constant tension not only within unions themselves but also in the available educational opportunities. Cooper (2002) illustrates these ambiguities in her evaluation of the Development Institute for Training, Support and Education for Labour (Ditsela) from its launch in 1996 in post-apartheid South Africa. Ditsela, as she reports (Cooper, 2002: 37), was created by the congress of the South African Trade Unions (COSATU) as a solution to "rebuilding the labour movement's capacity to respond to the major changes underway in the country There was a strong belief that a major educational initiative was required to build COSATU's capacity to play a proactive role in the new, democratic South Africa".

In many other countries, political accommodation is not possible. In many countries, the absence of pluralistic political cultures or the existence of repressive state regimes excludes often violently, recognition and legitimization of union practices. In parts of Africa and South America, such conditions characterize a number of countries; being a trade unionist can be very dangerous. Alexander's personal evaluation of "the courage and dedication of so many educators" in confronting "the brutal application of neo-liberalism and

imposed structural adjustment programmes” in Zambia and Zimbabwe over a number of decades, provides a stark reminder of circumstances in much of the world (Alexander, 2006: 595). In such volatile political contexts, union education has been continued and aided through external sympathetic agencies. The Commonwealth Trade Union Council, for example, in 2002, was involved in supporting Sierra Leone trade unionists in a civil society program with a strong focus on HIV/AIDS, campaigning against child labor in collaboration with unions in Botswana, Mozambique, Namibia, and Tanzania, and in encouraging women participation in Bangladesh. Similarly, financial support was provided to the Ghanaian trade unions educational work from the Netherlands, the Commonwealth TUC, and from the International Confederation of Free Trade Unions (ICFTU). The Trades Union Congress in Ghana has prioritized the education of members as an important part of its difficult struggle against structural adjustment policies. Training at the Labour College covers three broad areas: union organizational issues including health and safety, trade union history, and finally, special programs. In Niger, the ILO since 1999 has been supporting the two national union confederations in the provision of worker’s education in the informal sector and the French trade unions are involved in the development of a health insurance project. Maruatona’s study of adult education and trade union development in Botswana is situated against a background of significant constraints imposed by the state. Education he suggests, is an important vehicle in “helping address the worker’s problems” (Maruatona, 1999: 476).

Whether in Africa or elsewhere, labor organizations endeavor to ensure the initiation and reproduction of union leadership together with the necessary membership skills and capacities necessary to enter or maintain participation in the labor market. The employability agenda historically remains an important educational focus. The contexts and possibilities within which such agendas are pursued, however, differ significantly. In those regions of the world with strong repressive regimes, small formal economic sectors, and small union membership, worker learning is more likely to occur through forms of popular education (Kane, 2001), social action (Folley, 1999), or through participation in nongovernmental activity as Prieto and Quinteros’ (2004) study of women’s organizations and trade unions collaboration in the free-trade zones of Central America illustrates.

Union Learning in the Knowledge Economy

Today, it seems trade unions everywhere are in crisis. Whether in the Northern or Southern countries, falling membership, loss of bargaining power, new management

strategies, or the need for new workers in the new workplaces, labor organizations are seen as less relevant or significant than previously. Post-Fordism, post-industrial, new-information age, the knowledge economy, or post-Taylorist is but a selection of the formulations used to distinguish the new from the old. Globalization, however, is the dominant framework that usually uncritically is used theoretically to legitimate these formulations. Simply put, globalization has resulted in the international crisis of labor organizations. This was and is not a universal experience as recent struggles for basic democratic rights in, for example, South Africa, Brazil, and Korea illustrate (Kelly, 2002). However, while such deeply contested perspectives are beyond the focus of this article, there is a widespread consensus that particular worker organizations are struggling to successfully engage with the implications of the massively increased international mobility of capital.

From a trade union perspective, an important dimension to recent union revival or renewal discussion is the increased importance given to the education function. An extensive body of evidence, for example, is beginning to emerge in the UK around recent attempts to refocus trade unions as centers of learning (Healy and Engel, 2003). Learning to organize through the training and networked organization of workplace, union learning representatives (ULRs), and the creation of workplace learning centers are seen for British unions, as an important feature of engagement with the new employment agenda and with membership growth. Similarly, training for worker representation on the European Works Councils or the creation of new training academies or institutes in Australia, the USA, and Britain (Spencer, 2002) is illustrative of the increased importance being given by unions to the training function.

The rise rhetorically at least, of human resource strategies with the accompanying focus on knowledge management then, has resulted in the exploration of fresh educational developments as a means of accommodating to, or contesting with, the new circumstances. The increasing influence in employer (and international agencies such as the World Bank and International Monetary Funds) thinking and practices of human capital theory has resulted in a greater emphasis on employer–union partnership educational initiatives. Time, financial resources, and encouragement from employers are available in joint union educational initiatives that focus on strengthening employee corporate commitment, the promotion of soft social skills, and enhanced vocational training opportunities. At a regional level, there is usually an emphasis on union education that addresses more macro-, policy-informed subject areas. The educational provision of the European Trade Union Confederation, for example, has courses on foreign languages, freedom of movement of labor and work regeneration as well as more traditional union organization, recruitment, and leadership courses.

From a different perspective, there have been important recent international discussions and developments around what has been termed the new internationalism and social movement unionism (Moody, 1997; Munck, 2002). As Novelli (2004: 166) notes, "education is a key process for contestation in the struggle to develop an (alternative) movement and incorporate new allies." There is a need, she continues, to move beyond instrumental understandings of education and training toward conceptions and practices that situate research, investigation, and learning in the formulation of alternative strategies that are seen as part of a wider political project. Such sentiments historically have formed the basis of a consistent critical perspective in the understanding, discussion, and evaluation of union education and learning. The current defensiveness of trade unions internationally in the face of the neoliberal offensive not only reinforces the search for alternatives and new allies, but also increases the pressure for more instrumental educational solutions. It is likely that this contradictory dynamic will continue to shape union learning in the period ahead.

Conclusions

As most commentators recognize, analysis and understandings of union learning need to be contextualized within the changing nature of the unions themselves and the wider societal circumstances within which unions make and remake themselves in differing historical settings and in different parts of the world. However, irrespective of the particular place or forms that this learning might take, it remains true that for many people this learning provides an important (and sometime the only) means for an understanding of, and participation in, collective activities against social, economic, and political injustices. Despite the current difficult political circumstances, the increased attention in recent years to conceptualizing and documenting the ubiquitous nature of everyday learning incurred as a trade unionist, woman worker, or street trader has enhanced the importance and resources given to education by many union organizations.

Glossary

Engaged university – A university which plans and connects its teaching and research work with the needs and communities of the locality – city or region – in which it is located.

Learning city/learning region – An administrative region that has developed the capacity to collect, analyze, and use data and experience to enhance the quality of its understanding, leading to improved practice.

Place management – Application of the recognition of the importance of the concept and reality of place for effective, integrated, and acceptable governance.

Social construct – The understanding, concept, and definition developed by a community or network of policymakers, scholars, and practitioners about a concept and/or activity which draws them together.

The Learning City and the City-Region as a Social Construct

The learning city is an ideal, rather than a description of any actual place or places. It is an aspiration for the way the city might be better managed and manage itself in a complex world characterized by terms such as global and knowledge economy. The terms learning region and city-region are used also as a way of thinking about the management of a city area or region with an evident identity, boundaries, and some form of government. It reflects a sense that city and regional governance could and should be different, and better than they presently are. Local administrations in many parts of the world have in recent years expressed the intention to be learning cities; a number of them have announced that this is what they are, will be, or are becoming. In the sense that the learning city is a social and political aspiration rather than a well-defined and understood condition with agreed characteristic measures, it is best understood as a social construct.

The learning city is a new and evolving notion. Although urban and regional studies have existed for decades, the term learning city, or city-region, emerged only in the later years of the twentieth century. There is no established definition of what it means. In terms of

literature, it falls between several recognized areas of scholarship to each of which it is peripheral and ambiguous. It is best understood as heuristic, a metaphor which expresses a set of values and purposes, not an established concept in academic social science. The term is used mainly in policy arenas and among communities of practitioners who are concerned with how things can be done better.

This article explains the different ways the term is used. It then explains how it is related to issues of government rather than education. Various learning-city initiatives are referred to before considering research in the area and issues related to implementation. After a brief consideration of the important link with higher education, the article concludes by assessing the utility and the possible future of the concept.

Two Different Meanings

Although not hotly contested, the term carries different meanings and is used in different senses. Despite the word learning which locates it in the mindset of education, the richer and more fundamental sense has more to do with governance and politics than with education. Where a government authority is charged with the subject it may be a ministry of education, where it is seen as mainly related to schooling, education, and training.

In principle, there are two distinct levels of meanings to the concept of learning city or city-region. The easier-to-understand term implies an urban or regional authority that makes good provision for many people to learn. It sees learning, essentially in the forms supported by high-quality and widely accessible education and training, as crucial to economic productivity, competitiveness, and so to civic success. A UK report commissioned by the Department for Education and Employment in the late 1990s had the concept of the Educating or Learning City originating in an international conference convened by the Barcelona City Council in 1990, then focused in a report to the OECD 2 years later (Hirsch, 1992).

The policy agenda originating from this approach concerns increasing the volume and raising the quality of education, training, and learning opportunities for individuals. This may extend beyond the formal education sector, together with the less-formalized or nonformal adult and lifelong learning arena, to foster a culture of

lifelong learning. Occasionally it includes museums, libraries, and other arts and cultural facilities and venues seen as part of a wider civic learning environment. It is unlikely to go beyond this although learning in and through work (work-based and workplace learning) is recognized within the education profession and policy community as a significant dimension of education and training relevant to living and working.

The second, deeper and richer, as well as more historically accurate meaning concerns the capacity of a city or region itself to learn almost as an individual person or other organism can learn, understand, and adapt its behavior. There may be a difficulty in a Western democratic and individualistic tradition about accepting the notion of learning outside the individual. The recognition has been the strongest and longer established with respect to the learning organization as an informing principle for the study of organization behavior, for consulting to management, and in management education. Subsequently, learning has been affixed to many other institutions and phenomena, from schools and universities themselves to other kinds of organizations such as hospitals and banks to events such as festivals. In a geographical and political sense, it has been applied at levels from the nation to a small locality such as a village.

A widely used term with more conceptual underpinning than many of these is the learning community, used mainly with a sense of geographical locality and also sometimes of virtual communities. Linked to this are the terms and notions of communities of interest and communities of practice (Wenger, 1998). However, these concepts lack the component of place integral to the learning city-region: the recognition that an area with its inhabitants or citizens constitutes an entity or reality, cultural, social, and historical as well as economic, political, and geographical. The term place management has acquired currency in recent years to emphasize the importance of shared location, environment, and experience as important elements in how we organize, manage, and govern ourselves.

The terms learning city, region, and city-region have stronger validity and utility in this second and larger sense. The reduction in scope and meaning in relation to education and training may appeal to local and regional authorities wishing to be part of a new wave of thinking about governance; and it may enable or assist them to reinvigorate their education sectors by using a large and ambitious term.

The larger concept has more to do with the nature of governance and the capacity of political systems at whatever level to learn from their own and others' experience and to adopt new behaviors, possibly using concepts such as double-loop learning and triple helix to focus recognition of what this means. Insofar as the concept demands introspection and reflexivity, it may be radical and unsettling,

connected as it is to ideas about participation, devolution of authority, and empowerment. Perceived in this way, the learning city is about politics and government rather than about education.

Cities and Regions, Politics and Governance

In terms of fields of study, the learning city region belongs more to politics and government, geography, and urban and regional studies than to education. It is unavoidably political, having to do with the holding, sharing, and use of power rather than purely technical and organizational. Some of the terms with which it is associated have a heuristic, reformist, radical, or an ideological flavor and intent. In this sense, the idea of a learning city represents a challenge to current methods of governing and exercising authority and power. Looking at the administrative region as a place inhabited and used by different groups and communities of interest, and wishing to improve the quality of government so as to enhance the level of and capacity for learning, raises questions about participation as well as consultation in the process of government, and about the devolution of different kinds of decisions and control. The city-region may be seen as a contested space where interest groups vie for benefit and control. The style and nature of government, as well as the amount and nature of devolved authority, are called into question.

The concept of a learning region or territory can apply at all levels of government, although the main focus tends to be on the city. The term city-region is commonly used to refer not just to the metropolis, metropolitan area, or town but also to its physically, economically, and/or culturally natural territory or catchment area. A problem arises when these natural regions do not correspond with the local and regional authority boundaries, and also when the local and regional government are unstable and subject to central government intervention, with frequently changing boundaries, powers, and dispensations.

Here the idea of a learning city-region becomes entangled with another agenda: regionalization as a means of decentralizing and devolving power from the larger central state. Devolution is common in many countries; but the consequential required transfer of powers and resources does not always occur. Then a city or region may be unable to manage its resources and affairs so as to act on what it learns.

Problems occur for schools, colleges, and education systems when control and responsibility are divided among different levels of jurisdiction. They are more acute for a whole city or region. A major problem for effective learning applied to better governance is the separation and compartmentalization that is common among various functional departments, sometimes known

as silos, at whatever level. This is exacerbated when there is division, and the silo walls are strong between the parts of the administration, both vertically and horizontally.

Learning City Initiatives

There have been many recent initiatives to promote and disseminate the idea and practice of a learning community and region, for example, through projects funded by the European Union (EU). Some have gone beyond discussion of the ideas and processes to practical workshops and manuals on how to go about it, and how to equip local authority staff to enable local-level community learning as a part of the process of better – more participatory, more responsive and learningful – government (Longworth, 2006; Longworth and Allwinkle, 2005). A recent example is the 2005–07 project funded by the EU through its Grundtvig program and Pascal, on Learning in Local and Regional Authorities, in which partners in six European countries identify the training that the local authority staffs need to implement the learning city concept and design a training program and workshops to meet this need.

Many countries have seen learning city and learning community initiatives over the past decade. In Australia, the State of Victoria has sponsored an initiative for several years in which eight nominated towns were enabled and supported to use this title; they undertook and publicized the initiatives mainly related to education, training, or community learning. Several of these featured in conference reports and specialized in mainly local literature. A little later the State of Victoria created the Department for Victorian Communities, renamed as the Planning and Community Development in 2007. The central purpose was to enable local communities to develop confidence and expertise as place-based learning communities and to play an active role in managing their affairs, with better integration of services between and across government portfolios.

In the United Kingdom, the Labour Administration elected in 1997 initiated devolution to Scotland and Wales and strengthened the English regions with nine regional development authorities championed by the Office of the Deputy Prime Minister (ODPM). As part of this initiative, several learning towns and learning community projects led to over 20 towns and cities defining themselves as learning cities and undertaking various initiatives; a loose community of interest and practice grew up around and anchored in these. The activity peaked early in the current decade; there is a sense that interest and energy many have slackened, perhaps from lack of clarity on what the concept and label really mean and how to go about the complex process of implementing it.

A similar sense of uncertainty affects some initiatives in Canada. In Victoria, for example, pronouncement of

being a learning city was followed by hesitancy as to how to go forward, and a learning fair which proved unsuccessful, bringing the initiative to a hiatus. In Vancouver, the city resolved and pronounced similarly, setting up a working group to find ways to give expression to the concept. A steering group was led by the Superintendent of Schools and the City Librarian, reflecting a common focus in or near to the education system.

The ease of communication enabled by new information technologies globally, a tendency to compare and compete internationally, and being watchful for new initiatives mean that many countries now have local-level authorities claiming to be learning cities and regions, albeit with different emphases and meanings in different countries depending on the local traditions, culture, and conditions.

Research and Implementation

There is a lack of academic research and little strictly academic literature in the social science fields directly related to learning cities. The subject is touched upon tangentially in a number of discipline areas especially related to government, urban and area studies, and special interests within education, innovation, and organizational behavior. The main scholarly interest comes from a policy development perspective. Much of the intellectual endeavor concerns trying to improve governance and enhance practice.

The Organisation for Economic Cooperation and Development (OECD), as an economically oriented intergovernmental organization, has been prominent in developing and disseminating an understanding of the issues and dynamics. A key monograph on learning regions in the new economy was derived from five studies of city regions in Europe. It was published in 2001 (OECD, 2001) and followed by another round of case studies and an international conference in Melbourne in 2002, from which grew an international observatory on learning regions, place management, and social capital called Pascal. Pascal mirrors the learning city-region approach in being a means of dialog and exchange between policymakers, practitioners, and scholars interested as a policy community and community of practice in putting knowledge into practice, making knowledge work in this applied arena (Duke *et al.*, 2005, 2006).

The Pascal virtual community reflects the character of the learning city as a construct, in that it includes practitioners as well as academic scholars. The latter come from many different disciplinary backgrounds. It is emphatically applied in its orientation, with the explicit purpose of fostering a dialog across professional and disciplinary boundaries. In its commitment to breaking down silos, it echoes a central issue for the learning city region about

specialization and compartmentalization as an often ineffectual way of managing complexity.

Another intergovernmental organization that also has a direct governmental remit, the EU, also promotes consideration of the learning region, as well as of lifelong learning, as a means to manage and succeed economically in a competitive global environment. There is an emphasis on capacity for innovation conceived in terms of broader social issues as well as immediate economic indicators of growth. The EU has supported various activities related to learning cities and regions, some mainly of a research nature with a dissemination component, others more concerned with the development and exchange of good practice by means of networks of places and people. In thus seeking to give effect to the concept in terms of governmental and related practices, the EU mirrors some of the ideas of the learning city, trying deliberately and systematically to collect, analyze, learn from, and put into practice what is being done.

One project supported by the EU illustrates the kind of research needed to understand how cities function, and what might be implied to enhance their capacity to operate more effectively in terms of an ideal type. A 3-year research project which studied four European cities and one Australian city took the title CRITICAL as an acronym for city regions as intelligent territories, innovation, competition, and learning. Research groups in each place examined the same eight domains in each city to see how these functioned and how they compared. Domains included, for example, small and medium enterprises, cultural activities, neighborhood renewal, and city administration.

Based on these studies of different areas of city life and cities' communities, the research suggested a number of core principles on the basis of which a city functions in terms of understanding, learning, and developing in the chosen ways and directions. Crucial to the success of such a learning process appeared to be the way that governance as expressed through the city or city region administration is connected, giving and taking knowledge, and sharing reflection and planning with the different communities and arenas that comprised its complexity. The concept of communities of practice (Wenger, 1998) proved useful, as did work on the creative classes and what made cities attractive and successful places to be, attracting lively and innovative people as well as capital (Florida, 2002). Sustainability, now a significant concept for governance and management as well as in terms of the environment, was seen as an important element of learning and its wider applications.

A chronic problem at the heart of the notion of the learning city region is related to geographical scope and jurisdiction in terms of what powers are exercised at local and regional level. Thus Vancouver, a leading city within a federal system, accounts to both the national federal and the provincial government for different purposes, and is in turn divided between several city administrations. The reach of

Vancouver as a learning city is restricted to just one of these administrations, although as a learning region it makes sense to think of two other levels, the greater Vancouver metropolitan area and a larger economic region, which takes in the catchment of the river valley system on which Vancouver sits. Dublin, the fast-growing capital city of the vigorous Irish Celtic Tiger economy, confronts transport and social challenges which call for a city region response for which there is no local–regional government authority. The same is true for Melbourne and other Australian cities, where the metropolitan area is divided between many small city authorities. Greater Melbourne planning falls by default to the state administration, which has competing responsibilities, and regional development bodies tend to be weak, short-lived, and are subject to the vagaries of distant federal politics.

Higher Education and the City

Given the emphasis on knowledge, including research, evaluation, and innovation that is central to the learning city, it is natural that universities in particular, and education systems more broadly, should be a subject of relevant interest. The OECD in particular has sponsored studies related to the role of higher education in regional development and therefore as a part of the learning city-region concept. (OECD, 1999, 2007). A project by the OECD launched in 2004 and completed in 2007 studied the Supporting the Contribution of Higher Education to Regional Development by means of 14 case studies in 12 countries across five continents, with a weighting in favor of Northern Europe. The project was managed jointly by two distinct parts of the OECD, the Territorial Government and the Education Divisions, thus attempting to bring together two different approaches and remits.

From the perspective of a region, higher education is important as a reservoir of expert advice and research capacity; eminent universities, like international airports, are recognized as a significant element among the characteristics of successful competitive world cities and regions. For a university, the resources, interest, and support of the city and region where it is located may be important to its prosperity as well as in terms of comfortable and productive local relations. The idea of university engagement carries with it the idea of co-production of knowledge and shared benefit. However, the idea of local–regional responsibility and accountability also discomfits some universities, which fear the loss of academic freedom and too local or parochial an identity, at the expense of their standing in the unbounded worlds of disciplinary scholarship. In this sense, the idea of the learning city region, and its active promotion by governments at different levels, has become significant to a dialog about the nature of the university in an era of mass higher education.

An Assessment of the Utility and the Likely Future of the Concept

The learning city is one of a number of terms and concepts that has been developed in an attempt to explain, understand, and in some cases to influence and shape the situation in which we live and work, in an era called global and characterized by rapid change and complexity. As a concept, it has acquired meaning, identity, and a life of its own, expressed through the pronouncements and practices of local, city, and region-level governments in many parts of the world. It exists by means of the exchange of words and ideas, and the development of language and practices, that attempt to improve the understanding and practice of administration at these different local levels more effectively and better fitted for what is seen as contemporary need and purpose.

At least in the reduced form of a place and administrative authority which provides opportunities for education, training, and different kinds of nonformal and contextualized learning, the learning city and region seems likely to retain its currency and to exercise significant influence for a considerable time. Its connection with lifelong learning, another widely used though also an ambiguous concept, now firmly established among intergovernmental and national authorities as essential at least for innovation and economic success in a competitive global economy, strengthens that probability. Even in this narrower sense, the relevance to policy and practice of the learning city may be considerable for tertiary and higher education and training, since lifelong learning is associated with the economic and social effects of changing demography, especially longevity, and the need for people to go on learning and changing.

The more fully the larger concept of learning city region is adopted, the greater may be its impact on higher education policy through the idea and practice of the engaged university, and more broadly on technical and other tertiary education. Institutions can be thought of as suppliers of highly qualified skills, and knowledge to the labor force of a regional innovation system. They may also be seen as developing and applying knowledge vital to the economic and social well-being of a region. This perception affects the content and processes of the regular curriculum; students' connection with working and community life; and the character and outcomes of the university's research activity. In these and other ways it may be seen as an integral part of a city or a region as well as of a regional innovation system. A further point along a spectrum of engagement takes the university close to the heart of planning for the region, so that its and the region's or city's long-term development are woven together in a web of interdependency.

As an idea and an agenda for regional management and development, the social construct of the learning city region connects with a complex policy agenda for mass higher education and for whole education systems. It is

central to questions about the best configuration of government, devolution to subnational levels, and relations between different levels of administration in the multi-level systems. These may be federal, with significant powers belonging to the state or province, as in Australia, Canada, Germany, and the United States, or centralized but with increasing devolution, such as Spain has seen and the United Kingdom is developing.

The learning city, in the more complete sense, encourages recognition of different communities and zones of activity that cohabit the city or region. It emphasizes a need to connect and involve these, terms such as participation and empowerment as well as consultation, in order to involve and draw on their knowledge and experience in nurturing a prosperous, optimistic, competitive, and perhaps also harmonious, attractive, and sustainable social and physical environment. The concept thus calls to attention the nature of government, and the costs of dissociation, apathy, and alienation. In this stronger sense, it is about abiding issues of governance that have acquired new significance in current times.

Museums as Sites of Adult Learning

R S Grenier, University of Connecticut, Storrs, CT, USA

© 2010 Elsevier Ltd. All rights reserved.

Hundreds of millions of people throughout the world visit museums, galleries, zoos, aquariums, nature and science centers, and historic sites. This article discusses museums as sites of adult learning. These institutions are increasingly defined by their ability to act as dynamic agents of cultural dissemination and have the capacity to expand the range of learning opportunities for adults. Adult learning theory and research in the area of museum education transform the visitor or user's experiences into learning opportunities that occur in relation to sociocultural surroundings and stimulate active and reflexive learning. Through both free-choice and organized nonformal learning visits, adults have the opportunity to experience the unknown, revisit the familiar, stimulate their curiosity, and challenge their existing beliefs.

The first section of the article explores the educational role of museums by reviewing the variety of cultural institutions defined as museums, as well as the educational missions and purposes of these organizations. The next section discusses the intersection of adult education and museum education theories and how these influence adult learning in museums. The final section reviews adult learning in museums, and attention is paid to the concepts of nonformal and free-choice learning.

Educational Role of Museums

As lifelong learning increasingly becomes more important in society, greater demands have been placed on museums to offer learning opportunities for visitors throughout their lives. The significance of museums as sites of adult learning is reflected in the definitions and missions of these institutions. Museums were once merely private collections held by aristocrats and universities; however, today, they constitute much more. The field of museum studies focuses on an array of institutions including, but not limited to, historic homes and sites, science and technology centers, aquariums, zoos, and botanical gardens, as well as the traditional art, history, and natural history museums. In general, the term museum includes both institutions with collections of exhibits, and locations without their own collections or permanent exhibitions, such as ancient remains or historic sites. These institutions function as a place of memory, where heritage is conserved, collections are maintained, and the best possible conditions are created for visitors to experience these collections. The International Council of Museums

(ICOM) defines a museum as a permanent, nonprofit institution in the service to society and the development of society. It is open to the public, and works to acquire, conserve, research, communicate, and exhibit, for purposes of study, education, and enjoyment, the material evidence of people and their environment. The American Association of Museums (AAM) offers another definition based on seven characteristics. Museums must:

1. be a legally organized not-for-profit institution or part of a not-for-profit institution or government entity;
2. be essentially educational in nature;
3. have a formally stated mission;
4. have one full-time paid professional staff member who has museum knowledge and experience and is delegated authority and allocated financial resources sufficient to operate the museum effectively;
5. present regularly scheduled programs and exhibits that use and interpret objects for the public according to accepted standards;
6. have a formal and appropriate program of documentation, care, and use of collections and/or tangible objects; and
7. have a formal and appropriate program of presentation and maintenance of exhibits.

Definitions also exist to clarify the role of education in museums. The AAM's Task Force on Museum Education, in their 1992 landmark report, offers a broad notion of museum education, which sees museums as fostering visitors' ability to be a productive member of a pluralistic society, and contributing to solutions to address the challenges of global citizenship. Hooper-Greenhill (1994) stresses the educational role of museums as central to a museum's mission and defines museum education as the creation of open relationships between museums visitors in order to increase enjoyment, motivation, and knowledge. Falk and Dierking (1995) offer further clarification by suggesting that museums provide visitors with accessible content and facilitate connections between contrasting facts and ideas. Moreover, they stress the museum's affect on visitor values and attitudes, while also promoting culture, community, and familial identity. Lastly, museum education is foundational to encouraging a visitor's confidence, interest, curiosity, and motivation to gain new knowledge, as well as to affect a visitor's thinking and worldview.

The depth and breadth of these definitions have been recognized by museum professionals and, in order to meet

these demands, many museums employ educational staff or curators whose role is to direct the education, learning, and outreach functions of the museum. Several times, this is achieved within a museum education department. A museum's education department frequently works in the development of signage, exhibits, texts, community outreach, visitor services, guided and self-guided tours, visitor workshops, lectures, seminars, and speakers' bureaus. Additionally, these departments may include volunteers, guides, interpreters, and docents who work with the public to devise and deliver purposeful programming and free-choice learning experiences.

Depending on the size, expertise, and mission of the institution, museum programming may be comprised of lectures, guided tours, field trips, gallery demonstrations, costumed interpretations, teacher and public workshops, seminars and symposia, film series, classes, theater, the loaning of objects, and the development and dissemination of teaching kits and packs related to exhibitions and collections. Moreover, innovative and creative programming has emerged, including learning opportunities geared to personal and cultural development, community outreach and activism, programs for special needs visitors, collaborative programs between museums and other organizations, such as universities, libraries, and other cultural institutions, as well as virtual and mobile museums. With the advent of new forms of technology and the Internet, this last type of programming is increasing in popularity since it provides anytime, anywhere learning for visitors.

Museums have moved beyond static homepages to the creation of extensive databases for research purposes and sites and portals that provide the public with detailed content, resources, and educational material. Examples of how museums are utilizing technology for adult learning include virtual exhibitions that provide information about a thematic area determined by the museum, interactive sites that offer educational activities to support learning, and on-demand exhibits that let the user control the subjects being viewed. These multimedia forms expand the learning experience and educational programming beyond the doors of the museum.

In addition to the growing role of technology in shaping adult learning in museums, institutions have also emerged to specifically draw attention to and address the social, political, and cultural conditions around the world. Such museums extend adult learning to include the promotion of humanitarian and democratic values. For example, the International Coalition of Historic Site Museums of Conscience is a network of historic site museums throughout the world presenting and interpreting a variety of historic issues, events, and people. Its mission is to assist the public in making links between the history of the site and its contemporary implications. For example, the network includes the District Six Museum in South Africa whose mission entails ensuring

the memory of forced removals in South Africa and brings visitors' attention to confronting all forms of social oppression. By focusing on social and cultural conditions, sites such as this strive to not only facilitate adult learning, but also empower visitors to challenge their understanding of history and the human condition.

Using research and scholarship to inform practice, museums are increasingly positioning themselves as places for rich learning experiences. With mission statements that highlight their key role in public learning and education, an array of physical and virtual learning opportunities, and the increase in addressing sociopolitical and cultural conditions throughout the world, the growth of adult learning in museums is evident. From highly structured programs that are identified, designed, and delivered by the institution to less formal opportunities, including incidental or free-choice learning, museums are taking a more sociocultural perspective that emphasizes visitor experiences in relation to the objects, museum context, and society.

Educational Theories

Museums have utilized research and theory in order to intentionally design and facilitate learning opportunities for adults. By introducing people to cultural, historical, and social artifacts, as well as nature and science, museums have the ability to support visitors as they become engaged with novel ideas. To accomplish this, museum educators draw from traditional educational theory, adult education principles, and museums studies research to enhance the learning experience for adult visitors. A variety of empirical and theoretical literature for examining the learning needs of adults in museums is available and the two bodies of research parallel one another, emphasizing the underlying need for a deeper understanding and commitment to adult museum visitors.

Theoretical approaches to museum education have a foundation in the broader field of education. For example, some museums support a constructivist approach to learning in their institution. Constructivism is a theory of learning focusing on the learner and the personal meanings they make based on their prior experience, knowledge, and interests. Museums utilizing a constructivist approach argue that visitors learn the most when knowledge is constructed mentally, in contexts that are physically, socially, and intellectually accessible. Thus, the needs and motivation of the visitor guide the structure of the exhibits and are essential when museum educators conceive of and facilitate learning opportunities. Other institutions utilize a sociocultural approach in museum learning research. Museums using this theoretical framework recognize that visitors' meanings are made within a social context, rather than from facts learned.

The sociocultural approach to learning in museums focuses on the interplay between individuals acting in social contexts and mediators such as tools, talk, activity structures, signs, and symbol systems found in cultural institutions.

These theoretical perspectives influence a number of museum education models. Falk and Dierking (2000) argue for an interactive experience model based on the concept of free-choice learning. Similar to situated learning, which supports encouraging the use of knowledge and strategies in a variety of settings, the Interactive Experience Model addresses the personal, social, and physical contexts of learning in museums. The personal context recognizes that: motivation and emotional cues initiate learning; personal interest facilitates learning; knowledge is constructed from prior knowledge and experience; and learning is expressed in an appropriate context. The second context, sociocultural, emphasizes learning as an individual as well as a group endeavor and the physical context addresses the notion that learning is dependent on a person's ability to place prior experiences within the context of their physical setting. These three contexts combine in an attempt to explain how, why, where, what, and with whom people learn in museums. This model aids in framing museum services, and highlights the role of educational theory in the process of exhibit development, interpretation, and programming.

Additionally, a focus on the role of prior experiences and learning is central to both the museum education and adult education fields. Experience influences adults' approaches to learning, their ability to integrate new information, and the ways in which they build concepts around new knowledge. Museums researchers are emphasizing the same ideas by addressing the prior experiences of visitors and how those experiences establish what visitors will do, talk about, and take away from their visits. Thus, museum educators are facilitating learning opportunities that recognize and underscore the role of emotions, memories, background, and personal understandings in the process of assigning reference and meaning to museum content.

The significance of understanding the adult visitor is emphasized by Sachatello-Sawyer *et al.* (2002), who categorized adult learning in museums to include six dimensions: life-changing experiences, transformed perspectives, changes in attitude, increased appreciation, exploration of relationships, and acquisition of knowledge. These levels serve to explain the forms of personal change, long-term change resulting from the learning, and the integration of new learning. They also found that adult learners in museums fell into four distinct categories: knowledge seekers, socializers, skill builders, and museum lovers. Both the forms of adult learning and the categorization of adult learners in museums mirror the work of Mezirow (1991) and Houle (1961) in the adult education literature. Mezirow describes four processes of learning: elaborating an existing point of view, establishing a new point of view, transforming

one's point of view, and, lastly, becoming aware and critically reflecting on our generalized bias of how we view groups other than our own; and Houle's typology of adult learners includes: (1) the goal oriented, (2) the activity oriented, and (3) the learning oriented.

While terminology used in the two fields may differ, this section demonstrates that the underlying theoretical frames and the parallels in how both fields characterize learning and adult learners are similar. Regardless of the scholarship, the significance of lifelong learning in museums is receiving considerable attention from researchers and is providing opportunities for furthering our understanding of adult learning theory. Moreover, the research in the two fields, as well as from visitor studies, interpretation research, and leisure and recreation studies is informing museum practice, thus increasing the likelihood of presenting museums as sites of adult learning experiences.

Adult Learning in Museums

In general, adult learners frequent museums as visitors or users of museum services that include the availability of reference and resources, cultural and community programming, and virtual offerings. These learners are diverse and create a challenge for institutions seeking ways to provide adults with education and learning opportunities. Due to their broader life experiences, established identity, abstract thinking ability, understanding of the world they live in, and unique learning expectations, it is necessary to specifically address adult learning in museums. First, the motivations and agendas that adults take to museums are important in influencing the way they experience a visit, as well as their behavior and learning. Those facilitating educational opportunities in museums take into account such motivations in order to create engaging visits. Several factors influence the decision of whether or not to visit a museum, including an opportunity to socially interact with others and with family, the sense that they are doing something worthwhile, the challenge of new experiences, feeling comfortable with their surroundings, having the chance to actively participate, and having an opportunity to learn. The combination of these factors requires museums to develop programming that incorporates the breadth and depth of visitor characteristics ranging from purposeful learning to incidental learning resulting from a leisure visit.

Although learning is not a deliberate intention of many museum visitors, they often seek out or are unconsciously drawn into an experience that encompasses learning. When visiting museums, adults tend to look for opportunities to learn more about themselves, their culture, and their heritage, and gravitate to those places where they feel most comfortable. Overall, research in the area of visitor motivation suggests that adult visitors are not only motivated to

learn, but also perceive museums as sources of important information, are willing to commit to learning activities, and find such endeavors satisfying, all of which create both opportunities and challenges for the institutions.

Regardless of the motivation or intention, visits by adults to museums present both social and educational opportunities and create the possibility of purposeful and incidental learning that is the focus of much study in the fields of museum and adult education. Museums are distinct learning environments, and as such have received considerable attention by scholars. Within adult education, museums are categorized as nonformal education, while in museum studies, these learning environments are often referred to in relation to free-choice learning. Both terms provide a means for framing adult learning experiences in museums and offer similar perspectives on the role of the learner and the resources necessary to support the learning process.

Nonformal Education

Nonformal education is characterized as intentional and organized with the purpose of promoting learning to enhance an adult's quality of life (Heimlich, 1993). Ideally, it is learner centered, maintains a balance of power between the learner and the facilitator, is present-time focused, and is geared to meeting localized needs. In this same vein, learning in a nonformal context is often distinguished by activities outside the formal learning setting, with voluntary participation as opposed to mandatory participation. Within a taxonomy of adult learning, nonformal learning is identified by learners holding the objectives for learning with the means controlled by the educator or organization. In this way, nonformal education creates learning events in museums that can expand the range of opportunities for adults with practical applications to an individual's profession, personal interests, and community. Owing to the unique learning environment and resources museums offer, these institutions are constructing nonformal learning offerings ranging from senior citizen programs, programs for law enforcement officers, and restoration and preservation opportunities, to training for volunteers interested in working as docents, interpreters, and oral historians. One group of learners garnering significant attention is classroom teachers. Museums create learning opportunities for classroom teachers through in-service, continuing education and intensive, residential summer institutes. These experiences are designed and initiated by museums to provide educators with opportunities to explore museum resources, co-create curriculum with peers, and experience museum exhibits under the direction of museum staff and museum consultants specializing in k-12 curriculum and instruction.

Nonformal programming serves not only organized groups, but also those seeking personal development and

educational opportunities, and individuals serving as volunteers for museums. Adults involved in museum programs are often seeking out lifelong learning opportunities and look for ways to bring together their personal interests, professional expertise, and social consciousness. Programs like the Smithsonian's Resident Associate Program are one example of museums providing a range of experiences to adult learners including structured lectures, tours, and performances that offer cultural and educational opportunities for lifelong learners.

Despite the fact that nonformal learning includes museum-derived programming, nonformal education also provides for more self-directed and informal learning opportunities. For instance, many museums are emphasizing active involvement of visitors through the use of engaging questions, involved discussion, and co-constructed workshop methods. Such experiences encourage adults to handle objects, investigate the meanings and relationships between objects and exhibits, and address their own reactions to the museum content. Although museums serve the role of nonformal education for adult learners, a good deal of visitors are informal users that include individuals, friends, and families visiting museums casually as tourists or for entertainment and social interaction. These informal experiences are at the root of another form of learning in museums, free-choice.

Free-Choice Learning

Free-choice learning (Falk and Dierking, 2000) is a non-linear process that looks to visitors to bring their own awareness and interests to the museum experience in order to create a variety of learning outcomes. That being said, such learning opportunities are not completely unstructured since the nature and design of the exhibits form some structure to the learning experience. It is this choice and control over the learning that is central. In free-choice learning, the learner is intrinsically motivated by their desire to discover more about the world, gain information, and enhance their current understanding. More specifically, adults tend to engage in free-choice learning in museums because of one or more factors. The first factor is friendships and organizational relationships including the social connections established in civic associations, schools, and community and religious groups. These interactions strengthen a commitment to developing social networks through invitations to take part in the museum experience. The second is the visitor's family who communicates information about learning opportunities or emphasizes an interest in museums. The last factor is an adult's business and professional connections. These relationships can create the expectation of visiting a museum for professional networking, or to gain new knowledge to transfer to the work environment.

Museums are responding to free-choice learning by layering the experiences. By doing so, museums are able to present visitors with smaller segments that are more easily processed and integrated into prior experiences and learning. This limits visitors' sense of being overwhelmed and provides a chance for visitors to linger on specifics that are of most interest. Technology is also aiding museums in their facilitation of free-choice learning. Radio-frequency identification (RFID) is a method of automatic identification that relies on storing and remotely retrieving data using RFID tags. Using RFID, the Tech Museum of Innovation in San Jose, CA, began experimenting with Tech-Tags that work to link one exhibit to another within the museum, to personalize and customize the experience, and extend the museum experience beyond the visit. An RFID chip is embedded in a visitor bracelet enabling visitors to use their bracelet to activate exhibits as well as create a customized Internet record of the visit that can be explored after the leaving the museum.

In general, visitors in a free-choice environment decide whether to visit a museum, what will be viewed or done at the museum, and for how long. Essentially, free-choice is closely linked with educational leisure in that the experience is learner centered through exploration, connections to prior experiences, and control of the learning environment. Although museums are a significant source of free-choice learning for adults, it is important to note that people engage in free-choice learning through other venues including libraries, parks, radio, television and film, print media, and the Internet. When these sources are partnered with the learning opportunities of museums, what is produced is the opportunity for a robust and multidimensional form of understanding. Entities such as the Public Broadcasting Service (PBS) have used such partnerships to develop free-choice learning opportunities that bring together print media, technology, and museums to feature content and exhibits in relation to a PBS series.

Whether it is nonformal education or free-choice learning, the outcomes for adults' experiences in museums are diverse. Participation in museum-related activities contributes to the shaping of families, and other social groups, as well as expanding the personal and professional perspectives of individual adult visitors. By increasing knowledge and understanding, developing new skills and abilities, inspiring new learning and change, and stimulating lifelong learning, museums not only impact an adult's knowledge, but, often, also their attitudes, values, and beliefs.

Conclusion

Today, adult education stresses self-direction, critical reflection, experiential learning, learning to learn, distance learning, and collaborative learning. The same elements can also be associated with adult learning in museums, as is

evident in this article. Museums as sites of adult learning are stimulating and offer a place where ideas originating from the media or peers can be tested, confirmed, or modified. Museums also help visitors reformulate old pieces of understanding that have lost relevance or meaning. By purposefully taking part in educational activities in museums and engaging in free-choice learning, adults have the opportunity to share in conversations, discussions, debates, and social interaction, all of which are foundational to the work of museums and the expanding role of lifelong learning in society.

Overview of Lifelong Learning Policies and Systems

D-B Kwon and C H O Daeyeon, Sookmyung Women's University, Seoul, Republic of Korea

© 2010 Elsevier Ltd. All rights reserved.

Since lifelong learning systems embodying various policies are emerging in a variety of unique contexts, they represent very different perspectives from country to country. This article reviews lifelong learning policy models proposed by Green (2000), including market-led, state-led, and social-partnership-led approaches. Different policy initiatives and/or systems can be deemed to belong to one of three different models, although they may not correspond precisely. This article depicts seven well-known policy examples according to the three models.

Three Models of Lifelong Learning Policy

During the past two decades, the significance of lifelong learning has emerged and many influential policy documents have been released to promote it throughout the world. However, policies implemented in particular contexts according to different rationales yield substantially different results. Consequently, lifelong learning policies initiated by various governmental bodies can be deemed to belong to different types; have different characteristics, emphases, and objectives; and require different kinds of interventions. To sketch out a number of different lifelong learning policies, analytical models need to be selected carefully.

Green (2000) proposes three hypothetical models of lifelong learning policy including market-led, state-led, and social-partnership-led approaches: "some policies stress the role of the market and the responsibility of the individual; some advocate the central role of the state in orchestrating and managing the learning society; others emphasize social partnership among multiple stakeholding" (p. 35). It is acknowledged that the models can be regarded as positions along a continuum.

In the market-led model, there is a belief that lifelong learning is an individual project, and, therefore, the burden of lifelong learning tends to fall on the shoulders of the individual learner. Today's global market forces individuals to take responsibility for their own learning for personal growth and development. Both employers and individuals have to make decisions about what kinds of skills and knowledge should be acquired. In this sense, learning supply through education and training can be decided based on the needs of the market, represented by employers and individuals. In the labor market, employers play a central role in providing lifelong learning for individuals at work (PARN, 2002). As the market has a

more privileged position in this model, the role of the state and civil society is relatively neglected (Rubenson, 2006). On the other hand, there are some weaknesses in this approach: market-led lifelong learning policies can lead to underinvestment, inequality, and low quality (Green, 2000).

The state-led model allows governments to invent lifelong learning systems through legislation, controlling bodies, and related policy activities. The state plays a key role as a planner; at the same time, it can be the primary source of funds and quality control for lifelong learning practice. To accomplish these, the state creates a blueprint that must meet the various long-term needs of individuals, in addition to reconciling the demands of a variety of interest groups. The state regards lifelong learning as a matter of public responsibility. Thus, it tries to create the required structural preconditions, promote well-designed arrangements between organizations and entities, and ensure policy coordination and coherence in lifelong learning (Rubenson, 2006). The state-led approach addresses equity issues for young, old, and low-skilled adults who are at risk of being routinely excluded from society. Such policies reduce social inequality and promote personal development for all. Additionally, a strong link between lifelong learning and labor market policies can be built on this model. The state has strong power to use labor markets and policies to promote human capital through lifelong learning. The state-led policies also have some disadvantages, including "a slow pace of change, less diversity and responsiveness to particular needs, misjudged plans, and bureaucratic inefficiency" (OECD, 1996, recited from Green, 2000: 39).

Another possible model is based on social partnership. This model emphasizes not only individual responsibility, but also the building of partnerships with multiple agencies involving diverse stakeholders. This implies a strengthened public-private cooperation. However, state agencies' participation and coordination are not always required in this model (Schuetze and Casey, 2006). Regardless of the state's participation, agreements or cooperation among social partners can have an impact on lifelong learning and training policies (OECD, 2003). In the 1970s, civil society developed lifelong learning systems for the purpose of reducing educational gaps in society. At that time, the volunteer sector, including nongovernmental organizations (NGOs), played an important role in promoting lifelong learning (Rubenson, 2006). As there is no doubt that civil society cannot exist alone, social partnerships with other institutions are emphasized in policy development (OECD, 2003).

The three models can illustrate the different lifelong learning policies with distinctive features. Nevertheless, it must be taken into consideration that the three models have common characteristics, which can be seen in the state-led model to some degree. The distinguishing characteristics and some policy examples of each model are summarized in **Table 1**.

More recently, Schuetze and Casey (2006: 282–283) introduced four different lifelong learning policy models: (1) an emancipatory or social justice model, which put an emphasis on equality of learning opportunity (lifelong learning for all); (2) a cultural model focusing on each individual's life; (3) an open society model in which lifelong learning is seen as an appropriate learning system (lifelong learning for all who want, and are able, to participate); and (4) a human capital model, which implies continuous work-related training and skills development for a qualified workforce (lifelong learning for employment). There exist many commonalities between Schuetze and Casey's models and those of Green. However, Schuetze and Casey classify policies according to their aims for what the policy is, while Green distinguishes the approaches according to who has the power and who is the main actor with a more holistic viewpoint toward the policy.

Policy Applications of the Three Lifelong Learning Models

This section provides some policy examples with reference to Green's three models from developed countries well known for their lifelong learning strategies.

The State-Led Model

The state-led model has many advantages insofar as it provides a certain degree of consistency and coherence in conducting policy, securing qualifications, and ensuring more equitable opportunities for individuals. Those advantages are found in the countries' initiatives that are introduced below. They vary in the details, but each shares the goal of lifelong learning for all.

Sharing financial responsibility in Japan: Kameoka Lifelong Learning Foundation

In Japan, the central and local governments have legislated strong initiatives to support lifelong learning. For a long time, governmental agencies have promoted lifelong learning by installing facilities and equipment, and by subsidizing learning events. The main responsibility for administrative support of lifelong learning tends to fall to the municipalities. Since the financial base of the municipalities is not sufficient, the National Council on Lifelong Learning proposed establishing foundations to obtain private funds at the level of the local government (Shiraishi, 1998). With this purpose, there are some foundations such as the Kameoka Lifelong Learning Foundation (KLLF).

In 1990, Kameoka City established the KLLF, giving it initial funding. This foundation operates with financial support from the municipality and the management of its initial funds. Although Kameoka City provides financial support, the KLLF is an independent institution beyond the purview of the municipal and other governmental bodies (Shiraishi, 1998). The organization is autonomous in how it conducts the bulk of events related

Table 1 Distinguishing characteristics of respective policy model

<i>Model</i>	<i>Characteristics</i>	<i>Policy examples</i>
State led	Law and regulation Long-term / slow change Equality / accessibility Coherence / consistency Transparency / bureaucracy Equity / control high quality Inefficiency	<ul style="list-style-type: none"> • Kameoka Lifelong Learning Foundation (Japan) • Ensuring equity for immigrants (Finland) • Continuing vocational education and training (France)
Market led	Market driven / demand led Rapid / short term Individual needs Individual responsibility Employability Flexibility / diversity Inequality / underinvest	<ul style="list-style-type: none"> • Q-Card at Fraport AG (Germany) • The Credit Bank System (South Korea)
Social partner led	Balance / partnership Stakeholders in different levels Soft regulation / mixture Negotiation Inefficiency Difficulty of cohesion	<ul style="list-style-type: none"> • Dual system (Germany) • The new apprenticeship program (Australia)

to lifelong learning for citizens, thus enabling it to more easily obtain financial support from other sectors.

In the case of Japan, the government played a key role in developing and funding the foundation at the initial stage, preparing the foundation to develop as an independent organization later by widening its base of financial support from private donors. This project was a part of the government's long-term plan to establish private funding for lifelong learning enterprises at the local level.

Ensuring equity for immigrants in Finland

To ensure equity for immigrants, the Finnish government has implemented many policy initiatives over the past years. As more countries join the European Union, Finland is expected to have more immigrants, and thus shares the necessity of having sound policies that seek to integrate its newcomers. In this context, the Finnish government has launched a variety of programs available to immigrants. For adult immigrants who seek employment, special programs such as language and vocational ones are provided.

Since May 1999, many special programs, for example a 6-month preparatory vocational training program, have been offered for low-skilled immigrants. The program incorporates Finnish language and customs; guidance and some courses in a student's native language; remedial instruction if necessary; support groups of students; tutors; and a personal study plan (OECD, 2005a). This effort aims to reduce unemployment among immigrants by promoting their equality within Finnish society.

The Finnish immigrant policy does have some challenges to overcome, such as inconsistencies in policy implementation, and a lack of programs specifically for low-skilled immigrants. To develop more effective policies for immigrants, the Finnish government has set out a 5-year plan for 2003–08 (Ministry of Education, 2004). The Finnish government puts much effort into pursuing equity and consistency in lifelong learning policy for immigrants. Consequently, the case of Finland focused more on immigrants as an underprivileged group. The Finnish government program examined tries to provide equity and equitable opportunities for individuals, especially for those who could be otherwise excluded from the benefits of lifelong learning.

Continuing vocational education and training in France: Social partnership regulation

France's lifelong education on continuing vocational education and training (CVT) has been in constant change and expansion for almost 40 years, thanks to the 1971 law and subsequent reforms characterized by a state-led system of social partnership regulation. This law insisted on the roles and responsibilities of the various partners in training by instituting a collective financing obligation

between social partners (Green, 2000). This regulation took into consideration the promotion of equitable distribution of training costs and achieving the skills needed between social partners. In short, the creation of a huge training market could be achieved under the 1971 law in France (Colardyn, 2004).

For enterprises, the financial contribution was differed from the amount of payroll based on the number of employees. It was a very useful way to obtain equitable sharing of training costs from different enterprises. Such an equitable cost distribution encouraged greater investment in training by employers. At the same time, the state invested much effort on deciding training priorities by forming clubs of providers as well (Green, 2000). Government subsidy for training played a crucial role to overcome market failure in training. As a result, strong links were established between private and public sectors led by the regulation and public authorities.

Under the 1971 law, training became a legal right for all employees, and the responsibility for training was shared by enterprises beyond the government. In so doing, the government had better chance to look at individuals such as the young, women, and older workers. Clearly, many individuals have accessed training; a large training market has been created; and the training supply has improved (Colardyn, 2004). For instance, in the year 2000, there were nearly 42 000 training bodies, as compared to only 25 000 in 1990. The number of trainees has practically doubled in these 10 years, surpassing 12 million in 2000. Employer investment in training continues to increase (Green, 2000) and enterprises have been the major contributors since 1999. In spite of many positive results, several major critical issues can be highlighted (Colardyn, 2004): people who have had higher levels of initial education are more likely to participate in CVT; CVT chances have hardly translated into a higher level of educational attainment such as a diploma.

The Market-Led Model

There is no doubt that lifelong learning is a huge enterprise beyond a government's capacities. In addition, lifelong learning in most countries is more likely to be decentralized. Furthermore, the change of perspective from lifelong education to lifelong learning entails shifting the responsibilities for learning from the providers to the learners. This shift emphasizes the individual's role in the process of learning and deemphasizes the governmental dimension (Schuetze and Casey, 2006). Consequently, the role of employers and individuals in decision making and financing is strongly addressed. The responsibility of individuals for their own learning is emphasized to a greater degree as well. In particular, companies play a more direct and active role in promoting employees' learning in order to obtain greater global

competitiveness. Workplaces that support and promote lifelong learning for employees function as good examples of the market-led approach.

Investment on employee training by Fraport AG in Germany: Qualification card

Fraport AG operates Germany's largest commercial airport with 13 000 employees. It regards personnel development as an important factor in corporate success, and has adopted a variety of strategies relating to education and training. Fraport AG introduced a new educational approach in 2000. It developed the Fraport Qualification Card (Q-Card). The Q-Card is a bonus card that the corporation loads with a virtual credit of 600 euros each year. With this card, employees can take courses provided by Fraport College and Fraport Academy. The courses at Fraport AG are not directly required for the performance of their current jobs.

Employees in Fraport AG must invest their flexitime credits from their working time accounts. The program encompasses information technology, media skills, work techniques, and business administration. Approximately 85 different training courses were offered in the first half of 2002 (Wilfried, 2003). As a cost- and time-sharing instrument for lifelong learning, the Q-Card program earned Fraport one of the initiative awards for training and further education given by the Otto Wolff Foundation (Wilfried, 2003). Responding to the demands of employees and the employer, Fraport AG created a motivational system to promote employee learning and provided a wide range of programs to meet the learning needs of employees.

The Credit Bank System in South Korea: Nonformal educational institutions

The South Korean government initiated the Credit Bank System (CBS) in 1998. This essentially allows individuals to accumulate credits from diverse institutions including colleges, universities, nonformal educational institutions, and cyber open universities. An adult student can obtain an associate or bachelor degree depending on the amount of the necessary CBS-approved credits (OECD, 2005b).

The CBS can be regarded as a precondition to realize a society of lifelong learning and open education. It has some unique features that can be discussed in the state-led model. For instance, this system has been run on a strong statutory foundation. The CBS contributes to guarantee educational equity, particularly for the under-educated. The Korean government, together with the National Center for Lifelong Education, screens the curriculum provided by all nonformal educational institutions twice a year and earned credits and/or learning experiences and activities of individuals. These efforts are to maintain and control the quality of the CBS.

On the other hand, the CBS has qualities of the market-led model as well. The CBS policies are more likely to

focus on giving individuals more choices from different institutions and diverse learning programs. All types of educational institutions under the CBS need to study whether they should supply market-driven educational programs in order to meet adult learners' demands. Educational institutions that have marketing capability need to promote their credit courses by creating a variety of programs that are required to be endorsed by the government. The CBS should be utilized to sharpen adult learners' competency and employability regardless of their employment status as a way of enhancing the quality of their lives. Consequently, some features, including regulation, equity, and accessibility, which are addressed in the state-led model, are shown in CBS. However, this system still runs on the strong foundation of the market-led model. Compared with the state-led model, this case is more responsive to individual needs and tends to have more flexibility in the modes of provision.

The Social-Partnership-Led model

As most stakeholders in lifelong learning exist outside of governmental agencies, the coordination between various entities involved in policy development and implementation is crucial for overall success (OECD, 2004). However, such coordination does not fall exclusively into the domain of governmental agencies. Nevertheless, there is general agreement that using the potential of existing cooperative mechanisms is a way to build partnerships (Dace, 2003). In current lifelong learning policy and practice, cooperation among various partners has become a prominent international feature. Both cases described below created frameworks for lifelong learning in terms of encouraging cooperation among stakeholders and emphasizing the responsibilities of different partners. In this framework, various stakeholders participated in the whole process of policy development, implementation, and assessment.

Vocational education and training in Germany: The dual system

With the advent of a knowledge-based economy, Germany has recognized the importance of lifelong learning in order to pursue social cohesiveness. In particular, different types of social partnerships have been utilized to share the responsibility for lifelong learning. Among them, the dual system has been recognized as a representative example of vocational training on the social-partnership-led model. The system is called dual because vocational training takes place both in the company and in the vocational school.

Under the Vocational Training Act of 1969, the federal state sets the training regulations by which the roles, rights, and responsibilities of the different partners are determined. Representatives of employers, employees,

and educators together with federal and regional state officials are positively involved in an elaborate system of social partnerships (Green, 2000). The system is financed principally by employers, a feature that distinguishes the German system from the Australian and other European models that rely heavily on government funding as well as on wage subsidies. Although the operation of vocational training schools is regulated by the state, a substantial involvement on the part of employers through very active chambers of commerce is taken into consideration as the essential feature of the social-partnership-led model (NCVER, 2001).

The German dual system of vocational training is renowned as an example of social partnership. Within such a system, companies and their social partners play a prominent role as innovators. This system emphasizes collaboration among various partners and suggests co-financing between them. As the state's full financial responsibility in lifelong learning is perceived to be limited, co-financing among stakeholders should be strongly considered. Meanwhile, the dual system itself does exhibit weaknesses, such as inefficiency, because it may take much time to negotiate among the key social partners through a very complex process (NCVER, 2001). To keep the dual system effective and efficient, the government must continue to become more flexible in how it deals with its partners.

Embracing older workers in Australia: The new apprenticeship program

The Vocational Education and Training (VET) system in Australia was created to boost the country's economy, increase employability, and develop a more skilled workforce. Under the direction of the VET, the apprenticeship program has been newly updated to combine training and employment so that people entering an occupation can receive appropriate instruction in the specific skills needed on the job (OECD, 2002). Compared to the previous apprenticeship program, the new apprenticeship program focuses more on supporting and recruiting older workers, recognizing that it is crucial to have skilled workers in the labor market and that older people still remain as key players.

The new apprenticeship program was introduced in 1998, following many reforms of the traditional apprenticeship system. The Australian government created the new apprenticeship center to promote the new program and to provide support services with employers. The government developed specific programs to ensure a more effective implementation of the new apprenticeship. These include the new apprenticeships incentives program to develop a more skilled Australian workforce and the new apprentice support services, a national network that provides support for employers and individuals across the nation. There has been a huge increase in the number of workers in the new apprenticeship program

since it was introduced, from 135 000 in 1995 (OECD, 2002) to 367 100 at the end of 2003 (NCVER, 2003).

Through the new apprenticeship program, the Australian government tries to embrace not only the need of young people to obtain skills, but also the need of older workers to be given opportunities to upgrade their skills. Moreover, the new apprenticeship program makes cooperation among various partners possible so that these partners can meet the demands of individuals and employers. On the other hand, some limitations exist, such as the lack of sufficient training plans and inadequate arrangements for monitoring the quality of training in the new apprenticeship program (NCVER, 2001).

Conclusions

In this article, several examples categorized according to a threefold system of lifelong learning policy models were examined. The KLLF in Japan, immigrant policy in Finland, and CVE in France were introduced and explored as examples of the state-led approach. The examples of the market-led approach included Fraport AG in Germany and the CBS in Korea. Germany's dual system and Australia's new apprenticeship program served as examples of the social-partner-led model. Each country examined has very different lifelong learning policies in its own unique context. In addition, every country was found to have taken various initiatives at different levels including individual, enterprise, and local and central government. Despite the diversity evident in the above examples, it is interesting to note that some clear messages regarding current and future lifelong learning policies can be discussed.

First, an economically oriented mindset has penetrated the policies of almost every country. With the advent of the knowledge-based economy, all countries seem to agree that a shortage of workers with high-level skills or a lack of adequate learning systems puts national economic competitiveness at risk. Lifelong learning systems tend to be a credible way to achieve national prosperity. In looking at the examples illustrating each model, it is found they are strongly associated with basic and upgraded skill-development strategies for individuals. At the same time, policy reports related to lifelong learning are also more likely to express concern for social inclusion, democracy, social equity, quality of life, and personal well-being (Martin, 2000).

Second, cooperation among many stakeholders seems to be an inevitable feature in terms of developing and implementing lifelong learning policies. State-led initiatives are basically the strongest and most effective way toward pursuing lifelong learning opportunities for all. While it provides relatively less accessibility of learning opportunities to individuals than the state-led approach, the market-led approach is also necessary. However, neither state-led nor market-led approaches can fully

succeed without collaboration with other partners. In this sense, it is safe to say that countries try to involve relevant stakeholders and boost social partnerships between them. All the exemplary initiatives introduced show that many different parties are more likely to be involved and cooperate for the purpose of building better lifelong learning systems, regardless of the models they belong to.

The third point is related to government intervention. Today's governments face major challenges in extending lifelong learning. The government, even in the social-partner-led model, is found to play a vital role, and its intervention is unavoidable in the field of lifelong learning. Government intervention in most cases involves providing financial support, operating a qualifications system, or organizing networks for the various partners. As seen in the KLLF of Japan, municipal funding was an absolute necessity at the initial stage, allowing it to become an independent organization. The dual system in Germany and the new apprenticeship program in Australia are also evidence of the necessity of government involvement in funding and assessing evaluation. In the case of CBS, the Korean government plays a greater role in monitoring curriculum, earned credits, and learning experience of individuals to control the quality of the system.

Popular Adult Education

S Tøsse, Norwegian University of Science and Technology, Trondheim, Norway

© 2010 Elsevier Ltd. All rights reserved.

Glossary

Folkbildning – Swedish, meaning popular adult education.

Folkeop(p)lysning – Norwegian and Danish, meaning popular adult education.

Op(p)lysning – Norwegian and Danish, meaning enlightenment.

Introduction

Popular adult education is one of those slippery concepts within the field of education that is used to denote different educational aims, ideas, approaches, activities, and programs around the world. It is used more or less synonymously with other concepts; in addition, we also have to bear in mind that it is an English translation of specific national concepts with distinctive characteristics and differences of meanings. As such, popular adult education and its national linguistic synonyms are forms of educational phenomena that are socially constructed in a process of accommodation and transformation, cultural and hegemonic strife, and social movement learning in specific historical contexts. The concept is founded and shaped by the influence of individual educators and movements that have linked popular education to different aims, target groups, educational practices, and curriculum. Taking a worldwide perspective, the term popular adult education covers different trends and philosophies and is applied to so many different practices that it is hard to tell exactly what it means (Kane, 2001: 229–230; 2005: 135). The concept cannot be framed in a single and universal definition but, rather, has to be understood as an open-ended process that is continuously adapted to the concrete situations of local needs to expand people's participation into their learning and living (Han, 1995). The article starts with the different meanings and historical traditions, more deeply explores some Nordic, Latin American, and North American practices and initiatives, presents the current trends, and finally concludes with some common dimensions characterizing the popular adult education approach.

Different Meanings and Historical Traditions

In the European context, the word popular originates from the words people or folk, and popular adult education is associated with a long tradition of people's struggle for enlightenment, access to culture and knowledge, and the development of democracy. The popular concept is historically linked to the role of popular and radical movements as educative forces, for instance, the labor movement, which did not separate education from politics, but regarded education as a guide to social and political action for a better world. Knowledge was power and instrumental in the political struggle, and this struggle itself was educative. In many countries, it has been used more or less synonymously with education of the working class and loosely associated with the interests, aspirations, and struggles of ordinary people for democracy and social change (Martin, 2007). In this broad meaning, popular adult education has been the forerunner for, and almost used synonymously with, adult education (Jarvis, 1999).

In some countries, the popular education concept is also linked to the science-popularizing movement, which can be described as a charitable form of public service by university professors and industrialists in the Enlightenment tradition (Steele, 2007a, 2007b). It led to a multitude of associations for the popularization of science, as exemplified in the British and American mechanics institutes and in the Nordic countries' working men's institutes (from the 1880s) and their Norwegian successors' folk academies. Ideologically, this popular education signified political subversion, a means of class harmonization, or democratic emancipation. In the Nordic countries, these efforts of disseminating knowledge and information to the public (e.g., related to health, social questions, and policy matters) became state funded.

A specific form of the science-popularizing movement was the university extension movement spreading from England at the end of the nineteenth century to many European countries and, later, even to South America (Jarvis, 1992; Wallin, 2000), and resulted in so-called popular or folk universities devoted to the aim of bringing both university culture to the people and developing people's own culture. Van Gent (1992) has suggested the term sociocultural education for similar professionally focused training initiatives such as the people's colleges in Hungary, folk high schools in Germany and the Netherlands, folk

houses and cultural centers in the Netherlands, and the German centers for *Volkshbildung*. A primary aim for some of them was to provide training for people involved in popular education; however, many of these efforts failed to reach the people (Jarvis, 1992).

Although some of the above-mentioned forms were the result of personal initiatives to educate people, the concept of popular adult education is primarily linked to the social mobilization and the educational activities within social movements. Indeed, it is the social movements themselves who have coined the term and adapted it to their practices. In the literature, we even find popular adult education referred to as a separate social movement that is held together by regional or international associations and networks. It has been a world for a nonformal, out-of-school education organized by a variety of groups that have used the popular concept to defend education as a right for all people, to be designed for the people and by the people, and essentially associated to a form of pedagogical praxis that is controlled by participants. In Latin America, Africa, and Eastern Europe, the terms popular or folk education may be used instead of, or in conjunction with, community education (Tight, 1996: 65). Hamilton and Cunningham (1989: 440) regard "community development and popular education . . . as compatible." They do, however, find that subtle but important distinctions can be made, indicating that these two approaches are contradictory. Community development seeks reformation, while popular education seeks transformation. Indeed, a powerful idea, especially in Latin America, has been to make the concept identical to empower oppressed people to take part in the struggle for social and political change. Accordingly, it also shares many similarities with other terms expressing the aims of education such as resistance, liberating, and emancipatory education.

A problem for the demarcation of a popular education territory is that initiatives and practices might well fall within common definitions, but are not always considered as such. This is apparent in political liberation movements in Eastern Europe, for instance, Charter 77 in the former Czechoslovakia, which demonstrated a high activity of seminars, lectures, study groups, and free theater groups (Rubenson, 1995). The fall of communism and the drive for democratization in the former Eastern block coincided with a rise of civil society activities that have a close resemblance to popular education elsewhere. Some countries such as Slovenia have implemented new forms of study circle activities based on Nordic examples (Gougoulakis and Bogataj, 2007).

Regional Differences

The article cannot pay due attention to all forms of popular initiatives, and practices in all parts of the

world, but gives some examples of regional differences. One main form has originated from the ideas of the Enlightenment and Romanticism and has a strong basis in the Nordic countries. A second trend has emerged from the popular revolt against severe oppression in former colony countries or dictatorships. This form has its strongest basis in Latin America, which is the prime example here, but is spread to all parts of the world where people have been restricted the freedom to learn. A third example is popular education initiatives, which are less integrated in social movements and popular forces, but are more a result of personal initiatives and efforts of creating new mass organizations and institutions.

Nordic Popular Adult Education

The Nordic popular adult education is often referred to as a historical tradition that has emerged from the twin influence of the Enlightenment and Romanticism. The Norwegian and Danish concept *folkeop(p)lysning* is, in fact, a composition of enlightenment (*opplysning*), meaning education from above, and the word folk, which is a romantic invention. Sweden has adopted the German concept of *Bildung* and has constructed the word *folkbildning*, which indicates that enlightenment might also come from within (Korsgaard, 1997). A third, and increasingly stronger, influence through the nineteenth century, was the rise of social and democratic movements, which further developed the idea of folk as a political subject and transformed the meaning of popular education to be not only education to the people from above, but also education of the people and the creation of knowledge from below. Since the end of the nineteenth century, popular education in the Nordic countries has been identified as social movement learning within the civil society.

A characteristic of the Nordic situation is the organization of special study associations for popular adult education within movements. It can thus be understood as a popular movement itself and a specific organized activity within movements. In the institutional meaning, especially in Sweden, popular adult education embraces the study associations and the folk high schools. In charge of these, the meaning of popular adult education multiplied into a diversity of meanings which reflected the different ideologies, aims, and activities of the movements. Some made education a part of a distinctive countercultural struggle; however, this element has faded away in the course of time. Another characteristic is the ideal of education as a collective self-education based on the belief that enlightenment and culture can emerge from below, the common people, and that knowledge can be created and disseminated through dialog within groups of equal persons. A third

element is the emphasis on the aim of personal development. A unique character of Nordic popular adult education is also considered to lie in the pedagogy and methodology that is put into practice in study circles (Rubenson, 1995). These are built on the principle of independence of external requirements and are characterized by self-directed learning. In principle, all studies should not be examined and should provide a zone of freedom in which participants can choose subjects according to their real interests and needs (Andersson and Tøsse, 2006). Moreover, the study circles build on the common work of the participants and their experiences, and the active strive for knowledge, and work toward a collective goal.

Popular adult education in the Nordic countries includes a wide range of topics on every degree of difficulty, but is mainly understood as nonformal and out-of-school education, spare-time and hobby-related activities, and, by tradition, often nonvocational. The study circles provide an arena for deliberation and learning in an informal way. As the level of participation is high, especially in Sweden, peaking at 2.8 million participants in the 1990s – that is, a third of the total population – popular adult education may be considered as a specific public sphere that has contributed to establishing and enforcing basic elements in the Nordic model of democracy. The concept has also been used normatively as an instrument in the construction of a Nordic dimension in relation to adult education (Ehlers, 2006). Participation is therefore largely state funded on the ground that the study associations, in addition to being agents of popular movement, contribute to diversity, support culture, and create informed, active, and committed citizens (Rubenson, 1995; Larsson, 2001). The popular adult education field has, especially in Norway, been acknowledged as a part of the educational system and encouraged to focus on the needs and aspirations of people who traditionally do not participate in adult education or are not interested in formal qualifications, for instance, the elderly (Rubenson, 2006). In the recent years, however, the state subsidies have been decreasing; however, popular adult education in the Nordic countries is, as distinct from most other countries, still a state-funded as well as a self-governing area. As stated by Swedish researchers, popular adult education in Sweden is “part of the corporate state lying at the crossroad between civil society and the state ... at the intersection between the system world and the life world” (Gustavsson *et al.*, 1997).

Latin America

Outside the Nordic countries, popular adult education has almost exclusively been associated with the work and pedagogy of Freire, and has been described as “one of the most original and refreshing contributions that Latin America has made to universal pedagogical thinking” (Mera, 2005). Indeed, popular education is almost

conceived as a Latin American invention and mainly associated with the endeavors of social transformation in Third World countries. In the Latin American context, the term popular education, as Kane (2001: 247) observes, has been more sharply defined and the commitment to side with the oppressed is more openly spelled out. Building on Freire’s work, popular education has been advocated as a political, social, and educational process with the overall aim of counteracting the dominant worldview and creating an antihegemonic culture (Kane, 2001: 8–13). Its foundation is the convictions that grassroots people can collectively achieve critical consciousness and, from this awareness, act to challenge unjust uses of power that affects their social realities.

A pedagogical principle that Freire outlined in order to actuate the process of consciousness raising or conscientization was acquiring knowledge by way of problematizing the natural, cultural, and historical reality in which one is immersed. Another basic element is his thinking about language as inherently linked to culture which may thus convey a certain culturally transmitted worldview. Accordingly, language can both question and strengthen culture (Finger, 2005). The popular education approach is therefore making sense of the world to the ordinary people by uncovering and decoding languages (words) and meanings (themes) of their own. This must come through dialog, which in the Freireian sense is a process of generating and sharing the true word and actively naming and transforming the reality of the world (Han, 1995). This fundamental view of the teaching and learning transaction as a dialog is shared by Grundtvig and many other popular education theorists. However, far stronger than most others, Freire maintained that reflection through dialog means action, and emphasized that all education is political. A major aim of popular adult education is therefore to help participants put knowledge into practice. Under dictatorship in Latin America, popular education became a way of doing political work and naturally linked to the radical left-oriented policy and participatory research in cooperation with local groups. A basic principle politically as well as pedagogically is that it must be education with the people, not on their behalf, based on people’s experiences, and aiming toward empowering the ordinary people to become subjects of change.

In Latin America and Third World countries, educators inspired by the pedagogy of the oppressed often had to work among illiterate people; therefore, popular adult education is often identified with literacy and elementary education. Moreover, education with illiterate people also means drawing on popular culture and starting from the concrete, using drama, song, dance, art, and storytelling. Popular culture is here to be distinguished from elitist culture institutions and from the mass culture. One concrete example is Augusto Boal’s experiments with the People’s Theatre in Peru in the 1970s (Boal, 1979). Similar

efforts of using theater, dance, etc., in making the subaltern classes articulators of social and political change and waking up peoples' culture of silence, have also been, more or less successfully, executed in developing countries in Africa and Asia. The popular theater has best served the popular education approach when it has managed to not only make people aware of, but also activate participants (transforming Spectators into Spect-Actors!) in, the critical analysis of what is presented and mobilize them for taking action in their own development. At worst, it has been based on a developmentalist approach whereby popular theater forms are used to communicate government policies or to impose outsiders' views of what people need (Mluma, 1991; Lange, 1995; Bates, 1996).

Basically, popular education is defined by initiatives from below and on the grassroots level, and, in Latin America, has traditionally acted against the (oppressive) state. This was not always true in Europe, and, even in Latin America, could be a public- and state-initiated project. One example is the popular education in Nicaragua. After the revolution in 1979, the Sandinistas immediately started a literacy crusade that they followed up with a popular basic education campaign in which they copied Freireian methodology and principles. Both can be characterized as a massive training of the common people and presupposed an intensive training of teacher as well. Radio and newspapers were also put to use. However, it was a state-driven and-funded project, and some of the popular educators such as Fernando Cardinal occupied posts in the ministries of education in the 1980s (Flores-Moreno, 2005). The Nicaraguan example as well as similar educational initiatives of revolutionary movements in Latin America and elsewhere do, however, question whether education that is totally absorbed by the state or a movement in order to implement a specific policy or ideology can be termed popular. It might rather be characterized as a pedagogicalization of politics (Han, 1995).

North American examples

Popular adult education is primarily a specific form of social movement learning; however, initiatives and activities can often be traced back to individual educators. In North America, the Highlander movement is a prominent example of personal initiative and influence. It all started in 1932 when Myles Horton together with Don West founded the Highlander Folk High School in one of the poorest areas in Tennessee. Highlander did not provide mass education, but worked with leaders from several organizations or communities. Horton's assumption was that the leaders would take what they learned at Highlander and work with other actual or potential leaders and, thus, let the influence of Highlander multiply over larger numbers of people (Peters and Bell, 2001). His early contribution to popular education was then to combine the aims of social movement building and leadership training.

The creation of citizenship schools in the 1950s became, however, a mass activity. By 1970, these schools had helped 100 000 African Americans to read and write (Peters and Bell, 2001). The teachers followed the same principles and ideas as Freire and, in this way, made the citizenship education similar to popular education elsewhere. With the reorganization of Highlander to the Highlander Research and Education Center, its mission became to be an important alliance of the civil rights movement; thus, it retained its popular educational approach.

Another North America example of personal initiative is the Antigonish movement in Nova Scotia led by priest, philosopher, educator, and social reformer Moses Coady (1882–1959). His program was to organize shore fishermen so that they might be able to assist in formulating policies for the industry, promote scientific and technical education, and utilize the methods of producer and consumer cooperation. His work was founded on a strong belief in education as the solution of the economic problems of the region. Moses declared that education must begin with economics and proposed cooperation as an alternative third way between capitalism and state socialism. One of his original contributions to popular adult education was the organizing of mass meetings, which inspired people to join together into small groups called study clubs or discussion circles. As with many Nordic study circles, these groups were part of the self-help movement and did not involve any teacher (Crane, 2001). Development after the war, however, was not in favor of the cooperative ideas based on self-reliance, and, as an example of popular adult education, withered away.

Current Trends

Following Kane (2001), we may identify three currents of thought. One is concentrating on democracy, citizenship, new spaces, and social actors. This trend is intertwined with mainstream pedagogy and makes popular adult education part of the social capital formation that is initiated by social movements and may be seen as occupying and expanding the public space within civil society. This is evidently the case in Northern Europe, which has witnessed a process of convergence between the popular and the general education. In addition, in Latin America, we may see a pronounced permeability and interchange between the discursive configurations of popular and adult education. There is a feeling among some educators that the historical relevance of popular education has been lost and there is a growing willingness to make links with public and traditional schooling. As a consequence, the political aspect is de-emphasized and more importance is given to the quality of education, access, participation, citizenship training, and new social issues (Kane, 2005; Ruiz, 2006). A second trend is focusing on

class and structural change while remaining sensitive to issues of identity and difference. This trend tries to maintain its political vision and commitment. An example is the Popular Education Forum for Scotland, which calls attention to the need for reinvigorating the questions of equality and justice and linking popular education to the political efforts of stimulating a democratic renewal (Martin, 2007). A third trend is less concerned with theory and ideology and more with throwing itself into the struggle and grassroots work. This trend is linked to new social movements that have transformed the popular education discourse from class and structure to ethnicity, race, gender, ecology, and environment. It has adopted a community, practical, and participatory democracy approach of which the participatory budget of Porto Alegre in Brazil serves as a prime example and inspiration (Myers, 2007). New forms of popular education now seem to take place on a global scale with the help of the Internet as is demonstrated by the work of new social movements, the World Social Forum, and Attac which use the World Wide Web in organizing meetings and activities, spreading information, and educating the people. The Internet not only opens up access to expert knowledge for everyone, but also gives the popular forces new possibilities to take part in the oppositional social movement debates of a global call for action against poverty and injustice (Preece, 2006).

In recent years, popular adult education has developed areas of specialism, that is, for specific groups or for specific matters. From the early 1980s, feminists from different countries have gathered under the umbrella term of feminist popular education and formed an international network. A central aim of this is to support the struggles of women in oppressed communities, rather than women in general, and the work is therefore closely related to other nonformal, community, or radical educational practices. The feminists have also linked social justice issues more broadly to the whole person, that is, to embodied learning, which refers to practices that engage the body, mind, spirit, and emotion (Walters and Manicom, 1996; Stromquist, 2004).

Common Dimensions

Despite the regional differences and the different currents of thought, there are at least three dimensions, which, taken together, can give a core meaning of the term. These dimensions are all bounded to a normative philosophy, but the strength of the concept is just that it is based on some few, simple yet powerful ideas: of political commitment in favor of the oppressed, of enabling ordinary people to become subjects of change, of recognizing many types of knowledge, and a methodology that allows these different knowledge to be shared (Kane, 2001: 230).

First, popular adult education has a political–ideological dimension that is linked to a social commitment. The critical approach seems to be at the heart of the popular education approach, and, in dictatorships and oppressive countries, popular education has a specific role of unmasking and challenging unequal relations of power in order to change them. Change is defined as progressive in the interests of a fairer and more egalitarian society, and, in this way, it works in the interest of democracy. However, education and politics are not two sides of the same coin as Myles Horton reminded us. He drew a line between the two, which corresponded to the distinction between education and organizing. If popular education is subordinated to the command of a political goal and ideology, it will turn into propaganda and indoctrination and take the form of political instrumentalism and pseudoschooling (Han, 1995).

Second, popular adult education has a pedagogical–participatory dimension since it tries to recruit and organize people for collective learning and action while, at the same time, maintaining education as a voluntary activity and free from external demands. This requires an educational methodology that radically calls into question the authoritarian teacher-centered practice and transmission of knowledge characteristic of traditional pedagogy (Han, 1995). The popular pedagogy is based on active participation of the learners, dialogical teaching, and sharing of experiences between the learners in such a way that all participants acquire knowledge and take part in a collective learning process. Indeed, the knowledge base of popular education comes primarily from the experiences of the people involved. The method is critical and problematizing, rather than one that produces answers. This education believes in and trusts ordinary people, and is based on the belief that people are capable of understanding and working to improve the conditions of their lives (St. Clair, 2005: 50). Ideally, it is education of equals characterized by a horizontal relationship between teacher and learner.

Third, popular adult education has an action-oriented dimension. Action usually means concrete forms of grassroots activities, which may change power relations. However, critical learning, which corresponds to this education, is also a political act in itself (Newman, 2005) and a critical consciousness is a precondition for action and social change. According to Freire, reflection cannot be separated from action. In Nordic countries, study circles will hardly lead to social and political action; however, it is supposed that they contribute to foster the prerequisite for democratic action (Larsson, 2001). The transformative potential of Nordic popular adult education is not associated with its affiliation to political radicalism, as is assumed in oppressive and developing countries; rather, it comes from the democratic and participatory characteristics of its pedagogy.

Conclusion

Popular adult education is a nonformal type of education that has emerged from the educational work of social movements and may be seen as a paradigm shift to escape from the instrumentalization, systematization, and institutionalization of traditional schooling. It also questions the system of examination in the traditional mode of education, which incessantly serves to reproduce social injustice and its legitimization. The idea of popular education has been formulated as an educational movement to challenge the monopoly of the dominant school mode of education and is capable of presenting alternatives (Han, 1995). Defined in terms of aims, popular adult education may be seen as a specific response in the pursuit of social transformation and change as well as contributing to personal development. Defined in terms of pedagogy and methodology, it is education founded on the principles of voluntarism, institutional independence, dialogical teaching, active participation and the sharing of experiences, and working toward a collective goal. In the Latin American context, popular education represents a critical approach to adult education, which has both a pedagogical aspect of consciousness raising intended to foster a critical awareness of reality, and a political aspect of organizing people for collective action and putting them together for real social change (Han, 1995). In the Northern European context, popular adult education is more about fostering people's participation in order to stimulate personal as well as social development. The meaning of the term will, however, vary with the social context as the concept is an open-ended process that continues to adapt to individual interests and needs, to the popular and collective struggle to expand one's freedom, to the pursuit of popular values and cultures, and to the sharing and acquirement of knowledge and culture.

Provision of Prior Learning Assessment

P Andersson, Linköping University, Linköping, Sweden

© 2010 Elsevier Ltd. All rights reserved.

Introduction

Prior learning assessment (PLA) is a topic that has emerged as a central aspect of the policy and practice of lifelong learning around the world. The topic is of interest in adult education as well as in higher education. It could be not only a matter of defining eligibility and widening of access to education, but also a matter of assessment for credit so that people do not study what they already know. Further, PLA is of interest in relation to work life, where it could facilitate mobility, competence development, and competence utilization. It is not necessarily always a formal assessment; more informal methods for recognition of and making learning visible (Bjørnåvold, 2000) could be seen as expressions of the idea of PLA.

The provision of PLA differs around the world. This article will not give a description of the provision of PLA in different countries. Rather, the aim of the article is to provide some general perspectives on PLA provision, independent of national context.

Different Terms and Acronyms

There are different terms used around the world to express the idea of giving recognition to prior learning: PLA is used in the United States; prior learning assessment and recognition (PLAR) in Canada; recognition of prior learning (RPL) in South Africa and Australia; accreditation of prior (experiential) learning (AP[E]L) in the UK; validation of prior learning (VPL) in the Netherlands; and *la validation des acquis* (recognition of experiential learning) in France, for example. These different terms will not be elaborated in detail here. Instead, the article starts from the general idea of PLAR to provide a discussion that is relevant for all readers, independent of national background.

The General Idea of PLAR

The general idea of PLAR covers a number of different aspects, of which the most central aspects will be discussed here.

PLA is about giving recognition to prior learning, irrespective of when, where, and how learning has taken place. The prior of prior learning does not prescribe a certain time gap between learning and assessment. It could be a matter of recent learning, but the time gap could also be wide – the basic condition here is the assumption that the individual has present knowledge or competence as a

result of prior learning. Where the prior learning was acquired could have taken place in people's daily life, in the work place, or in a foreign country for example, and learning could have taken place in the context of formal education – if that learning has not received relevant recognition – or more commonly in a nonformal setting, thereby giving this learning a more formal recognition.

One limitation in the irrespectivity of where prior learning took place is that the assessment within a course, of what has been learned in that particular course, is not normally defined as PLA. Rather, a second central aspect of the idea of PLA is that it is strongly related to transfer and mobility. PLA should facilitate transfer and mobility of knowledge and of individuals. What has been learned before – prior learning – is assessed to get present recognition. In addition to this transfer in time, PLA is also often a matter of transfer in space. The knowledge that is assessed is not normally developed in the same context as where it is assessed, which lies in stark contrast to more traditional educational assessments where the main object of assessment is the knowledge developed within a certain course or educational program. In PLA, informal and nonformal learning has taken place in everyday life, work life, voluntary organizations, study circles, etc., and is (often) assessed in an educational context. Another example of transfer through PLA is that prior learning could have been formally assessed and certified in one context, but if this certification is not valid in a new context a renewed assessment might be needed, like when professional immigrants come to a new country. Of course, there are exceptions from this transfer in space. Some processes of PLA are, for example, situated in a work place, assessing knowledge that has been developed before, informally, in the same workplace context.

The History of PLA

The idea of giving recognition to prior learning is not new. It has been present in different contexts for a long time, even if these practices have not been given a name.

Although its origins are commonly traced to the post-World War II USA (Weil and McGill, 1989), when returning veterans wanted their skills recognized by universities, RPL is not a totally new phenomenon [...]. Rather, it is the formalization and (re)naming of pre-existing practices concerning alternative access and admissions, mature age entry, and so on (Harris, 2006: 3).

Thus, the more explicit ideas of PLA have roots in the post-World War II era in the USA, in the context of giving recognition to the experiences of the war veterans, to help them settle back into a normal life. There are also roots in France, where “[a] law passed in 1934 concerning engineering allowed people over 35 years old with no higher education qualifications, who had worked for at least five years on activities which are normally those of engineers, to gain the official title of engineer through the preparation and presentation of a dissertation based on their work experience” (Feutrie, 2000). In the 1970s, the interest in PLA was growing in the USA, with the idea of social justice through widening access to higher education. In the 1980s the ideas from the USA had been transferred to the UK, where PLA moved on to another area, the labor market and vocational training. Aiming at economic development through better competence utilization, methods for recognition of vocational competencies were developed. In France VAP was developed. Of course, the idea spread to other countries too, but the full history of PLA is beyond the scope of this article (for further descriptions see, e.g., Evans, 2000). However, two more emerging aims of PLA should be mentioned: (1) from South Africa, the utilization of PLA in a process of social change (in South Africa, RPL) as a possible tool to give recognition to prior learning and experiences among those with limited access to education during the apartheid era; (2) the identification of possibilities of PLA for developing self-knowledge and strengthening self-esteem (see, e.g., Cleary *et al.*, 2002; Andersson, 2006).

Differing Aims and Approaches

As we see in the history described above, different aims of PLA are discerned: social justice, economic development, social change, and individual development. It should be pointed out that these different aims are parallel to aims promoted in relation to the provision of adult education. PLA should promote social justice, for example, in relation to the admission to higher education – like availability of adult education is a matter of social justice. PLA should also promote economic development, through the process of recognizing knowledge and competence, which results in better opportunities to make use of these in the work life. This is parallel to the provision of vocational education/training for adults. Further, the idea of PLA as a tool for social change, like in South Africa, is similar to ideas of popular adult education, related to social movements with the idea of changing society through literacy and mobilization, for example. Finally, PLA for individual development is a matter of strengthening self-esteem and self-confidence, which is an important aspect of some adult education as well.

Different approaches to PLA have been typified in different ways. One categorization is between PLA adapted to the system, as compared to PLA changing (or intending to change) the system (Andersson *et al.*, 2003, 2004). Here, system should be understood in a generative way – it could be contributions to changes of the social system as a whole, like in South Africa, or a change of the system of education or of a single course. Among other things, this puts focus on the question of power in PLA provision. If PLA is adapted to a certain system, this means that PLA is based on an established distribution of power, where the assessment is often based on norms and criteria that are rooted in this system. For example, the assessment could be based on the pre-assumption that learning takes place in organized educational processes, rather than through informal processes, which could result in the exclusion of certain knowledge from the process or recognition. The Procrustean RPL (Jones and Martin, 1997) is an example of this type of approach, assessing people as if they were all cast in the same mold.

According to Procrustes, a ruler in Greek mythology, everyone could fit into his bed regardless of their size and shape. If anyone was too short, he placed them on the rack and stretched them. If they were too long, he would chop off their feet. (Jones and Martin, 1997: 16).

On the other hand, there are approaches that are, more or less explicitly, aimed at changing the system. Trojan horse RPL (Harris, 1999) is a category of approaches that bring new groups into a system, and by taking their experience and knowledge seriously a change of the system from within becomes possible.

There are also other ways to categorize different approaches. For example, the difference between credit-exchange and developmental models is identified (Butterworth, 1992), and another categorization consists of the technical/market, the liberal/humanist, and the critical/radical perspectives (Breier, 2005). These differing aims and approaches have turned up in different contexts during the history of PLA.

A Broad Spectrum of PLA Methods

As mentioned, PLA in a general sense could include a broad spectrum of activities, not only formal assessments but also other types of processes to give recognition to prior learning. On the one hand, some of these activities are formal and standardized, with multiple-choice tests – like scholastic aptitude tests. On the other hand, there are PLA activities that focus on the individual and particular aspects of knowledge, to give recognition to a variety of competencies – for example, in a portfolio. This broad

approach to the idea of assessment and recognition of prior learning, focusing not only the assessment *per se* but also recognition in a wider sense, means that the idea covers a spectrum from divergent (exploring and descriptive) assessment to convergent (controlling and examining) assessment methods (cf. Torrance and Pryor, 1998). Another definition of divergent and convergent assessments is that divergent methods focus on what the individual knows, while convergent methods focus on if the individual knows certain (predefined) things. It should be noted that this division between convergent and divergent methods is not a dichotomy. It is rather, as in other types of assessments, a matter of a continuum, where a certain method to some extent is more or less convergent and less or more divergent. However, putting forth this divergent–convergent dimension in the context of PLA highlights the problems in terms of validity that might be the result if the irrespectivity of when, where, and how is taken seriously, unless more divergent methods than in traditional educational assessment are considered. That is to say there will be problems making valid assessments with convergent methods, if the degree of validity refers to the extent to which PLA provides a fair assessment of what has been learnt in different times, contexts, and ways.

Different Methods in Practice

The ambitions of PLA could be reached in a number of ways. Different methods are used in different contexts, and some of these methods will be exemplified here, namely portfolios, interviews, standardized tests, traditional tests, and authentic tests. These methods are, of course, not only used in PLA, but they are also often used in different PLA approaches and illustrate the broad spectrum of PLA.

The portfolio represents a group of methods used in somewhat different ways. Challis (1993) has, for example, identified the difference between the outcome-related and the self-oriented portfolios. In the portfolio, the PLA candidate brings together documentation or proofs of his/her prior learning. These could be formal documents such as grades and certificates as well as less formal documents such as a testimonial from a former employer or an NGO (nongovernmental organization) where the candidate has done voluntary work. Another part of the contents of a PLA portfolio could be examples from your prior production of goods or texts. The proofs could be brought together and assessed in relation to certain convergent learning outcomes, but they could also be more divergent and self-oriented, that is, the task of the candidate in the latter case is to prove the personal competence, and it is the assessor who might relate the proofs to goals or criteria.

Interviews are used in PLA, for example, as a more divergent starting point to find out the potential of the candidate, particularly when the area of knowledge to be assessed is not given. The interview could result in a mapping of (possible) knowledge and competence, which might be further assessed with other methods that provide more valid proof of the knowledge in question. Depending on what knowledge area the assessment covers, interviews could also be used in more convergent PLA. For example, an oral examination could give a better picture than a written test of what an individual knows in a theoretical subject area, if the knowledge is developed in untraditional ways and without learning the traditional way of presenting it with paper and pencil.

Standardized tests are another method used in PLA. A typical example is a scholastic aptitude test. A multiple-choice aptitude test can be used in the selection of applicants, for example, for higher education. The predictive test assesses knowledge independent of where the learning has taken place. Thus, any prior learning could be important when taking such a test, even if the convergent character of the method means a limitation of what is actually made visible.

Traditional tests – tests (or other assessment methods) used in the school system – could be used to assess prior learning too. However, a problematic issue could be that these tests are adapted to an organized learning in formal education, rather than to more divergent learning experiences from other contexts, which might reduce their usefulness in PLA. It should also be noted that all educational assessments to some extent could be a matter of PLA – as an assessor you cannot know if/what the students or pupils have learned in the class or somewhere else.

Authentic tests are still another group of methods in PLA, aiming at assessing competencies in an authentic or simulated environment. The rationality of using authentic tests in PLA is that the results of prior learning that has taken place outside school are assessed there too. These authentic tests are, for example, used in the assessment of vocational competencies developed in the work place, competencies that in this way are assessed in the original context of learning.

Theories of Learning Underpinning PLA

We can see how different theories of learning explicitly or implicitly underpin some of the different approaches to PLA that are discussed above. Here the portfolio method and the authentic assessment exemplify this and will be related to different theories of learning (these theories will not be described in detail here, but will only be mentioned briefly).

Experiential learning (Kolb, 1984) is the basis of many portfolio methods in PLA. The basic idea is the learning cycle, where concrete experience, observation, abstract conceptualization, and active experimentation, etc., form a process of learning from experience. However, there is a discussion concerning how these methods value individual experiences and knowledge as compared to collective experiences and learning processes. Individual(istic) portfolio methods are thus questioned based on the assumption that informal learning in collective contexts is not valued in a fair way in these approaches.

The idea of situated learning (see, e.g., Lave and Wenger, 1991) is (at least implicitly) the basis of authentic assessment methods, where the ambition is to assess knowledge in the context of where it has been developed and thus is situated. The questions concern if these methods really become authentic and holistic, or if the result is a behavioristic and atomistic approach (the latter seems to be the case when detailed lists of required competencies are the basis of, for example, certain vocational qualifications). These (or this group of) situated learning theories also help us understand problems with PLA in relation to transfer and mobility. From a situated perspective, it is not evident that prior learning from one context could be transferred and having the same value in another context, where the demands are actually different. The differences are related to tools (language as well as material tools) and to the social systems.

The Value of PLA

What is the value of developing different PLA methods? The main value is that PLA identifies the value of knowledge (stemming from prior learning). On the one hand, the knowledge could have an exchange value. When the PLA process results in a formal documentation of knowledge or competence, the exchange value means that the candidate through this documentation, for example, could be admitted to an education/training program, could get a job and/or a higher salary. More informal assessment or recognition processes could of course have similar results as well, where prior learning is given an exchange value. Further, the exchange value of knowledge, identified in PLA, is not limited to the individual level. For example, it might have an exchange value for a company to know, and be able to show potential customers, that there is a high level of competence among its employees. On the other hand, knowledge often has a use value. Thus, PLA is identifying knowledge that is useful. When we are aware of this knowledge, it is easier to use it, to put it into action. This value is also relevant on an individual as well as on an organizational level – the value for the company is not only the exchange value but also the possible utilization of the employees' prior learning.

Critical Perspectives on PLA

The development of PLA has been discussed and criticized from different perspectives. Some of these discussions will be covered here, concerning the situation of prior learning/knowledge, the authenticity of authentic assessments, and the governing character of PLA. For a more extensive discussion, drawing on perspectives from assessment theory, the sociology of education, poststructuralism and situated knowledge/learning theory, activity, actor-network and complexity theory, and symbolic interactionism, see Andersson and Harris (2006).

PLA has been developed in a Western context, with an underpinning perspective on learning as an individual process. As mentioned briefly above in relation to the portfolio, this individualistic approach has been questioned, and not only in relation to the portfolio. The main point in this critique is that (particularly) informal learning is taking place in a collective process, which is better understood in terms of situated learning or situated knowledge (see, e.g., Michelson, 2006). A focus on assessing individuals, and individual learning outcomes, thus means that a lot of experiential learning remains invisible, in spite of the opposite ambition of PLA. The argument is against the Enlightenment epistemology and for a perspective of situated knowledge, or as Michelson (2006) puts it:

Reinscribed within a theory of situated knowledge, RPL can become a venue for examining how each of us moves back and forth between our own particular stories and the social production that is knowledge and for challenging oppressive taxonomies of knowledge and the power relationships they enact. It can grant visibility to knowledge that is valuable for its divergence from academic ways of knowing, not only its similarity, and affirm knowledge produced outside epistemologically-sanctioned locations, through dialogue within (and, when we are lucky, between) historically-situated communities. (Michelson, 2006: 157)

Are authentic assessments really authentic? As mentioned, some PLA approaches lean on assessment methods that are situated in an authentic or simulated context. The ambition is to assess in the situation where knowledge or competence was developed and is enacted. However, it could be argued that the assessment situation to some extent is artificial rather than authentic, even if it is situated in a context where informal learning takes place, outside the school context. It is not a part of the daily practice to be formally assessed when you use your knowledge (cf. Bowden and Marton, 1998). Thus the assessment results are not necessarily more valid in this case, even if they are viewed as authentic.

Do assessments adapted to the system provide a valid measure of prior learning that has taken place outside this (school) system? This exclusion of knowledge in, for

example, the Procrustean RPL has already been discussed above, and is a matter of governing of what knowledge should count. However, PLA is not only governing what knowledge counts. In a discourse analysis of policy on adult education and lifelong learning, PLA is identified as a technique for constructing and governing the adult learner (Andersson and Fejes, 2005). When learning is assessed more broadly, new knowledge about the learners is produced, which could be the basis of a more extensive governing:

Assessment, including validation, is a technique that colonizes the human as a knowledgeable subject; he is created as a subject by being an object of knowledge production. One way of reasoning about this colonization of the entire subject is the objective of knowledge. Formal knowledge has been, and is, a way of controlling the subject. The documentation in itself is an objectification of the subject and is the starting point from where techniques of governing are set in motion. Knowledge about the subject to be governed is the basis of all governances (Foucault, 1991) and, therefore, informal knowledge has not been given the same attention. What we now see is a trend where the informal and non-formal competence/knowledge should be transformed into formal knowledge. Consequently, this knowledge will also be the foundation of governing and control. Everything you do, lifelong and lifewide, constitutes experiences that are part of the construction of the competent adult. The subject to be governed is constructed as a different subject than was previously the case. (Andersson and Fejes 2005: 610)

Conclusion

We have seen how the provision of PLA has developed in a divergent way – with differing aims, approaches, and methods, more or less adapted to, or potentially changing, the present system of education, and more or less convergent/divergent. A particular approach also means that a certain epistemological position is taken – explicitly or implicitly. Independently of approach, a process of valuing knowledge is enacted through PLA, a process that identifies the exchange and/or use value of knowledge and that includes knowledge stemming from informal and nonformal learning to a higher extent than other educational assessments. However, there are also critical perspectives on PLA. Even if new types of learning/knowledge are included, there are also processes of exclusion present in PLA. For example, PLA has been criticized for its individualistic approach, which possibly excludes knowledge that is developed and situated in collective processes. This way of defining what knowledge that counts is one side of the coin when it comes to critique of the governing aspect of PLA – the other side is the

governing of the adult learner, where PLA means that the process of assessing a broader scope of learning also means that it is governing in a more extensive way as compared to traditional educational assessment.

The Age of Learning: Seniors Learning

P Jarvis, University of Surrey, Guildford, UK

© 2010 Elsevier Ltd. All rights reserved.

Older learning has become a major focus in international and national government's educational and social policies. Indeed, in support of the International Year of Older Persons, United Nations Scientific, Educational and Cultural Organization (UNESCO) and the National Institute for Adult Continuing Education in UK combined to issue a small pamphlet calling for older adults to have opportunities: to manage themselves and their quality of life; to have access to adult learning without there being an age limit to learning; for new learning; to contribute to the development of both themselves and their societies (UNESCO, nd). This article explores so many of the developments that have occurred in recent years that indicate how societies are changing in this respect. It has three main parts: the age of learning, retirement and retirement education, and organizations that promote older learning. Finally, there is a brief conclusion which makes reference to the wider benefits of learning.

The Age of Learning

The global economy has also been called the knowledge economy: products and processes have to be developed and marketed by the most efficient and effective methods. This has called for a greater investment in all forms of knowledge production and for a greater proportion of knowledge workers than ever before in humankind's history. Education has become more widely accepted as a lifelong process than ever before, despite the fact that the first book on lifelong education was written as early as 1929 (Yeaxlee, 1929). But now, it is accepted that this is an age of learning, rather than of education, and lifelong learning is a frequently employed term: it is recognized that seniors can and do continue their learning throughout the lifespan. However, it is important to recognize that they have been the driving forces of global capitalism that have generated this changed approach to learning (Jarvis, 2007; *inter alia*). It is significant to note, however, that as Stehr (1994) points out the new learning age emphasizes scientific, technological, and social scientific knowledge rather than the humanities, as Kerr *et al.* (1973) predicted. This restricted approach to knowledge meant that the broad educational program of the educated person began to appear out of date as competent professionals were sought. Now, however, a new model might be appearing within the context of lifelong learning whereby younger adults concentrate upon the sciences, technology, and the work-based subjects while liberal education

becomes a focus in the latter years of life when seniors have the time and inclination to reflect upon life itself and its meaning – if it has one. The education of elders, therefore, has assumed a totally different approach as a leisure-time pursuit which includes academic learning but which is not exclusive to it. Indeed, one other effect of globalization on the lifelong learning of elders has been the growth in educational tourism – an activity in which healthy seniors have been able to participate fully, as is seen below.

While globalization is the major cause for the development of this learning age, the focus on older learners may be seen as much as a result of demographics since we are living longer in an aging world. This is certainly the outcome of the improved standard of living that many people have enjoyed over the past century. Globalization and demographics, then, underlie the development of educational gerontology.

Education and Learning

In order to explore the idea of seniors' learning, it is necessary to unravel the complexities of definition underlying lifelong learning. The European Commission, for instance, defines it thus:

all learning activity undertaken throughout life, with the aim of improving knowledge, skills and competences within a personal, civic, social and/or employment-related perspective. (EC, 2001: 9)

However, this definition actually conceptually confuses education and learning: learning, however, is personal and existential and transcends education. While there has been considerable debate within education about the nature of learning and a variety of different approaches and definitions have been suggested, combining them all within an all-embracing definition, learning, which is a lifelong process, may be defined as:

the combination of processes throughout a life time whereby the whole person – body (genetic, physical and biological) and mind (knowledge, skills, attitudes, values, emotions, beliefs and senses) – experiences social situations, the perceived content of which is then transformed cognitively, emotively or practically (or through any combination) and integrated into the individual person's biography resulting in a continually changing (or more experienced) person (Jarvis, 2006: 134).

This definition emphasizes the fact that learning is not just a cognitive exercise and that our whole life experience is learned. In contrast to the existential, lifelong learning may also be seen as a social institution which is as education, as opposed to personal learning, and may be defined as:

every opportunity made available by any social institution for, and every process by which, an individual can acquire knowledge, skills, attitudes, values, emotions, beliefs and senses within global society (Jarvis, 2007: 99).

Lifelong learning, then, is personal existential learning and recurrent education. In a sense, these two definitions also combine the more traditional ideas of informal, non-formal, and formal learning: formal learning being that which is organized within the traditional educational institution, nonformal is organized learning but does not occur within the traditional classroom setting and informal learning occurs during the processes of everyday interaction. As people age, there are fewer opportunities for them to engage in formal learning in many countries of the world, although where open universities have been founded, such as the British Open University and the Greek Open University, age is no barrier to entry to formal education and in many other countries, we are beginning to see universities and colleges open classes to older adults, as we shall see below. Additionally, there are more opportunities provided within society for nonformal learning. It is shown throughout this article that nonformal and even nonacademic learning is where the growth in education for seniors is to be found. This is to be expected since in later life, people follow their interests and attend to activities that are relevant to them – a point that Knowles (1980) stressed when he discussed the practice of andragogy.

Definitions of an Older Person

Traditionally, at the age of 65 years, a person has been deemed to have reached old age, but now we are living longer and so the question of who is old becomes a much more contentious question. Indeed, in 2004, in the UK, a 65-year-old male could expect to live a further 16.7 years, an increase of 4.4 years since 1971 whereas a female could expect to live a further 19.6 years, and increase of 3.3 years since 1971 (HMSO, 2006: 100–101). This has meant that the concept of old age is undergoing something of a re-definition with some educational gerontologists suggesting that middle age now finishes at 70 years. (This was a suggestion made by Dr Jim Fisher of Milwaukee Wisconsin University.) Nevertheless, it is still possible to treat the start of the third age in life as something between 60 and 65 years and that of the fourth age as

75 years, or as when a person loses the capacity to live independently. However, it is possible in the UK to join the University of the Third Age from the time when a person is no longer in full-time paid employment. What is clear is that people are living longer and that the span of old age is increasing quite considerably, which has resulted in some research projects now being government funded into the very old in order to prepare policies for future eventualities.

Statistics

It is impossible in a brief article like this to review the population statistics for the whole world but it is commonly accepted that the world's population is aging and Western Europe is a graying population (HMSO, 2006: 11) – it is the oldest region in the world (UNESCO, nd) – and the figures for the United Kingdom tend to confirm this. By the year 2021, it is estimated that UK will have a population of 64 729 000 people, of whom 19.67% will be 65 years and older while 9.47% will be 75 years and older. In contrast, in 1971, the population was 55 928 000 of whom 13.25% were 65 years and over and only 1.54% was 75 years and over, but in that year there were 25.49% of the population under 16 years of age compared with an estimated 17.61% in 2021 (HMSO, 2006: 10). Similar statistics can be discovered for the USA which will have an estimated population of 70 million people, 65 years and older by 2030 (McGuire *et al.*, 2005: 443), which is why these authors advocate the introduction of aging education as a national imperative. McGuire *et al.* (2005) now suggest that there are about 16 000 senior citizens centers in the USA.

However, by 2020, it is anticipated by the World Health Organization that 1 billion people worldwide will be classed as older persons, with 700 million living in developing countries: China will have 230 million, India 142 million, Indonesia 29 million, Brazil 27 million, and Pakistan 18 million. These five countries will be among the ten countries with the largest number of older people in the world. Additionally, by 2020, Japan will have 31% of its population classified as elderly and many countries will have a high proportion of its population over the age of 80 years (UNESCO, nd).

Retirement and Preretirement Education

Traditionally, the age of retirement in UK, and elsewhere in the world, has been 65 years for men and 60 years of age for women. As work has become more knowledge orientated, more women have been able to find employment and so their working lives have in some cases become similar to men's. In addition, as society has become more consumer orientated, it has become incumbent upon husbands and

wives to work so that the family can enjoy the wealthy consumer lifestyle presented in the mass media and so we find that in Europe, in 2004, 70.9% of men and 55.7% of women work (HMSO, 2006: 53). However, it is now being mooted that the statutory retirement age should be later – perhaps 68 years. There are at least two reasons for this: first, pensions were planned and financed on a shorter life expectancy and age discrimination has meant that it is more difficult for employers to terminate work when an employee reaches retirement age. Indeed, it has been discovered that many people continue to work long after retirement from their job at retirement age, even to the extent of being re-trained for new forms of employment.

In addition, in the UK, 23% of men and 11% of women worked over 48 h a week in 2005 (HMSO, 2006: 59). This has meant that for many people, retirement is a momentous change in lifestyle and this has been exacerbated by the fact that society has done very little to ease this status transition. Consequently, some enlightened employers have run preretirement education courses or have released their staff to attend such courses a few months or so before retirement in order to prepare for the change. Sometimes, such courses have been run by the human resources or welfare departments of employing organizations but often they have been run by colleges and other educational institutions on behalf of employers. Fundamentally, these courses are designed to help retirees consider their futures in terms of identity, health, wealth, and leisure-time pursuits. In more recent times, however, the idea of preretirement education has spread to developing countries and Ogunbameru and Bamiwuye (2004) have showed how older employees in Nigeria recognized advantages in preretirement education even though it was not widely practiced there – which indicates that preretirement education is now taking the place of instruction during the liminal period of the *rite de passage*.

Retirement is a time of major status change. In earlier times and in more primitive societies, *rites de passage* were very prevalent in social living and had three stages (van Gennep, 1960) – a ritual of separation from the former status, a period of liminality or transition, and finally a ritual of inclusion into the new status. The three stages facilitated the status change and also served to prepare the small community for the transition. It was during the transition period that those changing status were instructed into the ways of their new status before they were ritually incorporated into the new society. While the place of work has remained a more personal place, the wider society has become less personal and much more associational and flexible which means that it can adjust to minor changes, such as people retiring from work, without a great deal of tension so that it now has no need of the ritual. Hence, the ritual of inclusion has disappeared from contemporary society although the ritual of separation has still been continued and people are separated from

their place of employment and go into liminality but now retirement is an unfinished ritual because there is no rite of inclusion (Jarvis, 2001).

Stereotypes of Old Age

Old age clearly spreads over a considerable age range – from about 60 years to over 100 in some instances, so that there are certain stages of aging although studies like Sheehy's (1995) *New Passages* fail to explore them. However with the different phases, there are different images of the elderly and many of these are based on the idea of the aging body although some present pictures of the aging and poorly functioning brain through conditions such as dementia. While the study of stereotypes is beyond the scope of this article (see Featherstone and Wernick, 1995), it is important to recognize the interconnection of body and mind which is closely related to older adult learning and that they can continue to learn and benefit greatly from the process is now beyond question. However, many people in their third age do not like being associated with the image of the fourth age which reflects the ever-increasing life span. But many advertisements, often seeking to get people to invest in retirement insurance policies, depicting happy and contented retirement are now presenting a different, younger stereotype of older persons who are able to get engaged in the world during their extended leisure time.

By contrast, in societies where old age is much more respected, for example, Islamic societies like Turkey, it might be expected that old age would be seen in a much more positive manner but this is not necessarily the case. McConatha *et al.* report that:

Even in Turkey, a collectivist society where intergenerational contact is likely to be more common than in the United States, attitudes towards aging and old age tend to be negative. As the population of older adults grows in Turkey, it becomes increasingly important to address concerns regarding aging and the needs of older adults in order to avoid an increase in ageism. McConatha *et al.* (2004:180)

It is perhaps significant that as society becomes more individuated, younger people have fewer contacts with seniors than they did when the extended family was a more common phenomenon and so there has been an increase not only in family learning, but intergenerational learning and courses for young people to learn how to interact with older people. Lynott and Merola (2007), for instance, report that after a 5-month program of intergenerational learning in a school each year for 4 years, younger people's attitudes toward aging improved considerably. Additionally, such contacts also help older people understand more about the younger generation.

Learning and Intelligence

It was traditionally thought that intelligence increased during the early years of life but by early adulthood it had reached its peak and, thereafter slowly declined so that by old age it was impossible to learn new things: phrases such as “You can’t teach an old dog new tricks” reflects this generally held traditional belief. However, learning is both an existential and an experiential phenomenon as we saw from the above definition so that for as long as we have experiences we are capable of learning and the idea of people’s intelligence declining has been disputed many times since the distinction between fluid and crystallized intelligence was highlighted – the former is biologically based while the latter is experiential. Fluid intelligence is based, to some extent on memory stored in the brain and as the body slowly declines, especially as the synapses in the brain are destroyed, then the mechanism of the brain is affected and it has been suggested that fluid intelligence decreases. In contrast, crystallized intelligence is based on lifelong experience and for as long as individuals continue to remain involved in social life, through social interaction as well as through all other ways of learning, it increases. This has certainly given more credence to the idea that learning is experiential and some learning theorists (Jarvis, 1987, 2006; Kolb 1984; *inter alia*) have emphasized this in their own work. There have been many experiments in more recent times to demonstrate how seniors are still sufficiently intelligent to continue learning at advanced levels: in UK, for instance, there is a national award in adult learner’s week for the senior learner of the year, and so on – the winner recently was a 98-year-old man who had just completed a masters degree! Indeed, Kliegel and Altgassen (2006: 122) have concluded from their comparative study of 45 young adults and 45 old adults that from a developmental perspective, chronological age was not a significant factor in the explanation of individual differences in learning performance, and the existence of many organizations that promote older people’s learning supports this viewpoint. More recently, it has also been noted that many academics continue their teaching long past statutory retirement age even when their universities fail to support them. As Geoffrey Cantor says:

I have joined the army of retired academic in the arts and humanities who, out of commitment to their subjects have remained research-active. But I have been disappointed how little financial support there is (Reisz, 2008: 40).

Perhaps this prolongation of academic work calls for universities to rethink their retirement policies, although it has to be conceded that they still have to prepare for the future by assisting younger academics to develop their own knowledge and skills. This, then, is an employment problem for all employing organizations. At the same time, the fact that academics can continue to do this

demonstrates the fact that age is not necessarily a factor in intellectual decline. Indeed, two recent phenomena have been beginning to appear: the recognition that employers might want to retain their older workers and have to make work attractive to them, and they have to be prepared to adapt to a changing workplace (Yeatts *et al.*, 2000) and retired workers returning to new employments and even being trained for their new role.

Organizations That Promote Older Learning

As early as 1962, the Institute for Retired Professionals was founded in the USA by Hy Hirsch and sponsored by the New York School for Social Research: this was 10 years before the University of the Third Age (U3A) was established by Pierre Vellas at the University of Toulouse in France and it took another 10 years for the latter idea to spread to the United Kingdom. Despite the fact that the founder in UK, Peter Laslett was a Cambridge don, the U3A in UK has little connection with the university world. Each U3A in UK is an independent non-governmental organization (NGO), although there is a third-age trust which, in some ways, acts as a coordinating body. The diversity of U3As in UK is tremendous having 628 separate organizations affiliated to the trust and some 168 628 members as of March 2007 (as per information supplied by the third age trust). Significantly, the difference in the way these two types of U3A were founded reflects something of the difference in their approach to their activities: the ones that follow the pattern of the European continental ones are attached to universities and are much more academically orientated while those in UK tend to emphasize leisure as much as learning and it is generally recognized that only through cooperation can these diverse and independent U3As run more sophisticated academic groups, except the larger group who have sufficient members to run large and diverse programs. A small U3A, with a membership of just over 200, runs about 20 different regular-interest groups, has about eight open lectures a year, and engages in a number of social activities. There is another factor that affects the UK groups and that is the presence of the British Open University; since its foundation at about the same time as the U3As in France, it has offered formal education at a distance at undergraduate and postgraduate level to anybody and many of its students have been seniors. Indeed, for a period there was actually an older-learners-research group based at the UK Open University (Clennell, 1994: 39–46). Older people in UK seeking formal education and academic qualifications would naturally turn to the Open University and so U3As offer a wide intellectual and leisure time program with perhaps more focus of the latter than

their counterparts on the continent of Europe. At the same time, this democratic and local approach to seniors' education has not been without its critics. For instance, Huang (2006) has suggested that the standard of teaching and learning in UK U3As could be improved by utilizing more university-trained teachers since its present mode of operation cannot control the level of education offered and, at the same time, the locally based democratic system might be more efficiently organized. While the accusations have some justification, there is a sense in which the present U3A activities are performing two separate roles – those of leisure and learning – roles which are undertaken in the USA by the two separate arms of the Elderhostel Institute Network. Since the organizations in UK are growing, it is clear that they are responding to local demands and so no incentive appears to exist in many local organizations to change – even though it might be beneficial for them to anticipate future pressures for change at this time. In addition, it is clear that while the organization might be judged as inefficient in one sense, it is certainly democratic and is organized locally by autonomous local committees. Nevertheless, the U3A movement has spread more widely throughout Europe and beyond and has its own International Association of Universities of the Third Age (AIUTA) which has not been extremely effective in recent years although it has been in existence for many years now.

The need for research into older learners was demonstrated by the creation of Third Age Learning International Studies (TALIS) in 1990, founded by Jean Costa who was involved in Toulouse with the original founding of the University of the Third Age: TALIS was something of a breakaway from AIUTA because it wanted to concentrate on the academic study of third-age learning. From its outset, TALIS attracted scholars from all over the world, thus demonstrating the prevalence of older-adult learning.

In the USA, the development of the Institute for Retired Professionals took a totally different route: the Institute had begun under the sponsorship of the New School for Social Research in New York City but spread slowly. In 1976, however, a conference of interested parties led to these becoming known as institutes for learning in retirement. At roughly the same time (1975), in New Hampshire, another movement was born – Elderhostel and this grew extremely rapidly – offering educational travel. By 2006, it offered some 8000 programs throughout the world to about 160 000 members – its success once again reflects the significance of globalization and the wealth of the current retirees. However, it was in 1988 that 24 institutes for learning in retirement joined with Elderhostel to form the Elderhostel Institute Network. At about the same time, locally, they adopted the name Lifelong Learning Institute. The network is a voluntary association of lifelong learning institutes that are funded by Elderhostel. Lifelong learning

institutes run a wide variety of teaching and learning programs and they are often sponsored by their local universities, so that they approach the type of provision made by the universities of the third age on the continent of Europe. It is significant that the cognitive-interest-motivation factor is dominant among its members, if the small-scale study conducted by Kim and Merriam (2004) is to be taken as representative. However, not all centers are sponsored in this way and some are quite independent: for instance, in a relatively large retirement community (15 000 population) it has been possible to run a college for 30 years catering for a wide variety of learning interests of the residents (Streib and Folts, 2003). In contrast, Elderhostel clearly caters for the many seniors who want to travel and learn local knowledge at the same time. It is also not insignificant that the United Nations should run a network of university departments throughout the world which is involved in educational tourism and which seeks to preserve local knowledge. Elderhostel has also spread to Canada where it is now known as Routes to Learning.

Another model that has emerged in Germany and Spain, among other places, is where universities open their classes to seniors. This certainly occurred in Germany in the 1980s and in Spain, the so-called third-age classrooms, as the Spanish government would not permit the use of the term university, began to function as early as 1978 (Socias *et al.*, 2004) and by 1993 it was decided to open universities to seniors with the University of the Balearic Islands initiating an Open University for Seniors. Nine years after the universities opened classes to seniors, 50 universities had begun to offer programs specifically for seniors and Socias *et al.* suggest that these programs will become more institutionalized during the twenty-first century. In Japan, there has been a similar movement but Shirasha (1995) comments on the fact that many of the academic staff working in this area are untrained.

However, the Chinese who have always had specialist universities – for example, University for Banking – have also had schools and universities for seniors – the first began in 1993 and the number grew very rapidly. (Liu Pengsheng, 1994; Li Herzhong, 1997) For instance, the TALIS conference in 2002 was held in the Wuhan University for the Aged People. It is significant that the growth of these universities reflects the fact that in the Chinese 7-year development plan of work on the aged, all cities and counties should run schools or universities for the ages (Li Zhi *et al.*, 1997).

With this tremendous growth in elders' learning, it is significant to ask whether a new sub-discipline of adult education is not emerging and this is certainly something that concerned adult-education scholars about the time that Knowles introduced the term andragogy to American adult education. In the terminological debate of that time, humanagogy, gerogogy, and educational gerontology were

among the terms being discussed. Ultimately, the idea of educational gerontology has been the one that has come to the fore since it rightly locates the study of the education of elders within the context of education *per se* and as a major element in lifelong learning, although on the continent of Europe – where the concept of andragogy has more to do with the academic study of the education of adults than the process of teaching and learning, as presented by Knowles (1980) – andragogical terminology is still utilized.

Accreditation

It is very clear that most of the above educational institutes do not offer accreditation for their courses and neither do many seniors seek it. In the UK, for instance, if they do want it, there is nothing to prevent seniors from enrolling in the Open University or in some of the university degree-course programs. This is also true for many countries where universities have an open access and a general acceptance of part-time higher education but the idea of the continental European U3As offering accreditation for some of their courses has been discussed at various times. This has not occurred everywhere in world; however, such as in many parts of the old Eastern Europe and the so-called Third World, but as the development of part-time education is almost certain to continue, the idea of older (but working) persons attending lifelong educational programs will become more common place: this might well be a precursor to the development of a more extensive senior's education movement in these countries. However, accreditation for vocational education is important and this has meant that in some countries, such as UK, government has been prepared to offer financial support for part-time vocational education but not for part-time leisure education and therefore not for the greater majority of senior's education. This reflects the emphasis placed upon the relationship between education and work in neo-liberal societies. Consequently, poorer older people are still disadvantaged in the world of education because their education is not seen to make a contribution to the neo-liberal economy.

In contrast to this approach, it is worth noting that there are other ways of measuring the value of learning: the Chinese have a scale of the value of learning (Leung *et al.*, 2006) based on Confucius' aphorisms which has five items: continuing learning, no boundaries to learning, keeping fresh in one's mind what has already been learned, people will decline if they do not continue to learn, and the harder one learns the better. There are elements here that reflect ideas in gerontology, such as the discontinuity hypothesis – that for so long as people continue to stay involved in society and continue to learn, then they will continue to develop; but, once they disconnect from the wider society the chances of decline

increase. While this Chinese approach might not be the answer to accreditation in older learning, it does suggest other ways of measuring its value.

This scale reflects in some ways the work of Cusack *et al.* (2003: 398) who have emphasized the idea of mental fitness in which they suggest that there are nine items: confidence in mental abilities, ability to set and achieve goals, willingness to take risks, optimism, creativity, mental flexibility, ability to learn new things, flexibility and ability to speak one's own mind. To enhance these in later life, is clearly a major benefit of learning.

Cusack *et al.* review three recent research programs; they note that they all have a common benefits to learning – a more positive attitude to life and increased hope. They make the point that:

Hope plays a powerful role in life. More than a sunny disposition and a belief that everything will be fine, it means believing that you have a normal life, without fear of “losing it”, and that inside you have the resources to accomplish personal goals and influence the course of your life. Hope means believing in a better future; hope means not giving in to anxiety and depression. (Cusack *et al.*, 2003: 395)

While this research as a whole is tangential to our major concern here, its findings on older learners are significant for educational gerontology and it is perhaps significant that in a survey of publications, of 4 years, of the journal *Educational Gerontology*, the number of publications on health education and there were nine papers that were specifically concerned about dementia and Alzheimer's disease. There were also a couple of papers that focused on physical fitness and one which looked at mental fitness – as the papers show, these two cannot be separated: one paper only was concerned with depression. Two papers were specifically about counseling.

Conclusion

To these studies, there is an indication that perhaps “lifelong learning may prevent or delay the symptoms of dementia, notably Alzheimer's Disease” (Cusack *et al.*, 2003: 395). In their own studies, they demonstrate that intensive courses of study improve the level of mental fitness – but it also contributes to the improvement of the more general level of health. From their own work, they regard continuing learning as health-promoting behavior. Similar research in the United Kingdom reaches similar conclusion (Schuller *et al.*, 2002).

However, we should not assume that all older adults are longing to continue their education or that there are not barriers to it: not only do these barriers include untrained teachers but they include untrained

bureaucrats who fail to assist in the developments of learning for older adults, lack of financial support for those who cannot afford to pay for their own education, lack of confidence in their own ability and so a fear of failure, and a lack of mobility and a disengagement with the wider world. Indeed, one of the major problems which advocates of older learning are confronted with is that many older people currently have negative images of their schooling and so they do not avail themselves to the benefits of nonschool learning, but as those people who have worked in the knowledge economy retire, the significance of older learning will continue to increase at every level of society.

Globalization and demographic factors have combined to make learning across the whole life span a reality and educational gerontology is not an established sub-discipline within education. The significance of its findings, such as those related to physical and mental health, have not been fully utilized by governments in education, health, or welfare programs although with the continuing aging population, it is clear that elders' learning will be seen as a major contributing factor in governmental policy. Seniors' learning has a major effect on the social capital of local towns and regions and finally, its personal benefits are beyond question.

University Adult Continuing Education: The Extra-Mural Tradition Revisited

M Slowe, Dublin City University, Dublin, Republic of Ireland

© 2010 Elsevier Ltd. All rights reserved.

Introduction

The expansion of higher education across Organisation for Economic Co-Operation and Development (OECD) countries at the end of the twentieth century represented one of the most significant aspects of change in higher education in recent times. Taking 1995 as a baseline, student enrolments increased dramatically across the higher education sectors of 21 member states (OECD, 2005). The growth was largely driven by young school leavers where, on average, participation rates of the population aged 18–24 years increased by 70%, and young adults, aged 25–29 years, where levels of participation increased by almost 50% (OECD, 2005). However, in some countries, significant numbers of older students also entered higher education (OECD, 2005) – a pattern reflecting what some analysts considered to be the basis of a lifelong learning model (OECD, 1999).

While the trends in relation to participation in higher education in the developing countries outside the OECD vary, they also reflect expansion in general. The scale is enormous – a study of middle-income countries involved in the United Nations Educational, Scientific and Cultural Organization (UNESCO) World Education Indicators (WEI) program showed that far more students entered and graduated from these countries than in the 30 OECD member states combined (UNESCO, 2007). (Countries participating in the UNESCO WEI program are Argentina, Brazil, China, Egypt, India, Indonesia, Jamaica, Jordan, Malaysia, Paraguay, Peru, Philippines, Russian Federation, Sri Lanka, Thailand, Tunisia, Uruguay, and Zimbabwe.)

In 2006, for example, China had more tertiary graduates (2.4 million) than the top three OECD countries combined – United States (1.4 million), Japan (0.6 million), and France (0.3 million). Overall, however, the proportion of young people gaining a higher educational qualification in the WEI countries (19.7%) was about half that of the OECD group.

In exploring the topic of university adult continuing education (ACE) and looking behind these headline participation figures, three factors need to be taken into consideration. First, one of the key comparative indicators of the levels of participation is the age participation rate (APR). This measures the proportion of the population of the typical school-leaving age which progress to higher education. By definition, this refers to young people, and only rarely are such measures used to explore levels of participation by

adults in higher education. Second, much of the expansion in higher education over the last two decades took place in non-university institutions such as polytechnics, community colleges, further education colleges, and the like. The statistics, therefore, generally refer not only to universities, but also, more generally, to participation across all types of higher education institutions. Third, international statistics usually refer to full-time undergraduate entrants, whereas mature students are more likely to be found on part-time, distance, post-experience, and non-credit programs.

The term university ACE is open to different interpretations reflected, since the 1980s or so, in the shifting policy discourse at national and international levels (Duke, 1992; Bourgeois *et al.*, 1999; Davies, 1995; Osborne and Thomas, 2003). A benchmark international study of adult participation in higher education undertaken by the OECD 20 years ago distinguished between four categories of the adult student in higher education (OECD, 1987):

1. students who enter or re-enter higher education as adults in order to pursue mainstream studies leading to a full first degree or diploma (delayers, deferrers, or second chancers, i.e., those who are admitted on credentials gained by means of work experience or second-chance educational routes);
2. adults who reenter to update their professional knowledge, or seek to acquire additional qualifications, in order to change occupation or advance in their career (refreshers and recyclers);
3. those without previous experience in higher education who enroll for professional purposes, especially in courses of short duration; and
4. adults with, or without, previous experience in higher education, who enroll for courses with the explicit purpose of personal fulfillment (personal developers).

In a follow-up study nearly 15 years later, another categorization, based on a combination of three criteria associated with (a) entry routes, (b) modes of study, and (c) nature of program attended, was developed (Wolter, 2000).

This resulted in a six-fold classification.

1. those who take a vocational route to the achievement of the high school leaving examination (the second educational route);
2. special admission examinations (the third educational route);

3. students with high school leaving qualifications who undertake vocational training or work experience before moving on to higher education (the double qualification route);
4. students studying on a part-time or distance-mode basis;
5. graduates who return to higher education for continuing professional development courses (often of short duration); and
6. older adults taking continuing education courses largely for personal development purposes.

Building upon this work, and developing it further for analytic purposes, five different conceptions of university ACE can be identified in the international literature at the end of the first decade of the twenty-first century:

- The first conceptualization focuses on the age of the learner – namely, mature students, defined in most countries as those aged somewhere between 21 and 25 years above when entering higher education) as opposed to young, recently matriculated high school graduates.
- The second focuses on the mode of study – predominantly part-time or distance, as opposed to full-time or on campus.
- The third focuses on the type of program undertaken – for example, professional updating or retraining and noncredit or community courses, as opposed to undergraduate degree qualifications.
- The fourth focuses on the life course stage, or predominant motivation of the learner – for example, second chance or postexperience, as opposed to direct progression from initial school education.
- The fifth conceptualization focuses on the mode of organization of provision for adult learners – through specialist institutions (such as open universities) or centers with a dedicated mission to meet the needs of adults (of which the extramural tradition, considered below, is the classic example) as opposed to widening access for adults to mainstream provision.

Global Trends in Lifelong Learning and University Adult Education

The widely debated concept of lifelong learning (Coffield, 2000; Bagnall, 2000) figured prominently in national and international educational policy discourse for three decades, with some more limited resonances in higher education (Field, 2006; Scott, 1995, 1997; Tavistock Institute, 2002; Watson and Taylor, 1998; Rubenson, 2006). In Europe, in a research exercise conducted as part of the major higher education reform agenda across all the

member states of the European Union – termed the Bologna process – 54% of respondents indicated that their university had a lifelong learning strategy; a further 25% said that one was in preparation, while 19% indicated that they did not have one; and 2% did not reply (Davies and Feutrie, 2008). Within this shifting discourse, one focus of attention relates to access by adults to higher education – and the statistics do point to generally increasing levels of participation by those aged over 21 years in higher education. This trend, for example, was highlighted in a joint report from the American Council of Education and the European Universities Association (Green *et al.*, 2002). In the United States, on a head-count basis (which includes part-time students), approximately 40% of all undergraduates were over 25 years of age, while, in Canada, 31% were over 24 years of age.

The reasons behind this growth in the numbers of adults in higher education in some countries are complex – ranging from demographic trends through to the emphasis on the development of the knowledge society (Schuetze and Slowey, 2003). In many developed countries, demographic projections of a substantial decline in the numbers of young people coming through from schools fuelled concerns about skill shortages and recruitment problems for higher education. Human capital theories had also become highly influential among policymakers and politicians, sparking a renewed emphasis on the continuous need for updating and retraining of the workforce and focusing attention on the extent to which university systems, structures, and staff were, in fact, prepared to meet the projected demand from employers and the professions. Additionally, for institutions of higher education, continuing professional/vocational education was being viewed as a potential source of new revenue – increasingly important as a result of funding pressures from the neo-libero public policy agenda.

Over and above all of these factors, and interacting with them in complex ways, is the issue of equality of opportunity and access to higher education. In most countries, the social class composition of higher education remains unrepresentative of the population at large; women students have grown as a proportion, but are concentrated in particular disciplinary areas; and the limited information available on participation by those from ethnic minority groups shows variable patterns in different countries.

Also important are internal changes of a qualitative nature, such as more flexible provision, new approaches to teaching and learning, and an increasing emphasis upon quality assurance and the evaluation and certification of learning. The forms of knowledge creation and dissemination, the greater access to information sources, the use of new media and new channels of communication, the development of complex partnerships with employers,

and the growing marketization of education are all factors that have a major impact on where, what, how, and why tertiary/post-secondary students learn.

In fact, many of the features associated with the policy emphasis on lifelong learning in higher education can be traced back to a wide-ranging reform agenda of Western higher education systems. For the better part of half a century, this agenda has included an emphasis on the student experience, especially at the undergraduate level; enhancing teaching quality; developing partnerships with employers and other external agencies; strategic planning at an institutional level; and expanding interdisciplinary teaching and research.

International Patterns of Adult Participation in Higher Education

While higher education systems in developed societies are subject to common economic, social, and demographic pressures, resulting in increasing levels of participation by adults, evidence from an international comparative study of ten countries suggests that the differentials between countries appear remarkably persistent over time.

Schuetze and Slowey (2000) developed a threefold typology along a continuum relating to the levels of adult participation in higher education.

- First, countries with relatively high levels of participation by adult learners and demonstrating a relatively high degree of flexibility in relation to entry criteria and study patterns; this category included Sweden and the United States.
- Second, countries with significant, but lower, proportions of adult learners across the system as a whole, and in which adult students were frequently located in open universities or dedicated centers of adult or continuing education within mainstream institutions; this category included Australia, Canada, New Zealand, and the UK.
- Third, countries at the other end of the continuum with very low levels of adult participation in higher education; this category included Austria, Germany, Ireland, and Japan.

Analyses of the same ten countries over a 10-year period indicated that, while overall levels of adult participation in higher education had increased, the relative levels of participation between countries remained largely the same.

This analysis suggests that, while trends toward convergence can be discerned as a result of globalization, the forms taken by contemporary university ACE continue to be largely determined by the higher education traditions from which they spring.

Historical Patterns of University ACE

In order to understand current patterns of university ACE, it is necessary to have a broad appreciation of the historical traditions from which they emerge.

In relation to university ACE, three major traditions can be identified.

1. First, the extramural model of bringing university education to the adult population. The origins of this model can be formally traced back to the 1870s in the ancient British universities, and led to the development of dedicated adult education departments. These departments were unusual in being multidisciplinary, and devoted to the delivery of university programs which were specifically tailored to meet the needs of adult students. This extramural approach provided a conceptual model which, for complex historical reasons, has had a widespread international influence, in particular in Commonwealth countries.
2. Second, traditions of university ACE which are connected to the ideal of service by the university to local and regional social and economic communities. A significant example of this tradition arises from the land-grant universities in the USA, which included a particular mission to support community and rural development from the start.
3. Third, traditions where educational provision to adults, as a distinctive group, was not seen as a significant function for universities. This is particularly evident where the university traditions emphasized research, and ACE allocated to other agencies and specialist institutions, such as open universities or vocational organizations (e.g., Germany).

The complexity and variability of patterns is demonstrated in the findings of a comparative study of continuing education in universities across 30 countries. This showed that:

...activity with ostensibly different purposes, including continuing professional development, second chance education, education for leisure and social development, U3A and technology transfer, are all within the remit of continuing education. Increasingly, continuing education within universities has become blurred with other aspects of flexibility including part-time education, summer universities, open and distance education, accreditation of prior learning and work-based learning. (Osborne and Thomas, 2003: 20)

In terms of theoretical writing on university adult education, and the practice in many countries throughout the world (particularly Commonwealth members), the extramural tradition was, for much of the twentieth century, a particularly influential model. In order to better

understand contemporary variations, therefore, it is useful to have a familiarity with the origins of the values and objectives underpinning this approach to university adult education.

Background to the Emergence of the Extramural Model of University ACE

The movement for university extension, such as the *folk-universitet* in some Scandinavian countries, formed part of the widespread growth of interest in university ACE in the nineteenth century. The extramural model which emerged from the ancient universities of Oxford and Cambridge in England is of particular interest as it was influential both in terms of time scale (several centuries) and geography (throughout the Commonwealth and in many English-speaking countries).

Some of the earliest university lectures for the general adult population can be traced to those given by Francis Hutcheson, Professor of moral philosophy at the University of Glasgow in the 1720s (Hamilton and Slowey, 2005). It was James Stuart – another academic who also had spent time at Glasgow University – who is credited with articulating the idea of university extramural (beyond the walls) provision in Cambridge University (Fieldhouse, 1996). In 1873, the University of Cambridge agreed to organize, formally, programs and lectures in various centers, and Oxford also undertook to provide a number of programs through extension centers. Shortly afterwards, the University of London established the London Society for the Extension of University Teaching (Jones, 2008). The work grew in fits and starts, but quite rapidly overall; thus, by 1902, Oxford and Cambridge had established well over 900 centers with more than 20 000 adult student learners attending.

However, from the outset, the activists were concerned to attract a broader cross section of the population and, in particular, students from working-class backgrounds – an objective which remained strong throughout much of the twentieth century. The challenges included low levels of literacy, relatively high costs, and, perhaps most notable of all, the cultural gulf between establishment, upper-class culture, as embodied in universities, and working-class culture.

What would be termed today quality assurance was also a persistent problem. How could the university ensure that its extension programs were of a standard appropriate for university-level provision? In an attempt to facilitate and sustain more focused study, both Oxford and Cambridge introduced residential summer meetings for adult learners. Despite all the problems, university extension was a significant force in the later years of nineteenth century in Britain and, consequently, also shaped aspects of the higher education systems of many countries.

Another aspect of this tradition related to the strengthening of links between universities and broader social movements – for example, the Workers' Educational Association in the UK, which reflected a broadly liberal ideological stance, exemplified the influential early leaders of university ACE such as Temple, Tawney, Lindsay, and Cole. Nottingham University was the first formally to establish a department of extramural studies, in 1920–21. Within a decade of World War II, most of the major British universities had developed such departments.

In 1947, the extramural departments came together to form the Universities Council for Adult Education (UCAE). This continues as a significant policy body in university ACE through to the present time (2009), albeit with changes in title, to the University Association for ACE (UACE) and, recently, to the Universities Association for Lifelong Learning (UALL). Many other countries developed equivalent bodies, notably the University Continuing Education Association (UCEA) in the United States, which grew out of the National UCEA – one of the oldest college and university associations in the USA, founded in 1915.

From the beginning, UCAE asserted that liberal studies, although the core concern of extramural departments, should be complemented by vocational, professional, and technical course provisions to address the changing needs of the postwar society. The resulting pattern of provision was a combination of shorter liberal studies programs (sometimes indistinct from WEA provision), attracting predominately middle-class students, and professionally orientated provision, much of it for the growing numbers of employees in the welfare state.

Internationally, in many university systems based around the Anglo-American model, large centers or departments developed over this period. Such departments often held unique positions in the university: on the one hand, they were part of the mainstream university structure, with representation on Senates, professorial appointments, and the like; on the other hand, however, they were also, in many important respects, separate and different, and more connected to their local communities.

Structural Tensions – Inside or Outside the Walls?

Structural tension – being partly inside, and partly outside, mainstream university structures and processes – is a distinguishing feature of the centers, institutes, and departments which have grown out of the extramural tradition.

To begin with, they are often separately funded, and, importantly, have the opportunity to generate their own direct fee income; their students are adults and part time, not standard age and full time; their teaching is

often off-campus and at nonstandard times; and they are multidisciplinary rather than having a single-subject focus as conventional mainstream academic departments do.

At a rather different level, it is also interesting to note that not only did they include, in their number, leading public intellectuals – such as E.P. Thompson, Richard Hoggart, and Raymond Williams – but also gave birth to, or were the key catalysts for, the development of new interdisciplinary areas of research and teaching, later to become major parts of mainstream university provision – for example, cultural studies, women's studies, industrial studies, and applied social studies.

Typical examples of the forms of provision of extra-mural departments and centers for adult education over the last three decades or so include:

- liberal studies of the traditional kind, characterized by intellectual effort on the part of the student, and the attainment of a standard appropriate for university study;
- continuing education programs designed to support a change of career or life course;
- the development of part-time courses for credit leading to university awards;
- role education for groups whose common element was their role in society – often including work with the public sector and nongovernmental organizations (NGOs);
- industrial education at all levels from management to the shop floor;
- social purpose, community education, and outreach;
- project research work;
- training for those engaged in the education of adults – increasingly at the postgraduate level such as masters and doctoral programs;
- research in adult education as an academic discipline; and
- acting as a seedbed for innovative programs – frequently regarded, for one reason or another, as high risk by the parent university.

In relation to the last point, there has been a growing recognition in many countries that universities should undertake more innovative and pioneering work to open up new fields of study and attract new learners where the provision, once established, might be handed over to other agencies. This, for example, includes access provision and third-arm activities such as work with local communities, employers, or other groups.

With the rapid expansion of higher education over recent decades, the overall shape changed as many countries developed some form of binary structure. In the UK, this distinction was abolished in the early 1990s. One consequence was that financial support for adult university education was mainstreamed across the entire system, so that part-time students, and the courses on

which they were enrolled, had to be accredited as equivalent to at least the first year of undergraduate study.

This created considerable turbulence in the system, with many adult learners withdrawing. On the one hand, it had the potential to bring adult learners into the mainstream of the university system; for the first time, adults could study for and, if successful, gain university awards through university ACE. In one sense, this could be seen as something of a coming of age for ACE. On the other hand, and to quite an extent, this eroded the autonomy and flexibility of university ACE, and was regarded by some as undermining the student-led, democratic culture of the ACE tradition. It also reflected an international trend, also seen, for example, in the shifting focus of the folk universities of the Nordic countries which, while originally not aimed at qualifications, "...are now increasingly involved in preparing students for professional life or upgrading previous qualifications" (Fagerlind and Stromqvist, 2004: 258).

Global Trends in University ACE – Convergence or Divergence?

As has been shown here, the forms which university ACE takes vary considerably over time, are integrally connected with the traditions from which they spring, and are subject to the broader global changes impacting national university systems. The case of the extramural tradition considered above illustrates common challenges faced. In essence, these boil down to the issue of the mainstream versus the dedicated provision for adult learners. How this balance tips is influenced by broad social and economic factors, mediated through university strategies at particular times.

In reviewing the current situation of university ACE, five broad international trends can be identified.

First, much of the recent growth in higher education has taken place in institutions other than universities. In some countries, adult students are predominantly located in these institutions which, typically, have a particular mission to work in collaboration with local and regional communities, and to strengthen links with employers. While these trends can be seen more generally (typically characterized as moving from knowing what to knowing how (Barnett, 1992, 2005)), their impact on newer and nonuniversity institutions tends to be strongest. On the plus side, it is very often the elements of flexibility and relevance that are of greatest interest to many adults. On the other hand, however, the growing emphasis on international university league tables – such as the Shanghai and the Times Higher Education rankings – serves to reinforce differentiation and hierarchical positioning of research-intensive, elite universities compared to the broader spectrum of higher education institutions.

In practice, in many countries, adult students tend to find it easier to gain access to nonuniversity institutions, and to be less well represented in the highest-status universities. Whether this matters or not – as long as learning needs are met and successful outcomes achieved – is the subject of ongoing debate.

Second, the use of new learning technologies and new modes of delivery are widespread in the broader field of continuing education for adults. However, their impact on mainstream university provision remains variable. Therefore, the utilization of new learning technologies does not (yet) appear to have resulted in an anticipated blurring of boundaries between full-time and part-time students in most countries. At the undergraduate level, the resourcing and organizational model of most university systems remains orientated toward the traditional, full-time student. However, perhaps this might change in the future as the patterns of study of young students alter, as they increasingly combine study with significant employment commitments, and as higher education comes to be viewed as an activity to be pursued over the life course (Slowey and Watson, 2003). At the professional masters' level, the pattern may be somewhat different. Some countries – for example, many member states of the European Union, through the Bologna process – have seen the growth of modular programs at the postgraduate level, which are designed to connect with the world of work and continuing professional development.

Third, core values associated with the extramural tradition of seeking to widen access to university learning to the wider public do indeed appear somewhat beleaguered along with being somewhat marginalized in relation to the broader field of research on higher education. Aspects of university ACE are also increasingly connected with the growing commercialization of higher education as evidenced, for example, through the inclusion of higher education under the World Trade Organization General Agreement on Trade and Services (GATS). As some universities in the richer countries seek to develop provision in the continuing education market as a global economic initiative, this undoubtedly carries potential implications for capacity and sustainability of universities in developing countries (e.g., UNESCO, 2005, 2008). Furthermore, within and between nation states, the arena of lifelong learning is one which is particularly subject to the growth of the private sector and both profit and nonprofit higher education providers (Peters, 2001; Marginson, 2007).

Fourth, in contrast to the structural and ideological issues which arise in relation to universities engaging in direct provision of adult education, activities such as the training of adult education professionals, doctoral education, and research in the field of adult education are all areas that sit relatively comfortably within the university environment – frequently as a special section or unit within faculties of education (Hinzen and Przybylska,

2004). Given the continuing international policy emphasis on lifelong learning, and interdisciplinary research, these are all areas which have the potential to form an important part of the future development of university ACE, and specialist research journals with a focus on adult and lifelong learning represent a flourishing area of publication (Jarvis, 2006).

Fifth, in organizational terms, long-standing structural tensions between university ACE and parent institutions continue to be observed in the twenty-first century – albeit in rather different forms. It is possible to detect on-going debates about the role of units, centers, or departments which operate at the interface between the higher education institution and external stakeholders such as local communities, employers, trade unions, and the like. This inside/outside – sometimes marginal – positioning continues to offer independence and creative space (Taylor *et al.*, 2002). The price to be paid for this independence, however, may involve exposure to institutional policies which can vary over time.

Whether or not contemporary developments will see a new flowering of university ACE and lifelong learning and will usher in a new era in which universities engage dynamically and imaginatively with the whole community remains to be seen. Without doubt, the environment is a volatile and unstable one, and there is much to strive for in the context of university ACE and the broader area of educational and training policies relating to adults.

Civil Society: The Problem of Definition

It is important to understand that the idea of civil society has been defined and deployed in different ways at different times, depending on what kind of social and political struggles were being fought, and won or lost. The meaning of civil society is part of the particular arguments and struggles of particular times. Consequently, for example, contemporary interpretations in adult education range from (literally) conservative formulations such as Robert Putnam's influential account of civil society as the source of social capital to Gramsci's radical notion of civil society as a site of struggle for moral and ideological hegemony.

Walzer (1996: 7) identifies civil society as the "sphere of uncoerced human association and also the set of relational networks . . . that fill this space." Essentially, civil society, in its most widely accepted current usage, is distinct from the state (formal/representative politics) and the market (economic production, consumption, and exchange). It is generally understood to refer to those aspects of informal social and political life in which citizens come together in voluntary groups, associations, and movements to pursue their own collective interests and projects in freely chosen and relatively autonomous ways. Modern civil society organizations would therefore include, for example, trades unions and employer associations, churches and voluntary agencies, nongovernmental organizations (NGOs) and not-for-profit social enterprises, cultural and ethnic groups, and a whole range of popular campaigns, struggles, and movements. It is widely recognized that the vitality and relative autonomy of such informal and non-institutionalized political activity outside the state is an important precondition for the health of democratic politics within the state.

In reality, civil society is frequently in danger of invasion, colonization, and control by the state or the market. For instance, third way policies often seek to incorporate citizens and civic associations into particular kinds of partnership with state and market interests. Similarly, in their concern to roll back the frontiers of the state, neo-liberal programs of privatization and structural adjustment may turn civil society into little more than an extension of the market or a manufactured instrument of state policy (Hodgson, 2004).

Finally, civil society is an ideal as well as an idea. Essentially, it may be said not only to embody a vision of democratic associational life, but also to represent the site of the kind of prefigurative work that is required to show that another world is possible. There is an important sense, then, in which civil society should be understood as an "intellectual space, where people in a myriad of different groups and associations can freely debate and discuss how to build the kind of world in which they want to live . . . a realm of emancipations, of alternative imaginations of economic and social relations and of ideological contest" (Howell and Pearce, 2002: 2–8).

Adult Education and Civil Society Today

There are a number of distinct, but related, reasons for the remarkable revival of interest in the idea of civil society in recent years. These include: the failure and collapse of the totalitarian communist state and its command economy in Eastern Europe; fiscal crisis in social democratic welfare states and the effects of neoliberal retrenchment on public service provision; growing disillusionment with the politics of representative democracy and its characteristic

democratic deficit; evidence of the increasingly important role of NGOs and other third sector agencies in both service delivery and governance; and the growth of new social movements and their demands for radical political and economic change. Edwards (2004: 13–15) distinguishes between the developmental roles of civil society in economic, social, and political terms: it compensates for market underdevelopment or failure; generates social capital and informal welfare; and is the site for the development of grassroots people power. In the context of what he calls peripheral capitalism, Youngman (2000: 209/210) sees the functions of civil society in wholly positive terms as promoting democratization and constructing alternative models of development – in both respects giving power back to ordinary people. At a more theoretical level, the work of Antonio Gramsci has been of singular importance in presenting civil society as the key site of struggle for the radical left; in addition, in terms of democratic thinking, the ideas of Jurgen Habermas have been particularly fruitful and influential. The impact of civil society on real political change is evidenced in the recent history of varied examples such as South Africa, Latin America, Poland, and Scotland.

As Welton (2001) emphasizes, there is nothing necessarily progressive, or even civil, about the idea of civil society. On the other hand, it does tend to be deployed in its current usage to focus attention on struggles for greater democracy and freedom and against injustice and oppression. Essentially, it has been important in stimulating new thinking. For instance, on the post-Marxist left, the focus of interest on new social movements suggests that the traditional working class can no longer be regarded as the privileged agent of the emancipatory project (Mouffe, 1992). Indeed, some writers who take an interest in civil society adopt a self-consciously radical position. For instance, Powell and Geoghegan (2004: 7) argue that what they call the new face of civil society denotes “a force for democratisation in liberal democratic societies, where the poor and oppressed have found a voice through associational activities”, thus making common cause in the struggle against exploitation and oppression.

There is an important sense in which civil society can be conceived as the distinctive space in which citizens come together to make democracy work (Cohen and Arato, 1992). On the one hand, this learning process may be ideologically constructed in different ways for different purposes. It is quite clear that much adult education today, particularly in the guise of lifelong learning, is primarily an instrument of state economic policy. The kind of technical rationality which drives it has nothing to do with democratic deliberation or social purpose. On the other hand, it is also important to recognize that learning in social movements has always been part of a particular kind of adult education. Indeed, some writers would argue that civil society is the natural territory of

radical adult education. Welton (1995, 2001, 2005) suggests that learning, particularly the kind consistent with the emancipatory interest which lies at the heart of radical adult education, develops directly out of the communicative interaction that characterizes the groupings, associations, and movements of civil society.

Three Perspectives on Adult Education and Civil Society

The Communitarian Perspective: Learning for Membership

The key characteristic of the communitarian perspective is the focus on a decline in moral standards in civil society caused by a variety of interconnected social changes. These include permissiveness in the 1960s, the break-up of traditional family structures, a decline in social trust, the growth of a dependency culture nurtured by welfare provision, increases in violent crime, a lack of responsibility, particularly among the young and the unemployed, and the proliferation of minority rights (Etzioni, 1995). These trends were exacerbated in the 1980s with the thrust toward the unbridled pursuit of self-interest associated with neo-liberal politics and policies. Communitarianism aims to shore up the moral foundations of society by remoralizing those groups which cause social problems. Educating people to be more responsible and active members of civil society is posed as the remedy for this situation.

The conservatism of communitarianism might have had very little appeal to many adult educators. However, its message that human relationships needed repairing and rebuilding chimed well with the emergence of social capital as a key policy concern, which has been influential in social policy and adult education. The dominant tradition of social capital refers to the norms of reciprocity and trust that appear to have been undermined by the breakdown in human relationships. Putnam's (2000) metaphor of Americans bowling alone (rather than in clubs) captured the sense of the loss of trust, cooperation, and shared activities that bind people together. Whereas communitarianism located the problem in a moral deficit in individuals, social capital relocates the deficit in the structure of people's relationships. Putnam's research (see also Putnam, 1993; Coleman, 1994) spurred the growth of a veritable social capital industry among academics. Distinctions have been made between bridging social capital (making ties between different groups), bonding social capital (developing contacts between like minded people), and linking social capital (connecting different levels of power or social status) (Kay, 2005).

The importance of trust, reciprocity, and participation in civic affairs has informed programs of community development which seek to create, enhance, and consolidate social capital in communities. In the UK, the Centre

for the Wider Benefits of Learning has documented various positive social, political, and health outcomes related to the impact of adult education on social capital (Schuller *et al.*, 2004). Participation in post-compulsory education – including adult literacy – is identified as one way of developing trust and building civic responsibility (Field, 2005; Tett *et al.*, 2006). Furthermore, social capital can increase the likelihood of enhanced economic activity as confidence levels increase and networks of connections ease the path into work (Falk and Kilpatrick, 2000). However, too much bonding social capital among groups with negative dispositions toward education has also been put forward as an explanation for non-participation in adult education (McGivney, 2001). The bonds that tie people can, in some cases, bind them. Social capital may also contribute toward civic involvement through volunteering and people becoming more active members of their community (Schuller *et al.*, 2004).

Arguably, social capital is an idea which is both politically expedient and highly normative. It is expedient in the sense that focusing on social relationships allows inequalities in social structure and resources to be ignored. Etzioni and Putnam take little interest in poverty and inequality as causal factors in the decline of communities and their social capital. The separation of civil society from the economy therefore leads away from politically controversial issues such as the distribution of wealth and power. It is normative in that only some types of social capital are valued, whereas others are not. For example, communities such as New Age Travellers may exhibit high levels of social capital, but are not the type of communities that governments want to support.

The focus on civil society, rather than the role of the state in reviving civil society, can let governments off the hook by transferring responsibility from statutory provision to voluntary effort (Ehrenberg, 2002). Ironically, the state's interest in encouraging participation in civic activity seems to be increasing at the same time as democratic spaces for learning seem to be diminishing. The distinction between the invited spaces of policy and the demanded spaces of communities are two distinct ways of thinking about democratic participation (Gaventa, 2006). In the former, participation is structured around the interests of top-down policy imperatives, whereas, in the latter, the spaces for participation emerge because of popular demands from below. Both present opportunities for adult education engagement, however, the context, purpose, and focus of the work provide very different challenges and prospects.

The Habermasian Perspective: Learning for Deliberation

From an adult education perspective, it could be argued that Jurgen Habermas is concerned about rescuing

democracy, and the learning process embedded in it, from both the instrumentalism of capitalism (in which it becomes simply a political means to an economic end) and the relativism of postmodernism (in which universal values and purposes are deemed no longer to matter). For Habermas, who “steadfastly refuses to ditch modernity's dream of using human reason to create a more humane world” (Brookfield, 2005: 25 and 26), the central task of critical theory is to encourage people to think constructively and creatively for themselves and to enable them to follow the agreed rules of democratic discourse. These are intended to ensure that “no one may be excluded; anything may be said, questioned, or challenged; and no force may be used” (Chambers, 1996: 197).

Habermas emphasizes the democratic work that is done in civil society when he describes it as a “network of associations that institutionalizes problem-solving discourses on questions of general interest inside the framework of organised public spheres” (Habermas, 1996: 367). According to John Keane, an eminent contemporary theorist of civil society, the key distinction for Habermas is between the “logics of the political and economic systems, regulated respectively by administrative power and money, and the life-world of self-organized public spheres based on solidarity and communication” (Keane, 1988: 18). In this sense, the state and the economy are complementary domains based on distinctive systems of power, and civil society is defined, partly, in contradistinction to them. The boundaries are often shifting and there may be a high degree of overlap and interpenetration; however, it is, nevertheless, important to maintain the distinction.

Democratic deliberation is essentially about communication, and how we use language to communicate with each other. This kind of discourse, including the rules of argumentation on which it is based, is something we have to learn. The appeal to reason in this process removes the distortions of power which would otherwise saturate and corrupt it. Democracy is constituted and sustained through a process of rational deliberation, which is conducted according to agreed rules and procedures, among equal citizens. In other words, adult learning is absolutely central to the Habermasian idea of building a democratic culture and defending the lifeworld, where people are authentically themselves, against invasion of and colonization by the steering mechanisms of the systems world of state or market. Habermas is concerned about stipulating the discursive conditions and procedures for conducting the democratic argument in the public sphere, understood as the space for deliberative democracy which civil society must keep open if it is to protect democracy. This is necessarily a continuing process, always unfinished.

There are many examples of adult education approaches which reflect this concern for democratic deliberation and organized public spheres. The Workers Educational Association in the UK is, at its best, a bearer of this tradition of

social purpose and political engagement (Fieldhouse, 1996). Perhaps the obvious example of this tradition is the study circle. The term itself suggests an egalitarian relationship between members in which participation and democratic discussion focused on issues of common interest or concern are fundamental. This form of organized democratic learning is strongly associated with the Scandinavian and Nordic countries. It also has important parallels in the USA, and resonates with the principles of mutuality which informed learning in the co-operative and labor movements in the nineteenth century (Bjerkaker and Summers, 2006). Moreover, as Welton (2005) points out, the social learning that occurs in progressive movements constitutes a communicative public sphere in which new meanings can be created and debated. These movements assert the importance of the lifeworld and seek to defend it against the corrosive power of instrumental rationality associated with the political and economic systems.

What the Habermasian perspective suggests is that the task of adult education is to create the pretexts and the contexts for this kind of learning to take place within the uncoerced associations and affiliations of civil society. In order to think through what this means, Habermas (1978) distinguishes between three domains of learning, each informed by particular interests: technical learning, which concerns the manipulation of environment and control of the world we live in; practical learning, which concerns the development of interpersonal understanding and relationships; and emancipatory learning, which concerns self-understanding and critical consciousness. Each has its part to play in learning for democracy; however, clearly, Habermas's main interest lies in the emancipatory project.

It is important to emphasize that good adult learning models the process of deliberative or discursive democracy. In this sense, adult education can be said to do the prefigurative work of democracy in which key ideas and arguments are tested out and interrogated in discussion. The purpose of this kind of learning is not necessarily to reach agreement: in the end, it may well be about agreeing to disagree, and learning to live democratically with the consequences.

The Gramscian Perspective: Learning for Activism

Radical adult education from the 1970s onwards drew inspiration from the Italian Marxist Antonio Gramsci because of his work on cultural politics and the role of intellectuals in social change. While Gramsci was never precise in his definition of civil society, its relationship with the state in his work is unique. He makes the distinction between two aspects of the superstructure of society (in contrast to the economic base) in terms of civil society and the state/political society. These correspond to the

exercise of two forms of power which reinforce class domination: hegemonic power (the leading and directive ideas and values in society) and the state's monopoly on legitimate coercive power. Civil society is made up of so-called private organizations like churches, trades unions, and voluntary bodies which are characterized by social relations based on autonomy and free association, whereas the state is primarily defined in relation to its coercive potential exercised through the activities of the army, judiciary, and courts. Gramsci was aware, of course, that the state was not merely coercive. More importantly, the boundaries between civil society and state are permeable, and organizations and practices can embody social relations belonging to both spheres. The connections between state and civil society in reproducing class rule are reflected in Gramsci's (1971) expanded view of the state as "political society + civil society, in other words, hegemony protected by the armour of coercion" (p. 263).

However, civil society's apparent distance from the state means it can be a powerful medium for the diffusion of the dominant hegemony. Education, for example, is provided in many countries by the state and influenced by its policies and economic priorities; however, Gramsci locates education firmly in civil society, which seems strange. The school is an important institution of social reproduction. In addition, schooling may be coercive, although adult education still has a voluntary status. Nevertheless, the core of educational relationships is primarily open, rather than closed; critical education can serve to engage the dominant hegemony, rather than simply reproduce it. This ambivalence (produced by social relations that are partly a product of the state and partly of civil society) provides opportunities and spaces for resistance against dominant ideas, values, and priorities.

The voluntary nature of adult education means that there is potentially more space for radical education because of its freer status. It has a crucial role to play in weaning the working class away from their dependency on traditional intellectuals, by creating their own organic intellectuals, who are able to articulate their interests and galvanize class action as a necessary first step toward social transformation. In this perspective, the focus is on winning hearts and minds before a frontal assault on the state – or even to remove the necessity for it. Education is therefore the foundation of revolutionary activity (Holst, 2002).

The radical nature of this type of education means that it is seldom located in the formal adult education provision. In the UK, there is the important historical example of the Labour College movement which focused on educating revolutionary militants (Simon, 1992). In some respects, this development prefigured Gramsci's analysis of the role of education in class struggle. Holst (2004) has made visible the largely unacknowledged educational role of revolutionary political organizations in the USA, and Boughton (2005) has documented the role of the

Communist Party in educating generations of militants in Australia. Allman (2001) addresses the centrality of alliance building under proletarian hegemony involving different social movements and popular forces as a key issue in critical and progressive educational work. The struggle against apartheid in South Africa is an example of the importance of alliance building across civil society in which radical educators played a significant role (von Kotze, 2005).

However, the emergence of new social movements from the 1960s onwards challenged the focus on social class as the privileged agent of change. The growth of neo-Marxist accounts of civil society and the development of postmodernist thinking also influenced various strands of radical adult education. Localized narratives of change (Usher *et al.*, 1997) and selective change around particular issues such as the environment (Welton, 1995), rather than generalized class struggle, have either used or dispensed with Gramsci to explain the dynamics of power in civil society and what can be done.

Toward a Global Civil Society? Roles for Adult Education

The discussion so far has considered three perspectives on adult education and civil society in the context of the nation state. It is now becoming increasingly important, however, to think in trans-national and supra-national terms. Each perspective suggests a distinctive way of thinking about the possible contributions of adult education in the context of a global civil society.

It might seem premature to talk of a global civil society, but it is important to recognize the growth of non-state actors such as trans-national social movements with a global interest (Mundy and Murphy, 2006). The spread of neo-liberal globalization, global systems of production, geo-political wars, nuclear armament, environmental degradation, and the role of powerful unelected international organizations in economic affairs have led to an increasing number of civil society groups, NGOs, and social movements contesting and challenging these trends. This globalization from below has been aided by the development of information and communication technologies which have made the coordination of action and dissemination of counter-information possible on a global scale. While the influence of these groups on policy development is debatable, they do have a highly visible international presence.

In the communitarian perspective, the focus is on developing membership among nation states at an international level to promote adult education and to develop reciprocal relations between different countries. There have been various adult education initiatives which might broadly be conceived as reflecting this perspective. The International Council of Adult Education (2007), for example, is a trans-national advocacy organization which is campaigning for

the right to learn and wider recognition of the role adult education can play in combating poverty, discrimination, and exclusion. In addition, United Nations Educational, Scientific, and Cultural Organization (UNESCO)'s International Conference on Adult Education (CONFINTEA) conferences target policy makers, academics, adult educators, civil society organizations, trade unions, and other interested parties to facilitate linking social capital, among other things. These events – held every 12 years – seek to promote adult education on a global scale and to embed it in various development goals and resourcing priorities of nation states and international organizations.

In the Habermasian perspective, learning in the public sphere is another arena where adult educators can make a contribution to the development of a global civil society. The World Social Forum, for example, actively contributes to what Barr (2007) calls “undiscovered public knowledge.” By this, she means independent sources of knowledge rooted in people's experiences and directed at the collective social, political, and human problems they seek to address. Newman (2007) argues that a deliberative democratic process is essential for making national politicians accountable. This process demands a sustained dialog between citizens and electors, and requires particular skills: “how to critically appraise the statements of others; how to think clearly for ourselves; how to think inventively; how to participate actively in the affairs of state; and how to participate wisely” (p. 10).

In the Gramscian perspective, globalization raises issues about the growth of a trans-national capitalist class, its hegemony, and how it can be opposed (Robinson, 2005). Gramsci's own work focused on civil society in the context of nation states; therefore, we need to extrapolate and develop his concepts for the new global context. This raises questions about the type of strategy and the type of social forces necessary to create an alternative hegemony. For example, the confrontational action against the World Trade Organisation in Seattle in 1999 and against the Group of Eight (G8) in Genoa in 2001 is, in Gramsci's terms, a “war of movement” (direct frontal assaults on the state) in contrast to his view about the necessity for a “war of position” (a systematic struggle for ideological hegemony). The latter points to the need for detailed and systematic critique of the intellectual and moral authority of international institutions, such as the International Monetary Fund, World Bank, World Trade Organisation, G8/9, and the Organisation for Economic Cooperation and Development, which legitimate the hegemony of an increasingly global capitalist class.

Conclusion

The three perspectives on adult education and civil society, constructed in terms of learning for membership, deliberation, and activism, demonstrate competing meanings and

distinctive practices. These are reflected in different adult education purposes, contexts, and constituencies. In the era of globalization, the struggle to define and control what civil society means and who it is for is increasingly likely to occur at an international level. Adult education has a distinctive contribution to make to the social and political contestation this will entail.

Adult Education and Nation-Building

S Walters, University of Western Cape, Bellville, South Africa

© 2010 Elsevier Ltd. All rights reserved.

Introduction

The late President of Tanzania said in 1976 that, “Adult education is a highly political activity. Politicians are sometimes more aware of this fact than educators, and therefore they do not always welcome real adult education” (Nyerere, 1976). By juxtaposing adult education and nation building, the political dimensions of adult education are foregrounded.

This article privileges experiences particularly in the Southern African Development Community (SADC) concerning adult education and nation building, to act as a lens to illuminate key issues which are also relevant to other regions of the world. The discussion is framed utilizing the following three social purposes of adult education:

1. Education that enhances strategies which enable women and men to survive the harsh conditions in which they live. Examples of this include literacy, primary healthcare, and some home-craft skills.
2. Education and training geared to developing skills for people in the formal and informal sectors that describe education for economic purposes.
3. Cultural and political education which aims to encourage women and men to participate actively in society through networks of cultural organizations, social movements, political parties, and trade unions.

The article begins with a discussion of various understandings of nation building, then moves to a discussion of adult education and nation building within SADC, highlighting universally important themes. This is followed by concluding remarks and suggestions for further readings.

Nation Building

“Nation building depends upon winning popular support for rapid change,” commented Lowe (1971). In the early 1970s, 20 years after the United Nations had been established, and many countries had recently gained independence from the colonial powers, there was much interest in the role of education in national development. Developing the nation-state was the primary focus of attention. Over 30 years later, a fundamental political question is whether existing plural states, which make up 90% of the current 180 or so nation-states in the world, would be able

to withstand the dual onslaught of ethnic nationalism and global economic integration (Phadnis and Ganguly, 2001).

The nation-state is a legal concept describing social groups who occupy a defined territory and are organized under common political institutions and an effective government. The state exercises sovereign powers within its borders and is recognized as sovereign by other states in the international system. A nation is therefore different from an ethnic group which can be transnational. (Phadnis and Ganguly 2001: 20) A key social construct within the nation-state is the citizen; therefore literature on adult education and citizenship (e.g., Bron and Schemmann, 2001; Korsgaard *et al.* 2001), can be a useful resource.

Mamdani (1996) provides a very rich analysis of the complexity of how the citizen and subject have been constructed in postcolonial states in Africa, which highlights the bifurcated state between urban and rural, between modern and customary, which is highly gendered, within one hegemonic state apparatus. Oga and Okwori (2005) illustrate the complexities of citizenship in Nigeria where people have stronger affiliation to ethnicity or religion than an imagined community of a nation-state. How citizenship is understood is therefore essential to the discussion on nation building.

Gaventa (2007), as editor of a series of texts on Claiming Citizenship: Rights, Participation and Accountability, points out that there is a growing crisis of legitimacy in the relationship between citizens and the institutions that affect their lives. In countries, both in the North and South, citizens speak of mounting disillusionment with governments, based on concerns about corruption, lack of responsiveness to the needs of the poor, and the absence of a sense of connection with elected representatives and bureaucrats. The rights and responsibilities of corporations and other global actors are being challenged, as global inequalities persist and deepen. Nation building is therefore deeply connected to notions of democracy, development, and globalization (Korsgaard, 1997; Finger, 2005). It is undoubtedly complex and contested.

The question arises then as to how far people's struggles for power, through liberation or social movements, can also be seen as part of a nation-building project Or is it a process that can only be led by a legitimate government in power? This question harks back to understandings of development and nation building (Youngman 2000). In this article, the position taken is that there are a range of actors in a society which contribute to nation building and, as Lowe suggests, winning popular support

for rapid change. There can be nation building from below, through social movements, and nation building through government interventions. As Finger (2005) points out, formal education for children, is often more tied to the state machinery than adult education which has most often stayed outside of government.

We look at what adult education and nation building means in southern Africa and in doing so elaborate on some of the above points, particularly relating to struggles for democracy and development.

Adult Education and Nation Building in the SADC

Southern African Development Community (SADC)

This section is adapted from an article entitled 'Adult education in lifelong learning in southern Africa', by Walters and Watters (2001).

Political and Socioeconomic Picture of the Region

The present global economy is pushing national economies and local industries to compete in the world market. The SADC was formed in 1992 and in 2000 the protocol on trade came into force which is moving SADC toward a free-trade area. SADC grew out of the Southern African Development Co-ordination Conference (SADCC), which had had South Africa as its common political enemy while sharing with it complex historical and economic dependence. The SADCC provided the structure for the countries to organize themselves in geopolitical terms in order to maximize their political clout and minimize their economic dependence on South Africa.

SADC is comprised of 14 countries, which vary in population from the Democratic Republic of the Congo (DRC), which has 62 million, to Swaziland which has just over a million inhabitants. Another four of the countries have populations of 2 million or less: Botswana, Lesotho, Mauritius, and Namibia. Many SADC countries still rely heavily on agriculture. Only Angola, Botswana, and South Africa have less than 10% of their production coming from agriculture. Five countries, Malawi, Mozambique, DRC, Tanzania, and Zambia, obtain more than 20% of their production from agriculture. It is one of the least urbanized parts of the world and only Angola, Botswana, and South Africa have urban dwellers in the majority. Economic performance is dominated by that of South Africa, which represents more than 70% of the combined sub-regional gross domestic product (GDP).

Commonly used indicators of poverty reveal that SADC members are among the poorest countries in the world. In 2005, the average human-development index for

the region's countries was 0.54, while the SADC website reports a 2003 GDP per capita of US\$1062. This compares unfavorably with the world average in 2003 of US\$5822 and the average for Western Europe, for example, of US\$30 449. The per capita income per person in the DRC in 2006 was only US\$128 per year, which makes it one of the poorest in the world.

There are a few countries which have a relatively high GDP per capita for developing countries. The 2003 SADC figures put Mauritius at the top with US\$4522 with South Africa and Botswana having above US\$3000 per capita per annum. But even in these relatively well-off countries, there is major inequity between the rich and poor. The SADC Regional Human Development Report of 2000 states that 30% of SADC population live in abject poverty while 30–40% of the labor force is unemployed or ekes out a living as subsistence farmers.

The life expectancy is very low in most SADC countries, for example, Swaziland where it is just 31 years and Botswana where it is 35 years (2004 figures). The terrible human immunodeficiency virus/acquired immunodeficiency syndrome (HIV/AIDS) pandemic is pushing the life expectancy even lower. The infant-mortality rate is as high as 260 in Angola and 205 in DRC per 1000 live births. Again, this compares unfavorably with, for example, Japan at 3.2 or the United Kingdom at 5.3.

Although still experiencing difficult economic situations, most SADC countries have adopted macroeconomic and social policies aimed at improving regional human-development performance. In order to achieve this, several governments spend around 20% of their budgets on education and almost 5% on health development.

This sketch provides a picture of a region that has a very wide spread of developmental needs, including adult education. The countries of SADC are peripheral capitalist economies and the development of adult education has been shaped very directly by this, including the macro-policies of international development agencies and the socioeconomic realities within each of the countries. (See, e.g., Torres, 2004) These in turn have sometimes spurred local people on to finding alternative approaches to development.

Social Purposes of Adult Education in the SADC Region

Most of the countries of the region have experienced major political and economic upheavals in the last 50 years. During this time, all of them went through, more or less, traumatic processes of decolonization. The last five countries to gain independence were Mozambique in 1976, Angola in 1975, Zimbabwe in 1980, Namibia in 1990, and South Africa in 1994. All five of these countries experienced extended liberation struggles. All of the countries in the region went through processes of reconstruction and

development toward building new nations in about the last 50 years. The approaches adopted by the different countries were shaped strongly by dominant development theories of the time which reflect particular ideologies and material interests (see, e.g., Youngman, 2000).

In order to give a sense of the fragmented and contested nature of the role of adult education in nation building, illustrations are provided, falling within the three major social purposes: survival; economic development; and political and cultural development.

Adult education for political and cultural development

As adult education is integral to social processes, it is not surprising that it gains in prominence at heightened political or economic moments through actions within the state, civil society, or the private sector. In the past, most governments have invested minimally in adult education with their emphasis on schooling. At the point of political independence, adult education became significant. For example, after the historic transition in South Africa to democratic governance in 1994, adult education was highlighted particularly in relation to redress for black people, economic development, and the growth of a democratic culture. Adult basic education was declared a presidential lead project but was to be dependent on international donors.

Another example is taken from Mozambique. The watchwords of Samora Machel, the late president of the newly independent Mozambique and head of the liberation movement, Frelimo, were “study, produce, and fight.” These were taken as serious marching orders in preparation for independence and a broad, popular literacy movement emerged throughout the country (Marshall, 1990: 83). Popular education involved mobilizing human resources for creating the new Mozambique and literacy was part of the dynamizing groups set up in most villages and towns. A national directorate of literacy and adult education was set up in 1976. Since those heady days with the systematic destructive power of the apartheid state in South Africa, state-sponsored adult education all but disappeared in Mozambique between the mid-1980s to mid-1990s. Since then, according to Mario and Nandja (2006: 192), there has been a process of rediscovery and rescue of adult literacy and education, with there now being an average rate of illiteracy of about 54%, with rates in rural areas and among women being disproportionately high.

The fact that most countries in the region have undergone radical political change in the last 50 years implies that there have been high degrees of political activism and education at different times. From the 1960s, Namibians and South Africans built powerful democratic movements of citizens, both inside and outside the countries, which created alliances of socialist revolutionaries, social democrats, and social reformers. Creative informal and

nonformal education was integral to these movements which involved thousands of community-based organizations which were forged into the democratic movements. (Walters 1989) There was rich learning through social and political action as people strove to build a new nation from below.

The struggles for people’s democracy in the mid-1970s in places like Angola and Mozambique had been overshadowed in the following 15–20 years by civil wars spurred on by the apartheid regime and other international interests. Many of the gains hoped for in education, health, social welfare, and economic development had been decimated. In Angola alone it is reported that over 500 000 people had been killed since 1989 and 3 million people became refugees (Oduaran 2000). The DRC too has recently emerged from a devastating civil war. In the region, while people’s movements for democratic social change have engendered innovative responses in some countries, in others, many millions of people are confronted with the struggle for survival from poverty, war, and disease under the most trying conditions. Not all people’s movements are necessarily positive; some are mobilizing children and adults for participation in violent crime and war. Literature is not available on what educational efforts are occurring within these situations but there are no doubt activists working to bring about peace and reconciliation on the one hand and activists training new recruits for violence and war on the other (see, e.g., Thompson, 2000).

Adult education for survival

One of the greatest educational challenges facing SADC presently is the devastating HIV/AIDS pandemic. The region has the highest incidence in the world. Thousands of people are dying of the disease. It is having substantial effects on the economies as it is the working adult population which is most vulnerable. The estimation is that there were 12 million AIDS orphans in Africa at the end of 2007 and estimates are that currently the higher education population in South Africa is 22% HIV/AIDS positive.

There have been various strategies developed over the last 15 or so years to counter the pandemic. It is primarily a sexually transmitted disease which is exacerbated by poverty. Educational processes are called on which challenge deep seated cultural, religious, ethnic, gender, or class attitudes and behaviors. In many societies, there are cultural practices that propagate the spread of the virus through promiscuity. Women are most at risk as often it is men who have multiple partners. The power relations between women and men make it nearly impossible for many women to insist on safe sexual practices. Some people predict that until women are empowered and gender relations are more equal, it will be extremely difficult to stem this tide.

Educational programs are being orchestrated in some countries through the health ministries, but this is seen to be inadequate. In South Africa, departments of education, labor, welfare, and health are working together. There are over 600 nongovernmental organizations (NGOs) working to counter HIV/AIDS. Some workplaces have begun running education and counseling services for workers. There is a growing awareness that all sectors of society, working with people of all ages, must join together to educate about HIV/AIDS. At the World Aids Conference held in Durban in July 2000, 13 000 scientists, activists, educators, development workers, government officials, and health workers, all came together to share research, information, methodologies, and policies. There were discussions, debates, information, and papers disseminated on a daily basis through community and national radio, television, and newspapers. It was a massive and impressive public educational process.

The growing campaign is being interpreted and taken forward by a very wide range of interest groups with different values, for example, rurally based indigenous healers, rural and urban women's groups, youth groups, religious and community organizations, and educational institutions. They are using different approaches, from ethnocultural, to feminist, to popular, to spiritual, among others, to organize awareness-raising, skills-training, and organizational-development strategies.

The responses to HIV/AIDS provide excellent contemporary examples of adult education for survival which involve most sectors of society and which draw on multiple pedagogical, organizational, and developmental frameworks simultaneously.

Adult education for economic development

In a region with such high unemployment and levels of poverty, economic development is of paramount importance. The United Nations Department of Economic and Social Affairs states that unemployment in the region varies from Namibia at 34% (2000) to Madagascar at 4.5% (2003). An independent assessment puts the rate in Zimbabwe in 2007 at 80%. A 1998 SADC report estimates that 30–40% of the labor force of SADC are either completely unemployed or are eking out a living as subsistence farmers. The same report indicates that less than 50% of the labor force is women. In the last 20 years, numerous adult-education programs focused on skill development have been embarked on by SADC countries in both the formal and informal economies.

Within the context of globalized economies, economic development and adult education, or adult learning, have become more urgent and complex. Within the debates on globalization are debates about the importance and the role of information communication technologies (ICTs) in economic development. Africa is the most poorly

served continent in ICT. Africa, with 14.2% of the world's population, has only 3.4% of its Internet users. South Africa has the most users in SADC, but is fourth on the continent after Nigeria, Morocco, and Egypt. This is seen as another major barrier to Africa's development and one which will lead to even greater inequality both within the continent and between Africa and other regions.

The type of adult education for economic development that has occurred in the last 20–30 years within SADC can be differentiated again in terms of competing interests. For instance, the economic-development projects for women have often been within a modernizing frame which has not challenged the sexual division of labor or attempted to transform women's subordinate positions.

Adult education for economic development occurs most frequently in large companies in the formal sector and for employees at the middle and upper levels. This is a worldwide trend which most often favors educated men and is reflected in the SADC region as well. This is likely to continue as, within the dominant neo-liberal framework, the globalizing economies require flexible, well-educated workers. As Stromquist (1998) suggests, it also requires uneducated workers to service the professional classes and hence the low priority given to literacy in the region despite government rhetoric.

The SADC is trying to position itself in the global economy. The discussions and debates about adult and lifelong learning are shaped directly by this. A key question is what is the primary objective of economic development? Is it to be globally competitive? Which is the predominant view? Or are there alternatives as argued by Klein (2007) and others? Within SADC, these are very pertinent and hotly debated issues within organizations of state, civil society, and business. Adult education is implicated in these debates and political contestations.

Adult education within lifelong learning

The discourse of adult education is being challenged by that of lifelong learning. Lifelong learning has entered the education and development debates of the region, as elsewhere. Education policy documents in Botswana, Namibia, South Africa, for example, all refer to lifelong learning as a goal. The contestation over lifelong learning for what among and within the different sectors is ongoing (see, e.g., Walters, 2006).

The shift in the discourse of adult education to lifelong learning may signal shifts in understandings of relationships between individuals and the nation-state; between individuals and their identities as national, regional, or global citizens. Lifelong learning most commonly relates to the need for continuing education and training for global competitiveness. It may reflect the weakening of the nation-state and the increasing requirements for

transnational and global relationships between the local and the global.

Conclusion

Experiences in SADC have shown how adult education gained in significance both during the struggle for and at the time of independence, with the formation of the new nation-state. Adult education was identified by social movements struggling for liberation in order to mobilize and prepare citizens for rapid change. It was also identified by new governments as necessary to mobilize and (re) shape citizens for their roles and responsibilities in the new society. The utilization of informal and nonformal adult education, within movements, helped to prefigure the new state. It was intimately connected to contestations concerning social and economic development, including notions of democracy and citizenship. Most of the SADC countries had leftist movements (i.e., Marxist, socialist, or social democratic) involved in the national revolutions. South Africa's apartheid government, in turn, played a catalytic role in the 1970s and 1980s in providing a common enemy, against which regional governments and liberation movements struggled. Solidarity among countries against apartheid was therefore an important element of citizenship of the region.

At independence, each of the governments projected adult education as an important part of their reconstruction and development of their nation state. However, few resources were invested and adult education and training has been dispersed among civil-society organizations, workplaces, and various departments in government. At the time of independence, adult education had a powerful symbolic purpose but it has not necessarily translated into systematic programs for the adult population. After the novelty and excitement of the birth of the new nation, adult education has settled back to being barely visible, but is integral to new social movements who are continuing to contest power relations in the society, and notions of citizenship, whether shaped by gender, race, class, geography, and physical ability; or specific cross-cutting issues, like health or criminality.

The discussions on adult education and nation building show that they cannot be divorced from understandings of democracy and development, within local, national, regional, and global contexts. This means that nation building is intimately linked to notions of citizenship, which, on one hand, are determined through the legal frameworks of a country. On the other hand, citizenship is often contested by social movements, political parties, or other social structures, as its interpretation reflects the power relations in the society. Nation building can therefore be driven by state structures or it can be

driven from below. Adult education, whether informal, nonformal, or formal is interwoven into political, economic, and social processes, which comprise the nation-building project at particular historical moments, in specific contexts. In the twenty-first century, with nation-states losing their predominance as defining economic entities, it is hard to hold the question of the relationship between adult education and nation building for long, before questions of the specificities of the local, regional, or global shout for attention.

Glossary

Active labor market policies – Policies aimed to facilitate adjustment to job loss, assist the jobless to find work, and encourage labor force participation. In addition to training and skills development, these policies include public employment services (counseling, job-search assistance, information, and placement), youth measures to aid the transition from school to work, subsidized employment, and measures for disabled workers.

On-the-job training (OJT) – Training taking place in the firm to learn procedures that are job related, but where learning is an activity separate from regular job duties.

Portability (of training) – The capacity to utilize skills and obtain returns on human capital investments obtained with a previous employer. This concept is linked to that of the specificity of training.

Selection bias – Error committed when estimating the effect of an intervention such as a training program, due to the fact that treatment and comparison groups are intrinsically different, and would have experienced different outcomes even in the absence of the intervention.

Specific training – Training that provides skills that are exclusive to a particular firm, occupation, or industry and cannot be applied elsewhere. The antonym is general training.

and professions, rapid changes imply a greater need for maintaining and updating skills and knowledge about current best practice. In addition, because of demographic changes and reduced fertility in many countries, the labor force is both aging and growing more slowly than in the past. In an environment in which labor shortages may become more common, there is greater emphasis on the skills of the existing workforce. As the workforce ages, there is a growing risk that older workers who lose their jobs may not have the skills needed to become reemployed.

Skill acquisition of adult workers takes many forms. Learning by doing (acquiring skills during the course of one's regular duties), for instance, is an important source of growth in workers' skills. Here, we focus instead on the acquisition of abilities that are job related, but where learning is a separate activity from regular job activities. Within these, we distinguish between formal (learning leading to the completion of diploma or degree) and informal (seminars, interdepartmental visits, etc.) training. A second important distinction relates to who pays for training. From the institutional point of view, individuals, employers, and governments generally differ in their goals when purchasing or providing adult education and training. Government-sponsored training is often concerned with enhancing the employability of displaced or unemployed workers, disadvantaged workers with limited skills, and those at high risk of social exclusion. Recipients of publicly provided training are likely to be unemployed and to come from the bottom of the skill distribution curve. In contrast, employer-sponsored training is provided to those currently employed, as is much of the adult education and training funded by individuals. Furthermore, as many studies have shown, those who are already well educated and highly skilled are more likely to receive work-related training. Employer-sponsored training is also more likely to provide firm-specific skills, which do not raise the value of the trainee to other employers. Governments, on the other hand, prefer general skills that increase individual employability in a variety of workplaces. Finally, these types of training generally differ in their timing. Employer-sponsored training will likely be spread out over the worker's career but the duration of any particular spell may be short, whereas government-sponsored training is concentrated during spells of unemployment and is usually discontinued when the worker becomes reemployed. Thus, there

Introduction

Adult education and training have been focal points of labor market studies in developed economies since the 1960s. Increased attention to this topic is part of a shift toward greater emphasis on human capital in both economic and social policy in societies that are increasingly knowledge based. Several factors account for the growing interest in these issues. Technological change – especially advances in information and computer technologies – and globalization of production have resulted in a growing demand for highly skilled workers and changes in workplace skills requirements. Within specific occupations

are numerous reasons to distinguish between publicly financed and employer-sponsored training.

Human capital theory has long emphasized the importance of on-the-job training (OJT) and work experience for productivity and earnings. Recently, additional empirical findings have given rise to a new training literature (Acemoglu and Pischke, 1999). Leuven (2005) provides a useful survey of theoretical developments. Evaluating the impacts of adult education and training on outcomes has generated an extensive literature and a wide range of estimated impacts. In this article, we provide an overview of the methods commonly used to evaluate the outcomes of adult education and training and a summary of the results of this literature.

The principal outcomes that have been examined – especially for government-sponsored training – are individual labor market outcomes such as wages, employment, and earnings. Earnings is a useful summary measure because it captures both the price dimension – the wage rate – and the quantity dimension – hours, weeks, and years of work. For employers, the key outcome is worker productivity and thus firm profitability, although the provision of training opportunities may also influence other dimensions of performance such as innovative activity as well as recruitment and retention of employees. The impacts on earnings and productivity are key ingredients in any assessment of the costs and benefits of adult education and training.

Methodological Issues in Evaluating Outcomes

Obtaining credible estimates of the impacts of adult education and training programs is a difficult problem. In modern approaches to evaluation, the nature of the challenge is usually illustrated using the potential outcomes model (Angrist and Krueger, 1999). Each individual in the population of interest – which in this case consists of individuals who may or may not receive training – has two potential outcomes: (1) the outcome that would be experienced if he/she receives training, and (2) the outcome that would be experienced if he/she does not receive training. One of these two potential outcomes is inherently unobservable. For each participant, we can never know what outcomes that individual would have experienced had they not participated. Similarly, for each person who does not participate we cannot know what outcomes would have been experienced had they participated. The problem is thus one of obtaining credible estimates of the counterfactual outcome – the potential outcome that cannot be observed. For participants, this means obtaining an estimate of the outcomes they would have experienced had they not participated in adult education or training.

The gold-standard approach to the evaluation problem is to use random assignment to treatment and control groups. Random assignment ensures that the treatment group that receives training and the control group that does not receive training are statistically equivalent in their pretreatment characteristics; that is, that there are no statistically significant differences in the characteristics of the two groups. Since the two groups are statistically equivalent prior to treatment, any differences in outcomes experienced by the two groups can be attributed to the causal impact of the treatment.

When random assignment is not feasible or desirable, there are a number of nonexperimental methods that can be employed, including regression-based methods, natural or quasi-experiments, instrumental variables, matching estimation, and panel data methods. Each of these methods has advantages and disadvantages, and has different data requirements. Furthermore, no one method dominates other methods in all circumstances. Determining the methodological approach to employ in a particular setting requires a detailed understanding of institutional features relating to program operation and the nature of available data. Simply put, there is no magic bullet in nonexperimental methods.

All nonexperimental methods for estimating the impacts of education and training programs use a comparison group of nonparticipants to estimate the outcomes that participants would have experienced had they not participated in the program. However, in the absence of random assignment, participants and nonparticipants will generally differ along several dimensions, some that are observed by the researcher and some that are unobserved. Because of these differences between the two groups, the outcomes experienced by the comparison group – in the absence of statistical or econometric modeling – are unlikely to provide a reliable estimate of the counterfactual. In particular, since individuals choose whether or not to apply for and/or enroll in a training program, the individuals who receive training constitute a self-selected sample and may differ in various ways from the individuals who do not apply for and/or enroll.

Employers also choose which employees receive training and which do not. Similarly, for government-sponsored training, there may be some selection by those who administer or operate the programs. Simple comparisons of participants and nonparticipants are thus likely to be subject to selection bias and do not provide credible estimates of program impacts. The various nonexperimental methods provide different ways of dealing with the selection bias problem.

In the past two decades, there have been significant advances in nonexperimental evaluation methods. Equally important have been improvements in the quality of the data available for analysis. As a consequence, recent studies using state-of-the-art techniques to assess the impacts

of adult education and training generally provide more credible evidence than earlier studies.

Outcomes of Adult Education and Training

As noted previously, there are several reasons for distinguishing between government-sponsored adult education and training and private-sector-sponsored training. Although the expenditure on private-sector-sponsored training far exceeds that by governments – even in countries such as Sweden that devote considerable public expenditure to training – more is known about the outcomes of publicly supported training. This situation reflects a greater desire by governments (and taxpayers) to evaluate the impacts of their programs, as well as data challenges in assessing the impacts of employer-based training.

Government-Sponsored Training

Government-sponsored training is part of the broader category of active labor market policies (ALMPs) that facilitate adjustment to change, assist the jobless to find work, and encourage labor force participation. These policies include public employment services (counseling, job search assistance, information, and placement), youth measures to aid the transition from school to work, subsidized employment, and measures for the disabled. Our focus here is on training programs, which are the most important active measure in many Organization for Economic Co-operation and Development (OECD) countries.

There is a significant amount of research assessing the labor market outcomes of government-sponsored training and other active programs. The comprehensive survey by Heckman *et al.* (1999) summarizes more than 40 studies from the US and Europe. Other useful surveys of this literature include LaLonde (1995), US Department of Labor (1995), Martin and Grubb (2001), and Kluve and Schmidt (2002). Our treatment is brief because several excellent surveys are available and there are space constraints.

Relative to other OECD countries, the US has traditionally displayed a stronger commitment to rigorous evaluation of government programs, including substantial use of randomized trials. As a consequence, the state of knowledge about the effectiveness of these programs is dominated by US evidence. However, as the recent surveys by Martin and Grubb (2001) and Kluve and Schmidt (2002) indicate, there is growing use of serious evaluations in several European countries, resulting in a rapidly expanding body of evidence on the impacts of active programs.

Several salient features emerge from reviews of the US evidence (LaLonde, 1995; US Department of Labor, 1995; Heckman *et al.*, 1999). First, the impacts on earnings of disadvantaged workers are mixed, being positive for some groups and zero or even negative for others. In this regard,

it is worth noticing that training programs for displaced workers (who typically have considerable work experience and are highly motivated) have in general, a better track record than those for the disadvantaged (Jacobson *et al.*, 2005b). Other generalizations include:

- government-sponsored training significantly raises the earnings of economically disadvantaged adult women;
- the effects of these programs on disadvantaged adult men are often smaller than on women, and not always positive;
- the impacts of training on out-of-school youth are generally zero or negative;
- classroom training can be effective for adult women, but has limited success for adult men, especially those with low education; and
- best results are obtained when classroom training or OJT have a strong work experience component linked to local employers.

Greenberg *et al.* (2004) offer evidence from meta-analytic techniques on the persistence of these effects. Impacts on earnings seem to diminish over time for adult males and youth, but remain stable over time for females.

A second feature of the US evidence is that estimated impacts, even when they are positive, are generally modest in size. As noted by LaLonde, this outcome is not surprising, given the limited duration and cost of these programs:

The best summary of the evidence about the impact of past programs is that we got what we paid for. Public sector investments in training are exceedingly modest compared to the magnitude of the skill deficiencies that policymakers are trying to address. Not surprisingly, modest investments usually yield modest gains... (LaLonde, 1995: 149)

A third salient feature of the US evidence is significant heterogeneity in estimated effects. Evaluation of experimental programs shows earnings effects that range from negative impacts for individuals who never worked before, to large positive impacts on economically disadvantaged female household heads or economically disadvantaged male household heads. Substantial variation in program impacts across sites is common in training programs using random assignment. Variability of estimated impacts on earnings is also evident in nonexperimental programs. However, when studies most susceptible to selection bias are removed, the qualitative evidence from nonexperimental programs is similar to that of experimental programs (Heckman *et al.*, 1999).

In Canada, the published literature on government training programs is considerably sparser – likely due to the fact that program evaluations are carried out internally by government agencies and the findings are not published in academic or policy journals (Riddell, 1991). Riddell

(1995) reviews employment and training programs that operated in the 1980s and early 1990s. Programs targeted on the economically disadvantaged had modest effects similar to those found in US studies, but impacts of programs serving clients with fewer barriers were larger. Subsequent analysis by Park *et al.* (1996) found significant gains from training programs for some groups, including women reentering the workforce and individuals trained in areas with identified skills shortages.

European programs are more focused on speeding the transition to work and reducing unemployment, especially among youths. The difference in emphasis reflects the facts that European youth are generally less economically disadvantaged than US youth, but are more likely to be unemployed for extended periods of time. A common finding of European studies is that training results in substantial gains in employment but has little impact on wages (Heckman *et al.*, 1999; Kluve and Schmidt, 2002).

In summary, government-sponsored training has a mixed record, with rising earnings of some groups (adult women and displaced workers) but having little or no impact on earnings of others (disadvantaged adult men and youths). Even when they are positive, the impacts on earnings are modest and are usually not large enough to substantially reduce poverty rates. Training does, however, have a better track record in improving the transition to employment.

Two general responses have emerged in response to the mixed performance of public training programs. One, illustrated by Carneiro and Heckman (2003), is to argue that problems associated with low skills should be addressed much earlier in the life cycle. The other, illustrated by Martin and Grubb (2001), argues that public training programs can be made more effective by improving their design. Design features that they regard as crucial include careful targeting on participants most likely to benefit from training, keeping programs small in scale, including a strong work experience component to establish links with employers, and having programs that produce a certification that is recognized in the labor market.

Private Sector Training

Private-sector training refers to forms of skill acquisition that are job related and where learning is an activity separate from regular job duties. This type of skill acquisition may include both formal and informal learning, be general or specific and either employer- or individually-sponsored. In general, employer-financed training tends to be firm specific and informal in nature. However, firms may finance the acquisition of (formal) vocational training, such as apprenticeships, that is more general in nature. Studies of work-related training focus on one or the other type of training, depending on data availability.

Methodologically, the literature surveyed here relies on nonexperimental data. The selection problems are

acute, as employers are likely to select for training the most promising individuals, who may have higher-than-average earnings regardless of training. Similarly, individuals who choose to undertake training are likely to be more productive or to have unobserved characteristics, such as motivation, associated with higher wages. The papers we consider here use different methods to resolve this problem.

Interest in the training policies of firms and the skill acquisition choices of workers originated in the US during the 1980s when slow productivity growth (relative to Japan) was at the forefront of the economic agenda. However, there was little information about training in available data (Barron *et al.*, 1997). During the next decade, research produced many studies on the determinants of training and on the effects of training on wages, thanks to the availability of the National Longitudinal Survey of Youth (NLSY), which follows a representative sample of youth over the period since 1978, gathering exhaustive information about their labor market experiences. The survey asks about any type of training, other than schooling, military training, and government-sponsored training, and further categorizes it as: (1) company training or OJT, (2) apprenticeship programs, and (3) off-the-job training (OFT). The richness of information regarding skill-related characteristics contained in the survey allows for adequate measurement of the variables involved, including usually unobservable variables such as those measuring ability. In addition, the longitudinal nature of the data allows researchers to address the methodological issues regarding selection bias.

Most of the US literature is hence based on the NLSY. One of the earlier studies by Lynch (1992) focuses on a subsample of non-college-educated youth to estimate the effect on wages of weeks spent in company training, OFT, or apprenticeship training. The estimated coefficients translate into approximately 25% higher wages for an average apprenticeship of 63 weeks and 15% for an average spell of company training of 31 weeks. Using all workers in the NLSY sample, Veum (1995) finds smaller returns of 7.5% for an episode of company training, 6% for an apprenticeship, and 11% for an occurrence of OFT. In addition, he estimates that company training and OFT increase wage growth by similar magnitudes. Both these studies are confined to episodes of training lasting more than 1 month. Later, Parent (1999), using a more sophisticated methodology and not restricting the sample to long training episodes, estimates that 1 year of OFT or OJT training increases earnings between 12% and 16%.

Further issues arise within this literature. One relates to the portability of training. Lynch (1992) separates training into that received with a current employer and that received with a previous employer, finding high returns to apprenticeships and OFT received during a

previous job, but no returns to company training received during a previous job. The results in Parent (1999), on the other hand, suggest that employer-based training and OFT are the most portable forms of training. Given the small fraction of individuals undertaking apprenticeships (around 1%), results regarding this form of training should be treated with caution. A second issue is who pays for private-sector training. Parent (1999) finds that workers partially pay for OJT with lower initial wages. Barron *et al.* (1999) use a different data set and find that although the initial wages seem to be smaller for workers undergoing OJT, the difference is small. The general perception in this matter is that firms pay for OJT training and reap the benefits through higher productivity of the firm.

In Canada, private-sector training has been much less analyzed and the results are nonconclusive. Parent (2003) uses the Follow-Up of the School Leavers Survey (FSLs) and finds that participation in employer-provided training raises male earnings by 10% but not significantly so for females. Results from this study also suggest that training may increase employment. Hui and Smith (2003), using the Adult Education and Training Survey (AETS), find positive effects of self/employer-financed training on employment for women. In addition, small positive effects on weekly earnings from employer-financed training are apparent for both genders, while self-financed training seems to have small negative impact on female wages. These findings seem to be contradicted by Havet's (2006) study, which uses matched employer–employee data and finds a positive impact of firm-provided training on the wages of women, but not of men.

Studies from Europe also tend to find positive effects of training on labor outcomes. In Great Britain, Greenhalgh and Stewart (1987) find positive effects of vocational training on occupational status. Booth (1993) estimates that 1 week of training raises the earnings of graduates by 1%. Both studies find significant gender differences. More recently, Blundell *et al.* (1999), use the National Child Development Study (NCDS) to study the impact of work-related training on the earnings of UK workers. They find positive returns (5–6%) for employer-provided training and also that this type of training seems transferable across employers. These findings are corroborated in a later study by Arulampalam and Booth (2001) that uses the same data.

For countries other than North America or the UK, evidence on the returns to training is less abundant. Goux and Maurin (2000) estimate wage returns to employer-provided training for France. They report around 7% higher wages among those who received training, but the estimates become insignificant when they account for firm selection of workers on the basis of posttraining mobility. Similarly, Pischke (2001) finds that, in Germany, 1 year of full-time work-related training (training during leisure time) increases wages between 3% and 4%. When he

accounts for selection based on wage growth, the returns are higher in magnitude, from 3% (males) to 6% (females), but not statistically significant. Schøene (2002) finds that employer-financed training participation is associated with 1% higher wages in Norway when controlling for selection based on seniority and job complexity (down from a 5% return in the absence of selection controls).

Overall, the returns to private-sector training seem quite high – higher, for instance, than the returns to schooling. In contrast, the incidence of training is not large, which is puzzling if there are such high returns. A leading explanation for the high returns to training is selection bias – that is, high-productivity workers are more likely to receive training and to have higher wages and/or wage growth. All papers find that addressing this selection problem is important. Estimates produced with a selection correction procedure are generally smaller than those obtained without, corroborating the heterogeneity of the returns to training. The effect of accounting for selection varies depending on the method used. In general, estimates are reduced by 40–50%. In some cases, the results are quite extreme. For instance, when selection is based on worker's mobility, since firms are less likely to train workers at high risk of leaving in the near future, the effect of training practically disappears (Goux and Maurin, 2000). A potential explanation could be that most of the benefits of training accrue to job movers and not to job stayers. Gerfin (2003) provides some evidence for this hypothesis in his study of Swiss work-related training. He shows that training undertaken during the last year generates the highest returns to individuals who changed jobs (around 5% increases in monthly earnings) versus those who stayed at the firm (1.2%). Other studies find no returns to training once selection is taken into account. For instance, Leuven and Oosterbeek (2007) find that when comparing the returns to training of Dutch workers who took training with the returns of workers who intended to undertake training but did not do so because of a random event (sickness or family circumstances), earnings differences are not statistically significant. There is also cross-country evidence from the European Community Household Panel indicating that the effect of training is significantly smaller when individual heterogeneity is accounted for (Bassanini *et al.*, 2007).

Finally, other factors may explain the correlation between high wages and training. Promotions, for instance, are a factor generally overlooked. These positively influence both pay and training. In addition, the returns to training are likely to differ by type of job, with more productive jobs (managerial/professional) requiring more training and higher pay than blue-collar jobs. Failure to account for these factors is also likely to overestimate the effect of private-sector training (Frazis and Lowenstein, 2005).

In summary, studies of informal private sector training seem to agree on the following:

- returns to training are generally positive and significant, particularly employer training and OFT;
- there are gender and ethnic differences in the returns to training, although the sign of the difference seems to be country specific; and
- there is substantial evidence that unaccounted-for factors lead to overestimating the returns to training. In general, those who undergo training seem to be those whose productivity, occupation, or other characteristics would lead them to have high wages regardless of training.

The papers examined so far in this section do not formally distinguish between formal and informal education, although it is expected that some OFT may be conducive to a degree or diploma. However, there are studies analyzing the impact of adult education and training that focus specifically on the effect of acquiring formal schooling later in life. Although the notion of adult education is country specific, it is generally accepted that formal schooling is associated with the completion of courses toward the achievement of a degree or diploma. The skills acquired with formal schooling are also more likely to be general rather than trade or profession specific.

The North American literature finds substantial returns to formal certification for older workers. Leigh and Gill (1997) and Jacobson *et al.* (2005a) find returns to community college in the US for workers over age 28 that are around 8% (9%) for males (females). In Canada, Zhang and Palameta (2006) use longitudinal information from the Survey of Labor and Income and Dynamics to evaluate the impact of formal schooling on earnings for individuals who have been out of school for more than a year and then enrolled in formal education. They find substantial earnings gains for those individuals who obtained a certificate (7% increase in earnings for men, 10% for females). In this study, younger workers who switch firms after obtaining a certificate gain the most from their studies, whereas workers over 35 reap higher benefits staying with the same firm. Ferrer and Menendez (2007) also find evidence for Canada of large earning effects from acquiring formal education later in life.

However, the European findings about the impact of adult formal education show that formal qualifications obtained later in life seem to have little impact on earnings. With the exception of the Blundell *et al.* (1999) study, which finds that all forms of work-related training leading to formal qualifications enhance earnings by 5–10%; other studies do not find such positive returns. Egerton (2000) uses 10 years of the British General Household Survey, which incorporates a rich data set of covariates including father's social class, to examine this issue. Her results show no significant difference in earnings between

full-time mature students and early graduates, although she does not address selection bias. Jerkins *et al.* (2003) use panel data from the NCDS to analyze the impact of adult education on employment and earnings. Their findings reveal that episodes of adult education, particularly in occupational training, have positive effects on employment but a limited effect on wages, except for the least-qualified individuals. Part of the difference in results with Blundell *et al.* (1999) is likely due to differences in the goals of study, which lead them to consider different control groups. In Sweden, Ekström (2003) analyzed the impact of adult secondary education on annual earnings during the early 1990s, finding a negative effect for males and only weakly significant positive effects for females. Later, Albrecht *et al.* (2004) follow the large expansion of Swedish adult education programs during 1997 through 2002, called the Knowledge Lift, to estimate the impact on annual earnings and employment of increasing formal schooling for the low skilled. Their results show no effect of Knowledge Lift programs on earnings or employment, with the exception of an increase in the employability (but not earnings) of young men.

In summary, the literature on employer-based training finds that this type of human capital investment generally has positive effects on labor market outcomes such as wages. The magnitude of the returns varies depending on the type of training undertaken and the methodology employed. As is the case with the literature on the returns to education, careful econometric analysis is needed to take into account the possibility of selection bias arising because training is undertaken by individuals who are more productive and would have commanded higher wages regardless of training.

Health and Adult Learning

P Bélanger, UNESCO Institute for Education, Hamburg, Germany

Generally absent until now from the *International Encyclopedia Education*, the theme adult learning and health is taking momentum in many countries as well as in international multilateral networks (UNESCO, 1997; US Dept. of Health, 2000; ICAE, 2001; WHO, 2005b). The growing recognition of “health as a basic human right” and the appeal for “relevant, equitable and sustainable access to health knowledge” (UNESCO, 1997), as well as the crisis of the welfare state, particularly with regard to health systems, is driving up the social demand for lifelong health education throughout life.

A new policy context is emerging linking health and lifelong learning policies. The call for Health For All, heard increasingly over the last two decades in multilateral organizations (European Commission, 2004; WHO, 2005a) finds growing legitimacy in positioning health as a key aspect of human development. In 2000, for example, the United Nations Economic and Social Council adopted a resolution recognizing the right to health, a state of physical and mental well-being, as “essential to the exercise of other rights.”

However, the attainment of this overall objective and of the more specific health-related Millennium Development Goals (to reduce infant mortality, improve maternal health, and fight world pandemic such as HIV/AIDS, malaria, and tuberculosis) could be severely hampered if the increasing cost of current curative policy cannot be controlled and the productivity of the health system is not improved. Researchers and policymakers are exploring ways to solve this predicament by pursuing the Health For All objectives while paradoxically searching to curb the increasing demand for curative services. One of the key responses to this contradiction has to do with adult learning.

Two major trends are emerging linking health and adult learning. First, health promotion is increasingly acknowledged as a critical component of health policies. It refers to the documented impact that general levels of health competency and knowledge have on both the social demand for health and the cost of curative services among different strata of a population. Health literacy and health promotion thus becomes mounting issues in national health policies. A second significant tendency relates to continuing medical education of health personnel. Intensive research and development in this domain is transforming the long-existing perspective and practices within medical and paramedical professions and, as a result, may turn medical and nursing continuing education into a prototype of a much larger

trend in continuing professional development (CPD) among other professions and occupations.

Health Literacy

In a time when an ever-growing part of public budgets is allocated to health services, the rapidly increasing need for healthcare tends to change the relations between health professionals and the public. In the context of a welfare state, already under pressure from neoliberal forces and now confronted by a continuously growing demand for healthcare services, the former pattern of interrelation between health professionals and patients is increasingly under time and economic pressure. Medical doctors, nurses, and therapists have less time available to spend with each of their clients who at the same time tend to question their traditional identity as patients. The tendency is, on the one hand, to reduce direct contact time by passing on more information through printed or electronic communication (pamphlet of information about the preparation of a coming surgery or treatment, instructions on direction for use of prescribed drugs, public vaccination campaign, information on preventative measures) and, on the other hand, to acknowledge ambiguity in past modes of unilateral relation between professionals and the public.

The trend toward written communication has the unexpected consequence of relying on people's capacity for initiative to be informed sufficiently and properly, and it does so without fully recognizing the impact of uneven distribution of health cultural capital. A mismatch is thus being created in these new healthcare systems between the growing complicated demand with which national health systems are confronted, and the average basic competency of the public for whom more self-gathering and treatment of information is required (Rudd *et al.*, 2004).

This unspoken transition in the mode of interaction between health professionals and people is bound to produce inequalities and puts at risk the attainment of the Health For All objective. In such a context, equitable and sustainable development of health literacy and health-related adult learning in general may become a key element of future public health and lifelong learning policy.

Of course, the association between formal education and health status is known in both developed and developing countries (Kickbusch, 2001), as well as between adult learning and socioeconomic benefit. What is new is the impact of various levels of health skills and knowledge on health condition. Health literacy represents the cognitive and social skills that determine the curiosity and ability of individuals to gain access to understand and use information in a way that will promote and maintain good health. It involves the ability to judge, sift, and act in the context of one's own life on the information provided (Kickbusch, 2001).

New inquiries on health literacy and more precisely on the direct assessment of people's health-related basic skills and knowledge are revealing a relation between levels of such competency and levels of education and income (Murray *et al.*, 2007). According to these surveys, between a third and half of all adults in postindustrial societies struggle with low levels of health literacy, a percentage much higher among the aging population. They have difficulty understanding and acting on currently available health information.

Health literacy levels tend, in many ways, to influence people's ability to benefit from healthcare and to prevent illness and avoid pandemic diseases. It affects the capacity to discriminate information printed on drugs or food labels, to search and use accessible information in order to prevent sickness. Health literacy also has an influence on the ability to navigate into the labyrinth of current healthcare services. This has to do, of course, with the capacity to read written dietary or medical advice, complete open entry forms, understand complementary professional advice given on paper, grasp the importance of danger notices found on domestic product packaging, access critical information on health and safety at home or at the workplace, and to read about disease prevention.

However, health literacy is more complex. It means not only to read messages, but also to interpret them and proceed accordingly in one's specific life context. It means to be able to draw consequences from consent forms, deal with health alerts conveyed in the media, and detect in one's own immediate environment early signs of emerging sickness. It means to have skills to interpret symptoms and be able to tell a professional one's health story or the story of a family member in order to inform him appropriately. Health competency is needed also to benefit proactively from preventive services operating increasingly through distance communication. Thus, health literacy impacts directly on the accessibility of the health system through people's capacity to get, screen, and mobilize information now mostly delivered not only in print, but also in a more diffuse way, through broader consequences of cultural and educational advantages or disadvantages throughout the life course.

Medical journals are beginning to address this issue. Uneven distribution of health competency is challenging

not only the functioning of current healthcare systems, but also its universal accessibility (Sentell and Halpin, 2006; Somnath, 2006; Paasche-Orlow *et al.*, 2006). The practice of including an adult literacy variable in health disparity research is increasing; it reduces the explanatory power of the already known variables (Nutbeam, 2000). Because health literacy significantly affects people's health and the ability of a system to provide effective quality healthcare (Institute of Medicine of the National Academies, 2004), it is of no surprise that growing awareness on the impact of health literacy is giving new impetus to the already well-known domain of public health. Health promotion comprises efforts to enhance positive health and prevent ill health, through the overlapping spheres of health education, prevention, and health protection (Downie *et al.*, 1990), and it is often centered on lifestyle diseases. However, following the horizontal perspective developed in health literacy, health promotion tends now to be extended to the full continuum of health-related activities and tends to rely more on interactive communication and adult learning approaches (see, e.g., Davis *et al.*, 2003b, 1999).

We observe, in the last few decades, a diffuse but growing demand for health-related adult learning, either through structured activities or through supported and unsupported self- and informal learning. Associated with shifts in attitudes and behaviors during adulthood, participation in adult learning is seen as an important element of health prevention policies (Feinstein and Hammond, 2004). A growing number of study circles in Nordic countries (Swedish National Council for Adult Education, 2005: 24–26) and already nearly one-fourth of night courses in the German adult education centers are related to health issues (Reichert and Huntemann, 2006; Nuissl and Pohl, 2004). A similar emerging trend is observed in adult literacy where some education ministries are introducing health and hygiene modules in their adult literacy programs (ICAE, 2001). Studies on informal learning in Canada indicate similar content interest (Livingstone, 1999). National health departments are developing evidence-based health education programs (Bartholomew *et al.*, 2001). They are setting up nutritional education programs, environmental sanitation training, prenatal courses, etc. Studies are made on patterns of health information handling in order to improve health education interventions (Zanchetta *et al.*, 2007; Kok *et al.*, 2004; Zorn *et al.*, 2004).

However, health literacy is more than functional; it means more than transmitting information and developing skills to be able to read pamphlets and successfully make significant appointments with physicians. It is also to be interpreted in the emerging expectation of people to participate in decision making related to their own health and to follow through on these decisions. In discourse and research on literacy in general, and also in health literacy

in particular, we observe “a new introduction of humans as active agents in the construction, negotiation over, and transformation of their social worlds” (Barton *et al.*, 2000: 5). Some refer to this as a paradigm shift from pathology to empowerment (Shernoff, 1997). Hohn (2002), a well-known author in this field of health literacy, refers to “empowerment health education.” The reality of health literacy is complex in another dimension. Current health literacy skills assessments tend often to ignore the multi-cultural dimension of health reality, the many social health literacies (Street, 1995), the popular knowledge, “the different medical traditions” and complementary “local ways of healing” (UNESCO, 1997: 6). In that sense, interactive and critical health literacy does not focus only on compliance, it relates to the autonomy of the subject, with the capacity of a local community to act on their health conditions, with people better equipped to overcome structural barriers to health (Nutbeam, 2000) and modify the relation between professionals and the subjects.

Aware of the important gap between the complexity of current health materials and the basic skills of the intended public (Rudd, 2004), public health agencies are looking not only on people’s capacity to participate in this evolving system, but also on communication and practice of institutions and health personnel. Public health agencies tend to revise accordingly their information–education–communication (IEC) plan. Communication strategies are developed using plain-language or clear-communication approaches. In the same perspective, new continuing education programs are created to help physicians, dentists, and nurses better interact and communicate with their various patients. Some journals of continuing medical education (e.g., the *American Journal of General Internal Medicine*) are even proposing proxy measures or screening items to help professionals identify patients with limited health literacy skills.

The issue of the various levels of health literacy and more broadly of its consequence on equity, quality, and productivity of health services is making a big push for stronger investment in health-related education and adult learning, particularly in low-income communities (Rudd *et al.*, 2004). Paradoxically, the recommendation of WHO to allocate 5% of national health budgets to health promotion, prevention, and education may put a strain on the already tight public finances, but in the long term may be the best strategy to bend demand for curative services as well as reduce the cost of those services precisely among people at risk. In this new context, prescription of learning (Institute of Medicine of the National Academies, 2004; James, 2001) may well become an integral part of national health policy: prescription of lifelong learning not only among the public, but also among the professionals. Already in 1986, WHO insisted, in its Ottawa Declaration, on the necessity of a two-pronged approach: individual participation and structural change. People cannot

assume more responsibility for more aspects of their health without more protection and better opportunities to improve their health competency (Gruman, 2003).

Professional Continuing Education in the Health Sector: In Transition

Professional continuing education is in transition (Cervero, 2001), particularly in the health domain. It is one of the fastest growing areas of adult learning. The number of hours spent on continuing education activities in the course of both medical doctors and nurses’ occupational careers, after their certification and licensure, tends to exceed the duration of their initial education and training (Davis *et al.*, 2003a). In many countries already, taking part in continuing education has been made obligatory for professionals and conditional to keeping their certification. Continuing medical education (CME) has become an essential effector arm in complex healthcare systems (Davis *et al.*, 1999). The demand for continuing education among health professionals is expected to grow even further. The accelerating pace of clinical and biopharmaceutical or medical research as well as of epidemiological studies requires doctors and other professionals to update their knowledge on indicators of disease predictability and on new practices or medication. It explains in part the growing demand for continuing education. Indeed, more than 80% of physicians as well as nurses of the coming decade have already left universities or colleges and have terminated their initial education. In fact, CME has already become in the United States alone an industry producing more than \$3 billion of activities every year. CME has even become a recognized international discipline (Davis, 1998) with its scientific journals like the *Journal of Continuing Education of Health Professions*, the *Canadian Journal of Continuing Medical Education*, and the *Journal of Advanced Nursing*.

What is of particular interest in the continuing education of health professions is not its expansion, which constitutes a trend that one could observe, though at different pace, in other professional fields, together with the typical diversity of the education agencies involved.

More significant is the shift in orientation of activities within the health sector. Up to the mid-1990s, CME activities tended to take the form of obligatory or voluntary information and formal education sessions aiming at updating knowledge among field practitioners. The logic of action tended to be one of passive dissemination of information and knowledge transfer in order to keep professionals up to date with the recent developments in their field of practice (Bero *et al.*, 1998).

Particularly because CME, together with the continuing education of nurses, became an intensive area of activities involving a growing amount of financial resources, many

studies have been requested to assess the acceptability and effectiveness of prevailing approaches (Thomas *et al.*, 2006; Davis *et al.*, 2003b, 2003a, 1999, 1995; Elwyn and Hocking, 2000; Brigley *et al.*, 1997; Kok *et al.*, 1997). Various aspects were scrutinized: continuing education practices, knowledge transfer, impact of various formal and nonformal strategies, contexts and conditions differently conducive to efficient linking between CME and practice, uneven circulation of clinical and scientific knowledge, as well as required alteration of initial education. Most of these assessments came to the same conclusion: formal and didactic transfer of information tends to have low educational value. They have little effect on professional practice. Attendance at passive educational events, even when reaching most practitioners through incentive, tends to have limited impact on individual practice and on the activity of health services involved.

Since then, a shift of orientation is taking place with new approaches being assessed for their impact not only on upgrading the knowledge of practitioners, but also on their daily practice as well as the operation of medical units and clinics. The aim is to make interventions relevant to the identified individual and organizational needs (Elwyn and Hocking, 2000). Some researchers have translated this change as a transition from CME to CPD (Du Boulay, 2000; Peck *et al.*, 2000). Essentially, what is going on is a shift in logic of action through which priority is given to supporting individual professionals in the ongoing development of their capacity to act, observe systematically, gather evidence, and co-produce research or at least be able to discriminate in one's context new knowledge relevant for one's practice. Then, validation and certification could be done but *a posteriori*, separated from the situated learning process.

Such approaches tend to be more tailor-made, more situated in their content and in their process, referring to both the perceived needs of professionals and local organization's demand. The input of recent scientific evidence produced by research networks remains central, but the question raised concerns the mobilization or appropriation of such external knowledge and its transfer into new capacity for action. However, such transition takes time and, even though more effective approaches have been proven, use of least-effective approaches still continues (Bloom, 2005).

A recent trend has emerged trying to create organic links between scientific institutional research, clinical observation, and practice. The aim is to connect more closely formal research agendas with questions emerging from practice, while simultaneously training field professionals on evidence-based medicine (Cusick and McCluskey, 2000), and offer advice and guidance to practitioners interested in research (Bateman and Kinmonth, 2001). This shift of orientation, bound to take place eventually among other professions, is happening earlier

among the health professions for many contextual factors. The first one, already mentioned, is the huge investment in time and money that has been made in CME. This considerable effort has urged agencies to assess its impact. The result was to look for CPD strategies that could be less focused on logic of education supply than on logic of individual and organization demand.

The very specific nature of practice in health professions and of its recent developments has also played an important catalytic role in its shift of orientation. First, the context of health service is changing. The multidisciplinary profile of today's health personnel (doctors, nurses, therapists, epidemiologists and sociologists, physical educators, dieticians, social workers, learning advisers, etc.) in clinics or hospitals, together with the increasing cooperation required from different departments (health, education, industry, sport, social affairs, etc.) raise questions about the monodisciplinary orientation of traditional CME and, more importantly, have put the focus on cooperation between these different content and agency inputs. Second, the relationships between health professionals and among health professionals and the public are changing. The health profession is relational in character; it is a profession of contact. At the core of their practice, health professionals have to relate directly with people coming from all social strata; they are working in close proximity with the general public. As such, this relational character is not new; the relation with patients has always characterized the practice of these professions. What has changed is the nature of these relations through external pressure to request more autonomy from the public, and through rising aspirations of patients to have their say and negotiate their life course, more so when it encounters health problems.

The reduction of time available in the relation between professionals and patients has tended to integrate health professions in a wider web of specialties. It has also created a demand for more capacity of initiative among a public having various levels of health literacy, with important consequences in daily practice of health professions, and therefore in CPD: necessity to acquire new relational skills and to practice new forms of cooperation with various agencies and professions. Relations between professionals are also changing to take into account social demand coming either from new social movements or simply from genuine aspirations of more literate patients eager to pilot their life, body, and soul. An interesting new phenomenon in this area is the emergence around typical sicknesses or pandemics of networks of patients and patients' relatives or peers who look for new information and review research reports in order to validate diagnoses, explore and suggest new therapies, and even discriminate, in given diagnoses, between scientific evidence and cultural bias. A good example is the role of gay movement supporting their members in their relations with health professionals more so at a time when research on AIDS

was proposing various curative procedures and some interpretations of AIDS occurrence amounted to discrimination (Epstein, 1995, 2000). The same can be said about the role of the women's movement questioning the handling of breast cancer (Lantz and Booth, 1998). Becoming credible participants in the process of knowledge construction, these movements, entering a realm traditionally restricted to the medical experts (Kleinman, 2000), bring about changes in the practices of biomedical research and of health professionals; they thus become complementary agencies of CPD.

The continuing education of health professionals, having to practice in such a changing social and scientific environment and being in daily intimate relations with a public also in transition, could not remain an updating unidirectional process. Hence, the shift in orientation of CME toward contextualized CPD was somewhat predictable. Of course, CPD of physicians and other health professionals is not without ambiguity. The interest of the biopharmaceutical industry to promote their brevetted drugs may explain their quasi-predominant role in nonobligatory CME (Relman, 2001). The vast resources involved in this new market tend also to create a tension between a logic of supply in the provision of courses and self-learning kits and the emerging logic, of a more reflexive nature, aiming to integrate more closely ongoing research with the specific concern of each practitioner, clinic, or hospital department.

Conclusion

A shift is emerging in national health policies that tend to balance their historically dominant remedial and prophylactic orientation with new concerns for health promotion and consideration of the health literacy dimension in public health strategies. Similarly, professional continuing development within health professions is reframing professional practices of physicians and transforming their initial and further education career. A timid but steady transition, not unrelated to the tension between functional and empowerment-driven health literacy, is thus taking place from the prevalent health welfare organization to a health participative and learnfare system.

More rapidly developed than in many other professional fields, CME is currently undergoing important changes that may be prototypal of similar developments taking place in other professions and occupations.

These two trends in health-related adult learning are indicative of the enlarged vision of adult learning policy that is currently taking place. Adult learning policy environment has indeed to be rethought and reconstructed; it can no more exclude indirect lifelong learning policies (Bélanger and Federighi, 2000), like the learning component of health policies described in this article.

The demand for health-related learning throughout one's life course both within health professions and among the general public may very well be, after work-related adult education and training, the strongest forces driving up the demand for adult learning in decades to come.

Modernization Processes and the Changing Function of Adult Learning

H S Olesen, Roskilde University, Roskilde, Denmark

© 2010 Elsevier Ltd. All rights reserved.

Education increasingly appears to be the natural form of learning in modern life within a contemporary Western mindset. However, learning is more than that. It is an integral aspect of human life, taking place all the time, necessarily and unnoticed. The societal functions of adult learning are accordingly multiple. The theme of this article is to look at the societal nature of adult learning and hence, the societal functions of adult education. We want to emphasize the historical dimension in the sense of linking adult education to the socioeconomic, political, and cultural context.

Adult Education and Modernization

We can distinguish three main types of adult education defined by their main content. These have developed as educational traditions in their own right, related to particular areas of learning. As such they have been described and critically analyzed elsewhere in the encyclopedia:

- Basic literacy education, such as reading and writing, with the aspect of cultural integration in the nation and state.
- Community and popular education.
- Education for work, such as continuing education and training.

Much of the recent discussion in adult education is a clash between educational cultures. On the one hand, there is a humanistic focus on personal and political self-articulation, which seems to be inherited from the traditional functions of community learning and liberal adult education. On the other hand, there is the instrumental perspective on lifelong learning for work, theoretically underpinned by human capital theory and similar frameworks of understanding. These ideological struggles refer to historical experiences, and so an understanding of the societal functions of adult learning in their contexts may bring them to bear on wider issues of contemporary society. The theoretical notion of modernization seems to be a productive backbone in understanding the multiple institutional realities, conceptual meanings, and historical changes of adult education and learning. Modernization, here, refers to the economic, social, and cultural changes which have taken place in the last 300–500 years, comprising the inclusion of feudal dynasties and independent city

republics in the melting pot of European nation-state building, as well as the imperial inclusion of cultures and countries in the Third and Fourth World that had been living separate from dynamic centers right until the great discoveries or later.

Capitalist economy has been the main motor in this modernization process, where traditional, self-sustaining local communities were included in larger societies, affecting all aspects of political, social, and cultural relations. The development of institutional (formal) education, replacing informal education and learning, is just one of these effects.

Adult education develops complementarily to this greater history of modernization and (formal) education, enabling individuals to deal with new societal realities. The very notions of adulthood and individuality result from this history, as a gradual and complex process creating the individual as a conscious agent in society has replaced the definition of adulthood by ceremonial inauguration.

There is a built-in risk in using the theoretical perspective of modernization framework. Seen from the dominant center of a global, modernized world, it may seem that adult education and learning is on hand to enable modernization, harmonize the levels of learning between generations, and live up to the accelerating needs for individuals to change. This may be a local truth of occidental modernization, where the efficiency and speed of knowledge transmission seems to be secured by institutional education. In order to avoid a narrow functionalist perspective, we must study adult education history with the perspective of discovering the multiple and infinite nature of this modernization process.

Literacy Education: Enabling Modern Societies

The original and most widespread understanding of literacy is related to reading and writing. Prototype literacy education has been engaged in making developing societies literate or in compensating for lack of adequate schooling in modern societies. If we look at it from a societal perspective, literacy is a precondition for citizenship and socioeconomic participation. In Europe, literacy has been closely related to the building of nation-states. The development of secular education activities and the emergence of literature in national languages were instrumental in the building of nation-states.

Today, literacy has become a political issue in the multi-cultural societies emerging in modern Europe, and in some cases, instrumental for minorities to establish home rule. However, the cultural integration of rural and urban working classes is also a condition for socioeconomic development. Today's industrial worker must be literate in order to fulfill simple work tasks because logistics and communication are built into every single task on the shop floor. Consequently, concern has moved from formal education to functional literacy – the competence to actually read and write in everyday life. New literacies are added, for example, numbers and mathematical modeling (Johansen and Wedege, 2002). Information and communication technology necessitates new reading and writing skills in order to be a competent member of society, but may also relativize the importance of traditional written language skills.

Literacy is empowering, but the acquisition of cultural techniques – whichever they are historically – also entails submission under cultural dominance. As a result of colonial modernization we can see derivatives of the great colonial empires, some united by the colonial language, and all to some extent influenced and shaped by colonial rule. Brazilian Paulo Freire answered this contradiction with a notion of political literacy he called conscientization, or learning to reflect the social reality and power relations involved in it. You may see Freire's ideas as congenial with mainstream modernist pedagogy, only related to the political learning process of those who are the victims and beneficiaries of a modernization coming to them from outside. In a more analytical key, questions have been raised about peripheral modernization, that is, a specific version of modernization in countries and regions that have had a modernization process pushed and influenced, but not entirely determined by colonial rule (e.g., Brazil).

Language is a medium for the individual sensual experience, as well as, for elaborating cultural experiences historically in a wider society. Written language has contributed significantly to societalization by enabling communication and knowledge transfer across time and space, creating a fundamental tension between immediate (local, situated) and mediated human experience. When printing technology created the industrial basis of the literate modernity, it reinforced this duality. The modern experience of the world is a language-mediated experience. Digital technology is probably proclaiming a new and more radical version of the same – or possibly a qualitative new relation to reality, an extended version of sensual access.

Community Education and Popular Education: Struggles about the Societal Atmosphere

All the different types of community and popular education are based in a community of people defined by

location, religion, cultural values, or political assumption, and often have a perspective of social, cultural, and political self-articulation. Most people engaged in such education probably perceive it as a free space for learning that is relatively independent of societal conditions and constraints. In a societal perspective however, adult learning is a substantial aspect of modernization itself. Community interests are very often defined by and responsive to societal change. Education preserves cultures that are threatened and overcome – and these pockets of social and cultural life that are not entirely penetrated by societal dynamics provide a productive space for self-articulation. Most typical community and popular education is probably based on resistance against some of the influences of modernization, for example, minority communities that also happened to be marginal and/or impoverished by capitalist modernization and centralization.

Independent of whether these communities see learning as explicitly political or not, learning is part of an attempt to create a public sphere of their own or set the cultural framework of understanding on a societal level. Out of closed communities or specific resistance grows – in a number of cases – a structural characteristic of modernity: the existence of civil society. Community and popular education based on specific histories of socioeconomic and cultural circumstances may – in very different and paradoxical ways – produce a general societal development. The history of independent Danish folk high schools provides a historical example. The folk high schools were based on and also contributed to a particular development of political, cultural, and social movement among Danish self-owning peasants, which in turn played a decisive role in establishing a modern democracy. In spite of the fact that the folk high school education was based on an antimodern, romantic ideology, it produced the experience of popular self-regulation and self-organization, which also in later developments contributed strongly to the specific modernization process in Denmark (Olesen, 1989). Its cultural-class compromise, uniting egalitarian and liberal principles and a basically anti-academic, informal notion of education, anticipated some of the developments of lifelong learning around the beginning of the twenty-first century.

The dialectic of local community learning and societal development is, more than anything, related to the role of work in culture and economy. Since the main driving force of modernization has been capitalist industrialization, the most important popular education activity in Europe in the previous century was of the labor movement and trade unions. Industry formed the life conditions in (urban) communities, and the labor movement in most countries organized working-class culture and its learning institutions, first as a resistance solidarity movement, then gradually as a more proactive cultural self-articulation and political movement. In some cases, community education also entails alternatives to the dominant capitalist economy – in the

form of cooperative economies – prominently in the Basque country and also at a smaller scale in most developed capitalist countries.

It is obvious that labor movement education activities are in one sense a product of an active resistance against some of the effects of modernization, similar to the culture of many communities that have been marginalized or impoverished by modernization. It is a clearly partial culture defined by political and trade union action, or at least from a general class perspective. Unlike many local and minority communities, however, labor movement education activities developed a universalistic perspective, challenging individualistic liberalism with ideas about equality and solidarity. The political struggles between different types of Socialism can be seen as different versions of a universalistic aspiration – communist, social democratic, anarchist, and syndicalist – that each carry in them more or less ambitious aspirations of justice and a new level of democracy beyond capitalism. The real histories of different countries have provided a variety of working-class cultures and not just labor movement experiences, as well as some in which universalist aspirations turned into totalitarian power.

Seen in a societal perspective, popular education comes out of premodern communities, as well as urban communities generated by modernization itself. They are formed by the specific histories of modernization and they take advantage of one of the effects of modernization, namely the existence of a space for noncoerced social organization, what we in modernization theory call civil society. The societalization – from *Gemeinschaftswesen* to *Gesellschaft* in the notions of the classical sociologists – eradicates or restructures communities at the same time as modernization extends the space of relatively free cultural activity. The juridical basic rights and economic affluence in modernized parts of the world create the societal basis of this civil society. A contemporary form of popular education must have its potential base in the organization of citizenship to deal with societal issues on a level and with an outlook adequate for contemporary society as a whole. Many one-cause movements and actions have a similar profile as community action of resistance or opposition though not necessarily founded in a community.

The bourgeois public sphere as the communicative framework of a fully developed civil society corresponds largely with the nation-state and ideas of formal (state) democracy. At the same time, global capitalism has in several ways bypassed this structure. Structurally, by its international operation and concentrations of power and capital in organizations larger than many states, creating a democratic deficit. Culturally, by the media and consumer cultures which take active part in the shaping of desires, fantasies, and preferences. One may see international labor organizations and forms of organizations like World Social Forum as – very fragile – civil society responses to this situation.

Learning for Work, or Human Resource Development

In the last couple of decades, the need for work competence building has tended to prevail over traditional forms and rationales of adult education and training in developed Western societies. In traditional societies, intergenerational transfer of knowledge and competences enables the reproduction of the labor force. Modernization has brought basic school education and some specialized institutions for academic and professional education – generally serving as basic, lifelong qualifications in the initial career. In advanced capitalist societies, this mode of transfer has increasingly come under pressure. When changes in work and labor market happen faster than the generational turnover in the labor force, adult education and training come in as a mediating instrument to secure the adaptation of labor to the requirements of work life.

It has mostly been left to employers and the individual worker to take care of retraining and adult education. The consequences have typically been a general market failure (i.e., underinvestment) and a very unequal distribution of training resources. Big industrial employers have in some cases been able to secure up-skilling of their own employees, but not mobility across sectors and competence levels. In Nordic countries, training of workers became part of welfare state policies. In Denmark, with its late development of industrial economy, urban industries needed skilled workers, and rural workers needed skills and socialization for industry. A separate new strand in adult education developed to support a rapid migration from rural to urban life, from agriculture to industry. What became later known as the flexicurity model (Jørgensen and Madsen, 2007) consisted mainly of adult education and training together with relatively good unemployment benefits. This combination enabled a more proactive policy from trade unions and employees than in a number of European countries in periods of economic growth. In the period of crisis and stagflation in the 1970s, continuing education was redirected/enhanced to take care of more long-term competence development for the more vulnerable segments of the labor force (e.g., women, young people without vocational qualification, and others).

Recently, adult learning seems to have assumed a more universal or all-embracing nature in all the advanced capitalist countries. As long as the development of work takes the form of strong division of labor based on mass unskilled wage labor, societal needs remain limited to training and retraining specialists and highly skilled craftspeople. However, with the development of postindustrial forms of work organization, a need for broader adult education emerges. The societal demand for knowledge economy has changed to include not only what were mostly called soft skills (e.g., communicative and collaborative skills, quality consciousness, professional attitudes,

and self-confidence) but also traditional literacy, as well as new literacies (e.g., numeracy and mathematic understanding, and computer literacy). Work-related learning seems to become broader and deeper and increasingly interferes with personal needs and identity (Olesen, 2005). Nevertheless, it is obvious in the rhetoric of lifelong learning that economic concerns and the focus on employment and work are determining factors. This can be seen as a very local view on global development. The position of most developed economies can hope to maintain their relative competitive advantage in a division of labor where they take care of knowledge-based, complex work and the service work for themselves, whereas developing countries deliver raw materials and build up low-tech industrial production.

The political consensus about lifelong learning of competences may not be so easy to maintain in this narrow key. Rather, the focus on work and human resource development may raise issues of control and the quality of work. The ideas of a knowledge-based economy have been criticized from several perspectives. One applies a wider, ecological perspective on work and learning, questioning the inward colonialism of human life without boundaries (Hochschild, 1997) and its cultural consequences (Sennett, 1998; Negt, 1984). The requirements on human flexibility and adaptation may erode the conditions of socialization and subjectivity, that is, the human resources on the whole. Another perspective emphasizes the direct political aspect of learning in which labor movements should take the opportunity to advance a politicization of work, including environmental questions, ownership, and use value of production, drawing on vanguard experiences of cooperative enterprises (e.g., The Mondragon cooperative – Antoni and Campbell, 1983), projects for conversion of production (Lucas Aerospace and others), and a vision of self-regulated work (Forrester, 2007). The dramatic emergence of the climate crisis and the fragility of the capitalist world economy underscore the need for more comprehensive perspectives on work and learning.

It seems most plausible to outline a neoliberal scenario of an individualized competence market, which will be subsumed into a global labor market. However, it also seems likely that this competence market will show an unprecedented example of market failure – and it will definitely have extreme effects in terms of inequality and the colonization of human labor. The question is whether there is another scenario in which the significance of the labor force as a subjective factor in the economy can be turned into individual and collective self-regulation of work and learning. This seems to be the open question that places the discussion about learning for work and the workers' role in the development of work as a central issue in global politics.

The resources for any alternative to neoliberal global capitalism must to some extent be found in institutional

practices, embodied experiences of the past, social organizations, and experiences of trade unions and other cultural organizations. They are present in the forms and levels of education, expectations, and preferences of young people as well as adults, but they do not form a simple and coherent alternative. While the new discourses of lifelong learning are international, Anglophone, and relatively homogenous, adult-education traditions have many names: popular education, community education, *educacao popular*, *politische bildung*, liberal education, *folkeoplysning*, *folkbildning*, *formation des adultes*, *formazione popolare*, *volksbildung* and citizenship education to name a few. In adult education discussions, these many names give rise to translation problems – although the names in different languages cover more or less corresponding phenomena, they do not have the same meaning because meaning is related to societal and cultural context.

Functions of Adult Learning in Historical Context

The exploration of the historical function of adult learning may lead to an open discussion of present-day modernization. The main types of adult education form strands of historical functionality over long periods of time. Analyzing them in terms of modernization may present a simplistic scheme: literacy enables modernization by integrating ordinary people in cultural communities that are independent of time and space; popular education elevates the ability of communities to reproduce themselves to a level of cultural construction and self-articulation, eventually a level of collective self-assertion and political activism; and continuing education and training for work aligns individual competence-building cycles with an accelerated and distributed organization of societal work in global capitalism. Obviously this complex societal evolution is not a unified process – it is asynchronous and very diverse across the world. So the societal function of adult education must be studied in concrete contexts, regarding the interplay with socioeconomic, political, and cultural history. Socioeconomic modernization and the type of learning needed and enabled are mutually interrelated, but institutional developments also set general conditions of this process. When and what type of adult education contributes to modernization (the level of general schooling and the influence on school by church and class movements), and political circumstances, may form very specific conditions and challenges (e.g., the *entnazifizierung* as a project for political education in Germany after World War II, or the modernization in Spain under a long-lasting dictatorship).

Today, on a global scale, we may ask whether modernization is just one process. The discussion about

peripheral modernization has been touched upon in this article. In postcolonial theory and political discussion, the emphasis on difference and multiple histories serves to demonstrate the overcoming of the modernist tale or vision of a rational evolution toward a better society. Sometimes the argument that modernization should not be seen as a continuous progress gets confused with the assumption that there was and is no modernization process at all. In a generalized discussion of global capitalism one may at the same time observe a pessimistic view of one culturally homogenized world (McDonaldization) and much more relativistic postcolonial theory of a general dissolution of the modernization process in a firework of difference. Both fail to grasp the complexity of durable social changes. Having said that, what is the role of learning in modernization processes? It can be argued and underpinned by examples that broad processes of learning and democratic participation lead to durable societal changes, whereas change processes that fail to engage the broader population remain unstable and produce conflicts in the form of imperialism and/or violent repression on macro- and micro-levels. The postcolonial discussion of education may, in the era of global capitalism, oscillate between the critical perspective of one culturally homogenized world at the end of the story (McDonaldization), and the postmodernist theory of a general dissolution of the modernization process in a firework of difference. There is a key to dynamic mediation between the two perspectives in an open-minded exploration of specific experiences and learning resources in their historical context.

It is essential to maintain that the possible futures of late- or postmodernity is a matter of social agency and hence also of learning processes taking place now. Lifelong learning implies a new discourse that brings learning beyond institutional education and into social reality. However, the lifelong learning discourse has been heavily influenced by neoliberal politics and human capital theory, and the world is relatively short of alternative ideas that can embrace the critique of educational institutions without accepting the neoliberal economic rationale. The options available are societal and subjectively relevant conditioned by experiences and resources of the past. The author has mentioned a long-lasting influence of the popular education tradition in his own country, which formed the ideological basis for a relatively democratic and liberal provision of formal and higher education, as well as adult education. Others are to be found in Latin America, South Africa, and other particular pathways of modernization.

Modernization is still an uncompleted development even in its original centers. While it seems that globalization brings forward further homogeneity, there are also factors that tend to enable a multicentered and polyphonic global world. The fact that China has had its

own almost independent cultural and social pathway, which is now – forcefully – joining global capitalism, forms an exciting experiment for the relation between human socialization and societal development. Oskar Negt calls it “the greatest social experiment in our time” (Negt, 1988/2007) in his discussion of the modernization(s) in China in the perspective of European modernization since the Renaissance. We may most productively see modernization as an infinite process that is still dependent on human efforts and choices on individual, as well as global level.

The Political Economy of Adult Education

G Rees, Cardiff University, Cardiff, UK

© 2010 Elsevier Ltd. All rights reserved.

The expansion of post-compulsory education and training has been one of the most striking recent changes in the education systems of more developed societies. Much of this expansion is accounted for by rising levels of participation among adults. Of particular interest here has been the growing prominence attached to the provision of learning opportunities for individuals throughout their working lives and, indeed, into retirement.

In part, this reflects the demographic shifts which imply an aging population – and workforce – in most of the more developed countries. Equally, there has been a fundamental political re-evaluation of adult education's role. Governments in these societies (and beyond) have been remarkably consistent in prioritizing policies for what has come to be termed lifelong learning; that is, learning throughout the life course, from preschool to old age. These policies, in turn, are based on a robust conventional wisdom – what Grubb and Lazerson (2004) have dubbed the education gospel – about the essential role of education and training in generating the high levels of skills necessary for economic competitiveness and growth in the globalized economy.

This conventional wisdom partly derives from the work of academic economists in developing human capital theory (HCT). This theory has become one of the most influential economic doctrines of the age, especially in its contemporary manifestation in theories of the knowledge-based economy (KBE). However, the central characteristic of the political economy approach is that it interrogates such economic doctrines in order to uncover their political and sociological premises. Rather than simply treating economic theories as frameworks of analysis in their own terms, political economy aims to explore the – often implicit – social assumptions on which they are based. In this case, for example, approaches to adult education derived from HCT assume that individuals are able to calculate the instrumental benefits of human capital formation; and that individuals' skills are rewarded in ways which reflect their productivity. Alternative approaches are clearly possible.

Equally, the political economy approach seeks to explain the influence which economic theories exert on policy in terms of the wider social and political context in which they are located. Here, the increasing dominance of neoliberalism during the 1980s and 1990s, orchestrated by international agencies, such as the World Bank and the Organization for Economic Co-Operation and Development (OECD), created a fruitful ideological environment

for the development of the individualized and instrumental approaches to adult education which are embodied in lifelong learning strategies. While governments adopted policies which reflected national circumstances, the policy repertoire available to them was limited by the wider ideological climate.

The next section presents an account of how the current conventional wisdom views the relationships between adult education and HCT, paying particular attention to theories of the KBE. Then, the critique from political economy of this position is explained. In the final section, the significance of the ideological context of neoliberalism for state policies on adult education is reviewed.

Theories of Adult Education as Human Capital Formation

The analytical basis for the view that, in general, education has a key role in determining economic development is provided by HCT, although the versions adopted by governments to underpin their policies have involved highly simplified accounts of the academic research. HCT has a very long pedigree, but its influence on thinking about the relationships between education and economic life became especially marked during the 1960s. Here, the macroeconomic arguments that investment in education and technological change constituted the basis for national economic growth provided a rationale for the expansion of educational provision by governments, especially at the upper secondary and tertiary levels.

In the harsher economic climate of the 1970s and 1980s, the emphasis shifted to the returns (e.g., from enhanced future earnings) which would flow to the individual from his/her investment in increased human capital (e.g., through undertaking extra education and training); and the productivity gains which would accrue to employers from the resulting enhanced skills levels. State intervention became limited to ensuring that the optimal conditions for these private individual investments prevailed. By the 1990s, the intellectual terrain had shifted again, strongly influenced by the development of theories of the KBE.

Human Capital in the KBE

Theories of the KBE adapt HCT to what are construed as the essential characteristics of contemporary economic life.

On this view, the globalization of trade and investment has intensified competitive pressures, especially for those national economies which are unable to compete on the basis of low-cost production. In these economies, competitiveness can be maintained only by enhancing the productivity of capital and labor. This implies continuous innovation, developing new goods and services and more effective processes for producing, marketing and distributing them, and applying the most efficient patterns of work organization. Hence, the creation and – critically – the application in production of new forms of knowledge become the key factor in shaping the prosperity of individual enterprises and economic development more widely.

This valorization of knowledge production and innovation also has critical implications for the operation of labor markets. The KBE offers expanding opportunities for the so-called knowledge workers who have the very high-level skills required to operate in professional, managerial, scientific, and creative jobs in the upper echelons of the new occupational hierarchy. Equally, even workers who do not attain the very highest occupational levels require, at a minimum, high-quality general education and cutting-edge intermediate skills, so that they can engage actively in driving up productivity.

However, the corollary of these new occupational opportunities is the sharp decrease in unskilled or partly skilled occupations, which formerly comprised significant segments of the workforce. Some of these occupations have been relocated to the low-cost economies, reflecting patterns of globalization more widely. Others have simply disappeared because of changes in the industrial structure and transformations in product and process technologies. The implication is, therefore, that, in the KBE, employment opportunities for those individuals who do not have significant amounts of human capital are bleak.

Adult Education and the KBE

Theories of the KBE have significant consequences for how the production of human capital is conceived. Effective systems need to be in place to ensure that individuals with the requisite high-level skills are produced in sufficient numbers to meet the growing demand for knowledge workers. This implies the expansion of tertiary education, increasing the numbers of people with degrees and postgraduate qualifications. Equally, through the compulsory phases of education, everyone needs to attain high levels of general education – especially in respect of the essentials of literacy, numeracy, and science.

Moreover, theories of the KBE have specific implications for human capital formation through adult education. In an economy that is characterized by continuous innovation and the adoption of new technologies and modes of working, individuals need the forms of human

capital which ensure that they are able to respond flexibly to these changing demands.

This requires the provision of opportunities for adults already in the workforce to compensate for any shortcomings in their previous education, in terms, for example, of the essential basic skills of literacy and numeracy or general vocational skills, such as communication, team working, and information and communication technology (ICT) competences. It also implies that workers are enabled to develop new knowledge and skills, as and when these become necessary. Not only are individuals expected to transfer from one job to another much more frequently than hitherto, but also new demands arise as existing occupations change in character. In these circumstances, workers need to be competent and flexible learners; learning to learn is thus an essential prerequisite.

Adult education is required to deliver effective opportunities for individual workers to acquire new knowledge and skills not only through participation in formal learning within institutions dedicated to the provision of education and training, but also through nonformal learning effected, in particular, within the workplace itself and largely instigated by employers. The workplace is also increasingly recognized as a crucial setting in which informal learning, especially through interaction with colleagues, should be facilitated.

It is, of course, important to emphasize that these theories of the KBE – as with most theories in the social sciences – are not without their critics. In the next section, some of these opposing views, drawing on political economy approaches, are explored.

Beyond Theories of Adult Education and Human Capital

Adult Education, the Social Construction of Skills and Learner Identities

In general terms, the link between human capital formation and economic development is well attested empirically. At the macroeconomic level, innumerable econometric studies demonstrate the strong positive relationship between education and national economic growth in the long term (Barro, 1997). There are also many microeconomic studies which show the returns which accrue to individuals from their investments in human capital formation.

Much of this evidence relates to school-based and tertiary education and qualifications. However, the available studies indicate that work-related adult education (and basic skills development in particular) does have positive associations with the earnings of individuals and with productivity increases (although the returns to other forms of adult education are less certain) (OECD, 1999). Accordingly, on the basis of this evidence – wholly consistent with theories of the KBE and the consequent understanding of

adult education's role – both individual workers and their employers benefit from greater participation in work-related adult education (Blöndal *et al.*, 2002).

Approaches to adult education derived from HCT assume that individuals and employers recognize that increased human capital will increase productivity and that this will be rewarded in higher wages. However, as many commentators have argued, skills and the returns that accrue to them cannot be understood simply in terms of productivity. How skills are defined is the product of complex social and political processes, which are frequently as much about excluding social groups from the rewards which derive from what are defined as highly skilled occupations, as the technical requirements of production. Most notoriously, the skills attached to jobs which are characteristically done by women have not been recognized as such by employers and, indeed, male workers and their trade unions. While the knowledge and competences embodied in occupations may have changed, skills remain socially constructed. Moreover, once the notion of skill is detached from its technical content, it becomes clear that human capital may best be understood in terms of regulating access to occupations of different kinds, and, in the case of work-related adult education, to the kinds of screening which employers operate to determine what kinds of people enter more desirable jobs.

Equally, it cannot be inferred from the evidence on returns to human capital formation alone that individuals will actually participate in work-related adult education. Hence, approaches derived from HCT assume that individuals accrue human capital (e.g., by participating in work-related adult education) on the basis that future returns (e.g., through increased earnings) will outweigh the costs incurred. In reality, however, people's participation even in work-related adult education reflects more than this narrowly constructed, instrumental valuation. For many forms of work-related training, people choose to take part only in a very limited sense. Participation is experienced as compulsion by the employer; and may, in consequence, result in very little by way of new learning. Even where participation is a matter of choice, individuals' decisions are constrained by their material conditions: their financial resources, family commitments, and even where they live. Moreover, people's choices are shaped by the expectations and norms – deriving from their experiences in their families, communities, and previous educational institutions – which define their identities as learners and, therefore, potential participants in adult education of all kinds (Rees *et al.*, 2006).

Adult Education and the Demand for Skills

Theories of the KBE predict increasing demand for skills across the economy as a whole, largely through the growth

of high-skills jobs. However, while there has been a significant increase in the professional, managerial, scientific, and creative occupations filled by highly skilled knowledge workers, this has not been matched by the demise of low-skilled, low-waged employment. Many more developed economies have experienced an increase in jobs at both the top and the bottom of the occupational hierarchy, with a hollowing out of occupations at the intermediate levels. To this extent, therefore, a substantial and even growing proportion of occupations do not require high levels of skill, either to enter them or to carry them out effectively.

While there may be persistent shortages of specific skills, there is no convincing evidence that there are general shortfalls in skills across the more developed economies as a whole. This is the case even in those national economies in which human capital formation has been regarded as problematic. For example, recent studies in the UK suggest that, if occupations are categorized by broad level of required skills, the only category for which there are more job openings than people qualified at the appropriate level is that where no formal qualifications are required. Conversely, the number of jobs requiring tertiary-level qualifications is far exceeded by the number of people having such qualifications (Felstead *et al.*, 2007). Evidence of this kind has led to the claim that, in many of the more developed economies, demand for skills, especially at higher levels, is being outstripped by supply.

Work-related adult education is not provided across the board in the ways prescribed in theories of the KBE. Access to such learning opportunities is not distributed evenly between different groups of workers. In general, the higher someone is in the occupational hierarchy and the greater his/her previous educational attainment, the more likely they are to benefit from the provision of work-related adult education. As **Table 1** indicates, while there are important national differences in rates of participation, this is the pattern across the more developed economies; and it reinforces the notion that significant parts of the labor market remain dominated by low-skill occupations.

Indeed, it has been argued that some economies are characterized by what Finegold and Soskice (1988) called a low-skills equilibrium. Here, employers adopt strategies geared to the production of low-cost, low-quality goods and services. These strategies are sustainable because production is primarily or wholly for local or domestic markets with little threat from cheap imports. Employers rely upon labor-intensive production systems and the mass production of low value-added goods. Therefore, they do not require workers with high skills levels. While there is little evidence to suggest that a low-skills equilibrium exists across any of the more developed economies as a whole, it is apparent that particular sectors and even regions can be dominated by low-skills, low-cost

Table 1 Participation in work-related adult education and previous education^a

<i>Level of education</i>	<i>Lower secondary</i>	<i>Upper secondary</i>	<i>Tertiary</i>	<i>All levels</i>	<i>Ratio (%) hours in training to annual hours worked</i>
Canada	6	20	35	25	30
Denmark	22	36	54	39	63

production, often reflecting a residue of past economic activity (OECD, 2001).

The development and application of skills are situated within the wider strategies which firms and other organizations adopt with respect to the production, marketing, and distribution of goods and services. Moreover, there is not a single strategy that provides employers with a pathway to competitiveness and profitability. Hence, simply expanding the supply of skills is insufficient, unless employers' production strategies are of a kind which ensures that extra skills can actually be applied. This has important implications for the kinds of skills development strategies adopted by governments.

In spite of these well-founded critiques, the KBE continues to provide the foundation for the very robust conventional wisdom as to how governments across the more developed countries should deal with adult education. In the next section, the role of an ideological context dominated by neoliberalism in explaining this seeming paradox is addressed.

The State and the KBE

In the official discourses of governments and international organizations, theories of the KBE provide the key justification for policies aimed at promoting higher levels of skills through lifelong learning. While the latter encompasses learning throughout the life course, adult education has been identified as an especially important mechanism for enhancing human capital formation. Hence, many national governments in the more developed countries have shifted priorities for adult education toward directly vocational provision, thereby displacing its contributions to traditional concerns such as personal fulfillment or cultural development.

So robust is this consensus on the need to gear state policies to promote high skills levels that it has become

the common sense of policy on adult education across the more developed economies. Accordingly, it is important to emphasize that this current conventional wisdom is situated within a historically specific ideological and institutional context.

Neoliberalism and Lifelong Learning

For much of the twentieth century, the governments of the developed economies operated Keynesian national settlements between employers, trade unions, and government. These were based on the mass production of standardized goods and services, high wage levels, and, consequently, rising living standards as well as an emergent consumer culture. The state played a key role in regulating economic activity and in providing key welfare services. While approaches to skills development varied significantly between different national economies, HCT was interpreted as providing the rationale for increased government investment in education, especially at the upper secondary and tertiary levels, in order to keep pace with the growing technological complexity of goods and services; but adult education was not given special attention.

This Keynesian regime broke down during the 1970s, to be replaced by one based broadly on neoliberalism. On this view, in the face of new patterns of globalized economic activity and competitive pressures, markets are deemed to provide the most effective mechanisms for the organization of economic activity. The role of government is limited to ensuring the conditions within which markets can function effectively, through maintaining macro-economic stability and providing public goods (physical infrastructure, basic education, environmental protection, etc.). Only where markets manifestly fail to deliver effective outcomes should state provision play a major role, as, for example, in meeting the basic needs of the poorest members of society through income redistribution.

Therefore, although the development of high skills levels through lifelong learning is acknowledged as central to meeting the demands of global competition and the KBE, the state's role in skills formation is a restricted one. It should ensure that the supply of basic education through schools, colleges, and universities is maximally effective. However, employers can be relied upon to encourage the development of vocational skills in response to the changing patterns of demand, and to reflect the true value of such skills in wage levels.

Most importantly, the principal responsibility for human capital formation is seen to lie with the individual worker. Intervention by government should be restricted to ensuring the availability of information, removing barriers to participation, and, where the market fails, subsidizing individuals' engagement in work-related adult education. The very language of lifelong learning implies that its effectiveness in creating and preserving human capital depends upon the capacities and motivations of individuals themselves. Failure in the labor market is interpreted in terms of the decisions that people make about improving their employability through increased human capital; and increasingly, welfare payments to the unemployed and other economically inactive people are conditional on their participation in education and training.

In this way, neoliberal approaches emphasize the key importance of human capital formation. However, they prescribe particular means of achieving this, emphasizing individualized and instrumental orientations to lifelong learning and work-related adult education, more specifically.

Government Strategies for Adult Education

The work of international organizations, such as the World Bank and the OECD, has been a key influence in shaping this neoliberal agenda on lifelong learning. More specifically, such organizations have been crucial in ensuring their significance in shaping the actual roles undertaken by governments. The work of the OECD has been especially important here and illustrates this agenda very clearly (Henry *et al.*, 2001).

From the late 1980s onward, the OECD has produced highly influential analyses of the essential role of human capital in the development of the KBE (e.g., OECD, 1989). It has also been an enthusiastic advocate of the necessary benefits of lifelong learning and, more specifically, of enhancing the human capital of adults. Moreover, it has been crucial in specifying the exact roles to be played by governments in ensuring effective provision of adult education. Workers require access to ongoing opportunities for learning of all kinds. Where firms and other organizations are unwilling to provide these opportunities, the state needs to intervene to ensure that such market failure is rectified, through, for example, providing subsidies for

employer-led provision, specifying mandatory spending on training by enterprises or granting the right to be trained to employees (OECD, 2002).

However, despite the almost hegemonic influence of neoliberalism, there remain significant differences in the strategies adopted by national governments toward adult learning. At the most fundamental level, this reflects the choices made by governments. For example, as has been seen earlier, the high-skills strategy is not the only possible response to the competitive pressures of a globalized economy. One clear alternative is, in effect, to adapt the strategies of the Keynesian era to changed circumstances, through an intensification of Fordist production of goods and services, emphasizing low-cost and, to a considerable extent, low-skill methods. This kind of low-skills strategy has not been adopted explicitly by any of the governments of the more developed economies, reflecting both competitive pressures from lower-cost economies as well as the ideological influence of the neoliberal consensus on the KBE. Nevertheless, it remains the case that, in reality, a low-skills equilibrium is characteristic of substantial parts of all of these economies.

The choices which governments make, in turn, are shaped by the skills development strategies which have been characteristic of national societies in the past. For example, the enthusiasm with which the Anglo-Saxon economies (the USA, the UK, Australia, and New Zealand) have embraced market-driven approaches reflects their voluntaristic traditions, as well as an ideological willingness to accept sharp inequalities between enclaves of highly skilled knowledge work and large numbers of low-skilled and low-waged jobs. In contrast, many of the northern European governments (e.g., in Germany, the Netherlands, and the Scandinavian countries) have based their adult education strategies much more on consensus between employers, employees, and government. This reflects both their historical attachment to this form of political economy and a rooted ideological commitment to avoid the worst social inequalities of a market-driven system through state support for greater employment security and access to learning opportunities among the socially disadvantaged. In developmental states, such as Japan, Korea, and Singapore, circumstances have been different again. Here, the state has continued to play a significant role in skills development, simply to try to ensure that the supply of skills matches the demands of economies undergoing strong growth (Brown *et al.*, 2001).

The Value of Adult Education

Despite these important differences in approach, it remains the case that the hegemonic discourse on adult education is currently dominated by instrumental orientations. Its value is seen to lie overwhelmingly in the

contribution which it makes to economic life. In distributional terms, investment in human capital formation through lifelong learning is argued to benefit not only the individual workers and employers making the investments, but also the wider economy through increased productivity, thereby warranting – limited – state support. Moreover, it is the recognition of these individual and social benefits that are viewed as underpinning individuals' motivations to invest in human capital formation in the first place.

Adopting a wider frame of reference, however, suggests alternative frameworks through which the value of adult education may be judged. In the right circumstances, engagement in lifelong learning certainly offers the possibility of significant economic returns, both to the individual and to the economy more widely. However, as many commentators have argued, this by no means exhausts adult education's potential total public value. Ironically, however, realizing this total public value may require governments to reassert priorities for adult education which have declined in significance over recent decades, reviving their role as provider of a liberal general education, especially to those social groups who need an educational second chance.

Wider Benefits of Adult Education

T Schuller, OECD, Paris, France

R Desjardins, Danish University of Education, Copenhagen, Denmark

© 2010 Elsevier Ltd. All rights reserved.

Introduction

This article focuses on the wider benefits of adult learning, covering a mix of personal and social (external) effects. The emphasis is on the effects of adult learning on health and civic engagement. Less attention has been given to this area than to the economic benefits of adult learning, although there is a growing body of research in this area. Some reference is made to the human and personal development aspects of adult learning as these can also be considered wider benefits; however, this topic has been discussed more elaborately elsewhere in the encyclopedia.

Defining the Wider Benefits

A basic issue is the question of what changes are affected by learning interventions. The changes are not limited to the individual. Adult learners can in turn initiate changes in the wider sense, by affecting the home/family, work, and community contexts that they engage in. There is a deep-rooted belief that adult learning has the potential to create personal, economic, and social value. This value can accrue to a variety of actors: to the learner, other private interests such as a current or future employer, and/or to society at large. In short, individuals, employers, and governments invest in adult learning with an expectation that there are benefits of different kinds to be realized.

Benefits can be categorized in a number of ways: cognitive or affective; psychological or behavioral; job or leisure related; and expected or unexpected. The notion of wider benefits usually refers to a mix of external, public, and nonmonetary benefits. The term social benefits is often used to refer to a similar range of effects (Behrman and Stacey, 1997; McMahon, 1999; Wolfe and Haveman, 2001; Psacharopoulos, 2006), although it does not include private nonmonetary benefits as in the notion of wider benefits as used by some authors (e.g., Schuller *et al.*, 2001, 2004).

Benefits that do not necessarily accrue to individuals (or other private interests such as firms) who make the decisions to invest are referred to as external. They are external because they are not taken into account when deciding to invest, even if they might be expected. The presence of external benefits provides justification for public policies that foster adult learning (Desjardins *et al.*, 2006). Otherwise there may be underinvestment from the standpoint of public policy. External effects are

commonly associated with public or societal effects because they tend to be nonexclusive (Lucas, 1988).

The notion of wider benefits can also encompass non-monetary benefits which occur at both the private or public levels. Private individual-level nonmonetary benefits are valued by the individuals who take up the adult learning but these are not directly exchangeable on markets and hence have no direct monetary value. Examples include the entertainment or consumption value of learning, health and life satisfaction, and improved family life. In contrast, public benefits are those benefits to members of society other than the learners themselves. Nonmonetary examples of public benefits include crime reduction, trust, social cohesion, political stability, and a well-functioning democracy. **Table 1** highlights examples of each private–public and monetary–nonmonetary combinations. Public monetary examples include reduced health and social transfer costs. These various benefits are not independent of each other (McMahon, 1999). For example, a private monetary return can in turn lead to the private nonmonetary return of improved individuals and family health – which in turn can lead to the public monetary return of reduced public expenditures on healthcare.

Different Types and Purposes of Adult Learning

The incentive to invest (time, effort, money, and other resources) varies among the different actors, depending on the type of value and who it is that benefits; in principle, this has implications for who should (and does) pay (Becker, 1964). It also has implications for the demand structure of different types of adult learning interventions. Majority of adults participate in adult learning for job-related reasons (OECD, 2003). Nonetheless, participation for personal and social-related reasons also plays an important role, and depending on the country these can form a substantial component of overall participation rates in adult learning (Desjardins *et al.*, 2006).

The reasons for participating have an impact on the nature and supply of learning interventions, including the form and content, and this in turn has implications for the potential wider benefits. However, specific evidence on the effects of different stages and types of schooling, or different curricula and pedagogical approaches is sparse. Most studies focus on the number of years of schooling or

highest level of educational attainment, primarily because these data are relatively cheap to collect and hence readily available in social surveys. Few studies focus on adult learning and what it is about these learning experiences that matter for wider benefits. In essence, much of the discussion of the benefits of learning at various levels has viewed education as a black box. Findings suggest that adult learning has positive effects on a wide spectrum of health and social outcomes and that these depend on individual life histories, social context, and the type of learning experience (e.g., academic, vocational, and leisure – see Feinstein *et al.* 2003).

Channels through which Adult Learning Can Affect Outcomes

Effects on Economic Positions and Resources

Adult learning can improve employability and income, which is a key pathway to realizing a range of other benefits. Adults with a record of adult education and training are less likely to be unemployed and more likely to experience wage growth (OECD, 2005: 35). This can translate into improved personal satisfaction and autonomy; personal health and security; and quality of child rearing. It can generate resources (e.g., time and money) for engaging in social, civic, and political activities, which in turn are key elements for democratic processes; solidarity and social cohesion; human rights and peace; equity, equality, and the absence of discrimination; and ecological sustainability – all important dimensions of a well-functioning society (Gilomen, 2003). Further, it can reduce inclinations toward criminal and antisocial behavior by meeting basic needs of subsistence and improving the chances for a successful life (Feinstein, 2002). The instrumental effect of education on income and wealth therefore feeds through into intrinsic benefits such as better health.

Effects on the Self

Learning can develop skill and cognition and can modify the traits and behavior patterns of adults (OECD, 2007).

Educational experiences can also serve an enlightenment function (Lauglo and Øia, 2006). They can promote tolerance of and respect for other groups (Turner, 1991), and in turn social cohesion. Many learning experiences make people aware of others around them and the complex processes involved in society (Pring, 1999), creating an interest to take part in the processes of social change. This also promotes an awareness of the value of investing in the future as well as an awareness of risks by providing an insight into the trade-offs among costs and benefits occurring at different points in time, which in turn influences a range of choices and behaviors, for example, regarding healthy lifestyles (Feinstein *et al.*, 2006). It can also develop psycho-social capabilities such as resilience that help to cope with adversity (Schoon and Bynner, 2003). Resilience has been empirically linked to a set of internal attributes (i.e., autonomy, problem-solving skills, a sense of purpose and future, and social competence), all of which are plausibly affected by continued learning (Howard *et al.*, 1999). Effects on other psychological characteristics include self-efficacy (the belief that the self can influence the world around them) and external efficacy (the belief and trust that others will respond to one's own actions).

In summary, learning experiences can lead to wider benefits by directly: shaping what people know; developing competencies, which help people use their knowledge to yield benefits for themselves and society; and cultivating values, attitudes, beliefs, and motivations that foster the potential for generating wider benefits. There is also a potential for negative effects, particularly where access to learning opportunities is unequal and where provision is injurious to self-concepts, learning, and development.

Effects on Social Position

The channels described above share the assumption that education affects outcomes by directly changing the self. A distinctly different mechanism suggests that education's impact is indirect, and operates by changing the position of the individual in the hierarchy of social relations (Verba *et al.*, 1978; Campbell, 2006; OECD, 2007). The main premise is that the relative position of individuals in a social hierarchy is largely a function of access to learning opportunities, and education's primary effect derives from its ability to locate people in this hierarchy. This can be called the positional or relative effect. For example, Campbell (2006) finds that certain social outcomes fit this model best, namely participating in politics: belonging to a party, or seeking to influence politics through lobbying. His findings imply that an across-the-board increase in adult learning participation preserving overall inequality may do little to increase political participation; or education may help people to better health by enabling

them to secure access to health treatment ahead of those below them in the pecking order.

Thus, learning may benefit individuals by increasing (or preserving) their social status. However, the benefit to the wider community may be nil or even negative, so that the benefits to some are achieved at the expense of others. This is far from hypothetical: to the extent that education accentuates rather than mitigates inequality, its overall net impact on health and other outcomes may well be negative.

Effects via Context

Adult learning can also have an impact on the role of contexts. Contexts refer to family, work, or community settings, where individuals have varying but always limited or bounded agency. Adult learning may influence the structural conditions of choice and opportunity as well as the distribution of resources (especially through collective agency). Therefore, it enables people, to some extent, to choose and shape the contexts within which they live and work, and the peers they associate with. Peer effects are potentially extremely strong, to positive and negative ends.

Effects on Health

Recent studies highlight the significance of the relationship between education and health outcomes (OECD, 2007; Feinstein *et al.*, 2006). Typically, health professionals have interpreted the association more narrowly as a marker of socioeconomic status. Findings now indicate that there are sizeable differences in health for those with different levels of education and that these are partly due to the effects of education and not solely due to differences that precede or explain education, such as socioeconomic status. For example, Ross and Mirowsky's (1999) findings suggest that education has health effects at all levels of income. Using rigorous methods, Spasojevic (2003) suggests that the effect of education on health is at least as great as the effect of income. An extensive review of the evidence on the direct effects of education concluded that independent of economic position, those with more years of schooling are substantially associated with better health, well-being, and health behaviors (see Feinstein *et al.*, 2006). In some cases, the evidence is particularly robust and suggests causality.

By combining findings from the National Child Development Study in the UK with a series of insights from biographical case studies collected by the Centre for Research on the Wider Benefits of Learning, Feinstein *et al.* (2003) (also see Bynner and Hammond, 2004; Feinstein and Hammond, 2004; Bynner, 2001) provide a rare analysis of the extent and nature of the wider benefits of adult learning. They find that adults who took at least one course between the age of 33 and 42 are more likely to have given

up smoking, increased their level of exercise, and increased their life satisfaction. According to the authors, such improvements can in turn lead to economic return, by reducing pressure on health services, and thus offer a return to the taxpayer and the economy more generally.

All types of courses were linked to an increase in exercise, but the marginal effects were larger for academic and leisure-related courses than vocationally oriented courses. Further, leisure courses appear to have a more important effect among adults who did not complete secondary schooling qualifications. One possible rationale for this latter observation is that the path to an increased sense of self-value and empowerment (psychological attributes that help people lead healthier lives) through learning, depends partly on previous learning experiences. Many adults, who have not completed secondary schooling, will have experienced academic difficulties and even failure; therefore, for some adults, an alternate sequencing of different types of learning may be necessary to build up a positive attitude toward learning and to avoid negative overall effects to psychological well-being. The biographical data, complemented with statistical results, strongly suggest that adult learning features as an important element in positive cycles of development and progression, and that there are cumulative effects associated with learning that occur in reinforcing sequences.

In a separate study using the British Household Panel Survey, Sabates and Feinstein (2006) estimate the effects of adult learning on the take-up of preventative health services. Using a model to predict changes in the levels of uptake of screening, they simulate the impact of whether 100 000 women were enrolled in adult learning on cervical cancer prevention. Adult learning is associated with a 2.2% point increase in the probability of utilizing screening. Using statistics on the smear tests analyzed in 2002 in the United Kingdom and the claim by health officials that cervical screening can prevent 80–90% of cancer cases in women who attend regularly, the authors estimate that about 116–134 cervical cancers would be prevented for every 100 000 women in adult learning.

Effects on Civic and Social Engagement

Adult learning can be instrumental for many in providing aptitudes that are useful for civic living and contribution. Svensson (1996: 62) found that the majority of participants in study circles (a form of adult popular education in Sweden) believes that they develop useful knowledge from participating. Civic skills acquired through nonpolitical channels, including on the job and in voluntary associations, are an important predictor of whether someone is politically engaged (Verba *et al.*, 1995; SOU, 1996: 47). Having skills motivates people by instilling a sense of agency – skills make people feel like they have something

to offer in the civic and social realm. Further, adult learning that takes place in the civic realm has been linked as an important contributor to the sustenance of democracy (Larsson, 1999).

The same study that was introduced above, Feinstein *et al.* (2003), also explored the effect of adult learning on a range of civic and social outcomes. They found that adult learning has a pervasive impact on social and political attitudes, especially among adults who participate in courses that are academically oriented. The suggestion is that these types of courses are most suited for opening minds and challenging previously held beliefs. Effect sizes of academically oriented adult learning on racism and political cynicism are on the order of about -0.07 to -0.10 and -0.03 to -0.065 , respectively (Preston and Feinstein, 2004: 25). Some respondents to the biographical field work indicated that learning experiences led to a greater understanding of people from different backgrounds. Even though social and political attitudes are thought to be fairly stable by mid-adulthood, adult learning was found to have normatively beneficial effects on most of the attitudes considered on a magnitude of up to 5% points, representing up to a 34% change from the baseline level predicted for those who did not participate. Overall, their findings link adult learning to increased racial tolerance, a reduction in political cynicism, a higher inclination toward democratic attitudes, and a higher level of political interest.

Bynner and Hammond (2004) report findings which suggest that participation in adult education courses is linked to higher levels of civic and political participation, including increased membership in groups and voter participation. Those who participate in one or two courses are about 34% more likely to become a member of an association and 13% more likely to begin voting compared to all those who abstained in the previous election. In contrast to its effects on attitudes, it is leisure-oriented courses that have the most significant impact on civic and social participation, especially among adults who have not completed secondary schooling. From the biographical accounts, it is those adults who are most initially isolated and lacking confidence that ascribed significant changes in their social activity to adult learning participation. In Sweden, Svensson (1996) found that at least 33% indicate that their motive for participating in study circles was to meet others.

Despite the link to increased social activity, less has been said about the effects of adult learning on the intents and purposes, or other qualitative aspects of different groups or networks (Emler and Frazer, 1999). Using the same biographical data from the Centre for Research on the Wider Benefits of Learning, Preston (2004) demonstrates that learning experiences may not only lead to an expansion of social networks, but can also cause their relocation and dissolution, albeit in such a way as to

maintain improvements in well-being. He linked adult learning to increases in self-confidence and self worth, which help to motivate individuals in removing themselves from unhealthy or even dangerous relationships.

Conclusions

The impacts of learning extend beyond those measured by increased productivity in the production of goods and services exchanged on markets. Learning in adulthood is linked to diverse items such as reductions of criminal activity, increases in social cohesion, changes in income distribution, savings in welfare and medical costs, and voter participation. Strong theoretical expectations about the wider benefits of adult learning exist, and although less abundant and generally less rigorous than the evidence on the impact of initial education (compulsory and post-compulsory schooling), there is some empirical research to support these expectations.

The measurement of noneconomic outcomes is attaining greater significance in many Organization for Economic Co-Operation and Development (OECD) countries. This trend brings with it a range of difficult methodological issues, notably in establishing robust techniques for assessing causality. A key issue is how far adult education is brought into this debate. Quantitative data on adult learning are universally weaker than that on initial schooling, and effects are therefore harder to measure using conventional approaches. Yet, extending the rationale for public and private investment in education to cover outcomes, such as improved health and stronger civic democracies, is a challenge which has much to offer.

Barriers to Participation in Adult Education

Participation in Adult Learning

Barriers to Participation in Adult Education

K Rubenson, University of British Columbia, Vancouver, BC, Canada

Introduction

A quick review of international policy documents reveals the importance of adult learning in supporting the well-being of nations and individuals. Success in realizing lifelong learning is seen as vital in promoting employment, economic development, democracy, and social cohesion. This has resulted in an urgency to develop a better understanding of why some adults participate in lifelong learning and others do not. There are two closely integrated bodies of knowledge focusing on this question, research on determinants of participation and studies of barriers to participation, that is being addressed in this article.

This article is organized into three sections starting with a brief discussion of conceptual and methodological issues. This is followed by a presentation of empirical findings, and then finally a review of theoretical.

Conceptual and Methodological Issues

Attempts to assess barriers to lifelong learning have traditionally used a classification developed by Cross (1981: 98), who sorts obstacles to participation under three headings:

- situational barriers (those arising from one's situation in life e.g., lack of time because of work, family responsibility, etc.);
- institutional barriers (practices and procedures that hinder participation e.g., fees, lack of evening courses, entrance requirements, limited course offerings, etc.); and
- dispositional barriers (attitudes and dispositions toward learning).

A fourth category has recently been added to the list. Informational barriers refer to a lack of information on education and learning offers and benefits (OECD, 2005).

While most surveys employ some version of Cross' classification, there are fundamental differences in how barriers are conceptualized, affecting who is being asked questions on barriers. One common view is that barriers are obstacles that prevent certain groups from participating. If these deterrents could be overcome, these people would participate in lifelong learning. According to this view, questions about barriers would only be addressed to nonparticipants. A different conceptualization is that barriers are factors that lower the extent of participation but may not entirely prohibit participation. By accepting this position, it is of interest to ask participants about possible barriers that may have caused them to lower the extent of their learning activities.

Another related issue concerns whether or not those who have indicated no interest in participating should be asked about barriers to participation. Large-scale national or international surveys like the US National Higher Education Survey (NHES), the Canadian Adult Education and Training Survey, or the Organization for Economic Cooperation and Development (OECD)-led International Adult Literacy Survey pose a battery of questions on barriers only to persons who indicate that they failed to take courses/programs they wanted to take and/or had felt a need for. The logic is that barriers come into existence only when an expressed wish to participate is thwarted; the role of research then is to discover the impediment. It seems irrelevant to ask individuals not interested in participating about barriers, because without an expressed interest there can be no barriers. Consequently, surveys using this approach tend to concentrate almost exclusively on situational and institutional barriers and pay little attention to psychological impediments.

As revealed in longitudinal research on participation, there are problems with using expressed interest to decide who should answer questions on barriers. In fact, large numbers of those who at one time had indicated no interest actually came to participate while a substantial number of people who stated that they were interested

never showed up. This finding reflects the broader changes that have occurred in the labor market, which among other things, forces people to participate because they are ordered to or feel pressured to undergo some form of adult education and training linked to their work. Thus, contrary to a commonly held position in research on participation and barriers, participation is not always a voluntary act.

The other major approach in large-scale surveys of barriers, found, for example, in national adult-education surveys in the Nordic countries, the UK, and in the European Union (EU) barometer on lifelong learning, treats the lack of interest as part of the cluster of barriers. Following this approach, the questions are asked by three groups of respondents: persons who have not participated, those who have considered but not participated, and those who have participated. This assures that more interest is given to dispositional barriers. Thus, in the 2001 UK National Adult Learning Survey (Fitzgerald *et al.*, 2002) respondents were asked to sort a deck of cards describing barriers containing the following dispositional impediments:

- I prefer to spend my free time doing things other than learning.
- I do not need to do any learning for the sort of work I do.
- I am not interested in doing any learning, training, or education.
- I have difficulties reading and or/writing.
- I would be worried about keeping up with other people.
- I feel I am too old to learn.
- I do not see a point in learning or education.
- I would be nervous about going back to school.

Similar lists of dispositional-oriented reasons for not participating can be found in Swedish and Norwegian national surveys.

Either approach raises ethical dilemmas. In arguing that everyone should be asked about barriers – including those without a declared interest in participating – one runs the risk of turning participation into a moral issue where it is seen as bad not to want to participate. In fact, it may be highly rational from a personal point of view not to want to engage in organized forms of adult learning. While this line of reasoning has many advocates, others would claim that it is not that straightforward. The counter argument is that if the system of adult education too strongly assumes that the adult is a conscious, self-directed individual who possesses the instruments necessary to make use of available adult education possibilities, it will rely on self-selection to recruit participants. This will, by necessity, widen rather than narrow the educational and cultural gaps in society.

In this respect, the design issue around barriers raises crucial questions about the relationship between the state and its citizens, and what understanding should inform

national surveys into barriers. In this context, Sen's (1982) concept of basic capability equality: the need to take into account, among other things, differences in those abilities that are crucial for citizens to function in society, is informative. Thus, as Nussbaum (1990) discusses, people living under difficult conditions tend to accept their fate because they cannot imagine any reasonable alternative. Consequently, it would be important to recognize that some citizens may not be sufficiently able to judge the value of and conditions for participation in adult education.

Findings

The overwhelming amount of information stems from large-scale surveys but there are also some in-depth qualitative studies that provide valuable insights into the reasoning of nonparticipants.

Findings from Large-Scale Surveys

Findings may vary between studies because of differences in methodology, target group, list of barriers, and so on, but nonetheless, some groups of barriers are consistently found to be of crucial importance. Looking across various surveys, situational and institutional barriers strongly dominate. In many countries, the main reason for not participating is commonly a lack of time. According to the International Literacy Survey (OECD, 2000), around 60% identified this as the major reason for not having started a non-work-related education one had needed or wanted to take. The EU-barometer on lifelong learning, looking at situational constraints across the 15 EU states, found that family-related obstacles like “my family commitments take up too much energy” were mentioned somewhat more frequently than job-related hindrances but the pattern differed from country to country (CEDEFOP, 2003). Not surprisingly, women are more prone to refer to family responsibilities than men.

Institutional barriers are also of major importance although to a somewhat lesser degree than situational barriers. In the *International Adult Literacy Survey* (IALS), on the average, around 45% of the adult population mentioned at least one institutional constraint that prevented participation in some form of work-related studies. The figure was lower for nonwork-related studies, around 30% (OECD, 2000). Generally, among institutional barriers, financial reasons (too expensive/no money) are by far the most prevalent hindrance, particularly in North America. However, as evident from the Euro-barometer on lifelong learning, cost is also a major restraining factor in Europe. Only between 12% and 21%, depending on purpose, were willing to pay for the full cost of studying, while close to 50% would pay none of the cost (CEDEFOP, 2003: 86). Another institutional barrier that is frequently identified is a lack of appropriate courses and the scheduling of them.

It is problematic to interpret the implications of the findings on situational and institutional barriers for policy. Time is not an endless resource and people have to make choices regarding how they want to spend their spare time. This is not to deny that some, because of work and family, may have very little time left over which they can freely decide to spend. For many, mentioning lack of time is as much a statement of the value they ascribe to education and training as to the expected outcome of such an activity. Thus, it is of interest to note that several studies have shown that participants mention situational barriers to the same extent, and in some studies, even more often than nonparticipants. This is also the case with institutional barriers where in fact there is a tendency for participants to report this slightly more often as the reason for not having taken other courses they were interested in. Similarly, Jonsson and Gähler (1996) found that there were as many people with objective barriers in terms of handicaps, young children, working hours, etc., that participated in adult education as did not participate. Based on this finding, the authors conclude (p.38): “Instead of barriers, that might have to do with cost, lack of time, it is probably differences in expected rewards that can explain why some choose to participate while others remain outside.”

While many would agree with Jonsson and Gähler’s interpretation of situational- and institutional-barrier data, it is important not to deny that some people face major hindrances like childcare and cost that makes it very hard for them to participate. So, for example, the fact that fewer people in upper-income brackets mentioned financial reasons is an indication that the answers not only reflect the willingness to pay but also the ability to do so.

The general findings on institutional and situational barriers are more or less the same regardless of survey approach. This is not the situation with dispositional barriers. Naturally, studies that approached only those who indicated an interest in participating pay rather scant attention to psychologically oriented barriers. Consequently, it is primarily surveys that have also approached those who indicated no interest that are of interest here. Findings from studies that have employed this strategy reveal two things. First, in almost all countries, a substantial share of the population refers to dispositional barriers. In the 11 European countries that took part in the EU-barometer the percentage raising psychological barriers varied from a low of 14% in Denmark to a high of 31% in the UK (CEDEFOP, 2003). Similarly, Livingstone (1999) found that psychological factors have a major impact on Canadians’ readiness to enrol in organized learning activities. Thirty-five percent stated that they did not need more education and one in five saw studying as boring. These dispositional barriers refer to perceptions like, little to gain by participating, concerns about own ability to succeed, belief that one is too old to go back to study, and in some cases bad previous experiences of schooling.

Second, comparing participants with nonparticipants, several studies indicate that the negative attitudes and dispositions toward organized adult education and training (dispositional barriers) are by far the most deterring factor (Rubenson, 2007). This would suggest that the main obstacle to participation is not situational or institutional but rather a lack of interest.

Results from Qualitative Studies

The few existing qualitative studies of barriers tend to concentrate on indifference to participating and are commonly conducted with a small group of nonparticipants. The research provides an in-depth insight into the subjective rationale for actively declining to engage in organized forms of adult education. The overall finding is that the lack of interest often reflects a subjective rationality that is constructed around the person’s life context. Several studies have pointed to how a lack of stimulating employment opportunities – either in the form of unemployment with small opportunities to become employed and/or a monotonous job – discourages participation (Paldanius, 2007). For this group, nonparticipation becomes a highly rational act. It is first when participation in adult education results in better and higher paying work that it is meaningful. The following quotes from Paldanius interviews with a group of nonparticipants can exemplify the subjective rationality of this group.

Learning for the sake of learning never, I have much more important stuff to do, for instance I can plant onions and then know that it will take so and so long time until I see the results of my actions, I have actually made something, manufactured something (Paldanius, 2007: 472).

Carlén (1999) found that automobile workers viewed work and education as separate praxis related to class identity. As wage earners, they should produce and not enter into other spheres. Forms of adult education that were unrelated to their work challenged their routine and were perceived to encompass a threat of change. Similarly Paldanius (2007) reports that a dominant view among the nonparticipants was that education was something that had to be done while waiting for the real life that begins in adulthood. By not participating in adult education, a person can avoid boredom. Further, unemployment did not seem to stimulate an interest in participating in adult education, but instead it seemed to inhibit their readiness for action.

Theoretical Perspectives

Large-scale national surveys on participation and barriers are rarely constructed on the basis of theory but are mostly descriptive. However, there are economic as well as

adult-education frameworks that could guide questionnaire construction.

Economic Theories

The human-capital perspective is prominent in education and training literature, although mostly absent in adult-education-participation frameworks. The underlying assumption is that individuals maximize welfare as they conceive it. Human capital analysis has, as a starting point, that individuals decide on their education by weighing the benefits and costs of this investment (Becker, 1964, 1993). Every action has a price tag in the market and every human act can be reduced to some kind of rational economic calculus of cost and benefit. The probability of participation increases as a function of the benefit/cost ratio. Common cost variables include: tuition, materials, and transportation as well as the less-tangible value of the time invested in studying. Benefits mostly focus on future monetary gains in the form of higher salaries but might also address job security, work conditions, and in some rare cases, cultural and other nonmonetary gains (US Department of Education, 1998: 13). As evident in the findings section above, some of the results can be interpreted in the context of a human-capital perspective. Although beyond the scope of this article, it should be noted that the homo-economicus framework has been severely criticized for its strong assumption of rationality. As Dow (1998: 13) states: if we see social structures as being organic and evolutionary, with creative, nondeterministic behaviors alongside behavior conditioned by habits and institutions, then individuals cannot be modeled according to deterministic rational principles.

An interesting variation on the cost-benefit framework is case-based decision theory (Gilboa and Schmeidler, 1995; cited in US Department of Education, 1998: 14). The idea is that people remember past problems, how they resolved them, and the outcome of action. When they meet a new problem, past experiences of similar problems direct their decisions. The framework does not assume that individuals have beliefs in the absence of data (recalled cases) and therefore does not list all possible costs and benefits, as only those in the memory can be used in reaching the decision.

It is worth noting that most large-scale surveys on participation and barriers already collect many demographic and social-background variables of interest to economic cost-benefit or expected-utility frameworks (US Department of Education, 1998: 66). However, they lack measures of relative expected utility and they are relatively meager on social psychological variables like intentionality and normativity with regard to adult education. Further, they are weak on external context, for example, the situation at work or in civil society, and mainly ignore key past experiences.

Adult Education

In adult education, it is mostly theories on participation, particularly motivation for engaging in adult education, that provide the framework for understanding barriers. Cross (1980: 122–124) found many common elements in existing adult education theories on participation and barriers. According to Cross, all:

- are interactions,
- build on Kurt Lewin's field-force analysis,
- are cognitivist,
- refer to reference-group theory,
- apply the concepts of incongruence and dissonance, and
- directly or indirectly build on Maslow's model of needs hierarchy.

On the basis of her review, Cross presents the so-called chain-response model which incorporates work on learning orientations, need press theory, and expectancy-valence theory. The model takes the individual as the starting point and begins by identifying two main constructs: self-evaluation and attitude toward education. These internal factors are seen to influence the value of goals and the expectation that participation will meet goals. Valence and expectations are also affected by life transition and development tasks that confront the individual in various life-cycle phases. Opportunities and barriers and available information will then modify whether or not an individual will come to participate. This model, like almost all others reviewed by Cross, employs psychological concepts to develop an explanation of why some adults participate while others do not. Cross (1981) argues that this does not mean that societal aspects are ignored; on the contrary, all theories are interactionist, that is, they understand participation in terms of interaction between an individual and his or her environment. However, theories tend to neglect the individual's life history. Further, they do not directly address how the main constructs in the model are related to and interact with the broader structural and cultural context. However, comparative data on participation reveal some interesting national differences that bring into question the usefulness of trying to understand barriers by focusing solely on how the individual interprets the world, which most theories on barriers and participation tend to do. First, the participation research shows that there are substantial differences in participation between countries at comparable stages in the modernization process and with quite similar economies (Desjardins *et al.*, 2006). Second, it reveals that while age, family background, educational attainment, and work-related factors are linked to inequality in participation in all countries, the level of inequality varies substantially between countries (OECD, 2000). Third, the findings suggest that patterns of inequality in adult

learning mirror broader structural inequalities in society, like inequalities in income. Participation patterns in a country thus seem to reflect its particular welfare-state regime. These empirical findings suggest that we have to consider broader structural conditions and targeted policy measures, and analyze the interaction between these and the individual's conceptual apparatus. Based on these observations Rubenson and Desjardins (2009) developed, the so-called bounded-agency model that aims to take account of the interaction between structurally and individually based barriers to participation.

The Bounded-Agency Model

The bounded-agency model is premised on the assumption that the nature of welfare-state regimes can affect a person's capability to participate. In particular, the state can foster broad structural conditions relevant to participation and construct targeted policy measures that are aimed at overcoming both structurally and individually based barriers. Structural conditions play a substantial role in forming the circumstances faced by individuals and limit the feasible alternatives to choose from, and therefore they can bound individual agency. According to the model, a particular welfare-state regime can be found not only to be implicated in social structures, adult-education systems, and life chances, but also in individual consciousness. This assumption builds on Sen's (1999) concept of human capability and functioning, which stresses the importance not only of having resources available – internal (i.e., knowledge or skills such as literacy) or external (i.e., money) – but also in terms of individuals knowing about the range of possibilities of how these resources can be employed to realize things that matter to them, and knowing how to do so. In this sense, dispositional barriers can be seen as factors that restrict a person's capability and hence freedom to participate. Further, dispositional barriers can be affected and even caused by structural barriers, such as institutional and situational ones.

To illustrate this point, the authors analyze the barrier section in the EU-barometer, which suggests that adults in Nordic and non-Nordic countries experience similar barriers to participation and nearly to the same extent. With regard to the bounded-agency model, the key question becomes the extent to which structural conditions and individual dispositions afford the individual the capability and freedom necessary to overcome barriers. In nearly all cases, adults from Nordic countries were more likely to participate in adult education even though they may perceive the same barriers as their counterparts in other countries. However, as reflected in high participation rates and relatively lower levels of inequality, the Nordic welfare state seems to be comparatively effective at resolving barriers. The Nordic welfare states feature structural

conditions under which a larger group of adults, as compared to non-Nordic countries, seem to value participation and hence see an expected reward. These conditions include a labor market structured around a high-skill strategy and a civil society that fosters learning for both social and personal development. In the bounded-agency model, the impact of these conditions on a person's capabilities and consciousness with regard to the beginning of adult education is referred to as the 'conditioning of values and perspective on opportunity structure'.

Conclusion

Three findings stand out in the review of barriers. First, while the policy community's concern for adult learning has resulted in the development of major national and supranational policy-driven surveys, there does not seem to be much of an interest in the scholarly community to engage with barriers. This is in sharp contrast to the 1970s and first half of the 1980s, when a considerable body of conceptually oriented work on participation was produced. However, at that time it was more an unease regarding a lack of scholarly progress in adult education than efforts to contribute to evidence-informed policy that drove the interest. Second, the findings from national and international surveys as well as a review of the scholarly literature point to some limitations in the present design of the major comparative surveys that are informing the policy discourse on barriers and suggest that the existing design might result in too simplistic an account of the factors behind barriers. A main limitation with many of the present surveys is that they concentrate almost exclusively on situational and institutional barriers. Therefore, consideration needs to be given to how to strengthen assessment of dispositional barriers. To address the lack of attention to dispositional barriers and questions on future interest, some existing conceptual frameworks can provide a fruitful starting point for getting better measures on general attitude as well as intrinsic and extrinsic values of learning. The data suggest that it would be particularly important to construct better measures of factors related to the work context and link these to expected utility and intentionality. Third, there is a serious lack of comprehensive qualitative studies. It would be particularly useful for the development of evidence-informed policy as well as theory generation to have access to comparative qualitative data. This would allow researchers an in-depth insight into the subjective rational for citizens' reasons to decline to engage in organized forms of adult education and also to explore how individual dispositions are directly and indirectly affected by broader structures and specific adult-learning policies.

Participation in Adult Learning

R Desjardins, Danish University of Education, Copenhagen, Denmark

© 2010 Elsevier Ltd. All rights reserved.

Introduction

Participation research is concerned primarily with three overarching questions: What is the extent of participation? Who is participating? Why are certain people or groups participating either more or less, or not at all? Traditionally, the focus has been on adult education and training (AET), rather than a broader notion of adult learning. In this article, a distinction is made between AET and informal learning where possible.

What Is the Extent of Participation?

Adult Education and Training

Participation rates based on the International Adult Literacy Survey (IALS; 1994–98) are reported in **Table 1**. **Tables 2(a)** and **2(b)** supplement with other international comparative data sources, and although the data from the alternative sources are not strictly comparable, the overall patterns are fairly consistent. In general, it can be inferred that rates vary substantially across countries, falling into four broad groups:

- close to or exceeding 50% – the Nordic countries include Denmark, Finland, Iceland, Norway, and Sweden;
- between 35% and 50% – countries of Anglo-Saxon origin such as Australia, Canada, New Zealand, the United Kingdom, and the United States as well as a few of the smaller Northern European countries such as Luxembourg, the Netherlands, and Switzerland;
- between 20% and 35% – this group features the remaining Northern European countries such as Austria, Belgium (Flanders), and Germany, some Eastern European countries such as Czech Republic and Slovenia, and some Southern European countries such as France, Italy, and Spain; and
- consistently below 20% – some Southern European countries such as Greece and Portugal, some additional Eastern European countries such as Hungary and Poland, and the only South American country where comparable data are available, Chile.

However, according to the 2003 data from the Adult Literacy and Lifeskills Survey (ALLS), Canada, Switzerland, and the United States appear to have climbed into the exceeding 50% category.

The mean number of hours per adult is also reported in **Table 1**. This combines the incidence and volume of

AET and thus offers a more comprehensive measure of the total effort. Denmark, Finland, and New Zealand report an average of over 100 h of AET per adult over a 12-month period – this is equivalent to every adult aged 16–65 years spending over 2.5 working weeks in AET per year. Countries featuring high participation but low average volume display comparatively lower adult learning per capita. Switzerland, the United Kingdom, and the United States have participation rates around 35–50% but, after adjusting for low volume, countries in the 20–35% range, such as Ireland and Slovenia, surpass them in their total AET effort. The former are considered to follow an extensive model, in which a fairly low volume is provided to a large number of adults, whereas the latter are considered to follow an intensive model, where provision is concentrated on fewer people (OECD, 2003a).

Changes in AET

Many national data sources point toward a general increasing trend in AET participation over the last 25 years. This is mostly attributed to the rising concern for human capital over the last decades since increases in AET for job-related reasons account for much of the rise since the early 1980s (Boudard and Rubenson, 2003: 267). More recent trend data from the European Union Labour Force Survey (ELFS) reveal a mixed pattern – participation rates appear to have generally increased between 1995 and 2000; however, this does not hold for all countries (OECD, 2003a: 39).

Types of AET

It can be seen from the IALS data in **Table 1** that job-related AET is dominant. Personal- and social-related AET can also play a substantial role. Comparatively high rates of participation in nonjob related AET are reported in Finland, the Netherlands, and Switzerland. It is, however, difficult to distinguish between different types of AET. Often, this is assessed on the basis of individuals' reasons for participating. However, Rubenson (2001) showed that there are many reasons for participation and that these are interrelated. Further, Desjardins *et al.* (2006) demonstrated that the way in which questions are phrased has implications for interpreting the complex motivations associated with participation. Ideally, surveys should not only permit respondents to state a number of different reasons for participating, but also ask them to rank them according to importance.

(2006). *Unequal Chances to Participate in Adult Learning: International Perspectives*. Paris: UNESCO.

Definitions and Measurement

Most AET data sources focus on measuring formal provision; however, increasingly, there is an interest in nonformal and informal activities. This poses some challenges, especially in defining what counts as adult learning. Increasingly, it is difficult to distinguish adult learners

from first-time students attending regular school or university. Pragmatic solutions are to consider all the learning activities of the adult population aged 25–65 years or, if possible, to consider the population aged 16–65 years, but exclude full-time students aged 16–24 years. A more sophisticated definition, if the data allow for it, is to count the studies of the following groups as participation: full-time students aged 16–24 years who are sponsored by an employer or union/association; full-time students over the age of 19 years who are enrolled in primary or secondary programs; and full-time students older than 24 years who are enrolled in postsecondary programs. The last group is significant because there can be substantial overlap between what is considered adult learning and higher education, especially in countries where the higher education system features a high degree of openness to non-traditional adult students.

Another issue is the reference period for which participation rates are based on. For example, the IALS uses a 12-month reference period, whereas the ELFS uses a 4-week period. Shorter reference periods are adequate for reporting participation rates of populations, but inadequate for an in-depth understanding of adult learning pathways, both in terms of understanding the takeup of adult learning and its interaction to the provision of opportunities.

Informal Learning

Informal learning encompasses a broad range of learning activities (Livingstone, 1999). Patterns of engagement thus depend on what is being measured. Of the nine informal learning measures in the ALLS (2003), two dominate. Learning by doing is mentioned by around 90%, while learning by watching ranges from a high of 87% in Switzerland to a low of 77% in Canada. These former measures cover a broad range of nonspecific experiences; therefore, it is difficult to interpret their significance or value. More specific informal learning activities, related to work and culture, are particularly prevalent in Switzerland and less common in Canada and the United States with Norway somewhere in between. A vast majority of the Swiss (86%) report that they read manuals or other materials compared to 55% for Canada and the United States. The Swiss more often note that they learn by being sent around their organization or attending special talks. Further, they more frequently (44%) go on guided tours at museums or galleries than Canadians, Americans, or Norwegians (30%). Comparative measures of learning through the interactive use of information technology reveal only small differences in the use of computers or the Internet, while learning with the help of video, television, and tapes varies from a high of 52% in the United States to a low of 35% in Switzerland.

Who Is Participating?

Observed differences in participation have been linked to inequalities of opportunity and living conditions; therefore, the demographic and social make-up of participation becomes an important issue.

Adult Education and Training

For a range of countries (18 Organisation for Economic Co-operation and Development (OECD) ones and two non-OECD ones), IALS data show that those who are women, older, from low socioeconomic backgrounds (as reflected in their parents' level of education), low educated, low skilled, in low-skill jobs, unemployed, or immigrants are the least likely to participate in adult learning (see **Table 3**). In many cases, people belong to more than one group at the same time, which exacerbates observed differences (see Desjardins *et al.*, 2006: 74).

Informal Learning

Some research has stressed that the law of inequality does not apply to informal learning (e.g., Livingstone, 1999). However, this depends on the measure of informal learning used. Measures that are all inclusive or very general and refer to nonspecific situations of learning by doing or learning by watching show that informal learning is more or less a universal activity (see above). In contrast, measures which are context specific and reflect learning that is likely to enable the creation of or access to resources tend to reveal a clear pattern of inequality. Rubenson *et al.* (2007) find that groups with low levels of educational attainment report a substantially lower engagement in reading or using computers to learn. There is limited research on the extent to which different forms of informal learning contribute to strengthening resources that have economic and social value.

Why Are Certain People or Groups Participating More than Others?

Determinants

Different characteristics can be used to explore and reveal patterns of participation in greater detail. As described above, this can be done by distinguishing among salient groups such as those delineated by: age, sex, social class, level of education, level of skill, and occupational, employment, and minority status. This broadens our empirical understanding of who participates. However, a determinants analysis goes a step further by including a range of factors that are thought to be relevant in explaining the observed patterns. This may include the same

characteristics used to define a group; however, the difference in a determinants analysis is that there are underlying theories that link the characteristics to the observed pattern, and thus have explanatory value. Participation research has explored various explanatory factors.

Disciplinary Perspectives

Different explanations have been put forth, ranging from those rooted in psychological to sociological to economic perspectives (Tuijnman and Fägerlind, 1989). The most appealing ones have an interdisciplinary character since they are more useful for building a comprehensive understanding of adult learning participation. It is rare, however, that different disciplinary perspectives are brought together. There is no unified or comprehensive theoretical perspective guiding participation research. One downside to complex inclusive models is that they can inhibit empirical testing and limit the usefulness of results, especially with regard to specific situations or needs. For example, practitioners may specifically be interested in knowing what information is best suited for altering adult beliefs about the likely outcomes of participating. In this situation, a psychological perspective may provide the necessary depth. Ideally, a portfolio of models, which can be applicable in different contexts for different purposes, needs to be built up.

Further research requires explanatory models or theories that are disciplinary, multidisciplinary, and multi-level. Rubenson (1987) mentions three approaches to model building. The first focuses on the individual's psychological factors – the micro-level. The second emphasizes external factors and their structural conditions which influence the individual – the macro-level. The third approach looks into the interaction between individual and social forces. Each type of explanation is essential, but neither is sufficient in isolation from each other.

Explanations Based on Psychological Perspectives

While motivation can equally be a social phenomenon that is driven by external expectations which are placed on individuals – such as family, workplace, and community demands for competencies – many explanations focus solely on individual psychological factors. The psychological perspective focuses primarily on personality traits, intellectual abilities, and other behavioral dispositions that center on attitudes, expectations, intentions, and other motivational attributes.

Personality traits and abilities

Individuals have a degree of agency; therefore, cognitions, beliefs, and psychosocial capabilities feature as crucial

^aOdds ratios reflect the relative likelihood of an event occurring for a particular group compared to a reference group. An odds ratio of 1 represents equal chances of an event occurring for a particular group vis-à-vis the reference group. Coefficients with a value below 1 indicate that there is less chance of the event occurring for a particular group compared to the reference group, and coefficients greater than 1 represent increased chances. From Hosmer, D. W. and Lemeshow, S. (1989). *Applied Logistic Regression*. New York: Wiley.

^bOdds are adjusted for: age, gender, parents' education, education, prose literacy skill level, employment status, occupation, immigrant status, minority language status, and size of community.

*p < 0.10, statistically significant at the 10% level.

**p < 0.05, statistically significant at the 5% level.

***p < 0.01, statistically significant at the 1% level.

elements that can explain participation. Participatory behavior is the result of diverse interactions between individuals' beliefs, skills, capabilities, and values. Rubenson (1987) stresses the importance of self-concepts such as self-esteem and self-efficacy in predicting participation. He suggests that adults who feel good about themselves are more likely to succeed in achievement-oriented situations. Conversely, an important benefit of adult learning is improved beliefs about self-efficacy (Hammond, 2003), pointing to a cycle of recurrent learning.

Previous learning experiences are key factors predicting further learning (Tuijnman, 1989; Boudard, 2001; Desjardins, 2004). Independent of educational attainment, Tuijnman (1989) finds that cognitive ability also exerts a positive influence on the accumulation of learning experiences over the lifespan. Educational attainment reflects accumulated knowledge, skills, and other traits that are associated with the probability of continued learning.

A common trait shared by early school leavers is a lack of self-confidence with regard to learning because of bad pedagogical experiences (Illeris, 2004a). Adults with low levels of education are less likely to participate because they lack readiness both in terms of knowledge and skills as well as their motivation to learn. A low readiness to learn is a substantial dispositional barrier to participation.

Motivational orientations and reasons

Motivational orientations toward learning can be important predictors of participation. Houle (1961) proposed a typology which suggests that participants are either goal oriented (use learning to accomplish objectives), activity oriented (find meaning in the circumstances of learning), or learning oriented (seek knowledge for its own sake). Boshier (1971, 1982) and Boshier and Collins (1985) developed the Education Participation Scale (EPS) to assign motivational orientation scores to individuals which allowed for in-depth investigation into the relationships among orientations and various demographic variables and other characteristic variables. Although the amount of variance explained by sociodemographic variables was small, research by Boshier and colleagues revealed that those with low education, low occupational status, and low income were most likely to participate for social contact, social stimulation, community service, and external expectation reasons. In contrast, those with higher levels of education, occupational status, and income were more often enrolled for professional advancement and cognitive interest reasons.

These findings partly corroborate with Maslow's (1954) hierarchy of needs theory which suggested that the motivating forces behind participation are conditional on whether subordinate needs are satisfied. Individuals with lower-order needs for survival which remain to be satisfied are deficiency motivated, whereas those working toward higher-order needs are growth motivated.

Arguably, obtaining secure employment is a lower-order need and, thus, the implication by Boshier's finding that professional advancement is associated with a higher-order need is puzzling. A more broadly based measure of job-related AET reveals that most adults participate for job-related reasons, whether associated with low socioeconomic status or not (e.g., OECD, 2003a; Desjardins *et al.*, 2006).

Learning for job-related reasons is linked to goals of finding a job, finding a better job, being promoted at work, keeping a job, and/or becoming more efficient in one's current job. It is a dominant reason reported (at least 60%) in recent surveys such as IALS, ALLS, and the 2000 European Union Barometer, and reaches as high as 90% in Australia, Denmark, Norway, the United Kingdom, and the United States. The divide between job- and non-job-related reasons, however, is not so clear-cut (Courtney, 1992: 50), which may be a reason why attempts to link distinct motivational orientations to participation explain little variation. Further, adults may find their reasons for participating difficult to articulate and they might not always be aware of them all (Darkenwald and Merriam, 1982: 136; Rubenson, 2001). Even a temporary lack of a specific reason may be seen as a reason for participating since the activity itself can be a way to obtain or rediscover new goals that could be pursued (Courtney, 1992: 87).

Attitudes and Intentions

Research has also pointed to the importance of attitudes toward learning. Houle (1961) claimed that every adult has an underlying conviction about the nature and value of learning which influences their opinion and, hence, the decision to participate. Darkenwald and Hayes (1988) constructed the Adult Attitudes toward Continuing Education Scale (AACES) to investigate the relationships among attitudes and participation. They found that the importance attributed to learning appears to be the most decisive factor in predicting participation; however, importance in relation to what needs further attention (see below).

Explanations Based on Social Perspectives

Individualistic perspectives have had serious consequences for how inequalities in participation are understood and what measures are deemed adequate to support lifelong learning for all. Individuals face several constraints in acting independently and making their own free choices. Shortcomings to the individualistic psychological and economic perspectives can be addressed by turning to the various external (and structural) influences on participation, such as social and economic institutions (government policy, organizations, industries, markets, and classes) at a macro level, and work structures at a micro level.

Separately, life history approaches to studying participation have broadened the structuralist approach by embracing much of the criticism of the individualistically oriented theories. This is done by situating the role of individual subjective experiences and actions as well as collective ones in their wider social and cultural contexts. A discussion regarding the relationships between life situation and participation as well as institutional barriers and participation, which are an elaboration of explanations based on social perspectives, is given elsewhere in the encyclopedia.

Explanations Based on Economic Perspectives

Most, but not all, explanations based on economic perspectives have tended to be dominated by individualistic approaches to the decision to participate. A common assumption is that individuals make a rational choice to participate or not, and that this decision is based on the information they have regarding the costs and benefits of participating. However, individuals are substantially limited by the imperfect information they have regarding the costs and benefits. There are also risks inherent with realizing the benefits which rational agents may not want to undertake.

Cost limitations and credit constraints

Desjardins *et al.* (2006) underscored the point that a lack of external economic support (from employers and governments) and credit constraints, especially for disadvantaged groups, is a significant barrier to participation. Even if individuals would like to participate because the future benefits outweigh the immediate costs, they may not have the financial means to do so because of credit constraints and imperfect capital markets. When individuals are not capable of borrowing money to invest in learning, because they do not have any collateral, which would otherwise be profitable, then market failure occurs.

Financial support and incentive-to-invest factor

The long arm of the job is becoming longer and stronger in terms of financing as well as motivation. IALS data show that about two-thirds of participants receive employer support (OECD and Statistics Canada, 2000). There are indications that participation may not always be voluntary and there may be increasing pressure to participate in job-related AET (Hight, 1998; Carré, 2000). Employer-supported AET is often suggested by employers, although a large portion that is suggested by employees is also supported by the employer (Tuijnman and Hellström, 2001). Many adults also participate for job-related reasons even though they do not receive financial support from their employer, which reveals the strength of the long arm of the job. Self-financing is, on average, the second most common

source of financial support, and, in some countries, the dominant source.

Firms represent a large portion of the training market (OECD, 2003a: 51–53). The Second Continuing Vocational Training Survey (CVTS2) data show that over 70% of firms in the majority of European countries provide support for AET (European Commission, 2002). Adults who work in large firms, especially those that compete on global markets and undergo significant technological change and/or changing work practices, appear to receive more AET.

The supply of employer-supported opportunities appears to be primarily targeted at prime-age employees who are highly educated and skilled. Plausibly, employers consider adults with higher levels of education more trainable. Older workers, women, and immigrants tend to face reduced opportunities for employer-supported AET (Desjardins *et al.*, 2006). These tendencies are consistent with the overall patterns of participation (see Table 3).

There is much debate about whether current levels of investment in AET are adequate. The potential for underinvestment arises due to several market failures, and can be linked to both employer and employee behavior (see Desjardins *et al.*, 2006). Overall, evidence shows that an underprovision of AET is likely to occur in all OECD countries (see OECD, 2003b: 248).

Government support, the least common source of financial support, tends to benefit those who already display high rates of participation, namely younger adults, the higher educated, and those who are in white-collar, high-skill occupations, rather than vulnerable groups. This is likely due to pressures for government policies to seek increases in efficiency through the adoption of a more market-oriented approach and outcomes-based funding. This increases the likelihood that AET initiatives/programs will target those easiest to recruit and most likely to succeed. Initiatives to reach disadvantaged groups often correspond better to the demands of the advantaged (Rubenson, 1999: 116). Few countries have effective public policies and structures in place to help those who are hard to reach. The Nordic countries are among the few and, accordingly, they tend to show comparatively higher rates of participation among the low educated (see Table 3).

Nature of work and skill-requirements factor

Recent research suggests that industrial and occupational structures of countries are instrumental in structuring participation. This perspective moves beyond the narrow individualistic one and encompasses a social and structural perspective. The world of work places substantial demands on individuals which necessitates continuous learning and periodic upgrades of competencies, acting as a substantial motivating force for many adults.

Recent research suggests that literacy practices at work – in particular the frequency and variety of reading practices – is one of the most significant determinants of participation in job-related AET (Desjardins *et al.*, 2006). More generally, the workplace is a learning space (Illeris, 2004b: 77–89); however, opportunities to learn new things on the job vary with the characteristic and position of the job, which exacerbates inequalities in adult learning (Åberg, 2002). Workers who are already better positioned in the labor market have more opportunities and incentives to acquire and develop competencies. Further, the structure of occupations and production in a particular country are likely to bear a strong influence on the distribution of work-related adult learning.

Explanations Based on Individuals' Interactions with Social Influences

Explanatory models of participation that include social and individual forces as well as their interaction have been proposed by a number of researchers. Some of the above explanations build on these, but a brief review of the more well-known ones is provided here. These models include most of the proximal and distal variables that are hypothesized as relevant to participation and are thus useful for building a comprehensive understanding of participation. The underlying reasons why adults participate (or not) are complex, featuring dynamic and interactive feedback effects that occur at multiple levels.

McClusky (1963) presented an individual–social interactive model called the power–load–margin model. Load represents the internal and external demands placed on the individual; power represents the agency of the individual to carry the load; and margin is the ratio of load to power which signifies the likelihood to participate. By linking Maslow's (1954) hierarchy of needs model with Lewin's (1947) force field analysis model, Miller (1967) suggested that when individual needs and social forces both point to a commonly perceived demand for participation, then participation will be high. Similarly, Boshier's (1971) congruence model suggested that when actual and perceived notions of self, others, and educational environment diverge, it is less likely that adults will participate.

Rubenson's (1975) expectancy valence model made a link between an individual's expectations about the value of participating, their attitude toward participating, and the likelihood of actual participation. According to this theory, participation will occur and persist if the learning activity is consistent with the learner's needs and expectations. According to Rubenson, the outcomes will depend on class since attitude and readiness are conditioned by structural and cultural factors. A model by Pryor (1990) and Pryor and Pryor (2005), which applied Ajzen and Fishbein's theory of reasoned action to participation,

focuses on more proximal variables. He suggested that participation is determined by the intention to participate and that the intention is determined by the attitude toward learning and perceptions of social pressures to participate. The latter is a subjective norm that is based on inferences about behavioral expectations of others. According to Pryor (1990), attitude tends to dominate over the subjective norm, and attitudes toward learning are primarily driven by a set of beliefs regarding the outcomes associated with learning.

Cross (1981) developed a psychosocial interaction model called the chain-of-response model, which suggested that participation relates to a complex chain of responses made by the individual vis à vis social circumstances. Beginning with a self-evaluation and a formation of attitudes toward learning, the importance of learning and the expectations associated with it are evaluated in relation to current needs and, in turn, this is influenced by available information, available opportunities, and institutional barriers.

Variants of these and other models exist and have been tested empirically. Based on a Swedish longitudinal study, Tuijnman (1989) puts an advanced set of structural models, which include psychological, sociological, and economic variables, to rigorous empirical testing. He reported that collectively, social origins, socioeconomic status, cognitive ability, initial levels of education, attitudes toward education, and specific interests in adult learning explain no more than 10–26% of the variance in the participation variable. Boudard (2003) more or less confirmed these patterns for a range of IALS countries.

Further Research

Major research questions that need to be addressed deal with the outcomes of adult learning and how this is linked with motivations to participate. Which mechanisms are more relevant for early development compared to the possible impact of later interventions? Is later intervention merely compensatory, with little chance of making a difference? Or could there be possibility for good timing later on? A better understanding of several relationships is needed:

- Substitutes and complements to more traditional schooling contexts.
- Formal education structures and adult learning, such as the degree of stratification and vocational specificity of pathways, and the extent and distribution of AET among different countries. This requires comparative data at both the system and individual levels.
- Occupational/industrial structures and adult learning. The structure of occupations and production in a particular country are likely to bear a strong influence on the distribution of job-related adult learning.

- Market failures and inequalities in participation. Market imperfections that may relate to learning outcomes are likely to have complex implications that spill over into other policy sectors; thus, reforms should not be undertaken without careful consideration of the relevant trade-offs. More specific information is necessary to devise viable strategies to overcome market failures and hence optimize the allocation and distribution of resources invested in the total learning effort.
- Government policy, governance, and adult learning. How are government policies regarding adult learning formed and coordinated at the intersection of various stakeholders and how does this shape the provision, purpose, and content of adult learning as well as participation?

Comparative and International Education: English-Language Scholarly Publications

D Post and M Fedri, The Pennsylvania State University, University Park, PA, USA

© 2010 Elsevier Ltd. All rights reserved.

Many national periodicals, dating back at least to the French Enlightenment, attended to developments in the schools and school systems of other nations. However, the first serial publications that were established explicitly to review education globally are more recent. This article discusses common trends and dilemmas facing several of the primary English-language periodicals whose purpose is to publish critical analysis, commentary, and research in education comparatively across nations. The article does not attempt a history of the field itself, its methods, findings, or the issues debated within specific journals. It does not offer an institutional history of these periodicals, since comprehensive accounts of their origins are available elsewhere. Instead, this article discusses the changing demands for, and demands on, journal publishing for readers who are concerned with comparative and international education.

Although reference is made to journals published in languages other than English, part of the dilemma facing authors and readers over the last 50 years is precisely that both have migrated to English-language publications, regardless of their language backgrounds. The identification of these publications and of comparative research with the English language – but not with any specific Anglophone country – reveals an important aspect of their construction. Another part of the recent trend is that these publications have increasingly tended to conceive themselves and be identified as scholarly journals. Although there remain publications with nonacademic

identities, the majority of journal articles in the field today are academic publications, that is, they are written and read by faculty of postsecondary educational institutions as opposed to school personnel or the educated public. For these reasons, English-language scholarly publications are the focus of this article.

The purpose of this short article is to describe the missions, administration, and the larger environmental context for publication about education comparatively across nations. The field of comparative and international education has evolved in response to new demands and opportunities. In addition to the field's evolution – but not independent of those changes – the media for propagating the field has also changed. New electronic technologies, gatekeeping functions, commercial relationships with readers, and library policies have all affected the direction of scholarly publications. In this article, such general changes are highlighted. More specific examples of the dilemmas facing authors and editors are drawn mainly from one journal, *Comparative Education Review* (CER).

Emergence of Scholarly Periodicals in Comparative and International Education

The longest-standing journal publishing today in the field is *International Review of Education* (IRE), which traces its origin to Cologne in 1931, when it was edited by Friedrich Schneider and co-edited by the American scholar Paul

Monroe, who himself had previously created the first edition of this *International Encyclopedia of Education*. After its interruption by World War II, IRE was reinvented as a periodical of the United Nations Educational and Scientific Organization (UNESCO), with articles appearing in German, French, and English. In its war-weary context, IRE's mission centered on mutual international understanding. The preamble to the UNESCO Constitution famously stated that, "since wars begin in the minds of men it is in the minds of men that the defenses of peace must be constructed." As the introductory editorial of the newly reconstituted IRE stated, "National educational systems and national educational ideas can no longer safely be developed without contact with educational thought and action elsewhere in the world. The maintenance of cultural life has ceased to be something to be guided by ideals purely national in scope." In addition to promoting international understanding and bridging political gaps, the IRE was intended to bridge professional/practitioner gaps. Thus, the introduction further stated the journal's intention to "provide a meeting-place for men and women from every country whose thoughts and actions deserve the attention of educationists throughout the world. Such men and women will usually, no doubt, themselves be professional educational thinkers and doers, but this will not always be the case: because education is today a matter of universal cultural concern contributions will be sought from leading minds in many fields."

The next journal in the field emerged shortly after the reconstituted IRE as a bulletin of a new association of US professors of education. The CER was created, along with the Comparative Education Society, in 1957 by US educators who saw scholarship and international cooperation not only as compatible but essential for a peaceful world. The tenor of the times was reflected in the international education work of Senator J. William Fulbright. In a recollection of his 1945 international education bill, Fulbright stated, "It is the task of education, more than any other instrument of foreign policy, to help close the dangerous gap between the economic and technological interdependence of the people of the world and their psychological, political and spiritual alienation." The journal's first editor, George Bereday, editorialized in the bulletin's premier issue that CER was designed "primarily for teachers of comparative education, who combine work in this subject with the teaching of other subjects and who cannot devote to the discipline their full-time research energies. . . . The *Comparative Education Review* is conceived as a service organ of the discipline and of the profession." The distinctions that are drawn today in universities between research and practice, or between service and scholarship, were invisible to Bereday and others concerned with education in a comparative light.

A third journal, *Comparative Education*, was launched in 1964 in the United Kingdom. It was designed to appeal to

a readership of general-education students and those who valued the role of schooling in the development of the British Commonwealth's new nation-members. Edmund King, writing in the inaugural issue of the journal, identified scholars and practitioners as equally important to the strength of the emerging field. King wrote:

The whole future of Comparative Education turns on whether we are trying to sanctify a cult or extending and strengthening the business of applying to the decisions of education a world perspective with the insights of many disciplines. Some decisions concern policy, all ultimately concern practice. Therefore we must make distinct and effective provision for students, teachers, and researchers in Comparative Education. We must also provide for those who (through this Journal) can apply the implications of Comparative Education in practice to their daily responsibilities in schools, homes, and education offices. The insights of these latter groups, if in line with world perspectives, are potentially as relevant as any others. They, and other pertinent information, must all be taken count of. In education today there is no one-way traffic.

Fundamental debates over the contours of comparative education flourished in the United Kingdom in the 1960s. These were reflected in the founding conference of the British Association for International and Comparative Education (BAICE) (under an earlier name). Once established, the association's bulletin – aimed only at keeping members informed of news – quickly evolved to one of the field's leading scholarly journals, *Compare*. One of the journal's early aims was to reach teachers of comparative education in many countries, and this aim remains today. The journal's broad scope, encompassing discourse, empirical study, and policy-centered analyses, directly reflect its parent association's mission. The journal has encouraged research into less-studied topics and contexts.

The most recently founded English-language scholarly journal in this field is the *International Journal of Educational Development*. The journal was conceived of in 1979 by two British management consultants, as a specific reaction to two troubling trends. First, they perceived a marginalization of education in development discourse and practice, which were dominated by economics. Second, they were dismayed by experts who felt able to issue policy recommendations and definitive scholarly analyses with little practical experience in or knowledge of specific contexts. This issue-driven motivation for the journal's founding, as opposed to service to a scholarly society, accounts for its relatively focused mission. It aims to highlight as well as interrogate the role of education in development, and to bring academic analyses to bear on practice and policy debates. Its enduring interest in the developing world is reflected in the number of submissions and published articles by a wide array of non-British

authors. In 2008, for example, its lead authors represented 24 countries from across the globe.

Trends and Challenges

Two of the English-language publications under review are sponsored by membership organizations. The BAICE sponsors *Compare*, and CER is sponsored by the Comparative and International Education Society (CIES). Although these associations originated in specific national contexts and were once dominated almost exclusively by UK and US citizens, it is significant that both have become increasingly international. For example, by 2008, approximately one third of CER's subscriber-members lived outside the United States, and the same fraction of libraries subscribing to CER are located beyond US borders. Many other readers are non-Americans who reside in the United States. Americans authored fewer than half the articles published by CER in recent years. The range of stakeholders in an originally US endeavor is striking, because the organizational membership of the World Council of Comparative Education Societies has expanded, and there is a growing number of non-English-language scholarly publication alternatives.

There are advantages to journal sponsorship by a membership organization that gives a journal subscription as a benefit of membership. A characteristic of emerging professions is greater identification with the calling of the profession than with the particular institution employing the professional. In an increasingly mobile profession, those who identify themselves with comparative education seek out a community beyond their institutions. By attending regular meetings of the BAICE and CIES, professionals obtain intrinsic benefits and collegiality that they might not otherwise experience. The economy of scale also lowers the cost of journal distribution, making individual subscriptions more numerous than institutional library subscriptions.

The three other journals of special interest in the article are not sponsored by membership organizations. As a consequence, individual subscribers are far outnumbered by institutional subscribers. Since there are fewer individual subscriptions, the publishers of these journals must charge higher rates to institutions. Furthermore, because these publishers are for profit, they pay particular attention to the financial bottomline. In recent times, subscription costs across the academic publishing spectrum have increased by about 13% per year, and for-profit publishers have typically charged six times more than nonprofit publishers. Another driver of cost has been the formation of for-profit conglomerates across all publishing fields, especially in the 1990s. For example, *International Journal of Educational Development* (IJED), published

from its early history by Pergamon Press, was enfolded by Elsevier. *Compare*, which was published by Carfax Publishers from 1976 to 2003, was incorporated into Taylor and Francis. The dilemma of pricing for institutional and membership subscriptions will only intensify as libraries scale back their purchases. In response to selective cuts, publishers now bundle subscriptions to their journals in packages. If a library decides to subscribe to one prominent journal, it is most cost effective to accept a package, which includes not only the desired journal but others that are in less demand. This strategy appears successful if success is measured by the number of citations to articles published in nonmembership journals. Despite the fact that *Compare* and CER (sponsored by the scholarly organizations) have greater numbers of individual subscribers than, for example, *Comparative Education*, the number of cites, downloads, and submissions are not so different as one might suppose. Electronic access through libraries, or access to the paper copies there, appears sufficient to engage scholars with the articles published in the non-membership journals.

The Role of the Academy

Except for IRE, which is edited by the staff of UNESCO, the publications under review have always been edited by full-time instructors and professors of higher education institutions. In the British context, this relationship has not entailed co-sponsorship by the institutions whose staff edit the IJED, *Compare*, or *Comparative Education*. The institutions housing those publications receive a comparatively small amount of support from the publishers and, in the case of *Compare*, from the sponsoring organization. The American context differs in that most university presses have traditionally been prepared to operate at a loss, and many US universities are willing to subsidize journals. Although this situation has changed somewhat over the years in the face of chronic financial concerns across higher education, it remains the case that many comparative-education journals based in the United States receive institutional support.

Significantly, CER has always been cosponsored by publicly funded universities with public service as part of their missions. A unique characteristic of American public higher education institutions is their commitment to open library and recreational access, as well as agricultural extension education, adult learning, and professional service. As professional dissemination is viewed as central to institutional missions, a partnership relation is more likely in the United States than in the United Kingdom. For example, CER drew more than half of its operating budget through contributions by its co-sponsoring institutions in recent years – the

universities of California, Pittsburgh, and Penn State. This arrangement is much less common outside the United States. Editorships of the other journals mentioned require greater personal sacrifice and volunteerism than does the editorship of CER. It is also likely that less personal time is available for each accepted manuscript in non-US publications, because of less-generous support provided by host institutions.

Manuscript Submission and Selectivity

In all the journals mentioned, there have been increases in the number of submissions. For example, in 2008, CER received 182 manuscripts, while IJED received 300. The editorial boards of journals read and give suggestions in response to every submission, if only to recommend a more appropriate journal to the author when there is an obvious mismatch. A smaller number of submissions are then sent for an external review by experts, some of whom may be chosen from the manuscript references themselves, and by other specialists in the region discussed or methods used by the author. Editors try to include at least one general reader, since the articles they publish need to attract a broad scholarly readership in addition to serve specialist researchers.

Publication in a peer-reviewed journal is time consuming both for authors and editors. For example, CER has rarely published an article without at least one major revision, and usually two or more. Even for the 15% of accepted articles, there are two further stylistic revisions, first by the CER editors and then again by University of Chicago Press copyeditors. CER editors generally invite revisions for about half the articles that are sent for an external review and, based on lengthy comments from reviewers and the editors' own reading of each submission, they reject the other half. In either case, the authors receive extensive suggestions. On several occasions, the reports submitted by external reviewers, together with a 2–3-page response from the editors, exceed 4000 words. Very rarely are fewer than six pages of comments returned to the author. This process can continue for as many as four rounds, over a 1–2-year period, becoming a friendly but critical three-way discussion between authors, editors, and reviewers.

Incentives for Reading and for Publication in Scholarly Journals

A fair question is why, given the large time investment needed to publish in a peer-reviewed journal, authors are willing to submit their research. One answer is that authors seek the engagement of this process at least as much as they seek formal publication or another line on

their curriculum vitae (CV). Consequently, even authors whose papers are rejected in the first round usually resubmit a revision if they are encouraged to do so by the editors. In this sense, a journal's function is as much about developing high-quality articles as about screening-out underdeveloped manuscripts. A more contention-filled reason is that journals have come to serve as gatekeepers for entry and advancement in higher education institutions, a function they did not originally intend but which affects the editing process nonetheless. Some editors feel that, since beginning scholars depend heavily on publication in their journals for advancement, it would be unfair to devote any part of their page budget to features other than research articles. Since double-blind, peer-reviewed research articles were originally only one part of these journals, the credentialing function they have been made to fill has clearly influenced their direction.

In the context of the gatekeeping function played by journals, it is not surprising that they have all experienced increasing numbers of submissions. However, the fact that authors are willing to submit revisions in such a lengthy and intensive process is remarkable in light of several other important contextual changes and challenges facing the journals in this field. One such change is the opportunity for scholars to publish in journals that are exclusively electronic, such as the now-mature and highly respected *Research in Comparative and International Education*, *Current Issues in Comparative Education*, and *Education Policy Analysis Archives*, the latter published in English, Spanish, and Portuguese.

Another change in the publishing context of comparative education, as much as other education fields, is the growing number of edited volumes that serve as an alternative to the increasingly lengthy process of publication in refereed journals. This marks a generational shift. In the 1950s, 1960s, 1970s, and even 1980s, periodicals served to disseminate quickly the findings of topical research. Books, however, took more time to produce and were expected to have longer shelf lives. Today, it has become far easier to publish an invited chapter in an edited anthology than to publish in a journal having a 15% acceptance rate, a 1-year backlog of accepted articles, and the expectation of two or more revisions. The result is an exploding number of edited, nonserial topical volumes from a wide range of commercial publishers. During its first decades, most journals in this field identified and reviewed new books of interest to comparativists. These books were almost always single authored or co-authored monographs representing a unified, coherent, sustained synthesis or presentation of original research. In recent years, most books received and/or reviewed were anthologies of shorter reports or investigations. In 2008, for example, out of 27 books reviewed in CER, only three were monographs, while the others were edited anthologies or conference proceedings.

Balancing Permanent and Current Scholarship

Many refereed journals in quickly moving fields seek ways to compensate for the lengthy review process so as keep their scholarship vital and current. No editor wants articles to become dated before they appear in print. Journal editors can help authors make a more immediate contribution with their articles by publishing electronic versions prior to paper versions. Most journals in international fields like comparative education now publish electronically, saving what otherwise would be many months from the time of acceptance to appearance online. Subscribers and members of subscribing libraries can sometimes download finished, edited pieces that have been scheduled for release in forthcoming numbers. Even so, the 6–9 months saved by web publication does not eliminate the time lag between submission and the possible acceptance of an article. Another approach used by editors is to anticipate proactively the themes and methods they believe will interest readers. Editors invite contributions along specific lines, using some combination of blind reviews or other selection methods. In the specific case of CER, the editors choose topics they believe are important to their readers and those who they target in efforts to expand readership. Next, they search for guest editors of the selected topic, who draft a detailed description of the issue and a call for submissions. CER circulates these calls, receives submissions and, after asking for reviewers' names from guest editors, places submissions in double-blind review as usual with at least three outside referees. Moderated discussions are the third way that some journal engage readers and create a more lively relationship with contemporary policy and research. For example, CER has hosted debates over the role of the World Bank in higher education development, patriotic education, the place-of-area studies centers, and reform within UNESCO.

Language of Publication

The irony of monolingualistic publications for comparative educators is apparent, but monolingualism is increasingly evident in all the publications discussed here. Polymath, polyglot comparativists of nineteenth-century education had no fear that their efforts would be lost in translation, since there was little need to translate their writings. However, after World War II, English became dominant in scholarly journals, such that even authors with mother tongues other than English began to use English in their scholarship. For example, during its initial period and even after it was reconstituted, IRE published equally in German, French, and English. Yet, recent contributions,

even by authors working in languages other than English, have been published almost exclusively in English. For example, of the 42 articles published in IRE during 2008, all but three were in English.

The dominance of English has not occurred for any lack of alternatives. The number of national associations for the study of comparative education has proliferated, many with journals, annual bulletins, or reports of congress proceedings. For example, *Education Comparée* was created for the French association in 1973, the Japanese Comparative Education Society created its own bulletin in 1975, and *Revista Española de Educación Comparada* (REEC) was first issued in 1995 as an instrument of expression for the members of *Sociedad Española de Educación Comparada* (Spanish Society of Comparative Education). An important exception to these examples of scholarly publications, which all originated from the initiative of nongovernmental organizations, is the mainland Chinese journal CER. This publication receives support from the Ministry of Education, and before that the propaganda department of the Central Committee of Communist Party of China. It was created in 1992 out of the former journal, *Foreign Education Trends*, and the mainland journal still has 'making foreign things serve China' as its official mission.

Several explanations have been offered for the dominance of English in comparative education despite the emergence of periodicals in other languages. One explanation is the legacy of colonialism. Intellectuals from the so-called periphery and former colonies continue to receive their education in English. Still, this does not explain the emergence of English in publishing among Francophone former colonies. Another explanation is that the leaders of comparative education have become members of English-based professional associations. An even more compelling interpretation, suggested by A. Suresh Canagarajah, is that journals in languages other than English do not appear in the libraries of peripheral countries. For example, because of donations from charitable foundations or university presses, a Sri Lankan library might not receive a Tamil-language publication from India, but nonetheless receive an English publication from the United States as a charitable donation. A library in the state of Oaxaca, Mexico, is more likely to receive a UNESCO publication than to receive *Revista Española de Educación Comparada* (REEC); and a Vietnamese library is more likely to receive CER than *Education Comparée*. This affects the orientation of scholars toward publication in English.

Evidence for the dominance of English can also be seen in the long-term trends in *Compare* and CER. These journals were founded by UK and US educators who sought to publish their contributions to an emerging field, especially articles coming from their annual conferences. Unsurprisingly, most of the contributors to these journals during their first years had English as their mother tongue. In the case of *Compare*, during its early years, nearly all

submissions came from the United Kingdom and few were from authors with non-English-language backgrounds. In recent years, the majority of submissions came from outside the United Kingdom and many were from authors whose mother tongue was not English. Similarly, in 2008, IJED received over 80% of approximately 300 submissions from outside the United Kingdom. The trends are likewise pronounced for CER. In its first 3 years, only five out of 47 published articles had non-English-background authors. By contrast, over the past 3 years, 39 out of 64 published articles were by non-English-background authors, although many had completed their formal training in English.

The Future of Publications in Comparative and International Education

Due to increased printing and international mailing costs, paper publications may well disappear over the next several years. However, regardless of the forms journals take in the future, their scholarly, community-building, and gatekeeping functions will persist. Despite the fact that membership societies continue to proliferate, authors in this field will increasingly publish for readers outside their own nations. Costs to institutions will rise as the numbers of individual subscriptions dwindle, especially for journals without a membership base. More readers will access journals through their institutions, and will download or read specific articles. This will increase authors' access to readers who are interested in the specific topics of their research. At the same time, selective reading could hinder the ability of journals to encourage cross reading. Maintaining a general readership could become increasingly difficult. The challenge for journal editors will be to enliven their publications in order to capture the greatest number of nonspecialist readers, while simultaneously adhering to high standards for scholarship.

Comparative Education: Philosophical Issues and Concepts

M Mason, Hong Kong Institute of Education, Hong Kong, People's Republic of China

C W Evers, University of New South Wales, Sydney, NSW, Australia

© 2010 Elsevier Ltd. All rights reserved.

In a special issue of *Comparative Education* on 'Philosophy, education and comparative education,' McLaughlin (2004: 475) suggests that comparison in education invites philosophical attention to at least the following four dimensions:

1. what is being compared with what (e.g., teachers, schools, teaching methods, and educational systems in differing cultural, national, and regional contexts);
2. the evaluative basis of comparison (e.g., the norms and principles being invoked in making comparisons);
3. the reasons and motives underlying the comparisons being made (e.g., disinterested scholarly enquiry, a search for insights, etc., to be applied from one context to another); and
4. the methods used in making comparisons (e.g., methods based on natural science, social science, hermeneutic traditions, etc.).

Limitless concepts, issues, themes, contexts, norms, principles, aims, purposes, and other ontological, epistemological, and axiological questions that constitute these four dimensions raise philosophical questions in comparative education, and this article, in providing an overview of and a brief introduction to some of those questions, is necessarily selective in which of these it considers, and brief in the extent to which it does. Following and expanding on Martínez (2003), the article considers the constitution and definition of the field of comparative education in terms of its substantive content or object of study, its method, and its aims and purposes; the differentiation of comparative education from related fields such as international education, educational development, and area studies; and conceptual issues associated with the role of cultures and countries, or nation-states, as units of analysis in comparative education.

The Constitution and Definition of the Field

The definition and distinction of the field of comparative education is perhaps the most intractable philosophical and conceptual debate in the field. It should, at the outset, be stated explicitly that comparative education is clearly not a discipline. If, following Hirst (1974), a discipline is epistemologically characterized by a common object of study, uniformly accepted criteria of truth and methods by

which truth might be approached, a particular conceptual structure, theoretical integration and internal consistency, and common products of knowledge, and a field is unified only by common phenomena of study or common material or practical pursuits, then comparative education is at best characterized in terms of the latter. Epstein (1994: 918) understands the field of comparative education as an interdisciplinary pursuit that applies historical, philosophical, and social science theories and methods to international problems in education. For Broadfoot, comparative education might be constituted yet more widely, as a context, a conceptualization which "allows for the interaction of perspectives arising out of a number of social science disciplines and from a wide range of national backgrounds" (Broadfoot, 1977: 133); it is, thus, a social science perspective or a context for critical cultural analysis (Broadfoot, 1999: 29). For Crossley and Watson (2003: 6), however, such a conceptualization of the field serves as an important reminder that context matters: the study of comparative education warns education policy-makers that major problems lie in any simplistic transfer of educational policy and practice from one sociocultural context to another.

Comparative education is an eclectically constituted field with flexible, porous, and, at times, indiscernible boundaries. Among many others, Kelly *et al.* (1982) have identified the central question of the identity of the field in asking what comparative education is, whether it is a distinct field of study, and whether it is best defined in terms of its method, or substantively in terms of its content or object of study. Garrido (1986) expands the last question as to how comparative education might be defined in terms of its object. Most definitions of comparative education understand its object in terms of the unit of analysis or comparison (Manzon, 2009), and most common among the latter is the comparative study of educational systems. This might commonly be generalized, following Martínez (2003), to the comparative study of educational policy, problems, and processes. Epstein (1994: 918) defines the object of comparative education simply as the trans-societal study of education. For Anderson (1961: 4), comparative education's core substantive content, its central object of study, is the relationship between school and society: comparative education is concerned with the cross-cultural comparison of the structure, operation, aims, methods, and achievements of various educational systems, and the societal correlates of these educational systems

and their elements. Noah and Eckstein (1969) also situate the relationship between school and society as the central object of study in comparative education. Olivera (1988) identifies the proper object of comparative education as the abstract patterns of relationships between two or more educational configurations, to which social scientific comparative methods are applied in order to understand educational phenomena beyond the differences associated with particular societal conditions.

Phillips and Schweisfurth (2007) suggest that:

What distinguishes the work of comparativists from that of other educationists – and what therefore distinguishes the approaches they use to research – is the obvious fact that they are concerned essentially with other cultures/countries. Aside from this concern with education ‘elsewhere’ and the question as to how comparisons might realistically be made, comparativists use all the research methods that other investigators of aspects of education employ in their research . . . , [utilizing additionally] approaches specific to the particular task of comparison. The essential questions are: What methods and conditions are appropriate to ensure adequate understanding of other cultures from a vantage point outside of those cultures? What does the act of comparison consist in and how might it best be undertaken?

Philosophical and conceptual issues associated with cultures and countries, or nation-states, lie, thus, at the heart of comparative education, and are considered briefly in the final section of the article.

For Halls, comparative education involves the study of “education by its various levels, and also systematically researches the historical, social, cultural, political, religious, economic and philosophical forces that partly determine and are partly determined by the character of education systems, and compares the resultant outcomes in two or more systems, areas or even globally” (Halls, 1990: 24).

In one of the most generous and inclusive conceptualizations of the field, Bray and Thomas (1995) suggest, on the other hand, that comparative education need not be limited to comparisons across countries, systems, or cultures. Their *Framework for Comparative Education Analyses* (Bray and Thomas, 1995: 475), well known in the field as the cube (see **Figure 1**), sets out to identify, in order to enable researchers to set down clearly their unit of analysis and comparison, what is being compared, who is being compared, and where are these phenomena being compared. What is being compared includes aspects of education and society that might include the financing of education, curriculum, or teaching methods. Who is being compared includes nonlocational demographic groups that could be defined in terms of gender, age, ethnicity, religion, and the like. Where, or at what geographical or locational level these phenomena are being compared, may be at the level of world regions, countries, systems, schools, classrooms, or even at the individual level.

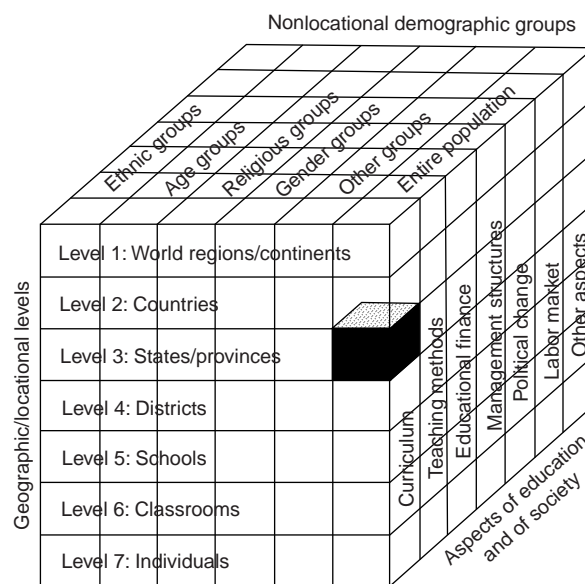

Figure 1 A framework for comparative analysis. From Bray, M. and Thomas, R. M. (1995). Levels of comparison in educational studies: Different insights from different literatures and the value of multilevel analysis. *Harvard Educational Review* 65(3), 475.

In their generosity, Bray and Thomas may, however, have expanded the borders of comparative education to include almost all research in education, perhaps even a single case study that relies, at best, on only implicit comparison, on the type of comparison, Schriewer's (2000: 9) “universal mental operation embedded in everyday social life,” without which it is impossible to distinguish anything from that which it is not. By not limiting the object of comparative education to the study of educational systems, such as Garrido (1986) would have researchers in the field do, the generosity of Bray and Thomas risks the dissolution of the field until it is indistinguishable from the broader field of education studies.

This substantive expansion of the borders of the field, and the associated risk of its dissolution, raises the question whether the field of comparative education can actually be defined substantively. Kazamias and Massialas (1965: 14) have, indeed, suggested that the subject matter of comparative education is “coterminous with the subject matter of education itself,” but intimate that what distinguishes it from the field of education studies is that it “goes beyond the confines of education in one nation, society or group, and uses cross-national or cross-cultural methods and techniques.” This lessening by Bray and Thomas of the principal emphasis of comparative education on comparisons among educational systems opens the way for an argument that comparative education should be defined in terms of its method or of its purpose, rather than in terms of its substantive object, since for them, the object becomes education in general, or at least almost any aspect thereof, rather than educational systems in particular.

Mason (2008) argues that it is not possible to isolate substantively a field of comparative education within or overlapping only in part with the field of education studies, given that the content of the former, as generously described by Bray and Thomas, is not able to be identified by any significant differences from the content of the latter. He concludes accordingly that it is the method specific to comparative education that identifies it as such: "Where comparison is used as an explicit research method, more than the implicit comparison that probably underlies most ways in which we make sense of the world (see Schriewer (2000) above), comparative education is a methodologically distinct aspect of education studies" (Mason, 2008: 1). For him, comparative education is a methodologically defined sub-field of education studies. Most well known in the field for the view that comparative education is defined by its method is Bereday (1964). More recently, Green has claimed that "comparative education needs to compare, and to do this systematically, if it is to avoid the accusation that it too often degenerates into a catalogue of traveller's tales, policy advocacy and opportunistic rationalization of unscientific policy borrowing" (Green, 2003: 95). Garrido (1986), however, cautions against defining comparative education in terms of method alone, since this could lead to an unacceptably wide interpretation of the scope of comparative education (such as is implicitly countenanced by Bray and Thomas (1995)) and its consequent equivalence in substantive terms to the field of education studies (as Mason (2008) has suggested is the case both conceptually and empirically) – and hence to its being indistinguishable from other sub-fields of education studies. For Garrido (1986), definition of the field should be in terms of both method and substantive object, with education systems being the appropriate object of study. Jones (1971), however, suggests that it is in terms of method and purpose that comparative-education research should be defined.

Debates about the identity of the field are not limited, however, to whether it is best defined substantively in terms of its content or object of study, or in terms of its method. The field has also been definitionally constituted in terms of its purposes. These purposes fall mainly into three dimensions: theoretical, pragmatic, and normative. Arnone (2007) describes a scientific (or theoretical) dimension that aims to formulate generalizable propositions about school systems and the economic, political, social, and cultural contexts in which they are situated; a pragmatic dimension associated with learning from the education systems of other societies to the end of improving educational policy and practice in the researcher's own society; and a normative dimension frequently oriented toward international understanding and peace. For Martínez (2003), these normative purposes are critical and emancipatory. (These critical and emancipatory purposes have had much to do with the interests of many comparative-education researchers working in the fields of international education

and educational development, closely related fields considered in the section titled 'The distinction of comparative education from other, related fields'.) It is no coincidence that the three dimensions identified by Arnone, among others, reflect the three knowledge-constitutive cognitive interests of Habermas (1971: 308): the technical cognitive interest that constitutes the empirical-analytic sciences; the practical cognitive interest that constitutes the historical-hermeneutic sciences; and the emancipatory cognitive interest that constitutes the critically oriented sciences.

Kandel (1933: xix) places the theoretical purposes of comparative education in the service of the practical, seeing the value of a comparative approach to educational problems "in an analysis of the causes which have produced them, in a comparison of the differences between the various systems and the reasons underlying them, and . . . in a study of the solutions attempted." Comparative education's purpose is "to discover the differences in the forces and causes that produce differences in educational systems" (Kandel, 1936: 406). For Bereday, the principal justification for comparative-education research is intellectual. "Knowledge for its own sake is the sole ground upon which comparative education needs to make a stand" (Bereday, 1964: 5). For Holmes, similarly, theoretical purposes in comparative-education research are prior to any pragmatic purposes: "One aim of comparative education is theoretical. It is to improve our understanding of education as such; and in particular of our own national problems in education" (Holmes, 1971: x–xi). A frequently articulated position in the field holds that it is concerned with a better understanding of one's own system of education by comparing it with others. Lauwerys (1959: 292) has noted "how hard it is for a teacher anywhere to explain his own school system to foreigners: often he considers as too obvious to need explaining precisely the most curious and puzzling features."

The identification of pragmatic purposes has been at the heart of comparative education since the earliest days when such a field could be identified. Both Jullien (1817) and Sadler (1900/1964) place the international transfer of policies and practices as a central, if not the central, purpose of comparative education, if from different methodological perspectives: positivist in Jullien's case and historical or relativist in the case of Sadler. King (1965: 148) identifies the implicit purpose of research in the field as the improvement of school systems. Gu has moved from a strongly ameliorative and reformist view of the purposes of the field to the view that its purposes lie in the identification of "general and specific principles in educational development [that might] act as a reference point for educational reform in our own country or region" (Gu, 2001: 240).

Several scholars have also placed normative purposes at the heart of comparative education, whether these purposes be ameliorative or critical. Masemann's (2003) position with respect to which theoretical perspective

most appropriately situates comparative ethnographic research in its wider context is located in the paradigm of conflict theory. She calls for a critical ethnography (an anthropological methodology informed by critical theory) that avoids the assumptions of neutrality and objectivity of functionalist and positivist approaches: “a critical or neo-Marxist approach is necessary to delineate the connections between the microlevel of the local school experience and the macrolevel of structural forces at the global level that are shaping the ‘delivery’ and experience of education in every country” (Masemann, 2003: 115). Mason argues that “comparative education is best conceptualized as a critical social science, incorporating an emancipatory interest focused on the distribution of power and its associated attributes: economic wealth, political influence, cultural capital, social prestige and privilege, and the like” (Mason, 2007: 196). He suggests that comparative-education researchers working in the domain of educational development identify the axes along which educational and other goods are differentially distributed (Mason, 2007: 196) and compare along and across one or more of these axes to the end of exposing educational inequities, inequalities, and injustices.

With respect to these critical purposes, it is worth nothing that Broadfoot describes a deep methodological divide between qualitative and quantitative methodological approaches to comparative-education research (Broadfoot, 2000: 360). As it is difficult to escape the value-laden nature of problems, methods, and conclusions in much comparative-education research, she accordingly calls (Broadfoot, 2000) for a more critical, theoretically informed, social-science perspective in the field, one steeped in a greater self-critical awareness. She suggests that “comparative educationists . . . need themselves to be willing to engage in fundamental debates about values; about the nature ‘of the good life’ and about the role of education and learning in relation to this” (Broadfoot, 2000: 370). For Cowen (2000), these questions imply a reading of the world by comparative-education researchers that involves wide-ranging cultural, historical, and political interpretations.

The Distinction of Comparative Education from Other Related Fields

Comparative Education and International Education

The fact that there is little consensus among researchers in the field about these distinctions notwithstanding, Bray (2007: 51–53) has identified four different definitions of international education that distinguish it from comparative education. Among these are Epstein’s view that, while comparative education is “a field of study that applies historical, philosophical and social science theories

and methods to international problems in education,” international education “tends to be less scientific than comparative education,” and is concerned less with analysis and study and more with policy implementation and practice (Epstein, 1968: 376–377). Postlethwaite (1988: xvii) has classified within international education those studies that “do not compare, but rather describe, analyse or make proposals for a particular aspect of education in one country other than the author’s own country.” For Epstein, international education is concerned with descriptive information about different educational systems and engaged in policymaking in the area of international exchange and understanding (Epstein, 1994: 918), while comparative education is concerned with explaining and analyzing the variance in educational systems and processes across societal contexts, and how those systems and processes relate to their wider contexts.

Ferrer (2002: 197) casts this distinction as the one between the theoretical and the applied, the analytical and the descriptive, and the explicative and the informative.

Wilson (1994: 452) has challenged Epstein’s relegation of international educators to a merely descriptive role. For him, “international educators originated – and continue to practice – the melioristic trend more prominently associated with comparative education; that is, the improvement of national educational systems by the addition of models, practices, innovations, and the like borrowed or transferred from other national educational systems.” Wilson locates this melioristic purpose in the work of “personnel in bilateral, multilateral, and non-governmental organizations engaged in national studies, usually related to a development project” (Wilson, 1994: 455). Many in the field see this purpose as generating the links among comparative, international, and development education, the latter frequently understood as international development aid (e.g., Crossley, 1999; Watson, 1999). This reflects Anweiler’s (1977: 109–110) contextualization of development education as a sub-field of international education. International education, in this sense, includes the study of the work of international educational organizations, such as the United Nations Educational, Scientific and Cultural Organization (UNESCO), that is typically focused on educational development in poorer countries and regions.

The term international education has also been identified with the work of international schools, typically in the research of Hayden and Thompson (see Cambridge and Thompson, 2004; Hayden and Thompson, 2001). Cambridge and Thompson describe two interpretations of international education: the first informed by educational purposes associated with the development of international attitudes, international awareness, international-mindedness, and international understanding; and the second associated with the global portability, recognition, and certification of educational qualifications (Cambridge and Thompson, 2004: 173).

Comparative Education and Educational Development

There is a marked discrepancy between the term comparative education and the number of articles published in the field's journals that are hardly or, at best, only implicitly comparative. Among many others, Halls (1990: 26) has identified this as a problem in the field. For Epstein (1994), however, this is not a problem, given his view that implicit comparison refers to a type of inquiry that may be focused on one particular society or historical period, but whose analytical scheme can be extended to problems in other societies and periods. Lauwerys has noted that, frequently, comparative studies produce such general statements, with the comparative element downplayed to an implicit level. "Studies can use the comparative method without being constantly and monotonously explicitly comparative. Comparative method can be the ladder by which one rises to a height from which a general view is gained; the scaffolding needed to build a house. However, there is no need to display the scaffolding ostentatiously, when the house stands solid and is provided with a staircase" (Lauwerys, 1959: 292).

That one of comparative education's frequently cited purposes is the development of education in poorer regions and countries of the world is a major reason for this discrepancy: many articles in the field's journals are less explicitly comparative and more concerned with issues of international educational development. Notwithstanding the fact that much of the most visible comparative-education research today has to do with large cross-national studies of student learning such as those undertaken by the International Association for the Evaluation of Educational Achievement (IEA) and the Organization for Economic Cooperation and Development (OECD)'s Program for International Student Assessment (PISA), Mason has suggested that "comparative education research . . . has its most worthwhile contribution to make [to the end of educational equity] in the domain of educational development" (Mason, 2007: 196).

For Parkyn (1977: 88–89), the distinction between comparative education and development education is one of purpose: while the purpose of comparative education is to increase our understanding of the relationship between education and development through a comparative study of trans-societal factors, the latter is concerned with the economic, political, and development needs of developing countries. He emphasizes that development education must rest on a foundation of comparative education (Parkyn, 1977: 90), not least because of the former's dependence on a holistic understanding of educational systems within their economic, political, social, cultural, and development contexts. One purpose of comparative-education researchers working in the domain of educational development is the "production of information

and plans to assist policymakers, the development of appropriate educational methods and techniques, and the training of personnel to implement programmes" (Halls, 1990: 24).

Comparative Education and Foreign Education, or Area Studies

Foreign education, a term used less frequently than previously, refers to the study of education (systems) in countries other than that of the researcher but perhaps not for comparative purposes – merely for description, analysis, and explanation. These days it is more frequently referred to as area studies, within one country or a particular region. Successive editors of the influential *Comparative Education Review*, such as Epstein (see Epstein, 1994: 922) and Rust, have argued that such studies could also be construed as comparative if they permit "readers outside that educational system to understand how its problems might illuminate problems elsewhere" or if "they rely on or test more general theories" (Rust, 2001: iv).

Cultures and Countries, or Nation-States, as Units of Analysis

(This explication of the conceptual issues associated with comparing education across cultures, countries, and nation-states draws substantially on the first-half of Mason's *Comparing Cultures* (Mason, 2007). For a consideration of the related methodological issues, which is beyond the scope of this article, the interested reader may consult the latter part of Mason (2007).)

McLaughlin (2004: 475) identifies a number of themes, recently and frequently considered by researchers in comparative education that are rich in their philosophical implications: globalization, postcolonialism, indigenous education, democracy, and citizenship. He also identifies (McLaughlin, 2004: 476) a number of educational contexts in which such comparison is situated, which are similarly rich in their philosophical implications: cultural, anthropological, political, and religious. Among the most common in the field, and also among the most complex, is the question of comparing education across cultures. "Culture, in comparative analysis and understanding, and certainly in national systems of education," claims Alexander (2000: 30), "is all." Limitations of space forbid philosophical explication of the other contexts and themes listed by McLaughlin, but this article would not be complete without at least a brief consideration of culture, of national culture, and of national culture under conditions of increased rates of globalization, in comparative-education research.

The summary claim of Phillips and Schweisfurth (2007) that comparative education is essentially concerned with

other cultures/countries raises at least two further conceptual questions, about culture, and about the nation-state. With respect, briefly, to the latter, Arnove and Torres (1999), Dale (2000), Ferrer (2002), and Green (2003) are among many scholars who have suggested that increasing rates of globalization have placed in question the role of the nation-state as a primary unit of analysis in educational comparisons. Green, for example, has suggested that the processes associated with globalization have created new “educational spaces which belong exclusively to neither nations nor systems” (Green, 2003: 95). Khôi (1981) describes supranational, international, and intranational classifications of education systems for comparison. Halls (1990) describes comparisons among nation-states, world systems, ideological systems, world regions; comparisons in terms of levels of economic prosperity; and local or intranational comparisons. As has been described above, the cube of Bray and Thomas (1995) lessens most appropriately, at least in the context of the processes associated with increasing rates of globalization, the emphasis on comparisons among education systems at the level of the nation-state by expanding the range of comparisons down to micro-social units such as schools, classrooms, teachers, students, and even individual lessons.

The Concept of Culture in Comparative-Education Research

Few comparative-education researchers would deny that cultural factors influence many aspects of education, but most would flinch from asserting precisely what these factors are. Such factors are notoriously difficult to isolate, and such assertions are often tenuous at best, given how easy it is not only to overstate the influence of a particular cultural factor in a complex world, but also to get it wrong. Perhaps worse than this, researchers who attempt to describe the influence of cultural factors on education face possible accusations of stereotyping, of treating culture as monolithic, and of overstating its influence in a hybrid world characterized by complex interactions and influences.

Comparisons of education across cultures are common, with the difficulty of generalization among the most intractable questions in this domain. Two well-known examples are the cross-national studies of educational achievement conducted under the auspices of the IEA and PISA. Secondary analysis of these results frequently involves a search for cultural factors associated with educational achievement – the immediately obvious first slippage being the one from country to culture (and indeed, if the adjective cross-national is used, from nation to country). The assumption that nation, country, and culture are synonymous is, of course, simply wrong. To assume that culture is a monolithic and discrete entity is equally wrong. Culture is not a fixed entity that shapes the lives of individuals. It is more accurate to speak of

a dialectical process between people and their social environments which also involves the shaping of the culture by those people as they manipulate its conventional symbols to create new meanings. Culture is, in other words, not a club, along with membership of which go certain attributes of membership. Culture functions more as a productive force constituted by a relatively amorphous aggregation of loosely bounded factors that both influences the lives of the individuals who share in it and is, in turn, influenced by those individuals.

There are at least two definitions of culture that are of interest to comparative-education researchers, the first underlying a research interest in material production, the second in symbolic systems, each of which overlaps the other substantially in much comparative-education research. With respect to the former, Williams (1985: 91) notes that “in archaeology and in cultural anthropology the reference to culture or a culture is primarily to *material* production,” while with respect to the latter, “in history and cultural studies the reference is primarily to *signifying* or *symbolic* systems” Williams (1985: 91).

The first, commonly understood as the anthropological definition, indicates “a particular way of life, whether of a people, a period, a group, or humanity in general” (Williams, 1985: 90). This way of life would include the shared values and meanings common to members of the group. Drawing on Keesing’s position that culture is “concerned with actions, ideas and artefacts which individuals in the tradition concerned learn, share and value” (Keesing, 1960: 25), Masemann’s anthropological approach to culture (Masemann, 2003: 116–117) assumes that:

culture refers to all aspects of life, including the mental, social, linguistic and physical forms of culture. It refers to ideas people have, the relationships they have with others in their families and with larger social institutions, the languages they speak, and the symbolic forms they share, such as written language or art/music forms. It refers to their relationship with their physical surroundings as well as the technology that is used in any society, [and] ... it expresses the value system(s) of a particular society or group.

The second definition of culture derives from its anthropological definition, and also refers to shared meanings within groups, but differs in emphasis from the former by focusing more on “the symbolic dimension, and on what culture *does* rather than what culture *is*” (Bocock, 1992: 232). Here, in cultural studies (more than in cultural anthropology), culture is less importantly a distinctive way of life as understood, for example, by its material artifacts, and more importantly “the set of practices by which meanings are produced and exchanged within a group” (Bocock, 1992: 233). At the heart of these practices lies language, because the sharing of a common language system enables people to communicate

meaningfully with one another. Language is here understood broadly, to include all sign and symbol systems through which meaning is produced: “any system of communication which uses signs as a way of referencing objects in the real world; it is this process of *symbolisation* which enables us to communicate meaningfully about the world” (Bocock, 1992: 233). These sign-and-symbol systems are most commonly understood as the words of a language, but they also include material objects. It is not least in the interpretation of the significance of the material object that this symbolic understanding of culture differs from, or at least extends, the anthropological understanding of culture.

In cultural anthropology, then, culture is understood as shared meanings and ways of life; in cultural studies and its associated fields, culture is understood as the practices which produce meaning (Bocock, 1992: 234). Again, the second draws on the first, and the first is also interested in the concerns of the second. It is more a matter of difference in emphasis: in the first, on the substantive contents of culture as a whole way of life; in the second, on the ways in which cultural practices produce meaning for those who share those practices. The approach to the analysis of culture typical of the second looks for the ways in which meaning is produced by the arrangement, the pattern, and the symbolic structure of an event (Bocock, 1992: 235).

National Culture in Modern Societies

Perhaps the most common expression of cultural identity in modernity is found in what is widely understood as national culture. While in premodern societies, cultural identity might typically have been constructed in terms of one's tribe, ethnicity, religion, or region, with the nation-state, the dominant political entity in modernity, these identities have gradually given way to a national cultural identity. Nation (as in national, associated with a country) and culture are, after all, often conflated in comparative-education research that attempts to identify the cultural factors associated with, say, educational achievement. The question then turns to the meaning of national culture. Here, we follow Hall (1994: 292), for whom a national culture is a discourse – “a way of constructing meanings which influences and organizes both our actions and our conception of ourselves.” National identity, argues Anderson (1983), is no more than an imagined community. That does not mean that national identity and culture are without real and substantial consequences; but before comparative-education researchers undertake comparisons across cultures, they should consider not only the ways in which the discourse of national culture is represented, but also the power of those representations to win national allegiance and to define cultural identity.

National cultural identity is best understood with reference to Hall, who points out that

national identities are not things we are born with, but are formed and transformed within and in relation to *representation*. We only know what it is to be ‘English’ because of the way ‘Englishness’ has come to be represented, as a set of meanings, by English national culture. It follows that a nation is not only a political entity but something which produces meanings – *a system of cultural representation*. People are not only legal citizens of a nation; they participate in the *idea* of the nation as represented by its national culture . . . National cultures construct identities by producing meanings about ‘the nation’ with which we can *identify*; these are contained in the stories which are told about it, memories which connect its present with its past, and images which are constructed of it. (Hall, 1994: 292–293, *emphases original*)

National culture emerged with and helped to shape modernity by gradually displacing (but of course, not entirely) the premodern discourses of identity mentioned earlier: tribal, ethnic, religious, and regional.

The origins of these representations, these narratives that constitute and reflect the discourse of national culture, lie in and may be constructed through:

- “the narratives of the nation, as it is told and retold in national histories, literatures, the media and popular culture,” which “provide a set of stories, images, landscapes, scenarios, historical events, national symbols and rituals which stand for, or represent, the shared experiences, sorrows, and triumphs and disasters which give meaning to the nation” (Hall, 1994: 293), and which “make up the threads which bind us invisibly to the past” (Schwarz, 1986: 155);
- the emphasis on “origins, continuity, tradition and timelessness” (Hall, 1994: 294), which represents national identity as primordial, “in the very nature of things” (Gellner, 1983: 48);
- the invention of tradition: as Hobsbawm and Ranger (1983: 1) point out, traditions which appear or claim to be old are often quite recent and sometimes invented;
- the creation of a foundational myth, one which “locates the origin of the nation, the people and their national character so early that they are lost in the mists of, not ‘real’, but ‘mythic’ time” (Hall, 1994: 295; Hobsbawm and Ranger, 1983: 1); and
- the symbolic grounding of national identity on the idea of a “pure, original people or ‘folk’” (Hall, 1994: 295; Gellner, 1983: 61).

Comparative-education researchers would be well cautioned about the shallowness and the arbitrariness of the foundations of cultural identity by understanding national cultural identity as more constructed than natural, more discursive than material.

Beyond these, questions about the rather arbitrary history and radically constructed nature of national cultural identity

are a further problem: whether national identities really are as unified, coherent, consistent, and homogeneous as appears in these representations of national culture. They are obviously not. As Hall (1994: 297) points out, "modern nations are all cultural hybrids." Most modern nations have, after all, been born out of violent conquest of one or more groups by another. National cultural identity is often constructed on a specious notion of race, marking as different those of different racial groups. National identity is also often strongly gendered, excluding women from its patriarchal norms. Class is another powerful divider, and it is almost without exception the cultural capital of the elite groups in a society that represents the norm, that constitutes what is to be emulated and sought by all. This generalization of the cultural norms of a society's elite groups to the level of national cultural identity does, what Bourdieu calls, symbolic violence to the representations espoused in the cultural identity of other groups in society, and all too frequently contributes to weak comparative-education research that misses such marginalized representations. Differences in language, geographical region, tradition, religion, customs, and the like constitute further lines marking difference and exclusion. While national cultural mythology works to draw together the different identities and local communities of which a nation-state is constituted, to make culture and polity congruent under the same political roof (Gellner, 1983: 43), and to paper over the cracks that divide those who identify with Anderson's imagined community from those who are not subsumed under the state's hegemony, it is a good comparative researcher who would be able to represent these subtleties and nuances to an extent that might be called true and fair.

The Influence of Increasing Rates of Globalization on National Culture

We have argued that national culture is somewhat arbitrary, probably best understood as myth, and not particularly successful at masking deep and cross-cutting social divisions. Increasing rates of globalization have complicated matters further. We turn in conclusion briefly to the consequences of globalization and its associated processes for national cultural identity. What might have been sedimented and layered into the accepted truths of national cultural identity has been marbled by processes associated with accelerated globalization. The cultural hybridity of the modern nation-state, masked as a homogeneous unity by the myths of national culture, is being exacerbated almost to the point of the displacement of the national culture by the processes of globalization. Of most relevance here are three such processes: first, national cultural identities are being rendered yet more tenuous than they already are; second, local and particular identities are being strengthened as a consequence of resistance to the processes of globalization; and third, these new hybrid

identities are becoming, at the expense of national cultural identities, increasingly visible. Perhaps the main conclusion to be drawn from the discussion in this section is that the anthropological definition of culture starts to look methodologically suspect in all but the most homogeneous and isolated of cultures, if indeed any exists anymore. It is perhaps to cultural studies and to sociological more than anthropological understandings of culture in contemporary society that researchers need to turn for making a comparison of education across cultures.

Comparative Education: Societies and Associations

M Bray, The University of Hong Kong, China

© 2010 Elsevier Ltd. All rights reserved.

This article focuses on professional societies and associations in the field of comparative education. Most of these bodies attract members as individuals, although some permit institutional membership. The societies and associations provide opportunities for networking through conferences and other activities, and many publish academic journals. Most of the world's national, regional, and language-based professional societies for comparative education are members of the umbrella World Council of Comparative Education Societies (WCCES).

The Oldest Societies

The first society in the field was established in 1956 in the USA. At that time, it was called the Comparative Education Society (CES), but in 1968 it became the Comparative and International Education Society (CIES). It is the largest body in the field, with over 2000 members and a highly-reputed journal titled *Comparative Education Review*. Although the society is registered in the USA, it has many members from other countries. The CIES holds annual conferences, usually in the USA, although occasionally in neighboring countries such as Canada and Mexico.

The second-oldest society is a regional body, the Comparative Education Society in Europe (CESE). This society was created in 1961 as an organization of individual membership, open to practitioners and scholars of comparative education from Europe and beyond. In due course, CESE created sections in Great Britain and Germany which became independent societies. The society organizes biennial conferences, and aims to do so each time in a different European location.

Creation of these two societies was followed by the establishment of three more during the 1960s. The Japan Comparative Education Society (JCES) founded in 1965, and, with a membership of approximately 900, is one of the largest academic societies in Japan in the field of education. It organizes an annual conference and publishes a journal (in Japanese) titled *Comparative Education Studies*.

The Comparative and International Education Society of Canada (CIESC), also known as the *Société canadienne d'éducation comparée et internationale* (SCECI), was founded 2 years after the JCES. As a society in a country which is officially bilingual in English and French, from the outset it has been a bilingual organization. The society organizes an annual conference and operates a journal titled *Canadian*

and International Education or *Éducation canadienne et internationale*.

The Korean Comparative Education Society (KCES) was founded in 1968 as an independent professional society. Two years later, it became part of the Korean Society for the Study of Education (KSSE) as its research section for comparative education, but it retained its original name to maintain a distinct identity. The KCES has organized multiple conferences and seminars, and publishes a journal (in Korean) titled *Korean Journal of Comparative Education*.

The World Council of Comparative Education Societies

In 1970, representatives of the five societies mentioned above came together in Ottawa, Canada, for the First World Congress of Comparative Education Societies. During that event, the WCCES was created as an umbrella body to bring together the various national and regional societies.

The leading figure in the WCCES was Joseph Katz, of Canada's University of British Columbia. Katz had been president of the CES in the USA, and had been the principal architect of the CIESC in Canada. The United Nations Educational, Scientific and Cultural Organization (UNESCO) played a significant role in the preparations, and one of the seven resolutions at the 1970 Congress was that the WCCES should seek consultative status with UNESCO.

Over time, the WCCES gained more members as additional societies were formed and sought affiliation. In 2009, the WCCES had 37 member societies (**Table 1**), of which some were national (e.g., for Cuba and Greece), some were subnational (e.g., for Hong Kong), some were regional (e.g., for the Mediterranean and Southern Africa), and two were language based (for speakers of French and Dutch). The number of member societies at the time of preparation of this table was the largest that it had ever been during the history of the WCCES. However, growth had not been entirely linear, and some societies which had existed at previous points in history had become defunct. Societies in this category included the ones in Colombia, Nigeria, and Portugal.

The statutes of the WCCES state that its broad goals are:

Table 1 Member societies of the WCCES (2009)

<i>Asociación de Pedagogos de Cuba (Sección de Educación Comparada)</i> (APC-SEC)
<i>Association française pour le développement de l'éducation comparée et des échanges</i> (AFDECE)
<i>Association francophone d'éducation comparée</i> (AFEC)
Australian and New Zealand Comparative and International Education Society (ANZCIES)
British Association for International and Comparative Education (BAICE)
Bulgarian Comparative Education Society (BCES)
Chinese Comparative Education Society (CCES)
Chinese Comparative Education Society-Taipei (CCES-T)
Comparative Education Section of the Czech Pedagogical Society (CES-CPS)
Comparative Education Society of Asia (CESA)
Comparative Education Society in Europe (CESE)
Comparative Education Society of Hong Kong (CESHK)
Comparative Education Society of India (CESI)
Comparative Education Society of the Philippines (CESP)
Comparative and International Education Society (CIES)
Comparative and International Education Society of Canada (CIESC)
Council on Comparative Education of Kazakhstan (CCEK)
Egyptian Comparative Education and Educational Administration Society (ECEEAS)
Greek Comparative Education Society (GCES)
Hungarian Pedagogical Society (Comparative Education Section) (HPS-CES)
Israel Comparative Education Society (ICES)
Japan Comparative Education Society (JCES)
Korean Comparative Education Society (KCES)
Mediterranean Society of Comparative Education (MESCE)
<i>Nederlandstalig Genootschap voor Vergelijkende Studie van Opvoeding en Onderwijs</i> (NGVO)
Nordic Comparative and International Education Society (NOCIES)
Polish Comparative Education Society (PCES)
Russian Council of Comparative Education (RCCE)
<i>Sektion International und Interkulturell Vergleichende Erziehungswissenschaft in der Deutschen Gesellschaft für Erziehungswissenschaft</i> (SIIVEDGE)
<i>Sezione Italiana della CESE</i> (SICESE)
<i>Sociedad Argentina de Estudios Comparados en Educación</i> (SAECE)
<i>Sociedad Española de Educación Comparada</i> (SEEC)
<i>Sociedad Mexicana de Educación Comparada</i> (SOMECE)
<i>Sociedade Brasileira de Educação Comparada</i> (SBEC)
Southern African Comparative and History of Education Society (SACHES)
Turkish Comparative Education Society (TUKED)
Ukraine Comparative Education Society (UCES)

- to advance education for international understanding in the interests of peace, intercultural cooperation, mutual respect among peoples, and observance of human rights; and
- to improve education systems so that the right of all to education may be more fully realized.

The statutes then specify two professional aims, namely:

- to promote the study of comparative and international education throughout the world and enhance the academic status of this field; and
- to bring comparative education to bear on the major educational problems of the day by fostering cooperative action by specialists from different parts of the world.

Then the statutes indicate that to achieve these aims, the WCCES will:

- encourage the teaching of, and research in, comparative education;
- promote interdisciplinary collaboration in the development of comparative approaches to the study of educational problems;
- facilitate cooperation between comparative educationists of different countries and regions, and foster the establishment of professional associations and groups of comparative educationists;
- support international programs in education and the agencies responsible for them, by focusing the attention of comparative research workers on the major problems encountered in these programs;
- organize research projects for which there is a particular need; and
- improve the exchange of information about research and methodological developments in comparative education.

The most visible WCCES activities are the world congresses held approximately every 3 years (**Table 2**). The Council's officers seek to hold the congresses in different parts of the world in order to promote balance in geographic and other emphases. The WCCES has also sponsored research and publication. The Council does not operate its own journal, although it has provided financial and other support to the journals of member societies.

Names and Approaches

Among the 37 bodies listed in **Table 1**, all had some variant of comparative education in their names, but some linked that field with another. Six societies included the related field of international education in their names, one linked comparative education with educational administration (Egypt), another linked it with history of education (Southern Africa), and another included intercultural education with comparative and international education (Germany). Further, among the 37 WCCES members:

- 27 were societies;
- three were associations (AFDECE, AFEC, and BAICE);
- two were councils (Russia and Kazakhstan);

Table 2 World congresses of comparative education societies

No.	Year	Place	Theme
1.	1970	Ottawa, Canada	Education and the formation of the teaching profession; educational aid to developing countries
2.	1974	Geneva, Switzerland	Efficiencies and inefficiencies in secondary schools
3.	1977	London, United Kingdom	Unity and diversity in education
4.	1980	Tokyo, Japan	Tradition and innovation in education
5.	1984	Paris, France	Dependence and interdependence in education: The role of comparative education
6.	1987	Rio de Janeiro, Brazil	Education, crisis, and change
7.	1989	Montreal, Canada	Development, communication, and language
8.	1992	Prague, Czechoslovakia	Education and democracy
9.	1996	Sydney, Australia	Tradition, modernity, and postmodernity
10.	1998	Cape Town, South Africa	Education, equity, and transformation
11.	2001	Chungbuk, Republic of Korea	New challenges, new paradigms: Moving education into the twenty-first century

- six were specialized comparative education sections in their respective national educational societies (China, Czech Republic, Cuba, Germany, Korea, and Hungary); and
- one (SICESE) operated as a quasi-national body but in constitutional terms was a section of a regional comparative education society.

The distinction between societies and associations was not of great significance. In French, the word association is more commonly used than society (*Société*) for academic bodies, with society being in widespread use in the commercial sector. It was chiefly for that reason that the French translation of WCCES, which was originally *Conseil mondial des sociétés d'éducation comparée* (CMSEC), was changed during the 1980s to *Conseil mondial des associations d'éducation comparée* (CMAEC). In the United Kingdom, the word association had been used in the London Association of Comparative Educationists (LACE), which was formed during the late 1970s but became defunct during the 1980s. When the British Comparative and International Education Society (BCIES) merged with the British Association of Teachers and Researchers in Overseas Education (BATROE) to form the British Association for International and Comparative Education (BAICE), the new body used the word association partly because it took the first two letters from BATROE and partly because the letters formed a good acronym.

In other dimensions, more important principles underlay the naming. For example, the Kazakh body chose to call itself a council rather than a society or an association because its members desired the body to have authority to grant doctoral degrees. In Kazakhstan, such power was given only to academic councils, and not to academic societies or associations. Similar factors related to the Russian Council.

Also significant have been changes over time, which have reflected changes in the nature and mission of some

bodies. Two categories of changes deserving more extended comment are a shift from comparative education to comparative and international education, and a shift from foreign to comparative education.

From Comparative to Comparative and International Education

International education can be defined in various ways, but when paired with comparative education it is commonly taken to imply a more practical and developmental approach to education which may focus on a single country (usually one which is not the original home of the person(s) presenting research findings or other information) and not necessarily based on a strong foundation of comparison. The six WCCES member societies listed in **Table 1** that had international education in their names were:

- the Comparative and International Education Society (CIES);
- the *Sektion International und Interkulturell Vergleichende Erziehungswissenschaft in der Deutschen Gesellschaft für Erziehungswissenschaft* (SHIVEDGE);
- the British Association for International and Comparative Education (BAICE);
- the Comparative and International Education Society of Canada (CIESC);
- the Australian and New Zealand Comparative and International Education Society (ANZCIES); and
- the Nordic Comparative and International Education Society (NOCIES).

In the CIESC, the international component was acknowledged from the outset. The only other member society that had CIES in its name from the beginning was the Nordic society, established in 1992. The historical evolution of

the names of the four older bodies – American, German, British, and Australian – reveals interesting patterns. They are discussed below in chronological order of the year in which they underwent the name change.

The CES existed for 12 years from 1956 without international in its name, and made the change a year after the founding of the CIESC. The name change was chiefly motivated by practical circumstances: the leadership felt that the society would attract funding if it added the word international. The society also had a growing constituency of members working in the applied field of international education, as distinguished from the original dominance of academics concerned with the theoretical and explanatory focus of comparative education.

The British society started as the British Section of CESE in 1966. It gradually diverged from its CESE parent, taking a more international and development orientation, and in 1979 became an independent national society called the British Comparative Education Society (BCES). Like its US counterpart, the British society witnessed a bifurcation of research interests between comparativists more interested in conceptual work and consultants and others more interested in practical international work. To reflect the dual nature of its constituency in a better manner, in 1983, the BCES became the BCIES. Fourteen years later, in response to a changed educational environment, it merged to create BAICE but retained both international and comparative in its title.

The British phenomenon of separation and then consolidation in response to wider interactions was paralleled in Germany. First was the German Section of CESE, formed in 1966 with a concurrent identity as a commission of comparative education in the *Deutschen Gesellschaft für Erziehungswissenschaft* (DGfE – German Society for Education). This created the *Kommission für Vergleichende Erziehungswissenschaft in der Deutschen Gesellschaft für Erziehungswissenschaft* (KVEDGE). In 1978, a Commission for Education with the Third World was formed alongside the comparative education body in the DGfE, echoing the emergence of an international education community in the United States and Great Britain. An intercultural education unit was also formed within the DGfE in 1992, reflecting the growing research interest in migration and its impact on German universities. In 1998, these three bodies were consolidated into one umbrella section, called the Section for International and Intercultural Comparative Education (SIIVE), also known as SIIVEDGE. These transformations were catalyzed by changing research interests and opportunities during the period. The initial fragmentation and splintering of research fields, as embodied in the proliferation of commissions and units, was later reversed with consolidation into one section.

ANZCIES offers another interesting case. It began in 1973 as the Australian Comparative Education Society (ACES). Within a decade, it underwent three name

changes: in 1975 to the Australian and International Comparative Education Society (AICES); then the Australian Comparative and International Education Society (ACIES) in 1976; and, finally in 1983, it became binational (and regional) as the Australian and New Zealand Comparative and International Education Society (ANZCIES).

The debate about names and aims of societies (and of the field) remained vigorous. The evolution in nomenclatures reflected evolution in the field's objects of study, its research interests, and its attractiveness to academics with different specializations. These academics have in turn responded to wider forces in international politics, institutional demands, funding policies, intellectual shifts, migration, etc. However, the patterns have not all been consistent. Thus, for example, the Spanish society in 1984 considered modeling its name after the CIES, but the proposal was not implemented. Similarly, the JCES, whose host country was actively engaged in international development assistance, considered adding international to its name in the mid-1990s. The move was stalled by awareness that renaming the society would cause confusion and overlap with the existing Japan International Education Society. At the same time, the fact that none of the other 31 WCCES constituent societies had the word international in their titles demonstrated that international education was not universally paired with comparative education – and indeed it was not universally recognized as a strong field in its own right in tandem with comparative education.

From Foreign Education to Comparative Education

The German and Chinese cases offer further interesting points for reflection on the difference between foreign education and comparative education. In the late 1950s, institutions in the German Democratic Republic (East Germany) distinguished between foreign countries and West Germany, since West Germany was not considered a foreign country. However, the term comparative education was not used at that time since most work was descriptive or consisted of translated articles of foreign authors. From 1963 to 1974, a department for comparative education existed in East Berlin, and comparative work between East and West flourished. This phase came to a close in 1974, and the term comparative education was replaced by education abroad, since comparisons were once more viewed by the authorities as ideologically risky. Only in 1990 did comparisons become visible again, although initially under the name comparative pedagogy rather than comparative education.

China offers a related story. The professional society in China started as a Foreign Education Research Sub-commission of the Chinese Society of Education (CSE), which was China's largest learned society in the

field of education. In 1983, the subcommission's name was changed from foreign education to comparative education. The name change reflected a change of understanding about the nature of comparative education as a subdiscipline of educational science, and a desire to provide reference for educational reform at home by identifying general laws in the development of education through comparative analyses. This new understanding of the nature and purpose of comparative education took place against the backdrop of China's Open Door policy, which aimed to accelerate national development by importing knowledge from all pertinent locations. A partial offshoot of these new thrusts was the renaming of several institutes of foreign education as institutes of comparative education.

Other Comparative Education Societies

Although the majority of societies in the field of comparative education are members of the WCCES, some are not. For example, during the 1980s and 1990s societies were formed in Albania, Romania, and Venezuela. They did not join the WCCES, either because the necessary connections were never made or because the societies had insufficient organizational capacity and later became dormant or defunct. More positive was the creation in 2005 of the Thailand Comparative and International Education Society (TCIES), with which the WCCES has had some contact.

Alongside these bodies, which were formed as national bodies with a geographic remit, have been two bodies with specialist foci within the field of comparative education:

- The International Society for Physical Education and Sport (ISCPEs) was formed in 1978, has held biennial conferences, and has produced some significant publications.
- The International Society of Comparative Adult Education (ISCAE) began as an informal grouping during the early 1990s. It had a loose membership without a formal constitution or membership fees, but nevertheless organized several significant conferences and publications.

One might expect similar professional societies with specialist foci to be established, although the majority of broadly-focused national bodies would be glad to provide a vehicle for such specialist work. For example, the CIES has created Special Interest Groups (SIGs), some of which focus on specific regions in the world while others focus on such themes as citizenship, early-childhood development, higher education, indigenous knowledge, and language issues.

Conclusion

In the field of comparative education, as in other fields, professional societies and associations have played an

important role in disciplinary institutionalization and scholarly networking. The expansion in the number of societies since the mid-twentieth century has significantly added to the weight of the field. Each society operates within its own sphere, but most societies have been glad to contribute to the global arena through the WCCES. The WCCES acts as a forum through which national, subnational, regional, and language-based societies can interact and collaborate on common agendas.

The fact that some societies have become defunct alongside the ones that have flourished shows that organizational structures may be fragile. Much depends on the leadership and enthusiasm of individuals, as well as on the institutional encouragement provided by universities and other bodies. Nevertheless, the societies have shown themselves to be valuable instruments for development of the field, acting as focal points for exchange of ideas and for publication of research. From a wider perspective, the development and expansion of these societies reflect developments within academia. Some societies also promote links with international organizations such as UNESCO and the World Bank.

Curriculum and Religion

C Kapitzke and P Graham, Queensland University of Technology, Kelvin Grove, QLD, Australia

Across continents and cultures and periods of history, religious beliefs and practices have underpinned curriculum in institutions of education. More recently, the so-called culture wars and terrorism have moved religion to the center stage. In both state and independent education sectors, deep-seated assumptions about the nature of reality, spirituality, religion, ethics, and knowledge, converge and clash in the curricular documents of science, history, literacy education, and the like. Prayer in school, intelligent design, and the expression of cultural and religious identity through dress codes, are issues around which otherwise disparate advocacy groups collaborate for policy activism in support of theological traditions.

Schooling and religion in the United States, the United Kingdom, as well as in Australia and Canada, have proven to be a divisive issue for governments and educators alike. Indeed, the classroom has become the locus of broader social conflict over religion's more general role in public life. In essence, government policies and public opinion, in public and faith-based schools, can be seen as an indicator of how each of these nations is handling the complex social issue of religion in the wake of recent world events.

Recent Trends and Issues

In the United Kingdom, for example, the Office for Standards in Education recently published a 5-year study into religious education in state schools (Ofsted, 2007). The report calls for an overhaul of the curriculum and recommends the need to address religion's changing role in a modern world facing an increase in religious fundamentalisms. The recommendations, including a push for a standardized, national religious education curriculum, marked a significant move toward addressing the political and social changes exacerbated by the so-called war on terror. This move toward an inclusive national approach

to broadening religious education in public schools, is in sharp contrast to the current public debate over whether faith-based schools pose a barrier to community cohesion.

By contrast, a recent United States report on the legal and constitutional battles over religion's place in public schools, (Lupu *et al.*, 2007), makes no mention of religions other than Christianity except under the heading multiculturalism. Recent conflicts over prayer in schools, the pledge of allegiance, creationism and evolution, and the rights of students and parents, are given in-depth examination, but there is no discussion on whether, post-September 11 public schools might have a legal obligation to provide students with a broader view of religion's place in the classroom as part of liberal education in a global context. In this respect, it seems that the United Kingdom's approach to religion in public education is grounded in a broader view of the sociopolitical prominence that religion holds outside of the classroom. Indeed, the report by Lupu *et al.* (2007: 1) found that 69% of Americans agreed with the notion that "liberals have gone too far in trying to keep religion out of the schools and the government." Yet, given the fact that in the same survey, almost two-thirds (58%) favored teaching biblical creationism along with evolution in public schools, it seems that in this instance, the word religion merely serves as a euphemism for Christianity.

In Australia, the support for faith-based schools is a well-established tenet of education policy. The deep-seated spirituality of Australia's Indigenous peoples and its centrality to successful learning and well-being is gradually being recognized (cf., Charlesworth *et al.*, 2005). There are perceptions, nonetheless, that some of the nation's Muslim schools are exposing students to extremist views pushed by visiting imams and religious scholars (see, e.g., Skelton, 2005). Skelton levels criticism at the Howard government for taking a big-spending *laissez-faire* attitude to faith-based schools' funding without implementing the necessary checks and balances to monitor curriculum, especially in primary schools.

A small but growing international literature on Muslim education indicates that these questions remain poorly understood for other cultures as well, and yet they have implications for curricular and pedagogical practice in educational contexts with increasingly diverse student populations. Other issues for Muslim education internationally are the role of *madrasabs* within a context of modernization and globalization, the educational needs of Muslim girls, and the interrelation of secular and traditional knowledge (Zia, 2006).

While Western nations are grappling to define religion's role in modern education, in China, Confucianism is making a comeback in both education and the national consciousness. Viewed by many as a means of returning to traditional values, Confucianism reentered the national consciousness last year after a television series based on modernized Confucian lectures proved to be a surprise hit, paving the way for a series-based book that is described as China's biggest bestseller in recent memory (see Yu Dan's *Insights on the Analects*). Chinese authorities are embracing Confucius even though it has been less than a generation since communist Red Guards denounced him as a symbol of a feudal past. Confucianism, both in education and in the home, is now being touted as an antidote to the sense of entitlement endemic in only children born under China's one-child policy.

The literature on the interrelation of education and religion typically begins with the Protestant Reformation and Luther's call for mass public schooling. Indeed, most theoretical and empirical work from the United States commences with the creation of common schooling in the early nineteenth century (cf., Slattery, 2006). By contrast, long before the breakthrough to alphabetic script and print literacy, religious beliefs in oral cultures were fundamental to the educational experiences of the adult and child alike. A turn to the past to rethink long-standing principles embedded within current curricular and pedagogical practice provides a useful context for understanding current issues and contexts. Mainstream scholarship, however, is heading in the other direction. Stark (2005), for example, argues that rather than being a barrier to progress, Christianity laid the foundation for it by enabling the West – specifically Protestant England, Holland, and later north America – to develop and pull ahead of other cultures economically and politically. However, this claim is neither benign nor well warranted.

An alternative argument is that Western beliefs about knowledge and knowing, teaching and learning, derive in large part from Greek culture, and the three dominant religions (Judaism, Islam, and Christianity) that privileged the book as a dominant cultural artifact. The epistemological legacy of this genesis is its implications for institutional education today. Within a context of intense cultural integration, economic globalization, and inequities in knowledge governance, the time has come for the West to engage

with the rest of the worldviews about education's role in society and culture in order to mitigate the epistemological ethnocentrism of Western education, curriculum development, and knowledge policy and practice.

Antiquity: Philosophical Ground

Educational practice, in any given cultural context, is heavily influenced by dominant social institutions; for example, the family in premodern China, theocracy for the Hebrews, and Socratic dialog in Greek pedagogy.

The Greek ideal of dialog through dialectics, logic, and rationality, which privileged the mind over the body, continues today in educational systems of the West. Plato asserted that the pedagogical technique of dialectic is “that strain which is of the intellect only” and that “when a person starts on the discovery of the absolute by the light of reason only, and without any assistance of sense, if he [sic] perseveres by pure intelligence, he attains at last to the idea of good, and finds himself at the end of the intellectual world” (cited in Monroe 1929: 211). The body plays little part here in the work of learning and knowing. Plato's later work emphasized science and mathematics more than poetry and philosophy, but this was a science that remained associated with metaphysics and religion. “Arithmetic and geometry culminate in astronomy and astrology, which forms the basis of social life” (cited in Monroe, 1929: 137).

Plutarch maintained an emphasis on reason as demonstrated in his treatise on learning in *Selections from the Discourse Touching the Training of Children*:

... what we are wont to say of arts and sciences may be said also concerning virtue: That there is a concurrence of three things requisite to the completing thereof in practice—which are nature, reason, and use. Now by reason here I would be understood to mean learning, and by use, exercise. (cited in Monroe, 1929: 307)

The manifestation of reason, believed to be language, continued as the focus of learning in Roman education. In the 12 books of *The Institutes of Oratory*, the Roman educator Quintilian developed his exposition on education, proposing that philosophy was divided into three parts: physics, ethics, and dialectics. As part of the continuing art of dialectics, the orator's business was “to know the exact significations of terms, to clear ambiguities, to disentangle perplexities, to distinguish falsehood from truth, and to establish or refute what he [sic] may desire” (cited in Monroe, 1929: 505). The disputations and the art of logic in the forum required “definitions and deductions, in marking differences and in explaining ambiguities, in distinguishing and dividing, in perplexing and entangling . . .”

The obligation for semantic precision and accuracy here constitutes the correspondence theory of truth, which

defines truth as requiring a correspondence between the thing (e.g., belief, proposition, or statement) and what renders it true (e.g., a fact, event, or state of affairs). It assumes an external, objective, and knowable world. These presuppositions of disembodied reason, ontological certainty, direct representation, the prohibition of contradiction, textual literalness, and thence ideological conviction, provided the philosophical ground upon which monotheistic religion subsequently thrived.

In many ways, the principles of modernity and corporate capitalism that are globally dominant today, were instituted by the Roman emperor Constantine in the third century CE (Steinberg, 2005). It is well known that Constantine's withdrawal of state support from pagan temples, the closing of non-Christian schools, and the exclusion of pagans from teaching following his conversion, Christianized the known world at the time (Lenski, 2006). It is less well known that Christianity was aristocratized by the patrician culture of pagan Rome. Finely grained statistical analyses of the social origins and conversions of the senatorial aristocracy of Rome during the third and fourth centuries have shown how the Christian message was molded and modified to appeal to this powerful aristocratic class (see Salzman, 2002). Their cultural values of honor, office, wealth, literary discernment, and *nobilitas* changed Christianity irrevocably as pagan Rome evolved into papal Rome, replete with the principles and practices of a hierarchized status culture and educational system.

Premodernity: Institutional and Textual Ground

After the collapse of Roman influence in Western Europe, literacy went into decline (Ganshof, 1949). Charlemagne issued his *admonitio generalis*, a main function of which was to establish "schools near the cathedrals or in the monasteries" (Ganshof, 1949: 522). The main purposes of the edict were to enable the careful transcription, correction, and conservation of biblical and liturgical texts, and to ensure minimal literacy standards among the clergy. Charlemagne's admonition was to be the rock upon which our current school, university, legal, and financial systems were built.

By the thirteenth century, especially in France, the system set up by Charlemagne had developed into a flourishing and formalized curriculum designed to produce ecclesiastical, bureaucratic, political, and professional expertise. According to Haskins (1904):

In the intellectual life of the middle ages the University of Paris occupies a place of preëminent importance. "The Italians have the Papacy, the Germans have the Empire, and the French have Learning", ran the old saying; and the chosen abode of Learning was Paris. The University of Paris was generally recognized as "the parent of the

sciences" and the first school of the church, and its supremacy was manifest not only in its position as the centre of scholasticism and the bulwark of orthodoxy, but also in the large number and wide distribution of its students, in its influence upon the establishment and the constitutions of other universities, and in its large share in the political and ecclesiastical movements of the later middle ages. (Haskins, 1904: 1)

Medieval curriculum fused form, content, and function according to its theological principles. Since most people could not read at that time, instructional communication between sacred and secular populations was oral. The *forma sermonis* (or sermon form) was the most common genre of public pedagogy, and was deployed by whichever branch of scholastic expertise for the purpose of directing public consciousness and action (Haskins, 1904).

As public discourse, the sermon had a hortatory function: it was deployed to get people to do things, just as contemporary government policy does. In any sustained period of political organization, genres of instruction are closely guarded. Conflicts over the right to use them characterize the most vigorous periods of political conflict. This is especially the case between and within institutions of power. Little wonder that once the sermon form became clearly defined, recognizable, and functionally effective, it proliferated as a genre of public discourse (Haskins, 1904). The right to use it publicly was contested for centuries.

The explosion in the use of the sermon for populist, political, and ecclesiastical purposes, led to a proliferation of *exempla*: the stories with which the sermons are embellished to exemplify the *thema* and elaborate subdivisions into which the thirteenth-century sermon was split (Haskins, 1904: 3). These stories came from all kinds of sources – fables and folklore, bestiaries, lives of saints, historical manuals, and personal experiences – and comprise the greatest variety of legends and miracles and contemporary anecdotes. In other words, common knowledge (consisting of vulgar history, myth, and everyday life experience) was appropriated in sermon form to change how people behaved.

A further effect of formally ritualizing public discourse was that popular preachers had to work hard to get attention:

In order to hold the attention of the people the preachers found it necessary to be entertaining, as well as simple and direct, and to make abundant use of marvels, anecdotes, and pointed illustrations from everyday life. If his audience showed signs of nodding, the speaker would begin, "There was once a king named Arthur", or shout suddenly, "That fellow asleep will not give away my secrets". (Haskins, 1904: 3)

The recently coined attention economy is merely a new expression to describe what happens when people

develop an indifference to time-worn rituals of public exhortation, when common experience and tradition are appropriated, recontextualized, and redirected at their popular source in order to meet the pedagogic demands of power. Medieval university chancellors were typically distinguished preachers (Haskins, 1904). No surprise, then, that around this time, knowledge begins to get confused with power in a formal sense. The illusion persists to this day in Bacon's widely cited dictum: "Knowledge is power." However, there is no such identity. Knowledge is not power. The ability to convert one's words directly into the actions of others is power, hence, the etymology of dictator and authoritarianism. What counts as knowledge has, since recorded history, been defined by those in power. For the largest part of human history, power has been claimed by a religious elite. Curriculum has been developed accordingly.

Although the Roman church had formed a recognizable hierarchy within a generation of its inception, its earliest writings already evidence a rebellion against the elders concerning the gifts of knowledge supposedly handed down by Christ (Bernier, 1992: 54–55). From its earliest stages, the institutional hierarchy of the church developed powerful forms for the control and dissemination of knowledge, including liturgies, sermons, and various sacramental rituals which endure to the present day (Bernier, 1992: 55–56). The scholastic method of presenting knowledge reached its apotheosis in the *Summa Theologiae* of Thomas Aquinas in the thirteenth century (Makdisi, 1974: 642). However, as Makdisi points out, "one must distinguish between the outer, external technique of presentation," which was organized into parts, questions, and articles, and the inner spirit of scholasticism, "of which the technical schema is merely the vehicle" (Makdisi, 1974: 643–645).

Which is to say: genres of official knowledge are also kinds of media. The more ephemeral texts deployed within them, and the more enduring institutional discourses that are produced, reproduced, and expressed by them, are the mutually constraining boundaries within which official curriculum develops and is disseminated. It is within institutions of power that the media of power are developed, in all their generic forms. What is a far more important and perhaps interesting aspect of the scholastic genres is that "it was not philosophy, not theology, but *law*, which supplied the most basic constitutive element" of a mode of expression that was "both a method of presentation and a way of thought" (Makdisi, 1974: 642). Scholasticism had both discursive and generic aspects; it was various mixtures of institutionally developed meanings, as well as their genres of expression. But the methods of law – formulating prescriptions for behavior and organization – were at the root of its development. Religion, politics, education, and the law became mutually defining institutions. From the institutional complex that

emerged from medieval theology came the rise of scientific method, an ever-uncomfortable Darwinism, the eugenics of Spencer, Galton, and Lamarck, and the disciplines of modernity which continue to multiply, mitigating against complete knowledge at every step.

Industrialism and Beyond: The Secular Theology of Price

As we have shown, formal curriculum has been shaped by religion since its historical emergence. The enlightenment was supposed to have changed all that. But many works, such as Callahan's *Cult of Efficiency* (Callahan, 1962), outline the secular mysticism that has transformed Western organs of education over the last century along the lines of business values – namely, the price system. The price system provides its own suite of moral imperatives, particular approaches to reason and representation, truth and text, as well as liturgy and law, generating a philosophical and institutional matrix for teaching and learning that serves a dominant belief system which reduces everything – beginning with human lives – to money. The current mysticism displays the same sense of theological certainty as was given through God's Holy Word to Muslim, Christian, and Jew, maintaining the schism of a rationally conceived world separate from the experience of teachers and learners alike.

Descartes' philosophical distinction between mind and body embedded a dualism between a knowable world and knowing learners, reifying a foundational space upon which superstitions have continued to underpin educational and scientific practice. Descartes' dualism privileged superstition, rendering embodied experience – literally common sense – unknowing and problematic. All Western curricular frameworks, sacred and secular, embody this principle: that only specific forms of knowledge which support the official mysticism *du jour* are considered valid and eternal. The phenomenology of quotidian experience, morality, and sociality, has no official validity, except as data to be recontextualized within the official framework of the day.

There are at least two reasons for the need to rethink the basis upon which curriculum is theorized and developed, given its almost universally religious foundations. The first is that recent empirical work in a number of disciplinary areas – neuroscience, cognitive psychology, linguistic and cognitive science, and quantum physics – has shown that any ontological separation between knowing and being is no longer tenable. Following this, Lakoff and Johnson (1999) argue for empirical responsibility in philosophy (p. 552). In turn, we argue for empirical and ethical responsibility in curricular theory. This call for ethical responsibility derives from the second reason for the need to rethink curricular precepts: the increasing global dominance of Western technocratic epistemologies

and the concomitant misalignment of knowledge cultures within a global knowledge economy dominated by the superstitions of the price system. It is a truism that occidental assumptions about people and their metaphysical and material relations to reality differ from oriental ones (Shen and Van Doan, 1995). The problematic place of indigenous beliefs and knowledges within new intellectual property regimes similarly indicates a need for genuine and deep engagement on the part of curriculum specialists with different modes of knowing, different belief systems, and different value systems (Reagan, 2005).

The ethical imperative for curriculum theory in a globalized knowledge economy also signifies a historic opportunity for the field: an opportunity to define the meaning of education as its own end and to define what a system thus oriented would look like; a chance to move from curriculum *occludere* to curriculum *vita*, the potential for education dominated by the needs of the people rather than by the dictates of price, prince, prophet, or Pope; to a system dedicated to the valorization of human potentials, understanding, and flourishing, rather than the principles of some occult agency as interpreted by a privileged elite. Such ideals are a distinct possibility given the emergence of a global knowledge economy, a system that seeks to embrace and commodify every aspect of a human being. But to do so, it must first render the full scope of those potentials visible. As a consequence, and however accidentally, glimpses of the fullness and diversity of human knowledge are coming into clearer focus every day. In this accidental view lies the potential to truly understand and learn from each other, and it is only in full view of humanity, we argue, that the ethics of truly enlightened curriculum development can be enacted.

Gender and Curriculum

Glossary

Hegemonic masculinity – An idealized form of masculinity that reflects normative ideologies regarding male power and dominance.

Heteronormativity – The reinforcement of ideologies, norms, and practices relating to the belief that heterosexual relationships between men and women are normal and natural and that homosexual and bisexual relationships are, therefore, aberrant.

In September 2000, the United Nations, World Bank, and the Organisation for Economic Co-operation and Development (OECD) developed a set of eight Millennium Development Goals (MDGs), which all 191 United Nation Member States have pledged to meet by 2015. The third of these MDGs aims to promote gender equity and empower women; the targets include improving the ratio of girls to boys in primary, secondary, and tertiary education and extending the ratio of literate females to males. Substantive work needs to be undertaken to meet these targets, and experience from those countries that have enjoyed gender equity in relation to access for education for some years (primarily in the developed world) suggests that even when equal numbers of girls and boys are attending formal education, there are still significant disparities in relation to issues of gender and curriculum that have implications for employment and standards of living.

Curriculum, which in etymological terms means a course to be run, is a concept that refers to both the taught elements of a program and the hidden values and messages that underpin that curriculum. In this article, the focus is on the taught elements of the program in schools and how they are predicated on implicit assumptions and hidden values regarding gender. The selection of knowledge that takes place in any construction of a curriculum is shaped by the wider social, cultural, political, and historical context. A particular curriculum does not simply mirror society's values, but also transmits those values and ideologies that are located within the domain of the dominant classes. In relation to gender, there are two key areas that need to be considered. The first is the relationship between gender, power, and knowledge in the construction of the curriculum and how this shapes the formation of school subjects. The second is that of gender and access to the curriculum and the way in which choice operates within curriculum delivery

and take-up. Both of these areas are addressed, in addition to more recent work on gender, sexualities, and curriculum.

This article is written from a theoretical standpoint that recognizes the relational nature of gendered identities. That is, it is acknowledged that gender is socially constructed and the categories of masculine and feminine are developed in relation to one another. As Francis (2000) suggests, "there is one (notional) masculinity and one (notional) femininity constructed as oppositional to one another, and consequently shifting, but flexible, and incorporating contradictions" (p. 15). The shifts, contradictions, and flexibility, therefore, can account for the diverse range of hegemonic and nonhegemonic masculinities and femininities that are constructed and performed by individuals. It is also important to note that gender does not work in isolation from other vectors of identity. Race, socioeconomic status, physical ability, sexuality, and other aspects of identity interact in complex ways and, therefore, any analysis of the curriculum that focuses on gender should acknowledge the interrelatedness of these elements.

Gender and the Construction of the Curriculum

The distinctions and disparities between the schooling of males and females have been apparent since historical records of education began to be kept. Rousseau's (1911) account of education, *Emile*, in which Sophie's education is marginal to that of her fiancé's, characterized, aptly, the fact that the schooling of females has been relegated as second in importance to that of males for hundreds of years. However, as this article is concerned with explicit curricula as defined by educational institutions, the analysis will be confined to the twentieth and twenty-first centuries. It is acknowledged that formal schooling took place in various forms prior to this; however, it was only at the advent of the twentieth century that curriculum studies, as a subset of the field of education, began to take shape and, thus, a study of gender and the curriculum emerged.

Curriculum theorists in the early twentieth century were not overly concerned with issues of gender and it was only with the advent of second-wave feminism in the 1970s and 1980s that the way in which the curriculum was inherently biased toward male interests began to be systematically documented. Texts such as those of de Beauvoir (1972) and Oakley (1972) were central to feminist moves to challenge the patriarchal nature of school

curricula. The development of formal schooling since the Enlightenment had been built upon the assumption that the highest forms of knowledge were decontextualized, rational, and not based on emotional or personal experience. Thus, subjects such as science and mathematics that were perceived to be based on reason and objectivity became equated with hegemonic masculinity. A Cartesian dualism, which purported a disjuncture between mind and body and disparity between technical rationality and the uncertainty of emotions, began to take hold in relation to school subjects. A hierarchy of subjects emerged, with science and mathematics, equated with masculine virtues and values, placed at the top of the pinnacle. From the earliest days of universal schooling in developed countries, there existed a sharp dichotomy between perceived interests of men and women and their psychological orientations to learning, which shaped the school curriculum in profound ways.

Much of the work on gender and curriculum in the second half of the twentieth century was concerned with identifying and analyzing these conflicting and competing epistemologies. Harding (1987) suggested that in the initial stages of critiquing andocentric forms of knowledge, feminist empiricists worked on the belief that experience is the basis for knowledge and that sex bias can be removed from research tools and processes in order to produce nonsexist knowledge. In contrast, in work that originated from a feminist standpoint epistemology, the issue was not about whether biased research methods were responsible for sexist assumptions and knowledge, but about acknowledging the way in which one's everyday experience informed one's viewpoint. Thus, the everyday experience of women meant that they had an understanding of the way in which sexism operated, and these experiences shaped the construction of knowledge. In this model, people who face oppression of any kind, including oppression due to gender, race, sexuality, and/or disability, are able to identify how such oppression works because of their experiences. Standpoint theory was thus also adopted in relation to other ways of knowing such as black feminist standpoints. Feminist standpoint epistemologies therefore countered andocentric knowledge by celebrating women's ways of knowing (Belenky *et al.*, 1986) in terms of curriculum development. Following this work, which indicated that there were differently gendered ways of viewing the world, research developed that looked, in greater detail, at the relationship between schooling and society and promoted critical approaches to concerns of gender equity. A large number of initiatives took place during this period in an attempt to change the construction of school subjects in order to produce antibias curricula.

In the later decades of the twentieth century, feminist poststructuralists challenged the rationalist Enlightenment view, which suggested that there was one solid version of reality that could be examined and understood, and

purported that there are multiple realities that exist alongside each other, with the implication that knowledge is therefore perspectival. In relation to curriculum studies, feminist poststructuralism led to an emphasis on the multiple positionings that learners might have and explored the interrelationship between gender and other aspects of identity in the experience of schooling. The relationship between power and knowledge was critiqued in the light of work on multiple gendered identities (Paechter, 1998, 2000). Postcolonial feminists challenged the othering of black and ethnic minority girls and women in the curriculum and pointed to the colonialist nature of much of the knowledge valorized in schools (Asher, 2005). This work, in turn, pointed to the necessity for critical self-reflection by both teachers and learners if curricula were to offer space for the deconstruction of ideologies and actively engage learners in the Freirean process of conscientization in which the processes of political, economic, and social oppression are laid bare.

Much of the scholarly work on curriculum and gender in the latter half of the twentieth century centered on the nature of the subjects such as science, mathematics, and technology that were perceived to be masculinist in nature. The lack of attention to the work of female scientists and mathematicians was pointed out, in addition to the ways in which these subjects focused on male concerns and interests. For example, practical examples and illustrations in science often started from typical male experiences; mathematical calculations were usually made in relation to objects, not people. It was thus argued that the relationship between power, knowledge, and gender was one that privileged masculine ways of knowing so that the various curricula reflected individualism, competition, depersonalization, and atomization of knowledge.

Attention was paid to the resources used in science, mathematics, and technology curricula in order to trace the delegitimization of female interests and practices. Textbooks are key educational artifacts in the selection, organization, and transmission of official knowledge; mathematics and science textbooks were identified in this period as being inherently sexist in their portrayal, or the lack of it, of females. Texts relating to other subjects were also identified as regurgitating stereotypical representations of gender. For example, early reading primers were found to be replete with images of women as homemakers and men as breadwinners, with the former portrayed as active in literacy practices and the latter less frequently engaged with written texts (Luke *et al.*, 2003). History textbooks marginalized and misrepresented the history of women and fostered colonial ideologies. Books used in the geography curriculum were both racist in their portrayal of different cultures and sexist in the ways in which they marginalized women, with the emphasis on physical rather than social geography exacerbating this tendency. The language of textbooks was also

analyzed in order to determine the ways in which sexism was inscribed in choices concerning vocabulary and syntax. The work conducted over this period on textbooks, artifacts, and other resources was central to establishing the material culture of gender stereotyping and identifying the marginalization of girls and women in the fabric of schooling.

The analysis of curricula during this period also led to an understanding of the way in which the hierarchies between subjects were both gendered and classed. For example, subjects with the highest status, such as science and mathematics, developed more coherent curricula that were adopted across schools, including boys', girls', and coeducational schools. Moves to introduce what were perceived to be feminine forms of these subjects, such as domestic science, were resisted by girls' schools that served the middle classes because it was recognized that this would disadvantage female school leavers, given that the masculine forms of the subjects would always be viewed as enjoying higher status. However, lower-status subjects were permitted to adapt their curriculum to cater to the perceived differences in the needs and interests of boys and girls (Paechter, 1998). For example, physical education developed distinct sports that were targeted at the different genders, such as gymnasium for girls and competitive outdoor sports for boys. Working-class children were channeled into more vocational subjects such as beauty therapy and woodwork that offered highly gendered curricula. During the later decades of the twentieth century, therefore, awareness was raised about the ways in which the curriculum both reinforced sexist stereotypes and (re)produced gendered subjects.

This was an intensive period for such analysis, influenced in some ways by the formation of gender studies as an academic discipline within higher education, a move which sought to further dissolve the boundaries between disciplines to challenge male-dominated traditions. The work during these decades was, by and large, a modernist project that sought to identify the extent of the problem and redress the balance in schooling in order to develop equitable curriculum practices. Toward the final years of the twentieth century, however, an alternative, transformative agenda was set by feminist poststructuralists and others who stressed the need to challenge the very foundations upon which curriculum studies were built. The advent of progressive reconceptualist curriculum theories led to the questioning of normative assumptions regarding the construction of knowledge and began to shift the focus toward the development of insider epistemologies and narrative inquiry as foundation for the curricula.

Poststructuralist feminist moves to challenge the gendered constructions of the curriculum were met, during the later years of the twentieth century, with a plethora of texts that created a moral panic regarding boys and underachievement, texts that Mills (2003) has labeled backlash

blockbusters. While the underachievement of boys in languages and literacy was not a new phenomenon, as it has been traced as far back as standardized assessment will allow, it became a prevalent discourse in the educational sphere and attention turned to the perceived feminine nature of the arts and humanities curricula. It was argued that language and literature curricula primarily focus upon narrative genres, and the emphasis is on producing personal responses to literature, neither of which is in line with the interests of boys (Millard, 1997). Nevertheless, both the evidence used to identify the underachievement of boys and to define language and literacy curricula as feminine in nature have been contested, with emphasis placed on the fact that socioeconomic status is a more significant factor than gender in underachievement. However, these exhortations to engage critically with the boys and the underachievement debate have been overlooked in the move to remasculinize education in neoliberal times, which has seen an increasing emphasis on masculinized discourses of technical rationality and a marginalization of gender equity issues (Arnot and Mac An Ghaill, 2006).

Gendered Access to the Curriculum

In addition to the content of the curriculum being highly gendered in nature, the way in which the curriculum is organized in formal education can affect how females and males take up or reject subjects. This is the case from the early years of schooling. In many nurseries and elementary classes, girls and boys have taken up different areas of the curriculum with more or less enthusiasm, with boys frequently orientating themselves to particular activities such as block play or outdoor play and girls electing to undertake activities such as sociodramatic role-play or art. Children in the early years of schooling have been found to have already-constructed normative discourses about gendered identities (Davies, 1989), which need to be challenged by educators in the development of curricula that offer children spaces in which to explore their multifaceted identities.

In countries that have introduced national curricula with specified subjects that are mandatory up to a certain level, there is greater gender equity in relation to subject participation. As soon as an element of choice is introduced, females and males begin to choose different options. Girls are less likely to choose science and mathematics when choices are available and, when they do opt for these subjects and succeed in them, their achievement is often viewed as the result of hard work rather than natural aptitude. Boys have traditionally been less likely to opt for subjects related to literature and languages. The way in which schools offer subject options can impact gendered curriculum choices. For example, if the

timetabling of options juxtaposes traditionally male-dominated subjects with traditionally female-dominated ones, there is likely to be a differently gendered take-up of subjects along stereotypical lines. A key difference in the study of subjects that lie outside of normative choices appears to occur in single-sex schools. While single-sex schooling appears to make little difference in terms of attainment, pupils who attend single-sex schools are more likely than their co-ed counterparts to choose subjects not traditionally associated with their gender.

It is not just the range of subjects offered that can shape differently gendered patterns of engagement, but also the ways in which educational institutions privilege masculinized subjects in terms of time and space allocation which affect the level of importance attributed to them. Mathematics, science, and technology, for example, all traditionally conceived as masculine subjects as suggested previously, are allocated both extended time within the curriculum and additional space in schools in order to accommodate laboratories and workshops. In contrast, subjects such as modern foreign languages and dance that have conventionally been perceived as feminine are marginalized both in terms of curriculum time and physical provision (cf. Paechter, 2000).

The way in which the construction of physical education curricula determines gendered participation in that subject has been widely documented. For example, gender as a physical embodiment becomes paramount in a subject in which males and females have, traditionally, been guided toward different sports depending upon assumptions about strength and stamina. Traditionally, more boys than girls have chosen to undertake outdoor sports, with the higher levels of competition, discipline, and regimentation apparent in this arena of male-dominated activity. Physical education has thus become a site for the performance of the gendered body and display of hegemonic masculinities and femininities.

It is, perhaps, in the area of vocational education and training (VET) that we see the most distinct forms of cultural, gendered reproduction occurring. The way in which vocational education is structured normally leads to distinct patterns in curriculum choices of girls and working-class boys, with patterns in many countries also reflecting ethnically defined choices (Rodgers and Boyer, 2006). Patterns in gender segregation in labor markets remain largely unchanged over the last 30 years and this is reflected in the choices males and females make in VET. The curricula of VET perpetuate gender dichotomies in that courses focused on the caring professions (nursing and childcare) emphasize affect and the importance of self-sacrifice, while male-dominated training (construction and manufacturing) focuses on rationality, objectivity, and instrumentalism (Colley *et al.*, 2003).

Intervention projects that have sought to address some of the barriers to curriculum participation have achieved varying degrees of success. Single-sex groupings can lead

to enhanced confidence in girls and enable them to engage in nontraditional curriculum activities. Mixed-sex activities can provide opportunities for male pupils to listen to and learn from the experiences of their female peers. Interventions are more likely to be successful when they are integrated into whole-school approaches that mainstream a commitment to gender equity. Success is also more attainable when curriculum development is linked to pedagogical changes so that more inclusive and democratic practices are promoted. The political shift in neoliberal times to a focus on boys and underachievement has seen a concomitant change in approaches to intervention projects. While the developments of the 1970s and 1980s that sought to entice girls into studying mathematics and science were conducted in an environment that focused on gender equity and paid attention to the needs of boys, more recent projects designed to orientate boys to languages and literacy have often marginalized girls and privileged masculine discourses, reinforcing stereotyped assumptions and essentializing gendered identities in the process.

Masculinities, Femininities, Sexualities, and Curriculum

In recent years, issues of multiple identities have risen to the fore in considerations of gender and curriculum. This work has sought to engage with the variations within gender categories, stressing the fluidity of category boundaries and the multiple positioning of individuals along the male–female continuum. This has necessitated feminist scholars engaging with conceptualizations of masculinities in an attempt to analyze the way in which gender as a category impacts educational experience. As the examination outcomes of girls have improved, there has been increasing attention paid to the way in which constructions of hegemonic masculinities work in opposition to notions of achievement and attainment in schools. The notion of laddishness (Jackson, 2006), the deliberate construction of resistant masculinities, has been advanced as a part-explanation for this male conflict with normative educational discourses. The work on masculinities has been valuable in further strengthening the understanding about the complexities of identity work and the relationship between structure and agency in the formation of gendered identities. Alongside this work, consideration has been given to multiple femininities, with acknowledgement that the relationship of girls with traditional gendered identities is complex and can be both compliant and transgressive. This has challenged stereotypes surrounding the compliance of girls in classrooms and led to a range of work that has illuminated how some girls work actively to destabilize academic identities, leading to alienation, underachievement, and even exclusion.

Drawing primarily from Foucauldian concepts of the relationship between power and knowledge, gender studies in recent years have sought to identify ways in which the embodiment and performance of gender can be traced in classroom discourses. Butler's (1990) insistence on gender as a citational practice indicates that the ritualized performances of what it means to be inscribed as male or female can be identified in the daily transactions of classroom life. This relates to the curriculum in a number of ways. If students are not challenged to question these norms, through the development of curricula that enable them to deconstruct normative gendered practices, then such practices produce idealized notions of gender that serve to further reinforce partial knowledge. In addition, a curriculum that fails to acknowledge the nature of multiple, fluid, and performed gendered identities is likely to silence those pupils who sit on the margins of classroom life and lead to pedagogical practices that promote alienation and the othering of difference. Recent work in gender studies and curriculum has, therefore, further problematized the relationship between curriculum and pedagogy and illuminated the way in which they work together to create the illusion of stabilized gendered identities.

There have been other developments in curriculum theory that relate to a consideration of issues of gender within the curriculum. Developing out of the work of a number of progressive reconceptualist curriculum theorists, the queer studies movement in education has challenged the heteronormative construction of the curriculum in which gender and sexuality are correlated in unproblematic ways (Pinar, 1998). This work has sought to disrupt the notion of heterosexuality as a secure category and indicated that the curriculum needs to incorporate work on constructions and performance of sexual identities. Attention needs to be paid to the way in which heterosexual practices and values become naturalized within curricula. Particular subjects have received more detailed analysis in this work than others. For example, physical education has been identified as an intensive site for heteronormative work, given the relationship between sexuality, gender, and the body. Compulsory heterosexuality is reinforced in a subject in which physical prowess is related to hegemonic masculinity. The study of literature offers more potential for the exploration of queer identities, although this is achieved in spite of, not because of, the official curriculum as gay, lesbian, bisexual, and transgendered readers reinscribe themselves into texts (Vicars, 2007). What is needed is the inclusion of texts that speak about the lives of marginalized pupils in the curriculum. In addition, the role of sex education in challenging prejudices and enabling self-exploration in relation to sexuality has been considered, and Britzman (1998) has argued that the subject should not simply reflect on issues relating to sex, but should also consider how knowledge about sexualities is constructed. There is still work to be done in relation to other curriculum subject areas, but the emergent

work on queer theory and curriculum has highlighted the need to trace, in close detail, the normative discourses regarding sexuality that are embedded within the development of curricula.

Conclusion

The place of gender within curriculum studies has developed considerably since the early years of the twentieth century. However, it continues to be an aspect of curriculum theory that takes place on the margins and needs to be central to the field as it moves forward. There are a number of areas that need attention in the years ahead; among them are issues relating to gender and curriculum in the developing world. As countries within the United Nations move toward the MDGs, it will be important to monitor how questions relating to gender and curriculum are addressed. In addition, while the progressive reconceptualist curriculum movement has challenged heteronormative constructions of the curriculum in recent years, there is still work to be done in further exploring the intersections of gender, sexuality, race, and class as they are inscribed in and by the curriculum. Further, there are aspects of gendered identities that are still to be examined in any depth in relation to curriculum studies. For example, the exploration of gender within the field of disability studies has not extensively explored the implications of that work for curriculum theory, neither has there been sufficient attention paid to the experiences of other marginalized groups such as women refugees, asylum seekers, and travelers. Finally, as the field of gender studies within social sciences develops, there will be further iterations of theories relating to the construction, embodiment, and performance of gendered identities that will have relevance for schooling. The future of gender and curriculum studies is one that will continue to be significant to the field as a whole, for it is in the reconceptualization of the curriculum in the light of multiple gendered and sexualized identities that questions regarding relevance, equity, and the nature of schooled knowledge itself become most salient.

Local Teacher-Based Curriculum Development

M D Osborne, University of Illinois at Urbana–Champaign, Champaign, USA

H B Barker, Regis University, Denver, CO, USA

The practice of organized, sanctioned, local teacher-based curriculum development – at least in the USA – is relatively new in public education. While the present view of teaching, especially at the elementary level, is that it is an interpretive act in which the teacher creates curriculum with each enactment; this is not the same as saying that teachers purposely and deliberately develop curricula – lay out the scope and sequence of the things that will go on during the school year in their schools and classrooms. In addition and most likely, in this age of national standards and outcomes followed by high-stakes achievement tests, teachers still are not asked to do this. They are, however, more and more frequently expected to develop the local, concrete, and connected expressions of national or state expectations. This is important, for it is what makes the abstract list of national standards or outcomes relevant and connected. It is this which makes the mandated curriculum teachable and actualizes educational reform – described at the policy level – in the classroom.

Philosophically, local teacher-based curriculum development is a practical restatement of a Deweyian educational principle – that to teach the abstract goals and values at the core of curriculum, it needs to be translated to the immediate and local, an activity that only the classroom teacher can carry out. This is based on the premise that learning is local and particular and learners construct knowledge in a much more holistic and experiential fashion than can be assumed by the preconstructed texts, worksheets, and basal readers typical of purchased curricula. To foster meaningful learning, teachers connect the differing experiences of individual learners and the abstract curriculum goals by reconstructing these goals into local curriculum. Understanding how their students think as well as what they know, teachers use an array of techniques as well as their own experientially shaped professional wisdom to build on and with the knowledge, ways of knowing and worldviews of their students. This more complex approach to teaching requires that teachers combine deep knowledge of subject matter and a wide repertoire of teaching strategies with intimate knowledge of students' growth, experience, and development. The move to acknowledge this and organize this process began in the USA with the postmortems conducted around the failures of the teacher-proofed curriculum of the 1960s and 1970s. In Great Britain, it crystallized in the work of Lawrence Stenhouse, in 1980.

History and the Professionalization of Teaching

The 1960s and 1970s were years in which the greatest efforts in the USA, and abroad, were made to reform education through curriculum materials. These curricular materials were produced by national organizations with unprecedented levels of funding (Darling-Hammond, 1996). The curriculum committees were comprised of experts from the disciplinary fields (as well as the occasional teacher) (Bruner, 1960/1977). Holding to the curriculum model of researchers such as Tyler (1949), educational experiences were selected and developed to attain objectives agreed upon by the expert curriculum committees. The effects of teachers translating the curriculum – with the assumption that this meant diminishing the curriculum – was purposely sidestepped through policy statements warning administrators to watch for and correct this tendency, extensive teacher manuals on implementation, workshops aimed at inducting teachers into correct ways of teaching the materials, and even scripted lessons. The results – whether disciplinary or equity driven – were not very positive, especially measured relative to the goals of the curriculum developers (e.g., Stake and Easley, 1978). In retrospect, this failure was attributed to the lack of acknowledgment of the role of the teacher both in forming the curriculum and in actualizing it. This set the stage for the present environment of organized, local teacher-based curriculum development.

The situation of education in the 1980s in the USA was shaped by two important sets of policy reports – the publication of *A Nation at Risk* in 1983 and the publications by the Holmes Group, the Carnegie Task Force of Teaching as a Profession, as well as other policy groups and teacher unions arguing for an acknowledgment of teaching as a unique professional activity with consequent public professionalization of teaching as a career. *A Nation at Risk*, in the USA, and similar studies and documents, in other countries, argued for an increase in academic standards and rigor in public schools. This initiated the development and implementation both of national and state disciplinary standards. Unlike *A Nation at Risk* – that called for greater external determinates of school curriculum – the Holmes Group and other reports on professionalization of teaching argued that the improvement of schools would come through increasing the status and power of classroom

teachers and by decentralizing school decision making. From then on until the recent policies such as *No Child Left Behind Act* (2001) came into play, the call was for the empowerment of teachers to participate in a central way in the determination of school goals and policies, and to exercise their professional judgment with regard to the content of the curriculum and means of instruction.

To reconstruct teaching as a formal profession analogous to other people-helping professions, such as social work or nursing (Stronach *et al.*, 2002), meant codifying the responsibilities of the teacher and constructing a framework for enabling and rewarding these professional activities. Most efforts in this regard focused upon pedagogy, and the resulting reward structures and professional certifications such as National Board Certification in the USA have endured. Similarly, the recent manifestations of local teacher-based curriculum development are linked to arguments around the professionalization of teachers. In other words, defining curriculum making as a teacher province has political overtones. The groundbreaking book *Teachers as Curriculum Planners: Narratives of Experience* by F. Michael Connelly and Jean Clandinin published in 1988, argued that curriculum development and planning were fundamental activities for teachers (Connelly and Clandinin, 1988). Since then, images of local teachers gathered together to write curriculum has become central to most current visions of the implementation of reforms of education in school – whether driven by disciplinary questions or those of social justice.

Discussion and Issues

This has fallen out in a number of ways, however, and, as an example, we describe two contrasting school districts we have worked with during the late 1980s through the 1990s as part of a larger set of studies on teacher-based curriculum development. In one, town X – with a heritage of libertarianism – until very recently had no curriculum, or rather there were no books or district-wide programmed course of study. Instead, there were lists of things each teacher was expected to cover and, finally, there were the state achievement tests to make sure they did. Each teacher was responsible for coming up with materials, activities, lesson plans, approaches, etc. – whatever was needed to achieve the goals. In town Y – which is next door to town X – there was a much more top-down approach. Here, there were the same lists of goals and outcomes but the administration organized teams of teachers to either evaluate commercial curriculum units and purchase them or to develop curriculum themselves. For example, in science in the late 1980s, the teachers decided to develop their own curriculum. To do this, they applied for grants to fund an infrastructure to support curriculum writing. They visited other school districts engaged in

similar endeavors. They developed a model of what they thought the curriculum should work like and a plan to actualize it. They applied for more grants to fund the teachers writing the curriculum and to do in-service work with the other teachers in the district so they would know how to teach it.

Arguably, what we have described are two models of the profession. In town X, the teacher is assumed the professional and the definition of the professional is that they are able to construct curriculum. In the second example, there is a systemic tie of curriculum development to professional development. In other words, the professional definition of the teacher is not that they know how to construct curriculum. Rather, they get smart and figure out ways to get smarter and they do this together; and this becomes school and professional development.

The distressing thing is that, often and in their varied ways, these processes duplicated the development and implementation years of the 1950s to the 1970s. For example, town Y, in recent years – when professional staff development funds from the state ran low – ended up using their science curriculum similar to the older teacher-proof materials of the 1970s. In town X, enterprising teachers formed affinity groups; so teachers with an interest in social studies, as an example, got together and began study groups developing curricular materials and discussing pedagogical issues. These were wonderful where they existed but often teachers who did not or could not join these groups ended up secretly hoarding ancient textbooks and guiltily teaching from those. The net effect was to reinforce the professionalism of some, but to disempower and isolate others.

Both descriptions illustrate the good and the bad of local school-based curriculum development. In the process of curriculum development, teachers translated the abstractions of policy and standards to the particular and teachable. Moreover, this development role required teachers to reinvent themselves professionally. They became, in practical terms, individuals that reinterpreted curricular ideas – adapting them to suit local circumstances and becoming curriculum developers (Schwab in Westbury and Wilkoff, 1978). Skilbeck's (1984) model of school-based curriculum development describes a form of situational analysis as an important element in the process whereby teachers redesign the curricula they teach. This is central in current manifestations of local school-based curriculum development and how it is placed in school-reform enactment. The net outcome of these processes in the 1990s was to assert the role of teachers in the development of distinctive school profiles and the institutionalization of collectively driven school-improvement plans – both of which are still customs within American schools today.

This professional role in which teachers are engaging in interpretative acts of curriculum construction and are asking themselves and their peers to recreate their

practice is full of conflicts, however. These roles often involve assuming grass roots leadership functions frequently in tension with existing hierarchies and relationships within a school. Teachers assume agency in constructing their interpretations of a reform, and this agency is responsive to, and shaped by, their interactions with others. In the process, reform is interpretative with teachers not as sole reform actors, but relationally positioned in the process of enacting reform. As an example, we describe another school district we have had a long-term relationship with, Z. This vignette is from a series of larger studies conducted by the authors (Barker, 2000; Leander and Osborne, 2008).

In district Z, the teachers in the science committee came to us to help them rewrite their science curriculum. After they outlined their needs, we formulated a threefold approach – ongoing support while they developed and chose curricular materials, a summer science camp in which teachers worked out pedagogical issues, and classroom support while the teachers piloted the units.

The members of the science committee took the lead. The first time that grade-level groups met in the second year of the project, they spent at least half of an in-service day discussing and going through the national and state standards applicable to each grade level. All of the sets of standards state that the learning of science should be a process-oriented experience, promoting science content through inquiry skills, and that the focus should be on the doing and discussing rather than on memorizing specific science content and facts. However, instead of seeing that fact as a powerful reason to make reforms, many of the teachers questioned whether these entities (the standards and the curriculum and pedagogy) were aligned and whether or not curriculum based on them would achieve good test scores.

David was not an original member of the science committee and he did not participate in the summer science camp, but he did come to the first of the grade-level meetings for the third grade. Part of the reason for a change in curriculum and the discussion of the science curriculum, according to David, was a lack of communication between grade levels and within grade levels about what science was taught. The following exchange took place between David and other teachers at the grade-level meeting.

David: So, there are only four unit topics to be covered the entire year? Do you see them lasting a full nine weeks each?

Jennie: Well, there is so much material and the kids are loving it. I'm hoping that I can get it all done before I have to move on.

Gordon (who was the administrator in charge of curriculum for the district): That's the mentality that we have to get away from. Now it's time for Science. Now it's time

for Social Studies. We need to start thinking of the learning as a whole.

David: That's easy for you to say, but I switch with another teacher and am locked into a schedule. I suppose we could combine classes and I teach science every day for a half hour. Will there be enough to last a whole nine weeks?

Liz: It's a different approach. Instead of a smattering of subjects, we are going in depth on a few.

David: So it's like if you teach multiplication in third grade then you don't get it again until it comes up in high school? Once the subjects are taught they aren't covered again.

Liz: But now we are teaching things that aren't appropriate for some grade levels. This scope and sequence looks at the grade levels and it isn't the only time a subject is taught.

The teachers who answered David had already been piloting some of the units in their classrooms or had been a part of the summer science camp where they had tried out the teaching. David had had no experience with the new curriculum, but was concerned about how it would impact the way his classroom and the science curriculum he had been teaching worked. The new program directly challenged the way that he perceived his success in teaching was achieved.

David wanted to make sure that his goals for teaching met the expectations of his community, the state, his administrators, and, most importantly, that they delivered what he believed to be good science teaching. He wanted to know that his students came away from his classroom ready to go to fourth grade, ready to pass the standardized tests, and ready to understand some basic science facts and concepts. David was not convinced that the new curriculum would meet these expectations. At one point, he made a list of the topics covered on the tests to show us. "Think about it. If the tests are in early spring that means my class will have only covered two maybe three topics. That's not what the tests expect that we've covered." David was worried about the test scores and concerned about the amount of content, vocabulary, and time spent on each unit. He was also concerned about the bigger picture of the topics taught and the depth of the topics taught across the grade levels.

The curriculum development and dissemination as well as the distribution of leadership roles among the teachers in district Z did not occur smoothly or without conflict. To the inherent difficulties grass roots leaders in schools face, we would add the question of dissemination and enactment. There are personal and professional tensions between teachers and those actually engaged in curriculum development – hierarchies exist within the teaching community and school and often curriculum developers come into conflict with these and, even when

this is not so, there is a tradition of individuality in classroom teaching that school-based curriculum development comes to confront. Sarason's (1982) mapping of school cultures – including his important analyses of the sociopolitical positions of teachers – critically foregrounds the tensions teachers face within schools, including the ones we are describing. Sarason and others have also noted how it is just these tensions which impede the evolution and change of curriculum and pedagogy.

Summary

This story and the previous highlight many of the conflicts and concerns teachers feel while engaged in local teacher-based curriculum development. Key issues include obtaining the time, space, and funding to support the teachers, obtain materials, hire substitute teachers, and professional support. When engaged in the experimental (Stenhouse, 1980) portion of curriculum development in which new units and their pedagogies are tried out, teachers need classroom support and spaces of relaxed accountability so that they can become risk-takers. School-wide dissemination of teacher-developed curricula is also full of tensions and role shifts. Support structures are rarely in place for this portion of the process. Finally, professional development for teachers involved in curriculum development currently takes the form of programs such as *Learning by Design* (Wiggins and McTighe, 1998). This might possibly include a component of presentation of research into making the 'practical' (Schwab, 1978) practical that goes beyond the action research programs currently in place.

Introduction: Linking Education and Human Rights

Education is a global fact. Education systems, and especially school systems, worldwide follow similar patterns, for example, in the choice of school subjects, in processes of curriculum planning and development, in the defined aims and goals, as well as the forms and styles of teaching and learning. At the same time, of course, every education system has its own historical, economic, social, and cultural context with specific problems and challenges that must be taken into account in curriculum development processes. Nevertheless, there are also common goals and principles in education which are shared by a growing number of pedagogs and experts worldwide. Such common goals and principles can be found in the documents and declarations of world education conferences, for example, the two World Education Forums at Jomtien (1990) and then Dakar (2000), the Global Campaign for the Right to Education which was launched in November 1999, or the Decade for Human Rights Education of the United Nations (1995–2004). They continue to develop in the struggle for freedom and equality in education and for a world where human beings share a life in peace. It is in this context where human rights become an important tool because they define basic norms for all actors involved in education: teachers, learners, and parents, as well as all actors involved in administration and planning processes.

For more than a decade, human rights are becoming more and more powerful in the international educational discourse. To link education with human rights poses questions to the existing forms and structures of education systems, in curriculum planning and development, as well as teacher training and the review of learning materials and text books. This article focuses on the three core

dimensions which must be taken into account when rethinking curriculum development within the context of human rights and through the lens of human-rights-based approach:

- the right to education as it is enshrined in international human rights covenants,
- rights in education and in the processes of curriculum planning and development, and
- human rights education as a guiding principle for curriculum development.

All three dimensions share important concepts which also constitute our modern understanding of human rights. At the core lies the understanding of individuals – learners as well as teachers – as human beings free and equal in dignity and rights. Freedom rights involved in education are, for example, the right to freedom of expression and participation, religious freedom, or the freedom of parents to choose for the education of their child according to their own beliefs and cultural values. Equality rights call for an inclusive approach in education and curriculum development. They try to embrace each learner, respecting the principal equality of each individual as well as everyone's right to be different. In pragmatic terms, this means that all forms and stages of education (curriculum development, text books and learning materials, teaching and learning styles, languages of instruction, teacher education, to list some examples) must be adapted to the core principle of nondiscrimination – which in turn means inclusion.

To make curriculum development a powerful tool for the stimulation of these core concepts, it has to create a framework in which every learner is seen as a subject to human rights (and especially the right to education) while education serves the aim of developing the full potential of the personality, as well as respect and competences for

realizing human rights and the values enshrined therein. A curriculum (curriculum is defined as a running, course, career, and is derived from Latin *currere*) entails more than just the aims and goals of a learning process or a study course. In the following, curriculum development is therefore defined in a broad sense, not only spelling out contents of education but also focusing on the process of learning, the broader framework in which learning takes place (e.g., the context of the school, teachers, learners, and parents) and the aims and goals of the learning processes which underlie continuing changes worldwide.

Creating a Common Language: What Do We Understand by the Human Right to Education?

The right to education is an empowerment right. It is not only a right, protected through international covenants, but also a tool for claiming one's own rights as well as – in solidarity – the rights of others. The best basis for understanding the right to education is found in the context of the United Nations (UN) specialized organizations for the promotion and protection of human rights. Therefore, in the following, the main sources for explaining what it means to fully realize the right to education originate from the human rights bodies of the UN, especially the reports of the UN Special Rapporteur on the right to education.

Historically, education has developed from being a privilege for some into being a basic human right for all. In the framework of the modern development of human rights, after the end of World War II, education was defined as a human right for the first time in the Universal Declaration of Human Rights (UDHR) of the UN. Here, it is crucial to also understand the historical background of the time: the UN were founded in 1945 and declared the UDHR 3 years later in 1948. It was in the spirit of never again that the community of nations decided for a human rights project. Never again should the world experience as massive violations of human dignity and rights as during the time of the Nazi regime and World War II. Concerning education, never again should education be misused to penetrate values into learner's minds that propagate hatred, racism, and anti-Semitism. To the contrary, education should be a catalyst to promote the spirit of humanity, human rights values, and the goals of the UN for the promotion of peace and justice in the world. Consequently, curriculum development should encompass the notion of human rights.

At the time, when the UN declared the UDHR, it was not clear that this document would develop into a powerful tool. However, in the following years, "to the astonishment of many, human rights would become a political

factor that not even the most hard-shelled realist could ignore. The UDHR would become an instrument, as well as the most prominent symbol, of changes that would amplify the voices of the weak in the corridors of power" (Glendon, 2001: xvi). The Article 26 of the UDHR defines the human right to education and has hence been the basis for all other formulations and definitions to follow. It founds the universal basis for education, including curriculum development, and it defines standards for quantitative as well as qualitative aspects of education.

- (1) Everyone has the right to education. Education shall be free, at least in the elementary and fundamental stages. Elementary education shall be compulsory. Technical and professional education shall be made generally available and higher education shall be equally accessible to all on the basis of merit.
- (2) Education shall be directed to the full development of the human personality and to the strengthening of respect for human rights and fundamental freedoms. It shall promote understanding, tolerance and friendship among all nations, racial or religious groups, and shall further the activities of the United Nations for the maintenance of peace.
- (3) Parents have a prior right to choose the kind of education that shall be given to their children. (Franklin and Eleanor Roosevelt Institute, 2001).

The quantitative notion of the right to education is simply that everyone is entitled to have access to this right. Most importantly, this is directed not only to children but also to adults, who, in their earlier life, did not have the chance to receive education, to have the right to a basic education to be able to participate in society. The state must ensure that every child – no matter if girl or boy, poor or rich, black or white, enabled or disabled – is included in education. For curriculum development processes, this means that they should start with asking: Who is the target of the curriculum, which learning groups are included or excluded, and why?

The qualitative notion of the right to education concerns the learning contents as well as the methods and didactics of teaching and learning, which again bears consequences for curriculum development. To further explain the essential features of the right to education and to create a common language, basic criteria are established to lead the way to accountability and commitment in a global context. The first UN Special Rapporteur on the right to education, Katarina Tomaševski, developed the 4-A scheme which defines the core obligations to fully realize qualitative as well as quantitative dimensions of this right, namely availability, accessibility, acceptability, and adaptability (Tomaševski, 1999). She explains that "education operates as a multiplier, enhancing the enjoyment of all individual rights and freedoms where the right to

education is effectively guaranteed, while depriving people of the enjoyment of many rights and freedoms where the right to education is denied or violated” (Tomaševski, 2001: 7).

Availability

For education to be inclusive and equally available for everybody, functioning structures and institutions must be in place. Format and shape of these institutions are of course bound to the context, but some basic requirements have to be met like, for example, buildings, where education can take place, with sanitary facilities and hygienic drinking water. In addition, teachers should be able to receive high-quality training before they start teaching in schools or other learning institutions. The teaching profession should be valued and wages shall be granted accordingly. This also means that the status of professional educators must correspond to their international recognized rights, including their right to form trade unions. Finally, availability must recognize not only the parental choice of education for their children but also their responsibility to ensure that they go to school.

Access

Access to education is bound to its compulsory nature. All school-aged children must be granted access free from any form of discrimination. This entails at least two dimensions, namely that compulsory education must be affordable and that exclusion of children from education on the grounds of sexist, racist or homophobic criteria, gender, physical or mental ability, age, social or marital status, and family background is prohibited. Here, the right to education pays attention especially to disadvantaged groups of learners who often need the chance to compensate what they might not get from their families or communities. Some children might need special attention in education because they have learning difficulties which must be taken into account. They too have the right to be treated equally and not in special institutions. Consequently, all obstacles that reject children's access must be eliminated, such as costs for education (school fees, books, transportation, uniforms, and school meals) or conditions which keep children out of school because families are too poor or boys and especially girls have to work to sustain the household of the family instead of going to school.

Adaptability

Education must be adapted to the needs of the learners. Therefore, curriculum development must be a flexible, continuing process because requirements and challenges of societies are constantly changing. Every curriculum

must take the diversity of learners as well as their diverse backgrounds and needs into account. This may also include, for example, different cultural or religious backgrounds or the home languages of the learners which may be different from the dominant language or *lingua franca* of a respective country. For the analysis of the adaptability of education, criteria are required which also include out-of-school children. Here, government's reports to the human rights bodies of the UN revealed that more than 30 categories of children are likely to be excluded from and in education (e.g., children who need to work, child mothers or pregnant girls, disabled children, HIV-infected children, homeless children, street children, or refugee children). Furthermore, curriculum development must be evaluated on the basis of a sound analysis of the impact of education on human rights and human rights values. Curriculums must be designed to assist children (and their teachers) to fully understand their rights and freedoms and to be able to apply them.

Acceptability

Education must be acceptable in terms of its form and content. The acceptability of education includes important norms concerning the contents and methods of learning, which must be relevant, suitable, and of a high quality. Curriculum development, therefore, shall be in line with the foundations of the right to education, as cited above in the article 26 of the UDHR: “Education shall be directed to the full development of the human personality and the promotion of respect for human rights and freedoms” (Franklin and Eleanor Roosevelt Institute, 2001). Minimum standards are required for the teaching process as well as the learning process. Additionally, curriculum developers should strive to integrate human rights as a content as well as guiding principle for the learning process. Both elements – adaptability as well as acceptability of education – are often hindered through curriculum development if it is concentrating solely on the preparation of children for the next level of education, to which some children maybe unable to proceed in any case.

Human Rights in Education

The second dimension of the human-rights-based approach to curriculum development is linked to the rights of all actors involved (teachers, learners, and parents) and offers safeguards for the prevention of human rights abuses in education. The full realization of the right to education involves three key actors: (1) the child as the principal bearer of the right, who also has the duty to participate since education entails an interactive dimension between the teacher and the learner, (2) the parents who shall stimulate

learning in the home environment and who must ensure that a child has access to schooling, and (3) the government as the provider and funder of public schooling – including education and training of teachers.

Children's Rights

Children's rights cover the life span between the ages of 0 and 18 years. They are protected through a special convention in international law since children are the easiest victims of abuses of power by their parents, teachers, and/or governments. Special human rights norms for children are necessary because of young persons' vulnerability, since history has proven that parents and teachers often do not have the best interest of the child in their hearts and minds. Children's rights include, for example, health rights, their freedom of expression, their right to participate in all matters that directly influence their well-being or their right to be protected from any form of violence or discrimination. At the core of the UN Convention on the Rights of the Child (1989) lays the best interest of the child, which consequently also constitutes the cornerstone for all curriculum development processes. The child itself is the subject to rights, and this must be given priority in any educational planning and practice. To put the best interest of the child at the core of curriculum development requires considering children not as passive recipients of education but as actively involved. Children, in turn, have the duty to participate in education since only through the participation of both, teachers and learners, the interactive notion of the right to education can be put in practice. It still is a great challenge to make children legally the subjects of the right to education instead of objects of agreements between parents and schools. Schoolchildren often express that they feel it is their right to be consulted with regard to their own education. They could also be involved in curriculum planning and development processes.

Parent's Rights

As cited in the article 26 of the UDHR above, respect for parental freedom indicates that they are able to choose for an education for their child in accordance with their religious, moral, or philosophical convictions. Nevertheless, human rights law also provides prohibitions against indoctrination, abuse, or exploitation of children. The rationale behind parental choice is not to recognize their denial of their children's rights, but to assure that they can choose for an education which is relevant, suitable, and of a high quality. Curriculum development must therefore allow for a diversification of learning contents as well as for teaching styles to include the diverse perspectives and backgrounds of children and their families. Freedom of choice, in this way, prevents state monopoly over education and protects pluralism.

Teacher's Rights

Education cannot take place without teachers. Although recent developments have shown that technological support for education could offer a lot of learning possibilities like, for example, webucation or distance learning, the teacher makes all the difference; even more if we take into account that children (but also adults) to a great extent learn through example, imitation, and role models. The problems that teachers are facing range from their low status (in some countries), discrimination, low salaries, or the denial of trade union rights including their right to strike, to the protection of their professional and academic freedoms (e.g., freedom of expression, freedom of assembly, religious freedom, and freedom from discrimination). To make sure that educators are in a position to actively promote human rights, their profession must be valued. Like no other profession, the teaching profession supports the intergenerational dimension between children and adults, which is a great challenge. Teachers shall not only equip children with the competences and skills needed for societies today, but they must also bear in mind that as future adults they may need other skills than the ones currently defined. To put this intergenerational dimension in the words of the UN Special Rapporteur on the right to education: "The knowledge, skills and values that the generation of future adults will need in their lifetime is not only unknown but unknowable" (Tomaševski, 1999: 24).

Prevention of Human Rights abuses in Education

Human rights, like the ancient Greek figure of Janus, are double faced. While one face turns to the full realization of rights, the another points to massive violations worldwide, and the unfulfilled promises which human rights stand for in many parts of the world. Every right can be violated, and the right to education as well as the rights in education are no exception. Violations of fundamental rights range from the denial of equality, or the rejection of privacy and free development of the personality, to freedom from fear and violence. Schools must be a safe environment for both, teachers as well as learners. But although in the past decades physical punishment of children has been abolished in most countries of the world, humiliating treatment of children – whether through other children or their teachers – still remains an enormous challenge for the creation of a safe learning environment. The first and utmost priority of every education should be that children learn to enjoy learning and that they like to go to school without fears of being a target of bullying or discrimination. Human rights abuses often may lead to the opposite. The challenge for curriculum development is therefore to provide a sound basis for the prevention of human rights abuses and the provision of tools to enable learners as well as

teachers to realize human rights values in their interactions. Contradictory practices in learning contents may occur compared to the styles of teaching. In addition, school discipline may conflict with any human rights messages verbally conveyed. Curricula and school textbooks repeatedly reproduce sexist or racist stereotypes, for example, if women are portrayed as staying at home, caring for the children while men go out to work in the public; or if black people are portrayed in low-status jobs rather than in leading positions.

Human rights law puts utmost priority to the elimination of inequalities. Education can be used as a means to both maintain and eradicate stigmatization, discrimination, and exclusion. Separate educational facilities that promote selection and segregation of children have proven to be inherently unequal. This insight goes back to the decision of the US Supreme Court in the famous case of *Brown versus Board of Education of Topeka* (Judgement of 17 May 1954, see E/CN.4/2000/5, page 28). To the contrary, inclusive education provides examples of how all children can benefit if they are in a position to learn from one another, embracing the differences and the diversity of all learners.

Human Rights Education as Guiding Principle for Curriculum Development

The third feature of the human-rights-based approach to curriculum development is human rights education itself as a guiding principle. Since the beginning of the 1990s, an immense amount of literature and learning material has been developed – especially since the UN has launched the Decade for Human Rights Education (1995–2004). Since education operates as a multiplier and is a passkey for unlocking other human rights, knowledge of human rights should become a priority in education policies. Through this conceptual shift, education will be a keystone for self-sustaining livelihoods as well as an instrument for enhancing the enjoyment of all human rights and freedoms.

There are three core elements which constitute human rights education and which can guide the curriculum development process, namely learning about human rights, learning through human rights, and learning for human rights. All three dimensions can be portrayed in a human rights education learning cycle where one element builds upon the others (Figure 1). Every stage, of course, must be adapted to the particular learning groups, concerning their ages, their previous knowledge and experience of human rights issues, or their cultural or religious backgrounds.

Learning about Human Rights

Learning about human rights covers explicit acquisition of knowledge. Too often curriculum development reduces human rights knowledge to an implicit approach,

Figure 1 The cycle of human rights education – Learning about, for, and through human rights.

assuming that teaching about democratic values or civic education automatically includes a human rights dimension. This is rarely the case. Learning about human rights encompasses the history and development of human rights around the world. It includes knowledge about human rights conventions (civil and political rights, economic, social and cultural rights, children's rights, women's rights, protection against racism or degrading, and humiliating treatment), specific instruments and the various actors in the human rights field on the domestic as well as on the international level (government actors, intergovernmental actors such as the UN or the Council of Europe, nongovernmental organizations (NGOs), human rights defenders, and social movements). Besides internationally accepted human rights norms, knowledge about human rights also needs to be contextualized to the reality of teachers and learners. Here, it is important not only to reduce the teaching about human rights on a Eurocentric perspective but also to include important regional or local developments.

Learning through Human Rights

Learning through human rights incorporates human rights values and principles into the learning process itself. It enables children to experience the values of a community when the learning environment supports dignity of, and respect for, all individuals. As already stated above, methods and styles of teaching and learning may conflict with any human rights messages verbally conveyed. Therefore, it is of utmost priority that the learners are in a position to develop attitudes that help them to develop morally and prepare them for active participation in society.

Learning for Human Rights

Most probably, learning for human rights is the most complicated part of the learning cycle since it includes

the acquisition of skills and competences to respect and realize human rights and the values enshrined therein. Learning for human rights enables the learners to play an active role in shaping the community and/or society on the grounds of liberating, antioppressive strategies. Basic competences include communication skills, analytical skills, critical reflection skills, and problem-solving and cooperation skills. This part of a human rights curriculum may lead to children wishing to actively engage in human rights groups or to the stimulation of immediate changes in the learning environment, which sometimes poses great challenges to teachers as well as school headmasters or parents. Here, it is important not to frustrate children's expectations but to carefully interact with them and support them with their new ideas of transforming their direct environment to a world where human rights can become real.

To conclude, one could ask, if all curriculum development shall promote human rights education or if all education inherently shall encompass a human-rights-based approach. The answer is yes. There is a fundamental link between human rights and education. The right to education not only includes general guidelines on what has to be learned but also how to do it: with respect and in dignity. It provides core elements, relevant for all curriculum development processes, and it could inspire collective efforts for education as a tool for liberation.

Glossary

Additive bilingualism – A context in which both languages are valued, encouraged, and used in the teaching and learning process.

Bilingual education – An educational approach that uses two languages as media of instruction (i.e., subjects are taught in and through two languages).

Biliteracy – The ability to read and write (as well as speak) in two languages.

Immersion education – A form of bilingual education, where L1 majority language students are taught predominantly through an L2, usually a minority language, in order to become bilingual and biliterate in that language as well as the majority language.

L1 – The first language a person learns and uses in the family.

L2 – The second language a person learns, either in childhood or adulthood.

Language interdependence – The widely accepted view that the level of competence that a child attains in their L2 is dependent to a large extent on the level of competence already achieved in their L1.

Monolingualism – Using or knowing only one language.

Submersion programs – Where L1 minority language students are taught solely through a majority language in a society as an L2. Though often confused with immersion education, a form of bilingual education, it is clearly not, as eventual monolingualism in the majority language is its key aim and students' L1 is excluded from the teaching and learning process.

Subtractive bilingualism – A negative or deficit conception of students' bilingualism, where the students' L1 is seen as interfering with the learning of another language, rather than supporting it.

This article explores the curricular and pedagogical implications of teaching cultural and linguistic minority students. While a number of substantive fields – most notably, multicultural education and bilingual education – address this question in detail, they often do so from different directions and in relation to different audiences. It is not possible to address the multiplicity of debates engendered in and by these different educational fields. Accordingly,

this article is limited to an exploration of the bilingual education literature, and focuses, in particular, on the question of which educational approaches are most effective in relation to teaching bilingual students.

Before doing so, however, one needs first to clarify the term bilingual education. This is important because commentators employ widely different understandings of what such an education actually constitutes. At one end of the continuum are those who would classify as bilingual any educational approach adopted for, or directed at bilingual students, irrespective of their educational aims (fostering bilingualism or monolingualism) or the role (if any) of first language (L1) and second language (L2) as languages of instruction. In other words, simply the presence of bilingual students in the classroom is deemed sufficient to classify a program as bilingual. At the other end of the continuum are those who distinguish clearly between nonbilingual, weak, and strong bilingual programs. The latter analysis – now widely accepted – forms the basis of this article.

Defining Bilingual/Immersion Education

There are a plethora of existing typologies with respect to bilingual/immersion education in the research literature, although, as one might expect, they do not always correspond or overlap, depending on the initial starting point, and position of the researcher. Some of the most accessible and informed are summarized in Baker (2006).

Before unpacking the characteristics of bilingual/immersion education further in light of these typologies, however, it is useful to begin with a classic definition of bilingual education, first posited by Andersson and Boyer:

Bilingual education is instruction in *two languages* and the use of those two languages as mediums of instruction for any part or, or all, of the school curriculum. (Andersson and Boyer, 1970: 12, original emphasis)

Put simply, bilingual education involves instruction in two languages (see also Baker and Prys Jones, 1998). This immediately excludes programs that include bilingual students but do not involve bilingual instruction, most notably submersion majority language programs, where students are taught only in the majority language, irrespective of their language background. It also excludes programs where an L2 is taught as a subject only. English as a second language (ESL) classes, which include the

Sheltered Instruction approach that is increasingly popular in the US, are examples of this, as are foreign language classes. Along with submersion programs, they can also clearly be described as nonbilingual programs.

For a program to be deemed to be bilingual, the key is that both languages must be used as media of instruction and thus to deliver curriculum content. As Baker and Prys Jones (1998: 466) conclude: “If there is a useful demarcation, then bilingual education may be said to start when more than one language is used to teach content (for example Science, Mathematics, Social Sciences, or Humanities) rather than just being taught as a subject by itself.” On this basis, immersion models that teach majority language students predominantly through a minority language, such as French-immersion programs in Canada or Maori immersion programs in New Zealand, are also clearly bilingual programs, since some curricular instruction in the majority language (English, in both cases) almost always occurs at some point prior to the end of the program, even in those programs with very high levels of immersion in the minority language.

An additional key point addressed by many commentators in defining bilingual education relates to the philosophy and related educational goals of any given program. In short, does the program in question aim to achieve, foster, and/or maintain longer-term student bilingualism and biliteracy, adding another language to the student’s existing language repertoire, which has come to be termed in the research literature as an additive approach to bilingualism? Or does it eventually aim to shift students from bilingualism to monolingualism in the dominant language, losing or replacing one language with another, a process that has been described as subtractive bilingualism?

First postulated by Lambert in Canada in 1974, the additive–subtractive distinction is also useful for another reason. Research over the last 30 years has consistently demonstrated that those programs which are most likely to achieve bilingualism and biliteracy for their students – that is, additive bilingual programs – are also the most likely to see those students succeed educationally. In contrast, subtractive programs not only atrophy their students’ existing bilingualism, but also exhibit far lower levels of educational success for these students, particularly over time (see Baker, 2006; Cummins, 2000, see also below).

With this broad distinction between additive and subtractive bilingualism clearly outlined, the next level of classification of bilingual programs can now be made in terms of the specific linguistic and/or educational aims of particular bilingual education models. According to Freeman (1998: 3), models are defined in terms of “their language-planning goals and ideological orientations toward linguistic and cultural diversity in society.” They can be understood as broad categories that help us to understand on a very general level what bilingual education

means, although there is inevitably a degree of arbitrariness in distinguishing among them.

Despite the welter of different classifications of bilingual education in the research literature, there are three broad models of bilingualism that are consistently included in these various typologies. These are transitional models, maintenance models, and enrichment models of bilingual education. In addition to these three broad models, there are also what have come to be known as heritage models. These are most often associated with indigenous language education initiatives, such as Maori-medium education in New Zealand, Navajo language education in the US, Quechua language education programs in Peru, and Sa’mi language education in Norway, among many.

A transitional model of bilingual education uses the L1 of minority language students in the early stages of schooling but aims to shift students away from the use of their L1 as quickly as possible toward the greater use of the dominant language, in order to cope academically in mainstream or general education (Freeman, 1998). In other words, the L1 is used only to the extent that it facilitates the transition of the minority language (L1) speaker to the majority language (L2). Accordingly, most transitional programs are also early-exit programs, where the L1 is used for only 1–2 years, before being replaced by the L2, and can thus be regarded as both a subtractive and weak bilingual model. In assuming that the (minority) L1 will eventually be replaced by a (majority) L2, bilingualism is not in itself regarded as necessarily beneficial, either to the individual or to society as a whole. This in turn suggests that the eventual atrophy of minority languages, or the aim of moving eventually from bilingualism to monolingualism in the majority language, remains a central objective of transitional bilingualism programs. Until their recent demise in a political climate, largely antithetical to any kind of bilingual program, a transitional bilingual approach was most prominent in the US, where transitional bilingual programs were developed widely for Spanish (L1) speakers from the 1970s onward.

A maintenance approach to bilingual education, on the other hand, differs fundamentally from a transitional approach because it aims to maintain the minority language of students, strengthen students’ sense of cultural and linguistic identity, and affirm their individual and collective ethnolinguistic rights. As such, it is clearly an additive and strong bilingual model. There are many types of bilingual program that can be said to fit into this model and these will be discussed in detail later. However, the typical participant in a maintenance bilingual program will be a national minority group member (e.g., Welsh in Britain, Catalan in Spain, French Canadian in Canada, Latinos in the US), whose L1 is already developed to an age-appropriate level (although they do not need to be literate yet in the language). The language of

instruction of the program will either be predominantly in the L1 or, if both L1 and L2 are used as mediums of instruction, at least 50% in the L1. This is because the aim of such programs, as their designation suggests, is to maintain the L1 for a sufficient amount of time so that academic language proficiency in the L1 is achieved. This in turn facilitates the acquisition of literacy in an L2, on the basis of the developmental interdependence principle (see Cummins, 2000). Consequently, the most common programs in a maintenance bilingual model are late-exit programs – that is, the use of L1 as an instructional language continues for at least 4 years, often longer.

Closely related to maintenance bilingual programs are enrichment programs. If the former are geared toward maintaining the L1 of minority language students, the latter are generally (but not exclusively) associated with teaching majority language students (such as L1 English speakers) through a minority target language. French immersion in Canada, where many of the students come from middle-class L1 English-speaking homes, is perhaps the most often cited example of an enrichment bilingual program. Welsh-medium schools, which also include many middle-class L1 English speakers, are another example. Elite bilingual programs such as the European Schools movement are also widely regarded as enrichment programs.

As with maintenance programs, the emphasis in enrichment programs is not just on achieving bilingualism and biliteracy for individual students but also on the ongoing maintenance of the minority language(s) in the wider community. As Hornberger (1991) argues, the enrichment model “encompasses all those bilingual education program types which aim toward not only maintenance but development and extension of the minority languages, cultural pluralism, and an integrated national society based on autonomy of cultural groups” (p. 222). Accordingly, she asserts that this type of program has the greatest potential to educate students successfully, given its strong additive bilingual basis. It is also the program most likely to reduce the educational and wider social and linguistic inequalities experienced by minority language speakers.

This broad L1/L2 distinction between maintenance and enrichment approaches is a useful one, or at least a useful form of shorthand, in the research literature. However, it does not necessarily help us to identify clearly where a heritage language model of bilingual education might fit in. As indicated above, this model is most commonly associated with indigenous language revitalization efforts, along with a wide range of other indigenous language education initiatives, although in its wider sense, it can also include other established and immigrant groups (Wiley, 2001). The latter tend to be focused on the reclamation of a heritage language no longer spoken as an L1, that is, the students are second language learners of the heritage language. The former include a combination of

student language backgrounds. Some indigenous language programs (e.g., Navajo; Hualapai in the US; Inuit in Nunavut, Canada; Sa’mi in Finnmark, Norway) are aimed at students who still speak the indigenous language as an L1 and may therefore be regarded as L1 maintenance bilingual programs. But many also cater to students with a mix of L1/L2 speakers of the language (Maori in New Zealand, Hawaiian), and some have only L2 speakers (or rather, learners) of the language (the Master/Apprentice program developed for the now largely moribund indigenous languages of California) and are therefore closer to the enrichment end of the continuum.

As such, heritage programs can also clearly be regarded as an additive and strong bilingual approach, but tend to be situated somewhere in between maintenance and enrichment models in terms of the L1/L2 status of their students (May and Hill, 2005). That said, increasingly, the majority of students in such programs tend to be second language speakers of the target language, the result in turn of previous patterns of language shift and loss of the heritage language. For example, McCarty (2002) notes that in the Navajo heritage language program at Rough Rock in Arizona – one of the strongest and longest established in the USA – only 50% of Navajo now speak their own language and their numbers are declining each year. In Maori-medium education in New Zealand, the overwhelming majority of students are first language English speakers (May and Hill, 2005).

The final level at which bilingual/immersion education can be examined is the program level, which is also, necessarily, the most complex and diffuse. According to Hornberger (1991), bilingual programs are more concrete categorizations than models, and can be differentiated from one another by an analysis of specific contextual and structural characteristics. For Hornberger, contextual characteristics include characteristics of the student population (numbers, stability/mobility in the school, SES, minority status, and language background) and characteristics of the teacher population (ethnic background, degree of bilingualism, training, roles). Structural characteristics include programs in school (whether school-wide or targeted), languages in curriculum (sequencing, oral/literate development, and subject allocation of the languages), and classroom language use (patterns and functions).

There is no space here to discuss the complexity of programs involved (for an exemplary extended analysis, see Baker, 2006), except to highlight – in light of the preceding discussion – the most common types of programs. Nonbilingual programs include Submersion, ESL, and Sheltered Instruction programs (all subtractive programs). Bilingual programs include weak (and subtractive) bilingual programs, such as Transitional Bilingual Education, where use of the students L1 is limited usually only to the first years of schooling. Strong (and additive) bilingual programs include L1 Maintenance Bilingual

programs, Immersion and Heritage programs. These programs, which have also been termed One-way programs (Thomas and Collier, 2002), tend to vary in terms of both their level of immersion in the minority or target language and the related timing and balance of instruction in the majority language. However, most of these programs will use the minority or target language as the medium of instruction for between 50% and 90% of the time. For example, the program may begin as a 90:10 program in the early years (with 90% in the minority or target language) and change gradually to a 50:50 program by year 4 of the student's schooling.

A variation of this Oneway approach, increasingly popular in the US most often with respect to Spanish-English bilingual instruction, has come to be termed Two Way Immersion or Dual Language immersion. The aims of Two Way immersion are the same as other strong, additive programs – bilingualism and biliteracy for their

students. However, unlike other forms of immersion, Two Way programs include native speakers as well as non-native speakers of the target or minority language in the same classroom, wherever possible, in roughly equal proportion. These programs thus specifically integrate English L1 students and target-language (e.g., Spanish) L1 students with the goals of developing the bilingual and biliterate skills of both groups (Lindholm-Leary, 2001).

The discussion thus far can be summarized, albeit somewhat simplistically (**Figure 1**), where the left-hand side can be equated with subtractive approaches and the right-hand side with additive approaches to bilingual students. As we shall see, addressing these various dimensions of bilingual/immersion education is a necessary prerequisite for understanding what research has subsequently found in relation to the relative efficacy of the various approaches just described. This research is discussed in the following section.

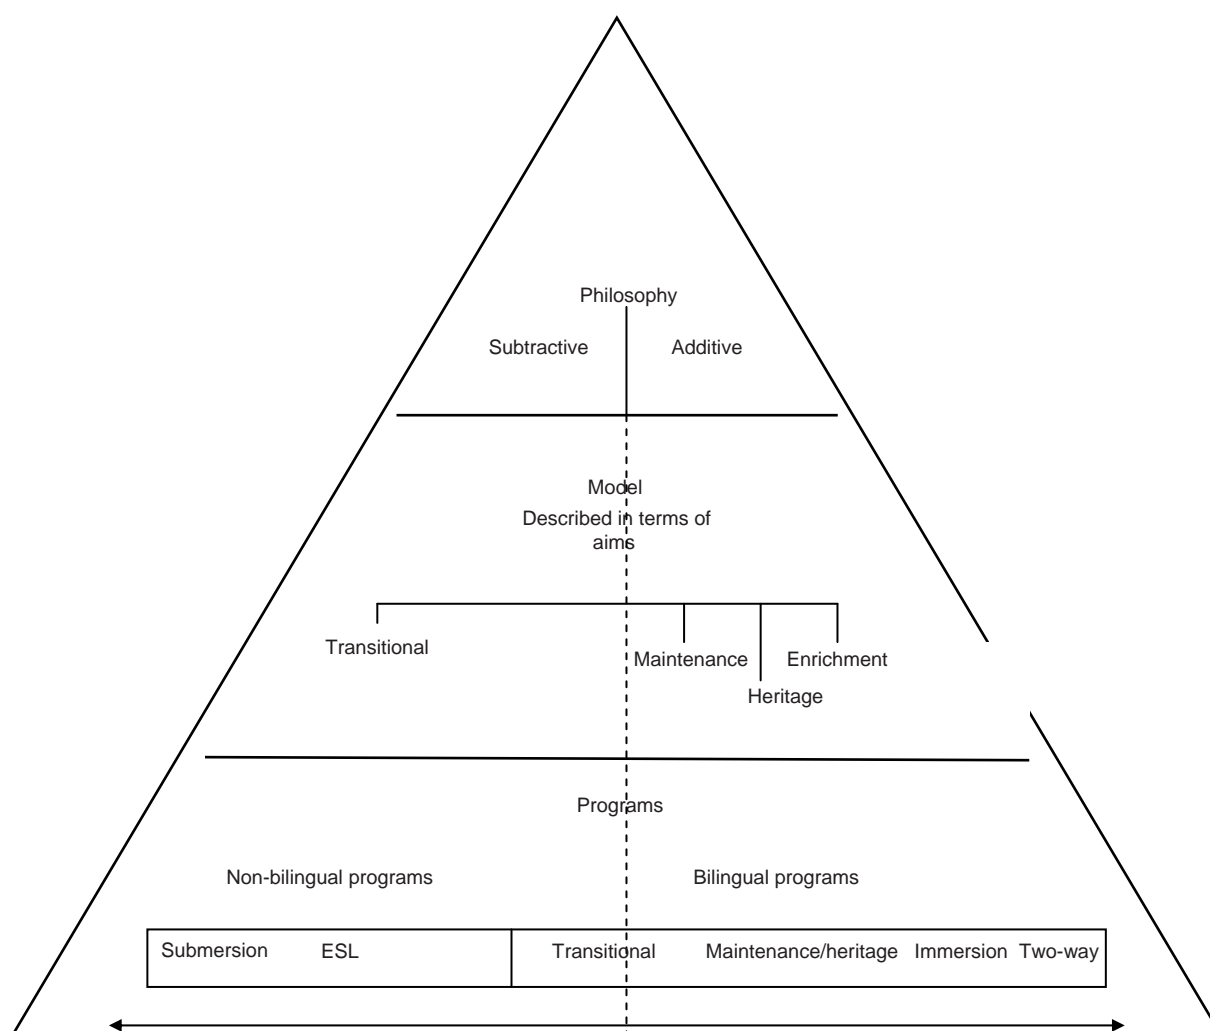

Figure 1 Principal axes of bilingual/immersion education. From May, S. (2008). Bilingual/immersion education: What the research tells us. In Cummins, J. and Hornberger, N. (eds.) *Bilingual Education. The Encyclopedia of Language and Education*, 2nd edn, vol. 5, pp19–34. New York: Springer. <http://www.springerlink.com/content/pj85556182584420/>, with kind permission by John Benjamins Publishing Company.

Educational Effectiveness and Bilingual Students

Bilingual education, as an educational approach, continues to generate controversy in the wider sociopolitical realm – particularly in those contexts, such as the US, where a subtractive view of bilingualism remains widespread, and where English-only approaches to schooling predominate in the US (see Cummins, 2000). What is interesting about these wider debates is their consistent tendency to ignore a compelling consensus in the research literature on the educational benefits, and efficacy, of strong, additive approaches to teaching bilingual students (see Ramírez *et al.*, 1991; Thomas and Collier, 2002).

Ramírez, Yuen, and Ramey (1991), for example, compared English-only programs with early-exit (1–2 years) and late-exit (4–6 years) bilingual programs, following 2352 Spanish-speaking students in US schools over 4 years. Their findings clearly demonstrated that the greatest growth in mathematics, English language skills, and English reading was among students in late-exit bilingual programs where students had been taught predominantly in Spanish (the students' L1) – equivalent to One Way Maintenance bilingual programs. These same students also demonstrated significantly better academic progress than those who were transferred early into all-English instruction. Ramírez *et al.* conclude that:

Students who were provided with a substantial and consistent primary language development program learned mathematics, English language, and English reading skills as fast or faster than the norming population in this study. As their growth in these academic skills is atypical of disadvantaged youth, it provides support for the efficacy of primary language development facilitating the acquisition on English language skills. (Ramírez *et al.*, 1991: 38, 39)

In contrast, the Ramírez study also confirmed that minority language students who receive most of their education in English rather than their first language are more likely to fall behind and drop out of school. In fact, it is important to note here that the English-only programs used for comparison in the Ramírez study were not typical to the extent that while the teachers taught in English, they nonetheless understood Spanish. This suggests that in the far more common situation where the teacher does not understand the students' L1, the trends described here are likely to be further accentuated.

In the largest and most recent study conducted to date, Thomas and Collier (2002) came to broadly the same conclusions. Thomas and Collier analyzed the education services provided for over 210 000 language minority students in US public schools and the resulting long-term academic achievement of these students. They did so by examining in depth five urban and rural sites from throughout the US over 5 years, from 1996 to 2001.

The school bilingual program types examined within these contexts varied widely – they included full immersion programs in a minority language, dual-medium or two-way programs, where both a minority and majority language (usually, Spanish and English) were used as mediums of instruction, transitional bilingual education programs, ESL programs, and mainstream submersion (English-only) programs.

As with the Ramírez study, one of Thomas and Collier's principal research findings was that the most effective programs resulted in achievement gains for bilingual students that were above the level of their monolingual peers in mainstream classes. Another key conclusion was that these gains, in both L1 and L2, were most evident in those programs where the child's L1 was a language of instruction for an extended period of time. In other words, Thomas and Collier (2002) found that the strongest predictor of student achievement in L2 was the amount of formal L1 schooling they experienced. As they state, "the strongest predictor of L2 student achievement is the amount of formal L1 schooling. The more L1 grade-level schooling, the higher L2 achievement" (p. 7). Only One Way and Two Way or Dual Immersion programs – strong bilingual/immersion programs in effect – achieved these results. As Thomas and Collier conclude:

[These] are the only programs we have found to date that assist students to fully reach the 50th percentile in both L1 and L2 in all subjects and to maintain that level of high achievement, or reach even higher levels through the end of schooling. The fewest dropouts come from these programs. (Thomas and Collier, 2002: 7)

Similar also to Ramírez, Yuen, and Ramey, Thomas and Collier found that students in English submersion classes performed far less well than their peers in strong bilingual programs, as well as dropping out of school in greater numbers. Students in transitional bilingual programs demonstrated better academic performance over time, but not to the extent of strong bilingual programs. In both these major large-scale studies, then, length of L1 education turned out to be more influential than any other factor in predicting the educational success of bilingual students, including socioeconomic status.

There are a wide range of other studies, both from the US and from other national contexts that broadly corroborate these findings. Of the wider, book-length, research-based literature, García (2008), Baker (2006) and Baker and Prys Jones (1998) provide magisterial overviews of the field of bilingual/immersion education. Cummins (2000) provides a useful overview of the key research findings with respect to the academic success of students in bilingual programs. Johnson and Swain (1997) and Tollefson and Tsui (2004) provide a wide range of international examples of effective bilingual and immersion education programs. All these contributions add to the

growing research literature confirming the efficacy of strong forms of bilingual/immersion education.

These various research studies and overviews are also complemented by ethnographic studies of effective bilingual/immersion education in various national and regional contexts. In the South American context, Hornberger (1988) explores Quechua language education programs in Peru, and King (2001) examines Quichua programs in the Ecuadorian Andes. In the US, McCarty (2002) provides a fascinating ethnographic account of Navajo language education, while Freeman (1998) discusses her school-based ethnography of Oyster Bilingual School in Washington DC. May's (1994) critical ethnography of Richmond Road School in Auckland, New Zealand is another key school-based ethnographic account of bilingual education. Such ethnographic accounts are important not only for highlighting the core curriculum and pedagogical principles required to teach cultural and linguistic minority students successfully, but also in unpacking the complex, lived experiences of all those involved in them.

Conclusion

This article has outlined the most commonly employed bilingual educational approaches to the teaching of cultural and linguistic minority students. Drawing on extensive research on bilingual education models and programs over the last 30 years, it highlights how strong, additive forms of bilingual education – where the students' bilingualism is both a basis and central aim of the teaching and learning process – are the most effective educational models for bilingual students. Not only do such models achieve and/or maintain the bilingualism and biliteracy of their students, they also provide their students with the greatest opportunity for long-term educational success. Given the ongoing relative lack of achievement of cultural and linguistic minority students in mainstream, often English-only programs, the linguistic and wider educational benefits of additive bilingual programs bear further serious consideration from not only educational researchers, but also crucially, educational policymakers, administrators, and practitioners.

Curriculum in Postcolonial Contexts

Glossary

Benev(i)olence – A play on the two concepts of benevolent and violent, implying that one can merge with the other. This mixture might characterize concepts such as the white man's burden and the civilizing mission of the West in relation to non-Western cultures.

Cultural interface – As explained by Nakata, it is a blend of traditional indigenous and Western ways of knowing that inform and constitute the daily lives and knowledge systems of indigenous people, causing them to traverse intersecting discourses, take positions, make decisions, and, in the process, remake cultures, "a place of tension that requires constant negotiation" (Nakata, 2004: 27).

Eduscapes – A term coined to reflect the possibility of imagining new global ways of organizing and practicing education which would combine ideas of global flows, landscapes, and the social imagination. The concept is influenced by the idea of the social imaginary articulated by Arjun Appadurai. This imaginary serves as an analytical tool, being composed of five dimensions of global cultural flows: ethnoscapescapes; mediascapescapes; technoscapescapes; finanscapescapes; and ideoscapescapes.

Eurocentrism – The ideology of Western cultural dominance underpinned by beliefs in race hierarchies and by racist assumptions of European sociocultural superiority.

Interpellation – The process which persuades a person to recognize himself or herself as belonging to a particular identity, for example, young, white, male, or liberal, and to identify with the particular ideologies and texts that imbue such identities with emotional appeal. As a powerful strategy of domination, the ruling group surveys and interpolates the inferior subject in a way that fixes his/her identity in relation to the surveyor.

Modernity – A period of the emergence, in Europe, of social forms and processes including the nation-state, the organization of large-scale economic modalities of capitalism and communism advocated as universalist doctrines, human domination over nature, formal schooling, the secularization of values and norms, and the rise of science, rationality, and government conceptualized in a Western manner. Interwoven with modernity was the spread of

European imperialism and the conviction that it was synonymous with civilized ways of life and should displace premodern formations which were deemed static, irrational, barbaric, and thus in need of the civilizing mission of the West.

Orientalizing – The process stemming from the concept articulated by Edward Said in his groundbreaking book *Orientalism*. Said shows how Western scholarship, while establishing the academic discipline of Oriental studies, intertwined the field with prejudicial and distorted racist and religious presumptions. From this perspective, colonialism is not understood as a process of domination for political and economic gain, but as a selfless mission to rescue Orientals from their own cultural and political backwardness and economic mismanagement, to save them from themselves.

Self-orientalising – A process in which non-European peoples are socialized into believing that they themselves are backward, weak, and inferior as characterized in Eurocentric portrayals.

Postcolonial theory provides tools with which we can interpret the powerful and lingering effects of European and (later) North American global dominance. For nearly 500 years, colonialism and imperialism gradually extended economic, military, political, and sociocultural power over most of the globe. Using postcolonial perspectives to interrogate education illuminates relations of power in the curriculum that are deeply influenced by this spread of European society and norms. The insights gained help to address questions of why so many curriculum practices and educational programs still appear far away from consensus on the goals, contours, and implementation of equity. A postcolonial analysis problematizes these issues in a unique way, identifying the contradictions embedded in neocolonial norms, working out strategies of change, and identifying the complexities and contestations which accompany change. This article provides an introduction to how various scholars apply postcolonial theory to understand the curriculum. It starts with definitions and overviews and subsequently applies postcolonial perspectives to disrupt conventional views of the various aspects of the curriculum.

The prefix post in postcolonialism is both temporal and epistemological. It does not denote a simplistic after-colonialism in terms of describing historical events but,

rather, is interested in the complex and contradictory experiences underlying the processes of colonialism and decolonization or, in the case of countries which were not overtly colonized, such as China and Thailand, what it means to live with the global consequences of the European empires and their successors. It is also interested in the effects of empire on those in the centers of power – Europe and its diasporas. The postcolonial theory explores these contexts by means of an epistemological shift that not only utilizes, but also goes beyond, the post of postmodernity, seeking equitable alternatives to overcome the sociopolitical and economic problems of the exploitative development paradigm that colonialism so deeply entrenched. Working at the nexus of identifying commonalities as well as distinctive situatedness in education, it probes issues of domination, resistance, subversion, contradiction, ambiguity, and change in a much more complex way than is achieved by dependency theory (see Hickling-Hudson *et al.*, 2004; Tikly, 2004; McLaughlin and Hickling-Hudson, 2005).

Historically and culturally grounded ideas from a range of scholars helped to formulate major strands of postcolonial thinking. (Widely cited as the inspiration for the postcolonial theory are key ideas of scholars such as Fanon (1967, 1968), Said (1978), Spivak (1988), Bhabha (1994), and Hall (1996).) One strand addresses colonial discourse, seeing it as a complex of statements, texts, and practices within which society came to be known, organized, and reproduced by both the colonizer and the colonized. From this flows the concept of the knowledge/power nexus between colonization as a system of power and exploitation, and colonization as a system of knowledge and representation which deeply affects the identity formation of the colonizer and the colonized. The conflicts, ambiguities, and hybridities of identity in postcolonial contexts are of concern to many scholars. Since the postcolonial theory identifies the colonial roots of many of the problems of our globalizing era and deconstructs the aftermath, it throws light on how the curriculum can be problematized and challenged within this historicized context.

Systemic Educational Inequity and Its Challengers

The postcolonial theory has not been adequately applied to explore how global educational inequity might be challenged and overcome at local, national, and global levels. Various impoverished countries have improved education with new approaches, including community involvement, adult basic education, child-centered pedagogies, health reform, and other strategies which have provided some opportunities for the disadvantaged. However, for most learners across the globe, education is

dominated by the contradictory characteristics of Western modernity with inequities relating to social class, ethnicity, gender, religion, academic versus vocational knowledge, and the rural–urban divide, built into a system that proclaims equal opportunity.

An overview of some of the features of global educational inequity is provided by Hickling-Hudson *et al.* (2006). They argue that in a planet where vast proportions of people are impoverished and marginalized in terms of social justice, it would not be possible, without fundamental socioeducational change, to overcome the global division of labor whereby the large, poorly educated populations in the new nations still provide cheap and low-skilled labor for the globalized industries of the wealthy.

A postcolonial analysis of the curriculum within a system of global inequity would discuss the complexities of reforming it and the significance of this for global change. This kind of approach is taken by Borg and Mayo (2002) in a thought-provoking analysis of the educational system of Malta. In a postcolonial manner, they explore how concepts elaborated by the great Brazilian educator Paulo Freire apply as much to understanding the features of society and education in Malta as they do to those of Brazil. They discuss colonialism as a parasitic relationship between the colonizer and the colonized, religion as a site of struggle, cultural domination from without and within, racism as a dialectic rather than a binary relationship, and the contours of banking or transmission education in comparison to those of praxis as transformative reflection and action for educational change, citing the struggle over the new high school syllabus as an example.

Decades ago, President Julius Nyerere of Tanzania critiqued the education system implanted by the British in Africa as inculcating elitism, abstract, bookish knowledge divorced from local needs, a disregard of nonprint knowledge, and as a parasitic relationship to the community (Nyerere, 1968). In most new nations emerging from colonialism, this system of education expanded rather than changed over the second half of the twentieth century: there was very little fundamental redesign (Bishop, 1989). Since its revolution of 1959, Cuba is one of the few nations which have deliberately tackled the dysfunctionality of neocolonial education. The revolution's radical educational changes have significantly advanced educational equity and effectiveness, and have been recognized by the United Nations Educational, Scientific and Cultural Organization (UNESCO) for bringing about outstanding educational outcomes for students compared to other countries in Latin America (see Carnoy and Marshall, 2005). A postcolonial analysis would do more than document how this has been done. It would also explore the epistemologies underpinning the revolution's education system, and would wrestle with questions of how far

it has been able to supersede the constraining knowledges of Eurocentric modernity.

Assessment and the European Connection

The perpetuation of particular European approaches to organizing school and university examination systems is entrenched in new nations. This is bound up with questions of sociocultural, national identity, as is pointed out by Koh (2004) in his analysis of Singapore's education system. As one of the more economically successful new nations, Singapore is using its wealth to improve its entire education system to a world-class level. Identifying dilemmas from a postcolonial perspective points to contradictions in this process.

Koh (2004) argues that Singapore's sense of nationhood is contradictory; combining a nostalgia constructed out of a romanticized British colonial history with a strident promotion of Confucian/Chinese values in a process of self-Orientalizing and othering Western culture. Singapore's examination system is one structure illustrating this kind of contradiction and ambivalence. It still uses the Cambridge General Certificate of Education (GCE) syllabus and school-leaving examinations, organized by the UK's Cambridge Examination Syndicate, which charges any country taking the GCE high fees for administering the exam. While relying on the Western discourses and knowledge embodied in these examinations to determine scholastic pathways, the government tries to compensate for the risk of Westernization by means of curriculum intervention that promotes Asian values and a distinct Asian cultural identity (Koh, 2004: 163).

As part of the decolonization process, some countries have moved away from Cambridge examinations to design their own system. The postcolonial gaze seeks to ascertain to what extent colonial legacies live on in the newly-designed systems, and with what impact. For example, the new Caribbean Council examination system, independent of Britain since the 1970s, has neocolonial elements that echo the traditional British GCE in several ways, perpetuating a range of sociocultural tensions and dilemmas. One dilemma is the continuation of an age-graded, lockstepped approach to organizing the curriculum and an emphasis on print technologies, both of which are becoming increasingly archaic in an era of information technology. Another major dilemma is that the Caribbean Examinations Council (CXC) examinations have continued to be the examinations of the Caribbean elite. Adequate preparation for these exams is best provided by preferentially resourced schools modeled after the British grammar school, and distinct from the lower-status schools of the majority modeled after the old vocational secondary or secondary modern school,

and the resource-poor all-age school which takes young people up to a senior primary level at age 15.

The status divisions in new nations such as those of the decolonizing Caribbean are thus symbolized by and entrenched in their examination systems. Difficult questions remain: How are inequitable exam systems to be overcome? Which discourse is to drive the design of alternative systems? These questions demand a postcolonial lens, for they cannot be answered without reference to a historicized understanding of deep sociocultural attachment to neocolonial examinations, as well as of their continued global economic power.

The Curriculum and Cultural Identity

Colonial and neocolonial education afforded strong mechanisms of interpellation – calling people through their experience of targeted curriculum and pedagogy and their dreams of educational achievement, into identifying with the culture of the colonial metropole. The educated saw themselves as inheritors of a superior European culture. Tiffin (2004), in her analysis of what she terms the benev(i)olence of imperial education, argues that the curriculum of empire exerted a powerful emotional as well as intellectual impact on its pupils. In particular, learning in the European language of education and absorbing parts of literary texts and memory gems by heart became part of the emotional core of one's nature, the goal of these curriculum techniques being to produce people who were, in the language of Macaulay's (in)famous *Education Minute*, "Indian in blood and colour, but English in taste, in opinions, in morals and in intellect" (Tiffin, 2004: 148).

Tiffin (2004) also discusses the ambivalence of colonial education in its interpellation of people into European epistemes. This facilitated colonial rule by the establishment of a hegemony in which European culture was promoted as unproblematically ideal, while local culture was repressed, devalued, and/or distorted. A significant part of the colonial curriculum was the inculcation of racist stereotypes, myths, and the inferiority complex of the cultural cringe, which defers to the intellectual and cultural authority of the West, as Koh (2004) pointed out with his Singapore example. Yet, the ambivalence of benev(i)olence was that postcolonial engagement, with its contradictions, produced, in new nations and among indigenous peoples, outstanding intellectuals who have forged brilliant new ways of thinking and problem solving as well as "some of the most spectacularly significant creative writing of the twentieth century" (Tiffin, 2004: 153). Educated locals in the colonies, trained in Western education systems, often formed a colonial intelligentsia dedicated to independence and anticolonial movements

which ultimately displaced the European supremacy (Willinsky, 1998: 109).

The intellectual violence of imposing a culturally distorted Eurocentric curriculum on students is still, in the twenty-first century, a strong part of the tradition of Western education – the benev(i)olent gift of imperialism. The contradictions continue, in that the effects of this curriculum can, at the same time, position the non-European learner in new nations to be a player in the globally dominant field of Eurocentric knowledge, assault the learner's cultural identity with a sense of otherness, promote misplaced shame and self-doubt, and beckon the learner into the delights of pursuing the educated imagination based on the Western canon, expertise, and the pleasures of globally respected learning.

Whose Language? Whose Knowledge?

At the heart of a postcolonial understanding of the curriculum is recognition of the central importance of the interlinking of language and knowledge. The language of instruction shapes how the learner absorbs knowledge and culture, with powerful material effects. Thiong'o (1986), in his lyrical and penetrating work *Decolonising the Mind: The Politics of Language in African Literature*, uncovers the significance of immersing children in the colonial language for nearly the whole of their education except for the very earliest years. This enabled colonialism to dominate the mental universe of its subjects. Ngugi stresses that this was one of the most powerful means by which the West secured (and still secures) the domination of resources and wealth. "Behind the cannon was the new school. The new school had the nature of both the cannon and the magnet. . . The cannon forces the body and the school fascinates the soul" (Thiong'o, 1986: 9). The resistance of some of the colonized to retrieving their native tongue, teaching in it, and writing in it was an indication of how far imperialism had distorted the view of African realities, making the abnormal seem normal, and vice versa. For example: "Africa actually enriches Europe; but Africa is made to believe that it needs Europe to rescue it from poverty. . . is made to feel grateful for aid" (Thiong'o, 1986: 28).

From a postcolonial view, foreign language imposition can have devastatingly negative effects on learning. Brock-Utne (2005, 2006) discusses the continuing ambiguous attachment of many Africans to teaching and studying in the colonial language, and shows how Western donors, through financial aid, exert an enormous impact on the curriculum. The regressive policies of the privatization and cost sharing imposed on African education by international agencies such as the World Bank and the International Monetary Fund (IMF) often include the insistence that the colonial language must continue as the language

of instruction, rather than as an additional foreign language. Owing to strategies such as this, many Africans continue to equate education with Eurocentric learning. The Western description of African countries as Anglophone, Francophone, and Lusophone has never been effectively challenged, there being no united push to reinstate in education the Afrophone character of the continent (Brock-Utne, 2005, 2006). It can be added that there is apparently no sense of irony in the African adoption of the term renaissance to symbolize the goal of an African cultural renewal, or among Caribbean people who continue to call themselves West Indian, thus entrenching the geographical errors of sixteenth-century Europeans.

Discarding Colonially Tainted Understandings

For students in Europe and its diaspora, learning is still often dominated by the Eurocentric bias nourished by ideologies of empire. As Coulby and Jones (1996) point out, school curricula frequently construct and inculcate, in the young, a stereotype of a European citizen who is tolerant, rational, and a model of democracy, ignoring the prevalence of xenophobia, narrow nationalism, and racism, which means that for many citizens of the European Union, life is far removed from these virtues. If a postmodern point of view emphasizes that constructed boundaries and plural identities are the reality for most Europeans, a postcolonial perspective would go further, uncovering for learners the central role of the aftermath of empire in their current lives.

Perhaps the most systematic analysis of the Eurocentric curriculum is that of Willinsky (1998) in his path-breaking book *Learning to Divide the World: Education at Empire's End*. Willinsky frames his analysis by problematizing the educational mission: How are we to educate the young about the seemingly naturalistic and inexorable divisions in the world between wealth, poverty, race, gender, ethnicity, culture, and learning? His answer is that teachers need to help students learn how to turn the tables on education by showing how the curriculum has schooled us in understanding difference from the viewpoint of the European conquest. This insight would be an essential step in discarding colonially tainted assumptions about why the colonized should be "subservient to a born-to-rule civilization" (Willinsky, 1998: 1, 2 and 4).

Willinsky advocates not just that we teach students about the intellectual legacy of imperialism, but also that we teach about the conflicts over this legacy, the contest of ideas that continually challenged it. Such teaching is difficult enough at the university level, where it is highly contested, but it is almost unheard of at the level of the public school with its entrenched tradition of excluding dissenting voices. His book provides groundwork for

launching the preparation of educators in carrying out this task. The book is perhaps the only detailed study of how the subjects that became the major curriculum areas of history, geography, science, language, and literature were shaped by empire, how they continue to be influenced by the colonial imagination in today's classrooms, and how educators and textbook writers are, at last, starting to challenge these imperial formations.

Race, Representation, and Power

A postcolonial perspective links racism to its colonial roots and deconstructs the many ways in which it operates in order to challenge it. An increasing number of scholars of education have applied this perspective to analyzing and challenging the continuation of racism in school curricula of the late twentieth and twenty-first centuries. For example, Hickling-Hudson (2003, 2004a) discuss the racism shown in the Eurocentric curriculum provided in indigenous and multicultural primary schools in Australia and the USA, and describe the challenges that indigenous communities have mounted to this curriculum. They argue that "A Eurocentric curriculum teaches no critical view of culture which would enable students to see that all cultures have strengths and weaknesses and that they operate within particular epistemologies. Lacking this critical approach, it unabashedly asserts the superiority of European culture, turning non-European cultures into the inferior 'Other' [...] It disrespects and devalues other cultures and other learning styles by making them invisible or distorting them. This absence or distortion is not a simple oversight – it is an example of institutional racism. Many teachers and teacher educators are intensely socialized into its norms. It can have a devastating effect on non-European peoples who are required to submit to this episteme through compulsory schooling" (Hickling-Hudson and Ahlquist, 2004b: 41).

Hickling-Hudson (2006) investigates further complexities of educational decolonization in the differently racialized settings of Australia and the Caribbean, showing how colonial legacies of race and social power continue to shape the inequitable ways in which curriculum is provided for different sociocultural groups. Pedagogical complexities face white Australians when their Anglocentric curriculum is confronted with indigenous ways of knowing, Jamaican teachers when they have to struggle with how poverty issues distort schooling, Grenadian educators in their fashioning of revolutionary experiments, and aboriginal elders when they demonstrate the necessity of holistic education starting from very different premises to those of Western systems. The analysis illustrates how educators can benefit from using postcolonial and comparative thinking to integrate their understanding of cultural complexity and equity in

educational change. Addressing the legacies of neocolonial constructions of race and ethnicity in the Australian context, Hickling-Hudson (2005) discusses a project in which student teachers begin to apply postcolonial perspectives to analyze the implications of these racial discourses for school learning.

Feminism and Education: Postcolonial Views

Deep contradictions were embedded in women's struggles for feminism in decolonizing nations. As Young (2003) points out, the winning of national sovereignty was, for women, not the end. Women's sociopolitical objectives for equity constituted another type of liberation struggle, given that national independence almost always involved a transfer of power to local elites who continued many of the repressions of colonial, and sometimes precolonial, systems against women and the poor. In contexts where the interests of women are routinely othered and subordinated, their participation in education is often much lower than that of men, as Fox (1999) shows in her discussion of educational issues of women in Papua New Guinea. However, even where female participation and achievements in education exceed those of males, such as in some Caribbean countries, this has not enabled women to break the glass ceiling which maintains a situation of male dominance in most areas of public life, pointing to the conclusion that successful female participation in neocolonial education systems will not necessarily move a society toward gender equity.

The experience of formal Eurocentric education imposed on traditional indigenous communities is well known as a process that devastates and ruins traditional cultures and environments with its ideology of individualist economic maximization leading to a putative progress. How this schooling particularly devalues the position of women is powerfully analyzed by Aikman (1999) in her study of the indigenous Arakmbut people of the southeastern Peruvian Amazon. Aikman shows how such teaching "not only contributes to the destruction of the Amazon environment but erodes and undermines women's position as guardians and custodians of biodiversity" (p. 78), leading to new male/female relations that further devalue women's knowledge and skills.

What Would a Decolonized Curriculum Look Like?

Following Said (1978), the postcolonial theory analyzes the self-serving construction of knowledge under imperialism. It is interested in the effects of this kind of analysis during the process of decolonization, looking at how it can

both catalyze a subversion of the old ways and stumble in face of barriers to genuine transformation. Postcolonial perspectives on the curriculum would necessarily move to envisioning curriculum renewal. They would ask the question of all curriculum areas asked by South African scholar Crush (1994) with respect to geography: “what would a de-colonized, de-whitened, post-colonial geography look like?”

Crush points to the work of the subaltern studies group in India as suggesting a way forward in its complex project to seek the recovery and foregrounding of the authentic voice of those who were silenced and marginalized by systems of oppression. He observes that geography in South Africa traditionally exhibited the cultural cringe of defining itself by, and seeking validation from, the metropole, and asks: “Does the decolonization of the discipline require a rupture with the knowledge industry of the western heartlands of geographical enterprise, or is there room for a productive, post-colonial interface?” (p. 338–339). He answers by outlining how South African geographical scholars seek to delink the discipline from any slavish adherence to Euro-American thinking, develop an indigenous and eclectic synthesis, and “shatter the boundaries between campus and community” (Crush, 1994: 342).

The challenge to Eurocentrism in the curriculum is full of its own contradictions and pitfalls. The authors of new history texts, for example, can easily fall into the contradictory position of pointing out the Eurocentric biases of historians and geographers, yet themselves showing these biases, as Willinsky (1998: 129–130) illustrates. A contrast to this kind of curriculum confusion is the blunt approach taken by Gill and Levidow (1987), educators whose edited textbook promotes an antiracist science curriculum, drawing on the work of a community of science teachers actively working in the UK for social change. The text assumes responsibility for teaching science not abstractly, but within the context of its role in the global economic and ideological system. For example, students’ attention is drawn toward the political causes and consequences of the putative concept of race and its use in science, and toward the point that “Science teaching masks the real political and economic priorities of science; hides its appropriation of non-Western scientific traditions; [and] often attributes people’s subordination to nature. . . . rather than to the way science and nature itself have been subordinated to political priorities” (Willinsky, 1998: 184). In the field of literature, Bean (2004) explores the postcolonial theory and multicultural literature as potential frames of reference for challenging the narrow vision and hegemonic structure of the traditional literary canon. He shows how issues of institutional racism, stereotyping, and socially deterministic views of indigenous groups are confronted in recent fiction for young adults, and discusses how strategies such as body

biographies, reading against the grain, and discussion questions can challenge the preconceptions of adolescent students.

The Cultural Interface

What Nakata (2004) calls the cultural interface between Western and indigenous knowledge systems would be the logical site of curriculum change that protects the interests of indigenous and other marginalized peoples. In this interface, the change directed by indigenous people should be informed by meta-knowledge: knowledge about knowledges. It must be “change that incorporates into our own knowledge all the ongoing developments brought about by the convergence of other systems of understanding, so that our own corpus of knowledge. . . keeps expanding. . .” (Nakata, 2004: 28).

Nakata discusses the web as a site of new opportunities for indigenous peoples to control the presentation of knowledge and, thus, take charge of their own scholarly agendas. He is part of a working group of indigenous academics across six universities striving to develop an online degree in Australian indigenous studies. Alternative theoretical platforms from indigenous standpoints will be encouraged in a process that engages with both Western and indigenous knowledge domains, thus facilitating not only the continued development of indigenous knowledge traditions, but also the opportunity for nonindigenous people to interrogate their own systems of thought (see Nakata, 2004: 30–33). Just ten items selected from the list of 25 put forward by Tuhiwai Smith (1999) as concepts and projects important to indigenous research suggest the depth of the challenge to conventional Western assumptions about research: “celebrating survival, testimonies, revitalising, connecting, negotiating, gendering, protecting, creating, representing, sharing.”

For curriculum renewal at the cultural interface, then, it is essential to offer students an introduction to the study of knowledges: an exploration of indigenous and Western knowledges and philosophies, as well as of Eurocentric views of the other and the use of these to justify domination and exploitation. To work toward a new, shared, postcolonial, and global space, it is essential for all students to understand how they have been socialized into Eurocentric ways of thinking, study the consequences, appreciate formerly suppressed knowledges, and to be part of forging alternatives.

Conceptualizing Curriculum in Post-Postcolonial Contexts

We end with provocative questions by Luke (2005) that attempt to conceptualize post-postcolonial contexts and

their implications for curriculum. Luke asks: “What would it mean to speak of a post-postcolonial moment in education theory and practice? ... Where do the systems of Asia, the Americas, Africa and the South Pacific go from here, in the face of rapid forces of cultural and economic globalisation, shifting and recentring of capital, and emergent new blends of language and discourse? What kind of ‘eduscapes’ can and should be constructed in response to these conditions?”

Luke’s (2005: xvii) sketches of possible eduscapes which might meet new challenges of globalization include those which would bring together, for example, identity politics with basic technical/vocational skills training, bilingual education with scientific training for new economies, and training in local school leadership with preparation for radical pedagogies. Although these scenarios are not new and do not answer the epistemological question posed above of what a decolonized curriculum might look like, they draw attention to the necessity of imagining educational structures, approaches, and content which would tackle the unprecedented crises of our time. As long as neocolonial attachments, patterns, and desires continue to constitute elements of these crises, educators will arguably need to do the postcolonial work of imagining “an education system that does not restrict access to schooling: a system that does not discriminate, stratify or exclude groups on the basis of class, ethnicity, gender, sexuality, disability or location ... a postnational system that reaches beyond the boundaries and identities of nation states... that disrupts preconceptions about knowledges and power relations, and about its own ability to establish final and forever appropriate structures and solutions” (Hickling-Hudson *et al.*, 2004: 1).

Curriculum, Economic and Cultural Development

A Rampal, Delhi University, Delhi, India

© 2010 Elsevier Ltd. All rights reserved.

The Convention on the Rights of the Child and the aims of education it recommends require that the curriculum must be of direct relevance to the child's social, cultural, environmental, and economic context. This may seem ubiquitously unproblematic and, yet, encompasses some of the most contentious issues and challenges of contemporary curriculum development. In low-income countries with deeply differentiated and widely pluralistic societies, still unable to provide elementary education to large sections of children, struggling with local issues of human development – of sustenance and survival – while also aspiring for a place in the global market, notions of curricular relevance and context are becoming increasingly contested.

This article begins by looking at models of curriculum development within different educational traditions, with a focus on the critical indigenous approach. It locates the dialectical search for a national curriculum in India, within its anticolonial struggle, where contested notions of modernization and Indianization were etched onto its developmental track. It relates these historical tensions to contemporary struggles for an equalizing curriculum – so that national does not imply a common centralized curriculum; modern is not constrained to serve only the knowledge economies, by alienating most children from their lives and knowledges of production; and indigenization reckons with plural and multicultural identities, not appropriated by a dominant and fundamental religiosity.

Curriculum in Different Educational Traditions

The 'Education for all' (EFA) report (UNESCO, 2005) looks at the curriculum in different traditions, including the aims, processes, and outcomes of education. The humanist tradition rejects "standardized, externally defined or controlled curricula, [which are] seen as undermining the possibilities for learners to construct their own meanings and for educational programmes to remain responsive to individual learners' circumstances and needs" (p. 32). The social constructivist approach builds on the humanist traditions to lay emphasis on learning as a social, rather than an individual process. On the contrary, the behaviorist tradition, which continues to wield significant influence on the practice of curriculum development across the world, more so in the present neoliberal era, endorses standardized, externally

controlled curricula, based on rigidly prescribed and nationally tested competences often defined independently of the learner.

The critical approach to redress social inequality and injustice "is emancipatory in the sense that it lets students find their own voices, frees them from externally defined needs and helps them to explore alternative ways of thinking that may have been buried under dominant norms" (UNESCO, 2005: 34). It stands for transformative education designed through participatory processes to encourage critical analysis of social power relations and of ways in which formal knowledge is produced and transmitted. By incorporating popular culture and situated and everyday knowledge, the critical curriculum further attempts to engage with the cultural politics of identity. However, there is a danger of tokenism where multicultural curricula may profess knowledge as socially constructed, but, with policies pushing for standardized testing, may end up with conventionally packaged information, and also ignore indigenous knowledge traditions that have nurtured ecologically sustainable cultures as being backward or irrational.

According to the EFA report (UNESCO, 2005) the indigenous tradition emerged out of alternative educational ideas rooted in the realities of low-income countries that challenged imported knowledge, images, values, and beliefs. "Prominent examples include the approaches of Mahatma Gandhi and Julius Nyerere, both of whom proposed new and alternative education systems with culturally relevant emphases on self-reliance, equity and rural employment." The indigenous tradition:

- reasserts the importance of education's relevance to the sociocultural circumstances of the nation and learner;
- assures that relevance implies local design of curriculum content, pedagogies, and assessment, using learners' rich sources of prior knowledge; and
- moves beyond the boundaries of the classroom/school through nonformal and lifelong learning activities (UNESCO, 2005: 34).

The Gandhian model of basic education (Hindustani Talimi Sangh, 1938) called for education for life, through life, and used a productive craft – weaving, carpentry, agriculture, pottery, etc. – as the medium of interdisciplinary hands-on learning in the primary curriculum, with the mother tongue as the medium of instruction. At the upper primary stage, the distinction between traditional academic and vocational streams was sought to be

reduced through flexible tracks, where science, home science, or agricultural science could be placed at par. This radical move matched the agenda of the anticolonial freedom struggle – for inclusive schools independent of government funding to also interrogate the traditional caste system that stigmatized the low castes and their vocations. Basic education schools continued to run in the 1950s, after India became independent, but did not receive sustained support from the government and the elites aspiring for white-collar employment through modern education.

The National within the Local–Global Dilemma

Analyses of indigenous curricula that forge new local trajectories against the grain of dominant global tracks reveal a legacy of philosophical and dialectical thought in specific sociohistorical contexts. Gandhi and Tagore were major Indian thinkers whose respect for each other refined their differences and also enriched the decolonizing discourse on wide-ranging issues such as development, nationalism, education, and science and its domination. Their letters (Bhattacharya, 1997) show passionate visions of national education located within the freedom struggle led by Gandhi through the movement of noncooperation and support to *swadeshi* (the indigenous) with the boycott of British goods, including the schools run by them. Tagore ran his own indigenous school, but felt that the “struggle to alienate our heart and mind from those of the West is an attempt at spiritual suicide. . . [as indeed] for a long time we have been out of touch with our own culture” (ibid. p. 62). Gandhi maintained: “It is unbearable for me that the vernaculars should be crushed and starved as they have been. I hope I am as great a believer in the free air as the great Poet. . . I want the cultures of all the lands to be blown about my house as freely as possible. But I refuse to be blown off my feet by any” (ibid. p. 64). Both developed distinct models of indigenous curricula, while Tagore questioned the utilitarian centrality of manual work at the cost of art and esthetics, and wondered if a differentiated education “should be doled out in insufficient rations to the poor” (ibid. p. 34), who thus get assigned to a limited place and vocation.

Their historic debate reconnects with several contemporary curricular discourses. Pinar (2004) sees the curriculum as an ongoing complicated conversation – and a social and subjective reconstruction, that allows an analysis of “one’s experience of the past and fantasies of the future in order to understand more fully, with more complexity and subtlety, one’s submergence in the present” (p. 4). The modernization–indigenization dilemma of the 1920s indeed continues to reconfigure around differently nuanced curricular dimensions, ranging from the

developmental–ecological crisis, rational–moral values, academic–everyday knowledge, intellectual–manual work, and English or mother tongue as the medium, to the material–cultural politics of identity.

The Indian Education Commission (Government of India, 1966) had advocated nonviolent science for development so that India could engage in reinterpretations and reevaluations of its deep fissures of inequality and injustice, using its own cultural resources of compassion, tolerance, and spirituality while it drew upon the new liberalizing forces that had emerged in the West. However, attempts to incorporate cultural or civilizational resources in school curricula have been part of major political contestations, especially in multicultural countries with complex colonial histories. Through its National Curriculum Framework (NCF, 2000), a right-wing party in power at the center promoted a form of cultural imperialism of the dominant religious identity, while its related textbooks presented a distorted and divisive view of history (Safdar Hashmi Memorial Trust (SAHMAT) and *sabrang.com*, 2001), even introducing a spiritual quotient on the lines of the intelligence quotient. A change in government recovered the secular space in the subsequent NCF 2005; however, since actual curricula and textbooks are prepared by state governments, the right-wing ideology prevails in some states. Lall (forthcoming) analyzes this curricular contestation over national identity to argue that “fundamentalisation in general, and curricular fundamentalisation in particular, are state-controlled discursive mechanisms through which to contain and deflect potential dysfunctions produced by the effects of globalization in societies.”

The Education Commission (Government of India, 1966) policy recommendation for a common school system for social cohesion and equity had been problematically translated by the first NCF (Government of India, 1975) as justification for a centralized common curriculum. It had said: “For a vast country like ours with its diversity of languages, social customs . . . and uneven economic development, the needs and demands of individuals and society will have differential pulls on the school curriculum, varying from one region to the other. For the sake of uniformity of standards and of national identity, therefore it is necessary to develop a common curriculum within a broad framework of acceptable principles and values” (Government of India, 1975: Section 2.1). Policy commitments are seen to have been circumvented by most nation states since “modern education, despite its egalitarian rhetoric, was never designed to provide equal or even appropriate education for all,” having been created by and for the center to consolidate its power through peripheralism of the majority (Cummings, 2003: 277).

Indeed, the system’s inherent inability to define the role of the curriculum, inevitably reduced to a fixed list of contents, variously called the syllabus or standards,

deliberately distorts the notion of diversity to instead construct slow and fast learners, and flexibility to imply addressing “the special needs of the talented, the backward, and those coming from non-formal channels” (Government of India, 1975: Section 2.15). However, the latest NCF (Government of India, 2005) desists from the standards discourse and, acknowledging alarming inequalities, focuses on democratic participation of learners through the construction of knowledge in local cultural contexts. It has promoted participatory development of syllabi and textbooks in a broad critical-indigenous tradition, and a departure from the behaviorist approach is most evident in textbooks at the primary level and in history and political science at higher levels.

Issues of Relevance, Quality, or Efficiency

The traditional high-/low-status divide continues to inform debates on criteria of relevance versus quality – which is differentially defined to offer exclusive skills to privileged groups, as opposed to parents of less-privileged children who want the curriculum to foster more equitable learning opportunities (Weiler, 1993). Indeed, the lack of relevance for urban children and dilution of academic standards were reasons cited by the middle classes for resisting a transformative curriculum that had made a difference to school performance, especially of the poor. Ironically, this was in Kerala, an exceptional state of India, where there is no sharp rural-urban divide, but where, despite near-universal enrolment and high social development indicators, the quality of learning had remained dismal.

Questionable attempts to conflate quality with efficiency, by an increasingly technocratic managerial agenda, often result in problematic quick fixes. Enrolment drives to get children or computers into schools (often devoid of essential blackboards or libraries), without a transformative vision and no examination of the structural inequity perpetuated by the system, result in doling out the same somewhat more efficiently. These programs, aggressively supported by the corporate sector, often profess a minimalist vision of schooling for the poor, with basic literacy and numeracy, and even problematically claim that they can achieve reading first and reading with meaning only later.

A particularly neglected area is curriculum development for out-of-school children and youth, especially girls, which constitutes nonformal education and also the increasingly popular option of open schooling. These demand much more concerted effort through academic-activist partnerships to bring insights from theory and praxis to address the situated knowledge and fragile literacies of mature learners, and also undertake public action to ensure appropriate accreditation. Such effort was evident in a few programs on women's empowerment

and the national literacy campaigns, as can be seen in the work on numeracy (Rampal, 2003), incorporating learners' indigenous knowledge of folk and street mathematics, or health education conducted by nongovernmental organizations (NGOs) such as Bharat Gyan Vigyan Samiti (BGVS) and Nirantar. Interestingly, learnings from the nonformal arena are appearing in school curricula; for instance, insights from unschooled math now find a place in *Math-Magic* – the new National Council of Education Research and Training (NCERT) textbooks developed for primary schools.

Schools and nonformal centers run by NGOs continue to be relegated to the margins of unrecognized institutions, without accreditation or certification. Neoliberal reform has not encouraged diversity in curriculum but, instead, has devalued alternatives and promoted a return to traditionalism (Gewirtz *et al.*, 1995). For instance, the Madhya Pradesh State Government in India aggressively promoted its own minimalist education guarantee schools, while closing down the Hoshangabad Science Teaching Programme, which ran a critical participatory curriculum in over 1500 rural government schools for three decades (Rampal, 2000). Indeed, the struggle for equality and equivalence of nonformal and nongovernmental curricula, meant for those left out of the formal system, has to contend with the same power equations that marginalize them in the first place.

Work and Education

Indigenous curricula to promote education for production were developed in several countries such as Ghana, Botswana, Cuba, and Vietnam. The EFA report (UNESCO, 2005) notes that Cuba, one of the few countries with high-quality education, has long laid emphasis on developing the whole individual while linking education with life and work. Its curricular processes promote solidarity and collaborative competition in the form of emulation for self-improvement – among students, teachers, and schools. The *colectivo pedagogico*, or teachers' collectives, enhance motivation and ensure participatory development of curricula and materials. “Giving children productive responsibilities, a typical educational feature of pre-literate agrarian societies, is usually lost in western schools, which traditionally deposit all authority and responsibility with teachers and encourage passive attitudes on the part of students” (Gasperini, 2000: 13). However, Cuba's residential secondary schools in the countryside, which had participated in the agricultural development plan of each region, with students working a few hours a day on coffee or citrus plantations, have now been subject to the pressure of changing social aspirations.

A study in South Korea warns that curriculum reform to morally engineer aspirations in the name of national

development without addressing people's work subjectivities can result in a hegemonic project to mechanically impose manual work without the state making consonant academic and financial investments in vocational and technical education (Cho and Apple, 2003). In the 1990s, the state attempted to curb labor strikes and augment labor shortage through a program for career education by its Department of Moral Instruction as a way to keep people from pursuing irrational aspirations for college education, and retain them as industrial workers. However, flexibility in terms of basic and common knowledge skills meant to help students adapt to rapidly changing work structures, as opposed to the earlier vocational education model of specific job skills, was seen to append a further disqualification to a curriculum that was popularly perceived as the 3 Ds – difficult, dangerous, and dirty. Curriculum development therefore calls for a continuous dialogic negotiation between selection of knowledge worth knowing and public validation of such knowledge.

In low-income countries like India, vocational education curricula remain the least sought after, perceived as meant for the nonacademic backward learners, even while working-class families despair that schools alienate their children from their own vocations and livelihoods. More often, institutes or polytechnics that offer such courses are not creatively or academically engaged with education or curriculum development, and, in some cases, are even placed under the Labour Department. In the renewed globalizing discourse of brain versus body skills, where creative twenty-first-century skills are competitively sought for curricula in industrialized countries, almost justifying the outsourcing of low-skill jobs to low-income countries, there lies an urgent challenge to design indigenous vocational curricula with an innovative and academic high-skill edge for the majority. Moreover, as Brown *et al.*, (forthcoming) argue, the dominant discourse on education and globalization needs to be challenged to show “that Britain and the US are not knowledge economies, where the value of knowledge continues to rise, but are characterised by an economy of knowledge that is transforming the relationship between education, jobs and rewards.”

National Aims and Changing Contexts

Despite stated national aims, the sociopolitical environment of a country plays a significant role in how the curriculum translates into educational outcomes, as seen in the sharply contrasting situations of Cuba, Chile, and Brazil (Carnoy *et al.*, 2007). Even though, in all three societies, education is ideologically viewed as the great social equalizer – for transforming class structure into meritocracy, and providing pupils from different social classes a common experience of national education – their markedly different social structures produce different

results. Brazil and Chile display much more economic and social inequality than Cuba. Thus, in Brazil, education does not play its professedly equalizing role; children in low-income regions have far less access to schools, with far fewer resources than the public schools in Chile or Cuba, while the latter shows consistently outstanding achievements.

Despite the call for education for all with an expanded vision – for the empowerment of children, youth, and adults – by the 1990 Jomtien World Declaration, curricular aims are seen to be shifting to facilitate, rather than interrogate, the global neoliberal agenda. An EFA review (Amadio *et al.*, 2005) of the trends in national aims between the 1980s and 2000s shows an increased call for expanding human capabilities and choices with a curriculum shift toward a student-centered approach. Within the goal of strengthening human societies, notions of democracy and citizenship find more emphasis in countries in Central and Eastern Europe (having prior ties with Europe and current aspirations for integration into the European Union), while the accent on national identity is more marked in Central Asia. Though citizenship could ambivalently mean ensuring democratic participation in elections or simply pledging allegiance to the ruling party, national identity has remained one of the most important aims even in the 2000s, with positive recognition of linguistic and cultural diversity – in the past seen as major obstacles in nation building. The Latin American region stands out with at least 17 countries having developed bilingual education programs, and 11 constitutions amended to recognize the right of indigenous populations to education in their own languages. The EFA review notes that, unlike in the 1980s, only a few references to socialism are seen in the 2000s. Most significantly, the role of education in helping individuals to transform society – a notion expressed in several country statements of the 1980s – now lies abandoned in favor of “facilitating successful adaptation to an ever-changing world” (Amadio *et al.*, 2005).

Curriculum development in countries with large populations marginalized by the globalized agenda of development acquires a greater sense of urgency as inequalities have been seen to increase in their rapidly changing local contexts. This only underscores the role of indigenous critical agency to reiterate the relationship between education, equity, and social transformation.

Globalization and Curriculum

R Dale, University of Bristol, Bristol, UK

Glossary

Governance – Used often to contrast with government, it implies a form or means of coordination of policy activity that is not wholly state run, but that which involves combinations of actors, such as state, market and community, and activities of governing, such as funding, provision, and regulation of services. It may be seen as the coordination of coordination, referring to the processes of combining forms of coordination, such as the state and market. This is the sense in which it is used in this article. As used in good governance in the discourse of the World Bank and other international organizations, it is seen as involving respect for the rule of law and private property in order to assure the safety of investment, and it is used to refer to changes in how universities are organized, managed, and controlled.

Mandate(for education) – What is considered desirable for education to achieve.

Modernity – “that historically unprecedented amalgam of new practices and institutional forms (science, technology, industrial production), new ways of living (individualism, secularism, instrumental rationality), and new forms of malaise (alienation, meaninglessness, a sense of impending social dissolution)” (Taylor, 2004).

PISA – The Programme for International Student Assessment, created by the Organisation for Economic Cooperation and Development (OECD), is an internationally standardized assessment that was jointly developed by participating countries and administered to 15-year-olds in schools.

Introduction

Globalization connotes a notoriously complex set of issues and problems that present particular problems in an article like this. The best way to address that complexity is to embrace it, rather than seek to simplify and possibly distort it. That involves recognizing that there are at least five distinct, but nonmutually exclusive, and overlapping perspectives on globalization, and that it is necessary to take each of them into account to get an effective sense of the

relationship between globalization and curriculum. These see globalization as an ontology; a discourse; a process; a condition, or state of affairs; and as a political project (of different kinds) (see Mittelman, 2000). This article first specifies its broad (ontological) approach. From this, key propositions will be derived, and addressed through each of the lenses set out above.

This is an auspicious moment to discuss the relationship between globalization and school curriculum, because their relationship is developing in the early stages of what will undoubtedly be a prolonged paradigm shift in the development of capitalism. This fundamental argument draws on the work of Boaventura de Sousa Santos in suggesting that it is crucial to the understanding of the current global era to distinguish between the trajectories of capitalism (as found currently in the form of neoliberal globalization), and modernity, and to examine the relationships between them, as they begin to unravel under neoliberal globalization. His fundamental argument is the “‘sociocultural paradigm of modernity’ will disappear before capitalism ceases to be dominant,” partly because it will be both superseded as it fulfills some of its promises, and become obsolescent as it proves incapable of meeting others (Santos, 2002: 1–2).

The basis of the argument in this article, then, is that education, in the form of schooling, with curriculum at its heart, has been perhaps the most significant modern institution, and that what we now observe and experience are symptoms of what may be seen as its obsolescence vis-à-vis the current, neoliberal phase of capitalism. One example of this obsolescence is the curriculum as it was framed, assumed, and experienced over most of the second half of the last century. The key consequence of this is that the relationship between globalization and curriculum is becoming not so much one of updating the contents of the curriculum as container, but one where the very shape of the container, and its place in the processes of education, are undergoing significant change.

This is because the shape of the curriculum container was determined in modernity by a common grammar of schooling, and perceived national needs, while the place of the curriculum was to embed the aims and objectives of education through determining the content of what was to be taught, and how it was to be taught, in schools. Now both of those things are under strain from the changes just mentioned, as the position of the national in both the mandate and the governance of education changes, and the demand of schools in what is represented as a global knowledge economy (GKE) shifts from content knowledge

to competences (and as we shall see below, it also comes under pressure from antiglobalization forces). One important complicating factor is that these changes are not reflected in the terminology used to describe what is happening. As the anthropologist Gavin Smith warns “a whole series of key concepts for the understanding of society derive their power from appearing to be just what they always were and derive their instrumentality from taking on quite different forms” (Smith, 2006: 628). Thus, the curriculum, the national, and the state that are discussed today are not the same curriculum, national, and state that were assumed 20 years ago. So, it is crucial in looking at the relationships between globalization and curriculum not only to take into account the different forms of globalization, but also to take a critical perspective on what the term curriculum is actually referring to, as well as recognizing that the relationships taking varying, not identical, forms across time and space.

A Very Brief Ontology and Epistemology: A Common World Education Curriculum, or a Globally Structured Agenda for Education?

Any theory of the relationship between globalization and curriculum has to have three components: an account of globalization, an account of curriculum, and an account of how the two are linked. Two different accounts that meet these criteria have been outlined and discussed elsewhere (Dale, 2000); these are referred to as the Common World Education Culture (CWEC) and the Globally Structured Agenda for Education (GSAE).

The labels themselves are, of course, deliberately contrasted. Both World and Global imply an extranational focus. While the former sees nation-states that organize education as part of an international system of nation-states, and as embedded in a world society (Meyer and Ramirez, 2000: 113), Global implies social and economic forces operating supranationally and transnationally, rather than internationally, to elude, break down, or override national boundaries, while reconstructing the relations between nations. Structured agenda is contrasted with culture; the latter implies a shared, and equally available, set of resources at a high level of generality, the former, a systematic set of unavoidable issues for nation-states that is framed by their relation to globalization.

In CWEC, education is largely equated with curriculum, particularly the increasing isomorphism of curriculum categories at a transnational level. The striking degree of homogeneity across the societies of the world, irrespective of their location, level of development, or religious, and other traditions derive from the very model of modern stateness that has spread since 1945. As the old empires broke down, they were replaced by new states whose legitimacy as real states

was based on their adherence to the same values and models of Western modernity as those of their former colonial masters (see Wong, 1992: 126).

Education is central to this modernizing mission; the curriculum, too, is based on world, rather than national level curricular scripts (Cha, 1992), so that the curricular commonality that we observe is not the product of globalization as currently conceived, but has a much longer history, associated with the spread of the values and assumptions of modernity, such as scientific rationality, individualism, and progress.

In the GSAE, what counts as education is seen as framed by questions of practice (who is taught what, how, under what circumstances), policy (how and by whom are these things determined), political economy, and outcomes (public, private, personal) (see Dale, 2000). For GSAE, globalization is a set of political-economic arrangements for the organization of the global economy, driven by the need to maintain the capitalist system rather than by any set of values. No nation-state, not even the United States or China, is now able to control or direct the global economy. Rather, it is the interests of the global economy, as represented through the plethora of international organizations created for the purpose such as Group of 8 (leading industrial countries; G8), World Economic Forum (WEF), Organization for Economic Cooperation and Development (OECD), World Bank, World Trade Organization (WTO), and regional organizations such as the European Union (EU) and North American Free Trade Association (NAFTA) to which individual nation-states willingly cede some part of their national power in the interest of collective control of the global economy in their joint interests (which means that rather than a tension between globalization and nation-states, certainly the rich ones, states are themselves the most active agents and promoters of globalization), that ultimately sets the parameters for education and curriculum.

In summary, then, the proponents of the CWEC approach highlight the presence of international discourses, institutions, and practices based on the ideas, norms, and values of Western modernity that inform – even script – national responses to a range of issues, including, especially, curricula. In the GSAE approach, neoliberal globalization is seen as eroding the national, state-centered, and curriculum-as-content assumptions of the CWEC approach (see Dale and Robertson, 2007).

On this basis, this article is structured around the following propositions:

- that the curriculum as it has been known and practiced takes its form and purposes from the discourses, institutions, and practices of modernity;
- that globalization represents a challenge to each of those elements, and thus to the nature of the curriculum that was shaped by them; and

- that it is possible to discern the outlines of a new container for the processes and products of education that involves a shift from content to competences and from teaching to learning.

The relationships between these propositions and each of the different conceptions of globalization noted above will now be briefly considered.

Globalization as Discourse

The CWEC account of the relationship between curriculum and the extranational has seen the discourses of modernity – science, progress, individualism, and the nation-state – as the key framework of curriculum debates. The place and role of curriculum were essentially meliorist and progressive, an essential means through which nation-states achieved their goals through education, and in particular the basis of nation-building. Education was essentially equated with schooling, and in particular with the grammar of schooling, which includes such conceptions as the school year and the school day and the division of that day into periods; classes and classrooms; and a curriculum based on subjects. This has developed over a considerable period, to become itself an independent element in schooling and curriculum.

Recognizing that significant changes have occurred, John Meyer has argued that curricular models that assume a national base are now being replaced by those based on global models of what national societies and states should be like and of what they should do (Meyer, 2001). However, this presents globalization as a process without an agent (see next section) and assumes the same shape and place of the curriculum, which is not perceived as requiring anything more than adjustment to changed circumstances.

For the major international organizations, the major discursive shift has been to see globalization as entailing a new GKE of which all nation-states are part, and to which education is to contribute in a major way. The GKE is seen to require a radical modification of the curriculum, with changes in its shape and place. In particular, competences are to take priority over content knowledge, and universalism is to give way to tailored offerings, right up to the point of personalized learning, which is to be achieved through any place, any time, any provider life-long learning. The shift to a GKE representation of globalization requires a transformation of thinking from curriculum as a body of knowledge justified by its basis in and contribution to the values of modernity, and to be taught in a planned, sequenced way, to competences to be learned *ad hoc*, as and when necessary.

Globalization as a Condition, or State of Affairs

The main curricular responses to the altered condition, or state of affairs in which we live as a result of globalization

have centered on a re-emergence (Marshall, 2003) of the field of global education. Marshall, writing mainly from a UK perspective, and Kirkwood (2001) from a US perspective, both suggest that global education originated essentially with the UN Declaration of Human Rights, addressing the need for a place in the curriculum for world studies, human rights, peace education, and so on. Here, global education seems tightly related to discourses of modernity. The main curriculum pattern is one of nationally based responses, as nation-states perceive a need to respond to the changed condition of globalization and to shape their responses to the way it may impact on them. This has been largely based on what might be called global education for, and as part of, national citizenship. This involves “bringing the world into the classroom, where teachers teach from a world-centric rather than an ethno-specific or nation-state perspective” (Kirkwood, 2001), or what Marshall (2005) calls a “global gaze.” Kirkwood commends Merryfield’s framework for global education, which comprises: human beliefs and values; global systems; global issue and problems; cross-cultural understanding; awareness of human choices; global history; acquisition of indigenous knowledge; and development of analytic, evaluative, and participatory skills (Merryfield, 1997). Marshall’s analysis produces rather more critical frameworks, with a more explicit emphasis on social justice and antiracism (Marshall, 2005), while Davies’ focus on the consequences of the security and conflict agendas leads her to take this point further, suggesting that this leads to a more direct concern with matters of social justice rather than “international awareness or ‘global citizenship’” (Davies, 2006: 6). Davies also very usefully sets out the range of possible combinations of global citizenship and education, as follows:

1. global citizenship + education (definitions of the global citizen, and the implied educational framework to provide or promote this);
2. global + citizenship education (making citizenship education more globally or internationally relevant; think global, act local);
3. global education + citizenship (international awareness plus rights and responsibilities); and
4. education + citizenship + global (introducing dimensions of citizenship and of international understanding into the school curriculum, but not necessarily connected) (Davies, 2006: 13, 14).

These can be seen as moves from reactions to banal (McDonaldization, global village) conceptions of globalization to more analytically based responses to the condition of globalization. Moving qualitatively beyond these response are approaches best exemplified in the work of Noel Gough on transnational curriculum inquiry. These explicitly recognize the need for problematizing and reimagining, rather than seeking to modify, however radically, the approaches to curriculum inherited from the

discourses of modernity, and the need for a shift from the national to the transnational as the basis for curriculum work. What these entail are, respectively, the need to move beyond representations of curriculum that see it as a fixed bundle of necessary elements, such as contents, processes, objectives, outcomes, and so on, that are mutually related; and international curriculum scholars creating transnational spaces to reframe and decenter existing knowledge traditions as a basis for collective work (Gough, 2004).

Globalization as Process

As noted above, it is crucial to recognize that while globalization can be seen as a process, it is never a process without agents, and that the main agents of globalization are nation-states themselves.

For CWEC, the main agents of the processes of curricular isomorphism are epistemic communities, international groups of experts, within and outside international organizations who collectively shape what is to count as curriculum, as effectively “carriers” of the principles of the world polity and culture (McNeeley and Cha, 1994: 2, 3). The picture is of modern discourses, carried by modern institutions with the authority of science, that bring about the isomorphism of national systems that is at the center of the world polity theorists’ claims about the curriculum.

By contrast, GSAE sees new agents and new activities, operating at multiple scales, emerging around the governance of education, including the shape and place of the curriculum. These include the development of education as a global commodity for sale on a world market (see Robertson *et al.*, 2002). This has profound effects on curriculum. Because the product has to be globally marketed, it must shed nationally, or regionally, defining features. Other new, or transformed, agents of globalization are international textbook publishers, and especially purveyors of electronic curricular materials. The two agents who are most altered by globalization are the state and international organizations. The role of the state has become smaller and more focused. In terms of objectives, it has become predominantly a competition state, whose priority is increasing the competitiveness of firms located within its borders. Its scope and *modus operandi* are also changed, in direct response to neoliberal globalization, particularly through the widespread application of the New Public Management (NPM) which calls for the separation of policy advice and implementation and of provision and funding of public services. Both of these, and especially the former, have direct implications for curriculum. However, the most significant impact of the NPM on curriculum comes in the form of the widespread use of techniques of audit, benchmarking, and indicators set in place as accountability mechanisms under the NPM. These involve a crucial shift from *ex ante* to *ex post* monitoring and evaluation of public services. In the case of the curriculum, this involves

a shift from monitoring and evaluation of curriculum content, prior to its being implemented, to monitoring and evaluating its outcomes. This gives much greater power to the monitors and evaluators. Setting the targets to be achieved, and monitoring (and publishing the results of) their achievement, can control what is taught in schools much more effectively, and curriculum becomes more and more what the test/evaluation requires.

The most powerful and wide-ranging example of this is the OECD’s Programme of International Student Assessment (PISA) program. PISA assesses the competences – the ability to use what they have learned, rather than the content of what they have learned – of 15-year-olds in a large number of countries, including many that are not members of OECD. The crucial point here is that the competence focus of the program, together with the publication of its results in league table fashion, has led to great hand-wringing and significant changes in the secondary education programs of a number of countries, most notably Germany. PISA may be the most effective mechanism of bringing about fundamental changes in secondary school education across the world that we have yet seen.

Globalization as a Project

Finally, the question of how the idea of globalization as a project to be pursued, rather than a process without agents, or as relatively passively received, might affect the curriculum is addressed. At least three quite distinct and contrasting projects of globalization can be identified. The first is the neoliberal form of globalization, which is itself a political-economic project, driven largely by finance capital and those who would benefit from minimizing barriers to free trade, which we have already discussed briefly; its focus on audit provides a common currency of educational exchange, suitable to a GKE, whereas the other projects, in different ways, aim to provide a common language of educational exchange, suitable to a more humane world.

The other two projects are conceived as respectively alternative forms of globalization, which might be loosely characterized as seeking good globalization, and oppositional forms of globalization, or antiglobalization movements, as they are generally represented.

Much of the alternative approach may be seen as radical versions of global education, such as Gough’s; the difference is summed up by Davies’ distinction between the “empathy” of the one, and the “outrage” of the other (Davies, 2007: 7). Several diverse strands come together under the alternative heading. It assumes Touraine’s argument that the problems created by globalization are not so much economic as social. There are connections with conceptions of cosmopolitanism, which welcomes the break up of the nation-state system generated by globalization but looks for a more humane version of globalization than the

currently economically dominated one. It also draws on the existence and nature of what are often called planetary problems, such as environmental and climate issues.

These alter-globalizations are seen to be susceptible to realization through education, particularly through appropriate curricula. They are not fundamentally opposed to either capitalism (except the worst excesses of neoliberal capitalism) or modernity (except in the form of an exclusive Western canon), but seek to work with both, while seeking to bring about changes in the societies, and the relations between them, that have been produced by the excesses of both.

By contrast, the oppositional approach is strongly opposed to both modernity and capitalism, both of which it sees as implicated in the subjugation of two-thirds of the world. While most alter-globalization comes from the West, and while there is certainly significant antiglobalization in the West (especially around the WTO), the most radical curriculum-relevant forms come from the (metaphoric) South. One form may be seen as reformist, emphasizing the importance of the local and an end to the domination of the West. Torres (2000), for instance, argues for a reversal of the (Western) supply-driven education, with donor-controlled agendas and conceptions of what counts as knowledge, and the conditions within which it is to be realized (such as the prescription of minimum class sizes of 40, and a limit on teachers' salaries), all of which impact on the nature and value of curriculum. The more radical views are represented in the very substantial and important postcolonialist and subaltern literatures. What differentiates these approaches from those we have discussed so far (with the exception of Gough) is that they represent critiques of globalization from outside rather than from within, using the language, epistemology, and cognitive understandings of modernity as the basis for the critique of modernity and globalization themselves. What the antiglobalization project emphasizes is that the Western globalization project is not only economically and politically, but also culturally, cognitively, and epistemologically driven.

Santos (2004) makes this point most clearly with his argument is that "there can be no social justice without global cognitive justice." Of particular significance is his "sociology of absences" which "consists of an inquiry that aims to explain that what does not exist is, in fact, actively produced as non-existent" (p. 238). He distinguishes five logics through which absences are created: "The *monocultures of knowledge, of linear time, of classification, of the universal and the global, and of criteria of capitalist productivity and efficiency*. These produce (respectively)... five principal social forms of non-existence: the ignorant, the residual, the inferior, the local and the non-productive" (Santos, 2004: 238, 239). The basis and the target for curriculum must be the acknowledgement of these absences and the means of their creation as a necessary condition of any antiglobalization project.

Conclusion

Globalization has generated two fundamental critiques of the curriculum as it has been recognized over the past half-century. The first is that it is increasingly unfit for purpose; it is unable to supply the requirements of the GKE. The second is that it has exposed starkly the obstacles to global social justice that curriculum as we have known it constitutes. Both these have been to a degree recognized by curriculum workers, but this has been in the form largely of reactions that draw on, while trying to modify, the existing paradigm. The more basic responses called for by both critiques, respectively, the transformation of the system of education as schooling and the abandonment of the current conception of curriculum in both its economic and cultural/epistemological/cognitive assumptions remain on the agenda, and may increasingly come to constitute the spaces that have until now been specified and occupied by conceptions of curriculum.

Popular Culture

K Schultz and R Throop, University of Pennsylvania, Philadelphia, PA, USA

© 2010 Elsevier Ltd. All rights reserved.

Popular culture influences and is influenced by our desires, language, identities, and moment-to-moment interactions. Daily, youth experience and (re)create popular culture through music transmitted onto iPods, phrases appropriated from television programs, political statements crafted on YouTube or podcasts, portraits created on MySpace, and poetry performances. Despite the possibilities engagement with popular culture can offer in classroom settings, its relationship to curriculum remains contested. Youth engage with new forms of media and digital technologies in a manner that is often perplexing to adults, including their teachers. What should be the relationship between popular or everyday culture and the content of education? Rather than explicitly answering this question, this article provides an overview of the literature that informs this debate.

Recently, Pennycook (2005) has argued that music, such as hip-hop, and languages, such as English, are both fixed and fluid. For instance, hip-hop texts and English language are fixed to the extent that they are situated in local contexts. On the other hand, they are also always fluid, as they change across space and time through performance. This same distinction is useful for understanding how popular culture has been conceptualized in relationship to curriculum. As fixed, the study of popular culture focuses on the critical analysis and consumption of texts. When understood as fluid, an examination of popular culture emphasizes youth productions across multiple media and modalities. These different analytic perspectives have practical consequences for how popular culture is understood in relation to school. An analysis of popular culture and curriculum as fixed leads to a discussion of what to include, or add, to the curriculum to reflect youth's knowledge, interests, and activities outside of school. An understanding of popular culture and curriculum as fluid takes the influence of popular culture on curriculum and pedagogical practices seriously, and focuses instead on the changing and global nature of youth cultural production both in and out of school.

This article begins with a historical look at the definitions of popular culture. Various conceptions of the relationships between popular culture and curriculum are explored. Next, the article reviews current studies that elaborate these relationships. Finally, future directions and lingering questions for the field are discussed.

Framing the Study of Popular Culture and Curriculum

Popular culture is often defined as texts and lived experiences received and acted on by people as a part of everyday life. Dolby (2001) elaborates, "Popular culture... is not a solid fixed object, but instead an ever-changing network of movement, which is structured by and through apparatuses of power and is itself a result of struggle" (p. 14). The study of popular culture seeks to explore the relationship between everyday life and the construction of cultural forms (McRobbie, 1994). Perhaps because we live in an age of identity politics, current research on popular culture tends to highlight the role it plays in the formation of identities, situating the popular as an important site of political struggle. Understandings of what popular culture is and how it operates, however, have evolved over time and should be situated historically.

Initially, popular culture developed as a construct to distinguish the culture of the bourgeoisie from that of the masses, carrying with it a disparaging connotation. In Marxist theory, and particularly in the work of Frankfurt School theorists, popular culture is positioned as mere ideology: beliefs and materials imposed on the masses by the mass media. More recently, scholars on the Left have argued that this stance ignores the way people act politically and show resistance through popular culture. While this stance validates the cultural forms of subordinate groups, such as the working class, it is predicated on false assumptions that these groups have a culture uncontaminated by the dominant ideology, producing an essentialist view of popular culture (Giroux and Simon, 1989). Further, it locates agency solely in resistance, ignoring the way social actors may exercise agency through conformity or submission.

Current work on popular culture aims at moving past these shortcomings. Popular culture has evolved into a more fluid construct that encompasses both high and low forms. Since World War II, popular culture has become the dominant mode of communicating knowledge (Kellner, 1995). As Willis (1990) explains, popular culture has "...helped to produce an historical present from which we cannot now escape and in which there are many more materials – no matter what we think of them – available for symbolic work than ever there were in the past" (p. 19). Rather than positioning popular

culture as an imposed ideology, or celebrating it uncritically, scholars contend that oppression and liberation are continuous social projects that exist simultaneously within the popular, depending on the ways in which it is taken up and employed by social actors.

The Relationship between Popular Culture and Curriculum

How are, and how should, popular culture and curriculum be related? What roles do popular culture and curriculum play in social organization? Just as understandings of what popular culture is have changed over time, so have ideas around the relationship between popular culture and school curriculum. Willis' (1977) *Learning to Labor*, a study of working-class high school boys, addresses this set of issues. Willis' text emphasizes the pedagogical influence of popular culture; he demonstrates the way youth use popular culture to respond to and, in some ways recreate, the formal curriculum of schooling. The lads in his study create a counterculture in opposition to the official school curriculum and, in so doing, participate dynamically in the (re)production of their social positions. Willis argues that, on some level, the lads sense the structural fact that school will not produce the promised rewards for them; the lads thus create a counterculture in school to protect their dignity. Ironically, this disrupts the intended consequences of the school curriculum and, in effect, disqualifies them from the opportunity to enter into middle-class jobs.

While Willis focuses on the role of popular culture in processes of schooling, Apple (1979) focuses instead on the effects of official school curriculum. In his influential text *Ideology and Curriculum*, Apple describes the role that the content and organization of school curriculum play in maintaining social inequalities. He argues that external control of curriculum distances learning from teachers' and students' lives. As he explains, "the language of learning tends to be apolitical and ahistorical, thus hiding the complex nexus of political and economic power and resources that lies behind a considerable amount of curriculum organization and selection" (p. 28). Apple's critique suggests that, in contrast to the distanced curriculum of school, youth have a vested interest, a voice and a stake in their production and consumption of popular culture. Drawing on Pennycook's (2005) distinction, a fluid rather than fixed notion of curriculum could lead away from the conception of curriculum as texts and materials contained within the school day and walls to a broader understanding of curriculum that extends beyond the boundaries of school (Hull and Schultz, 2002). In this framework, youth take up and recreate popular culture as they construct their identities across the boundaries of home, school, and community.

Today, the trend in many educational systems, however, is to move away from these ideas. Luke (2006) describes the current technocratic/industrial model of education which has led to the deskilling of teachers who are fed curriculum materials tied to large-scale assessments. As a result, curriculum and pedagogy have migrated far away from the popular everyday culture to decontextualized bits of knowledge; teachers have become both the objects and the subjects of the market-produced curriculum. Luke argues that in our global world, curriculum is closely tied to individual nation-states. Schooling is defined and regulated at the local level. He suggests that we need transcultural and cosmopolitan teachers who can move seamlessly between the local and the global. We would add that we need conceptions of curriculum that recognize the ways in which popular culture engages with global ideas while unfolding in distinct ways in local circumstances, crossing the boundaries of school, community, and family.

Whether one focuses on the pedagogical influence of popular culture or the content of official school curriculum, concepts of fixity and fluidity can help in rethinking possible relationships between curriculum and popular culture. For example, if curriculum is defined in a more fluid way and education is conceptualized as occurring across the boundaries of school and community, the fixed dichotomy of learning either in or out of school can be eliminated. This dichotomy suggests that youth engage in popular culture out of school and follow a standard curriculum inside school walls, with occasional moments of engagement in work that reflects their interests and knowledge. Understanding curriculum more broadly as the content and form of learning across time and space, however, allows for a larger picture of what youth learn across a school year. Further, a more fluid understanding of popular culture suggests that we pay attention to the pedagogical influence of the (re)making of popular culture that occurs in both in and out of school spaces. Willis (1990) suggests that schools are losing their influence as popular culture becomes the primary material youth use in constructing their identities. He explains, "Common culture will, increasingly, undertake, in its own ways, the roles that education has vacated" (p. 147). For some, Willis's work raises questions about whether youth are victims of mass marketing (or ideological curriculum) or producers of new cultural forms. Rather than entering this debate, Willis emphasizes that in order to address the relationships between popular culture and curriculum, educators must look beyond the products of popular culture to their uses in context.

Ethnographic research, through the close studies of youth's lives, has provided insight into the way young people relate to, and with, popular culture. School-based

work highlights the way teachers engage with popular culture through their pedagogy and curriculum. As Pennycook (2005) explains, “If we believe that education needs to proceed by taking account of student knowledge, identity and desire, we need to engage with multiple ways of speaking, being, and learning, with multilayered modes of identity at global, regional, national and local levels” (p. 40). The following section highlights current work that in some way extends our understandings of popular culture and school curriculum.

Current Work

It is useful to divide current work on popular culture and curriculum into two categories: research which positions popular culture *as* curriculum and research which demonstrates the inextricable relationship between popular culture *and* curriculum. The first body of work investigates what happens, or what might happen, when popular culture is added to a scripted or more traditional curriculum. Current scholarship along these lines argues for starting with the texts of students’ lives in schools, while concomitantly acknowledging that adding popular culture to the curriculum is not in and of itself sufficient to guarantee student success, nor is it without its own problems. Acknowledging these constraints, scholars thoughtfully explore what happens, or what might happen, when popular culture is incorporated into curriculum, and often detail the relationship between broadening traditional definitions of curriculum and school success.

Popular Culture as Curriculum

Elaborating the concept of circulating literacy practices, Vasudevan *et al.* (under review) describe a longitudinal research project in which they sought to understand the possibilities for increasing student engagement in learning by adding digital modalities and opportunities to bridge home and school worlds in literacy classrooms. By providing a detailed analysis of the composing practices of three students during this year-long multimodal storytelling project, and focusing on the way practices circulate across the boundaries of home, community, and school, the authors show how engagement with various media allowed students to draw on their lives outside of school to produce and rework rich in-school texts. The project demonstrates “. . . the need to reconceptualize composing practices as occurring beyond the printed page and outside the boundaries of the classroom” (p. 1), and addresses the possibilities inherent in broadening our conceptions of curriculum to draw on the popular culture of youth. Significantly, this work offers starting points for considering the affordances and constraints of integrating digital composing practices into the classroom. It points to the

possibilities for increasing student engagement in learning by bridging the popular cultures of youth with the more formalized school curriculum in innovative ways.

Hill (in press) locates his research in a classroom at the nexus of the interpretation and production of texts. Together with a colleague, Hill developed a high school English curriculum around hip-hop texts. He analyzes a particular kind of talk around the text that he calls “wounded healing,” which allows students in the class to produce new knowledge through critical analysis of dominant narratives. He emphasizes the role of texts, interpretation, collective storytelling, and a curriculum based on the lived experiences of youth, in forming a cohesive classroom community. The study reveals the complexity, and indeed danger, in bringing a curriculum based on popular culture into the classroom, warning against romanticizing this move. He illustrates how connections to the popular or everyday lives of students can too easily unearth deep personal pain and social inequality that teachers must be ready to address.

In their text, *Popular Culture in the Classroom*, Alvermann *et al.* (1999) focus on the praxis of teaching and researching critical media literacy. Each chapter of the text details and deconstructs a classroom teaching experience where a teacher taught a lesson on media or popular cultural forms, advocating a self-reflexive approach to media pedagogy. Their analyses demonstrate the way that youth cultures shape, and are shaped by, what happens in the classroom, and points to both the importance of and inherent complications in working with youth to become critical consumers of popular culture as part of the formal curriculum. Their work supports themselves become critical consumers of the media.

Other scholars have started outside of the classroom, considering the pedagogical influence new technologies have on youth today, and wondering about the ways these technologies might be appropriated as part of school curriculum (e.g., Knobel and Lankshear, 2007). Gee (2007), for example, considers the relationship between video games, pleasure, and learning. He argues that good video games act as technologies for cultivating learning by tapping into a source of pleasure in students. He claims that since these games allow students to have meaningful learning experiences in a visual and embodied way, they might provide clues for ways to learning in the future.

Interactions between Popular Culture and Curriculum

A second body of work explores, in the tradition of Willis (1977), how popular culture is taken up and used by youth in (re)writing the formal and informal curriculum of school. Over the years, Dyson has argued for the permeability of the classroom writing curriculum to include the linguistic and symbolic tools that children appropriate

from popular culture and through their social relations with peers. She claims that young children come to school with the experience and ability to manipulate a broad range of popular or media texts. They incorporate these texts into their play; this experience shapes their participation in school activities (Dyson, 2003). Young children take up compelling images and ideas from popular culture texts and transform the school curriculum through their writing, talk, and play. An important contribution Dyson makes is her documentation of the way that youth use media to support their official literacy practices through fostering an interplay between the unofficial and official worlds of school.

While Dyson's work demonstrates the way that youth's knowledge and use of popular culture can (re)shape the official school curriculum, Finders (1996) illustrates how a group of adolescent girls use the acquisition and reading of teen magazines, or zines, as a cultural practice to mark their status on the path to adulthood, distinguishing them from their peers. The girls further use zines to establish the boundaries of their friendship networks and to ascribe status within the group. The study demonstrates the power of popular culture in shaping youth identities, illustrating how the girls appropriated the words and experiences in the zines as their own. Finders argues for the importance of helping youth to develop skills to examine and critique the social scripts that undergird popular culture texts.

Dimitriadis (2001: 29) points out the "complex, emergent and messy relationships" young people often have with popular culture, detailing how two teenage boys use popular culture texts to construct a sense of place. Southern US rap music provides the boys, living in a Midwestern town, with the ability to index and feel connected to their Southern heritage. Dimitriadis's account provides a strong critique of textual analysis, highlighting the importance of locating popular cultural forms within their social context. Although textual analytic approaches might suggest that rap represents a degradation of values or tradition, these boys employ rap music texts to engender a sense of connection to their heritage and to the strong values of their elders. The boys use the rap music to forge connections that are meaningful to them, thus shaping their relationship to learning and the curriculum.

In her ethnography of a multiracial high school in South Africa, Dolby (2001) details the interrelationships between race, popular culture, and the public sphere of school. She demonstrates how students construct racial identities and boundaries through a discourse of taste. Popular culture acts as an alternative curriculum among the youth in her study, proving to be a rich space for identity formation. Youth use time in school to select and employ popular practices that reflect their taste, particularly with respect to clothes, music, and clubs, to both reproduce their positions within racial hierarchies, and simultaneously challenge those positions. Focusing on

the social curriculum, Dolby advocates exploring the ways in which difference is constructed and maintained in schools, critically considering the way popular cultural forms shape these processes.

In recent years, countries around the world have adopted core or mandated curriculum, often connected to high-stakes testing. From different angles, both these groups of studies raise questions about the decision to move in this direction. The first group suggests integrating popular culture into the school curriculum. This research argues that rather than conceptualizing curriculum as a fixed body of material, it can be understood as a fluid construct that reflects and provides opportunities to build on youth's knowledge and experience to further school success. The second group of studies suggests that the core curriculum is always and inevitably (re)shaped by youth's common culture, emphasizing the social nature of learning. In other words, whatever the official curriculum might be, there are no standard or predetermined effects given students' social interactions, and their particular interests, knowledge, and desires.

Future Directions

Moss (2001) argues that school knowledge and curriculum belong to a different age, especially when compared with the worlds inhabited by youth in which vast quantities of information and materials are available for symbolic work (Willis, 1990). She explains that school contexts tend to be vertical discourses that are ordered, explicit, and hierarchically organized, while everyday discourses are often local, context dependent, and multilayered. Moss suggests makes the transfer from one context to another difficult, at best. She warns against thinking that literacy practices from outside of school, such as viewing horror movies, can be simply transposed into school knowledge. Pennycook (2005) argues, further, that youth are engaged in learning across space and time, no longer bounded by the classroom and the school day. He suggests that youth across the world are involved in a wide range of transcultural, technological practices. Borrowing from Appadurai (1996), he suggests that teaching hip-hop with the flow "...suggests not so much an incorporation of hip-hop texts into the curriculum but an opening up of possible languages and identities, an engagement with multiple ways of speaking, being and learning" (p. 40). New conceptions of learning and engagement made possible by digital media and transnational networks suggest that current understandings and uses of curriculum are outdated. We need new ways of thinking about what curriculum is, and what it might be. Conceptions about the relationship between popular culture and curriculum must be recalibrated to reflect these understandings.

When curriculum is conceptualized as the content and form of learning in and out of school, erasing those boundaries which are often crossed in a digital age, the question of whether popular culture should be incorporated into school curriculum is transposed into the following questions, among others: What is the curriculum that youth are currently engaged in across a range of contexts? How is popular culture interwoven into this curriculum? How do these conceptions of curriculum and learning shift our understandings about the purposes of school? What are the opportunities and dangers of reconceptualizing curriculum, learning, and schooling in this manner?

Much of the current research is geographically and temporally located, either in schools and classrooms or out of school and in the community, and either during or after the school day. We suggest that researchers locate their study of popular culture and curriculum at the intersection of these locations so that constructs such as learning, engagement, authorship, identity(ies), and agency(ies) can be interrogated across space and time. Appadurai (1996) has introduced the notion of global flows to suggest that people, ideologies, images, and texts are always in constant motion. They are simultaneously local and global. This notion of the flow of information and people highlights the importance of considering the role of popular culture in shaping school curriculum. As Pennycook (2005) explains, if we locate classrooms within global transcultural flows, then schools are no longer seen as bounded sites, students do not enter from fixed positions carrying identities tied to local contexts, and curriculum is no longer seen as a static body of knowledge.

Buckingham (2003) suggests that contrary to past images of children as vulnerable targets of the media, today they can be more accurately understood as savvy consumers and producers of knowledge that may not be understood by adults. A focus on the shifting practices, relations, and identities of youth pushes us to rethink the functions of school curriculum in learning. Much of the research on popular culture and curriculum has focused on youth as consumers and producers of popular culture (e.g., Buckingham, 2003; Dimitriadis, 2001; Dolby, 2001; Dyson, 2003; Willis, 1990), teachers as critical pedagogues who incorporate popular culture into their teaching (e.g., Hill, in press), or texts (Giroux and Simon, 1989). Future research on popular culture and curriculum should be located at the intersections of youth practices, pedagogy, and texts or media. Recent work has examined youth productions outside of school pointing to new possibilities for the construction of identities through spoken word performances, written narratives, visual media, musical compositions, and animations, with a focus on fostering agency through a range of semiotic resources (Hull and James, 2007). These productions, with their emphasis on performativity, suggest new possibilities for the creation of spaces where youth can take on or perform new identities.

Recently, on the first day of school in an under-resourced district, one of us heard a US teacher ask her elementary students to write ideas on two note cards. On one note card they were asked to write the reasons why they would make Annual Yearly Progress (AYP) this year and on the other why they would not meet AYP. (AYP is the metric in the US established by the *No Child Left Behind* legislation that measures progress against local and national targets.) In a single assignment, the goals of the curriculum, and ultimately the purposes of schooling for the year, were reduced to meeting specific testing goals. Versions of these conversations are enacted each day across the US and throughout much of the world. In this climate, where AYP is held up as the standard for student achievement, it is difficult to envision a role for popular culture in the school curriculum. On the other hand, if one starts from the assumption that learning and education cannot be contained within school walls, as suggested by the research reviewed in this article, the questions become how – rather than whether – popular culture acts as curriculum in youth's lives, and how learning can be conceptualized as extending beyond the school walls and the school day. Understanding the changing and evolving conceptions of popular culture and curriculum is a first step in this direction

Introduction

This is an opportune time for an overview of research in curriculum inquiry. The last two major assessments of the field took place in 1992 with the publication of the American Educational Research Association's *Handbook of Research on Curriculum* (Jackson, 1992), and in 1994 with the second edition of this encyclopedia. The follow-up to the Jackson handbook is due for publication in late 2007 with the *Sage Handbook of Curriculum and Instruction* (HCI) (Connelly et al., 2008), and this edition of the encyclopedia will appear not long thereafter continuing the symmetry between the handbook and the encyclopedia.

Many of the trends and developments seen in these earlier documents continued in the interim and are more strongly in evidence as this encyclopedia is written. Some of these trends have been important enough to convey altered views and structures in the field. In important respects research in curriculum inquiry, though continuous with its past, looks very different now than it did 15 years ago. New curriculum subject matters, and ways of thinking about them, have emerged; there has been a (1) massive expansion in the range of curriculum topics and preoccupations studied and (2) methodological and theoretical expansion paralleling postmodern philosophical developments. Moreover, there is an increased awareness of curriculum inquiry in international contexts and some see the field as being on the cusp of a more international and cross-cultural approach to curriculum studies which tends to be parochially North American in outlook (Hameyers, 1991). This article sums up these developments, raises some of the ongoing large questions in the

field, and relates curriculum inquiry to current views of the structure of the field. It begins with an introduction to definitions and meanings, and general observations on the field that make a difference to inquiry.

Meanings/Definition of Terms Internationally

Curriculum, and curriculum inquiry, have been commonplace educational terms in North America for over a century. Dewey's (1902) *The Child and the Curriculum* is probably the single most important document in the term's history, though Hamilton (1989) traces the origins to nineteenth-century Europe. Curriculum and instruction departments have been common in North American teachers' colleges and faculties of education for many years. These departments are often responsible for, or associated with, teacher education with the result that curriculum inquiry has strong overlapping links with instruction and teaching methods inquiry.

The definition of curriculum, and therefore of curriculum inquiry, has long been contentious, closely linked to philosophical, conceptual, and ideological views on the purpose of education. Multiple definitions were shown to be possible based on Schwab's (1960) commonplaces of curriculum. For Schwab, depending on the times and the circumstances, the appropriate focus for curriculum concern is one of four factors or commonplaces – student, teacher, subject matter, and society. With each reshuffling of the relationship of these commonplaces, a different definition of curriculum emerges.

For instance definitions of curriculum, and of curriculum inquiry, derived from taking the learner as the starting point differ from definitions, and from curriculum inquiry, which start with social purposes. The most comprehensive account of the definitional issue was provided by Jackson. Following a survey of the variability of definitions, Jackson concluded that an argument about what was worthwhile, and a definition, went hand in hand. For him, a change in the purpose or argument would result in a change in the definition, and hence in the forms of inquiry. Connelly and Xu (2008) adopt this notion for the HCI, adding to it the idea of practice. In that publication we argue that definitions, arguments, and practices are interwoven. The implication of adding a notion of practice is that definitions are never fully determined theoretically, logically, or linguistically, but are driven by practical school-based problems under investigation in inquiry. Thus, what is studied affects the inquiry.

Beyond these complications for inquiry arising out of the multiplicity of possible definitions of curriculum, and hence curriculum inquiry, is the fact that the term curriculum is not used universally throughout the world. Some countries use pedagogy, others didaktik, others have no counterpart to curriculum, and still others such as China appear to be borrowing North American curriculum terms. Comparing curriculum is not simply a question of translating terms such as pedagogy into curriculum because when a term like pedagogy is used it tends to imply a different configuration and range of considerations than does the term curriculum, similarly with the notion of didaktik. One of the issues, discussed below and foreshadowed here, that emerges from this is that as educational thought and curriculum thought become more international, there is, as Anderson-Levitt documents in her HCI chapter, much room for miscommunication. Moreover, as she goes on to show, there is the potential for a kind of North American curriculum colonization: the borrowing and using of North American curriculum terms and their uses in international contexts. Dialog across cultures is important, but dialog is not enough if it is carried out in only one dominant cultural voice and set of terms. As education, and curriculum inquiry develops internationally, more cross-culturally aware frameworks for reviewing research than exist now will be required.

Characteristics of the Field and of Curriculum Inquiry

The overall nature of curriculum inquiry reflects the place of curriculum studies in public discourse about education and in the relationship of curriculum to the broader field of education. Curriculum discourse cannot be cleanly separated from educational discourse more generally. Almost all public discussion of education either

hinges on curriculum or is essentially a curriculum topic. For example, discussions over the purposes of education, achievement, and accountability, while broad and educational in scope, are also fundamentally curricular. This interdependence of curriculum with the broader field of education and with political/social discourse complicates the question of what is and what is not curriculum inquiry. A study conducted in psychology, for example, might be a purely psychological matter or it might be a curricular matter if, for example, questions of subject matter, content, and/or methods of teaching and learning were included. This ambiguity has led to a situation where a great deal of curriculum research is carried out under a different name. Both the Jackson (1992) handbook and the upcoming Connelly (in press) handbook contain a wide range of curriculum inquiry research into topics and preoccupations by people who are not primarily known as curriculum writers and yet who do curriculum inquiry. Thus, if one were to review only the curriculum inquiry journals, one would miss much curriculum inquiry which often appears in other places. Part of the reason for this situation is that, in North America, curriculum theory has turned away from curriculum practice to textual analysis and to theoretical sources in the arts, humanities, and social sciences (Westbury, 2007). North American curriculum theorists tend not to be involved with practical, curricular research. People doing such research have tended to migrate to other subfields defined by newly emerging curriculum topics and preoccupations, and into other academic departments.

Structure(s) of the Field and Curriculum Inquiry

The definitional variability, and the various curriculum starting points that link curriculum inquiry with educational inquiry more generally, result in different working structures within the field. These structures, in turn, provide different frames for organizing curriculum inquiry. In the following two main ways of thinking about the structure of the field are described: (1) practice–context–theory, and (2) subject matter, topics and preoccupations, and curriculum theory/general curriculum. Subsequently, five developments emerging in the last 10–20 years related to these structures, as a basis for providing an overview picture of curriculum inquiry, are described.

Practice–Context–Theory

Jackson's review of curriculum inquiry led him to the view that the field was in structural disarray. His essay remains important reading because it documents the division between theoretical inquiry and practical inquiry

in curriculum studies. Though this dispute and separation has not disappeared, its impact has been mitigated (Connelly and Xu, 2008). Ironically, perhaps, context is essentially omitted in the theory/practice inquiry dispute even though context is central to all curricular. It is one thing to bridge the theory/practice argument, and gaps between theory and practice, by ensuring that practical curriculum inquiry be embedded in, or develop, appropriate theory; and conversely that theoretical inquiry be grounded in the real world of curriculum practice. However, context adds a new dimension to each. The contextual idea is that nothing practical happens in isolation but always happens in relation to people, places, and things; in relation to organizational structures, policies, political discourse, and ideological frames. Taking these into account makes for good curriculum inquiry. Likewise, curriculum theory needs to account for curriculum in context, not merely curriculum in practice. Moreover, curriculum theory is not derived merely from theoretical, postmodern abstract thought but, itself, takes place in the same contextual frames that surround the practice of curriculum. Theories and theoretical thinking in curriculum are contextual and dependent. They are not, as some might have it, abstract and universal.

Context is also the starting point that is, the problem or topic, of much curriculum inquiry. This point is discussed later in the section on developments in the last 10–20 years. For now it is sufficient to note that context is not merely a surrounding frame for practice and for theory but is itself a source of inquiry. Thus, within this structure of the field there are practical, contextual, and theoretical curriculum inquiries, all of which, depending on the inquiry, are related in different ways to one another.

One further point relevant to the overall frame provided by this encyclopedia is that while subject-matter inquiries are not part of the assigned topic for this section, subject matters are an important part of the practice of curriculum and, as Deng and Luke in their HCI chapter show, curriculum subject matter is currently being studied in terms of changing political and economic demands. In other words, subject matter is being studied in context.

Subject Matter, Topics and Preoccupations, and Curriculum Theory/General Curriculum

Readers will readily see the relationship between the just-discussed structure of practice–context–theory, and subject matters–topics and preoccupations–general curriculum. The former is a more formal structure while that discussed in this section, though closely related, refers directly to the way curriculum and instruction departments are organized, offer their courses, and conduct their professional business through conferences, journals, and the like.

Subject Matter

The most obvious feature of curriculum inquiry for a casual viewer of the field is subject matter. Parental and public concern is with matters such as reading, language, science, mathematics, the arts, and so forth. School curriculum is basically structured around curriculum subject matters with corresponding school board, province, and national policies in the form of guidelines, courses of study and policy memoranda. Though no quantitative accounting is available to our knowledge, there can be little doubt that the amount of research in this area equals, and likely exceeds, the total of research in the other two areas. Moreover, the most high-profile public/political discourse is most often about subject matter, for example, national literacy, mathematics achievement, reading capability, and so forth. This discussion is often associated with national policies as, for example, the American No Child Left Behind policy and, these, in turn, are related to a host of curriculum inquiry studies ranging from what the policy means, to how it may be implemented, what kinds of achievements are accomplished, and critical/theoretical inquiries into the social/political nature of the policies and programs.

It is worth noting that modern curriculum inquiry in subject matter goes beyond the methods research common in the past and takes on contextual and philosophical qualities. Chang and Rosiek's (2003) *Anti-Colonial Antinomies in a Biology Lesson: A Sonata-Form Case Study of Cultural Conflict in a Science Classroom* is illustrative. The study explores the cultural, philosophical, and subject-matter content tensions confronted by a Hmong immigrant teacher and his Hmong students in an American science classroom. The study of subject matter is conducted in cultural context and is a contribution to the contextual topic of culturally relevant pedagogy. Moreover, as the title indicates, postmodern narrative and arts-based research methodologies are used.

Topics and Preoccupations

The rapid growth of contextually aware curriculum inquiry in the past few decades has created an unrecognizable (at least for some) landscape of curriculum inquiry. However, a review of some of the topics and preoccupations in the HCI reveals a vast body of work. The problem is that some writers conflate general curriculum/curriculum theory with the broader field of curriculum inquiry. Thus, what is said of curriculum theory is often incorrectly thought to apply to curriculum inquiry as a whole.

Curriculum topics were not mentioned in earlier encyclopedic compilations. It would be a mistake to think that because they were not mentioned there has been a major turning point in the last 10–15 years. Everything in educational inquiry is continuous with its past and, although

the present, may, at times, appear startlingly new, careful thought reveals historical narratives. Multicultural education, or at least that part of it that might be properly called curriculum inquiry, is perhaps the most widely developed and researched curriculum topic. Though it might appear that this is new because of the increased attention given to it worldwide, for example, ethnic studies in Asia and Europe, this topic has a long history. Banks and Banks (2004) trace the origins of multicultural education to African-American scholarship in the nineteenth-century and to the curriculum reforms of the 1930s in North America. The *Handbook of Research on Multicultural Education* (Banks and Banks, 2004) has 49 chapters and is over 1000 pages in length. Not all of the titles are explicitly curricular, but many are, and those that are not are directly relevant to curriculum.

The curriculum topic, multicultural education, reveals many of the developing characteristics and qualities of curriculum inquiry found in other topics and preoccupations such as textbook analysis, anti-racism, gender, achievement, and equity. Foremost among these qualities is the fact that research in the topics and preoccupations explicitly begins in practice. For some, saying that research is grounded in practice may appear to be stating the obvious but, as Westbury (2007) notes, North American general curriculum studies have taken a turn toward texts. By this he means that curriculum writing and curriculum theory has a hermeneutic quality involved with the analysis of written texts and with the abstract application of theoretical positions to practical topics. Starting points for inquiry tend not to be real world practices but, rather, other texts and theory often originate outside of education.

Literature reviews of curriculum inquiry in the HCI illustrate the notion of contextual curriculum inquiry in the topics and pre-organization. For instance, Ladson-Billings and Brown's chapter on the topic of curriculum and cultural diversity begins with the practical problem of racism. Context is central to their review of curriculum inquiry and they discuss the relationship of selected social developments and their relationship to racism. Moreover, their work is strongly theoretical as they explore critical race theory to help them understand their topic. Their review of the literature demonstrates the in-between (Connelly and Xu, 2008) quality of curriculum inquiry in the topics and preoccupations. The literature on which they draw – and the way in which they review it – is in-between practice and theory. Practice is the starting point: theory is drawn upon to help account for the practices in question: and context is an important interpretive frame for understanding the topic in both its practical and theoretical aspects.

We draw attention to this in-between quality of curriculum inquiry in the topics and preoccupations because, while it may seem obvious to some, Jackson demonstrated

that general curriculum inquiry was split on the question of theory and practice. On the one hand, people who did practical work were often judged by their more theoretically oriented colleagues as pursuing merely practical, status quo research, while those pursuing theory for the sake of theoretical understanding were, according to Schwab (1983), doing the wrong thing in curriculum. Jackson's assessment at that time was that curriculum inquiry was splitting up in two directions, researchers aiming toward practice and those aiming toward theory. The current view as expressed in the HCI is that there is a vast in-between literature of topics and preoccupations in which practice and theory are brought into dialectical relationships in contextual frames.

To give one more example, He, Phillion, Chan, and Xu's HCI chapter on immigrant students' experience begins with a contextual, demographic, account of the world's changing multicultural and multilingual landscape and connects this to the everyday experience of education by immigrant students. In their summary of curriculum inquiry, context is not only used for justification of the significance of the topic for inquiry, and it is also the part of the topic as defined. This is so because culture is one of the central terms in their topic, and culture is part of the language of context. As their account develops, the interdependence of practice and context is shown as immigrant students' experiential problems in the school system are interpreted in contextual terms. Cultural content is seen as both the source of, and solution to, those experiential issues. In order to provide theoretical insight, the authors use a variety of theoretical frames, a practical process Schwab called the eclectic. They draw on key terms related to language, culture, identity, and power and bring forward theoretical resources in each; and they describe two main lines of curriculum inquiry, ethnography and narrative inquiry.

Their account conveys our opening remarks on the intimate relationship between curriculum inquiry and educational inquiry more generally. The theoretical resources for understanding and improving the educational lives of immigrant children are broad and are found throughout the field of education. Furthermore, the topic is linked to transmigration social patterns and associated educational matters.

To sum up this section on topics and preoccupations, it is important to note that it has not summarized the list of possible topics and preoccupations. The purpose here is to show the significance of this broad area in curriculum inquiry for understanding the nature of curriculum inquiry and its current directions. This work is closely linked to new directions for curriculum inquiry into subject matter. There are similar curriculum inquiry qualities between context-oriented subject-matter studies, and the in-between topics and preoccupations. Context and practice are increasingly interwoven, and research in these areas is increasingly far reaching and eclectic.

Curriculum Theory/General Curriculum

Curriculum theory is one of the more contested areas in curriculum inquiry. Schubert's (1986) scan of the field remains a useful overall view of curriculum studies. Slattery (2006) recently wrote that "curriculum theory has many hostile and competitive factions at odds with one another" (p. 193). Unlike the case in the physical sciences, for example, where competing theories such as the wave and particle theories of light are debated in terms of their explanatory power relative to observable phenomena, disagreements over appropriate curriculum theories tend to relate to ideological positions and to be settled politically as followers of one or the other ideology gain credence. Westbury (2007) traces developments in what might be called the politics of curriculum inquiry for the United States and Europe.

Furthermore, the purpose of the act of theorizing – the value of theory itself – is in question in curriculum inquiry in a way that it is not in the physical sciences. There is little dispute in the physical sciences over the ultimate purpose of theory, namely, to help account for the phenomenal world. But in curriculum inquiry, the very purpose of theorizing itself is in question. In a series of articles culminating in an agenda of work for curriculum professors, Schwab (1983) criticized the enterprise of curriculum theorizing arguing that describing and critiquing what went on in schools is the proper task of curriculum people. This was influential work. Levine (2006) and Reid (1999) believe that curriculum theorists would nominate Schwab to a list of the five most influential scholars in their field in the twentieth century. Schwab criticized curriculum theory's purpose rather than contesting any one of its claims. In Schwab's view curriculum theorists had abandoned curriculum phenomena as their starting point in favor of texts and theories external to curriculum and to education. He labeled the enterprise of curriculum theory as exhibiting a "flight from the field," meaning that it was talk, and talk about talk, not talk about curriculum as practiced in schools, and other places.

Schwab proposed that the principal purpose of theorizing in curriculum inquiry should be to describe and account for curriculum phenomena as experienced. He also argued for a critical role for curriculum inquiry but his idea of criticism was one founded in observation more so than on theoretical application. Again, it is a question of starting point. The basis for Schwab's notion of criticism was description of what was the case, rather than imagined scenarios derived from theory. Wraga and Hlebowitsh (2003) reapplied Schwab's analysis of theory in curriculum inquiry with similar results to Schwab's. In the debate that followed the central point about the proposed practical purpose of curriculum theory was mostly in the background. According to Doyle (1977), Schwab's argument and purpose lost out in the politics of curriculum

inquiry in North America to the reconceptualists (Pinar *et al.*, 1995). In the second edition of this Encyclopedia Goodlad (1994) remarked "the critical theorists have a tendency to stop with criticism; the reconceptualists continued their dialogue; there was little movement . . . into the study of ongoing practices recommended by Schwab" (pp. 1264–1265).

Connelly and Xu (2007) have argued that though the intensity of debate over the purpose of curriculum theory has waned, its significance has not. Westbury (2007) writes that the move to curriculum theory as text is a wrong turn. He contrasts the purpose in this turn with European work (e.g., Dahllöf, 1971; Lundgren, 1972) which is more closely akin to Schwab's proposed purpose. There were, of course, elements of both purposes of curriculum inquiry in North America and Europe. Basically, since curriculum theory has been primarily a North American enterprise, summations of it have been mostly from an American perspective. There is important curriculum inquiry work to be done in examining the nature of curriculum and curriculum theory internationally and cross-culturally, reaching beyond America and Europe.

The dichotomous picture of the enterprise of theorizing in curriculum inquiry found in Jackson, Doyle, Westbury, and Pinar overstates the case. To begin with, too little is known about the role of theory in curriculum theory outside North America and parts of Europe. It is possible, but seems unlikely, that the characteristics and history of theorizing in curriculum inquiry offered by American writers characterizes the rest of the world. But even in North America the dichotomous characterization and the question of which purpose is winning politically is not as clear as suggested by some. Westbury, for instance, modifies his own position by pointing to a list of works that fit Schwab's purpose for curriculum inquiry, that of providing descriptions of schools and school learning. Some, but not all, of these writers cite Schwab. More important, perhaps, as we have argued (Connelly and Xu, 2007) is the fact that in addition to Schwab's flights from the field, many curriculum scholars appear to have moved to the sidelines, and sometimes even out of curriculum. Thus, their work went unnoticed by those writing and debating curriculum theory.

However, they were working in Schwab's practical tradition. Writing in the HCI, Craig and Ross, in the most definitive current statement on the influence of Schwab on curriculum inquiry, catalog a large body of research explicitly drawing on Schwab, almost none of it cited or noted in the curriculum inquiry theory literature. In effect, these are writers who adopt the practical purpose for theory in curriculum inquiry but who, in a move to the sidelines, avoid the disputes, debates, and politicizing that takes place at the level of arguments over the correct theoretical path to follow. Craig and Ross bring

forward an extensive literature and present, in detail, programs of research associated with the arts (Eisner), leadership in higher education (Fox, Scheffler, and Maron), pedagogical content knowledge (Shulman), and teachers as curriculum makers (Clandinin and Connelly); and they describe six broad areas where Schwab's work has been significant: study of teacher education and teaching practices, action research, portfolio development, narrative practices, interdisciplinary efforts, teacher groups, and teachers helping teachers. In addition to the body of work explicitly drawing on Schwab's argument on the purpose of theorizing in curriculum inquiry, much, if not most of the work described in this essay on the topics and preoccupations, while not necessarily drawing on Schwab, fulfills a practical purpose for theorizing in curriculum inquiry.

The overall picture that emerges is that most curriculum inquiry is, in fact, practical in the sense proposed by Schwab. There are lines of research explicitly drawing on Schwab and there are large bodies of literature in the topics and preoccupations which begin in practice and where theory plays a practical role. The practical potential of theorizing in curriculum inquiry is mainly unrealized and is generally agreed to have had little impact (Doll, 2002). Rethinking the directions for theorizing in curriculum theory is taking place, a point evident in HCI essays by Enns, Hansen, Levin, Pinar, Schubert, and Short. For instance, Pinar references several theorizing strands aimed at practice – multicultural curriculum theory, curriculum theory and gender, phenomenological curriculum inquiry, esthetic curriculum inquiry, and theological curriculum inquiry. Moreover, Pinar's own attentions have recently been given over to international matters in curriculum inquiry. In a similar vein, Schubert refers to the grievous error of separating form and substance in curriculum inquiry. Adopting Schwab's practical term eclecticism, Schubert describes the integration of form and substance in nine curriculum inquiry areas: practical inquiry, curriculum evaluation, existentialist perspectives, hidden curriculum, critical theory, counter-culture teachers, teacher action research, reconceptualist theorizing, and curriculum history. This list of curriculum inquiry areas represents the first of two categories presented by Schubert: emergent eclecticism, which he calls neo-Deweyan inquiry, and contemporary venues. Eight contemporary venues are listed: intended curriculum, taught curriculum, experienced curriculum, embodied curriculum, hidden curriculum, tested curriculum, null curriculum, and outside curriculum.

To sum up this section, theorists in curriculum inquiry appear to be making attempts to minimize the abstract, textual, and distant-from-practice purpose of studying theory in curriculum inquiry. Several of Pinar's examples fit the area we call topics and preoccupations, and Schubert forthrightly argues against mere theorizing, arguing for, and illustrating, inquiries integrated in theory and practice.

Though context as such does not loom large in either of these two comprehensive overviews of theory in curriculum inquiry, context is playing an increasingly significant role in theorizing in curriculum inquiry.

Curriculum Inquiry Developments during the Last 10–20 Years

Our discussion of the structures of the field and of curriculum inquiry has touched upon ongoing trends and developments in curriculum inquiry since the publication of the last edition of this encyclopedia. The following picks up on these developments and briefly discusses five: expression/expansion of context in curriculum inquiry; curriculum subject-matter developments; movements to international curriculum inquiry; development of a theoretical curriculum inquiry literature; and a focus on practice and a move toward integration of theory and practice in curriculum inquiry. What is described herein is not so much new as it is an overt expression of factors, forces, and work long underway. There is a tendency in the general curriculum literature, to view the field cataclysmically as if there were reconstructions, new moments, paradigmatic shifts, renaissances, movements, and so forth. These ways of viewing the field are partially political, aimed at highlighting a pattern of inquiry of ideological orientation over another. In these cataclysmic accounts of the field, writers, and lines of work, that may have at one time been important and visible, may be obscured and lost. The HCI is built on the idea of continuity such that people and ideas are thought of as part of a narrative history. Such an interpretation is conveyed here. The following five developments are intended to be read in the spirit of continuity. They are not brand new ideas created *de novo*, conceptualized out of nothing. They are expressions of work well underway in the last edition of this encyclopedia, and before.

Expression/Expansion of Context in Curriculum Inquiry

One of the curiosities of the curriculum inquiry literature is the extent to which it is often labeled as being dysfunctional, while there has been steady growth of work on the curriculum in context. Jackson's answer to his question "How do curriculum matters look at a distance?" (p. 3) was "confusion." He cited 17 authors who variously described the field as in conflict, elusive, in disrepair, moribund, in disarray, suffering from severe disorientation, chaotic state of curriculum terminology, ill-defined epistemology, and great disenchantment with curriculum inquiry. Since that time the general assessment has more or less remained the same though the intensity of concern over it seems to have declined. Wraga and Hlebowitsh (2003) refer to

“a chronic state of disarray, even crisis” (p. 425). But some say that the expansion of theoretical writing overshadows the supposed chaos and is one of the principal achievements of curriculum inquiry. Those that take this view champion the idea of multiplicity of theoretical resource, seeing it as a sign of vitality (Connelly and Xu, 2008).

The attention to curriculum context, particularly in the topics and preoccupations, seems mostly to have gone unnoticed in these debates. Though unnoticed in the curriculum inquiry literature, curriculum inquiry carried out in context is even more diverse than curriculum inquiry in theory. This follows from the fact that there is not only theoretical variation but also practical and contextual starting point variation in curriculum inquiry in context. A second point to note is that though the contextual literature is more variable than the theoretical literature, there is nothing like the theoretical disputes in the contextual curriculum inquiry literature. The reasons for this are reasonably clear. First, because of the practical focus of contextual work, writers tend to have a more pragmatic approach. The question of whether or not work in the topic or preoccupation makes a difference to the practical world is what is principally at stake. Second, because curriculum inquiry in context is driven by practice, people working in different topics and preoccupations often have little collegial relationship and may not even be aware of and/or cite one another's work. Even topics that may appear similar to an outsider are often populated by people of different professional persuasions. For example, the Editorial Board for the HCI attempted to commission a chapter on ‘cultural and linguistic diversity’. Potential authors when contacted wrote that they could write on one or the other of the topics but not on both. What this means is that there tends to be little sense of community among scholars across topics and preoccupations. People may be in different departments, attend different professional meetings, write in different journals, and so forth. The advantage of this is that their preoccupation with practical matters and improving the world permits the growth of knowledge on important educational curricular problems. The downside is the lack of a sense of community. It is here that curriculum theory could play a role as it might knit together the main themes and curricular insights of the various practical and contextual curriculum inquiries.

But what is context? The simple answer is that it depends. It depends on the topic or preoccupation and the particular way questions are asked. The preoccupation with the topic of curriculum development and educational reform is illustrative. Westbury's HCI essay began by noting the international trend toward national, government directed, curriculum development. He asked why states develop curricula, why doing so is so attractive at this time in our history, and how effective can states be. For Westbury, the principal context for examining this question is the set of reasons state planners and politicians

offer for chosen curriculum directions and how state decisions are organized and conveyed publicly.

Westbury's analysis is different from that of Fullan who treats the same topic. Fullan casts the problem in terms of forces and factors for and against the state's successful implementation of policy goals. Thus, for Westbury, the context for this topic is the logic and rationale offered by policymakers, and for Fullan it is the tactics and strategies of policy implementation. Both Westbury and Fullan tackle the same broad topic with a similar sense of the overall problem, namely, that governments have taken on curriculum development responsibilities and have been notoriously ineffective in terms of impact. Both offer highly contextualized accounts. Westbury's inquiry has a somewhat abstract, analytic quality, while Fullan's inquiry tends to be more pragmatic and operational. Their contextual analyses are so different that writers in the Westbury mode tend not to cite those in the Fullan mode and vice versa, though both agree to the main problem, and both agree with the main effects.

Working in the same topic in the handbook, Apple, drawing on his influential writings on the distribution of power relations in education (e.g., Apple, 1995), tackles the same problem by starting with context; that is, he begins with power relations and works from there. For him, context is the matrix of power relations that exist in educational institutions and practices. He sees educational change in terms of shifts in power relations which result in social movements. Thus, for him, the appropriate context for understanding curriculum development is the social movements within which governments, policymakers, and curriculum developers operate. It might be said that a move through the work of Fullan, Westbury, and Apple is a move through different contextual levels such that Westbury's state-wide rationales and logical forms are the context for Fullan's tactics and strategies; and Apple's social movements and shifting power relations are the context for Westbury's analysis.

Contexts have this quality of being dependent on the way people ask questions and, somewhat like an ancient Chinese pagoda, of one strata unfolding to reveal yet another. For instance, when Anderson-Levitt asks questions about curriculum development and educational reform she does so by drawing on her own and others' (e.g., Meyer and Ramirez, 2000) work which takes educational systems in the world as context. She understands the problem of curriculum change and reform as one of globalization and internationalizing of the curriculum and she discusses processes of cross-cultural curriculum transition. Again, Anderson's topic is closely related to that of Fullan, Westbury, and Apple, but she comes at it with a different notion of context, one which might be seen as context for Apple's context.

Things, of course, are never quite as simple as suggested by the unfolding pagoda's notion of boxes within

boxes, or contexts within contexts, since contexts interact and intermingle both in the world of reality and in curriculum inquiry. The separation of contexts as presented above tends to overstate contextual independence. All deal in some fashion with the contextual matters most important to others. For example, Fullan, Westbury, and Apple acknowledge Anderson-Levitt's global context. Luke's handbook idea of eduscapes lets him name and symbolize the blurring and blending, and intermixing of contexts that marks this expanding and important broad area in curriculum inquiry.

Curriculum Subject-Matter Development

This brief section is not aimed at covering inquiry in the various curriculum subject matters. That is dealt with elsewhere in the encyclopedia. There are, however, developments in the idea of curriculum subject matter, its content, and how it is conceived. This section provides a brief sketch of these developments.

A comprehensive review of disciplinary, practical, and experiential conceptions and philosophies for the organization of curriculum subject matter is found in Deng and Luke's handbook chapter. Though much of the ground they cover has a recognizable status in curriculum inquiry, this ground has renewed significance given public and political discourse, primarily in the United States, Britain, and Australia, over achievement and the foundational role that basic disciplines may play in curriculum subject matter. Their analysis is particularly relevant for states where the main educational questions revolve around what knowledge should be taught, what level of achievement is desired, and how it is measured.

Curriculum subject matter is increasingly studied in contexts other than disciplinary origins. There are several developing contexts: cultural, classroom, pedagogical knowledge, and personal practical knowledge. School subject matter is traditionally conceptualized in terms of logical, epistemological psychological, pedagogical, and sociological matters bearing on its use in a classroom environment. Curriculum subject-matter inquiry is different from traditional ways of relating school subject matter to disciplinary knowledge, and it is different again from a cultural context approach and from pedagogical and personal practical knowledge approaches. The German *didaktik* is related to all of these contextual approaches in that its focus is on subject matter in classrooms, and teachers' and students' relationship to it.

The emphasis on disciplinary knowledge in the United States, the UK, and Australia is, in the overall scheme of things, not so much new as a recycling of intellectual traditions that come and go with the times. Mixed in with these moves, however, is the influence of technology. In her HCI chapter, Means shows how development and

research have moved from the early notions of technology as an efficient device for teaching subject matter and minimizing or even replacing teachers to what she calls a more humble approach. Not many years ago one of the mantras of curriculum inquiry and subject matters was the knowledge explosion. Now, the main impact on subject matter appears to be a tidal wave of access to information and knowledge through the Internet. Means notes that this results in access to approved standard-based curriculum materials, access to transformative curriculum materials, and access to curriculum processes such as assessment and curriculum decision making, and access to knowledge building tools. These developments have the potential to overwhelm the traditional textbook writing process which, regardless of prevailing ideologies and philosophies of knowledge, tended, at least at the secondary school level, to reduce to a process in which curriculum writers modified advanced college and university texts in various disciplines. That process is coming under siege.

One of the ways this transformation is occurring is through the production of student-oriented Wiki texts (Wikibooks, 2007). This process is only now underway. The old Dominion University approach, described in this citation, has a carefully planned research and development program over a series of years. There is an interaction between overall guidelines provided by course instructors, and texts produced by students. These student-produced texts are then used in subsequent courses, modified, and reused. There are numerous philosophical, cultural, ethical, and practical questions associated with this process. However, Wiki texts appear to hold promise and will increasingly be the topic of curriculum inquiry in the subject matters.

Movement to International Curriculum Inquiry

Curriculum inquiry has always been characterized primarily in local terms: how to influence this curriculum, in this situation in this classroom, and so forth. Local school districts were at the heart of the well known Eight Year Study. The tendency to localism in curriculum inquiry is understandable in terms of the fact that curriculum is at the payoff point of teaching and learning in educational thinking. But as shown above, one of the current marks of curriculum inquiry is its attention to context. Increasingly, one of those contexts is globalization and the internationalizing of curriculum (e.g., Meil, 2003). The HCI has a section on internationalizing the curriculum; people like Pinar are shifting their attentions from theory to international matters (which, of course, constitute theoretical issues); and the writings of anthropologists and world culture sociologists such as Anderson, Anderson-Levitt, Baker, and Meyer are filtering into curriculum studies.

Modern technology, communication, and transportation are speeding up the process as the world is increasingly thought of in terms of a global village. Historically, as Deyhle in her HCI chapter shows, curriculum has always been influenced by transmigration and by colonizing cultures. Anderson-Levitt describes anthropological and sociological world culture theorist approaches which are aimed not only at understanding curriculum in specific international cultural contexts but also at understanding how curriculum travels and is adopted and influenced as world culture changes. Westernization of curriculum is at issue in the world culture literature. Similar inquiries may come to the forefront relative to Chinese and other Asian cultures. Following her review of the literature, Anderson-Levitt concluded that there is a move to curriculum uniformity around the world. She also pointed out, however, that commonalities were most noticeable at the level of policy and curriculum materials. At the actual classroom instructional level, local adaptations and modifications tend to maintain diversity.

It appears that international curriculum inquiry may have a leavening effect on the intensity of ideological debates that frequent the literature. Anderson-Levitt, citing others, suggests that international curriculum inquiry reveals different ideological systems coming to somewhat similar practical educational ends. The opposite, of course, may also occur. Xu's (in press) work on the narrative origins of immigrant ways of knowing and being sheds light on the profound influence of historical contextual/cultural knowledge structures on how education takes place as cultures interact.

Development of a Theoretical Curriculum Inquiry Literature

As noted above, one of the main debates in curriculum inquiry has to do with the development and role of a theoretical literature. Pinar *et al.* (1995: 6) wrote that the reconceptualists moved away from practice and were "preoccupied with understanding." "Understanding," as Schwab showed, is the appropriate end in the natural sciences and other theoretical disciplines. In the HCI Pinar summarizes the reconceptualist's current purpose as: "a multi-discursive academic effort to understand curriculum: historically, politically, racially, autobiographically/biographically, esthetically, theologically, institutionally and internationally, as well as in terms of gender, phenomenology, post-modernism, and post-structuralism." The theoretical literature aimed at understanding is too massive to summarize here. In addition to Pinar's comprehensive overview, there are other summaries.

This rich and intellectually exciting literature is distant from practice and has little effect on it. Though theoretical possibilities are hardly exhausted, one might

imagine that the attraction this literature has for the self-development of its writers (Kridel, 2006) may tend, over time, to be replaced by more practically oriented inquiry. The following section explores this possibility.

A Focus on Practice and a Move Toward the Integration of Practice and Theory in Curriculum Inquiry

Schwab's argument that the aims of curriculum inquiry should be practical doings rather than theoretical understandings has been widely misinterpreted in the literature as meaning that Schwab, and those who worked in his tradition, wanted simplistic practical work on methods, curriculum development, and so forth. It is sometimes said that this practical line of work was dominated by the disciplines in such a way that conceptual, intellectual, and contextual matters were relegated to minor factors under the auspices of foundational disciplinary thinking. Ironically, however, and notwithstanding its rich, nuanced, postmodern thought, the understanding literature is more akin to the disciplinary movement than was that of Schwab and his followers. Schwab was a dialectician and proposed the interweaving of theory, practice, context, and criticism within a practical doing starting point framework. To take a simple example, his methodology for bringing practical, public, and theoretical factors to bear on curriculum situations was what he called deliberation and the eclectic application of theory. Fox (1985), a student of Schwab's, illustrated these ideas in the workings of curriculum planning teams. Aimed at practical solutions and considerations, the work of these teams was complex, requiring assessments of the practical situation involved, representation of participant voices, evaluation of possibilities among teachers, learners, subject matter and milieu, and the assessment of an eclectic array of theoretical resources. Craig and Ross in their HCI chapter document several programs of research following in the practical tradition.

Connelly and Xu's (2008) assessment of this matter based on their reading and interpretation of current reviews of the field was that when the field of curriculum inquiry is taken in its entirety, that is, subject matter, topics and preoccupations, and general curriculum/curriculum theory, there is evidence of a theory/practice dialectic taking place, primarily within context. Practical issues and problems are increasingly thought through in terms of a mix of theories, and some theoretical writings are carried out as explorations within the topics and preoccupations. Moreover, while theoretical understanding is still a goal of a small body of theoretical curriculum inquiry, the bulk of curriculum inquiry defined by subject matter and the topics and preoccupations originates in practice and in context and is aimed at improving curriculum situations.

Ongoing Puzzles for Curriculum Inquiry

Solutions and deliberative resolutions in curriculum inquiry always remain open. The same is true, but in a somewhat different sense of course, for the theoretical fields where understandings tend to pass the test of time and require major conceptual revolutions to modify. However, in practical fields such as curriculum inquiry a reconfiguration of the many factors and forces at work will catalyze an apparently settled matter. Accordingly, a very long list of ongoing curriculum inquiry questions might be drafted. Instead, named, with little discussion, are five such puzzles that, for this time, are more than ordinarily noticeable.

1. *What happens to curriculum inquiry in state policy development and implementation?* As states increasingly take on comprehensive policy formulation roles, there is concern that curriculum scholars will be marginalized. Policy formulation and implementation at the state level can be dominated by political and technical qualities. This puzzle of what role curriculum inquiry should or can play differs from state to state and, judging from the literature, is of most concern to curriculum scholars in the United States. The balance of public opinion, political policy, and curriculum inquiry in curriculum reform needs to be carefully studied worldwide.
2. *Can school reform make a difference?* The potential effects of policy reform, whether by states or by professional, academic, and other associations, shares disappointing results. Some believe that more adequate implementation technology will improve the practical impact of policy, others think that broad social effects overwhelm what might be accomplished within education, and still others believe that the purpose of state policy formulation is primarily a political act designed to assuage public opinion. This puzzle needs to be studied in different political contexts worldwide.
3. *Diversity: What is it and how to think about it in curricular terms?* The idea of diversity was, at one time, perhaps, most noticeable in curriculum under the rubric of individual differences. Diversity is now a broad postmodern notion pointing to variation and alternative possibilities in curriculum inquiry. Comparatively new diversity constructs have evolved into the broad notions of race, class, and gender. But the concept has taken on the intellectual role of a way of thinking about curriculum matters. This way of thinking has profound consequences for states, and local settings, where singular, perhaps certain, views of curriculum matters exist. Research is needed on how diversity and cultural norms interact in a world of accessible knowledge and cultural mobility.
4. *How to think about different ways of knowing and being as cultures interact?* Transmigration is reshaping the curriculum-for-immigrant-education question from

one of cultural adaptation to one of reciprocal, mutual reeducation. Curriculum inquiry is needed on cultural reciprocity and mutual learning as cultures intersect in different ways, in different places, throughout the world.

5. *How to maintain diversity and cultural equality in globalization?* This puzzle is related to the last. The puzzle has tended to be conceptualized in terms of Western curriculum colonization, but with shifting global patterns it appears the issue will take on a different complexion. Curriculum inquiry is needed on the conditions that affect diversity and equality as cultures intersect; and inquiry is needed on a global scale to track international value systems bearing on the curriculum.

Glossary

Illuminative evaluation – This uses naturalistic methods to identify underlying factors and issues important to participants.

Naturalistic evaluation – This is responsive and involves the use of qualitative methods for the collection and analysis of data generally to complement the evaluation design.

Portrayal evaluation – This uses data collected using qualitative methods to provide description of the context and participants of the evaluation.

Transactional evaluation – This provides data about the processes and exchanges between the evaluator and the participant.

Curriculum evaluation, as a field of study, is dynamic. For over the years it has been responsive to the developments in the conceptualization of curriculum and the associated processes of curriculum change. The concept of curriculum is integral to curriculum evaluation and can be defined in terms of what can and shall be taught to whom, when, where, how, and why. Much of the decision making relates to what knowledge is to be selected for inclusion in the curriculum. The term curriculum is often used to refer to the programs of teaching and learning with some theorists emphasizing the content, standards, or objectives while others give more attention to didactic choices such as the teaching methods and pedagogical strategies used. In this article, a consideration of terminology, that is central to an understanding of the nature and development of curriculum evaluation, is given first. A historical overview and an outline of the approaches and the developments in the methodology of curriculum evaluation follow with some recent trends in the context of test-based accountability and the use of assessment data included. How these developments are seen to drive educational evaluation, in general, and curriculum evaluation, in particular, is taken into account.

Curriculum in terms of policy is best understood in the context of levels, from the broadest level such as the education system through to the level of the classroom. The emphasis in the curriculum in terms of the knowledge selected to be taught will vary depending on the context. At the level of the school, the curriculum is classified in terms of the subject such as the mathematics or the science curriculum. Such selections of knowledge are further

described in terms of: scope and sequence; syllabus; content; standards; textbooks; course of study; and planned experiences. The decision making involved from the origins of the curriculum through to implementation include choices regarding the range of subjects, disciplines, activities, subject matter, sequence, settings for learning, assessment, teacher development, and the like. In this context, there are competing viewpoints and interest groups and therefore curriculum development has been considered a political activity that involves political decisions.

Evaluation has been defined as the processes of description, analysis, and judgment of educational programs, practices, institutions, and policies for a range of purposes. Assessment is the term used most often in relation to student learning or performance and relates to the activity or task designed to show what a person knows or can do. Assessment constitutes only a part of evaluation in connection with a concern for the outcomes of a course, curriculum, or program.

Any evaluation project, will either explicitly or more often implicitly, contain within it a constellation of answers to certain key questions about its purpose (Why is this evaluation being undertaken? Who is sponsoring the evaluation? Who is conducting the evaluation?); ethics (Whose judgment counts? What rights do those being evaluated have?); political stance (Who is the audience? How is the evaluation reported? Who will take action as a result of evaluation?); and procedural choices (How is the evaluation to be carried out? Whose criteria of value are being applied?) (Harland, 1994).

Evaluation of curriculum involves determining the value or worth of particular products or processes that can include learning objectives, documents, or experiences for the purposes of informing decision making about the curriculum. Individuals, organizations, communities, and governments engage in curriculum evaluation to maintain, develop, or modify a particular curriculum program, policy, or practice with a view to implementation, development, or change. Curriculum evaluation can be conducted for formative or summative purposes. Formative evaluation of the curriculum fulfills a role in improvement, development, or modification and is conducted as curriculum is evolving. Often, it is carried out concurrently providing feedback into those processes of development and implementation. Summative evaluation on the other hand takes place generally to assess the outcomes, the merit, or worth of a particular curriculum.

Summative evaluation also informs decision making about whether or not a curriculum is considered worthy of continued support or adoption.

Curriculum evaluation serves different purposes ranging from providing understanding about how to improve a particular practice or program to providing proof that productivity and efficiency gains have been achieved by the implementation of a particular curriculum practice or program. Chelimsky's (1997) categorization of evaluation purposes is helpful. She has identified the purposes of accountability (measurement of results or efficiency), development (to develop or improve), and knowledge (deeper understanding of practice or policy). The purpose of the evaluation of the curriculum will impact on the choice of methods used. A range of procedures and processes are used to judge the value or merits and the shortcomings of both current and emergent practices of curriculum in the education system for varying purposes, including regulation and policy development. Initially, curriculum evaluation was carried out to support the development and implementation of curriculum innovation; the maintenance of curriculum through curriculum evaluation came later with the move toward control of the curriculum becoming more evident in recent times.

Historical Overview

For many years, teachers and others have informally evaluated curricula using school-level strategies. Such curriculum evaluation has been situational or problem specific and has been conducted to meet the information needs of particular audiences. In conducting such evaluations, teachers have used methods such as observations, interviews, tests, and questionnaires to collect data for judging the quality of certain aims or learning intentions, materials, processes, and outcomes. Informal curriculum evaluation conducted by teachers has helped raise questions about the quality of choices made and the choice-making process itself in connection with the curriculum and the teaching and learning programs.

In more formal settings, the strong interactive relationship between the concepts of innovation (planned educational and/or curriculum change) and evaluation can be traced back to developments in the United States. For instance, in the early 1920s, curriculum theorists such as Bobbitt and Charters were strongly influenced by the forces of industrialization, and accompanying concepts of division of labor. Their analyses of the social role of the school curriculum led them to identify the need for specialized training and the adoption of the procedures of job analysis and aspects of scientific management theory for the construction of a differentiated curriculum based on educational objectives in preparation for adult life. In terms of curriculum evaluation, a further development

was the identification of definite qualitative and quantitative standards (Kliebard, 1992) and as is evident today, the efficacy of standardized curriculum via the use of standardized assessment has survived into this century.

By the mid-twentieth century, it was the launch of Sputnik by the Russians that inspired further curriculum development. In particular, it was the science and mathematics projects which helped foster a curriculum development movement that continued into the 1960s and 1970s both in the US and the United Kingdom. Growth in funded curriculum projects was of a scale never before experienced which helped generate evaluation activity. Increased government funding to update curricula in the 1950s and 1960s led to particular strategies for curriculum development and enhancement of particular subjects such as science and mathematics. With such increased spending on curriculum development, evaluation became mandatory. The focus on value for money led to curriculum evaluation that included quantification in terms of inputs and outputs.

These funded projects were accompanied by systematic evaluation activities which stimulated interest in the processes of change and innovation. Evaluators were asking not only how successful a given program was proving, but also why some programs succeeded and some did not, and why some contexts and implementation strategies were conducive to effective implementation and others were not. Sometimes the overall value of the planned change was questioned. Curriculum evaluation thus emerged as a response to the need to establish the worth of innovative curriculum projects. An academic and professional discipline of evaluation (Stake, 2004) was now required.

New methodologies emerged in order to understand the implementation of curriculum projects and the nature of the complexity of the curriculum change process. With changed methodologies, the awareness of ethics became more obvious and with a greater awareness of the intrinsic political nature of evaluation, the need to provide information for a range of decision makers became important. The increasing sophistication of evaluation theory and practice in the context of curriculum was significant in alerting both policymakers and practitioners to the political and cultural issues surrounding curriculum innovation and change. The theorizing about curriculum evaluation that followed led to various models and approaches to evaluation.

Although formal curriculum evaluation was originally associated with innovation and development, since the 1980s it has increasingly come to be used as a management and, indeed, as a control strategy. Evaluation is a political activity and the process of valuing existing curriculum practice and current curriculum policy developments is a potent influence on educational reform. Curriculum evaluation can be seen as a vehicle for giving

priority to particular values and for determining who gets what, when, and how. Today, it is a mainstream activity, part of many policy initiatives, often having an impact beyond its apparent function and still capable of providing an important window on the processes of implementing curriculum change.

Curriculum evaluation is concerned with evaluating a particular curriculum project or program which can lead to the evolution of a theory of how to change the curriculum. Curriculum evaluation can also use theory (such as organization theory) to interpret and explain what is being evaluated or it can look to theory at the methodological level in the analysis of data. Curriculum evaluation differs from theory in its direct concern with a particular evaluation or that which is being evaluated (Stake, 2004).

Approaches to Curriculum Evaluation

Approaches to curriculum evaluation have a bearing on practice and have paralleled developments in curriculum. Some early curriculum evaluation was characterized by measurement and the collection of factual information. A psychometric approach was dominant and geared particularly to assessing student attainment rather than policies and programs. Tests were used to evaluate the efficiency of teachers and schools in delivering the curriculum.

The objectives achievement curriculum model, popularized by Tyler (1949), was a reaction to the reliance on traditional content curriculum. This development coincided with the modernization of industry. Tyler's objectives model saw the curriculum behaviourally; the curriculum was evaluated in terms of student achievements and outcomes. This approach to curriculum evaluation concentrated on inputs and outputs, involved pre- and post-testing, experimental design, and had common sense appeal because it was direct and simple. The limitations of this model were soon identified. These included the practice of teaching to the test and a lack of consideration of the quality of the objectives. Issues related to curriculum and pedagogy were seldom pursued in such evaluations, and questions of why certain outcomes were not achieved were not taken into account. In this approach to evaluation, the curriculum, in terms of the teaching and learning programs, remained the black box.

Critics of this objectives achievement model of evaluation soon emerged with Scriven (1967) refocusing evaluation toward judging the merit or worth of the goals and whether the program was indeed fulfilling the client's need. He introduced the concepts of formative and summative evaluation and distinguished between the roles (function) and goals (what is to be achieved) of evaluation. Evaluation involved perceptions of value and estimations of goal achievement according to Scriven. Cronbach (1981) added to the debate and emphasized the importance of

usability over accuracy in evaluative criteria for improvement particularly in the examination of possible causes and effects of teaching quality. Cronbach was one of the first to use evaluation data for course improvement or to fulfill a formative function. Stufflebeam (1971) highlighted how evaluation could feedback into the decision-making process at the beginning, during the planning, and implementation phases of curriculum development classifying data as context, input, process, and product (CIPP). However, this approach focused mainly on administrative decisions.

Stake (1967) introduced countenance evaluation which distinguished between describing and judging in the process of evaluation. Many useful data for program evaluation were proposed by way of the countenance matrix. This matrix provides the data collection structure for the evaluator to attend to the intents and observations for description on the one hand and the standards and decision making for judgment on the other. Stake maintained that to evaluate a program it needed to be both described and judged. In this model of evaluation, capturing the notion of time was included by differentiating the antecedent, transaction, and outcome data. This was a major shift from a focus on the outcomes of education to the inclusion of the conditions and factors that impact on teaching and learning. Responsive evaluation which Stake (2004) describes as an attitude more than a model is a perspective that responds to the teaching and learning program to be evaluated and constitutes a search for quality. This approach is more responsive to issues in the program identified by different people and represents a further development, particularly methodologically, toward a more process-oriented approach. The teaching and learning program in the context of curriculum evaluation provides the stimulus and focus. There is acknowledgment of the differing information needs of the audience. A teacher will have very different information needs from the curriculum evaluation to those of a policy officer. In responsive evaluation, the focus is on the issues, the conceptual organizers (Stake, 2004) of the particular curriculum development program, rather than its intents. Different people's views will be engaged in the reporting of its success or failure. In this sense, responsive evaluation recognizes different sources and different grounds for valuing particular teaching and learning programs.

In the UK, for example, there was no such tradition of curriculum evaluation as in the US. There was no consistent model of curriculum design. A climate of accountability at that corresponding time was not pervasive. The model of curriculum evaluation that did emerge was one of informed professional judgment. Schools and classrooms became the sites of implementation and evaluation and the teacher-researcher movement in UK emerged as a response to teachers as agencies of their own improved pedagogy. The curriculum development movement in the UK was an opportunity to develop innovative curricula

which started with the Nuffield Foundation funded projects in the sciences, followed by the development of projects in the humanities sponsored by the Schools Council. Some of these curriculum projects were evaluated formatively by curriculum development teams while others were evaluated summatively by independent, external evaluators. A cadre of external evaluators emerged and a profession of evaluators began to be established. Teachers and local authorities rather than politicians were the audience for these evaluations.

The adoption of the research and development approach to one's teaching, either with peers or alone, became prominent with the take-up of the notion of teacher as researcher and the view that there could be no curriculum development without teacher development (Stenhouse, 1975). This approach which arose in response to the limitations of the curriculum objectives model defined the classroom process in terms of what the teacher should teach at the level of principles and what should be learned by whom, when, where, how, and why. This model of curriculum was more process oriented. It constituted a reaction against the focus on objectives, products, and knowledge to a focus on principles (the best criteria for the selection of content and pedagogy), processes (including both teaching and learning processes), and development (from expanding the amount of students' knowledge to developing their minds or improving the quality of their learning). Similar to reflective practice, this approach to evaluation developed into an action-research movement. School self-evaluation (Simons, 1987) also developed in this professional context to take account of the need to change the institutional context if one was to change the teacher pedagogy or curriculum within it.

With such curriculum-inspired development, approaches to evaluation emerged that enabled evaluators to more closely examine the curriculum development program, in terms of the processes and interactions at the local professional level of the classroom (Simons, 1987). These interactions included those between teachers, students, subject matter, and context. Attention to processes and experiences in the analysis of curriculum programs also helped reveal the complexities and the change potential of a curriculum program. Responsive evaluation, illuminative evaluation, and democratic evaluation (MacDonald, 1976) provided the necessary strategies for exploration inside the black box of the teaching and learning programs. The naturalistic evaluation paradigm which drew on qualitative methods for data collection and analysis and on human experience as the data source grew in significance. These changes evolved as the basis for evaluation broadened to include issues related to the implementation of curriculum. Different information was required by different audiences as evaluation was used to describe the quality and value of particular curriculum and was used to help explain why

some curriculum practices had shortcomings. Teachers too were developing insights into their pedagogic and assessment practices as they grew professionally from their active involvement in the evaluation process.

It became recognized that there was a need for different evaluation information for political and professional accountability purposes at the various levels from the center to the local dimension. The typology of bureaucratic, autocratic, and democratic evaluation (MacDonald, 1976) helped heighten awareness of the power relationships that exist among the levels of accountability and evaluation. MacDonald's (1976) typology of evaluation provided three categories of enquiry: bureaucratic, autocratic, and democratic. Bureaucratic evaluation involves service to government agencies. The evaluation is conducted within the value system of the agency and the information provided addresses the agency's policy objectives. The methods chosen to conduct the evaluation also have to be acceptable by the bureaucracy whose interests dominate. The evaluator does not control how the information is used and the evaluation report is owned by the bureaucracy.

Autocratic evaluation is conducted as a conditional service to government. The evaluator provides validation of a particular policy with recommendations that are to be met by the agency. The value system within which the evaluation is conducted is derived from that which the evaluator perceives to be the responsibilities of the bureaucracy. The evaluator is an expert advisor and must provide proof using methods acceptable to academic peers as the report remains with the bureaucracy, and yet can also be reported in academic journals.

Democratic evaluation, a form of process evaluation, is the type that MacDonald (1976) supported and developed. The evaluator provides an information service to the community about a particular curriculum or educational program. The sponsor does not have privileged rights over the evaluation. Different audiences and values are acknowledged. To achieve this requires methods and reporting that are accessible to nonspecialists. The evaluator represents the range of interests in identifying the issues and the various responses to the program. This approach emphasizes the rights to know about the program and the responsibilities of the evaluator to offer confidentiality to the informants. Such democratic forms of evaluation represent a wider range of perspectives and interests, involve more stakeholders in the evaluation process, and provide increased opportunities for dialog and deliberation (House and Howe, 2003). Evaluation that provides information for a wider range of decision makers requires an approach that includes teachers, pupils, administrators, and curriculum developers.

Process evaluation that operates within a participatory inquiry paradigm and a democratic ethic engages the practitioner in understanding the demands of the curriculum program, policy, or practice. In recent years, the use

of more participatory and democratic forms of evaluation that value dialog, engagement, relationships of trust, and respect for multiple values has become more evident.

Developments in the Methodology of Curriculum Evaluation

Closer analyses of curriculum programs, policies, or practices were made possible by more democratic and process forms of curriculum and evaluation. They provided greater understanding of the potential for change of the particular curriculum development. No longer was curriculum change and innovation considered only from a technological or professional perspective; political and cultural points of view were equally valued (House, 1978).

A technological perspective is permeated by concepts of rationality, stage, and sequence, and is often strongly normative in quality. From this view, a curriculum innovation is implemented and explicated using a rational, planned process with staged, sequenced procedures. Techno-rational discourse has tended to dominate such evaluations. In the latter part of the twentieth century, some education management, leadership, and school effectiveness studies of curriculum change were conducted using a classical, quantitative methodology to capture this rational approach and to explain causality. The evaluation methods that tended to dominate were psychometric incorporating quantitative data analysis of student assessment data to measure teaching and learning outcomes.

Evaluation and analysis of planned curriculum change, from a political perspective, documents issues and problems associated with the irrational, the self-interested, and the awkward in the process of curriculum change. The key concepts of power, ideology, resources, resistance, and negotiation are identified and the territory in which they operate is the local, or the specific institution; this is micro- not macro-politics. To capture the micro-political nature in curriculum evaluation, it is important for the methodology to include qualitative and illuminative methods such as interviews and classroom observations. The evaluator in this context has to build and sustain relationships to gain and maintain access. There is a need for the evaluator to observe the interactions closely to explore contingencies and the relationships between people and between people and events. The evaluator works closely and more interactively with those involved in the evaluation enabling a richer understanding of the complexity of curriculum change. However, to evaluate curriculum change as only a political process and to ignore problems such as understanding, identity, competence, or management is overly reductionist; it is important to consider the change from a cultural perspective.

Curriculum innovation from a cultural perspective not only acknowledges the importance of the political, but also involves a more complex understanding of change, involving not only political negotiation between the self-interested and differentiating powerful groups, but a recognition of the importance of change and pluralism in terms of values, beliefs, understanding, practices, relationships, and structures. The whole culture of the institution is important to consider from this perspective. This means to understand curriculum change fully requires an understanding of the general culture of the institution and the cultures of the groups that are embedded within. In a planning context, this implies that the management of curriculum change involves not only the development of structures and procedures, but also the development of a cultural sensitivity and insight, plus an ability to understand the meaning of change from a range of perspectives other than one's own. This is a significant departure from the rationalist classification of models and strategies developed within a technological perspective. To capture this level of complexity and understanding of curriculum innovation and change the evaluation methodology is more comprehensive and holistic engaging both quantitative and qualitative methods. In this methodological approach, there is collaboration between the evaluator and the teacher or respondent; the methods are more interactive and iterative, with greater collaborative efforts to understand and explain action. In this context, the teacher is both informant and judge.

The case study in curriculum evaluation has been described as the methodological counterpart of democratic evaluation (Kushner, 2002). In democratic evaluation, the purpose and function is to understand, to describe, and to judge the characteristics of the curriculum change, policy, or practice from multiple viewpoints; the evaluator is sensitive to the different values of participants. Case study is an appropriate method to achieve this purpose and requires the use of more extensive, naturalistic, adaptable, empirical approaches such as ethnographic fieldwork. Interview, observation, portrayal, vignettes, and narrative accounts are often used to provide thick description of experiences and information for analysis. Different models of evaluation such as responsive evaluation, portrayal evaluation, transactional evaluation, illuminative evaluation, and holistic evaluation, that can incorporate case study, give a richer understanding of the cultural, the political, the ethical, and the methodological.

Recent Trends in Curriculum Evaluation

Since the early 1990s, an international trend of growing dissatisfaction with existing educational practices and outcomes has led to increased educational reform.

At the same time, there has also been a worldwide shift in control of education away from teachers toward the state for the purposes of restructuring economies. More bureaucratic forms of curriculum have resulted, with a return to the use of more techno-rational discourse in evaluation for purposes of efficiency, accountability, impact, and performance management.

Today, what appears to have survived from the work of Bobbitt and Charters is the view by some curriculum developers of the identification of the skills, knowledge, capabilities, or competencies that will benefit the child in the future. These predictions of what one will need have become the bases for planning of the curriculum (Kliebard, 1992) with the use of standardized testing in curriculum evaluation to check the efficacy of standardized curriculum.

To illustrate the bureaucratization of curriculum, an example is given from the UK when in 1988 a national curriculum that was preoccupied with achievement in terms of student results was adopted. Evaluation took on primarily an accountability function. The national curriculum identified the content of programs, and the objectives and processes, in terms of targets or standards. The publication of league tables became a device for judgments about school performance. Evaluation was divided into two trajectories. First, evaluation directed from the center was embedded in the bureaucratic process of centralized curriculum. The use of inspection and punitive accountability systems emerged. Second, the tradition of school self-evaluation (Simons, 1987) went underground as the dominant focus reemerged of testing and achieving targets. There was a groundswell of school self-evaluation activity which was eventually overtaken by other forms of evaluation that focused on assessment and testing.

Internationally, policymakers and others have shown increased interest in international measures of educational attainment such as the results from the Program for International Student Assessment (PISA), developed by the Organisation for Economic Co-operation and Development (OECD) or the Third International Mathematics and Science Study (TIMSS) of the International Association for the Evaluation of Educational Achievement (IEA). These comparisons have influenced policy development, yet important questions of whether we are comparing like with like have not always been considered. When such comparisons are made, it is important that a common set of criteria is used for measuring performance, that there is comparability between samples and the reporting of the results, that there is a match in terms of the content of the curriculum and the approach used, and that regard is also given to context.

The results from such international comparisons have been used by governments to justify the introduction of ongoing curriculum change. For example, in the UK, the then Department for Education and Employment (DfEE) commenced a National Numeracy Project to address

perceived weaknesses, particularly in the teaching of mathematics at primary school level, after the publication of the results of TIMSS in 1996. This project was followed by the adoption of the National Numeracy Strategy, the National Literacy Strategy, and the Key Stage 3 Strategy by the Department for Education and Skills (DfES).

For curriculum evaluation, the consequence of such developments has been that – far from representing a relatively independent and/or predominantly professional activity – evaluation has been incorporated into the processes of policy development and system management. Effectively this has meant that evaluation is little concerned with debating fundamental value issues in the curriculum program or curriculum strategy itself, but is now incorporated into implementation. Some organizations and government agencies are reporting evidence from curriculum evaluation using a what-works approach. In an accountability context, the need to demonstrate performance is heightened and explicating what works is pursued. Schwandt (2003: 362) has described such knowledge as a commodity that is bought, sold, and applied. The value of dialog and deliberation with practitioners in evaluation to facilitate understanding of the challenges of diverse values in the context of practice has been recognized.

However, the combination of a what-works approach and evidence-based decision making has reinvigorated concerns relating to measurement, validity, and reliability of quantitative measurement. Some government agencies are demanding evidence-based policy and practice (EBPP), derived from randomized experimental designs, as a basis for intervention and pursuit of policy agendas. In this drive for efficient use of resources with the development of guidelines and frameworks to regulate and assess evaluation practice, caution must again be taken to ensure that we are comparing like with like. It is important that in the synthesis of evaluations for EBPP that outcomes have not been simplified and contexts have not been ignored.

Conclusion

As time passes, the purposes of curriculum change as do the purposes of its evaluation. The evaluator of a particular curriculum program or practice will identify the purpose of the evaluation first, then the most appropriate methodology to serve that function is chosen. Important methodological insights have been gained by evaluators over time as the purposes of evaluation have shifted from proving a particular outcome to gaining a deeper understanding of the practice or policy and how it might be improved by engaging with practitioners. The refocusing of approaches and methodologies has been accompanied with a growing understanding of the complexity of the interactions among the levels from the political center to the local professional level of the classroom.

However, in spite of the generation of democratic, responsive, and deliberative forms and purposes of evaluation it would appear that evaluation for accountability and control continues to impact on current practice as is evident in the reemergence of bureaucratic forms of curriculum and the return of quantitative, reductionist approaches as evident in No Child Left Behind. What also becomes apparent in the name of efficiency is a return to technological and behavioristic refinements of curriculum evaluation and a possible trivialization that threatens the richness of the intellectual activity of those involved in the discipline of curriculum evaluation.

Curriculum Studies, Discourse Analysis, and the Construction of Historical Time

J Laspina, Independent Scholar, Los Angeles, CA, USA

© 2010 Elsevier Ltd. All rights reserved.

In every society the production of discourse is at once controlled, selected, organized and re-distributed by a certain number of procedures, the role of which is to conjure its powers and dangers. Michel Foucault *The Order of Discourse* (Paras, 2006: 49)

As the current literature attests, the practice of discourse analysis has entered the educational research mainstream (Rogers, 2004, ix). The relationship of discourse analysis to the curriculum and the field of curriculum studies has always been strong. It developed in several phases internationally since the 1970s, starting with the sociology of education movement. A theoretical base may be found in the seminal work of Basil Bernstein, Pierre Bourdieu, and Louis Althusser on cultural transmission (Karabel and Halsey, 1977: 451–455). However, the theory of transmission articulated in their work is not a simple one-way process of communication in which a sender conveys a message directly to a receiver. Rather, in Bernstein's work, knowledge is produced through a complex linguistic interaction of regulative and instructional discourses. In Bourdieu, the school tends to reproduce the dominant cultural and social discourse of society. For Althusser, the institutional process that reproduces that dominant discourse takes the social form of hegemony in which a privileged class dominates through a sociopolitical process of conflict and contestation in which social resistance is neutralized and a hegemonic order is reproduced. One of the principal ideological mediums for this transmission is the curriculum (Apple, 1979).

Power, dominance, and the institutional structures that produce these discourses are the key themes of discourse analysis (Van Dijk, 2001: 301–02). In general, discourse analysis considers three social science domains, and its practice is shaped by at least six distinct traditions (Wetherell *et al.*, 2001: 5–6):

Discourse Domains

- the study of social interaction
- the study of minds, selves, and sense making, and
- the study of culture and social relations

Discourse Traditions

- Conversation analysis and ethnomethodology;
- Interactional sociolinguistics and the ethnography of communication;
- Discursive psychology;
- Critical discourse analysis and critical linguistics;

- Bakhtinian research;
- Foucauldian research.

Within these traditions two methodologies by Fairclough (1992) and Gee (1999) who have been influenced by the work of Bernstein, Bourdieu, and Althusser are presently widely used in the field of educational research (Rogers, 2004: 6–7). However, the purpose of this article is not to present a general exposition of these prominent methodologies of discourse analysis, but to present a historical overview of the turn to discourse in the field of curriculum studies. The method of discourse analysis applied herein is primarily historical, but with a Foucauldian emphasis on the way discourse is understood as fundamentally historicized, that is having meaning only in terms of a specific historical context (Hall, 2001: 74).

This condition reflects the most elemental feature or condition of discourse – its temporality (i.e., production occurs in time). To an inevitable extent, the historical representation of the postmodern turn to discourse in the field of curriculum studies is conventional as an interpretative representation of the seminal texts which are reviewed over a period of the last two decades. Consideration of these texts over time tends to highlight not so much how their ideas may change, as how discourse is constructed. In Foucauldian terms, this historical account of major developments in the field of curriculum studies may be analyzed as it coexists with other accounts. In such a historical analysis, the purpose is not to “treat . . . the representations that might exist behind the texts defining this development, but rather the discourses themselves as regular and distinct series of events” (Paras, 2006: 50). For that distinctiveness or variability is but a reflection of how discourse is produced. For if they are considered successively, the historical rendering of these accounts may better serve to expose the linguistic procedures and institutional resources supporting their ideality and ideological power.

In *The Production of Reason and Power: Curriculum History and Intellectual Traditions*, Thomas S. Popkewitz, states that

Curricula are historically formed within systems of ideas that inscribe styles of reasoning, standards, and conceptual distinctions in school practices and subjects [and that these] systems of reasoning embodied in schooling are the effects of power.

In a word, Popkewitz is calling for a curriculum history that acknowledges its power as discourse (Popkewitz, 2001: 151). In light of his ambitious project, this article has a more modest objective: To present a historical overview and analysis of developments in the field of curriculum studies that disposed it to understanding curriculum as discourse. These developments are represented in three phases beginning with the postmodern turn to discourse in the field. In a Foucauldian sense this account is intended to present curriculum history as a historicized discourse.

Postmodernism and the Emergence of Curriculum as Discourse

A postmodern view of the field of curriculum studies tends to accentuate its temporal and ideological discontinuity. This discontinuity may be illustrated by three temporal and theoretical dichotomies:

- modern/postmodern;
- traditional/reconceptualist; and
- theorists/practitioners

The apparent binary is stressed because it can be used to illustrate the principal tenet of discourse analysis. According to Potter and Wetherell (2001), “people . . . us[e] their language to *construct* versions of the social world.” Being constructed, these “versions” or “accounts of events,” they note, “are built out of a variety of pre-existing linguistic resources,” and involve “active selection, some resources are included, some omitted.” This suggests that every account is a linguistic construct or version of reality, which in effect excludes other versions (Potter and Wetherell, 2001: 199).

The turn to postmodernism in the field of curriculum studies begins in the 1970s with the reconceptualist movement (Doll, 1993). Over the next three decades, the American reconceptualists introduced the European continental philosophical theories of phenomenology, deconstruction, and hermeneutics to the field. These disciplines require the conceptual movement of framing curriculum as text and the production of texts (Pinar and Reynolds, 1992; Slattery, 1995). For the reconceptualists, viewing curriculum as [text] signals the field’s entry into discourse.

But how do the reconceptualists conceive of discourse? With the publication of *Understanding Curriculum: An Introduction to the Study of Historical and Contemporary Curriculum Discourses*, they attempt to provide a comprehensive statement, a multivocal discourse that weighs in at over a 1000 pages, references included (Pinar *et al.*, 1995). In four sections and 15 chapters, the authors distinguish between discourses that are historical and those that are contemporary. For the authors, this distinction between past and

present, the historical and the contemporaneous, is meant to frame a paradigmatic shift in the field, which they describe as a conceptual movement “From Curriculum Development to Understanding Curriculum” (Pinar *et al.*, 1995: 3–11).

Invoking Kuhn (1962), the authors localize the production of discourse within fields which “are comprised of people with ideas working on problems – theoretical and practical . . . within institutional constraints” (Pinar *et al.*, 1995: 4). They stress that a field of study is a field of study, a study of language or discourse; that is:

To understand the contemporary field it is necessary to understand the curriculum field as discourse, as text, and most simply but profoundly as words and ideas. By discourse we mean a particular discursive practice, or a form of articulation that follows certain rules and which constructs the very objects it studies. Any discipline or field of study can be treated and analyzed as such. To do so, requires studying *the language of the field*. (Pinar *et al.*, 1995: 7)

The notion of text as the source of discourse can be viewed in the broadest of terms as: words and ideas that are spoken, written, or represented in multiple media. Three conventional examples are noted:

- enunciation as in speech acts (e.g., Fairclough and Gee’s methods of discourse analysis in large part describe and analyze the discursive relations and social practices embedded in ordinary language and discourse, see Rogers, 2004: 4–6);
- any or all written official documents involving the formal institutional aspects of schools and their organization, for example, state-approved curriculum frameworks; and
- any text representation of knowledge, for example, instructional textbooks, which figure prominently in *Understanding Curriculum* (Pinar *et al.*, 1995: 11–24).

Much hinges upon this from/to turn of phrase. For the reconceptualists, it serves as a conceptual crux to distinguish postmodern theory from modernist curriculum practice. The conceptual movement to an understanding perspective versus viewing curriculum development as action, that is, a prescribed set of industrial procedures in which a course of study is produced, represents the still dominant modernist paradigm of curriculum represented by Ralph Tyler (Slattery, 1995: 245–246). In effect, their pronouncement is meant to be taken as the ideological point of divergence. To make this point, they use a generic view of curriculum development by Decker Walker to highlight the difference between theory and practice. Walker states that

The one term “curriculum development” covers at least three distinguishable enterprises: *curriculum policy making*, the establishment of limits, criteria, guidelines, and the

like with which curriculum must comply, without developing actual plans and material for use by students and teachers; *generic curriculum development*, the preparation of curriculum plans and material for use potentially by any students or teachers of a given description; and *site-specific curriculum development*, the many measures taken in a particular school or district to bring about curriculum change there. (Pinar *et al.*, 1995, 665)

The reconceptualist advance reveals a long-standing debate in the field, between theorists and practitioners. Walker and Soltis (2004) consider this debate over curriculum development by going to its source: Schwab's (1970) landmark essay, *The Practical: A Language for Curriculum*. Walker and Soltis observe that

Schwab states flatly that the curriculum field is "unable, by its present methods and principles, to continue its work and contribute significantly to the advancement of education. . . . [It] has reached this unhappy state by inveterate, unexamined, and mistaken reliance on theory.' The field will only recover . . . "if curriculum energies are in large part diverted from theoretic pursuits . . . to three other modes of operation . . . which differ radically from the theoretic . . . the practical, the quasi-practical, and the eclectic" (2004: 59).

These three alternatives, Walker and Soltis observe, are practical paths of approach that reorient the field back to practice, deliberative paths of action that may be taken in "specific situations" (2004: 59). Theories, they argue, have merit only for their "applicability and usefulness in a particular case" (Walker and Soltis, 2004: 59).

Null (2006) places Schwab's *Practical* within a "deliberative tradition" that has both a classical and contemporary pedigree. In Null's introduction to a new edition of William A. Reid's *The Pursuit of Curriculum*, he places Schwab and Reid in a philosophical lineage that reaches back to Aristotle's *Ethics*. He notes that the distinction Schwab makes between the theoretic and the practical is simply a restatement of Aristotle's distinction in the *Ethics* between intellectual and moral virtue, how each play a complementary role in shaping and informing the deliberative acts of everyday life (Null, 2006: xiv). Null, however, adds little to easing the debate in the field that Schwab's challenge poses. In a direct reference to the 1995 opus, *Understanding Curriculum*, Null coolly states that "instead of the development of understanding, the purpose of practical inquiry is to arrive at a decision about what we should do at a particular time and within a particular context" (Null, 2006: xiv).

Another alternative path of curriculum discourse analysis that moves beyond this narrowly defined debate is suggested by Posner's (1995) *Analyzing the Curriculum*. Posner transcends the political dichotomy between theory and practice, by advancing an approach to the curriculum

that he calls: "Reflective Eclecticism," which wisely makes the two elements complementary. In the terms of a discourse perspective: the theoretic and the practical are recursive aspects of Null's deliberative intellectual process, but in a more open transformative field of discursive production.

Posner accepts the power of theory, but argues that critical analysis of curriculum requires an eclectic approach to theory (Posner, 1995: 255). Posner cites five "perspectives: the traditional, experiential, structure of the disciplines, behavioral, and cognitive," but is careful to note that these only "summarize, many, but certainly not all, approaches curricula may take" (1995: 46). Posner's conception of a perspective and the reconceptualists idea of viewing curriculum as text may simply be an academic one. Within Posner's alternative framework of reflective eclecticism, the discourse of modernism and the post-modern perspective represented in *Understanding Curriculum* (1995) appear to comfortably coexist. In the reconceptualized view of the field, curriculum as discursive text is mapped in multiple perspectives Pinar *et al.*, 1998: vi–x):

- Historical Text
- Racial Text
- Gender Text
- Phenomenological Text
- Post-structural/Deconstructed/Postmodern Text
- Autobiographical/Biographical Text
- Aesthetic Text
- Theological Text
- Institutionalized Text
- International Text.

Curriculum as International Discourse

The historical account rendered up to this point is largely an account of pivotal developments in the American field. The narrative arc may be characterized as one of extension and consolidation. The intent of the reconceptualists was to move their understanding of curriculum to an international stage and forum. Curriculum comes of age as discourse within the international field in the decade of the 1990s. A major expression of this development is the 1992 publication of the magisterial *Handbook of Research on Curriculum* edited by Phillip W. Jackson and produced by the American Educational Research Association (AERA). Pinar *et al.* (1995) rely heavily on Jackson (1992) in the opening chapters of *Understanding Curriculum*, which frame curriculum as a historical text (see Section II, chapters 3 and 4, pp. 67–240). If the *Handbook of Research on Curriculum* represents the paradigmatic consolidation of curriculum as a national discourse, its exhaustive structural mapping of the discipline still situates the field

firmly within the modernist confines of the nation-state system and the research and development (R&D) complex of the American university.

The AERA project on curriculum provided a model that the reconceptualists would reproduce, albeit in international terms a decade later. The *International Handbook of Curriculum Research* (2003) “represent[ed] the first move in postulating an architecture of a worldwide field of curriculum studies” (p. 1). Another publication appearing that year, which also heralds the consolidation of curriculum as discourse is *The Internationalization of Curriculum Studies* (2003), which is a volume of “selected proceedings from the LSU Conference 2000.” The conference sponsors traced the idea for the project to a conference held at the University of Oslo, Norway, in August 1995. The intent of the conference sponsors is indicated in their conference publication, *Didaktik and/or Curriculum: An International Dialogue* (Gundem and Hopmann, 1998).

Like the later Louisiana State University (LSU) conference, *Didaktik* was an early articulation by the field that considers the advent of globalization and its impact on education systems worldwide. It views these developments as an opportunity for dialog “across national borders” on “curriculum research and development” (1998: 1). The conference sponsors saw a definite “obstacle” to international “cooperation” and “inter cultural communication” because of “differing attitudes” to curriculum “planning and implementation,” more generally, development (1998: 1). The conference explored the complex national and cultural differences between just two “basic models” and “sets of attitudes” for teacher education. The two models are the North American “Anglo-Saxon tradition of *curriculum studies*,” and the “Central and North European tradition of *Didaktik*” (1998: 1). The term *Didaktik* has no literal equivalent in English and its precise meaning is refracted through regional linguistic and cultural idioms of Scandinavian and German pedagogical institutions. In its elemental sense, the term *Didaktik* is meant to convey a “comprehensive intertwining of action, reflection, practice and theory” (1998: 2).

By contrast, the 2003 *International Handbook of Curriculum Research* frames the problem of international dialog in terms of power. The problem is compounded not just by linguistic and cultural diversity, but by the political structures that tend to undercut the possibility of a democratic dialog (Trueit, 2003: xii). In his opening remarks to the LSU conference, William Pinar, the leading reconceptualist in the field, addressed the attendees by referring to America as the narcissistic center of the field. If American dominance is a threat to a level playing field of curricular discourse, so too, in Pinar’s opinion, is globalization in its perceived rush to reduce curriculum studies to a new market (Pinar, 2003: 5).

Nevertheless, the LSU Conference, which was held at Louisiana State University in April, 2000, was used as a platform to launch the first international association of

curriculum scholars (Pinar, 2003: 1–2). On 30 April 2000, the first organizational meeting of the International Association for the Advancement of Curriculum Studies (IAACS) was held. At that meeting, the mission of the association was articulated. The mission of the IAACS is:

To support a worldwide—but not uniform—field of curriculum studies [that does not mirror] the standardization and uniformity the larger phenomenon of globalization threatens. . . . Our hope, in establishing this organization, is to provide support for scholarly conversations within and across national and regional borders about the content, context, and process of education, the organizational and intellectual center of which is the curriculum.

The discourse of academic research presented in the *International Handbook of Curriculum Research* is intended to stand as a bulwark against economic globalization and the standardization of curriculum studies. A major force for this standardization is the international educational publishing industry. The historical account of the reconceptualists view that advances an understanding of curriculum as discursive text, in hindsight may be understood as a major development in the field.

However, in a Foucauldian sense, as discourse, it is already radically historicized, bearing in its version of the field, the same internal contradictions of the modernist paradigm. Up to this point, two successive phases describing major developments in the field of curriculum studies have been represented: the national advance of the reconceptualist paradigm and its transnational dissemination and diffusion. This is less discourse analysis in a classical sense (e.g., as practiced by Fairclough and Gee), than it is a particular reconstruction of these developments through a selective examination of seminal documents and publications. The method is basic historiography, using narrative (a form of discourse) to represent the theoretical turn to discourse in temporal terms. The emphasis on narrative form is deliberate because it highlights its discursive construction.

The emphasis placed on narrative form highlights the complex interaction of form and content in textual representation. The concluding section of this article focuses on the denouement of postmodern trends in curriculum discourse by considering new formal conditions for narrative production that may be changing the order of curriculum discourse that the reconceptualists have labored to produce.

Curriculum as Digital Discourse: The Virtual Materiality of Textbooks

Since the advent of the public Internet in May 1995, knowledge can no longer adequately serve as an organizer

for curriculum. There is no means by which 125 000 new books or 300 million websites each year can be assessed, shaped, or organized. There is no way that the instant retrieval of all information can be filtered or controlled. The boundaries of our understanding, in all fields, have been overrun; there is neither scope nor sequence to the new information age. (Wiles and Bondi, 2007: 298)

The print version of the *International Handbook of Curriculum Research* (2003) where the IAASC mission statement appears, concludes not with a citation to a printed source, but with a URI: a Universal Resource Identifier which begins with the string of letters: <http://> (the Hypertext Transfer Protocol), and the now ubiquitous code: WWW (W3), representing the World Wide Web or more colloquially the Web (Berners-Lee (1999); W3C-World Wide Web Consortium.). The URI identifies the database source on the Web and <http://> code the computer protocol for transferring and connecting with that information source.

Between the publication dates of *Understanding Curriculum* (1995) and the *International Handbook* (2003) is a mere 8 years, but its paradigmatic significance for this account of curriculum as discourse may be portentous. With the advent of the Internet, this string of coded letters signals a vast fast-moving transition away from the cultural conditions that made the reconceptualists account of curriculum possible. An additional sign of this change may be discerned in the curricular order of things found in the print version of the *International Handbook* in *Part II: Thirty-Four Essays on Curriculum Studies in 28 Nations*. The organization of the 2003 *International Handbook* arranges the essays alphabetically starting with two on Argentina, followed by Australia, Botswana, Brazil (for which there are three entries), Canada, China, etc.

Other than A–Z, no discernable relation between the nations (presented in alpha order) as exemplars of curriculum discourse is apparent. Several conventions for ranking are obvious but inadequate: By region/continent, First World/Fourth, developing/postindustrial. The absence of a compelling form of exposition to present an international perspective on curriculum studies suggests that the medium adequate to its representation may only be in a protean stage. If the subject index of the *International Handbook* is correct, the use of the term Internet only appears once in 665 pages of text.

The synoptic textbook figures prominently in *Understanding Curriculum* (1995), but its authors have little to say that is positive about the second edition (1984) of the Wiles and Bondi textbook (quoted above in its 2007 edition). For them it represents the standardization and uniformity of the global educational publishing industry, the antithesis of curriculum as discourse. Nevertheless, Wiles and Bondi share a common perception that the Internet is transforming the textbook. Is it also a sign that the linear

narrative form of the 2003 *International Handbook* is inadequate to a new order of discourse emerging within digital culture? As the educational publishing industry is grappling firsthand with the transformation of print media by digital technology, it is one site where these conditions are prevalent. As a consequence, it provides a crucial site for curriculum research and possibly the terms of an emerging curriculum discourse.

In a series of studies tracking changes in the educational publishing industry that parallel the rise of the Internet, LaSpina (1998, 2001, 2007) examines the impact of digital technology on the design of social studies textbooks. Rather than focus on the instructional nexus of computers and textbooks, LaSpina begins with the textbook publishing design process and examines what happens when computers are introduced into that process. LaSpina observes that when computer-based graphic design is used in development of instructional textbooks, it transformed the linear narrative conventions of the expository textbook. When the narrative form changed, so too did the textual organization and structure of content in the textbook. LaSpina argues that changes to the formal order of text representation portend a larger transformation, the transition from page to screen.

The dematerialization of printed text and its virtual reconstitution is a sign of a new curriculum settlement, unapparent within the present order of curriculum discourse. The historical narrative of the transition to a postmodern paradigm of curriculum as discourse presented in this article, is meant to emphasize the historical method as a discursive practice to complement other approaches to discourse analysis, and to present new ways of seeing curriculum that are only understandable in the context of historical time.

Curriculum Use in the Classroom

M Ben-Peretz and B Eilam, University of Haifa, Haifa, Israel

Glossary

Commonplaces – They refer to the main issues and topics treated by curriculum developers in the development process: teacher, learner, subject matter, milieu (Schwab, 1973).

Curriculum use may be defined as the ways in which curriculum materials are employed, applied, treated, and even manipulated by several stakeholders in the educational world. Curricular materials mentioned are: syllabi; teacher handbooks or guidelines; textbooks; additional instructional materials, such as worksheets, films, tapes, and so forth; and materials for student assessment, tests, and other kinds of examination modes, such as questionnaires measuring attitudes toward specific subject-matter areas.

In this article, stakeholders are conceived of as representatives of three of the four commonplaces that Schwab (1973) suggested as the three main realms of curriculum, namely, learner, teacher, and milieu. The milieu is represented in this article by members of society. The mode of curriculum use by these stakeholders has far-reaching consequences. The article begins with the presentation of each stakeholder's mode/s of curriculum use based on relevant literature.

The modes of use in each case are analyzed on a continuum from low to intensive engagement with the curriculum. Low engagement refers to little active involvement, either as learners, teachers, or members of society. Intensive engagement means active involvement in decision making concerning the nature of curriculum materials. After presenting the uses of each stakeholder, an integrative, comprehensive model for analyzing curriculum use is presented, accounting for the nature of users and intensity of engagement with curriculum materials. In order to focus explicitly on the separate modes of use of each stakeholder, the interactions and linkages among the three are related throughout the text. Such linkages may have an impact on curriculum use. For instance, there may be a very strong demand by societal agents such as a Ministry of Education that teachers use National Curriculum as it is planned; or teachers' use may be shaped by learners' nature, for instance, in the case of new immigrants at schools.

Teachers as Curriculum Users

The following are possible distinct curriculum uses by teachers (Ben-Peretz, 1990). From research conducted in the 1980s on the way in which teachers used curriculum materials, the following modes were found to articulate different uses.

Teachers as Users of Teacher-Proof Curriculum

In this mode, teachers are expected to use the planned curriculum explicitly as it is prescribed. In order to achieve this goal, the curriculum presents teachers with minute details of the intended use.

Teachers as Curriculum Choice Makers

In this mode, teachers apply their own principles, criteria, and awareness of concrete circumstances to make decisions about the specific curriculum content, such as part of the textbook, to use in their teaching. Oftentimes, constraints constitute a strong component in this process. Another issue is the pedagogical tension between breadth versus depth in teaching any subject-matter area. Teachers may also be influenced in their choices by their understanding of the nature of students, their abilities, interest, or prior knowledge.

Teachers as Curriculum Adaptors

Teachers may act as curriculum adaptors who change the curriculum materials in response to the perceived needs of their students, or in line with their own interest and knowledge base. Fullan (1982) mentions the tremendous power teachers have to introduce any changes they see appropriate in the process of curriculum implementation. Teachers' adaptation of curriculum, and their attempts to introduce changes in existing texts, raises the problem of adherence to curricular guidelines or to curriculum materials. How far may teachers go in their adaptations without destroying the spirit and meaning of the planned curriculum they implement in their classes? Curriculum analysis may help teachers recognize the special characteristics of curriculum materials. Such insights may aid teachers in their efforts to interpret materials and to plan their lessons on the basis of this interpretation. The term curriculum

envelope has been suggested for describing the special characteristics of the planned curriculum. Inside this envelope, teachers may plan their own mode of use.

Teachers as Creators of Curriculum

Finally, teachers as creators of curriculum may create their own curriculum materials, based on specific general guidelines or syllabi, or completely independently. Teacher-based curriculum development may be called forth for a number of reasons. Special needs of student groups may require individualized curriculum materials which are not to be found commercially. The faculty of a school may decide to try to react to some societal problems, such as a high incidence of teenage pregnancies, through the local development of a course on family life and family planning. Because of the great sensitivity of such issues, it is necessary to bear in mind the specific beliefs and values of students, parents, and community while constructing such a course. Such school-based curriculum development (SBCD) may cover a whole school curriculum, or be confined to individual subjects or themes.

According to Marsh *et al.* (1990), “the term ‘school based curriculum development’ (SBCD) is used in various ways in the literature but typically as a slogan for devolution of control, for ‘grass-roots’ decision-making, and as a representation of the polar opposite of centralized education” (p. ix). Though there is a tendency nowadays to move toward more centralistic school systems, for instance, through enforcing standards, or the national curriculum in England, the practice of SBCD still seems to be occurring, and sometimes even flourishing. Marsh *et al.* claim that it is unlikely that schools will retreat to an isolated existence where parents and community have no say in curriculum matters.

At the site-level of SBCD, both personal and social processes have a strong impact on teachers’ use of curriculum. Fullan (1982) points out that beliefs guide and are informed by teaching strategies and activities and Miller and Seller (1985) go on to claim that personal factors affect implementation and use of curriculum materials. Miller and Seller (1985) argue that too often, implementation is centered on things, such as textbooks, teaching aids, and explanatory booklets. However, implementation is not as one-sided as it is often portrayed; rather, it is an interactive process during which the teacher adapts the program to his/her educational context.

The Notion of Curriculum Potential

One of the ways in which teachers gain ownership of the curriculum is through their imaginative use of curriculum potential (Ben-Peretz, 1990). Although curriculum materials are often perceived as the expression of their

developers’ intentions, Schwab (1973) warns us that these intentions convey the values of the developers only imperfectly and merely suggest ways of constructing teaching activities. Actual classroom experiences of the curriculum might serve to reduce the ambiguity of the stated intentions as well as modify them. Implementation of ideas and activities, which are proposed in the curriculum, turns these into concrete experiences. These experiences may correspond to the perceived intentions of the developers, but they may also serve different ends. It is important to remember that the notion of curriculum potential is dependent on the interaction between teachers and materials. Materials offer starting points, and teachers use their curricular insights, their pedagogical knowledge, and their professional imagination to develop their own curricular ideas on the basis of existing materials. The scope, variety, and richness of the curriculum potential embodied in materials are determined by the wealth of their content and the flexibility or rigidity of their structure. Good curriculum materials have many different potentials for diverse educational situations.

In terms of the continuum from low to intensive engagement with the curriculum, here the movement is from being users of teacher-proof curriculum to teachers as curriculum planners.

Learners as Curriculum Users

One of the most critical phases of the curriculum transformation model, suggested by Goodlad *et al.* (1979), is curriculum as experienced by students. Usually, the experienced curriculum is evaluated through measuring students’ achievement. The notion of learners’ experiences is expanded to include the process of actual interaction between students and curriculum materials such as understanding of text or manipulation of tasks. Students may play a role in evaluating curriculum materials. Overall, it is deemed important to give students a voice in curriculum matters. Frequently, classroom context determines to a large extent the role of students as curriculum users. The interaction of students with textbooks cannot be viewed as an entirely passive process. There is an implicit assumption that meaning is determined by the text itself. This approach neglects the reality of interpretation of textbooks by students. “Depending on social context and social psychological variables such as ethnicity, gender, social class, personality and psycho-pathogenesis, individual pupils may reach vastly different interpretations or decodings of one and the same text” (Kalmus, 2004: 470–471). These interpretations by students may be conceived as an important component of classroom curriculum use.

One of the modes of students’ interacting with the curriculum is in the form of a community of discourse.

Interpretive community is one in which constructive discussion, questioning, and criticism are the rule rather than the exception. Students and teachers alike have ownership of knowledge and experience but no one has expertise in all areas. Members of the community share their expertise through reciprocal teaching and collaborative learning activities. In such an environment, students may act as teachers and discussion leaders, thus having an active role in curriculum use.

In a constructivist classroom, students are viewed as thinkers with emergent theories about the world and teachers seek the students' points of view in order to understand students' conceptions for use in teaching. In this sense, students become part of the planners of curriculum use. This active role of students is opposed to their role in traditional classrooms, where students are often viewed as blank slates onto which information is etched by the teacher. Typical constructivist instruction asks learners to play more of the task-management role than in conventional instruction.

Self-directed learning represents an independent mode of curriculum use, through assignment, theme, and topics for students to learn by themselves (e.g., problem-based learning, inquiry, projects). Independent and self-regulated learning usually takes place in the frame of the mandated school curricula. This kind of learning may focus on several key self-directed learning processes: defining what should be learned, developing learning goals, identifying a learning plan, successfully implementing it, and self-evaluating the effectiveness of learning. Thus, students almost develop a curriculum according to the Tylerian rationale.

Among the salient approaches to involving students in curriculum implementation is, for instance, design-based science curriculum, learning and teaching through inquiry, or project-based classroom learning. Open-inquiry instruction is beneficial in engaging students at all levels of achievement in the learning process (Yerrick, 2000). "The 'just the basic' mentality and compromising science by watering down the curriculum for lower track students continue to perpetuate a learned helplessness for these students regarding scientific knowledge" (Yerrick, 2000: 231). In this case, allowing students to play a highly active role in the curriculum is a prerequisite of successful curriculum implementation.

There is an important message in these findings for the development of educative curriculum materials. In order to help students learn in the most productive ways, and be successful curriculum users, curriculum materials need to be designed to support teachers in engaging in particular teaching-learning processes and in addressing particular learning challenges. Teachers have to become aware of the positive impact of giving students an active role in the implementation of curriculum.

Homework may be conceived of as an extension of students' curriculum use outside the frame of school.

Almost all children at school all over the world are asked to do some kind of homework. In this sense, the curriculum comes home, where it is used, and not only in the classroom. There is generally consistent evidence for a positive influence of homework on achievement, especially in grades 7–12.

The movement here in terms of the continuum from low to intensified engagement with the curriculum is from students reading prescribed texts to students as independent learners in the inquiry mode.

Society as a Curriculum User

Society constitutes an important stakeholder. As stated above, society, the milieu commonplace includes members of society such as diverse societal groups, policy-makers, and parents. However, unlike the direct use of curriculum by teachers and students in the classroom, curricula serve to mediate between society and its goals and are used for achieving diverse societal goals and agenda. Such goals are constantly changing in accordance with the various contexts, local or global, as they are perceived in different times. Society and culture affect classroom use of curriculum as far as related to curriculum content and proposed goals. "Increased literacy demands and diversity in student populations are only two of several social changes affecting the scope and complexity of curriculum use in classrooms" (Sowell, 2000: 110). An example for curriculum fostering societal goals is the response of educators in the USA to the competition in space technology with the Soviet Union.

As long ago as the 1940s, Tyler regarded society as one of the sources of curriculum objectives, viewing the curriculum as serving societal needs. Curriculum scholars from the 1960s onward challenge the perception of society as a single entity, and called for a re-conceptualization of curriculum theories, which "always carry a privileging dimension that serves some groups and individuals, while simultaneously harming others" (Hlebowitsh, 1999: 345). They call for an increased sensitivity to social contexts and issues of race, ethnicity, gender, or social status, moving away from the imposing of control of one societal group over others (Hlebowitsh, 1999).

Social Class as Stakeholder

Curriculum dialog was enriched, becoming also more controversial, by the deepening and widening of perspectives regarding its use in schools and the revelation of the various mechanisms working behind curriculum use. Already, in 1981, in her well-known study, Jean Anyon called attention to school reproduction of unequal class structure (Anyon, 1981). Anyon demonstrated subtle

differences in the curriculum in use among schools situated in contrasting social-class settings. What counts as knowledge in these schools was found to be different along dimensions of structure and content. Curricula in the working-class schools were only partially used in comparison to elite schools, where high cognitive demands were placed on learners. By situating school knowledge in the particular social setting, Anyon showed how it contributes to contradictory social processes of conservation and transformation. Schools play a central role in both changing and reproducing social and cultural inequalities along generations.

Curriculum as Political Text

School was not perceived anymore as detached from ideologies or politics; rather, the term of ideological hegemony was coined together with the resulting belief that only a critical approach would undermine the reproductive forces and present individuals with alternatives (McLaren, 1989). Curriculum was perceived as a political text, aiming at the perpetuation of domination of the rich and strong over the weak and poor in society. The concept of the hidden curriculum has been used to describe all the implicit and tacit assumptions and ways in which knowledge influences behaviors and thoughts (Jackson, 1968). It is well understood that books, images, and media used in schools perpetuate negative racial and gender-related attitudes.

A recent example of a society's use of curriculum to respond to political needs is post-apartheid South Africa (Fataar, 1997). Placement of two million children in schools was viewed as central to rebuilding the country. The curriculum had to be changed from a colonial white curriculum to a post-colonial indigenous one. A policy of quantitative expansion of schooling should not ignore the quality of schools; otherwise, education becomes a factor contributing to social inequality rather than to social reconstruction.

Curriculum as Economic Text

The social dimension of curriculum use, societal utilization of curriculum in the classroom to achieve its own goals, may be best exemplified by literature reports concerning the preparation of students for labor in the current globalization and technological age. Although it is impossible to predict the future, one may recognize some core trends against which societal agendas may be evaluated. It is often indicated that characteristics of work are greatly changing especially concerning the demands for skills and technology, due to the rapid pace of changing economy and technology. Standards of efficiency, productivity, and quality are raised due to global competition

(Bishop, 1990; Smith, 1999). Various countries formed committees and initiatives to deal with employment-related key competencies while reevaluating and adapting national educational goals to face these changes (Smith, 1999). In the USA, national economic/educational goals were proposed in response to the skill gap. However, the debate concerning issues dealing with the need for preparing students for higher demands of workplace, and with the ability to transfer school-acquired procedural knowledge to the workplace, or the relations between education and worker productivity, continues.

In the past, some researchers suggested no necessary connections between education and workplace productivity (Bishop, 1990) or argued that such relationships between workplace characteristics and cognitive demands of workers were more complex and less direct (Smith, 1999). Kress (2000) suggested that demands of the coming era require education for instability rather than being directed for a certain disposition and cultural reproduction. He claims that present curricula in most Western states were developed to needs of nineteenth-century school, with its desire for "a homogeneously conceived citizen for that state" (p. 134). He calls for the dissolution of former frames and the emergence of new framings (Kress, 2000).

Parents as Stakeholders

Among the societal stakeholders in the curriculum domain, parents tend to play a central role (Klicka, 1998; OECD, 1997). Parents send their children to school so that they attain the necessary knowledge to function in the societal context and the labor market. The school curriculum and its uses are vehicles for achieving these goals. How much, if any, impact do parents have on the development and use of curriculum? Involvement of parents in curriculum development is usually lacking except in special cases of SBCE. On the other hand, parents' involvement in curriculum uses may be rather significant. Parents may play a role in assisting their children in school tasks, such as homework or projects. Usually their involvement reflects the provision of home support to their children in homework performance or learning for exams. Parents may also act as supporters, or obstacles, in the path of curriculum innovation.

Parents' involvement in the curriculum process, especially in reform movements, requires explaining the new approach of teaching and learning involved in the innovation. The most active and involved role of parents in the curriculum domain is in the context of home schooling (Klicka, 1998). Home schooling means that parents adopt the role of teachers including the planning of curriculum materials. Parents rely on numerous educational curricula and resources that are available to them. Independent

studies were found that, on an average, home-schooled children score above average on standardized achievement tests. This outcome reflects the skillful use of existing curricula adapting them to specific teaching situations.

The relationship between parental involvement and educational outcomes exists regardless of students' socioeconomic or race/ethnic background and regardless of whether parental practices occur in the middle grades or in high school (Catsambis, 2001). Parents as stakeholders come from different social, religious, ethnic, racial, or economic groups, drawing on different value systems, and relating differently to their children or to schools. It is certain that they all want the best for their children, but cannot agree on what best is, making it difficult to uniformly conceptualize parents' involvement in the curriculum domain.

A number of research projects looked at the relations between schools and parents in different social groups – immigrant parents and low socioeconomic status showed that active involvement of parents in school activities promotes students' learning and achievements. School activities may be in the form of classroom volunteers, being an integral part of the decision-making process at school, for instance, in curriculum matters. Parents, as educational partners, no longer feel intimidated by teachers but voice their opinions and suggestions for the school curriculum.

The term parent power refers to increased parental activism, expressed in increased numbers of parents' participation in various organizations and associations. It reflects parents' ability to pressure educational systems

to enact a curriculum that responds to their group needs. A current example is parents' involvement in the curricular debate concerning the teaching of evolution versus teaching creation (intelligent design). Present-day governments tend to support and legislate for parents' collective voice, expressed in parents' representation on policymaking bodies at the various levels and parents associations. An interesting survey has shown that one in three students learn in a school where his/her parents may influence the curriculum (OECD, 1996). Hoover-Dempsey and Sandler (1997) argued that three major constructs are center to parents' involvement in curricular decisions: (a) teachers' beliefs about parents' roles in their children's education, (b) parents' sense of efficacy for helping their children succeed in school, and (c) the perception that both child and school want parents to be involved.

In the case of society as a curriculum user, the move from low to high intensity of engagement has to be analyzed separately for each of the sub-groups mentioned above.

An Integrative Model for Analyzing Curriculum Use

Based on the analysis of each of the stakeholders' interactions with the planned curriculum, a model for viewing the complexities of curriculum use and the transformation of the planned into the enacted curriculum is presented (Figure 1). This model is presented in a visual

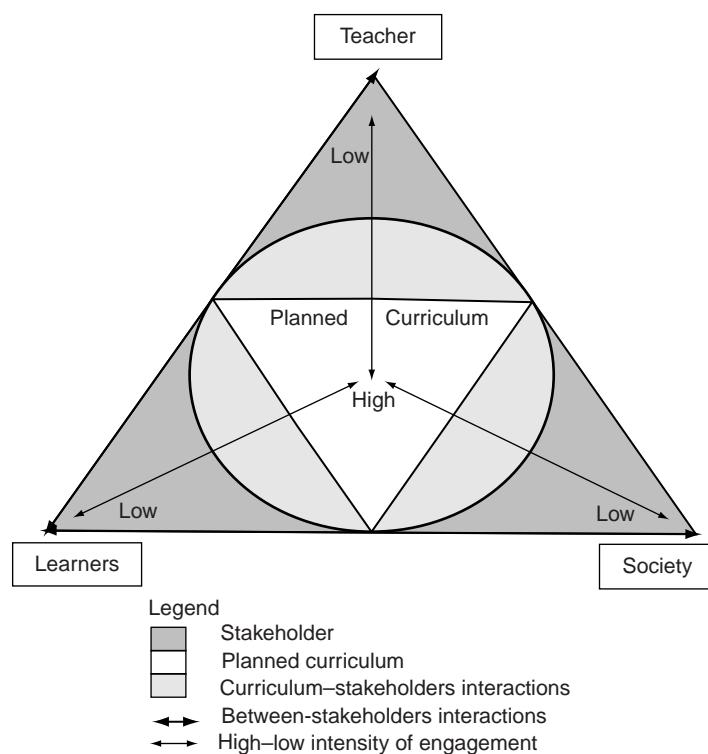

Figure 1 A model for analyzing curriculum use.

form, because the process of curriculum use is conceived as simultaneously involving three different stakeholders.

The model consists of a triangle, each apex representing one of the three stakeholders: teacher, learner, society. The teacher is placed at the top, because teachers are considered as main decision makers in curriculum implementation. A circle within the middle part of the triangle represents the planned curriculum. The three shaded parts of the model are formed by the interaction between the stakeholders and the curriculum, and represent the enacted curriculum. In order to remind readers of interactions among stakeholders themselves that potentially have impact on curriculum use (as mentioned before in the text but are not the focus of this article), two-way directional arrows are marked on the three sides of the triangle. The continuum from low to high intensity of engagement is marked by three arrows going from each stakeholder toward the planned curriculum. The closer a point on this continuum (arrow) is to the curriculum, the higher the intensity of engagement.

The novelty of this model presented here relates to two aspects of curriculum use: (1) viewing three different users whereas usually teachers alone are considered, and presenting their use as simultaneously enacted, and (2) conceiving of curriculum use as a continuum reflecting intensity of engagement – from low to high intensity.

This model has the potential to be used in studies of curriculum implementation and in the process of introducing teachers to the curriculum domain. The distinction between low and high level of intensity of users' engagement raises research questions that can be studied in relation to each of the subgroups of society, for instance, in relation to immigrant parents. Such a view of engagement allows curriculum researchers to go beyond the measuring of students' achievement as major factors in curriculum use. The continuum from high to low intensity of engagement provides refined insights into the understanding of stakeholders' impact on curriculum use and may enhance their possible involvement.

The Roots and Routes of Teacher-Based Action Research and Curriculum Inquiry: An Historical Perspective

L G Putney, University of Nevada, Las Vegas, Las Vegas, NV, USA

J L Green, University of California, Santa Barbara, Santa Barbara, CA, USA

© 2010 Elsevier Ltd. All rights reserved.

This article provides a historical perspective on developments underlying the relationship of teacher-based action research and curriculum inquiry. The exploration of the relationship begins with a historical journey tracing the roots and routes of different approaches to teacher-based or practitioner research across the past 100-plus years and moves on to factors related to their development. The historical analysis will show that the evolutionary path (Noffke, 1997) of teacher-based action research, curriculum inquiry, and practitioner inquiry is not an unbroken chain of developments, but rather a set of routes taken by researchers, educators, and practitioners at particular periods of time in response to particular intellectual, social, political, and educational conditions.

Reviews over the past six decades have shown that the approaches identified are known by various names, including action inquiry, action research, collaborative action research, emancipatory action research, ethnographic action research, narrative inquiry, participatory research, practitioner inquiry, practitioner research, teacher research, and teacher action research, among others (e.g., Cochran-Smith and Donnell, 2006; McKernan, 1987; Noffke, 1997; Wann, 1953; Zeichner and Noffke, 2001). The question framing this article, therefore, is what counts as teacher-based action research and curriculum inquiry across different periods of education research.

An ethnographic perspective guided this historical analysis (Green *et al.*, 2003) in order to identify the roots and routes of different approaches to practitioner inquiry, action research, and curriculum inquiry. This perspective framed the following questions, which are designed to make visible what gave rise to the approach, and what each was seeking to accomplish: Who are the practitioners? With whom are they engaged? When and where does the inquiry take place? What types of inquiry are undertaken? What purposes does the research serve for practitioners (and others)? What knowledge is generated? How is the knowledge used in practice? How is it shared with others? What processes are central to research that can be defined within the overarching categories of action and practitioner research?

These questions unearthed a common goal across the varied approaches: “the study of a social situation with a view to improving the quality of action within it” (Elliott, 1991: 69). These questions also made visible that those

developing the forms of action research often had one or more purposes: to develop knowledge for practice by practitioners (e.g., Winter, 1987) and/or to develop knowledge for informed social action by members of a community (Carr and Kemmis, 1986; Collier, 1945). Furthermore, in exploring the historical development of teacher-based action research and its intersection with curriculum inquiry, the goal was to identify the social, political, and educational conditions that led researchers and practitioners, at different periods of time, to take up this common goal uncommonly.

Uncovering Early Roots: Locating a Place to Begin

Elliott’s definition proved useful in uncovering the early roots of teacher-based action research; it focused the search on teachers studying their social situation, either alone or in collaboration with others. This framing of the problem immediately led to several reviews of literature, which mentioned forms of curriculum inquiry and teacher-based or action research, and which were used to identify the roots and routes taken in particular periods of time. A key review identified was the one by Kenneth Wann in 1953. He argued that the adaptation of action research methodology had a long and evolutionary history, marking the 1920s and 1940s as key points for major curriculum inquiry work to improve secondary schools. Wann (1953) noted, “The development of action research in schools represents an attempt to provide a research methodology which is suitable for study and solution of school problems in relation to the total social situation and which can be conducted by teachers as a part of their teaching activity” (p. 337). In concluding his review, he pointed to the need to examine how teachers are part of curriculum inquiry, and what supports and/or constrains such work. Wann also pointed to a need to examine the role of university-based courses and collaborations with teachers, and to a school’s capacity to engage in such inquiry, in order to gain a robust picture of teacher-based action research and curriculum inquiry.

Wann (1953) served as an anchor in time, driving searches both backward and then forward in time on Google and Google Scholar to identify additional reviews

and references to teacher research that predated those cited in the reviews identified. This mapping approach located a broad range of work in the US and abroad and also located historical books and articles that were not readily available in a search of our university libraries. Although the focus in the current article is on the US as an illustrative case, some of the routes presented include ones developed in the UK and Australia that had impact on US developments.

Route 1 – John Dewey and the Teachers of the University of Chicago Laboratory School (1896–1904)

In the 1899 edition of *The School and Society*, Dewey argued that teacher questions, knowledge, and actions in the laboratory school that he and his wife, Alice Chipman Dewey, founded (1896–1904) were the basis for developing theories of knowledge and inquiry. Dewey (1899) argued that “[t]he teachers started out with question marks and if any answers have been reached, it is the teachers in the school who have supplied them” (p. 116). The teachers’ questions served as a focus for discussions about the developing goals of the school and the curriculum focused on personal growth rather than mastery of a discrete body of knowledge – the curriculum prevalent at that time. In describing the goal of the school, Dewey argued that “[w]e have attempted to find out by trying, by doing – not alone by discussion and theorizing – whether these problems may be worked out, and how they may be worked out” (p. 120).

Dewey described these elementary school teachers as engaged in processes and practices usually reserved for higher education: devising, investigating, discarding if necessary, and defending new approaches to reading, writing, arithmetic, and other areas of activity that constituted the developing curriculum. For him, collaborative inquiry with teachers was critical to developing new principles and forms of pedagogy and curriculum, as well as providing a basis for generating his theory of inquiry and knowledge development. The work of this collaborative community, while not yet named action research, clearly foreshadowed the collaborative nature of action and practitioner research, and the co-expertise of participants central to many of the approaches currently promoted, particularly in the area of curriculum inquiry.

Dewey’s approach makes visible the dialogic potential of collaborations and how participants can learn from practices in action. It also makes visible how theorizing can be a grounded process through which principles of practice are developed, challenged, discarded, and reformulated by the collective as well as by individuals within the collective engaged in research.

Route 2 – Laboratory Schools: Blurring the Boundaries between Research, Theory, and Practice

Dewey, along with other scholars of his time, was central to the progressive education movement, which was part of a larger US sociopolitical reform effort known as the Progressive Era (*c.* from the 1840s to the 1920s). Progressives sought political, educational, and social reforms that addressed corruption in politics, expanded high schools, enacted child labor laws, supported women’s suffrage, enacted minimum wage laws for women workers, and passed four constitutional amendments: women’s right to vote; income tax; direct election of senators; and manufacture and sale of alcoholic beverages. These reforms were undertaken in the face of growing populations in cities, waves of immigrants to the US from Europe, and the growing population that resulted from the admission of ten new states to the US.

Progressive educators drew on Dewey’s ideal that schools should be about personal growth and learning through experience in a school-as-community approach. To ensure that children from all classes received a basic, common education in elementary grades, progressive reforms increased the number of children in schools by establishing compulsory attendance laws and labor laws restricting children’s work. Many also embraced the need for early education proposed in Europe by Pestalozzi and Froebel, leading to the founding of kindergartens in the US. Along with new forms of curriculum, progressive educators also promoted a scientific approach to studying education.

During the Progressive Era, the need for greater numbers of teachers was met by the opening of laboratory schools in public and private universities. In these new institutions, as in Dewey’s school, the goal was to blur perceived gaps between theory, research, and practice, making practice a basis for theory development and integration. While many laboratory schools were established for teacher training, others were founded as places for exploring research, theory, and practice relationships as a form of school experimentation. In a tradition that continues today, laboratory schools served as officially sanctioned, dynamic contexts that involved teachers, administrators, students, and, at times, community members in collaborative research for developing and testing new forms of school organization, curriculum directions, and pedagogy.

The Progressive Era was also a time when research-oriented professional organizations in education were founded (e.g., National Council of Teachers of English in 1911, American Educational Research Association in 1916, and National Association for Research in Science Teaching in 1928). These professional organizations were important in promoting educational research and curriculum inquiry. They became forums for exploring and

disseminating educational research across university and education communities that continue today. These forums led to new understandings of what counted as scientific research and what counted as theoretically grounded approaches to the study of topics such as curriculum, learning, and administrative leadership.

Analysis of the larger historical contexts that gave rise to the progressive education movement indicated that the focus on scientific methods was not solely an educational research direction, but one embedded in the zeitgeist of the historical period. Furthermore, this analysis made visible the role that university laboratory schools play as sites for generating theory as well as practitioner inquiry. It also made visible ways that research, theory, and practice can play a dynamic part in educating teachers and developing innovative curriculum, and how scientific and grounded approaches to school and pedagogical experimentation are important parts of this process.

Route 3 – Curriculum Inquiry Research and Teacher-Involved Action Research

The period from the 1940s to 1960s was another dynamic period of developing approaches to practitioner inquiry. During this period, action research, a term often attributed to Kurt Lewin (1944) and/or to John Collier (1945), developed. At the same time, curriculum inquiry approaches to research begun in the Progressive Era were continued. These routes permit a close examination of how teacher action research and curriculum inquiry contributed to, and were (re)formulated to address, the growing interest in both community-based research and research on the individual–organizational relationships. These routes are described in this section.

The first route discussed is action research. Scholars who framed the approach called “action researcher” were focused on understanding the impact of social change on individuals or groups and on promoting social change at both the societal level and the organization or individual-within-group levels. This work includes two directions, one known as action research (Collier, 1945; Lewin, 1944), and a later direction known as action science (Argyris and Schön, 1989). These three directions influenced work in educational administration as well as work on reflective teaching in the post-1960s period of the development of teacher-based action research and practitioner research in the US.

The first form of action research identified focuses on action research as an approach to community development that was developed by Collier in 1917 for his work in the New York Peoples’ Institute. Later, he used action research as the director of the Bureau of Indian Affairs to support local inquiry by members of tribal councils as a way of transforming government policy and building

self-sufficiency. Central to Collier’s approach to action research was the identification of problems perceived by a local community, which then led to a process of gathering information and making decisions about how to take social action within the community based on the data and evidence collected. This form of action research was, in turn, a form of social activism implemented to bring about political, social, and educational reforms. Wann (1953) identified Collier’s multifaceted approach to inquiry as ethical actions as a historical root of action research in education.

The second form of action research was developed by Kurt Lewin (1944) to examine how changes among members of groups had an impact on behaviors, actions, and attitudes of individuals-within-the-group members. This work focused on group dynamics and was based on an understanding of the interdependence of fate among group members as well as task interdependence. For Lewin, action research was a way of engaging actors in explorations of the impact of change (often initiated by Lewin) in order to develop ways of achieving a more democratic form of group dynamics. This research, as well as his work on the impact of leadership and social organization, was later used in teacher education. Similar to Dewey, Lewin did not view democratic actions as static; rather, he argued that democracy had to be learned anew in each generation, that experiential learning was important to personal change and development, and that a scientific approach to the study of such learning was needed.

Lewin’s work was extended by Argyris and his colleagues (e.g., Argyris and Schön, 1991) over the next two decades to create what became known as action science. Argyris, Schön, and colleagues built on Lewin’s notion that “...causal inferences about the behavior of human beings are more likely to be valid and enactable when the human beings in question participate in building and testing them” (Argyris and Schön, 1991: 86). What distinguishes action science from action research is an emphasis on the differences between espoused theories and the actual, tacit, and spontaneous theories in use that participants bring to practice and research. Action science has influenced work on organizational leadership with administrators. Schön’s work on reflective practitioners and their theories in use influenced directions in teacher and practitioner research.

As action research was developing, curriculum inquiry in laboratory and related school was continuing as described by Wann (1953) in his review of curriculum inquiry and the intellectual on this approach. One influence he identified was the theoretical work and research of both Collier and Lewin, discussed previously. Another influence was the work of Stephen Corey and colleagues in the 1950s at the Horace Mann–Lincoln Institute for School Experimentation. Corey and his colleagues (such as Alice Miel) worked collaboratively with teachers

within the laboratory school context and related school sites in New York to explore issues of curriculum, social development, and early childhood development among other areas. Based on his review of this work, Wann argued that action research work in this period was an emerging methodology, and called for experimentation to “develop a way of working which will make it practical for teachers to carry on research of a high quality” (p. 342).

In a later review, Noffke (1997) also identified Corey and his colleagues as key developers of action research in the school context. She argued that they had the dual goals of legitimizing action research by placing “greater emphasis upon evidence, upon the action hypothesis, and upon the importance of cooperative research” (Corey, 1953: 40). Through this process, they sought to blur the boundaries between research, theory, and practice, while creating a basis for theorizing practice in action. Thus, Corey, similar to Lewin, Argyris, and Schön, reiterates Dewey’s earlier arguments about the need for high-quality research and warrantable knowledge grounded in the actions of teachers and students in classrooms (e.g., Dewey, 1938).

The picture emerging through these brief explorations of the roots of action inquiry is one in which educators, social science researchers, and university-based educators were seeking warrantable ways of understanding human experience by engaging with people in local environments. The developing picture also shows that some of the roots began in education, while others were created by researchers who used education as a site for exploring their interests. Additionally, analysis of the goals of these different researchers showed that some of them engaged in action research to develop theories of action and to understand change in social worlds, while others had a more transformative agenda of promoting democratic change. Regardless of the arena of action and research, what was common was that the theories and approaches developed grew out of collaborative work with educators and others, creating an approach to theorizing that meets Elliott’s (1991) goal presented earlier of “... improving the quality of action within [the social situation]” (p. 69).

Route 4 – Continuity, New Routes, and the Action Research Turn

The period from the 1970s to the present is one of continuity with historical directions, and great variation in approaches as described in the opening of this article. Given the variety of directions developed in this period, a discussion of each is not possible. Therefore, three routes representative of groups of developing traditions are presented. Two of these routes have their roots in curriculum inquiry and action research directions presented previously. The third represents a shift from a curriculum focus to one

currently referred to as practitioner research (Zeichner and Noffke, 2001) or practitioner inquiry (Cochran-Smith and Donnell, 2006). These three directions enable us to examine how the arena of action and purpose of study led to diverse sets of approaches (Noffke, 1997). The three routes identified represent conceptually and socially different ways of engaging in action research, curriculum inquiry, and the more recent iteration – practitioner inquiry.

The first route identified has continuity with the earlier traditions of the progressive education movement and with the curriculum inquiry approaches of the period from the 1940s to 1950s. One way to view directions in curriculum inquiry from 1970 to the present is to view them on a continuum from school- and teacher-based approaches to approaches designed to create a state, district, or national curriculum in which teachers had little input, but that claimed authority from certain forms of educational research – for example, large-scale research. Approaches at one end of spectrum have roots in the earlier work on curriculum studies. The most recent form of this work is referred to as arts-based research (Barone and Eisner, 2006), an approach that continues the progressive ideals, but argues that humanities based inquiries, not just social science approaches, are the appropriate ways of examining and representing the complex work of constructing curriculum with students. This approach seeks innovative ways of engaging teachers in exploring and constructing their theories in action as a way of enhancing curriculum. It is often undertaken by collaborative communities and has been influential in creating new understandings of curriculum as a dynamic process of meaning construction.

This situated and teacher-based approach contrasts directly with the dominant, reform-driven approaches referred to as curriculum alignment studies (Porter, 2006). In these studies, the question is a policy-related one – whether or not the teacher’s work is aligned with the prescribed goals and practices of the planned curriculum. The object of study is teaching behaviors, not teacher actions to improve the quality of curriculum. This movement is also visible in cross-national assessments and is grounded in twentieth-century views of scientific inquiry as searching for generalizable practices and knowledge. The alignment approach contrasts with the work of Dewey, Lewin, Argyris, and others. Although these scholars sought rigorous high-quality research, they also viewed teacher questions and knowledge as central to the research, and curriculum inquiry as a basis for theorizing practice in local contexts. Thus, the current focus on imposed curriculum ignores practice as a basis for new knowledge generation and for improving the quality of local actions.

The second route, one developed in Australia, has influenced critical, participatory, and collaborative action research directions in the US and elsewhere. Grounded in work by Stephen Kemmis, Robin McTaggart, and Shirley

Grundy, among others, this approach, similar to Collier's work, seeks to support local groups in constructing a more fair and equitable democratic society. Researchers within this tradition seek ways of becoming critical (Carr and Kemmis, 1986) as an ethical stance to engaging with communities in order to support members in researching locally identified problems. The research process is collaborative, locally situated, and recursive. Actions with community members include: identifying a problem, collecting information in local contexts, engaging in the analysis of information (data), interpreting the data, supporting the planning of actions based on the local study, and, at times, repeating the action research cycle until the community has achieved their desired goals. In education, this means that teachers conducting action research could be of value in affecting change of educational theory, policy, and practice when participants become agents of change in their local communities.

The third route focuses on practitioner research in a professional context and contrasts with the previous routes in particular ways. There are two interconnected directions for practitioner research in this tradition, one grounded in theories and research in the UK that have influenced US directions, and one in the US represented in recent reviews (e.g., Cochran-Smith and Donnell, 2006; Zeichner and Noffke, 2001). The first direction builds on theoretical traditions and perspectives from the UK (e.g., Day *et al.*, 2002), focusing on theory and practice of action research and situated views of learning. In this tradition, practitioners are viewed as cultural beings and as members of a professional community that shapes, and is shaped by, professional cultures in which they live and work. The boundaries of theory and practice are blurred and action research becomes a professional ideal realized not as a formal study, but as everyday work to enhance the quality of teaching, service, or care. The practitioners' questions and the challenges they face become the basis for action, and inquiry is ongoing, reflexive, and responsive to the needs in the local social situation. Practitioner inquiry becomes a means through which professionals are able to (re)discover, articulate, and communicate core values and take actions that promote the common good.

In the US, practitioner inquiry has become an umbrella term for a variety of approaches, many with different epistemological and theoretical frameworks (Cochran-Smith and Donnell, 2006). In contrast to earlier routes, the named approaches come from different theoretical orientations, purposes, methods, and sites or arenas of inquiry (Noffke, 1997; Zeichner and Noffke, 2001). Regardless of theoretical grounding or the method used, practitioner inquiry involves one or more practitioners in research about a problem or issue in their local context with or without external support or intervention. Such inquiry may take many directions. One direction involves teachers in research on a new curriculum or on a new area

of study initiated through participation in a university course. Another direction represents collaborative work in a professional development community. The third direction is one in which the individual teacher engages in reflective practice in his/her own classroom. These and other directions of practitioner inquiry, such as the practitioner action research of the UK, seek to develop reflexive action and inquiry as professional ideals, where inquiry is part of the professionals' repertoires for action, for (re)formulating practice, and for enhancing the quality of actions, service, or care within professional work settings.

Across all of the action research and practitioner inquiry traditions of this route is the understanding that practitioner-based action research and curriculum inquiry involves research designed to address questions of importance to practitioners and community members within a local context. This research often leads practitioners (or community members) to (re)theorize their work, (re)consider their assumptions about learning (or other related outcomes of practice), explore how they make decisions about their practice, develop plans for actions to resolve the problem identified, and monitor the impact of the planned actions on students and others in their classrooms (or other professional settings). This reflexive and recursive process is central to the different approaches within this route.

Possibilities and Challenges for the Twenty-First Century

Although many additional outcomes and goals of teacher-based action research, curriculum inquiry, and practitioner research exist, the ones highlighted in this article show a continuity of goals across the past 100-plus years – to frame sound educational (or locally responsive) processes and practices that represent the actions, work, knowledge, and understandings of teachers and community members in the contexts of professional practice or community life. In a recent review of different roots and routes, published between 2004 and 2006 in *Action Research*, Dick (2006) argues that the scope and depth of work indicates an action research turn, not just in education, but also across disciplines and fields of professional work. This turn, he argues, does not mean that all of the work of framing action research is complete, but rather that interest has been growing in this approach, one in which further theoretical and methodological work needs to be done, a point supported by Cochran-Smith and Donnell (2006) and Zeichner and Noffke (2001).

One further observation and a set of challenges to the continuing development of action research and practitioner inquiry provide a fitting close for this analysis of teacher action research. Bauman (2004) argues that the twenty-first century is a period of liquid modernity in which the theories of the nineteenth and twentieth

centuries will not be adequate to understand the fluid world of the digital age, with its new, often interdisciplinary, areas of study and its knowledge base that is changing with greater speed than in the twentieth century (i.e., every 2–4 years in some disciplines, in contrast to every 10 years). He also argues that educational systems and societies are now educating for jobs that do not exist yet. In a fluid world, action research holds a key to insuring equity of access to education, improving curriculum in changing fields, and enhancing community and student learning about the new challenges and directions. This value can be seen in the recent takeup of action research in fields such as informational technology, allied medical fields, and architecture.

Two unresolved challenges face those involved in developing this approach further. The first was articulated by Dewey more than 100 years ago, Wann almost six decades ago, Winter and Elliott in the UK, and Cochran-Smith, Zeichner, Noffke, and others in recent reviews – the need to build support, time, and policies for professionals to engage in action or practitioner research in their contexts of practice. The second is the challenge of building theories of action research and professional action and how this form of research can inform policymaking in new ways. In the twenty-first century, teacher-based action research and curriculum inquiry need to become professional ideals that support professional action in the fluid and complex world of work and professional activity.

Curriculum and Syllabus Design

A Woods, A Luke and K Weir, Queensland University of Technology, Kelvin Grove, QLD, Australia

© 2010 Elsevier Ltd. All rights reserved.

This article is an overview of syllabus design as part of the curriculum process, with a focus on design and the technical form of syllabus documents. The distinction between curriculum and syllabus has not been clearly delineated within either practice or policy in this field. Yet, the distinction is not a trivial one. The conflation of the design, structures, and functions of the syllabus, on the one hand, and the enacted curriculum, on the other, remains a practical problem for policymakers and practitioners. We review work in two fields of education that have a tradition of detailing issues related to syllabus design: English-language teaching and higher education, then turn to issues of syllabus design in the compulsory years of schooling. Models of curriculum have informed and constrained the content and technical form of school syllabus documents. However, current curriculum debates have tended to focus on ideological, cultural, and scientific curriculum content, with little or no discussion on or about the technical form of the curriculum or syllabus documents.

Defining Curriculum and Syllabus

Curriculum is the sum total of resources – intellectual, scientific, cognitive, and linguistic – that is brought to bear on the dialog and exchange of teaching and learning. It includes documents, textbook and adjunct resources and materials, both official and unofficial – that are brought together by teachers and students to structure teaching and learning in classrooms and other learning environments. Taken in its simplest terms, curriculum is simply what is taught and learned in schools. It is the constitutive cultural

and scientific content of education that is transmitted by the message systems of pedagogy and assessment.

In contrast, the syllabus is a bid to shape and set the parameters of the curriculum, usually prepared at a school-system level. It is a defensible map of what is valued as core skills, knowledge, competences, capacities, and strategies to be covered within a particular context at a particular time, usually with affiliated statements of standards, which are used for accountability. The *Oxford English Dictionary* tells us that the term syllabus has evolved to refer to a summary of what is to be taught and learned. The Greek etymology of the word refers to the verb ‘to collect’. Cicero used the term to refer to correct leader, suggesting an authoritative status. In the seventeenth century, the term referred to the finished curriculum or a course of study completed. By the nineteenth century, the term was used to refer to a statement, a table of contents, or heads of study. The syllabus was used in fields such as literature and law to refer to a map or outline of curriculum.

Current work on syllabus design in the field of higher education tends to represent and explain the syllabus and its functions through a series of metaphors. According to Parkes and Harris (2002), the three most common metaphors employed in discussions around the syllabus are to discuss the term as a contract, a permanent record, or as a resource for student learning. Many define the syllabus as a communication tool or device (e.g., Thompson, 2007; Slattery and Carlson, 2005). Another common metaphor utilized in the literature is the syllabus as a map. Green and Stortz (2006) take the idea of the syllabus as a journey to another level when they discuss the syllabus as a passport that enables a common culture of teaching and learning.

There is a paucity of discussion around the alignment of the curriculum and the syllabus. The default approach for those developing official syllabus documents has been the Tyler rationale for curriculum development. The end result is that the relationship between a syllabus and its curriculum is neither well understood nor discussed to any depth in contemporary literature and research except where its significance is integral to syllabus design. For example, Habanek (2005) views the syllabus as a permanent record of curriculum and “an agreement that specifies the accountability of the major players in the learning process” (p. 63). In his seminal work on curriculum development and design, Print (1993) presents a much broader description of the link between syllabus and curriculum, while acknowledging that the two entities are often confused. His idea is that the syllabus forms part of the overall curriculum and tends to be a list of content areas which will be assessed, whereas the curriculum is “all the planned learning opportunities offered by the organisation to learners and the experiences learners encounter when the curriculum is implemented” (p. 9). The syllabus has traditionally been defined at one level of technical generality from the actual content of the curriculum – forming an authoritative outline, schema, or structure for courses of study. However, because of the lack of conceptual clarity in defining the syllabus, these historical definitions are merged, often without clarity, in teachers’ and curriculum developers’ work.

Westbury (2008) defines the syllabus as a guide to the curriculum, while Schwartz (2006) describes the syllabus as a written curriculum that acts as an action-oriented guide or tool for teachers. The syllabus is an official map of a school subject – of the terrain to be covered (cf. Dewey, 1902). The syllabus is not an exhaustive view of the territory, but it sets the grounds for teachers’ and students’ actual educational journey through the terrain. Following Dewey, the syllabus is not, and cannot be, comprehensive or exhaustive. It prescribes pedagogic method, approach, style, and instructional interaction at the risk of constraining teacher professionalism in responding to student diversity. Therefore, the school syllabus can provide teachers with a rationale and outline of the school subject in question, an overview and specification of preferred expected content to be taught and learned, and a description of operational ways of appraising standards for gauging student performance.

Available Knowledge About Syllabus Design

There is little technical literature on syllabus design. The academic literature around syllabus design and implementation principally is found in two fields of study: English-language teaching and higher education.

An additional small body of work related to vocational and adult education focuses on module-based syllabus planning. Each of the two fields reviewed here views the syllabus from quite different perspectives and each differs in its depth of inquiry. However, the implied goal of the majority of research is methodological, with a focus on the ‘how to’ of planning and teaching a syllabus at a course or unit level in these areas.

Syllabus Design and Teaching English as a Second or Foreign Language

The syllabus literature that relates to research and scholarship in the field of English-language teaching originates from a corpus of general textbooks on the topic published during the 1980s. This reflects an era of renewed interest in teaching English as it became an essential global language, and coincides with a paradigm shift in the teaching of English toward a sociolinguistic model for understanding language acquisition that emphasizes communicative language teaching.

This work focuses on methodologies for teaching English in specified contexts. According to Nunan (1991), this reflects significant influence language teachers themselves have had on syllabus design and learning resources. The literature is therefore typified by the language-learning context in which the syllabus is to be implemented, and the syllabus appears to be represented in terms of a structured, linear pedagogical approach to teaching English. The approaches include English as a second or foreign language (ESL or EFL respectively); teaching English to speakers of other languages (TESOL); English-language teaching in its social context; and English for specific purposes (ESP), which incorporates English for academic purposes and occupational purposes.

In this context, the syllabus is mainly represented as a pedagogical tool that prescribes a particular method’ for teaching English and a specific sequence of incremental acquisition of language competence. The syllabus is described using a range of lexical descriptors that generally reflect the pedagogical approaches they represent. This representation of the syllabus appears to have been initiated by Wilkins (1976), who created a superordinate classification of notional syllabus types, labeling them analytic and synthetic: terms that relate to the role of the learner in acquiring a language. Other syllabus types described in the literature reviewed include the text-based syllabus; the task-based syllabus; the communicative syllabus; the topic-based syllabus; the negotiated syllabus; and the negotiation and process syllabus.

In sum, the English-language teaching field tends toward simplifying the syllabus as a guide for teachers wanting to implement a particular sequenced approach to teaching English (Breen, 1987).

Syllabus Design for Teaching in Higher Education: The USA Context

The other field of study that dominates the literature in syllabus design is the scholarship and practice of teaching in American colleges and universities, based in departments of instruction within faculties. The work tends to be presented as practical manuals or guides for writing syllabi to reflect institutional teaching and learning policies. However, some of the work at least identifies the underlying purposes and instructional principles of syllabus design, and outlines principal components of a syllabus.

Doolittle and Lusk (2007) indicate that syllabus components, functionality, and perceptions by faculty and students are three foci of the literature. Their work details not only a focus on the considerable variability in the construction and uses of syllabi (p. 65), but also that there is little in the higher education literature that provides ongoing dialog beyond the basic elements and utility of the syllabus as a material artifact of the curriculum. Cardozo's (2006) work further supports this as he claims that "syllabus construction itself remains a significantly under theorized professional activity" (p. 412). The lack of sustained inquiry around the syllabus seems incongruous considering its almost universal status as an educational tool. There remains very little research into syllabus design and implementation in relation to the compulsory years of schooling.

Curriculum Models and Syllabus Design for Schooling

A range of curriculum models have impacted upon the content included in syllabus documents and as such these models warrant discussion. Current curriculum models begin from stances on content. However, in doing so, these major curriculum models explicitly and implicitly define the technical form of the syllabus. The dominant models of curriculum underlying current practice and policy debates can be categorized into several models. It is important to note that we do not include commentary on the phenomenological model or other models of curriculum (e.g., Green, 2005) that have had less direct influence on actual school syllabus definition.

The Outcomes-Based Model

This model was developed in the United States by Spady (1982) and colleagues in the 1980s and 1990s. It argued that curriculum should focus less on the traditional selection and specification of knowledge content, and less upon pedagogic experience and process, and more on the specific visible and demonstrable outcomes in student performance. It marks out a technocratic model of education:

an industrial-era model of curriculum derived from Tyler (1949) that breaks subject areas into smaller constituent parts on the basis of claims about student needs. Its technical form is enumerated, categorical lists of outcomes for specific subjects and age/grades. These have tended, in the outcomes models, to be couched in behavioral terms, that is, as skills and behaviors that can be demonstrated and observed. This model is amenable to consensus-building, expert-committee, and professional consultation processes. Its focus on lists of outcomes also enables a dovetailing with systemic testing for accountability purposes. The model has been strongly criticized by critical theorists, traditionalists, and progressives. From radically different perspectives, they argue that it tends to atomize and narrow down the curriculum, reducing its richness, and that it excludes a range of valued contents, experiences, learner backgrounds, and pedagogical processes.

The Process-Based Model

The process-based model, affiliated with the cognitive developmental work of Bruner (1960) in the post-Sputnik era, tended to treat curriculum in terms of a developmental continuum of educational experiences and processes. The technical form of the curriculum when founded within these perspectives tends to be more strongly developmental, stressing students' engagement with and experience of particular repertoires affiliated with subject areas and content. However, skill and content narrowly defined are not taken as the central purpose of curriculum and instruction. This model is generally affiliated with traditions of progressivism and constructivism, with a strong focus on developmental experience and the active construction of new knowledge. The model has been strongly criticized by advocates of the technocratic/accountability model as soft on the specification and assessment of outcomes, and by classicists as failing to engage with cultural traditions, contents, and canonical texts and knowledge. It has been critiqued by critical theorists for overemphasizing individual development over social and cultural development.

The Critical Model

This model, affiliated with critical theory and cultural studies in the humanities and social sciences, strongly emphasizes the need for competing, revisionist descriptions and models of the world, and for critical, active, and agentive student engagement with knowledge. While it has influenced education and curriculum content in at least some systems, such as Australia, it has had little impact on the technical form of the curriculum. It directly addresses content issues and tends to stress higher-order or critical skills. The model has been strongly criticized by

technocratic advocates as failing to deliver demonstrable outcomes. It is critiqued by the classicists for being politically and ideologically biased, and leading to a diluted or skeptical engagement with key traditions and works. It is critiqued by developmentalists for overemphasizing social and cultural development at the expense of individual cognitive and psychological growth.

The Traditional Content Model

This model was based on a neoclassical model of curriculum (e.g., Bloom, 1956) – that neoclassical model was based on the identification of canonical knowledge and texts in fields. Its technical form entails the enumeration and prescription of content knowledge, prescribed reading and topics. Until recently, it has been the dominant model in university teaching, and is strongly affiliated with traditional curriculum examination systems. The model is criticized by technocratic/accountability advocates as failing to provide demonstrable outcomes other than content reproduction. It has been critiqued by developmentalists for being insensitive to individual and developmental diversity in background knowledge and approach to learning. It has been critiqued by critical theorists on the basis of the assumption that this model hides its biases and ignores the dynamics of economic, cultural, and social change.
