52. Higher education teaching personnel should enjoy the right to freedom of association, and this right should be effectively promoted. Collective bargaining or an equivalent procedure should be promoted in accordance with the standards of the International Labour Organization (ILO) set out in the appendix.

53. Salaries, working conditions and all matters related to the terms and conditions of employment of higher education teaching personnel should be determined through a voluntary process of negotiation between organizations representing higher education teaching personnel and the employers of higher education teaching personnel, except where other equivalent procedures are provided that are consistent with international standards.

Nevertheless, there are a number of countries in which there is no right to collective bargaining in the general law or where such rights are in practice unavailable due to repression by the state or the absence of the rule of law in labor relations. A list of such countries includes Brunei, Burma (Myanmar), Peoples' Republic of China, North Korea (DPRK), Laos, Maldives, Oman, Qatar, Saudi Arabia, Syria, Djibouti, Libya, Sudan, Togo, and Cuba. Moreover, in countries and territories including Afghanistan, Somalia, Democratic Republic of the Congo and Haiti, Iraq, and Western Sahara, civil strife renders collective bargaining and/or higher education inoperative.

In many other countries, laws preclude employees and/or employers in higher education from collective bargaining, most commonly as part of exclusions of varying classes of public employment or those engaged in essential services, which often include education.

Country Analysis

This brief survey of collective bargaining, discussed in the following sections, concentrates its attention only on a selection of countries. While such a selection is necessarily arbitrary, it includes many of the highly developed and the largest national sectors, as well as other countries representing the diversity of higher education, and demonstrates how collective bargaining operates in different constitutional, cultural, and economic settings across six continents.

United States of America

The strongest and perhaps most diverse higher education sector is that found in the United States of America. There are large public university systems established by state governments, although employees are rarely direct employees of the state, as well as many strong private universities.

Collective bargaining developed gradually during the twentieth century, but was boosted greatly by a 1970 decision which found that universities were engaged in interstate trade and commerce, bringing them within the ambit of the National Labor Relations Act (NLRA), which provides the opportunity for collective bargaining. However, a Supreme Court decision in 1980 declared that most full-time academic staff were managerial employees and were therefore excluded from the NLRA. This major setback to collective bargaining has been offset by state legislation providing collective bargaining rights to employees in public universities in some states, and by private universities voluntarily agreeing to bargain with academic employees.

The result of these legislative changes is that collective bargaining has been widespread among nonacademic staff and among adjunct and sessional staff, including those who work as contingent (or casual) staff. On the other hand, among academic staff, depending on definitions, about 40% of full-time academic staff in the USA in 1998 were covered by collective bargaining arrangements, with the figure being around 50% in the public sector. In recent years, separate bargaining among graduate assistants has become a feature, with some bitter strikes and disputes, particularly about union recognition, as well as legal disputes about whether graduate assistants are employees or students.

Although fragmented to the level of each institution, and often broken into different bargaining units representing academic staff, part-time academic staff, and nonacademic

staff, academic bargaining is coordinated to a limited extent by the three national organizations representing academic staff.

United Kingdom

In the United Kingdom, the public sector dominates higher education, but universities remain separate autonomous employers. Nevertheless, collective bargaining on pay and related matters occurs at a national level between unions and employers for all academic and nonacademic staff, through the Joint Negotiating Committee for Higher Education Staff (JINCHES). The tradition of free collective bargaining in the UK is less formal than in most other countries, with national agreements coexisting with many local arrangements and agreements. None of these requires formal registration nor are they, strictly speaking, enforceable, except by industrial action, which can occur at any time, subject to an employee ballot. In 2006–2007 a new union, the University and College Union was formed, with over 100,000 members, representing all academic staff. This may lead to changes in the way collective bargaining will operate for the future.

France

The state has a dominant role in higher education in France, which has a multilayered system of *grand ecoles*, universities, research institutes, and *polytechniques*. Most university staff in the public system are direct employees of the state, and are generally represented by unions affiliated to one of several major labor federations. The right to strike is guaranteed in the French constitution, and is not limited to disputes over collective bargaining.

University salaries are set by the state, and the tenure enjoyed by most university staff arises directly from their relationship with the state, leading to the unusual position that staff unions tend to oppose increased university autonomy – at least in relation to employment matters. Unions have agitated for agreements with the government about job security, the ratio of tenured to untenured staff, and workloads – which have been affected by rising student/staff ratios – as well as the usual issues of salaries and pension arrangements.

Germany

German higher education institutions consist of three types of *Hochschulen*: *Universitäten* (universities), *Fachhochschulen* (universities of applied sciences), and *Musik- und Kunsthochschulen* (colleges of music and art). Higher education institutions are either state run or state recognized, and all are subject to higher education legislation.

University professors and lecturers are *Beamte*, or civil servants. As *Beamte*, such staff are entitled to reasonable

pay, access to the *Beihilfe* health plan, an indexed pension, and pension insurance.

While German Basic Law guarantees freedom of association and protects the right of unions to exist and to be active, *Beamte* may not conclude collective agreements and their working conditions are unilaterally established through laws rather than through collective bargaining with a union. Such university staff also do not have any right to strike. However, some lecturers employed on contracts by universities do enjoy the right to collective bargaining.

The *Gewerkschaft Erziehung und Wissenschaft* (GEW) teachers' and faculty staff union states that employment conditions are better for university staff in research institutes outside the university system.

Sweden

In Sweden, the public sector dominates higher education, and plays a coordinating role. University staff have the same rights to collective bargaining as other employees. Employees have the right to strike in support of collective bargaining claims and employers have the right to lock-out. As in the rest of the economy, staff are organized into separate union federations of manual, administrative and technical and professional workers. Collective bargaining is organized at various levels, and agreements can be at an industry level, or at the level of the higher education institution. Bargaining in Swedish higher education rarely leads to industrial action and the academic union SULF supports some individually determined salary arrangements. However, tensions have existed over the employment consequences of short-term research funding and the employment status of doctoral students.

Russia

A new labor code (NLC) for Russia was ratified in 2003 amid mass protests, weakening some union rights and making union organization more difficult for smaller unions. Collective bargaining is permitted through the NLC, and employees can walk off the job if their pay is more than 15 days overdue. Employees cannot be terminated for taking subsequent strike action.

To date, despite the existence of a strong trade union representing education employees in the public sector, a mature system of negotiations about salaries and conditions of employment in the dominant state-run university sector is yet to emerge. Unions since the mid-1990s have engaged, however, in many protests against the nonpayment of salaries in education.

West Africa and East Africa

In West Africa, there has been a serious decline in higher education since the 1970s, with expansion in the number

of students but a relatively sharp decline in public resources, particularly as several countries carried out Structural Adjustment Programs (SAP) prescribed by the World Bank. Meager salaries have led many qualified staff and potential staff to seek employment in other sectors of the economy, with many staff also remaining university employees. Authoritarian postcolonial regimes have proscribed collective bargaining either generally in the economy or specifically for university staff and other public sector employees. Nevertheless, academic staff unions in Ghana, Nigeria, *Côte d'Ivoire*, Burkina Faso, Senegal, and Cameroon have all been able to operate independently, and to varying degrees pressure governments, which generally set conditions and salaries by decree.

In East Africa, Kenyan academic staff and successive governments have been engaged in years of bitter industrial disputes over salary levels, without reaching agreement.

Nigeria

In Nigeria, the political turmoil and economic crises of recent decades have seriously affected higher education. These factors and the very low salaries paid to university staff have contributed to the so-called brain drain, with many of the best-qualified staff seeking employment in other countries. Labor relations within the university system, which is public and overseen by the federal government, have been seriously affected by, and contributed to, these problems. Negotiations on pay traditionally occur at the national level, between university unions and the government, although the universities themselves are separate employers. National collective agreements have been the subject of prolonged strike action by academic and non-academic staff in recent years. These disputes and the dismissal of union members have been the subject of repeated complaints to, and adverse comment by, the ILO.

Cameroon

In neighboring Cameroon, political liberalization since the early 1990s has allowed the formation of unions representing university staff. However, it has only been in the face of repeated strike action that, early in this century, the government has been willing to deal with unions on conditions of employment, governance, and academic freedom. University salaries remain fixed by government decree, rather than being a result of formal collective bargaining.

South Africa

With Nigeria, South Africa holds a dominant position in sub-Saharan Africa, and this is reflected in the level of development of its higher education system and its labor

market institutions. Collective bargaining and the right to strike are guaranteed by law and practiced widely in the higher education system, which consists of a dominant public sector of universities and *Technikons*, and a small private sector. Collective bargaining takes place in the context of the transformation of South Africa after apartheid. This involved major growth in enrolments to combat the legacy of apartheid, a redistribution of resources within the sector toward both historically disadvantaged students as well as primary and secondary sectors, in conjunction with outsourcing of many support functions, institutional amalgamations, and the use of market solutions to make up for the shortage of public investment.

Union representation is highly fragmented, particularly among academic staff, and despite the campaigns of some national unions for national collective bargaining, bargaining occurs at an institutional level, with the state not directly participating. Centralized bargaining, and the harmonization of pay rates to which it might lead, were opposed by employers and by some employees and local unions at those institutions where salaries and conditions of work are more favorable.

India

India has a large higher education sector, with over 6 million students and nearly 200 general and specialist universities, as well as thousands of other colleges. Collective bargaining around pay and pensions does not occur directly between the universities and the unions representing university staff. Pay for university staff and other public employees is set by the central (union) government on the recommendation of national pay commissions, which are established from time to time. Six have been established since independence in 1947. Despite this bureaucratic mode for salary determination, higher education staff generally have a legal right to form unions and take strike action.

South Korea

While there is official freedom of association, Korean governments have consistently attempted to suppress union organization. When accepted into the Organization for Economic Cooperation and Development (OECD) in 1996, Korea pledged to bring labor relations into line with international standards. Since then there have been active movements toward recognizing collective bargaining rights for government-employed teaching staff. However, the International Confederation of Free Trade Unions (ICFTU) (now International Trade Union Confederation (ITUC)) says that the position of trade unionists in South Korea is still worse in relation to freedom of association than in any other OECD country, with consistent state repression of union demonstrations and strikes.

Korea's universities have faculty-based unions, although there has been a move toward national unionization. The Korean Federation of Teachers Associations covers all education workers, including university staff, and a new professors' union was established in Korea in 2001. The Korean Professors Union has indicated that it wishes to use collective bargaining as a tool to enshrine greater participation in university governance and intellectual freedom.

Since 1998, teaching staff have been free to form new unions, and academic freedom has improved. However, there is a legislative ban on political activities, strikes, and sabotage in the Teachers Union Act, and infringements of academic freedom still occur regularly. In 2003, Korean Teachers Union leaders were imprisoned for participating in protests against a national online educational data system. In 2004, an academic who publicly called the Korean War North Korea's war of unification was questioned by police, leading to demonstrations by university staff.

Japan

The Japanese constitution enshrines freedom of association and a right to organize and bargain collectively. It also provides a guarantee for academic freedom. Japan has a large higher education sector, in which the most prestigious universities are in the public sector, but in which the private sector dominates numerically. The public sector universities in recent years have been corporatized, and are now expected to raise a far greater proportion of their income from private sources.

The law previously deemed all university staff to be civil servants, who are precluded from collective bargaining rights and who may not go on strike. This absence of a bargaining culture has, however, pervaded both public and private universities and colleges, where local unions representing staff have traditionally lacked influence. It is too early to tell whether the corporatization of the public sector institutions will lead to more fundamental changes.

China

Freedom of association and the right to strike are not recognized in the People's Republic of China. China's All-China Federation of Trade Unions (ACFTU) effectively acts as a wing of government, and includes 16 industrial unions and 30 provincial trade unions, with 91.3% of all employees being members.

The 1994 Labor Law reforms failed to guarantee some basic rights, although enterprise-level collective contracts are now permitted. Minimum conditions of employment, including maximum hours, leave provisions, and occupational health and safety, are set by law, but these minima are often not enforced.

Article 50 of China's Higher Education Law states "the state protects the legitimate rights and interests of teachers and other educational workers of institutions of higher learning, takes measures to improve the working conditions and living conditions of teachers and other educational workers of institutions of higher learning."

Other than this statement, there is little information on the conditions of employment for Chinese workers in higher education and their access to collective bargaining. However, we know that in the 1990s and 2000s significant reforms have been undertaken in higher education, including massification of higher education and decentralization and marketization of higher education institutions. These reforms will inevitably present new challenges for the organization of labor in Chinese higher education institutions.

Malaysia

Malaysia's labor laws are widely acknowledged as being oppressive. The criteria for legal registration of trade unions are restrictive and trade union membership is low, at less than 10% during the 1990s. Collective bargaining (and strike action) is not permitted over selected matters and, in any case, public servants including teaching staff do not have the right to bargain collectively.

Large-scale reform of higher education commenced in the 1990s, with significant corporatization of universities. However, most universities still rely on public funding for survival.

Academics employed by public universities are prohibited from forming a union. Staff associations exist but they cannot perform the full range of functions of a union. However, academics in private tertiary colleges are permitted to form a union if the proposed union wins a ballot of staff, or has over 50% of staff as members.

Indonesia

In the mid-1960s, under President Soekarno, Indonesia had a strong union movement, led by the communist union organization *Sentral Organisasi Buruh Seluruh Indonesia* (SOBSI). Soekarno's fall in 1966 ended this period, and unions were effectively outlawed. In the 1990s, the Ministry of Manpower regulations granted a tightly restricted right to strike and introduced penalties for violating workers' rights. However, the military continued to be involved in labor disputation and union activists were imprisoned and notoriously subjected to human rights abuse.

The 2003 labor legislation, while entrenching freedom of association, failed to guarantee a right to strike (particularly for public servants, including in higher education) and does not protect collective bargaining. In practice, collective bargaining agreements rarely exceed statutory

minimum employment standards, and labor laws are routinely ignored.

There are currently 51 public universities, 26 state/public polytechnics, and 1328 private higher education institutions.

Australia

Australia for many decades had a system of arbitration of wages and conditions by a quasi-judicial commission. This was replaced in the 1990s by a system of enterprise-level collective bargaining with a limited right to strike, which allowed employers to bypass unions in making collective agreements. In 2006, a controversial new law gave legal primacy to statutory individual contracts and further limited the rights of unions. In higher education, the federal government has used funding incentives to require universities to offer these individual contracts and to further restrict collective bargaining rights. These actions have been the subject of complaints to the ILO and UNESCO by the National Tertiary Education Union.

Mexico

The Mexican constitution guarantees the right to strike, but public sector employees may only strike if there has been a systematic abuse of their constitutional rights. Education workers are often employed under civil contracts for providing professional services, under which they are not permitted to join a trade union. Under these contracts (not legally employment contracts), education workers do not have the right to take strike action or to negotiate a collective agreement.

While there is no official collective bargaining in the public sector, unions have used discussions about general working conditions to negotiate unofficial collective agreements. Notice must be given of a strike, and while actual strike action is not common, if held to be legal, the company must close and may not hire replacement workers. If the strike is illegal, the workers can be ordered to return to work immediately.

Chile

The higher education system in Chile is decentralized, and tertiary institutions have a great deal of autonomy from central government. While public sector funding declined in the 1980s (and increased again in the 1990s), Chile's higher education institutions benefit from strong contributions from the private sector.

A new labor code was passed in 2001, including the right to organize and bargain collectively. Public servants do not have the right to strike (although government teaching staff have organized strikes in the past). There is no provision for compulsory arbitration in the public

sector. Rights to collective bargaining exist at the enterprise level, but national collective bargaining is only voluntary.

Argentina

All workers have the right to form unions and the right to strike. The constitution gives unions the right to bargain collectively and to access conciliation and arbitration; however, in 1990, the right to strike in essential industries, including education, was restricted.

In 2002, Argentina's financial crisis led to a virtual freeze in collective bargaining and widespread strikes in the education sector. Teaching staff and government workers protesting the late payment of their salaries in 2002 were dispersed with tear gas and pellets.

Collective agreements at anything over and above the enterprise level require the approval of the Ministry of Labor.

In 2004, a reforming labor law was passed which is expected to bring labor rights in Argentina closer to ILO standards.

Brazil

The 1988 constitution provided for freedom of association and the right to strike, but strikes are not permitted in the public sector. However, in 2002, teachers and university professors joined other unionists in widespread strike action over pay, which was repressed severely by the state. The police used tear gas and truncheons to prevent protesters from entering the Education Ministry buildings.

The government may cancel collective agreements that are not consistent with its wages policy. Bargaining rights were extended from municipal to state and national level through labor law reforms in 2004.

Themes and Issues in Bargaining

Although no trend is universal in higher education, there are a number of issues which appear repeatedly in any world survey of collective bargaining. Many countries still lack basic labor rights, and in others civil society is underdeveloped, or the state is so hostile, that higher education employees have no effective collective representation.

One area of contention is the scope of bargaining. The claims of management prerogative, and of public policy, almost inevitably clash with the claims of employees and unions for the right to bargain about matters which affect the employment relationship. For example, the length of the academic year may be claimed by the state or by management as a question exclusively of educational policy, yet will be seen as central to employment conditions by staff. The law, state policy, and accepted conventions,

all will affect how these issues are resolved, and these vary greatly. For example, in most public universities in those US states which allow bargaining, there are statutory restrictions excluding or limiting the right of unions to bargain about such matters as faculty workloads, the academic year, or course offerings.

In Australia, recent funding policies of the national government have proscribed that there must be no bargaining about the use of precarious employment modes and a range of other matters.

In Malaysia as well, the subject matter that may be included in a collective agreement is severely curtailed, with no proposal for a collective agreement being lawfully able to include matters such as promotion, transfer, appointments to vacancies, termination, dismissal, reinstatement, or assignment of duties. Such matters are considered to be within the purview of managerial prerogative.

A further issue is the relationship between the state, the institutions, and the higher education institution. In many countries across the developing and industrialized world, the state plays a central role. This sometimes involves the state directly regulating salaries, with unions playing what is essentially a lobbying or protest role. In a minority of countries the state generally remains at arm's length from the process, with even public higher education providers seen as autonomous employers. Changes in the role of the state over time, as legislator for education or labor laws or as holder of the purse strings, can reflect the policy of the state or interests of one of the industrial parties, and there is no universal pattern. However, the survey indicates that interventions by the state on behalf of employees or unions are rare.

Collective bargaining in higher education since the 1990s has also regularly seen the intersection, and arguably the contradiction between, some of the traditions of a university and radical changes taking place in the industry. Academic freedom has always been seen as one of the core values of the university. According to organizations of academic staff, the protection of such freedom has generally required a high level of job security, lest staff be laid-off or disciplined arbitrarily. Such discipline may ostensibly be for operational reasons, but in fact may actually be for expressing unpopular views or undertaking research which opposes dominant paradigms or offends funding bodies. This is reflected, for example, in the major policy statements of the American Association of University Professors (AAUP), which stress the importance of tenure of academic staff as a bulwark of academic freedom.

Unions representing faculty staff internationally have sought to use collective bargaining as a means to make this a legal reality. At the same time, since the 1960s, higher education in nearly all countries has undergone rapid growth. Higher education has grown from a small, relatively elite, and, in many countries, self-governing system of teaching and research to its present status as a large

industry providing mass education. Higher education now constantly has to respond to the perceived needs of government economic, labor market, and educational policies, which have been mediated by the increased use of market mechanisms and private contributions from both students (tuition fees) and corporations (to research funding).

In the eyes of many government and university employers, the traditions of career employment for academic and nonacademic staff are often seen as relics of a bygone age, as are the special protections for academic freedom. However, in many countries, existing academic freedom protections are similar to those operating in many associated professions.

These challenges have hit much of the developing world in quite different ways. Beginning in the 1980s, the World Bank encouraged many indebted governments to cut public expenditure and encourage more private provision of education. Whatever the economic merits of these policies, many countries, particularly in Africa, are now suffering a brain drain caused by the steep decline in salaries and resources.

Financing of Higher Education

B Chapman, Australian National University, Canberra, ACT, Australia

Introduction

There are very many possible ways to finance higher education and this is illustrated in what follows with respect to the systems of a large number of countries. We consider in detail the conceptual issues related to the costs and benefits of different approaches to student loans. Income contingent loans (ICL) are emerging as a mechanism to deliver financial assistance to students, and international reforms in this area are examined in some detail.

Descriptions of Higher Education Financing Systems

International Comparisons of Tertiary Education Expenditure

The financing of higher education varies greatly from country to country. Among the developed economies of the Organization for Economic Co-operation and Development (OECD), spending on higher education institutions averaged 1.4% of the gross national product (GDP) in 2003, which is about the same as a decade ago. Expenditures range from less than 1% of GDP in Italy up to almost 3% of GDP in the USA (see **Figure 1**). The variation in spending reflects large differences in both enrolment rates and in expenditure per student.

On average, 24% of tertiary expenditures in the OECD were financed privately in 2003. This is a marked increase from 1995, when the average was only 19%, although this partly reflects changes in the composition of countries within the sample. In some countries (the United States, Korea, Japan, and Australia), most spending is from private sources (see **Figure 1**). In others, including most European countries, almost all spending is by the government.

Notwithstanding these variations, government subsidies are substantial in every industrialized economy. The rationale for this government support for higher education is controversial. For example, it is often said that tertiary education is a right, not a privilege. However, the same might be said of food or clothing, which governments do not heavily subsidize. A more concrete argument is that subsidies permit children from less-wealthy families to undertake higher education, promoting equality of opportunity. This argument is powerful when the only alternative is the free market. However, as discussed

below, other government policies, such as provision of student loans, can facilitate access without large subsidies. Perhaps the most common argument in the academic literature is that higher education provides benefits to others, not just the student – so it is fair and efficient that society pays a share of the cost. Examples of these benefits or externalities include technological innovation and civic participation. In practice, estimating the size of these benefits is difficult. Therefore, while there is widespread agreement in principle that governments should contribute to some of the costs of higher education, there is also disagreement as to how large that contribution should be.

International Comparisons of Tuition Fees

As might be expected, countries that finance higher education privately tend to have high tuition fees, and this is illustrated in **Figure 2** which also shows differences between private and public institutions. Estimates across countries are not precisely comparable but the ranking of countries is not very sensitive to measurement issues. In particular, tuition is relatively expensive in the United States, Korea, and Australia, and tuition is low, or even free, in most European countries.

Other Costs

The direct education costs described above typically represent a small share of the total cost of attendance. Students also need to pay for room, board, and other living costs. Estimates of these tend to be highly judgmental and are difficult to compare. As one indicator, governments and educational institutions in the United States typically base financial aid packages on the assumption that students need about \$US10,000 to \$11,000 per annum to live on. That compares with an average tuition fee of around \$US8000. In other countries, estimates of both living costs and tuition fees tend to be lower, but the former outstrip the latter by even wider margins. The sum of tuition and living costs (less scholarships and grants, discussed below) represents the amount that needs to be financed by the typical tertiary student.

Students with ready access to finance will recognize that living costs would be incurred regardless of whether or not they study and hence are not relevant to the choice as to whether to enrol. The opportunity cost – the resources that are sacrificed in order to enrol – is foregone income. An

Figure 1 Expenditure on tertiary education institutions: OECD countries percentage of GDP, 2003. Countries are ranked by level of private spending. In Switzerland, private spending data are not available. For further notes and qualifications, see source. From table B2.1b OECD (2006). *Education at a Glance*. Paris: OECD.

Figure 2 Average tuition fees: tertiary type-A institutions, 2003. Countries are ranked by average tuition fee, weighted by full-time enrolment. Tertiary type-A institutions mainly comprise bachelor's degree programs, and also include masters and professional degrees and some academically oriented associates degrees. Where data are provided as a range, the midpoint is used. For further notes and qualifications, see source. From table B5.1 OECD (2006). *Education at a Glance*. Paris: OECD.

illustrative estimate is the median earnings of a 20-year-old high-school graduate in the United States – around \$22,000 a year. This exceeds the cost of tuition at almost all institutions, a difference that is even greater in other countries. Hence, although public discussion often emphasizes fees as a barrier to education, the bigger disincentive is foregone earnings and the need to finance living costs. Furthermore, although tertiary education is often described as free in

many countries, the size of living costs and foregone earnings means that large contributions are nevertheless required on the part of the student.

Different Kinds of Public Support

The form of public support for higher education also differs widely. In all OECD countries, direct spending

on institutions accounts for the majority of public spending on tertiary education. Indeed, in many countries (e.g., Switzerland, Poland, and Portugal), it is almost the only form of support. Elsewhere, however, substantial support is provided through households in the form of grants and loans. Grants may be based on academic performance (when they are often called scholarships) and/or means testing, either of family or individual income. Loans may be provided directly from the government, or indirectly through a government guarantee of a commercial bank loan. However, increasingly financial assistance from governments is taking the form of an ICL, and this reform is considered in detail in the following sections.

From **Figure 3** it is apparent that New Zealand is the OECD country that relies most heavily on loans, while Denmark relies most on grants. The OECD loan estimates shown represent the gross amount directly lent by government, plus subsidies to private lenders. For some purposes, this overstates the budgetary cost of loans, as repayments are excluded. Meanwhile, it may understate the importance of guaranteed private loans. In principle, it would be desirable to also include tax concessions; however, comparable international estimates are not available.

The relative merits of grants, loans, direct institutional funding, and tax concessions are strongly debated. Researchers have endeavored to measure the costs and benefits of these alternative policies but effects are not always clear. One simple piece of evidence is presented in **Figure 4**, which shows that countries with large loan programs tend to have above-average enrolments. There are several possible explanations for this, including reverse causation. However, the most usual interpretation is that the ready availability of finance facilitates access to higher education.

The following sections consider the conceptual bases of different policy approaches to student loans.

Conceptual Issues Concerning Student Loans

The Need for Student Loans

A significant financing issue for higher education discussed above is that there is a case for both a contribution from students and a taxpayer subsidy. The next important question is: Is there a role for government beyond the provision of the subsidy?

An understanding of the issue is facilitated through consideration of what would happen if there were no higher education financing assistance involving the public sector. That is, a government, convinced that there should be a subsidy, could simply provide the appropriate level of taxpayer support to higher education institutions, and then leave market mechanisms to take their course. Presumably, this would result in the institutions charging students upfront on enrolment for the service.

However, there are major problems with this arrangement, traceable in most instances to the potent presence of risk and uncertainty. This critical point was first raised by Friedman. The argument can be best understood with reference to the nexus between labor markets and human capital investments. The essential point is that educational investments are risky, with the main areas of uncertainty being as follows as discussed by Barr (2001), Palacios (2004), and Chapman (2006a):

1. Enrolling students do not know fully their capacities for (and perhaps even true interest in) the higher

Figure 3 Public subsidies to households as a percentage of total public expenditure on tertiary education (2003). Countries are ranked by share of public spending flowing through households. Loans are measured as gross amount directly lent by government, plus subsidies to private lenders. For further notes and qualifications, see source. From table B5.2 OECD (2006). *Education at a Glance*. Paris: OECD.

Figure 4 Student loans and entry rates to tertiary education, 2003. The entry rate is the proportion of people entering tertiary type-A programs for the first time. It differs from enrolment rates in that comparability between countries is not distorted by different course lengths. Loans are valued as the gross amount directly lent by government, plus subsidies to private lenders. From table B5.2 OECD (2006). *Education at a Glance*. Paris: OECD.

education discipline of their choice. This means in an extreme they cannot be sure that they will graduate with, in Australia for example, around 25% of students ending up without a qualification.

2. Even given that university completion is expected, students will not be aware of their likely relative success in the area of study. This will depend not just on their own abilities, but also on the skills of others competing for jobs in the area.
3. There is uncertainty concerning the future value of the investment. For example, the labor market – including the labor market for graduates in specific skill areas – is undergoing constant change. What looked like a good investment at the time it began might turn out to be a poor choice when the process is finished.
4. Many prospective students, particularly those from disadvantaged backgrounds, may not have much information concerning graduate incomes, due in part to a lack of contact with graduates.

These uncertainties are associated with important risks for both borrowers and lenders. The important point is that, for example, if the future incomes of students turn out to be lower than expected, the individual is unable to sell part of the investment to refinance a different educational path. For a prospective lender, a bank, the risk is compounded by the reality that in the event of a student borrower defaulting on the loan obligation, there is no available collateral to be sold,

a fact traceable in part to the illegality of slavery. Moreover, even if it was possible for a third party to own and sell human capital, its future value might turn out to be quite low taking into account the above-noted uncertainties associated with higher education investments.

It follows that, left to itself – and even with subsidies from the government to cover the value of externalities – the market will not deliver propitious higher education outcomes. Prospective students judged to be relatively risky, and/or those without loan repayment guarantors, will not be able to access the financial resources required for both the payment of tuition and to cover income support. There would be efficiency losses (talented but poor prospective students would be excluded), and distributional inequities (the nonattainment of equality of educational opportunity). Government intervention of some form is thus required.

The capital market failure with respect to higher education financing is apparently understood by the governments of most countries, given that public sector loan interventions are commonplace internationally. Until recently, government intervention often took the form of public sector guarantees for commercial bank provision of education loans, but over the last decade or so has increasingly involved ICL. While quite different in practice, both approaches are motivated in part by the recognition that, left alone, higher education markets will function poorly.

The Costs and Benefits of Conventional Student Loans

A possible solution to the capital market problem described above, used in many countries, is the provision of student loans – either directly by the government or indirectly through guarantees to banks. Typically, and most simply, these loans involve fixed repayments, as, for example, with a house mortgage. While this seems to address the capital market failure, it raises problems of default.

Students face an important default issue; that is, some may be reluctant to borrow for fear of not being able to meet future repayment obligations. Not being able to meet repayment obligations has the potential to inflict significant damage to a person's credit reputation (and thus access to future borrowing, e.g., for the purchase of a house). These concerns imply that there will be less borrowing than there would be in the absence of this default concern.

A reluctance to borrow due to the uncertainty of repayment constitutes what might be labeled an *ex ante* default problem for prospective students. There is also an *ex post* problem, which is that a proportion of those students who took the credit risk of borrowing for a human capital investment will end up not being able to repay because of low incomes. In these circumstances, default imposes a potentially large cost on those unlucky borrowers who do poorly in the labor market. Significantly, research suggests that members of the default group are predominantly those who ultimately experienced relatively high unemployment rates and relatively low earnings.

The prospect and consequences of a student defaulting on a loan obligation is a potentially critical issue for borrowing to finance human capital investments, due to the uncertainties noted above. A consequence is that some eligible prospective students will not be prepared to take bank loans. This problem can be traced, in part, to the fact that bank loan repayments are insensitive to the borrower's financial circumstances.

The bottom line is that, even though government-assisted conventional loans are a common form internationally of public sector involvement in higher education financing, such an approach has several apparently very significant weaknesses.

The Costs and Benefits of ICL

A final approach to student financing involves income contingent loans, such as Australia's Higher Education Contribution Scheme (HECS), introduced in 1989. The attraction of these schemes is that they can be designed to avoid the problems associated with alternative financing policies.

First, there is no concern with intrafamily sharing so long as the scheme is universal. That is, no student would

be denied access through the imposition of means-testing arrangements that could exclude some whose parents or partners are unwilling to help.

Second, given an efficient collection mechanism, there is no default issue for the government. That is, if the tax system is used to collect the debt (at least for Australia, this is essential because the Australian Taxation Office is the only institution with reasonably good information on a former student's income), it is extremely difficult for the vast majority of graduates to avoid repayment. There is a small default issue in that some students will not pay back in full, because income contingent systems are designed to excuse some former students' payments because their lifetime incomes are too low. Harding (1995) calculates that the total repayments remaining uncollected because of the nature of HECS would be of the order of 20% for the original scheme (when the repayment conditions were much more generous for the student (before the 1996/1997 changes)). Other reasons loans may not be repaid include death and emigration.

Third, because repayments depend on income, there should be no concerns by students with respect to an incapacity to repay the debt. That is, once an individual's income determines repayment, and so long as the repayment parameters are sufficiently generous, it is not possible to default because of a lack of capacity to pay. This is the critical practical advantage of income contingent collection schemes – unlike any other form of assistance, there is insurance against default.

Income contingent schemes have significant advantages over alternative financing arrangements, in that they can be designed to avoid the major problems of their alternatives. This, however, does not make such approaches a panacea generally: for an income contingent scheme to be made operational, it is essential that there is an efficient administrative collection mechanism.

The matter of collection is of great importance for the introduction of ICL in countries without the necessary institutional apparatus. Chapman argues that the minimum conditions for a successful income contingent loan seem to be:

1. accurate record keeping of the accruing liabilities of students;
2. a collection mechanism with a sound, and if possible, a computerized record-keeping system; and
3. an efficient way of determining with accuracy, over time, the actual incomes of former students.

While most OECD countries will have income tax systems that enable efficient collection of income contingent debts, it is very unlikely that developing countries have the capacity to meet the third requirement mentioned above.

International Reforms in Student Loan Systems

Background

Friedman's suggested policy response to the capital market problem involved a type of graduate tax in which former students would repay their debts as a percentage of their incomes for a given period of time. It was not until the 1970s that a more conventional ICL arrangement was first introduced, unsuccessfully, by Yale University. The policy approach received a major boost involving the use of the national income tax system for collection with the introduction of the HECS in Australia in 1989, followed by quite similar policy reforms in other countries. These experiences are now reviewed briefly.

The Yale Plan

Yale University introduced an ICL in 1972, which was extended in 1976 but discontinued several years later. Apart from loans being repaid depending on income, the scheme had the feature of the borrowing being of the form of a group loan, in which there was mutual responsibility between members with respect to the repayment of the total debt. Chapman (2006a, b) categorizes the Yale scheme as a risk-pooling ICL.

Individual repayments were not unlimited, however, with a cap being defined at 150% of the borrower's loan. This then became a buyout option for former students wishing to discontinue in the program (Palacios, 2003). Even so, risk pooling necessarily meant that high-income earners covered the unpaid debts of low-income earners and those who defaulted for other reasons. High initial default rates eventuated, predicted by Nerlove in 1975, because of moral hazard, and the scheme was discontinued. One of the major problems with the Yale scheme was that the university was ill-equipped to act as the collection agency.

Sweden

Prior to 1988, Sweden had a student loan system with fixed repayments and heavily subsidized interest rates. In 1988, repayments were made a flat 4% of income, with less-subsidized interest rates. In 2001, following concern about interaction between these income contingent repayments and the country's already high marginal income tax rates, this scheme was replaced by one in which repayments are initially low, then increase based on a formula that takes into account the students' outstanding debt, the prevailing interest rate, and an annual escalator (Usher, 2005). There is little available evidence of the effect of the scheme.

Australia

As noted, in 1989 Australia instituted a broadly based risk-sharing ICL charging system for higher education, known as the HECS, which seeks to recover a part of tuition costs, and the system does not involve student income support. In Australia, student income support takes the form of means-tested grants. Students incur a debt which is repaid according to future incomes, there being at the time a first threshold of repayment of around average Australian earnings. The Australian Tax Office is the collection agency.

Payments are progressive and, after the debt is incurred, there is a real rate of interest of zero. However, the interest rate regime is more complicated than this, because if a student chooses to pay upfront they (currently) receive a 20% discount. This means that HECS implicitly has a rough form of a real rate of interest, in that those choosing to pay later initially incur a higher level of debt, although the difference obviously reduces in present value terms over time. The discount could be seen to be Australia's way of encouraging what are called parental contributions.

There has by now been considerable research on the effects of the introduction of HECS on a critical issue for policy, the consequences of the scheme for the access of relatively disadvantaged prospective students. The conclusions from the Australian research with respect to socioeconomic mix and access are as follows:

1. the introduction of HECS was associated with aggregate increases in higher education participation; and
2. HECS did not result in decreases in the participation of prospective students from relatively poor families, although the absolute increases were slightly higher for relatively advantaged students.

Both findings raise some important discussion points. With respect to the first, it does not follow that HECS *per se* resulted in an increase in the demand for higher education. Indeed, if this were the case it would constitute a curiosity for economic theory, since the result would suggest that increasing the price of a service increases also the quantity demanded. Indeed, an important finding from many disparate case studies is that the socioeconomic mix of higher education students seems fairly insensitive to funding regimes. That is, marked changes in the levels, incidence, and nature of grant, as well as loan support systems (and tax and other fiscal incentives) do not seem to affect significantly the proportion of enrolments of students from different family wealth backgrounds.

The other important finding from HECS is that the collection of the debt is apparently quite efficient in administrative terms. That is, the Australian Tax Office estimates put the collection costs at around \$25 million

annually, or less than 3% of yearly receipts. Administratively, the system seems to have worked well.

New Zealand

Third, after Sweden and Australia, New Zealand adopted an ICL scheme in 1991 that shares several features of HECS. Specifically:

- loan repayments depend on an individual's income, and are collected through a tax system which made this simple in operational terms; and
- a first income threshold of repayment, after which there is a progressive percentage rate of collection.

The New Zealand arrangements differ importantly to those introduced in Australia. In particular:

- the loans are designed to cover both university fees and some living expenses, although there is also a system of means-tested grants for students from poor backgrounds;
- initially the loans carried a market rate of interest, but now the nominal rate is zero so there is a negative real rate of interest; and
- until recently, universities were free to set their own fees.

A potential advantage of the New Zealand scheme is that universities have discretion over the prices charged, and receive the tuition revenues directly. This implies that in New Zealand there is the prospect of resource allocation effects within the higher education system as a result of the direct nexus between the prices charged and the revenue received. In 2005, the Australian government suggested reforms that were more along these lines. There is little direct evidence of the effects of the New Zealand ICL on the access of disadvantaged prospective students.

The Republic of South Africa

The Republic of South Africa introduced an ICL in 1991, known as the National Student Financial Aid Scheme (NSFAS). NSFAS was motivated essentially by a concern that without assistance the marked racial skewing of the higher education system away from non-white students would remain. While bursaries could have been used instead of ICL, it was considered that the costs involved "... would not be financially sustainable" (Jackson, 2002: 83). The scheme initially provided resources to about 7500 students, but by 2002 this number had risen to over 100,000, or more than 20% of South Africa's higher education students.

Resources are distributed through the universities, with preference going to prospective students who are

both poor and academically able. That is, unlike other national schemes, the South African ICL involves means-testing on the basis of family income at the point of entry to higher education.

There are two major differences between the South African approach and those used in both Australia and New Zealand. The first concerns the first income level of repayment, which at about \$US5000 is very much lower than the thresholds used in other countries' ICLs. Second, in the first instance, the student repays directly to the lending institution. That is, the taxation system is not the first port of call, but is instead a last resort. Employers are required to be involved only when a student is apparently not maintaining expected debt repayments. It is unclear how much this adds to administrative costs, but it would seem to suggest that collection would necessarily be relatively expensive. Jackson argues that the annual administrative costs are less than 2% of the total value of loans distributed. The more important figure, however, would be costs as a proportion of revenues collected – data not reported.

The UK

Higher education financing policy over the last 15 years or so in the UK has been characterized by considerable change. In 1990, a loan scheme was introduced, but collection was not based on a former student's income. In 1997, an ICL was initiated which took the following form: students from poor backgrounds were excused from paying any tuition, while students from rich families incur the entire debt. In between, the debt obligation is determined by means of a sliding scale. This decision seemed to reflect a concern by the government that relatively disadvantaged students would be more likely than others to find an ICL a deterrent to higher education participation, a view at variance with the evidence from the HECS experience reported above. In 2006, the UK government announced further reforms to higher education financing. The major changes are:

- the introduction of price discretion for universities, but with a cap of 3000 pounds per full-time student year; and
- the introduction of tuition for all students, but with the poorest being provided with subsidies.

As with the Australian and New Zealand schemes, the UK ICL policy is likely to be relatively inexpensive to administer. This is because income tax arrangements in these countries greatly facilitate the operation of ICL. As pointed out by Chapman, this is far from the case with respect to developing countries, where public administrative challenges related to the collection of ICL loom large.

The US

In 1993, the Clinton administration introduced broadly based reforms to student loan programs. One noteworthy aspect of the reforms included an option for students to adopt income contingent repayments for some part of their loan obligations, with the ICL obligation being 20% of disposable income.

The ICL reforms introduced in the US have not worked well. With respect to takeup, for example, in 1999 only 7% of the eligible student population initially chose to repay their loan obligations through the ICL option, although 26% of borrowers consolidating (bundling) their loans choose ICL repayments. The basis for low takeup of ICL in the US seems to have two, arguably closely related, explanations. In broad terms, these are: the poor design characteristics of the scheme; and the government's ineffectiveness in accurately explaining and publicizing the scheme's implications for student debt and repayment obligations. It is possible that both weaknesses reflect a lack of ICL policy commitment on the part of those with US policy influence. As of mid-2007, the US Congress was considering legislation that would substantially expand the income contingent component of its existing loan programs.

Other Countries

Other countries have introduced ICL systems, but in general it is not obvious that these have been successful. Chile's 1994 scheme ran into significant collection problems (the tax system was not used), and the Thailand ICL reforms of 2006 have now been suspended arguably in part because of concerns with both the extent of taxpayer subsidies and matters of collection. Israel is close to implementing an ICL, and there are active debates concerning the costs and benefits of such arrangements underway in a large number of countries.

Conclusion

As variations between countries and over time may indicate, there are no definitive answers to how higher education should best be financed. Nevertheless, as indicated above, there is a trend toward both decreases in direct taxpayer support and increased reliance on student loans, particularly those with income contingent repayments. International organizations such as the OECD, International

Monetary Fund (IMF), and World Bank routinely recommend their members move in this direction, and the OECD, for example, describes income contingent student loans as international best practice. This assessment, however, is based in large part on economic reasoning rather than solid evidence, although data consistent with the predictions of the conceptual arguments are accumulating. A critical issue concerns the collection of ICLs, and it is difficult to believe that for many developing countries that this approach can currently work.

Higher Education Crossing Borders

J Knight, University of Toronto, Toronto, ON, Canada

© 2010 Elsevier Ltd. All rights reserved.

Growth and Complexity of International Academic Mobility

A fascinating but very complex world of cross-border education is emerging. The last decade has been a hotbed of innovation and new developments. For instance, Phoenix University has become the largest private university in the US (owned and operated by Apollo Group) and is now present or delivering courses in Puerto Rico, Netherlands, Mexico, and Canada. Other Apollo companies are offering courses in Brazil, India, and China. The Netherlands Business School (Universiteit Nijenrode) has recently opened a branch campus in Nigeria and Harvard is planning to develop two branch campus initiatives in Cyprus and the United Arab Emirates. Furthermore, Jinan University will be the first Chinese university to open a branch campus outside China and will do so in Thailand. Laureate Education (formerly Sylvan Learning Systems) has purchased whole or part of private higher education institutions in Chile, Mexico, Panama, and Costa Rica and owns universities in Spain, Switzerland, and France. Dubai has developed a knowledge village in the Dubai Technology and Media Free Zone and to date the London School of Economics, Indian Manipal Academy of Higher Education, and the University of Wollongong from Australia are offering courses through franchising agreements and branch campuses. The University of Westminster (UK) is the key foreign academic partner in the new private Kingdom University of Bahrain and plays a similar advisory/provision role with new institutions in Nigeria, Uzbekistan, and Kazakhstan. (OBHE, 2004)

These are only a few examples of hundreds of new initiatives that have developed in the last few years. They involve higher education providers (including institutions and companies) delivering their courses and programs to students in their home countries. It is convincing evidence that it is no longer just the students who are moving around the world. Different kinds of providers including private companies, traditional academic institutions, and professional associations are now taking academic programs to students where they live. Various types of program delivery methods such as franchising, twinning, joint degrees offer a wide range of courses. New types of partnerships including public/private, nonprofit/for-profit, local/foreign, and institutions/corporations are being formed to respond to the burgeoning demand for access to higher education, and in many cases, the appeal of foreign academic qualifications.

In short, the world of education crossing borders is escalating exponentially and it is likely to continue based on the prediction that the demand for international education will increase fourfold from 1.8 million students in the year 2000 to 7.2 million students in 2025. (Bohm *et al.*, 2002) These are staggering figures. They help to explain and forecast the growth in worldwide academic mobility and sharpen the focus on the movement of programs and providers across borders.

Given the expansion of education crossing borders it is important to discuss emerging issues such as the implications for licensing, quality assurance, access, funding, research, intellectual property, trade policies, recognition of qualifications, and joint ownership. While these issues are definitely central to the analysis of the new forms of international academic mobility, it is difficult to address them, especially in terms of models, policies, and regulations, if there is confusion about what cross-border means and how it relates to internationalization, globalization, and trade in education services.

Evolution of Terminology

It is both fascinating and revealing to see how the vocabulary of international education has evolved. International cooperation, international relations, and international education were the most common terms used 40 years ago. These concepts were usually defined in terms of activities such as development projects, foreign students, and international academic and cultural agreements. In the 1990s, the discussion centered on differentiating the term 'international education' from 'comparative education', 'global education', and 'multicultural education'. But, today, international academic mobility is the focus and there are a number of terms such as cross-border, transnational, and borderless education to describe this phenomenon. **Table 1** illustrates how the international education vocabulary has evolved in the last four decades.

Clearly, the growing interest in the international dimension and delivery of higher education is accompanied by an increase in the number of terms used to describe the changes. It is important to be clear at the outset how related concepts are used in this article and their link to higher education crossing borders:

1. Globalization. It is described as a process that is increasing the flow of people, culture, ideas, values,

Table 1 Evolution of international education terminology

<i>New terms Last 15 years</i>	<i>Existing terms Last 25 years</i>	<i>Traditional terms Last 40 years</i>
<i>Generic terms</i>

From Knight, J. (2005a). *Borderless, Offshore, Transnational and Crossborder Education: Definition and Data Dilemmas*. London: Observatory for Borderless Higher Education.

knowledge, technology, and economy across borders resulting in a more interconnected and interdependent world. Globalization affects each country in different ways. It can have both positive and/or negative consequences, according to a nation's individual history, traditions, culture, priorities, and resources. (Knight, 2006a) Education is one of the sectors impacted by globalization.

2. Internationalization of higher education. This is also a process, albeit a different process than globalization. Internationalization of higher education is described as the process of integrating an international, intercultural, and global dimension into the purpose, functions (teaching, research, and service), and the delivery of higher education at the institutional and national levels (Knight, 2006b).
3. Internationalization strategies. These include international cooperation and development projects; institutional agreements and networks; the international/intercultural dimension of the teaching/learning process, curriculum, and research; campus-based extra-curricular clubs and activities; mobility of academics through exchange, fieldwork, sabbaticals and consultancy work; recruitment of international students; student exchange programs and semesters abroad; joint/double-degree programs; twinning partnerships; branch campuses, etc. Internationalization strategies apply to both campus-based activities and cross-border initiatives. The cross-border aspects of internationalization are the focus of this discussion.
4. Cross-border education refers to the movement of people, knowledge, programs, providers, ideas, curricula,

projects, research, and services across national or regional jurisdictional borders. Cross-border education is a subset of internationalization and can be part of development cooperation projects, academic exchange programs, and commercial initiatives.

5. Trade-of-education services is a term that is primarily used by the trade sector. It focuses on those cross-border education initiatives that are commercial in nature and are usually intended to be for-profit in nature – though this is not always the case. This term coincides with the advent of the general agreement on trade in services (WTO, 1999) which includes the education sector as a tradable service.

Relationship of Cross-Border to Transnational, Borderless, and Offshore Education

The knowledge society, information and communication technologies (ICTs), international trade agreements, market economy – all important aspects of globalization – have had a profound influence on the shape and substance of the higher education sector. As a result, there is a new emphasis on international academic mobility and new terms have been introduced to describe international academic mobility.

Transnational and Offshore Education

Australia was one of the first countries to use the term transnational education in the early 1990s as it wanted to

differentiate between international students recruited to Australian campuses and those who were studying for Australian degrees offshore. (Davis *et al.*, 2000) Hence, the term transnational education became used to simply describe offshore international student enrolments regardless of whether the offshore students were studying through twinning, franchise, distance, or branch campus arrangements. It is interesting to note how the use of terms in Australia has evolved in such a way that international education usually refers to foreign students studying in Australia and transnational education refers to those studying offshore. In this conceptualization of the term transnational, the focus is on where the student is studying.

UNESCO and the Council of Europe in their code of practice on transnational education describe transnational education as all types and modes of delivery of higher education study programs, or sets of courses of study, or educational services (including those of distance education) in which the learners are located in a country different from the one where the awarding institution is based. Such programs may belong to the education system of a state different from the state in which it operates, or may operate independently of any national education system (UNESCO and the Council of Europe, 2005). This definition differs from the Australian term as it includes all situations where programs move across a border or where the provider is virtual and delivering by distance. It is unclear whether they cover new types of providers, especially those that establish a physical presence in the country and obtain permission from the receiving country to offer recognized qualifications. In this scenario, the providers are clearly awarding foreign degrees but they are not necessarily located in a different country than the student.

Offshore education is usually used to denote education delivered abroad, but its use is decreasing due to the more recent introduction of the term cross-border. Furthermore, those countries without a shoreline find this term irrelevant to their situation.

Borderless Education

The term borderless education first appeared in an Australian report (Cunningham *et al.*, 2000) and was followed by a similar type of study in the United Kingdom. Basically the term borderless education refers to the blurring of conceptual, disciplinary, and geographic borders traditionally inherent to higher education (CVCP, 2000). The innovative feature of this term is that it goes beyond geographic and jurisdictional boundaries to include temporal, disciplinary, and conceptual borders. This is the strength of the term, but also a possible weakness. Its contribution is at a conceptual level as it remains fairly

abstract and challenging to use in concrete and applied situations.

It is interesting to juxtapose the concepts of borderless education and cross-border education. The former term acknowledges the disappearance of borders while the latter term actually emphasizes the existence of borders. Both approaches reflect the reality of today. In this period of unprecedented growth in distance and e-learning education, geographic borders seem to be of little consequence. Yet, on the other hand, we can detect a growing importance of borders when the focus turns to regulatory responsibility, especially related to quality assurance, accreditation, funding, joint ownership, or intellectual copyright. (Verbik and Jokivirta, 2005) Borderless education does not seem to be extensively used in operational or applied settings. Nevertheless, it is a useful concept to capture the notion of the blurring and erosion of traditional academic boundaries and for that reason has played an important role in raising awareness about changes in the education sector.

Cross-Border Education

As noted above, cross-border education includes the movement of people, knowledge, programs, providers, ideas, curricula, projects, research, and services across national or regional jurisdictional borders. In many ways it seems ironic that the role of borders is actually stronger in a globalized world that encourages the free flow of people, ideas, goods, services, knowledge, capital, and technology. The introduction of new multilateral trade rules or immigration laws are examples where crossing borders into a different jurisdiction has major implications. Hence, the notion of jurisdictional boundaries has increasing significance for many sectors including education. During the last 5 years, partially in response to the importance of borders, the term cross-border education has emerged and is becoming more widely used as a comprehensive term.

Both UNESCO and OECD have cross-border education higher on the policy agenda in response to member state interests. They have developed, with key education stakeholders, the guidelines for quality provision in cross-border higher education (UNESCO/OECD, 2005). The definition of cross-border education in the proposed guidelines is as follows: higher education that takes place in situations where the teacher, student, program, institution/provider, or course materials cross national jurisdictional borders. Cross-border education may include higher education by public/private and not-for-profit/for-profit providers. It encompasses a wide range of modalities in continuum from face-to-face taking various forms from students traveling abroad and campuses abroad to distance learning using a range of technologies and including e-learning.

Whether higher education is conceptualized as moving across borders or across nations may seem to be insignificant, but the difference between crossing jurisdictional borders (cross-border education) and the separation of learner and the awarding provider in different locations (transnational education) does involve consequences in terms of regulations. There needs to be clarity and consistency of terms within a country for national regulations to work and for a common understanding of regional/international policies. That said, one is optimistic that the new cross-border guidelines developed jointly by UNESCO and OECD will bring some leadership and convergence to the current confusion about terminology.

Elements of Cross-Border Education

Table 2 provides a framework to understand the nature of cross-border education and illustrates two significant trends. The first trend is the vertical shift downward from student mobility to program and provider mobility. It is important to note that numbers of students seeking education in foreign countries is still increasing; but, more emphasis is currently being placed on delivering foreign academic courses and programs to students in their home country. The second shift is from left to right signifying substantial change in orientation from development cooperation to competitive commerce, or in other words, from aid to trade.

Growth in Number and Diversity of Cross-Border Providers

The increase in worldwide demand for higher education has resulted in a diversity of providers delivering education across borders. The providers are classified into two categories: (1) the traditional higher education institutions (HEIs) which are normally oriented to teaching, research, and service/commitment to society, and (2) the new or alternative providers which primarily focus on teaching and the delivery of education services.

Traditional Higher Education Institutions

This category includes public nonprofit, private nonprofit, and private for-profit institutions. Many countries have a mixed system of publicly and privately funded HEIs. There is a definite blurring of the boundary between public and private institutions as public universities are now finding it necessary to seek private financing and are charging a tuition or service fee. On the other hand, in many countries private institutions are eligible for public funds and engage in social nonprofit activities.

An important factor is whether the HEI is part of a home national education system and recognized by a national bona fide licensing/ accrediting body. In cross-border education recognition/registration is critical to

ensuring the legitimacy of the institution and the qualifications provided. The majority of traditional universities are bona fide institutions that comply with domestic and foreign regulations (where they exist). But, there is also an increase in rogue or low-quality providers who are not recognized by bona fide accreditation/licensing bodies in either the sending or receiving countries. Rogue providers are often accredited by self-accrediting groups or by agencies that sell accreditation (accreditation mills). In addition, there is a worrisome increase in the number of degree mills operating around the world. (Garrett, 2005) These are often no more than Web-based companies that are selling certificates based on life experiences and are not delivering actual education programs.

New or Alternative Providers

The new providers are diverse in nature, but are typically described as a company or organization that provides education programs and/or services on a commercial basis. They are more oriented to delivering education and training programs than to undertaking research and scholarly activities. The new providers include publicly traded companies such as Apollo (USA), Informatics (Singapore), and Aptech (India), corporate universities such as those run by Motorola and Toyota, professional associations, and organizations. These new types of cross-border providers can be brick-and-mortar institutions or virtual universities and can complement, compete, collaborate, or simply co-exist with domestic higher providers (and other cross-border providers).

Typology of Program Mobility

Cross-border mobility of programs can be described as the movement of individual education/training courses and programs across national borders through face to face, distance or a combination of these modes. Credits towards a qualification can be awarded by the sending foreign country provider or by an affiliated domestic partner or jointly. Franchising, twinning, double/joint degrees, and various articulation models are the more popular methods of cross-border program mobility (Knight, 2005). A short description of each follows:

1. Franchise. It refers to an arrangement whereby a provider in the source country A authorizes a provider in country B to deliver their course/program/service in country B or other countries. The qualification is awarded by provider in country A. Arrangements for teaching, management, assessment, profit-sharing, awarding of credit/qualification, etc. are customized for each franchise arrangement and must comply with national regulations (if they exist) in country B.

2. Twinning. It describes a situation where a provider in source country A collaborates with a provider located in country B to develop an articulation system that allows students to take course credits in country B and/or source country A. Only one qualification is awarded by provider in source country A. Arrangements for twinning programs and awarding of degree usually comply with national regulations of the provider in the source country A.
3. Double/joint degree. It is an arrangement where providers in different countries collaborate to offer a program for which a student receives a qualification from each provider, or a joint award from the collaborating partners. Arrangements for program provision and criteria for awarding the qualifications are customized for each collaborative initiative in accordance with national regulations in each country.
4. Articulation. It refers to various types of articulation arrangements between providers situated in different countries permit students to gain credit for courses/programs offered by all of the collaborating providers. This allows students to gain credit for work done with a provider other than the provider awarding the qualification.
5. Validation. Validation arrangements between providers in different countries allow provider B in the receiving country to award the qualification of provider A in source country. In some cases, the source-country provider may not offer these courses or awards themselves which may raise questions about quality.
6. Virtual/distance. It refers to arrangements where providers deliver courses/program to students in different countries through distance and online modes. It may include some face-to-face support for students through domestic study or support centers.

A critical factor in program mobility is who awards the course credits or ultimate credential for the program. As the movement of programs proliferates, there will undoubtedly be further changes to national, regional, and even international regulatory frameworks. The question of who grants the credits/awards will be augmented by who recognizes the provider and whether or not the program has been accredited or quality assured by a bona fide body. Of central importance is whether the qualification is recognized for employment or further study in the receiving country and in other countries as well (OECD, 2004). The perceived legitimacy and recognition of the qualification at home and abroad, are fundamental issues yet to be resolved.

Given that several modes for program mobility involve partnerships, there are questions about who owns the intellectual property rights to course design and materials. What are the legal roles and responsibilities of the participating partners in terms of academic, staffing,

recruitment, evaluation, financial, and administrative matters? While the movement of programs across borders has been taking place for many years, it is clear that the new types of providers, partnerships, awards, and delivery modes are challenging national and international policies.

Typology of Traditional and New Provider Mobility

Cross-border mobility of providers can be described as the physical or virtual movement of an education provider (institution, organization, and company) across a national border to establish a presence in order to offer education/training programs and/or services to students and other clients. The difference between program and provider mobility is one of scope and scale in terms of programs/services offered and the local presence (and investment) by the foreign provider. A distinguishing feature between program and provider mobility is that with provider mobility, the learner is not necessarily located in a different country than the awarding institution, which is usually the case in program mobility. Credits and qualifications are awarded by the foreign provider (through foreign, local, or self-accreditation methods) or by an affiliated domestic partner. (Knight, 2005) Different forms of cross-border provider mobility are as follows:

1. Branch campus. A provider in country A establishes a satellite campus in country B to deliver courses and programs to students in country B. This may also include students from country A taking a semester/courses abroad in country B. The qualification awarded is from the provider in country A.
2. Independent institution. A foreign provider A (a traditional university, a commercial company, or an alliance/network) establishes in country B a stand-alone HEI to offer courses /programs and awards. There is usually no home institution in country A.
3. Acquisition/merger. A foreign provider A purchases a part of or 100% of a local HEI in country B.
4. Study center/teaching site. A foreign provider A establishes study centers in country B to support students taking their courses/programs. Study centers can be independent or in collaboration with local providers in country B.
5. Affiliation/networks. Different types of public and private, traditional and new, local and foreign providers collaborate through innovative types of partnerships to establish networks/institutions to deliver courses and programs in local and foreign countries through distance or face-to-face modes.
6. Virtual university. It refers to a provider that delivers credit courses and degree programs to students in different countries through distance education using

predominantly the Internet technology mode, generally without face-to-face support services for students.

The virtual and physical movement of providers to other countries raises many of the same registration, quality assurance, and recognition issues that program mobility does, but there are additional factors to consider if a network or local/foreign partnerships are involved. Setting up a physical presence requires attention being paid to national regulations regarding status of the entity, total or joint ownership with local bodies, tax laws, for profit or nonprofit status, repatriation of earned income, boards of directors, staffing, granting of qualifications, selection of academic programs and courses, etc. For some countries, it means that strict regulations are being developed to closely monitor, and in some case restrict, new providers coming into the country. In other instances, incentives are being offered to attract high-quality institutions/providers to set up a teaching site or full campus. This is especially true where knowledge parks or technology zones or education cities are being developed to attract foreign companies and education/training providers.

Challenges

In a field that is changing as much as international education is, the challenge of finding common meanings for the same and similar terms will continue. Each country, association, or government agency will use terms that make sense from their perspective. It is not the intention to propose one universal definition but it is useful to have a common understanding of what is being debated and more importantly, what is being regulated. The emphasis is on developing a common understanding of the terms for policy, regulations, research, and data-collection purposes, not necessarily a common language, though the latter does facilitate the former.

The mobility of students, professors, knowledge, and values has been part of higher education for centuries but it has only been in the last two decades that there has been a significant growth in the mobility of programs and providers through physical and virtual modes of delivery. This presents many new opportunities – for increased access to higher education; for strategic alliances between countries and regions; for the production and exchange of new knowledge; for the movement of graduates and professionals; for human resource and institutional capacity building; for income generation; for the improvement of academic quality; and for increased mutual understanding. The list of potential benefits is long and varied. But so is the list of potential risks. Risks can include: an increase in low-quality or rogue providers; a potential decrease in public funding if foreign providers are providing

increased access; unsustainable foreign provision of higher education if profit margins are low; foreign qualifications not recognized by domestic employers or education institutions; elitism in terms of those who can afford cross-border education, overuse of English as the language of instruction; and national higher education policy objectives not being met.

Risks and benefits vary between sending and receiving countries, between developed and developing countries, for students, institutions, companies, and employers. In the light of the fast pace of cross-border growth and innovation, it is important that the higher education sector be informed and vigilant about the risks and benefits and more importantly, the need for appropriate policies and regulations to guide current and future developments.

Higher Education in Post-Conflict Societies

M Daxner, Carl-von-Ossietzky Universitaet Oldenburg, Oldenburg, Germany

© 2010 Elsevier Ltd. All rights reserved.

Glossary

FRY – Federal Republic of Yugoslavia. A federal state which was systematically dismantled and fell into parts after 1991.

Secondary conflicts – Conflicts that stem from the intervention into a territory that has been subject of an external intervention in order to stop original conflicts between two or more parties both internal and cross-border.

Societies of intervention – Postconflict societies where the interveners form a kind of ‘new society’ together with the intervened people. Both sides contribute to this new society by bringing their traditions, culture and customary laws as well as competing lifestyles into a joint structure, which will later be disentangled again. In the meanwhile the society of intervention develops its own culture of intervention.

The World has Changed

Following the Cold War and the end of the bipolar hegemony by two superpowers, the world has become more global and less stable; only for a few countries – for example, in Eastern Europe – is there a clear peace dividend; for other countries – their situation has become more volatile, even precarious, because the well-established elements of balancing economic, political, military, and cultural structures have become shaky. In addition, for quite a few countries, there are no sustainable fundamentals of society and state due to the effects from wars and violent conflicts. It is this group of countries which are in the focus of interest for this article.

Postconflict Societies

Since 1989 – that is, the year of the Communist hemisphere disintegrating – the only remaining superpower is the United States of America. However, new superpowers are emerging, which are likely to bypass established major players in global policies, such as India, China, Brazil, and some more in a second line – among them Australia, Iran, Turkey, South Africa (SA), and South Korea. The old masters of the game, for example, united by their alliances in the North Atlantic Treaty Organization (NATO), the European Union (EU), Association of Southeast Asian

Nations (ASEAN), etc., have become accustomed to deal simultaneously with the USA – one or more of the older powers and at least one of the new players – be it at the level of G 20, the United Nations Security Council, or the International Atomic Energy Agency (IAEA). It is important to start from this viewpoint, because it allows an understanding of the importance of the new conflict scenarios as different from previous wars and belligerent conflicts, such as the two world wars or the series of liberation wars during decolonization. Consequently, these new conflicts create new postconflict constellations. A few qualities of the new scenarios should catch our attention, before we look at the impact those conflicts have on higher education and at the influence of higher education in creating conflicts and contributing to peace-keeping and peace building.

Many conflicts are no longer between (nation-) states, but rather between imperfect states and nation-states or among imperfect states. Imperfect states – also known as failed states, sometimes as rogue states – lack the qualities of recognizable states with most of ingredients such an organization requires in order to be accredited with the international community. The causes of conflicts may be traditional ones, for example, on borders, resources, land for settlement, traffic routes. More often, they are based on ethnic, religious, and other ideological justifications, which may or may not tell the true reason for conflict. We know of cases, where oil or diamonds are the true cause of a rift, but – in the course of conflict – other reasons have won the power of dominating the discourse, such as religious or national discord. Conflicts can start over single issues, such as water resources or access to the sea; they may be the result following the secession of an ethnic entity which had been previously integrated, if not well respected. Many conflicts have very strong partners taking sides – though these may not be active participants in combat, their financial and diplomatic support and their role in supplying one side with arms and logistics may be decisive for a conflict.

The results are many wars – which increasingly share two paradoxical characteristics: The conflicts occur in a zone where the international law (e.g., conventions of warfare, combatant status, prisoner of war (POW), and refugee status) does not apply or is questioned or neglected by at least one party of the conflict; and the conflicts take place in a domain – which can be called enhanced global domestic policy – to the disadvantage of traditional foreign policy and external relations among states. The traditional

prerogative of national prefixes to treaties and agreement is fading. Within the orderly part of the world, supranational agreements and structures replace national institutions and structures; this may be in the course of globalization, or even anticipate global development. The conflicts have become borderless, they transgress traditional limits of warfare, they have become asymmetric, and the outcome has become almost unpredictable. Military success is often twinned with the inability to win peace for the people.

This introductory consideration is necessary in order to make clear how education and higher education fit into the new constellation. Conflicts do not happen among the military alone. They must have been prepared by a complex interplay of institutions and interest groups, of carefully orchestrated provocation and heating up the wars of words and gestures. Since education and culture play a pivotal role in forming a discourse of conflict and inclusion or exclusion, they are also absolutely crucial to prepare a society for a violent conflict – or to restrain their constituency from such a confrontation. The same crucial role is destined for higher education in any postconflict situation.

What does postconflict mean? There are legal consequences from ceasefires and mutual agreements between antagonists, with or without any interlocutor or pairing force. However, in this instance, we must distinguish between the systems level and the level of life-world. This is not simply the distinction between governments and military rulers high up and the rest of the people deep down. The systems level indicates the place where the norms, laws, and rules for the essential infrastructure of the society to emerge and its organization are being designed and decided upon. In many cases, the normative texture of a postconflict society is written outside the country – for example, at the Petersberg/Bonn-Conference for Afghanistan, or at a special body such as the Security Council. In other cases, the system is being re-established inside the country, but far away from the respective society. The life-world level is the domain of traditions – of internalized rules and norms for settling personal conflicts and of arrangements with everyday life, experience, and common sense, and also strong genealogical allegiance, and routines, which are not well understood outside the very cycles of local life. The two normative levels – system and life-world – exist in all societies. However, the importance of the gap and relation between the two is more significant in societies which have only a few civic traditions, or which are totally torn apart by preceding wars and violent conflicts – especially when they lasted for a long period of time. As a rule, the relation between the two levels is heavily damaged during conflicts. In addition, as a consequence, the relation remains deficient for a long period in the postconflict era. Even if there are signs of normalization in a postconflict or reconstruction period, this deranged relation can be detrimental to any civic progress.

Furthermore, it should not be forgotten that postconflict does not mean a complete ending of a preceding conflict. In many cases the conflicts prevail, but are reduced or controlled by new measures of power or by an emerging effect from the rule of law; in some cases, a short period of peace is mistaken as the beginning of a period of low conflict, when the antagonism just regroups and the adversaries resurface after a while. In cases of true reconciliation, we find a good ground for society building and reforms; in such cases, the emerging democratic rule and the impact of civil society help to overcome typical postconflict situations.

The Crucial Role of Higher Education

Higher education has always been a catalyst for the emergence of conflicts and social confrontation. We even have examples, where the universities (in brief, for all higher education institutions) were instrumental to shape and fuel a secessionist insurgency, like in Kosovo (former Federal Republic of Yugoslavia (FRY)). In many cases, students are at the core of the attacking and the defending units, which may be paramilitary, guerrilla, or regular military. More important for both conflict and postconflict is the tight linking of universities with teacher training and with a certain ability to shape the mindset of major actors. Their authority often attributes credibility to them, which most of the politicians and other peers are lacking.

Some elements are often neglected or underestimated, when it comes to the pivotal role of higher education in the process of society-building following a war or other conflict.

1. The student masses are one of the most consistent social strata in a society; they represent a typical passage of status and are united by certain comprehensible political or ideological ideas; more often than not, they take part in movements calling for change. Less often, students are split along the partisan lines of the conflict itself, for example, in cases of ethnic or tribal clashes.
2. Universities have the most effective access to social multipliers of ideas and messages. Both intellectuals and teachers are the perfect bodies to spread information, messages, information, and interpretation.
3. It is within the academic world that the most significant clash of any postconflict society is likely to take place. It is the confrontation between those returning from exile, temporary migration, and foreign employment, and those who have stayed as residents, combatants, active participants in the conflicts, or as hostages and victims of the conflict. Both sides may share a history of political oppression and detention – even torture and other hardship – though it may be this experience which continues the division between the

sides, as its sources and effects may be totally in contrast with each other.

4. Universities often own assets and valuable land, building, and equipment, which may attract the attention of rivaling postconflict groups.
5. Academia is most likely to have international connections and both personal and institutional links with the world outside the conflict zone. Together with the media, universities are likely to determine whether a conflict becomes known to the international community and to form a first – and quite often sustained – image of the conflict.

It is a truism – which does not need an open conflict to be confirmed – that universities are dangerous institutions. They are dangerous for any dictatorship or authoritarian rule, especially when it is based on faith, a narrow ideology, or an exaggerated nationalism. Therefore, universities are first attacked or even shut down in any case of emergency or violent clashes, or they may be instrumental for one of the parties in the conflict.

The Postconflict Scenario

What does a country or a society need when it has just passed through a period of war and destruction? There are two answers – which concur and antagonize nevertheless. One answer is that security and safety – together with a re-establishment of political representation and a strong monopoly of power by the new government or military force – should be established. This would enable the economic and infrastructure to recover. The other answer is pointing at the necessity to create a spirit of ownership and responsibility with the people. The priorities are clearly set in the soft sectors, that is, the reconstruction of education, public health, and social security. Of course, it is evident that both sides must become intertwined and should develop in a complementary way. However, their implementation regularly creates secondary conflicts, and it is likely that the competition between hard and soft sectors is a major impediment to proper reconstruction. The formula which is almost unanimously accepted, if not applied in most cases, is that the rule of law should precede any other major institution, and that security must prevail in order to let civil society and public institutions develop.

How to Restart Universities – Some Case Studies and Examples

Postconflict societies are not to be compared to normal societies: people are traumatized, they have suffered severe losses, and many have lost next of kin or partners; businesses out of function, there is no social security,

displacement is a major problem, refugees compete for scarce resources, etc.

One aspect should be considered with special emphasis. Postconflict societies are stressed with quite a few secondary conflicts – which are different in any case – but share one element altogether: the secondary conflicts merge in the comprehension of the people with the preceding conflicts that were the initial cause of the situation. For example, if there is an occupation regime, its behavior is often compared to the authoritarian style of the prewar regime, and thus creates analogous reactions under totally different auspices. Another factor is the presence and interference of military. Civil and military affairs mix, but are rarely tuned.

There is a special postconflict culture in the making, which can turn – in case of external intervention – into a culture of intervention.

The diverse roles of higher education under such circumstances and their interdependence with the society-building process are described by a few paradigmatic examples. There is no best-practice approach, but a few lessons-learned scopes and good-practice examples may depict the multiple problems. (The intention is not to go into a comprehensive review of all concerns, but to highlight a few with special significance).

South Africa (SA)

Following the fall of the Apartheid Regime and the long-lasting conflicts, the country has achieved a rapid return into the international community of higher learning. Notwithstanding residual conflicts from earlier, such as ethnic and class-related discrimination, SA has adopted a system of higher education – which aims at utmost compatibility with international standards. The most prominent initiator of higher education reforms, Jairam Reddy, was called to the National Higher Education Commission, in 1995, and inspired major reforms and legislation. He recommends this form of reforms to the reconstruction of Iraqi higher education. When it comes to accreditation, quality assurance, and curriculum development, the system has accepted the pull of global standards, while the push is for more participation, equality of access, and an end to the residual conflicts from the past. The Higher Education Quality Committee (HEQC) is now chaired by an internationally recognized scholar, Mala Singh, who – after Reddy – has already established a kind of reform routine, which is essential for the sustainability of postconflict reconstruction. The point here is that the higher education system has adapted to the new situation – which is democratic and free – without relinquishing all features from the past. The system is reformist in many ways, while the society has undergone a revolution. Reconciliation, truth commissions, and a diversified civil society are helping to

stabilize a still fragile system – and all challenges can be coped with. This does not imply that there are no severe postconflict potentials and frictions; but, SA is one example for an inclusive role of higher education. Certainly, the stark international attention the country – and its role in Africa and worldwide – enjoys adds to the success of the system.

South-East Europe (SEE)

The FRY dissociated gradually after 1989. Wars and secession have dismantled one formerly large federal nation-state into six sovereign states and one (Kosovo) to be, while one other (Bosnia-Herzegovina) is split into three ethnical entities and some ten ethnic cantons with different features of higher education. The former FRY higher education was a modified socialist state-centered system with some rather well-reputed universities, that is, Belgrade, Zagreb, and Novi Sad, and quite a few outstanding research accomplishments. The universities became instrumental in the process of dissolving a Yugoslav identity in favor of national resurfacing (Croat, Serbian, Bosnian, etc.). The wars of secession (Slovenia and Croatia), the cruel liberation war in Bosnia – which ended with the Dayton Agreement (1995) – and the war on Kosovo (1999) dissociated a formerly moderately centralized system with very high autonomy of the institutions. This autonomy was, however, embedded in the authoritarian rule of a party regime and an increasingly ineffective state-ridden economy. The system was structurally more corrupt than it was individually. While Slovenia is now a member of the EU and likely to be entirely integrated within a few years, the other countries still struggle on their way to the new Europe: there are many losers and there is certainly nostalgia from those who cannot adapt to the competitive standards of the new supranational situation. We can take a closer look at a typical postconflict entity: Kosovo – which was never a full fledged Republic in the FRY – developed a quasi-state parallel system following 1989, when the autocratic rule of Milosevic began to tyrannize the province. The official institutions (one university and some other tertiary colleges) expelled all students from the Albanian majority and became mainly Serbian, only admitting few non-Albanian minorities. The parallel system hatched a parallel school and university system – which enjoyed a lot of support from expatriate Albanians and the international community. While it is true that this system was idealized and did not meet high academic standards, it was able to function as an ideological center for the guerrilla war of the Albanians against the Serbian dictatorship, and, at the same time, prepared for a purely Albanian structure following the conflict. This was the situation encountered by the United Nations interim government (UNMIK), which had to set up a fully developed civil administration under the mandate of the Security Council (Resolution 1244). While the

Albanians, following the liberation, wanted to continue the old, basically socialist system under altered ethnic terms, UNMIK insisted on reform legislation and succeeded in promulgating a new law on higher education – written by the UNMIK administration, local experts, and the Council of Europe. This law is typically postconflict and represented the new Europe versus a national – that is, local – solution. Most of it is still in effect, but the interethnic perspectives and liberation of the higher education system from its traditional ties has only been realized partially. Thus, the university is still an incubator for some political parties and a source of utmost concern for the international working group, which prepares a state-building solution for the conflict. In addition, local and international corruption and a remarkable inconsistency of the UNMIK administration following 2003 have created a difficult legacy for a failed state-to-be.

Serbia – which was still the heart of the residual FRY in 1999 – was heavily hit by the NATO bombardment in order to rescue the Kosovo Albanians from the ethnic purging. While its domestic policy changed into a phase of fragile Europe-oriented reformism under Prime Minister Djindjic, its higher education system could immediately connect with the civil society from the prewar underground or opposition. Milosevic had narrowed the autonomous leeway of universities till he destroyed all freedom by the legislation of 1998. During his dictatorship, many higher education associations and also some governmental and nongovernmental organizations (NGOs) supported the major opposition network, the Alternative Academic Education Network (AAEN). It was from this network that the major reform impulses came into the administration and new legislative efforts. European standards and ongoing reforms – for example, the Bologna process – enjoyed some support, while the core element of the socialist system – the autonomy of faculties under a weak rector's rule – prevailed. Following the assassination of Djindjic and the establishment of a nationalist government, the old structures could partially regain in power, though the reforms and the new spirit did not entirely disappear. One university – Novi Sad – has managed to use the relative autonomy of its provincial structure – The Province of *Vojvodina* – to become a truly integrated European institution; Belgrade still struggles with the postconflict inconsistencies; and the other universities lose ground because of the ambivalence of the government – whether to connect more closely with European reforms or to follow nationalist isolationism. It is hoped that that a final decision on Kosovo will clearly push the country into a European allegiance with hopes to join the EU. One very typical effect of postconflict situations can be studied in Serbia: as there are no longer stark ethnic frictions, the mere existence of a traditional state bureaucracy and administration is still an asset of the respective government, although it slows down radical reforms.

Iraq

Iraq is certainly no postconflict country, but it is the extreme case of peaceful reconstruction of one sector while war is pending. The postwar situation is certainly worse than the years under the dictatorship of Saddam Hussein – at least with regard to Sunni female students and to scholarship. Apart from the Kurdish regions – which always had a particular structure – the dominating intervention power – that is, the USA – has given way to a re-establishment of fundamental religious impact on education and lifestyle. On the other hand, the former high level of higher education and scientific standards allows, at present, a much faster reorientation to the future than in other postconflict areas, for example, Afghanistan. We can study some effects from a forced and alienating imposture of foreign values, which are evidently not shared by major parts of the population. On the other side, the availability of sufficiently enough well-trained school teachers and academics allows for a rapid redevelopment of international ties and scholarly partnership. As one journalist put it: there is a war within the war. The USA itself and its allies have pledged a vast amount of money for the reconstruction of higher education. There is the danger that these peaceful segments of the present policy will fall prey to a general anti-American and anti-Western resentment and that the country will increasingly become divided into three cultures – that is, Kurd, Shiite, and Sunni. One lesson to be learned from the present status of higher education is that formerly highly qualified faculty should be given a chance to actively take part in the reconstruction, and to use their old ties with the international community of learning. Since Iraq is far from any South African approach toward reconciliation, it is dangerous to wait for the moment when justice can determine who will be part of the future academia; this is a situation before the rule of law can also determine the future of universities.

Afghanistan

This country is the paradigm for what we can call peace in wartime. Afghanistan had enjoyed its last strong reform period in the 1920s. Following World War II, the system was capital-centered (Kabul), with a small urban upper class and sufficiently developed higher education for the upper-middle classes, while the elite were trained in foreign countries – mainly in the West. The last legislation under preconflict conditions stems from 1976. Following the Soviet occupation in 1978, the country has suffered, until recently, an endless succession of violent conflicts, liberation wars, civil wars, and dictatorships, of which the last one – the Taliban regime, until 2001 – was the worst. Consequently, the establishment of the Karzai Government, in 2002, by international intervention and

recognition by the international community of states gave the postconflict commonwealth a strong legitimacy. However, a system of barely 40 000 students in a country of 27 million inhabitants and an infrastructure which has been totally destroyed cannot be rebuilt by one consistent act. Moreover, the secondary conflicts as described above cumulate in the country. While the war against the Taliban regime was eventually won by the victorious Northern Alliance with the massive support of international military, it goes on in many areas. It is not clear whether this is part of the global War on Terrorism, or whether the resurfacing of Taliban is a regional conflict – only concerning Afghanistan and Pakistan.

From 2002 to 2004, a treacherous progress occurred: the Minister of Higher education was then a secular, intelligent typical returnee from the USA – a scholar and liberal patriot, who enjoyed high reputation internationally. In this time, a review of the system resulted in plans for new legislation, a stark expansion of the system, and a broad admittance of women and formerly neglected parts of the population, mostly rural. Community colleges were in the focus of the policy. A rectors conference was founded and asked for more academic freedom and institutional autonomy. Following the elections, however, the balance shifted away from the returnees toward the local residents – who were more traditional, had a stronger inclination toward religion, and certainly followed stronger ethnic imperatives. The ideas then, until 2006, were to re-establish a slightly modernized version of the 1976 law, and to restart a society – or academic community at least – which was, given the horrible years to follow, relatively calm and stable. Today, the new draft law resembles an authoritarian, state-oriented master plan of the government. This is a reaction to the typical postconflict frustration – when the call for a strong state and a speeding up of reforms and improvement is no longer entrusted to the people, but to power. The situation is literally one of peace in wartimes. In many parts of the country, there is a full-fledged war – conducted mainly by international intervention forces – and reconstruction continues throughout the country, with some effect. Higher education is the most sensitive area for the immediate future. If it does not happen that many more young people can enrol in useful and educating programs, the men will likely defect to more radical groups than earlier, and the women will fall back into their depreciated, oppressed status. Furthermore, if the universities do not deliver tens of thousands of well-educated schoolteachers every year, the basic reforms of the school system in an overpopulated country will fail: 50% of the people are below 21 years of age.

Another element is also critical to the success of the reforms. Afghanistan has a small, well-educated elite – who had returned at one time or another from exile, either in the USA and Western Europe, or from Iran and Pakistan. They know about good universities. They are the advocates

for adopting global standards in the system, also being aware of the benefits of diversification and quality control. The mainstream policy is slowing down the reforms and hopes for an autochthonous solution of problems, thus alienating international assistance.

Thus, there is a competition between two different elites that is presently underway.

Conclusion and Lessons to be Learned

All postconflict societies share the fate of being torn apart as a consequence of the incoherent pace and structure of reconstruction. The vicious circle is hard to dismantle: there is a devastated society, there are traumatized people, and what are needed are education and the security and safety to lead a decent life. Education does depend much more on universities than on the reform of primary education. Universities and other tertiary institutions are the hinge between the upcoming elite and the masses of people who are in dear need of practically everything. As higher education is hardly ever factored into the initial steps to restore civic life – that is, immediately following ceasefires and the provisional establishment of government and administration – an impact from higher learning on society-building is neglected or even unwanted. Thus, the important segment of students and future leaders is given too little attention as to generate quick impact loyalty to the new situation; many students only become open to extremist propaganda because they are not embedded in the new ownership spirit. Second, universities do not get quickly enough influence on the mindset of teachers – who are the major multipliers in any new society, apart from clergy and strongmen. Third, higher education is the place where ideally reconciliation can start. It is a place where the global exchange of ideas does follow more civic rules than economy and foreign policy; this is important because the soft power of international cooperation can be evidenced as one of the most motivating and sustainable impacts on regaining self-attainment and identity. In all countries described as examples, international organizations such as the International association of Universities (IAU), the International Association of University Presidents (IAUP), UNESCO, or national rectors conferences have moved minds and money in order to create islands of stable development. The Magna Charta Observatory – which is an organization monitoring academic freedom – has extended its range of action beyond the borders of Europe into countries like Afghanistan and the Arab world, thus showing the universal aspects of higher education reforms. The main obstacles to all these changes are the local governments, the old vested interests among the academic elites, and the prevailing insecurity – which makes it less attractive to invest in higher education. Governments give in too easily

to claims from fundamentalist religious leaders, and they allow an unorganized privatization to take stock where a strong and liberal governmental leadership is needed. Finally, the civil–military cooperation also gains in importance in the academic sectors. Not only do institutions and individuals very often need a kind of protection which only the military can provide, there is also a militarization in post-conflict societies, where the military – especially foreign intervention forces – play a role in creating a new culture, with or without their explicit intention. From the classic postconflict region in Europe, we know how important the military of the allies was for re-education. In many cases – especially in Afghanistan, where there is sovereign state – the cooperation between foreign military and local forces has even created a model for such cooperation – the provincial reconstruction teams (PRT).

Conflicts must be regulated. They cannot be solved like other social and political problems. Regulation always depends on power. In addition, each legitimate power needs to understand the basis of its own functionality. That is why, from the beginning of a postconflict situation, universities and research into the environment of the diverse powers and social groups are needed. This also gives the universities the chance to influence the new societies better than they usually had been able to do in the past. We should not forget that postconflict regimes need time, resources, and sufficient brain gain in order to survive.

Glossary

Franchised programs – The programs designed and awarded by one institution but delivered under license by another.

Gross enrolment ratios – The percentage of the age group enrolled in tertiary-education institutions of all kinds.

Incubator centers – The offices or proto-manufacturing facilities usually located close to a university where the outcomes of university intellectual property or enterprise are piloted.

Introduction

Since this article has to cover a massive field, in order to distil the range of countries and the key issues into a manageable framework, the main focus is on China and India and the issues that arise within them as two of the world's largest higher education systems. Three cross-cutting issues are then considered in the context of the Indian subcontinent and other emerging nations.

The rankings from the United Nations Development Program (UNDP)'s human development index for five emerging economies are shown in **Table 1** and are compared with Norway and Australia, two countries at the top of the index. The literacy rate is shown to be low in India and gross tertiary-enrolment ratios in China, India, and South Africa are well below the two developed countries. The share of public expenditure taken by tertiary education is also low, although this figure can often be distorted by private-sector participation and funding.

China

The Chinese higher education system has expanded rapidly since 1980, growing from 1 million students in 1980 to 15 million in 2005 with the gross enrolment ratio shown above of 19.1%. China may have overtaken the USA to become the largest higher education system in the world, as reports from the Ministry of Education in March 2008 claimed that enrolments exceeded 25 million.

This expansion has been faster than targeted in the 5-year plan and has involved growth across the board in

both public and private-sector provision. The key features of the expansion have been:

- Structural reforms with the centrally managed mergers of institutions. Between 1993 and 2001, 708 universities were merged to become 302 and as a result, several institutions (such as Sichuan or Jilin Universities) have student populations exceeding 50000.
- The removal of responsibility for specialist universities from parent ministries (under a Soviet model) to place them under provincial governments.
- Managerial reforms which delegated more powers to university presidents and in the provinces, particularly, allowed them greater autonomy. The Ministry of Education agreed to share the strategic management of some of its institutions with the provincial administration where it was based.
- The introduction of tuition fee in the 1990s which increased gradually and is now capped at RMB 6000 by the Ministry of Education. In 1992, such fees accounted for less than 5% of universities' total income, but now represent up to 20% of income across the board.
- The generation of income from other sources such as consultancy and commercial enterprises. This policy backfired in some instances in the late 1990s, and some universities lost money on ill-advised commercial ventures. Government is now more cautious in its encouragement of entrepreneurial activity.
- A general welcome for a suitably regulated private sector as part of the national system. In 2001, there were more than 1200 private higher education institutions with over 1.1 million students.

The sudden growth in enrolments and numbers of graduating students is affecting employment prospects and reports of graduate unemployment have been circulating – even among those who have paid to receive a Western-university education. Consequently, some universities have been developing very close links with employers in neighboring business parks in order to guarantee jobs for their students.

The dramatic transformation of the income profile of Chinese universities can be seen in **Table 2**.

Universities are also being transformed academically. Until the mid-1990s, many institutions had outdated equipment, aging facilities, and curricula. Students gained honors by rote learning and memorization. This has now changed with a massive investment in equipment and buildings as well as a transformation in the approach to

Table 1 Relevant statistics from four emerging economies

Country	Overall HDI ranking (2005)	Adult literacy rate	Gross tertiary enrolment ratios	Public expenditure on tertiary education, 2002–05 (% of all levels)
Brazil	70	88.6%	22.3%	19%
Russian Federation	67	99.4%	68.2%	n/a

learning. Visitors from other countries are astounded at the scale and speed with which large new campuses (and in many cases, associated business parks or incubator centers) are being developed all around the country.

Policymakers see the growth of a group of elite universities as being central to national goals of strengthening economic competitiveness. The national aim is that a select number of Chinese universities should be accepted as world class by 2010 and considerable investments are being made by the ministry in the two categories of elite institution: the 100 or more in the 211 grouping and the 35 in the most prestigious category of 985 universities. The criteria for admission to these two groupings are not published, but their numbers include most of the large comprehensive universities as well as selected specialist ones in medicine, education, and agriculture.

Chinese universities are encouraged to develop strategic partnerships with leading universities in the USA and Europe and internationalization is a strategic goal for all the major institutions. In the first 7 years of the twenty-first century, hundreds of such partnerships, teaching and research collaborations, have been established

and, after taking advantage of a new law relating to private and international providers, several offshore campuses were set up by UK and US institutions. There are many hundreds of twinning, joint degree, and franchised programs with overseas universities, and in 2007, a queue of 378 applications for such programs was awaiting approval by the Ministry of Education. This global strategy is beginning to work: in 2007, The Times Higher World University rankings included five universities from China, while Peking University was ranked 18th in the world for life sciences and for arts and humanities. Tsinghua University was listed as number 16 for technology.

China is the world's largest supplier of internationally mobile students with as many as 67 000 in the USA and 50 700 in the UK. However, these flows are gradually being reversed as another element in the internationalization picture is the recruitment of international students to China itself. In March 2008, the Chinese Ministry of Education announced that 195 000 overseas students were studying in China, making it the sixth largest destination country. In order to attract such students, many courses are delivered in English and tuition fees are set well below Western levels, thus ensuring a flow of students from the Asian market.

Chinese policymakers are frank about the shortcomings of their system. They acknowledge for example:

- that quality and quality-assurance processes are in need of attention;
- that most development has been from the center and that more needs to be done to encourage local initiatives; and
- that university presidents lack management competences.

Despite these concerns, the Chinese higher education scene has come a very long way in the last 15 years and is moving rapidly toward a fully developed system similar to that in North America and Europe. All this has been achieved by a clear sense of strategic direction from the center, allied to a substantial investment of funds.

India and the Subcontinent

The Indian subcontinent presents a microcosm of most of the issues confronting tertiary education in developing economies; it also illustrates very different responses to the problems from those seen in China.

The gross enrolment ratio in tertiary education in the subcontinent is well below that of regional competitors such as Malaysia, Thailand, and China (see **Table 3**). Figures for Sri Lanka are not available.

Despite their low starting point India, Pakistan, and Bangladesh have aspirations to enter the knowledge economy and to provide higher education to a much

Table 3 Gross enrolment ratios in the Asia region

Malaysia	32%
Thailand	43%
China	19%
India	12%
Pakistan	5%
Bangladesh	6%

Extracted from UNDP Human Development country reports for 2007–08.

higher proportion of the relevant age group than at present. National planning targets require significant expansion in public-sector institutions. In 2007, this was recognized in India since the 5-year plan for 2007–12 aims for a participation rate of 15% by 2012 and could involve a doubling of the number of institutions and another 6 or 7 million students. There are some doubts as to whether the number of graduates that would emerge could find jobs in an economy that is currently dominated by public-sector employment.

The Indian tertiary education system is complicated and has the following elements (see **Table 4**).

The Indian government's strategy is to create 20 new institutions of national importance (which will include five new entities called Indian Institutes of Science Education and Research), 30 new universities, and hundreds of new colleges. In addition, existing universities would increase their student numbers by 50% over the next 5 years. For example, Delhi University would grow from 120 000 to 180 000 students in parallel with increasing the proportion of its students coming from other backward classes to 27%.

India's resurgent economy should make this expansion possible and the plan suggests a dramatic quintupling of higher education funding. Until this decision, however, public funding for higher education had remained static at less than half a percent of gross domestic product (GDP) for two decades. One-third of institutions received no government funding at all, relying on tuition fees and surpluses from providing distance education (Agarwal, 2007).

However, funding is not the main concern of Indian policymakers. In November 2006, the National Knowledge Commission produced a report for the prime minister that painted a very dismal picture of the state of Indian universities in the state sector (with a few notable exceptions). (National Knowledge Commission, 2006). It reported that the curriculum has not changed for years, buildings and equipment are in poor condition, academic staff are poorly motivated, promotion is not based on merit, there is little good research, and campuses are often politicized. Much of this was due to low funding, as 90% of recurrent budgets are absorbed by salaries and there are no incentives to generate income from other sources. The scope for entrepreneurial management is limited.

Table 4 Key statistics for higher education institutions in India

Institutions of national importance (e.g., IITs, IIMs)	13
Central universities funded by the UGC	18
State-funded universities funded by their state	211
Deemed universities, funded by the UGC or other public bodies	38
Private deemed universities	72
Private universities	10
Government colleges	4,250
Private and private-aided colleges	7,964
Students enrolled (in millions)	11.2

From Agarwal, P. (2007). *Private Higher Education in India*. London: Observatory on Borderless Higher Education and University Grants Commission (2006). *2004–05 Annual Report*. New Delhi.

The other major issues that remain to be resolved in the Indian higher education system are:

- The very uneven quality of higher education, which ranges from the world class institutions such as the Institutes of Indian Technology to very poor-quality provision in the bulk of the government colleges affiliated to universities. There is no compulsory quality-assurance regime and a body set up to undertake accreditation; the National Academic Accreditation Council (NAAC) has limited powers as its reviews are voluntary.
- The ambivalent and confusing attitude of government to private institutions, which again range in quality terms from many that are outstanding and far superior to the majority of the state universities to some that are of very low quality indeed.
- Government attempts to introduce some regulation and quality assurance over the private sector and to encourage collaboration with international providers have been thwarted by the legislature and the courts.

Despite the absence of any clear policy steers from government, North American, European, and major Asian universities have been clamoring to establish partnerships and teaching and research links with the better Indian institutions. An Indian government survey in 2007 reported that there were 130 twinning programs between foreign providers and private institutions; the majority of the foreigners being American universities. Unlike China, there have been no foreign universities establishing their own campuses in India, since this is not yet allowed. Research collaborations between Indian institutions and foreign partners are mushrooming and some Western governments have established funds to foster research links. An example of this is the UK India Education Research Initiative, which uses government and UK private-sector funding to support joint research projects.

Distance learning is a significant player in the Indian system with a network of 11 state open universities and

the Indira Gandhi National Open University. Together with distance education institutes within conventional universities, these deliver higher education to over 2.8 million students. However, as with the state universities, the quality of the provision is uneven.

Other Countries on the Indian Subcontinent

In Bangladesh, the 2006 higher education strategy took a similar approach as that taken by India in suggesting that existing public institutions would grow substantially. However, the bulk of the expansion would be handled by the private sector and the Open University in view of the government's inability to fund more than a certain percentage.

In India, Sri Lanka, and Bangladesh the consequence of a small tertiary public sector is that many students leave secondary education qualified to enter tertiary education, but cannot get a place in public institutions. The figures are particularly striking in Sri Lanka:

- secondary school leavers qualified to enter higher education: 117 000;
- annual entrants to public universities: 16 000;
- students who study overseas (estimated): 12 000;
- possible entrants to the private sector: 15 000; and
- unaccounted for: 74 000.

As we shall see below, the place of the private sector in expansion is crucial. It offers governments an alternative way to achieve the skilled manpower they seek. Yet, its status in many national higher education systems is still unclear, uncharted, and suspected. Despite this, the private sector is filling the gap and parents are paying to get their children an education that the state cannot provide. Given that many already pay for private nursery, primary, and secondary education, they see little wrong in the principle of paying for tertiary education.

The planned Indian expansion of higher education funding follows the example of Pakistan where, after a long series of task-force reports and strategic reviews, it was decided in 2003 to invest very large sums in a major reform of the sector. The agency for this was the Higher Education Commission (HEC), a new powerful body, independent of the ministry that was given the authority to embark on an ambitious investment program covering:

- staff-development scholarships, fellowships and exchanges with over 15 countries;
- curriculum reform;
- installation of a national academic information and communication technology (ICT) network;
- a digital library offering open access to all staff and students;

- management training for leaders;
- a quality-assurance agency;
- research grants and development grants for industrial linkages.

The work of the HEC is regarded as the most wide-ranging and ambitious sector-reform program in the world and owes its success to presidential support and energetic leadership of the HEC.

Cross-Cutting Themes

In emerging economies, there three common issues that dominate the agenda of every minister responsible for higher education. They are:

- how to finance expansion;
- the role of the private sector; and
- maintaining quality, relevance, and employability.

Financing Expansion

Funding the expansion of higher education is beyond the purse of most governments. There are only four ways in which the money can be found from within the public sector:

- *Increasing tuition fees.* This issue is always political rather than financial or procedural. In many countries, fee levels have often remained unaltered for 20 years. In Bangladesh, India, and Sri Lanka tuition fees of US\$10–US\$15 a year are not uncommon, but the suggestion of an increase to this figure is likely to lead to student riots and political retreat. Yet, there are massive contradictions in reality; Bangladesh has recently launched a new public institution that charges near-market fees and even state-funded universities such as the Bangladesh University of Engineering and Technology are able to levy realistic charges for accommodation and lecture facilities which result in massively improved and visible premises. In Sri Lanka, students in public universities continue to receive stipends as well as access to food and facilities at almost no cost. In India, a large number of state-run institutions only survive because of the fees that they can charge for distance-education programs. In Kenya and Uganda, the government encourages public universities to charge market-level fees to separate streams of students in parallel with state-sponsored low-fee-paying students.
- *The flows of repayments from student-loan schemes.* Such schemes allow poorer parents and students to borrow the full cost of their fees and costs (or receive a grant toward them) and are an essential concomitant to increases in tuition fees. Yet, they suffer from real barriers; no money is saved in the short term since the funding for the loan (or financial guarantees) must still come from government initially; very few developing

countries have found ways of collecting loan repayments efficiently; the mechanisms for assessing needs and managing the loan processes are themselves expensive and prone to fraud and inefficiency. As a consequence, it will take some time for the trickle of repayments to represent any substantial share of government income in most countries.

- *Improving the economic efficiency of institutions.* This is often cited as another way to produce more from the same inputs of resources. There are several candidates for improvement:
 1. Worsening the student–staff ratios above the current levels in the developed world of around 15:1–20:1 to 30 or 40:1. This presents a risk to quality and is more likely to occur as a result of financial neglect rather than a clear strategy.
 2. Reducing the numbers of manual support staff, which are often bloated and hard to justify. Ratios of four support staff for each academic staff member are not uncommon.

Since remedying both inefficiencies involves a reduction in staff numbers, they are extremely hard to achieve in societies such as India and Bangladesh, where employment is regarded as for life and where leadership responsibilities are held by politically sensitive appointees.

- *Generating income from nongovernment sources.* This is a useful avenue, but it requires the support of responsive internal procedures and incentives as well as entrepreneurial skills. These are both rare but not unknown, but tend to be found in the more market-related disciplines such as engineering, law, or business in universities in capital cities. There are exceptions; the Department of Archaeology at the University of Peradeniya in Sri Lanka, for example, draws a significant income from its contracts with the United Nations Educational, Scientific and Cultural Organization (UNESCO).

The Role of the Private Sector

The role of the private sector is increasingly important in those countries where the state is unable to finance the necessary expansion in public institutions. We saw the

large numbers of private institutions in China and India and this is reflected in most other emerging and developing countries (Table 5). An emerging pattern is for the number of public universities to remain constant, while expansion occurs in the private sector.

Governments' policies toward the private sector can be classified as follows:

- *laissez faire*, with no regulation or quality assurance, as a result of which poor-quality providers can flourish at the expense of an ill-informed public;
- hostile, with a regulatory regime that is aimed at controlling the worst providers (but which does not apply equally to public institutions) and a presumption that all private-sector universities are of poor quality;
- neutral, with licensing, accreditation, and program-review regimes that apply equally to both public and private-sector institutions; and
- positive, with government incentives such as the award of land, tax relief, and access to funding for suitable sponsors.

It is common for the vested interests of the established public institutions to dominate decision making in ministries of education and their buffer bodies and this leads in many countries to a reluctance to acknowledge the role of the private sector and to support it. However, this attitude often sits alongside a willingness by academic staff in the public sector to accept well-paid part-time teaching appointments with private institutions and by former public vice chancellors to take up posts in the private sector after their retirement.

While the private sector does contribute to meeting the national targets for higher education, there are concerns about its reliance on market-orientated disciplines and the lack of research activity which can inform and strengthen teaching. Another major concern is that of equity, since the students come from social classes with the ability to pay (and usually from the wealthier urban areas), since very few private institutions can afford to set aside funding for scholarships and bursaries. In countries with low participation rates in higher education, this criticism can also be levied at the public sector, since entrance to universities is always very competitive (as in

Table 5 Numbers of private institutions of higher education (HE) in selected countries

the Sri Lankan example mentioned above) and only those with access to the best urban private secondary schools have much chance of gaining a university place.

If a foreign university wishes to establish a campus in an emerging economy, it is regarded as a private-sector entity, but is also subject to additional scrutiny because of its origin. Most countries are uncertain about how to treat enquiries from overseas institutions, although some such as Singapore welcome them within their long-term strategy. In Asia, the Chinese government has temporarily stopped approvals of overseas campuses, after granting three to the UK, and the Indian government has faced political difficulties in getting any legislation on international providers through parliament. Malaysia has encouraged the creation of foreign-branch campuses for some time and Vietnam has made an open invitation to foreign providers, following the success of Royal Melbourne Institute of Technology (RMIT), Vietnam.

Maintaining Quality, Relevance, and Employability

National strategies for higher education have to face the question of how to maintain the quality of provision as the system expands. It is all too easy for more to mean worse and for the growth in the academic profession to have to rely on recruiting new staff at lower levels of talent. This inevitably leads to a vicious circle of lower standards of learning, poor quality of graduates, and increased unemployment as they are rejected by employers.

The programs adopted by governments to improve quality include:

- Establishing accreditation and quality-assurance regimes that follow best international practices and are validated where possible by regional or international peers. China is seeking to do this and India is yet to build on the foundations of NAAC.
- Restoring practices such as the use of external examiners to prevent insularity. This will depend on institutional budgets meeting the cost unless subsidies are provided by government.
- Investment in academic-development programs such as research fellowships with overseas institutions and exchanges. The programs of the HEC in Pakistan illustrate the scale of investment needed, if standards have been allowed to fall.
- Subject reviews of curricula by panels with academic members from other countries.
- Encouraging twinning or franchising arrangements with reputable overseas partners, as has been the policy of Malaysia.
- Promoting the establishment of high-quality private institutions (backed by international partners if possible) that will provide benchmarks for the public sector.

- Investing in regular staff development and training programs for academic staff, both prior to appointment and mid-career.

The important point for governments to acknowledge is that academic quality is an international issue. While there are many hundreds of institutions aspiring to be world class, only a limited number can achieve this and questions of reputation, brand, and image are often based on subjective assessments between peers. These are rooted in regular exchanges and interchange between institutions. As both India and China show, a country cannot isolate itself from the global academic community and, once it embraces regular flows of academic staff, qualitative benefits will become apparent.

Closely related to quality is the issue of the relevance of the learning experience. If universities are not providing graduates with the skills that make them employable, much of the national investment will be wasted. A common complaint of graduates in many countries is that the curricula they study in public universities are out of date and irrelevant to today's job market. By comparison, private universities are seen to be better able to modernize and make their graduates employable. In India, 45% of the public-sector enrolment is in arts and humanities subjects, while over 80% of enrolments in professional disciplines are offered by the private sector (Aggarwal, 2007).

Conclusion

This article has shown that the issues facing higher education policymakers in emerging countries are very similar to those in the more developed world. All the countries concerned are keen to expand the numbers of their citizens enjoying higher education; some like China and India have rapidly growing economies and are well positioned to make the extra investment needed. India's decision in 2008 to make a fivefold increase in funding for tertiary education proves that point. Others do not have the resources and have to face either the tricky political question of cost sharing by introducing tuition fees or develop their higher education systems in partnership with the private sector and foreign institutions.

The benefits of such investments are already clear from countries that are further down the road such as Malaysia. Previous generous support for public institutions and a liberal attitude to foreign providers has positioned Malaysia at number 40 in the World Bank's Knowledge Economy Index, compared with China at number 75 and India at 101. Its gross enrolment ratio is well on the way to reaching the levels in the most developed nations.

Human Resource Issues in Higher Education

E El-Khawas, George Washington University, Washington, DC, USA

© 2010 Elsevier Ltd. All rights reserved.

Universities and other higher education institutions address the human resource issues faced by all large organizations. Their rules and procedures provide an orderly structure of roles and appropriate conditions of employment, and arrange for recruitment, promotion, and retention of workers as well as for their retirement or dismissal at some point.

Higher education institutions also face distinctive human resource issues related to their academic staff, which makes up the largest and most critical part of a university's workforce. Institutions of higher education must adjust their general personnel rules to the special nature of tenure and other forms of job security, to the multilayered structure by which academics are evaluated, and also to the constraints imposed by norms of academic governance and academic freedom. As academics often account for a significant part of a university's workforce, appropriate and up-to-date human resources policies are vitally important to all universities and systems of higher education.

This article on human resource issues in higher education focuses on the professoriate, and is organized into two main themes. First, it examines issues arising during the different stages in the life cycle of the academic career, from recruitment into initial positions to advancement in one's career. Second, the conditions of employment for academic work are discussed, with special attention to the impact of recent pressures for greater productivity. The article begins with a brief outline of recent challenges facing universities and higher education systems. Over the last few decades, significant external pressures have been felt, with potentially transformative implications for the shape and responsibilities of the academic workforce. It must be acknowledged that, because of space constraints, the article focuses on the general trends and patterns widely found among countries today. Readers may consult the sources provided in the section titled 'Further reading' for discussion of country-specific approaches.

A Changing Context

Higher education institutions in almost all countries around the world have faced new challenges during the last few decades, with the outlines of significant impacts on university life already emerging. Rising enrolment, spurred by demands for wider access, has placed higher education in the public spotlight and has led to a heightened climate of expectations and closer public scrutiny. At the same time, new technology, constrained financing, and

increased competition have exerted other pressures on academe. Business models have been applied at many institutions of higher education, resulting in greater attention to financial efficiency and managerial accountability. Increasing globalization of business and communication, along with new imperatives to adapt to a knowledge-based economy, have placed new burdens on universities to aspire to international standards for academic research and institutional reputation.

Taken together, these secular trends have impacted most institutions and systems of higher education around the world, with significant repercussions for the academic profession. As several studies have shown (Altbach and Lewis, 1996; Henkel, 2001; Kogan *et al.*, 1994), the academic work force today, in most countries, involves a greater diversity in positions, settings, and expectations. To be sure, the classic model of academic work still remains a model in which persons with advanced degrees in a specialized field have lifelong university appointments that combine research and teaching (cf. Clark, 1987). In many countries, however, other models have emerged, with different combinations of academic tasks for those taking appointments in nonuniversity institutions, or different terms of employment being offered to those accepting temporary or part-time academic positions. Even for established academics, there are new pressures to secure research funding, to develop productive partnerships with industry, or to modify their teaching and the curriculum to respond to changing student interests. According to some analysts (e.g., Slaughter and Leslie, 1997; Henkel, 2001; Harman, 2003), significant reshaping of the academic profession has resulted, in large part due to the specific policy choices made by government and by university administrators.

Does this trend apply only to certain universities and countries, or does it depict a long-term scenario likely to affect all types of higher education institutions across most settings? Currently, there is no systematic information to answer this question, especially with respect to the experience of developing countries. To be sure, dramatically new models of academic work have emerged in only a few settings. Substantial uncertainty remains as to whether a fundamental change is taking place. Is the long-dominant paradigm of traditional academic careers merely shifting to accommodate new challenges by offering new, more efficient models at the margin? Instead, is the nature of academic work undergoing deep structural shifts that will create significantly new forms? Have policies creating a second-tier of academic positions

become widespread? Will the classic model disappear from contemporary practice? This review of changing policies and practices in a wide range of countries suggests that a serious transformation in the nature of academic life is underway, despite uncertainty about its long-term effects.

Recruitment and Hiring for the Academic Career

A distinctive aspect of the academic workforce is that almost all positions are specific to a scholarly discipline and often to an area of specialization within the discipline. To recruit and hire members of academic staff, countries around the world generally follow a universalistic or meritocratic model that acknowledges the importance of specialized knowledge and skills. Available positions, with duties and necessary qualifications described in some detail, are formally announced and qualified individuals are given an opportunity to apply for the positions. Selection and appointment to each available position are governed by procedural rules in which the quality of the candidate's qualifications weigh most heavily.

Countries differ in whether recruitment and hiring are conducted centrally, for example, at the ministry level, or can be conducted on a decentralized basis. In some settings, the university or the department arranges the recruitment. Typically, general rules set terms of employment, in some countries based on formal regulations. Even in countries characterized by more open, market-based recruitment and hiring patterns, informal norms provide a general framework. Data on average salaries and other terms of employment for each academic rank, for example, are widely available in the United States and other market-oriented countries.

Planning issues sometimes arise as to whether a country can depend on an adequate supply of candidates for new positions, especially in more specialized or demanding fields. The main source of recruitment is found in a country's own production of individuals holding the doctorate or other highest degree in each field. For some countries, the supply of new doctorates routinely exceeds the number of academic positions available in universities, with the excess finding positions outside of academe or in other higher education institutions. Other countries have difficulty filling positions, including some that suffer from brain drain as their best graduates take academic positions in other countries. International competition in recruitment has grown over the last decade, putting pressure on some higher education institutions to introduce stronger incentives to attract highly qualified candidates. Higher pay, provision of research support, or lighter workloads are among the incentives offered. Some countries have modified the types of entry positions they offer, as illustrated by Germany's adoption of 3-year contracts, renewable once, for junior professorships.

The overall constraints on university funding have introduced other issues affecting recruitment patterns. One general response has been to meet staffing needs with part-time or temporary appointments. While practice varies greatly across different countries and types of higher education institutions, with nomenclature varying widely as well, financial considerations are a major reason that large numbers of part-time and temporary appointments are being made.

Most countries have witnessed an expansion in part-time teaching positions in which qualified individuals receive contracts on a term-to-term basis, according to the university's needs. Individuals in these positions typically teach a specific course or for a certain number of hours but have few other duties, and may not have offices. Traditionally, such part-time or adjunct positions were used occasionally, in response to specific needs or opportunities, and were justified as a way to bring specialized or real-world knowledge to teaching (e.g., accomplished artists, writers, or businesspersons). Increasingly, higher education institutions use part-time positions to cover a significant proportion of the institution's teaching needs, and do so for pragmatic reasons; such positions avoid the commitment to regular, permanent positions and may allow lower salaries or fewer benefits to be offered. In many countries, such part-time positions are undertaken by persons moonlighting in these roles after completing their obligations tied to their regular employment positions. In other countries, individuals may accept part-time positions at several different institutions after failing to secure a full-time university position.

There has also been increased use of full-time temporary appointments, contracted for a year or other limited term. Such positions are sometimes termed as visiting positions. Persons in these positions take on the full range of academic duties – teaching, research, and service – but the institution does not incur long-term employment obligations.

These two trends – toward greater use of part-time and temporary appointments – raise many questions of how systems of higher education plan for their human resource needs over the long term. In settings where short-term appointments are not renewed, considerable institutional effort is sometimes needed to find and hire capable individuals for these appointments, with last-minute decisions, based on enrolment, sometimes requiring compromises with what skills are sought. In other settings, individuals on temporary appointments provide good service and have their appointments renewed several times, raising questions of why they are kept in temporary arrangements. These appointments, which function largely as teaching-only appointments, may fill short-term needs and offer cost savings for universities; however, academic departments and programs must balance the benefits of substantial, continuing reliance on this type of staffing

with the need to maintain sufficient stability and long-term strength in the areas of expertise they need.

Another issue for systems and institutions is to consider the implications of a two-tier system of appointments, with differing employment terms and benefits, especially in job security. A limited, second-tier career line is emerging, in which individuals who have held temporary positions may find it impossible to gain a permanent academic appointment because, with heavy teaching obligations, they have not been able to develop a strong record of scholarly productivity. In some countries, inequities in gender and minority status are strongly linked to this emerging two-tier system, with less-favorable academic appointments – positions in nonuniversity institutions, in part-time or temporary positions – being occupied more often by women or minority individuals. The question for systems of higher education is how to determine the right mix and how to keep the negative consequences of using temporary positions to a tolerable level.

Advancement in the Academic Career

Countries have differing practices in the types of academic appointments or ranks that are available, and how formal the requirements are for gaining promotion to a higher rank. Some models are quite specific, including the well-known progression from assistant professor to associate professor to full professor. Typically, a formal set of procedures and guidelines have been developed to guide each step in the promotion process. At each stage, the individual academic must submit documentation showing that his or her accomplishments meet expectations for moving to the next rank. Academic self-governance is a distinctive part of the process for reviewing this documentation. In some countries, academics review the individual's record as a preliminary step before government officials make decisions; in other countries, a committee of academics makes the decision (promotion or not), which is then affirmed by university or governmental officials as long as formal guidelines have been followed.

The first phase of the academic career is a lengthy probationary period. Countries vary on how this is regulated but, in general, new appointees are under continuing pressure over a 4- to 6-year period to demonstrate that they can meet high expectations for research and teaching, develop good relationships with other academics and, generally, can build their scholarly reputation. In some countries, probation takes place within one university and can lead to permanent appointment within that university. In other countries, a young academic, after the initial appointment, must formally apply for a permanent or senior position at another university. Some countries require further specific accomplishments (e.g., a habilitation or other

formal evidence of research) before a young academic can seek a permanent senior post.

These models, reflecting different ways to obtain evidence of scholarly productivity, represent attempts by universities or higher education systems to control the overall quality and shape of their academic workforce. The more flexible models sometimes create imbalances in the supply of academics at each career stage. If most academics are in senior positions, few openings may be available for beginning academics; at another time – after increased enrolment, for example – most academics may be relatively new, with few senior academics available to share their experience. Recently, a number of countries are aware that their current academic workforce is aging, with sizable numbers likely to retire within the same decade.

In light of the increased hiring of part-time and temporary appointments that is found in many countries, new issues have arisen about promotion or renewal of individuals with such appointments. Sometimes, strict policies affirm that persons with temporary appointments cannot be renewed or promoted, but policies in other settings allow for renewed contracts, sometimes with terms of 2 or 3 years instead of 1-year renewals. Whatever the details, individuals with part-time and temporary appointments face differential treatment compared to those with full-time academic appointments.

After they have gained permanent appointments, academics are expected to continue to be accomplished in research and teaching. In some cases, university officials require regular reports of one's scholarly productivity and confirmation that contracted obligations for hours of teaching or other service have been met. In other settings, an elected committee of academics reviews annual or biannual reports. From the viewpoint of the individual academic, however, this type of continuing review is not generally difficult, and at best may be the basis for an increase in pay level.

In most academic systems, after achieving promotion to the rank of professor, academics encounter a typically lengthy period in which formal expectations are relatively steady – to continue with research, to meet teaching, as well as service obligations. Notably, individuals differ greatly in how hard they work on their research, how prolific they are in publishing and sharing their work, and how well known they become in their discipline. While the ideal of high productivity is quite clear, surveys have shown that large proportions of academics do quite well in teaching and service but have only modest research accomplishments (e.g., Altbach and Lewis, 1996).

In most countries, retirement for academics generally falls between 60 and 65 years of age, based on rules applied to all academic staff, regardless of their own interests or level of performance. In some countries, academics are sometimes awarded emeritus status upon retirement, a largely honorary title but one that sometimes provides access to

university offices, library, and other services. Some academics take retirement but stay active with consultancy, with short-term administrative assignments at their institution, or with the support of continued research funding.

Conditions of Employment

The classical model of academic work remains as a valued and desired view of academic life. Under this model (cf. Clark, 1987), an academic carries out a bundle of interrelated tasks – teaching in one's areas of expertise, conducting research and producing scholarship on a continuing basis, providing service through committee work and limited administrative duties related to his/her departmental unit, as well as contributing to one's discipline on editorial boards, committees, and through presentations at academic conferences.

Many observers contend that this classical model has been eroded, and that the nature of academic work has undergone significant change over the last several decades. Some general trends have affected the academic workplace in most countries, especially the necessity of adapting to constrained funding. Higher education systems have found that, as enrolment and participation rates have grown, higher education's share of a nation's budget increases, moving it into competition with other broad areas of public spending. Recent experience has been that higher education's share has not grown in such countries, even as enrolments have increased.

Another general trend affecting academic work has been a shift toward managerial concerns in the administration of higher education institutions. Human resource issues have become focused on discussions of efficiency, measuring outcomes, and strategic planning. In some settings, academic deans are expected to raise funds and to generate certain levels of revenue on a continuing basis. In other settings, entrepreneurial actions are expected, sometimes to develop partnerships with business and, at other times, calling for the development of new educational offerings specifically designed to yield net income.

As to be expected, many academics have been highly critical of these changed demands. Studies conducted in several countries have documented increased levels of dissatisfaction and disillusionment among academics but considerable adaptation has been found as well (Kogan *et al.*, 1994; Harman, 2003). While it is unclear whether perceptions will improve over time, and dissatisfaction has certainly not led large numbers of academics to leave their positions, universities, and systems of higher education need to be mindful of possible long-term damage to the academic profession.

The combined effect of constrained funding and managerial perspectives has undoubtedly led to changes in how academics work. Several analysts (e.g., Harman, 2003;

Amaral *et al.*, 2003) have shown that, in a wide range of countries, the traditional bundle of tasks – teaching, research, and service – has become more demanding. Academics are teaching many more hours, and many more students, in response to greatly increased enrolments. In some settings, academics have been compelled to commit more time to administrative and committee assignments, as their universities have engaged in more evaluations of their operations, reorganized or introduced new structures or program offerings, or responded to an array of mandated external reporting and assessment. For some countries, entrepreneurial pressures have introduced additional work, with academics participating in the planning and delivery of revenue-producing partnerships and similar activities, often in other countries.

Another trend involves a fragmentation of academic tasks (Slaughter and Leslie, 1997). Teaching-only positions have emerged in some countries as a matter of government policy. In other settings, institutions impose heavy teaching requirements and give no systematic support for research, creating positions that are, in effect, teaching only. Especially in the sciences, research-only positions have proliferated as large-scale research grants and contracts have become a larger part of university activity. So also, a small number of high-profile academic positions have emerged, in which academic stars achieve much scholarly productivity, are active contributors to policy debate, widely quoted for their views, and called to serve on important projects and commissions. Typically, such stars have very limited teaching and service obligations.

Still another trend involves a sharp differentiation between the work done by permanent staff and that done by temporary staff. Some systems and institutions have allowed their staffing to evolve in a way that separates academics into core and secondary roles. This pattern first emerged in the United States with instruction based on distance learning and other electronic technologies for course delivery. Under this model, a large number of academic staff work under temporary contractors carry out various teaching duties (e.g., as facilitators of online or actual discussions, and as graders of student papers), while a small permanent academic staff offers continuity by designing, evaluating, and implementing academic programs but engaging in very little direct teaching.

In addition, these trends have led to greater disparities in the compensation and benefits accorded to academic staff. Traditional academic values emphasized a general level of equality among academic staff, with small gradations in salary and benefits according to rank and length of service. In many settings, a central decision body, usually government ministries, determined salary levels for each academic rank, and established the terms for pay increases that applied to all academic staff. Merit-based or performance-based pay increases were unusual, tied to promotion in rank. However, in today's changing

academic world, the picture has become more complicated. Some countries have allowed separate, and sharply lower, pay scales for temporary and part-time academics, compared to those on permanent appointments. In other settings, academics judged to be more productive have received higher pay. Overall salary levels, however, have stagnated in some countries, with academic pay falling well below levels in comparable professions.

Similar differentials have emerged with regard to other benefits of academic employment. Opportunities for travel to conferences or for research funds and space are increasingly distributed according to the new hierarchies, with reduced opportunities for second-tier academics.

An unusual aspect of academic work is the ability to move temporarily to other settings. Unlike other professions, academics have several mechanisms allowing them to engage in new activities without giving up their long-term appointments. Typically, an academic arranges to be at another higher education institution during a sabbatical leave (a release from all obligations for one term or 1 year, after completing some years of service, intended to allow uninterrupted attention to scholarly research). Established academics may take positions as visiting professors at another university (e.g., in order to work on a different research project) while on temporary leave from their own institutions. A similar opportunity, possibly increasing in frequency, is for academics to leave their university temporarily to take positions in government or industry. In the past, such appointments were seen primarily as a benefit to the individual academic but, recently, as partnerships become more strategically important to universities, these temporary appointments help enhance university relationships with current or future partners.

Finally, mobility between institutions – changing from one permanent position to another – is also distinctive to academic work. In some systems of higher education, it is necessary to move in order to gain a position at a higher rank. In more market-oriented systems, established academics may seek other postings as a way to advance their careers more rapidly. There can be substantial differences in mobility across countries and even from one time period to another in the extent to which such changes are made. When the entire higher education system is expanding rapidly, established academics have the opportunity to move to newer institutions. In other periods, with tight financial circumstances, academics may experience very little mobility.

Systems and institutions of higher education, in turn, need to respond to such shifting opportunities for mobility. In more competitive periods, institutions have typically needed to improve the conditions of work for their own academics, as a way to preserve a stable staff. When systems are feeling competitive pressures for productivity, bidding wars can develop for certain high-performing academics. The Research Assessment Exercise in the United Kingdom,

which rewarded those departments with highly productive academics, led to significant institutional attempts to improve their profile by hiring strong academics within certain assessment time periods.

On the whole, it must be acknowledged that the academic profession is quite stable. Some early career academics may need to move when it appears that they will not gain a long-term appointment in their initial setting, perhaps simply because there are no vacancies in senior positions but, once they achieve a permanent appointment, academics in the past have tended to spend the rest of their career at one institution (e.g., Altbach and Lewis, 1996). In the changing context of academic work, however, this pattern may be changing.

Conclusion

This article on the recent trends in the conditions of academic life has relied on reports from a limited number of countries, along with a few broad, multi-country studies. Given the substantial change that appears to be underway, judgments have been necessarily tentative about the overall impact of trends. Fortunately, readers can soon look to the findings from a significant new international study on the changing academic profession, now underway (Brennan, 2006), which should reveal much about the status of the professoriate on a worldwide basis, clarifying the effects of many changes over the last decade.

While the broad direction of change is relatively clear, there is much uncertainty. This new international study should help establish whether the classic academic model is still dominant or, instead, how prevalent the trend has been to a more differentiated and demanding model. It should also shed light on how current members of the academic profession view their circumstances. Some have argued that morale and levels of commitment to academic work have declined in response to recent trends, but others believe that the overall picture shows a mutual accommodation, as policies have been modified where they were too harsh and academics have adjusted to new circumstances.

International Accreditation in Higher Education

A Stella and D Woodhouse, Australian Universities Quality Agency, Melbourne, VIC, Australia

© 2010 Elsevier Ltd. All rights reserved.

Introduction

Over the last 20 years, many countries have created quality assurance (QA) bodies to assist, check, or regulate their higher education institutions (HEIs). These bodies exercise their QA responsibility through various modes and methods that essentially fall under one of the three basic approaches – accreditation, assessment, and quality audit. Of these modes and their combinations, accreditation is the most widely used term in many countries around the world and many QA bodies have some form of accreditation practices. Accreditation being the predominant mode of QA, the term accreditation is used in the following pages to denote all forms of QA.

A recent phenomenon in accreditation is that institutions are looking beyond their national borders, and they voluntarily undergo multiple accreditation processes from QA bodies in different countries. What can a foreign accrediting body offer that is not provided by an institution's local agency? The answer lies in addressing the emerging challenges and changes in the higher education (HE) sector. The HE sector in many countries is changing dramatically characterized by increasing international operations of HEIs, demand for value for money from the various stakeholders, increasing academic and professional mobility across national borders, demand for recognition of qualifications, and growth of regional and global trade initiatives. These are the new rationales that drive international engagement and put pressure on HEIs to take an international approach to accreditation.

Changing Rationales of International Engagement

Internationalization has now come to be defined in very broad terms. From an initial focus on bringing international students to the domestic campus, it has expanded to include the international engagement of HEIs through collaboration in curriculum development, teaching, research, and outreach. There are two dimensions to the international engagement of HEIs. Institutions may integrate an international or intercultural aspect into the teaching and research in their domestic campus and encourage international students and staff to join the domestic campus; this is called internationalization at home. HEIs may cross national borders to offer their services in other countries and that is internationalization

abroad. Both these aspects of international engagement are increasing rapidly and this affects various stakeholders in different ways. Stakeholders such as governments and the public who once emphasized accountability and quality improvement in the national context now extend their attention to the international operations of the HE sector.

Furthermore, the drivers of internationalization have changed. Until recently, cultural, educational, and mutual understanding motives were the common historical basis of internationalization policies for HE. For one or more of these reasons, every country finances staff and students to study or research abroad, via university bursary schemes, bilateral or multilateral agreements, and policies to promote mobility. These rationales and the attendant policies are still present today, but they have been complemented by new trends and rationales. Although mutual understanding and international cooperation in teaching and research rank high on many countries' internationalization agenda, economic and revenue-generation rationales have become much more important recently and have sometimes become primary (OECD/Norway, 2003). The economic rationales have made the international clientele scrutinize the value for money spent on study. To be able to remain competitive, especially in the overseas marketing of the programs, HEIs are under pressure to affirm their quality in an internationally comparable way.

In parallel, mobility of students and staff has grown considerably. Regional and global trade agreements are encouraging the movement of professionals across national borders. One of the most important consequences of this development is the demand for academic and professional recognition of qualifications. Discussions on the World Trade Organisation's (WTO) general agreement on trade in services (GATS) have already identified problems in recognition of qualifications as an indirect barrier to liberalizing trade; as countries join GATS, issues related to recognition issues are gaining greater momentum, and HEIs look for ways to enhance the portability of the qualifications they offer.

Closely related to the recognition of qualifications is the issue of accreditation. Credential evaluators, recognition bodies, employers, and professional bodies show interest in determining the quality of an institution, program, or qualification, and they are inclined to take account of the quality of the institution in their decision making. Many of the problems in this context are around determining whether a program or institution awarding a certain qualification meets certain threshold levels of

quality. This attention to levels of quality and standards exerts pressure on HEIs to assure the quality of their services to clientele spread across national borders.

In recent years, there have also been criticisms about the quality of internationalization itself. The QA arrangements and academic oversight an institution has for its domestic offerings may be robust, but it may not be possible to generalize that to the international activities because of variations in academic oversight and coordination. This situation has resulted in severe criticism, especially of the marketing of offshore programs in receiving countries. To address this, HEIs take a strategic approach to their planning and development; today, internationalization and assurance of its quality are given an institution-wide systemic and strategic attention.

Thus, the interplay between various internal and external pressures has resulted in HEIs exploring strategic approaches to their QA processes with an international orientation. This has triggered developments in three major streams and they are outlined in this section. First, HEIs have opted for multiple accreditation and international accreditation. Second, associations of HEIs have started approaching QA issues that cross national borders through codes of practices and agreements. Third, QA agencies and their networks have expanded their scope and approach to QA in response to the internationalized HE sector.

HEIs in the Internationalized Landscape

National QA bodies often focus on assuring the quality of programs offered in their respective countries by their domestic institutions. In such systems, HEIs active in international engagement realize that they have outgrown their national contexts, including their national QA systems. Acknowledging that the national QA systems are not yet ready to serve the cause of international engagement of the order the HEIs need, many HEIs have opted for QA strategies that go beyond the national approaches.

Of the various factors that have motivated HEIs to take an international approach to QA issues, the demand for academic and professional recognition of qualifications ranks very high. Often the recognition of qualifications across borders is complicated by the lack of transparent national criteria for quality and standards. Even in Europe, which is known for student mobility programs such as European region action scheme for the mobility of university students (ERASMUS), supported by the network of information centers and recognition bodies, incomplete recognition for the credits earned in study abroad and delay in getting the recognition was a problem till recently. The situation has been improved by the wider introduction of the European credit transfer scheme and the Bologna process. However, in other parts of the world,

the recognition of qualifications beyond national borders is not very encouraging and the impact that national QA systems can have to address this issue is still weak.

To get past the limitations of national QA systems in this respect, some HEIs opt for certification by international organizations such as the International Organisation for Standardisation (ISO) for their quality management systems. ISO 9001 is an international standard which relates to the achievement of quality in an organization. Although some institutions find it helpful to use ISO 9001 to demonstrate their quality in an internationally comparable way, there is a general criticism that ISO standards originate from the manufacturing context and are not therefore well matched to the educational sphere. Few HEIs find the effort required to achieve full ISO 9001 certification provides adequate returns, although many institutions have ISO 9001 for part of their operations, usually administrative areas.

More commonly, HEIs attempt to overcome the barriers to recognition of qualifications by undergoing QA processes of organizations that operate internationally. Often, one HEI undergoes multiple reviews or accreditations. This is particularly found in professional areas of studies where student and staff mobility is high. The European Foundation for Management Development (EFMD) under its European Quality Improvement System (EQUIS), the Association to Advance Collegiate Schools of Business (AACSB), and the Association of MBAs (AMBA) are professional associations that accept international applications for their accreditation process in business studies.

Associations and Networks of Higher Education Institutions

In addition to such direct methods for addressing academic and professional recognition of qualifications, institutions also assure themselves and others of their quality by adherence to codes of practice and guidelines established by associations and networks of HEIs. Codes of practice are common at the national level and for the most part they are statements of principles related to moral imperatives in international engagement. The code of practice and guidelines for Australian universities on provision of education to international students by the Australian vice-chancellors committee; the code of practice for the assurance of academic quality and standards in HE: collaborative provision, QAA, UK; principles of good practice for educational programs for non-US nationals by the council for HE accreditation; and the code of ethical practice in international education developed by the Canadian Bureau for International Education are a few examples.

Making a commitment to adhere to codes of practice serves as a generic type of QA and it can work well in mature HE systems. If the code is framed as a guideline

rather than as a policy, it may not be possible to have a system in place to monitor and assess compliance. Instead, such a code appeals to the ethics and conscience of the institutions and the staff who are involved in international engagement and it tries to develop a set of values and principles to guide the process.

In addition, associations and networks of HEIs have initiated projects on quality that cut across national borders. The institutional evaluation program (IEP) initiated by the European University Association (EUA; formerly CRE) is an example that has a focus on quality management. In 1994, EUA launched the individualized education plan (IEP) for its member universities to assess their strengths and weaknesses in quality management. The review is based on a self-evaluation and external peer review conducted by senior international institution leaders. So far, over 150 universities in Europe and worldwide have participated in the evaluation. EUA reports that the major benefits derived are an increased strategic capacity and strengthened internal quality culture – two essential attributes for dealing with current and future challenges in HE. Since 2001, EUA has also carried out sector-wide evaluations to identify and make recommendations on the systemic challenges and the common issues shared by all institutions in a given sector.

Other examples include the projects and benchmarking initiatives of the association of commonwealth universities on issues that are common to universities across national borders; the task force on accreditation established by the international association of university presidents; and a working group on accreditation set up by the confederation of European rector's conferences.

As internationalization becomes more widely understood and the process of internationalization matures, it is increasingly important that institutions of HE address the issues of quality assessment and assurance of the international aspects of their operations. This realization galvanized international and intergovernmental bodies with an interest in HE to pay attention to the international aspects of HEIs. For example, the OECD program on institutional management in higher education (IMHE) has taken a close interest in the international dimension of HE over a number of years. Since 1994, it has led an activity focussing on a cross-country analysis of institutional level strategies, the internationalization quality review process (IQRP). IQRP aims to help individual institutions of HE to assess and enhance the quality of their international dimension according to their own stated aims and objectives.

Several organizations of HEIs have produced position papers and declarations on issues related to quality in cross-border education, triggered by the GATS debate. They too serve as guidelines in shaping the international approach of the HEIs toward QA. Examples are the Accra Declaration on GATS and the Internationalisation of

Higher Education in Africa (2004) by the Association of African Universities; and the document Sharing Quality Higher Education Across Borders: A Statement on Behalf of Higher Education Institutions Worldwide (2005) jointly prepared by the International Association Of Universities, the Association Of Universities and Colleges of Canada, the American Council on Education, and Council for Higher Education Accreditation.

Response of the Quality Assurance Agencies

As HEIs collaborate with their counterparts across borders, it is but natural that they expect the quality assurance agencies to follow a similar approach and collaborate with QA agencies across borders. If QA agencies do not develop this capacity to cooperate with their counterparts, the serviceability of QA agencies to HEIs and the effectiveness of QA services will be seriously limited. While looking at the way the QA agencies have responded to the international engagement of HEIs, it is necessary to see the general QA developments as well as the developments specific to professional areas of studies where the professional bodies and professional accreditors do the gate keeping and act as QA bodies in their areas of specialization. Professional bodies are a type of quality agency, using many of the common methods, although their authority is confined to one discipline area.

Professional Bodies and Their Networks

Attention to the mobility of professionals has given a fillip to professional accrediting associations, whose members want international collaboration between associations in order to achieve international recognition of their professional qualifications. Systems of licensure, certification, and accreditation are emerging to support professional mobility. This gives rise to international definitions of quality of education in professional areas of studies. Professional organizations, accrediting bodies, and certification and licensure bodies are interested in developing mutually acceptable standards in cooperation with their counterparts in other countries and are considering mutual recognition (MR) agreements. There are instances of professional bodies accepting international applications and recognition agreements among a group of countries with mutually acceptable standards. The way the accreditation board for engineering and technology (ABET), a federation of the US professional engineering societies, expanded its scope is an interesting example.

As the demand for engineering mobility has increased, the assessment of the quality of education in engineering programs at institutions outside US has become increasingly important. To meet these needs, ABET has become

involved internationally through mutual recognition agreements, program evaluations, educational consultancy visits, assistance in developing accreditation systems in other countries, and in the accreditation of engineering programs outside US. The Washington Accord that developed out of this international approach of ABET is a successful example of a mutual recognition agreement. It is an agreement between the bodies responsible for accrediting professional engineering programs in each of the signatory countries. It recognizes the substantial equivalence of programs accredited by those bodies, and recommends that graduates of accredited programs in any of the signatory countries be recognized by the other countries as having met the academic requirements for entry to the practice of engineering. As of May 2007, there are ten signatories to this accord with four more in the provisional list.

The procedures underpinning this accord include circulation and consideration of any revisions made by any one of the associations to its procedures, and intermittent attendance at accreditation events by teams of representatives of the other members of the accord. It is to be noted that these agreements are between English-speaking countries or countries that are willing to operate in English for this purpose. Despite the wide attention to this accord, it has not spawned many copies.

Professions more tightly controlled by law or statute find the mutual recognition task more difficult. However, some progress is being made in a number of other areas. In architecture, the international union of architects (UIA) has developed the UIA Accord on Recommended International Standards of Professionalism in Architectural Practice and nine related accord policy guidelines. It is the first time the profession of architecture has adopted a global standard. Further, an international charter for architectural teaching was agreed in 1996, and work on this has resulted in the UNESCO–UIA validation system for architectural education.

The International Federation of Nurse Anaesthetists (IFNA) has been working on this for a number of years, and IFNA is the first international nursing or medical organization to have developed international standards and guidelines for education, practice, and ethics. The International Council of Nurses and IFNA have started addressing the concept of international accreditation, but it will be several years before it is fully implemented. There are also some bilateral MR agreements of more limited extent. The actions of the professional associations in this area overlap with the regional and global trade initiatives and consequently with the GATS requirements.

Although professional associations are themselves quality agencies, they do not commonly contribute to the design and development of the wider QA framework. On the other hand, general purpose QA agencies often engage in the QA developments of the professional sector. Most regional accreditors in US, QAA (UK), New Zealand

Universities Academic Audit Unit NZUAAU (New Zealand), and Australian Universities Quality Agency (AUQA) (Australia) collaborate with professional associations to varying degrees, from two-way information sharing, to collaborative review events.

General QA Developments

Just as HEIs are internationalizing, so is QA itself. Similar to the HEIs offering their services across borders, some QA agencies extend their service to international clientele or HE sectors across borders. One reason is the need for capacity development in QA in some countries. The second reason is the unsustainability of a dedicated QA system in some situations such as small island nations. It might be more practicable for these countries to approach another reliable QA agency(ies) for QA services. Auditing of the universities of Mauritius and the South Pacific, the latter covering 12 small island nations, by the QA agencies of neighboring countries, is an example. Another example is the accreditation carried out by the regional accreditors of the US for overseas non-US institutions. The current volume of this activity is low, but is increasing.

The networks of QA agencies have made a significant impact in creating awareness among the QA agencies on common issues related to QA of international activities. There is a growing acknowledgment by quality agencies that they should whenever possible recognize each others' decisions, and that if possible this recognition should be mutual between the agencies. Two agencies that are both operating at the internationally accepted level of competence may recognize each other's judgments about the institutions in their jurisdiction, and jointly provide assurance to governments, employers, students, and other institutions about the quality and standing of the institutions and their qualifications.

The International Network of Quality Assurance Agencies in Higher Education (INQAAHE) has discussed the mutual recognition of QA decisions among its members. The Asia-Pacific Quality Network (APQN) runs a project on mutual recognition and has a target of all its full members recognizing each others' judgments by 2010. The European Association for Quality Assurance (ENQA) has also been active in pilot projects on mutual recognition. The European Consortium for Accreditation, which is a sub-network of ENQA, and whose members are those agencies in Europe whose main evaluation activity is program accreditation, have committed themselves to develop a system for mutually recognizing each other's accreditation decisions. ENQA has also committed itself to developing a European register of QA agencies, and agency compliance with the European standards for external QA agencies will be one criterion for placement in the register. This register has the potential to facilitate mutual recognition developments.

MR depends on the trust and confidence QA agencies can have in each other's QA decision making. In recent years, the networks of QA agencies have paid attention to the question: what is a good QA system? Discussions addressing this question have resulted in the description of features that can be expected of ideal QA systems, and in the identification of ways in which QA systems may attain these characteristics. Notable developments include the INQAAHE guidelines of good practice (GGP), and standards and guidelines for quality assurance in the European HE area (ESG), 2005.

In addition to the networks of QA agencies, pointers and guidelines have also been developed by intergovernmental bodies such as UNESCO and OECD, drawn up by various stakeholders as well as experts in the field.

Role of Intergovernmental Bodies

Intergovernmental bodies such as UNESCO and OECD have also contributed to these developments. UNESCO regional conventions on recognition of qualifications are a notable example. UNESCO Conventions are legal agreements between countries to recognize academic qualifications issued by other countries that have ratified the same agreement. A number of recognition tools such as a diploma supplement and the code of good practice in the provision of transnational education (adopted by the Lisbon recognition convention committee) have been developed in the framework of the UNESCO Conventions. It was the Lisbon convention that established an explicit link between QA and the recognition of qualifications. Specifically, the diploma supplement, designed to facilitate international recognition of qualifications is required to show the QA regime under which the qualification was awarded. Unfortunately, it continues to be difficult to give effect to this link, and QA agencies and recognition bodies tend to operate in different spheres.

UNESCO–OECD guidelines on quality provision in cross-border HE (2005) propose good practices that can assist countries in assessing the quality and relevance of HE provided across borders and to protect students and other stakeholders in HE from low-quality HE provision.

Issues for the Future

Capacity Development

Traditionally, the national QA systems were not oriented to cover the international engagement of the HEIs. As the international engagement of HEIs increases, the expectation that national QA agencies be able to expand their scope is emerging as an imperative for all countries irrespective of the stage of development of their HE systems.

Surveys conducted by networks such as APQN, CINDA (in Latin America), AAU (in Africa), and INQAAHE have indicated that there is a need for capacity development in quality-related issues of the international activities. Similar results have been highlighted in the surveys conducted among the APEC economies as well as in the reports produced by UNESCO on mapping the QA systems in different regions. Consequently, many capacity-development initiatives are in progress, supported by national governments and intergovernmental and international bodies such as the World Bank and the UNESCO. In spite of attention to capacity development, unequal stages of development will continue to be a problem in the future. Till the capacity of the national QA systems to adequately cover the international engagement of their HEIs is raised, HEIs might be burdened with multiple and international accreditation to facilitate recognition of their qualifications across national borders.

Lack of Convergence among Diversity

Policies and practices of QA of the international activities of the HEIs vary even among countries of similar type, especially regarding internationalization abroad. QA agencies take various approaches to assuring the quality of this cross-border education. For example, in the UK, the Quality Assurance Agency (QAA) from time to time convenes a panel to visit a group of overseas operations of the British HEIs in one country or region. In Australia, AUQA's audits address the transnational operations of the university sector institution by institution. The regional accreditors of the US carry out visits to any operation that is established more than 40 miles from the institution's main campus, including across borders. If there is such a variation among the three major exporters, one can understand how difficult it would be in other situations to look for a common framework. Now QA agencies have realized that they need to ensure convergence toward some common framework and some QA agencies have taken initiatives to map the common framework. Developments in Europe through the Bologna process have the potential to facilitate this convergence, but how much convergence can be achieved in the QA of international activities in the near future is a big question.

Lack of Dialog and Cooperation among Quality Assurance Agencies

There is a need for strengthened dialog among QA agencies at two levels. First, communication among the QA agencies of major sending countries needs to improve. There are many instances where an institution of the receiving country that has partnership with HEIs from different countries is burdened with the QA regime of a number of those countries, embracing a number of separate reporting requirements and review visits. This could

be avoided if QA agencies of the major sending countries can establish an appropriate mechanism to work collaboratively. Collaboration is emerging, but it will take many years for the cooperation to materialize in ways that will reduce the QA overload of institutions.

Second, the dialog between the QA agencies of the sending and receiving countries is very weak. Differences in the capacity of the QA systems to consider international activities itself may be a barrier to facilitate a meaningful dialog among the QA agencies.

Lack of capacity, diversity in practices, and absence of a productive dialog among QA agencies lead to mistrust and stereotypic understandings about the QA of international activities. That perception is gradually changing in some countries due to the evidence that international engagement in HE can respond to human and social development needs, provide new opportunities, and increase the possibilities for improving workforce skills if managed appropriately. Teacher-education programs offered in Africa, when there was shortage of trained teachers, with the support of the Commonwealth of Learning through open and distance learning, is an example and India had an active role in this. Malaysia, Singapore, Hong Kong, Korea, China, Maldives, and Indonesia are examples of countries in the Asia-Pacific that have benefited from cross-border educational services. Today, countries have realized that there are ways to protect the interests of both the sending and receiving countries and they see cooperation as the best way to do that.

As the quantity of international activity grows, and generates corresponding QA attention, there is a danger of too much QA for international operations. In the long term, this might be a threat to innovation and creative learning models and promote a compliance culture, as HEIs have to undergo multiple QA regimes leading to overload of QA. This realization has resulted in many pilot initiatives for cooperation among QA agencies and their networks. Regional initiatives with political will such as the Bologna process and the Brisbane Communiqué are likely (eventually) to make a significant impact on these initiatives.

Conclusion

There are massive changes in the international engagement of institutions, both in nature and in quantity. This poses challenges for the institutions as they operate in different cultures and their students cross national boundaries. Maintaining high quality of these activities is the responsibility of the institutions (QA of internationalization) and also of the QA agencies (internationalization of QA). However, most QA agencies were established with national authority and national remits. They must work

(and indeed are working) on the mechanisms for assuring quality across boundaries and for collaborating with other national QA agencies. Networks of QA agencies are playing a central role here, in capacity-building for their member agencies, and advocating the development and use of good practice. Ensuring some convergence among diverse QA policies and practices, and strengthening cooperation among QA agencies, emerge as issues for the future. Until these developments take hold, there will be a mismatch between what the HEIs need in terms of international QA and what the various QA bodies are able to provide. The current widespread attention to these needs gives cause for optimism that a better alignment will gradually be achieved.

Internationalization of Higher Education

M van der Wende, University of Twente, Enschede, The Netherlands

The Shaping and Motivation of Internationalization in Higher Education

The international dimension of higher education is widely recognized. Knowledge transcends borders, research has an intrinsically international character and wandering students were already a feature in medieval Europe. Arguments of this type usually provide the basis for claiming the international character of higher education, which is generally acknowledged. This does not, however, substantiate the often advanced position that higher education has always had, and has inherently, an international character. In fact, nation-states have played a crucial role since the nineteenth century in the development of the modern university. Neave (2001) refers to two centuries of nationalism in higher education. Very few higher education institutions can lay claim to a centuries-old international tradition for the simple reason that most of them were established after 1900 or even after World War II. The modern university is a national institution, a creation of the nation-state (Scott, 1998). Furthermore, the extent of international activity and orientation in teaching and research varies enormously depending on the discipline and professional area concerned. Finally, the proportion of students and staff who actively participate in international activities is usually quite limited and internationalization may therefore remain marginal on many campuses.

Nevertheless, in the second-half of the twentieth century, a gradual change in the extent to which higher education was nationally determined and orientated can be observed. International cooperation between nations in the field of higher education emerged following major political and economical developments (Blumenthal *et al.*, 1996; De Wit, 2002). The post-war reconstruction of Europe was supported by promoting peace and mutual understanding through the stimulation of scientific cooperation between the USA and Europe. The Fulbright program is a prime example of this so-called North–North cooperation. During the Cold War, the focus of internationalization was on achieving foreign policy goals through aid and technical assistance. The process of decolonization in the 1950s and 1960s resulted in new forms of mobility and cooperation aimed at the development of a new intellectual stratum in the former colonial nations (South–North mobility and North–South cooperation). From the 1980s on, processes of regional integration notably in the European Union (EU), the Asia Pacific

Region, and Latin America (Mercosur) resulted in new types of multilateral exchange and cooperation such as the European Region Action Scheme for the Mobility of University Students (ERASMUS) and the University Mobility in Asia and the Pacific (UMAP) programs. After the terrorist attacks in 2001, internationalization became in the USA more clearly tied to diplomacy and national security, with new exchange programs with Muslim countries and heightened awareness of the need for language and area studies (Green and Knight, 2004).

In the context of these political and economical developments, internationalization of higher education became a way for governments to support the related processes of reconstruction, nation building, economic and democratic reform, technological development, regional integration, and international dialog. Public subsidies were made available to achieve these aims. Implementation was shaped through student and staff mobility, scientific cooperation, capacity building, knowledge transfer, the training of intellectual cohorts to international quality standards, and the promotion of mutual understanding and knowledge of different languages and cultures. Rationales for internationalization in higher education may thus include political, economic, cultural, and academic dimensions (Knight and de Wit, 1995; Blumenthal *et al.*, 1996). While from a government perspective, foreign policy and economic development have dominated the agendas, higher education institutions traditionally focused on internationalization as a way to improve the quality of teaching and research as well as to help institutions in other countries build capacity.

At the start of the twenty-first century, with globalization and the knowledge economy as major contextual factors, the various categories of activities and rationales can still be recognized in policy approaches to internationalization (OECD, 2004, 2006). Mutual understanding is an approach especially related to the social, cultural, and linguistic aspects of regional integration, international diplomacy, and more generally to the creation of international networks of elites and the enhancement of human capital. Student mobility programs are the main policy instrument in this approach and are still by and large publicly funded. Capacity building refers to the growing demand for higher education in an increasing range of developing countries and emerging economies, which can be met by study abroad (and return), but is increasingly paralleled by the establishment of foreign providers, that is, higher education institutions from

abroad that offer programs and services either on their own or in cooperation with domestic institutions. Since the new context is characterized by more and global competition in which knowledge is a prime factor for economic growth, access to higher education has become a key issue of national competitiveness and a more market-oriented model in which import and export categories can be distinguished emerged in the 1990s. In this context, internationalization may also be undertaken as a revenue-generating approach considering higher education as an export industry and using the revenues to finance the domestic higher education sector. Full-cost tuition fees and for-profit branches abroad play an important role in this approach and private sources of funding are often substantial. Finally, global competition urges national economies not only to educate their own population to the best, but especially in cases with national shortages in certain fields, also to attract highly skilled foreign people for the knowledge economy. Skilled migration is therefore another approach that may characterize the internationalization of higher education. Foreign graduate students and academic staff are attracted to enhance the competitiveness of higher education and the research and development sector in the host country. Internationalization policies of this kind need to be coordinated with immigration regulations, as visa and work permits are conditional.

Obviously, reality will usually reflect a combined blend of these various approaches, while focus and priorities differ across types of institution, countries, and regions, as discussed below. Overall it is clear, however, that economic rationales have become more dominant for internationalization over the last decade (Van der Wende, 2001a, 2001b; Van Vught *et al.*, 2002; Teichler, 2004). This is clearly linked to the process of globalization and its impact on higher education, notably the global competition for talented students and highly skilled workers as key resources for the knowledge economy and the emergence of an international market where demand for access to higher education is being met across borders. Responses from the higher education sector have in many countries been conditioned by national reforms that draw on the techniques of new public management (Marginson and Considine, 2000), including the modeling of national systems as economic markets and government-steered competition between institutions. In this spirit, governments apply steering models that grant institutions considerable autonomy and encourage them to become entrepreneurial also in the international higher education market. This may be complemented by active policies to lower barriers to such economically driven internationalization activities (i.e., international trade in higher education) through trade negotiations in educational services under the General Agreement on Trade in Services (GATS) of the World Trade Organization or other trade agreements.

Definitions and Related Conceptual Issues

Internationalization is understood in the literal sense as inter-national and refers to any relationship across borders between nations, or between single institutions situated within different national systems. It assumes that societies defined as nation-states continue to function as bounded economic, social, and cultural systems even when they become more interconnected as activities crossing their borders increase. In contrast, globalization puts emphasis on an increasing convergence and interdependence of economies and societies and a de-nationalization and integration of regulatory systems as a well as a blurring role of nation-states are taken for granted (Huisman and Van der Wende, 2004). The point that internationalization is predicated on a world order dominated by nation-states while globalization is more agnostic on this point (Scott, 1998) and the issue of whether national systems become more integrated as suggested by globalization, or more interconnected as with internationalization (Beerkens, 2004) can be seen as central distinctions between the two concepts. Furthermore, internationalization can involve as few as two units, whereas globalization takes in many nations and is a dynamic process drawing the local, national, and global dimensions more closely together (Marginson and Rhoades, 2002).

Globalization cannot be regarded simply as a higher form of internationalization. The relationship between the two concepts is not linear or cumulative but of a different order. Scott argues that the relationship is in fact a dialectical one in the sense that “not all universities are (particularly) international, but all universities are subject to the same process of globalisation – partly as objects, victims even, of these processes, but partly as subjects, or key agents of globalisation” (1998: 122). Globalization and internationalization in higher education may thus be potentially conflicting or rival, while at the same time interactive, mutually generative, and continually reinforcing each other. Globalization goes directly to the economic, cultural, and political core of nations, while also refashioning the larger higher education environment and thus creating a dynamic impact on higher education. In a networked environment in which every higher education institution is visible to every other, and the weight of the global dimension is increasing, it is no longer possible for nations or for individual institutions to seal themselves off from global effects. In this respect, internationalization can be seen as one possible response to globalization, that is, as a way to make higher education institutions more effective in response to the globalization of societies, cultures, economies, and labor markets (Van der Wende, 1997); as by definition, internationalization is a process more readily steerable by governments than is globalization. By the

same token, single governments have only a partial purchase on global developments through the medium of internationalization (Marginson and Van der Wende, forthcoming).

Internationalization: Main Elements and Strategies

Conceptually, internationalization was for a long time mainly seen as concentrating on the cross-border mobility of individual students and scholars and not as a strategy that affected higher education institutions or systems. This, however, changed over the last two decades. A broadening of the range of activities associated with internationalization has taken place – from an almost exclusive focus on individual mobility to more elaborate strategies encompassing curriculum development, research cooperation, staff development, and quality enhancement. Yet, international mobility remains a very important and visible element.

In 2003, 2.12 million students were enrolled in higher education outside their country of origin, of which 93% studied in the Organization for Economic Co-Operation and Development (OECD) area. Comparison of these numbers over the last 5 years reflects an annual increase of 8.3% on average. Five major countries of destination enrol the vast majority (70%) of these students: the USA (28%), the UK (12%) Germany (11%), France (10%), and Australia (9%). Substantial numbers of students are also attracted to Japan (4%) and the Russian Federation (3%). Malaysia is playing an increasing role in receiving students from China and India. On average, foreign students represent 6.4% of the total student population in OECD countries in 2003, up from 4.5% in 1998, indicating that in most countries, the foreign student population is growing faster than the overall domestic participation in higher education. A closer look at the numbers show that although the USA attracts the largest number of foreign students (close to 600 000), this represents less than 4% of its overall student population. A comparison with Europe indicates that the EU attracts a higher number of foreign students than the USA, but that more than half of the students studying in Europe are from within the region. Finally, comparisons between foreign students and domestic students studying abroad point to important differences between countries: these indexes may differ between 23.0 (Australia), 15.8 (USA), 8.9 (UK), and –18.3 (Korea) (OECD average = 2.4 students received for one student going abroad; data for 2001), indicating important imbalances between incoming and outgoing students in especially the main receiving countries (OECD, 2004, 2006).

A particular category of mobile students study abroad in an exchange program for a relatively short period (up to 1 year). The EU's ERASMUS program celebrated its

twentieth anniversary in 2007 with a total of around 1.5 million exchange students. The annual number of ERASMUS students has risen steadily and was over 144 000 in the year 2004–05. The largest EU member states are obviously the main sending and receiving countries and reciprocity is an important principle of the program. Nevertheless, also in this context, the UK demonstrates the greatest imbalance between incoming and outgoing students (2.25). ERASMUS students are found mostly in business studies (21%), languages (15%), engineering (11%), and social sciences (11%) (EC, 2006). Other examples of exchange programs are the Fulbright program, sponsored by the US Department of State. Since its establishment, more than 44 000 students from the US and 147 000 students from other countries have benefited from this program. The Fulbright US student program is now the largest US exchange program offering approximately 1200 grants annually in all fields of study (IIE, 2006).

High expectations were placed on the virtual mobility of students when the use of new information and communication technologies in higher education (notably the Internet and digital learning environments) increased in the 1990s. Electronic learning (e-learning) was expected to widen global access to higher education, to lead to pedagogic innovation, and decreased costs. Virtual universities were seen to become serious competitors for campus-based institutions, challenging the centrality of the face-to-face classroom setting. Expectations on the contribution of e-learning to internationalization still envisage opportunities for enhanced access, exchange, and collaboration. However, the challenges have also become clear. They are related to learner support and guidance systems that can effectively operate across national, cultural, and linguistic borders, to international systems for accreditation and for the recognition of qualifications, and to ensure affordable prices for international e-learning. (Helios, 2006). Market research shows that Australia's higher education export programs solely delivered through e-learning only represent a small proportion of total offerings and that virtual for-profit providers in the Asia-Pacific region reported more often losses than brick-and-mortar providers (OBHE, 2005). Further reflections on the experiences indicate that distance-education provision will lose ground in favor of prestigious providers – perhaps in consortium arrangements – with a commitment to a major brick-and-mortar presence, and a traditional academic focus on research and furnish students with a real (rather than virtual) campus experience (McBurnie, 2006: 66). In the US, only 3.2% of the students took all their courses online (in 2002–03) and they were mostly adult learners in professional areas. Generally, students prefer blended models of learning (Douglas, 2005). So far, e-learning has generally failed to emerge as a significant global market. The complex possibilities of international e-learning are typically left to small-scale,

department-led experiments (OECD, 2005). They show that organizational conditions, such as different academic calendars and time zones, student and staff competences in areas as intercultural communication and foreign languages, and technological challenges and issues of ownership related to the coupling of institutional learning environments, cannot be taken for granted.

Data on the mobility of academic staff show that the mobility of teachers in the ERASMUS program rose from less than 8000 in 1997–98 to almost 20 000 in 2004–05 (EC, 2006). Yet, there are no clear signs of a process of Europeanization in academic recruitment and careers, as each national academic labor market is still characterized by salaries, status, recruitment procedures, workloads, career patterns, and promotion rules being very different from one country to another (Musselin, 2004). But while in Europe, postdoctoral mobility is stable (Enders and de Weert, 2004), in the USA, a high and increasing proportion of postdoctoral personnel holding a US doctoral degree are foreign born: 41% in 2001 compared to 21% in 1985 (NSB, 2006). The USA followed by the UK also draws the largest number of visiting faculty, at least 20% coming from Europe. In 2005, US higher education institutions hosted 89 600 foreign scholars to conduct teaching or research activities. Two-thirds were in science and engineering. In most OECD countries, two to four scholars and researchers hold positions in the USA for every 100 at home. In 2003–04, the ratio of visiting scholars to those at home was highest for Korea (13 per 100), the Russian Federation (8), and China (6). About half the foreign doctoral graduates stay in the USA after graduation, many in faculty positions, augmenting the capacity of the United States as a global knowledge economy (OECD, 2006). Obviously, these flows create serious concerns regarding brain drain in other, especially non-OECD, countries.

In the area of academic research, international collaboration is clearly on the rise. The growth of internationally co-authored scientific articles (with at least one international co-author) went from 8% in 1988 to 18% of all scientific articles in 2001. In the USA, they represent 23% and in Europe as much as 33% of all articles, although in Europe the collaboration has a strong intra-regional character. Foreign scientific articles are increasingly cited, representing 55% of all citations in 1992 compared to 62% in 2001. The average number of collaborating countries in scientific activities increased from 89 in 1994 to 102 in 2001 (Vincent-Lancrin, 2006).

Student mobility and the international collaboration in research have been two important driving forces in the development of institutional strategies for internationalization. Such strategies typically include provisions for mobility and exchange, including the related support structures, for example, international offices and cooperation agreements with foreign partner institutions.

In the area of curriculum development, many institutions undertake activities to ensure that the nonmobile students also benefit from an international dimension in their training. Internationalized curricula can be described as curricula with an international orientation in content, aimed at preparing students for performing (professionally/socially) in an international and multicultural context, and designed for domestic students and/or foreign students (Van der Wende, 1996). Initiatives in this area include joint degree programs (offered by two or more institutions in different countries), programs that involve substantial foreign-language learning and/or are taught in English as a second language, and that involve an international classroom, which is seen as a key to acquiring intercultural skills and competences (Hudson and Todd, 2000).

The focus of institutional strategies for internationalization is linked to the institution's aims in this area (Huisman and Van der Wende, 2005). Institutions that seek to become recognized global players understand internationalization as being related to worldwide competition among elite universities (encouraged by global university rankings) for the recruitment of bright, talented students, young researchers, and renowned teaching staff. Their student recruitment strategy is very explicit and highly selective. Other institutions undertake internationalization in the context of cooperation and networking for mutual benefit and want to strengthen their regional profile. Their strategies are focused on collaborative research, exchange of students and staff, joint study programs, etc. In other cases, internationalization may be necessary for survival, for instance, related to decreasing domestic demand, and institutional income generation. Recruitment of (full) fee-paying students and the establishment of overseas programs and branches are used to this end. Finally, institutions may see internationalization as a way to enhance their local or national status. Especially certain nonuniversity or teaching-oriented type of institutions employ international activities in order to offer, for instance, degree programs at higher levels, to develop research activities, or even to achieve university status. Institutional aims and strategies for internationalization are closely connected to institutional profiles. Research-intensive universities are clearly driven by international collaboration and competition in research, and therefore focus more on attracting talented graduate students, whereas teaching-oriented institutions usually focus more on undergraduate students. Specialized institutions, such as business schools or arts schools, are real niche players that attract very specific international clientele.

Internationalization strategies at institutional level reflect the wider set of policy approaches as discussed before. Clearly, global competition and the knowledge economy have advanced, especially the revenue-generating and skilled-migration approaches. This coincides with

what is seen by many as a shift from cooperation to competition as the main paradigm for internationalization. Especially in continental Europe, perceptions indicate that cooperation is seen to be the inherent model of internationalization, associated with academic exchange, quality and excellence, and cultural notions of mutuality and intercultural learning. More generally, the conception of the university as a competitive (global) enterprise is countered with the public service model and the notion of higher education as a public good (Olson 2005; Van Vught *et al.*, 2002). However, both cooperation and competition are important strategic options for internationalization and in many cases, internationalization strategies are indeed composed by a combination of cooperative and competitive options. Examples of cooperation for competition can be found in global university alliances (consortia). The complexity of such strategies, however, is demonstrated by the fact that despite the high expectations of the potential role of these consortia in the global higher education scene, whether they are successful or not seems to be largely defined by the extent to which the institutions concerned are embedded in their national systems (Beerkens, 2004). More generally, it can be said that: “Despite all the research demonstrating the growing importance of internationalisation, and even more the rhetoric in this respect, higher education institutions’ behavior (including their internationalisation strategies) are (still) mostly guided by national regulatory and funding frameworks. For internationalisation in particular, historical, geographic, cultural and linguistic aspects of the national framework are of great importance” (Luijten-Lub *et al.*, 2005: 238).

System-Level Changes, Concerns, and Perspectives

The international mobility of students and scholars requires systems for the recognition of diplomas and qualifications, in terms of academic recognition (a decision that allows a person to pursue or continue studies, or to use an academic title or degree) and professional recognition (a decision to grant professional rights, license to practice, or status to a graduate). Recognition methodology developed over the second-half of the twentieth century from an approach aimed to establish equivalence to one based on acceptance (of the nearest comparable degree) as expressed in the Council of Europe/UNESCO Recognition Convention of Lisbon (1997). The latter approach requires mutual trust in each other’s education system. The related need for more transparency was one of the main rationales for the Bologna Declaration, which was signed by 29 European countries in 1999. With the aim to promote employability within the EU and to enhance the international attractiveness of European higher education, a process of convergence toward a

two-cycle (undergraduate–graduate) degree system was undertaken (Reichert and Tauch, 2005; Alesi *et al.*, 2005; Witte, 2006). The process now includes 45 countries and is increasingly influential on internationalization agendas also beyond Europe (Australian Government, 2006). Besides a framework for recognition, the Bologna Process also aims to set international standards for quality assurance.

In the context of internationalization, quality is an issue of concern as much as this context offers opportunities for improvement. On the one hand, learners should be protected from low-quality provision and qualifications. To this end, guidelines on quality assurance of cross-border education were developed (UNESCO/OECD, 2005). On the other hand, international benchmarking, perhaps ranking (provided that methodological principles are seriously respected, see IREG, 2006), and especially the comparison of actual learning outcomes can offer higher education useful insights into the quality and effectiveness of systems and institutions. The further process of internationalization is expected to offer many new and challenging opportunities in this respect and will be beneficial if governments and institutions manage to combine competitiveness with quality improvement and enhancement of opportunity for all.

Glossary

Institutional classifications – Listing of higher education institutions in groups on the basis of nominated characteristics such as mission, size, and/or level of study.

University ranking – Ordinal listing of individual higher education institutions, or groups of institutions, based on performance indicators and/or surveys of reputation.

Introduction

Ordinal rankings have become installed as a prominent feature of higher education in many countries and also on the global scale. With one important exception discussed below (CHE, 2006), rankings take the form of vertically ordered league-tables. They operate both at the level of institutions, and also at the level of disciplines and specializations, such as business, law or medicine schools, or aspects of institutional mission. Rankings systems draw on a variety of methods to derive rank order, including quantitative metrics and absolute and comparative judgments expressed in surveys and by expert panels. Rankings are often conducted by publishing companies that draw on the techniques of annually updated consumer guides (Usher and Savino, 2006).

Although higher education rankings have roots as far back as the nineteenth century in the United States, their modern origin was the annual survey and ranking of higher education institutions by the US News and World report (USNWR, 2006) from 1983. Most rankings systems have been established after 2000 (Salmi and Saroyan, 2006). The trend to rankings can be understood as part of the larger evolution of techniques of evaluation and accountability; the focuses on competition between institutions, outcomes, quality, consumer choice making, and institutional management in higher education; and the growing public discussion about the sector. In turn, the rankings process contributes to these secular tendencies, especially by fostering intranational and global competition between institutions. National rankings function as an often potent shorthand accountability mechanism for institutional leaders. Global rankings serve a similar function and, by extending scrutiny to the performance of

systems, they extend the accountability pressure to national governments.

Notwithstanding the public prominence of rankings systems, and the apparent authority of their findings, these systems use varied, sometimes eclectic, and often contested methods to reach those findings. On the whole, research and publications performance, with established metrics recognized on the global scale, has proven to be the aspect of higher education most amenable to rankings. There is much debate about techniques used for combining different measures or judgments about quality into single indices for rank-ordering purposes. There is less debate about rank ordering *per se*. Rankings data are widely publicized and utilized, more than any other data on higher education; however, media organizations and public authorities are more comfortable with rankings than are higher education institutions themselves.

National Rankings

Most countries with large higher education systems have rankings of one kind or another. Countries with rankings devised by newspapers and magazines include China and Hong Kong China, Japan, India, the Ukraine, Romania, Poland, Portugal, Italy, Spain, Germany, Sweden, Switzerland, France, UK, USA, and Canada. In Thailand, Malaysia, Pakistan, India, Kazakhstan, Korea, Tunisia, Nigeria, the Netherlands, the UK, Brazil, and Argentina, rankings have been instigated by ministries of education, grants councils, or accreditation agencies. In China, Japan, Australia, Kazakhstan, Slovakia, Romania, Russia, the Ukraine, Germany, Spain, Switzerland, the UK, and Canada, rankings have been initiated by universities, professional associations, or other organizations (Salmi and Saroyan, 2006). Usher and Savino (2006) review rankings compiled in Australia (Williams and Van Dyke, 2006); Canada; China, with several rankings systems (Liu and Liu, 2005), and Hong Kong; Germany; Italy; Poland; Spain; the UK, where four different newspapers have developed rankings; and the United States. For the most part, national rankings consist of a single table; however, in the USA and Canada, higher education institutions have been divided into groups according to mission and other characteristics, creating a set of mini league tables within which the category of comprehensive research universities has highest status.

Specialist rankings focus on characteristics ranging from research output, to student services, to MBA programs, to Yahoo magazine's ratings of connectivity, the contribution to social diversity, and other features. These rankings are not further discussed here but it can be noted that ratings of disciplines and other aspects feed into the larger schemes of Shanghai Jiao Tong University (SJTU) and the German Centre for Higher Education Development (henceforth, CHE).

USNWR Rankings

In the United States, the annual USNWR survey focuses on aspects of institutions seen to contribute to the quality of teaching and the student experience, with research and scholarship playing a minor role. The categories of institutions are drawn from the classification in 2000 by the Carnegie Foundation for the Advancement of Teaching (USNWR, 2006: 81ff). The most important grouping is national universities – 248 universities (162 public and 86 private) with a wide range of fields of study and offering degrees to doctoral level. Most of them are research intensive. Other categories are liberal arts colleges, master's-level universities, comprehensive bachelor-level universities, business programs, undergraduate engineering programs, and specialty schools mostly in the fine and performing arts. In national universities and liberal arts colleges, the largest part of the index (25%) is comprised by a survey of undergraduate academic excellence sent to university presidents, provosts, and deans of admissions. Two items constitute 20% of the index: student retention and graduation rate; and faculty resources which reward small classes, high academic salaries, high academic qualifications, and a high proportion of full-time staff. Student selectivity at entry, a proxy for market demand, is worth 15%. The lesser items are: spending per student (10%), the proportion of alumni who donate back to the institution, and the graduation rate after controlling for spending and student aptitude (each 5%) (USNWR, 2006: 77–79).

The annual US News survey shapes institutional prestige and influences the flows of high-scoring students, academic labor, and resources. Individual institutions usually make strenuous efforts to improve their market standing, focusing on measures designed to enhance reputation and data management of those indicators open to discretionary action. Some employ highly remunerated enrolment managers to manipulate student entry so as to maximize student scores and the rate of refusal of applications; for example, limiting the size of the initial intake, taking in some students through nonselective means, and offering incentives to high-scoring students. These trends have been criticized for enhancing merit-based student aid at the expense of needs-based aid and fostering social elitism and institutional interest at the expense of the public interest (Kirp, 2004). Comparative retention and

graduation rates can be enhanced by dropping academic standards or even by poaching students from rival institutions. Other indicators open to gaming and variable reporting techniques include alumni donation rates as well as staffing and spending levels.

Despite criticisms of the US News survey, its functioning seems to be accepted. The parallel Canadian survey by MacLeans has achieved lesser consensus. In 1994 and 1995, there were large-scale institutional boycotts; subsequently, there were selective boycotts of data provision in specific areas, and in 2006 11 universities withdrew *in toto*. MacLeans stated that it would use freedom-of-access laws to secure the data necessary to maintain its rankings (Salmi and Saroyan, 2006: 12–13).

The CHE rankings

The CHE, located in Gutersloh in the state of north Rhine-Westphalia in Germany, in conjunction with the German Academic Exchange Service, which assists international students, and the publisher *Die Zeit*, has developed a distinctive approach to national rankings. This dispenses with holistic (summative) rank ordering of institutions in league tables. CHE surveys 130 000 students and 16 000 academic faculty in almost 250 higher education institutions, focusing on student experiences, student satisfaction, and academic recommendations on the best places in each field of study. It supplements the surveys with independent sources comprising one-third of the total database. No data are taken from institutions. CHE ranks institutional departments according to each separate indicator of academic and service quality, assigning them to the top third, middle third, or the bottom third of all institutions. It provides neither discipline-based league tables nor institutional league tables. It refuses to integrate the different indicators into a single indicator for each institution because there is no one best university across all areas, and minimal differences produced by random fluctuations may be misinterpreted as real differences in holistic rankings systems (CHE, 2006).

The CHE data are made available to prospective students and the public free of charge though an interactive web-enabled database. Any person can interrogate this database by investigating and rank identified disciplines and administrative services, using their own combination of criteria (CHE, 2006), thereby creating weightings and rankings themselves. CHE acknowledges that the definition of quality is purpose driven and open to variation and passes power over the definition from the ranker to the consumer. It also provides by far the most comprehensive set of comparative data devised so far. A difficulty is that the CHE approach requires sufficient homogeneity between institutions and their programs and services to enable the comparisons. Arguably, it would be necessary to develop several sets of institutions for CHE-style

comparisons in more varied environments such as that of the United States.

This process of data collection has been extended from all higher education institutions in Germany to Switzerland and Austria. The Netherlands and Belgium (Flanders) are preparing to join the system, and some Nordic countries may follow. The CHE ranking system is well positioned to develop into a European-wide system, and has attracted attention in other parts of the world as well (Usher and Savino, 2006; see also Van Dyke, 2005), including Canada and the USA. The Commission on the Future of Higher Education in the US is working on a comparable concept that would allow consumers to rank colleges based on variables of their choice (Field, 2006).

Global University Rankings

Increasingly, national policymakers and institutional leaders respond to a global higher education environment in which cross-border linkages and flows of knowledge and people are essential to strategy, and international comparisons are constantly being made. The advent of global university rankings suggests that higher education is now constituted by an open worldwide competition between nations, and between individual institutions as global actors in their own right. The most influential global rankings, prepared annually by the Shanghai Jiao

Tong University Institute of Higher Education (SJTUIHE), began in 2003. The second main global rankings, prepared by The Times Higher Education Supplement (THES), commenced in 2004.

Table 1 sets out the top 20 universities in each ranking. Although these ranking systems use quite different measures of university quality, both confirm the reputations of the leading American and British universities, including Harvard, Stanford, Yale, Berkeley, Massachusetts Institute of Technology (MIT), Caltech, Princeton, Cambridge, and Oxford.

Global comparisons are possible only in relation to one kind of institution, the comprehensive research-intensive university. This is the only model sufficiently widespread and homogeneous to lend itself to the formation of a single competition. Research and doctoral education are the most globalized of all dimensions of higher education within the medium of a singular English-language system of publication. This is not to say that global comparisons of research performance, and the exclusion of knowledge produced in languages other than English, are unproblematic.

SJTU Rankings

In compiling an academic ranking of world universities, the SJTUIHE focused exclusively on broadly available and internationally comparable data of measurable research performance (Liu and Cheng, 2005: 133). It was considered impossible to compare teaching and learning

on a worldwide basis “owing to the huge differences between universities and the large variety of countries, and because of the technical difficulties inherent in obtaining internationally comparable data.” The SJTUIHE also decided not to use subjective measures of opinion or data source from institutions. It has consulted widely and its annual data are increasingly robust.

The main part of the SJTU index is determined by publication and citation performance in the sciences, social sciences, and humanities: 20% by citation in leading journals; 20% by articles in *Science* and *Nature*; and 20% by the number of HiCi researchers in the institution. HiCi researchers are those named in the Thomson/Institute for Scientific Information (ISI) classification of the leading 250–300 researchers by field of study, nearly all of which are science-based disciplines, on the basis of citation performance (ISI, 2006). Another 30% is determined by the location of the winners of Nobel prizes and Fields medals in mathematics, during their training (10%) and in their current employment (20%). The remaining 10% is determined by dividing the total derived from the above data by the number of academic staff.

Factors determining performance in the Jiao Tong rankings

The SJTUIHE rankings favor universities that are large and comprehensive enough to amass research performance over a broad range of research fields, especially those strong in the hard sciences, and with relatively few research-inactive staff. They also favor English-language universities because non-English-language work falls outside the main journals and is cited less within them; and they favor universities from the United States because Americans tend to cite Americans (Altbach, 2006). Of the HiCi researchers, 3614 are located in the USA compared to 224 in Germany, 221 in Japan, 162 in Canada, 138 in France, 101 in Australia, 94 in Switzerland, 55 in Sweden, 20 in China, and none in Indonesia (ISI, 2006). Among the US universities, Harvard and its affiliated institutes alone have 168 HiCi researchers; Stanford has 132, UC Berkeley 82, and MIT 74. There are 42 at the University of Cambridge in the UK.

One criticism made of the SJTU rankings is that Thomson, the publishing company that comprises the Thomson/ISI database and determines which journals should receive an ISI rating, has a vested interest in selecting Thomson-published journals ahead of other journals. The Nobel prize criterion is perhaps the most controversial, as the prize is submission based and, at times, an element of politicking appears to enter the decisions; scientific merit is not the only factor.

According to the SJTUIHE, 54 of the world's leading research universities are located in the United States. The UK provides 11 of the top 100. When Canada (four) and Australia (two) are added, the English-speaking nations

between them constitute 71% of the top 100 group. A further 22 are located in Western Europe, six in Japan, and one in each of Israel and Russia. The principal Western European nations are Germany (five), France and Sweden (four each), Switzerland, (three) and the Netherlands (two). China and India have none of the top 100 research universities. India has just two in the top 500. China, including Hong Kong, has 19 of the top 500.

As **Table 2** indicates, there is a broad overall correlation between a nation's gross national income per head and its proportion of universities in the SJTUIHE top 100 and top 500 when the size of the national economy is taken into account. When SJTUIHE research performance is compared to overall economic size and wealth, Israel, Sweden, Switzerland, UK, the Netherlands, Canada, Finland, Denmark, and Australia appear to perform better than expected. The USA performs very well in its share of the world's top 100 but less well in the top 500, indicating its internal stratification. Germany does well at the level of the top 500, indicating a broad-based research capacity across the national system, but less well in its share of the top 100. Japan underperforms relative to its economic capacity on both measures.

There is a closer correlation between the strength of public research systems and SJTUIHE research performance. Aside from the USA, in nations that over-perform relative to economic capacity, the independent private sector plays a relatively minor role. Correspondingly, several nations that underperform at the top 100 level have large private sectors and a highly stratified research effort, including Japan, Korea, Poland, Brazil, and Mexico. Moreover, even though it is obvious that these are all non-English-speaking nations, some non-English-speaking nations in Europe have developed strong basic research systems. These findings underline the dependence of basic research capacity on public investment, given the public good character of research (Stiglitz, 1999).

Times Higher Rankings

The THES sets out to provide the best guide to the world's top universities (THES, 2005). Altogether, 40% of the index is comprised by an international opinion survey of academics and 10% by a survey of global employers. There are two internationalization indicators: the proportion of students that are international (5%) and the proportion of staff (5%). Another 20% is determined by the student-staff ratio, treated as proxy for teaching quality. The remaining 20% of the Times index is comprised by research citations per staff member using the Thomson/ ISI database.

The reputational surveys and the student internationalization indicator appear to boost the standing of universities active in the global market in cross-border students. The THES rankings boost the number and

From World Bank (2006) and SJTUIHE (2006)

placement of British universities in the top 20, while reducing the number of US universities in the top 100 from the 54 in the SJTUIHE rankings to 32. The number of Australian universities in the top 100 rises from two in the SJTUIHE rankings to seven in the THES rankings.

The THES rankings are open to a number of criticisms. The surveys are nontransparent: it is not specified who has been surveyed or what questions were asked. The student internationalization indicator rewards volume building rather than the quality of student demand or the quality of programs. Teaching quality cannot be adequately assessed

using a resource quantity indicator such as the student–staff ratio. The THES rewards an institution's marketing division better than its researchers. Further, the rankings can be highly volatile, raising questions about whether there is a positive incentive-based relationship between performance and ranking. To cite some examples among many: between 2004 and 2006 the University of Malaya oscillated between rankings 89 and 192; Fudan in China between 72 and 195; Seoul National between 63 and 118; and the Royal Melbourne Institute of Technology (RMIT) in Australia between 55 and 146. In the USA, Emory has risen from

173 to 56, and Purdue has fallen from 59 to 127. It is highly unlikely that these fluctuations reflect actual changes in performance. They are more likely to reflect changes internal to the THES instruments and methodologies.

Newsweek Rankings

Newsweek (2006) prepared a composite system of rankings that combined the research publication and citation measures from SJTIHE with the measures of internationalization, student staff ratios, and citations per head from the Times, adding also a metric for library holdings; thus removing the least plausible aspects of both the Times index (the reputational surveys) and the SJTUIHE index (the Nobel indicators). Newsweek's leading universities were Harvard, Stanford, Yale, Caltech, and Berkeley. Cambridge, UK was at six, MIT at seven, Oxford at eight, Tokyo 14, Toronto in Canada at 15, and the Federal Institute of Technology in Zurich at 18. There were five universities from Switzerland in the first 41, the same number as the UK.

Issues of Method and Interpretation

Comparing ten rankings systems Van Dyke (2005) concludes that although the rankings share broad principles and approaches, they differ considerably in aims, systems, cultures, as well as in availability and reliability of data. Usher and Savino (2006: 12–26) examine 19 league tables and ranking systems. The number of raw indicators in use varies from 1 to 71. Indicators are selected from five broad categories:

1. the starting characteristics of students;
2. learning inputs (financial and other resources, staff, and the learning environment);
3. learning outputs (student retention and completion, skills and attributes of graduates, employment outcomes, and citizenship attributes);
4. research (resources invested in research, doctoral programs, publications, citations, and awards); and
5. indicators of institutional reputation.

Half of all rankings systems use surveys to collect data, the other half use data provided by universities, and nearly all use data collected from other sources. The different rankings systems are driven by different purposes and associated with different notions of what constitutes university quality, a highly contested notion (Usher and Savino, 2006: 9). Some look at outputs, others focus on inputs. "Among both inputs and outputs, there is very little agreement as to what kind of inputs and outputs are important"; "rankings have an element of capriciousness to them: with a large enough sample, choosing a different set of indicators does indeed create a different

set of ordinal rankings" (pp. 29–31). Rankings systems that are below the very top produce widely divergent results (Salmi and Saroyan, 2006: 19).

Holistic Reputational Rankings

Usher and Savino also remark on the arbitrary character of the weightings used to construct composite indexes uniting the different aspects of quality or performance. Weighting systems are rarely grounded theoretically (Salmi and Saroyan, 2006: 9) and many institutional practices are omitted. As Rocki (2005: 180) concludes, "the variety of methodologies, and thus of criteria used, suggest that any single, objective ranking could not exist". But "the fact that there may be other legitimate indicators or combinations of indicators is usually passed over in silence. To the reader, the author's judgment is in effect final" (Usher and Savino, 2006: 3).

A recurring problem is that rankings are called on to do more than is mandated by the data. Rank order becomes an end in itself. In some cases, institutions are rank ordered when the differences between them are not statistically significant. Typically, rankings particular to certain aspects of inputs or performance become used as general indicators of reputation. The Jiao Tong research rankings are widely interpreted as holistic indicators of the best universities for students despite the warnings of the SJTUIHE group. No ranking or quality-assessment system has been able to generate data based on measures of value added during the educational process; few focus on teaching and learning as such (Dill and Soo, 2005: 503–507), although these data would be most useful for prospective students. There is no necessary connection between the quality of teaching, and student selectivity or research outputs. "The correlation between research productivity and undergraduate instruction is very small and teaching and research appear to be more or less independent activities" (p. 507).

Reputational surveys like that of the Times tend to recycle reputation rather than reward quality (Guarino *et al.*, 2005: 149). "Raters have been found to be largely unfamiliar with as many as one third of the programs they are asked to rate" (Brooks, 2005: 7). Well-known university brands generate halo effects. One American survey of students found that Princeton was ranked in the top 10 law schools in the country. Princeton did not have a law school (Frank and Cook, 1995: 149)!

A still more fundamental problem is that higher education institutions have different goals and missions, vary profoundly throughout the world, and are internally differentiated. By establishing the Anglo-American science university as the dominant model, the main rankings systems tend to weaken diversity by undermining the prestige of institutions with different purposes: technical and vocational institutions, such as the German *Fachhochschulen* and institutions in Finland, Switzerland, and

France; specialist colleges of all kinds; and institutions everywhere that are primarily oriented to teaching. Even among comprehensive research universities there is much variation in mission, size, scope, and languages of use. This category varies from small establishments focused on graduate education and research in relatively expensive scientific fields to the very large access-based national universities of Mexico and Argentina. There are many institutions in between for which preparation in the professions is at least equally important as the research mission. However, once a rankings system is understood as holistic and reputational, it fosters the illusion of a level playing field, obscuring the specific criteria used to compile the rankings and the identity of the institutions and nations favored by the chosen criteria.

Conclusions

Rankings have discernable effects on behaviors. They generate a strong drive to improve the comparative position. Within national systems, global rankings have prompted a greater emphasis on research concentration and in some cases greater institutional stratification, for example, in China, Germany, and Australia. The European Union has proposed the European Institute of Technology which would draw together existing research bases in a mega-university or network capable of challenging the superior SJTUIHE rankings position of the US universities. Global rankings have stimulated global competition for HiCi researchers and the best younger talent, with likely upward effects on the price of research labor. These responses have both cemented the role of the rankings themselves and intensified competitive pressures in the sector (Marginson and van der Wende, in press).

However, there are continuing doubts about whether interpretations of rankings data are sound and are contributing to ongoing improvements in quality, especially teaching quality. Most problems of interpretation are avoided when it is recognized that all rankings in higher education are partial in coverage, and purpose driven, and rankings data are interpreted in the light of those purposes and limits. However, these restraints are mostly not observed in the public discussion of rankings, where holistic reputational rankings, however flawed, carry greater weight than more valid data.

In 2004, an expert group was established to develop principles on good practice in rankings. This International Ranking Expert Group (IREG) was founded by the United Nations Educational, Scientific and Cultural Organization-European Centre for Higher Education (UNESCO-CEPES) in Bucharest and the Institute for Higher Education Policy in Washington. Together with the CHE, IREG published its Principles on

Ranking of Higher Education institutions in May 2006 (see UNESCO/IHEP, 2006). The Berlin Principles focus on the purposes and goals of ranking, the design and weighting of indicators, the collection and processing of data, and on the presentation of ranking results. They are meant to set a framework for the elaboration and dissemination of rankings, to support the continuous improvement and refinement of methodologies, and to guide those producing rankings in holding themselves accountable for the quality of their data collection, methodology, and dissemination. However, the Berlin Principles do not distinguish good rankings from bad. Perhaps the more promising sign is the emergence of the CHE rankings, which sidestep the problems of reputational league tables and provide the most informative data.

Steering of Higher Education Systems – The Role of the State

K Yokoyama, University of California, Berkeley, California, USA

V L Meek, University of Melbourne, Victoria, Australia

© 2010 Elsevier Ltd. All rights reserved.

Glossary

Neoliberalism – A type of capitalist political philosophy, which emphasizes markets, choice, and competition. It is associated with the theories of Friedrich Hayek, who criticized socialism, statism, and Keynesianism, arguing that the free market mechanism is superior to collectivist planning.

Policy instrument – A method or mechanism used by government, political parties, or individuals to achieve a desired effect through various means.

The Role of the State in Higher Education

The role of the state in higher education is not fixed, but contextual and contingent. It is related to different political, ideological, economic, sociocultural, and historical contexts. Analyses of state/higher education steering relationships are concerned with such concepts as power, legitimacy, influence, ideology, and autonomy.

One of the best-known conceptualizations of the role of the state in higher education coordination is that of the model by Clark (1983). Clark's triangle of coordination of higher education is a heuristic model, incorporating three contrasting forces: state authority, academic oligarchy, and the market. Each corner of the triangle in the model indicates the extreme form of one force and the marginal form of the other two forces. According to Clark, the state is but one force that shapes higher education coordination. Academic oligarchy and the market are also influential – although the ways in which the three forces interact vary according to contexts. The power of the state is, therefore, for Clark, not absolute, but moderated by academic oligarchy and the market.

While Clark's model has been very influential in the study of the coordination of higher education, it tends to ignore two important aspects: the interaction between actors and the state's involvement in the market; and a more pluralistic perspective involving multiple stakeholders. Clark approaches the state, academic oligarchy, and the market as independent actors. However, the market cannot be seen as an actor that is independent of the state since the state controls and conditions the market – for example, by putting a cap on student numbers or

removing it (Olssen and Peters, 2005; Williams, 1995; Yokoyama, 2003).

State actors include central bureaucracies (such as Treasury), specific government agencies, and intermediate bodies (such as former funding councils – Commonwealth Tertiary Education Committee in Australia and University Grant Committee in the UK). The power and influence of these actors wax and wane over time – note the demise of buffer bodies in some countries, mainly due to severe criticism of the efficiency of central state control and the public funding crisis in recent decades. The pattern of state involvement in the coordination of higher education and the policy instruments available to the state through which to effect its involvement (funding, legislation, evaluation, planning, etc.) are influenced by politics, ideology, and the history of specific higher education sectors. For a better understanding of the dynamics of the power relationships between the state and higher education, the way in which particular policy instruments are employed needs to be addressed.

Policy Instruments

Policy instruments are related to the effectiveness of an actor's influence over other actors' decisions and behavior. These are often thought of in terms of degrees of restrictiveness.

The idea of policy instruments has been developed in the areas of public administration and public policy. There is no consensus on the categories of policy instruments in these disciplines. Two scholars of higher education policy, Maassen and van Vught (1994), in reviewing the literature, identify various types of policy instruments (p. 45):

- Prescription, enabling, positive incentives, and deterrence (Bardach, 1979)
- Mandates (providing constraining rules), inducements (providing financial resources to encourage certain activities), capacity (providing financial resources to enable actors to take certain actions), and instruments of system-change (Elmore, 1987; McDonnell, 1988)
- Authority tools, incentive tools, capacity tools, symbolic and hortatory tools, and learning tools (Schneider and Ingram, 1990)
- Information, treasure, authority, and action as government's administrative tools (Hood, 1983).

In the context of higher education, Goedegebuure *et al.* (1994) identify four policy instruments: funding, planning, evaluation, and regulation. Veld *et al.* (1996) highlight the following most usual instruments: regulation, money, and persuasion (pp. 45, 46).

The degree of restrictiveness between instruments is not clear in the context of higher education. Some argue that funding is the most effective instrument. However, funding can be linked to evaluation, as seen in the case of the Research Assessment Exercise (RAE) in England, which indicates the possibility of a combination of different policy instruments. Moreover, the effectiveness of policy instruments is often contextual, influenced by socio-cultural, historical, and political conditions, and, to some degree, contingent. Accordingly, it is a complex task to identify the most restrictive or least restrictive instruments. Nonetheless, understanding the way in which policy instruments are used is useful in the identification of patterns in state steering of higher education systems.

State Steering Models in Higher Education

Governments steer higher education through the use of policy instruments. State steering refers to the “approaches governments use to control and influence specific public sectors, such as higher education” (Gornitzka and Maassen, 2000: 268).

State steering models relate, on the one hand, to state roles and functions, and, on the other, to university autonomy. These models reflect “the efforts of government to steer the decisions and actions of specific societal actors according to the objectives the government has set and by using instruments the government has at its disposal” (van Vught, 1994: 3). They also highlight the importance of institutional context in the policy processes (Gornitzka and Maassen, 2000), which is often related to collegiality and university autonomy. These models largely rely upon theories of organizational governance.

State steering models, according to Gornitzka and Maassen (2000), elucidate the differences between two underlying sets of rules: interaction rules and context rules. The former refers to the “structure [of] the interaction behaviour of actors in a public sector.” The latter is “the way the context in which the interaction takes place is regulated” (p. 268).

There are various ways of depicting how the state goes about coordinating higher education, such as state control models, state regulatory models, or state supervisory models. In this article, the relationships embedded in state steering of higher education are conceptualized as: (1) bilateral; (2) multilateral; and (3) contextual. These models and approaches have been developed mainly at

the Center for Higher Education Policy Studies, University of Twente, the Netherlands.

Bilateral Relationships

Bilateral steering models focus upon two actors: the state and academic professionals or faculty guilds. The state’s actions are often understood as those performed on behalf of society, while self-governance of the academic estate is often linked to the idea of university autonomy. State power is the opposite of universities’ power in the models. The reality is found in the balance between the two. Bilateral steering models are based upon a snapshot of the state/higher education relationship and often lack a historical perspective concerning the transformation of higher education systems.

Van Vught (1989), later with (Neave and van Vught, 1994) and with (Maassen van Vught, 1994), proposes two fundamental models for government regulation of higher education: the model of rational planning and control or the state control model; and the model of self-regulation or the state-supervising model. The former model refers to governmental actors and agencies controlling through stringent rules and an extensive control mechanism, while the latter model relies upon institutional self-regulation. The former is based upon full confidence in the government’s capability to control. It assumes that governmental actors and agencies are capable of acquiring comprehensive knowledge and making the best decisions. The model relies upon the normative ideal of the rationalist perspective of decision making. It was a model found primarily in continental Europe.

The model of self-regulation is in opposition to the state control model. It is based upon the assumption that the devolution of complex decision-making processes to the institutions will bring about robustness, flexibility, and innovation to a significant degree, simultaneously limiting information, administration, and other transaction costs. This model relies upon a cybernetic perspective of decision making and a strategy of self-regulation. The government regards itself as an arbiter who “watches the rules of a game played by relatively autonomous players and who changes these rules when the game is no longer able to lead to satisfactory results” (Maassen and van Vught, 1994: 40). In other words, in this model, the government supervises institutions, which are relatively autonomous, and changes the rules if the result of institutional actions does not fulfill the government’s aims. Self-regulation, however, is not the same as pure market coordination. Van Vught and Maassen argue that the model of rational planning and control tends to go with highly restrictive instruments, while the model of self-regulation fits with the less-restrictive instruments.

Neave and van Vught (1991) suggest bilateral steering models that incorporate contrasting notions of the nation-state: facilitatory states and interventionary states.

The idea of facilitatory states and interventionary states are related to the state-supervising model and the state control model, respectively. They argue that the former suits the characteristics of higher education and promotes diversification and innovation at the institutional level. On the basis of such a theoretical framework, they argue that higher education in Western European countries has shifted from an interventionary state to a facilitatory state, in which procedural autonomy has been extended.

Some of the literature, however, questions the extent to which these dichotomous models reflect the real world. "Especially in Continental Europe the traditional bilateral relationship between higher education and the state is rapidly becoming a multilateral relationship between higher education and various external actors, including the Ministry of Education" (Maassen, 2000: 9).

Multilateral Relationships

Multilateral models of state steering pay attention to the complexity of higher education and not only encompass the rationality-bounded model and institutional self-regulation model, but also highlight the importance of market mechanisms and corporate pluralism in terms of the number of stakeholders involved in the policymaking structure. The elements in multilateral models, therefore, overlap with those in bilateral steering models to a significant degree.

Gornitzka and Maassen's (2000) hybrid steering approach is archetypical of multilateral models. It is based upon Olsen's (1988) four models of state governance and agency autonomy, reinterpreting them in the higher education context. Accordingly, the central concern in their approach relates to the degree of autonomy which government is prepared to allow.

The four models originally proposed by Olsen are based upon organizational theories: the sovereign, rationality-bounded model, institutional state model, corporate-pluralist state model, and supermarket state model. Olsen argues that the relationship between organizational forms and outputs is not simple because organizational forms interact with other variables, modifying the effect of an organizational form from one context to another.

The sovereign, rationality-bounded state model concludes that rationality is problematic because of the limitation of political leaders' time and energy. In this model, leaders choose between tight control of agencies or loose coupling. The former case makes agencies formalistic and lacking in initiative. The latter case enables agencies to pursue self-interest. Higher education in this model is, according to Gornitzka and Maassen, viewed as a political instrument for achieving government goals, and the model emphasizes universities' accountability to political authorities.

The institutional state model sees legitimacy as problematic, assuming that the role of the state is to maintain

norms that are shared by the population and autonomous institutional spheres of society. Agency autonomy is based upon a shared norm about the noninterference of the state. In the higher education context, the model is related to institutional responsibility for the protection of academic values.

The corporate-pluralist state model views power negatively, based upon the assumption that the state is "an area for resolving conflicts between self-interested public and private actors" (Olsen, 1988: 237). The public is considered as one of a variety of self-interested formal organizations. Reorganization is the result of struggles over the control of organizations in constellations of interests, resources, and alliances. Gornitzka and Maassen explore this model in the context of higher education, highlighting a pluralistic point of view which includes multiple stakeholders that shape higher education, such as professional associations, student and staff unions, and industrial and regional authorities.

The supermarket state model is market oriented and involves minimal state control. In this model, the state is viewed as a service provider, with the public as sovereign consumers.

The models outlined above are useful for categorizing state/higher education relationships at a particular point in time. However, they have little or nothing to say about the factors that bring these relationships into being. For causal models of state steering of higher education, we need to look more carefully at contextual variables, including the history of particular higher education systems.

Contextual Relationships

In contrast to the above models, historical, contextual approaches to state steering rely upon theoretical analysis in context. They highlight the transformation from bureaucratic control of higher education to market or market-like coordination, and in the case of Meek's (2002) approach, new coordination approaches in the post-marketization era. Market coordination is based upon the assumption that market forces lead to cost effectiveness, better management, and responsiveness to clients' demands.

Neave's (1988, 1998) evaluative state thesis offers a comparative, historical perspective, emphasizing the importance of how various policy instruments are used. The concept of an evaluative state subsumes Neave's previous work on state control and university autonomy. He argues that government regulation of universities in Western European countries has, since the mid-1980s, stressed efficiency and client responsiveness through increasing use of performance-based evaluation and output-based funding. According to Neave, the shift in the mode of state regulation toward a lighter form of surveillance and the rise of the evaluative state are the result of the government's increasing demands for greater quality and

institutional efficiency, coupled with the introduction of market mechanisms as the supreme regulating principle for higher education.

The underlying philosophy of Neave's evaluative state thesis is neoliberalism, which emphasizes market supremacy within an overall context of continuity of state power. The concept of the evaluative state is antithetical to that of bureaucratization.

The difference between the evaluative state thesis and the bilateral and multilateral state steering models introduced above relates to their respective emphasis on the patterns of macro-management defining the relationship between the state and individual institutions. The difference between them is that the evaluative state highlights the contractual relationship between the state and the universities. In addition, rather than focusing on the degree of state power, the evaluative state thesis identifies particular types of policy instruments and how they have changed from a routine verification and maintenance mode, which was based upon the instruments of guideline laws, decrees, and circulars, to a *a posteriori* evaluation and funding (e.g., performance indicators, quality indices, and standards through benchmarking).

Some scholars have examined the feasibility of the evaluative state thesis as well as contextualized it. For instance, Dill (1998), in evaluating the evaluative state thesis through focusing upon agency theory points out two technical problems in the evaluative state model in relation to the function of public authorities: (1) the principal or evaluative body may be inefficient, caused by ambiguity in the quality measurement of academic output; and (2) the high cost of the state's performance measurement in the evaluatory mode, compared to other instruments such as market competition and professional control.

Meek (2002) questions the usefulness of drawing a strict dichotomy between market steering and centralized state control of higher education. He stresses that the reality is found in the balance between bureaucratic control and market coordination, or between centralized funding and planning, and institutional autonomy. Meek also identifies the negative effects of market coordination and argues that the market may be a greater threat to academic freedom and university autonomy than state bureaucratic control.

Meek identifies two stages in the recent changes to higher education coordination. The first is the shift from state regulation to markets, competition, and entrepreneurship as the result of failure in public policy and bureaucratic controls. The second, which offers a new perspective in the study of state steering in higher education, is the return to state regulation as the result of market failure in achieving the goals and aims of higher education in many countries. New Zealand is a case where the state has backed away from market coordination, reintroducing a buffer body.

There appears to be a movement back and forth between state regulation and market coordination brought about by the continuing attempt to find a proper balance between the two.

The significance of Meek's argument can also be found in his clear identification of the roles of intermediary bodies. He argues that governments have stopped using intermediary bodies – which used to protect the interests of higher education institutions – to regulate higher education in countries such as Australia (not in India and Hong Kong) in favor of market-oriented coordination. The United Kingdom also falls into this category since the nature of the funding councils has changed from being a buffer to being a government agency. It appears that the main reason for this change was the government's desire to directly manage higher education, making higher education institutions more accountable to the state and society as a whole, as well as making higher education contribute more directly to economic growth. In continental European countries and Japan, opposite trends are observed, moving in the direction of steering at a distance, emphasizing deregulation and quality control. Important national differences in state steering models remain.

Conclusion

Neoliberal political ideology underpins much of the recent change to state steering of higher education. For example, the neoliberal political philosophy, with its emphasis on the market and light state surveillance, is clearly evident in both the supermarket and evaluative state models. The supermarket and evaluative state models emphasize the state's supervisory function without tight, detailed control of institutions, as well as the self-regulatory nature of higher education institutions based on strong executive leadership and the efficiency of resource utilization and management. These models and approaches are to a significant degree illustrative of current higher education trends in Australia, Western Europe, and Japan. The state's roles in the evaluative state model, in theory, encapsulate the idea of the separation of funder and provider, and policy and delivery.

The evaluative state thesis identifies evaluation – in particular, output rather than input and process quality control – as the government's main policy instrument in the postroutine evaluation regime and in the context of scarce public resources. A *a posteriori* evaluation as well as financial incentives are common policy instruments currently in use in Western European countries and Japan. In this respect, it can be argued that the higher education systems in these countries are converging on the evaluative state model.

The higher education system can be understood as a subsystem of the nation-state system. It can also be

understood as a part of a state education system – which is “a nationwide and differentiated collection of institutions devoted to formal education, whose overall control and supervision is at least partly governmental, and whose component parts and processes are related to one another” (Archer, 1984: 19) – regardless of whether individual institutions are public or private. However, challenge to traditional state steering models and approaches in higher education have also arisen from new global and regional trends, such as the Bologna process. Meek (2002) identifies the global dimension – including international higher education consortia such as Universities 21 (a network of 18 leading research universities in ten countries) and supranational coordination authorities such as the United Nations Educational, Scientific and Cultural Organization (UNESCO), the World Bank, and the European Union – and attempts to incorporate it into the concept of higher education coordination. These supranational actors and agreements affect the choices which government can make, which in turn changes the mode of higher education coordination.

In the final analysis, the steering of higher education is observed within the nation-state system. The role of the state has been modified by various forces and trends and is not the same in all countries. However, in the end, it is the state that is supreme. For example, education and training fall under the principle of subsidiarity in the European Union. The Bologna Declaration, which is a multinational agreement initiated by education ministers of individual countries, relies upon its implementation by the government of each nation-state. The steering of higher education remains the state’s prerogative, with the exact form that steering assumes being dependent on a variety of national political and ideological factors.

Student and Faculty Transnational Mobility in Higher Education

U Lanzendorf and B M Kehm, University of Kassel, Kassel, Germany

Introduction – History and Typology

Student and faculty transnational mobility is defined as the crossing of national borders for the purpose of studying or teaching in higher education or engaging in research abroad. Academic mobility will be used here as a generic term referring to both groups of participants (students and faculty).

Historically, the golden age of academic mobility was the Middle Ages when nation-states did not exist. There were only a limited number of cosmopolitan universities across Christian Europe which adhered to similar study programs taught in Latin. This enabled students and faculty to gain academic experience at different institutions across the region. One of the best-known wandering scholars of that time, Erasmus of Rotterdam, later gave his name to the largest European support program for academic mobility and cooperation (ERASMUS which is also the acronym for European Community Action Scheme for the Mobility of University Students).

Contemporary forms of academic mobility go back to the 1920s (United States) and to the period after World War II (Europe). Different development phases can be distinguished for the United States and Europe, which are the traditional geographical foci of transnational student flows (Baron, 1993; Briggs and Burn, 1985; de Wit, 2002).

The first phase, which lasted until the mid-1970s, was dominated by one-way student flows from countries with less-developed higher education systems to countries where higher education was well developed. Mainly, students from the South went to a limited number of countries in the North, namely the United States, France, the USSR, Germany, the UK, Canada, and Italy. Teichler refers to this type of student mobility as vertical (Teichler and Jahr, 2001: 443). Since the objective of vertically mobile students is usually to obtain a degree abroad, this type of mobility is also referred to as degree mobility.

Among the countries with well-developed higher education, study experiences abroad were actively promoted primarily in the US. Already since the 1920s, the so-called junior year abroad provided third-year undergraduate students with an intercultural experience and helped to strengthen their foreign-language proficiency. It is organized by the home universities of participating students, which often have branch campuses abroad so that mobile students do not necessarily have to be affiliated to a foreign institution of higher learning.

National education and immigration policies have been important enabling or limiting factors for student mobility from its inception. During the first development phase, host countries valued foreign students as future contacts for the promotion of their political or economic interests abroad. Their policy of open doors' was an element of foreign policy and initially enabled high growth rates of inbound student flows. Later, host countries brought this trend to a halt by strategically regulating and partly restricting student influx, for example, by setting quotas by field of study, imposing high entrance qualifications, increasing study fees for foreign students, or making visa regulations stricter.

In the second development phase of academic mobility (mid-1970s to 1987), political strategies to guide transnational student mobility became more elaborate and students from countries with well-developed higher education systems increasingly participated. In Europe, the promotion of study abroad displaced the regulation of foreign-student inflow at the top of the political agenda. The ideas of student exchange and intercultural learning gained ground and complemented the traditional search for learning opportunities by students from underprivileged world regions as determinants of transnational student flows. The most important destination of intra-European mobility at that time was the United Kingdom. Student mobility between similarly developed national higher education systems has been called horizontal (Teichler and Jahr, 2001: 443) or temporary, the latter term referring to the fact that students did not want to obtain a degree abroad, but only to spend part of their study program at a foreign higher education institution. With the expansion of this type of mobility, the recognition of learning abroad by the home institutions of mobile students became a relevant topic.

Another new element of the second phase was the systematic promotion of faculty mobility in Europe. In fact, a support scheme for the mobility of university teaching staff was the first element of supranational mobility policies introduced under the objective of regional integration. In 1976, the European Commission established the Joint Study Programme to support international faculty contacts and stimulate joint curriculum development. Soon after, however, financial support was focused on the promotion of student and teacher mobility because these activities seemed to be more visible for a broad public. The idea developed to offer students the possibility to participate in organized study-abroad programs – a strategy which

resembled the longer-standing practice of American universities. Finally, in 1984, a specific budget line for student mobility grants was introduced into the Joint Study Programme. With this measure, the European Commission took the European lead in the promotion of academic mobility.

The third phase in the development of academic mobility started with the introduction of the European support program for horizontal academic mobility called ERASMUS in 1987 and lasted until 1999. ERASMUS stands for the strategic supranational support of student and faculty mobility within the context of regional integration in Europe (see, e.g., Smith, 1996) and complements national schemes for academic mobility. With respect to student mobility, its objective was to make study periods at foreign universities attractive by providing grants that covered the additional costs of study abroad and promoting the support of mobile students with respect to admission procedures and accommodation abroad, health insurance, and academic recognition upon return to the home university. As a new subcategory of transnational student mobility, self-organized versus organized mobility became relevant. Students who did not participate in a particular scheme but organized their study abroad period themselves came to be called free movers. The length of ERASMUS study abroad periods is between 6 months and 1 year. They are explicitly intended to serve higher education in addition to linguistic and intercultural learning. Apart from student mobility, ERASMUS also supports teaching periods at foreign partner universities for faculty. It is expected that faculty mobility provides new learning experiences to students and stimulates joint curriculum development and internationally integrated study programs of which student mobility is an essential part. The immediate objective of ERASMUS was the promotion of mutual understanding and interaction between national higher education systems in Europe. This, however, contributed to a so-called provocation of national systems – discussions on alternative ways of organizing higher education were stimulated – and can therefore be assumed as indirectly having paved the way for policies of structural convergence in European higher education (Wächter, 1996).

Especially after the Treaty of Maastricht had created a legal basis for the European Commission's activities in higher education in 1992, academic mobility was the nucleus of comprehensive Europeanization policies in higher education. As from 1996, ERASMUS was integrated into the newly set up umbrella program SOCRATES which, up to 2006, promoted Europeanization in the fields of higher education, school education, and continuing/adult education. Concomitantly, the support for student mobility and cooperation was substantially increased and the development of internationalization strategies by universities was introduced as a new element of the ERASMUS program. Another new policy objective was to make

the nonmobile higher education students benefit from Europeanization by stimulating internationalization at home. Successively, the number of countries participating in SOCRATES increased beyond the European Union (EU) member states. In 2007, 31 countries were eligible for program funding.

For Europe, a fourth phase can be identified, starting with the Bologna Declaration in 1999 and running until the present. The so-called Bologna Process was initiated by the self-commitment of the ministers of education of 29 EU member states to work toward a structural harmonization of their national higher education systems. The core element of reform is the change to a tiered system of study programs and degrees (bachelor and master) in all signatory states of the Bologna Declaration (by 2007 their number had grown to 45). Thus, national governments may be regarded as finalizing the process of integration in European higher education which had initially been started by the European Commission. The Bologna Process aims to create a European Higher Education Area by 2010 to enable European students to change countries during their course of study without facing problems of recognition of prior learning. In this context, the development of joint or double-degree programs organized in cooperation with universities located in different countries receives particular attention. In recent years, the topics of quality assurance, academic recognition, and doctoral education have been added to the Bologna policy agenda. The European Higher Education Area is expected to significantly increase the visibility and attractiveness of European universities to students from the Third World countries.

In the US, the terrorist attacks of September 2001 triggered substantial changes in the conditions for student and faculty mobility. Government regulations regarding visas and reporting obligations to government agencies became stricter, and international students were charged new types of fees (Altbach, 2004). Recently, US policy toward transnational student mobility has outlined a future focus on study abroad (Senator Paul Simon Study Abroad Act of 2007). The aim is to set up a national study-abroad program in order to significantly increase the transnational mobility of national students so as to make study abroad the routine, rather than the exception, and reach participation of at least 1 million American students each year within 10 years. Particular emphasis is laid on the necessity to direct more students to nontraditional destination countries.

Statistical Overview – Patterns and Trends

The global pattern of student mobility is relatively well documented by the United Nations Educational, Scientific

and Cultural Organization's (UNESCO) annual compilation of national enrolment data which covers nearly all countries in the world. With respect to faculty mobility, however, data are scarce. The only internationally comparative statistical reference is provided by figures on the participation in short-term ERASMUS teaching assignments abroad. Further data are available from national surveys, regularly conducted, for example, in the US or Germany. They are, however, not comparable between countries and primarily address the mobility of scholars for purposes of research.

Student Mobility

According to UNESCO statistics, there were some 2.5 million mobile tertiary education students worldwide in 2004 (UNESCO, 2006). This figure excludes students who are enrolled outside their country of permanent residence for up to one academic year. However, participation figures in temporary, that is, nondegree, mobility are comparatively small. In 2004/05, just over 200 000 study-abroad students from the US received academic credit after returning to their home institution (Koh Chin and Bhandari, 2006). In addition, there were about 145 000 ERASMUS students, and a modest number of temporary mobile students supported by programs funded by individual European countries (Maiworm and Wächter, 2006).

Since 1975, when internationally comparative data became available, worldwide participation in student mobility has more than tripled. The sharpest rise ever in foreign student numbers took place at the beginning of the twenty-first century. Comparing figures for 1999 with those of 2004, a 41% increase can be observed (UNESCO, 2006: 34). However, the growth rates of student mobility have always been roughly in line with the overall increase in participation in higher education. Only recently has the actual share of transnationally mobile students among the total number of tertiary education students slightly increased. Scenarios on the future growth of the worldwide demand for international higher education have been presented by an Australian study (Böhm *et al.*, 2002). International higher education involves student mobility and may also be provided by foreign institutions in the students' home countries. The study came to the conclusion that the demand for international education will at least double between 2000 and 2015 and double again by 2025 to reach more than 7 million students.

What is the current structure of student mobility? In 2004, the pattern of outbound student flows was as follows:

- UNESCO statistics show that almost 30% of students spending more than 1 year abroad came from East Asia and the Pacific. Almost half of these (nearly 350 000) came from China alone. The second most important

region of origin is Western Europe, sending nearly 20% of worldwide mobile students (roughly 400 000). Student mobility from East Asia and the Pacific is increasing, whereas participation from Western Europe is stagnating. The third most important sending region is Central and Eastern Europe with 12% of all mobile students on a worldwide scale (just below 300 000 students).

- The major individual sending country is China (sending 14% of worldwide mobile students), followed by India (5%), the Republic of Korea (4%), Japan (2.5%), and Germany (2%).
- The overwhelming majority of mobile students from Western Europe (77 %) remains within this region. With about 40%, the proportions of students from North America or East Asia and the Pacific staying within their regions are also high.
- Notably, the share of outgoing students among all tertiary students is lowest in the United States (0.2%), whereas the countries of sub-Saharan Africa on average have by far the highest share of tertiary students learning abroad for more than 1 year (6 %) (UNESCO, 2006: 37). Yet, the fact that in Western Europe the share of tertiary students enrolled abroad also surpasses the worldwide average shows that it is not only a low development status of higher education which makes large numbers of students decide to study abroad. Further, it is interesting to note that in East Asia and the Pacific the proportion of students enrolled abroad among all tertiary education students is close to the global average. Obviously, Asian students are not particularly inclined to study abroad, although a very high absolute number of transnationally mobile students come from Asia.

For inbound mobility, the following aspects are noteworthy:

- Western Europe and North America stand out as the most important destinations of transnationally mobile students, currently attracting 44% and 25% of worldwide mobile students, respectively. Another 15% decide to study in East Asia and the Pacific. (It must be noted that data for Western Europe tend to overestimate inbound student mobility because they refer to students with foreign nationalities, a relevant number of who live permanently in their country of study (about 32% in Spain, 23% in the UK, and 16% in Germany. See Lanzendorf, 2006a).)
- The most important individual target country of mobile students in the world is the United States, with 23% of mobile students. The next four most frequent study destinations each account for a maximum of about half the US American share in worldwide student flows: The United Kingdom (12%), Germany (11%), France (10%), and Australia (7%). Together, the five

major destination countries attract 62% of mobile students worldwide. Among the developing countries, South Africa and Malaysia host substantial numbers of incoming students. They benefited from the recent expansion of mobile student numbers, whereas international student enrolment in the US has not grown since the academic year 2002/03 (Koh Chin and Bhandari, 2006). This is probably due to stricter access regulations after the events of 11 September 2001.

- For the United States, the structure of inbound student mobility is rather well documented in the annual Open Doors report (Koh Chin and Bhandari, 2006). Data show that incoming graduate students have slightly outnumbered incoming undergraduate students since the beginning of this century. The most frequent field of study of inbound mobile students is business and management (about 18% of all international students), closely followed by engineering (about 16%).
- In Europe, many national higher education systems traditionally have a single-tier study structure. It will therefore only be possible to distinguish undergraduate from graduate inbound mobility after the implementation of the Bologna goals which envisage a common two-tier structure. ERASMUS statistics show that most temporary mobile students in Europe come from business studies (more than one-fifth). The second and third most highly represented fields of study are the social sciences and engineering/technology (about 11% each).
- In Germany, students from economic fields comprised 16% of nonpermanent resident students in 2005 (Deutscher Akademischer Austauschdienst and HIS 2006). The next most frequent subjects are German and informatics (about 9% of non permanent resident students each). They are closely followed by electrical engineering and mechanical and process engineering. The social sciences do not figure among the ten most often represented fields of study.
- For some target countries, foreign students – who do not necessarily have to be inbound mobile students – make up significant shares of all tertiary students. Particularly high percentages of foreign students among all tertiary students can be observed for Switzerland (18%), Australia (17%), Austria (14%), New Zealand, the UK (13% each), France, and Germany (11% each) (UNESCO, 2006: 48).

Faculty Mobility

Faculty mobility is statistically documented for the US, Germany, and for the ERASMUS program. In the US, available data refer to inbound mobile academics at doctoral-degree-granting institutions (Koh Chin and Bhandari, 2006). Of almost 97 000 incoming scientists

and scholars in 2005/06, the overwhelming majority primarily engaged in research. Only less than 20% (nearly 20 000 scholars) came either for teaching (12%) or for teaching and research purposes (7.3%). The overall number of incoming academics has steadily increased since the beginning of the 1990s, and the trend shows a slight increase in the share of scholars with teaching only functions. Of all incoming academics, most originate from China (nearly 20%), Korea, and India (9% each). In 2005/06, the life and biological sciences were represented most often, followed by the health sciences (23% and 20%, respectively). The two fields, physical sciences and engineering, accounted for over 10%. Other fields of specialization had only marginal relevance.

For Germany, data on inbound and outbound research mobility supported of (post-)doctoral researchers and senior faculty are available (Deutscher Akademischer Austauschdienst and HIS, 2006). They are, however, limited to the participation in major national support programs. In 2004, nearly 21 000 incoming researchers and over 4000 outgoing researchers received support. Among the incoming researchers, about 50% were doctoral students or graduate students pursuing a research project, and among the outgoing researchers almost two-thirds belonged to this group. The absolute number of outgoing researchers has clearly been decreasing in recent years. The number of incoming researchers, however, has shown a slight increase. The majority of mobile researchers came from science and engineering fields.

Within ERASMUS, more than 20 000 teachers taught temporarily in another of the 31 countries participating in the SOCRATES program in 2004/05. The largest number of ERASMUS teachers came from Germany (about 13%, corresponding to about 2% of academic faculty at German universities). Spain and France were the next two major sending countries, accounting for about 11% each of overall faculty participation in SOCRATES/ERASMUS. Germany, France and Italy, followed very closely by Spain, were also the major destinations of ERASMUS teaching staff mobility. Teaching periods abroad lasted on average about 1 week with at least 8 h teaching. Teaching staff mobility is most frequent in languages and philological sciences as well as in engineering/technology with about 15% and 14% of participants, respectively. Business studies come third. However, this field of study comes first among outward faculty flows from Central and Eastern European countries (about 19%).

Perspectives of Students and Governments and Impacts of Academic Mobility

Students studying for a degree abroad usually expect that the foreign degree will open up opportunities for

obtaining a good job in their home country or abroad. The selection of a host country is based on criteria such as language, admission practices, study costs, reputation of a higher education system or specific subjects, and general living conditions abroad, including attitudes toward foreign students. As demonstrated by large student flows between countries with identical or similar languages or neighboring countries, many mobile students prefer to study in cultural contexts with which they are familiar (see, e.g., Lanzendorf, 2006b).

A recent study carried out on behalf of the European Commission provides insights into the criteria applied by students in Brazil, China, India, Mexico, Russia, and Thailand when planning to study abroad (Wächter and Maiworm, 2006). In 2004, a survey was conducted among nearly 20 000 students from these six countries. They were asked to provide information about their motivation for planning international mobility and their perception of European higher education. The results of the survey show that they consider the master's level to be the most appropriate period for going abroad. Their most frequent general motivation was to experience new ways of thinking and acting in their field of study (88%). Furthermore, they hoped to improve their opportunities for an international career or a career in their home country, to improve their language skills (81% each), and to have an opportunity for personal development (76%). In contrast, limited access to high-quality education at home or a lack of opportunities to specialize in a particular subject area were of minor importance (Wächter and Maiworm, 2006: 169). The students surveyed considered the worldwide recognition of degrees from a country and the prestige and quality of an institution as the major criteria in selecting the host country for their study-abroad period (Wächter and Maiworm, 2006: 180). Students notably looked for specific and high-quality provisions in their area of specialization and an up-to-date and well-managed institution with a high standing and affordable fees. As major obstacles and problems, more than 50% of the students surveyed quoted insufficient financial resources. Immigration regulations and language preparation were also mentioned as problematic aspects.

It is widely assumed that a substantial proportion of internationally mobile students intend to live and work abroad, possibly in the host country of study, after graduation. However, little is known about the share of foreign graduates who do not go back to their home countries. Suter and Jandl (2006: 8) provide some information. According to them, for Canada, survey data suggest that between 15% and 20% of students from abroad on average do not return to their home countries after graduation. In Norway, about 18% of non-European students stay in the country. In the UK, the retention rate for students from European countries is particularly high, that is, about 27% in 2005.

Students' motivations and expectations with respect to nondegree mobility have been relatively well investigated. Comprehensive information is available from evaluation studies on the ERASMUS program. The most recent survey among former ERASMUS students from all countries participating in the program – the ERASMUS 2000 study – referred to mobile students and faculty of the 1998/99 academic year. With respect to students' motives for spending a study period at a foreign university, it was found that a number of different aspects were important, that is, improvement of foreign-language proficiency, self-development, academic learning experience, the wish to travel, and better opportunities for future professional development (Maiworm and Teichler, 2002: 87). Some variations could be observed for different fields of study. Academic and educational matters were especially salient for students in the fields of agriculture, architecture, fine arts, and mathematics. For students of education, cultural reasons were particularly relevant. Students of economics had a particular interest in career advancement. The overwhelming majority of participating students had already spent a minimum of one period abroad of at least 1-month duration before going abroad with ERASMUS (Maiworm and Teichler, 2002: 87).

With respect to the perceived impact of temporary ERASMUS study abroad, a general finding is that students regard academic matters highly, but observe more impressive advancement in foreign-language proficiency, personality development, and career enhancement. This picture differs only moderately according to students' home countries. The relatively cautious ratings of academic progress could be explained by students taking this kind of success largely for granted and being more excited about other learning experiences. This interpretation is substantiated by the finding that more than 50% of the students who were surveyed in the ERASMUS 2000 study rated their academic progress abroad more highly than what they would have expected for a corresponding period at home. Only 18% of the 1998/99 students thought that they made less academic progress abroad than at home (Maiworm and Teichler, 2002: 110). In addition, according to the ERASMUS 2000 study, about 80% of mobile students were either granted credit for study abroad or their study achievements were otherwise considered equivalent to requirements of their home program by their home institution. Almost 60% of the courses recognized upon return were recognized as equivalent to mandatory courses at home (Maiworm and Teichler, 2002: 109). Irrespective of this positive finding, more than 50% the 1998/99 ERASMUS students surveyed expected to need more time to graduate than would have been necessary had they not gone abroad. They estimated that their overall period of study would be prolonged by more than half the duration of their study-abroad period.

Recent research on the professional impact of ERASMUS-supported study-abroad periods across

graduates from all participating countries suggests that the relevance of temporary study abroad to obtain the first job and its perceived positive impact on the type of work and income had decreased during the last decade (Bracht *et al.*, 2006). In a first survey among former ERASMUS students who had been employed up to 3 years, in 1993, 71% of respondents believed that the period abroad had been helpful in obtaining the first job. In a subsequent survey of the year 2000, this figure decreased to 66%, and in the most recent study conducted in 2005, only 54% of graduates surveyed perceived a positive outcome in this respect. A positive impact on the type of work and the income level has always been recorded by a minority of former ERASMUS students. In 1993, 49% perceived a positive impact on the type of work and 25% on income; the respective figures 12 years later were 39% and 16%. These findings could reflect that international experience was becoming a less-exceptional asset with globalization. The authors of the survey called it a “gradual decline of the uniqueness of the ERASMUS experience” (Bracht *et al.*, 2006: xxiv).

A survey of about 20 000 academic staff in 14 countries conducted in the mid-1990s revealed that highly research active faculty were more inclined toward international activities than those with a preference for teaching (Welch, 1997). Surveys of former ERASMUS teachers point in a similar direction. They come to the conclusion that academic activity abroad is particularly relevant for expanding research contacts. In the most recent one, the improvement of research contacts was more often stated as a positive impact of temporary teaching abroad than the improvement of teaching and the development of new teaching methods (Bracht *et al.*, 2006). In general, former ERASMUS teachers found a particularly positive impact of short-term teaching stays abroad on their intercultural understanding and the breadth of their academic knowledge. With respect to individual career prospects, however, they did not have an impression of benefit. Overall, the most recent study comes to the conclusion that the professional impact of 1-week faculty assignments abroad is impressively high. It is particularly high for faculty from Central and Eastern European countries (Bracht *et al.*, 2006).

National governments and international organizations support student mobility for various reasons. At the national level, human capital development plays a major role. Mobile students are expected to acquire competences which they would not develop if they did not go abroad. Whereas brain drain is a major concern of countries sending large numbers of students abroad, host countries increasingly develop brain-gain strategies. As Suter and Jandl (2006) report, European countries and, for example, New Zealand have introduced policies to facilitate the integration of international graduates in the home labor market. In the US and Canada, providing such options is already a long-standing practice. On the contrary, for other

industrialized countries, it can be observed that scholarships for students from the South increasingly require that students must return to their home country or else reimburse the scholarship after finishing their studies. As stated above, at the European level, student mobility is viewed as contributing to regional integration.

Outlook

Recent policy initiatives in the US and in Europe suggest that major developments can be expected in the field of academic mobility, especially concerning student mobility. The US initiative to reach 1 million study-abroad students per year has the potential to fundamentally alter the global picture of student flows. If it reaches its ambitious objectives, it will substantially increase the weight of short-term, nondegree mobility and of student flows from the North to the South.

In Europe, the introduction of a system of tiered study programs and degrees according to the bachelor and master model has led to concerns that mobility could decrease because the new study programs are shorter, are structured in a more rigorous way, and – at least at the bachelor level – frequently have very dense curricula. A recent study (Bürger *et al.*, 2006) tried to answer the question for German students whether the new tiered study programs would discourage them from temporary study abroad with ERASMUS. The results of the study showed that the new study programs did not discourage mobility *per se* but that greater efforts had to be made in the accompanying measures, that is, information and advice, integration of study abroad into the curriculum, learning agreements for study abroad, recognition, and contacts between home and host institution. The study was also able to show an emerging trend toward more degree mobility, that is, going abroad for a whole program (mostly for a master’s degree) rather than just spending a temporary period abroad within an ongoing program. In order to substantially increase the number of European higher education graduates who have experienced foreign teaching and learning cultures, the feeling is that alternative means to student mobility must be further developed; especially the internationalization of teaching at home deserves more attention.

On a global scale, discussions on the future of academic mobility are increasingly shaped by issues of transnational education. Universities from countries with well-developed higher education systems export their study programs to countries where the national demand for study places cannot be met by local institutions. Thus, students in these countries do not necessarily have to go abroad any more to study for a foreign degree. The spread of transnational education is expected to complement rather than to lower participation in transnational student

mobility. However, it does lead to a new need for faculty mobility insofar as mother universities are involved in the teaching and quality assurance of their programs abroad.

A further trend to be noted is that international competition becomes increasingly complementary to intercultural learning and cooperation as rationales for the political support of academic mobility. In the context of globalization, national higher education policies increasingly stress the relevance of generating an additional institutional income by promoting the enrolment of foreign students and gaining competitive advantages by attracting and keeping best talent from abroad. In most European countries, for example, universities are keen to develop English-language-taught degree programs, particularly at the master and doctoral level to attract students from abroad. Through its openness and – in many countries – comparatively modest tuition fees, Europe as a study destination is becoming more and more of a competitor to the US. In parallel, however, new destination countries of transnational student mobility such as South Africa or Malaysia emerge.

The Bologna Process in European Higher Education

D Rich, University of Tasmania, Launceston, TAS, Australia

© 2010 Elsevier Ltd. All rights reserved.

The overall aim of the Bologna Process is to modernize European higher education and encourage the development of a high-quality, internationally competitive system. By 2010, it will create a European higher education area (EHEA) that will:

1. facilitate mobility of students, graduates, and higher education staff;
2. prepare students for their future careers and for life as active citizens in democratic societies, and support their personal development; and
3. offer broad access to high-quality higher education, based on democratic principles and academic freedom.

The intention is to allow the diversity of national systems and universities to be maintained while the EHEA increases comparability and compatibility between systems and institutions and enhances their quality. The approach is not to mandate harmonization in the sense of imposing a single common approach, but to provide a means of connecting varying national systems.

Launched as the Bologna Process in 1999 by ministers for education and university leaders from 29 countries, by 2008, some 46 countries participated, extending from Portugal and Iceland in the west to the Russian Federation and Azerbaijan in the east (see **Table 1**). All are party to the European Cultural Convention and are committed to the goals of the EHEA. Importantly, the Bologna Process is not a European Union (EU) process: the EU does not have authority over higher education and the EHEA extends well beyond EU boundaries. Participation in the process is a voluntary decision made by each country and its higher education stakeholders, and there is no legally binding treaty or regulation. All stakeholders, including national governments, universities, employers, students, and quality agencies, are involved in the decision-making process. A key to success is the close cooperation between all parties.

The Bologna Process has stimulated sweeping reforms in higher education across much of Europe at the level of national systems and individual institutions. Due to the sheer size of the enterprise – involving 46 countries, 5600 tertiary-education institutions, and 31 million students – as well as deliberate attempts to engage with higher education outside of Europe, there is the potential, over time, to induce major changes in higher education across most of the globe.

Evolution

The Bologna Process has long historical underpinnings, with its roots in post-World War II efforts to create institutions to guarantee freedom and democracy in Europe. It builds on fundamental principles laid down in the *Bologna Magna Charta Universitatum Europaeum*. This document was signed by the heads of 430 universities in 1988 at a ceremony marking the 900th anniversary of the University of Bologna, widely recognized as the progenitor of the modern university. The Magna Charta, since signed by another 400 universities, affirmed the autonomy of universities, the essential link between teaching and research, and the transcendence of limits imposed by geographical and political boundaries.

A more immediate precursor was the Sorbonne Declaration, adopted by France, Germany, Italy, and the United Kingdom in 1998. Underpinned by a belief in the importance of education and educational cooperation in the development and strengthening of stable, peaceful, and democratic societies and universities' central role in the cultural development of Europe, the Declaration proposed the creation of an EHEA as a key means to promote the mobility and employability of citizens and the overall development of the continent.

The Bologna Declaration of 19 June 1999 reaffirmed support for the values reflected in the Magna Charta and the general principles laid down at the Sorbonne. It committed signatories to achieve, within the first decade of the third millennium, six objectives considered to be of primary relevance in establishing the EHEA and in promoting the European system of education worldwide:

1. adoption of a system of easily readable and comparable degrees;
2. adoption of a system based essentially on two cycles of higher education, undergraduate and postgraduate. The former would require at least 3 years of study and would be a qualification relevant to the European labor market; access to the second would require successful completion of the first and would lead to a master and/or doctoral degree;
3. establishment of a system of credits to indicate studies completed as a means of supporting student mobility;
4. promotion of mobility by removing obstacles to free movement of students, teachers, researchers, and administrative staff;

5. promotion of cooperation in quality assurance with a view to develop comparable criteria and methodologies across Europe; and
6. promotion of European dimensions of higher education, particularly with respect to curriculum development, interinstitutional cooperation, mobility schemes, and integrated programs of study, training, and research.

Since the signing of the Bologna Declaration, the Bologna Process has evolved in many directions: modification and extension of the initial objectives; increases in the number of signatory countries and expansion of participants to include a number of European-level institutions; development of links with other European processes, particularly those related to vocational education and training; and efforts to build links beyond Europe.

Supporting Structures

Decision making in the Bologna Process is carried out intergovernmentally; it is not administered by the European Commission. Decisions are reached by the consensus of the ministers for higher education of the countries involved, an approach that is designed to recognize the diversity of higher education systems across Europe.

The key forum in the decision-making process is the 2-yearly ministerial review meetings, where ministers in charge of higher education meet to assess progress and determine next steps. Meetings have occurred successively in Prague (2001), Berlin (2003), Bergen (2005), London (2007), and Leuven/Louvain-la-Neuve (2009). An extraordinary summit will occur in Vienna and Budapest in 2010 to mark the culmination of the process and the creation of the EHEA.

Ministerial meetings are supported by two groups, the Bologna Follow-Up Group and the Bologna Process Board. Both are administered and supported by the Bologna Secretariat, drawn largely from the next nation to host the ministerial meeting.

The Bologna Follow-Up Group consists of ministerial representatives from all participating countries as well as representatives of other European-level organizations, including: the European Commission, European University Association (EUA), European Students' Association (ESA), European Association of Quality Assurance in Higher Education (ENQA), European Association of Institutions in Higher Education (EURASHE), the Council of Europe, the United Nations Educational, Scientific and Cultural Organisation European Centre for Higher Education (UNESCO-CEPES), the Education International Pan-European Structure and the Union of Industrial and Employers' Confederations (renamed BUSINESSEUROPE in 2007). The group's role is to follow up on the recommendations made at ministerial

meetings. It produces a work program of events, projects, and working-group activity on specific aspects of the Bologna Process.

The Bologna Board is smaller. It consists of representatives of the previous and forthcoming ministerial summits, and representatives of the previous, current, and succeeding European presidencies, the European Commission, the European-level organizations participating in the Follow-Up Group, and of two non-European countries. The board is chaired by the host of the next ministerial meeting.

In addition, numerous seminars, conferences, and meetings are convened, carrying the unofficial title of Bologna Seminars. These discuss various aspects of the Bologna Process, obstacles to implementation, and opportunities for cooperation. These occur at a variety of levels from pan-European, through national, down to institutional scales. While not formally part of the Bologna support structure, in many cases they play an important part in translating European objectives and priorities into local actions via planning and implementation at the national and institutional levels.

Key Priorities and Outcomes

After a decade of debate, negotiation, and reflections on practical experience, the Bologna Process identified ten so-called action lines required to establish an EHEA in 2010. These build on, and in some cases modify, the original six priorities:

- adoption of a system of easily readable and comparable degrees;
- adoption of a system based on three cycles of higher education, undergraduate, master, and doctoral;
- establishment of a system of credits;
- promotion of mobility;
- promotion of European cooperation in quality assurance;
- promotion of the European dimension in higher education;
- focus on lifelong learning;
- inclusion of higher education institutions and students;
- promotion of the attractiveness of the EHEA; and
- doctoral studies and the synergy between the EHEA and the European Research Area.

The Bologna Process has brought particularly significant changes in three areas, which are detailed below.

Three Cycles of Higher Education

Until the Bologna Process, every European country had its own degree structures, duration of study, and approaches to assessing student achievement. A key objective of the

Bologna Process is to converge higher education structures in Europe toward a common framework, more in line with international standards, without enforcing strict adherence to a single pattern. The complexity and diversity of national systems made it hard to attract foreign students, despite the worldwide growth in student mobility in recent decades. Giving effect to the European vision of greater mobility of students, portability of qualifications and migration of labor required new frameworks and also systems for mapping the equivalence of learning outcomes and qualifications. In 2005, ministers adopted an overarching framework for qualifications in the EHEA comprising three cycles and agreed to develop national qualifications frameworks compatible with the Europe-wide schema.

National qualifications frameworks describe the qualifications available in an education system and how they interrelate. They describe what learners should know, understand, and be able to do on the basis of a given qualification, as well as how learners can move from one qualification to the next within the national framework.

Within the European framework, the first cycle (bachelor) program should involve discipline-based study relevant to the European labor market. Access to the second (master) cycle usually requires successful completion of the first cycle and again involves discipline-based study. The bachelor degree requires 3–4 years of full-time study (or equivalent part-time) and the master's degree 1–2 years, depending on the discipline and the national context. There is no differentiation between countries with 11, 12, or 13 years of pretertiary study; whatever the duration of primary and secondary education, it is deemed to provide the general educational background needed to complete a first cycle of university study.

Many countries have made substantial changes to their degree structures in response to the Bologna Process. The first two cycles have been adopted by every country participating in the Bologna Process, sometimes in parallel with existing degrees during a transition period, sometimes replacing them completely. Introduction of new degree structures and implementation at the institutional level has required an enormous effort in reviewing and reconstructing curricula and learning outcomes. As well as widespread changes in the structure and duration of degree programs, many countries have used the reform process as an opportunity to implement a more student-focused approach and new quality procedures.

The third (doctoral) cycle was not explicitly included in the Bologna Process until the Berlin ministerial meeting in 2003. Subsequently, there has been a continuing policy-level focus on the need to build closer links between higher education and research. However, adoption of a structured approach to the third cycle has been much slower and more uneven than is the case with the first and second cycles.

New Means of Reporting Student Achievement

Despite the implementation of a common qualifications framework across Europe, a significant level of diversity will remain between and within countries. Within a context of broad adherence to the principles of the framework, such diversity is seen as highly desirable. Consequently, reliable and transparent tools are required for measuring and reporting student achievement to allow for adequate understanding and appropriate recognition of those qualifications between institutions and between countries.

In this context, the European Credit Transfer and Accumulation System (ECTS) has been developed as a standard measure of student achievement. In this system, credits reflect the total workload required to achieve the objectives of a program; those objectives are defined in terms of the learning outcomes and the competences achieved. Under the ECTS, 60 credits measure the workload of a full-time student during one academic year. The actual workload may vary between 1200 and 1800 h of various forms of study. Credits are only obtained after successful completion of the work required and appropriate assessment of the learning outcomes achieved.

The ECTS now plays an important part in curriculum design and in validating learning achievements. It makes study programs easy to comprehend and to compare for all students, and so facilitates academic recognition and student mobility. Its design reflects the desire to switch from an inputs-based approach to reporting study achievements (usually defined in terms of hours spent) to a focus on learning outcomes.

The other key tool for reporting student achievement is the Diploma Supplement. Attached to the higher education diploma (credential certificate), the Diploma Supplement describes the qualification achieved by a student in a standardized and easily understood way, as well as relating it to the higher education system and institution within which it was awarded. It provides a standardized description of the nature, level, context, content, and status of the studies successfully completed by the graduate. It is not intended as a resume/curriculum vitae or a substitute for the original credential, but rather as a means of providing more detailed information about any qualification in a way that will aid interpretation and understanding of the nature of the qualification.

Taken together, the Diploma Supplement and information on the number of ECTS credits attained reflect the achievements of a graduate. The information can be used in a systematic way to evaluate what a student has achieved and to assist in comparing those achievements with those of other students in interpreting them in other higher education contexts. It is therefore seen as a key instrument to support mobility of students and labor between diverse environments.

Quality Assurance

The term quality assurance refers, in higher education, to all the policies, review processes, and actions designed to ensure that institutions, programs, and qualifications meet specified standards of education, scholarship, and infrastructure. Quality assurance aims to guarantee and further enhance the quality of higher education provision. The Bologna Process is actively encouraging the development of a quality culture within European universities and a more systematic approach to quality assurance at the national and European levels.

Individual universities, which are primarily responsible for maintaining and improving their quality, have commonly seen Bologna-driven structural and curriculum reforms as an opportunity to reflect on their management practices, review their programs and teaching methods and, in many cases, implement more systematic approaches to quality assurance. In addition, the last decade has seen the rapid emergence of national quality-assurance systems in many countries; as a result, Europe-wide requirements for national systems have been defined to improve consistency of national quality-assurance schemes.

European standards have also been developed for internal and external quality assurance to provide institutions and quality-assurance agencies with common reference points. The resulting standards and guidelines for quality assurance in European higher education were adopted by ministers in 2005. The European Quality Assurance Register for Higher Education (EQAR) was set up in 2005 to list those agencies that operate in accordance with those standards and guidelines and the relevant national legal provisions. The overall intention is to increase transparency and confidence regarding quality assurance in higher education and therefore ultimately in higher education itself and the qualifications it provides.

Wider Dimensions

The Bologna Process of modernization and reform of course lies within a wider context that extends well beyond higher education. From a EU perspective, it is part of the Lisbon Strategy for Growth and Jobs, launched by EU member states in 2000 and relaunched in 2005. The overall intention of the strategy is to enable Europe to maintain and increase its prosperity and therefore to preserve and enhance its social models. To achieve this, the European Council called for the EU to become the most competitive and knowledge-based economy in the world, capable of sustainable economic growth with more and better jobs and greater social cohesion. Key elements of the strategy include budgetary sustainability, better regulation, improved tax and benefit systems, and

improvements in education and training systems, and investment in research to maintain comparative advantage over other parts of the world. Achieving the ambitious objectives was seen to require a radical transformation of the European economy and a challenging program for the modernization of the social welfare and education systems, including higher education.

The Lisbon Strategy also involves strengthened cooperation in vocational education and training, the so-called Copenhagen Process. The European Commission has sought to establish synergies between the Bologna and Copenhagen processes, for example, via the development of the European Qualifications Framework (EQF) for lifelong learning and vocational education and training equivalents of the ECTS and ENQA.

A continuing theme in the Bologna Process has been the need to build closer links between higher education and research. The European Commission has sought to develop close links between the EHEA and the European Research Area (ERA). Unlike the EHEA, the ERA is an EU initiative, taken in 2000, to create a unified area across Europe in which researchers can move and interact seamlessly, build and benefit from world-class research infrastructure, and work with excellent networks of research institutions. As research institutions, universities are closely involved, particularly through their third-cycle doctoral programs. With its focus on investment in research, the Lisbon Strategy builds intimately upon the ERA.

Beyond Europe

A key objective of the Bologna Declaration was to increase the international competitiveness of the European higher education system. A continuing theme of the Bologna Process has been to ensure that European higher education becomes an attractive worldwide destination for students. The Bergen Communique from the 2005 ministerial meeting identified the EHEA as a partner to higher education systems in other parts of the world, stimulating balanced student and staff exchange and cooperation between higher education institutions. It is therefore no surprise that the Bologna Process has increasingly engaged with, and impacted upon, higher education beyond Europe.

The Bologna Process and development of the EHEA has prompted discussion between European and international partners on a range of higher education policy issues and areas of potential cooperation, particularly quality assurance and mutual recognition of qualifications. To provide a framework for cooperation at European, national, and institutional levels, in 2007, ministers adopted a strategy entitled *The European Higher Education Area in a Global Setting*. This strategy incorporates five priorities:

1. improving information on the EHEA;
2. promoting European higher education to enhance its worldwide competitiveness and attractiveness;
3. intensifying policy dialog;
4. strengthening cooperation based on partnership; and
5. furthering the recognition of qualifications.

The EHEA has thus opened dialog with educators and educational administrators in many parts of the world, but there are widely varying understandings of and responses to the Bologna Process.

There is momentum for increased investment in education, educational reform, and a degree of alignment across international boundaries in the Asia-Pacific region. In 2006, 27 ministers for education met in Brisbane (Australia) in 2006 to discuss how to respond to the challenges of the Bologna Process and create stronger regional links. The resulting Brisbane Communique laid down Bologna-like objectives such as increasing student and academic mobility, transferability of qualifications, and greater interchangeability or integration of education frameworks. Ministers agreed to collaborate on quality-assurance frameworks, recognition of qualifications, common competency-based standards for teachers, and mechanisms for the common recognition of technical skills. Moreover, Bologna-like, they agreed to establish biennial ministerial meetings that will consider and plan for educational issues throughout the Asia-Pacific region. Subsequently, South-East Asian ministers for education adopted a long-term project titled *Raising Awareness: Exploring Ideas of Creating a Higher Education Common Space in South-East Asia*.

Some countries are beginning to adopt specific Bologna-inspired features. For example, in 2008, the Australian government announced its intention to provide an Australian Higher Education Graduation Statement for all graduates, a document similar in purpose and content to the European Diploma Supplement. Elsewhere, for example, in parts of Africa and South America, attempts are being made to align higher education with elements of the Bologna Process.

Perhaps at the other extreme, knowledge of and official responses to Bologna in the United States were very limited during the George W. Bush administration. While all indicators demonstrate that the US accounts for the majority of the world's best universities and it still attracts a large proportion of the world's best scholars, there are concerns that its dominant position is under threat. For example, while it clearly remains the leader in research, its share of international students has fallen, while that of Europe has risen sharply since 2000. Nevertheless, growing concern about the standing of American higher education has not translated into national-policy responses to the Bologna Process. For example, the 2006 final report of the Secretary of Education's Commission on the Future of Higher Education (the *Spellings Report*) made little mention of international trends in higher

education and no direct reference to the Bologna Process or the EHEA.

Despite this limited attention at the level of national policy, influential educators have begun to argue that the United States should pay more attention to the implications of the Bologna Process and perhaps adopt some of its features. For example, given the highly diversified system of higher education in the United States, it has been suggested that there should be efforts to build common understandings of what bachelors degrees represent in terms of learning outcomes and skills developments. Others have pointed to the need to come to grips with the implications of the three-cycle system if the United States is to attract a share of the most able postgraduate students from Europe.

European Futures

As the Bologna Process moves toward its target date of 2010, three outcomes are becoming clear. First, and most obviously, there have been very substantial changes in the structure of higher education and the surrounding policies and processes. Many countries have made substantial progress toward implementing two- or three-cycle models consistent with the Bologna model; quality-assurance processes and systems have been more widely embedded. Second, there has been widespread curriculum reform with an increasing emphasis on defining explicit learning outcomes. Third, the objective of improving the quality and attractiveness of European higher education seems to be at least partly achieved, as reflected in the EHEA's growing share of in-bound international student movement.

However, it is important to note that there remains substantial diversity in both the nature and speed of change in all these dimensions. Besides, in many cases there remains a contrast between the adoption of Bologna-compliant legal and policy frameworks and limited changes in educational practice or the experience of individual students. There is an enormous complexity of detail, which can be tracked through annual reports provided by each participating nation.

Much will remain to be done to complete implementation of the ten action lines after 2010. A continuing theme of particular importance is likely to be the embedding of more sophisticated and robust quality-assurance processes as a basis for building confidence in and understanding of educational qualifications that are essential to underpin the goal of increasing the mobility of students, staff, and labor.

Nevertheless, there will clearly be progressively less emphasis on structural and process change. It is expected that a new agenda will be defined at the 2009 ministerial meeting in Leuven. It seems likely that three emphases

will dominate the forthcoming decade. The emergent emphasis on the learning process and the creation of a student-focused, rather than teacher-driven, education is likely to become a dominant feature.

Second, there will probably be a renewed focus on the purposes of higher education and its role in both individual personal development and societal change. In the wake of the global economic crisis of 2008–2009, it is almost certain that this will involve a reinforced focus on skills, employment, and economic growth, although there will be at least lip service to the long-held belief in the value of education as a key underpinning of democracy and freedom.

A third and final element will certainly be a renewed emphasis on the external dimension. As a minimum, there is little doubt that the EHEA will strengthen its programs for reaching out to other nations and regions to increase global awareness of the Bologna Process, build partnerships, and increase mutually beneficial cooperation. It is also quite likely that the next decade will see increasing competition between three global powers in higher education and research, the EHEA, the United States, and the Asia-Pacific, dominated by China and India.

The Economics and Finance of Higher Education

A Wolf, King's College, London, UK

© 2010 Elsevier Ltd. All rights reserved.

Glossary

Agency theory – Deals with situations where a principal hires or depends on an agent, who may have different interests, and where there is imperfect (or asymmetric) information: typically the agent knows things the principal does not or cannot know.

Economies of scale – Occur when, the more you produce, the cheaper it is to produce any one unit.

Positive externalities – Exist when individuals and firms making decisions or selling/buying goods and services do not get the full benefit of the decision. Some of it is received by others. (Examples include beekeepers who pollinate others' field, people ensuring their children receive vaccinations, and creators of beautiful private gardens on view from the public highway.)

Public choice theory – Studies the behavior of politicians and government officials and employees using the theoretical apparatus of economics to explain their actions, and using the same assumptions of rational self-interest.

A Public good – One where consumption by one individual does not 'use up' the good (it remains available for others) and where you cannot exclude people from using it and preserve it only for those who pay. Examples include the rule of law, and national defence forces.

Skill-biased technological change – A change in productive technology and techniques that favors and increases the demand for highly skilled workers.

The economics of higher education is normally understood to cover both analyses of higher education's impact on the wider economic system, and the use of economic theories and methods of analysis to examine the higher education system as a system: for example, the demand and supply of higher education, the efficiency of higher education institutions, and the drivers of innovation within the system. This sounds like a potentially enormous field of enquiry, and indeed it is. In practice, however, academic work in this area has been concentrated in rather a limited number of areas.

Far and away the most important current area of study, at least in terms of volume of output, is concerned with the economic impact of higher education on people's earnings and on the economy. This work is generally

approached from the perspective of human capital theory. As recently as the previous edition of this encyclopedia, it was possible for the writer of the economics of higher education article to refer to human capital theory as highly controversial. Today, it is the overwhelming orthodoxy of both academic economics and political policy-making worldwide.

Its influence derives largely from the work of Gary Becker, the Nobel-prize-winning economist, although the basic idea is very old. Using the normal definition of capital as something which is not entirely used up in the production period under examination, but remains as a source of future production, human capital is seen as something embodied in individuals which contributes to production and economic growth. It is created through "activities that influence *future* monetary and psychic income by increasing the resources in people. These activities are called investments in human capital" (Becker, 1993: 11, emphasis mine). Discussion of higher education's impact on the economy is now carried out overwhelmingly from this perspective, and is the topic of this article's opening section.

It is followed by a discussion of economic work related to the efficiency of higher education. Efficiency is a core topic for economics but research is extremely difficult to carry out in this area because of the intrinsic problems in measuring higher education's output: namely, that universities are multioutput organizations, that there is no agreed relative importance attached to different outputs by society, and that only some outputs are measurable across the system as a whole. The volume of publications in recent years has been correspondingly small, but includes some very interesting empirical work. We then turn to two emerging fields: the application of economic theories of organization to higher education, and work using concepts from the economics of information. The final section addresses the financing of universities. This is largely and of necessity descriptive, although good theoretically based work on what determines public, and not just private, willingness to pay for education would be very useful in a rapidly expanding and changing sector.

The Economic Impact of Higher Education

Work on the economic impact of higher education is, as noted above, dominated by work which examines this in terms of human capital, built up by individuals during

their studies, and used across a lifetime of work and employment. Much of this work deals with rates of return: specifically, how much more people earn as a result of attending university, and how much this contributes to productivity, growth rates, and prosperity.

Rates of Return

In volume terms, the economics of higher education is dominated by empirical studies of the individual rate of return to years in college and to formal degrees: that is, the impact of university attendance on the individual's future earnings. This is part of a more general growth in such studies, which use large data sets on individual earnings and prior education to examine the financial benefits of formal education, and cover an ever-expanding list of countries. This literature, termed a veritable tsunami by Krueger and Lindhal (1999), is reviewed by Psacharopoulos and Patrinos (2004), who list over 100 studies, and cover over 80 countries in what they emphasize to be a constantly expanding field.

The estimates which can be made with some confidence are of private returns: namely, how much more individuals earn as a result of an additional year of education, compared with those who are otherwise like them (and allowing for costs borne directly by the individual plus income foregone as a result of studying rather than being at work). Such private returns are almost universally highly positive, but the absolute levels vary by country and level of education (primary/secondary/higher). In some parts of the world, primary education confers much higher rates of return than higher education, in others, the opposite. Returns are usually higher for poorer/developing countries than for wealthier ones. The status of the university attended, age at graduation, and the subject studied all affect the result (see e.g., Grogger and Eide, 1995; Egerton, 2000; Egerton and Parry, 2001; Hoxby, 2004; Zhang, 2005). However, Hamermesh and Donald (2004) indicate that the differences associated with degree subject chosen may be overstated, since that choice is itself highly correlated with other factors which influence later earnings (such as prior ability and hours worked once employed).

In the Organization for Economic Cooperation and Development (OECD) countries, private returns to primary education have historically averaged out at slightly above those for secondary and higher education. However, with primary and lower-secondary education now universal, the question of most interest to policymakers has been the extent to which returns to higher education remain high in a context of ever-expanding enrolments. The question is important because very few university students, anywhere in the world, pay the full cost of their education, with tuition fees, in particular, being highly subsidized by most governments.

The high private returns to college and university are themselves enough to explain the huge increases in enrolments which have taken place in recent years (Kosters, 1999; Wolf, 2002). Other things being equal, one would expect that an increased supply of graduates would tend to lower their average price (and hence the private returns to be gained), compared with other parts of the labor force. The composition of the job market has changed in recent decades, so in that sense, things are not equal: developed countries register a marked increase in the proportion of technical and professional jobs, and a sharp fall in the proportion of skilled manual jobs. However, studies also conclude consistently that there is a good deal of over-education or graduate underemployment, with graduates employed in jobs for which their level of education is not a necessity (see, e.g., Patrinos, 1997; Alpin *et al.*, 1998; Battu *et al.*, 2000; Green *et al.*, 2002; Kler, 2005; Duru-Bellat, 2006). While most detailed studies of over-education employ data sets from developed countries, the phenomenon is also common and highly visible in many developing nations (see, e.g., Dore, 1997).

One of the major puzzles in this field is, therefore, the continuing high level of private returns to higher education and, even more specifically, the fact that, in developed countries, these have tended to grow, relative to other forms of education and, especially, compared with an education which does not include a formal upper-secondary certificate (e.g., a North American high school diploma, or a baccalaureate). Discussion of this phenomenon involves, inevitably, the debate over more general trends in income distribution, including increases in earned income inequality which were especially marked in some countries (notably the United States and United Kingdom in the 1990s) but generally widespread (Atkinson, 2003). The current consensus – for which returns to university education provide some of the evidence – is that the main driver has been skill-biased technological change, and it is this rather than, for example, outsourcing of jobs to developing countries or widespread low-skilled immigration that has kept the wages of the less educated depressed relative to those of graduates (Heckman *et al.*, 1998; Moore and Ranjan, 2005).

Although there can be little doubt that private returns to a university education are high, calculating the precise impact of that education is extremely difficult, and the subject of a large literature in itself (Card, 2001; Blundell *et al.*, 2005). One problem is that those who enter higher education may differ from their peers in ways over and above the simple fact of university study. If they are more able, or harder workers, later returns to education may in fact be rewarding skills and effort as well, or instead. Data sets differ in the degree to which they allow controls for other variables; in general, the finding is that, while returns decrease somewhat with controls for ability, they remain significant. Randomized or controlled experiments are, of

course, impossible, and natural ones very rare at this level of education. One such occurred in France, however, when the 1968 student riots resulted in many formal examinations being shelved. The result was that a number of individuals entered university who in the previous or later periods would not have done so. Maurin and McNally (2005) demonstrate that the benefits were significant and strong for this marginal group – the wage returns to a year of university study are, for them, about 14% – and that the benefits were also passed onto their children, who were in turn more likely to enter higher education than if their parents had not done so (but been otherwise unchanged).

Another problem, which a natural experiment such as this cannot resolve, is the extent to which graduates are being rewarded for substantive skills gained at university. As Spence argued in his classic work on signaling (Spence, 1973), formal qualifications may be used to signal underlying qualities, such as innate ability, hard work, and perseverance, rather than as evidence of specific, valued skills learned on the courses which the qualification accredits, and may be used by employers for general screening purposes. It is extremely difficult to estimate how much qualifications (of any sort) operate as signals of this type, and how much their associated wage premia are a reflection of specific acquired skills. The evidence suggests that both factors are important, but in varying proportions depending on time, place, subject studied, etc. (Cameron and Heckman, 1993; Murnane *et al.*, 1999; Wolf, 2004).

The difficulty of estimating how much the private returns to higher education are returns to new and valuable skills complicates the question of how much there is a social, as well as private, return to university education; and, therefore, how much governments should subsidize higher education. Funding of higher education – both teaching and research – is a major item in the budget of almost every national government in the world, and, as discussed further below, has been under increasing strain in recent years. The dominant rationale for these subsidies is economic: more so, indeed, than in previous centuries, when social, cultural, and religious arguments were relatively more prominent. Reflecting the influence of Becker (1964), governments have taken on an explicit responsibility for developing their countries' human capital.

This implies that – on economic grounds – public funding and subsidy for higher education should be undertaken up to, but not beyond, the point at which the social return on the investment reaches the cutoff level conventionally adopted by the country's finance ministry when evaluating public investment opportunities. However, the social returns are very hard to calculate (Wolf, 2002; Psacharopoulos and Patrinos, 2004). Conventionally, they simply involve adjusting the private rate to allow for the full cost of the education, and not just that part which the student pays. The result is assumed to reflect

the benefit to society, on the grounds that individuals' increased earnings reflect their increased productivity as a result of their education. However, many graduate wages, especially in the public sector, are not set by market forces and so may not accurately reflect additions to economic output; and any part of the private return which is determined by signaling rather than skills is similarly problematic.

Externalities

Most of the economic literature on university outcomes emphasizes private returns, and their presumed reflection of individuals' increased skills (human capital), with social returns treated as simply a more fully costed version of these. However, economics also suggests that higher education may influence the economy in rather less-obvious ways. The most important economic argument advanced to justify the public funding of university research, especially in science, is that knowledge should be treated like a public good, available to all. (If a private good is consumed by someone, then it cannot also be consumed by others: we cannot all eat the same apple or own and occupy the same house. Knowledge produced by universities and in the public domain remains there for others to use; however, many other people have used it beforehand. Knowledge is not, however, naturally a public good, unlike, say, defense, law and order, street lighting, and public drains.)

The alternative, which is to have private companies and individuals finance research, and own its results, is likely to be highly suboptimal, because it means that the owners monopolize information to their own benefit and (excess) profit, and militates against continuing innovation and scientific progress, because of the inaccessibility of important findings (Aranson, 1995). While this is difficult to prove, it is noteworthy that developed countries rarely are successful in industrial sectors where their universities are weak in the corresponding underlying sciences (Porter *et al.*, 2000; but see also Kealey, 2008).

A related argument is that there are general spillover effects (positive externalities) from having a highly educated workforce with many graduates. The productivity effects will be greater than the sum of the individual parts because they will have a generally beneficial effect on the performance of co-workers and on technological progress. This belief has underpinned the recent enthusiasm of governments for increased public subsidies for higher education, and for raising the proportion of a cohort graduating (both absolutely and as in relation to other OECD countries). However, the supporting economic evidence is slim at present. At a global level, higher education participation levels do not seem to have any consistent, positive relationship with wealth or growth (Pritchett, 2001; Wolf, 2004; Lewis, 2004). A review conducted for a major UK government review of higher

education in the 1990s found no clear evidence of externalities (Gemmell, 1997). More recently, however, there have been some studies which indicate genuine cluster or spillover effects, not only for industries operating at the technological frontier, which benefit from closeness to universities, but also at the within-plant level (Audretsch, *et al.*, 2003; Moretti, 2004a, 2004b).

Although the relationship between higher education and wealth continues to dominate the literature, a number of other themes have also emerged, or been revisited, in recent years. These can be grouped broadly under the headings: (1) studies of institutional efficiency; (2) applications of general theories of economic organization to the higher education sector; and (3) analyses of student and other consumer behavior in terms of information search and related transaction costs.

Education Production Functions: Efficiency and Productivity

The growing size and expense of universities has created corresponding demands from government funders for efficiency gains, and for accountability and performance indicators. The fact that universities have multiple outputs, and the difficulty of measuring any of these outputs with any precision, means that economics is unable, with any ease, to examine the efficiency of universities, in the sense of their ability to generate given output levels with more or fewer resources. In the school sector, externally set assessments often are available as a more or less comparable, albeit imperfect, measure of outputs at the within-country level; but university degrees and grades cannot be treated as standardized in this way, and there is also no agreement on how best to measure research outputs.

A good deal of the rather limited literature in this area looks at either teaching, or research, in isolation. In the case of teaching, one possible approach is to look at changes in graduation rates over time, and relate them to resources, although this assumes that grading standards remain constant at the within-institution level. Bound and Turner (2006) use a very large US data set to argue, on this basis, that lower levels of resource per student (using levels of public subsidy per student as proxy) have a direct and significant effect on graduation rates: that is, that reduced resources per student reduce the likelihood of graduation.

However, this finding needs to be evaluated with care. An extensive literature on the impact of resources on primary and secondary schools has underscored the complexity of the relationship (see e.g., Hanushek, 2007; Chevalier *et al.*, 2005). There appears to be no clear, let alone linear, relationship between levels, or changes, in total resource per pupil and learning outcomes, even when the measure of resource accurately reflects spending per pupil at the classroom, rather than the system, level. It seems unlikely that

universities (where large amounts are spent in ways which have no direct impact on students' classroom experiences) will display a simple link between resources and graduation rates, let alone resources and substantive learning. For example, Andras *et al.* (2007) argue that the productivity of science faculties in UK universities (in terms of quantity and quality) increased between 1975 and 2004 relative to the United States, even though the resource gap was actually widening during this same period.

Studies at a more micro-level, where learning outcomes can be treated as standard, are potentially more fruitful, although the issue of what makes for best practice in teaching, and the efficient organization of teaching, remains little understood, and little researched by economists. One exception is a study by Bettinger and Long (2004) of standardized college remediation courses, which provide assistance to students whose skills, on entry, are deemed inadequate for coping fully with the college curriculum. Such courses are controversial. They not only may assist students in coping with regular courses, but may also discourage them from persevering at all. The research indicates that both outcomes exist – those who complete remediation are more likely to persevere in college than otherwise comparable students, but being placed in such a course increases the likelihood that the student will drop out or transfer.

Another recent study using detailed administrative data from a Canadian university indicates that, among first-year students taking large courses (with multiple instructors but common assessments), instructors have a small but significant effect on students' grade, likelihood of dropping out and likelihood of taking the same (elective) subject in later years of the degree (Hoffman and Oreopolous, 2006). The effects are not attributable to instructors' rank or salary, but are positively correlated with students' pooled subjective rankings of instructor quality. Such studies have the potential to provide findings which can be applied directly to instructional practice, and it is to be hoped that, in spite of the difficulty, research of this type will increase in future years.

There have also been some innovative attempts to examine whether different institutions are more or less efficient in producing research outputs, notably in the sciences and economics, where international citation indices provide an acceptable measure of quality. Kim *et al.* (2006) use data from economics and finance faculties in over 800 universities to demonstrate that, while absolute levels of high-status publications are higher in elite universities, the latter do not seem to add value to academics' performance. In the 1970s and 1980s, being at a top university generally had a positive impact on individuals' productivity. Today, young scholars in these disciplines are publishing high-impact papers without having to be in elite institutions when they do so. Conversely, when and if their publications win them better jobs, the move does not

affect their performance; the fact of being in an elite institution, among established or other rising stars does not have any obvious positive effect. This may, however, be because the move does not actually change who they collaborate with. Over the period studied, the authors also show a big increase in the number of co-authored papers involving both elite and nonelite institutions, which would be consistent with this interpretation.

At the sectoral level, the measurement problems associated with higher education's multiple outcomes and objectives remain formidable. A number of studies have used data envelopment analysis (DEA) or multiproduct cost function to address the issue. DEA examines how far, within a group of similar organizations, individual organizations diverge from best-practice performance. (The technique requires that some units be identified as representing best practice, for comparison purposes, even though none of them may in fact be operating at anything close to the best-practice frontier.) These studies are concerned both with technical efficiency, in the sense of asking whether institutions could generate more with given resources; and with scale efficiency, or whether institutions might be more efficient if they were smaller, or larger, because returns to scale are not constant. Abbott and Doucouliagos (2003) find, on this basis, that there are few major differences in the operating efficiency of Australian universities. Johnes and Johnes (1995) apply the technique to an analysis of the technical efficiency of UK university economics departments as producers of research. They argue that the technique not only has a positive contribution to make, but also underline how susceptible the results are to the choice of inputs and outputs.

Other researchers examine economies of both scale and scope, looking at teaching and research, although again the number of studies is small. Dundar and Lewis (1995) used peer ratings of graduate program quality, in conjunction with quantitative measures of student credit-hours and publications to look at economies of both scale and scope; and their results give clearer indications of the existence of both, in American public research universities, than most previous studies. Hashimoto and Cohn (1997) similarly look at undergraduate and graduate teaching plus research, and find evidence of ray economies of scale, and both global and product-specific economies of scope, in Japanese private universities.

While the evidence of returns to scale may have some important policy implications, there are, as Cohn *et al.* (1989) emphasize, major problems associated with any attempt to analyze multiproduct organizations, and especially when – as in higher education – the measurement of both the teaching and the research outputs is highly problematic, and there is no agreed weighting for the relative importance of teaching, pure research, and applied research/consultancy as outputs. This has not prevented governments from pursuing measures of quality and productivity which can be placed on a scale and so used for

accountability and funding purposes. The UK government, for example, wishes to move to a metrics-based approach to distributing its research funding for universities, even though empirical research indicates that quite small changes in the measures used, and the weightings they are given, can lead to major changes in both scores and rankings (Sastry and Bekhradnia, 2006).

The Organization of Higher Education

Classical economic theory has concerned itself in large part with the way in which resources are allocated through price mechanisms in more or less competitive markets. Higher education, however, has for many years been an overwhelmingly publicly funded, and, in many cases, publicly run activity in which governments determine the number of students, provide most or all of the expenditure for the sector, and allocate it between institutions which are themselves generally directly created by, or licensed by, the state. This has been the case even in the United States, which has a large private not-for-profit higher education sector, as well as many proprietary schools.

This is likely to change in the future, because of the rapid growth of private institutions, notably in ex-Communist and developing countries, and the emergence of a successful for-profit sector in the United States. The circumstances under which such institutions emerge and succeed, alongside subsidized public-sector provision; the types of degree they offer; their pricing strategies, and the often highly segmented nature of their target student populations, would all appear to be areas in which economics should be able to provide useful insights (Ortmann, 2001; Kraft and Vodopivec, 2003; Tooley and Stanfield, 2007). To date, however, the published literature in this area is still small.

Economics has paid rather little attention to the forces determining levels of public subsidy across time and jurisdictions (though see Carpentier, 2005). However, the analysis of how university staff and students' behavior is affected by different funding and incentive patterns has been addressed, intermittently, by economists, most of whom draw more or less explicitly on the pioneering analyses of Smith (1776/1976). Smith argued that the reason why the quality of teaching was low in the English universities of his day, as compared with the Scottish, was that in the former, faculty lived off endowments while in the latter they had to attract fee-paying students. Later economic analyses (Buchanan and Devletoglou, 1970; Garvin, 1980; West, 1995; Raines and Leathers, 2003) have advanced similar arguments which draw broadly on public choice or agency theory: students for whom tuition is free will act as uninformed consumers, while faculty whose jobs are paid for by block grants from state revenues will prioritize their own interests (maximize their own utilities) rather than the objectives of students or, indeed,

the funding governments, especially when protected by tenure, and not-for-profit governance structures. For many, this will involve prioritizing research and related activities which bolster their own, and their institutions', prestige, and, therefore, their future career opportunities.

This analysis would lead one to expect changes in recent years, as students' fees have come to account for rapidly growing proportions of university expenditure in many countries. This has indeed been predicted, but Zemsky *et al.* (2005) find less change than expected. They ascribe this to students being most interested in their diploma's reputation, or brand, rather than what they actually learn; and therefore having interests which are more aligned with those of faculty than has generally been assumed.

This approach to understanding universities has also been elaborated using theories of property rights. Meiners and Staaf, for example, note the wide-ranging and recurrent criticisms made of higher education in the United States, and argue that most are "implicit normative arguments for changing property rights" (Meiners and Staaf, 1995: 197). As already noted, a recurrent theme in both academic analysis and public comment on universities is the importance of research, and research publications, for individuals' career success, and the consequent devaluing of teaching, and especially undergraduate teaching (see, e.g., Ehrenberg *et al.*, 2003). The property rights approach elaborates on the traditional economists' explanation by noting that the value of research outputs is relatively easily measurable, and that a good deal of it can be captured by the researcher directly. For successful researchers, it adds directly to their opportunity cost; the salary they could obtain by moving to another institution, forego by staying where they are, and which is in fact therefore very likely to be paid in full or almost in full by their current institution, which generally does not wish to lose them. (Good researchers bring in grants, which are shared with the employing institutions, and increase a university's reputation, which in turn attracts both students and other faculty.)

Teaching, by contrast, is successful to the degree that students learn. As noted earlier, compared with primary and secondary education, very few data are available on the extent to which higher education teacher quality affects learning. However, whatever the impact of the teacher, learning requires joint inputs, by students as well as by teachers. It is, in practice, impossible to calculate routinely the degree to which it is the teacher's input rather than the student's effort which matters; moreover, while students who learn effectively because they are well taught may later earn much more as a result, the teacher concerned has no way of capturing any of this gain for her or himself. (If a given institution is effective in raising students' later incomes more than others in the same system, it may be able to raise tuition fees; but these benefits will accrue to the institution as a whole, and,

while they may lead to higher average salaries, cannot be captured by individually excellent teachers.) The tension between research and teaching is thus endemic in higher education, and there is little or no market for good teachers.

A more general principal-agent perspective is used by a number of analysts to explain the relative importance given to teaching or research in different institutions and systems, and the effort expended by academic staff on either or both. Changes in the financing of higher education have provided an opportunity to see whether universities respond in the directions predicted within this framework (Slaughter and Leslie, 1997; Webster and Etzkowitz, 1998; St. John and Parsons, 2004). These changes are discussed in more detail below, but may be summarized briefly as involving a reduction in the proportion of funding received in the form of governmental grants, and increases in the importance of fee income, research grants, and contracts.

These changes have been characterized by Slaughter and Leslie as creating a new form of academic capitalism, by which they mean that universities, including public universities, are now directly involved, at all levels, in attempting to secure external monies in a competitive marketplace, and do so on the basis of whether or not given activities are likely to be profitable. Countries greatly vary in the extent to which this model reflects their current form of organization; the United States can be seen as one end of the spectrum, whereas in some other countries, developed and developing, there has been rather little such development. (Italy is a case in point.) However, movement is generally in the direction of this model (CERI, 2004).

The effects vary as a result not only of the relative size of the different income streams, but also of the way that universities are organized internally, and the extent to which this also involves market-type mechanisms, with individual departments and staff benefiting directly from successful income generation.

The most obviously market-oriented and entrepreneurial activities are those which involve direct collaboration between academics and industries, including cases where universities launch their own start-ups, and these have been extensively studied (Etzkowitz, 2007). Webster and Etzkowitz (1998) point out that a situation in which universities generate income by capitalizing the knowledge they produce involves a genuine structural change in the way higher education is financed. Although the amount of money raised in this way remains relatively small compared with tuition fees, research grants, and block grants, it changes incentives for academics in ways which are highly discipline dependent, and also has led to far more differentiated contracts of employment for entrepreneurial staff (Slaughter and Leslie, 1997). For example, among successful faculty in the relevant fields – mostly

science and engineering – many work largely within centers or institutes which are as much engaged with commercial as with academic cultures and networks, have little engagement with departmental duties or teaching, and negotiate terms and conditions directly with central university administrators.

The impact of other changes in university financing very strongly depends on the internal organization of universities. It might appear that a growing dependence on tuition income would increase the influence of the student body, and go some way to redress the imbalance between incentives to do research and incentives to prioritize teaching. However, in some systems (including the United States), the internal allocation of both block grant and tuition revenues is often the prerogative of central administrations, and resources do not follow students in any formula-based fashion. Instead, for example, undergraduate fees may be used to subsidize graduate teaching; and science and engineering infrastructure may be supported at levels which cannot be covered from funds dedicated to those areas (Ehrenberg *et al.*, 2003).

In contrast, in some other systems – notably the United Kingdom and Australia – a large proportion of fee income is commonly devolved directly to the departments which recruit the students, creating a tuition–profit-sharing system. Both these countries, in common with many others, operate with a dual-fee policy, in which home students and overseas students pay very different levels of fee (with home students, but not overseas ones, also attracting matching funds from government). This creates strong incentives for departments to attract and recruit students, especially from lucrative overseas markets, and to concern themselves with their reputation as teaching, as well as research, institutions. Both the United Kingdom and Australia (and New Zealand) have become highly dependent on overseas fee income, and have developed qualifications – notably the 1-year master's degree – in direct response to these financial incentives (CERI, 2004). The ways in which new departmental incentives to recruit students and maintain teaching quality interact with continuing individual incentives to prioritize research and consultancy have not, however, been studied empirically in any detail to date.

Information Issues

A major focus of much contemporary economic analysis, especially in fields relating to public-sector provision, is information: its accessibility, for consumers (and other principals); the costs of obtaining it; the degree to which consumers engage in rational information search; and the extent to which people depend on particular signals (including brand names) as a way of managing the costs of information search.

Access to and use of information about quality and outcomes are acknowledged to be important issues in higher education, as are the strategies which institutions use to establish and maintain reputation in an increasingly global market (De Burgh *et al.*, 2007; Keep and Mayhew, 2004; Zemsky *et al.*, 2005). The growing size of the university sector, both within countries, and worldwide, and of the increasing numbers of students studying outside their own countries, means that universities which are competing for students and faculty must establish name recognition; something which was much less problematic at a time when students had very little choice of institution and studied almost entirely within their countries of birth.

One result of this is the emergence of a winner-take-all syndrome, echoed in other spheres such as sport and the arts, in which a few institutions which have an established reputation for very high quality are able to command increasingly high relative prices from fee-paying students, and greater, and increasing, shares of renowned faculty and research revenue (Frank and Cook, 1995; Wolf, 2002). Competition for entry into these institutions is commensurately intense, with applicants using both traditional and new ways of distinguishing themselves from each other, especially in systems where the application process is not tightly controlled by government (Bakker and Wolf, 2001). Another consequence is that employers more or less consciously sort institutions and qualifications into a very limited number of categories for selection and screening purposes (Jenkins and Wolf, 2005).

The number of higher education institutions which can become global winners is limited by the costs and difficulty of processing large amounts of information. For example, the international league tables showing university rankings, which have become increasingly numerous and widely reported in recent years, sometimes include several hundred institutions – by itself a tiny fraction of the worldwide number. Most reports, however, focus on the top 50, 100, or at most 200 institutions.

Developments at the elite end of the sector demonstrate that some students are engaged in very active information search leading to discriminating application decisions. It is less clear, *a priori*, whether such behavior characterizes the bulk of applications for university. A large body of work has questioned whether the concept of rational, utility-maximizing consumers is consistent with empirical observations of human behavior; for example, people often appear to use discount rates in making decisions which are very different from market rates, and researchers have argued that young people from poorer and less-educated backgrounds do not act as informed rational consumers in making decisions about education and training (Chapman, 1996; Ball *et al.*, 1999). A small number of detailed studies now exist of information search and university applications, and their relation to both students' labor-market expectations and their expectations of obtaining admission

to different institutions. These indicate that, for university entrance, young people's behavior is in fact largely, although not entirely, consistent with the type of information search and application strategies that would be predicted by traditional economic theories of utility-maximizing behavior (Cam, 2001; Rochat and Demeulemeester, 2001; Menon, 2004; Varga, 2006).

Financing Higher Education

For most of the twentieth century, higher education in developed countries, including the United States, whose system is the most studied, received much of its funding in the form of block grants made to public or quasi-public institutions. Tax breaks are also very important in some countries (e.g., exemption from property taxes, allowing donors to deduct gifts from taxable income). The justification for public funding and support was partly economic, and also cultural, social, and religious (Thelin, 2004).

In recent decades, a number of developments have placed this system under pressure. Higher education enrolments have soared, as a result of both student demand and governmental enthusiasm, the latter reflecting a belief that universities are a potent tool for promoting economic growth (see above). However, the increased size of the sector (absolutely and as a proportion of the eligible population) has made it increasingly difficult to secure funding increases from governments which maintain funding on a per-student basis, even though governments are committed to general expansion.

Figures for public spending on education are published annually for all member countries by the OECD. The average proportion of tertiary spending which comes from public sources has fallen since the mid-1990s for both the OECD and the European Union (EU), although not by huge amounts (five and two percentage points, respectively), and the large bulk of funding remains public, although with large differences among countries. It is, for example, extremely high (well over 90%) in most of Scandinavia, Greece, and Turkey; but well under 50% in Japan, Korea, and the United States. Looking at trends over the last decade (OECD, 2006), it emerges that about half the OECD countries have seen a fall in the proportion of funding that comes from public sources, although these falls greatly vary in scale – major in Australia, the United Kingdom, and Italy, and very small indeed in a number of other cases. Conversely, only four countries have seen increases in the proportion of funding from public sources, although in two of these (the Czech Republic and Ireland) the rise has been quite substantial. Remaining countries have seen no effective changes. These trends are, it must be emphasized, for the proportion of funding from public sources. They do not in themselves imply anything about levels of real spending.

In some countries, higher education has also attracted falling shares of public education budgets, even when the latter as a whole are protected or growing as a share of gross domestic product (GDP) or public spending (Rizzo, 2003; St. John, 2003; St. John and Parsons, 2004). However, in others, and for the OECD as a whole, the growth in the size of tertiary education has meant that it captures a larger percentage of total GDP than 10 or 20 years ago, and maintains or increases its share of the total education budget. It is at institutional and per-student level that falls in real spending are most likely to occur.

At the same time, the sector has been unable to realize significant efficiencies in the use of labor or find effective technological means to increase productivity to any significant degree. Indeed, small class sizes remain a key selling point for many private universities. In this situation, universities are constantly affected by what Baumol has characterized as the cost disease of the public services (Baumol and Bowen, 1966; Baumol, 1996). The problem is that some industries achieve above-average increases in productivity (e.g., through new machinery which allows the production of a given output with much less labor), whereas in others – notably education, health, and the performing arts – there are no such advances. Unless the latter also raise their wages, however, skilled and high-ability labor will gradually leach away. Some widening in the earnings gap may be tolerated, but there is also, inevitably, pressure to raise prices or reduce quality (e.g., in education, by increasing class sizes or reducing the number of taught hours). Even in countries which appear to have maintained per-student funding, in the sense that expenditure per student keeps pace with inflation, this creates serious pressure on the quality of higher education.

In countries where universities are unable to access funding other than governmental grants, the main impact of reduced block grant levels has simply been on class sizes (and, presumably, teaching quality), and on workloads and salaries (Capano, 1999). However, in many countries, universities have been able to change their funding mix, by increasing tuition fee income, research income, and/or consultancy income from industry. This has been particularly important for those universities which are part of a competitive system either internally or – increasingly – globally, and for whom the maintenance of prestige and brand recognition involves the hiring of high-status staff who are themselves part of a global labor market. A growing dispersion in salaries for professors is noticeable in such systems, which include the United States, United Kingdom, and Australia (see e.g., AAUP, 2007).

Increased fees, or the introduction of fees into systems which were originally free at the point of use, have been the most visible, and the most politically controversial aspect of these developments. User charges for lodging and food, and smaller student grants are also in evidence. For example, China and Britain introduced tuition fees in

the late 1990s; the value of maintenance grants shrank in Russia, and Central and Eastern Europe; tuition fees rose at rates well above inflation in the United States. In Germany, the states secured a legal victory over the federal government in 2006 which allows them to charge tuition fees, something their universities see as necessary to reestablish quality provision. Even in Scandinavia, where there is a very strong political commitment to free higher education, tuition fees are under active discussion, and there is very limited subsidy of students' living costs.

Another strategy is to maintain public funding for a limited part of the higher education sector, while directing excess demand toward courses and institutions which levy higher, or full-cost, fees. In Russia and eastern Europe, this often takes the form of two tracks within the same institution, with competition for the free places. Elsewhere, the distinctions take place at institutional level, between public and private colleges and universities. The public institutions may be the best resourced and most prestigious, but with entry highly circumscribed (as in, say Japan and much of Latin America); or, rather more commonly, public institutions may expand, but with rapidly declining expenditure per student, so that private institutions emerge as more desirable and higher prestige. The latter group includes much of Southeast Asia and Italy (see e.g., Ehrenberg, 2002; Johnstone, 2004; Karkkainen, 2006).

Although fiscal pressures provided the major impetus for reforms in higher education financing, a growing awareness of the very high private returns to years in college have been important in changing the willingness of politicians to increase cost sharing (by raising fees) rather than simply holding down expenditures at the expense of quality. This has been especially evident in the political debates surrounding finance reforms in the United Kingdom, New Zealand, Australia, and Hungary, all of which introduced comprehensive income-contingent loan systems for student fees and living expenses in the 1990s or 2000s (Barr, 2004; Barr and Crawford, 2005). Such systems require students to repay loans only when their earned income reaches a certain threshold. In the United States, there has also been a steady move toward student loans rather than grants (Hoxby, 2004; Hearn and Holdsworth, 2004; Lyall and Sell, 2006), but the system is far more complex, with multiple student-aid programs, plus various forms of tax relief for families and individuals paying college fees (and attendant information-processing costs).

A shift away from free tuition to fees plus a student loan system is attractive to governments because they save money. However, such systems do still, as a rule, involve extensive public subsidy and regulation. They also mean that support is not tied to a particular institution: students, having taken out a loan, can decide which institution to attend more freely than under a system whereby grants are made to universities, and education is free at the point of use. Some economists support such a move because it is

likely to increase competition within the sector, and also makes it easier to target support to the more needy.

Block grants which are used to keep tuition low for home students – whether within-state, as in the United States, or within-EU, as in European member states of the EU – tend to be regressive in their impact, since most students come from the wealthier segments of society (Kosters, 1999; Wolf, 2002). However, economists also, for that reason, caution against the idea that any policies for the delivery of higher education funding can provide an effective method of counterbalancing the growing wage inequalities which make a degree so attractive in the first place. With universities throughout the world recruiting from a predominantly advantaged population, government education policies which are primarily concerned with equalizing opportunities and skills should, logically, concentrate on prioritizing expenditures at pre-university level rather than on levels of funding, or funding methods, for higher education as such (see e.g., Hoxby, 1999; Cameron and Heckman, 1999).

The Role of the OECD in the Development of Higher Education in a Globalized World

R Yelland, OECD Directorate of Education, Paris, France

© 2010 Elsevier Ltd. All rights reserved.

Origins of the Organisation for Economic Cooperation and Development

The Organisation for Economic Cooperation and Development (OECD) was created in 1961 as the successor to the Organisation for European Economic Cooperation (OEEC), which had itself been created to manage the reconstruction of Europe following World War II. During the 14 years since George Marshall's 1947 Harvard University address and the launch of the plan that bore his name, European prosperity had been restored, and the European Community had been established. The United States remained economically dominant but the Cold War was at its height. The new organization was headquartered in Paris, like its predecessor, and shared its principles and goals.

The Organization's Aims and Purpose

The OECD describes itself as: "a unique forum where the governments of 30 market democracies work together to address the economic, social and governance challenges of the globalizing world economy, as well as to exploit its opportunities. . . . OECD countries between them produce almost 60% of the world's goods and services, but in an interdependent global economy the OECD does not and cannot work alone. It shares expertise and exchanges views with more than 100 countries worldwide on topics of mutual concern from improving health and education systems' performance to encouraging innovation and ensuring accountability of governments to their citizens." (OECD, 2005: 7)

Article 1 of the OECD Convention says that the aims of the organization

shall be to promote policies designed:

- a. to achieve the highest sustainable economic growth and employment and a rising standard of living in Member countries, while maintaining financial stability, and thus to contribute to the development of the world economy;
- b. to contribute to sound economic expansion in Member as well as non-member countries in the process of economic development; and
- c. to contribute to the expansion of world trade on a multilateral, non-discriminatory basis in accordance with international obligations.

OECD work covers a wide range of government activity – from aging society to transport; from entrepreneurship to agriculture. The process by which priorities are set, specific outputs determined, and budgets allocated is led by the Council, which is made up of representatives of the member countries and the European Commission.

Roles and Methods of Work

The paradigm for OECD activity in pursuit of its objectives runs from data collection and analysis, through discussion and decision making, to surveillance through peer review of policy implementation.

One of the key roles of the organization is therefore as a collector and provider of reliable and comparable data on economic and social issues. To underpin its analytical and policy work, the OECD compiles statistics for the 30 member countries and selected nonmember economies, and contributes to the development of international standards for statistics. OECD statistics are made public in a range of statistical publications and databases.

Developing cross-cutting, high-quality, shared, accessible data about how a society is doing is crucial to ensure that decision making is both responsive and responsible at all levels. However, in an age of unprecedented and overwhelming information flows, the common understanding necessary for informed public discourse is often inadequate. In particular, quality of life is a concern common to all societies and a consensus is growing around the need to develop a more comprehensive view of progress – one that takes into account social, environmental, and economic concerns.

The OECD, in cooperation with other international organizations, has embarked on a global project to measure and foster the progress of societies. The work is built around regional conferences culminating in a world forum, launched in Palermo in 2004, and the second of which on statistics, knowledge, and policy took place in Istanbul in June 2007.

The organization also provides a setting in which member countries can compare and assess their own policies and practices. It is frequently the initiator and incubator of soft law – nonbinding instruments – that is, recommendations and decisions, which on occasion lead to formal agreements, treaties, or conventions. Perhaps the best-known example is the 1997 Convention on Combating Bribery of Foreign Public Officials in International

Business Transactions which has been ratified by a number of nonmember countries as well as all OECD members. More recently in 2005, the Council accepted the OECD recommendation concerning guidelines on earthquake safety in schools, which seeks to apply peer pressure and review to improve national policy and practice. This was the first recommendation in the field of education and was quickly followed by the Guidelines for Quality Provision in Cross-border Higher Education described more fully below.

Growth in Membership in OECD

The organization grew quickly to the point where by 1974 its 24 members “produced more than two-thirds of the world’s goods, and accounted for more than four-fifths of its trade” (Sullivan, 1997: 7). The 20 founding members of the OECD are: Austria, Belgium, Canada, Denmark, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, the United Kingdom, and the United States. They have since been joined by Japan (1964), Finland (1969), Australia (1971), New Zealand (1973), Mexico (1994), the Czech Republic (1995), Hungary, Poland, Korea (all 1996), and the Slovak Republic (2000).

Further enlargement is on the agenda. Since 2004, the European Union includes countries which are not OECD members. Moreover, attention is increasingly paid to the major global players: the 2006 OECD Ministerial Council Meeting encouraged the major emerging economies to participate more actively in OECD’s work and to move closer to OECD standards and disciplines and they called on the organization to support this process and to strengthen its capacity to deal with global issues and the impact of important new players in a comprehensive, systematic, and forward-looking manner.

On 16 May 2007, the OECD Council, meeting at the ministerial level, took a landmark decision, agreeing to:

offer enhanced engagement programmes, with a view to possible membership, to Brazil, China, India, Indonesia and South Africa; to invite Chile, Estonia, Israel, the Russian Federation and Slovenia to open discussions for membership of the Organisation; and to expand the OECD’s relations with selected countries and regions of strategic interest to the OECD, priority being given to South East Asia, with a view to identifying countries for possible membership.

Funding OECD Work

The organization is funded primarily by assessed and voluntary contributions from its member countries,

within the framework of a biennial program of work and budget. Through the budget, the Council accords the necessary commitment authorization and makes the necessary appropriations for the functioning of the organization and the delivery of its agreed output results. It determines the amount of assessed contributions to be paid by members after taking into account other resources of the organization.

All the OECD member countries fund the Part I Budget (M EUR 167 in 2007), which accounts for about 50% of the overall budget (M EUR 340 in 2007). Their contributions are essentially based on a scale of contributions proportional to the relative size of their economies with a cap of 24.975% (USA). Part II programs (around M EUR 67 in 2007) include a significant number of non member participants in addition to those member countries. Part II programs are funded according to a scale of contributions or other agreements among the participating countries. The other main budget items are pensions (M EUR 86 in 2007) and publications (M EUR 12).

The approval of the budget by the Council empowers the secretary-general to make all payments to be borne by the organization, and to receive the income entered in the budget, together with any other resources accruing to the organization in respect of its activities.

Engagement with Nonmember Economies

From its beginning in 1960 global relations have been an integral part of the OECD program. The organization’s global nature has been expressed in the OECD Convention, which states in Article 1, that OECD Members “should contribute to sound economic expansion in Member as well as non-Members countries in the process of economic development.”

However, until the mid-1990s, most of the work with nonmembers was either done with Central and East European transition economies, or it was undertaken by separate bodies of the organization. The work with transition economies was unidirectional, that is, aimed at assisting transition economies in their development toward market economies. Things have changed since 1997 when the OECD progressively evolved from a traditional concept of outreach in its relations with the rest of the world to a two-way flow where giving access to and participation in core OECD work and processes is as important as disseminating OECD best practices. Today, besides the OECD’s 30 members, many more countries and economies outside its membership are involved in the organization’s work. In 2007, 25 nonmembers participated as regular observers or full participants in at least one committee or working group. Altogether, there are about 70 nonmembers engaged in at least one OECD working party, scheme, or program.

The OECD's Global Relations Programme includes policies to enhance the investment climate, improve both public and corporate governance, build stronger national institutions for trade policy, and, more generally, to encourage the range of domestic reforms required in all countries to reap the benefits of globalization. The program consists of global forums, regional approaches, and country programs, which together propose solutions at the global, regional, and country levels.

Development of Work on Education

Even in the 1950s, before the establishment of the OECD, one office within the OEEC addressed issues of education and provided analyses about how to increase the number of students, as well as scientific and technical personnel. This was a response to the need to improve the scientific and technical potential of European countries in the face of competition from the US and – following the Sputnik launch – the USSR. The 1960s were a decade of rapid educational growth throughout the OECD area, especially in secondary and higher education. Consequently, the OECD focused on issues of managing – and paying for – expansion, using a combination of manpower planning and an investment approach to education.

The formal recognition of the educational policy role of OECD came with the creation of the Education Committee in 1970, with a mandate to address “prospects and policies for educational growth and development to meet social and economic objectives, both in relation to the general problems of allocating resources and for the efficient management of resources in education as such.” Both the Programme on Educational Building and the Programme on Institutional Management in Higher Education have their origins in the early 1970s, while other key themes of work in that decade include equality of opportunity and the related debate about selection for secondary school, and early work on recurrent education which – renamed lifelong learning – has been a leitmotif of OECD work ever since. The economic outlook for the late 1970s and 1980s was dominated by the oil shocks and the ensuing recession. The OECD's work on education put a greater emphasis on the labor market relevance of education through vocational education and training, and to an examination of the funding of higher education.

The dominant feature of the 1990s was the developing capacity and confidence of the organization in collecting quantitative information on education, using it to develop indicators, and not just statistics, and the gradual acceptance that policy development could be supported by international comparative analysis of outputs and outcomes, not only inputs. The annual publication in September of Education at a Glance, first published in 1992 has become a fixture on the educational scene, while the Programme on

International Student Assessment (PISA) in secondary education has had an even more explosive impact. In 2002 a separate Directorate for Education was created which brings together most the OECDs work on educational issues.

OECD Work on Higher Education

Unlike UNESCO the OECD Directorate for Education does not have a division of higher education; and unlike the Council of Europe it does not have a standing Committee overseeing work on higher education policy. Analysis of higher education policy and practice runs across the four functional divisions of the directorate: Education and Training Policy Division, Centre for Educational Research and Innovation, Indicators and Analysis Division, and Education Management and Infrastructure Division. The aim is to bring a set of skills and expertise to bear on the analysis of the sector in appropriate combinations.

It has been recognized by all the OECD countries that higher education plays a vital role in driving economic growth and social cohesion, and it is now understood that a high-quality system of higher education is central to the ability of nations to participate successfully in the global knowledge economy. With more and more players getting involved in higher education, and with the great expansion and diversification of higher education system itself, this sector is facing challenges to meet the needs from knowledge economy, labor market, local community, and individual learner. This context has led the OECD to focus on higher education in its work related to education and innovation. In 2006, the biennial meeting of the OECD Education Committee at Ministerial level at Athens, Greece focused specially on higher education at the first time. “Higher education: Quality, equity and efficiency” was the theme of the meeting where issues like purpose, governance and sustainable provision of higher education, who should pay for higher education, measuring the quality and impact of higher education, internationalization and higher education's contribution to research and innovation were addressed. Participants from different countries all agreed on a new task: to go beyond growth, by making higher education not just big but also better.

The OECD is the main collector and provider of reliable, international comparative data on a wide array of aspects of education. On higher education, the OECD develops statistics and indicators about access and participation, finance and investment, labor force attainment and on internationalization. The latter will seek to capture more comprehensive data on mobility, including data by field of studies. In addition, the OECD will continue to develop indicators on labor market earnings and the returns to education for the individual and for society. These statistics and indicators are widely used to inform policy decision making. The OECD will also assess the

skills and competencies of the adult population in various countries with the new Programme on International Assessment of Adult Competencies (PIAAC). Since 2007, the OECD has been exploring possibilities for an international assessment of the general and subject specific competencies of higher education graduates known as AHELO – the Assessment of Higher Education Learning Outcomes.

The thematic review of tertiary education, which has been conducted between 2004 and 2007, aims to examine how the organization, financing and management of tertiary education can help countries achieve their economic and social objectives. The focus of the review is primarily upon national policies for tertiary education systems, rather than upon policies and practices at the institutional level. Key questions include the economic and social objectives of tertiary education; sustainability, structures, links and mechanisms to ensure quality; mobilizing adequate funding resources; and national policies and mechanisms to ensure effective governance. More specifically, the review synthesizes research-based evidence on the impact of tertiary education policies, identifies innovative and successful policy initiatives and practices, facilitates exchanges of lessons and experiences among countries, and identifies policy options for countries. Twenty-four countries take part in the review. In addition, some countries have chosen to take part in a ‘Country Review’. This involves an external review team undertaking a country visit. The panel produces a ‘Country Note’ containing an analysis of national tertiary education policies and policy recommendations. The final comparative report published in 2008 brings together the evidence collected and presents key findings and policy messages.

Internationalization and Trade in Higher Education

Internationalization and trade in higher education have also been a recent focus of the work of the OECD’s directorate for education. The increasing international mobility of students, faculty and employees, and new forms of cross-border delivery of education call for an international policy approach because internationalization challenges the regulatory capacity of national and regional education authorities. Cross-border tertiary education presents opportunities and challenges in sending as well as receiving countries for quality, access, cost, and capacity building. It has become a significant economic and commercial stake in some countries and educational services are included in the current negotiations under the General Agreement on Trade in Services in the World Trade Organization. The Center for Educational Research and Innovation (CERI) has brought together the education and trade communities to discuss the opportunities and

challenges of these new trends through three fora on trade and education in 2002, 2003, and 2004.

The policy implications of cross-border tertiary education have been analyzed in two publications: *Internationalization and Trade in Higher Education: Opportunities and Challenges*; and *Quality and Recognition in Higher Education: The Cross-border Challenge*. Furthermore, the OECD develops conceptual foundations and a data strategy to improve international statistics and indicators on the internationalization of tertiary education.

The OECD has collaborated with UNESCO on the development of guidelines for cross-border tertiary education that will enhance learner protection while respecting countries’ rights to regulate the quality of their systems. These guidelines are based on an analysis of the ways in which OECD countries deal with international quality assurance, accreditation, and recognition of higher education qualifications. The guidelines have been endorsed by the OECD Council in 2005 and their implementation is overseen by the OECD Education Committee.

Future of University and Tertiary Education Systems

Another strand of OECD’s work in higher education examines options for the future of university and tertiary education systems over the next 15 years. To this end, CERI elaborated four scenarios about the future of higher education systems. These scenarios inform about the socioeconomic changes affecting higher education and about the challenges and opportunities offered by these trends. They are intended to stimulate policy debate about strategic and long-term plans, and to help stakeholders in proposing adequate responses to socioeconomic changes.

To develop the scenarios, the OECD and higher education experts undertook in-depth thematic reviews of how six major socioeconomic changes affect higher education systems. The changes reviewed were:

1. demographic change;
2. avenues opened by new information and communication technologies for learning, teaching and research;
3. the rise of market forces and quasi market forces;
4. the globalization of higher education;
5. changes in university research; and
6. labor market demands.

The four scenarios about the future of higher education systems were developed based on these thematic reviews and on the discussions in various expert meetings and stakeholder seminars. The OECD program on Institutional Management in Higher Education (IMHE) was also involved in this project and looked at the implications of socioeconomic changes for higher education institutions.

The future scenarios were presented and discussed at the Meeting of OECD Education Ministers in Athens in 2006.

The Program for Institutional Management in Higher Education (IMHE)

Issues around the governance and management of higher education institutions have for many years been a feature of the work of the OECD's Directorate of Education. These topics are addressed by the Programme on Institutional Management in Higher Education (IMHE). This program differs from other OECD programs in that it is financed by the contributions of more than 200 members, including higher education institutions (the majority), associations of institutions and Government departments. Its mission is to provide members with analysis and advice on issues of higher education governance and institutional strategy. Since its creation in 1969 the original focus on management information tools and capacity building has broadened to include the wider interface between government, academia, and the market. IMHE is essentially a collaborative network. Member institutions meet in a variety of settings to discuss and to develop their idea on issues of the day. The research activities are supported by OECD experts and external consultants. A governing board made up of representatives of the members determines the Programme of Work, within the broad framework of the OECD.

IMHE addresses a variety of issues about institutional management and typically runs three to four projects at a time. One major current focus has been the investigation of innovative solutions for improving the contribution of higher education institutions to regional development. This project is a response to the finding that higher education can make significant contributions to regional development but that potential synergies are often thwarted by failures of communication and conflicting agendas in higher education institutions. Other IMHE projects have addressed institutional strategic management in a changing policy environment, the impact of ranking an institutional behavior, university research management, quality management, and higher education internationalization strategies.

IMHE supports its members through the publication of the journal *Higher Education Management and Policy*, which addresses higher education administrators and managers. The journal covers issues such as quality assurance, human resources, funding, and internationalization. In addition, IMHE helps its members to build capacity in institutional management through leadership development seminars, the biennial general conference, international meetings on specific issues and the IMHE newsletter and website. Topics that have been addressed in recent years

include human resource management in higher education, public relations of higher education institutions, or the role of governing boards. The Centre for Effective Learning Environments (CELE) works with IMHE to examine trends in the provision of tertiary education infrastructure.

Directorate for Science, Technology and Industry (DSTI) Work on Higher Education

The DSTI is responsible for work on research and innovation. Innovation and R&D are pillars of a knowledge-based society, as well as fundamental to the dynamism and effectiveness of education. They focus on questions relevant to education like: is education sufficiently innovative? Does the education system invest sufficiently in R&D? A number of relevant indicators suggest that there is a long way still to go. The lessons of this work are of interest to those at very different levels in the overall educational enterprise, from the 'macro' level of government right through to 'micro' level of practice. It also brings in the 'meso' level of the wide range of intermediaries in between who are critical to the innovation and R&D process.

With its agenda set by Ministries responsible for science, technology and Industry, DSTI has a strong interest in educational innovation and R&D, and the development of human resources. The essential part of DSTI's work deals with higher education and how this sector can be more effectively developed and used as a lever of change within knowledge-based societies. It focuses on policies in support of private-sector innovation: financing R&D and education; using intellectual property rights and competition policy to create innovation-friendly environments; and fostering links between science and industry. Management of public research, including R&D in higher education is also a key area of DSTI's analyses. Work focuses on: priority setting and funding of public research and questions relating to development of human resources for the knowledge economy, including innovation in the education system.

The Global Dimension of OECD's Work on Higher Education

Given the increasing importance of higher education in emerging economies and the growing internationalization of higher education, the OECD undertakes projects with a global dimension and includes nonmember countries in their studies. Global issues are frequently pursued in co-operation with UNESCO and the World Bank. Together with UNESCO, IMHE has begun to develop an International Higher Education Policy Portal (IHEPP) intended to inform policymakers, institutional leaders, and other stakeholders about policy developments and

experiences in higher education. Other examples of projects with a global perspective are the aforementioned guidelines for Quality Provision in Cross-border Higher Education (see above), the forum on trade in educational services, and the study 'Financing Education – Investments and Returns', which investigated the link between the level of education and economic growth in 16 emerging economies. All these activities were undertaken in cooperation with UNESCO.

The OECD also frequently cooperates with the World Bank in order to make its analyses valuable to member as well as nonmember countries. IMHE supported the project Internationalization of Higher Education in Latin America which was led by the World Bank and the identified risks, opportunities and challenges of internationalization in this specific context. Another example is a seminar on quality assurance in tertiary education which had the goal of moving toward a collection of general principles of good practice, as well as to set a research agenda to better understand what makes for effective quality assurance in developing countries. CERI is working on the possible uses of cross-border tertiary education for capacity building in developing countries with Netherlands Organisation for International Cooperation in Higher Education (NUFFIC) and the World Bank, and is preparing a joint publication with the latter.

Conclusion

Over the past 40 years, the OECD has made important contributions to the development of higher education around the world. In cooperation with policymakers, institutional leaders, and researchers, the OECD has produced influential analyses of important issues such as lifelong learning, internationalization, or the contribution of higher education to socioeconomic development. This sharing of good practices has supported policymakers and institutional leaders in preparing higher education systems for a global knowledge economy. Due to the OECD's provision of international comparative statistics and indicators on the performance of higher education systems, policymakers now have the necessary information for making sustainable and strategic policy decisions. As an international organization, the OECD is uniquely positioned for collecting international comparative data, promoting the international exchange on good practices and developing international guidelines. This role as an international disseminator of data and good practices is likely to become ever more important as higher education continues to expand, diversify, and internationalize.

Acknowledgment

I would also like to acknowledge the assistance of Wen Wen, Department of Education, University of Oxford, in preparing this article.

Transforming Higher Education in Developing Countries: The Role of the World Bank*

J Salmi and R M Bassett, The World Bank, Washington, DC, USA

© 2010 Elsevier Ltd. All rights reserved.

Introduction

The time when higher education was almost a proscribed subject at the World Bank is long past. The 2002 publication of *Constructing Knowledge Societies* marked the culmination of a decade of growing attention to and investment in higher education in all regions of the world where the Bank is active. Not only is higher education seen today as a crucial element in the Bank's development strategy, but the Bank's thinking and actions in this area have also begun to influence a number of bilateral donors into reconsidering their own focus on basic education as the only priority for financial and technical assistance in the education sector.

Higher education's contribution to economic and social development is multifold. It exercises a direct influence on national productivity, which largely determines living standards and a country's ability to compete in the global economy. Higher education institutions support knowledge-driven economic growth strategies and poverty reduction by (1) training a qualified and adaptable labor force, including high-level scientists, professionals, technicians, teachers in basic and secondary education, and future government, civil service, and business leaders; (2) generating new knowledge; and (3) building the capacity to access existing stores of global knowledge and to adapt that knowledge to local use. Higher education institutions are unique in their ability to integrate and create synergy among these three dimensions. Sustainable transformation and growth throughout the economy are not possible without the capacity-building contribution of an innovative higher education system. This is especially true in low-income countries with weak institutional capacity and limited human capital.

This article begins by presenting the progression of the World Bank's position with respect to higher education and its contribution to development. It then reviews the different ways in which the Bank works with developing and transition countries in support of their higher education reform efforts, before concluding with a few

observations about higher education's prospects within the World Bank's agenda.

The World Bank's Policy Framework: From Taboo Topic to Mainstream Theme

Even though the first World Bank project in education, launched in 1963 in Tunisia, included a teacher-training component, for many years the institution did not consider support for higher education among its priorities, and decades passed before the Bank developed a fully articulated and supportive position regarding the importance of higher education in the development agenda. In fact, during the era between 1963 and the 1994 publication of the first policy paper on higher education, *Higher Education: The Lessons of Experience*, the education sector within the Bank was guided by rate-of-return formulas that discouraged investment in higher education in favor of primary and secondary education. Skepticism over the comparative value of investment in and reform of higher education in borrower/client countries led, in parts of the Bank, to the purposeful exclusion or, at best, minimization of higher education within lending for the education sector.

Later Bank-supported research and policy papers, including those analyzed in this document, cast doubt on the validity of rate-of-return analysis as the main approach for measuring the value of investment in tertiary education. By focusing exclusively on the private returns of government spending, the methodology excluded broad social benefits such as research externalities, entrepreneurship, job creation, good economic and political governance, and the effect of a highly educated cadre of workers on a nation's health and social fabric (Bloom *et al.*, 2005: 20).

With the acknowledgment that higher education "is of paramount importance for economic and social development" (p. 1), the first policy paper marks a significant turning point in the Bank's support for initiatives designed to improve higher education capacity in its client countries. This paper identifies the crisis in higher education emerging around the world: with diminished public funding coupled with dramatically increasing need and demand for higher education and operational inefficiencies at the institutional level.

In this policy paper, the Bank outlined four key directions aimed at reform for higher education in developing

*Respectively Tertiary Education Coordinator and tertiary education consultant the World Bank. The findings, interpretations, and conclusions expressed in this paper are entirely those of the authors and should not be attributed in any manner to the World Bank, the members of its Board of Executive Directors or the countries they represent.

countries: diversification of institutions, including private institutions; diversification of funding sources, including student fees, and linking funding with performance; reexamining the links between government and higher education; and focusing policy developments on quality and equity objectives (World Bank, 1994: 4). However, this paper does not indicate so much a transition of focus from primary/secondary to higher education as it does a realization that higher education serves a separate and equally important function in broad socioeconomic development, requiring a distinct level of attention and expertise.

Following the first policy paper and the subsequent emergence of higher education as a stronger area of interest for the Bank's education endeavors, the Bank and the United Nations Educational, Scientific and Cultural Organization (UNESCO) convened an independent task force to examine the specific challenges facing higher education in developing countries at the turn of the twenty-first century. *Higher Education in Developing Countries: Peril and Promise* (2000) emerged from the efforts of this group, which was headed by professors Henry Rosovsky (Harvard University) and Mamphela Ramphele (University of Cape Town), and included researchers, policy analysts, and practitioners of higher education from 13 countries.

Peril and Promise emerged from 2 years of detailed research as well as discussions and interviews of relevant issues with actors around the world. The focus of the report is the crises that higher education in developing countries must manage in order to fulfill its mission of promoting sustainable cultural, social, and economic development. Major areas of concern included: privatization, access (particularly for women), diminished government funding, and increased demand. Of greatest consequence in the short term is the decline of funding at a time of dramatically increased demand as well as the understanding that effective development depends on becoming an active participant in the international knowledge economy.

The report expounds upon four main areas in which immediate action is needed, including: funding (focusing on mix-source models), resources (using physical and human capital to its greatest advantage), governance (promoting structures for good governance and effective management techniques for environments with limited resources), and curriculum development (with focus on complementary elements such as general education and investment in science and technology). These issues are, by and large, reminiscent of the issues of focus in *Higher Education: The Lessons of Experience*, exposing the inherent challenge of effectively addressing deeply embedded issues, regardless of awareness of or commitment to the necessity of taking such action.

Peril and Promise provides both qualitative, anecdotal evidence of the problems plaguing higher education development, and quantitative data supporting comparative analyses on the demographics of higher education around the world. The report takes a stance supporting

comprehensive investment in higher education as a vital component of sustainable development in a global knowledge-based economy and political environment. It concludes that policymakers and the higher education community must focus on two, highly broad issue areas: increasing resources for higher education and managing those resources better and more efficiently.

Finally, in 2002, the Bank published its most comprehensive examination of higher education as a tool for poverty reduction, development, and participation in the global knowledge economy in *Constructing Knowledge Societies: New Challenges for Tertiary Education*, which emerged from a thorough data collection and research process that not only focused on the efforts of the Bank directly, but also examined the experiences of relevant actors outside the Bank. By bringing together these different perspectives, *Constructing Knowledge Societies* offers a broad analysis of the current issues facing the higher education sector across developing and transitional countries. It also presents predictions and recommendations for the future of higher education in these countries.

Between the publication of *Higher Education: The Lessons of Experience* in 1994 and *Constructing Knowledge Societies: New Challenges for Tertiary Education* in 2002, the list of the most challenging issues facing higher education reform had changed very little. Unresolved challenges at the time of the publication of *Constructing Knowledge Societies* included: the need to expand the higher education sector to meet the rapidly growing demand, inequality of access and outcomes, quality assurance concerns, and the need for more effective and relevant governance and management structures. The range of findings of *Constructing Knowledge Societies* spans from more traditional concerns such as promoting higher education as a tool for human (cultural), economic, and social development to more modern challenges such as utilizing higher education as a means of participating in an increasingly service- and technology-driven world and facing the myriad challenges of globalization.

The Bank, as a lending and knowledge-sharing institution, is in a unique position to promote mechanisms to assist countries in addressing all of these issues within higher education reform policies. *Constructing Knowledge Societies: New Challenges for Tertiary Education* presents the basic principles that the Bank follows in supporting specific activities within any one country and notes that the support should: "be appropriate to each country's circumstances; based on strategic planning at the national and institutional levels; promote autonomy and accountability in the higher education sector; focus on capacity enhancement and regional sharing of successful experiences and models; sequence activities in a manner consistent with the entire development agenda for any one country; and acknowledge and account for the political nature of higher education reform" (pp. 119, 120).

In its conclusion, *Constructing Knowledge Societies* does not attempt to present readymade solutions, per se, to the challenges originally outlined in *Lessons* and reiterated in *Peril and Promise*. Indeed, in *Constructing Knowledge Societies* the Bank explores more thoroughly than in previous publications the need for locally driven higher education initiatives that can be supported and enhanced by the international expertise offered by a multilateral organization like the Bank.

At the same time, however, *Constructing Knowledge Societies* identifies significant global public goods that countries on their own may not be able to handle effectively, including human capital migration (brain drain), intellectual property concerns, the challenge of quality assurance for borderless higher education, the digital divide, and the impact of the global trade in services on higher education.

In sum, *Constructing Knowledge Societies* makes the case that merely modernizing the higher education system will no longer be enough. To play their role effectively, higher education systems must be locally relevant yet globally aware, adaptive and evolving, flexible, and of high quality. *Constructing Knowledge Societies* underscores the continuum of engagement in higher education development that the Bank has undertaken and the direction in which the Bank anticipates a long future of related efforts.

The latest World Bank *Education Sector Strategy Update* (December, 2005) confirms the importance of tertiary education within a holistic view of the education sector, recognizing the key role of education advancement at all levels and the significant linkages between education and the rest of the economy. The Education Sector Strategy Update (ESSU) emphasizes three themes: “integrating education into a country-wide perspective, broadening the strategic agenda through a system-wide approach (from pre-school through tertiary education), and becoming more results-oriented” (p. vi). These themes underscore the broader focus on linkages between education and labor markets, with more systematic attention to secondary and tertiary as pillars of the knowledge economy, to complement efforts made in expanding basic education through Education for All (EFA). The 2005 ESSU ties together the Bank’s successive and evolving statements about the significance of tertiary education with *Lessons* (1994) and continued through *Perils and Promise* (2000) and *Constructing Knowledge Societies* (2002) and translates the foundation of these works with continued support for investment in tertiary education development around the world.

Table 1 summarizes the main messages and implications of the various policy papers reviewed in this article.

World Bank Activities in Higher Education

Though the World Bank is known, essentially, for the loans given to countries in support of their development

efforts, an equally significant contribution is the policy dialog and analytical work conducted by the Bank, as a knowledge-sharing institution, to help governments consider options about possible higher education reforms and set the stage for their implementation. **Table 2** presents the list of countries where higher education studies were prepared in recent years.

Through its projects across four continents, the World Bank has supported countries’ efforts to expand higher education and improve its quality and relevance. Even in earlier times when higher education was not a priority subsector, the Bank financed a significant number of projects in response to specific requests by countries such as China, Kenya, or Tunisia. World Bank projects in tertiary education have amounted to approximately one-third of total lending in education in the era since the 1970s. **Table 3** details the lending for tertiary education within total education lending between 2001 and 2006, providing important data to highlight fluctuations in education lending as a whole and tertiary education lending in particular. Specific commitments to tertiary education during this 5-year period amount to only 14.5% of new education commitments. It is important to note, however, that commitments in other areas (e.g., lifelong learning initiatives and lending for teacher training for primary and secondary school teaching) may be classified under a different education subsector but are, in fact, directly tied to tertiary education.

Table 4 provides a more detailed illustration of the scope of Bank lending for higher education in recent years, with total lending figures broken down by region and highlighted with examples of the largest borrower countries during this period.

The main types of activities supported by Bank projects come under one or more of the following headings, tailored to the needs of the country and the specific requests of the national authorities and the higher education community:

- vision development, strategic planning, and consensus building at both the national and institutional levels;
- finance reforms (e.g., allocation of recurrent budget; competitive funding; cost sharing; student loans; and scholarships)
- governance and management reforms (creation of policy bodies; mergers; adoption of academic credit systems; and management information systems);
- quality improvement (strengthening of existing programs; evaluation and accreditation systems; innovations in program content and delivery; innovations in academic organization; and information and communication infrastructure);
- institutional diversification (establishment or strengthening of polytechnic or technical institutes); and
- science and technology development (strategy development; capacity for monitoring and evaluation; reform

Table 1 Key publications/policy frameworks

<i>Publication</i>	<i>Challenges</i>	<i>Main messages</i>	<i>Bank role/strategy</i>
<i>Higher Education: Lessons of Experience</i> (1994)	Need to re-examine rate-of-return priority that de-emphasized higher education in favor of primary and secondary education	<ul style="list-style-type: none"> • Higher education is of paramount importance for economic and social development • A crisis in higher education is emerging around the world, caused by diminished public funding, rapidly increasing demand for higher education, and operational inefficiencies at the institutional level 	<ul style="list-style-type: none"> • Diversification of institutions, including private institutions • Diversification of funding sources, including cost-sharing, and linking funding with performance • Re-examining the links between government and higher education institutions • Focusing policy developments on quality and equity objectives • Funding (focusing on mixed source models) • Resources (effectively using physical and human capital) • Governance (promoting structures for good governance and effective management) • Curriculum development (with focus on complementary elements such as general education and investment in science and technology)
<i>Higher Education in Developing Countries: Peril and Promise</i> (2000)	Crises in higher education in developing countries must be managed to ensure HE fulfils its mission of promoting sustainable cultural, social, and economic development	<p>Major areas of concern include:</p> <ul style="list-style-type: none"> • privatization • access (particularly for women) • diminished government funding • increased demand for HE 	<ul style="list-style-type: none"> • Curriculum development (with focus on complementary elements such as general education and investment in science and technology)
<i>Constructing Knowledge Societies: New Challenges for Tertiary Education</i> (2002)	Remaining challenges include expanding the HE sector to meet increasing demand, inequality of access and outcomes, quality assurance concerns, and the need for more effective governance and management structures	<p>Programmatic support for HE should be:</p> <ul style="list-style-type: none"> • appropriate to each country's circumstances • involve planning for development at institutional, local, and national levels • promote autonomy and accountability • focus on capacity enhancement and regional sharing of successful experiences and models • sequence activities in a manner consistent with the entire development agenda for any one country • acknowledge political nature of higher education reform 	<p>Asserts the need for locally driven higher education initiatives that can be supported and enhanced by the international expertise offered by a multilateral organization like the Bank</p> <p>Identifies significant global public goods that countries on their own may not be able to handle effectively, including:</p> <ul style="list-style-type: none"> • human capital migration (brain drain) • intellectual property concerns • the challenge of quality assurance for borderless higher education • the digital divide • the impact of the global trade in services on higher education
<i>Education Sector Strategy Update</i> (December 2005)	Recognizes the key role of education advancement at all levels and the significant linkages between education and the rest of the economy	<p>Emphasizes three themes:</p> <ul style="list-style-type: none"> • integrating education into a country-wide perspective • broadening the strategic agenda through a system-wide approach (from early childhood development through tertiary education) • becoming more results oriented 	<p>Support Bank's broader focus on education-labor market linkages, with more systematic attention to secondary and tertiary as pillars of the knowledge economy, to complement efforts made in expanding primary education through Education for All</p>

of resource-allocation mechanisms; competitive funding; promotion of research in priority areas; joint public-private sector technology development; capacity for metrology, standards, and quality testing; and intellectual property rights).

The combination of policy dialog, analytical work, and financial assistance has facilitated the implementation of comprehensive reforms in the higher education sector in countries as diverse as Argentina, Chile, China, Vietnam, Egypt, Tunisia, Ghana, or Mozambique. Often, governments use the resources made available through multilateral

loans as incentives for institutions willing to challenge old modes of operation and be innovative new ground after thorough strategic planning and/or self-evaluation efforts.

The competitive innovation funds that several countries have established with World Bank support have been among the most effective channels to stimulate the participation of higher education institutions in meaningful transformation efforts. Under such funds, institutions are typically invited to formulate project proposals that are reviewed and selected by committees of peers according to transparent procedures and criteria. One of the main benefits of competitive funding mechanisms is that they

Sub-Saharan Africa	223 (15%)	Ethiopia (\$37m), Ghana (\$30m)

From World Bank data.

not routinely talk to each other. In several countries, for example, the Bank has been instrumental in initiating a dialog between public and private universities, between universities and technology institutes, or between universities and employers. Similarly, in countries where the relationship between the government and the university sector is tense or even conflictive, the Bank sometimes manages to facilitate a constructive policy dialog on key issues, as happened in 2003 in Bolivia around the themes of quality enhancement and accreditation.

The Bank has also played a convening role at the regional level, as evidenced by the success of the global business school initiative in the Africa region and the launch of several regional quality-assurance networks (Asia and Latin America). Ideally, the regional policy seminars that the Bank organizes on a regular basis provide an effective forum for South–South knowledge sharing. In 2002–2003, for example, a series of seminars in South Asia helped stimulate reform efforts in Sri Lanka and Nepal. In 2005 and 2006, the Bank organized seminars in sub-Saharan Africa that helped disseminate successful reforms in individual countries and/or institutions.

While it is difficult to measure the direct impact of global publications such as *Constructing Knowledge Societies*, sometimes these policy documents can serve as catalysts for initiating reforms. In Pakistan, for instance, after the publication of *Peril and Promise*, the government established its own higher education task force whose findings and recommendations guided the launch of a comprehensive reform in 2003. In Yemen, the government received a small technical assistance loan (Learning and Innovation Loan) from the Bank in 2004 that facilitated the launch of

a nationwide consultation effort and the preparation of a long-term strategy for higher education reform.

The capacity of the World Bank to play these roles of convener and facilitator is due to several factors: the institution is able to rely on direct experience across a wide range of countries and situations; it interacts with client countries from a multisectoral perspective; it has learned to cooperate with multiple stakeholders; and it seeks to integrate its higher education work into the overall economic and social development framework of the concerned countries.

Conclusion

It is impossible to have a complete education system without an appropriate and strong higher education system . . . You have to have centers of excellence and learning and training if you are going to advance the issue of poverty and development in developing countries . . . the key . . . is higher education, not just on the technological side, but to create people with enough wisdom to be able to use it.

James D. Wolfensohn, former President of the World Bank (March 1, 2000).

In the past two decades, the World Bank has adopted a more holistic view of education, and higher education has become an essential part of the Bank's work in the sector, representing between 15% and 25% of the lending program in education depending on the year. Today, even countries that no longer need or want to borrow from the World Bank, such as China, Kazakhstan, or Malaysia, actively seek policy advice on various aspects of higher education reform, often guided by aspirations of becoming full-fledged knowledge economies.

In the coming years, the evolution of the World Bank's higher education program will likely be shaped by the following factors. First the Bank's higher education work will be increasingly framed within the overall context of the knowledge economy strategy first articulated in the 1998 World Development Report. Recent analytical work on innovation and competitiveness in Malaysia and Brazil, focusing on the role of higher education for human capital formation and the construction of strong national innovation systems, is symptomatic of this trend.

Second, in accord with a renewed Bank-wide focus on results, the success of higher education reforms will be assessed by looking at outcomes rather than considering only the reform measures themselves. This will require extensive work on the determinants of quality and the effectiveness of various quality assurance mechanisms, progress in measuring actual learning outcomes of students, and impact evaluations of innovative schemes

such as the new voucher funding in the US State of Colorado and Kazakhstan or the ProUni program in Brazil, which provides scholarships for low-income students financed through tax exemptions for private higher education institutions.

Third, the World Bank recognizes that, in higher education more than in any other area of education development, reform programs and innovative approaches have little chance of success unless careful attention is paid to the political economy of change. Stakeholder consultation and consensus building are as important as a technically sound design. Mozambique provides a powerful illustration of how a new minister of higher education managed to implement a comprehensive reform based on a strategic vision elaborated after extensive consultations and debates. Bank experience in several countries underscores the need for continuous policy dialog and vision sharing with all stakeholders to ensure the sustainability of reforms. Increasingly, the preparation of new Bank projects in support of higher education reform includes a social assessment exercise to identify the concerns of key stakeholders and inform the design of the project, as happened, for example, in Jordan, China, and Colombia.

Last but not least is the increased attention paid to global public good issues that affect higher education in all countries but that are often beyond the control of any one government. For example, the World Bank is supporting efforts to improve connectivity in Africa and to develop distance education opportunities through the African Virtual University. It is also helping establish regional networks of quality-assurance agencies in Asia, Latin America, and Africa and working toward consolidating these regional initiatives into a global network that would help developing countries enhance the quality and relevance of their tertiary education institutions through capacity building and experience-sharing activities. In attempting to address these global public good issues, the World Bank works increasingly in partnership with other multilateral agencies (OECD, UNESCO, AUF, etc.) and with international and regional associations of universities (IAU, AAU, SADEC, etc.).

UNESCO's Role in the Development of Higher Education in a Globalized World

S Uvalić-Trumbić, UNESCO, Paris, France

© 2010 Elsevier Ltd. All rights reserved.

UNESCO and Its Global Mission

The United Nations Educational, Scientific and Cultural Organization (UNESCO) was created in 1945 in the aftermath of World War II. Although it was written several decades before world globalization entered the vocabulary, its Constitution describes a mission that balances global and national concerns:

That since wars begin in the minds of men, it is in the minds of men that the defenses of peace must be constructed; (. . .)

That a peace based exclusively upon the political and economic arrangements of governments would not be a peace which could secure the unanimous, lasting and sincere support of the peoples of the world, and that the peace must therefore be founded, if it is not to fail, upon the intellectual and moral solidarity of mankind; (. . .)

For these reasons, the States Parties to this Constitution, believing in full and equal opportunities for education for all, in the unrestricted pursuit of objective truth, and in the free exchange of ideas and knowledge, are agreed and determined to develop and to increase the means of communication between their peoples and to employ these means for the purposes of mutual understanding and a truer and more perfect knowledge of each other's lives; (. . .)

These principles are firmly embedded in UNESCO's Higher Education program. The formal establishment of the program goes back to a Resolution adopted by the 2nd General Conference of UNESCO in Mexico (6 November–3 December 1947) which mentioned higher education explicitly as one of the six main areas of work. Working with universities was perceived as a useful vehicle for promoting international understanding. Along with the other educational activities identified in these early statements, such as primary education, adult education, and teacher education, higher education is still at the core of UNESCO's strategy today.

A recent UNESCO world report underlines the fundamental role that institutions of higher education are destined to play in knowledge societies following radical changes in the traditional patterns for the production, diffusion, and application of knowledge. It reaffirms the unique position of UNESCO "as the only one in a position to carry out the tasks needed to ensure quality and

relevance of systems of higher education, while at the same time furthering the development of international cooperation in this field" (Towards Knowledge Societies, UNESCO, 2005).

This article will first look at the context of global higher education before giving examples of some of UNESCO's work.

Globalization and Higher Education: The Context

The trend to mass higher education is now the key driver in the worldwide development of the sector. Student enrolments are burgeoning and there are some 138 million tertiary students worldwide if part-time students are included (UIS, 2005). China and India have doubled enrolments in the past 10 years and China now has the largest higher education system in the world with some 27 million students in 2008.

Most countries want to join the knowledge society by following the example of developed countries where age participation rates in higher education of 40–50% are now perceived as necessary for sustainable development. Unfortunately, many countries in the developing world are far from reaching this percentage and government action alone cannot satisfy the rising demand. Indeed, government budgets for higher education are declining steadily on a per capita basis. An example from Africa demonstrates that due to the massive enrolment growth, public expenditure per student fell from US\$6300 in 1980 to US\$1241 in 1995 (Martin and Sanyal, 2006).

Burgeoning demand has encouraged a diversification in the ways higher education is provided and funded. Open universities, community colleges, and vocational schools are already making higher education more accessible, especially to working adults and those in remote rural areas.

One aspect of this trend is that private higher education (including for-profit institutions) is now the fastest growing element of the sector worldwide which already accounts for one-third of global enrolments. Although in Western Europe only 10% of students enrol in private higher education institutions (PHEIs), in other parts of the world they are now well established. For example, in Asia Pacific countries such as Japan, South Korea, Philippines, and Indonesia, 70% of students are enrolled in private institutions, although governments exercise

control and regulation over this private sector (Altbach and Levy, 2005). In Africa there are often partnerships between private and public institutions and IT academies like Cisco deliver certificates (Varghese, 2006). In Latin America 45% of enrolments are in private higher education, a figure that has risen from only 3% in 1950 (Levy, 2008), with Brazil, Colombia, and Argentina showing the highest enrolments in PHEIs.

Open and distance learning (ODL) and e-learning are growing in order to provide access to the wider student population now seeking higher education. Where there were only ten open universities in the world in 1988, by 2005 there were more than ten in India alone.

Growing student mobility is another dominant trend worldwide: 2.4 million students went abroad in 2004 – a threefold increase since 1980. African students are proportionately the most mobile, with one out of every sixteen studying abroad. The Global Student Mobility 2025 Report predicts that demand for international education will increase to 7.2 million students in 2025. However, some of these students will study with a foreign institutions in their own country. For example in 2004, 33% of all international students enrolled in Australian institutions studied in their own countries, a figure which was up from 24% in 1996.

This is an example of the growing mobility of programs and institutions. China saw a ninefold increase in foreign programs between 1995 and 2003, and in 2000 more Singaporean undergraduate students accessed a foreign program in Singapore than went abroad. With the rapid deployment of information and communications technology (ICT), ICT-enhanced Cross Border Higher Education (CBHE) is likely to become a significant development (Böhm *et al.*, 2003).

These trends in global higher education raise a number of policy issues for governments and institutions. Are private higher education, distance education, and cross-border provision the answers to expanding access to higher education in the developing world? What policies can governments and institutions adopt to ensure that these new providers make a positive contribution? How do countries address the challenges of Quality Assurance and the Recognition of Qualifications? What about the growing threat of degree mills and bogus institutions to the integrity of national tertiary systems? How can we draw a line between institutions providing substandard programs that are susceptible to improvement and the out-and-out degree mills?

UNESCO's Responses to These Trends

Policy debate

The World Conference on Higher Education (WCHE) that convened in Paris in 1998 gave a new momentum to policy debate on higher education. It brought together 4000 participants from 182 countries and provided a

comprehensive forum for policy debate. Education ministers were joined by other stakeholders, recognizing that governments could no longer manage alone the most radical renewal of higher education they have ever been required to undertake.

The 1998 conference adopted a World Declaration on Higher Education for the Twenty-first Century: Vision and Action, supported by an action plan (UNESCO, 1998). It outlined a conceptual framework based on a set of basic principles: broadening access to higher education as a key factor of development, both as a public good and also as a human right; promoting reforms of higher education at system and institutional levels to enhance quality, relevance and efficiency; and securing adequate resources and funding – both public and private – to cope with the increased demands placed on higher education by its different stakeholders.

As the twenty-first century dawned, globalization became another buzz-word in higher education: globalization as a form of greater interdependence as well as globalization as contrasted to internationalization. For some, globalization, in the sense of a global market, is seen as a threat to the traditional values of higher education, notably to the notions that higher education is a public good and therefore primarily a public responsibility, and that access to higher education based on merit is a basic human right.

As the nation-state loses its monopoly over higher education provision, there are concerns, for example, about how an agenda of social inclusion can be pursued in the context of the increasing commercialization of higher education. This has generated heated political debate about national sovereignty over higher education. The most common response is for states to focus their attention on quality, assessment, and standards, through quality assurance mechanisms and accreditation systems.

International organizations have had to position themselves in this worldwide debate, particularly after the General Agreement on Trade in Services (GATS), under the World Trade Organization (WTO), included higher education as one of the 12 tradable services under Education. A key event in the process was “OECD/US Forum on Trade in Educational Services” held in Washington in May 2002. Acrimonious discussions, pitting the academic and trade communities against each other, put the issue of the nature of higher education firmly on the table.

At the Conference, however, keynote speakers and leading government representatives, although stressing the opportunities for trade in education, also emphasized quality assurance, accreditation, and qualifications recognition as key elements in the trade-in-education agenda. They highlighted the importance of UNESCO's role in this global debate and urged that the nexus between trade and education be seen in a common and wider perspective, so as to maximize its benefits and minimize

possible disadvantages. It was also proposed that OECD and UNESCO should work together.

Following an expert meeting in September 2001, UNESCO pursued this agenda by launching the UNESCO Global Forum on International Quality Assurance, Accreditation and the Recognition of Qualifications in Paris in October 2002. This took the debate forward and strengthened UNESCO's mandate to address these issues. The opening address by Sir John Daniel, Assistant-Director General for Education, set the tone of the debates with a positive approach to globalization in higher education, based on the UN position on globalization, enshrined in UNESCO's Medium Term Strategy (globalization with a human face; globalization to be made to work for all). He put forward certain basic principles, combining the notion of higher education as a public good with the conviction that "new need not be bad" and that globalization promotes competition, which in turn creates diversity (Daniel, 2002).

The Global Forum was conceived as a response to the ethical challenges and dilemmas facing higher education in an era of globalization. Its mission was to provide a platform for exchange between different partners and to initiate debate on the social, political, economic, and cultural dimensions underpinning globalization and higher education.

Compared to the frustration felt by civil society and academia at the OECD Forum in Washington, the launch meeting of UNESCO Global Forum was more harmonious. It was successful in bringing together a wide variety of stakeholders ranging from for-profit providers such as the Apollo Group's Phoenix University, corporate universities such as Cap Gemini Ernst & Young, and the private sector such as the University Relations Division of Hewlett-Packard, to the UNESCO's traditional partners such as public higher education institutions, teachers' and students' associations. Both developed and developing countries were well represented.

The forum ended with unanimous support for an action plan. The participants agreed on the need to build bridges between education (i.e., academic values and principles) and trade in higher education services and that UNESCO, the WTO, and the OECD could complement each other in providing a joint forum to assess both the cultural and commercial aspects of trade in higher education.

The two subsequent meetings of the Global Forum (UNESCO, Paris in 2004 and Dar es Salaam, Tanzania in 2007) took these discussions further. They addressed respectively the issues of capacity building in higher education and responding to learners needs in new higher education spaces.

A third OECD Forum on Trade in Education was hosted by Australia in Sydney in October 2004 as a collaborative effort of the OECD, UNESCO, and Australia. The event was a good demonstration of unity and the

value of partnerships and showed that in the 2 years since the Washington event, the world had moved on in a constructive manner.

To make UNESCO's position clear an education sector position paper on "Higher Education in a Globalized Society" was prepared as one in a series of position papers that aimed to give UNESCO's views on some key issues in contemporary education. Based on reviews of trends, issues, global debates, and regional concerns through case studies, as well as UN and UNESCO standard-setting instruments and principles, UNESCO stated its position as follows:

Higher education in a globalized society should assure equity of access and respect cultural diversity as well as national sovereignty. In addition, UNESCO is committed to assuring the quality of global provision of higher education in an increasingly diverse higher education arena and raising the awareness of stakeholders, especially students, on emerging issues in this field. This position aims to establish the conditions under which the globalization of higher education benefits all.

The 1998 World Conference generated the establishment of two powerful, independent and self-financing networks, supported by extra-budgetary funding: the UNESCO Forum on Higher Education, Research and Knowledge with a Secretariat in the UNESCO Division of Higher Education but with a wider interdisciplinary approach, and the Global University Network for Innovation (GUNI) network with a Secretariat at the Technical University of Catalonia (UPC) in Barcelona. Both networks generate research and policy debate on issues related to globalization and higher education. However, the impact and outreach of these two networks deserve a more in-depth analysis which is beyond the scope of this article.

Standard setting

As part of its core functions of setting standards, building capacity at national and regional levels, and serving as a clearinghouse, UNESCO has grounded its responses to the new challenges in global higher education in the existing legal framework that is supported by the six regional conventions on the recognition of qualifications that have been ratified by over 100 member States worldwide. Although the ultimate objective of the conventions was to develop a universal convention covering the whole world, this is still an unrealistic objective, so the regional conventions are now being revised and regional frameworks are being strengthened in response to the rising challenges of globalization.

An important result of the Washington OECD/US Forum on Trade and the first meeting of UNESCO's Global Forum was the decision by the Education sectors of the two organizations to work together to develop

Guidelines for Quality Provision in Cross-Border Higher Education. The Guidelines address six groups of stakeholders in higher education: governments, higher education institutions, student bodies, recognition bodies, quality assurance bodies, and professional bodies. They recommend actions based on collaboration, foster mutual trust and confidence, and encourage access to reliable and transparent information. The overall aim is to promote quality in the growing phenomenon of cross-border higher education.

Global initiatives for capacity building in quality assurance

The 2002 Global Forum on International Quality Assurance, Accreditation and the Recognition of Qualifications created a space for policy debate. Its third meeting, held in Tanzania in 2007, brought together stakeholders around the theme, Guiding Learners in New Higher Education Spaces: Challenges for Quality Assurance and the Recognition of Qualifications. Since the key theme of the Global Forum was empowering learners, it discussed issues ranging from mobility and migration to academic fraud.

The meeting urged a strong focus on capacity building for quality assurance at all levels and the 2006 Guidelines for Quality Provision in Cross-border higher education jointly developed by UNESCO and the OECD were held up as a useful tool for this work as CBHE spreads. The Guidelines have been acknowledged as such within the Bologna Process in Europe. They featured at the last Bologna Ministerial Conference in 2007 and in the 2007 the London Communique, as part of the global context of the Bologna process.

In early 2008, UNESCO and the World Bank launched a new partnership, the Global Initiative for Quality Assurance Capacity (GIQAC). This aims to create a global framework to support capacity development in developing and transition countries. In the first year, GIQAC will support regional Quality Assurance networks in Africa, the Arab States, the Asia/Pacific region and Latin America and the Caribbean, as well as the International Network for Quality Assurance Agencies in Higher Education, INQAAHE. Capacity-building activities within GIQAC are also based on sharing experiences across regions and promoting South–South cooperation.

Clearinghouse: The UNESCO portal of higher education institutions

To further its responsibility for protecting and empowering learners, UNESCO launched a pilot project for a portal of recognized higher education institutions in 2006 and presented the first results in 2008. This work was a logical extension of its earlier work with the OECD on the Guidelines for Quality Provision in Cross-Border Higher Education as well as of its Study Abroad publication that includes information tools for students, directories and listings of

ODL institutions, financial aid and information on bogus providers.

The aim of the UNESCO Portal is to make up-to-date, accurate, and comprehensive information on recognized higher education institutions/providers available at the international level. It provides authoritative data on the status of higher education institutions and quality assurance systems in countries around the world in order to help students make informed decisions about undertaking higher education (including cross-border higher education), and to protect them from misleading information, biased guidance, low-quality provision, rogue providers, and qualifications of limited validity.

The pilot phase of the portal included access to information on institutions and systems in Argentina, Australia, Canada, China, Egypt, Jamaica, Japan, Kenya, Malaysia, Nigeria, Norway, Switzerland, the United Kingdom, and the United States of America. The portal was launched in April 2008, now counts 20 countries and is growing rapidly. The country information on the portal is managed and updated by the competent authorities in the participating countries.

Information on the national processes for recognizing or otherwise sanctioning institutions is available on the country pages. These define key terms, indicate where information can be found, describe the national higher education system, list recognized institutions and programs, and provide information for students planning to study in the country (including details on foreign credential assessment and recognition, opportunities for financial assistance, and provisions for cross-border higher education).

What about degree mills?

Fraudulent and bogus providers, popularly known as degree mills, threaten the credibility of the online provision of courses internationally by offering costly credentials and degrees of no educational value. Electronically delivered degrees are largely unregulated and pose serious challenges around the world. Although comprehensive and reliable data on degree mills are not available, thousands of degree mills are estimated to be in operation. The growing and often unsatisfied demand for higher education has created a significant market for such providers but few governments or organizations are positioned to do what is necessary to educate and protect the public.

These fraudulent providers often misuse the names of international organizations, in particular UNESCO, in various ways. These range from claiming a connection with UNESCO where none exists to exaggerating a real link with UNESCO to give the impression that UNESCO accredits them. UNESCO is not an accrediting agency.

The US Council on Higher Education Accreditation (CHEA) is working with UNESCO to address the

problem of degree mills and accreditation mills, beginning with the development of some general international principles. The aim is to develop suggestions for effective practice to assist the international community in confronting bogus providers. A possible outcome is the establishment of an ongoing, reliable network of higher education, quality assurance/accreditation bodies, and international organizations that can identify degree mills and share information and ideas.

The Next Milestone: The 2009 World Conference "The New Dynamics of Higher Education"

Is higher education today really a driver for development – for sustainable development – nationally and internationally? Does the sector live up to the expectations that it will foster change and progress in society and be a key architect of knowledge societies? How does higher education contribute to the development of education systems as a whole? What are the most significant trends that will shape the new higher education and research spaces? How are learners and learning changing? What are the new challenges for quality?

These issues will be on the agenda of the World Conference on Higher Education that is to be held from 5 to 8 July 2009 in Paris. The conference will take stock of changes in higher education since the 1998 World Conference on Higher Education and will address the new dynamics that are likely to shape the strategic agenda for the development of higher education policies and institutions for the foreseeable future.

The 1998 World Conference on Higher Education was a special moment for the international higher education community. However, the policy agenda has evolved considerably since 1998 and today the sector is a greater priority than ever. Higher education faces many challenges, both new and ongoing. Understanding them better will help to shape action at the global, regional, national, and institutional levels.

The 2009 world conference will provide a global platform for future-focused debate and thinking about the rapidly changing higher education and research spaces in order to identify the actions necessary to ensure that the sector meets both national development objectives and individual aspirations. The conference will bring together key stakeholders in a new commitment to the development of higher education. In preparation for this event, a series of regional conferences will be organized to bring specific regional concerns, expectations, and proposals to the 2009 world conference.

At the time of the preparation of this article, several significant regional and subregional events have already taken place as part of the build-up to the 2009 event: The Regional Conference on Higher Education and the Caribbean (CRES, 2008) held in Cartagena de Indias,

Columbia, on 4–6 June 2008; The Southeastern European Forum and High-Level Roundtable on Science, Higher Education and Innovation Policy in Budva, Montenegro on 1–3 July 2008; the Asia-Pacific Sub-regional Preparatory Conference in Macao, SAR China on 24–25 September 2008, and the Regional Conference on Higher Education in Africa (CRESA, 2008) in Dakar, Senegal (10–13 November 2008). These conferences revealed some convergence of thinking on the key challenges faced by higher education and also identified specific regional concerns.

This suggests that the key challenge for the 2009 WCHE will be to establish a proper balance between the global and local missions of higher education and reveal how UNESCO can best play its role in leading the world toward a new commitment to Higher Education and Research by sharing responsibilities with the different stakeholders.

Conclusion

For many years the primary educational focus of the international community and of UNESCO as its lead agency for education has been the achievement of the goals of Education for All (EFA), most especially Universal Primary Education. So far higher education has seemed somewhat marginal to that work but this is now changing rapidly for two main reasons.

First, the growing success of the campaign for Universal Primary Education has led to large increases in the numbers of children seeking education beyond that level. Ministers in many countries are grappling with the challenge of expanding the provision of both secondary and tertiary education to meet the coming surge in demand.

Second, there is increasing acknowledgment that "at no time in human history did the welfare of nations depend in such a direct manner on the quality and outreach of their higher education systems and institutions" (UNESCO, 2004). Many Higher Education Ministers are coming to UNESCO with requests for help with policy development to strengthen and sustain their national higher education systems. As Professor Mahmood Mamdani told the 17th Conference of Commonwealth Education Ministers: "If your object is to transform general education, you have to begin with higher education. For higher education is the strategic heart of education; it's where choices are developed" (Commonwealth Secretariat, 2006).

International organizations are repositioning themselves accordingly. The Secretary-General of the UN, Ban Ki-moon, recently announced that the UN is developing an initiative called Academic Impact aimed at building stronger ties with institutions of higher learning, believing that they can foster the development of global

citizenship and encourage higher education to respond to the global challenges of this millennium.

We hope that these global political realities will stimulate the renewal of UNESCO's original mission of intellectual solidarity and empower it to continue its successful tradition of support of higher education by playing a leading role in the new circumstances of a globalized world.

Relationships Between Central and Decentral Powers and Responsibilities

Of the nearly 200 countries worldwide, about 20 are characterized by a federal political system, and about 20 others with a dominant allocation of the political power at the central level have some federal features. With the exception of China, federal systems prevail in the largest countries of the world, but can also be found in small countries, for example, Switzerland.

In centralized or unitary systems, various governmental levels might exist as well, but the provincial and local levels are subordinate to the central government. Federal systems are based on a share of ultimate power; in other words, the central institutions ultimately derive their authority from the approval of the constituent decentral units. Federal systems vary according to the degree of rights and powers allocated centrally or decentrally as well as to the degree of overlapping and shared responsibilities and activities. Moreover, modes of funding vary substantially.

In federal systems, international relations and defense tend to be national prerogatives. Often, national governments have a strong say in economic matters as well. In contrast, powers for education are often allocated decentrally. Higher education and research are treated in some countries as a subsector of education, while in others, they might be placed separately. In almost all federal systems, both the central government and decentral governmental units (provinces, states, *Länder*, *Kantone*, etc.) are involved in higher education. Even in the Federal Republic of Austria, where the coordination, supervision, and most public funding of higher education rest with the central

government, the provinces might establish and fund universities of applied sciences (*Fachhochschulen*).

In most analyses of higher education in federal systems, a distinction is made regarding the central and decentral role with respect to:

- the overall coordination of the system (e.g., safeguarding similarities of study programs and credentials);
- the supervision and possibly the establishment of individual institutions; and
- funding of higher education.

Some analyses lay prime emphasis on the allocation of rights and powers as well as on the respective political debates. Others aim to establish the extent of homogeneity or heterogeneity of systems with respect to key features of higher education, for example, types of study programs, qualifications of academic staff, and modes of administration (Brown *et al.*, 1992; Heidenheimer, 1992).

Most federal systems are characterized by a certain degree of fuzziness of the central and decentral territories of power and influence. Decentral governments often try to defend or increase their influence by pointing at cultural and educational diversity and at the needs of communities, while central governments try to stabilize or enlarge their powers by pointing at international dimensions of higher education and its economic relevance. Often, national governments ensure their influence through their superior financial resources.

As the political roles of the central and decentral governments as well as the extent of similarity or variety differ substantially by country, their characteristics can be best described through the presentation of cases. Hence, five countries are presented subsequently.

United States of America

In the United States of America, the individual states have the legislative and supervisory power of higher education. Public universities, as a rule, are state universities. The decentral emphasis of public higher educational policies is visibly underscored by the fact that citizens of the state, where the public university is located, pay substantially lower tuition fees than out-of-state students. Private universities, enrolling altogether more than one-third of students, dominate among the most prestigious universities, but are also represented on other levels of quality and reputation.

No formal interstate coordination exists. The federal government runs colleges only for its own administrative purposes (e.g., military colleges). It does not have any coordination rights as regards the higher education system, but it exerts a substantial influence by the power of the purse (see Heidenheimer *et al.*, 1990). It funds student aid, including tuition fees, thus making students the carriers for institutional support. The federal government is the key funding source of research in many areas, and it provides funds for innovation programs in higher education. As these funds are often conditional as regards institutional policies (e.g., affirmative action), they are more influential than mere financial support schemes.

Nationwide coordination in the US is to a large extent based on informal communication and cooperation among diverse actors, for example, umbrella organizations of higher education institutions, regional accreditation agencies, academic and professional agencies, and more or less visible lobbies. System changes, such as the emergence of a postdoctoral career stage, often are initiated not through legislation, but through communicative processes, and funding initiatives and experiments.

Altogether, the role of system coordination, legislative steering, and state supervision for the overall character of the higher education system in the US is viewed as relatively weak. Most states steer and supervise higher education more loosely than in other countries; the individual institutions have enormous room for maneuver, but are expected to be accountable in providing evidence that public support was used effectively and efficiently. Moreover, private donors, industry, churches, communities and other organizations, as well as individuals play a major role in funding and often claim legitimate stakeholder influence regarding the development of the individual higher education institutions.

As a consequence, an enormous degree of vertical diversity among institutions, often combined with a variety of institutional profiles, is more highly accepted in the US as a virtuous element of higher education than anywhere else. This reinforces the view that strong political powers of coordination are not needed. The federal political system keeps top-down coordination and supervision

of higher education in the US in bounds and reinforces diversity of higher education.

Canada

In Canada, the public right of supervision and of establishing higher education institutions rest with the individual provinces. Many experts suggest that there has never been any higher education system in Canada. The federal government is not involved in any formal mechanism of coordination and supervision of higher education. It is only directly in charge of military colleges. However, it has been holding a strong power for a few decades in the overall coordination of research policies and in research funding, and it takes initiatives here and there for funding innovation programs in higher education (see Fischer *et al.*, 2006; Jones, 2006).

Canadian higher education has been relatively homogeneous for a long time. The university sector is highly uniform in spite of substantial cross-border interaction with the diverse US higher education system, although some differences are noteworthy between the Anglophone provinces and in the Francophone province Québec. In the process of higher education expansion, however, this uniformity was gradually blurred, and the newly established nonuniversity institutions vary substantially between the provinces.

The gradual increase of diversity is linked to the fact that the provincial governments had favored the existence of autonomous higher education institutions being steered more strongly through funding and casuistic regulation mechanisms rather than through heavy-handed legislation and homogeneity-oriented reform concepts.

From the late 1980s onward, Canadian higher education began to suffer serious financial constraints caused by cuts in the federal transfer of tax revenues to the provinces. Although the so-called Established Program Financing inaugurated in 1976 ensured the full discretion of the provinces to determine how the funds made available by the federal government actually are spent, the universities were affected by these cuts. The Canada Assistance Plan of 1995 practically ended the role of federal transfers being the major source of basic funding for Canadian post-secondary education. However, concurrently, the federal role grew through enlarged funding of research and the physical infrastructure. Curiosity-based research was largely funded by federal monies transferred to research councils in charge of quality-based competitive distribution of these funds. Overall, the federal government created a variety of other financial support schemes, some of which could exert substantial influence on the characteristics of the higher education system.

For example, the Canada Foundation for Innovation was created in the mid-1990s to provide massive infrastructure support for programs linked to the private

sector. The Canada Research Chairs Program, established in 2000, provided salary and some infrastructure support for the creation of new research chairs at universities in order to help them attract leading international scholars and retain leading domestic professors.

The increase of federal incentive programs for higher education was accompanied by the establishment of varied similar schemes of the individual provincial governments. Combined with the expectation that universities have to seek increasingly for nongovernmental sources, a low-key supervisory attitude of the Canadian provincial governments *vis-à-vis* higher education emerged, which contributed to an increasing diversity of higher education both within and across provinces. Within the provinces, the diversity is most pronounced with respect to the intensity of research and the character of nonuniversity higher education. Across provinces, it is worth noting that, for instance, Alberta, Ontario, and British Columbia increased their tuition fees, created performance-funding mechanisms, and other initiatives to strengthen market forces, and took various measures to support linkages between higher education and industry. In contrast, Québec and Manitoba maintain low tuition fees as a mechanism to encourage access.

Germany

When the Federal Republic of Germany was established in 1949, the *Länder* exclusively were in charge of higher education, notably of regulation and supervision, the establishment of individual institutions, and the funding of the higher education system. National system coordination was the task of the Permanent Conference of the Ministers of Education and Culture of the *Länder* (KMK), which actually was active in areas of access and admission, formal structures of degree programs, etc. The federal government supported international cooperation in higher education and research, and, through its responsibility for the national coordination of the civil service, shaped the employment conditions for the staff.

In the course of the 1950s, the federal government got involved in research promotion. Mechanisms were established through which the federal government and all *Länder* governments together each funded 50% of the major research institutes outside the university and a research-promotion program for projects in higher education institutions. Similarly, the federal government took over 65% of the costs for a newly established need-based student-aid system, and it established its own promotion system of applied research.

In the late 1960s, a change of the constitution led to the establishment of joint responsibilities of the federal and the *Länder* governments in the coordination of the higher education. In addition to the funding schemes

previously established, this comprised the inauguration of the Federal-State Commission for Educational Planning and Research Promotion (BLK). Both governmental levels cooperated and shared the costs for construction of new university buildings. In addition, they became jointly responsible for setting frameworks for study programs, institutions, staff, and decision making as well as other similar matters: The two chambers of the national parliament – the representatives elected nationally and the representation of the governments of the individual *Länder* – eventually agreed on a Framework Act of Higher Education (HRK, for the first time enacted in 1976) serving as a binding guideline for the laws of the individual *Länder*, that is, those actually regulating higher education (see Teichler, 1992).

The complex system of federal–*Länder* interaction in the coordination and funding was in part due to the fact that the federal government could take over the rising costs more easily. Moreover, federal–state cooperation could contribute to a balance between two conflicting constitutional principles affecting higher education: to be embedded in regional cultural surroundings and to safeguard a homogeneity of living conditions in Germany as a whole; the latter, for example, with respect to the entry qualifications and admission, the financial conditions for study, any element of higher education relevant for the freedom of occupational choice. A relatively strong nationwide coordination of higher education was widely viewed as necessary to counteract centrifugal powers in the wake of higher education expansion, because a more or less even quality among universities had prevailed, whereas intrainstitutional diversity among staff and among students as well as the two-type structure of universities and universities of applied sciences (*Fachhochschulen*) were seen as appropriate arenas of diversity.

Over the years, the *Länder* repeatedly tried to reduce the power or even exclude the federal government, when new needs for system-wide coordination arose. They tried to set up new mechanisms of inter-*Länder* coordination instead of federal–*Länder* coordination. In reverse, the federal government often took new needs for funding and innovation as a starting point for the establishment of new federal or federal–*Länder* promotion schemes. At the beginning of the twenty-first century, many federal and *Länder* reform initiatives triggered off time-consuming fundamental debates about the rights of the central level and the *Länder* level. Moreover, the federal government and the *Länder* governments came to the conclusion that increasing joint legislation and joint funding schemes in many political sectors have led to overly complex decision-making processes. Consensus was reached in 2005 to reduce the number of areas of joint decision making (see Kehm, 2006). Actually, most legal rights of the federal government with respect to higher education were discontinued, while the systems of joint funding

of research institutions, research promotion, student aid, and construction of buildings were retained. Even new schemes of joint funding were agreed upon, notably the so-called excellence initiative for preferential funding of top universities, research clusters, and graduate programs, as well as a program to provide funds to cope with the expected temporary rise of student numbers for a limited number of years. The funding of the latter task, traditionally solely in the domain of the *Länder*, was justified as emergency measure only for a period of exceptional enrolment growth eventually offset by a demographic decline thereafter.

Switzerland

Switzerland is a country where the national identity is deeply rooted in the belief that the ultimate political power rests with the 23 cantons, while the national government clearly derives its power either through agreements on the part of the cantons or from national popular votes on individual political motions. This belief is reinforced by Switzerland's multiculturalism and the existence of four linguistic regions: the German-speaking, the French-speaking, the Italian-speaking, and, the small, Romanisch-speaking regions. Actually, some experts point out that the Swiss universities in the French-speaking area have more in common with French universities than with the Swiss universities in the German-speaking area which are in various respects similar to German universities.

The individual cantons are in charge of establishing, funding, and supervising educational institutions including universities. Actually, only 10 of cantons run universities, that is, those in Basel, Berne, Fribourg, Geneva, Lausanne, Neuchâtel, Zurich, St. Gall, and Lucerne as well as the *Università della Svizzera Italiana*; this created quite an uneven financial burden. In 1979, an intercantonal agreement was signed according to which major parts of the costs for study places are paid by the student's home canton.

Cantonal governance promotes an increase of differences between cantons. The structure and duration of secondary education varies, and participation rates differ enormously. Student aid provided by the cantons is heterogeneous. For many years, the motivation for higher education was different among language regions; it remains higher in French- and Italian-speaking regions than in German-speaking areas because people in the latter have more nonacademic routes of social and economic mobility.

The autonomous university sector is not the only one in Switzerland; another important part is that of federal institutes of technology. The *Eidgenössische Technische Hochschule* Zürich (ETHZ) and the corresponding French-speaking institution in Lausanne are supervised and financed by the federal government. This is based on article 34 of the constitution, where the responsibility for general regulation of vocational training in industry, crafts,

commerce, agriculture, and domestic economy is attributed to the Confederation.

In the 1990s, former advanced vocational training institutions were upgraded to universities of applied sciences (*Fachhochschulen* or *hautes écoles spécialisées*). In 1999, the constitution was revised to allocate the responsibility for these new institutions and advanced vocational training institutions to the Confederation. While the Department of Home Affairs of the Confederation is in charge of matters of universities and science, the responsibility for universities of applied sciences rests with the Department of Economic Affairs.

The Confederation plays a major role through funding. It funds the research-promotion system, and provides the public means for covering the regular costs of the institutes of technology and the public universities of applied sciences. With respect to the universities not under federal supervision, the Confederation covers minor parts of the operational costs and provides substantial subsidies for capital costs and equipment. Moreover, the so-called extraordinary subsidies are made available for activities such as training and research in informatics, continuing education, ecology and environmental sciences studies, and national and international university mobility.

The cantons cooperate in the Conference of Cantonal Ministers of Education (CDIP) which, for example, coordinates teacher training. The major nationwide coordination bodies are the Swiss University Conference (CUS), a cooperative common agency of the Confederation, the cantons and the universities, and the Council for Universities of Applied Sciences (Conseil UAS) (see OECD, 2003).

Since 2002, the Swiss Confederation stimulates nationwide discussions and initiatives for constitutional reforms in order to strengthen the overall system coordination of the various sectors of higher education. This was considered necessary in the wake of increasing international cooperation and global competition in higher education.

Australia

Most higher education institutions in Australia are public. They have been established by an act of the state government in charge, and they had been funded traditionally by state governments, and even now they are required to present an annual report to their state government. The most widely known exception is the Australian National University which is under direct supervision of Commonwealth, that is, the national government. Australia, however, moved relatively early to a hard federalism with respect to higher education. Since 1974, the financial responsibility of all public universities rests with the national government, and it established over the years changing advisory or buffer institutions not only for the sake of allocating basic funds to higher education, but also for many other issues, for example, research promotion, the institutional patterns of the

higher education system, and improving the links between higher education and social and economic priorities of the country. Over the years, however, state government became more strongly involved in the funding of their institutions of higher education, whereby they often tried to ensure a closer link between the activities of higher education institutions and the specific policies and perceived needs of the individual state.

There are three types of higher education institutions: universities, self-accrediting providers (other than universities), and non-self-accrediting providers. The terms self-accrediting and non-self-accrediting refer to the freedom with which these institutions are able to accredit their own awards; universities are also self-accrediting providers. Non-self-accrediting providers are authorized by state or territory legislation, and they offer at least one course that is accredited as a higher education award. These three types of institutions are present at the private sector as well. There are 39 universities – 37 of them are public and two are private.

Since the 1980s, successive federal governments attempted successfully to change universities into corporate-style entities and to wean them from federal funding. This reduced the financial burden of the federal government, and close and detailed supervision of public funds gave way to a steering from a distance. As a consequence of these changes, universities had an increased *de facto* autonomy from governmental policies but, according to some experts, initiatives and new strategies to raise funds increased the influence of some stakeholders, notably that of industry. Moreover, the Australian universities increased their revenues through taking in vast numbers of fee-paying foreign students.

Nowadays, the Australian higher education system is strongly shaped by market principles. The federal government has structured the rules for competition for funds and prestige, it shows the assumption that this competition drives efficiency, forces accountability to industry and student-clients, and secures production of public goods. The former binary system of universities and colleges of advanced education was replaced from 1989 on by a unitary system somewhat stratified as a consequence of increased competition and additional income generation (see Marginson, 2006).

The rules for competition and a call to align to national priorities are set in *Our Universities Backing Australia's Future*, a document elaborated in 2003 on federal level by the minister of education, science, and training (Nelson, 2003). The Commonwealth also created a new grant system spelling out the federal contributions to the numbers of study places annually negotiated between each institution of higher education and the Commonwealth and state governments.

The Commonwealth also provides student aid, for example, in subsidization of loans and help for fee-paying students in Australia and abroad. It funds special initiatives such as the establishment of the National Institute

for Learning and Teaching in Higher Education and awards for centers of excellence. Moreover, research funding is a federal task, whereby competitive funding is customary and the individual institutions are encouraged to be more flexible and responsive in developing a strategic portfolio of research activities and training programs.

Altogether, the Australian universities have to report to state governments in many respects. However, the allocation of study places, student loans, and research funding and promotion, including quality audit, is done on a federal level. Moreover, the federal level is influential through various ways of guiding the system, for example, as regards access and equity, and various initiatives, for the promotion of excellence, for example, in teaching and learning.

Mexico

Mexico is officially a federal system, however, its higher education system is highly centralized and, at the same time, it has fostered heterogeneous and unequal conditions among its states and among the subsystems of higher education. For many years, the Mexican federal government, after public protests against the repression of student protests in 1968, avoided interference into university matters. In the 1980s and at the beginning of the 1990s, however, new rules for the regulation of interactions between the state and higher education were created.

The Mexican higher education system is constituted by six subsystems, in four of them, the federal government has functions of direct coordination, namely the subsystem of public universities, which includes the three federal universities (*Universidad Nacional Autónoma de México* (UNAM), *Universidad Autónoma Metropolitana* (UAM), and *Universidad Pedagógica Nacional* (UPN)) and the state universities; the subsystem of technological education, which is coordinated at the federal level by the subsecretary of the Ministry of Public Education; the subsystem of other public institutions, such as navy and army academies and the National Institute of Fine Arts; and the subsystem of higher schools for teacher training called *Normales*. The other two subsystems are the subsystem of private higher education institutions, which does not receive any federal funding and is regulated only for the official recognition of its programs; and the subsystem of technological universities, which was created in the 1990s following a joint initiative by the federal government and the state governments.

The centralism of the Mexican higher education system is most obvious in the modes of funding. The federal government funds the federal universities completely, among them the large UNAM and the UAM, and technological institutions are financed by more than 50%. Altogether, the major public sources for higher education in Mexico are: (1) the ordinary and extraordinary federal subsidy,

(2) the ordinary state subsidy, and (3) the subsidy for enlarging educational facilities, with federal and state funds.

The creation of an extraordinary federal subsidy in 1984 strengthened the federal role. Previously, higher education institutions were free to spend the funds for salaries, research, facilities, etc. Under conditions of economic crisis, extraordinary federal subsidies were viewed as necessary, but these were provided for specific purposes.

The National System of Researchers (SNI) was created in 1984 providing incentive funds through the National Council of Science and Technology (CONACYT) for the production of publications and for obtaining a PhD degree. In 1990, the Fund for the Modernization of the Higher Education (FOMES) was established to finance projects of institutional development as well as ESDEPEP, a system of incentives for teaching performance, which is run by the Ministry of Treasury and Public Loan (SHCP). In 1996, the Program for Improvement of Professors (PROMEP) was created, providing professors of public universities with scholarships to carry out high-quality postgraduate studies. Since 1998, the Program of Support for University Development (PROADU), also coordinated by the Ministry of Public Education, provides funds for various purposes of institutional development. All these funds aim to increase competition between universities (see Kent and Richardson, 2002; Casanova, 2006).

The creation of the – rapidly growing – subsystem of technological universities at the beginning of the 1990s, although funded jointly by federal and state governments and operated under the coresponsibility of federal and state authorities, is generally viewed as a step toward decentralization. These institutions are expected to promote regional development, and many of them were established in localities without other higher education institutions. In the late 1990s, the State Commissions for the Planning of the Higher Education (COEPES) were reactivated: they delegate responsibilities to state governments and aim to develop the strategic administration of the state institutions, approve new proposals of academic programs and educational models, elaborate, disseminate, and evaluate state policies of higher education, and implement actions and projects for the development of higher education in a specific state. Concurrently, the federal government decided to subsidize public programs only if they were previously approved by COEPES.

Concluding Observations

In most federal systems, the supervisory power as regards higher education does not rest at the central (federal) level. This provides room for the regional (state, provincial, etc.) governments in charge to have a substantial influence in many respects. However, the coordinators or actors of higher education in some countries are in favor of

guaranteeing a system-wide homogeneity or similarity of various features of the system and aim to realize that either through central powers, through the coordination between central and regional powers, or through cooperation among regional powers. Moreover, the central government in most federal systems has the power of the purse to a certain extent, notably regarding research promotion, student aid, etc.; in some countries, federal innovation programs provide central powers even with a stronger say.

Governmental policies in many countries have strengthened the formal autonomy of universities and the managerial power of university leadership in recent years. Expert views vary whether governments altogether have strengthened their role of strategic target setting alongside or have delegated part of the strategic target setting to the individual institutions of higher education. Notwithstanding this, governmental target setting in the majority of federal systems aims increasingly for nation-wide coordination.

Pathways and Articulation into Higher Education

G F Moodie, Griffith University, Brisbane, QLD, Australia

Glossary

Adult and continuing or community education –

The informal sector of post compulsory education that offers mainly unaccredited studies for personal development or interest.

Articulation – A relationship that educational institutions establish between programs and normally links curriculum to provide for the accumulation or transfer of credit.

Grade point average – The average of grades awarded in a program which is weighted by the size of each subject.

Horizontal transfer – The transfer of students from one program or institution to another at the same level.

Modularization – The division of the curriculum or teaching program into discrete but linked parts with specific opportunities for students to make choices which may or may not be linked to specific assessments.

National qualifications framework –

A classification and description of the relations between types of qualifications often depicted as a table where the rows group qualifications by educational level and the columns group qualifications by broad field, occupational group or educational sector.

Nested awards – The qualifications that are conceived and developed as a coherent whole but offer a number of entry and exit points.

Numerus clausus (Latin, closed number) – An entry quota.

Pathway – An arrangement for students to transfer from one program to another which may be either designed by educational institutions or developed by students themselves.

Transnational education – The education that involves a student or teacher traveling to another country to study or teach.

Twinning – An arrangement between two institutions which allows students to undertake the initial years of their study in one institution and complete their study at the institution that awards the qualification.

Unitization – The division of a qualification into discrete parts or units, normally of the same size, which are assessed and awarded credit separately from other units.

Vertical transfer – The transfer of students from a lower to a higher level of education, most commonly higher education.

As higher education changes from admitting a small elite of typically around 5% of the group that provides most of its students to a mass system admitting more than 15% of the relevant age group (Trow, 1974: 63), it not only greatly expands but also diversifies its intakes and intake routes. This may be observed in the increasing popularity of nontraditional pathways or routes into higher education.

Pathways into Bachelor Programs

Broadly, the transition from elite to mass higher education is associated with a shift from admitting almost all students through traditional pathways shown in the early numbers of the typology set out below to admitting a higher proportion of students from less-conventional routes listed lower in the typology:

1. Entry from school.
 - a. Direct entry from an academic or general school.
 - b. Entry from a vocational or specialist school.
2. Transfer from a program at the same level of higher education.
3. Transfer from a program or institution in a lower tier or sector of tertiary education.
4. Second chance or mature-age entry.
 - a. By (modified) open entry.
 - b. After completing a higher education transitional program.
 - c. After completing an adult or continuing education program.

Direct entry from an academic or general secondary school remains the most populous, but not necessarily the majority, pathway into even mass higher education systems. This is typically based on performance in a university entrance examination established by the middle of the twentieth century, such as England's A-levels, France's *Baccalauréat*, Germany's *Abitur*, and the *Matura* administered in Italy as well as many central European countries. Matriculation or entering into the register (*matricula* in Latin) of a university has been automatic upon completion of the university entrance examination in

some countries, particularly those in continental Europe such as France, Germany, Italy, and Spain, and countries in this tradition such as some in Latin America. However, many countries have since introduced *numerus clausus* (closed number in Latin) or entry quotas, particularly for entry to programs in high demand such as medicine. Most United States do not have a university entrance examination and competitive entry to higher education is based on a personal application which is assessed individually but often with heavy reliance on the applicant's performance in a national standardized aptitude test such as the Scholastic Aptitude Test or the ACT, formerly American College Testing.

As secondary education became mass and then near universal from the middle of the nineteenth century, many countries established separate schools or streams for preparing students for advanced vocational study. Some countries established specialist schools or secondary academies for a specific vocation. Initially, higher education institutions did not accept graduates from vocational and specialist schools for admission but they started to do so as higher education expanded. Thus, it can be seen from the results of a survey conducted by the Organization for Economic Cooperation and Development (OECD) shown in **Table 1** that tertiary education institutions admitted 55–85% of their students from general secondary education and from 2% to 15% of students from vocational education.

Table 1 Students' qualifications on entry to tertiary education, selected countries

	%
<i>Australia commencing bachelor's (1991)</i>	100
Complete final year of secondary education	55
Some tertiary education	26
Mature age or employment experience	6
Other	13
<i>Denmark modeled cohort analysis all participants (1993)</i>	100
General upper secondary	75
Vocational upper secondary	15
Other	10
<i>France first-year entrants (1995–96)</i>	100
New baccalauréat – general	62
New baccalauréat – technological	23
New baccalauréat – vocational	2
Other	13
<i>Japan first-year entrants from high school (1995)</i>	100
General secondary	85
Vocational secondary	15
<i>United Kingdom first-degree and diploma students (1994–95)</i>	100
A-levels	65
Vocational qualifications (NVQ, GNVQ)	8
Other	27

Reproduced from OECD (1997). Responding to new demand in tertiary education. In OECD (ed.) *Education Policy Analysis 1997*, pp 79–96. Paris: OECD, with permission from OECD Publishing.

Conversely, not all students who complete general secondary education and proceed to tertiary education proceed to higher education. Another OECD analysis shown in **Table 2** found that 45–80% of students who completed a general secondary education proceeded to tertiary education, with many proceeding to institutes of technology or universities of applied science such as *Fachhochschulen* in Germany.

Graduates from secondary vocational or specialist schools were initially restricted in their higher education studies or were required to undertake transitional studies, but these requirements were gradually relaxed as it became clear that they performed as well as graduates from academic or general secondary schools. More recently, some jurisdictions have established academically selective senior secondary schools to prepare students specifically for transfer to higher education. In the United States, these are called middle college high schools when they are located on higher education college campuses.

For many students, higher education is as much about learning about themselves as it is about acquiring high-level knowledge and skills; therefore, it is not surprising that some seek to transfer to a different program or institution after their first year of study. Higher education institutions have long accepted students transferring from other programs or institutions at the same level, what is sometimes known as horizontal transfer. Some students know their preferred program well, but are unable to gain direct entry because their entry score or other qualification is not as competitive as other applicants' scores. In some countries, these students may be admitted to their preferred program if they perform well in their initial program. This is often measured by the grade point average, the average of grades awarded in the initial program which is weighted by the size and, in some instances, the importance of the subjects in the initial program.

Since the early twentieth century the United States has established a sector of higher education called successively junior, community and 2-year colleges with the explicit aim of providing lower-cost and low-risk opportunities for students to complete a short program, typically a 2-year associate degree in arts or sciences. The associate degree was designed to be both a valuable qualification in its own right and also a qualification for entry into the third year of the normally 4-year bachelor degree offered by senior colleges and universities. This is often known as vertical transfer. As nearly 50% of higher education students in the United States are enrolled in 2-year colleges and since admission to the preferred 4-year colleges and universities is highly selective and hence very competitive, the effectiveness of the vertical transfer system is crucial to the fairness and vitality of United States higher education.

There is, therefore, a small industry of studies of higher education student transfer in the United States which is

Table 2 Destination of students entering tertiary education by entry qualification, selected countries, percent of students

Country	General entry qualification	Vocational entry qualification
France (1995)	Baccalauréat – general	Baccalauréat-technological
University	72	30
Preparatory classes for <i>grandes écoles</i> (CPGE)	13	1
University institutes of technology (IUT)	8	13
Advanced technician sections of <i>lycées</i> (STS)	7	56
Germany (FTFR) (1992)	Higher education entrance qualifications	Fachhochschule entrance qualifications
University	79	8
Fachhochschule	21	92
Japan (1995)	General high-school graduate	Vocational high-school graduate
University	45	21
Junior college or special training school	55	79

Reproduced from OECD (1997). Responding to new demand in tertiary education. In OECD (ed.) *Education Policy Analysis 1997*, pp 79–96. Paris: OECD, with permission from OECD Publishing.

conducted by statisticians and policy analysts in state higher education coordinating boards, policy think tanks and charitable foundations, staff of 2-year colleges, as well as researchers in 4-year institutions. Long-standing issues are: how transfer is measured and whether rates are going up or down (Grubb, 1991), how well 2-year colleges prepare and advise their graduates for more advanced work (– California Postsecondary Education Commission, 2002: 15), the alignment of core subject and distribution requirements of 2- and 4-year colleges (Prager, 1993), and 4-year colleges' selection practices and granting of credit for prior studies (US Department of Education, 2006: 15).

Student transfer is also becoming increasingly common in other countries, typically from institutions established initially for vocational training but which have acquired broader and higher-level programs as they have developed. Thus, there is an increasingly important pathway into higher education from further education colleges in the United Kingdom, *Instituts Universitaires de Technologie* (IUTs) in France, *Hogescholen* in the Netherlands, vocational education and training institutes in Australia, polytechnics in New Zealand, and from Germany's *Berufsakademien*.

The final important pathway into higher education is by various second-chance or mature-age entry provisions. These open opportunities to applicants who finished their schooling, often without completing secondary education, several years earlier when persistence to the final year of secondary education and transition to higher education was more restricted than it is in many countries now. Initially traditional universities had rather modest intakes of 'second chance' students, but these have been expanded considerably as these students have shown that their maturity and motivation lead them to success in higher education similar to more traditional students. Second chance entry has also been encouraged by the noteworthy success of students attending open universities that do not have entry requirements such as the University of South Africa, the UK's Open University, Germany's FernUniversität, and India's Indira Gandhi National Open University.

One of the early and most prominent, national, modified, open-entry schemes is Sweden's 24:4 rule which reserves places for people aged at least 24 years who have 4 years' work experience. The scheme was introduced in 1977 and has since been further liberalized. Some campus-based higher education institutions now admit significant numbers of students by various schemes for which the only entry qualification is being adult or mature age, often over 25 or even 21 years of age. In other countries, higher education institutions offer foundation, preparatory, or bridging programs of 6–12 months to prepare students who are not otherwise prepared for higher education. In many countries, adult and continuing or community education – the informal sector of post compulsory education that offers mainly unaccredited studies for personal development or interest – provides an important pathway into further study which often leads to higher education. However, the role of adult and continuing education in providing access to higher education is unsystematized and is largely unacknowledged.

The discussion so far has assumed that pathways into higher education are into the bachelor program, which is typically of 3–4 years' duration. In many countries, higher education formally includes short-cycle programs of a 2-year duration and so pathways into higher education should also include pathways into short-cycle programs. However, short-cycle higher education programs often overlap or are at least confused with advanced vocational education programs which are also often of up to 2 years' duration. With the implementation of the Bologna process in Europe, the bachelor degree of 3–4 years' duration is becoming an increasingly common initial higher education qualification.

Pathways into Postgraduate Programs

There are also multiple pathways into postgraduate programs, which again may conveniently be considered in descending order of frequency:

1. an undergraduate program in the same field;
2. an undergraduate program in a different field;
3. a lower-level postgraduate program;
4. work experience.

The most conventional route to postgraduate study is through an undergraduate program in the same field as the postgraduate program. This assumes that the postgraduate program builds more or less sequentially on undergraduate studies. However, institutions have developed a number of programs that do not assume specific prior knowledge, although they may assume a general intellectual ability and knowledge similar to an undergraduate degree. The most ubiquitous of the nonsequential postgraduate degrees is the master of business administration, which is often studied by technical specialists who seek to develop broad business management expertise as they move from their specialization into middle management. The entry requirements for MBAs vary widely; however, while they are likely to require a degree, this is unlikely to be in business administration. Just as important for many MBA schools is the applicant's work experience and seniority. Higher education institutions have developed several other nonsequential masters degrees.

In some countries, higher education institutions have developed other postgraduate qualifications, such as graduate certificates, which typically require 6 months' equivalent full-time study or 30 credits in the European Credit Transfer System (ECTS), and graduate diplomas of 60 ECTS credits. While some graduate certificates and diplomas are sequential qualifications, others assume no specific prior educational knowledge and admit students with appropriate work experience. These in turn may qualify students for progression to specific masters programs, which introduces the notion of linked or articulated higher education qualifications.

Articulation into Higher Education

While pathways are arrangements for students to transfer from one program to another which may be either designed by educational institutions or developed by students themselves, articulation is a relationship that educational institutions establish between programs that normally links curriculum to provide for the accumulation or transfer of credit. A student following a pathway into higher education will normally be required to compete for a place in a program with *numerus clausus* or an entry quota. Students following an articulated route into higher education may be required to compete for admission to the higher-level program but, particularly if the programs are integrated, students may also be guaranteed progression into the higher-level program subject to satisfactory academic progress.

While there is commonality in the concepts underlying articulation into higher education, there is considerable variation in the terminology. Articulation into higher education may be:

1. sequential;
2. concurrent
 - a. multiple enrolment,
 - b. multiple credit;
3. integrated
 - a. nested awards,
 - b. incorporated awards.

The simplest instance of sequential articulation into higher education is where a lower-level program is designed to prepare graduates for progression to a higher-level program, for example, where a secondary school or specialist preparatory academy prepares graduates for admission to specific undergraduate programs or where an undergraduate program prepares graduates for admission to a sequential postgraduate program. Articulation from upper secondary to higher education is common in many countries but United States states generally have much weaker articulation between senior secondary school and higher education.

More sophisticated sequential articulation is common. In the United States, associate degrees offered by 2-year colleges may be, but are not always, articulated with bachelor degrees offered by collaborating 4-year colleges. In other countries, a college may offer the initial years of an undergraduate degree that is awarded by a collaborating higher education institution. This is increasingly common in transnational education where students undertake the initial years of their undergraduate study in their home country and complete their degree overseas at the campus of the awarding institution. This is often known as twinning and is described in shorthand by the number of years students study at each institution. Thus, a 1 + 2 is a twinning arrangement whereby students undertake the first year of their degree at the home institution and complete the final 2 years of a 3-year degree at the awarding institution, whereas 2 + 2 would represent the standard (but not necessarily majority) study pattern of a United States transfer student.

There is considerable variety in articulation which provides for students to study multiple, but normally only two, programs concurrently. Thus, students undertaking the final years of their secondary education may study concurrently a higher education subject which is often known as advanced placement programs, or they may study concurrently for a vocational education qualification. Where there is considerable overlap in the curriculum of the concurrent programs, some subjects may be credited toward both programs. A survey conducted by the US Department of Education National Center for Educational Statistics (Waits *et al.*, 2005) found that 71% of United States public high schools offered subjects for

dual credit and 67% offered advanced placement subjects in 2002–2003.

Although dual credit articulation is a more recent development in articulation arrangements involving different institutions in different sectors, it is reasonably common among students studying at the same level in the same institution where a student may be described as studying for a double major or joint degrees. While sequential articulation normally involves programs in the same discipline but in different sectors, concurrent articulation may involve programs in the same or different sector or in the same or different discipline. However, some of the most interesting concurrent articulations are of programs in complementary disciplines, such as accounting and information systems.

A further integration of articulated programs can develop into nested awards which are conceived and developed as a coherent whole but offer a number of entry and exit points. An example of nested awards is:

- certificate of bookkeeping,
- diploma of financial services,
- associate in accounting systems,
- bachelor of accounting.

At the end of each section of the nested sequence, students are granted an award whereupon they may choose to exit or continue to the next stage of the sequence. Students are not required to negotiate entry to each program because progression through the sequence of programs is guaranteed on condition of satisfactory academic progress. Nested programs are normally within the same field of study. A considerable advantage of nested awards is that they offer students early accreditation so that they may work part time as a credentialed worker in their field while continuing their study toward a higher qualification, thus gaining valuable experience from integrating work and study (Wheelahan, 2000: 19). An even closer form of integrating articulated awards is to incorporate one within another. Thus, a bachelor of science may incorporate a laboratory technician's certificate. Incorporated awards offer similar advantages to nested awards.

Measures to Broaden Pathways and Strengthen Articulation

Kintzer (1973) propounds a useful typology of articulation agreements and transfer policies: state formal agreements or legal prescriptions requiring the adoption of specified measures, state policies encouraging articulation and transfer, and voluntary agreements between individual institutions or systems. United States have adopted a variety of measures to promote articulation and transfer from 2- to 4-year institutions, most exhortatory or

voluntary rather than mandatory despite often being expressed in legislation. The Education Commission of the States (2001) found that of the 50 United States, 30 had legislation supporting transfer, 40 had statewide cooperative transfer agreements, 33 states regularly collected and reported transfer data, 18 states offered incentives and rewards to either transfer students or sending or receiving institutions, and 26 states maintained a statewide guide to transfer. While there is some evidence that state policy can influence the effectiveness of student transfer (Wellman, 2002: 45), others (Anderson *et al.*, 2006) have doubted the effectiveness of state articulation agreements. Other jurisdictions adopt the range of measures to promote articulation described in Kintzer's typology, with the extent of state prescription, encouragement, or quiescence on articulation generally related to the extent of their involvement in other aspects of higher education.

Thus far the discussion has considered pathways and articulation largely based on arrangements between institutions and their occupational and academic communities. These arrangements are strong in East Asian and continental European countries such as France, and in Germany where the social partners—employees, employers, and the federal as well as *Länder* (state) governments—cooperate closely in maintaining the links between tertiary education and work. In contrast, some countries have sought to broaden pathways and strengthen articulation into higher education by establishing a national qualifications framework above institutions. National qualifications frameworks typically place qualifications in a table where the rows sort qualifications by educational level and the columns sort qualifications by broad fields, occupational groups, or educational sectors. The aim is to provide students the means for moving from one qualification to another so that in principle there remain few if any terminal qualifications.

National qualifications frameworks have been adopted by many of the Anglophone countries of the Commonwealth of Nations that have structured their tertiary education in a neoliberal market, such as New Zealand, Scotland, Australia, South Africa, England, and Ireland. They may also be considered in Kintzer's typology, with those founded in New Zealand and South Africa being prescriptive and those of Scotland, Ireland, and Australia being more enabling (Young, 2005: 12) and almost voluntary for some sectors. Some argue that a qualifications framework is part of the neoliberal program since it commodifies education and thus “contributes to the creation of educational markets by providing a common qualifications currency. This common currency, like money in an economy, is viewed as promoting greater competition between the providers of educational qualifications because all institutions are recognising and rewarding learning in the same way” (Strathdee, 2003: 157). However, even in the countries that have heavily marketized

their tertiary education, such as New Zealand, Australia, and, to a lesser extent, England, national qualifications frameworks are promoted as a way to minimize barriers to vertical and horizontal transfer and to “maximise access, flexibility and portability between different sectors of education and work and different sites of learning” (Young, 2003: 224). However, there is relatively little evidence that national qualifications frameworks achieve these goals (Young, 2005: 1).

Most national qualifications frameworks are associated with the unitization of programs, although in some countries programs have been unitized independently of national qualifications frameworks. Until the mid-twentieth century, higher education students’ performance was not formally assessed until they reached the end of their program, when the assessment was to determine whether the student met the requirements for the award of the qualification. Therefore, students may not have been formally assessed until three (UK), four (US), or, in continental Europe, up to 7 years after they started their program. While end-of-year assessment was introduced in many countries, this was still a long and, for some, an unwieldy learning cycle; hence, teachers or institutions divided the curriculum or teaching program into discrete but coherently linked parts or modules with specific opportunities for students to make choices. Modules may or may not be linked to specific assessments (Young, 2005: 25). Young (2005: 25) distinguishes modularization of the curriculum from unitization of qualifications.

Young characterizes unitization as a more radical departure from traditional approaches to the curriculum since it refers to the break up of qualifications, not the curriculum, and it is concerned with assessment rather than teaching. Unitization divides programs into discrete parts or units, normally of the same size, which are assessed and awarded credit separately from other units. While institutions had previously assumed that all students in a cohort began together and studied common subjects, unitized programs allow students to treat units as the building blocks of many different qualifications. Whereas previously the teacher had determined the study sequence, students determine their sequence in a unitized program (Young, 2005: 25). Unitization greatly increases students’ flexibility and, at least in principle, facilitates the construction of pathways and articulation into higher education.

Perhaps the most significant influences on pathways and articulation into higher education are broad economic, technological, and social changes. Increases in national wealth allow governments to expand higher education and establish facilities in smaller population centers, greatly expanding access. Increases in personal and family wealth give people and their children the resources and, importantly, the aspiration to pursue higher education. Improvements in and the reduced cost of transport and communication make it much more feasible for

students to study at institutions distant from their home. These are some of the reasons for the great expansion of transnational higher education over the last two decades, which has spawned the twinning arrangements noted earlier as well as the many pathways and articulation agreements that are being developed between institutions in different countries. The techniques of distance or resource-based education and, more recently, the great expansion of information and communication technologies have supported a variety of new pathways and articulation arrangements. This suggests that future developments in pathways and articulation into higher education are likely to be influenced as much as by these general economic, technological, and social developments as by measures specifically directed to pathways and articulation into higher education.

Glossary

Binary system – A higher education system consisting of two groups of institutions, normally universities and nonuniversity institutions.

Stratification – A division of the higher education system in distinct groups with different status.

Unitary system – A higher education system without a formal distinction in types of institutions; also known as a unified system.

Introduction

Policymakers and researchers alike for many years have struggled with the question of system design and structure. Teichler's observation that "[t]he structure of the higher education system has been a major topic of debate and of reform efforts in most Western industrial societies since about the mid-1960s" (Teichler, 1988: 96) is as valid 20 years later as it was then. This points to the fact there is no right answer to the question about what is the ideal structure of a higher education system. It is dependent upon a combination of factors that include the developmental stage of the system in terms of participation rates, political priorities, the structure of the secondary-education system, and, increasingly, its international connectedness. In this article, the primary focus is on the issue of system dynamics: what are the tensions that particular structural arrangements evoke and how do they play out? This brings us into the realms of status and hierarchies and the question whether multidimensional classification schemes are a possible way forward. First, however, the most common structural arrangements that can be found in higher education systems are presented.

Structural Arrangements in Higher Education Systems

Throughout the higher education policy literature a number of structural typologies can be found to categorize systems. The earliest one probably is Trow's distinction of elite–mass–universal higher education systems, based on the participation rates of a system (Trow, 1974). In his typology, elite systems are those with participation

rates up to 15%, mass systems have a 15–40% participation, and universal systems enrol over 40% of students from the standard age group. Technically, this typology does not say anything about the structure of a system, but since it is so commonly used, it needs to be included here. However, it should also be noted that the concept of an age group is increasingly becoming contentious with lifelong learning becoming the rule rather than the exception. Scott (1995) identifies four broad types of higher education systems: the dual system, with separate positions for universities and other postsecondary-education institutions that are treated differently; the binary system in which "alternative institutions are deliberately established to complement (and rival?) the universities" (Scott, 1995: 35); the unified system in which there is no formal differentiation between types and all institutions are part of a common system; and the stratified system, which also comprises all institutions, but with specific roles allocated to the institutions in it. As Scott himself acknowledges, the distinction between the first two types is not really watertight (blurred) and the typology may be "too simplistic to capture the complexity of existing higher education systems" (Scott, 1995: 36). This leads him to rearrange the building blocks in an evolutionary typology where higher education systems move from university-dominated to dual to binary to unified and finally stratified systems (see also Kyvik, 2004). We return to this evolutionary path later in this article, which in 2007 Scott modified to a pre-binary, binary, post-binary/unified, and differentiated/market-system trajectory (Scott, 2007). Teichler (1988, 2004) has a different take on distinguishing systems by grouping them in two categories: diversified and integrated systems. According to him, diversified systems are characterized by substantial differences in quality, status, and content of the programs provided by the institutions in the system, while in integrated systems, those differences are much more contained. Important to the further discussion in this article, he notes that "some kind of consensus seems to have emerged that borderlines between various sectors of the higher education system ought to be blurred, and that a certain degree of permeability of educational ladders ought to be ensured" (Teichler, 2004: 7). Binary systems, with clear distinctions between university and nonuniversity type of institutions are the most common example of diversified systems, although there also are examples of more complex systems such as the French system. Clear examples of integrated systems would be Australia and the United Kingdom. Both countries decided

to abandon their binary systems in favor of a single sector, university system. We return to this later, but first a few more words on the most common of formally diversified systems, the binary system.

Binary Systems: Rise and Demise

There is strong agreement in the higher education-policy literature that binary systems originated out of the desire of policymakers to keep an elite university system while also allowing for greater participation (e.g., Pratt, 1997; Goedegebuure and Meek, 1988). Nonuniversity institutions were set up as basically teaching-only institutions with a predominant vocational orientation, as policymakers realized that meeting increased demand through expansion of the university sector would be financially unsustainable. The perception of expansion at the cheap and thus a lower status was politically countered by the introduction of the equal but different rhetoric. Although these newly created institutions at the outset indeed were different, the equality concept in practice never really got off the ground. It should also be noted that the underpinning academic-vocational distinction from the outset has been contentious, with disciplines such as law and medicine remaining firmly located within the university sector. This has been exacerbated by universities further entering the so-called vocational domain to secure student numbers and nonuniversity institutions entering the postgraduate domain to secure both students and academic reputation, although many would deny that this is what they are after.

There is no denying the occurrence of academic and vocational drift, but we should be wary of treating binary systems in a dichotomous or black-and-white manner.

First of all, since the rise of the early binary systems in the 1960s, our world, including the world of work, has moved on and has become much more complex. In response to this, the programmatic offerings of higher education institutions have become more diverse, both in terms of content, levels, and mode of delivery, competency-based curricula being a good case in point. This has resulted in a certain blurring of boundaries.

Second, with the ever-growing number of students, both traditional and mature, higher education institutions have grown in size as well as complexity, and many more people now find employment in this sector than was the case 40 years ago. A substantial number of staff working in nonuniversity institutions would have obtained their training in universities and hence have been exposed to a university culture. This in turn would have resulted in a blending of what at the outset were distinct institutional cultures. Once again, care should be taken how far this argument can be stretched, but certainly in the more mature binary systems such as Germany and the Netherlands, increasing emphasis

is placed on the importance of staff with doctorates to support both research and postgraduate training activities.

Third, it should be realized that not all binary systems find their roots in the 1960s and that their developmental trajectories therefore are quite different. Binary structures have become a common feature in the post-communist higher education systems in central and Eastern Europe; they have been introduced in the Nordic countries in Europe much later, and also in countries like Austria, Portugal, and Switzerland. As such, many of these institutions find their substantive roots in the 1990s, and many have been established not for reasons of protecting universities, but rather because universities in these countries were not meeting the demands of a diversifying labor market and hence of industry.

Fourth, one should be aware of the different sizes of both sectors. As Kyvik (2004: 404) demonstrates, in Europe there is a wide variety in enrolment patterns of first-year students across the two sectors, with the Netherlands seeing 75% of enrolments in the nonuniversity sector, Flanders 70%, Finland 60%, and Ireland and Norway 55%. On the other side of the scale, we find Austria with a 15% first-year enrolments in the nonuniversity sector, Switzerland and Germany with 30%, and Sweden and Portugal with 40%. As is the case with the introduction of bachelors and masters under the banner of the Bologna Process, what this teaches us is that one binary system is not identical to another binary system: much diversity resides within these broad container concepts (see also: Taylor *et al.*, 2008). It also very clearly points to the role played by the nonuniversity sector in terms of the transition from secondary to higher education and expanding access to higher education (for an elaboration of this, see: Moodie, 2008). In this respect, it is not the case that there is a clear link between the structure of secondary education in terms of vocational/professional tracks and general/pre-university tracks and entry patterns to higher education. Three examples may suffice to illustrate this point. In the Netherlands, secondary education is clearly segmented or tracked with 6 years of preuniversity education providing for access to university studies and 5 years of more vocationally oriented studies allowing access to the polytechnic sector. Flanders, however, only has general secondary education upon competition of which students can enrol in either a university or a polytechnic program. Finally, Finland has a segmented secondary-education system with general upper-secondary education traditionally being the route to university entrance. However, the vocational upper-secondary education and training track provides eligibility to both university and polytechnic programs. This mixture of preparatory tracks leads to the hypothesis that in those systems with large enrolments in the nonuniversity sector, this sector has been able to establish itself as a viable alternative to the university sector, with a less-academic orientation and in

general lower entry levels. Although testing of this hypothesis is beyond the scope of this article, there is plenty of supportive documentation available to not reject the hypothesis out of hand. In both the Netherlands and Flanders, it is common for students to try a university program, find out that they have difficulty in coping, and then cascade down to the polytechnic sector where the vast majority completes their studies successfully. In Finland, the university sector is organized very traditionally and the creation of the polytechnic sector in the early 1990s intended “overcoming the functional shortcomings in the system [...] and a means of clearing a vocational and matriculation backlog” (OECD, 2006: 8). The review report then goes on to argue that since then the polytechnic sector has “continually matured to equal status with a very specific character to universities...” (OECD, 2006: 8).

The notion of maturing or coming of age logically brings back the concept of evolutionary pathways: is there a natural progression from one system state to the other? Once again, we need to be careful. First of all, evolution is a random process of adaptation and selection, and not a process of progression despite the commonly used iconography from ape to man. Taking progress and stages into our higher education world is problematic. As argued elsewhere: “(...) the jury is still out with respect to the applicability of concepts like natural selection and evolution in the social sciences” (Goedegebuure *et al.*, 1996: 7). Second, there appears to be an empirical problem to substantiate the argument. As a matter of fact, there only are two well-documented cases of binary systems being replaced by unified systems: Australia and the United Kingdom. This, therefore, begs the question whether these are the exception rather than the rule. To answer this question, we need to examine the rationale behind these cases more closely. For Australia, Meek and Goedegebuure (1989) point to the failure of the binary system to deliver on its promises of furthering equity and contributing to economic growth through expansion of participation in combination with the structure’s internal contradictions and inconsistencies. As they argue “College students were very much like their university counterparts, slightly less financially well-off, but taking similar subjects and having, on the whole, similar aspirations. [...] College academics had the same predilections for research and postgraduate teaching as their university colleagues” (Meek and Goedegebuure, 1989: 31) and certainly the larger nonuniversity institutions had developed the capacities to deliver on this. Therefore, basically, the binary system became untenable because the differences between the constituting sectors on the important indicators such as program level, subject distribution, entry levels, and research intensity no longer constituted significant differences. Much the same picture can be painted for England. As argued by Clark (2006: 14): “In the 1991 White Paper ‘Meeting the Challenge’, the Government

announced the abolition of the binary line on the grounds that there was significant overlap in the academic work of the two sectors (with many polytechnics offering research degrees). It was generally agreed that a single sector of universities (and colleges) with diverse aims and objectives would better serve the interests of students and society. It was expected that direct competition between a wider range of institutions would lead to increased efficiency and effectiveness.” Since the Australian higher education system has been modeled to a large extent on the British system, the question thus becomes whether these two binary systems lost their *raison d’être* because they had existed for some 25 years and had evolved to the next stage, to use the Teichler and Scott terminology, or whether it was their location in systems of similar structural and cultural order that resulted in their ultimate demise.

The above is not an easy question to answer, but the following observations may provide some further insights. If the evolutionary paradigm holds true, then over the next decade one would expect to see the demise of all binary systems in Europe. All countries that have binary systems in Europe now also have a similar degree structure as a resultant of the Bologna Process, which also was the case for Australia and the UK. Unified transnational quality assurance processes will further reduce sectoral differences, and continued staff and student mobility schemes will further integrate academic norms and value systems. In 10 years, this hypothesis can be tested, but now it has to remain in the realm of speculation. Extrapolating from empirical observations, however, could also lead one to hypothesize that binary systems can viably be maintained on the condition that firm boundaries are set and not transgressed. The most well-known case in point would be the Californian higher education system where the master plan, originally developed under the leadership of Clark Kerr in 1960, stipulates clearly differentiated and legislated roles and mission for the California State University (CSU) system and the University of California (UC) system. As such, the system clearly is a stratified system with a formal hierarchy and has remained so for almost 50 years. The point to be made here is that the structure has not been without tension, in particular when it comes to the doctoral-granting status that has been the preserve of the UC institutions, much to the chagrin of ambitious CSU institutions, but it has remained in place because of strict mission-oriented legislation and higher education policy (for an elaboration, see Douglas (2003); Fox (1994); formally, of course, the system also includes the community colleges sector). Despite the fact that the Californian system is the best known, these types of nonpermeable stratified systems are quite common across the US. Taking this to Europe, one could equally hypothesize that binary systems will remain conditional on national governments willing to put in place and keep in place regulation and policies that keep

both sectors clearly apart in terms of mission, programs, and stakeholders. This, however, is no mean task as there are inherent tensions embedded in segmented systems (as, *inter alia*, there are in all systems for that matter but they come to the fore more easily in segmented systems).

Inherent Tensions in Formally Diversified Systems

The main problem that policymakers and institutions alike find with working in formally diversified systems such as binary systems, is that most of the times the crucial underpinning philosophy of equal but different does not work. As summarized by the Organization for Economic Cooperation and Development (OECD), this is because of: “the social and cultural status attributed to older universities and their members (staff and students); the more generous resourcing available to elite and research-oriented universities; and the ‘trickle-down’ effect of academic staff recruitment: most staff in all but the most prestigious institutions are likely to have obtained their qualifications from an institution higher in the academic hierarchy than their present place of work” (OECD, 2008: 97). University staff salaries on average are higher than in the nonuniversity sector, and research by and large remains more valued than teaching. So basically, we do not have a level playing field when it comes to binary systems. In fact, they can well be conceptually conceived of as stratified systems. As Riesman has already noted in 1956, in stratified systems lower-status institutions will try to gain status by imitating higher-status institutions, resulting in what he calls a reptilian procession (Riesman, 1956; see also: Neave, 1979; van Vught 2008). The overall result, of course, is that over time, differences between institutions diminish and sectoral boundaries become more difficult to maintain. These processes of academic – and its corollary vocational – drift not only are stimulated by perceptions of status, they are equally instigated by uniform policy environments with singular reward and/or incentive structures. A policy environment can be characterized as “a political arena in which institutions and interests groups within institutions vie with one another to maximize status, prestige and financial rewards. Diversity and convergence become part and parcel of the political process, for one or the other state of affairs may privilege one set of institutions or interest groups over others, setting in train campaigns by the ‘disadvantaged’ to alter their circumstances” (Goedegebuure and Meek, 1997: 315). Therefore, in order to create and maintain relatively stable stratified systems, it is paramount that distinct policy environments are put in place that reward the different missions of the institutions in these sectors at a relatively comparable level. In this way, legitimacy for both sectors can be ensured. But once again, this is easier said than done. Mission-based

steering requires a solid policy capacity at the central government level which is not something that should be taken for granted. In addition, many governments the world over have moved away from this type of hands-on governance approach to more market-like arrangements. Consequently, existing boundaries between sectors become increasingly blurred as institutions are provided with the opportunity to imitate perceived higher order institutions. But it is not only imitation behavior that blurs boundaries. As has been argued before, our world is increasingly becoming complex and in response our tertiary education institutions are becoming increasingly complex, simultaneously operating on what can best be described as multilayered chessboards. While on certain of these boards, they may be engaged in the same play for reasons of national or regional needs, on others they may be engaged in quite different sets of games. It is this complexity that makes sector boundaries at times more like artifacts than a reflection of empirical realities, and it makes the afore mentioned mission-based steering arrangements so difficult to implement for one central government agency. In this respect, we need to remember that the overarching rationale for the move from state control to state supervision exactly was this notion of increased complexity (Neave and van Vught, 1991). A possible way out of this dilemma might be found in recent initiatives to introduce multilevel classification schemes that reflect the multifaceted nature of contemporary higher education institutions and allows for self-selection by individual institutions on the dimensions they want to be held accountable for.

From Stratification to Classification?

Probably the best-known institutional classification is the so-called Carnegie Classification in the US. Originally developed in 1970 to support the research and policy analysis program of the Carnegie Commission on Higher Education, the classification “has been the leading framework for describing institutional diversity in U.S. higher education” (Carnegie Foundation for the Advancement of Teaching, 2008). In 2005, a new system was introduced based on a set of multiple, parallel classifications which “provide different lenses through which to view U.S. colleges and universities (...) organized around three fundamental questions: what is taught (Undergraduate and Graduate Instructional Program classification), who are the students (Enrolment Profile and Undergraduate Profile), and what is the setting (Size and Setting)” (Carnegie Foundation for the Advancement of Teaching, 2008). The new classification scheme also allows for a set of elective classifications that depend on voluntary participation by institutions – all other sets are constructed on the basis of publicly available empirical data – to highlight specific mission elements such as community engagement. The new classification scheme has been developed

for a better reflection of the institutional fabric existing in US higher education and to address some of the negative aspects that have come to the fore through the use of a single classification framework in, for example, newspaper rankings (McCormick and Zhao, 2005).

In similar vein, a project to build a European classification of higher education institutions, supported by the European Commission, has been ongoing since 2005. The aim of the project is to create a level of transparency in the European higher education area which would support the various stakeholders in this area:

- Business and industry will be able to have a better identification of the institutions they wish to relate to with respect to hiring graduates, commissioning research, organizing knowledge transfer, etc.
- Policymakers (at various levels) will be able to target policies and programs better.
- Students will be able to easily identify their preferred higher education institutions and make better choices regarding their study programs and labor-market perspectives.
- Higher education institutions will be able to develop their missions and profiles in a better manner and engage in partnerships, benchmarking, and networking (CHEPS, 2008: 11).

Like the Carnegie Classification, the European classification under construction is multidimensional and uses *a posteriori* information. The 2008 draft version has been developed through an extensive and encompassing stakeholder-consultation process and is explicitly nonhierarchical in terms of the dimensions, criteria, and categories used. It consists of 14 dimensions on the basis of which institutional profiles can be created: types of degrees offered; range of subjects offered; orientation of degrees; involvement in lifelong learning; research intensiveness; innovation intensiveness; international orientation: teaching and staff; international orientation: research, size, and mode of delivery; public/private character; legal status; cultural engagement; and regional engagement.

Both the US and the European classification schemes allow for a range of profiles, making it possible for institutions to identify with a group of similar institutions to be compared with on the basis of actual performance. It can help institutional policymakers to set aspirational goals and missions and allow them to clearly state what the institution wishes to be funded for and to be judged on (and even ranked on – thus avoiding the current apples-and-oranges problem). It also allows for the identification of diversity within a system and for national policymakers to fund institutions in terms of their missions and to be far more assured that this will generate the intended policy outcomes rather than the unintended ones that so often occur due to copycat behavior. It can create parity of esteem as sets of missions are agreed upon by institutions

and national governments and each of the sets (or classification groups) has an intrinsic value since it has been arrived at through an inclusive consultative stakeholder process. As such, it may avoid the rigidities and hierarchies that formally stratified systems encompass. By having institutions in the driver's seat in terms of selecting the dimensions they consider important and want to be central in the national policy processes, it avoids the capacity problems at the national policy level identified above. It is still early days in terms of the actual viability of these schemes, particularly in Europe; yet, their multilayered principles may be instrumental in reducing the negative status and hierarchy connotations that accompany formally stratified systems such as binary systems, and may provide a better support for higher education institutions in the pursuit of multiple missions attuned to the needs of an ever-evolving society.

Viewing Private Higher Education: How Much, Where, Why, and What?

D C Levy, University at Albany (SUNY), Albany, NY, USA

© 2010 Elsevier Ltd. All rights reserved.

Overview

This article aims at a broad sketch of private higher education (PHE). PHE now holds roughly 30% of total global enrolment. Yet there has been woefully little scholarship about the sector. Fortunately, the amount and quality has been improving in the last few years, with recent cross-national volumes including Altbach and Levy (2005), Slantcheva and Levy (2007), Gupta *et al.* (2008), Mabizela *et al.* (2008), and Levy and Zumeta (forthcoming). Thus, one goal of this article is to promote the adequate entry of PHE into analysis of important higher education topics.

This article proceeds to three parts: (1) the astonishing growth of PHE; (2) major types of institutions that constitute the sector; and (3) private–public contrasts in finance, accountability, and governance. Throughout, comparisons will be drawn to the public sector. Most often there is considerable intersectoral distinctiveness, but there is also blurring. Contrasts are especially sharp where the private sector is largely for profit (Kinser and Levy, 2006).

Reality differs greatly within and across regions and countries, and across time. PHE is a wide-ranging and multifaceted phenomenon. Most generalizations about it are simplifications, usefully qualified, including with counter examples, and made with risk. Nonetheless, we can now make a number of warranted and weighty generalizations about PHE.

Emergence and Size

Leaving aside precursors including colonial institutions, borderline training and secondary higher education institutions, specialized colleges, and old private–public hybrids, indeed leaving aside almost everything prior to the twentieth century, our focus is contemporary, basically on first-degree higher or tertiary education. The growth of graduate (Landoni, forthcoming) and research PHE (Levy, 1996) merits attention, as does comparison between PHE and private primary and secondary schools (Scheker, 2007).

Outside the US, for most of the twentieth century, higher education was usually public, religious roots receding, and until mid-century PHE remained limited in scope. However, the surge from mid-century, especially since the 1980s, has been almost unabated to the present (Levy, 2006, 1992).

PHE growth is mostly about the developing and transitional post-communist world. The only clear-cut example of a developed country with majority private enrolment has been Japan, although currently South Korea and Taiwan could reasonably be cited as well.

Western Europe continues to be the main region with only very limited PHE. Its higher education system has been mostly state centered. Private sectors often have been only marginal (Geiger, 1986). Even in this region, however, recent years show privatization. The most noteworthy is the partial privatization of the public sector, but that goes beyond the scope of our article. MBAs exemplify private emergence tied to marketization and globalization. There is very recent major philanthropy for two private institutions – Germany and Italy. Still, Portugal remains the region's sole example of PHE holding a substantial share (27%) of total enrolment.

Until 1989, even more nonprivate was communist Europe, but that picture was transformed quickly and powerfully (Slantcheva and Levy, 2007). Most dramatic until the mid-1990s, the growth produced up to 30% private shares (Paschuavili, 2007 on Georgia and Jablecka, 2007 on Poland), although others of only a few percent (e.g., Croatia and Slovak Republic). Moreover, PHE growth may convert to stagnation and even decline given the aging demographic context, just as it may in Japan. Decline is also a threat for particular sectors of PHE, as shown by Catholic PHE in the US (Collier, in progress) and elsewhere.

Yet if continued private growth is not inevitable everywhere, it has prospects of further ascent elsewhere. The newest regional sites of sudden private development from near zero to noteworthiness are the Middle East and North Africa. The private breakthrough is partly a byproduct of the still-very-low cohort enrolments in higher education overall. There is much room to grow, if economies develop, with corresponding intensification of demand for higher education. Much of the Gulf, Morocco, Egypt, Syria, and Jordan (and Israel, if we concentrate on colleges) are among the noteworthy examples, usually with government initiative and support. Meanwhile, the surge in sub-Saharan Africa (Mabizela *et al.*, forthcoming) has been a bit longer but dramatic nonetheless, more often following the typical global development pattern of an unplanned and unanticipated private surge (Levy, 2006). Although uneven, the private growth is now widespread in Africa.

A longer experience with PHE characterizes Latin America. Cuba is alone in having no PHE. From only about 3% private around 1950, the regional private share catapulted to near 40% by around 1980, despite unprecedented public growth in absolute numbers (Levy, 1986) and may be around 45% now, according to the United Nations Educational, Scientific and Cultural Organization (UNESCO) data. Brazil, Chile, Colombia, the Dominican Republic, and El Salvador are examples where most of the system's enrolments are private.

Largest in population, Asia shows enormous variation with striking cases of over 70% private (Indonesia, Japan, the Philippines, South Korea, and Taiwan). A set of countries more in the 30–40% range includes India, Kazakhstan, and Malaysia. However, the largest present growth, with huge potential, comes in countries with private shares still under 15%. Most important is China, but Vietnam, Cambodia, and Thailand are other examples.

This overview of PHE growth and size of course tells us much about one of the chief societal concerns about higher education overall: access. Among developed countries, possibly only Japan massified through the private sector (again now reasonably adding South Korea and Taiwan). Yet the situation is radically different for much of the developing world. No surprise then that PHE promoters prominently cite the provision of access as a major achievement. Even societies not ideologically keen on privateness in education have faced the stark reality of lack of funds and commitment to provide mass access through the public sector. Soaring demand for higher education has been a characteristic of recent decades and is projected to further intensify rather than slacken in the coming decades. “You can’t do it without us,” could be the PHE rallying point about access.

As a corollary, expanded access usually means access for groups less-socioeconomically privileged than those already in the system – including those in the extant public sector. Of course, access for the less-privileged is one of public higher education’s most passionately proclaimed aims and there are indeed relevant accomplishments. Yet the public sector is usually less concerned with competition from the private sector on higher education’s low end, than it is at higher rungs.

Types of PHE

PHE varies tremendously. Differences among institutions can be greater than those within the public sector. Therefore, most questions and answers about PHE should fruitfully be attentive to types of private institutions. Different types can be widely encapsulated into three categories, which are discussed below. Each has a fairly defining set of characteristics, most intertwined with factors driving their emergence.

Group Identity

Historically, initial private emergence has frequently, perhaps usually, been tied to religious beliefs or grouping. A particular catalyst was often the secularization of pre-existing institutions, along with the fresh creation of markedly secular public institutions. Thus, public higher education today is overwhelmingly secular. In contrast, much of the private sector remains discernibly (though not overwhelmingly) religious. Religious higher education has been a way to promote – although largely just to protect – the identity of a religiously based group.

Two principal changes have recently modified the picture. One is the increasing mix of religions. In Latin America, most markedly, but in other regions as well, Catholic predominance yields to an evangelical Protestant emergence as an expression of the growing evangelical population. A quite contrasting culture arises where Islamic higher education also emerges. Where Muslims are a minority, PHE is an option; where they are a majority, religion may find expression in the public sector. Perhaps the region with the most dramatically surging PHE religious proliferation (Catholic, evangelical, and Islamic) is Africa.

The other change has been the shrinking share of the religious within the cultural identity category. This may or may not reflect falling religious enrolment but it certainly reflects a rise of outlets for nonreligious identities. The most important of these identities is ethnic. Naturally, the phenomenon may be particularly strong in countries with quite heterogeneous populations. As on the religious side, so also on the ethnic side, PHE is often both protective and promotional in intent and practice. It has played those roles even in societies of relative religious tolerance and pluralism, as in the Protestant majority in the US. In more divided or intolerant societies, the minority cultural niche is often especially defining. South Asia and most of the European and Asian post-communist world provide notable examples.

Sometimes, overlapping a group or religious orientation is a set of values at odds with perceptions of what dominates in the public mainstream. Where these values stress authority, safety, and the like, parents have special PHE interest for their daughters. This may link up with concentration of study in traditionally female fields such as nursing.

Semi-Elite PHE

Although the type of PHE that often generates the greatest interest, elite PHE is very rare. The main exception is the Americas, particularly the US. However, outside the US the private sector is rarely the pinnacle, rarely the top choice for students who have choice. Although some Asian PHE institutions are reasonably seen as elite, they almost never match the public top; Japan has a few

privates in the top ten (e.g., Keio University and Waseda University) but only in South Korea are privates dominate the top ten. The much publicized global rankings produced in China and the United Kingdom confirm the only paltry appearance of non-US PHE. Accordingly, here we emphasize semi-elite PHE. In Africa, Asia, and post-communist Europe, a set of public universities continues to dominate the top, so that semi-elite private universities may compete principally against public universities in the next tier.

Important institutions in Latin America may well merit an elite label, but we must highlight limitations. For one thing, in countries such as Brazil and Argentina, the most prepared students continue disproportionately to choose leading public universities. Elsewhere, even where PHE holds an overall lead and there is disenchantment with quality and disorder in the public sector, the best publics usually remain the top choice in certain scientific and medical fields as well as in other traditional professions (e.g., law). Moreover, full-time teaching, graduate education, and research remain the exception even toward the top of the region's PHE. In both Latin America and beyond, it is mostly in niches that semi-elite concentrates and even approaches the elite level. Business fields are the leading example, including at the master's level.

Criticism and praise for the semi-elite subsector partly echo that associated with the elite subsector. A major example is the lament that students tend to come from privileged families; another is that they are too non-national, too tied to US models, English, or fitting into the global economy. At the same time, semi-elite institutions lack the quality and breadth of the elite counterparts. Conversely, they are serious institutions providing good opportunity below the pinnacle but ahead of the bulk of the sector or system. They often pursue success within high-demand areas associated with lucrative employment. Witness the 1990s enrolment surge in academies of economics (business), rising from zero to nearly 300 000 (Kraft and Vodopivec, 2003). Many semi-elite institutions are entrepreneurial and competitive, demonstrating capacity to improve and enlarge, sometimes using gains from fields with heavy demand (yielding substantial income) into more costly fields, facilities, and faculties. However, it is difficult to rise above semi-elite. The already-established top places, public and private, boast the highest level of students, faculty, competitive grants, donors, political muscle, and alumni.

Nonelite Demand Absorbers

Were importance defined only by numbers, the clearly nonelite subsector would warrant the bulk of our attention. Here, most students are not choosing their institutions over other institutions as much as choosing them over nothing. The crux of the nonelite subsector is demand

absorption as the soaring demand for higher education – fueled by economic growth and an enlarging middle class, as well as by copying the examples of others – exceeds the public supply of slots as governments conclude they are no longer able to finance most new enrolment. Further contributing to private nonelite proliferation has been a lax regulatory environment at least for some initial period of proliferation (Levy, 2006), although this factor has been weaker in East Asia and the Middle East than in Africa and Latin America. In every region in which PHE becomes the majority sector (and in many where it becomes a large minority sector), it is this demand-absorbing subsector that has been numerically dominant, usually increasingly so.

The private nonelite subsector often includes institutions labeled universities but the label is questionable. Moreover, this is the subsector most concentrated in institutions not even labeled universities. Indeed, many private institutions are technical or vocational institutions, ambiguously perched on the definitional borderline marking higher education as well as on a for-profit, non-profit border (Atchoarena and Esquieu, 2002).

Evaluation of the nonelite sector is often extreme, especially on the negative side, reflecting a mix of real observation, traditional prejudice, and stereotype. Unfortunately, the negative critique is often apt. Fly-by-night institutions operate in search of financial reward, shamelessly profiting from the large demand–supply gap. They are most often quite small, sometimes family owned, with much of what they do quite nontransparent. Here is where we mostly find institutions that are legally nonprofit yet functionally for profit; in addition, among the legally for-profit institutions the overwhelming number is in the nonelite private subsector. Attempts to justify these demand absorbers are strained but become serious where we turn to demand absorbers that pursue aims beyond financial gain alone. The best of these institutions tend to be focused on useful training and teaching (Education Commission of the States and Kelly, 2001; Cao, 2007). As the whole nonelite subsector is composed of less-privileged clientele than found in much or most of higher education, it makes a substantial contribution to access – in often egregiously unequal societies. Moreover, the serious institutions may well strive for improvement, even hoping eventually to border the semi-elite subsector. In contrast, the fly-by-night organizations are vulnerable to national tightening of licensing standards or introduction of accreditation systems.

The Finance, Governance, and Accountability Nexus

Issues of finance and governance as well as accountability are also addressed elsewhere in the encyclopedia. How does

PHE fit? We explore this question with distinctions by type of private subsector. In general, private–public differences are formidable, notwithstanding overlap and blurring.

Finance

PHE operates basically on private money. Across all regions, and types of PHE, as well as for all the decades of private growth, a salient characteristic of PHE is its huge reliance on private income. Most private institutions are fully or almost fully tuition dependent.

Exceptions go all the way to predominantly public finance, but these exceptions have been few. Belgium and the Netherlands are the long-standing cases, matched by Chile around the 1960s and 1970s, where private–public higher education differences overall have been limited. The limitations stem from government coming to treat private institutions the way it treats the public ones. This means public funding of both public and private sectors. In India, private colleges became basically public institutions after the nation's independence; they are affiliated to universities (Agarwal, 2006). Moreover, even these cases do not suggest private–public near uniformity in funding the whole system. Additionally and strikingly, quite private institutions may emerge alongside the publicized private predecessors. Perhaps the most dramatic case is Chile, where the military government and neoliberal economists hatched the idea of a whole wave of new private institutions (Bernasconi, 2003). The prior, publicized institutions are now referred to as old privates to distinguish them from the markedly private institutions. Similarly, India's neoliberal policies and economic boom have contributed to the rise of a quite private sector, privately funded.

Much less dramatic but more and increasingly common is government funding of some, but not the bulk, of PHE income. Provision is linked to some desired criteria other than private–public status. Following US precedent, two prominent modes are funding to students (usually based on need), rather voucher like, and competitive funding of research grants. Such funding remains an idea more than a reality for the bulk of the world's PHE but the reality is expanding. In Israel, students at private colleges are eligible for public funds. In New Zealand, private institutions are eligible for public money. In Thailand, as in other parts of East Asia, PHE can receive grants in aid, income-contingency loans, and the like. Added to the increasing share of public higher education funding that comes from private sources, this public funding of PHE makes for an intersectoral blurring. However, convergence would be too strong a term, since the key comparison remains stark: most public higher education funding is public, most PHE funding is private.

A few PHE subsectoral tendencies merit mention. Religious institutions have been recipients of public funding in some cases where they are long-standing, have shown a

degree of academic seriousness, and largely emulate the public sector except for religious mission. However, cultural institutions built around ethnic minorities may present particular political difficulties in regard to potential public funding. Naturally, any sort of religious or ethnic institution may receive private contributions, thus diversifying the private funding base beyond tuition and fees alone.

Elite privates have a substantial claim on competitive public or private (e.g., foundation, domestic or international) funds in terms of quality, including ability to compete for sector-blind funding pools – but elite PHE is rare. Semi-elite PHE shares some of that claim and particularly highlights the possibilities of contracts and applied research funding. In addition, semi-elite institutions can charge high tuitions and have some realistic prospect for future alumni giving. Corporate funding is another possible source, including where for-profit PHE is tied to corporations.

Where tuition and fees are usually the nearly complete source of funding is in the demand-absorbing subsector. Yet even there the upper-end, serious institutions may be able to broaden their income profiles, including that if public funds are available for PHE it is often for accredited institutions.

In the financial blurring of sectors, however, weightier than additional public funding of PHE is additional private funding of public higher education. As with so much of the global transformations of higher education, the US has been the leader both by its less statist and more market-oriented traditions and by its intensification of those tendencies; the market penetrates very deeply into even the (public and nonprofit private) high-end research universities (Geiger, 2004). The introduction of tuition public-sector fees remains heavily opposed for a variety of reasons; however, it is also increasingly overcome – sometimes not only by introducing nontuition fees, or by introducing tuition at the master's level, but also by direct and widespread imposition at the undergraduate level. A particularly striking African and East European manifestation – reflecting our earlier point about private–public competition above the low end of the system – is public institutions' admission of private, paying students alongside their subsidized ones, sometimes in semi-elite beachheads in market-oriented fields. Another intriguing recent development (as in South Africa, China, and Russia) is partnership between public universities and private colleges, the former bringing power, academic resources, and standing, the latter bringing in tuition-paying students to the public universities. Yet the main twentieth-century and persisting public norm is state funding of public institutions.

Accountability and Governance

Much of what can be said about PHE accountability relates to the nature of funding, as well as to parallel

points about governance. However, whereas finance is mostly clear and measurable, accountability and even governance are vaguer concepts, more subject to interpretation.

Self-financed, most PHE institutions are self-governed. At least this tends to be the case with regard to government, whereas autonomy may be limited by private funders to whom accountability may be owed (e.g., churches, businesses, foundations, and families).

However, as by far the main funders are the students' families, one could reason that PHE is accountable to them. True in many cases, the proposition is dubious where we are dealing with fly-by-night demand absorbers in situations of demand vastly exceeding supply, an easy market for private institutions. Of course, they still need to attract students but many students have little alternative between no higher education and this private education. Thus, these private institutions may have to deliver much less than they may promise, that is, the accountability is low; or it may be enough for institutions to offer up a loose copy of what public or other private universities provide, thus garnering sufficient credibility and legitimacy to survive. Yet, when demand slackens, low-status private institutions face a much greater threat and may have to compete more and be much more accountable than they had been. This is the present case in Japan and there are echoes in Eastern and Central Europe, also owing much to changing demographics. Similarly, US Catholic and other nonelite institutions find themselves sinking or swimming in a more difficult market than before. It is likely that semi-elite institutions need to be more accountable than demand-absorbing ones when it comes to satisfying paying clients, given that fees are higher, clientele more privileged, and institutional aspirations clearer and more ambitious. Accountability to pertinent businesses (funders and/or employers) is also a logical reality for semi-elite institutions.

To whatever extent PHE institutions might provide accountability, and to whom, the accountability is often tied to comparatively hierarchical management at the institutional level. These institutions usually make little pretence to internal democracy or broad participation in governance. In other words, the risk of institutions being forced internally to change their mission and profile of accountability is limited. Student and faculty power pales compared to what is found not infrequently in the public sector. Faculty are mostly part time (including many who are full time at public universities), unionization minimal, and professors lack high academic training and status. On the student side, the classic formulation of student choice (of institutions) without much voice inside holds. The formulation is especially defining in for-profit institutions, where faculty power is especially weak (Kinser, 2006).

PHE accountability tends to be rather targeted to particular groups, especially those that pay. Key is that accountability need not be widely spread out. A typical

PHE institution need not be responsive to broad wishes of a broad public. Nor need it be responsive to private actors that are crucial at another private institution. By the same token, however, its accountability to its few lords may have to be deep and substantial. A common for-profit claim is that they prove themselves through measurable results, usually in the job market. These results can be crucial to their legitimacy, whether they also pursue legitimacy through accreditation (Kinser, 2007).

In contrast, public university accountability tends to be more diffuse, often at least with a claim of responsiveness to the general public. This tendency also suggests a more prominent place for government than found for private institutions, although this tendency is blunted where public universities enjoy traditions and guarantees of substantial autonomy, a reality that today fuels widespread government proclamations that public institutions must become much more accountable, including measurably so.

The extreme of PHE nonaccountability to government relates back to the unplanned explosion of PHE. Yet the deleterious effects of this lack of accountability, combined with operation in nontransparent and easy markets, have increasingly led to more imposition of rules, what we might call delayed regulation (Levy, 2006). Some rules are system wide, others targeted at PHE. Accreditation is a major global example normally tied to system-wide rules. Private-public contrasts may further diminish as public universities are urged, including by government, to institute more management techniques associated with private sectors. The new contract of greater autonomy in exchange for clearer accountability in terms of results can be seen as a form of partial privatization in the public sector.

Conclusion

PHE growth has substantially reshaped the higher education landscape. Once the norm, public monopolies and near monopolies have become uncommon. When we refer to higher education we must be sensitive to the reality of two sectors and the differences between them.

PHE growth has been spectacular in recent decades, mainly in the developing and transitional world, where there still appears to be much potential for further expansion. Across regions and within them, the strength and extent of PHE growth have varied, but no region has been unaffected.

Also connected to variation is that there are several different principal types of PHE. Numerically and increasingly the dominant form is nonelite, absorbing demand unaccommodated by the public sector. Within this subsector, in particular, it is crucial to try to distinguish between fly-by-night institutions and serious ones usually oriented to the job market. On the other end of the PHE subsectoral spectrum are elite universities but unless

the term is used liberally, few such institutions exist, although of course the exceptions are noteworthy. Much more common are semi-elite institutions, sharing some characteristics with high-end, nonelite counterparts, and often doing well in status and results in the entrepreneurial realm. Finally (and sometimes overlapping the semi-elite), religiously and culturally oriented institutions maintain a strong presence. Growing in important respects, receding in others, they contribute considerable diversification to the private sector and to higher education overall.

PHE growth is significant not just for the numbers alone but for the fundamental differences that generally characterize the two sectors. Of course, the differences are not uniform and we can identify tendencies of increased public roles in PHE and increased privatization within public higher education. However, for the most part, the public sector remains quite public, whereas private institutions are privately financed and have governance and accountability profiles consistent with their funding and purpose.

Children of Migrant Populations

M M Suárez-Orozco and C Suárez-Orozco, Immigration Studies at New York University, New York, NY, USA

Ours is the age of movement. Approximately 200 million transnational migrants are living beyond the countries of their birth – and hundreds of millions more are internal migrants within the confines of ever-changing nation-states. What drives global migration? First, the global integration of production, distribution, and consumption of goods and services stimulate migration because where capital flows, immigrants follow. Second, new information, communication, and media technologies enable global economic production and also stimulate migration by generating new desires, tastes, consumption practices, and lifestyle choices. Third, globally integrated economies increasingly rely on foreign workers (in north-western Europe and Japan due to demographic considerations: low fertility rates and rapidly aging populations) both in the well-remunerated knowledge-intensive sector and in the least desirable sectors of the economy. Fourth, the affordability of mass transportation has put the option of migration within the reach of millions who, heretofore, could not do so. Fifth, globalization stimulates new migration because it has produced uneven results – wage differentials, when controlled for cost-of-living differences, are on the order of 4 –1 in many North–South migration corridors.

In the field of global migration, remarkably, the well-being and future of the children of immigrants are all too often neglected. The children of immigrants are a fast-growing sector of the child and youth population in countries such as Australia, Canada, Germany, Italy, the Netherlands, Spain, Sweden, and Spain. In the United States, the country with the largest number of immigrants

in the world, approximately 25% of all youth, are of immigrant origin and it is projected that by 2040 over one-third of all children will be growing up in immigrant households. Schools in cities, large and small, the world over, from New York to Beijing, from Barcelona to Toronto, from Sydney to Reggio Emilia, are being transformed by growing numbers of immigrant children. Just as schools face the challenge of educating linguistically, culturally, and racially diverse students, globalization imposes yet another challenge on education – nurturing ever more complex skills, competencies, and sensibilities on students to equip them to engage in the globally interlinked economies and societies and to become globally conscious and competent citizens in the twenty-first century.

Immigrant-origin youth arrive in new destinations with distinct social and cultural resources: high aspirations for education, meta-cognitive advantages afforded by a dual frame of reference, well-honed skills for developing relationships to help them negotiate unfamiliar territories, and the abilities needed to navigate across difficult circumstances. Their optimism, high aspirations, dedicated hard work, and positive attitudes toward school and ethic of family support for advanced learning contribute to the fact that some immigrant youth in some countries educationally outperform their native-born peers of comparable backgrounds. Many immigrant youth also encounter such a myriad of challenges – xenophobia, economic obstacles, language difficulties, family separations, under-resourced neighborhoods and schools – that they struggle to gain their bearings in an educational system that often puts them on a downward trajectory.

Immigrant youth arrive from multiple points of origin at multiple destinations often adding new threads of cultural, linguistic, religious, and racial difference to the social tapestry of their new homes. Some are the children of educated professional parents (such as Indians in California), while others may have illiterate parents (such as Kurds in Stockholm). Some received excellent schooling (such as the children of emigrants from Hong Kong in Vancouver), while others left educational systems that were in shambles (such as the children of emigrants from Haiti). Some escaped political, religious, or ethnic persecution (such as Iraqi children in Jordan), others are motivated by the promise of better jobs and better educational opportunities (such as Uzbek children in the Russian Federation). Some are documented migrants, while others are unauthorized young migrants. Some join well-established communities with robust social supports, while others move from one migrant setting to another, forcing students to often change schools. The social and educational outcomes of immigrant youth will vary substantially depending upon the specific constellation of resources and the settlement context.

The global economy is largely unforgiving to those who do not achieve formal education. Indeed, schooling processes and outcomes shape socioeconomic mobility. Recent studies suggest that, while some children of immigrants are successfully navigating the educational system in their new societies, large numbers struggle academically, leaving schools without acquiring the tools that will enable them to function in the globally competitive labor market.

Academic trajectories and performance are multiply determined by an alchemy of family-background variables, the quality of schools that immigrant students encounter, second-language-acquisition challenges, student engagement, and relational supports. Taken together, these factors serve to bolster or, conversely, undermine academic adaptation and success. Next, we review the variables that have the strongest implications for the schooling performance and social adaptation of immigrant-origin youth in new societies: (1) family background; (2) quality of schools; (3) academic language of the new country and general second-language-acquisition challenges; (4) individual level factors; and (5) social supports.

Family Background

Parental Education

Immigrant youth arrive in new countries with varied levels of human capital. On one end of the spectrum, we find youth from upper-status urban backgrounds. Their parents are typically highly literate, and the children arrive with high levels of literacy, and well-developed study skills. These parents are well equipped to guide the children in how to study, access, and make

meaning of data and information, and can provide resources, including additional books, a home computer, Internet access, and tutors. In contrast, there are immigrant youngsters whose parents have little or no formal education. These children may arrive having missed critical years of classroom experience and often cannot read and write adequately in their native language. Such varied experiences and backgrounds will have important implications for the transition to their new countries. Unsurprisingly, youth arriving from families with lower levels of education tend to struggle academically, while those who come from more literate families and with strong educational skills typically flourish.

Poverty

Poverty has long been recognized as a significant risk factor for poor educational outcomes. Children raised in circumstances of socioeconomic deprivation are vulnerable to an array of distresses, including difficulties concentrating and sleeping; anxiety and depression; as well as a heightened propensity for delinquency and violence. Poverty frequently coexists with a variety of other factors that augment risks – such as single parenthood, residence in neighborhoods plagued with violence, gang activity, and drug trade, as well as school environments that are segregated and overcrowded. High poverty is also associated with high rates of housing mobility and concurrent school transitions. All of these stresses are highly disruptive to educational engagement and performance.

There is evidence that large numbers of immigrant-origin students in many contexts suffer from the challenges associated with poverty. The United States offers a worrisome example. In 1999, 22.8% of Latinos, two-thirds of them immigrants or the children of immigrants, were living in poverty, compared with 7.7% of whites. In 2006, the poverty rate for Latino students in the United States (28%) was almost double of that of white children (16%). For immigrant Latino families, poverty reaches much higher percentages. Fully 35% of foreign-born Latino students live in poverty, compared to 27% of native-born counterparts. Immigrant children are more than 4 times as likely as native-born children to live in crowded housing conditions and 37% of Latino immigrant families report difficulties affording food. A large proportion of these children are raised in families where parents are working but many are employed in very low-paying professions with erratic working conditions. Similar patterns of immigrant poverty can be found in other countries of immigration.

Such impoverished family conditions may lead immigrant students to shoulder financial responsibility for the family; many immigrant students contribute to their family income by working after school. According to a recent US survey in 2007, 17% of immigrant-origin Latino students between the age of 16 and 18 held jobs.

Research suggests that working long hours can distract from concentration on school work and is related to lower grades. After-school work is also associated with lower achievement on math and science scores of the National Educational Longitudinal Study (NELS) data, and has a particularly negative effect on boys. Poverty and other heightened stressors have negative implications for educational outcomes for immigrant origin youth.

Undocumented Status

Millions of immigrant children live in new countries without proper documentation. In the United States, for example, nearly 2 million children and youth are unauthorized immigrants. Research suggests that undocumented youth often arrive after multiple family separations and traumatic border crossings. Immigrant children and youth in households with unauthorized members often experience fear and anxiety around being separated from family members if they or a relative is apprehended or deported. Such psychological and emotional duress can take a heavy toll on the academic experiences of children growing up in these homes. Further, while unauthorized youth may in some settings legally have equal access to basic education, they may not have equal access to health, social services, or to jobs. In some countries, undocumented students with dreams of graduating from high school and going on to college may find that their legal status stands in the way of their access to post-secondary educational opportunities. Thus, immigrant students who are unauthorized or who come from unauthorized families suffer from particular burdens.

Seasonal Migrant Youth

Being a child whose parents do seasonal migrant work presents additional challenges – multiple moves, frequent interruptions in schooling, poverty, as well as harsh working and living conditions are realities in their lives. For example, in a representative national survey in the United States, Latinos comprised 83% of the migrant farm workers interviewed, with 75% born in Mexico. Many families lived in conditions of poverty. It is estimated that over 750 000 children travel with their seasonal migrant parents in the United States each year. The lack of continuity in their schooling trajectories (because of interruptions during the school year, the difficulty of transferring school records, health problems, and lack of English-language skills) contributes to an acute risk of low attendance, and high dropout rates.

School Factors

Where immigrant families settle will shape the experiences and adaptations of the children, particularly with

regard to the kinds of schools their children access. Many immigrant-origin students attend segregated schools where the majority of their peers are other immigrant students – segregation is a notable problem in many advanced post-industrial societies with large numbers of immigrant youth, including the United States, Germany, and Sweden. Immigrant segregation often involves race, poverty, and linguistic isolation – so-called triple segregation. Triple segregation is inexorably linked to negative educational outcomes, including academic underperformance, linguistic isolation, in many cases reduced school resources, lower achievement in standardized tests, greater levels of school violence, and higher dropout rates.

Second-Language Learning

While some immigrant children, like Ecuadorians in Spain speak the same language at home as in school, many immigrant youth the world over are second-language learners. Many are receiving suboptimal, if not erratic, bilingual and English (or French, or German, or Italian, or Spanish, etc.) as a second-language instruction. Research has established that it takes 5–7 years of optimal academic instruction to develop academic second-language skills comparative to native-born samples. Yet, for many immigrant students robust second-language-acquisition educational infrastructures and adequate supports are rarely in place. In the United States, the National Assessment of Educational Progress data showed that 70% of English-language learners (ELLs) immigrant-origin students tested in the fourth grade scored below basic in reading, while 1% scored at the advanced level and 71% of the ELLs in the eighth grade scored below basic, while 1% scored at the advanced level.

Academic language difficulties present particular challenges for optimal performance for immigrant students in the current context of educational tracking systems. Even when immigrant students are able to participate in mainstream classrooms, their academic language skills may still be developing and they may struggle, missing subtleties in lectures and discussions, reading more slowly than native speakers, and experiencing difficulty in academic writing. The Program for International Student Assessment (PISA) study quantified the comparative disadvantage of immigrant youth across 17 countries, showing that language-minority immigrant youth are on average 1 year behind their peers in various measures of academic achievement. In a number of European countries of immigration, for example, immigrant-origin children are currently being placed into the lowest academic and vocational tracks before they have sufficient time to learn the academic language needed to keep up with their peers.

For second-language learners in the United States, high-stakes tests have become *de facto* language policy shaping their curriculum and daily instruction in a myriad

of ways; many are indeed tested before their skills are adequately developed – dropping out of the educational system prematurely as a result.

Second-language-acquisition issues can mask the actual skills and knowledge of immigrant youth in both oral and written displays. With more time to develop academic language skills, and more flexibility between educational tracks, however, immigrant students have been shown to sustain high-achievement trajectories. The nearly exclusive focus on learning the majority language and performance on high-stakes tests developed for and normed on native-born speakers has led researchers and policymakers to neglect the immense opportunity immigrant youth have to contribute to a multilingual and multicultural society in the age of global interdependence. As a consequence of this neglect, immigrants in many settings lose their native-language competencies by the second generation in the new society.

Individual-Level Factors

For many immigrant students, the educational journey begins with their migration to the new country. Migration is a transformative process with profound implications for the family as well as the potential for lasting impact on socioemotional development of the child. By any measure, immigration is one of the most stressful events a family can undergo. Immigration removes individuals from predictable contexts – community ties, jobs, and customs, and stripping them of significant social ties, extended family members, best friends, and neighbors. New arrivals who experienced trauma may remain preoccupied with the violence and may also feel guilty about having escaped when loved ones remained behind. Those who are undocumented face an ever-present threat of apprehension that can lead to further traumatic and sudden separations. For some immigrants, the dissonance in cultural expectations, the cumulative stressors, together with the loss of social supports lead to affective and somatic symptoms. Some immigrant parents are relatively unavailable psychologically due to their own struggles in adapting to a new country, thus posing developmental challenges to their children. The immigrant parents, whether their children are of the first or second generation, often turn to them for help in navigating the new society. Children of immigrants are asked to take on parentified roles, including translation and advocacy. Such tasks often fall more on the shoulders of daughters, which have both positive and negative consequences for their development.

Immigrant children and youth also face the challenges of forging an identity and sense of belonging to a country that may reflect an unfamiliar culture, while at the same time honoring the values and traditions of their parents. Acculturative stress has been linked to high levels of

intergenerational conflict as well as psychological and academic problems. Immigrant children are often asked to take on responsibilities beyond their years, including sibling care, translation, and advocacy, which at times undermine parental authority. These often highly gendered roles may have both positive and negative consequences for development.

First-generation immigrant youth face their parents' challenges of adjusting to a new context. Often, the children migrate not simply to a new country but also to new family structures as many are separated for long periods of time from their parents during the course of their migration. During long family separations, divorces can take place, new partners can enter the family system, and new siblings can be born. In such cases, the reunited immigrant child will have to adapt to new family constellations. Further, the first-generation immigrant child must learn a new language going through a difficult transition when they are unable to communicate their thoughts with ease; while some acquire competency over time, most are marked by accents, and others never gain full proficiency. The significant time it takes to acquire academic language in the new country presents significant educational as well as social challenges for immigrant students.

The second-generation students may have limited facility in their parents' native language, which presents other challenges in maintaining communication at home. While the second generation may share a lack of access to those who can guide them through the institutions of the unfamiliar dominant society, they are typically spared the challenges of premigratory trauma, undocumented-status-related stress, and family separations. On the other hand, they often face the stressors of poverty – especially if they live in segregated urban contexts – without the protection of immigrant optimism and a dual frame of reference.

Data examining the well-being of immigrant origin populations in various countries and across generations and ages reveal mixed results according to country of origin, destination, developmental group, cohort, and age of arrival as well as developmental outcome. While there is a fairly consistent immigrant paradox showing a decline across generations with greater length of residency for physical health outcomes and engagement in risk behaviors, the results are inconsistent with regard to the risk to psychological health. Further, the body of evidence on immigrant health has focused on adults and families rather than on adolescents. Immigrant youth of refugee origin appear to be at greatest risk for affective disorders. Immigrant adolescents show patterns of progressive risk-taking behaviors the longer they are exposed to the culture of their new societies. This is also the case for academic engagement – an increasingly important indicator of well-being in the knowledge-intensive economy – which also decreases across time and across generation (in some

cases, after peaking in the second generation). Given the limited and mixed evidence on the developmental trajectories of this growing population of immigrant adolescents, more research on a variety of indicators of their well-being is needed using both qualitative and quantitative lenses.

Social Contexts of Learning

Healthy social support networks are linked to better adjustment and psychosocial outcomes. Interpersonal relationships provide a number of functions. Social companionship, a basic human need, serves to maintain and enhance self-esteem as well as provides acceptance and approval. Instrumental social support provides individuals and their families with tangible aid (such as running an errand or making a loan) as well as guidance and advice (including information, and job and housing leads). These instrumental supports are particularly critical for disoriented immigrant newcomer youth.

The Immigrant Family and Motivation

For many immigrants, social relations play a critical role in initiating and sustaining motivation in a new land. While for mainstream nonimmigrant students achievement is often motivated by an attempt to gain independence from the family, immigrant students are typically motivated to achieve for their families. Family cohesion and the maintenance of a well-functioning system of supervision, authority, and mutuality are perhaps the most powerful factors shaping the well-being and future outcomes of children. For immigrant families, extended family members – godparents, aunts, uncles, older cousins, and the like – are often critical sources of tangible instrumental and emotional support.

Families can support children's schooling by maintaining a value of education and establishing a standard of expectation. Families establish expectations about appropriate behaviors and attitudes vis-à-vis school authorities and peer interactions. They can also actively scaffold children as they complete school assignments. Immigrant parents who work long hours and may have limited schooling are at a distinct disadvantage in this regard. Immigrant parents may be unable to tangibly support their children in ways that are congruent with the new country's cultural models and expectations. Many come from traditions that revere school authorities and expect parents to keep a distance from the day-to-day workings of their child's education.

Communities and Community Organizations

As no family is an island, family cohesion and functioning are enhanced when the family is part of a larger community displaying effective social supports. When immigrants settle in cohesive communities and when adults

within the community are able to effectively monitor, sanction, and support youngsters' activities, they will tend to display better social adaptations and psychological adjustment. Children who live in such communities are less likely to become involved with gangs and delinquency and are likely to be more focused on their academic pursuits.

Youth-serving organizations can enrich immigrant communities and foster healthy development through the support they provide to children, parents, and families. Such urban sanctuaries, often affiliated with neighborhood churches, religious groups, and nongovernmental organizations (NGOs), provide immigrant youth out-of-school time that is not spent in isolation, unsupervised, or on the streets with one's peers. These programs can provide safe havens from the pressures of the streets. Community program staff can serve as culture brokers for youth, bridging the disparate norms in place in children's homes and those in place at school. Adults who work in community programs can provide tutoring, educational guidance, advice about the college-application process, and job-search assistance – information that is often inaccessible to immigrant youth whose parents have not navigated the academic system in the new land. Such programs can aid in counteracting embittered school personnel and toxic schools' impact on the educational trajectories and academic achievement of immigrant youth.

Mentoring Relationships

In nearly every story of immigrant success, there is a caring adult who took an interest in the child and became actively engaged in his/her life. Connections with non-parent adults – a community leader, teacher, church member, or a coach – are important in the academic and social adaptation of immigrant adolescents. These youth are often undergoing profound shifts in their sense of self and are struggling to negotiate changing circumstances in relationships with their parents and peers. Protective relationships with adults can provide immigrant youth with compensatory attachments, safe contexts for learning new cultural norms and practices, and information that is vital to success in schools.

Mentoring relationships may have special implications for immigrant youth as during the course of migration, loved ones are often separated from one another and significant attachments are ruptured. Mentoring relationships can give immigrant youth an opportunity to be involved in reparative relationships engendering new significant attachments. In some cases, the guidance and affection of a mentor may help to fill the void created by parental absence. The mentor, as an adult who has been in the Netherlands longer than the *protégé*, can also provide information about and exposure to Dutch cultural and educational institutions, and help as the adolescent negotiates developmental transitions. If the mentor is of

the same immigrant background as the *protégé*, he or she can interpret the rules of engagement of the new culture to parents and, hence, help to attenuate cultural rigidities. Furthermore, bicultural mentors can serve as role models in the challenging process of developing a bicultural identity, exemplifying the ways in which elements of the ethnic identity can be preserved and celebrated even as features of the more mainstream culture of the new country are incorporated into youth's lives.

Peer Relationships

Peers can provide emotional sustenance that supports the development of significant psychosocial competencies in youth. Peers can specifically serve to support or detract from academic engagement. By valuing (or devaluing) certain academic outcomes and by modeling specific academic behaviors, peers establish the norms of academic engagement. Peers can tangibly support academic engagement by clarifying readings or lectures, helping one another in completing school assignments, and by exchanging information (about examinations, helpful tutors, volunteer positions, and college pathway knowledge). However, as immigrant youth often attend segregated schools, they may have limited access to knowledgeable networks of peers.

Taken together, networks of relationships can make a significant difference in immigrant youths' lives. They can serve to help immigrant youth develop healthy bicultural identities, engender and sustain motivation, and provide specific information about how to best navigate schooling pathways. When successful, these relationships help immigrant youth and their families overcome some of the barriers associated with poverty and discrimination that prevent full participation in the new country's economic and cultural life.

Immigrant-origin youth are the fastest-growing student population in a number of countries. They often arrive with an optimism and hope in the future that must be cultivated and treasured – almost universally they recognize that schooling is the key to a better tomorrow. Over time, however, too many immigrant youth, especially those enrolling in impoverished, segregated, and mediocre schools, face negative odds and uncertain prospects. Too many leave schools without developing and mastering the kinds of higher-order skills needed in today's global economy and society. The future of our world will in no small measure be tied to the fortunes of these new young immigrants.

Third Culture Kids

R E Van Reken, Families in Global Transition, Indianapolis, IN, USA

© 2010 Elsevier Ltd. All rights reserved.

Glossary

Adult cross-cultural kid (ACCK) – A person who has grown up as a cross-cultural kid (CCK).

Adult third culture kid (ATCK) – A person who has grown up as a third culture kid (TCK).

Cross-cultural kid (CCK) – A child who lives in – or meaningfully interacts with – two or more cultural environments for a significant period of time during the first 18 years of life.

Hidden diversity – A diversity of experience that shapes a person's life and worldview but is not readily apparent on the outside, unlike the usual diversity markers such as race, ethnicity, nationality, etc.

Hidden immigrant – A child who has moved to host or passport culture and, while physically resembling members of the surrounding culture, has had a different life experience shaping his or her deeper layer of culture.

Third culture kid (TCK) – A child who accompanies parents into another culture, usually for a career's sake. This person spends a significant period of time in developmental years outside the parent's passport culture.

Before World War II, most communities – whether in the city of Chicago, the suburbs of London, or the village of Timbuktu – shared one thing in common: they were basically monocultural societies. In such an environment, children easily learned their sense of personal and cultural identity because who was 'us' and who was 'them' were clear. Role models for what life would be like in the future abounded. In general, the cultural environment in which educators had grown up was similar to the one their students knew.

Since the end of World War II, however, global shifts have had major, but often unrecognized, ramifications for educators around the globe. As ease of transportation and communication has exponentially increased the number of international businesses and organizations, millions of children worldwide are now being raised amid a plethora of cultural worlds. While recent increases in immigrant populations have been obvious to educators, the growing population of children identified by sociologists as *third culture kids* (TCKs) has sometimes been more invisible. For educators to remain maximally effective in today's globalizing world, it is important that they understand not

only what the common characteristics of this population are, but more importantly, why these characteristics occur.

Defining Third Culture Kids (TCKs)

In the mid-1970s, a sociologist from Michigan State University, Ruth Hill Useem, traveled to India to complete a research project. While there, she became fascinated with the dynamics she observed among internationally mobile families who had gone from their home, or first culture, to live in a host, or second culture, because of a career choice, not as permanent immigrants. Useem noticed that these expatriates were not living as they would have lived in their home culture nor the way members of the local host culture lived. They had, however, developed a basic lifestyle they shared as expatriates. Useem called this an interstitial, or third, culture (see **Figure 1**) – one lived out between the first and second (Useem, 1973).

Useem named the children who grew up in this internationally mobile experience third culture kids (see **Figure 2**) and defined them simply as "children who accompany their parents into another culture" (Useem, 1993: 1).

In the mid-1970s another intercultural pioneer, David C. Pollock, expanded the definition and described TCKs as individuals who spend "a significant part of their developmental years outside the parents' passport culture(s)." (Pollock, 1989: 1). Again, his focus was on internationally mobile children, not immigrants. Pollock's emphasis on the developmental years differentiates a cross-cultural experience for TCKs from that of the adults who grew up in a more traditional, monocultural upbringing and move cross-culturally for the first time as adults. While they, too, are definitely changed by cross-cultural sojourns, when these adults move to a new place, they have already developed a strong sense of their personal and cultural identity. For children, this is not so. The key developmental tasks of childhood, such as forming a sense of identity, belonging, and cultural competency, become more complicated when the cultural mirror by which children define themselves is forever changing.

Pollock also describes common outcomes of a global childhood.

The TCK frequently builds relationships to all of the cultures, while not having full ownership in any. Although elements from each culture may be assimilated into the TCK's life experience, the sense of belonging is most often in relationship to others of similar background. (Pollock, 1989: 1)

Figure 1 Third culture model. From David C. Pollock/Ruth E. Van Reken, used by permission.

Related Terms

Those who have grown up as TCKs were defined as adult TCKs (ATCKs) during the mid-1980s. Ruth Van Reken conducted the first ATCK research project in 1986 (Van Reken, 1989). Useem and Ann Baker Cottrell followed with a comprehensive project among ATCKs in 1993 (Useem and Cottrell, 1993).

Norma McCaig, a business ATCK, coined the term *global nomads* as another way to identify TCKs. Her definition reads,

Global nomads are persons of any age or nationality who have spent pre-adult years living in one of more countries outside their country of passport because of a parent's occupation. (McCaig, 1987: 2)

During this same time frame, other researchers, including Momo Kano Podolsky, were studying Japanese children raised abroad. In Japanese, *kaigai* means overseas, *kikoku* means return to home country, and *shijo* is the word for children. Thus, they identified those children living with their parents outside of Japan as *kaigai-shijo* (literally, overseas children) and named them *kikoku-shijo* (literally, returned home children) when they returned to Japan (Podolsky, 1994).

Understanding the TCK Experience

While TCKs may not share similar traditions, ethnicity, nationality, or race, the external experience they share of growing up cross-culturally in a highly mobile lifestyle creates many common internal and external responses. Culture is also a system of shared concepts, beliefs, values, and a worldview from which people interpret and make sense of life and the world around them (Hiebert, 1983). In fact, Ximena Vidal used the TCK experience to demonstrate a new way some sociologists were beginning to define belonging and identity through a shared experience rather than through the traditional models of race, tribe, and nationality (Vidal, 2000).

What TCKs Share

Virtually all TCKs share three things which are different from children raised in the more traditional monocultural environments of the past.

1. TCKs grow up in a genuinely cross-cultural world. During their formative years, TCKs don't just observe various cultures, they interact deeply with them – moving back and forth between the cultural milieus, negotiating relationships on a daily basis between those of different backgrounds.
2. The highly mobile nature of the third culture lifestyle is obvious for TCKs who have lived in many countries. But even when TCKs live in one place for an extended time, they still travel back and forth between home and host cultures at regular intervals and others in their expatriate community constantly come and go.
3. Expected repatriation is another norm for TCK families. Whether or not all do repatriate is another question, but most adults working internationally expect that one day they will return to live in their home country again. Parents make educational choices based on this expectation.

Common Benefits and Challenges

It is from these shared experiences that the often paradoxical characteristics of the TCK profile emerge and become apparent by young and ongoing adulthood. Obviously, not every TCK has the same experience or reaction to it. Personality, family of origin, home and host cultures, all play a role. Through the years, however, well-documented themes occur. The following are some of the benefits and often corresponding challenges (Pollock and Van Reken, 2009).

Large worldview versus ignorance of own culture

Many TCKs develop a large worldview from first-hand interactions with people of many cultures which can help TCKs develop strong negotiating skills on a personal and group level.

Conversely, TCKs may be ignorant of cultural nuances in their passport country. This can lead to a sense of uneven maturity. In some ways, TCKs seem wise beyond their years. In other ways, they can be socially slow.

3-D view of the world versus painful view of reality

TCKs have seen places that others only read or watch on TV.

With that privilege, they have also often witnessed first hand the pain and suffering that poverty, bad governance, natural disasters, or war bring. Increasingly, TCKs may themselves be involved in traumatic situations because of political unrest in areas where their parents are working.

Some may suffer depression or post-traumatic stress syndrome as a result of such experiences.

Large network of friends worldwide versus avoidance of close relationships locally

Most TCKs have friends all over the world and try to keep up with them via incessant text messaging, Facebook, or Skype.

This can, however, keep some TCKs from moving on in the current scene. They don't want to become close to others one more time only to say goodbye again. Others feel they are being disloyal to old friends if they move on.

Multilingual versus potential confusion

The TCKs often learn more than one language. For most, this is a great gift which frequently can be used in later careers.

For some TCKs, however, the issue of multiple language learning may create special challenges during their school years. Many TCKs attend school where their mother tongue is not the language of instruction. While the child may learn the language used at school, if parents are not fluent in this language, the child may have little help when projects are assigned as homework (Van Reken and Rushmore, 2009). In addition, while such TCKs may converse in their mother tongue at home, they often lack the academic vocabulary needed to continue higher education in that language after they repatriate (Pollock and Van Reken, 2009). One other particular challenge related to language often occurs when TCKs move to a country where their mother tongue is the one used at school. While they and their educators presume language will be no barrier, both may soon discover that spellings can differ from country to country or a particular word can have vastly different meanings (Bethel and Van Reken, 2003). In addition, Meneses demonstrates the importance of language in forming a sense of personal and cultural identity. If students have lost their mother tongue, this can have significant effect on their lives in these critical areas (Meneses, 2007).

Rootlessness versus restlessness

For many TCKs, the questions *Where is home?* or *Where are you from?* are most difficult to answer. In some ways, they feel connected to each place they've lived, but in other ways they may never feel a total sense of belonging to any of them.

Many have 'itchy feet syndrome'. Since they have moved so frequently, they see a transitional lifestyle as the norm. Rather than facing conflicts or struggles, the instinct is to deal with any stress by moving and starting over. This can affect their academic life significantly if this syndrome kicks into high gear during university years. Too often, they will keep changing schools or majors and have

a hard time finishing. In the end many find their roots in relationships rather than a particular geographical site.

Adaptability versus sense of cultural imbalance

The fact that they regularly change cultural worlds means TCKs must learn to stop and pay attention to how people interrelate in this new environment. This often leads to a sharper capacity to notice the nuances or behind the scenes messages occurring. If TCKs see puzzling behavior, many want to understand it rather than dismiss it. Like chameleons changing color to match their environment, many TCKs learn to change their behavior to blend in with the new surrounding cultures. The TCKs carry that basic sense of adaptability into adulthood where it translates as a strong sense of confidence and the ability to think outside the box or to start something new.

Sometimes, however, such chronic adaptation can leave TCKs with the sense that they are always just a bit off balance culturally and never quite at ease because they don't know for sure how the game is played here. In some ways they can fit everywhere. In other ways, they feel they never quite fit anywhere.

Multifaceted identity versus identity crisis

Ultimately, many TCKs become comfortable with the idea that there are many facets to their cultural identity. As one ATCK said, "My life is like windows [on a computer screen]. I know that all the [cultural] windows are open, but I have to operate in the one that is on the screen at the moment" (Pollock and Van Reken, 2009).

On the other hand, because they have grown up among many cultural worlds TCKs face particular challenges to developing a clear sense of their personal or cultural identity.

Although biracial or bicultural children also often face very real challenges to their identity as they try to sort how to which race or culture do they belong, TCKs often face an even greater challenge (than biracial or bicultural children). Their parents may be from one culture, they may live in a second one, and their peers or school groups may belong to a third one. They are connected to two or more cultures, without a real sense of roots (Meneses, 2007).

This search for identity congruence (Schaetti, 2000) is one of the biggest challenges TCKs face as they seek to answer these fundamental questions: Which of my many selves am I? Is it all right to be all of the above in a world which often asks me to choose one of the above?

Resilience versus unresolved grief

The TCKs, and often those closest to them, move back and forth between home and host cultures with great regularity (White, 1983). Some international schools report that a 30% turnover in their student population each year is normal (Jehle-Caitcheon, 2009). Each move precipitates a normal transition cycle. In any transition, there

is loss as well as gain. Rosalea Cameron discusses how these chronic transitions affect the developmental ecology of TCKs (Cameron, 2003). The TCKs who learn how to process transitions in a psychologically healthy way can develop a remarkable resilience in dealing with change throughout their lives (Pollock and Van Reken, 2009). In fact, many come to view future moves positively, often with anticipation and excitement.

Many TCKs, however, do not find healthy ways to process the losses inherent in any transition process. This leaves them with the second major challenge TCKs and ATCKs often face: unresolved grief. There are several reasons for this:

- *Many losses are invisible.* It is not easy to recognize how significant such things as the loss of a sense of cultural balance, or loss of the sights, sounds, and smells of a world can be when TCKs switch nations and cultures overnight with one simple airplane ride.
- *TCKs may have little permission to grieve.* The gifts of their lifestyle are so many, the losses of leaving friends, family, and place are often discounted by themselves and others.
- *There is often little time.* In the fast-paced twenty-first century there is little time to grieve appropriately (Pollock and Van Reken, 2009).

All of these factors can impede the process of appropriately moving through the various stages of grief Dr. Elisabeth Kübler-Ross identified as denial, anger, bargaining, depression, and acceptance (Kübler-Ross, 1997). Some common patterns educators might see as evidence of this unresolved grief are students who refuse to enter into the activities of the new school, excessive demeaning of the current school or surrounding culture, or a withdrawal into their own silent world (Pollock and Van Reken, 2009).

Expanding Our Language

In 1984, sociologist, Ted Ward, predicted that TCKs were the prototype citizens of the future. By that he meant that the experience of growing up among different cultural worlds would one day be the norm rather than the exception (Ward, 1984). That time is nearly here. As more and more people who did not grow up in a traditional TCK experience say they relate to the benefits and challenges of the TCK profile (such as large worldview, speaking several languages, questions of identity, and unresolved grief), it has become useful to expand the traditional paradigm for TCKs (Van Reken and Bethel, 2005). Just as military, corporate, missionary, and diplomatic children are subsets of the TCK model (see **Figure 2**), TCKs can now become a subset of a larger group called cross-cultural kids (CCKs) – children who live in – or meaningfully interact with – two or more cultural environments for a significant period of

Figure 2 Traditional third culture kids. From David C. Pollock/Ruth E. Van Reken, used by permission.

time during the first 18 years of life (Van Reken, 2006). An adult cross-cultural kid (ACCK) is one who grew up as a CCK (see **Figure 3**).

This group of CCKs includes:

- Traditional TCKs – children who move into another culture with parents due to a parent's career choice.
- Children from bi/multicultural homes – children born to parents from at least two cultures. May or may not be of the same race.
- Children from bi/multiracial homes – children born to parents from at least two races. May or may not be of the same culture.
- Children of immigrants – children whose parents have made a permanent move to a new country where they were not originally citizens.
- Educational CCKs – children who may remain in their home or passport country but are sent to a school (e.g., an international school) with a different cultural base and student mix than the traditional home culture or its schools.
- Children of refugees – children whose parents are living outside their original country or place due to circumstances they did not choose, such as war, violence, famine, or natural disasters.
- Children of borderlanders – children who cross borders frequently, even daily, as they go to school, or whose parents work across national borders.
- Children of minorities – children whose parents are from a racial or ethnic group that is not part of the majority race or ethnicity of the country in which they live.
- International adoptees – children adopted by parents from another country other than the one of that child's birth.
- Domestic TCKs – children whose parents have moved in or among various subcultures within that child's home country.

This new model demonstrates not only the many ways children grow up in culturally diverse situations but also

Figure 3 Cross-cultural kid (CCK) model. From David C. Pollock/Ruth E. Van Reken, used by permission.

demonstrates the increasingly complex worlds in which some children live. Many TCKs are now in bicultural or biracial families. Instead of living between their passport country and one host country, countless TCKs have lived in three, four, five, and even more countries. Some TCKs are from minority communities. Others have parents who immigrated to a new land before or during the time they embarked on their international career.

In addition, this new paradigm also provides a way to look at why so many who live in, or have grown up among, many cultural worlds in ways that are different from the traditional TCK model, relate strongly to many common characteristics of the TCK profile. Using the lens of the traditional TCK experience to look at deeper issues that relate to a cross-cultural childhood will not only give educators a deeper understanding of the TCK experience itself, but offer beginning insight into some core factors many other CCKs also share (Van Reken, 2007).

Understanding Hidden Diversity

The concept of culture as an iceberg is a key place to begin looking at the effects of a cross-cultural childhood. Anthropologist, Gary Weaver, explains that just as there are seen and unseen layers in an iceberg, so there are seen and unseen layers in culture. The visible places of culture, such as food, dress, language, and customs are where

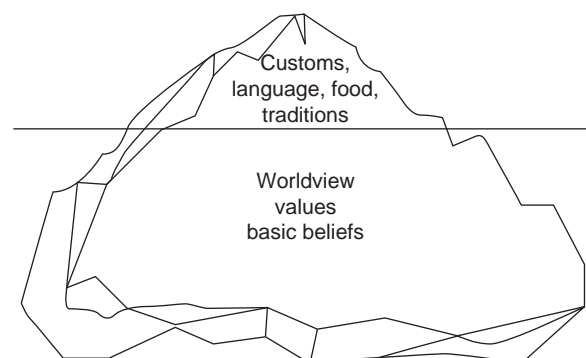

Figure 4 The cultural iceberg. From Weaver, G. (2006). *The American cultural tapestry*, Washington, DC: eJournalUSA, used by permission.

people express the unseen places of who they are (see **Figure 4**). Based on what is seen, people decide when meeting one another if they will relate from likeness or difference.

Weaver warns, however, that in today's globalizing world, the visible layers of culture will begin to look more similar among people of many backgrounds. People will then assume the deeper layers of culture are also alike and the usual allowances given to someone known to be different will be gone. This, he says, will only lead to more cultural clashing and confusion.

Such disparity between the visible and invisible layers of culture is at the heart of many challenges TCKs and

Figure 5 Possible spheres of culture influence in a TCK/CCK's world. Adapted from chart for GNI's. From Norma McCaig (1988), used by permission.

other CCKs face. The visible and invisible aspects of their lives often do not match according to traditional expectations of others. The TCKs and other CCKs, like everyone else, learn cultural practices, values, and worldviews from their environment. The difference between TCKs/CCKs and others from a traditional monocultural background isn't how they learn culture, but the world in which they learn it. **Figure 5** shows some of the markedly different cultural communities with which TCKs/CCKs may interact.

In the predominantly monocultural environments of the past, it was relatively easy for children and others in the community to develop a clear sense of who they were. Children saw themselves reflected in their parents, extended family, teachers, and peers who generally both looked and thought like them and vice versa.

For TCKs and many CCKs, this simply is not so. Because they have grown up interacting closely with many who do not share their national or ethnic culture, they often wind up with a hidden diversity – “a diversity of experience that shapes a person's life and world view but is not readily apparent on the outside, unlike the usual diversity markers such as race, ethnicity, nationality, etc.” (Bethel and Van Reken, 2003: 1). Ultimately, social scientists may have to relook at traditional models of developmental and diversity patterns and see which ones still apply to children in our changing world and where we may need new models (Meneses, 2007; Cameron, 2003).

Not only do TCKs interact with many cultural worlds while living in a particular place, but the high mobility patterns of their lifestyle mean the actual world around them is constantly changing as well. **Figure 6** demonstrates basic patterns for how children raised among many cultures can relate to a surrounding dominant culture (Pollock and Van Reken, 2009). Of course, a single

Foreigner Look <i>different</i> Think <i>different</i>	Hidden immigrant Look <i>alike</i> Think <i>different</i>
Adopted Look <i>different</i> Think <i>alike</i>	Mirror Look <i>alike</i> Think <i>alike</i>

Figure 6 The PolVan cultural identity box. From David C. Pollock/Ruth E. Van Reken, used by permission.

airplane ride can completely shift them from one pattern of relating with the surrounding culture to another.

Figure 6 helps explain some challenges these global shifts of culture and mobility are creating for educators. When students are in the foreigner or mirror box, who they are inside, matches what others expect them to be when looking from the outside. Educators will make allowances for language differences, or possible curriculum discrepancies if students are clear foreigners. For students who are mirrors, educators will assume correctly that these students know the language and cultural practices operative in this school. For both foreigners and mirrors, their identity is clear and life is relatively simple. When, however, students are in the hidden immigrant or adopted box, life can become quite complicated, particularly at school. Educators may assume that a student who is a hidden immigrant knows the historical or cultural references in the curriculum and not realize this child has no idea of the information others expect them to know. Conversely, educators may assume a student in the adopted category will have knowledge about the language or cultural practices of the ethnicity or nationality he or she appears to be when, in fact, that student knows no more about those things than anyone else in the classroom. These are examples of the hidden diversity mentioned above: who others expect them to be is not who they are because they have learned their cultural cues amid various cultural groups. Often these experiences can leave TCKs feeling as if they are always on the margins, or even outside, of the current culture in which they live (Schaetti, 1996).

Typical Responses to Identity Challenges

There are three common ways TCKs and other CCKs often react when they sense that others are assigning them a different cultural identity from how they see themselves. They may choose to be cultural chameleons, screamers, or wallflowers (Pollock and Van Reken, 2009). Cultural chameleons try to make the visible layers of themselves look and act like others in the place, no matter how differently they may feel inside. Screamers may adopt some form of extreme behavior, dress, or attitude to let everyone around know that, despite external appearances, they are

not like their peers inside. Wallflowers choose to withdraw until they know how life operates in the place. Others have used the terms homecomer, cosmopolite, and stranger to refer to similar types of reactions when they occur specifically during repatriation to the passport country (Meneses, 2007). In her studies, Schaetti found the most common reaction during repatriation was that of withdrawal (i.e., becoming a wallflower) because TCKs “expected to find some measure of homecoming and found instead that they were strangers in an unfamiliar land” (Schaetti, 2000).

Summary

The TCKs are students who, during their formative years, lived in one or more cultures which were different from the passport, or home culture(s) of their parents. These students have adopted many feelings, thought patterns, relationships, and traditions of the various culture(s) in which they have lived, but the outcome is more than an amalgamation of these different worlds. The very experience of growing up among an assortment of cultural worlds leads to well-documented shared characteristics with others of similar experience. The gifts of this experience are many, potentially developing skills of the capacity to be effective cultural bridges and negotiators in our globalizing world. The challenges are also real, particularly issues related to identity and unresolved grief. These students may feel like foreigners when in their passport culture even though they look like the majority of their classmates or they may feel at home when they don't look like most of their classmates. Because of varying degrees of looking and thinking alike and differently, TCKs may be misunderstood or even ridiculed by other students for things they do not understand in the present culture. Most TCKs struggle with answering questions like “Where are you from?” because of the connectedness they feel to each culture that others would see as foreign. The mobility of their lifestyles lends itself to feelings of unresolved grief which can be expressed in ways. Lessons learned from the traditional TCK model can be useful in helping educators understand other types of CCKs and the growing personal complexity of cultural mixing of many students.

Glossary

ICT – The abbreviation for information and communication technology. This term is often used interchangeably with information technology (IT) in the literature on technology in education.

IEA – The abbreviation for International Association for the Evaluation of Educational Achievement.

IT – The abbreviation for information technology. Also used interchangeably in the literature on technology in education with ICT and refers both to computer hardware and software, as well as networking infrastructure to enable the user to connect to the Internet via the computer hardware.

The design of International Association for the Evaluation of Educational Achievement (IEA) studies generally involves collecting data from different levels: education system, school, teacher, and student levels. Until 2008, IEA had completed two comparative studies of information and communication technology (ICT) in education – the first study, Computers in Education Study (CompEd), conducted between 1987 and 1993 and the second study, Second Information Technology in Education Study (SITES), conducted between 1997 and 2008. In addition to these two major studies specifically devoted to ICT in education, IEA has also gathered information about access and use of computers and the Internet through background questionnaires in some of its other studies such as Trends in International Mathematics and Science Study (TIMSS) and Progress in International Reading Literacy Study (PIRLS). The rationale for ICT in education worldwide has seen changes over the 20 years during which the CompEd and SITES studies were conducted, and hence the specific research questions and designs for

these two sets of studies also differ. This article provides an overview of the research design and key findings from these two ICT-specific studies to shed light on the status and role of computers in school education, the changes that have taken place over the two decades since the late 1980s, and the factors that have influenced ICT use in schools in different countries around the world.

The First Computers in Education Study (1987–93)

The CompEd study was designed as a two-stage investigation. The first stage, with data collection in 1989, aimed to provide an overall picture about how computers were used, the extent and availability of computers in schools, the nature of instruction about computers, and estimates of the effects that computers are having on students, the curriculum, and the school as an institution. Stage 2 with data collection in 1992 comprised two parts: a repetition of the Stage 1 survey to examine the rate of development of computers in education over time, and a survey of students to find out the level of access to computers, ways in which computers were used in schools and outside of schools, the extent of students' information technology (IT) competencies, and their attitudes toward and perceptions of computers.

The Stage 1 Study

The Stage 1 study results are reported in Pelgrum and Plomp (1991, 1993). The survey was conducted on a random sample of schools and teachers at primary, lower-secondary, and upper-secondary levels. Altogether 21 systems participated, 15 of which were from Europe, two from North America, three from Asia, and New Zealand was the only participating country from outside these three continents.

Schools were sampled with probabilities of selection proportional to the size of the school. Surveys were distributed to principals, technical coordinators (or anyone who was most familiar with the technical aspects of the computer infrastructure in the school), computer-education teachers, and computer-using and non-computer-using teachers in mathematics, science, and the mother tongue.

The Stage 1 survey conducted in 1989 found great diversity across countries in the availability of computers in schools, and access was generally highest in upper-secondary schools and lowest in primary schools. In 1989, in a few countries such as Canada (British Columbia), France, and the US, the access was almost 100% throughout all three levels of education, while the access was much lower even in some highly developed countries such as Japan. An examination of the history of computer use in countries found that typically a period of about 4 years was needed to equip all schools with computers and a longer history was associated with more favorable student-computer ratios. Computers were located in special computer rooms for a majority of computer-using lower- and upper-secondary schools in almost all countries. In computer-using elementary schools, there was a comparatively higher probability of computers used in classrooms compared to secondary schools, though computers were still more likely to be located in special computer rooms.

The dominant use of computers in the curriculum differed between primary and secondary schools. In secondary-school education, computers were used mainly for teaching students how to use computers as a separate subject, and the two subject areas with the highest frequency of computer use were mathematics and commercial subjects. In primary schools, computers were most frequently used for drill and practice. Different locations of computers tend to favor different kinds of computer use. Availability of computers in classrooms was more closely associated with the integration of computers into the teaching and learning of school subjects rather than for computer literacy.

In terms of the responsibility for introduction of computers in schools, school authorities were the most mentioned group. The most prominent reason given by principals in all three populations for the use of computers in the school curriculum was to develop students' computer literacy. Where improving the teaching and learning process was given as a reason for using computers, there was also more reported use of computers in the teaching of school subjects. The lack of hardware and software were identified as the two main obstacles to computer integration in the teaching of school subjects. It was also found that the integration of computers into subject teaching was most consistently associated with the knowledge and skills of teachers. The amount of training teachers received and the topics covered were found to have positive influence on teachers' attitudes toward the

educational impact of computers and the likelihood of computer integration in their teaching. Further, the use of computers appeared to be male dominated and, in most countries, a majority of schools did not have special policies to promote gender equity.

The Stage 2 Study

The Stage 2 survey was conducted in 1992. In addition to a repeated administration of the Stage 1 survey to gauge the rate of development of computers in education over the intervening years, a survey of students sampled from three populations was conducted: students in grades in which the modal age was 10 and 13 years, respectively, and students in the next to final year of secondary education. Only 12 systems participated in this second stage of the CompEd study.

Results of this study are reported in Pelgrum and Plomp (1996) and Pelgrum *et al.* (1993). It was found that in most countries, there was considerable improvement in access to hardware and software over the 3 years since the Stage 1 survey. However, only very small numbers of students were using computers regularly and still mainly for learning about computers. Hence, the educational impact of increased computer access was not evident. A Functional Information Technology Test (FITT) was developed to assess students' ability to function effectively with respect to practical information-related tasks. In most countries, there was a large achievement gap between the mean scores for the lowest 25% and highest 25% of students surveyed. Though the reported opportunity for students to learn the assessed knowledge and skills was extremely low, the students' results were well above chance level, indicating that many students did possess significant functional knowledge and skills about computers. Further, the use of computers in a school did not appear to add much value to students' FITT results, indicating that students' functional knowledge about computers was probably learnt outside of schools. Exposure to computers was found to be positively correlated with students' level of knowledge and their attitudes toward computers.

In all countries, boys scored higher than girls, and the difference is highest in upper-secondary education, though the difference was not significant in some countries. Girls also tend to enjoy using computers less than boys. However, it was rare for schools to have gender-related policies related to computer use. A large number of students agreed with unethical practices related to computer use, such as illegal copying of software.

The most available types of professional development at the school level were introductory courses on computing and application programs. Technical coordinators were very often regular teachers and they did not have much time available to help with the training of other teachers.

The Second Information Technology in Education Study

The motivation behind the conceptualization of the Second Information Technology in Education Study (SITES) was rather different from that of the CompEd study, although the time gap between data collection in CompEd Stage 2 and SITES Module 1 was only 6 years. SITES was not interested in studying the teaching of computer-related subjects, but geared rather to address the increasing policy focus on ICT use in the curriculum as an integral part of preparing students for adequate and effective functioning in the information society. The assumptions of the SITES study are that education has to prepare and support citizens for lifelong learning and that ICT can play an important role in this process of change (Anderson *et al.*, 1997; IEA, 1999).

SITES was initially designed as a research program consisting of three modules. Module 1 (SITES M1), was a survey of a random sample of schools conducted in 1998 to provide a snapshot picture of the situation regarding ICT in education, mainly with respect to access (hardware, software, and Internet availability), pedagogical vision and practices according to the principals, as well as the availability of professional development and support for teachers and students for the use of ICT in teaching and learning. Module 2 (SITES M2) was an international comparative study of case studies of innovative pedagogical practices using technology, with data collection conducted in 2000–01 to gain insight into whether and how ICT use may contribute to changes in teaching and learning that will achieve the new education goals described in many policy documents around the world regarding the preparation of twenty-first-century citizens. Module 3 (SITES M3) was initially intended as a third module of the study that will build upon findings from the leading-edge innovative classrooms of Module 2 and utilize the emerging pedagogical practices as the central themes for a teacher survey and a student assessment. The specific goal of this module was to measure the ICT-supported knowledge-management competencies of students, including their abilities to retrieve, organize, critically evaluate, communicate, and produce knowledge (Kozma, 2002). Unfortunately, the IEA General Assembly, which makes all key decisions on IEA studies, found the methodological issues and hurdles that need to be overcome for the study to meet all the stringent requirements for a rigorous international comparative study to be too challenging and rejected the proposal. A further proposal to conduct a survey of schools and teachers to study pedagogy and ICT use in schools was subsequently accepted for data collection in 2006. This study focused on how teaching and learning took place in mathematics and science classrooms and the role of ICT in them, and is referred to as the SITES 2006 study. Each of the three completed SITES study components are described briefly below.

SITES M1

At the time the SITES M1 study was conceptualized, many countries had announced system-wide education-reform efforts involving changes in both the goals and pedagogies of school education that aimed to prepare citizens for the knowledge society. Hence a major question that this study addressed was the extent to which such changes have actually taken place and the role of ICT in the school curriculum. The study also aimed to find out which ICT infrastructure was available in schools, what staff development and support services exist with regard to ICT use in schools, and the roles played by the school leadership. This survey study was administered between November 1998 and February 1999 to principals and technical coordinators in randomly sampled schools at three levels of the education system: primary, lower secondary, and upper secondary. Altogether 26 countries participated in the study, mostly from Europe and Asia. Only 12 countries took part in the survey at all three education levels, and the numbers of countries participating at the primary, lower-secondary, and upper-secondary levels were 14, 24, and 21, respectively. The key results of this study are published in Pelgrum and Anderson (1999).

The SITES M1 results found, from responses of the national research coordinators in participating countries, that governments generally acknowledge the need for education reforms. In most countries, there were programs that aimed to improve the ICT infrastructure in schools, though the financial commitments differed widely across countries. In order to find out whether the kinds of teaching and learning practices promoted in many policy documents on education reform were actually taking place in schools, the study constructed indicators for emerging and traditionally important pedagogical practices based on principals' responses on the extent to which different kinds of learning and teaching activities were present in their schools.

The survey findings indicate considerable variation in the presence of emerging pedagogical practices across countries, as well as between schools within the same country. While it was not clear whether schools with a higher emerging pedagogical practice indicator score had a stronger reform orientation, it was found that these schools tended to have more favorable student–computer ratios. There appeared to be a correlation between the use of IT, and the school and classroom cultures of a country (Law *et al.*, 1999). In Hong Kong, Belgium, the Czech Republic, France, Israel, Italy, Japan, Singapore, South Africa, Thailand, and Slovenia, there was a strong policy goal for teachers to use computers for instructional purposes. On the other hand, in Canada, the Scandinavian countries, and most of the European countries participating in the study, the policy focus was more on enabling students to use computers as supportive learning aids to

cultivate in them the ability to process and analyze information, use e-mail for communication, and gain access to external databases via the Internet.

In terms of ICT infrastructure, the computer–student ratio, as an indicator of access opportunity, has improved considerably compared to the same statistics collected 3.5 years earlier in the TIMSS-1995 study. However, there were very large variations within and across countries. Even when the comparison is made across computer-using schools, the mean computer–student ratio in schools at the lower-secondary level in the participating countries varied from 1:7 to 1:216. The kinds of computers available are also important as these have great implications on the kinds of activities that can be conducted. In some countries, almost all equipment was suited for multimedia purposes while in other countries, particularly in East European countries, substantial numbers of early generation (8-bit) computers were in use, which cannot practically be used to support activities beyond learning the basics of programming. There were also considerable differences in schools' access to the Internet and World Wide Web for teaching and learning. In a few countries such as Singapore, Iceland, and Canada, almost 100% of schools had Internet access for instructional purposes, while the statistic was 10% or less in some others, and was almost nil at the primary level in a few countries.

Staff development is generally identified as an important factor influencing ICT use in classrooms, particularly for integration in everyday educational practice to support learning and teaching. Teachers' lack of ICT-related knowledge was seen as a major obstacle to realizing the ICT-related school objectives by a large number of principals in many of the participating countries and is the second most-reported obstacle, next to the lack of computer hardware. It was also found that the majority of schools had a policy goal that all teachers should receive training for the instructional use of ICT, but the achievement of this goal and the availability of courses reported were both low. Furthermore, the technical coordinators' self-rated ICT competence was much higher for general applications than for instructional uses. In terms of school leadership, great variation was found across countries in terms of the school principals' attitudes toward the contribution of ICT to lifelong learning.

SITES M2

Altogether 174 case studies of technology-supported pedagogical innovations were collected in 2000–01 and reported by research teams in the 28 countries/regions participating in the SITES M2 study. A basic assumption of the study was that new pedagogical practices were emerging in schools and that in-depth comparative case studies would provide a better understanding of what kinds of pedagogical innovations have developed around the world where technology

plays a substantial role, and what kinds of school factors contribute to the emergence and sustainability of these innovations. The study aims to inform national and local policymaking, contribute to improved classroom practice, and to advance knowledge and build theory about the contexts and factors within and across countries that contribute to the successful and sustained use of innovative technology-based pedagogical practices through providing rich case descriptions. The research design and key findings are reported in Kozma (2003).

Cases in SITES M2 may be selected from one or more of the elementary, lower-secondary, and upper-secondary levels based on a set of selection criteria and process established by the International Coordinating Consortium. Each participating country followed a guideline to establish an expert panel comprising a range of stakeholders that might include policymakers, teachers, administrators, technology experts, and researchers to provide a local definition for innovation and to review and select the cases for study. National research teams were responsible for conducting the case studies based on the study guidelines, procedures, and instruments and for writing an approximately 5000-words report on each case. Each case report comprises a summary, a description of the school background and culture, the history of the innovation, the technological infrastructure available in the school, the national and regional policies that affected the innovation, as well as details of the innovation in terms of the curriculum and assessment goals, and the teachers' and students' practices and outcomes, according to a common template.

It is noteworthy that there was great similarity in the criteria for innovation decided by the different national expert panels. The case studies collected in this study reflect a very different picture than the traditional classroom where the teacher lectures in front of the classroom and students take notes or do worksheets, indicating that technology was supporting significant changes in classroom teaching and learning in these cases. Students were often involved in searching for information, designing products, and publishing or presenting the results of their work; collaboration among students (within and outside of the same classroom) was common. The most frequently used technology were productivity tools such as word processors and presentation software, as well as World Wide Web resources, e-mail, and multimedia software. Many of the case studies were ICT-based innovations involving multidisciplinary projects. Innovations pertaining to a single subject area were found in only 29% of the cases, and only a small minority of the cases involved the study of computer literacy, computer science, or informatics as a subject area.

Law (2003) reports on the use of a six-dimensional framework for comparing innovativeness of the case studies: (1) the curriculum goals, (2) the roles played by the teacher, (3) the roles of the learner, (4) types of products indicative of learning outcomes, (5) the complexity and sophistication of

the ICT used, as well as (6) connectedness – the extent to which the classrooms are connected to the outside world through external participants such as teachers and students from other classes or even other countries, parents, alumni, and experts. While the six dimensions were interrelated, the teacher's role was found to have the strongest impact on the students' roles, and the kinds of learning outcomes observed. Examination of the case studies reveals large diversities across these cases, and cases with highly innovative characteristics on all the 6 dimensions were rare. It was found that cases from Asian countries were less connected compared to cases collected from European countries (Law, 2004).

Despite the innovativeness of the case studies collected, only 18% reported a change in curriculum goals or content that was supported by technology, and only 41% provided evidence that the innovation had been disseminated to other classrooms or schools (Kozma, 2003). The energy and commitment of teachers, student support, the perceived value for the innovation, the availability of teacher-professional-development opportunities, and administrator support were important school factors contributing to the sustainability of the innovations. Support from external sources, innovation champions, funding, and connection with national technology plans that provided resources often enabled the innovations to succeed.

SITES 2006

SITES 2006 built on the previous two SITES studies within a global context of increasing policy interest in the use of ICT in schools to help students develop twenty-first-century skills, such as the ability to engage in collaborative knowledge creation and problem solving with peers and experts around the world. It was a comparative study of ICT use within the context of the overall pedagogical practice of the teacher in mathematics and science classrooms. The contextual factors examined in this study also include those found pertinent to supporting pedagogical change and innovation. In 2006, the study collected information from principals and technology coordinators from roughly 9000 schools and over 35 000 grade 8 mathematics and science teachers in 22 education systems. The national research coordinator from each country completed a questionnaire related to system-level conditions in relation to education and ICT use in schools. The research design and findings of this study are reported in Law *et al.* (2008).

Twenty out of the 22 systems reported having a system-wide ICT in education policy. In nearly all of the participating systems there was some level of government funding for the provision of hardware and software in schools and at least slightly increased ICT spending during the previous 5 years. Across the 15 systems that participated in both SITES M1 and SITES 2006, great

improvements in access to computers and the Internet since 1998 were observed. With the exception of one country, all participating systems reported all or almost all schools having access to computers, although there are wide diversities in terms of ICT infrastructure available in schools. There are also wide variations in the extents to which technical support and pedagogical support were available, as well as in the relative priorities given to these two kinds of support.

Many educational systems do not have active, centralized policies on teachers' professional development related to ICT use or new pedagogies, and only a very small minority of schools required teachers to be trained in a variety of areas dealing with new pedagogy and ICT. In a few systems, re-allocation of workload to allow for collaborative planning was reported in 80% or more of the schools, but the percentage was much lower in other systems.

Less than half of the mathematics teachers and science teachers in 12 and 4 systems, respectively, reported having used ICT with their target class. Generally, ICT use was more prevalent among science teachers compared to mathematics teachers in most systems. On the other hand, the extent of ICT adoption by teachers differs enormously across systems, varying from below 20% to over 80%. Further, no clear relationship was found between the mean student-computer ratio of a country and the mean percentage of its mathematics teachers or science teachers reporting instructional use of computers.

The teacher survey constructed indicators for traditionally important and twenty-first-century-oriented pedagogical activities. The study found that pedagogical practices of the mathematics and science teachers surveyed were still mainly traditional. In most systems, there was a stronger twenty-first-century orientation in the ICT-using teaching and learning practices compared to pedagogical practices in general. However, ICT adoption *per se* does not determine pedagogical orientation as evidenced by the observation in a few systems that ICT-using practices exhibited a stronger traditional orientation. While the teachers' perceptions of the impacts of ICT use on themselves and on their students were generally positive, the perceived learning gains were not necessarily associated with higher levels of reported ICT use. Increased impacts on students were reported in the area of twenty-first-century abilities, such as inquiry and collaboration skills, and the ability to work autonomously at the student's own pace, though the perceived extents of such impacts vary greatly across systems. Further, the impact of ICT use on students was found to be highly dependent on the teachers' pedagogical orientation adopted in ICT use – lifelong-learning-oriented pedagogical uses of ICT were positively correlated with the perceived gains in students' learning outcomes, the correlations being highest for inquiry and collaboration skills and the lowest for traditional outcomes. No significant correlation was found for

traditionally oriented uses of ICT and perceived students' learning outcomes.

While the CompEd study found a much higher proportion of male teachers using computers compared to female teachers, the SITES 2006 study showed a very different picture. In a few countries, particular gender or age groups of teachers were found to be more likely to report having used ICT in their teaching. However, there are no general gender or age-related trends with respect to ICT use across all participating countries. Hence it can be concluded that age and gender effects, where they exist, are most likely due to age- and gender-related contextual factors rather than the reflection of an inherent relationship between these teacher characteristics and ICT use.

Summary

The CompEd and SITES studies conducted under the auspices of the IEA have provided important comparative data on the changes that have taken place over two decades since the late 1980s in terms of the status and role of computers in education. These studies clearly show that the policy focus of ICT in education has moved from computer/information literacy to leveraging ICT use to realize the education-reform goals of preparing learners for the twenty-first century. Great improvements in computer and Internet access in schools have been observed, but the actual adoption of ICT in classroom practices by teachers in 2006 was still relatively low in many countries. Furthermore, general pedagogical practices were still largely traditional and ICT use was not necessarily associated with more twenty-first-century-oriented practices.

While the IEA studies have contributed much to our understanding of ICT use in schools, there is still a lot of scope for researchers to conduct further secondary analysis on the datasets of these studies accessible from the IEA website.

IEA Studies in Mathematics and Science

F K S Leung

Introduction

International Association for the Evaluation of Educational Achievement (IEA) is an independent, international organization with members comprising national research institutions and governmental research agencies from nearly 70 countries. It was founded in 1959 to coordinate international studies among countries to determine the level of students' achievement within an educational system. IEA conducts cross-national studies of educational achievement in different subject areas. Other than mathematics and science, areas of study include reading literacy (Progress in International Reading Literacy Study or PIRLS), civic education (CIVED and ICCS), information technology in education (SITES-M1, SITES-M2, SITES 2006), and pre-primary education (PPP). In the area of mathematics and science, four studies were conducted before the 1990s, namely, the First International Mathematics Study (FIMS), the First International Science Study (FISS), the Second International Mathematics Study (SIMS), and the Second International Science Study (SISS). In 1995, the Third International Mathematics and Science Study (TIMSS) tested both mathematics and science, and the study was repeated in 1999 (TIMSS-R). From then on, it was decided that the study be conducted in 4-year cycles, and from the 2003 cycle, the study has been renamed Trends in International Mathematics and Science Study, while keeping the acronym TIMSS. The latest testing took place in 2007, and the results were released in December 2008. Planning for the next cycle of the study in 2011 is underway. In addition to this regular cycle of studies in mathematics and science achievement, IEA conducted a video study of mathematics classroom practices in 1995 (Stigler *et al.*, 1999), and another one involving mathematics and science classrooms in 1999 (Heibert *et al.*, 2003), and is conducting a study on teacher education and development in mathematics (TEDS-M).

Early IEA Studies of Mathematics and Science

The first IEA study was the so-called 12-country survey for which mathematics and science were two of the five areas under study. The study, conducted between 1959 and 1962, was in essence a piloting one, testing the feasibility of conducting large-scale cross-national studies. Although difficulties were identified, the survey concluded that conducting such large-scale studies was viable. On that

basis, IEA launched its first formal study in early 1960s, the First International Mathematics Study (FIMS), and 12 countries participated in the study.

The First International Mathematics Study

FIMS was more than a study of the mathematics curriculum. It was meant to be a comparative study of the outcomes in different education systems around the world using mathematics achievement as the indicator for output (McLean *et al.*, 1986). The main objective of the study was "to investigate the 'outcomes' of various school systems by relating as many as possible of the relevant input variables" (Husén, 1967a: 30). Mathematics was chosen because of the general interest in the mathematics curriculum around the early 1960s and because mathematics was considered a universal language, relying on symbols that were more or less international and hence easier for comparison.

FIMS was a comprehensive study, collecting information on the educational systems, school structures, teacher attitudes and classroom practices, as well as student attitudes toward and achievement in mathematics. Achievement was measured by tests that were specially designed for the purpose through a thorough procedure that involved national centers comprising mathematicians and mathematics educators. Other information was collected through questionnaires, one for students, one for teachers, one for schools (school heads), and one for nations (completed by a representative in that nation). The population of students studied comprised of 13-year-olds and pre-university students.

The FIMS report was written by Husén (1967a,b) and published in two volumes. For a study of this nature and scale, it is not surprising to find that many of the hypotheses posed at the outset of the study could be neither confirmed nor rejected. In the chapter on 'Summary of major findings' in the second volume of the report, for example, the author admitted that "neither the 'productivity' of an educational system of a country, nor the effect of the instruction given, can be assessed from national means" (Husén, 1967b: 288). The only consistent finding was the great variability in student achievement. The report listed the correlations of achievement with many other variables and discussed problems related to school organization, instruction and curriculum, and societal factors, and some rather obvious conclusions were drawn.

Perhaps the most important contribution of FIMS is that these obvious findings were tested empirically for the first time in the international setting.

The First International Science Study

FISS took place in the late 1960s and early 1970s, and was part of the Six-Subject Survey (science, reading comprehension, literature education, English as a foreign language, French as a foreign language, and civic education). Eighteen countries participated in the study, and the target populations were 10-year-old students, 14-year-old students, and students in the final grade of the secondary school. The study encompassed three domains of science: biology, chemistry, and physics. Similar to FIMS, data were also collected on student and teacher attitudes, methods of teaching, the development of students' practical skills in science, and understanding of the nature of science.

The major findings of the study were that there were high intercorrelations between the subscale scores in biology, chemistry, physics, and practical performance, and so it warranted the calculation and usage of a total score in science achievement. Boys outperformed girls in science, and there was significant improvement in science scores between age levels. Time given to the study of science had significant effects on student achievement, and the variance of science scores explained by school and classroom factors was sizable. New teaching method, such as controlled practical work, did not lead to better performance in science, although secondary school students tended to perform better if their teachers were "specialist science teachers or had received more post-secondary education, had participated in science curriculum reform, had spent more time on preparation, or were members of a subject association."

The SISS report admits that "limitations of time and money imposed serious constraints which prevented the Committee from attaining their goals completely" (Walker, 1976: 78). However, the report still concludes that schooling did matter, although the effect was not as marked as could be expected.

The Second International Mathematics Study

SIMS was conducted in the early 1980s, and 20 countries or systems participated in the study. Like the first study, a large number of variables were studied in addition to mathematics achievement, but the organizers emphasized that, unlike the first study where mathematics was chosen for convenience (Travers, 1980), the second study focused on the teaching and learning of mathematics in schools.

Its purpose was "to compare and contrast, in an international context, the varieties of curricula, instructional practices, and student outcomes (both affective and cognitive) across the schools of twenty countries and educational systems" (Travers and Westbury, 1989: 1).

SIMS conceived the curriculum as being made up of three levels: the intended, the implemented, and the attained levels. The first level was measured by survey questionnaires as well as an international grid completed by educators in different countries. The implemented curriculum was measured by, among other instruments, an opportunity to learn (OTL) index which asked teachers to rate each item in the tests given to their students according to whether that topic had been taught to the students or not. Student achievement was measured by a battery of tests, and attitudes measured by questionnaires, with some of the items identical to those in the first study for comparison purposes.

The major findings of SIMS were that, for the education systems, "there is a fair degree of structural similarity between the various target populations even though there are significant differences in the organization of curricula and courses and in the grade levels being investigated" (Travers and Westbury, 1989: 78). For the intended curriculum, there was a common core of mathematical content for all countries, but there was great variety in geometry content across the systems (p. 110). For the implemented curriculum, teachers' general approaches to teaching were found to be rather similar, namely largely chalk and talk and relying heavily on a prescribed textbook (Robitaille and Garden, 1989: 235). Furthermore, there were substantial overall discrepancies between the intended content coverage and implemented coverage (OTL), so that it was "difficult to make confident claims about the validity of either or both of these indices of coverage" (Travers and Westbury, 1989: 116). For the attained curriculum, "performance on items involving . . . straightforward applications of basic concepts was generally good; however, performance fell off sharply on items calling for the use of higher order thinking skills" (Robitaille and Garden, 1989: 238).

The Second International Science Study

SISS was also conducted in the 1980s, and 23 countries or education systems participated in the study. For each science topic in SISS, three types of activities were tested: knowledge, understanding of a principle, and application of information and principles to solve a practical problem. The science test was complemented by questionnaires for students, teachers, and school principals. In addition, countries participating in the study prepared a National Science Education Case Study Report on teaching science within the country.

The key findings were that there was a general consistency in all countries concerning the content of science taught in the fields of biology, chemistry, and physics, but not in earth science. Science was seen as a practical subject requiring proficiency in the manipulation of apparatus and in experimentation, but emphasis on the applications of science was rather low. At all grade levels, the opportunity to learn provided in the curriculum as well as time given to the study of science were related to the average achievement level of a country, and students perform better when they are taught by teachers who are experienced and competent in science.

Between SISS in the 1970s and SISS in the 1980s, the majority of countries saw a significant improvement in students' science achievement, and science had assumed a more prominent place in the curriculum. At the upper-secondary school level, although the average level of achievement in science dropped in those schools where a higher proportion of students remained at school and continued studying science, the performance of the better students did not decline. In several countries, the difference between boys' and girls' achievement at both middle- and upper-secondary school levels lessened, particularly in the physical sciences.

Third International Mathematics and Science Study – TIMSS 1995

By late 1980s and early 1990s, when IEA considered the third wave of mathematics and science studies, it was decided that the two fields of studies be combined to form the Third International Mathematics and Science Study, or TIMSS. Data were collected in 1995, and altogether more than half a million students from more than 40 countries or systems participated in the study, the largest international comparative study up to that time. TIMSS was an extremely ambitious study. Not only did it encompass the two subjects of mathematics and science, but it also targeted three populations of students: the 9-year-olds (known as population 1), the 13-year-olds (population 2), and students in the final year of secondary education (population 3). To capture students of the target ages in populations 1 and 2, two adjacent grades with the highest number of students of the relevant age were sampled for study.

TIMSS investigated the mathematics and science curricula of the participating countries through an analysis of curriculum guides, textbooks, and other curricular materials. For the format of the test, questions requiring composed answers, in addition to multiple-choice items, were used. Furthermore, a subsample of students was selected to be tested on their hands-on skills (known as Performance Assessment). All these were done on top of

the usual questionnaires for students, teachers, schools, and system personnel.

The key findings of TIMSS were that, for most countries, gender differences in mathematics achievement were small or essentially nonexistent. In science, the gender differences in the primary school years were much less pervasive than in the middle school years. However, boys had significantly higher achievement than girls at both levels in about 50% of the countries, particularly in earth science and physical science. One spectacular finding of TIMSS is that the East Asian countries performed very well, especially in mathematics.

For student attitudes, the majority of students in nearly all the countries indicated that they preferred mathematics and science and that they did well in the two subjects. Interestingly, some of the countries with the highest achievement also were those whose eighth-grade students had the most negative perceptions of success.

For home and school factors, having educational resources at home was strongly related to student achievement. In school, for both mathematics and science, small-group work was used less frequently than other instructional approaches. Across countries, teachers reported that working together as a class with the teacher teaching the whole class, and having students work individually with assistance from the teacher were the most frequently used instructional approaches. At grade 8, teacher demonstrations of experiments were common in science lessons.

Third International Mathematics and Science Study Repeat (TIMSS-R)

Because of the great impact of TIMSS on the international community, a repeat study (TIMSS Repeat or TIMSS-R) was conducted in 1999 to study trends in mathematics and science achievements. In TIMSS-R, only eighth-grade students were tested. Thirty-eight countries participated in the study, 26 of which had participated in the eighth-grade test and 17 of them had participated in the fourth-grade test in 1995.

The key results of TIMSS-R are that, for most of the countries that participated in both TIMSS and TIMSS-R, there was not much difference in terms of their relative performance in the two studies. In mathematics, East Asian students continued to outperform their counterparts in other parts of the world, and in science, boys had significantly higher average achievement than girls in 16 of the 38 countries. The latter was attributable mainly to significantly higher performance by boys in physics, earth science, chemistry, and environmental and resource issues. The gender gap in science achievement is especially apparent among high-performing students, but the average gender difference showed a decrease from 1995 to 1999.

In 21 of the 38 countries, science was taught as a single general subject, while separate courses were offered in the different science subjects in other countries. The trend data from 1995 to 1999 show a small but significant increase for integrated science.

For variables related to achievement, there was no clear relationship between the wealth of countries and their students' achievements. Within the TIMSS-R countries, students with a higher level of educational resources at home and in school did better in the test.

As far as student attitudes are concerned, eighth-grade boys generally had a more positive self-concept in science than girls, and this difference was most pronounced in countries where the sciences are taught as separate subjects. Moreover, although student attitudes toward science were generally positive in countries where eighth-grade science is taught as a single subject, they were less positive in separate-science countries.

In mathematics, students' positive attitudes toward the subject were related with higher achievement within a country, but the same relationship did not hold across countries. In fact, with the exception of Singapore, all the top-performing countries had relatively negative attitudes toward mathematics. In particular, it is noticeable that students from all the five top-performing East Asian countries had very low self-image of mathematics.

As far as instructional practices are concerned, science teachers reported devoting substantial percentages of their class time to student experiments and teacher-guided student practice. In mathematics, teachers reported that the two most predominant activities in their classrooms were teacher lecture and teacher-guided student practice. Although solving nonroutine problems was mentioned in the intended curriculum of nearly all countries, teachers reported that they put relatively low emphasis on mathematics reasoning and problem solving.

Trends in International Mathematics and Science Study – TIMSS 2003

The publication of the TIMSS-R results again drew the attention of the education community and beyond, worldwide. IEA therefore decided to continue the study in 4-year cycles, with the following cycle to take place in 2003. TIMSS was renamed Trends in International Mathematics and Science Study.

More than 360 000 students in 49 countries participated in TIMSS 2003. In mathematics, at both fourth and eighth grades, gender difference was negligible in many countries, and the trend results at the eighth grade showed that a few more countries showed improvement in girls than boys. In science, the majority of eighth-grade boys outperformed girls, often by a substantial margin.

This was attributable mainly to higher performance by boys in physics and earth science, although girls had higher achievement in life science. Nevertheless, girls had greater improvement than boys, especially since 1999. At the fourth grade, gender difference in science achievement was negligible.

For factors related to student achievement, the home context for learning was important in helping to foster higher achievement, including having more highly educated parents, having more books at home, frequently using a computer, etc. Besides, students expecting to finish university had substantially greater achievement. Students with higher achievement attended schools with positive climates for learning, with fewer students from disadvantaged homes, and where teachers and students felt safe.

TIMSS 2007

TIMSS 2007 is the fourth and latest round of assessment in TIMSS. Together with results from previous rounds of TIMSS, it provides achievement information at four time points over a 12-year period. The key findings of TIMSS 2007 included the following:

- On trends of achievement, in both mathematics and science, more countries showed improvement in 2007 than declines in the fourth grade. At the eighth grade, the pattern was less pronounced. Differences in achievement between boys and girls were negligible in approximately 50% of the countries in both mathematics and science at the fourth grade. At the eighth grade, the differences in achievement between boys and girls were negligible in about one-third of the countries. In the remaining countries, girls had higher achievement than boys in more countries, especially in mathematics.
- Similar to findings in previous rounds of TIMSS, at the eighth grade, better home environment was associated with higher mathematics and science achievement. Students with more positive attitudes toward these subjects, who reported a higher level of self-confidence in learning mathematics and science, and placed a higher value on them as important to future success, also had higher achievement. Student achievement was highest where there were high expectations for student achievement and parental support.

Observations

Few people would dispute the idea that a high-quality education is extremely important for the individual and for society, and so there is a pressing need to gauge the

quality of education that our school system offers. But how do we find out how well our school system is doing? Are there ways in which our policies, our schools, and our teachers can do better? Many school systems around the world have measures in place to monitor the output and value-addedness of their system (e.g., through national testing). However, since many conditions are constant within a country, it is hard to objectively evaluate the effectiveness of the system. Many 'what if' questions simply cannot be answered through measures and studies within the system, since it is difficult or impractical to alter some conditions within the system. International studies conducted by IEA aim exactly at providing answers to these important questions, using the world as a laboratory. Through these IEA studies, we can measure how well students from our own system perform compared to students from other countries, especially countries which have a similar background. We can look at conditions which do not exist in our own system, and investigate how these conditions are affecting student achievement in other countries, and how conditions in our own system may be changed to bring about higher student achievement.

For 50 years, IEA has gathered detailed information on the mathematics and science achievements of students in participating countries, as well as a host of data on student, teacher, school, curriculum, and system backgrounds. The rich data set generated allows explanations of achievement to be explored, and thus may throw light on the answers to some of the questions mentioned above. The TIMSS series of studies also offers powerful information to study trends in mathematics and science learning. Results of these international studies help clarify the relationship between system background variables and student achievement and increase our understanding of our education system, and will no doubt provide important information for both policymakers and practitioners in improving student learning and achievement.

The IEA studies, however, do not elucidate all the factors affecting achievement or offer unambiguous answers to all our questions on quality of the school system. In particular, as can be seen from some of the findings above, many factors that explained differences in performance within a system failed to account for differences across systems. This failure should perhaps be expected for studies of the nature and scale of IEA. For example, notwithstanding all the precautionary measures taken by IEA, there are limitations in the use of questionnaires as an instrument in getting at the factors that influence student achievement in a cross-cultural setting. The same term in a questionnaire may mean different things in different languages, and the different cultural values may render some of the comparative results dubious. In particular, it is hard for instructional practices, a potentially important explanatory variable for achievement, to be captured by a self-reporting questionnaire

(Stigler *et al.*, 1999), and that is why the associated TIMSS video studies are so important in this regard (Heibert *et al.*, 2003). What these IEA studies do tell us is that there exist vast differences in mathematics and science achievement across a large number of countries. Hopefully, the recognition of the differences will fuel a search for the ways of enhancing our education system rather than a race to top the league tables generated by such studies.

Because of the limitations of large-scale international studies discussed above, care should be taken in interpretation of the results, especially in understanding the meaning and contexts behind the ranking of countries. This is especially important for policymakers, since IEA studies, such as TIMSS, have already had major impact on educational policies in many countries. Nevertheless, it should be pointed out that these studies have been conducted in very rigorous manners, and extreme care has been taken on the side of IEA to ensure that the results are as reliable as such large-scale studies can afford. Therefore, the results of such studies should not be brushed aside lightly.

The most important thing is perhaps that such international studies are meant for countries to learn from each other, and before learning from another culture, one should first understand one's own cultural values, take them as a given starting point, and design and improve educational practice on that basis. Complicated factors might have affected classroom practices and student achievement, and drastic changes should not be undertaken until such factors are thoroughly examined. Simple transplant of policies and practices from high-achieving countries to low-achieving ones would not work because one cannot transplant the practice without regard to the cultural differences, and any change in educational policy must ensure that the strength in a country is not lost in the process. What is needed is to identify not only superficial differences in educational settings and practices as identified by these international studies, but also the intricate relationships between these practices and the underlying culture. Through a careful study of these relationships, one may then determine how much can or cannot be borrowed from another culture.

Concluding Remarks

Public interest in IEA studies usually focused only on the ranking of countries in the league tables generated, and it is understandable that attention is drawn to this aspect of the findings. However, there is much more to the IEA studies than a league table. As argued above, these studies for which participating countries have invested so much in terms of money and manpower deserve the attention beyond a competition of student achievement.

Furthermore, results of IEA studies often provide for countries' impetus toward educational changes, but sometimes, such changes are made without a careful consideration of the complex context within which the achievement and classroom instructions are situated.

To make better use of the IEA studies, the study results should serve as mirrors for us to better understand our system. Education is an extremely complex enterprise, and one cannot expect these international studies to produce quick answers for all national problems in education. Instead, the major contribution of IEA studies is that they provide a rich data set based on which individual countries may engage in the process of seeking solutions to improve their education system. In this regard, we need discernment and wisdom, and not just data and a league table!

IEA Study in Civic Education

J Torney-Purta and J-A Amadeo, University of Maryland, College Park, MD, USA
J Schwille, Michigan State University, East Lansing, MI, USA

© 2010 Elsevier Ltd. All rights reserved.

Glossary

Civic dispositions – Attitudes toward various kinds of civic participation and attitudes toward social justice issues, such as immigrants' and minorities' rights.

Civic knowledge – Ability to recognize and understand concepts in the civic and political domain such as democratic practices, constitutions, political rights, and press freedom.

Civic skills – The ability to apply civic knowledge to understand political communications such as cartoons and election leaflets.

Concepts of citizenship – Beliefs about the characteristics and norms of good adult citizenship

National Assessment of Educational Progress (NAEP) – Test administered to samples of U.S. students in various subject areas including civic education.

Open classroom climate – The perception that the classroom is a place for respectful discussion of students' views about civic issues, including controversial issues.

Qualitative research – Uses data from document analysis, interviews, and/or observations often gathered into case studies or other descriptive formats.

Quantitative research – Uses data from a test, survey, or experimental performance analyzed with statistical techniques.

Introduction to International Association for the Evaluation of Educational Research International Comparative Studies

The International Association for the Evaluation of Educational Research (IEA) celebrated its 50th anniversary in 2008. It was started by a small number of well-known educational researchers from Europe and the United States, who decided in 1959 to see if it was possible to design and use a cross-national test of educational achievement (to supplement the data on which national comparisons had previously been based, such as

enrolment figures). Since the 1960s, IEA has pioneered in carrying out influential large-scale, cross-national studies in education, the Third International Mathematics and Science Study, now Trends in Mathematics and Science Study (TIMSS), and Progress in Reading Literacy (PIRLS). From being a small group of distinguished researchers with an informal decision-making structure, it has developed into a consortium of institutions in over 60 countries.

IEA's formal research agenda started with the first international mathematics study. Mathematics was chosen because it was thought to be relatively easy to measure and was taught universally. Thus, measures of achievement in mathematics could be considered an important outcome of education suitable for international comparison. The aim of IEA from its beginning to the present has been not only to measure outcomes as national educational indicators, but also to attempt to explain why some students, schools, and countries have better outcomes on these tests than others. From the start, data were collected about potential explanatory factors at the individual, school, and country levels. Some of the studies have emphasized country differences, but some of the studies have placed relatively equal emphasis on individual or school-level predictors of achievement as on analyzing country differences.

Following the success of the initial mathematics study in the late 1960s, IEA launched one of its most ambitious efforts, a study which addressed six subject-matter domains, including science, reading, literature, French as a foreign language, and English as a foreign language. Civic education was added as the sixth subject, but not without controversy. It is difficult to recapture today the concerns that surrounded this domain in the midst of the Cold War. What counted as legitimate civic education in one country was not what counted in countries with different ideologies. A few communist countries were starting to participate in IEA studies in mathematics and science. Second, measurement was daunting in the civic-education domain, where attitudes were important as desired outcomes of civic education, and where model standards for measurement of knowledge were rare. In other words, this study was a bold move with risks both for the researchers and for IEA as an organization. Nevertheless, under the leadership of J. Torney-Purta, A. N. Oppenheim, R. Farnen, and J. Schwille, the study was designed and implemented successfully, testing in 1971, though in fewer than a dozen countries. By the time the results were published

(Torney *et al.*, 1975), civic education was recognized as a solid part of the IEA six-subject survey.

Nevertheless, compared to the IEA core subjects of mathematics, science, and reading/literacy, civic education remained at the margins of the IEA effort, along with foreign languages, literature, and written composition. There were no timely efforts to follow up with a second study. It was 20 years before the second IEA Civic Education Study began (with a planning committee chaired by J. Torney-Purta starting in 1994 and testing in 1999–2000). This study, called IEA Study of Civic Education (CIVED), established the civic domain as a part of the IEA core. The second IEA Civic Education Study capitalized on interest in preparing young people for life in newly created democracies and recruited more than two dozen countries to participate (11 post-Communist countries, 12 other European countries, two Latin American countries, Australia, Hong Kong SAR, and the United States). The methodological procedures and standards that had been established by IEA for the TIMSS and PIRLS studies were helpful in allowing the second civic education study to meet high standards of methodological rigor. With widely disseminated results of the CIVED study and a third study (International Civic and Citizenship Education Study (ICCS) testing in 2008–09), civic education has found a niche in providing respected research evidence for international policy discussions of education.

The Roots of the CIVED Study

In 1993, when IEA's general assembly first expressed interest in a second study of civic education, a basic question formed the core of interest: how were young people prepared to undertake their roles as citizens in a range of countries? How was this different in new democracies (where teachers and parents had been educated under a different value system) and in older democracies (which were seeing declining proportions of young people interested in civic and political participation)? Further, how would it be possible to encompass both the meaning of civic education for a nation (e.g., the need to transmit basic knowledge about legislative processes, national attachment, and belief in the rule of law and attitudes toward civic participation) and its meaning for individual young people of different levels of cognitive development or different ethnic groups? An earlier educational encyclopedia entry for civic education noted, "The civic values that individuals internalize often differ substantially from those that representatives of the polity [including educators] have attempted to inculcate, either because of individual differences in the processing of information or because of experience and reflection, which leads to challenging the status quo" (Torney-Purta, 1992: 158).

In the years between the first and second civic-education studies, substantial research had been conducted on the topic of political socialization, much of it by political scientists and primarily using surveys measuring the attitudes of young people of secondary-school age in the United States and Europe (Jennings, 2007). There was a diminution in this research in the late 1970s to 1980s, with some studies by psychologists and social studies educators filling the gaps (Torney-Purta, 1990). The National Assessment of Educational Progress (NAEP) in the United States tested the civic knowledge of representative samples of fourth, eighth, and twelfth graders starting in the 1970s and continuing to the present. A reanalysis of the 1988 NAEP data suggested that educators should again give attention to this area (Niemi and Junn, 1998). This analysis indicated that civic-education courses in upper-secondary school were important, but also pointed to the existence of considerable learning before that age (corroborating studies by psychologists, who had also studied attitudes and intentions to participate using multimethod studies). At about this time, improving civic education was also being discussed in Australia and England.

Design of the CIVED Study and the Associated Collaborative Process

The CIVED Study was designed and implemented in two phases, the first phase more qualitative in nature, and the second more quantitative (see Table 1). During the first phase, national researchers from 24 countries collected information on the circumstances, content, expectations, and processes of civic education in their countries including students' civic engagement and political interest. These national case studies provided insight into the political, social, economic, and educational context within which civic identity develops and civic education occurs (Torney-Purta *et al.*, 1999). The information collected during the first phase also contributed to the conceptual framework which then guided the design of a test of civic knowledge and skills and a survey of civic attitudes, concepts, and expected behaviors administered to students during the second phase of the study.

During the second phase, approximately 90 000 14-year-old students from 28 countries were administered a test and a survey, each taking about 40 min. These data were collected in 1999; findings were released in 2001, and reported in the volume titled *Citizenship and Education in Twenty-Eight Countries: Civic Knowledge and Engagement at Age Fourteen* (Torney-Purta *et al.*, 2001). School heads and teachers also provided information.

In the following year, over 50 000 upper secondary school students from 16 countries (15 of which also tested 14-year-olds) received a similar test of civic knowledge and skills and the same survey of civic attitudes and

Table 1 CIVED study: Focus of two-phased study^a

	<i>CIVED phase 1 (1999)</i>	<i>CIVED phase 2 (2001/2002)</i>
Number of countries	24	28 (14-year-olds)
Primary method	Qualitative	16 (16–19-year-olds) Quantitative
Primary focus	Context within which civic education occurs Countries' expectation for civic education outcomes for 14-year-olds Collaboration and consensus about the study among national researchers Development of conceptual framework: Democracy and its definition; democratic institutions; citizenship rights and duties. National identity; international relations Social cohesion and diversity.	Contents of test and survey for age 14: Civic knowledge and cognitive skills: 38 items and 3 IRT scales Concepts of democracy, citizenship, and government: 52 items and 4 IRT scales Attitudes of trust in institutions, attitudes toward one's country and government, political efficacy: 24 items and 5 IRT scales Attitudes toward immigrants, women, minorities: 34 items and 4 IRT scales Expected political activities: 12 items and 4 IRT scales School conditions for learning: 19 items and 2 IRT scales Student background: Demographics and organizational participation 31 items

^aTest for upper-secondary students contained similar items as well as economic literacy items. Survey was identical to survey given to 14-year-olds with a few additional items about contextualized efficacy and intervention added.

behaviors (Amadeo *et al.*, 2002). In sum, during the second phase of the study, quantitative data were collected from over 140 000 students to provide an assessment of the civic knowledge and engagement of both younger and older adolescents across a diverse set of democratic societies (see **Table 2** for a list of participating countries).

Both groups of students were tested on their civic knowledge and skills. They were also surveyed on their concepts of democracy and government; their attitudes relating to trust in institutions, political efficacy, and opportunities for immigrants and women; and their expected participatory actions relating to politics. A final part of the student survey assessed the students' perceptions of the climate for discussion in their classrooms as well as other background variables. In addition, an internationally relevant list of organizations was developed and students were asked to indicate to which groups they

belonged. This list includes organizations such as student government, environmental groups, and other youth organizations (see **Table 1**).

The theoretical framework of the CIVED conceptualizes the ways in which "the everyday lives of young people in homes, with peers and at school serve as a 'nested' context for young people's thinking and action in the social and political world" (Torney-Purta *et al.*, 2001: 20). This theoretical model, found in **Figure 1**, has its roots in ecological theory (Bronfenbrenner, 1988) and situated cognition (Lave and Wenger, 1991).

Selected Results

The first major result of these cross-national studies of civic education has been to demonstrate the feasibility and utility of focusing on civic education as a domain for cross-national assessment and research. When the first civic-education study was started by IEA in the late 1960s, it was met with skepticism for attempting precise measurement of a politically contentious sphere. It continues to be the one area of IEA research, where noncognitive outcomes receive as much or more emphasis than cognitive outcomes. In short, over the years the IEA work in civic education has continued to be a pioneering effort in defining and measuring what it means for young people to learn about democracy and related matters such as national identity and social cohesion. Already in the first study in the 1970s, the Federal Republic of Germany had attained remarkable support among young people for attitudes considered important to democracy by Western

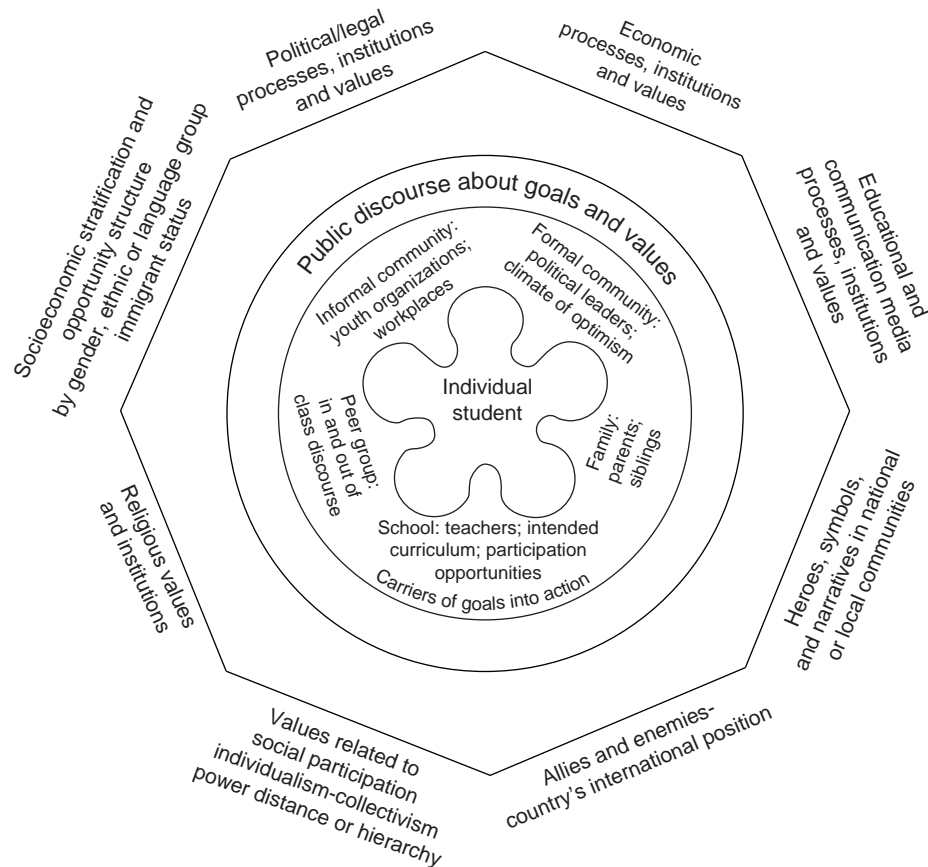

Figure 1 The octagon model of Civic Education Study (CIVED). Torney-Purta, J., Schwille, J., and Amadeo, J. (1999). *Civic Education across Countries: Twenty-Four National Case Studies from the IEA Civic Education Project*. Amsterdam: IEA.

theorists whereas nations with longer traditions of representative democracy did not all reach the same level. By the early years of the twenty-first century, the cross-national study of civic education had progressed from a marginal and controversial part of the IEA research agenda to a domain that receives systematic attention.

Second, while civic education is still generally considered a difficult area to assess and deal with in complex multivariate and psychometric models, in fact it has been possible to develop robust results with considerable implications for education using data in this subject area. One of the most significant findings to emerge from IEA cross-national civic achievement studies in the last 40 years is the relationship, controlling for potentially confounding variables, between the existence of a climate that encouraged open discussion in classrooms on the one hand, and scores on civic-education knowledge tests (as well as on attitude measures) on the other. In cross-national studies of other subject matters such as mathematics, science, and literacy, generalized cross-country relationships between pedagogical or classroom-process variables and achievement have proved elusive. What seems important in the case of civic education is that the

empirically demonstrated importance of encouraging open expression by students in classrooms is consistent with and supportive of much theorizing about the importance of discussion and deliberation to desired outcomes in civic education (Hess and Avery, 2008).

Third, the qualitative national case studies of civic education in the 1990s collected in the first phase of CIVED provided in-depth information about what sort of role schooling can and should have in civic education, challenging the conventional wisdom that much of civic education takes place outside schools. These case studies (Torney-Purta *et al.*, 1999) revealed a strong consensus that civic education was not sufficiently responsive to the alienation from political life observed among young people. Issues confronting civic education in school were examined, including the status of civic education as a separate subject (vs. integration with other subjects), the needs of civic education pedagogy, the importance of school organizations as well as student rights and student government for civic preparation, and how civic education can respond to forces outside the school such as the media. Although a very ambitious role for schooling in civic education has been proposed, few countries in the 1990s claimed to have

been successful in implementing this challenging agenda. Assessment and teacher preparation have been especially neglected. In fact, realizing the aspirations of civic education as documented in these case studies would require systemic reforms of education far beyond the capacity of civic educators to carry out without support from members of the community (including parents) and those who shape the policy of educational, political, and economic institutions (Schwille and Amadeo, 2002).

Fourth, the CIVED survey results interpreted in light of both observed country similarities and differences show a multidimensional picture of the outcomes of the civic-education process. For example, there was considerable consensus among 14-year-olds across countries about important norms for political engagement such as obeying the law and voting. In most of the countries, testing in CIVED the less conventional but nonprotest types of activities, such as joining an environmental or volunteer organization, were more positively viewed than conventional political activities such as running for political office or writing a letter about a political issue. Even young people who believed strongly in social justice were unlikely to say that they would actively protest for a political cause. Very small proportions across countries planned to join a political party. Even among upper-secondary students (aged 16–19), when many students are eligible to vote and welcome to join partisan organizations, the preference is still for community volunteering and support of human rights and the environment (Torney-Purta and Amadeo, 2003).

Fifth, some widely held beliefs about civic education were challenged by these results. Many argued that the most important reason for civic-related classes is that young people need historical and contemporary civic knowledge. However, the CIVED results indicate that knowledge of civic and political processes and concepts by itself is insufficient to ensure participation. Civic knowledge was strongly related to the students' expectations that they would vote but was not related to expectations of other forms of adult engagement such as political activities extending beyond voting or engagement in volunteer activities. Knowledge of civic topics was related to students' support for the rights of immigrants and minorities. There was a curious lack of willingness to move beyond expressing attitudes to action in support of equality among many students who express beliefs in social justice (Torney-Purta, 2009).

Sixth, the need for a balanced emphasis on skills in addition to content knowledge was suggested by the CIVED results. Distinct measures of conceptual civic knowledge and civic skills (assessed by questions asking for the interpretation of an election leaflet or political cartoon) were developed. Students in the United States had the highest score of the 28 countries on these cognitive civic skills. Other countries where hands-on teaching

methods and political media are regularly used in class, such as England, Australia, and Sweden, also had relatively high scores on civic skills. Students in the post-Communist countries performed much less well on the portion of the test requiring mastery of skills. However, students in some Eastern and Central European countries scored well on questions asking about democratic concepts, such as what role constitutions play in democracy. In contrast, students in the United States ranked tenth out of the 28 countries in this conceptual knowledge of democracy.

Seventh, in democratic societies, civic knowledge, civic skills, inclinations to participate, and civic-education opportunities are supposed to be equally distributed across economic groups. In fact, the IEA study shows a substantial equality gap in civic knowledge as well as in expectations of voting and some other types of activity that is evident when comparing students from home backgrounds with more and fewer educational resources and when comparing those who plan to attend higher education with those who expect to drop out before completing secondary school (Baldi *et al.*, 2001; Torney-Purta *et al.*, 2001; Wilkenfeld, 2009). Furthermore, a small group of students in the United States has highly negative attitudes toward minorities and toward obeying the law; a substantial proportion of ninth graders who expect to drop out before completing high school are in this alienated group (Torney-Purta *et al.*, 2008). Schools with many students from disadvantaged home backgrounds also experience curricula that lack major positive civic-education features (Baldi *et al.*, 2001; Kahne and Middaugh, 2008).

Dissemination of CIVED Results and Influence on Policy Resulting from the Research

The IEA organization prescribes a pattern for its publications. After the technical committee has approved a study's instrument and plans including scaling, the basic analysis by country is completed, resulting in tables or figures of results, usually concentrating on country comparisons. A draft report is prepared, usually by the International Coordinating Center (for CIVED, the Humboldt University of Berlin) and with the close involvement of the international steering committee (for CIVED coordinated through the Department of Human Development, University of Maryland). This draft was circulated to the national research coordinators for their suggestions. The volume reporting the data collected from nearly 90 000 14-year-olds in 28 countries (Torney-Purta *et al.*, 2001) was released at the Comparative and International Education Society's meeting in March 2001, while the report of the 50 000 upper-secondary students surveyed in 16 countries

(Amadeo *et al.*, 2002) was released at the meeting of the International Society for Political Psychology in August of 2002. An executive summary for each volume and a webpage, which includes publications and the released survey questions were prepared. Activities to stimulate the awareness of the public, of professional educators, and of policymakers about the results of the CIVED study and its implications for policy and practice were also undertaken. Numerous articles tailored to particular audiences of educators and policymakers, as well as presentations at conferences to audiences with interests in policy or professional practice stimulated a broadened debate about young people's preparation for civic engagement.

The study was released, and there was a resurgence of interest in civic learning among educators and foundations in many countries. Empirical evidence about the knowledge and attitudes of young people received new attention. For example, in the United States, a consensus process involving researchers and practitioners supported by the Carnegie Corporation of New York and the Pew Charitable Trusts resulted in a report entitled *The Civic Mission of Schools*; the IEA CIVED research is a frequently quoted source of evidence in this influential report. The report has served as the basis of a major public-awareness campaign on civic learning. Similar reports were formulated in England and Australia in the 1990s and the CIVED research evidence played a role in their implementation.

The Education Commission of States (a nongovernmental organization (NGO) in the US) mounted an effort to assist state policymakers to clarify the meaning of competencies in the areas of civic knowledge and skills in order to enhance policies in the 50 states to promote these competencies (Torney-Purta and Vermeer, 2006). An associated effort collected and disseminated high quality and innovative measures for assessing students and schools, in order to encourage the assessment of students' civic knowledge, skills, and dispositions as part of educational accountability. The resulting website of juried items included many from the CIVED. Further examination of the CIVED data prepared for scholarly audiences in the United States has included an analysis of differences between the civic knowledge and attitudes of Latino/a and non-Latino/a students in the United States (Torney-Purta *et al.*, 2007) as well as estimating the proportion of US students who were conventionally civically engaged, engaged in support of social justice, indifferent, and alienated (Torney-Purta *et al.*, 2008).

The Council of Europe launched the year of education for democratic citizenship in Europe in 2005, and a report based on the CIVED data served as their background paper on policies regarding the practice of democracy at school. The emphasis in this paper was on the relation between measures of the existence of democratic practices at school and student outcomes within and among

countries. Additional analysis for scholarly audiences has taken a similar direction, looking at the impact of the participation of governments in intergovernmental dialog about human rights on the knowledge of and attitudes toward human rights among adolescents in 27 countries (Torney-Purta *et al.*, 2008).

The Organization of American States supported a specialized analysis of the IEA data from Chile, Colombia, Portugal, and the United States published in *Strengthening Democracy in the Americas through Civic Education: An Empirical Analysis of the Views of Students and Teachers* (2004). The analysis identified problems in this region with students' lack of awareness of threats to democracy and poor understanding of citizens' rights that had been obscured when all 28 countries were analyzed. The National Commission on the Reform of Citizenship in Chile reflected these research findings in their recommendations for curricular reform. A similar effort has addressed the results from the Pacific Rim countries that participated in CIVED (Kennedy *et al.*, 2008). A special issue of the British journal *Citizenship Teaching and Learning*, was entitled *Reflections on the IEA Civic Education Study (1995-2005)*, and included contributions covering Latin America, the post-Communist countries, the United States, and Australia.

All IEA studies release their data for use by other scholars. The first step was the issuing of a technical report (Schulz and Sibbers, 2004). Civic Education Data and Researcher Services (CEDARS) was established at the University of Maryland, US to provide assistance to researchers, graduate students, and policymakers' staff. This culminated in the acceptance of the data for systematic dissemination by the Interuniversity Consortium for Political and Social Research (ICPSR) at the University of Michigan, US. Political scientists have used the CIVED data to study, among other things, the extent to which women political leaders serve as models for adolescent girls' political engagement (Campbell and Wolbrecht, 2006).

The International Civic and Citizenship Education Study (ICCS 2009) builds on the previous CIVED. The studies have a similar purpose, to investigate the ways in which young people are prepared to undertake their roles as citizens in a range of countries. ICCS includes student achievement on a test of conceptual understandings and competencies in civic and citizenship education, but does not distinguish between content and skills as CIVED did. ICCS has also collected data about student dispositions and attitudes relating to civic and citizenship education. The population tested includes students enrolled in the grade that represents 8 years of schooling, provided the mean age at the time of testing is at least 13.5 years. ICCS teacher and school questionnaires gathered information about teaching and class-management practices, school governance, and climate. An innovation in this study is the inclusion of regional modules for Asia, Europe, and Latin America.

Summary

The first IEA study of civic education began its planning in the late 1960s. Since that initial study, which tested in 1971, civic-education research has become an integral part of cross-national study. While it is still considered a difficult domain to assess, the IEA civic education studies demonstrate that it is possible to develop research models and assessment instruments relevant to countries with different ideologies. The major findings (particularly those from CIVED) have had substantial implications for education policy and teaching. Further, the research has emphasized that the distinction between civic knowledge and skills is an important one, and that civic knowledge alone is not sufficient for democratic participation. Young people's attitudes, activities, and concepts are also of vital importance. The findings from CIVED have been disseminated widely in numerous countries and secondary analysis of the data is ongoing.

IEA: Globalization and Assessment

H Wagemaker, International Association for the Evaluation of Educational Achievement, Amsterdam, The Netherlands

© 2010 Elsevier Ltd. All rights reserved.

Introduction

The International Association for the Evaluation of Educational Achievement (IEA) is an independent, not-for-profit cooperative of national research institutions and governmental research agencies that collaborate to conduct large-scale comparative studies of educational achievement. The association was legally incorporated as a scientific society in Belgium on 21 September 1967. Its legal and financial affairs are conducted through the Stichting IEA Secretariaat, Nederland. The secretariat is situated in Amsterdam and is a registered foundation under the Chamber of Commerce in The Hague, the Netherlands. A standing committee in association with the Amsterdam secretariat functions as a board of directors. The IEA Data Processing and Research Center (DPC), based in Hamburg, Germany, provides ongoing organizational and operational support for all studies.

Membership in IEA is open to all countries, each of which is required to nominate a national research center from which to conduct IEA studies. The member countries of IEA constitute the association's General Assembly, which meets on an annual basis to review project progress and develop new initiatives. In 2008, 66 countries from five continents were members of the organization. To date, approximately 100 countries have participated in IEA's various studies.

Through its comparative research and assessment projects, IEA aims to achieve the following:

- Provide international benchmarks that may assist policymakers to identify the comparative strengths and weaknesses of their educational systems.
- Provide high-quality data that increase policymakers' understanding of the key school- and non-school-based factors that influence teaching and learning.
- Provide high-quality data that serve as a resource for identifying areas of concern and action, and for preparing and evaluating educational reforms.
- Develop and improve the capacity of educational systems to engage in national strategies for educational monitoring and improvement.
- Contribute to developing the worldwide community of researchers engaged in educational evaluation.

Although IEA did not become a legal entity until 1967, its origins date back to 1958 when a group of scholars, educational psychologists, sociologists, and psychometricians met at the United Nations Educational, Scientific

and Cultural Organization (UNESCO) Institute for Education in Hamburg to discuss problems related to school and student evaluation. In an era when the quality of schooling was largely judged on the basis of school inputs or of data-free assertions about the relative merits of one educational system over another, those attending the meeting concluded that effective evaluation of schooling also requires a focus on student outcomes, including knowledge, attitudes, and participation.

Despite IEA's first meetings being held under the auspices of UNESCO, the association's roots were firmly tied to leading academic institutions through its first scholars, who included Benjamin Bloom from the University of Chicago, Arnold Anderson and Robert Thorndike from Teachers College, Columbia University, and Torsten Husén from the University of Stockholm. During the early years of the association, these leading academics were primarily responsible for organizing its work. Motivated by a desire to understand and identify those factors that might have meaningful and consistent influences on educational outcomes, they contributed their time and resources on a voluntary basis. The international comparative focus was, for them, a context from which to view the policy- and practice-related differences that occur naturally across countries and thereby provide insight for policy reform and improvement. They argued that evidence from a wide range of educational systems would be of sufficient variability to permit the revelation of important relationships that would otherwise escape detection.

Foshay *et al.* (1962), the authors of one of the first publications to arise from the work of IEA, eloquently expressed this focus when making the case for international comparisons: "If custom and law define what is educationally allowable within a nation, the educational systems beyond one's national boundaries suggest what is educationally possible" (p. 2). This desire to explore the limits and possibilities of schooling and the quest to identify and understand those factors capable of providing insights into and explanations for differences in outcomes became the key drivers of the design of IEA studies.

IEA Studies

Organization, Principles, and Development

Since its inception in 1958, IEA has conducted more than 24 research studies of cross-national achievement. Each

IEA study is managed through an international coordinating center, which is responsible for carrying out all key international developmental and administrative tasks. International advisory and expert committees guide the countries participating in the respective studies. Their aim is to ensure that the highest quality expertise is brought to bear on key aspects of each study and, in particular, on the more complex issues relating to study design, subject-matter content, and analysis. National research coordinators and their national centers are responsible for conducting the studies within each participating country. All participants contribute to decision making in the respective studies.

Contemporary IEA studies, particularly those with a focus on student achievement at the primary and secondary levels of schooling, are fundamentally concerned with measuring learning outcomes and their antecedents after a fixed period of schooling. This broad organizational principle along with a curriculum model that links the intended curriculum (i.e., what educational policy dictates) with the implemented curriculum (what is taught in classrooms and how) and with the achieved curriculum (what students know and can do) is central to the design and conduct of IEA studies.

IEA has recently moved beyond the study of student achievement and has engaged in a study of the preparation of mathematics teachers. This study, called the Teacher Education Development Study-Mathematics (TEDS-M), examines the antecedents and outcomes of the preparation of mathematics teachers. As for the studies of student achievement, it is organized around the curriculum model described above.

The first IEA study, known as the Pilot Twelve-Country Study, was implemented as a feasibility study and conducted between 1959 and 1962. It examined the performance of 13-year-olds in mathematics, reading comprehension, geography, science, and nonverbal abilities. While many of the findings of this study had practical value, its significance was that it showed that constructing a common set of achievement tests and questionnaires that work cross-culturally is possible and that some of the significant methodological challenges related to language differences can be mitigated through careful translation procedures.

The First International Mathematics Study (FIMS), which followed, with data collection taking place in 1964, explored what 13-year-old students and students in their pre-university year had learned after a fixed period of schooling. In addition to identifying factors influencing the teaching and learning of mathematics, this study introduced and demonstrated the importance of the concept of opportunity to learn for understanding learning outcomes. Moreover, FIMS, in building on the experience of the Twelve-Country Study, established the aforementioned relationship between what is prescribed by policy and the curriculum (the intended

curriculum), what is taught in classrooms (the implemented curriculum), and what students know and can do (the achieved curriculum), as a key design feature of future IEA studies.

The FIMS also raised the question of whether and to what extent factors positively associated with achievement in mathematics could be generalized to other subject-matter areas. This question provided much of the impetus for the group of studies that came to be known as the Six Subject Survey, which examined the performance of 10- and 14-year olds in science, reading comprehension, literature, French as a foreign language, English as a foreign language, and civic education.

The manner in which IEA's studies have evolved since the early years (see **Table 1**) reflects not only the interests of IEA's early pioneers but also the findings and experiences of the first studies and the ongoing shaping effects of a variety of factors across time. The latter include the demands of increased globalization and concerns for greater local accountability, the needs of an increasing and more diversified membership and participant group of countries, and the development of the technology and science related to large-scale assessment.

Funding

During IEA's early history, limited project funding meant that individuals who volunteered their time and expertise carried out much of the association's work. As the demand for greater regularity of studies increased, and the need for higher standards of technical quality and expertise rose, so too did the need to secure more stable financial support. The decision in 1990 to establish a permanent secretariat with an agreement to charge membership and (later) project fees helped secure the financial base of the organization and its projects.

In 1995, IEA decided to make mathematics and science (Third International Mathematics and Science Study (TIMSS), later renamed Trends in Mathematics and Science) its core study. In 1999, reading (Progress in Reading Literacy Study (PIRLS)) was also made a core study. These events, which marked a significant turning point in the development of IEA, were made possible by securing core funding for the studies from the US Department of Education, through the National Center for Educational Statistics, and establishing an international study center at Boston College. The latter assumed overall management of the two series of studies, and in so doing ensured continuity of expertise.

Although the intention was for the balance of project costs to be met through country participation fees, these presented a significant barrier to participation for many developing countries. From 1999 onward, IEA was successful in securing partial support for many developing countries through partnerships with such organizations as

Table 1 Chronological listing of IEA studies

<i>Name of study</i>	<i>When conducted</i>
<i>Completed studies</i>	
Pilot Twelve-Country Study	1959–62
First International Mathematics Study (FIMS)	1963–67

Transformation and Expansion

Examination of the transformation that has occurred over the years in the design and scope of IEA studies allows us to observe the transition from the early studies, where the focus of the research was primarily descriptive, to the later investigations, where more sophisticated attempts have been made to conduct more explanatory analyses. The successful completion of four cycles of TIMSS and two cycles of PIRLS represents a significant advancement in study design, scaling, data analysis, and reporting.

Whereas in the late 1970s the more tactical approach to participation in IEA studies led to the repetition of studies in mathematics and science on a somewhat *ad hoc* basis, the period at the end of the 1980s and the beginning of the 1990s was characterized by an increasing demand

for regular assessments, particularly in the areas of mathematics, science, and reading. This development reflected the growing recognition that regular monitoring of educational outcomes is a necessary strategic investment in quality assurance. The release of the results of IEA's Reading Literacy Study and, more importantly, the results of the Third International Mathematics and Science Study (TIMSS 1995), contributed significantly to this recognition and also brought to public attention advantages and concerns associated with international competitiveness in the area of education. The TIMSS 1995 was the first of IEA's regular cycle of studies of learning in basic school subjects. Like the PIRLS that followed in 2001, these studies were designed as trend studies – studies that allow the performance of students from different cohorts to be examined for changes over time.

For many developed countries, particularly those that were members of the Organization for Economic Cooperation and Development (OECD), the late 1980s were characterized by an increased concern for greater public

accountability for the outcomes of public schooling. The more general concerns about educational quality were accompanied by the premise that it was no longer sufficient for educational systems to be nationally relevant. Instead, countries needed to develop educational systems that would prepare their respective citizens to meet the demands of global competitiveness and thereby ensure economic and social wellbeing. In many of these countries, which included, for example, Canada, the United Kingdom, and New Zealand, significant public sector and educational reforms accompanied these demands. In this context, the role of assessments, both national and international, were central to the discourse about quality accountability.

As participation in IEA studies has expanded in terms of the absolute number of countries and the diversity of their economic development, IEA has increased its investment in capacity building and training. Training has always been an integral part of IEA projects, but many of the countries with more limited experience in large-scale assessment require additional support. These demands and changing expectations related to the need for more in-depth analysis of data have precipitated several initiatives to facilitate not only the successful completion of studies but also the use of data for policy evaluation and reform. Regional and country-specific training seminars in particular have begun to address training needs that go beyond the specific demands of participation.

In the beginning of the first decade of the new century, IEA introduced two important developments in response to the increasing demand for secondary analysis of IEA study data. The first was the association's establishment in 2004 of a biennial international research conference (IRC). The second, which took place in 2006 in cooperation with the US Educational Testing Service (ETS), was the association's establishment of a joint research institute based at the IEA Data Processing and Research Center in Hamburg. The IEA/ETS Research Institute (IERI) provides twice-yearly training for academics in a broad range of research and analytical areas. The institute also supports and conducts secondary analysis of data (particularly in support of the IRC) and publishes a monograph series with a specific focus on the science of large-scale assessment.

IEA's Impact on Educational Policy, Research, and Practice

The work of IEA, perhaps more than any other organization involved in similar work, has brought into sharp relief the outcomes of schooling. As noted above, the public visibility of the results of the first TIMSS study was arguably a key factor in shaping the public policy debate.

The outcomes of the major IEA studies, including TIMSS, PIRLS, Civic Education, and Second Information Technology in Education Study, have all captured media attention not only in the international media such as the Associated Press, CNN, and USA Today, but also in many – if not most – of the major newspapers of participating countries. One prominent example of how visible the work of IEA has become relates to comments made in 2004 by Alan Greenspan, Chair of the United States Federal Reserve, during his testimony before the Committee on Education and the Workforce of the United States House of Representatives. Greenspan appealed to data from TIMSS to express his concern about educationally low performing sectors of the United States population and the assumed consequent detrimental impact on the United States economy.

Another indication of the influence of IEA studies is that dissemination of study findings is not restricted to OECD countries. Independent evaluations (Elley, 2002; Gilmore, 2005) of the impact of IEA studies in the developing countries that participated in TIMSS and PIRLS note that although public release of information was politically difficult in some of these countries, most, if not all, produced national reports that were released and, in some cases, were the focus of intense public scrutiny.

In more recent years, countries such as England and Norway have used the release of study results, especially those from TIMSS and PIRLS, to stimulate public discussion and debate with respect to educational reform and improvement.

Evidence that the work of IEA has entered public discourse and the public policy debate is but a first step in arguing the case for the marked impact that IEA studies can have on educational discourse and educational policy, particularly that related to systemic and curricular reform. Again to take TIMSS as an example, the release of the TIMSS 1995 data led to countries as diverse as Iceland, Kuwait, New Zealand, Norway, Romania, and South Africa serving as a catalyst for curricular review and change. In Iceland, the information collected during TIMSS resulted in a recommendation (and subsequent implementation) to increase teaching hours for mathematics and science instruction at the elementary school level. In New Zealand, the TIMSS results precipitated the establishment of a taskforce charged with addressing issues that had emerged from the data on science and mathematics education. These issues included the low expectations of success for New Zealand students held by many teachers and parents, underachievement among Maori and Pacific Island students, and teachers' lack of confidence in their ability to teach some aspects of the mathematics and science curricula. In Israel, the periodical, *Education Week*, published a substantial article headed Down in rankings: Israel seeks changes in education,

featuring an account of the reforms being implemented in that country largely as a result of what it had learned from TIMSS.

While TIMSS and PIRLS, focusing as they do on core subjects, tend to attract particular interest from educational policymakers and planners, the outcomes of IEA's many other studies have also made and continue to make important contributions to educational policy and practice. Findings from Second Information Technology in Education Study Module 1 (SITES-M1), for example, drew the attention of policymakers worldwide to at least three major issues. The first concerned the fact that although, in participating countries, the earlier challenge of providing schools with sufficient numbers of computers had generally been met, a critical gap still existed – that of teachers not being sufficiently familiar with and able to use technology for instructional purposes. The second issue was that, with few exceptions, the promise or expectation that computers would transform curricula and pedagogy had not been realized. The third issue centered on the difficulties schools were beginning to have in managing access to the Internet and protecting children from inappropriate materials. The availability of information about the changes that had taken place in terms of the penetration of computers into classrooms also helped change the discourse relative to information technologies in education from questions about, for example, whether to invest in computers to questions about how to facilitate their integration into curricula and instruction. The SITES-M1 showed educational policymakers, planners, and practitioners that while technology has the capacity to shape the teaching–learning environment, efforts to implement it into schools and integrate it in classroom programs tend to create considerable turmoil for schools, teachers, and students.

The findings of the Civic Education Study (CIVED) has also featured strongly in educational policy debate both nationally and internationally. Conducted at a time of significant change in Central and Eastern Europe, CIVED addressed concerns related to the processes of civic education. It asked, for example, such questions as how countries manage the process of preparing students for citizenship and membership of participatory democracies. The findings of this study revealed important differences across and within countries in terms of knowledge about and understanding what is meant by democracy, as well as of student attitudes toward nation, government, immigrants, and women's political rights.

The IEA studies have also had a tangible impact on research acumen. For most countries, participation in various studies and the training opportunities they afford have significantly enhanced ability to carry out research and assessment activities. Independent evaluations (Elley, 2002; Gilmore, 2005) provide compelling evidence of the

positive impact that participation has on developing national assessment capacity. For example, in countries like Macedonia, TIMSS 1995 was the first instance of a national assessment of student achievement being conducted. Furthermore, all countries that participated in TIMSS 1995 were reported (Elley, 2002) to have benefited in some way from the training in large-scale student assessment that accompanies participation in IEA studies. For many countries, direct outcomes of the TIMSS training activities included capacity building. Some countries built on this experience by establishing dedicated research institutes that used the skills and knowledge developed through the TIMSS experience to enhance their national educational and curricular policy and assessment development. Even in the more economically advanced countries, centers of excellence have developed in those institutions responsible for the execution of IEA projects. While perhaps already in possession of a group of skilled researchers, these institutions generally have been exposed to new techniques and technologies as a result of the evolving methodological and analytical sophistication of IEA studies.

The IEA studies (with TIMSS and PIRLS again to the fore) have furthermore been instrumental in spawning a large number of research investigations, both national and international, directed at key policy issues as well as at developing fundamental understandings of subject-based learning (notably mathematics, science, and reading). An increasing body of research involving secondary analyses of data from other IEA studies is also evident, as is research prompted by questions emerging from the findings of the more recent IEA assessments.

The impact of IEA studies on curriculum development and educational practice within schools is, as yet (given time lags between implementation of policy arising out of research findings and evidence of those developments on practice), less strongly articulated. However, several countries (notably Australia, Canada, Spain, Japan, and the Philippines) used TIMSS 1995 results to bring the teaching of mathematics and science into sharp focus. Canada (Ontario), for example, developed instructional materials as an outcome of its participation in the study. In the Philippines, government resolve was reflected in a program to train 100 000 mathematics and science teachers over a period of 5 years.

In other countries, TIMSS findings have pointed to particular practices and curricular resources in need of reconsideration, remedy, or recognition. In England, for example, the results of TIMSS focused attention on lower-achieving students and were also the catalyst for a guidance document that drew attention to the frequency with which students were using calculators and accordingly stressed the importance of having students do mental calculations. In Iran, the TIMSS results led to major changes to the science curriculum and textbooks. In New Zealand,

information from TIMSS contributed to the development of resource materials and professional development programs (designed to address the perceived areas of relative weakness) for mathematics and science teachers. In the United States, the TIMSS findings saw the structure and content of the United States approach to curriculum coming under intense scrutiny and debate, a state of affairs that continues today.

The PIRLS has also forced examination and reappraisal of reading-related teaching practices and curriculum content and guidelines. The data from the PIRLS questionnaire for parents, for example, highlighted, for nearly all participating countries, the importance of parental involvement in the reading acquisition process and raised the question of how parents might be better involved in their children's learning to read.

The SITES assessments have provided important insights into the role that technology does and can play in teaching and national curricula. As noted above, the first module of the study identified the gap between the provision of technology and teacher readiness in the use of that technology for instructional purposes. In Norway – a country that has invested significantly in the provision of computer technology – this gap was a particular area of concern.

Summary

The growth and development of IEA has been stimulated by ongoing and growing concerns related to public accountability in education and the imperative for improved quality of educational outcomes associated with increased globalization. During the last 10–15 years, IEA has experienced a significant increase in both its membership and in terms of participation in its studies. As reflected by the change in focus of the organization over the last 50 years, this changing membership has placed increasing demands for training and support for secondary analysis of project data. It is through its commitment to make educational reform and improvement a primary goal that IEA's influence can be seen and measured. The influence is clearly evident not only in terms of the impact that the studies have had on the public discourse on educational quality but also in terms of the very tangible impact that IEA studies have had on educational policy, research, practice, and curriculum.

Introduction

The European Union (EU) is a partnership of some, though not all, European countries. Its mission is to “provide peace, stability, and prosperity” for its citizens. Founded as the European Coal and Steel community with six countries in 1951, it currently comprises 27 member countries with a number of candidate countries seeking admission. The three countries of the European Economic Area and Switzerland also participate in some EU programmes. The intervening decades have seen a succession of treaties and constitutional developments. These have been matched by a growth in the EU's sphere of operations: it has a substantial budget (€129 billion – about 1% of EU Gross National Income – in 2007) and concerns itself with a wide range of policy matters in the economic, social, regulatory, and financial areas. It has major programmes in agriculture, energy, the environment, and research. It launched the euro as a common currency in 2002; this is now used in 16 member countries (plus some others outside the EU) and is already established as a major world currency.

Support for research is organized within framework programmes which run for a number of years. The current programme, which is the seventh, has a budget of €50 billion for the period 2007–13. The topics covered include energy, food and agriculture, information and communications technology (ICT), the environment, transport, security, space, and the socioeconomic sciences.

The European Commission (EC) is the executive arm of the EU. Political authority is vested in the Council of Ministers as the top-level decision-making body and the European Parliament which is directly elected across all member states every five years, but operational responsibility falls to the EC. The Commission currently comprises one Commissioner from each of the 27 member

states. It is assisted by a civil service made up of 46 directorates-general (DGs) and services, which are mainly based in Brussels and Luxembourg.

Education and Culture is one of the Commission's 46 DGs. Its mission is “To reinforce and promote lifelong learning, linguistic and cultural diversity, mobility and the engagement of European citizens, in particular the young”. It engages in a range of actions to improve the quality of learning systems and provide learning opportunities for people at all stages of their lives. While each member state is in charge of its own education and training system, the Commission has the specific role of supporting co-operation between countries so as to achieve common goals in education and training. Its work focuses on two areas in particular: cooperation with national authorities and European stakeholders in improving policies and exchanging good practice; and the development and administration of funding programmes.

Early Educational Cooperation in Europe

The history of educational cooperation in Europe is a checkered one. Despite the much-quoted dictum of Jean Monnet, one of the founding fathers of European cooperation, “If I could start again, I would begin with education,” education did not feature at all in the early years of the European Community. Indeed, one author describes the time from 1957 to 1969 as “a period when education remained a taboo subject within the corridors of the European Community” (Neave, 1984: 6). This was because of a visceral attachment to curriculum, school organization, and so forth at national level, on the one hand, and a widespread belief, on the other, that action in the political, economic, and labor market spheres was both more necessary and more likely to be efficacious.

The beginnings of European cooperation in education were, in fact, achieved outside the European Community, in particular, through the Council of Europe. The latter is quite separate from the EC, having been founded in 1949 and comprising 47 member countries. The Council of Europe was in fact the main player in European cooperation in education for many years, because of its early commitment to education, the active networks of policy makers, experts, and nongovernmental organizations it facilitated, and the fact that the European Community did not at the beginning concern itself with education. From its early years it stimulated important initiatives in areas such as language learning, research and documentation, and adult and higher education.

Despite some structural similarities with the EC – it has a Council of Ministers and a Parliamentary Assembly – the Council of Europe has a distinctive set of programmes (and a very much smaller budget). Its principal concerns are with human rights, the rule of law, democratic development, and intercultural cooperation. In education, the initial focus was on information sharing through activities such as EUDISED (European Documentation and Information System for Education), a multilingual directory of ongoing and completed projects of European educational research and development (R&D), conferences, and expert meetings. For many years, it convened regular meetings of the directors of European educational research institutions. Its current emphases are on education for democratic citizenship and human rights, language learning, intercultural education, history teaching, aspects of higher education, and the education of Roma/gypsy children.

The practice of collaboration and the associated networks established by the Council of Europe provided a fertile seed bed for the more substantial programmes that the EC's greater political and budgetary clout made possible. The two bodies collaborate in areas of common interest such as higher education, language learning, and the promotion of democratic citizenship. Thus, they jointly organized the European Year of Languages 2001 and collaborate in supporting the Bologna process aimed at creating a European higher education space.

Emergence of Educational Cooperation in the EU

The first meeting of ministers of education within the EU took place in 1971. This was followed 2 years later by the establishment of an administrative division specifically responsible for education. The first Community-wide programme in the field of education was agreed in 1976 and encompassed six fields for priority action:

- education of migrant workers and their children
- closer relations between educational systems in Europe
- compilation of up-to-date documentation and statistics

- cooperation in higher education
- teaching of foreign languages,
- equal opportunities.

While the rationale for these action fields was clear, if not compelling, in the context of greater European cooperation, progress was slow for a number of years. This was partly because of budget constraints – less than 0.1% of the Community budget was committed to the programme – and partly because of political sensitivities and (some) countries' opposition to anything that smacked of European harmonization of national educational systems. The aim, therefore, was to share information and strengthen mutual understanding through pilot projects, studies, and study visits.

Despite this low-key start, some progress was made. With regard to migrant workers, whose children numbered an estimated 3.5 million in EC schools in the 70s, a Directive adopted in 1977 required all member states to provide mother tongue teaching. This led to new pedagogical approaches to language learning, and, in later years, to a focus on the development of intercultural education.

An information network on education in Europe, Eurydice, was established in 1980 to share information on policies and systems in a structured way. Along with Eurostat, established in 1978 to collate and publish statistical data on education, it continues to be a key tool in creating links between European education systems. Now established as part of the EC's umbrella Lifelong Learning Programme, it provides a wide range of information to policy makers in education at European, national, and local levels. At the European level it maintains a range of databases that give comprehensive descriptions of European education systems and conducts studies to provide comparative information on topics of current interest. It is supported in this work by a network of national units which provide inquiry and current awareness services. All of its information is provided free of charge.

Despite some work on student mobility and mutual recognition of qualifications, progress in higher education was modest. Likewise with foreign languages, there was little progress until the Lingua programme in 1989, though the European Bureau for Lesser Used Languages was established in 1982 to support regional and minority languages within the EU. Regarding equal opportunities, the main thrust was the large programme on preparation for working life; explicit attention to gender issues was delayed till 1985 and to disabilities and learning difficulties till 1987.

Parallel developments were taking place in vocational training. Structures and activities similar to those found in education were created. While there was some linkage with education, for example, in relation to the programme on preparation for working life, the emphasis was firmly on the labor market. Key drivers of activity were the growing levels of youth unemployment and the need to improve the technological skills of the workforce.

The late 1980s saw significant developments, which culminated in 1992 in the establishment for the first time of a legal basis for European Community cooperation in education. These were driven, in part, by the appointment of Jacques Delors as president of the EC in 1985 and, in part, by juridical rulings. Delors' success in relaunching the social dialog between employer and trades union representatives went along with a greater recognition of the importance of education and training. This led to a strengthening of administrative support for education and training activities within the Commission, culminating in the establishment of a separate Directorate-General for education in 1995, which became the current DG for Education and Culture in 1999.

A judgment by the European Court of Justice in 1985 (that all European students were entitled to undertake vocational training in any country on the same basis regardless of their nationality; and, very importantly for Commission purposes, that the interpretation of vocational training should be expanded to include higher education) opened the way for substantial programmes in education and training, as described below. In particular, it created the momentum which would lead to the establishment of a legal basis, in Articles 126 and 127 of the Maastricht Treaty of 1992, for European cooperation in education and training. These articles allowed the European Community to take actions and commit resources to 'contribute to the development of quality education' and to 'implement a vocational training policy'. Apart from being an important symbolic gesture which liberated education and training from the uncertain status they had long endured in the EC, this enabled substantial action in the following years.

The major programmes rolled out in this period were: Comett (university-business cooperation); Erasmus (student mobility and cooperation between universities); Tempus (university cooperation with central and eastern Europe); PETRA and Youth for Europe (initial training for young people and youth exchanges); FORCE (continuing vocational training); and Lingua (language learning). These programmes became the main thrust of Community cooperation in education and training between member states. In comparison with previous activities, they were highly resourced and some had a substantial impact.

Education and Training Post-Lisbon

The current framework for education and training in the EU derives from a wide-ranging economic and social programme agreed by Heads of State meeting in Lisbon in 2000. The so-called Lisbon Strategy set the target for 2010 that the Union "should become the most competitive and dynamic knowledge-based economy in the world, capable of sustainable economic growth with more and better jobs and greater social cohesion" (European Council, 2000). The

economic dimension remained paramount but it was now accompanied by an explicit recognition that the economic goals would not be met without greater attention to the modernization of education (and social welfare) systems. Indeed, the Council was to assert in 2002 that Europe should be the world leader in terms of the quality of its education and training systems.

This new recognition of the role of education and training led ministers of education to adopt a report on the future objectives of education and training systems (European Commission, 2002a) and a 10-year work programme (European Commission, 2002b), now commonly known as the Education and Training 2010 process. This covered school education, vocational education and training, higher education and lifelong learning, and marked the first time that ministers had agreed on a common set of objectives in education across the EU.

Countries retain control over their education and training systems but much is made of the so-called 'open method of coordination' as a means of achieving common goals. This is a governance process that depends on persuasion and voluntary agreement as opposed to regulation and the use of sanctions. It reflects the 'soft' approach to governance characteristic of much of the work of bodies such as the United Nations and the Council of Europe, but in its EU version the process is relatively more developed and data-driven. Broadly, there are a number of stages: strategic goals and objectives are agreed at a senior political level; these are then translated into appropriate policies at national and regional levels; indicators by which performance can be measured in respect of these are developed; and statistical information is collected in the light of these so that countries can compare themselves with EU averages and with specific other countries. Besides statistical data, information on good practice is also gathered and disseminated. The process relies, therefore, on information gathering and the publication of information – and the associated public pressure – rather than on regulation or other legal instruments.

The goals agreed at the political level were necessarily rather general, and are concerned with issues of effectiveness, quality, and access. These were developed into 13 objectives: improving the training of teachers and trainers; developing key competences; ensuring ICT access for everyone; increasing the number of science and technology graduates; making best use of resources; creating an open learning environment; making education and training more attractive; working on active citizenship, equal opportunities, and social cohesion; strengthening links with the worlds of work, research, and society; developing the spirit of enterprise; improving foreign language learning; increasing mobility and exchanges; and strengthening European cooperation.

The work programme that flowed from this marked progress in two significant respects. First, it capitalized on the new recognition given to education and training, and

went further – by asserting that education and training were important and deserving of investment in their own right, and not simply as instruments for employability. This led to an explicit focus on matters such as social skills, citizenship, and intercultural understanding. Second, it introduced regular monitoring of performance and progress: indicators and benchmarks were established to provide a framework for detailed information gathering across EU countries.

The initial proposal was to base monitoring on 29 indicators and five benchmarks agreed in 2003. Annual reports were produced from 2004 onward to set out the evidence on progress and provide guidance on the progress of the Education and Training 2010 Programme. As a result of these early reports, the framework was modified and in 2007 a new framework comprising 16 core indicators was agreed.

The five EU-level benchmarks agreed in 2003 continued to be relevant, not least because of the uneven progress toward them. They are:

- No more than 10% of early school leavers
- Decrease of at least 20% in the percentage of low-achieving pupils in reading literacy
- At least 85% of young people to have completed upper secondary education
- Increase of at least 15% in the number of tertiary graduates in mathematics, science, and technology, with a simultaneous decrease in the gender imbalance
- 12.5% of the adult population to participate in lifelong learning.

The 16 core indicators agreed in 2007 are concerned with the following:

1. Participation in preschool education
2. Special needs education
3. Early school leavers
4. Literacy in reading, mathematics, and science
5. Language skills
6. ICT skills
7. Civic skills
8. Learning to learn skills
9. Upper secondary completion rates of young people
10. Professional development of teachers and trainers
11. Higher education graduates
12. Cross-national mobility of students in higher education
13. Participation of adults in lifelong learning
14. Adult skills
15. Educational attainment of the population
16. Investment in education and training.

The 2008 report (European Commission, 2008b) indicates how challenging these benchmarks are for education and training systems in Europe. The report draws on a rich array of statistical data from EU agencies and beyond

(sources also include IEA – the International Association for the Evaluation of Educational Achievement and OECD – the Organization for Economic Cooperation and Development) to indicate the directions in which European educational systems are moving and where they stand in relation to meeting the EU's Lisbon objectives.

The core message is that, while the provision of education and training in Europe is improving and some aspects match the best in the world, performance across Europe is very uneven and most of the benchmarks developed within the Education and Training 2010 programme will not be met by 2010.

Nine countries (Finland, Denmark, Sweden, the United Kingdom, Ireland, Poland, Slovenia, Norway, and Iceland) exceed the composite objective of the five benchmarks set for 2010 and are progressing well. Other countries, however, fall below one or more benchmarks and are not on track to meet the targets. Of the individual targets, the only one that has been met is that relating to increasing the number of graduates in mathematics, science, and technology (though not in respect of decreasing the gender imbalance): all countries are increasing the number of graduates relative to 2000, and the majority are already close to or above the 2010 target.

Regarding early school leavers, eight countries have achieved the benchmark (of not more than 10%) but the EU as a whole falls below this with 14.8% of early school leavers in 2007. Eleven countries reached the benchmark of 85% upper secondary completion rate, although again the average EU rate falls below this; at 78.1% it has increased little from 2000.

Literacy levels represent the most challenging target area. Only ten countries have hit the target (and three of these are losing momentum), and the EU as a whole is falling back from the target of a 20% reduction in low achievement in literacy. On the measure used, 24.1% of 15-year-olds were deemed to have had low literacy levels in 2006, an increase over the figure of 21.3% in 2000. These figures mask very wide discrepancies across Europe, from fewer than 5% of low performers in reading in Finland to more than 50% in some countries.

Nine countries have reached the benchmark of 12.5% participation in lifelong learning. Despite the high levels of participation in some countries – more than 25% in Sweden, Denmark, and the United Kingdom – the EU average is just below 10%, and the 2010 target is unlikely to be met.

Following consultation with member states and others in 2008, the Commission issued a Communication in 2008 (European Commission, 2008a) reflecting on the achievements to date, outlining urgent priorities in the short term and looking to the long term. The document proposes four strategic challenges for the years to 2020: make lifelong learning and learner mobility a reality; improve the quality and efficiency of provision and outcomes;

promote equity and active citizenship; and enhance innovation and creativity, including entrepreneurship, at all levels of education and training.

Lifelong Learning Programme

The EC's various spending programmes in education and training have been pulled together into a single overarching programme, the Lifelong Learning Programme. This is scheduled to run from 2007 to 2013 and is resourced with a budget of €7 billion. This replaces or subsumes all previous programmes in education, vocational training, and e-learning and aims to support individuals at all stages of life to pursue stimulating learning opportunities across Europe. The Programme has four sub-programmes focusing on the different stage of learning.

Comenius

The Comenius programme is concerned with the first phase of education, from early years and primary education to secondary schools, and is open to staff and parents as well as pupils. It seeks to develop knowledge and understanding among young people and staff of the diversity of European cultures, languages, and values. It promotes partnerships between schools in different countries and facilitates the mobility of pupils and staff. It has particular objectives in relation to language learning, innovative use of ICT and the European dimension of teacher education.

Target: Comenius should involve at least 3 million pupils in joint educational activities over the life of the project.

Erasmus

Erasmus is the EC flagship programme in higher education. Its initial *raison d'être* was to support student mobility, and 1.9 million students – from 90% of European universities – have participated since it started in 1987. In addition to student mobility, it supports staff travel and professional development, facilitates networking, and underpins multilateral projects. Erasmus aspires to be the main driver of the modernization of European higher education and indeed to help create a European higher education area.

Target: Erasmus should reach a total of 3 million individual participants in student mobility actions by 2012.

Leonardo da Vinci

The Leonardo da Vinci programme links policy to practice in the field of vocational education and training. Projects range from those giving individuals the chance to improve their competences, knowledge, and skills through a period abroad, to Europe-wide cooperation between training organizations. The programme enables training organizations to work with European partners to exchange best practice and increase the expertise of their staff, thereby helping to make vocational education more

attractive to young people. By enabling European citizens to acquire new skills, knowledge, and qualifications, the programme also aims to bolster the competitiveness of the European labor market.

Target: Leonardo da Vinci should increase placements in enterprises to 80 000 a year by 2013.

Grundtvig

The Grundtvig programme focuses on the teaching and study needs of those in adult education and alternative education streams, as well as the institutions and organizations delivering these services. In addition to the learners, it also covers the teachers, trainers, education staff, and facilities. These include relevant associations, counseling organizations, information services, policy-making bodies and others involved in lifelong learning and adult education at local, regional, and national levels. There are also actions supporting adult learner mobility such as exchanges and, in the 2007–13 programme, 'European Assistantships,' as well as initiatives to support collaboration between adult education providers.

Target: Grundtvig should support the mobility of 7000 individuals involved in adult education each year by 2013.

Transversal programme

While these four sub-programmes are directed at different stages of education, they have a number of elements in common. A crosscutting or 'transversal' programme targets these common elements in order to ensure that the sub-programmes achieve the best results possible. This has four key activities:

1. *Policy cooperation:* This activity has two strands: study visits; and studies and comparative research. It is open to policy makers, experts and a wide range of education practitioners. Priorities for support are decided on an annual basis. For 2008, priorities for visits include: educational systems and their values; school environments; vocational education and training; adult education; and language teaching and learning. Studies and comparative research are intended to strengthen the evidence base for policy and practice in education and training. Current priorities include: the promotion of excellence in higher education, especially student access and retention; quality in adult learning; weaknesses in early years and compulsory education, particularly in the acquisition of key competences; promoting vocational education and training; and the role of creative activities in the learning process.
2. *Languages:* This activity aims to raise awareness of the importance of linguistic skills, boost access to language learning resources and develop teaching materials. It has two strands that operate across the different stages of education: multilateral projects to develop new language

learning materials, including online courses, instruments for language testing, the promotion of language awareness, and access to language learning resources; and networks to promote languages policies and disseminate good practice. Any language is eligible for funding under this activity, including European regional and minority languages. Other initiatives include publicity campaigns, conferences, studies, and the development of statistical indicators.

3. *ICT*: Effective use of ICT is seen as critical to learning in each of the sub-programmes, and this activity seeks in general to develop innovative educational practices, improve access to lifelong learning, and help develop management systems. It is not concerned with developing the technology itself but rather with the use of ICT tools to enhance learning. At present, priorities include: multilateral projects to encourage innovation in learning and teaching and boost the use of new ICT tools and trends, particularly for groups at risk of exclusion, such as early school leavers, ethnic minorities, and elderly people; and networks to promote greater linking up between learning communities, and foster creativity through the use of ICT.
4. *Dissemination*: All project findings arising from the Lifelong Learning Programme should be made as widely known as possible to potential users. This activity is concerned with boosting dissemination and exploiting initiatives by funding complementary work. The latter could include: improving accessibility of project results; actions to translate project results into policy; using networks to exploit results; developing models and practical tools for sharing and exploiting project results; and supporting think tanks geared to user needs.

Jean Monnet programme

A final strand within the Lifelong Learning Programme is the Jean Monnet programme. Originally launched in 1990, it seeks to stimulate excellence in teaching and research on European integration in higher education institutions throughout the world. The programme is concerned with the construction of the European Community and its institutional, legal, political, economic, and social development. It has projects in 61 countries across five continents and reaches up to 250 000 students a year. The programme supports three distinct activities: university-level projects on European integration, including university chairs, centers of excellence, and research activities; six specific academic institutions pursuing an aim of European interest, such as the College of Europe and the European University Institute; and associations active at the European level (in at least 12 member states) in the field of education and training. Other activities include Jean Monnet conferences and thematic groups focused on topics of contemporary political interest.

Conclusion

The European project in education is an extraordinary one. Given the historical divisions, fierce attachment to national educational systems, and the enormous diversity across Europe, it is remarkable that such a comprehensive set of programmes has secured political and fiscal support. The Lisbon process is still relatively young, however, and many challenges remain to be addressed. Some of these are sketched below in terms of dilemmas that remain to be resolved.

The first tension is the traditional one between education for economic competitiveness and education for personal fulfillment and social benefit. While European rhetoric has long acknowledged the imperatives of democracy and peace, the principal driver of EC action has been the push for economic development. Education, when considered, was viewed in its relation to the labor market. The Lisbon process accords an important role to personal and social goals, and the explicit regard for active citizenship and intercultural understanding bodes well. The main thrust of action, and funding, however, remains strongly on education as preparation for the labor market. This tendency may well increase if, as seems likely, the economic recession of 2008 lasts for some time. If this were to happen and the EU reverted to being mainly an economic and labor market player, it is difficult to see the broader vision of Europe being realized.

A further tension relates to the place of Europe, and European countries, in a global context. The attachment to Europe as a guiding concept is challenged by some countries' orientation toward other parts of the world, for example, Britain toward the USA (and the Commonwealth), Portugal and Spain toward Latin America. (These are the most obvious examples, but there are many others such as the orientation of many countries in north-west Europe toward North America.) There may well be economic and cultural advantages for Europe in the links, say, between Portugal and Brazil, but there is no gainsaying the fact that countries are not alike in their understanding of or attachment to the European ideal. This plays out in schools and educational systems in relation to differences in curriculum, language learning, school and system organization, and core values.

Language brings many of these issues to a head. There is a strong tension between the well-known educational benefits of providing school instruction in the mother tongue and the pragmatic demand for competence in a regional language. (For many, the latter will be English but, depending on the part of Europe, it could be Russian, German, or French.) The EC's principled commitment to linguistic diversity requires it to spend considerable resources on Europe's many languages. (The total cost of translation and interpretation within EU institutions across the 23 official languages was

estimated at €1.1 billion in 2006 – close to 1% of the total EU budget (Europa, 2006). To this must be added the substantial expenditure on language learning within the Lifelong Learning Programme.) This is in sharp contrast with those many commercial enterprises who conduct their business in English regardless of whether they are in Barcelona, Berlin, or Birmingham. Cost apart, Europe's linguistic diversity raises extremely difficult issues relating to national (and sub-national) identity and the extent to which it is dependent on language, cultural participation and exchange, personal mobility, the emergence of technocratic elites who have mastery of a regional language, and so on.

The concept of a European educational space is complex, if not problematic. This is not simply because of the extraordinary diversity residing in European families and schools. The diversity is real, and a challenge, but the bigger difficulty is in developing this concept in sufficient detail for it to be useful *and* securing agreement to it. The many actions of the Lifelong Learning Programme and the structures furnished by the open method of coordination are undoubtedly giving many Europeans a better understanding and appreciation of each other, and helping education and training systems to benefit from each others' good practice. This is some way short of a European educational space, however. It may be a necessary step along the way but there is still a distance to travel.

National University on Educational Planning and Administration, New Delhi*

J B G Tilak, National University of Educational Planning and Administration, New Delhi, India

© 2010 Elsevier Ltd. All rights reserved.

The National University of Educational Planning and Administration (NUEPA), New Delhi, India, is a specialized public institution of higher education that is involved in research, training, consultancy, and teaching in the area of educational policy, planning, and administration, operating at the national and international levels.

The Genesis and the Growth

The National University assumed its present form and name after 45 years of existence, initially as a training institution and later as a research and training institute in the area of educational planning and administration. Its origin dates back to 1962 when it was established, in pursuance of a resolution passed at the Eleventh Session of the General Conference of the United National Educational, Scientific and Cultural Organization (UNESCO) to help the member states in the Asian region. The member states were: Afghanistan, Burma (now known as Myanmar), Ceylon (now known as Sri Lanka), Republic of China, India, Indonesia, Iran, Japan, Khmer Republic (now known as Cambodia), Republic of Korea, Laos, Malaysia, Mongolia, Nepal, Pakistan, the Philippines, Singapore, Thailand, and Republic of Vietnam. It was established with an objective of preparing the key personnel needed for implementation of the Karachi Plan for the provision of compulsory primary education of at least 7 years' duration by 1980. It was established as the Asian Regional Centre for Educational Planners, Administrators and Supervisors by the UNESCO in February 1962 under an agreement signed between the UNESCO and the Government of India. The main functions of the Asian Regional Centre for Educational Planners, Administrators, and Supervisors were to conduct research on problems connected with educational planning, administration, and school supervision, to conduct short-term training programs for educational planners, administrators, and supervisors in Asia, and to offer technical assistance to member states. Besides launching short-term, including 3-month, training programs for educational planners and administrators, one of the important outputs of this organization was a report of long-term educational projections for India, prepared in 1963. With effect from 1 April 1965, the Asian Regional Centre for Educational Planners,

Administrators, and Supervisors was renamed as the Asian Institute of Educational Planning and Administration and continued to be funded primarily by the UNESCO. The institute functioned under the legal and constitutional framework of the Government of India and its director and other staff were appointed by the Government of India in consultation with UNESCO. The Asian Institute provided, *inter alia*, valuable research inputs to the Indian Education Commission, constituted by Government of India 1964. The Commission, chaired by Dr. D.S. Kothari, submitted its voluminous report in 1966 (Education Commission, 1966), which formed the basis for the first National Policy on Education (1968). Several recommendations of the Commission are found to be still relevant for educational development in India.

At the end of the 10-year agreement between the UNESCO and the Government of India, the Asian Institute was taken over by the Government of India and subsequently the National Staff College for Educational Planners and Administrators was established in December 1970. The institute was registered as an autonomous institution in 1970, and was re-registered as National Institute of Educational Planning and Administration (NIEPA) on 31 May 1979. The primary focus of attention of the institute changed in a sense, from Asian region to India, and more importantly from being a staff college more intended for training, to an academic institution with an added emphasis on research. Compared to the earlier days, the research agenda of the organization after it became the institute in 1979, was widened and deepened as well and the institute was begun to be seen almost for the first time as a major research institution. Immediately after it became a national institute, it launched a series of studies on surveys in educational administration in various states in India, and a large number of research studies on various other issues. Although it had been an important objective to help the Government of India, as the National Staff College or the National Institute, and it was mandated, besides conducting and promoting research, to provide services to the union (central) Government of India and state governments in India and other government bodies, agencies, institutions, and personnel engaged in educational planning and administration, it continued to meet training, research, and consultancy needs of other countries and international organizations as well.

In recognition of the important work being done by the organization in the area of educational planning and

* The views expressed here are personal and are not necessarily shared by the organization with which the author is associated.

administration, the institute was conferred the status of a university in 2006 – an institution deemed to be university under Section 3 of the University Grants Commission Act, 1956. Thus, it traversed a long distance over a period of four-and-a-half decades from a UNESCO regional center to a national university and grew from strength to strength. Thus, it is a young university, although an old research and training institution.

Nature and Activities

Some of the special characteristics of this institution are worth noting. First, with an exclusive focus on educational policy, planning, and administration, the institute is widely recognized as a unique institution of special significance. There is no comparable institution of the kind in India so exclusively focused in an area and, also at the same time, performing four different functions, namely, research, training, consultancy, and teaching in addition to dissemination of information; and very few exist in other neighboring countries of the Asian region. Even as a university, it is visualized as a single faculty research university with students enrolled in doctoral (and predoctoral) programs only. Second, the institute considers education as a holistic system and it recognizes that all levels of education – primary, secondary, and higher – are important and interlinked branches of the educational edifice. Accordingly, the institute's activities focus on all levels as whole as well as each level separately. Third, it also considers educational planning as an integral part of overall development planning. This is true from the very beginning. The Asian Institute, for example, emphasized the need to study educational planning as an integral part of overall planning and to visualize educational development with an integrated approach. Fourth, the institute recognizes the importance of multilevel planning in education, and accordingly focuses on planning at central and decentralized levels – global, regional, national, and subnational – state (provincial), and below state levels. The institute's national diploma program of 6 months duration, introduced in 1982 has helped a lot in capacity building at local (district) levels and helped in strengthening mechanisms of decentralized planning in education. For planning to be effective, the flow of information has to be in both directions – from the lowest unit to the highest (central) level, and vice versa. Fifth, it also notes that educational planning means long-term planning. Several activities of the institute with respect to training and research focused on long-term planning – developing methodologies for long-term planning and research on long-term planning in education. Sixth, although it is specialized in the area of educational planning and development, it views educational planning as an interdisciplinary subject both for research and planning. Accordingly, its faculty are drawn from various social sciences – economics,

sociology, anthropology, psychology, education, politics, law, history, management, etc., besides statistics, mathematics, and computer sciences – but deeply interested in issues related to educational policy, planning, and administration. The recently introduced Doctoral program is also multidisciplinary and students are selected from various disciplines primarily in social sciences. Finally, although it is mostly funded by the Government of India, it is registered as an autonomous organization.

The present functions of the institute also reflect the special nature of the organization. Research, training, better known as capacity building, consultancy, essentially to the governments, and teaching are the four important functions of the organization. Research is largely, but not exclusively, policy oriented and empirical in nature. The institute's capacity-building activities involve training the educational policymakers, planners, and administrators at all levels of education – ranging from school-level principals or headteachers, to the top-level civil servants in the Union government, majority being administrators and planners at state (provincial) level; coverage ranging from primary school education managers to university vice-chancellors, registrars, etc. Although most of the trainees are from the state sector, private-sector people are not necessarily excluded. Training programs also meet the needs of many developing countries. The organization provides the much-needed technical and professional assistance to the government at the central and state levels and other public bodies in India, such as the University Grants Commission, All-India Council for Technical Education, Planning Commission, Finance Commission, State Councils of Higher Education, and the Central Advisory Board of Education, by providing research and professional inputs into the formulation of educational policies (e.g., National Policies on Education 1968, and 1986, 1992), plans (e.g., 5-year plans formulated by the Planning Commission), and other development programs, projects, and schemes (e.g., Operation Blackboard and the scheme of mid-day meals). The institute's contributions did change the nature and quality of policymaking and planning processes (e.g., District Primary Education Project, and Sarva Shiksha Abhiyan). The institute also helps in the development and implementation of plans and programs of the government and in setting up other institutions in educational planning and management (e.g., State Institutes of Educational Management and Training). Discussions on policy issues at the institute contribute to research, training, and consultancy. In a sense, the institute serves as an important, rather the only, think tank and also more than a think tank on educational issues in the country. The institute's faculty also render consultancy services to international organizations in the area of educational policy, planning, and development. Presently as a research university, it has an additional program of doctoral research in the area of educational policy, planning, and administration. This fourth important activity recently added, involves

teaching and research, which aims at producing certified professional educational planners and administrators. Another important function that the institute took up was collection, processing, and dissemination of huge amount of data on schools in India and developing an educational management information system. All these functions are visualized as closely related and to be contributing to strengthening of each other. Thus, analysis of policy issues and development, application and dissemination of planning methodologies, and management techniques form the main content of the institute's activities. The very names of the academic departments also indicate the area of focus of the university. The departments, some of which are thematic, some level specific, and some geographically specific, are: educational policy, educational planning, educational finance, educational administration, school and nonformal education, higher education, comparative education and international cooperation, inclusive education, foundations of education, and educational management information system, the later four of which were added in the recent years. By very design, the departments are so planned to be overlapping in their work.

In its activities, the NUEPA is often compared with the International Institute for Educational Planning (IIEP) set by UNESCO in 1963, which also has exactly the same four functions – research, training, consultancy, and teaching, teaching being the most recent addition, as in the case of NUEPA. However, the IIEP's activities are mainly at the international level, while the activities at NUEPA are both national and international in coverage, although the national content forms a major part. NUEPA's International Diploma in Educational Planning and Administration of 6 months duration is often compared with IIEP's Advanced Training Programme of 8 months duration. NUEPA and IIEP do not however, compete, but actually have close collaboration with regard to quite a few of their activities; they jointly conduct training programs and research studies and bring out joint publications. The collaboration has been mutually beneficial. From its inception, the institute has an active international collaboration and its activities spread beyond the national borders. Presently, it has international collaboration for research and training with a large number of universities (e.g., Hiroshima, Sussex, and Stanford) and institutions of higher education (e.g., Korean Educational Development Institute, Shanghai Institute of Human Resource Development, and Australian Council for Educational Research, to name a few), and also international development agencies, such as the World Bank, the Department For International Development (DfID), the United Nations Children's Fund (UNICEF), the United Nations Educational, Scientific and Cultural Organization (UNESCO), Danish International Development Agency (DANIDA), and European Union (EU). Collaboration with some of these institutions has been under the

framework of a network called Asian Network of Training and Research Institutions in Educational Planning (ANTRIEP), in the formation of which, the institute along with IIEP played an important role, and the focal point of which is housed at NUEPA.

In short, as an apex-level organization, the institute serves the society with a strong research base, as a major think tank, as a training institution focusing on building capacities of manpower at different levels, helping in skill formation and building of human capital among the educational planners and administrators in India and abroad, and as a consulting and advisory body, contributing to sound policymaking and efficient planning at international, national, and subnational levels in the area of education.

Governance

The University is governed by a council, which is the highest-level governing body of the organization. This is presently headed by the Minister for Human Resource Development in the Government of India. The University has also a Chancellor. The Board of Management, headed by the vice-chancellor, is the main executive body that guides and supervises the functioning of the organization. Other management and other committees include the Finance Committee, Academic Council, Board of Studies, etc. The annual report of the institute is presented in the national Parliament every year.

Funding

Except for the first decade of its existence, when it, as the Asian Regional Centre or the Asian Institute when it was completely funded by the UNESCO, it as a National Staff College or National Institute and now as a National University is funded primarily by the Government of India. The University, however, generates a small amount of resources through student/trainee fees and miscellaneous user charges, and also through projects from international organizations.

Regarding the fee for trainee, it may, however, be added that most of the training programs are offered free. No fees are charged. The participants, in most cases, however have to meet their travel and subsistence costs, and in some special needy cases the travel and subsistence costs are also met by the institute. Since the institute's core budget comes from public sources, and since the trainees are mostly public servants, such an arrangement is found to be somewhat socially efficient. Travel and subsistence costs of trainees of the 6-month national diploma program are also met by the institute. In addition, a stipend/fellowship is also given to the trainees. A small token fee is charged for programs specially meant for private sector in India. A major exception to the free

training is the international diploma program, for which a fee is charged. The fees, however, do not cover the total costs of the program; the program is also partly subsidized by the University.

Although a small token fee is charged from the students enrolled in the University's doctoral program, every full-time student is also provided with a generous fellowship. This is to attract talented graduates from universities to pursue serious research in educational policy, planning, and administration.

Challenges and Future Perspective

From a small training and research center, over the last four-and-a-half decades, the institute has undergone significant transformation and has grown into a national university. The young university faces new challenges and tasks, with the rapidly changing socioeconomic, political, and educational milieu. Although the institute continues to remain focused on educational policy, planning, and administration, it has diversified in its areas of interest and extended to new areas. For example, for a long time it was felt that traditional disciplines of study which were offered in conventional universities need not be the focus of the institute. Hence, areas such as foundations in education and comparative education were not considered relevant for the institute for a long time. However, given that inadequate attention has been given to these areas in the other universities, the National University has taken them on as additional areas of concern for itself.

Second, the institute has also diversified its activities. Although its core activities revolve around research, training, consultancy, and teaching, several other activities also gradually entered into the work program of the institute, which include funding and management of research, collection and dissemination of data on a large scale, helping the government in executing policies and implementing programs/schemes, serving as a clearing house of ideas and information, conducting extension activities, organizing briefing sessions, in addition to conferences, workshops, meetings, and seminars, and also serving even as an advocacy group.

Given the small size of the faculty, and accordingly in the limited number of areas of specialization, spreading of the interests thinly into various areas of operation may lead to different kinds of problems. The principle of comparative advantage suggests that although one can do many activities better than many others, it would be socially efficient if one focuses on the areas in which he or she or the institution has a more relative advantage. NUEPA may have been at fault, to some extent, in its approach with respect to this principle.

Third, research is a very important function of the institute. For obvious reasons, the whole research is policy

centric. Although it can be argued that every research has a policy use in the long term, the term policy here is narrowly interpreted so as to refer to immediate, current, or contemporary policy. Evaluation exercises and also developmental work on implementing government policies and programs all tend to be treated as policy research. Any research which is not of direct relevance to the present context is regarded as other or academic research. However useful it could be in a long-term perspective, such research might not get a place in policy-research organizations. Nonetheless, there are discussions about according due priority to academic research as well, which is not only of long-term significance, but also long term in duration of research, which can also be termed as delayed returns research in contrast to immediate/instant returns research (Beteille, 2007).

Given (1) the role of the government in funding and in the governance of the institute on the one hand, and (2) the predominance of activities that support and/or are related to the government programs – policy research and training the government personnel, NUEPA runs the risk of being branded as a government department, by the government, by the organization, and by the society at large, which may turn out to be detrimental in the long run for developing it as a strong independent academic organization. There are, therefore, calls for making strong efforts to develop, through its various activities, critical thinking on various issues, going beyond and even against the governmental thinking.

An important issue that NUEPA faces is shortage of faculty. Given the specialized nature of faculty and its areas of work, one does not find manpower in abundance. The shortage of manpower has been severely felt by the university as whole as well as by certain specific areas. There is a demonstrated necessity of securing a critical mass in the development of a specialized branch of study. The interdisciplinary nature also makes it a more complicated issue. The shortage of manpower also makes it difficult not only to fully develop the institute, but also to produce replicas or its centers in a big country like India, the need for which is being felt.

Over the years, the institute emerged as a strong, vibrant, and unique institution of its own kind not only at the national level, but also in the Asian region and the developing world, and even at the international level at large in research and training in educational planning, administration, and development. Both as NIEPA and NUEPA, the institute is different from typical research/training institutions and conventional universities. The contribution of NUEPA, including in its earlier forms, has been remarkable, although not vast in quantum. Its contribution is confined to research, capacity building, and lending support to the government in the area of educational policy, planning, and administration, but its contributions are unique. Its training programs have vastly

improved the quality of planning and administration in India and in quite a few other countries. The research and professional contributions have helped in the improvement in the information base, in informed policymaking, and created knowledgeable discourses on policy issues. Given the changing and challenging circumstances NUEPA faces daunting challenges in the near future, to make the institute's academic programs qualitatively better, sustainable, and more effective, and to produce a significant multiplier effect on the educational research environment.

On School Management – International Council on School Effectiveness and Improvement, Commonwealth Council on Educational Administration and Management

A Walker, Hong Kong Institute of Education, Hong Kong SAR, People's Republic of China

T Townsend, The University of Glasgow, Glasgow, UK

© 2010 Elsevier Ltd. All rights reserved.

The purpose of this article is to outline the development and activity of two successful international professional networks focusing on educational management and organizational change. Between them the Commonwealth Council for Educational Administration and Management (CCEA/M; the CCEA was renamed as the Commonwealth Council of Educational Administration and Management (CCEAM) in 1994 (Sapre, 2000). For a description and history of the Commonwealth foundation see their website at: <http://www.commonwealthfoundation.com/>) and the International Congress for School Effectiveness and Improvement (ICSEI), have successfully stimulated meaningful cross-national and cross-cultural dialog between scholars and practitioners since the early 1970s. As such, both organizations have worked successfully to fuse closer links among school leaders and others attempting to improve education across the globe.

The article has three sections. The first section describes the foundation and ongoing activity of the CCEA/M; the second section does the same for the ICSEI. Knowledge of why these organizations were formed, who was involved, and the activities they engaged in is necessary to understand why they have become successful networks. A brief recount of their histories holds some useful messages for the establishment and sustenance of international networks even though these largely pre-date the electronic era. The third section, therefore, identifies a number of key messages that emerge from the histories.

The Commonwealth Council for Educational Administration (and Management)

In 1955, the infant University Council of Educational Administration (UCEA) was established at Teachers College, Columbia University with a grant from the W. K Kellogg Foundation (see Culbertson (1995) for a history of UCEA). The US-based council's purpose was to improve the professional preparation of what were then labeled 'administrative personnel in education' (Culbertson, 1976). It also sought to build and broadly disseminate empirical findings, emerging concepts, and worthwhile teaching materials to activate their agenda.

In 1966, as part of its strategy to collaboratively build and share knowledge, UCEA brought together key educators interested in educational administration from Australia, Canada, Great Britain, and the USA to discuss research and practice in the area. This ground breaking gathering was funded by the Kellogg Foundation and was called the International Inter-Visitation Program (IIP). At the conclusion of the foundation, IIP delegates expressed a desire to continue their work together and meet regularly in order to advance international exchange and development. Part of the conversation around this theme focused on the benefits of closer formal links with and between British Commonwealth countries.

Conversation in this direction ensued over the next three or so years and reached fruition at the 1969 UCEA conference in Atlantic City. Partly facilitated by Jack Culbertson, then president of UCEA, an agreement was reached to hold a second IIP in 1970, this time in Australia. Accord was also made "to attempt to establish a Commonwealth Council for Educational Administration (CCEA) as soon as possible" (Walker, 1972: 20).

The second IIP was jointly planned by the UCEA and the University of New England in Australia. It was generously funded by the Commonwealth Foundation. The key role of the UCEA in the early foundation of the CCEA prompted Walker (1972) to call the fledgling organization "UCEA's bright son (*sic*) at Morning." However, despite the close linkage between the two bodies, CCEA diverged in some important ways from its US-based backer. As Culbertson (1995) noted, the understanding was "that the projected new organization should *not* be an international UCEA. Rather, it (would) be defined by its differences – not its similarities to UCEA" (p. 185, emphasis in original).

As planned, the CCEA was officially formed during the 1970 IIP. Fourteen developed and developing Commonwealth countries attended the conference (Culbertson, 1995). The infant CCEA was established as a nongovernmental organization (NGO) within the Commonwealth. As noted, CCEA differed fundamentally from UCEA in that it opened membership to non university-based educators – to everyone and anyone interested in the practice of educational administration (UCEA enrolled university-based units only, not individual members). The first CCEA newsletter (CCEA, 1971) stated this clearly:

(Membership is) open to all those interested in the administration of education. This prescription enables educationists from all levels – pre school to tertiary – to participate in Council activities. Similarly, it permits membership for practising administrators, for scholars and professors involved in the study and teaching of educational administration, for teachers aspiring to administrative status, for politicians and civil servants” (p. 1).

The purposes of the fledgling council further reinforced the inclusive nature of its establishment.

1. To foster close links between those concerned with the improvement of educational administration in Commonwealth countries.
2. To foster a high standard in the practice and study of administration at all levels.
3. To hold Commonwealth-wide and regional conferences on various aspects of educational administration.
4. To facilitate the dissemination of knowledge about research and practice in educational administration.
5. To foster high standards in the preparation of educational administrators.
6. To facilitate the exchange between member countries of teachers, students, and practitioners of educational administration
7. The establishment in Commonwealth countries of national associations of those concerned with the improvement of educational administration. (Thomas, 1971: 129)

The aims of the organization have changed somewhat in terms of nomenclature and the number of ‘points’, depending on the source, but they have held steadfastly to the founding values. Although predominantly comprising scholars from the ‘old Commonwealth’, the composition of the first CCEA Board highlighted its intention to become a true international network. Board members came from Australia (3), England, Canada, The Gambia, New Zealand, and East Pakistan (now Bangladesh). The background of the presidents over the years shows a similar, though stronger propensity toward the traditional Commonwealth powers. In chronological order, the presidents were: William Walker, Australia (1970–82), Robin Farquhar, Canada (1982–86), Meredydd Hughes, UK (1986–90), Bill Mulford, Australia (1990–94), Angela Thody, UK (1994–2000), Jo House, New Zealand (2000–04), and Petros Pashiardis, Cyprus (2004–08).

The formation of the CCEA as an international network was unusual for its time, at least within the Commonwealth. The normal track for international network formation through the Commonwealth foundation was for diffuse national bodies to be brought together into a multinational network. In contrast, CCEA followed what Harris (1976) called an ‘upside down’ approach in that it actually began as a Commonwealth-wide structure and then proceeded to foster the establishment of national

and/or intra-national professional bodies dedicated to educational administration – this became one of the major activities of the CCEA. As Culbertson recalled, “During the decade of the 1970s, it (CCEA) nurtured the founding of numerous national associations” (p. 186).

The CCEA’s effort to support the creation of professional bodies dedicated to educational administration was remarkably successful. For example, in 1973 it was involved in the formation of the Australian Council of Educational Administration (ACEA – later to become the Australian Council for Educational Leadership) and associated state affiliates. By 1976, CCEA had played a role in supporting similar professional associations in Cyprus, Malaysia, New Zealand, Singapore, Sri Lanka, Trinidad and Tobago, and the UK. In early 2009, it had 23 affiliated bodies, including seven in Africa, five in Australasia, three each in the Americas and Europe, and five (regionally based) in India.

Since its establishment, the CCEA has instituted strategies intended to increase and tighten links between Commonwealth societies and national and more provincial associations. The Council’s main activities include promoting dialog through face-to-face contact, including different forms of conferences, publications, and a range of other connective activities.

The spark behind and formation of the CCEA transpired during the first IIP. This connection was maintained even while the program evolved through the 1980s, 1990s, and 2000s. Involvement in various IIPs put CCEA members in touch with cutting-edge ideas and debates in the field, including the landmark meeting in Bristol in 1974. One which Jacobson (in Lee, 2008) described as “arguably the most notable” in that it “triggered the famous T.B. Greenfield–Dan Griffiths debate” (p. 11). Discussion and involvement with IIP positioned CCEA members at the heart of issues, many of which shaped the meaning and definition of the field (Gunter, 2001; Sapre, 2000; Lee, 2008).

The organization, however, did more than co-sponsor the four-yearly IIP; it also played a key role in encouraging, supporting, and promoting numerous regional conferences and workshops throughout the Commonwealth. In its early years, these included conferences in Fiji in 1973, Penang in 1995, Dacca in 1977, and Cyprus 1980 (Harris, 1976; Hughes and Bush, 1991). The function of these conferences was to focus on areas of concern relevant specifically to educational leaders across the Commonwealth. Perhaps just as importantly, the CCEA/M became heavily involved in people and idea exchange through loosely connected sets of workshops. Commenting on the CCEA/M, Culbertson (2005) captured the influence of such activities.

Going beyond idea exchange, CCEA’s leaders developed national associations and new training programs which helped advance educational management in

many countries. Seeing much potential in CCEA's initiatives, leaders in non Commonwealth countries adopted most of CCEA's innovations and applied them for their own practices. Culbertson (p. 192)

The formation and operation of the CCEA/M also spawned a number of enduring formal communication mechanisms, predominantly through publications. These emerged both within the states comprising the organization and directly from the CCEA itself. The latter includes the *CCEA Newsletter* (currently called *Managing Education Matters*) and *International Studies in Educational Administration*, now in its 36th year of operation and still one of the few truly international journals in the field.

The CCEA/M has also played an influential connective role beyond the Commonwealth, forming strong working relationships with non Commonwealth developing nations, a range of nongovernment organisations (NGOs), the European Forum for Educational Administration (EFEA), UCEA, the European School Heads Association (ESHA), other Commonwealth-based groups and international bodies such as UNESCO (Pashiardis, 2008; Weeks, 1991).

Despite the tremendous effort committed to formal knowledge networks, perhaps CCEA/M's greatest connective contribution cannot be quantified through formal occasions, affiliations, or outputs, but rather through the personal and personal/professional relationships formed between educators across the globe keenly interested in further understanding and improving the practice of educational administration. This phenomenon, which endures still, was neatly captured by the one-time executive director of CCEA/M, Harry Harris:

The role of CCEA is not to be the focal point of all activity. Rather its function is that of diffusing, encouraging, multiplying through collective effort. . . . We need to encourage: improvisation, imagination, divergent ways of thinking, how to be positive, to say 'how can it be done?' to strengthen leadership qualities in everyone. (Harris, (1980: 273), emphasis in original, cited in Weeks (1991))

As the CCEA/M rapidly approaches its 40th anniversary, it continues to function as a conduit for international networking across the field of educational administration. Although the Council has changed somewhat in terms of shape and activity, the observations made by Walker (1991) continue to broadly define the Council:

- CCEA was never anglocentric, with its headquarters located 12 000 miles from London, the base of most other professional associations, and with the spread of linkages from Australasia into the Pacific and South-east Asia matched by encouragement from the United Kingdom of initiatives in Africa, and links from Canada into the Caribbean.
- There was little order or rationality in the Council's growth, a good reason being that expansion usually

depended, in days prior to teleconferencing and the Internet, on the enthusiasm of a committed individual and his or her leadership and *mana* or prestige, a less acceptable reason being the great variety in teachers' conditions and salaries across countries so that a universal subscription rate was quite impracticable.

- Leadership of successive presidents was drawn from across the Commonwealth and the regional representation on the Board and the selection of vice presidents emphasized the sense of a Commonwealth 'Education family' (pp. 9–10).

The formative values which fashioned CCEA/M's character appear as relevant today as in its early developmental years. Evidence of this can be found in the outgoing president's 2008 annual report (Pashiardis, 2008). In the report, Pashiardis welcomed six new affiliates (Cameroon, Kenya, the Seychelles, and three from India – Assam, Gujarat, and Uttar Pradesh), reported funding for conferences in Kenya and South Africa and for visiting fellows in three African countries, noted the continued publication of ISEA and MEM and announced new (or renewed) partnerships with EFEA, UCEA, and ESHA.

The International Congress for School Effectiveness and Improvement

In January 1988, a group of educators met in London for the first International Congress for Effective Schools (ICES). According to Judith Chapman's report in the first issue of the *Australian Network News* (Chapman, 1989: 1):

The initiative for ICES was taken by Dale Mann, former Chairperson (1976–85) of the Department of Educational Administration, Teachers' College, Columbia University, who served as the first Chairperson (1984–85) for the National Council for Effective Schools in the United States ...[who] felt it timely to bring policy-makers, researchers and planners together.

By mid-1987, eight countries, the USA, England, Wales, Scotland, Australia, Sweden, Canada, and South Africa had shown sufficient interest for an international congress to be conducted in late 1987 or early 1988.

The planning group at Columbia was interested in a Congress in two parts: (1) a conference on school effectiveness open to all with an interest and with papers presented in the normal fashion for such events, and (2) a decision-making meeting at which the organisation would be formally constituted and decisions made. (Chapman, 1989: 1)

In January 1988, the first Congress was held at the University of London. Policy makers, practitioners and scholars from 14 countries, including the initial eight, together with Germany, Hungary, Ireland, Israel, the

Netherlands, and Norway, attended the Congress and adopted the name 'International Congress for School Effectiveness.' However, it was clear to those involved that this did not really capture the current mood for change in education. The effective schools research had the underlying purpose of developing practical means for school improvement, but there were some important distinctions and relationships between school effectiveness and school improvement that needed to be identified and highlighted. As Smink (1991) pointed out:

School effectiveness is concerned with results. Researchers try to describe certain variables for school success in measurable terms. On the other hand, school improvement places the accent on the process; here one finds a broad description of all the variables that play a role in a school improvement project. Both approaches need the other to successfully modernize the system. (p. 3)

So the organization became the International Congress for School Effectiveness and Improvement when it was formally constituted at the third congress in Israel in 1990. The Congress's constitution states that:

- The purpose of ICSEI is to enhance the quality and equity of education for all students in elementary (primary) and secondary schools.
- It is intended that this purpose be achieved through the acquisition and dissemination of information in a co-ordinated effort among policy makers, practitioners and scholars, using the Annual Conference, the Congress's related journals, the website and any other appropriate methods.
- It is acknowledged that efforts to achieve this purpose are made in diverse settings by many individuals and organisations employing a variety of perspectives. These efforts have been variously described, reflecting among other things a concern for school effectiveness, school improvement, excellence in education, quality in education, equity in education, school differences and school effects. (www.icsei.net)

In the early years, the organization was overseen by country representatives who made recommendations to the Annual General Meeting held during the congress. Congress program chairs covered the administration of the organization, supported by the publisher Swets & Zeitlinger. By the early 1990s, a constitution had been developed and it was agreed that ICSEI would be better served by having a formal committee, a president, and a formal structure. Hedley Beare from Australia served as the first ICSEI president (1994–95) followed by Larry Sackney, Canada (1995–97); Janet Chrispeels, USA (1997–99); Tony Townsend, Australia (1999–2001); Louise Stoll, England (2001–05); Leif Moos, Denmark (2005–2007); John MacBeath, Scotland (2007–2009), and currently Tony Mackay, Australia (2009–11). To ensure

international perspectives are always considered, the ICSEI Board members must come from different countries, with no single country having more than one general member (except for the elected office bearers). Key decisions made by the Board still need to be accepted by the Annual General Meeting, ensuring that all members have the opportunity to contribute. Membership of ICSEI is fee based, but there are different fees for different categories of membership, with people from UNESCO-designated low-income or medium-income countries either paying a substantially reduced membership fee, or no fee at all.

The two dominant driving forces-cum-communicative mechanisms for ICSEI have been the Annual Congress and the journal *School Effectiveness and School Improvement*. These two vehicles were seen as the prime means of bringing people together and the key to ICSEI's success as an international network.

In January 2009, in Vancouver, ICSEI celebrated its 22nd year of bringing over 500 people together from more than 50 nations. Conferences have been held in many parts of the world, in Rotterdam, the Netherlands (1989); Jerusalem, Israel (1990); Cardiff, Wales (1991); Victoria, Canada (1992); Norrköping, Sweden (1993); Melbourne, Australia (1994); Leeuwarden, the Netherlands (1995); Minsk, Belarus (1996); Memphis, USA (1997); Manchester, UK (1998); San Antonio, USA (1999); Hong Kong (2000); Toronto, Canada (2001); Copenhagen, Denmark (2002); Sydney, Australia (2003); Rotterdam, the Netherlands (2004); Barcelona, Spain (2005); Fort Lauderdale, USA (2006); Portoroz, Slovenia (2007); and Auckland, New Zealand (2008).

Each year, key educational researchers, practitioners, and policy makers have been brought together to consider ways of making schools effective for all students who enter them. All of the key thinkers in the field of school effectiveness or school improvement have been keynote speakers for these congresses; these have been attended by researchers, policy makers, and practitioners from more than a hundred countries.

Substantial progress has been made from the early 1980s, when the five-factor model of school effectiveness (leadership, instructional focus, climate conducive to learning, high expectations, and consistent measurement of pupil achievement; Edmonds (1979)) was paramount, to a time in the 1990s when it was widely acknowledged that the effectiveness of any school must be considered within the context in which that school operates rather than simply on the various 'ingredients' that help to make up the school's operations.

Despite its strong proactive stance on the importance of ongoing research into school effectiveness and school improvement, ICSEI and other organizations recognized that this was not universally accepted by education researchers (e.g., Slee *et al.*, 1998; Thrupp, 1999). To address this, ICSEI was invited by the American Education

Research Association (AERA) to present a symposium on international developments in the field, which brought the proponents of school effectiveness research face to face with the critics – the challenge was readily accepted.

On Wednesday 26 April 2000, the session entitled ‘School effectiveness comes of age: 21 years after Edmonds and Rutter; has school effectiveness had a positive or negative effect on school reform?’ was offered at the AERA conference in New Orleans. Four papers were offered and a lively debate ensued. The four papers (Slee and Weiner, 2001; Reynolds and Teddlie, 2001; Thrupp, 2001; Teddlie and Reynolds, 2001) proved to be so insightful and popular that they were published in the *Journal of School Effectiveness and School Improvement* (Vol. 12, No. 1, March 2001) as a means of expanding the debate. This became a landmark issue because of the broader critical position, previously not heard, as well as the more traditional perspective was brought to the field – this soon became another characteristic of the Congress and moved their activities beyond the annual conference and the journal.

In order to encourage ongoing debate both between congresses and for people unable to access the journal (or journals, now that ICSEI has entered partnerships with leadership journals around the world to enable members to access the literature they need), ICSEI has now established a series of networks. These include the *Educational Leadership Network*, *The 3P Network* (policymakers, politicians, and practitioners), and the *MORE Network* (methodology of research in effectiveness), where members can access information, exchange ideas, and blog with each other.

Another initiative emerging from ICSEI was the regular exchange of international research through country reports. This strategy was designed to stimulate research and debate across national cultural boundaries. Country reports became a major part of ICSEI’s development and comprised a significant contribution to the Congress (a selection of the reports from this first meeting was published in Reynolds *et al.* (1989)). Creemers and Osinga (1995: 1) explain that the major studies (Brookover *et al.*, 1979; Mortimore *et al.*, 1988; Rutter *et al.*, 1979) were well known but almost nobody had a full picture of the studies and the improvement projects going on in the field in all the countries participating in this first meeting.

The second meeting in Rotterdam in 1989 started the tradition of country reports. Creemers *et al.* (1989) demonstrated clearly that the search for more effective schools no longer remained a North American and European pursuit. However, it also became clear that the time required to translate research into practice meant that it was preferable to produce ICSEI country reports every few years rather than each year. As it stood, there was much new, more general research, and activity and this deemed to take precedence in ICSEI’s formative years.

Consequently, the next major attempt to collate a series of country reports was made for the Leeuwarden

conference in 1995, where nine countries from Europe, North America, Asia, the Middle East, and the Pacific region joined to become part of the ICSEI reporting network. The major aim of the conference was to establish links between school effectiveness and school improvement. Scholars were invited to comment on international developments. Their comments provided a context within which international development in school effectiveness and school improvement, in the areas of research, policy, and practice, could be judged (some of the country reports were subsequently published in *School Effectiveness and School Improvement*, vol. 7, no. 2, 1996).

At the 1998 Manchester conference, the ICSEI country reports were reactivated, but with the special brief of trying to increase both the number and the diversity of the countries included. The purpose here was to encourage educators from a greater range of countries to consider development falling within the purview of school effectiveness and improvement, while maintaining contact with countries already involved. The result was a publication by Townsend *et al.* (1999), which contained a total of 20 country reports, including those of some nations not represented previously; these included Scandinavian, Pacific, Asian, African, and South American countries.

This publication helped ICSEI to provide accessibility to and understanding of school effectiveness research and improvement policies and practices to developing as well as developed societies. Although this was not complete, it did lay a foundation which allowed the Congress and individual countries to chart the progress of school effectiveness research within and outside their contexts. Through this endeavor, ICSEI publicly acknowledged that developing countries faced issues that were often very different from those in more established economies. For example, some countries were forced to make judgments about the meaning of effectiveness even when educative opportunities could not be provided for all students. Others were trying to interpret effectiveness while struggling to rebuild after suffering under oppressive regimes.

The *International Handbook of School Effectiveness Research* (Teddlie and Reynolds, 2000) and *Improving Schools and Educational Systems: International Perspectives* (Harris and Chrispeels, 2006) provided further evidence of the interest in, and developing understanding of, the international perspective of school effectiveness and school improvement, a tradition continued in the two-volume set entitled *The International Handbook of School Effectiveness and School Improvement* (Townsend, 2007). The handbook contained over 50 chapters from around the world and considered both the history and future of research into these two important fields.

In its short history, the ICSEI has provided the research, the opportunity for interaction, and the leadership that has taken the object of its concern to the forefront of political

and educational thinkers. It has been influential, sometimes more than it perhaps should have been, in changing the face of education in many parts of the world.

International Networks

A number of 'rough' commonalities can be drawn from the histories of the CCEA/M and ICSEI. These patterns emerge from the histories of the two successful international networks built around a dedication to education management and school change. The patterns, however, are based on observations from the two bodies only and may not apply to other organizations or networks. Other tentative conclusions may also be drawn – the list below is not intended to be comprehensive.

- International networks begin when a small collection of like-minded energetic people purposefully gather around a well-defined purpose. This purpose can be a variant of an existing if differently shaped formalized network and/or from a 'seed' concept linked to new areas of interest and research.
- To take root, successful international networks require funding, vision, energy, and concerted political action. These resources and activities come from already formalized structures, different-leveled institutional (established) support, personal energy and belief structures, and purpose-driven collective beliefs that are fed, rather than restricted, by national, ethnic, or cultural traditions.
- When growing, intra- and inter-network energy and values feed off each other to produce personal and collective commitment and enthusiasm. This also drives the acquisition of the physical resources needed for initial sustenance.
- Successful international networks are inevitably 'hooked' to other formal and informal networks. They do not appear to work in isolation but rather cross-fertilize within and across boundaries. As such, at least in their formative years, they appear more complementary than competitive.
- To remain effective (and relevant), networks not only accept evolution but recognize and work within it to change form and adjust activity – but within a defined purpose only. In other words, the skills needed to spark and found a network must be applied throughout the network's life span to keep it useful and relevant – without this, it may cease to exist.
- Successful international networks must explicitly and implicitly embrace diversity and difference. (This is a complex issue. As recounted in the histories, both networks sought to engage diversity, which they appeared to do well. However, their top leadership was drawn almost exclusively from 'developed,' normally English-speaking countries. The fact that this appeared to work

may be related to resource availability and the location of more established institutional and societal structures in these countries.) In fact, without this, international networks cannot claim relevance.

- International networks organize regular and 'movable' high-profile events to maintain their usefulness. These (conferences) seem to be important collective devices for the core network as they act as gathering points for affiliation, sharing, debate, and coherence.
- International networks produce regular formal outputs in their area(s) of focus in order to maintain linkage. Outputs take the form of written publications, usually reporting empirical work, scholarly commentary, emerging knowledge and recent network activities.
- International networks ultimately survive and flourish on the personal and personal–professional relationships forged between members – these loosely attached relationships spread to sustain the networks over time.
- To become truly international, organizations need to recognize and identify strategies to support colleagues from countries whose resources would otherwise prevent them from being actively involved.

This article described the foundation and ongoing activity of the CCEA/M and ICSEI. It also attempted to identify some key messages that emerged from these histories. The assumption was that knowledge of why these networks were formed, who was involved, and the activities they engaged in is necessary if we are to further understand why they have become successful.

UNESCO's International Institute for Educational Planning

S J Hite, Brigham Young University, Provo, UT, USA

M Bray, International Institute for Educational Planning, Paris, France

© 2010 Elsevier Ltd. All rights reserved.

Introduction

UNESCO's International Institute for Educational Planning (IIEP), which was founded in 1963, is headquartered in Paris, France. The Institute also has an office in Buenos Aires, Argentina, which was opened in 1998. The Paris office mainly operates in English and French, and has a global focus, while the Buenos Aires office mainly operates in Spanish and chiefly focuses on Latin America.

In its 2008–13 medium-term plan, IIEP indicates that it “is mindful that it is a small organization with a huge mandate” (IIEP, 2007: 5). While the actual or relative size of IIEP is open to interpretation, the extent of its mandate in the core functions of training, research, and technical assistance is indeed huge. Conceived and established during a time of significant geopolitical change, IIEP has been both a mainstay and an innovator in the field of educational planning. Geopolitical contexts and trends have played a significant role in defining the need for IIEP's activities.

Contextual Precedents: Global Expansion, Expectations, and Imperatives

At the first session of the 1963 IIEP Governing Board, C. E. Beeby, chairman of the UNESCO Executive Board (quoted in IIEP, 2003: 4), declared:

I know of no human activity that is much more important at this moment in the world's history than research and teaching in educational planning, and I know none that is more difficult. . . . [W]e know little as yet about the planning of education on the scale, at the speed and in the economic conditions that now face many of the countries we set out to advise. Few of us have had to face problems as complex as these that now beset the Ministers of Education in developing countries. It is for this reason that I am happy at the emphasis you are placing on research as well as on teaching. There is, as yet, no ready-made body of knowledge to impart, and the Institute must learn as it teaches.

Nested within this statement are salient ideas that reflect the complex conditions into which IIEP was thrust. First, IIEP was created in a context defined by a specific set of world conditions, and was designed to address particular issues within those conditions. Second, not only was educational planning seen as difficult, but little

was known (if anything was substantially known at all) about educational planning of the type which IIEP was expected to assist. Planning of course had a long history in the Soviet Union and then China, but this was in a very different political context from that of the newly independent countries in Africa and elsewhere. Third, the scale and speed at which the Institute was expected to operate was unprecedented. Fourth, the focus was intended to be on the needs of ministries of education in developing countries, which has indeed remained IIEP's main focus albeit with some diversification. Fifth, IIEP was expected not only to deliver training but also to conduct research – and in the process to find synergies between them.

IIEP was thus indeed given a huge mandate by the United Nations Educational, Scientific and Cultural Organization (UNESCO). To understand this mandate better, the global context that led to the establishment of the Institute needs to be outlined. This will be assisted by commencing with the creation of the United Nations (UN).

The United Nations

The UN was established in 1945, very soon after the end of World War II (WWII). The impact of the war on geopolitical structures was profound. Empires and nations collapsed either during the war or as a result of it, and the UN was created to address the world transformation that occurred at this time. Four powerful sets of ideas had been generated: peace, independence, development, and human rights. This last idea, human rights, carried the bold assertion that every individual in every country had an equal claim to not only civil and political rights but also to economic and social freedom.

Flowing from this post-WWII idea of human rights, the UN's 1948 Universal Declaration of Human Rights asserted in Article 26 that:

Everyone has the right to education. Education shall be free . . . [and] shall be equally accessible to all on the basis of merit. Education shall be directed to the full development of the human personality and to the strengthening of respect for human rights and fundamental freedoms. It shall promote understanding, tolerance and friendship among all nations, racial or religious groups, and shall further the activities of the United Nations for the maintenance of peace.

Education, then, emerged as not only a fundamental component of human rights but also a mechanism by

which the UN could help achieve its mandate in the post-WWII era. The challenge remained, however, as to how the UN would facilitate this education-oriented mandate. The creation of UNESCO provided the institutional solution, and the evolution of UNESCO's membership in the early years dictated the institutional context giving rise to the need for IIEP.

UNESCO

UNESCO is an agency of the UN, and all UN member states have a right to belong to it. At its inception in 1946, UNESCO was formed with 20 signatory states. As former colonies became independent, this number grew substantially and balances changed. By the time of its 60th anniversary in 2006, UNESCO had 193 member states. As more states joined, most from the developing regions of the world, clear needs emerged for specific types of institutional responses and services. In particular, a focus on the human right of education emerged as critical, particularly in Africa and Asia.

By the early 1960s, UNESCO clearly recognized the need for a focused institutional response to the expanding educational imperatives of emerging member states and the growing geopolitical complexities. The most pressing need for educational assistance focused on countries where the capacity for planning educational systems was clearly the lowest. From the early post-WWII origins of the UN and UNESCO, a global conviction of the twin ideas of education as a human right and the potential power of education in national economic development took hold. However, no proven basis existed upon which the national systems of the newly independent countries could be planned.

Thus, the need for IIEP within UNESCO's institutional boundaries was generated, and the initial elements of IIEP's services were defined. Educational planning, particularly for member states in the developing regions, became a critical but uncharted institutional imperative for UNESCO. A significant component of UNESCO's response to this imperative was the formation of IIEP.

IIEP's Early Years

Government representatives from Brazil, France, Germany, Italy, Nigeria, Sweden, the United Kingdom, the USA, and the USSR, as well as agency representatives from the Food and Agriculture Organization (FAO), the International Labor Organization (ILO), the World Bank, the World Health Organization (WHO), and the UN met in 1962 to discuss the creation of an institute within UNESCO that would focus on training and research in educational planning. As the committee discussed the mission, structure, and management, it determined that

the institute should be multidisciplinary, a place for practitioners and potential practitioners to be instructed and to gather useful experience, and a body with significant autonomy within UNESCO's administrative and funding structures.

Institutional Autonomy

IIEP was formally established in July 1963. The rationale for an autonomous institute was rooted in the belief that autonomy would better allow IIEP to create a strong cooperative and operational network between international institutions that might otherwise be reluctant to converge under the larger UNESCO umbrella with its administrative constraints. At the same time, with IIEP as a formal institute within UNESCO's legal framework yet outside the UNESCO secretariat, those same international institutions could draw upon the political capital of the UNESCO brand. Ultimately, the autonomy of IIEP would allow UNESCO the benefit of being viewed as an active agent in educational planning without impinging on the Institute's ability to create the necessary network of partners. IIEP's autonomy would also enhance its flexibility to define itself and its programs within the emerging domain of educational planning.

IIEP has its own statutes and an independent governing board with full authority over the Institute's policies, programs, and budget. The structure of the governing board is distinctive in the UNESCO system, and brings with it both strengths and potential challenges. Its 12 members are drawn from a broad global spectrum, including eight elected members from among economists, educators, and other discipline-specific specialists, with at least one member each from Latin America, Asia, Africa, and the Arab States. Four additional members are designated by the UN, the World Bank, a UN agency, and a UN economic commission. The strengths of this composition are that the members provide broad disciplinary and institutional representation in the governance, evaluation, and maintenance of IIEP programs and services. When compared to some other UNESCO agencies and institutes, the lack of members of the governing board with voting rights in UNESCO's general conference is one possible drawback. Nonetheless, the level and structure of IIEP's institutional autonomy has served its purpose well.

Training and Research

Training and research emerged early as IIEP's two core functions. In his first report to the governing board, Philip H. Coombs, the Institute's first director, promoted a critical mindset that guided IIEP in its formative years:

In a broad sense the Institute's establishment at this time expresses the growing recognition by economists, educators, general planners, and national leaders that more

emphasis must be placed on the human factor in economic and social development. Shortages of competent manpower, reflecting educational inadequacies, have become in many countries a serious handicap not only to economic growth, but to the strengthening of crucial social institutions and advancement generally. (1 GB/5 \$4)

The Advanced Training Program

For IIEP, the human factor, shortages of competent manpower, strengthening of crucial social institutions, and advancement generally were all parts of how the Institute went about creating and implementing what was initially called the Annual Training Program and was later renamed the Advanced Training Program (ATP). The ATP remains the centerpiece around which IIEP has delivered its various training programs. Lasting 10 months, the ATP chiefly serves participants from developing countries around the world. IIEP's first medium-term plan defined the purposes of the ATP:

- to familiarize participants with the concepts, analytic tools, and techniques necessary for developing competence in the field of educational planning; and
- to enable participants to take advantage of their stay at the Institute in order to think more deeply about their country's educational problems and the ways in which improved planning and administration could help to solve them.

The ATP was created to focus on experienced senior- and middle-level education professionals at the national, regional, or provincial levels. A high priority has been placed on the return of ATP graduates to their home countries for assignment to key posts in the planning and monitoring of national education systems.

Research

Research in a broad sense draws of course from different perspectives, is directed at various needs, and generates knowledge aimed at accomplishing very different types of goals. Since educational planning was a new field in the early 1960s and was directed at the practical needs of national educational contexts in developing countries, the chosen IIEP research modality was applied and practical.

To a significant degree, the early research of the Institute served three basic purposes: (1) to help IIEP set its priorities; (2) to clarify what areas should serve as focal points for the Institute's subsequent research; and (3) to provide the bases for its training courses. The first research studies focused on the USSR, France, and various Latin American and African countries.

From the outset, significant publications have helped to define and guide the field of educational planning. Particularly important is the series *Fundamentals of Educational Planning*, in which all volumes are published in English and

French and of which many volumes have been translated into other languages. As explained in the cover notes for the early booklets in the series, the works:

are written primarily for two groups: those engaged in – or preparing for – educational planning and administration, especially in developing countries; and others, less specialized, such as senior government officials and civic leaders, who seek a more general understanding of educational planning and of how it can be of help to over-all national development. They are devised to be of use either for self study or in formal training programmes.

Geopolitical Events and IIEP Responses

As an institute born in response to the needs of particular institutional and geopolitical realities, IIEP evolved according to changing global events, trends, and priorities. While these events cannot all be detailed here, and the consequent influences and responses cannot be extensively chronicled, some major events and resulting changes in IIEP's programming deserve note.

Among the significant geopolitical events contextualizing IIEP's history have been:

- decolonization and its ongoing effects;
- persistent political turmoil, institutional instability, and economic distress in many parts of the world, particularly Africa;
- the sweeping post-Cold-War era of democratization, with consequent movement toward decentralization, localization, and grass-roots participatory systems;
- the impact of the human immunovirus/acquired immunodeficiency syndrome (HIV/AIDS) pandemic on social services, national economies, and cultural structures, especially in Africa;
- World Bank policies and conditionalities, such as the structural adjustment programs;
- the World Conference on Education for All (EFA) held in 1990 in Jomtien, Thailand, which led to UNESCO being designated as the principal coordinating and monitoring agency for EFA;
- the 2000 Dakar World Education Forum, leading to the Dakar Framework for Action for EFA; and
- The United Nations' Millennium Development Goals (MDGs) resulting from the 2000 Millennium Summit.

Each of the above events has had a major impact on IIEP work. For example, the EFA movement and the MDGs were specific reference points in both training and research, and IIEP became a leader in identification of the implications for education of the HIV/AIDS pandemic. By the end of the first decade of the twenty-first century, the focus of IIEP had transformed significantly in many domains. At the broadest level, the two initial institutional areas of activity – training and research – had evolved into a

three-pronged strategy focusing on training, research, and technical assistance. The domain of technical assistance was officially added by UNESCO's Executive Board in 1993. Much of this assistance is grouped with training in what IIEP calls organizational support.

Training and Organizational Support

Training is widely accepted, both within and outside IIEP, as the most important of the Institute's functions. While IIEP delivers a number of training modalities, the uncontested centerpiece of IIEP's training and organizational support domain is the ATP. Well over 1500 trainees have attended the ATP since its creation in 1965. ATP participants have come from over 150 countries, with most coming from Africa, Asia, and the Arab States.

Perhaps the three most significant changes to the original ATP have been the creation in 1998 of the Spanish-language Regional Training Course (RTC) taught in the Buenos Aires office, the addition of a master's option in 2002, and the launch in 2008 of an education sector planning (ESP) course for Anglophone African countries through distance education supplemented by face-to-face meetings. Both the RTC and the ESP are equivalent to the common core of the ATP, and their graduates can join the program in Paris for the specialized phase of study and completion of the full ATP.

In addition to the ATP are other forms of capacity development. IIEP offers short courses, strategic seminars, intensive training courses, distance courses, Internet discussion forums, and a summer school. These programs serve a very broad spectrum of educationists from around the world. In many cases, they are either tailored to particular countries and held in those countries, or provided on a regional basis. Within these courses, attention has been given to gender balances. From a low of 23% female participants in the ATP class of 1988/89, female participation rose, albeit with fluctuations, to 52% in the 2008/09 class. The RTC has usually had more females than males, with 71% of participants in 2008 being female. Other courses have been dominated by males, and the overall balance in 2008 was 42% female.

IIEP also ensures much capacity development through on-the-job coaching in forms of technical assistance. Some of this has been through relatively short assignments while others have had multiyear arrangements. The latter category has been work in Afghanistan, Angola, Cambodia, and Egypt, for example. IIEP's technical assistance focuses on capacities in:

- preparation of planning documents;
- costing of plans and projects, preparation of medium-term expenditure frameworks, and budgeting;
- educational management information systems at national and subnational levels;
- school mapping and micro-planning;

- educational project design and management;
- organizational audits of ministries of education and other institutions;
- assessment of training needs in decentralization schemes; and
- monitoring and evaluation of educational reforms.

Producing New Knowledge

Following the publication of Coombs' (1968) book entitled *The World Education Crisis: A Systems Analysis*, the interdisciplinary nature of educational planning became more obvious. Economists, sociologists, psychologists, and political scientists, among others, could each demonstrate significant contributions. With the onset of the HIV/AIDS pandemic, healthcare professionals also emerged as central to the endeavor of educational planning.

In the early period, research priorities included:

- the performance of educational systems;
- the mutual adaptation of educational and economic systems;
- the internal effectiveness of educational systems;
- resources employed in education;
- lifelong learning; and
- governance, planning, and management of education.

Global imperatives, such as those driven by EFA, the MDGs, and HIV/AIDS, have generated appropriate responses and realignment within IIEP's research agenda. For example, the medium-term plan for 2008–13 designates the following key areas for the production of new knowledge:

- equity, access and quality;
- costs and financing; and
- governance and management.

While overlap is clearly seen between the two lists, the particular focus and nuanced implications of terminology reflect the influences of contextual and geopolitical realities. All IIEP research is required to have conceptual and/or practical relevance to the real concerns of practitioners, which naturally evolve over time. Research in the contemporary era has given much more attention to themes, such as decentralization, internationalization, and privatization, which were not strong thrusts in the early years of the Institute's existence. IIEP has been able to use its functional autonomy to address some themes which are sensitive and which could not easily be addressed within the more political arena of UNESCO headquarters. An example is IIEP's work on corruption and education which was initially viewed externally with some caution, but is now viewed as having been pathbreaking.

Sharing Knowledge for Informed Decisions

Findings from IIEP's research are shared in three ways. First are the publications, of which the Institute has

produced over 1500 since 1963. The majority of publications from the Paris office are in English and/or French, while most publications from the Buenos Aires office are in Spanish. In addition, works have been translated into Arabic, Armenian, Azeri, Chinese, Japanese, Portuguese, Russian, and other languages. All print publications produced in recent years, and some produced during earlier periods of history, are also available in electronic format. All electronic publications can be downloaded free of charge from the website.

A second mechanism for sharing knowledge is through the documentation center, which contains over 33 000 items of both historical and contemporary value, including national planning documents and the findings of the Institute's research. The documentation center also operates an electronic portal of national plans and related documents, entitled Planipolis. In 2009, this portal attracted 20 000 visits per month, which demonstrated that it was indeed a valued resource. Another team within the documentation center operated the HIV and AIDS Education Clearinghouse in conjunction with other UNESCO offices. The Clearinghouse issued a regular newsletter to call attention to new resources and to explain how existing resources could be accessed electronically and/or in hard copy.

Third, IIEP undertakes policy dialog and advocacy through its website, training, policy forums, and technical assistance. IIEP personnel participate in many significant policy-related and academic events, particularly at the international level and frequently also at the national level. The Institute collaborates for such events with other parts of UNESCO, with the United Nations Children's Fund (UNICEF) and other UN bodies, with nongovernmental organizations (NGOs), and with various national bodies. Three specific networks receive particular IIEP support, namely the Asian Network of Training and Research Institutions in Educational Planning (ANTRIEP), the Southern and Eastern Africa Consortium for Monitoring Educational Quality (SACMEQ), and *Educación, Trabajo, Inserción Social* (RedEtis). IIEP also works closely with bodies such as the Inter-Agency Network for Education in Emergencies (INEE), and provides the secretariat for the International Working Group on Education (IWGE).

The nature and role of ANTRIEP deserves elaboration because it permits introduction of a sister institution which operates mostly at the national level and has a long history of collaboration with IIEP. This institution is the National University of Educational Planning and Administration (NUEPA), in New Delhi, India. NUEPA commenced its life in 1962 with UNESCO support as the Asian Regional Centre for Educational Planners and Administrators (ARCEPA). In due course, it evolved into the National Institute of Educational Planning and Administration (NIEPA), and then in 2006 NUEPA. Particularly in the early decades, IIEP had significant partnerships with this body. ANTRIEP remains among these partnerships.

NUEPA is the focal point for ANTRIEP with significant IIEP support.

IIEP also of course shares knowledge through its alumni network. Graduates from the ATP and other programs are located in ministries of education, international organizations, and development bodies in many countries. The Institute endeavors to remain in touch with the alumni, and continues to receive many requests for information and support. Some of the alumni occupy top positions in government as ministers and senior advisers.

Finally, IIEP welcomes many visitors, especially in the Paris office. Some visitors are seasoned professionals who wish to use the documentation center and dialog with counterparts, while others are junior colleagues who are at the outset of their careers. In the latter category are various groups of postgraduate students whom IIEP welcomes on an annual basis on study tours organized by their universities in France, Germany, the United Kingdom, and elsewhere. The Institute is glad to host such visitors and to promote the types of interchange which are so important for the learning of lessons and for continuing innovation.

Conclusion

IIEP represents an ideal, as well as being an organization; it is comprised of people as well as having a physical location; it offers services globally and in its pair of offices; it has significant autonomy, but chooses to operate in partnerships and networks; it leads and influences the field of educational planning, but is responsive to global events and priorities. In short, IIEP is a complex entity and can be legitimately considered from a number of perspectives. The Institute indeed has a huge mandate, as declared in the 2008–13 medium-term plan. In pursuing its mandate, IIEP has been both responsive and adaptive while remaining central and influential in both practical and academic global efforts to train, research, and deliver technical assistance to receptive individuals, groups, organizations, nations, and regions throughout the world.

LEADERSHIP AND MANAGEMENT

Leadership and Management Overview

B Mulford, University of Tasmania, Hobart, TAS, Australia

© 2010 Elsevier Ltd. All rights reserved.

Introduction

Educational leadership and management is a relatively young field of study; however, in recent times it has entered a golden age in Anglo-American societies (Day and Leithwood, 2007). At the same time the field is faced with the fact that new managerialism, which embraced managerial efficiency and effectiveness through bureaucracy and accountability as key levers for reforming schools, cannot sustain improvements. What is argued throughout the articles forming the leadership and management section of this encyclopedia is that the time has come for the professionals and educational leaders to strive to ensure what happens now and in the future is what they want to happen in schools and that they are professionally accountable for their choices. However, it is recognized that overcoming the gap between dependence on, or a feeling of the inevitability of, system or school bureaucracies as the means of achieving what they want and their preferred model of seeing schools as communities of professional learners remains a challenge (Mulford, 2008). Part of the challenge involves a shift from what is to what ought to be.

A very brief summary of the major recurring points from the articles forming the leadership and management section of this encyclopedia starts with a reaffirmation of the importance of school leadership (in contrast to school administration or management), especially in its distributed form, for continued student learning. This leadership is then seen to work best when it is indirect, working through the building organizational capacity (such as in communities of professional learners or organizational learning), has agency (such as professional identity or professional autonomy), and uses networks to build social capital, including in and with the wider community. Strong arguments are presented for a greater

focus on what ought to be, including the ethical, equality, social justice, and the democratic. There are also calls for greater use of quality evidence by school leaders and the generation of more quality research in the field to support this evidence.

In order to achieve the greater professionalism that has been called for, it is clear that educational leaders need to understand and be able to act concurrently on the context, organization and leadership of the school, as well as the interrelationship among these three areas. Successful educational leadership involves being contextually literate, organizationally savvy, and leadership smart, as well as being the prime vehicle for linking all three areas. As a single input by a leader can have multiple outcomes, success will depend on which areas and in what sequence the educational leader chooses to spend time and attention over time. This article is organized around these three broad themes.

Contextually Literate

Context matters. School leaders need to be contextually literate. A context involving rapid advances in science and technology, increased globalization, changes in demography, including changes in the nature of work, and pressures on the environment sees educational leaders both having to choose between competing forces and broadening of what counts for good schooling.

Articles forming the leadership and management section indicate that choices between competing forces make the most sense when they foster stability for change (in the form of a school's collective capacity to learn), independence rather than dependence, community rather than individualism, and heterogeneity rather than homogeneity. Broadening what counts for good schooling is seen to

include excellence and equity as well as the cognitive and noncognitive (especially personal and social skills).

Choosing between Competing Forces

Continuity or constant change

In contrast to past continuity, recent times have been witness to constant change, a stream of new movements, new programs, and new directions. Unfortunately, some in education seem to be forever rushing to catch the next bandwagon that hits the scene; unfortunately because there is increasing evidence that many a school and school system and its children have been badly disillusioned by the itinerant peddlers selling the new movements.

The main challenge in such a situation, a world of massive and constant change, is how to foster enough internal stability in people and the organization in which they work and study in order to encourage the pursuit of change. Stability for change, moving ahead without losing our roots, is the challenge (Peters, 1987).

It is quite incorrect to assume that a school is effective only if it is undergoing change. Change may be in an inappropriate direction, for example, toward a facade of orderly purposefulness (Sergiovanni, 1990). It may also involve the use of inappropriate measures of success, especially when they are merely procedural illusions of effectiveness (Meyer and Rowan, 1978) such as program planning budgeting systems, school-based management, charters/partnership agreements, strategic plans, standards, benchmarks, and so on. Such processes contribute an illusion of effectiveness and become desired outputs in themselves, thus deceiving outside observers and many of those in schools as well. Such deception should have no place in the provision of quality education.

In a changing world it might be more helpful for school leadership and management to remember Noah's principle: one survives not by predicting rain (change) but by building arks. Amid uncertain, continually changing conditions, many schools are constructing arks comprising their collective capacity to learn, striving to become communities of professional learners.

Dependence or independence

A second contextual area relates to the balance between the competing factors of dependence and independence and what is believed to be the current imbalance favoring dependence. This situation is most easily seen in the over dependence many of those in schools place on leaders outside schools (such as ministers of education, heads of departments of education), often engendered by the overconfidence of these leaders in their own abilities or importance.

There seem to be a lot of these people who want to tell those in schools what to do. This situation is unfortunate

because many of those doing the telling do not seem to want to accept responsibility for their advice, including not being around long enough to take responsibility for their directions. A different approach is required involving greater independence, empowerment, partnership, and consistency for those in schools. Hyman, who left 10 Downing Street after many years as speech writer and advisor to the prime minister to work as an assistant to the headteacher at London's Islington Green School, concurs:

Perhaps the biggest eye-opener for me on my journey has been how the approach I had been part of creating, to deal with 24-hour media and to demonstrate a decisive government, was entirely the wrong one for convincing front-line professionals, or indeed for ensuring successful delivery. Our approach to political strategy has been based on three things: momentum, conflict and novelty, whereas the frontline requires empowerment, partnership and consistency. (Hyman, 2005: 384)

Individualism or community

Although schools do have the responsibility of care for students, at the same time debate continues as to whether schools can deal with broad social issues (Bernstein, 2000). It may be unreasonable to expect the schools to pick up the slack if the home and community cannot. But who will counter, for example, the pressure inherent in much of our modern society to act alone rather than with, or for, the community? We are reminded in the articles forming the leadership and management section that change for the sake of change, including technological change, is not necessarily good; it must be tempered with other values such as wisdom, compassion, and justice.

A different generation, those born from the 1980s onwards, the new millennial learner (NML), now populate our schools – as students and, increasingly, as staff. The NML is the first generation to grow up surrounded by digital media, and much of their activity involving peer-to-peer communication and knowledge management is mediated by these technologies (Howe and Strauss, 2000). This generation, also called Homo Zappiens (Veen, 2003), has made popular the less controllable socially oriented technologies such as blogs, wikis, tagging, and instant messaging (Pedro, 2006).

In this individualistic, technology-mediated world, a skills crisis would indeed be bad enough but a values crisis would be devastating. For example, turning back the tide of a virtual, computer-based cyberspace existence, with its stress on individualism and encouragement to dissociate oneself from an increasingly challenging world, is vital for our future survival. For, as Peck (1987) has reminded us, a community is a place where conflict can be resolved without physical or emotional bloodshed and with wisdom as well as grace. A community is a group that fights gracefully.

A generation unable to feel for others is incapable of creating the social trust that is so essential to maintain culture; also, as it is in the broader culture, so it is in schools. For example, it has been demonstrated that where teachers' trust in principals is undermined by perceptions of principal co-option of top-down system change initiatives, especially when unsupported by teachers, it results in teacher alienation and feelings of disempowerment, which can then bring teacher strategies of resistance to the fore (Bishop and Mulford, 1999).

Homogeneity and/or heterogeneity

Articles in the leadership and management section argue that a common denominator in successful schools is to find a way to get some of the staff and students to do radical things, to take initiatives, and to take risks. If a system is too tight for risk taking there will be no search, and no development and if there is no search and no development there is no learning.

One lesson here is that reductionist approaches in education, to the complexity that is the world of the teacher and the student, should not go unchallenged. Uniformity for schools and education systems in aims, in standards, and in methods of assessment is a complexity-reducing mechanism. It is far tidier to have a single set of aims for all, a single curriculum for all, a single set of standards for all, and a single array of tests for all than to have locally developed approaches to school improvement.

Homogeneity of outcome for the future of our schools and society is not necessarily the highest pinnacle and attempts to reach it may have backfired in terms of student attitudes to school. International research (OECD, 2004) shows, for example, that more than a quarter of students agree or strongly agree that school is a place where they do not want to go. Researchers in UK are:

beginning to encounter students expressing doubts about the genuineness of their school's interest in their progress and well-being as persons, as distinct from their contributions to their school's league table position. [The result is that] contract replaces community as the bond of human association. (Fielding, 1999: 286)

Broadening What Counts as Good Schooling

Pressures from competing forces, such as those outlined above, suggest that in order for schools to fully achieve their purposes there is a need to broaden what counts for good schooling. Measures of successful student achievement in a knowledge society are increasingly being seen as wider than the cognitive/academic, more personalized and involving both excellence and equity (DfES, 2005; OECD, 2001; World Bank, 2005). For example, if we stress only scientific and technological knowledge, or only

literacy and numeracy, we could languish in other areas, including physically, esthetically, morally, and spiritually.

Consistent with this argument to broaden what counts is a range of impressive research using data from the British Cohort Study. This database follows all children born in the UK in the first week of April 1970 and surveyed them again in 1975, 1980, 1986, 1991, and 1996. At age 10, in 1980, over 12 000 children were tested for mathematics and reading ability and the psychological attributes of self-esteem and locus of control. The children's teachers were questioned about their behavioral attributes of conduct disorder, peer relations, attentiveness, and extraversion. In 1996, at age 26, information was collected on highest qualification attained, earnings, and periods of unemployment.

The author of one of these studies, Leon Feinstein, an economist, summarizes his findings as follows:

...attentiveness in school has been shown to be a key aspect of human capital production, also influencing female wages even conditioning on qualifications. Boys with high levels of conduct disorder are much more likely to experience unemployment but higher self-esteem will both reduce the likelihood of that unemployment lasting more than a year and, for all males, increase wages. The locus of control measure ... is an important predictor of female wages ... Good peer relations are important in the labour market, particularly for girls, reducing the probability of unemployment and increasing female wages. ...

[These results] suggest strongly that more attention might be paid to the non-academic behaviour and development of children as a means of identifying future difficulties and labour market opportunities. It also suggests that schooling ought not be assessed solely on the basis of the production of reading and maths ability. (Feinstein, 2000: 22, 20)

These results have been confirmed in other longitudinal research by Carneiro et al. (2006) where it was found that 7- and 11-year-old children who exhibited social maladjustment were less likely to stay on at school post-16 (after taking into account cognitive ability and other family background factors), did less well in terms of performance in higher education, were more likely to display negative adolescent outcomes, such as trouble with the police by age 16 and teenage motherhood, and even conditioning on schooling outcomes were more likely to have both lower employment probabilities and lower wages at age 33 and 42.

Other research (e.g., Cunha *et al.*, 2005) shows that non-cognitive skills are more malleable than cognitive skills, thus suggesting that while both areas are important, schools can have a greater effect on students' noncognitive than cognitive outcomes. Cunha *et al.* (2005: 1) also reminds us that "remediation of inadequate early investments [in such areas of social skills] is difficult and very costly."

Organizationally Savvy

The articles forming the leadership and management section of this encyclopedia show that school organization also matters. Educational leaders need to be organizationally savvy. Broadening the way schools are organized and run would see a move from the mechanistic to living systems, from thin to deep democracy, from mass approaches to personalization through participation, and from hierarchies to networks. The emphasis here is very much on building capacity, on social capital, learning organizations, and collective teacher efficacy, or, in brief, communities of professional learners.

From Mechanistic to Organic, Living Systems

In her book, *Finding Our Way: Leadership for an Uncertain Time*, Wheatley (2005) employs two competing metaphors – organizations as machines and organizations as living systems – as explanation for both organizations and leadership that differ radically in their functioning and outcomes. The machine metaphor encourages a view of organization as a fixed structure of some sort, a structure consisting of parts that need to be oiled if they are to function together smoothly. From this view, organizations require effortful monitoring, coordination, and direction by someone, typically a leader.

Wheatley (2005: 4) notes that “in the past few years, ever since uncertainty became our insistent twenty-first century companion, leadership strategies have taken a great leap backward to the familiar territory of command and control.” Such leadership, aiming to increase employees’ certainty about their work (and increase the school’s level of accountability to government and the public), is mostly transactional. This means that, in the case of school organizations, teachers are assumed to be motivated by the promise of such extrinsic, positive rewards as money and status and opposing, extrinsic, negative impacts such as school reconstitution and public shaming through the publication of league tables.

Transactional, command and control, forms of leadership on the part of principals further manifest themselves in the close supervision of teachers, specification of the one best model of instruction which all teachers must use, centralized decisions about how time in the classroom is to be used together with very long lists of curriculum standards or expectations which teachers are required to cover with students. Teachers are allowed little autonomy over their work in classrooms, their voices are heard weakly, at best, in school-wide decision making and yet they are held almost entirely accountable for student achievement (Day and Leithwood, 2007).

An organic, or living systems, metaphor encourages a view of organization as a process, one of constant

adaptation, growth, and becoming that occurs naturally and inevitably in response to a strong desire for learning and survival. As Wheatley describes it:

the process of organizing involves developing relationships from a shared sense of purpose, exchanging and creating information, learning constantly, paying attention to the results of our efforts, co-adapting, co-evolving, developing wisdom as we learn, staying clear about our purpose, being alert to changes from all directions. (Wheatley, 2005: 27)

A description of organization-as-living-system bears a strong resemblance to accounts of organizational learning in schools, professional learning communities (OECD (2001, 2006) scenarios for future schools as social centers and learning organizations.

From Thin to Deep Democracy

Furman and Shields (2003) argue that there is a need to move our schools from thin conceptions of democracy based on the values of classical liberalism, and its concern with the right of the individual to pursue his or her self-interest and the resolution of conflict through democratic majority voting, to a notion of deep democracy. Dewey (in Furman and Shields, 2003) saw deep democracy as involving respect for the worth and dignity of individuals and their cultural traditions, reverence for and the proactive facilitation of free and open inquiry and critique, recognition of interdependence in working for the common good, the responsibility of individuals to participate in free and open inquiry, and the importance of collective choices and actions in the interest of the common good. Furman and Shields (2003) state that deep democracy needs to be practiced in schools. However, as a consequence of risk of chaos and loss of control from the forces on schools, the typical pattern they perceive is that students

are expected to conform to hierarchically imposed decisions about what they study and teach and when, what the outcomes of instruction should be, how to behave and talk, and even how they look. ... [In fact,] learning democracy may be one of the least experiential aspects of K–12 curricula. (Furman and Shields, 2003: 10)

The results of a recent analysis of school principal training in the Australian state of Tasmania (Mulford, 2004) leads one to suggest that the same could be said about the adults in schools within bureaucratically designed systems. Deep democracy needs to be practiced by them but it may be the least experienced aspect of their working world, especially when it comes to their own professional development.

Personalization through Participation

A major debate taking place in the UK about the future shape of public services picks up on the confused organizational situation for those in schools. This debate is pitched into the chasm between the way public institutions work and how users experience them. For example, in the education sector it has been argued by Leadbeater that efficiency measures based on new public management as reflected in:

[t]argets, league tables and inspection regimes may have improved aspects of performance in public services. Yet the cost has been to make public services seem more machine-like, more like a production line producing standardised goods. [And, I would add, increasingly create dependence on the system.] ... It is ... clear that the State cannot deliver collective solutions from on high. It is too cumbersome and distant. The State can only help create public goods – such as better education – by encouraging them to emerge from within society. ... That is, to shift from a model in which the centre controls, initiates, plans, instructs and serves, to one in which the centre governs through promoting collaborative, critical and honest self-evaluation and self-improvement. (Leadbeater, 2004a: 81, 83, 90)

It is further argued (Leadbeater, 2004a 2004b, 2005) that public services can be improved by focusing on what is called personalization through participation. The pay off of personalization is believed to be increased knowledge, participation, commitment, responsibility, and productivity. Thus, personalization can be seen to be both a process and outcome of effective public organizations, including schools.

A personalized public service is seen as having four different meanings:

- providing people with a more customer-friendly interface with existing services;
- giving users more say in navigating their way through services once they have access to them;
- giving users more direct say over how the money is spent; and
- users are not just consumers but co-designers and co-producers of a service.

As we move through these four meanings, dependent users become consumers and commissioners then co-designers, co-producers, and solution assemblers. As Townsend *et al.*, point out, the change in focus is from one where teachers teach, students learn, and parents support, to one where everyone contributes what they know (teach), and works toward common goals (support), one of which is the ongoing improvement of what the school does (learns).

In schools, learners (students and staff) become actively and continually engaged in setting their own targets, devising their own learning plan and goals, and choosing among a range of different ways to learn. As we move through these four meanings, the professional's role also changes from providing solutions for dependent users to designing environments, networks, and platforms through which people can together devise their own independent and interdependent solutions.

From Hierarchy to Networks

Authors in the leadership and management section of this encyclopedia and others (e.g., Leadbeater, 2005) believe that personalized learning will only become reality when schools become much more networked, collaborating not only with other schools, but also with families, community groups, and other public agencies. Arguably, one of the best-funded and continuous school networks – The Network Learning Group (NLG) with its hub at the UK's National College for School Leadership (NCSL) – summarizes its learning about the advantages networks in comparison to traditional hierarchically designed organizations as greater sharing, diversity, flexibility, creativity, risk-taking, broadening of teacher expertise and learning opportunities available to pupils, and improved teaching and pupil attainment. They point out that while there is no blueprint for an effective network, it is possible to identify factors that successful networks have in common:

- design around a compelling idea or aspirational purpose and an appropriate form and structure;
- focus on pupil learning;
- create new opportunities for adult learning; and
- plan and have dedicated leadership and management.

However, Leadbeater (2005: 22) warns that the collaboration needed for effective networks “can be held back by regulation, inspection and funding regimes that encourage schools to think of themselves as autonomous, stand alone units.” Levin (NCSL, 2005: 6) agrees, pointing out that there “are inevitable tensions between the idea of learning networks, which are based on ideas of capacity building as a key to reform, and ... reform through central policy mandate.” Rusch (2005), in fact, concludes that networks cannot be controlled by the formal system. She questions the role of the system in effective school networks, identifying competing institutional scripts between what is likely to be required by networks as opposed to the system as follows:

- structures are seen as malleable in networks but fixed and hierarchical in the system;
- conflict is open and valued in networks while it tends to be hidden and feared in the system;

- communication is open and unbounded in networks but controlled and closed in the system;
- leadership tends to be fluid in networks while it is hierarchical and assigned in the system;
- relationships are egalitarian in networks but meritocratic in the system; and
- finally, knowledge and power are based on inquiry and learning is valued in networks while expertise and knowing are valued in the system.

Social Capital and Communities of Professional Learners

Arguably, the two organizational concepts that underpin schools as living systems and deep democracies and involving personalization through participation and networking, are social capital and communities of professional learners.

Social capital

The idea of social capital has enjoyed a remarkable rise to prominence. By treating social relationships as a form of capital, it proposes that they are a resource, which people can then draw on to achieve their goals. It also serves alongside other forms of capital (such as economic, human, cultural, identity, and intellectual) as one possible resource and accepted contributor to our individual, community, and national well-being. International bodies such as United Nations Educational, Scientific and Cultural Organization (UNESCO), Organization for Economic Co-operation and Development (OECD), and World Bank have engaged in extensive conceptual, empirical, and policy-related work in the area.

What does social capital mean? The World Bank (Grootaert *et al.*, 2004: 3) concludes that social capital “is most frequently defined in terms of the groups, networks, norms, and trust that people have available to them for productive purposes.” In addition to this generally accepted definition, Grootaert *et al.* (2004: 4) point out that common distinctions are made among bonding, bridging, and linking forms social capital. Bonding social capital refers to “ties to people who are similar in terms of their demographic characteristics, such as family members, neighbours, close friends and work colleagues.” Bridging social capital is also horizontal in nature but refers to “ties to people who do not share many of these characteristics.” However, it continues to connect “people with more or less equal social standing.” Linking social capital operates across power differentials and thus is seen vertical in nature. It refers to “one’s ties to people in positions of authority such as representatives of public (police, political parties) and private (banks) institutions.”

Knowing the definition of social capital and its different forms is helpful, but it does little to assist educational

leaders with the challenges in building social capital in schools. A way through this situation is for the educational leader to see bonding social capital as that occurring among work colleagues within schools. It is the most developed area in the research literature. Bridging social capital can be taken as that occurring between schools. This area is a recent but growing one in the research literature, especially in the area of networking. Linking social capital can be understood as that occurring between a school and its community. While there is a long research tradition in this area, it tends to be unidirectional, concentrating on what the community can do for the school, rather than the other way around.

The research evidence is clear in its strong support for all three forms of social capital. The outcomes are impressive, not the least of which being improved student engagement, academic performance and later life chances, improved teaching and learning, reduced within school variation and retention of teachers in the profession, and increased individual and community capacity to influence their own futures.

However, the research also points to many challenges to overcome at the contextual, organizational, and individual levels including the current accountability press, especially system preoccupation with a limited number of academic performance outcomes, the micro-politics of schools such as contrived collegiality, groupthink, and conflict avoidance, differences between policy development and its implementation, dedicated leadership, large, secondary, high-poverty schools, and professional autonomy.

Communities of professional learners

Where do we take this research evidence on the importance of and challenges to social capital? The way forward is to see the task as establishing communities of professional learners (CPLs) and to see it as developmental starting with the building of social capital. A message arising from the other articles in the leadership and management section is that those in schools must learn how to lose time in order to gain time. Awareness of, and skill development in, group and organizational processes is a first step in any effective change. Instead of others trying to insert something into a school’s (or community’s) culture, the school, and especially its leadership, should first be trying to help that culture develop an awareness of and responsiveness to itself (Scribner *et al.*, 2002).

In brief, there are three major, sequential, and embedded elements in successful school reform. It takes the two elements in the definition of social capital: groups, networks, norms, and trust and for productive purposes, and extends them to include a third element, learning. The first element in the sequence relates to the community, how people are communicated with and treated. Success is more likely where people act rather than are always reacting, are empowered, involved in decision-making

through a transparent, facilitative, and supportive structure, and are trusted, respected, encouraged, and valued. It is a waste of time moving to the second element until such a community is established. The second element concerns a community of professionals. A community of professionals involves shared norms and values including valuing differences and diversity, a focus on implementation and continuous enhancement of quality learning for all students, de-privatization of practice, collaboration, and critical reflective dialog, especially that based on performance data. However, a community of professionals can be static, continuing to do the same or similar thing well. The final element relates to the presence of a capacity for change, learning, and innovation; in other words, CPLs (see Mulford, 2007).

Each element of a CPL, and each transition between them, can be facilitated by appropriate leadership and professional development. Furthermore, each element is a prerequisite for the other; they are embedded within each other with only the emphasis changing. For example, when learning is occurring there is still a need to revisit the social community and the professional community, especially where there has been a change of personnel and/or a new governmental direction announced.

Using this analysis of bonding, bridging, and linking social capital to understand the importance of, challenges to and developmental nature of CPLs can assist the educational leader in better translating the research into policy and practice. It can help him or her to:

- Understand better and be able to take action on the intricacies involved in moving a school, or part of a school, from where it is now to becoming truly a place of ongoing excellence and equity without those in schools being bowled over by the demands for change that surround them.
- Target appropriate interventions to ensure more effective progression through the stages; in targeting interventions, recognition will need to be given to the fact that it is a journey and that actions at one stage may be inappropriate, or even counterproductive, at another stage.
- Support the position that a school will need to be evaluated differently depending on the stage it has reached.

As Stoll concludes, what colleagues do together outside of classrooms is critically important in supporting what they do inside to promote student learning, as well as to enhance their own and their school's development. However, changing the organization and leading of schools and school systems so they become CPLs will not be for the faint of heart. It will require schools and their leaders to radically rethink how they operate. However, and as Leadbeater (2005) points out, many of the basic building blocks of traditional education, the school,

the year group, the class, the lesson, the blackboard, and the teacher standing in front of a class of 30 children, could be seen as obstacles. All the resources available for learning – teachers, parents, assistants, peers, technology, time, and buildings – will have to be deployed more flexibly than in the past. School leadership in such organizations will certainly be less lonely and more collaborative and professionally interactive than ever before (NCSL, 2007).

Leadership Smart

Educational leadership and management matters, is changing, and, given the changing context and organizational response, needs to be smart. Unfortunately, in this situation, the plethora of advice about strong, adjectival, one-size-fits-all school leadership – instructional, transformational, transformative, distributed, democratic, authentic, teacher, strategic, and so on – seems anachronistic. Successful educational leadership and management is more complex; it needs to be able to see and act on the whole and well as the individual elements and the relationships among them over time (i.e., in a developmental manner). As Hargreaves and Fink (2006) point out, it is a meal not a menu, with all pieces needing to fit together in different ways at different times.

A lack of time and professional isolation are major barriers to collaborative endeavors. Donaldson (2001: 11) describes some major attributes of schools that contribute to what he calls a leadership-resistant architecture reflected in a conspiracy of business. There is, according to Donaldson, little time for the school leader to convene people to plan, organize, and follow through. Contact and the transaction of business often take place catch-as-catch-can. Opinion setting and relationship building in schools, he argues, are mostly inaccessible and even resistant to the principal's formal attempt to guide and structure the direction of the school.

Given that the effects of leadership on a wide range of student learning are largely indirect, it may be that strong, visible, visionary leadership is dysfunctional. Barnett *et al.*'s (2001) research is key here, showing as it does the positive effects of principals demonstrating individual concern and building relationships but the negative effects of being inspirational and visionary. While one leadership style or approach may work well for some leaders, most have a range of leadership styles. As schools develop and change, different leadership approaches will inevitably be required and different sources of leadership will be needed that the development work keeps moving. A one-size-fits-all, adjectival style or approach to leadership, or checklists of leadership attributes, may seem superficially attractive but can often limit, restrict, and

distort leadership behavior in ways that are not always conducive to school development and improvement.

Regarding this point, it is interesting to note that proponents of instructional, transformational, and distributed leadership have, over time, moved well away from the one-size-fits-all, charismatic, heroic model of school leadership and expanded their understandings to include aspects of the context, antecedent conditions (e.g., school level, size, SES) and school mission, culture and a reinforcing structure (especially developing people, collaboration, and monitoring), and instructional program.

Conclusion

As we have seen over the course of this overview article, a great deal of a school's success depends on those areas of school life the educational leader chooses to spend time and attention. As a single input by a leader can have multiple outcomes, a leader needs to be able to see and act on the whole, as well as on the individual elements, and the relationships among them over time.

Recent developments in the field of educational leadership and management demonstrate that it is more complex, nuanced, and subtle than previously portrayed (Mulford 2008). The article moved through evidence on three elements: context, organization, and leaders. Context is related to the forces currently pressing on schools and the implications of these forces for schools and their leaders. School organization focused on evolving models that moved beyond the outmoded and ineffective bureaucratic model to communities of professional learners. Evidence on leaders questioned whether one type of leadership fits all contexts and organizations. A great deal of promise was found in the evidence on successful leaders building school capacity, or communities of professional learners, and doing this in a developmental way.

To be successful on all these fronts and how they interrelate in the interests of continuing improvement in student learning is the biggest challenge for the field. Within such complexity, school leaders need to be part of ongoing conversations about context and its implications for schools. Leaders need to understand and be able to act on the evolving and preferred organizational models for schools; in addition, they need to be able to understand and act on the quality evidence that is now accumulating on being a successful school leader and what it means for their professional learning and standards.

With the eminent retirement of a larger-than-normal proportion of school leaders (for Australia, see Anderson *et al.*, 2007), there is no better time to act on these challenges. Will education systems and, more importantly, the profession take up the challenges? Will they actually use quality evidence, such as that provided in the articles in the leadership and management section of this

encyclopedia, in schools and school systems to enable us to continually move forward? Inherent in this question is a plea for us to move beyond mere technical competence in school leadership. Galton makes this point well in terms of teachers:

By making certain techniques mandatory you run the danger of turning teachers into technicians who concentrate on the method and cease to concern themselves with ways that methods must be modified to take account of the needs of individual pupils. As we face the demands of a new century, creating a teaching profession which while technically competent was imaginatively sterile would be a recipe for disaster. (Galton, 2000: 203)

As it is for teachers, so it is for school leaders (PricewaterhouseCoopers, 2007).

Gronn concludes that it is the latitude for choice and discretion that provides educational leaders with their sources of work satisfaction, fulfillment, and self-actualization. It is when the incentives to perform their work begin to dry up, and the constraints and demands cease to be enabling and become burdensome, that leaders come to experience their work as greedy and all consuming; at that point, some form of disengagement may become an option.

There is clearly a need to achieve better balances in our world, including between learning what the political and bureaucratic systems require of individual educational leaders and what practicing professionals require of themselves and their colleagues. On the basis of the available research, we believe this balance can best be achieved by groups of educational leaders, or professional collectives and alliances, setting, negotiating, and delivering their own agendas. This position is also consistent with the emerging priorities for successful educational leadership detailed in this article. After all, participation in context, organization, and leadership, including policymaking, not only enhances efficiency in implementation, but also contributes to the creation of more pluralistic and democratic political systems (Lecomte and Smillie, 2004).

Contexts for Leadership at the Beginning of the 21st Century

Introduction

The last couple of decades have seen a proliferation of approaches in education which attempt to either extract the essence of individual achievements, and apply these universally, or devise policies almost as an ideological thought experiment, and then construct a series of aims, objectives, and targets, to be engineered into particular institutions. Both of these approaches ignore a critical mediating factor – the individual context. This is a fatal mistake, as it ignores the personal understandings of local situations, and therefore the humanity and appropriateness of the educational exercise. This article then argues that context is critical to a proper appreciation of the challenges of education leaders at the beginning of the twenty-first century. It however suggests that context is not a simple term, as there are both different meanings and different levels to the term. It therefore discusses the meanings of context before arguing that there are at least four levels of context. In so doing, it suggests that an appreciation of current contexts suggests the need for four leadership dispositions – what are called ironic, autonomous, ecological, and public dispositions.

What is Context?

The Concise Oxford Dictionary defines context as the circumstances relevant to something under consideration. This is useful as far as it goes, but leaves many issues open, one of which is the problem of selecting circumstances as relevant. After all, Carr (1982), in describing historical facts, said that they were like fish swimming in

some huge ocean, and which ones were actually caught depended in part upon where one was fishing, what equipment one was using, and what one wanted to catch. The same kind of thing can be said of contexts, for they are in part defined by how people define them, and that is usually influenced by a number of prior agendas. This can lead down a relativist road: context is then how you want to define it. However, it need not be: one can require as much justification for relevance in the definition of a context as for any other activity, even if such justification may never be fully objective in some positivist sense. As Popper (1982: 111) argued with respect to scientific proof, it doesn't rest upon absolute foundations of truth, but is rather like a structure being erected on piles on swampy ground. One may never then actually drive the piles down to some permanent solid base, but as long as the structure is sufficiently stable, it can be used, even if one knows that it will almost certainly need further adjustments in the future.

One can, then, get better and worse descriptions, even if they cannot be proved better or worse in some ultimate way. This applies to the descriptions of context given by Seddon (1993) when she argues that there are at least three different frames through which leadership can be viewed. The first, and most simple, frame is the categorical – where particular individuals are not seen as real people, with all their personal idiosyncrasies, but as examples of particular categories of individuals – transformational leaders, for instance. This description of context neither provides a rich description of individuals, nor of the particular circumstances within which their lives are conducted. A richer description is given by Seddon's second frame, the interpretive context, where not only are real people with their passions and peculiarities described, but so are

their relationships, and their different perceptions of these. Yet, a more complete understanding of context would describe all those things of which individuals may not be conscious, but which affect them and their relationships. This is the relational context, described by Gronn and Ribbins (1996: 456) as “networks of hierarchically stratified, material institutional arrangements” which may be unique to different societies or cultures, and which may then “both provide opportunities for the expression, and constraint, of human agency.” In thus describing this movement from categorical, through interpretive, and on to a relational meaning for context, Seddon deepens and broadens our appreciation of the range of factors that must be included.

Levels of Context and Their Interactions

A particularly useful way of developing an appreciation of current contexts when it comes to educational leadership is to examine different levels of context at the micro-, meso- and macrolevels, and of the interactions between these levels. It is important to appreciate not only the issues at these levels, but also the interactions between these different levels. Each is examined in a little detail.

From the Micro to the Meso

The microlevel is viewed here as that of the individual, the interactions between individuals, and the effects that individuals have upon each other. At a time when rationalist approaches to management and leadership focus on aims, outcomes, and processes, and the structures needed to implement and measure these, the influence of this level of context can be underestimated or even ignored. Yet, individuals differ in how they approach and deal with issues, and this can have dramatic effects upon particular events. Take, for example, the extensive literature on burnout, early retirements, and the lack of applications for the post of educational principal in the public sector across the Western world (see Gronn (2003); Hargreaves (2003); Fullan (2004)). However, even though similar pressures may apply to an entire population of headteachers, individuals may react very differently. So while *The Independent* (19/01/07) notes that New Labour, since coming to power, has imposed 58 new responsibilities on headteachers in England (*The Independent*, (19/01/07)), research (e.g., Bottery, 2007) has shown that the effect of such pressures is neither uniform nor predictable, for the personality and experience of the headteacher, as well as the relationships they have with significant others, radically affect the impact of such a legislative deluge.

As one moves from the purely micro- to the mesocontext, one moves to the influence of particular groups within an organization. Bryk and Schneider (2002),

through their work in Chicago elementary schools, provide a good example of this when they argue that trust, as well as other kinds of relationships, within educational institutions should be understood not as simply between individuals, but rather as between individuals taking on roles and responsibilities as a member of a group within the institution. The relationships then need to be seen as transcending the purely personal, for now individuals join with others to take on particular roles. The kind of interaction that occurs then, is what Bryk and Schneider describe as relational trust. In the schools they studied, the significant groups were parents, teachers, local government officials, and the principal. Each had a role to play, a particular objective to achieve. When each of these groups carried out their respective role obligations within the larger vision of institutional priorities, and each group saw that the other groups were doing likewise, the development of relational trust was strongly correlated with school academic attainment. Bryk and Schneider thus demonstrate that relational trust helped sustain a focus by all groups upon advancing the best interests of the children, rather than one which concentrates upon personal interests. Such an example indicates that a context can exist, which shares the characteristics of both the personal microlevel, and the institutional mesolevel.

The mesocontext of organizations can be conceptualized in a variety of ways. Morgan (1997), for instance, suggests that there are at least eight different images in which they may be viewed. As organizations have more of the attributes of one image than another, the dominance of particular characteristics can have major effects upon individuals within them. Morgan's image of the organization as a machine, for instance – described at various times by Weber (1970), Taylor (1911), and by Ritzer (1993) – emphasizes the characteristics of predictability, efficiency, calculability, and control, and tends to reduce individuals to performers of particular operations within a bureaucratized pattern of management. In so doing, however, it can reduce the capacity to think creatively, or ethically. Yet, one needs to avoid painting a too simplistic picture. No organization conforms completely to one image; it contains elements of many other images as well. Moreover, organizations will always contain a variety of different interests, and therefore will never be totally functional, totally rational in some simplistic hierarchical sense. Instead, Hoyle and Wallace (2005) argue that as organizations will always generate incommensurable values and demands, which in turn produce dilemmas and ambiguities, no amount of rationality, efficiency, or control will completely eliminate these. If this is the reality of organizations, then an awareness and acceptance of such ambiguity makes great sense, and becomes an essential leadership-survival tool. Through such appreciation, leaders will be able to better interpret and mediate macro-agendas into specific locations and contexts.

Hoyle and Wallace suggest that the last two decades of centrally imposed directives in the UK have exacerbated the generation of ambiguity and dilemmas, as they have prevented the local interpretation of legislation. In so doing, more ambiguities and dilemmas have been created, making the longer-term, sustainable practice of leadership that much harder. Greater professional and leadership autonomy is then not always a self-serving desire: it follows logically from the need to interpret policies or legislation into the local. Without an ironic disposition, and without the autonomy to make best sense of the local, institutional success is much more difficult. These then are powerful arguments for the recognition and significance of personal and institutional contexts.

The Macro

While the personal and institutional are local contexts, the national is a macrocontext for educational leadership practice, encompassing historical, social, and cultural backgrounds, as well as current legislative determinants of practice. Indeed, Grace (1995) argues that one can only understand the situation and challenges of English headteachers by appreciating this shared national background. The more recent periods of such experience, he suggests, are:

- the nineteenth century assumptions that headteachers would be leaders of educational hierarchies, concerned with control, and moral and cultural transmission;
- the mid-twentieth-century role of patriarchal leadership at a time of professional domination, with a remit to pursue a social democratic vision of the public good; and
- the late twentieth-century experience and expectations of headteachers in a quasi-market situation, where service competition, entrepreneurialism, and responsiveness were seen as central qualities.

It would seem that a further period can now be added to Grace's analysis:

- the early twenty-first century situation of being largely an outcomes headteacher, having to mediate a centralized, short termist vision of standards, value-added targets, benchmarking self-evaluation, and an integration with other services.

No other country has had quite the same experience. Thus, while US principals experience some of the current pressures of English headteachers, they come to their role with a very different tacit knowledge and understanding. Goodwin *et al.* (2005) describe the history of the American principalship as:

- a nineteenth- and early twentieth-century duty of producing an American citizen out of a melting pot of a culturally diverse immigrant population;

- a mid-century emphasis on the use of education as a response to perceived increasing Soviet competition;
- from the 1960s onward as having to deal with the implications of the civil rights movements for issues of equality, diversity, and tolerance; and
- most recently, in having to deal with the implications and fall-out from the No Child Left Behind Legislation of 2002 (Meier *et al.*, 2004).

Such historically different backgrounds suggest that while countries may share the same language, they do not necessarily share the same leadership assumptions. Indeed, such difference is brought out even more markedly when one examines the context of the Chinese principal. Thus, Ribbins and Zhang's (2006) analysis of the role of headteachers in rural China, allied to wider work by writers like Hutton (2006), suggests that at least four strands need to be recognized in understanding the role of the principal:

- the continued influences of the millennia of Confucian and patriarchal culture, which emphasize hierarchy, respect, and rote learning;
- the lingering effects of the cultural revolution, which is still seen by a few as a necessary counterblast to increasing Western capitalist influences;
- the influence of Communist ideology and of the power of the party, which still essentially controls the official political and educational culture of the nation; and
- the expanding impact of the new economic culture, which challenges the ideology of communism, and of its influence upon the individual.

In these, as in all other cases, it has to be asked if these are descriptions of the evolution of the role, or rather an accumulation of expectations. If it is the former, the role is likely to be more understandable, more manageable. There must, however, be doubt here; certainly in the English context, it seems to be less about smooth transition, and more about the jerky movement from one set of ideas and legislation by policymakers desperate to get their ideas implemented and evaluated as a success before the next election, to another group with similar short-term concerns. Indeed, this may well be part of the explanation for the increased stress and early retirements of educators seen throughout the Western world.

Moving to the Global

While contexts may be different, Levin (2003), in discussing the commonalities and differences between English-speaking countries' educational policy experiences, suggests that they share some similarities. Thus, while some may be less wedded to assessment and accountability, and there is differential adoption of policies within countries with federal structures, they nevertheless all share the same

economic rationales for educational change, possess a more critical climate toward professional practice than previously, declare similar pressures on additional educational funding, are engaged in forms of financial decentralization, and in the publication of results, and all see markets as vehicles to generate greater competition and choice. This, then, is a policy context, beyond any particular nation-state, which in an age of policy borrowing cannot be ignored.

It is a context which points to a final level which has been under-appreciated by educators. This is the global context, where a number of forces exert an influence transcending any particular nation-state, or grouping of states. There may be as many as nine of these forces (see Bottery, 2005), steering nation-states toward the adoption of practices and values, and from there down to organizations and individuals. This article examines three of these which have particular effect upon educational activities – technological, economic, and demographic globalizations.

Technological Globalization

Technology has huge influence on the current nature of globalization, partly because of the massive increase in the ability of people around the world to communicate and access information. It is however also in part because of the speed of such technology, which permits individuals to access, make decisions, and take action more quickly than ever before. Such trends then tend to democratize access to information. Indeed, as the cost of technology hardware drops, Friedman (2005) argues that another democratizing tendency takes place: the poor begin to compete on more level terms with the rich, and the level of competition moves from one between nations, to one between individuals. If the recent history of global economic competition has been in part that of Asian tiger economies catching up with their Western counterparts, the present situation is increasingly one where even at the highest technical level, competition is between individuals in rich and poor countries. They can now remain in Bangalore, India, or Dalian, China, and yet compete with the best of the West. The result, globally, is an even greater rate of change, and an intensification of global economic competitiveness. In such situations, Western governments are even more keen than previously to keep their workforces ahead in this game by re-engineering their educational systems to meet these demands.

As technological access, speed of interaction, and economic competition increase, they generate international education comparisons. Government advisors now talk of education as needing to be “world class. . . which matches the best anywhere on the planet” (Barber, 2000). When the vision becomes global rather than national, governments begin to judge their educational systems less by

comparing internal performances, and more by using international comparators. As policy and practice are then seen as international, national and local standards are expected to adapt to international benchmarks. As the vision changes, so does the purpose of education.

Economic Globalization

For some people, economic globalization is what globalization actually means. Certainly, it is an immensely powerful force which impacts on all other globalizations. It consists of a number of different elements. One is the acceptance of the use of free-market approaches as the best means of generating wealth, a view which has migrated to affect the structure and practice of many public sectors around the world. Thus, socialist prime ministers like Tony Blair talk of the choice between private and public provision of a service as a purely pragmatic decision: “what matters is what works” (quoted in Ainley, 2004: 507). Yet, so do Chinese communist premiers like Deng Xiaoping, who argues that the choice of communist or free-market economics in developing China’s economic base is no more important than choosing between a black or a white cat to catch mice: it doesn’t matter as long as it succeeds in achieving the ultimate objective. Free-market economics is then the overwhelmingly dominant global economic standard.

Yet, such adoption is not entirely a nation-state option, for, a second element of economic globalization is the influence of supra-national bodies like the World Trade Organization, the International Monetary Fund, and the World Bank, which facilitate the entry of nation-states into international agreements which prevent them from firewalling their economies against global financial movements. In so doing, nation-states become increasingly vulnerable to global financial market trends, a situation exacerbated by the speed of such transactions. Nation-states, however, are also weakened by a further force, – their increasing dependency upon the investments of multinational corporations, who search out the most profitable national locations for their operations, moving these as and when they see greater profitability elsewhere (see Korten, 2001).

The acceptance of the free-market paradigm globally, the global nature of financial transactions, the national vulnerability to international financial transactions, and the actions of multinational corporations, are large elements in what Bobbitt (2003) argues is the transmutation of the nation-state into the market state. According to him, nation-states, unable to provide the historic degree of protection and welfare to its citizens, are aligning themselves with neoliberal economic policies through the provision of an increasingly privatized range of different educational mechanisms. Their role then is reduced to providing opportunities for citizens to generate individual

wealth. This, Bobbitt argues, has been most strongly seen in the regimes of Bush in the US and Blair in the UK, and likely underpins policy moves in England over the last few years toward greater consumer choice, through the creation of specialist schools with a degree of private investment and considerable private control. While such effects may be rather more parochial than Bobbitt might believe, and vulnerable to changes in political leadership, this does seem a good example of how difficult it is to appreciate national policies without understanding the global context within which such ideas are generated.

Finally, because markets reduces educational activity to that of an individual good, such globalization effects prevent the articulation of the kind of vision for education which Grace (1995) suggests it must have. For him, education can develop in citizens “a moral sense, a sense of social and fraternal responsibility for others”(p. 214), and by doing so, provides the basic conditions for making democracy possible. He argues that, because of this quality, education should be accorded the status of a public good. Given such a global economic context, a third essential leadership disposition, then, in addition to those of irony and autonomy, is a belief in education as an activity transcending the satisfaction of the purely personal, and of the re-statement of education as a good for society as a whole.

Demographic Globalization

One further significant global force impacting on education systems currently is a general increase in the age of populations, at the same time as there is a decrease in fertility (Business week (2005)). Where this occurs, there is a threefold result. First, there is a decline in the proportion of children in a population, and therefore a decline in the number of schools and teachers required. Second, there is a decrease in the percentage of a population who work, and who therefore contribute taxes. As governments then recognize the financial implications of lower tax revenues, of increased spending on pensions, and of having to devote more resources to treating the chronic diseases characteristic of the elderly, policies are generated which are aimed at reducing pensions, or raising the age of retirement. It also means that not only are there less pupils, less schools, and less teachers, but as tax revenues decline, there is less money for remaining educational activities. In such situations, governments are very careful with the money that they do have, wanting more of its control and direction, and greater value for what is spent. The effect on educators' work has been apparent for a couple of decades at least. While the economic globalization of neoliberal policies has led to greater marketization, choice, and competition,

demographic factors have paradoxically led to greater control and direction of professional work, and greater accountability for what they do. In the process, notions of professional autonomy are seriously eroded.

The result highlights once again the ambiguity and irony pointed up by Hoyle and Wallace (2005); this time, contradictory global pressures are the ultimate causes, as government policies of both control and fragmentation are visited upon institutions, which have to be managed, mediated, and implemented by individuals within them. A lack of appreciation of such a global context, and of the forces emanating from that level, leaves professional educators parochial and myopic, unable to see why things are happening the way they are, and therefore unable to articulate for themselves, their pupils, and their communities, why such things are happening, and what can be done about these. If knowledge is power, a lack of appreciation of the global context leaves professionals powerless. This then suggests a fourth and final necessary leadership disposition – the need to develop an ecological view of leadership – one which appreciates the range of contexts that impinge on professional practice and identity, which recognizes that this range extends to the global, and which can understand how such forces affect the work of individuals and institutions.

Conclusions

Context is normally seen as an appreciation of the local, yet, if one is to truly understand the effects of standardization and control, or the marketizing tendencies in education over the last 20 years, one needs to understand the wider contextual situation within which professionals work. Such an ecological perspective then enables educational leaders to better utilize both an ironic pragmatism and an autonomy in translating such macroforces within the particular meso- and micro-contexts they inhabit. However, these three dispositions or qualities, while essential to a more successful and more humane educational practice, also need to be informed by a heightened valuing of the public nature of education, and of the appreciation of its erosion by elements of national and supra-national contexts. In such ways do educational leaders understand that context extends from the personal, through the institutional, past the national, and all the way to the global, defining, determining, and directing their work. Without such an appreciation, they are blind, and the danger is, as Matthew, verse 14 states, “...if the blind lead the blind, both shall fall into the ditch.” The next generation will face enough problems in the twenty-first century without being led by those who cannot, or will not, see.

Educational Leadership: Philosophical Issues

C W Evers, The University of New South Wales, Sydney, NSW, Australia

© 2010 Elsevier Ltd. All rights reserved.

Glossary

Coherentism – A pattern of justifying theories, or sets of knowledge claims, that appeals to a range of criteria, including empirical adequacy, consistency, simplicity, comprehensiveness, explanatory unity, and fecundity.

Epistemology – A branch of philosophy that deals with the nature and justification of knowledge claims.

Ontology – The branch of philosophy concerned with the nature of being and existence.

Postmodernism – A philosophical doctrine that claims that particular epistemologies have only the status of meta-narratives, or stories, about knowledge and its justification, and are not themselves justified.

Theory – A body of interconnected claims related to some topic or set of topics.

Introduction

Although discussions of educational leadership presume stances on many philosophical issues, these issues are often hidden or regarded as background, and despite some notable exceptions, are rarely discussed explicitly. Yet, they exert an enormous influence over substantive positions taken with regard to how educational leadership is to be understood, theorized, and practiced.

In an effort to render these influences more transparent, and therefore open to critical commentary, the article is structured according to major philosophical categories that bear on different aspects of educational leadership. Because philosophical ideas have most bearing on conceptions of leadership theory, this is the main focus of this discussion.

Educational Leadership Theory and Science

What can we reasonably expect of a theory of educational leadership? One approach asserts that such a theory should have a normative function, offering advice on what ought to be done in educational contexts, concerning not just the means to achieve certain ends, but also the ends themselves (Begley and Johansson, 2003; Hodgkinson, 1978,

1983, 1991, 1996; Samier, 2003; Sergiovanni, 2006; Starratt, 2004). However, many writers place a premium on leadership theories that purport to be scientific where this sense of the term is thought to exclude norms or values as elements of theory (Hoy and Miskel, 2005). In this approach, leadership theories are descriptive, serving as guides to practice only when it comes to means for achieving goals that have been determined by appeal to normative resources that lie outside these theories. Here, the divide between these perspectives is portrayed as a contrast between leadership as a science and leadership as primarily an ethical and political discipline. Views about the nature of leadership theory are thus shaped by views about the nature of scientific theory.

Within the so-called Theory Movement at the center of attempts, during the 1950s in North America, to reconceptualize educational administration as a more rigorous academic discipline, a good scientific theory of leadership was claimed to possess the following properties, thought central to behavioral science:

1. A hypothetico-deductive structure of empirical claims, with more general claims at the top of the structure and more particular derivable claims descending downward from the top.
2. A procedure of justification based on empirical testability having two components. If empirical claims derived from the theory are actually observed to be the case, then the theory is confirmed. If they are refuted by empirical evidence, then the theory is said to be disconfirmed. A theory is more justified than its rivals if it has more confirmations and fewer, or no, disconfirmations.
3. All theoretical concepts should be operationally defined in terms of some measurement procedure or instrument.

The above-mentioned properties, typical of logical empiricism, found their way into the dominant systems theoretic accounts of educational administration that continue to exert influence today (Evers, 2003a). When applied directly to leadership theory, logical empiricism yields what purports to be a science of leader behavior. An early influential example is Halpin's (1966: 81–130) study, 'How leaders behave', where he describes the methodology in the following terms:

By measuring the behavior of leaders ... we can determine by objective and reliable means how specific leaders differ in leadership style, and whether these differences

are related significantly to independent criteria of the leader's effectiveness and efficiency. In sum, the Leader Behavior Description Questionnaire offers a means of defining these leader behavior dimensions *operationally*, making it possible for us to submit to empirical test additional specific hypotheses about leader and group behavior (Halpin, 1966: 88).

Notice that within this framework of assumptions, ethics is excluded from leadership theory because what functions as evidence for such theory is observable behavior. That is, the evidence will always be about what leaders do, not what they ought to do. As Halpin (1966: 8) puts it, "the immediate purpose of research is to enable us to make more accurate predictions of events, not to prescribe preferential courses of human action."

Also excluded is methodological recourse to a leader's unobservable thought processes such as having certain intentions and beliefs, or holding a particular interpretation of events. We may, of course, define these operationally from patterns of observable behavior; however, the subjective inner episodes of cognition and affect cannot themselves constitute empirical evidence.

These philosophical ideas also influence the formulation of research designs, and even research questions, in the empirical testing of theories of leadership. For example, one issue of much interest is the matter of the effect school leaders have on student learning outcomes. The sorts of statistical analyses reported in meta-analyses conducted by Hallinger and Heck (1998) or Witziers *et al.* (2003) attempt to measure correlations among a range of observed leader behaviors and learning outcomes, or to calculate effect sizes of leadership activities. Evidence of small or no effect sizes in turn figures in assessing, for example, the merits of transformational leadership over instructional leadership (Hallinger, 2003).

The demise of logical empiricism in philosophy in the 1950s and 1960s, at the hands of Quine (1951, 1960), Hanson (1958), Popper (1959), and Kuhn (1970), among others, did not lead to its similar demise in educational administration; however, it did usher in a range of alternative perspectives during the 1970s.

Generality in Leadership Theory

In addition to philosophical disputes over what is admitted into the content of a theory of educational leadership, there is a more fundamental dispute over what it means for a theory of leadership to describe anything. There are two main strands of argument. Concerning the first, even if there is agreement that a theory of leadership can somehow represent phenomena in the world, debate exists over how much generality we can expect such representations to express. Traditional views of science place a premium on law-like generalizations, a reasonable-enough emphasis

where the phenomena under investigation are relatively invariant with respect to contextual variables. However, in the study of leadership in particular, and social science in general, the boundary between context and the phenomena to be described is difficult to draw and, in some cases, may be impossible to draw in principle. Hence, it is claimed, a theory of educational leadership will be about particulars, not generalizations, and making good inferences from this sort of theory to guide practice will be an art, or perhaps a craft, not a science.

This point is made in an incisive way by Donmoyer (2001), following some ideas developed by Toulmin (1972, 1993). His claim is that in meeting the challenge of deciding what to do in social contexts, the sort of theory that decision makers need to appeal to is not that given in scientific theory, but rather that which pertains to a policy field. For example, in deciding where to build a dam, the answer that engineers might give, based on a fairly narrow range of technical considerations, could be different from the answer that policymakers give.

The latter group must balance the engineers' technical concerns with a host of other concerns and values. They might, for example, need to consider such things as economic impact, the toll of neighborhood disruption, and even whether particular decisions will affect their own or their party's re-election. (Donmoyer, 2001: 566)

Scientific theory is thus the wrong model to apply to these sorts of multidimensional, multicriterial decisions since it is the particularities of each case that can be crucial. So if a theory of leadership is centrally a theory of contingent leader behaviors, the difficulty is that both leaders and the circumstances of their actions are so immersed in the particularities of individual differences and the unique features of contexts of action that the scientific notions of generalization, prediction, and deductive explanation from more inclusive empirical claims becomes untenable.

In replying to this argument, observe, first of all, that it assumes something similar to a logical empiricist view of the nature of science. However, more recent philosophies of science also reject this characterization of science (Godfrey-Smith, 2003). Take the quest for law-like generalizations, reasonable in, say, physics, but hardly possible in social science. Nevertheless, there exists a range of orderliness in the world between the ideal of exceptionless laws in physics on the one hand and randomness on the other. The possibility of social life is only sustained by a vast number of patterns in social behavior. We catch planes, drive on busy roads, turn up for work, and are participants in a thousand social activities that are accomplished by organizations whose existence and conduct is sustained by both the expectation and the accomplishment of regularities, or patterns, in the social world.

This range or orderliness is captured by the scientific concept of compression. Following Chaitin (1975) and

Dennett (1991), we say that the more the data can be compressed, the greater pattern they exhibit, where compression means that we can find an expression for the data that is shorter than that required to describe every individual item. Very high degrees of compression can be found in the natural sciences where simple formulas compress vast amounts of data. However, even in the social sciences, the practice of explaining, predicting, and understanding human behavior in terms of the rational coordination of beliefs and desires achieves significant levels of compression.

Second, decision making that involves the satisfaction of multiple soft constraints is actually one of the proposed methodologies for choosing scientific theories, according to recent approaches to theory choice. Not only is empirical adequacy required, but so also are simplicity, comprehensiveness, consistency, explanatory unity, and fecundity. These criteria are more extensive than the traditional logical empiricist criterion of empirical adequacy and are known as coherence criteria (Evers, 1999; Churchland and Hooker, 1985).

Recently, a number of writers on leadership have argued that the traditional science model is compromised further by the unpredictable or even chaotic behavior of some complex systems, including social systems. It is argued that the whole idea of making inferences from generalities in theory should be replaced by the development of learning strategies that take us beyond known particulars (Morrison, 2002).

Hallinger (2003: 346) raises the less exotic possibility that no one model of leadership may be suitable because of the wide range of variation in the contingencies of its application and that “it is virtually meaningless to study principal leadership without reference to the school context.” Once differences in students and their backgrounds, schools and their social and economic location, resources, staffing expertise, and the bureaucratic and organizational arrangement have been taken into account, it is at least an open question whether any particular theory of leadership will be suitable.

One way of combining the effect of radical contingency with the idea that we can build warranted theories of leadership is to locate the task of theory building at the level of the school leader. Suppose that principals approach the tasks of leadership from the perspective of being critical learners. In dealing with problems, they apply their knowledge in the form of a tentative theory, engage in testing their theory against the demand that problems be solved, and improve their theory in the light of this experience by making coherent adjustments to it so that it better provides solutions. Assuming that something similar to this sequence of epistemic procedures makes for some growth in knowledge and allows principals to do better than chance in problem solving, decision making, and acting in the world, we end up with a lot of good

theories of leadership tailored to the contingencies of particular circumstances, but with the possibility that they have little in common (Evers and Katyal, 2007).

The second main strand of argument, associated with postmodern views of educational leadership, by denying the assumption of epistemically progressive procedures that enable the growth of knowledge, denies that theories are known to represent. Rather, theories are best seen as narratives, or stories that we tell ourselves, and are not to be judged on their truth content, because the categories of truth and falsehood are thought not to apply, but on their esthetic qualities, or perhaps their role in giving voice to interests that are silenced (English, 2003; Maxcy, 1994, 2001). According to Maxcy (2001: 585), for contemporary school administrators “theory’s role becomes one of reinterpreting the meanings that attach to practice, transforming them as part of an interpretive rather than justificatory enterprise that is at once critical aesthetics and practical artistry.” This is a position that draws heavily on skeptical arguments taken from epistemology. These arguments are believed to show that knowledge has no foundations and that, as a consequence, theories cannot be said to refer to things in the world. (See Donmoyer *et al.* (1995) for a range of applications of this view.)

As with all major philosophical disputes, debates over skepticism are both complex and enduring. However, in replying to postmodern critics of leadership theory, the broad strategy can easily be sketched. In general, a defense of doubt either requires some foundational premises to start the argument, or doubt needs to emerge from a more coherent nonjustificationist viewpoint. If the former is the case, then the attack on foundations of knowledge seems to require the very thing it is attacking. If the latter is the case, then coherence is functioning as a form of epistemic justification that does not require foundations. This latter alternative opens the door to the possibility of administrative and leadership theories that are justified by appeal to coherence epistemic criteria (Evers and Lakomski, 1991).

Leadership and Ontology

Ontology is the study of what exists, including criteria for positing existence and the natures or categories of posited entities. The link between epistemology – the machinery used to justify theories – and ontology is particularly close where it is believed that what exists is something that is known from what our most warranted theories say exists (Quine, 1948). Nevertheless, other considerations also can determine ontological issues, particularly where the epistemological enterprise is thought to be mistaken.

One longstanding dispute in the field concerns whether the explanatory apparatus of natural science is the appropriate framework for conducting social science and building theories in social science. This issue was first

raised is a particularly clear and incisive way by Thomas Greenfield, initially in 1974, and then, increasingly in a series of publications in which he sought to defend a radically subjectivist view of epistemology and its ontological corollaries (Greenfield and Ribbins, 1993). At issue is whether a theory of administration should try to describe the world as it really is, or whether that is a mistaken goal and such a theory should be concerned with how different people construe the world in different ways. Greenfield takes the latter view, with the result that, for him, theory is not sets of law-like generalizations about society and human conduct, but rather, is “sets of meanings which people use to make sense of their world and action within it” (Greenfield and Ribbins, 1995: 7). However, if reality is how people see things and a matter of their interpretations, understandings, feelings, intentions, reasons, and will, then the ontology of the world cannot be separated from these various subjective acts of interpretation, understanding, and the like. Hence Greenfield’s claim that “organizations are invented social reality” (Greenfield and Ribbins, 1995: 7). It follows from this that so also are leaders and leadership roles.

Although Greenfield’s approach takes its cue from skepticism about the objectivity of traditional science when applied to human affairs, skepticism does not automatically spill over into explanations in terms of human subjectivity, especially where these are to do with reasons (as opposed to causes), because these are subject to their own normative constraints, not everything counting as a good reason. Moreover, a measure of intersubjectivity is required to sustain the kind of collective intentionality necessary for organizational and social life. For someone to be seen as a leader in organizational contexts requires a lot of others sharing that interpretation. Searle (1995, 1998), for example, has developed a view of social explanation that combines a rigorous defense of objectivity in epistemology with a thoroughgoing interpretivist perspective on the understanding of social life. In addition, as we saw earlier, the regularities that underpin the very possibility of social engagement, although not law like, may turn out to be explicable in terms of a science of patterns after the fashion of Chaitin’s (1975) or Dennett’s (1991) work. (See Macmillan (2003) for critical perspectives on Greenfield’s ideas.)

In leadership studies, ontological issues traditionally arose over the question of whether leadership is best characterized in terms of a set of special attributes, or properties, or traits that leaders possess. Although the quest for a stable set of traits possessed by those who are clearly leaders has been carried on extensively as an empirical research program by many scholars, the results have been disappointing. There does not seem to be any obvious nontrivial trait, or set of traits, that all leaders possess, or which is essential for the performance of leadership tasks.

Some writers have suggested that the absence of manifest leadership performance is not sufficient evidence for the absence of essential leadership capacities; instead, context matters. For example, Winston Churchill’s leadership capacities manifested in the context of war, but arguably, not in peace. Under this common contingency view of leadership, leadership behaviors are the result of a combination of leaders possessing certain capacities, together with the existence of appropriate contexts in which leaders can act suitably (Hoy and Miskel, 2005: 375–409). One problem with this view is that it presupposes that the relationship between purported traits and their contexts for manifestation is well understood. However, this is not the case. At the center of the issue is the need to understand the relationship between individual agency and the structures that contexts impose. Generally speaking, social science does not always permit an allocation of causal responsibility to leaders concerning particular outcomes in causally complex situations.

A further problem for a distinctive ontology of leadership is that there is evidence that leadership is a relational property and, therefore, not intrinsic to leaders. To give an example of this sort of property, being a husband is not an intrinsic property of a man, but rather a relational property that depends on having a wife. That is, husbandhood is not some kind of latent capacity that is manifest by becoming married, as a contingency explanation would have it. Rather, one acquires the property of being a husband when one marries. In the same vein, it is argued that leadership cannot be conceptualized in the absence of followership. The parallel with husbandhood is particularly close where we are dealing with leadership in the context of constitutively defined roles, that is, roles defined by contracts, legislation, or some network of social rules. Leadership will thus only make sense within the relational leader–follower nexus.

Recent work on distributed leadership makes an ontology of leadership even more problematical by combining causal complexity with relational conceptualizations. Lakomski (2005) has argued in a very detailed way that much of the evidence we have for making attributions of leadership is, in fact, evidence for no more than coordinated behavior attributable to very local cues. To give an example, the flocking behavior of birds looks like it critically depends on there being a lead bird that all the others follow. However, a closer analysis reveals that flocking can be simulated in models where birds are merely responding to what their immediate flockmates do (Reynolds, 1987). They do not get too close or too far away from each other, maintain the same speed, and head in the average direction of those that are nearest (Lakomski, 2005: 122–123). Lakomski’s point is not that all organizational leaders are ontologically similar to lead birds in terms of leadership attributions. Rather, she is objecting to the methodological presumption, a kind of

commonsense consensus, that they are not. This is the sort of consensus that Resnick calls the centralized mindset and says that it “is not just a misconception of the scientifically naïve. It seems to affect the thinking of nearly everyone” (Resnick, 1997: 4).

The upshot of these arguments is that the ontology of leadership may fragment in much the same way as causal attributions of leaders’ contributions to the achievement organizational goals in the presence of variable contingencies. That is, leaders may require some attributes in some contexts and other attributes in other contexts. They may be similar to lead birds in some organizational settings and like leaders in others. There may be no general theory of leadership from which we can read off the required ontological posits.

Epistemology, Ethics, and Leadership

In discussing the nature of leadership theory earlier, it was clear that epistemology had a significant part to play in shaping the structure of these theories. However, epistemological considerations also figure in determining, or adjudicating, the content of leadership theories. For example, theories that require of leaders knowledge that outruns the resources posited by good epistemology imply that leaders are required to know things that they cannot know.

As an example of this kind of critique, consider the case of transformational leadership. Proposed in many places as an adjunct to implementing rapid change, particularly varieties of school-based management which are subject to the twin demands of autonomy and accountability, transformational leadership purports to promote organizational goals by transforming the followership in four distinctive ways. Such leaders act as an idealized influence, being trusted and respected, and indeed charismatic; they exercise inspirational motivation, changing expectations and forging a shared vision; they provide intellectual stimulation for problem solving and creativity; and they attend to the needs of individuals (Leithwood *et al.*, 1996). In examining this theory, epistemologists would ask how someone could ever acquire the knowledge required to be an effective transformational leader. Consider the matter of promoting a shared vision. Apart from the trivial sense where vision is analytically related to the nature of the organization, visions can sometimes be mistaken, and when they are not, the means chosen to achieve them, such as outcomes from problem solving, can be. In the absence of leader infallibility, organizational mechanisms for error detection and correction become a vital epistemic tool for achieving organizational outcomes.

This raises the more fundamental question of how an organization goes about facilitating error detection and

correction. The difficulty is that on the one hand, any kind of leadership that influences others on a course of action contributes to decisive decision making and efficient implementation, while on the other hand, leadership that has the power to influence the actions of others also has the power to privilege a leader’s ideas, thus contributing to confirmation bias, a form of groupthink where potential error signals are construed as confirming a leader’s vision and strategy, even when these are wrong, hence impeding organizational learning. Hutchins (1995: 260–261) regards the trade-off between effective decision making and reducing confirmation bias as a basic organizations issue, varying in terms of an organization’s goals and its value commitments. This epistemic argument thus pits a preferred model of fallible leadership against the demands for organizational learning.

Also raised is the question of the place of values in leadership theory. As we saw earlier, traditional science approaches to theory located values beyond the scope of theory, owing to a belief in a sharp distinction between fact and value (Simon, 1976: 45–60). The logical empiricist epistemology that underwrites the traditional science of administration sees theories as being justified by appeal to facts, but value justification lies beyond appeal to facts. Values reflect an attitude to facts; they are not justified by facts. Or so the story goes. In response to this argument, Hodgkinson (1978, 1983, 1996), in his many writings, has concluded that administration is therefore not a science at all, but rather a humanism. Furthermore, he claims that there is an isomorphism between epistemic access to levels in a hierarchy of the types of moral decision making and one’s position in an organizational hierarchy. Administrative leadership, as opposed to management, invokes awareness of the highest level of moral knowledge, the type I values that are transrational and intuited as the right courses of action (Hodgkinson, 1996: 157).

Most writers in the field accept some distinction between facts and values. However, those who defend coherentist models of justification blur the distinction, seeing the justification of moral claims as on a par with the justification of other theoretical empirical claims; namely, they are justified if they are part of a more coherent rival theory (Evers, 2003b). Those of more Aristotelian persuasions defend ethical claims by appeal to the good character of leaders (Sergiovanni, 2006). Those in the critical theory tradition defend ethical claims by appeal to the extent to which the normative requirements of maintaining an ideal speech situation in organizational life are attained (Foster, 1986). In addition, those within the Deweyan tradition defend such claims by appeal to their role in describing the conditions that best serve to promote the growth of knowledge (Willower, 1994). Perhaps the most explicit appeals to the ideas of philosophy are to be found in discussions over the place of ethics in leadership theory and practice.

Conclusion

Philosophical ideas about the nature of leadership theory, of its ontology, epistemology and ethics, or axiology, are at the center of theoretical discussions of educational leadership, and presumed by other types of discussions. The characteristic methodologies of philosophers therefore have the potential to make a decisive contribution to thinking about educational leadership.

Ethical/Moral Issues in Educational Leadership

The Societal Context of Ethical Leadership

Increased technological advances as well as the relentless rationalization of layers of administrative control of corporate and governmental institutions have led many to question the significance, for human beings, of progress made in the name of economic rationality. This questioning is notably visible in ethical issues surrounding, for example, moral accountability for illegal corporate decisions, when the complex maze of decisions appears to relieve individual administrators from responsibility for their actions; moral accountability for the degrading of the natural environment; moral accountability for the suppression of civic participation of cultural, linguistic, and religious minorities; and moral accountability of commercial and governmental institutions for enormous disparities of wealth and social privilege within their own communities, as well as for fellow humans facing dramatic problems of starvation, displacement, crippling diseases, and tribal violence in the Third World. In a rapidly interdependent, globalizing world, these issues inevitably become moral issues for everyone. The market-economy era, which was supposed to bring with it increased wealth, freedom, and prosperity for all, appears to have delivered its promises to a few at the expense of aggravated inequality and injustice for many. The world is currently mutating under the influence of globalization and increased social and political interdependence and these mutations seem to imply major modifications in society's moral bearings.

Within this globalizing and interdependent social context, educators and schools face a variety of ethical concerns, varying in intensity from country to country and culture to culture. The context of economic development or underdevelopment; of race, gender, language, and cultural inequalities; of differing religious communities and political ideologies; of the level of professionalization and social status of educators; the epistemologies behind various learning theories – these and other contextual factors tend to shape and weight the ethical issues that one finds at the forefront of public debates. What follows in this section are verbal reports from educators and scholars in various countries, intended to provide a small sample of ethical issues and debates within and around the field of education and educational leadership.

In Canada, one debate highlights the developing ambiguities and political ambivalence around the professionalization of teaching. Political disagreements between provincial governments and teacher unions around government control over the content and process of teaching; the establishment or imposition of codes of ethics for teachers, whether by the union or by the government or by negotiation between the two; the evaluation of teachers by administrators using government-designed criteria (e.g., standardized tests), or professional criteria (research-based or otherwise) – all these raise issues around the rights, responsibilities, and ethical identities of teachers as professionals. These rights are inescapably connected to the rights and responsibilities of governments – led by politicians of various ideological commitments who are charged with providing the funding for schools – to impose standards. That brings into focus the rights, responsibilities, and ethical identities of educational leaders whose responsibilities simultaneously overlap, and sometimes conflict with responsibilities to the local and provincial governing agencies, to the rights of students, to the rights of teachers, to the rights of parents, and with the fundamental educating mission of the school.

Many groups including racial minorities, women, indigenous peoples (natives), and religious minorities in Canada feel excluded from a common culture not only because they are economically disadvantaged but because they are different. Some groups demand the incorporation and enforcement of their traditional or religious codes within the dominant school system. Muslim communities ask for their girls to be excused from gym classes; Sikh communities request their sons to be allowed to wear their kirpan.

The special accommodations demanded by immigrant minorities, religious groups, gays and lesbians, and other such identity groups, are typically designed to facilitate the integration of their members into the larger society, not their separation (Normand and Kimlicka, 2003: 221).

Education and educational leadership in Australia and the United States is characterized by continuing ideological tensions between the states (constitutionally, the primary governing agency responsible for education) and the federal government, which is increasingly driving the educational agenda with focus on the national interest. Ostensibly, it constitutes a clash between federal political

and economic ideologies and the more socially oriented tendencies of the state governments, influenced as they are by local political pressures. The ethical challenges in education, generally, parallel those in Canada, for example, development of a national curriculum framework, national testing regimes and standardized forms of reporting to parents; national standards for teaching and school leadership; and, at the same time, the contradictory calls for the greater professionalization of teachers (Legault, 1999).

Much of the debate in educational circles on this emerging national agenda tends to be more ideological and political than ethical and moral. While considerations of care and justice influence the critique of the national initiatives, these tend to be subsumed within the political and ideological rhetoric, which surfaces during state and federal elections. The media's moral compass seems to be directed much more toward recent ethical and moral scandals in the corporate world. There is little evidence of a national dialog and debate on the ethical dimensions/contradictions within the emerging federal policy agenda on education and educational leadership (e.g., student, parental, teacher rights; values, other than economic prosperity, involved in educating the young; etc.).

In differing conditions, educational leaders in South Africa face quite different ethical issues. In rural communities, for example, the lack of technical, financial, and professional resources, as well as the poverty of the communities being served, leaves local educational leaders with multiple, more basic dilemmas, for example choosing to devote meager budgetary funds to provide snacks for children or new textbooks, to include adult literacy programs for the parents of the children in order to increase parental collaboration with the school's literacy education of their children, or to devote some funds to AIDS prevention seminars for adults (including teachers, among whom exists an alarming rate of HIV infection). In South African cities, educational administrators face not only the lack of sufficient funds, but also tribal rivalries and allegiances, among groups of parents, teachers, and students, that challenge administrative attempts at an equitable distribution of resources and influence within the school. Educators face similar ethical issues in other African countries, with the additional problem of political instability, displaced populations, and armed, intertribal and religious violence.

In Sweden, other ethical challenges for educational leaders surface around the long-established mission of the schools to educate for democratic participation in the country's civic life, as the cultivation of that mission encounters traditional attitudes about the role of women in public life, and the more recent influence of the corporate community to concentrate on education for economic and technical proficiency.

Thus, when surveying the ethical challenges educational leaders face, one is confronted by a multiplicity of

perspectives, both analytical, ideological, and political, that tend to reflect the differing societal and internal contexts of schools and the differing perspectives – traditional, progressive, research-based, individualistic, or communitarian focused – on the process of educating the young. These realities suggest the necessity of careful analysis of differing perspectives as a necessary methodology of ethical deliberation, as well as a weighing of consequences of various choices.

Theoretical Developments in the Ethical/Moral Agenda in Education

In the past 20 or so years, there have been significant theoretical developments in the area of ethics in education in general. The work of Kohlberg (1981) and his associates at Harvard University highlighted the cognitive development of reasoning about ethical issues of justice, bridging the earlier work of Piaget and Inhelder (1969) on cognitive development with Rawls' (1971) theory of justice. Kohlberg developed an approach to a just community school in which he attempted to encourage a pedagogy in line with his stage-theory of cognitive moral development. One of his students, Carol Gilligan developed an alternative view of women's moral development, one characterized by a primary concern with relationships (Gilligan, 1982; Gilligan *et al.*, 1988). This highlighting of women's ways of knowing and thinking (Belenkey, 1986) was further reinforced by the work of Nel Noddings (1984) on the ethics of caring.

In the meantime, a number of scholars' voices had been raised in various criticisms of schools, criticisms that pointed to deep structural and cultural inequities in schools that, in turn, were rooted in the attitudes and beliefs that underlay inequities in society at large. These critics would agree with Karen Lebacqz (1987: 10) who argued that, "reflections on justice must begin with the realities of injustice." This approach to ethics in education begins with a view of a world already steeped in ethnic and racial injustice, sexual injustice, economic injustice, political injustice, and cultural injustice – each strand of injustice often interwoven with one or several other strands, creating a social fabric of institutionalized, legitimated injustice. As Lebacqz suggests, within such a social fabric, decontextualized discourse about justice cannot help but be distorted by the social context of widespread, if unexamined, injustice. Authors such as Freire (1970), Bowles and Gintis (1976), Apple (1982), Giroux (1983, 1988), Bates (1983), Foster (1987), Spring (1988, 1994), Pagano (1991), Nieto (1992), Purpel (1989) and others provided the analysis of injustice both as it infected the way schools were run as well as the choice of the content and pedagogy of teaching. Their critique implied an ethic, an ethic of resistance and a struggle for emancipation based on the inherent human dignity of those who were institutionally disenfranchised

because of their race, sex, economic class, cultural identity, language, sexual preference, or politics.

In the last decade or so of the twentieth century in the United States, these three ethical discourses seemed at war with each other. Those proposing an ethic of justice upheld a rational, principled approach, in opposition to what they characterized as disjointed, emotional, or subjective responses to moral dilemmas. Those espousing an ethic of care criticized adherents of the ethic of justice as embracing an impersonal, decontextualized, rationalistic form of ethics. The scholars immersed in the ethic of critique accused the proponents, of both an ethic of justice as well as an ethic of care, of naiveté. That is, in specific ethically charged situations in institutions that were already structurally and culturally compromised, a search for justice or affiliative community could not be conducted as though those institutions were ethically neutral.

Emerging Theory of an Ethics Served by Multiple Perspectives

Starratt (1991) argued against the apparent separatism of each ethical position, proposing that each ethic could find its deeper fulfillment only and necessarily in a larger synthesis of the three dominant ethical discourses. If an ethic of justice were to avoid a minimalist approach to estimating what could be considered just, then it would need to be filled out, deepened, or made more humane, by an ethic of care that would ensure a level of generosity in applying the justice formulae. Some morally charged situations calling for the care of a friend or child might also require consideration for the common good, and for complying with the demands of justice. Some situations raise questions not only about the fair application of a school rule, but also about the rule itself, thus bringing the ethic of critique into play. On the other hand, in order to avoid the ranting of the perpetual malcontent or the cynicism of the self-righteous, the ethic of critique needs to be tempered by some sense of compassion for human weakness and moral ineptitude. While some cases will require a heavier emphasis on an ethic of caring, others will require an emphasis on critique or justice. Still other complex cases will require a combination of all three ethics in their fuller resolution.

Subsequently, Strike teamed up with Noddings and Katz to search for common ground between the ethics of justice and caring (Katz *et al.*, 1999). While the essays in that book were too diverse to construct a coherent umbrella for the two ethics, the book pointed to the complementarity between both ethical approaches. Furthermore, as Strike (1999) pointed out in his essay, it would be a mistake to assume that the ethics of justice and caring encompassed the whole field of educational ethics and its many complex problems. That suggestion

echoed the earlier work by Capper (1993) who had stressed the need for a multi-paradigm approach in her collection of essays that reflected the challenges a pluralistic society pose for educational leaders.

Nash's (1996) ecumenical approach for developing legitimate, but differing bases for understanding the real world of ethical situations, also agrees with Strike's argument for using multiple perspectives. His book on the ethical education of educators and other human service professionals suggests that values and beliefs derived from one's upbringing should be taken seriously, not discounted out of hand. Rather, he would have his students test those ethical beliefs and values in explicit applications to various ethically charged situations. He encourages, also, an ethical exploration of moral character based on foundational virtues that seem essential to a fully human life. Finally, he had his students explore the application of principled ethical reasoning to various situations. Throughout his book he refused to provide correct answers, insisting that everyone take responsibility for their choices to respond to each situation and provide reasonable defenses for those choices.

In Australia, the work of Haynes (1998) analyzes multiple ethical theories and perspectives but argues that it is not "... useful to treat them as oppositional theories, but as theories that simply pick up different aspects of morality" (1998: 8). She recommends that educational practitioners should learn to reflect on ethical and moral challenges in a rational way, rather than adopt a stance of unthinking acceptance and they should develop their criteria or standards for moral judgment through dialog on the propriety of their actions and those of others.

Shapiro and Stepkovich (2001) turned their experience of team-teaching a course in ethics to prospective school administrators into a book. They echoed Capper, Strike, and Nash in arguing for multiple paradigms, including both a personal and a professional code of ethics. They call attention to the ethic of the profession which is centered around the best interests of the student, thus bringing deliberations derived from all of the ethical perspectives into focus around this core value.

Emerging Awareness of Ethics and Values for Educational Leaders

Starratt (1991) proposed an ethical perspective specifically for school leaders and administrators. That same year, Hodgkinson (1991) published *Educational Leadership: The Moral Art*, considered by some as his best work. Hodgkinson, steeped in classical philosophy, argued that educational leadership embodied by its very nature various moral commitments, and called forth the virtuous character of the leader. No doubt educational leaders needed professional expertise and a commitment to reasoned

decision making. Nevertheless, as leaders of an educational enterprise that involved adults working carefully to effect the human growth of young people, their leadership involved them in the moral character of that work.

The 1990s saw the growth of interest in the moral/ethical side of school administration among scholars and university professors involved in the preparation of school administrators. Strike *et al.* (1988) published their influential work, *The Ethics of School Administration*, which moved much of the ethical analysis developed in their earlier work on the ethics of teaching (1985) into a focus on the work of administrators. Their analyses of various cases of administrators caught up in morally complex cases tended to employ a Kantian emphasis on the inviolability of persons, the utilitarianism of Mill, and the classical liberal theory of justice espoused by Rawls. Beck (1994) applied the ethic of care to the practice of educational administration, showing in the process that educators acting out of an ethic of care often were led also to tackle issues of justice in their schools. In other words, caring about children and their communities led these educators to critique conditions in their school and seek to promote a clearer sense both of respect and fairness to the students and their parents.

The Willower and Licata (1997) work on values in the practice of education emphasized the growing awareness in the field of educational leadership preparation of the need to employ ethics and values within the practice of leadership in education. Previously, the widespread emphasis on the management side of administration, especially as fulfilling bureaucratic functions – budgeting, goal setting, scheduling, monitoring daily operations, resource management, and so forth – had tended to dominate educational administration. Management practice was considered an applied science; as science, it assumed the fact/value dichotomy in human organizations. Managers were to deal in objective facts, not in subjective and emotion-laden values.

That view of administration and leadership was changing. In 1994 and again in 1997, Beck and Murphy surveyed the field of graduate schools of education in the United States to find out whether ethics played a part in their administrative preparation programs. They found that some university programs had initiated a course on ethics in administration, or had introduced ethical consideration into their cases of problem solving in a variety of courses. Nevertheless, the field was clearly involved in an ambivalent catch-up situation, with the question frequently asked, “Whose ethics shall we teach?” The research of Beck and Murphy (1994, 1997) uncovered promising initiatives, though little consistency in the field.

In Australia, while some consideration has been given to the importance of general ethics for educational practitioners, especially, principals, only passing concern has been shown for professional ethics. Evers (1992: 39) was one of the first to directly address the practical implications

of moral philosophy and ethical theories for educational leaders. He recommended some “. . . moral requirements for the existence and maintenance of organized learning . . . and . . . that these requirements be used to morally evaluate educative leadership.” His approach in developing these requirements reflected a pragmatic realistic tradition drawing on the work of Dewey and Popper.

Recent Empirical Research in Ethical Educational Leadership

Langlois followed up empirical research begun in her doctoral dissertation (Langlois, 1997) on Starratt’s tri-dimensional ethic of justice, care, and critique, with further quantitative studies of superintendents and system directors in Canada. Her findings (2004) show that administrators employ two and three ethics to solve their moral dilemma, thus tending to confirm Starratt’s position about the complementarity of the ethics of justice, care, and critique. Her continuing research has identified the ethical dimensions and delineated the decision-making process among several samples of school administrators and thus has put some empirical meat on the skeleton suggested by Starratt. Her results (Langlois, 2004; Langlois and Lapointe, 2006) indicate that varieties of ethical responses are related very much to the given context. Variables such as age and experience exercise a determining ethical influence whereas gender has less impact. Early on in their careers, administrators tend to refer to a normative framework to justify their decisions. The more administrators gain experience, the more they seem to be able to free up their moral imagination and use multiple ethical lenses to better analyze a situation. Evaluating the consequences of their decisions and making room for reflection on ethics, two aspects close to Jonas’ philosophy, become part of their decision-making process.

Walker and his associates (Walker and Quong, 1998; Walker and Dimmock, 2005; Walker, 2006) have uncovered in their research in Hong Kong that principals face pressures to conform to traditional culture in a city that is changing rapidly. Principals’ ethical leadership in schools characterized by multicultural diversity requires both a pragmatic, ground-up approach to responding to issues of social justice and courage to tackle issues of racism, poverty, and ethnic differences head-on.

Most research-based work on ethical leadership in Australia focuses on principals’ ethical leadership practice, and on ways of preparing educational leaders for contemporary ethical challenges and dilemmas. Duignan (Duignan *et al.*, 2003), based on a three-year research project with school principals, has provided a framework for the analysis of ethical dilemmas and recommended a formation approach for principals to enable them to resolve situations with ethical tensions. Duignan has developed these ideas further

in his most recent book (Duignan, 2007), where he argues that ethical educational leaders need to be, first and foremost, capable and authentic human beings. He proposes a leadership development approach based on leadership capabilities, not just competencies.

In a recent PhD study on ethical leadership and principals (Branson, 2006), echoed Duignan's focus on the person of the principal when he concluded that "arguably, truly ethical leadership might only be possible for those leaders who have the commitment and courage to come to know and understand the full extent of the influential power of their whole inner Self" (p. 2). He recommends that principals "... engage in some professional development experiences incorporating a process of deeply structured self-reflection" (p. 20).

Cranston *et al.* (2004, 2006), focusing their research on the ethical dilemmas faced by seven independent school heads in Australia, reported that ethical dilemmas, usually involving staff and/or student issues, have become daily challenges of educational leaders' lives. They also developed an analytical framework for educational leaders to understand and respond to the dynamics of ethical dilemmas. They recommended problem-based professional development programs in ethics and ethical decision making for principals.

Wildy *et al.* (2001: 12), reporting on parallel research work on the moral dimensions of principals' work in two Australian states, conclude that education reform efforts should focus more on "... the pivotal role of the relationships formed by principals with people inside and outside their schools" (they refer to this as developing social capital) and that professional development programs for principals should engage principals in case analysis that "... is grounded in everyday recognisable [ethical] problems and dilemmas to stimulate reflection on practice." (pp. 10–11).

Research by Dempster (2001), Dempster and Berry (2003), and Dempster *et al.* (2004a, 2004b) concludes that when faced with ethical dilemmas principals, overall, do not display consistent conceptual knowledge of major ethical theories and they require professional development that educate them on the concepts and processes required for consistent, confident, and well-reasoned ethical decision making (2004a: 450). Further, principals are left "... unprepared and often unsupported when they are confronted with decisions that are influenced by macro-political, social and market-oriented forces" (2004b: 163).

Burford (2005: 18), suggested that a major moral challenge and ethical dilemma facing primary principals in Australia is to "... confront and attempt to create authentic and transforming learning for children," in their schools. He refers to an ongoing project engaging key educational leaders in clusters of schools in New South Wales called leaders transforming learners and learning (LTLL), which uses Starratt's (2004) virtues of authenticity, responsibility, and presence as its energizing ethical source.

Burford cautions, however (2006), that there is a lack of clarity in what we mean in our language of ethics and leadership and how we communicate that meaning to the field. In this, he points to a recently recognized need by scholars working in the field of ethical educational leadership to attempt an empirically grounded international effort to develop a more commonly accepted language and perspectives that will prove useful to practitioners and scholars alike.

International Scholarly Networks Focused on Ethical Educational Leadership

The University Council for Educational Administration (UCEA), a national association of research universities in the United States that grant the doctorate in educational administration, has supported scholarly attention to ethical issues confronting school leaders. Themes that ground the annual conferences of UCEA have tended in the last decade or more to bring issues of social justice to the forefront of the agenda of educational leadership, issues such as school inequities based on race, sex, social class, disabilities, immigrant status, anti-democratic school practices, and so forth. UCEA's partnerships with associations of leadership scholars in other countries have stimulated a growing international synergy among scholars around ethical issues as an important area for ongoing research.

Furthermore, UCEA has supported several university-based research centers, one of which, The Center for the Study of Leadership in Ethics, has become an international source and stimulus specifically for research in the ethics of leadership. That center includes other partners in Sweden, Hong Kong, Denmark, Canada, and Australia. The Center has produced in the past 3 years six academic books edited by center associates around themes of ethics and values in educational administration, and six special issues of refereed journals focusing on ethics and values in educational leadership, besides numerous papers delivered by center associates at various national and international conferences (Begley, 2006). The scholarly ferment stimulated by the Center has helped develop a growing network of scholars collaborating on further research in the ethics of leadership, which contains the promise of continuing developments in this field (Begley and Johansson, 2003).

Needed Initiatives/Developments in the Field

Recently, Johansson (2006), Langlois (2006), and Burford (2006) have suggested that the field may be ready, given the groundwork of steadily increasing international collaboration and sharing of ideas and studies, to embark on a more structured form of international collaboration, one

that seeks to establish, with greater scholarly rigor, a significant empirical base across a variety of national and regional contexts that will illuminate a grounded theory for ethical educational leadership. Such a theory cannot suggest, given the significant differences across countries and cultures, a uniform, hierarchical formula for deliberation or for practice. Nonetheless, the empirical studies could begin to suggest various underlying commonalities that, when the context is sufficiently taken into account, point to what might be called a meta-ethics of professional responsibility, or, in more technical terms, professional virtue.

In order to gain scholarly credibility and legitimacy within the academy, however, such international studies would initially have to fit within an overall plan agreed to by the researchers involved. Such a plan would, following the suggestions of Johansson (2006) and Langlois (2006), conform to accepted methodological rigor for empirical studies, allowing for a legitimate meta-analysis of studies that revealed adherence to similar methodological criteria. Those studies would follow, for example, the following methodological structure: (1) study the same research questions (with the understanding that the terminology used in the question might have to differ to convey the similar inquiry but in the vocabulary appropriate to a specific region or culture); (2) employ the same sampling methods; (3) employ the same data-gathering instruments and methods; (4) use the same data-analysis methods; (5) use the same data-reporting methods and formats; (6) seek for comparisons and contrasts with existing studies that resembled their own; and (7) seek for policy and practice recommendations/ implications that might flow from their findings, especially as those might concern the school renewal efforts in the various countries and regions of the study.

History of Educational Leadership/Management

In 1902, John Dewey warned that “it is easy to fall into the habit of regarding the mechanics of school organization and administration as something comparatively external and indifferent to educational ideals” (Dewey, 1902: 22, 23). The history of educational leadership and management as a field of study and practice bears out his misgivings for, despite some exceptions, the field is historically constructed around a strict separation of administrative theory from educational concerns and constituted by a focus on the mechanics of school organization.

The formal study and teaching of educational administration began in the United States in the early years of the twentieth century with the appointment of men such as George Strayer at Teachers College Columbia; Paul Hanus at Harvard; Edward Elliot at Wisconsin; Bobbit at Chicago; and, perhaps most importantly, Ellwood Cubberly at Stanford. Cubberly had little background in the study of education, his own education and profession being that of geology and physical science. This did not prevent him, however, from undertaking to teach “school administration, school problems, school organization, school statistics, secondary schools, history of education, relation of ignorance and crime to education etc.” (Tyack and Hansot, 1982: 124). Partly, no doubt, these topics sprang to mind as a result of the 2 years he spent as superintendent of schools in San Diego, where he came to the conclusion that urban school boards should become nonpolitical. In this, his views coincided with those of the emerging Municipal Reform Movement, a movement that was devoted to the amalgamation of small public enterprises such as schools and school districts into large, hierarchically ordered, and centrally directed corporate systems. The model was that of the large industrial corporation informed by the newly emerging science of administration. When this new science of administration was applied to the public sphere, it isolated administrative questions from political questions: “...administration lies outside the proper sphere of politics. Administrative questions are not political questions” (Woodrow Wilson, 1887: 97).

By 1930, the transformation of American city management, along with the management of schools, had succeeded in displacing local political interests and creating a series of professionalized bureaucracies linked together into national organizations supported by systematic professional education and a national network of influential individuals. Strayer, for example, argued that “significant progress in the administration of city school systems during the past twenty-five years is due primarily to

two causes. First, the application of the scientific method to the problems of administration, and, second, the professional training of school executives” (Tyack and Hansot, 1982: 152).

Carter Alexander, a colleague of Strayer’s at Teachers College, outlined the administrative progressives’ view of the purpose of educational research as being: “to discover, in the light of the purposes of education commonly acknowledged, the most efficient procedures in the organization, supervision, finance and evaluation of the program of educational service” (Tyack and Hansot, 1982: 153). Taken to extremes, this agenda led to what Callaghan (1962) called the cult of efficiency, a cult based on supposed agreement over the purposes of education commonly acknowledged, which were then set aside from the pursuit of efficient administration.

Based upon the *Principles of Scientific Management*, first advocated by Taylor (1911), leadership in education became defined as extracting the maximum efficiency from educational resources, both physical and human. Advocated and publicized widely by leading figures such as Strayer, Cubberly, and Bobbit, this business-managerial conception of educational leadership dominated the emerging university-based programs of training in educational administration. Moreover, while the new professional elite of university-trained administrators set about supplanting the Tammany Hall of local politics and cronyism, they created for themselves and their protégés a national “educational Tammany Hall that made the Strayer–Englehardt Tammany Hall in New York look very weak” (Tyack and Hansot, 1982: 141). This educational trust reformed education from the top down through new university programs, national associations (both public and private), and networks of political influence in key school districts through which the new meritocracy of the administrative progressives was established and sponsorship and patronage exercised in the creation of the new educational elite.

The result was a widespread transformation of leadership in American education that consolidated many small local districts into large systems; imposed the efficiencies of scientific management upon teachers; entrenched central administrative control over curriculum and assessment; and replaced educational ideals with managerial goals. Callaghan’s judgment was that this constituted an American tragedy that was fourfold, one in which: “educational questions were subordinated to business considerations; ... administrators were produced who were not,

in any sense, educators; . . . a scientific label was put on some very unscientific and dubious methods and practices; and . . . an anti-intellectual climate, already prevalent, was strengthened" (1962: 246).

There were, of course, voices raised against this transformation, chief among them being that of John Dewey who insisted that the displacement of educational ideals from the discourse of educational leadership was unfortunate and that the transformation of educational leadership into an oligarchy was inappropriate in a democratic society (Dewey, 1902, 1916).

However, the clash was not a clash of ideas alone. The educational oligarchy developed through the appeal to scientific management and the creation of a professionally trained cadre of managers was overwhelmingly male. Indeed, while one of the objectives of scientific management was the separation of conception from execution and the enhancement of managerial prerogatives (Edwards, 1979), its application in education was designed to separate male managers from overwhelmingly female teachers. This separation was challenged by women such as Ella Flagg Young who, as superintendent of the Chicago School District, provided leadership to women unionists and was a strong champion of female leadership of the profession. One of the battlegrounds for the female challenge to the male oligarchy was the National Education Association (NEA) where Margaret Haley spearheaded an attack on the male old guard and its centralist tendencies arguing that its intention was "to make a despotism of our entire school system" (Tyack and Hansot, 1982: 186). Attempts by women teachers to broaden participatory structures within the NEA met with some success, but were eventually repulsed by male executive members such as Charles Eliot whose patronizing attitude was indicated in his comment that women such as Young and Haley exhibited "a general moral ignorance or incapacity which is apt to be in evidence whenever women get stirred in political, social or educational contexts" (Tyack and Hansot, 1982: 186).

Young and Haley, however, were arguing not simply for greater female participation in administration and leadership, but also for a style of leadership that was aligned with Dewey's observation that in order to sustain a democratic society, a democratic education was fundamental. Their call was for a kind of educational leadership that "would make education the great instrumentality helping children and youths grow into citizenship in a government intended to be of, by and for all" (Young, 1916: 6). In this, they were arguing for the reintroduction of politics into educational leadership and for an acknowledgment that educational ideals were indeed political and an inescapable part of educational leadership.

While the leaders of the Educational Trust were pursuing efficiencies in the management of increasingly large-scale urban school systems and insisting that education was

an activity best left to the professionals, the inescapable links between politics and education were being demonstrated through the leadership of teachers such as Leonard Covello whose political agitation in East Harlem led to the establishment of and his appointment as the first principal of Benjamin Franklin High School in 1934. Covello believed that the school should adapt to the cultures of its students and be a place of mobilization of communities for social justice. Learning was to be through active participation in the community, and politics and learning, democracy, and social justice were to be articulated through action (Covello, 1936, 1958; Peebles, 1978). Leadership was not so much to be demonstrated through the application of principles of efficiency and scientific administration, but through assisting in the articulation of democratic claims through learning and social action in the pursuit of social justice: a very Deweyan perspective.

Meanwhile, in the academy, a new generation of professors, while continuing their studies of school finance and efficient administration through survey techniques, was increasingly concerned with the disparagement of colleagues in the real science departments who looked upon education and educational leadership as unscientific pursuits. The result was a shift toward importing ideas from the social sciences, especially psychology and sociology. By the 1950s, an influential cadre including Jacob Getzels (a psychologist at the University of Chicago), Andrew Halpin (a member of the Personnel Research Board at Ohio State University), and Daniel Griffiths (an iconoclastic professor of administration at Columbia Teachers College) began what became known as the Theory Movement in educational administration. Grounded in a commitment to logical positivism, these professors decried the atheoretical nature of research in educational administration and set about devising an approach both grounded in theory and articulated through research design derived from the emerging social sciences (Culbertson, 1988).

The Theory Movement took the depoliticization of educational leadership one step further through the pursuit of a value-free science of administration which would reveal, through the study of what is, rather than what ought to be, a series of empirically grounded hypothetico-deductive propositions that could form the basis of a proper positivist science of administration. This was seen as a general theory of administration of which educational administration was simply a specific instance.

Supported by the Kellogg Foundation through the Cooperative Program in Educational Administration, eight university-based centers were established at Chicago, Teachers College (Columbia), Harvard, George Peabody, Texas, Oregon, Stanford, and Ohio State in the United States, and at Ontario Institute for Studies in Education (OISE) and Alberta in Canada. These centers were charged with developing scientifically based programs for the preparation of

educational administrators, producing a new literature on educational administration, and supporting the establishment of professional organizations committed to the new approach to educational administration and leadership (Moore, 1964). The effect was to instantiate systems theory and behavioral science as the theoretical foundations of educational administration and leadership.

In essence, the Theory Movement was built on the appropriation of Parsonian systems theory through Getzels' 'A psycho-sociological framework for the study of educational administration' (1952). Here, the abstractions of the social system, nomothetic and ideographic dimensions of social behavior, and those of institution, role, expectation, and individual, personality, and need disposition were elaborated into a theoretical set of systematic relationships for exploration through empiricist methodologies. The 1964 National Survey of Student Engagement (NSSE) yearbook (*Behavioural Science and Educational Administration*; Griffiths, 1964) showed how pervasive systems theory and its associated abstractions had become. Leadership was thus further stripped of its normative concerns and the study of leadership became the study and classification of how leaders behave, divorced from the ethical concerns of what they ought to do (Halpin, 1958: 6).

While the Theory Movement pursued its theoretical abstractions on which a science of administrative and leadership behavior was to be built, educational leaders in the United States were being confronted by the Civil Rights Movement and with the aftermath of Brown versus Board of Education, that is, the landmark legal decision intended to bring to an end the provision of segregated schooling in the United States. The 1964 NSSE Yearbook was published a decade after Brown versus Board of Education; however, there is not a single reference to the impact of Brown versus Board of Education on the field of educational administration and leadership in it. Nor is there a mention of the leadership of education in the Southern states that closed virtually all black schools and sacked 38 000 black teachers and administrators (Hudson and Holmes, 1994; Anderson, 2006). Nor is there the name of a single member of the Theory Movement on the list of social scientists who signed the report prepared by the Black psychologist, Kenneth B. Clark, which was so influential in the Brown versus Board of Education decision.

This disconnection of administrative theory from the world of school leadership was noted as early as 1960 by Andrew Halpin when he observed, with regard to the Theory Movement, that: "There is indeed something missing. The fault is that the scientist's theoretical models of administration are too rational, too tidy, too aseptic. . . we had better examine afresh our current perspectives" (1960: 284). This was a sentiment echoed by Schwab (1964) in his assessment "...that the theory movement

reflected a false model both for inquiry and training" and that hypothetico-deductive systems were viciously abstract (in Culbertson, 1988: 19).

Despite this disconnection, however, there was an increasing demand for university courses in educational administration – at least in part because of the enormous growth in the numbers and size of secondary schools during the postwar period. This was not simply the case in North America, but also throughout the world. In Britain, courses in educational administration were established at the Institute of Education (London University), Bristol, Birmingham, and Oxford, led by men such as Ray Bolam, Meredydd Hughes, Eric Hoyle, Len Watson, William Taylor, and George Baron; in Australia, they were led by Bill Walker at the University of New England and Bill Bassett and Mac Grassie at the University of Queensland; and in Canada, they were led by Robin Farquhar at OISE and Art Reeves at Alberta.

While there was general agreement in the Commonwealth that the social sciences were a useful source of theory and methodology for educational administration (Walker *et al.*, 1973; Baron and Taylor, 1969; Greenfield, 1968), the traditions of analysis in the Commonwealth were somewhat different from those in the United States. For instance, in Great Britain, the historical traditions and political and religious roles of the headmaster were important influences. Given the role played by the great public schools in England, this is not surprising (Baron, 1970; Bernbaum, 1976). Indeed, in many cases, the fate of not only schools, but also whole communities was dependent upon the success or failure of the headmaster (Bamford, 1957). Even today, Marlborough College, for instance, enrolls some 800 pupils and generates some 22 million pounds a year income in a town of less than 8000 inhabitants. Rugby School generates some 18 million pounds a year for the town of the same name.

Historically, the role of the head in such schools (Peters, 1976) provided the foundation for the great man theory of leadership where autonomy, authority, religion, and morals jointly defined an omnipotent role for the headmaster, perhaps best put by Thring of Uppingham: "I am supreme here and will brook no interference" (quoted in Bernbaum, 1976: 34). Issues of religion, class, and politics were brought together in the headship in ways that influenced ideas of educational administration and leadership (Cannon, 1970). Central to this vision was control of the curriculum and its relationship to religion and to class stratification. As Gordon (1974) pointed out, the history of schooling in England was a history of class warfare: "No scheme of education will be accepted as satisfactory by the middle class which does not provide for the entire separation of their children from those of a lower grade, a separation as complete as that which exists between them and the children of the upper classes. . . One of two things only can relieve the pressure felt by the middle class: either

the curriculum of the secondary schools must be raised, or that the Board and Voluntary Schools be reduced to a more elementary standard" (quoted in Gordon, 1974: 292).

The politics of class warfare inevitably, therefore, shaped the study of educational administration in England, as did the policies of successive twentieth century governments directed toward increasing access to both primary and secondary schooling for a greater and greater proportion of the population (Baron, 1969). As Hoyle (1986) pointed out, in such a context, the politics of school management were central to the understanding of educational administration and management. A similar view was taken in Canada (Robinson and Elliott, 1973) and in Australia (Partridge, 1968). In New Zealand, such a perspective had been long established (Webb, 1937; Parkyn, 1954) and influential (Currie, 1962).

It was hardly surprising that, in 1974, when Thom Greenfield delivered his address to the International Intervisitation Program in Bristol, those from the Commonwealth were largely supportive of his view that organizational theory as it stood on the twin supports of behaviorist theory and systems theory was an inadequate and misleading explanation of schools as organizations (Greenfield, 1975). The furor among those from the United States was, however, quite patent. The very foundations of the Theory Movement were under attack and were to be defended in strident terms.

The ensuing decade can be seen both as an attempt to shore up the remnants of the Theory Movement through texts such as Hoy and Miskel (1978) and Silver (1983), which continued to separate education from administration and pursue a science of the latter, and as setting the groundwork for exploration of alternative theoretical approaches as a basis for the teaching of educational administration as well as an attempt to redress the feeling among educational administrators (especially in the United States) that contemporary courses were "...too abstract and remote from real administrative conditions" (Glatter, 1970: 66).

That Glatter's observation was justified was confirmed by the publication, in 1988, of the *Handbook of Research on Educational Administration* (Boyan, 1988) which displayed both an obsession with abstract theorizing and an astonishing parochialism which ignored the increasing volume of work being produced in the Commonwealth. As Bill Walker observed, despite UCEA support for the establishment of the British, Australian, Canadian, and New Zealand educational administration societies and their umbrella organization the Commonwealth Council for Educational Administration and its outreach to Africa, the Caribbean, and Cyprus, and the outpouring of research and writing that ensued, the Americans continued to pursue scholarship in educational administration that was characterized by "narcissism and the tyranny of isolation" (Walker, 1984; in Boyan, 1988: 12).

During the 1980s, a variety of new perspectives made an appearance. Sergiovanni did his best to encourage a cultural approach to educational organizations (Sergiovanni and Corbally, 1984). Greenfield further developed his subjectivist perspective (Greenfield and Ribbins, 1993; Macmillan, 2003). Foster (1987) articulated an approach based on the critical theory which was followed up by Smyth and his colleagues (Smyth, 1989). Bates (1980, 1983, 1987) developed an approach based on the new sociology of education and called for the redress of the separation of educational and administrative ideas along with calling for educational administration to be informed by ideas of social justice. Gronn (1986) was advocating the application of micropolitical theory and psychosocial perspectives to the management of schools. Leithwood (1982) was linking educational leadership to curriculum decision making. Fullan (1982) was linking leadership to educational change. Stephen Jacobsen and his colleagues were arguing for educational leadership to be seen within the context of educational reform (Jacobsen and Conway, 1990).

There was, in fact, an outpouring of ideas and, by the early 1990s, a wholly new postpositivist perspective was being developed in the United States by Donmoyer, Scheurich, and their colleagues, a perspective which sought to build a new approach to theory, construct a quite different knowledge base for educational administration, and include previously excluded voices – particularly those concerned with gender and race (Donmoyer *et al.*, 1995).

The 1990s saw a further broadening of perspective, including considerable work around the local management of schools as a practical response to concerns in educational management (Caldwell and Spinks, 1992; Wallace, 1992) as well as a renewed attempt to reassert the centrality of educational issues as a central focus for educational leadership (Duignan and Macpherson, 1992). Crump (1993) and his associates placed school-centered leadership within the context of turbulent social and political change in both national and international contexts. Hodgkinson (1991) further developed his ideas of educational leadership as a moral art. Ribbins and Marland (1994) renewed biography as a means of understanding leadership. Starratt (1990) applied dramaturgical analysis to leadership. Evers and Lakowski (1995) advocated a coherentist approach to theory. Blackmore, Kenway, and Hall articulated a feminist perspective on educational leadership (Blackmore, 1999; Blackmore and Kenway, 1993; Hall, 1996). Begley and his colleagues articulated a values base for educational administration (Begley and Leonard, 1999). Grace (1995) presented a policy scholarship approach to school leadership. Gronn (1999) presented an analysis of educational leadership located in the demands of the new world order. Sergiovanni (1999) once again rethought about educational leadership and the school as a covenantal community.

Schmuck and Runkel (1995) consolidated an organizational development approach to schools, one earlier pioneered in Australia by Mulford and his associates (Mulford and Kendall, 1975; Mulford *et al.*, 1977; Mulford, 1978).

What is noticeable about this diversity of approaches is the shift of emphasis from administration to management and from management to leadership. Historically, the roots of the field began in administration, moved through management, and now focus on leadership. This transition is exemplified by the changed titles of the British Educational Administration Society and its journals: *Educational Administration* in the 1970s; *Educational Management and Administration* in the 1980s and 1990s, and *Educational Management, Administration and Leadership* now, in the 2000s. The shift of focus has been significant as currently, leadership has become the dominant theme.

While, for instance, Tomlinson's (2004) encyclopedic collection of papers is called *Educational Management*, its categorization of those papers is shaped by four key ideas: educational values, theory, leadership, and change. In this, its organization is markedly different, for instance, from Boyan's *Handbook of Research on Educational Administration* of 1988. While Tomlinson's collection is retrospective, other collections such as those edited by Davies and West-Burnham (2003) and English (2005) herald the entry of significant new voices in the field and a diversity of themes that is markedly different from past decades. Perhaps stimulated by the kind of concerns elaborated by Murphy (2002, 2006), there is a significant concern with the transformation of the context of education; the impact of globalization and the demands of the new economy; the social purposes of schools and the impact of the market economy; the management of learning; school improvement and change; the role of leadership in professional development; the impact of technology; and the micro-politics of school leadership. Other collections, such as Brent-Davies (2005), display the variety of approaches to leadership (strategic, transformational, invitational, ethical, learning centered, constructivist, poetical, emotional, entrepreneurial, distributed, and sustainable), now part of the discourse in the field. New texts such as Starratt (2003) display a focus on meaning, community, and responsibility, absent from earlier work. Marshall (2004), Larson and Murtadha (2002), and Bates (2006) relate educational leadership to social justice. Lingard *et al.* (2003) place a renewed emphasis on leadership and learning as do Mulford and his colleagues (Mulford *et al.*, 2004; Mulford, 2005). Starratt (2004) and Samier (2003) examine anew the ethical foundations of leadership. Gunter (2001, 2005) explores the responsibilities of leading teachers within a Bourdieuan framework. Gronn (2003) examines the idea of designer leadership and the new (greedy) work of teachers. Samier and Bates (2006) renew interest in the role of esthetics in leadership.

Walker and Dimmock (2002) espouse a cross-cultural perspective. Bottery (2004) places educational leadership within the context of the global crisis. Beare (2000) argues for leadership to be concerned with the future of the school as an institution. Ribbins (2006) and his colleagues revisit the place of history in the study of educational leadership.

In all this recent writing, there are several connections of great importance. First, the importance of leadership in the promotion of learning is being reestablished; second, such leadership is increasingly connected with the social, economic, and political changes and demands of societies that are becoming both localized and globalized; third, leadership is seen to be no longer focused on a single person, but distributed throughout educational institutions as a shared responsibility; and fourth, and perhaps most importantly, the mechanics of school organization and administration can no longer be seen to be something comparatively external and indifferent to educational ideals. Dewey would have approved. A 100 years of effort in the study and practice of educational leadership has not been a wasted one after all.

Educational Leadership as a Field of Study: Professional Journals 1994–2006

A R Thomas, University of Wollongong, Wollongong, NSW, Australia

© 2010 Elsevier Ltd. All rights reserved.

Developments in Educational Leadership Journals

A professional journal serves to define its discipline. As such, in its immediacy, it reports contemporary practice and scholarship. In the longer term, however, a journal also serves to redefine its field because knowledge begets knowledge and the boundaries of scholarship are inexorably extended. An example of the latter may be seen in the title of this article: were it written a decade ago, educational administration would have appeared. However, within that same decade, leadership has infiltrated the lexicon of practitioners and scholars. In the United States of America and United Kingdom, for example, where administration and management respectively have long served, leadership appears to be gradually replacing these generic descriptors. Further evidence is available. For example, in the United Kingdom, in 2004, *Educational Management and Administration* became a more comprehensive journal – *Educational Management Administration and Leadership* (Vol. 32 No. 1); in Australia in 2005 *The Practising Administrator* was retitled *The Australian Educational Leader* (Vol. 32 No. 1).

At the outset, a rider must be added. Scholars in educational leadership are eclectic in their research and writing. Accordingly, there are many journals not specific to the field from which authors draw material and to which they also contribute. Examples of such may be readily found in *Administrative Science Quarterly*, *Journal of Leadership and Organizational Studies*, *Journal of Social Issues*, *Race, Gender and Class*, *Women in Management*, and *Phi Delta Kappan*, to name but a few.

The purpose of this article is twofold – first, to report developments in the publication of journals in educational leadership since the appearance of the second edition of the *International Encyclopedia of Educational* in 1994 and, second, to analyze the themes of the articles published therein in an attempt to capture, at least in part, the vast growth and change in knowledge in the last 10–15 years.

There are many worthy journals in the field of educational leadership; little did this author realize that, in preparing this article, his reading would be come so extensive and time consuming. Ultimately, a proposed survey of all journals became a passing review of several and a specific concentration on a few. Criteria for selection were that a journal had to be generalist in composition but

with its emphasis on school and system leadership, refereed, well established, and frequently cited. A journal also had to be in English, admittedly a disappointing limitation, particularly when there are available substantial non-English publications such as the Israeli *I'yunim Be'minhal U're'irgun Hachinuch* (*Studies in Educational Administration and Management*). The journals consulted (with some exceptions to the preceding criteria) are displayed in Table 1.

The three journals chosen for detailed analysis satisfy the previous criteria and were also established well before 1994:

- *Educational Administration Quarterly* (EAQ), established 1964 and edited in the United States of America. EAQ is the journal of the University Council for Educational Administration (UCEA) (of which there are approximately 80 institutional affiliates). The journal's editorial board consists of 43 members (no more than ten of whom may be from non-UCEA institutions) "representing a diversity of conceptual and methodological expertise as well as institutional affiliation, gender, and race." During the period 1994–2006 there were five editors. The EAQ appears in five issues per volume (as from Vol. 32, 1996).
- *Educational Management Administration & Leadership* (EMAL), established 1973 and edited in the United Kingdom. EMAL is the journal of the British Educational Management and Administration Society. The journal's international editorial board consists of approximately 20 members (currently drawn from 12 countries). During the period 1994–2006, there were two editors. The journal appears in four issues per volume having undergone a significant increase in pagination (as from Vol. 34, 2006).
- *Journal of Educational Administration* (JEA), established 1963 and edited in Australia. The JEA has no particular institutional affiliation although it is edited from the University of New England for its 44 volumes. Since 2007 (Vol. 45), the journal is being edited from the University of Wollongong. The journal's editorial advisory board consists of 33 members (currently drawn from ten countries). The responsibilities of board members are to referee submitted papers, advise the editor on journal policy, and select the annual outstanding paper award. There has been only one editor throughout the review period. The JEA appears in six issues per volume (Vol. 33, 1995, five issues; Vol. 39, 2001, six issues).

Arguably, and at the time of writing, these are the leaders in the field. Which of the three may be labeled the premier journal is open to debate although editors of two have laid a claim to such distinction. Lindle (2003), editor of *EAQ* has editorialized:

As the oldest (sic) journal in the diverse and applied field of educational leadership, Educational Administration Quarterly holds a venerated spot in the annals of our field. Over the past couple of decades, other journals have arisen to address the vexing problems of practice that persist in educational leadership. Even among the burgeoning claims to immediate answers concerning the complex issues of leadership, *EAQ* persists in delineating the scope and direction of a volatile field of scholarship (p.433).

Pounder (2005), Lindle's successor as editor, was also "committed to promoting and maintaining *EAQ*'s reputation as the premier scholarly journal in the field of educational leadership" (p.3).

Bush (2004b), current editor of *EMAL*, has championed his journal:

Since becoming editor in August 2002 I have been seeking to develop Educational Management Administration and Leadership (*EMAL*) as the leading international journal in the field ... I have continued to encourage international researchers and scholars to regard *EMAL* as the outlet of choice in disseminating research findings and critical comments on all aspects of our field ... this issue of the journal comprises papers from five countries and four continents (p.123).

As revealed in **Table 1**, the number of journals is increasing. The 1990s in particular saw (at least) five new publications – a period as productive as any preceding decade – and since 2000 there have been three more – *Cases in Educational Leadership (CEL)*, *Values and Ethics in Educational Administration (VEEA)* and, most recently, *Research on Leadership in Education (RLE)*. (Two of these – *CEL* and *RLE* – have been produced by UCEA.) Each journal reflects a move to greater specialization, designed to capture material that hitherto has been dispersed among the generalist journals. It may also be argued that these specializations reflect, not just the further maturing and consolidation of educational leadership, but also an expansion and part re-definition of the field.

Cases in Educational Leadership is an electronic journal, possibly the first of its kind in the field. Whether it pre-sages more of this kind is a matter of conjecture. Clearly, however, the most influential factors affecting journals throughout the period under review have been the rapid developments in information technology. Access to most of the journals listed above has been greatly extended through the Internet. University library databases, often enlarged via consortium agreements with other institutions, have facilitated an extraordinary accessibility to

contemporary and archived journal articles. Records of downloads of contents pages, abstracts, and full-text articles can now provide data of inestimable value to journal publishers, editors, subscribers, and contributors alike.

This information, challenges in several respects, the hitherto simple meaning of a journal's circulation! Nevertheless, the equation – circulation equals subscribers – persists although not all journals advertise such figures. Of all those reviewed, however, the *EAQ* is the most open and specific in this regard. Details of its circulation are provided annually as part of its statement of ownership, management, and circulation (1200–1300 in 2006). For others, such as *JEAL* and *International Journal of Educational Management*, such information is classified by their publishers.

The application of new technologies to the editorial processes of receipt and evaluation of submitted manuscripts has gathered pace. As shown in **Table 2**, most journals have eschewed paper submissions in favor of an all-electronic process. *EAQ* and *EMAL* are in this category; the *JEAL*'s procedures switch to electronic in 2007. Software systems produced by some of the journals' publishers (e.g., Emerald's JADE) are being installed to provide, *inter alia*, information to contributors about the status of papers under review.

The preferred length of manuscripts varies considerably with papers as brief as 1000 words and as long as 8000 being entertained. Perusal of articles in the three selected

journals quickly revealed that generous tolerance in wordage is frequently afforded authors!

Technology has also provided the means of reducing turnaround time for contributors. It has not been the custom for journals to advertise their turnaround times but within the past 3 years, such information has started to appear, usually on websites. Two months is seen by some editors as an ideal minimum but all aspire to reduce this period. Queuing time – from receipt of manuscript through the refereeing process to publication – has long been an understandable concern of contributors and editors as well, of course, who strive to maximize the currency of their journals' contents. The editors of *EMAL* and *JEA* both report queuing times of at least 12 months although, with the latter, a paper if accepted promptly and without substantial amendment, may be published 9 months after receipt.

As Henson (2003) states in his biennial contributions to *Phi Delta Kappan*, there is no uniform definition of refereed. Accordingly, in order to categorize the 50 or so educational journals that he reviews, Henson has established his own formula:

I award one point if manuscripts are sent outside the editorial offices for review, one point if the names of authors and their institutions are withheld from the reviewers, and one point if the manuscript is accompanied by a rating instrument of some sort (p. 789).

(Of the few journals relevant to education leadership in Henson's review, *NASSP Bulletin* and *Planning and Changing*

each score 3; *Educational Leadership* and *School Administrator* each score 0.) Using these criteria, the three journals closely examined for this article – *EAQ*, *EMAL*, and *JEA* – all score 3. For each refereeing is customarily conducted blind by three readers. Each of the three *JEA* referees comes from a different country.

Of importance to contributors – and also the tenure and promotions committees that plague editors for such information – is a journal's acceptance rate. These data were once relatively obscured, but most journals now acknowledge then via their websites. Comparison is not always straightforward; some journals calculate acceptance rate as a percentage of all papers submitted; others disregard papers culled initially by their editors and use only those assessed by referees as the basis for calculation some count an amended paper as an entirely new submission. Advertised figures for *EAQ*, *EMAL*, and *JEA* are currently 6%, 23%, and 27% respectively but these are not fully comparable and are, in fact, misleading – different formulae have been used in each case. Likewise, details relevant to citation frequency and impact factor are starting to appear – a direct response to the seemingly insatiable demand that permeates academe to quantify a journal's quality.

It has not been the intention of this article to analyze the range of research methods encompassed by the articles reviewed – notwithstanding the importance of such methods in further illuminating the dimensions of educational leadership as a social science. Suffice it to say that, in this respect, the methodology of research in the field is diverse

and comprehensive. While qualitative research methods have assumed a greater role throughout the period under review, quantitative works continue to remain prominent. Descriptive and inferential statistics still find ready use in educational leadership research, the latter enhanced by the availability of ever-increasing computing power.

In a fashion similar to their requirements for keywords in the 1980s, electronic databases have, understandably, demanded greater commonality in both the content and acuity of article abstracts. In 2005, both *EAQ* and *JEA* prefaced all articles with structured abstracts, which had to address four obligatory fields – purpose, design, findings, and value. The design/methodology/approach field requires authors to indicate how their objectives were achieved, the main method(s) used, their approach to the topic, and the theoretical or subject scope of their papers. Similarly, authors must locate papers within one of seven categories. Of these, five are particularly apposite to the articles reviewed for this article: research paper (which may involve the construction or testing of a model or framework, action research, testing of data ... surveys, empirical, scientific, or clinical research), viewpoint (author's opinion and interpretation), conceptual (...developing and testing hypotheses ... discursive ... philosophical and comparative studies of others' work and thinking), case study (actual interventions or experiences within organizations), and literature review (...annotate and/or critique the literature...).

The standing of a professional journal depends in no small degree on its internationality – the extent to which it conveys its discipline to the world at large and its reciprocal, the extent to which it attracts submissions from scholars throughout the world. Accordingly, at least three journals in educational leadership lay claim to such standing by including international in their titles. The educational objectives of the *International Journal of Educational Management*, for example, make this clear:

To provide those interested in the effective management of the educational process with a broad overview of developments and best practice in the field, with particular reference to how new ideas can be applied worldwide ... seek to contain material relating to innovation in educational management across the spectrum, the development of educational delivery mechanisms, and the creation of an environment in which the management of resources provides the most efficient outputs achievable on an international basis to allow the sharing of new initiatives.

Likewise, the *International Journal of Leadership in Education* expresses its intent. The journal

is an international journal for the publication of theoretical and practical discussions of educational leadership. It provides a forum for researchers and practitioner researchers to consider conceptual, methodological and practical issues in a range of professional and service settings

and sectors ... It offers a broad definition of leadership, including teachers as leaders, shared governance, site-based decision-making and community-school collaborations.

Two of the three journals chosen for close analysis are also avowedly international in outlook. *EMAL*

publishes original contributions on educational administration and management in the wildest sense: on the management of schools of all types, and of further and higher education institutions; on administration and policy at all levels – institutional, local, national and international; and on the study and teaching of educational administration.

Contributions may encompass critical discussions, accounts of new methods, developments and controversial issues as well as research reports. Analytical contributions from those actually involved in the practical management and administration of education – as heads, senior school staff, local education authority advisers and education officers, college and university staff – are particularly welcome.

The *JEA*

is for all interested in the practice and theory of educational administration worldwide. It is designed to meet the needs of principals, inspectors, superintendents, directors of education, administrators in institutions of higher education, and of university teachers and students of educational administration.

In seeking to advance thinking in the field, the Editor believes that there is no aspect of education more deserving of disciplined study and research than the administrative process, on which the efficacy of the teaching – learning process so much depends, and that this will best be achieved through an international approach to the field.

For long assumed to be the domain of the English-speaking world, the study of educational leadership has spread its wings. Encouraged, *inter alia*, by the formation of international bodies such as the Commonwealth Council for Educational Administration and Management (CCEAM), educational leadership has developed – and continues to develop – as a field of scholarship. Reference above to information accrued on journal websites highlights evidence of such growth. The nationalities of authors contributing to journals also lend further substance to this development. In stark contrast to this development, however, a sample of 25 issues of *EAQ* revealed that 81% of articles were by American authors, 19% by authors from elsewhere. Furthermore, of the articles authored by Americans, 70% were submitted from UCEA universities.

One may surmise as to why the *EAQ* publishes relatively few articles from non-American sources. Clearly the sheer size of the United States of America and the many, many universities there are reasons for this. But there may also be a level of insularity therein that serves to discourage international contributors. Nevertheless,

the *EAQ* is integral to the operation of UCEA; that it is seen as the first choice for publication by UCEA-affiliated authors should not come as a surprise. As stated in the journal's preamble:

EDUCATIONAL ADMINISTRATION QUARTERLY invites the submission of manuscripts contributing to scholarly knowledge about educational administration. Submissions may include but are not limited to empirical investigations, conceptual and theoretical perspectives, policy and legal analyses, reviews of research and practice, and analyses of methodological procedures related to broad conceptions of administration in education. Papers on education reform, governance and reform in colleges of education, the teaching of educational administration, and the professional preparation of educational administrators – topics advancing the University Council for Educational Administration – are welcome.

Similar analyses in other journals revealed, somewhat serendipitously, yet in accord with the preceding two paragraphs, that authors tend to favor their local or own-national journals as outlets for their scholarship. This is not altogether surprising, particularly when articles are localized in content. Nevertheless, in spite of their professed internationality, journals seldom include a majority of articles from elsewhere. For example, identification of nationality of principal authors of articles in *EMAL* from a sample of 15 issues (excluding thematic or special numbers) revealed that 60% were from the UK, 40% from other countries. Two other UK-edited journals display this phenomenon. *School Leadership and Management* and the *Journal of Educational Administration and History* publish 67% and 54% local articles respectively. A startling exception to these practices is to be found in the (aptly titled) *International Journal of Educational Management (IJEM)* (also edited in the United Kingdom) wherein 86% (37) of the 43 articles in Volume 20 (2006) were by international contributors. An analysis of 21 issues of the *Journal of Educational Administration* displayed a similar distribution – 22% were by Australian authors, while 78% were submitted from other countries.

Thus, in acknowledging that the study of educational leadership is not the monopoly of a few English-speaking countries (particularly the United States of America, United Kingdom, Canada and Australia), the three journals – but especially *EMAL* and *JEA* – have, throughout the period of review, and particularly in more recent years, published papers submitted by authors in Belgium, Brazil, Brunei, Chile, China, Cyprus, Denmark, France, Germany, Greece, Hong Kong, Israel, Kenya, Kuwait, Malaysia, Netherlands, Papua New Guinea, New Zealand, Nigeria, Norway, Palestine, Singapore, South Korea, Spain, Sweden, Thailand, Turkey, United Arab Emirates, West Indies, and Zimbabwe. Add to these three other

sources – Finland, India, and Malta – in the *IJEM* and a clear picture emerges, one very different from that which prevailed throughout the 1970s and 1980s: the study of educational leadership has assumed international acceptance.

Every issue of the *EMAL* and *JEA* reviewed was introduced by an editorial. In the *EAQ*, the editorial has been an irregular inclusion, variously known as editor's foreword or note, or letter from the editor. Two elements are common to all editorials – an introduction to each of the articles included and obituaries acknowledging the contributions to the field by prominent professors – Foster, Griffith, and Willower in *EAQ*, Baron, Griffith, and Tomlinson in *EMAL*, and Walker and Willower in *JEA* (Dedicated memorial issues for Foster and Willower have been published respectively by *EAQ* and *JEA*). A third common feature may also be tentatively identified – the inclusion of operational details such as acceptance rates and queuing times for each.

In the main, editorials have not sought (as do those of newspapers) to support particular policies or influence readers' opinions on aspects of educational leadership. However, encouraging exceptions to this generalization may be found in *EMAL*, where, on occasions, the editors (Ribbins and Bush) have both authored well-designed, researched, and relatively outspoken statements of policy. Bush (2004a), for example, searches for greater clarity in the terminology of management, administration, and leadership. The subtitle to his editorial – Leadership in the Ascendancy – corroborates one of the significant findings to emerge from the analyses of articles described in the following section.

Lamented in two editorials (*EAQ* and *JEA*) has been the paucity of responses/rejoinders critical of articles published. The current review has identified very few examples. Could this be reflective of a nonargumentative readership and/or the outcome of a refereeing process that, in general, permits the publication of papers only after extended processes of amendment?

Article Themes

A key purpose of this article is to identify the subjects that authors have addressed throughout the period under review. In order to meet this challenge, attention was directed exclusively to the three leading journals identified above. During the period 1994–2006, over 1000 articles were published in these three journals – approximate figures for each: *EAQ* 340; *EMAL* 350; *JEA* 390. Of these, 120, 82, and 116 articles were attributable to thematic or special issues of the journals respectively. Such issues are customarily the outcome of a call for papers addressing a special theme designated by a guest editor. In recent years, it has become a practice for the *EAQ* and *JEA* to publish two thematic issues per volume and for *EMAL* to

publish one. Details of the thematic issues are provided in a later section.

For purposes of the following analysis, it was decided to focus only on the articles published in the nonthematic issues of the journals. This was done in order to better capture the broad, spontaneous nature of research and scholarship in the field. Accordingly, 210 articles in *EAQ*, 265 in *EMAL*, and 272 in *JEA* were considered. Each article was examined primarily by abstract and, where available and necessary, by keywords. The information was crosschecked with the article's title to ensure that the key subject was identified (titles sometimes do not reveal, and may even deliberately obscure, an article's intent!). Subjects were recorded and processed through an iterative series of groupings in order to identify broad themes of content. For example, the resultant theme of teachers included articles that addressed subjects such as recruitment, retention, commitment, motivation, empowerment, effectiveness, collegiality, and so on. Public schools, a major theme in each of the three journals, encompassed subjects such as instruction, effectiveness, development, safety, control, school-based management, and so on. On occasions, articles gave equal prominence to multiple themes. These were categorized accordingly.

To be established, a theme required a minimum of five articles in a journal that could clearly be clustered thereabouts. In total, 39 themes were identified in the nonthematic issues of the three journals. Some were common to the three journals, for example, principals/headteachers; some common to two, for example, organization theory in *EAQ* and *JEA*; some were unique, for example, teaching educational administration in *EAQ*, deputy principals/middle managers in *EMAL*, and stress/anxiety in *JEA*. The ten most-addressed themes for each of the three journals are listed in order of frequency in **Table 3**.

Any exercise of this kind has inherent dangers and, although the author has strenuously endeavored to eliminate them, some elements of subjectivity and arbitrariness must inevitably remain. Although the journals reviewed are published in English, the background and location of each journal bring numerous differences in expression, especially, in labeling. One additional task, therefore, has been to establish common ground on which to locate seemingly different subjects. Thus, for example, schools described variously as private, independent, maintained, religious, and nongovernment in the United States of America, United Kingdom, and Australia are herein identified as nonpublic.

The interpretation of these themes must be approached with caution, although there does seem some justification in claiming that, collectively, their emergence serves to add definition to the field of educational leadership. In particular, the themes common to the three journals – public schools, principals/headteachers, and reform/restructuring/change – vouch for far-reaching and international

Table 3 Most frequently addressed themes in three selected journals

	<i>EAQ</i> (USA)	<i>EMAL</i> (UK)	<i>JEA</i> (Australia)
1	Gender/women	Higher education	Principals
2	Students	Public schools	Public schools
3	Law/legislation/politics	Resources	Comparative/international
4	Teachers	Headteachers	Teachers
5	Public schools	Governance	Higher education
6	Organization theory	Deputy principals/middle managers	Values/ethics
7	Inclusion/special education	Comparative/international	Organization theory
8	Principals	Reform/restructuring/change	Stress/anxiety
9	Reform/restructuring/change	Inclusion/special education	Gender/women and Reform/restructuring/change (eq)
10	Teaching educational leadership	Nonpublic schools	Students

concerns among scholars in the field. Less expansive, but nevertheless important, are the themes that are located in two journals: for example, gender/women, students, teachers, and organization theory in *EAQ* and *JEA*; higher education and comparative/international in *EMAL* and *JEA*; and inclusion/special education in *EAQ* and *EMAL*.

As always with grouping or categorizing, the process in some aspects may be counterproductive, serving, for example, to mask what may be emerging or developing subjects of concern and scrutiny. Thus, for example, subjects such as trust and truth in schools, efficacy, schools' nexus with business, physical conditions of schools (including architecture), school marketing, technology, learning organizations and communities, and chaos/complexity theory may not be identified, either being subsumed in broader categories or isolated as minor groupings.

The reader will note that all of the themes identified are expressed as nouns. Implicit in each, of course, is an activity (or activities) of some kind. That activity (and here differences in English use bedevil the field) is managing or administering or leading. These are the action words that explicitly or implicitly accompany all journal articles. By far the most commonly used (and lending further support to the opening paragraph of this article) is leadership.

Leadership (or derivatives of such) has been used in almost 22% of all article titles uniformly in each of the three journals. Furthermore, the rate of use has been

increasing. In the period 1994–2000 titles containing leadership appeared in 14% of *EAQ*, 10% of *EMAL*, and 16% of *JEA* articles. In the later period 2001–06, these percentages have increased respectively to 26, 30, and 21.

Leadership is not a buzz word; nor is its use simply an attempt to resolve long-standing semantic arguments. Through increasing use of leadership, journals are contributing to a renaming of the field – a field that seeks a more appropriate descriptor of what it is school managers and administrators actually do and, ideally, what they must do in order to achieve the most desirable of outcomes for all who are engaged in the educative process.

As this author has stated elsewhere:

The phenomenon of leadership is, once again, undergoing one of its periodic, sustained examinations: definitions of leadership, components of leadership, correlates of leadership and so on, are occupying more and more journal space and more and more conference time. Yet therein lies an emerging danger. Just as the trait approach to leadership in decades past ‘succeeded’ in identifying a plethora of individual attributes or characteristics ‘fundamental’ to ‘successful’ leadership, contemporary studies threaten to engulf us with their own tidal wave of descriptors (Thomas, 2006: 11).

So from the titles of articles in the leading three journals, the following have emerged to confront this reader: administrative–instructional, authentic, dialogic, democratic, departmental, directive, distributed, educational, educative, effective, female, goal-orientated, headteacher, inclusive, instructional, local, moral, organizational, participative, peer-assisted, principal, school, school-technology, servant, site-based decision-making, small school, strategic, successful, symbolic, synergistic, teacher, technology, transformational, values-driven, and even bastard and principled-bastard leadership!

Again, it seems apposite to make the following observations:

Such a profusion of labels may be viewed with alarm and, paradoxically perhaps excitement: alarm because of the possibility of duplication in conceptualisation, definition and approach, with a resulting potential for confusion and even exasperation; excitement because of the variety of ‘lenses’ being used to examine educational leadership. One may only hope that for the individual presenters of these [articles] valuable guidelines are actually providing bases for their future leadership. Similarly, one may hope for a successful application of their findings beyond the specific institutions in which they collected their data. (Thomas, 2006: 11).

The preceding analysis has been derived from standard issues of the three selected journals. As previously stated, each of the journals published several thematic issues throughout the period under review. A selection of thematic issues for each journal is presented in **Table 4**.

Table 4 Samples of thematic issues

<i>Educational Administration Quarterly</i>			
Vol	No	Year	
30	3	1994	Connecting schools, families, and communities
33	5	1997	What will replace the comprehensive high school?
36	1	2000	Women in the superintendency
38	2	2002	Ensuring the capacity of university-based educational-leadership preparation
39	1	2003	Can the politics of education inform practice in educational leadership?
39	2	2003	Justice in the school – an issue devoted to the law and education
40	2	2004	The legacy of William Foster: Promises for leadership and schooling
40	4	2004	Critical perspectives on mentoring for leadership
41	4	2005	Pushing back resistance: African American perspectives on school leadership
42	1	2006	Educational change over time
<i>Educational Management Administration & Leadership</i>			
Vol	No	Year	
22	4	1994	Greenfield on educational administration
24	3	1996	Primary schools and their management
25	4	1997	Special international edition celebrating the 25th year of the journal
27	3	1999	Redefining educational management and leadership
28	3	2000	Reconstructing the learning society
30	1	2002	Theorists and theorizing in educational administration and management
30	2	2002	Education and its management. Global dimensions: local challenges
32	3	2004	The National College for School Leadership
33	2	2005	Researching leadership. Preview of progress
34	2	2006	Leadership and diversity
<i>Journal of Educational Administration</i>			
Vol	No	Year	
34	5	1996	Culture and educational leadership: An introduction
35	5	1997	Inclusion and school leadership
39	5	2001	Donald J. Willower: appraisal, appreciation, remembrance
41	2	2003	New technologies and educative leadership
41	6	2003	Violence in schools
42	2	2004	Education, ethics, and the cult of efficiency: Implications for values and leadership
42	6	2004	Democracy and leadership
43	1	2005	Educational institutions and leadership through the lens of organization theory
43	6	2005	The international successful school principalship project
44	4	2006	Beginning the principalship – international views

Each journal has explored a wide range of special themes several of which, it will be recognized, relate closely to some of those that emerged from analysis of standard issues.

Summary

The first section of this article reported on developments that had taken place in the production and publication of educational leadership journals since 1994. An extensive sample of English-speaking journals was initially identified. It was observed that the number of journals is increasing, simultaneously adding greater specialization to the educational-leadership library. Three major generalist journals – *EAQ*, *EMAL*, and *JEA* – were selected for intensive analysis.

The extraordinary developments in information technology have exerted the greatest influence on all aspects of journals' operations. Although not fully utilized by all educational-leadership journals, the Internet has paved the way for a more efficient conduct of the submission, refereeing, and publishing process. The first all-electronic journal has been established; others will follow. Offshoots of the Internet – databases bringing a greater array of indexing and abstracting facilities – have in part, brought about a retailoring of articles through demands for keywords and structured abstracts. It is likely that future developments in electronic presentation will induce further changes in articles' structure.

That submitted papers are refereed is no longer sufficient evidence of a journal's quality. Several factors – particularly the requirements of tenure and/or promotion committees – demand added forms of validation for journals. Quantifiable features such as acceptance (or, better for some, rejection) rates, impact factors, and even (as this author/ editor was recently asked) the number of indexing and abstracting agencies reporting a journal, are used increasingly to calibrate a journal's quality.

The influence of the Internet has also contributed substantially to the growing internationality of most educational-leadership journals. Easier and far-reaching access to journals has encouraged and enabled the expansion of educational leadership as a field of study. Data on electronic visits, together with an expanding international authorship, attest to such.

With few exceptions editorials remain policy free and do not seek to influence the field. Concomitant with this practice is a dearth of opposing and/or dissenting rejoinders to published articles.

The latter section of this article reported the analysis of article content in the three selected journals. It did so in order to present a picture of research and writing in the field since 1994. Over 700 articles, published in nonthematic

issues of the journals, provided grounds for establishing 39 content themes. The ten most-identified themes for each of the journals, in tandem with the subjects of their respective special or thematic issues, revealed considerable diversity in article content. Whereas there were some themes in common, the three journals displayed several differences and even elements of uniqueness. Nevertheless, collectively, the themes portrayed a field that encompasses much diversity.

The concept of leadership increasingly pervades the literature of journals but with a diversity of definitions and applications. One can only hope that, come the next edition of the encyclopedia, greater agreement will have been reached on what is perceived by so many as a noble behavior.

Research on Educational Leadership – Approaches/Promising Directions

W A Firestone, Rutgers University, New Brunswick, NJ, USA

V M J Robinson, The University of Auckland, Auckland, New Zealand

© 2010 Elsevier Ltd. All rights reserved.

Glossary

Backward mapping – A research or planning strategy that starts with the intended outcome and works backwards to identify the most proximate variables or conditions likely to affect that outcome. After clarifying how the proximate variables influence the intended outcome, the process works farther back to other layers of variables until the most distant ones of interest are identified. That is, one starts from the intended effect rather than the intended innovation.

Indirect effects – When a first variable influences a third variable through a second variable. For instance, leadership may influence student achievement through its effect on teaching.

Instructional leadership – A theory of leadership limited to education that focuses on how leaders influence student outcomes.

Leadership – Influence based on some mix of formal authority, individual characteristics, or the perceived “rightness” of the proposed mission such that volunteers want to follow: influence that is at least partly consensual and leads to change.

Leadership content knowledge – Knowledge that leaders have about an area of the curriculum that help them supervise, make decisions about resources, and provide assistance and professional development to teachers.

Pedagogical content knowledge – the special knowledge teachers have about a subject area, different from what other “experts” have that help them teach that specific content effectively.

Transformational leadership – A general that is not education-specific—form of leadership that relies on some mix of charisma, inspiration, intellectual stimulation, and individualized consideration to change the motivations and practices of followers.

compares research on educational leadership with that in other areas of education, the effects are smaller, the designs are often less rigorous, and studies are less likely to be peer reviewed. This can be seen by comparing a recent meta-analysis of leadership studies such as that by Waters *et al.* (2003) with one on phonics (Ehri *et al.*, 2001). The field continues to be plagued by faddism that precludes accumulating findings in a useful way (Ogawa *et al.*, 2000).

Yet, since Bridges made his observation, things have improved considerably. The best studies have become more sophisticated methodologically and conceptually (Hallinger and Heck, 1996). In the early years, researchers in educational administration drew primarily on general theories of leadership to formulate their studies (Lagemann, 2000). After the Coleman report, the effective schools movement created a greater interest in how leaders might improve instructional outcomes in general and help contribute to educational equity in particular (Edmonds, 1979). By now, there is a great interest in understanding how educational leadership contributes to student learning and reducing the variation in outcomes stemming from family background (Elmore, 2000; Firestone and Riehl, 2005).

These developments have generated exciting new trends that will substantially increase the contribution of research on educational leadership policy and practice and reduce the isolation of the field from those branches of educational and social research that are more directly concerned with teaching and learning (Robinson, 2006). The purpose of this article is to introduce these trends and the theoretical and methodological approaches through which they are being pursued.

The first trend is an increasing emphasis on the impact of educational leadership on students' cognitive and non-cognitive outcomes. The second trend involves a shift from a predominantly generic approach to the study of educational leadership to one that is more focused on the knowledge, skills, and practices that are specific to educational leaders. Third, there is a shift from the study of leadership style to leaders' thinking and practices. Finally, research has moved from the study of the single heroic leader to analyzing distributed leadership. In identifying these four trends, it is not implied that the shifts are radical or that there are no rich veins still being explored in the earlier approaches. Rather, these shifts signal changes that will bring leadership research much closer

Concluding a review of leadership research administrator in 1982, Bridges quoted a predecessor to the effect that “The utility of such research is simply underwhelming in relation to its volume” (Bridges, 1982: 26). Moreover, when one

to students, teachers, and classrooms and to the questions now being raised by policymakers about the leadership of school reform.

The Concept of Educational Leadership

These new trends challenge older concepts of leadership and require greater clarity about, for example, the difference between the concept of leader and leadership. This is particularly true of work on distributed leadership which needs to be able to address the question of what it is that is distributed.

There is general agreement that leadership is an influence process – that it causes another person or group to think or act in ways they would not have done otherwise (Leithwood and Riehl, 2005). Additional specification is needed, however, because we would not want to call many types of influence – such as force, coercion, or manipulation – leadership. The distinguishing feature of leadership is that the source of the influence is either positional authority (the right of the person or institution to require things of others is accepted) or the reasonableness of what is proposed (Fay, 1987).

This account of leadership indicates that, unlike other forms of influence, leadership is fundamentally consensual, with followers agreeing to do what was asked because they judge “that the leaders occupy a position which gives them the right to command a course of action or that they possess the requisite personal characteristics of leaders, or that they seek an action that is correct or justifiable” (Fay, 1987: 121). Leadership involves change, and this aspect of leadership enables distinctions to be drawn between leading and managing. Managing maintains operations and routines while leadership garners support for their reconsideration and change. The distinction should not be drawn too sharply, however, for managers need leadership skills (to be influential) and leaders need management skills (so they can assess how well the daily routines serve organizational goals).

Both conventional positional and new forms of distributed leadership are included in the above account of leadership. It can embrace research on all formal position holders in the education system and also recognize that leadership may be exercised by anyone whose ideas or actions are influential in the context of specific tasks and activities (Robinson, 2001).

What is educational leadership? Educational leadership can be distinguished from leadership in general in several ways. One approach is to say that leadership that is exercised by those in educational institutions is by definition educational leadership. This is unsatisfactory because it rules out the possibility that some leadership activities in schools are not directed toward educational ends.

Indeed, one concern of educational leaders and policy-makers in many jurisdictions is just how much of the work of school principals, for example, particularly in self-managing systems, is not directed toward educational ends (Hallinger, 2005). Educational leadership is more fruitfully treated as those leadership acts that improve the quality of teaching and learning, either through direct intervention into teachers’ work or through creating school conditions that do so indirectly. This concept of educational leadership focuses directly on the core business of teaching and learning and strongly associates educational leadership with its improvement (Elmore, 2000). It also foregrounds the empirical work that must be done to identify the nature of the leadership practices (including the leadership values, skills, and knowledge) that are needed to engage in this work.

First Trend: An Increased Emphasis on the Impact of Leadership on Students

At least five compilations of research ask about the nature and extent of leaders’ impacts on students (Bell *et al.*, 2003; Leithwood *et al.*, 2004; Mulford, 2003; Waters, *et al.*, 2003; Witziers *et al.*, 2003). These studies suggest that leaders make a very slight to modest difference to the cognitive and non-cognitive outcomes of their students. This finding is contrary to the political and public expectation that the quality of school leadership is a powerful influence on the quality of teaching and learning. The public may have an overly romantic view of the power of their educational leaders (Meindl *et al.*, 1985). On the other hand, research approaches may not yet be capturing how leaders make a difference. There are several reasons why the latter may be the case.

First, much research on the impact of leadership on students employs theories that are not designed for this purpose, as is described below. Second, there are major methodological challenges in doing quantitative research on the impact of leadership on students. The impacts of leadership can not be reliably detected unless the numerous out-of-school conditions that impact achievement are adequately modeled and statistically controlled (Hallinger and Heck, 1996). In addition, since the path through which educational leaders make their impact on students is usually indirect, a theory is needed to guide the specification and measurement of the in-school variables. Here, there is considerable overlap between research on school effectiveness and research on leadership. The selection and measurement of student outcomes is also a considerable challenge, for while both cognitive and non-cognitive student outcomes are important, and cognitive assessments should tap work of intellectual depth, such measures are expensive to obtain. How leaders are sampled also makes a difference as outlier studies (Heck *et al.*, 1990; Marks and Printy, 2003) typically

find much stronger findings than those which use more representative samples.

In summary, the new research and policy emphasis on the impact of leadership on students brings substantial theoretical and methodological challenges in identifying the leadership practices that make a difference, and the antecedents of those practices.

Second Trend: From Generic to Educational Leadership

While generic leadership skills and knowledge (e.g., staff relationship skills) are applicable to educational leadership, those generic skills must be infused with educational content to promote educational goals. This is the point at which educational leadership theory and research needs to engage deeply with research findings on the pedagogical, assessment, curricular, and student management practices that help diverse students engage in important intellectual work. Instead of asking if leadership theory has any educational impact, an alternative backward-mapping strategy starts with research on effective pedagogy and teacher learning and identifies the role of leadership in creating the conditions that develop and sustain those practices. Theories of educational leadership would be the end result rather than the starting point of such programs of research.

Most research on educational leadership has not used this approach. One of the most frequently researched leadership theories focuses on transformational leadership. Transformational leadership is a form of leadership through which a combination of charisma, inspiration, intellectual stimulation, and individualized consideration is expected to change the motivations and purposes of followers. The theory was first developed by Burns (1978), who wanted to explain why leaders in many settings gain unusually high levels of effort and commitment from followers. It was not designed to predict how leadership affects student learning. Much subsequent empirical work was done in industry and is summarized by Bass and Avolio (1994). A recent review of the research on transformational leadership in education finds that most studies have not looked at how it influenced student achievement (Leithwood and Jantzi, 2005). Those that did found mixed results. It was more common to examine the effects of transformational leadership on student engagement with school; those results tended to be more positive.

In contrast to transformational leadership, instructional leadership theory is more educationally oriented. While there are variations in the concept, the common theme is the close involvement of leaders in establishing and overseeing the academic mission and goals of the school. Specific practices can include setting academic goals, ensuring appropriate resourcing of the teaching program, acting as a resource for solving pedagogical problems, evaluating teaching, and monitoring student progress (Hallinger, 2005). Instructional leadership theory

has its origins in studies of leaders in high-poverty urban schools that succeeded against the odds (Edmonds, 1979). Subsequently, survey instruments were developed to measure dimensions of instructional leadership and its direct and indirect impact on student learning (Hallinger, 2005). While the impacts are still modest, the multivariate research using measures of instructional leadership has produced somewhat stronger impacts on student outcomes than has similar research on transformational leadership (Hallinger *et al.*, 1996; Heck *et al.*, 1990).

These two traditions are starting to converge. Some educational research on transformational leadership has incorporated instructional leadership variables such as “providing instructional support” (Leithwood and Jantzi, 1999). In addition, there is some evidence that leaders who integrate both transformational and instructional leadership qualities achieve greater gains in student learning than leaders who score high on only one of these leadership qualities (Marks and Printy, 2003).

Even though instructional leadership research has a more explicit focus on teaching and learning, it does not draw explicitly on theories of teaching and learning to develop ideas of what leaders should do. For that step to be taken, educational leadership researchers have moved beyond organizational theories to learn from researchers studying classroom phenomena.

Third Trend: From Leadership Styles to Educationally Powerful Leadership Practices and Cognitions

Abstract constructs like transformational leadership and instructional leadership provide only the most general guidance to people in schools about what they need to do in order to help schools improve. While sensitive to varying degrees to school conditions, they are rather insensitive to teaching *per se*. As Stein and Spillane (2005) note, leadership researchers need to take advantage of the cognitive revolution of the 1980s wherein people supplemented behavioral research with a more direct focus on the thinking of teachers and students (Shulman, 1987). This shift has been very fruitful. It opened up new methods through which researchers looked closely as students went about learning and teachers went about teaching. Researchers also asked how both made sense of their day-to-day work. In the process, researchers gained greater access to higher-order thinking processes (Stein and Spillane, 2005).

In addition to identifying the teaching and learning practices that leaders need to target, leadership research needs to expand conceptions of the school setting and the elements of the school and its context on which the leader must act. One conceptual resource for thinking about how to do this comes from Hallinger and Heck’s (1996) idea that the effects of the leader’s work are mediated by school

conditions. More detailed analysis is needed to determine what those school conditions are and the actions through which leaders can influence them. With a better understanding of what teaching practices need to change, what elements in the school setting are available to support the change process, and how leaders think about the change process, researchers will be better able to ask how leaders can actually change teaching and learning.

Backward mapping takes advantage of these conceptual developments to create a conceptual framework that links student learning to leaders' thoughts and actions (see **Figure 1**). In the process, it draws on a great deal of research on teaching and learning to suggest new avenues for research on educational leadership. Here we highlight two of the several possible areas. The first is research on leadership content knowledge, an area that comes directly out of research on teaching and learning. The second is research on teachers' professional communities – a school condition that can promote the teacher learning that improves student learning.

Leadership content knowledge (Stein and Nelson, 2003) refers to leaders' understandings about the content of school subjects. This is different from the knowledge of lay people, professors, students, and teachers. It refers partly not only to the kinds of things that educated people know about a subject, and partly to the kinds of things teachers need to know – that is, the pitfalls of learning the subject and ways to overcome them – but also to special knowledge of administrators about how to assess materials, how to help other educators improve their performance, and how to explain necessary changes to the community for instance (Stein and Nelson, 2003). Leadership content knowledge derives from a very different paradigm from that used in the research on transformational and instructional leadership. Rather than focusing on what leaders do, it asks how they think (Stein and Spillane, 2005). Except for Leithwood's research on leaders' problem solving (Leithwood and Steinbach, 1995), this cognitive shift has been slow to arrive in the study of educational leadership. One of the most useful forays in that direction has been to explore leaders' content knowledge in mathematics (Stein and Nelson, 2003). This research draws on Shulman's

(1987) useful observation that the content that teachers need to know to teach well – that is, pedagogical content knowledge – is different from what researchers in a discipline need to know. Teachers, Shulman suggests, need to know the pitfalls of learning a subject and ways of representing a topic to help students overcome those pitfalls. By analogy, it was suggested, leaders may need to have special knowledge about a subject in order to help teachers become more expert instructors, to make better decisions about curriculum, to be better able to communicate about the subject to parents and so forth.

The methods used to study leadership content knowledge to date have been to examine how leaders learn about specific curricular areas. The most elaborate program of research is underway in mathematics (Nelson and Sassi, 2000). The researchers study how principals make sense of simulated and real mathematics lessons, what they attend to – that is, what teachers are doing or what students are learning – what kind of supervision they provide, and how they manage the process of selecting curricular materials. To date, this research has been largely descriptive. It explores dimensions of leaders' content knowledge and how leaders with different kinds of content knowledge engage in different administrative processes. It has also raised important problems. For instance, how can principals develop content knowledge in all the subjects in the curriculum; and if they cannot, how can they compensate? At some point, as understanding grows about how leadership content knowledge influences leaders' work, it will be important to establish the relationship between such knowledge and student learning, but that relationship will undoubtedly be complex – and like all instructional leadership relationships – indirect.

Professional community is an organizational condition that helps teachers learn to become better at instruction (Louis and Kruse, 1995). It does so by creating a school culture where teachers have the opportunity to learn from each other because there is a collective focus on student achievement, and teachers engage in reflective dialog, so they talk extensively and analytically with each other about teaching and their students. Moreover, teachers de-privatize their practice by observing in each other's classroom or sharing student work. Case studies illustrate how professional communities build commitment to improved teaching and support teacher learning of improved teaching practice (Louis and Kruse, 1995) while correlational research suggests that stronger professional community is associated with higher levels of authentic achievement (Louis and Marks, 1998).

Case study research also illustrates how leadership is important in creating professional community (Louis and Kruse, 1995). Leaders put in place some of the conditions necessary for professional community, like time for reflective dialog and classroom observations. Their actions also create a context of trust and communication that allows for shared

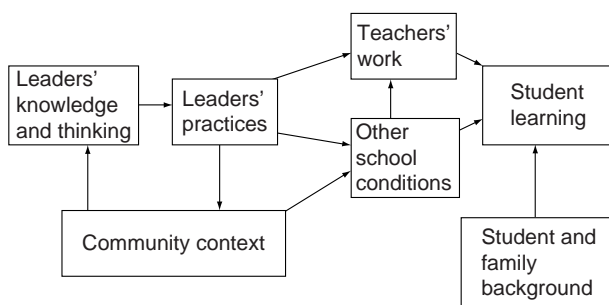

Figure 1 Conceptual framework for understanding how leadership relates to student learning.

values and authentic communication to develop. Leaders' failure to act or negative actions can undermine professional communities as well (Rollow and Bryk, 1995).

Fourth Trend: From Heroic to Distributed Leadership

Until recently the study of educational leadership focused on those who hold the most senior formal position in the organization, as if leadership impacts are attributable to this person alone. This heroic model of leadership is now being challenged by the idea of distributed leadership, which recognizes a division of labor for leadership like the more general division of labor in schools (Gronn, 2003). Rather than a single heroic leader, the distributed approach sees leadership as a set of activities in which the initiators and recipients of influence are constantly changing depending on the task at hand, the available expertise, and the willingness and skill of those involved (Robinson, 2001; Spillane *et al.*, 2004). A distributed leadership approach is critical to capturing the extent and impact of instructional leadership in schools and to discovering the role of principals in developing, coordinating, and evaluating the instructional leadership of teachers. It has also created space for the growing literature on teacher leadership (York-Barr and Duke, 2004) and, in some countries, for considering how leadership is distributed between schools and districts (Firestone and Martinez, 2007).

Research on distributed leadership needs careful theoretical and methodological development if it is to identify how the influence attempts of a wide range of staff make a difference to students. One problem with some initial writing on distributed leadership was the assumption that greater distribution was desirable in itself. Certainly one could argue that a rejection of the heroic in favor of a more distributed model of leadership is desirable on grounds of democracy and teacher empowerment. It does not follow however, that it is better for students (Timperley, 2005). Distributed leadership will serve students' learning if it is coordinated around that purpose. This means that studies are needed not only of the distribution of instructional leadership but also of how it is coordinated so that instructional goals are achieved. There are many coordinating mechanisms in organizations, not all of which require face-to-face interaction. Electronic templates, checklists, and written policies co-ordinate the activities of people who are working on part of a task and who may never meet to discuss their work. The people who design the tools around which people coordinate their work also exercise leadership (Halvorson *et al.*, 2004).

Conclusion

The study of educational leadership has come a long way since Bridges made his remarks about its limited utility.

Since then, the field has become more theoretically complex, has drawn on a greater variety of intellectual sources from the study of organizations to research on student learning, and has become more methodologically diverse and sophisticated as fits a field where the phenomena of interest are complex and interactive. The field still needs to identify a few common problems and develop a critical mass of energy around them. With any luck, the growing interest in leadership for learning will focus on that critical mass. At the same time, the combination of borrowing from other research areas, policy pressures, demands from educators and our own drive, persistence, and imagination will create the mix of rigor and relevance needed to generate the breakthroughs to really influence practice in a serious way.

Leaders for Productive Schools

J Murphy, S N Elliott, E B Goldring and A C Porter, Vanderbilt University, Nashville, TN, USA

© 2010 Elsevier Ltd. All rights reserved.

In this article, we develop a portrait of leaders for productive schools, or what we refer to elsewhere as leadership for learning (Murphy *et al.*, 2006). It is this type of leadership that is closely associated with schools in which all youngsters reach ambitious academic targets of performance. We draw our portrait from the school effectiveness and school-improvement literature. We capture the knowledge base of new leadership for new schools in eight dimensions and 30 functions (Table 1).

Vision for Learning

Leaders in high-performing schools devote considerable energy to “the development, articulation, implementation, and stewardship of a vision of learning that is shared and supported by the school community” (Council of Chief State School Officers, 1996: 10). On the development end of the continuum, leaders ensure that the vision and mission of the school are crafted with and among stakeholders. They also ensure that a variety of sources of data that illuminate student learning are used in the forging of vision and goals. In particular, they make certain that (1) assessment data related to student learning, (2) demographic data pertaining to students and their families, and (3) information on patterns of opportunity to learn are featured in the development process.

Effective leaders facilitate the creation of a school vision that reflects high and appropriate standards of learning, a belief in the educability of all students, and high levels of personal and organizational performance. They emphasize ambitious goals, ones that call for improvement over the *status quo*. In particular, instructionally anchored leaders make certain that goals are focused on students, feature student learning and achievement, and are clearly defined.

They ensure that responsibility for achieving targets is made explicit and that timelines for achieving objectives are specified. In short, they make sure that the school vision is translated into specific, measurable, and concrete end results. They also ensure that the resources needed to meet goals are clearly identified – and made available to the school community.

Effective principals and other school-based leaders articulate the vision through personal modeling and by communicating with others in and around the organization. On the first front, they are adept at making the school vision central to their own daily work. They demonstrate through their actions the organization’s commitment to the values and beliefs at the heart of the mission as well as to the specific activities needed to reach goals. On the second issue, communication, instructionally grounded leaders work ceaselessly to promote the school’s mission and agenda to staff, students, parents, and members of the extended school community (e.g., business and religious leaders, district office staff). Indeed, effective leaders are masters in keeping vision, mission, and goals in the forefront of everyone’s attention and at the center of everyone’s work. To accomplish this, they engage a wide array of formal and informal avenues of exchange and employ a variety of techniques (e.g., symbols and ceremonies).

Leaders for productive schools are especially well versed at translating vision into operation and in stewarding the school’s vision. They are careful monitors (1) ensuring a continuous examination of assumptions, beliefs, and values; (2) assessing implementation of goals; and (3) evaluating the impact of school objectives on organizational performance and student learning. These leaders recognize, celebrate, and reward the contributions of community members to the development, the implementation, and, most importantly, the realization of school goals. At the same time,

Table 1 Leadership for Learning

<i>Vision for learning</i>
• Developing vision

• Ethics

they are not wanted to overlook shortcomings and failures. Certainly a critical dimension of stewarding is seeing to it that school vision and school goals shape routine school activities and anchor organizational systems and structures. On a personal front, shepherding occurs when leaders act as keepers and promoters of the vision; maintain enthusiasm and a sense of optimism, especially in periods of waning energy; and inspire others to break through barriers to make the school vision a reality.

Instructional Program

Leaders in highly productive schools have a strong orientation to and affinity for the core technology of their business – learning and teaching. In the area of pedagogy, they are knowledgeable about and deeply involved in the instructional program of the school and are heavily invested in instruction, spending considerable time on

the teaching function. They model the importance of teaching by being directly involved in the design and implementation of the instructional program. They pay attention to teaching, visiting classrooms, and working with groups of teachers on instructional issues, both in formal and informal settings.

Leaders in schools where all youngsters reach ambitious learning targets realize that teachers are the keystone of quality education. Therefore, they devote considerable time and undertake much careful planning to guarantee that the school is populated with excellent teachers, and with colleagues whose values and instructional frameworks are consistent with the mission and the culture of the school. Instructionally centered leaders are also diligent in assigning teachers to various responsibilities. These women and men allocate this critical resource based on educational criteria, especially student needs, rather than on less-appropriate foundations such as staff seniority and school politics.

Instructionally grounded leaders devote abundant time to supporting colleagues in their efforts to strengthen teaching and learning in and across classrooms. Foremost, they are aggressive in identifying and removing barriers that prevent colleagues from doing their work well. They provide intellectual stimulation and make certain that teachers have a high-quality stream of job-embedded opportunities to expand, enhance, and refine their repertoires of instructional skills. They also make sure that the materials that teachers require to perform their jobs are on hand in sufficient quantity and in a timely fashion. Consistent with the involvement and investment theme, effective leaders make themselves available to, and demonstrate personal interest in, the staff.

We know from the literature that feedback about performance is essential to the learning process, and leaders in high-performing schools are diligent about providing this information to colleagues on a consistent basis and in a timely manner. In supplying performance feedback, these women and men (1) rely on personal knowledge developed through numerous classroom observations, both informal and formal; and (2) employ a variety of supervisory and evaluation strategies. They make student learning the calculus of the exchange process. Effective leaders are especially expert in opening up a wide assortment of improvement opportunities for teachers. They are relentless in counseling poor teachers to leave the classroom. In a related vein, instructionally grounded leaders aggressively monitor the instructional program in its entirety, assuring alignment between learning standards and objectives and classroom instruction.

Academic learning time is the caldron in which student achievement materializes, and effective leaders work tirelessly with staff to ensure that this precious resource is maximized. They begin by making sure that the great bulk of time is devoted to instructional activities and that noninstructional time is kept to a minimum. They also see to it

that the majority of instructional time is dedicated to core academic subjects. Within this learning space, they work with teachers to accentuate the use of instructional strategies that maximize student engagement at high levels of success. On a parallel track, effective leaders undertake an array of activities that protect valuable instructional time from interruptions, including: (1) assigning academic subject time slots that are least likely to be disturbed by school events; (2) protecting teachers from distractions from the school office; (3) developing, implementing, and monitoring procedures to reduce student tardiness and absenteeism; and (4) ensuring that teachers are punctual. They also foster more productive use of time by coordinating time usage among teachers and across classes (e.g., all language arts instruction unfolding during the first 2 h of the day).

Curricular Program

Effective leaders are also knowledgeable about and deeply involved in the school's curricular program. They work with colleagues to ensure that the school is defined by a rigorous curricular program in general and that each student's program in particular is of high quality. On the first issue, they establish high standards and expectations in the various curricular domains consistent with blueprints crafted by professional associations and learned societies. On the second topic, they ensure that opportunity to learn is maximized for each youngster. These leaders are also diligent in monitoring and evaluating the effectiveness of the school's curricular program.

In the array of factors that define high-performing schools, curriculum alignment enjoys a position of exceptional prominence. Moreover, effective leaders are especially attentive to creating a tightly coupled curriculum throughout the school. This means that they ensure that objectives (standards), instruction, curriculum materials, and assessments are all carefully coordinated. It also means that all special programs (e.g., bilingual education) are brought into the gravitational field of the regular program. Finally, it means that there is a high degree of coordination (1) across subjects within grades, (2) across grade levels and phases of schooling (e.g., from the elementary to the middle school), and (3) among teachers within and across departments and grade levels.

Assessment Program

Assessment systems in schools with effective leaders are characterized by a variety of distinguishing elements. First, they are comprehensive. They address classroom- and school-based activity. They feature the use of a wide variety of monitoring and data collection strategies,

both formal and informal, that is, they ensure that student learning is measured using an assortment of techniques. For example, comprehensive designs often include teacher-record-keeping systems, end-of-level or end-of-unit reports, student work products, criterion-referenced tests, and standardized measures of student performance. They also highlight information gleaned from direct observations in classrooms. Second, they disaggregate information on the important conditions and outcomes of schooling (e.g., program placement of students and test results) by relevant biosocial characteristics of students (e.g., gender, race, and class). Third, they are constructed in ways that foster the triangulation of data from multiple sources in arriving at judgments about the effectiveness of curricular and instructional programs and organizational operations. Finally, as alluded to above, these systems highlight tight alignment between classroom-based and school-based methods of assessing student learning. We close here where we began, that in schools with effective assessment programs, the fingerprints of school leaders are distinctly visible.

The literature also informs us that effective leaders are master craftspersons in the communication and use of the data that is the lifeblood of the assessment system. On the issue of use, instructionally grounded leaders ensure that assessment data is at the heart of (1) mission development, (2) instructional planning, (3) the evaluation of the curricular program, (4) the identification of and the design of services for special needs students, (5) monitoring progress on school goals and improvement efforts, and (6) the evaluation of school staff. On the communication front, effective leaders provide teachers and parents with assessment results on a regular basis. They also unpack the meaning of results with staff – as a body of the whole, in appropriate groups, and individually. They make certain that information about student progress is regularly reported to students and parents in an accessible form, at multiple times, across an array of forums, and in multiple formats.

Communities of Learning

Effective school leaders are especially skillful in creating learning organizations and fostering the development of communities of learning. They are vigorous promoters of professional development, they nurture the growth of communities of professional practice, and they shape school organizations to adhere to the principles of community. In the area of staff development, effective leaders thoughtfully attend to their own growth, modeling a life-long commitment to learning for their colleagues. Unlike many peers, these women and men focus their learning on issues of school improvement. They assume an active role in planning and evaluating specific staff-learning activities and the overall professional-development system of the

school. Attending to professional development is a significant piece of their work portfolios.

In working with colleagues, instructionally centered leaders establish an expectation that the continual expansion of one's knowledge and skills focused on helping students succeed is the norm at the school. These leaders also demonstrate a dedication and a willingness to assist teachers in strengthening their instructional skills. They furnish needed resources to teachers, including support to help teachers gain new knowledge (e.g., they fund workshops, hire coaches, and facilitate intra- and interschool visitations) and they provide the materials teachers require to implement new skills in the classroom. These leaders are committed to ensuring that their colleagues have both direct and indirect, both formal and informal, guidance as they work to integrate skills learned during professional development into their portfolios of instructional behaviors. They are well versed in providing regular incidental interventions – casual conversations and suggestions of ideas – that assist teachers in their efforts to improve instruction. As we outline below, they create systems and procedures that nurture this type of informal learning throughout the school, mechanisms that promote the exchange of professional dialog about strengthening instruction and improving the school.

Instructionally centered leaders forge a structure for professional development from the principles of learning theory and models of best practice. They make certain that a robust system for developing staff expertise is in place and that each staff member has the learning experience necessary to grow his or her instructional skills. They ensure that development opportunities and experiences flow from data on student achievement, link carefully with district and school goals, are integrated into the culture of the school, and focus on student learning. These leaders also make sure that learning activities are scaffolded on the principles of adult learning.

Leaders in effective schools actively promote the formation of a learning organization, the development of staff cohesion and support, and the growth of communities of professional practice. At the broadest level, these leaders endeavor to create a culture of collaboration and the systems, operations, and policies that provide the infrastructure for that collegial culture. At this level, they also are active in building shared beliefs about the importance of community. They nurture collaborative processes (e.g., shared decision making), forge schedules (e.g., common planning time), and create organizational structures (e.g., team leadership) that permit and encourage shared mission and direction, collaborative work, and mutual accountability for school goals and student learning. These leaders are particularly attentive to ensuring that there are a variety of mechanisms for teachers to communicate among themselves. Besides, to be sure, these women and men are active participants in the various

school learning communities, often serving a key linking and pollinating role in the process. They understand and help others understand that communities of professional practice offer the most appropriate caldrons for professional learning and the forging of new instructional skills. Finally, they take advantage of the fact that they are in a unique position to garner and allocate resources to bring communities of professional practice to life.

Leaders in high-performing schools also often promote a shared or team approach to leading the organization. The DNA of this more distributed conception of management – of pushing leadership outward to students, parents, and especially staff and helping others assume the mantle of leadership – is the privileging of expertise, rather than role, in managing the school. Effective leaders are adept in meeting this challenge. They involve others in the crafting and implementation of important decisions. They empower others and provide faculty with voice, both formal and informal, in running the school, not simply their own classrooms. They delegate often and effectively and often form leadership teams to assist in shaping the vision and in managing the operations of the school, especially in and around the core technology.

Resource Allocation and Use

High-performing school leaders have a gift for acquiring, allocating, and using resources to promote student success. Indeed, researchers in the areas of school improvement and instructional leadership consistently report that high-performing school leaders are more successful than their peers in locating and securing additional resources for their schools. In particular, these women and men use the formal and informal channels at their disposal to influence district-level decision making to better the competitive position of their schools in the distribution of resources. They also show adeptness in attracting additional funds and materials from the larger school community. Evidence is also emerging that effective leaders are more skillful than their peers in building up the stock of social capital at the school level.

On the allocation and use issues, two critical dynamics are in play in high-performing schools. First, leaders here assiduously link resource deployment and use it to attain the mission and goals of the school. All requests and all commitments are not equal in effective schools. Financial, human, and material resources are all directed in the service of improved student learning. Second, effective leaders are masters at taking the dimensions of work that have historically occupied centerstage in school administration – management, politics, organization, finance – and ensuring that they are no longer ends in themselves but assume importance to the extent that they strengthen the quality of the instructional and curricular program and enhance student learning.

Organizational Culture

Effective organizations in all sectors, including education, are marked by a strong production emphasis (Bossert *et al.*, 1982: 37). And consistent with the core theme of this article, leadership is a key factor in explaining the presence of this organizational orientation toward outcomes. On the front end of this condition, leaders in high-performing schools work ceaselessly to create an environment of high-performance expectations for self, staff, and students. They model risk taking in the service of attaining important goals. They regularly communicate a concern for and interest in staff performance and student achievement. They establish clearly defined, school-wide academic standards to bring expectations to life. They carefully ensure that these high expectations are translated into school policies and behavioral expectations. These leaders make certain that expectations are decoupled from beliefs about biosocial characteristics of students.

On the other side of production emphasis, effective leaders maintain school accountability. They hold everyone – students, teachers, parents, and school administrators – responsible for achieving school goals and reaching targets in the area of student performance, providing special weight to the contributions of teachers and other professional staff at the school. While these leaders acknowledge the value of hard work, they clearly couple success to performance.

Instructionally grounded leaders are the catalysts in school-based efforts at continuous improvement. They understand and communicate that complacency is the enemy of improvement, that *status quo* is more tightly linked to decline than to growth. These leaders confront stagnation. They ensure that the school systematically reviews and adopts more productive strategies to accomplish important goals. They take risks and encourage others to do so in the quest for better education. They act entrepreneurially to support school-improvement efforts. They encourage initiative and proactiveness. They make sure that the assessment program we described earlier is a driver in the work of continuous school improvement.

As with many of the areas we explore in this article, leaders have a dual role in the domain of learning environment. On the one hand, they demonstrate what is valued through their own behaviors. Thus, effective leaders model appropriate behavior by personally enforcing discipline with students and by confronting problems quickly and forcefully. On the other hand, these leaders are responsible for the creation and operation of systems and structures and the performance of colleagues. In this area, they ensure that operations, rules, and procedures to maintain discipline and order in the school community are developed and monitored on regular basis.

There is a fair amount of research that shows that impersonality reigns in many schools in America, especially

secondary schools. That is, students are neither well known nor particularly well cared for. Since schools have been constructed using institutional and hierarchical blueprints, both of which feature impersonality, this condition should come as a surprise to no one. Yet, the fact that it can be explained is not much consolation to the youngsters in these schools. On the other side of the ledger, we know that in schools where academic and social learning thrive high, academic press is almost always coupled with high personalization. At the broadest level, this indicates that each student is well known and cared for, that each youngster feels valued and important at school.

Recognition and rewards also fill a central cell in the personalization design in high-performing schools. In these communities, an abundance of classroom-based and school-wide recognition systems and mechanisms are in play, systems that are carefully designed to be reinforcing. Rewards are distributed frequently and they reach a high percentage of students. They are seen as meaningful and important throughout the school community, especially to students. They are often public in nature. They highlight the accomplishments of individuals and groups. And while they unquestionably privilege academic accomplishments, rewards are provided for success in a wide array of areas. We close our narrative here with an important reminder: Leadership is the central ingredient in ensuring that these frameworks of meaningful student engagement and widespread rewards and recognition become defining elements of school culture.

Social Advocacy

Working from a research base that overlaps quite extensively with the one we examine here, the framers of the Interstate School Leaders Licensure Consortium (ISLLC) standards for school leaders concluded that one of the defining characteristics of highly productive leaders is that they “understand, respond to, and influence the larger political, social, economic, legal, and cultural context of schooling to promote the success of all students” (Council of Chief State School Officers, 1996: 25). That is, they actively manipulate the environment in the service of better education for youngsters and their families. The central issue here is understanding contextual trends and influences and their potential impacts on the school and the larger community, particularly how these environments support or hinder learning in classrooms. In their role as social advocates, effective leaders proactively respond to external policy initiatives (e.g., speak at public forums, address civic organizations) to ensure that public policy is advantageous to the children and youngsters in their schools – and their families.

Effective leaders demonstrate an understanding of and a commitment to the benefits that diversity offers to the

school. They translate this knowledge and commitment into work that creates educational experiences that honor diversity (e.g., the use of culturally rich educational materials) while strengthening instruction and improving student achievement. As we see below, these leaders are also adept at building and using channels of communication that promote ongoing dialog with diverse groups of stakeholders.

According to the literature, most noticeably the ISLLC standards, effective leaders “act with integrity, fairness, and in an ethical manner” (Council of Chief State School Officers, 1996: 18). On one front, the authors of the standards note that this means that leaders fulfill legal and contractual obligations and apply laws and district and school policies and procedures fairly, wisely, and considerately. It means that they guarantee the privacy rights of students and recognize and respect the legitimate authority of others. At a deeper level, it means leaders treat others fairly, equitably, and with dignity and respect – and they establish the expectation that others in the school community act in a similar manner.

On a personal basis, effective leaders are more cognizant than their peers of their own values and beliefs and they shape their behavior in accord with personal and professional codes of ethics. They are more reflective and self-critical about their own practice and its impact on others in the extended school community. They know the difference between using office and position for one’s own gain and for the benefit of the school community and they honor the latter. These leaders serve as role models in terms of accepting responsibility for what happens to children and families in their school community.

Finally, the research on high-performing schools and instructionally oriented leaders reveals that effective leaders are attuned to and expert at linking the school to parents and others in the extended school community. Much more so than peers, these leaders weigh connections in terms of their value in enhancing the academic and social learning of students. That is, they engage families and other community members in the service of school goals, the learning agenda, and student performance. Inside the school, these women and men model community collaboration for staff, establish norms about the importance of parent connections, and provide opportunities for staff to develop the collaborative skills needed to work effectively with parents. They also ensure that information about family and community concerns, expectations, and interests inform school decisions.

Effective leaders craft and work from a comprehensive design about school–community relations that is anchored by the school’s academic mission. The plan is systematic, not simply a collection of *ad hoc* and unrelated activities. In the wider community, these leaders develop relationships with influential actors in the religious, business, and political sectors. They are actively involved in the school community and communicate frequently with stakeholders therein. They employ multiple channels and a variety of

forums to operationalize these connections. Their objectives are to inform, promote, learn, and link – to ensure that the school and the community serve one another as resources. On the extended community front, effective leaders are also specially attentive to building bridges with (1) other youth and family-service agencies that can promote better lives for youngsters and their families and (2) the media that can help promote the image of the school.

For effective leaders, connections with parents occupy a strategic position in the algorithm of stakeholder engagement. Leaders communicate with families regularly and through a variety of channels. They create programs and strategies that bring parents from the periphery to the inner circle of school operations.

Acknowledgment

This article was developed with the help of a Wallace Foundation grant on leadership assessment to Vanderbilt University. The generous support of the Wallace Foundation is gratefully acknowledged.

NCSL – National College of School Leadership

NSO – Nederlandse School voor Onderwijs management (Netherlands School for Educational Management)

The pivotal role of the school leader as a factor in effective schools has been corroborated by findings of school effectiveness research for the last decades. (The term school leader, in this article, is used instead of principal, headteacher, administrator, rector, or other terms describing the person who is in charge of an individual school.) Extensive empirical efforts of the quantitatively oriented school effectiveness research – mostly in North America, Great Britain, Australia, and New Zealand, and also in the Netherlands and in the Scandinavian countries – have shown that leadership is a central factor for the quality of a school. The research results show that schools classified as successful possess a competent and sound school leadership (there is a highly significant positive correlation). The central importance of educational leadership is therefore one of the clearest messages of school effectiveness research (see Gray, 1990). In most of the lists of key factors (or correlates) that school effectiveness research has compiled, leadership plays such an important part, so much so that the line of argument starting with the message, schools matter, schools do make a difference, may legitimately be continued as: “school leaders matter, they are educationally significant, school leaders do make a difference” (see Huber, 1997).

Studies on school development and improvement also emphasize the importance of school leaders, especially in the view of the continuous improvement process targeted at an individual school. For all phases of the school development process, school leadership is considered vital and is held responsible for keeping the school as a whole in mind, and for adequately coordinating the individual activities during the improvement processes. Furthermore, leadership is required to create the internal conditions necessary for the continuous development and increasing professionalization of teachers. It holds the responsibility for developing a cooperative school culture. In this connection, the role model function of the school leader is worth mentioning.

Leadership Development

In view of the ever-increasing responsibilities of school leaders for ensuring and enhancing the quality of schools, school leadership has recently become one of the central concerns of educational policymakers. In many countries, the development of school leaders is high on the agenda of politicians of different political wings. At the beginning of the new century, there seems to be a broad international agreement about the need for school leaders to have the capacities required to improve teaching, learning, and pupils’ development and achievement. On looking more carefully, however, it is apparent that a number of countries have engaged in this issue more rigorously than others. While in some countries discussions of school leader development are mainly rhetoric, elsewhere concrete steps have been taken to provide significant development opportunities for school leaders. Hence, a closer examination of school leadership development opportunities in different countries is instructive.

In this article, we first use a comparison drawing on data from an international study of school leadership development programs (see Huber, 2004). This project on school leadership development was based on researching, analyzing, contrasting, comparing, and discussing programs of 15 countries in Europe, Asia, Australia/New Zealand, and North America. The report surveys the development models for school leaders in those countries. It describes international patterns in school leadership development and provides recommendations based on current trends. A broad variety of school leadership development approaches and models became apparent from this project. Second, we use our experiences not only in developing program designs, but also in implementing training and development opportunities.

International Approaches

Table 1 summarizes school leadership development models in 15 countries. It is meant to provide an accessible overview of predominant approaches in use across Europe, Asia, Australasia, and North America.

In spite of the differences in cultural and institutional traditions, the study’s findings underpin a number of international patterns or tendencies in school leadership development seen from a global perspective. While some of them may be viewed as differences in emphasis, others may be so

Table 1 Overview of current approaches to develop school leaders*Europe*

Denmark

Optional offers made by municipalities, universities, and private suppliers without any central framework or delivery system

Sweden

A national preparatory program offered by universities through a basic course plus additional offers by the municipalities

England and Wales

A centrally organized program delivered by regional training centers; combines assessment and training with a competency-based and standards-driven approach; the program is embedded in a three-phase training model

France

A mandatory, centrally designed, intensive, full-time, half-year preparation program with internship attachment for candidates who have successfully passed a competitive selection process; completion guarantees a leadership position on probation (during which further participation in training is required)

Netherlands

A broad variety of different optional preparatory and continuous development programs by different providers (e.g., universities, advisory boards, and school leadership associations) in an education market characterized by diversity and choice

Germany

Courses conducted by the state-run teacher training institute of the respective state, mostly after appointment; differs from state to state in terms of contents, methods, duration, structure, and extent of obligation

Austria

Mandatory centrally designed, modularized courses post-appointment; delivered by the educational institute of each state; required for continued employment after 4 years

Switzerland

Quasi-mandatory, canton-based, modularized programs offered post-appointment; delivered by the respective provider of the canton, most often the teacher training institute, wherein the aim is nationwide accreditation (national standards are currently being developed)

South Tyrol, Italy

A mandatory program for serving school leaders to reach another salary level as becoming Dirigente; delivered by a government-selected provider that combines central, regional, and small group events with coaching attachment

Asia

Singapore

A mandatory, centrally controlled, preparatory, 9-month, full-time program provided through a university; comprised of seminar modules and school attachments

Hong Kong, China

A centrally designed, mandatory, 9-day, content-based induction course immediately after taking over the leadership position

Australasia

New South Wales, Australia

An optional, modularized, three-phase program offered by the Department for Education; centrally designed, yet conducted decentralized through regional groups; besides, there are offers by independent providers

Continued

Table 1 Continued

New Zealand

A variety of programs with variation in contents, methods, and quality; conducted not only by independent providers, but also by institutes linked to universities; no state guidelines, standards, or conditions for licensure

North America

Ontario, Canada

Mandatory, preparatory, university-based, 1-year, part-time program delivered through several accredited universities following a framework given by the College of Teachers (the self-regulatory body of the profession)

USA:

Washington

New Jersey

California

Mandatory, intensive, preparatory, 1-year, university programs that include extensive internship attachments; programs use a broad variety of instructional methods

Huber (2004)

significant as to represent paradigm shifts. The largest differences are evident in those countries with longer experiences in school leadership development and school leadership research. In the following sections, these trends will be explored (for a full account, see Huber, 2004).

International Trends

Central Quality Assurance and Decentralized Provision of Programs

Provision of development opportunities for school leaders varies broadly across the countries (as shown in **Table 1**). There are different degrees of centralization and decentralization with regard to how much choice prospective participants have over available providers and development programs. Here, the interrelation between the approach to school leader development and the educational policy and school system background is of particular interest. The countries can be categorized in terms of these two dimensions (see **Table 2**).

In some centrally organized school systems (see **Table 2**, cell A), there is a centrally regulated development program. It has a standardized approach and its delivery is centrally organized. The program is mandatory for all school leaders. In contrast, in some decentralized school systems (see **Table 2**, cell D), there are a variety of programs offered by competing providers. The choice of which program(s) to attend is up to the individual (aspiring) school leader. Here, the governments abstain from any regulation or control of professional development. Countries with a predominantly centralized school system and with an entrepreneurial approach to school leader development could – not too much surprisingly – not to be found in the study.

Table 2 Centralization and decentralization of school systems and school leader development

		<i>Approach to school leader development</i>	
		Predominantly centralized or using standards or guidelines	Entrepreneurial
<i>Level of central control over school management</i>	Predominantly centralized	A France; South Tyrol; Austria; Germany; Hong Kong; Singapore	B
	Substantially devolved	C Ontario, Canada; USA ^a ; NSW; Australia; Sweden; England and Wales Switzerland	D Denmark; Netherlands; USA ^a ; New Zealand

^aDouble listing is due to differences in the approaches of the different states.

Another existing variant, however, is represented by countries with decentralized school systems (see **Table 2**, cell C), whose programs are designed according to central guidelines, but are not standardized in every detail. Their general approach seems particularly progressive and pioneering. In North American countries, responsibility for designing and conducting qualification programs (preservice training) lies primarily with universities (e.g., Ontario, Canada as well as in the US examples included in the study). However, these universities are not completely independent when setting up their development programs. They must take centrally developed goals and standards into account.

Generally, there is a developing trend in which the responsibility for designing goals and programs, and assuring quality lies with a central institution, while delivery is decentralized. Teachers who want to qualify for a leadership position can choose among various service suppliers, but rely on a fundamental level of quality assurance due to established guidelines or standards, and on nationwide acceptance and recognition of programs by employing bodies.

New Forms of Cooperation and Partnership

New models of partnerships in numerous countries can be viewed as the second trend. These arrangements were created to conceive, implement, supervise, and evaluate school leader development programs. The most striking

feature of this development, however, is the fact that representatives of the recruiting committees (either state or local) of the colleges of education at the universities, and an increasing number of representatives of the profession itself (predominantly from professional organizations, and also from local schools) are now included as well.

It becomes apparent that much of the coherence that characterizes the new programs in these countries is due to this cooperation. These groups contribute a variety of perspectives concerning the essential content of the programs, the teaching strategies and learning methods, and the organizational and chronological conception of the programs; in other words, their conception on a macro- and micro-didactic level. These partnerships have also contributed to the creation of a pool of highly qualified and accredited or certified trainers in some countries.

Dovetailing Theory and Practice

Partnerships such as these have also contributed to the increasing combination of the theoretical and practical aspects of school leadership development, which is an important and yet, difficult task to achieve.

It might sound axiomatically that theory has to be made accessible through practice and vice versa. Seemingly, it has never been easy to achieve both at the same time. In many of the countries investigated, it was perceived that either development programs emphasized theory and were theoretically, respectively academically oriented or were focusing on a more practical approach based on experiences of practitioners. Both models, therefore, seem to suffer from a one-sided approach, and do not seem to be attracting participants or leading to the expected increase in knowledge, understanding, skills, and abilities. Only a more balanced model leads to participant satisfaction and is a suitable method to meet the participants' needs. It is thus safe to assume – although this aspect has not yet been investigated sufficiently – that dovetailing theoretical and practical aspects is essential for designing effective development programs which aim at changes in one's behaviors and dispositions. Admittedly, school leaders themselves seem to prefer what they refer to as practical experience and, at times, regard theoretical and academically oriented topics as less useful. It can be seen (see West *et al.*, 2000), however, that they find it much easier to deduce general knowledge from their experiences and to use effective strategies when they have a theoretical conceptual framework that underpins their decisions and actions.

Theory and practical experiences are interdependent and therefore have to be developed together. The partnerships indicated above appear to be a suitable starting point, since research is conducted alongside the development programs and can affect the development concepts.

Hence, research-based training concepts are realized. This connection requires partnerships between the individuals working at schools and those who research and study schools. This will more effectively link the work carried out in both areas. Mutual respect and collaboration between both groups are essential for this to occur.

Preparatory Qualification

Effective school leadership requires a demanding set of attitudes, attributes, skills, knowledge, and understanding. Thorough training and development, starting with appropriate preparation prior to assuming the position, has been recognized as undoubtedly vital. Hence, in many countries, development opportunities are scheduled before taking over school leadership. Preservice preparation is offered instead of relying solely on in-service training. Moreover, these programs differ as to whether they are optional or mandatory (see **Table 3**).

In countries that have mandatory preparation (see **Table 3**, cell A), taking part in the program is an

important selection criterion for future employment as a school leader.

In countries where preparation programs are optional (see **Table 3**, cell C), there is a tendency among employing bodies toward expecting some preparation for the position. An alternative trend finds the provision of in-service training immediately after appointment and before taking over the leadership position.

Extensive and Comprehensive Programs

Taking the school leaders' role seriously and regarding school leadership as a profession have implications concerning the extent of training and development provision for school leaders. In some countries, the school leader is no longer seen as *primus inter pares*, as being a teacher with only a few additional responsibilities. Hence, some development programs have become quite time consuming, comprising around 100 or more course days.

By way of illustration, some examples are given here from North America, Europe, Asia, and Australia/New Zealand (see **Table 4**). It is important to mention that all of the programs listed here are preparatory, which means that they all take place before appointment (except the offer from the Netherlands, which may also be attended after appointment). This suggests the increasing recognition of school leader professionalization.

While **Table 4** indicates only the number of course days, the real demands on the time of the participants are apparent when we consider that beyond contact time there is other time committed to preparation. Additionally, activities include individual study time for readings and writing assignments, time for internships or school-based projects, and the documentation of one's progress and reflection by writing a learning journal to mention but a few examples.

Table 3 Timing in participants' career and nature of participation

		Preparatory	Induction
Mandatory	A	Ontario, Canada; USA; France; Singapore	B Germany ^a ; Austria; Switzerland ^a ; South Tyrol; Hong Kong
Optional	C	England and Wales; Netherlands; NSW, Australia; New Zealand	D Denmark; Sweden; Germany ^a ; Switzerland ^a

^aDouble listing due to differences in the approaches of the German Laender or Swiss Kantone.

Table 4 Length of school leader preparation programs (contact time)

Multiphase Designs and Modularization of Programs

Clearly, providers are increasingly moving toward multiphase development models based on a coherent conceptual approach and comprising orientation, preparation, and induction phases for aspiring and newly appointed school leaders, as well as a continuous development phase and a reflective phase for established school leaders.

There is also a trend toward providing professional development through a series of modules. This takes two general forms. In the first form, the models are conceived of as a mandatory sequence of rounded single programs. In the second form, there is no specific sequence for completing the modules. Rather participation in the modules depends on the professional position and development needs of the individual participant. The modules may be collected in a kind of personal portfolio. The individual school leader may well fall back upon them as support in crucial career phases.

In general, there is a tendency away from one-size-fits-all designs and toward programs tailored for the individual participant through modularization. Development should be linked to the career cycle and to specific needs of the leader, both personally and dependent on the particular school. Needs assessment and choice, rather than a flexible curriculum, helps in this matter (Table 5).

Personal Development Instead of Training for a Role

As the role of school leaders is becoming increasingly complex, it becomes more and more evident that it is no longer sufficient to train potential candidates or school leaders for a fixed role, whose model may be quickly outdated. Instead, aspiring school leaders must develop a

vision within the context of their school and adapt their role and responsibilities to that context. To achieve successful adaptive leadership, the programs of some countries include components such as personal vision, personal and professional development, development of fundamental values and of one's ability to reflect, time and self management, developing mental models of the organizational structure, and activities in the school that mirror good leadership activities. Moreover, day-to-day school or internship experiences have become reflective activities that result in constant re-conceptualization.

As far as qualifications are concerned, the emphasis has shifted from focusing on a specific role to a broader one that concentrates on personal learning and one's needs in the areas of knowledge, dispositions, and performances that would be useful in a more complex environment. Often, training for a management position has been replaced by offering professional development opportunities for one's leadership style. It is the personality of the (aspiring) school leader that becomes the focal point of any program.

The Communicative and Cooperative Shift

In spite of the increasing stress on school leaders due to the complexity of the role – particularly in countries with more devolved systems – school leadership programs are not preoccupied with administrative topics. On the contrary, the overall focus of school leadership programs is no longer on administrative and legal topics as it used to be in earlier programs, but has shifted to topics that focus on communication and cooperation.

The image of school leaders as experts in administration has shifted to school leaders as experts in communication and cooperation. This trend has become another international paradigm shift. Topics such as communication,

Table 5 Phased models of school leadership development

The individual squares represent courses; the black line signifies the sequence of participation.

motivation, collaboration, collegiality, and cooperation are essential parts of all programs. Internationally, there is the recognition that understanding and effectively using these topics is essential for one to become a successful school leader.

Communication and cooperation, as essential components in leadership development programs, also play an important role as far as the methods applied in those programs are concerned. Realizing that learning processes that take place in groups provides participants with better opportunities for experiential learning, more programs are moving in the direction of small- and large-group interaction. The aim then becomes one of creating reflective practitioners and this will intensify the teaching–learning experiences. In addition to traditional seminars, collegial learning—learning together with other colleagues—is being realized through a variety of strategies, including peer-assisted learning, peer coaching, critical partnerships, acquiring knowledge from experienced peers by shadowing, or through mentoring programs or collegial networks (professional learning communities) that were created (e.g., as a result of experiences from the cohorts that existed during other training programs). When one uses these strategies, learning evolves through mutual reflection and problem-solving processes; it is about learning with and from colleagues.

From Administration and Maintenance to Leadership for Improvement

Schools are more and more viewed systemically as learning organizations, each with their own specific conditions, rules, and cultures. Consequently, leading schools entails developing learning organizations (see Senge, 1990; Fullan, 1993, 1995). Hence, the overall focus is not on managing schools with an emphasis on maintenance, but has shifted to a focus on leadership for improvement.

The central task of school leadership is the continuous improvement of the school in cooperation with all stakeholders and agents. This is mirrored in the choice of contents and methods of development programs, which take into account that school leaders must be educational leaders and that is about initiating, supporting, and sustaining substantive and lasting change as well as continuous improvement in schools for the benefit of pupils. Communication and cooperation, school development and staff development, and evaluation and quality assurance play an important part. The focus is then on a collaborative and collegial style of leadership.

Qualifying Teams and Developing the Leadership Capacity of Schools

The conceptualization of school as a learning organization increasingly shifts the focus away from the development of the individual school leader to the development

of each individual school's leadership capacity. In consequence, the school leadership development program becomes a means of school development. With this in mind, some providers now explicitly focus not only on (aspiring) school leaders, but also on teachers who want to enhance their leadership competencies even if they are not planning to apply for school leader positions. A few programs even target whole school leadership teams, and may include parent and community representatives.

As an additional note, this new focus on developing team leadership capacity has interesting implications for program contents. When a program focuses on a team, development activities must become even more contextualized: it is no longer context-free training, but context-specific applied development.

From Knowledge Acquisition to the Creation and Development of Knowledge

When rapid social and economic change and changes in the educational system are coupled with a global increase in information production, it is insufficient for programs to focus solely on enlarging the quantity of leaders' knowledge. The qualification must prepare for an unknown future environment. This suggests yet another paradigm shift. It is a shift away from imparting a stable knowledge base and toward the development of procedural knowledge that can be applied. The notion of acquiring knowledge is being replaced by the concepts of developing or creating knowledge and by information management. The participants will enhance their ability to learn, understand cognitive processes, and achieve what is referred to as conceptual literacy (see Giroux, 1988). They have to be enabled to act in a complex, sometimes chaotic, work environment (see Murphy, 1992).

Needs-, Experience-, and Application Orientation

There is consensus that delivery methods must address the learning needs and competences of adult learners. Hence, fundamental andragogic principles must be taken into account. This reflects the belief that new knowledge is built on previous experiences and the knowledge of the adult learners. Adults bring personal and professional experiences, prior knowledge, and their own personal ways of seeing themselves to bear on the learning process to a greater degree than children (see Siebert, 1996). Themes that cannot be linked to previously existing cognitive systems are often quickly forgotten. The reality and the experiences of the participants, their needs and problems, should therefore become the starting point of new learning. Consequently, methods of learning tend to favor a problem-centered rather than theme-centered approach. According to Gruber (2000), gaining experience for professional competences means learning in complex

application-relevant and practice-relevant situations (see also Joyce and Showers, 1988/1995). New competences are mostly gained in a process of practice and feedback. For this reason, sufficient theoretical foundations should be imparted as well in order to foster reflection on practice (see also Schön, 1983, 1984).

In many development programs, there is a clear tendency toward experience-oriented and application-oriented methods and toward practice-with-reflection-oriented learning.

New Ways of Learning: Workshops and the Workplace

Increasingly, the participants are placed in a workshop surrounding, and confronted with modeled situations of school leadership work life and carefully constructed cases. They may be involved in teams in problem-based learning (PBL) where learning is cooperative, interactive, participative, and, to a certain degree, group- and self-organized. More consequently than the case studies and simulations often applied in development programs, the PBL approach starts with real-life experiences and then looks for supportive knowledge as a tool. The slogan here is: first the problem, then the content (Bridges and Hallinger, 1995: 8).

Within PBL, team learning is especially critical in order to achieve solutions to problems. Problem solving is an interactive participative process.

Going one step further means using genuine cases that are taken from real schools, either from the schools of the participants or from partnership schools. Within this approach, participants of the project group become external counselors for the leaders of these schools. Through this interaction, both parties benefit.

Some development programs take a step further: leave the workshop and turn to the authentic workplace, using it as a clinical faculty. It is argued that only the authentic working context can assure an adequate complexity and authenticity leading to learning processes required. For the participants of preservice school leader development, internships at one school or several schools are organized parallel to the training. They can observe the school leader by shadowing her/him, can partially take over leadership tasks themselves, and can carry out projects independently. The school leaders at the internship schools then function as mentors or supervisors and will also benefit from this cooperation. In general, new partnership arrangements between universities, other providers of school leadership development, and schools are an important basis for learning opportunities such as these. Thus, certainly the best possible practice relevance is created: exemplary learning processes take place in the reality of school.

As Huber and West (2003) show, the training provision can be conceptualized as being spread across two continua

Table 6 Emphasis of learning opportunities within school leader development programs

<i>Experience-Based Learning</i>		<i>Course-Based Learning</i>	
Centered around experiential methods	Extensive internships	Mixed model	Centered around courses
	France; Singapore; Washington, USA	NSO, Netherlands; New Jersey, USA; Ontario, Canada; England and Wales	Germany; Hong Kong

It has not been taken into account whether the offers are made to teachers aspiring to leadership or to school leaders newly appointed and in position. Besides, the different emphasis could be viewed in reference to the total amount or length of training available; since offering experiential learning opportunities inevitably means expanding the program accordingly.

of course-based and experience-based learning opportunities. Hence, it is possible to distribute the programs worldwide according to the relative emphasis given to these two strategies (see Table 6).

Adjusting the Program to Explicit Aims and Objectives

It becomes increasingly obvious that the process of developing school leaders is becoming more professional. This also includes explicitly stating the program's aims that aspiring leaders must achieve and adjusting the program to these explicit aims and objectives. Until now, programs were not necessarily developed with explicit goals or objectives, especially in the early stages of their development. Instead, generalized statements such as school leader development aims at developing school leaders were used. Contentwise, however, the aims postulated differ greatly at a higher level of explicitness. They can be classified according to their main foci: those with an explicit functional orientation and/or task orientation, those which are distinctly competence oriented or cognition oriented, those with a definite orientation toward school improvement, and some which are clearly vision or value oriented. Moreover, they state definite and explicit expected outcomes.

As new concepts of leadership and schools emerge, based on the values of society, they increasingly begin to impact the programs.

New Paradigms of Leadership

Changes in the schools and their context also have some impact on the role of school leaders. This new role can hardly be filled with old concepts of leadership.

School leader development has to take this into account. Consequently, some of the development programs relate to new and quite specific leadership conceptions.

As schools are no longer seen as static systems, conception such as transformational leadership, are becoming more popular. Transformational leaders view school as a culturally independent organism that is able to develop. Hence, they exercise an active influence on the culture of the school. They are expected not only to manage structures and tasks, but also to concentrate on people and their interpersonal relationships. They make an effort to win their cooperation and commitment. Leadership of this type is considered more suitable for the tasks of school development (see Leithwood, 1992).

If school is to become a learning organization, this implies the active empowerment and cooperative commitment of all stakeholders and agents. Then, the previous division between the positions of teachers on the one hand and learners on the other hand cannot be maintained; nor can the division between leaders and followers. Leadership is no longer statically linked to the hierarchical status of an individual person, but empowers as many staff members as possible as partners in various parts. This is conceptualized by the notion of posttransformational leadership (see Jackson and West, 1999).

Another concept, for example, is integral leadership. It views school leaders primarily as leaders with genuinely educational tasks and emphasizes an integrating perspective, which overcomes the divide of management and leadership for the sake of the educational aims of schools (see Imants and de Jong, 1999).

Instructional leadership is another model cited very often (see, for example, de Bevoise, 1984; Hallinger and Murphy, 1985). This leadership concept focuses most on those aspects of school leadership actions that concern the learning progress of the pupils. They include management-oriented as well as leadership-oriented activities such as a suitable application of resources for teaching, agreeing upon goals, and promoting cooperative relationships between staff (e.g., preparing lessons cooperatively), but, especially, the evaluation and counseling of teachers during lessons through classroom observation, structured feedback, and coaching (see Hallinger, 2003).

Moreover, we can see concepts such as organizational-educational management and leadership (Rosenbusch, 2005; Huber, 2004), moral or democratic leadership (mainly in Europe), and, as a more eclectic model, integrative leadership (see Huber, 2004; Huber and Moos, 2007).

Orientation toward the School's Core Purpose

School leadership development programs are more strongly oriented toward the schools' core purpose, namely teaching and learning, and the specific aims of schools within society today and in the future.

The idea of school as an administered addition of lessons, as the lowest unit in the school system's hierarchy is no longer up to date. Many changes in the school system have occurred in recent years, even in the more centralized school systems. Therefore, it would be quite important to make the aims of school in society and possible goals of schools of the future as central themes in the program. These should then be discussed by the participants and adapted into their thinking framework for aligning their action to these goals.

These reflections on leadership activities, the school, its role, and function are explicitly made in some countries. Increasingly, there is more conceptual elaboration of the aims toward which schools are to be developed. The aims of school leader development programs should answer questions such as these: What is school and schooling about? What is leadership and management about? What is the core purpose and what should be the aims? What kind of training and development opportunities are therefore needed to prepare and support (aspiring) school leaders in adjusting their perspectives, conceptualizing their role and function, developing the necessary competences, and mastering the manifold tasks within the individual school in order to provide conditions and support staff so that effective and efficient teaching and learning take place for the sake of the pupils?

This multilevel adjustment of aims should be essential designing, implementing, and evaluating school leadership development programs and should shape the programs with regard to contents, methods, patterns in terms of timetabling, etc. (see Huber, 2004).

Conclusion

A comparison of school leader development programs gives a dominant impression of global approaches and shifts. What can be clearly stated about school leader development from this international perspective is that there have been many changes during the last years in many countries. In other countries, this process has just started. School leadership and leadership development are high on the agenda of educational policymakers.

Obviously, many of the countries that have enhanced their leadership development programs have increasingly focused on linking leadership development with school development. Here, increasing the leadership competences of an individual is seen as a component of building the leadership capacity of the whole school.

To sum up, we find two new avenues in preparing school leaders: first, new ways explore the development of training and development designs, quality assurance, and the overall organization through the development of central institutions that are in charge or the setting up of standards and accreditation procedures for the providers.

Second, new ways explore the implementation and carrying out of training and development programs based on new macro- and micro-didactic considerations of instruction and learning settings with a focus on putting theory into practice and, vice versa, using experiences to develop subjective theories. (Macro-didactic considerations are about defining not only the target group(s), the timing, the nature of participation, and the professional validity, but also the pattern with the total number of training and development days, the time span, the scheduling, etc. Micro-didactic considerations are about the curriculum, the content, the teaching strategies and learning methods used, etc.)

For successful training and development opportunities, it is necessary to link stakeholders and agents in the school system both vertically and horizontally. The training needs to have a multilevel approach using this vertical and horizontal linking. It is about: (1) cooperation within the school and among schools, either position or theme oriented; (2) learning from and with colleagues, and professional learning communities within the whole school system; and (3) developing a shared language, shared concepts, and a shared culture. This approach is a vehicle for school development and has to be taken into account and mirrored by leadership training and development opportunities.

Bringing theory and practice together seems to become very important as well. The linkage is using a reflective learning approach. Reflection – also together with others (peers, seniors, and experts) – plays an important part. Moreover, training and development have to be seen as a continuous process, and have to be multiphase oriented. Additionally, programs have to be context related (to the country, the society, the school system, the individual school, and to the individual needs of the participants). Besides these premises, training and development opportunities should be needs oriented, practice oriented, and application-oriented, consequently, competence oriented. Finally, development programs – as mentioned above – require a multistage adjustment of aims. (For further concrete recommendations for program designs and their implementation, see Huber, 2004.)

Given the fact that school leadership is getting increasingly complex and that not only the tasks but also the competences are too demanding for one person alone, shared, distributed, or cooperative leadership concepts seem to be solutions discussed internationally not only in the academic community but also increasingly in the profession itself. However, it may be stated that the conception of school leadership in training and development programs, even taken internationally, still is a rather narrow one. Perhaps there does need to be one supreme head in each school. Maybe school leadership development programs are about finding and equipping such individuals. However, perhaps there are other alternatives – collective leadership, the development of whole teams of staff, and the

reconceptualization of the school leader's role as simply one part in a team, a team made up of leaders who all need support, training, and development opportunities. For us, it is this last issue that seems to challenge most forcibly the orthodoxy underpinning current provision, and that offers the most interesting avenue of exploration for the future. Particularly in the last couple of years, we have been able to find that writings about shared, cooperative, or distributed leadership concepts have increased, more policy initiatives which promote these concepts have been put in place, and training institutes implicitly integrated and explicitly offered programs which foster these approaches. Although this has an impact on training and development programs for school leadership, it is still too little, quantitatively and qualitatively speaking.

If change is on the agenda of schools and school leaders, it is crucial to have a vision which gives them a direction. Leaders (of any kind) need to know what goals and aims for real improvement are as well as what is needed is to have criteria to judge the overall leadership approach and the day-to-day decision making. This should be back-mapped against the core purpose of school, namely teaching and learning. As a solid base for what education aims at, in some of the programs an orientation toward a specific value-based attitude is intended. Thus, the understanding of leadership in this context includes moral and political dimensions.

A very final remark should hint at the phenomenon across countries that fewer teachers are interested in leadership functions. Training and development opportunities can and have to take that into account, in terms of fostering potentials. Besides being an individual training measure and a school development initiative, they can also be a measure for personnel marketing. It is about attracting potential leaders to apply for school leadership positions. This can be achieved more easily if training and development programs are less position oriented than competence oriented. Hence, there may be training and development programs, which are not school leader programs with a fixed set of competences in mind, but school and school leadership development programs, which try to enhance the development and leadership capacity of a school in particular and the school system in general. This, as well, fits to the now newly discussed concepts of system leadership.

Increasingly relevant to policy, practice, and research is the issue of the effectiveness and efficiency/efficacy of training and development programs. It is about the resources needed, the output and outcome, and the benefits not only for the participants, but also for the individual school organization and the school system in general. Whether school leadership development programs are successful is still not researched sufficiently. The efficacy and effectiveness of programs are still a research desiderate.

Research for Leaders: The National College for School Leadership

G Southworth, National College for School Leadership, Nottingham, UK

© 2010 Elsevier Ltd. All rights reserved.

Introduction

The National College for School Leadership (NCSL) was established in 2000 to be a single national focus for school leadership, be the driving force for world-class leadership in schools, and to coordinate national development programs and other leadership initiatives and activities in England. It is almost wholly funded by the central government.

It has been a founding principle that NCSL would be a learning organization. Therefore, it has always strived to be an evidence-informed institution. The research group plays a key and strategic role in knowledge management within NCSL, aiming to provide access to the latest thinking and research into school leadership for school leaders, policy makers, and staff in the institution, who manage and develop leadership activities. In terms of knowledge management, the role of research and evaluation is to create, collate, and communicate what is known about effective practice. Moreover, as a national organization, we constantly scan research findings within education and beyond (e.g., business schools and the public sector) in the UK and internationally.

It is important to note that NCSL is committed to actionable knowledge. We regard our activities as delivering leadership learning for action, and our research should realize this aim. Hallinger and Heck (1996) demonstrated that there were some persistent blind spots and blank spots in educational leadership research and advised ways of addressing these. NCSL took their advice seriously, particularly in respect of the need to study how leaders make a difference. Thus, while NCSL's research covers a range of leadership topics and issues, one issue which is pursued in depth is how school leaders make a positive difference to the progress and achievements of pupils.

In a relatively short time, NCSL has established a high profile internationally and, while we are never complacent about the scale of the task, it is also fair to say that we have received some very positive feedback on our work. For example, a critical review of leadership development in the USA, published in 2005, which had examined what the NCSL did as an external comparison to work within the USA, concluded that NCSL "blends research and practice better than any American school of education" (Levine, 2005: 59).

This article will draw on NCSL's research evidence, which includes knowledge of others' findings, to provide a high-level overview of what we know about successful school leadership.

What We Know about School Leadership

Between 2001 and 2006, NCSL hosted and sponsored a number of think tanks, seminars, visiting scholars, and practitioner enquiries. We commissioned a high number of research studies, evaluations, and literature reviews. We also scanned research publications and outputs nationally and internationally and attended and presented at major research conferences.

Without doubt, there is a wealth of work now available to practitioners, policy makers, and the research community. Moreover, it is important to bring this work together to build coherence, note differences and inconsistencies, and summarize the key insights. Furthermore, having been in existence for 5 years, in 2006, researchers at NCSL took the decision to synthesize and summarize their work and that of others. That exercise forms the basis of what now follows.

The knowledge base is characterized by the following features:

- There exist a high number of small-scale research studies.
- The evidence tends to be either qualitative or quantitative; there are only a limited number of projects which use mixed methods.
- Often, there is a conflation between description and prescription – with advocacy sometimes a strong feature of the scholarship and empiricism placed in a distant second place.
- There is not always enough building on preexisting knowledge – and, perhaps, there is insufficient integration and too much atomized thinking.
- Generally, there is weak attention paid to examining the impact of leaders. There are some exceptions too, notably Silins and Mulford (2000), who, as part of their study, attempted a critical path analysis and showed the value of trying to trace linkages.
- North American research sometimes dominates; yet, at the same time, we are increasingly aware that context-sensitive studies are needed. Cross-cultural borrowing needs to be treated with caution.

In recent years, there have been a number of attempts to summarize the knowledge base, for example, Leithwood and Reihl (2003), Leithwood *et al.* (2006b), and Ingvarson *et al.* (2006).

From our own work, which includes a number of practitioner studies as well as academic ones, and our

awareness of other project findings, it is possible to identify seven sets of insights about which there is growing agreement. These are described in the following.

Context Matters

There can be little doubt that contingency theories are very popular both with the academic community and with practitioners. The former regularly make much of the need for leaders to be alert to the demands of their specific contexts. For example, Leithwood *et al.* (1999) declare that outstanding leadership is “exquisitely sensitive to the contexts in which it is exercised” (p. 4), while Hallinger and Heck (1996) state that it is “virtually meaningless to study principal leadership without reference to the school context” (p. 14). Practitioners too subscribe to the importance of context by repeatedly describing the communities that their schools serve and explaining their actions as leaders in terms of the needs of the students, their home backgrounds, and the social and economic circumstances of their communities.

Therefore leaders need to be contextually literate: they have to be able to read their contexts like a text, including understanding the subtexts, the meta-messages, and the micropolitics, while not becoming victims of them. Leaders are not passive players in their contexts – indeed, they are influential actors and should be proactive in shaping their organizational settings, ways of working, and cultures (Schein, 1985). It should also be recognized that becoming contextually literate is a major, indeed core, skill and one which has important implications for leadership development. It implies that leaders should be able to analyze and understand their settings, determine priorities, and enact their own and others’ leadership in ways which are needs based. This means using a mix of strengths, weaknesses, opportunities, and threats (SWOT) analyses, school self-evaluation methods, and student outcome data to recognize trends and the brute facts of the school’s levels of performance, progress, and rates of improvement.

In emphasizing the context-specific nature of leadership, this is not to impute particularity. There are some core skills and strategies which leaders need to know about and adopt. According to Leithwood *et al.* (2006b), almost all successful school leaders draw on the same repertoire of basic leadership practices (see section titled ‘Core tasks for leaders’):

- setting directions (motivation);
- developing people (capacity);
- managing the instructional program (stability); and
- redesigning the organization (setting).

Furthermore, it is the enactment of these basic leadership practices – not the practices themselves – that is responsive to the context. In other words, how leaders

read and then act, given their intimate knowledge of their contexts, is the distinguishing issue between them. Expressed more simply, it is not so much what you do as a leader, as how you do it that makes the difference in any given environment.

Leaders of Learning

Schools are places where children and young people are expected to learn whatever a community or society decides should be passed on to them. In turn, this means that school leaders are responsible for the learning which takes place there and, essentially, school leaders are leaders of learning.

The intention of this first paragraph is not to be tautological, but to make the core purpose of school leadership plain. In addition, it needs to be spelt out because there has always been a tendency for some leaders to become leaders of the organization as against exercising leadership of what the school is for. Moreover, the larger the school, the more organizational demands there are, and the more remote school leaders can be from the core business.

None of the above is to imply that headteachers and principals do this single handedly, nor that these are their only responsibilities. Nevertheless, research at NCSL (2004b) has shown that high-performing and rapidly improving schools are characterized by learning-centered leaders. Such leadership is focused on influencing what happens inside classrooms and is geared to improving the quality of teaching and the pupils’ learning. In addition, such a strong focus and interest in students’ learning is the basis for these leaders being role models for teacher and staff colleagues.

Learning-centered leadership is relentlessly focused not only on learning – most of all, student learning processes and outcomes – but also on staff learning and development – especially pedagogic development. The leaders monitor what is going on inside classrooms and across the whole school by using data, observing teaching and learning and identifying strengths and the development needs of teachers, and determine priorities for groups of students and units of the school.

Such leadership is shared, with middle leaders increasingly playing important roles. Headteachers and senior leaders create and sustain leadership at all levels because although distributing leadership matters, what matters most is distributing and developing learning-centered leadership. Therefore, the development of leadership is an important feature of school leadership today – it always has been – however, as headship has intensified and become more complex, so also has the need to share leadership increased, bringing with it the responsibility to develop other leaders.

Part of such school-based leadership development rests on the school being an environment characterized

by relational trust and professional dialog, and leading by example and management arrangements which enable feedback, coaching, and teamwork. Furthermore, collaborative research with NCSL's leadership network shows that when these conditions and behaviors are present and effective, within-school variations in pupil and departmental performances are reduced (NCSL, 2006c).

Having conducted a number of studies examining learning-centered leadership in action, NCSL (2004b) researchers concluded that learning-centered leaders:

- lead by example;
- monitor the achievements and progress of pupils, classroom practices, and the quality of teaching;
- use data to analyze and evaluate performance;
- generate discussion about teaching and learning;
- take steps to sustain school improvement; and
- create school structures, systems, and processes to support learning.

Core Tasks for Leaders

As implied earlier, recent work, while concluding that there is no one way to lead because it is so strongly situational, has identified a core set of leadership practices which form the basics of successful leadership (Leithwood and Reihl, 2003; Leithwood *et al.*, 2006a). The basics are:

1. Setting directions: identify and articulate a vision, create shared meaning and high-performance expectations, foster acceptance of group goals, monitor organizational performance, and communicate.
2. Developing people: offer intellectual stimulation, provide individual support, and an appropriate model – lead by example.
3. Developing the organization: strengthen school culture and modify organizational structures; build collaborative processes and manage the environment.
4. Respond productively to the challenges and opportunities created by accountability.
5. Respond productively to the challenges and opportunities of educating diverse groups of students.

These five practices also imply that leadership rests on certain qualities too, notably optimism and a positive disposition, a developmental orientation (e.g., that people and organizations can and do improve), and a strong moral compass – schools exist to serve children and students and to enable them to grow and improve as learners and social actors.

These qualities are vital because leadership is powerfully motivational (and, by definition, demotivational when it is less effective). Inspiring others and securing their followership is part and parcel of leadership. Yet, while there has been considerable attention paid to moral purpose and the importance of vision, little research has

actually been conducted into what teachers find motivating, although Blasé and Blasé (1998) have explored followers' perceptions of leaders and what teachers' preferences from their principals or headteachers are.

Values also play a part in leadership; indeed, they are inextricably tied up with leadership. There is a considerable body of work to support this claim (e.g., Fullan, 2003). Work by some of NCSL's research associates shows that what sustains school leaders in difficult times is their core values and moral purpose (Flintham, 2003).

It should also be noted that while there is growing consensus on some of the technical competences, there is also a broadening of enquiry in the leadership field to include studies on the passions and emotions of leadership (Sugue, 2005; Day, 2004) as well as the moral and spiritual dimensions of leadership (West-Burnham, 2002; Starrat, 2004). However, there are only limited studies regarding leadership for social justice, that is, research on those leaders who frame their leadership as a quest for equity (Jansen, 2006: 37, 38).

Distributing Leadership Matters

Distributed leadership has already been mentioned as part of the section titled 'Leaders of learning'. For some researchers, distributed leadership is, without doubt, one of the current big ideas which has swirled around during the last 5 years (see Spillane, 2005). There is considerable advocacy for the concept from a number of different perspectives. Some argue for distributing leadership on grounds of social equity and the democratization of schools as organizations; others extend the concept to include students and view it as an advancement of pupil voice and inclusion. Undoubtedly, further work is needed to untangle some of the reasons why distributed leadership matters.

NCSL research shows that distributed leadership has a part to play in school improvement; it does make a difference to school and student performance (NCSL 2004a, 2004b, 2006c). Moreover, NCSL's work demonstrates that distributing leadership is vital if schools are to be places where pools of leadership talent are created and from which tomorrow's school leaders can be drawn.

It should also be acknowledged that distributed leadership supports system leadership: they are two sides of the same coin – you cannot have headteachers and other leaders working beyond their schools unless and until other leaders are willing and able to step up and take on new roles and responsibilities; each supports the other.

Leadership Succession

Across many developed nations, there is a demographic time bomb ticking away. Urgent attention is needed to defuse this challenge, and NCSL's staff have been examining what the

challenge is and how it might be addressed in England (NCSL, 2006a). Essentially, the challenge is demographic – larger-than-average numbers of school leaders are going to retire between 2008 and 2012 and there are lower-than-average numbers of teachers and leaders following them – too few to replace those who will be retiring. Moreover, in England, the time it takes to become a head is now too long for the next bulge in the teacher population to be ready to take up the vacancies anticipated in the coming years.

All of this means two things in England – and in other countries too. First, we are going to need many more school leaders than in recent times. Second, we need more leaders than those that current approaches to promoting staff are presently able to produce.

Furthermore, the demographic challenge is compounded by negative perceptions of the work and role of school leaders – especially regarding accountabilities and workload. Many of those most likely to step up to headship do not like the look of leadership. However, such perceptions tend to be held by those with little or no experience of running a school for a period. Those who have had a spell of running a school report that the experience does two things: shows them that there are significant rewards and job satisfiers which are underreported by some serving school heads; and that having had a go at leadership, the great majority have learned that they can do it and this markedly improves their self-confidence and increases the likelihood of applying for leadership positions.

Therefore, NCSL has advised ministers that, to address the demographic challenge, there needs to be: increased fast-tracking of those with leadership potential, which means early identification of talent, and mentoring and coaching these individuals; providing them with many more opportunities to lead – in their own and in other schools – to broaden their knowledge of school types and contexts, and increase the number of head-teacher role models.

Our advice to ministers recommended that this national challenge is dealt with by local solutions developed by groups of schools taking responsibility for developing their talent pools. Local initiatives will need some additional and external support and, nationally, there needs to be a campaign to talk up headship since we know that the overwhelming majority of headteachers are very positive about their work. By providing more opportunities for middle leaders and deputies to experience periods when they are acting heads, we believe that perceptions of the role can be made more positive and self-confidence to perform the job increased. However, this is an English, context-specific strategy. It has been constructed in the light of England's devolved school system and may not be appropriate for other school systems.

At the same time, we should also appreciate that succession planning is not simply a quantitative issue. It is

vital to ensure there is a supply and flow of high-quality candidates for headship and leadership teams. Attending to quality also means tracking over time that we have the right mix of leaders (e.g., gender; ethnic minorities) and that the recruitment and appointment of headteachers improve (NCSL, 2006b).

School Leadership Is Hard Work

Over the last two decades, research has suggested that the work of leaders has intensified and become more complex, relentless, and accountable. It should therefore be no surprise that leaders become tired, if not exhausted, when working in some of the most challenging environments. Without doubt, concerns about work–life balance and well-being are legitimate. School leaders need to look after their own well-being and spend time on the balcony as well as on the dance floor (Heifetz and Linsky, 2002).

While their work may feel ever more urgent and demanding, their learning, development, and support needs have equally increased and must be met. In part, this means remodeling not only the school's workforce, but also the support mechanisms on which the heads and the leadership team can call upon – in particular secretarial and personal assistant support, and school business managers, as well as access to good-quality human resources advice. Unless these are rethought and redesigned, headship and principalship may continue to look too intensive, demanding, and too accountable.

It is also the case that, in addition to improved support for leaders within their schools, more attention should be paid to their coping strategies (Cooper and Kelly, 1993; Southworth, 1995) to deal with the strains and pressures of their work and workloads. Indeed, there are rewards, and some heads derive a sense of achievement from being able to deal with whatever comes their way, as well as the success of the school, staff, and students. However, it is also the case that a more mature approach to sustaining leaders is needed today; indeed, sustainable leadership might be one of the next big leadership issues (Hargreaves and Fink, 2006).

The work Is Polyphonic

One weakness of many a leadership research is that it takes but one slice of leadership activity and fails to register that leaders engage in several things, often at once. It is for this reason that the metaphors of practitioners for their work tend to be about juggling and plate spinning.

In an early attempt to synthesize research findings and move beyond atomistic analyses, NCSL researchers emphasized two conclusions:

1. One thing leads to another.
2. Leadership is both simple and complex.

With regard to conclusion 1, NCSL researchers noted that a single input by a leader can create multiple outcomes, and that effective leaders use time twice or thrice. For example, one episode of coaching between a more experienced leader and a novice could contribute to strengthening distributed and learning-centered leadership, growing tomorrow's leaders, and creating a culture of learning for students and staff alike.

As for conclusion 2, this insight is based on evidence which showed that effective leaders do not have a repertoire of skills unknown to other leaders. Rather, what distinguishes the highly effective leaders is their ability to deploy seemingly ordinary strategies and tactics and execute them to an extraordinary degree. In addition, they use tactics in combinations and with care and diligence, knowing that one thing leads to another, and therefore concentrate on applying them consistently so that they mutually reinforce one another.

This suggests that rather than tackling each task in a serialized way, or in some checklist manner, what it takes is the ability of leaders to make links between their tasks and tactics, develop their awareness of how one approach links to others, and their capacity to create synergies between all they have to do. Such polyphonic working may lie at the heart of what makes them effective and their work manageable. In turn, this idea suggests that leaders need to be able to see the whole – as well as the individual elements – and to be able to appreciate that the sum total of leadership can be greater than the parts (NCSL, 2005: 43).

Conclusions

These seven sets of findings suggest that the texture of school leadership is changing; therefore, it is possible to say that school leadership today is:

- more data and evidence based than ever before;
- less lonely and more collaborative;
- involving the building of leadership capacity;
- leading by example; and
- intense and varied.

These changes have, in some cases, pushed at the parameters of school leadership, certainly in England, so that relatively new models of headship emerge, such as system leaders, executives who run more than one school, federations of schools, community leadership, multi-agency leaders, and co-headships.

It is also true that leadership in and of networks has taken root in the last 5 years. Networks can be fertile environments for developing leaders since they create new ways of engaging with others and accessing different school contexts, and enable leaders in one school to contribute to the development of many others.

If this points to leaders working in more than one context, it does not mean that leadership is confined to geographical location. In today's world, context includes awareness of policy directions and system needs. In school systems which are highly devolved, as in England, this places a responsibility on the shoulders of leaders to know and understand what a central policy means for them and their schools since the implications of policy have to be understood quickly and acted upon. Hence, strategic leadership has become more important in the last decade. Leaders need to be able to look ahead, especially in a fast-changing world for which we are preparing pupils and future leaders.

In turn, this implies that the development of leaders and leadership is becoming increasingly pivotal to the performance and vitality of their schools and the communities that they serve.

Taken together, these findings show three things. First, the theme of leaders needing to be able diagnosticians and proactive about their contexts should be developed – otherwise they themselves are not leading, but following existing patterns. Second, the importance of context reinforces what we have known for a long time about leaders as cultural designers, builders, maintainers, and (sometimes) destroyers (Schein, 1985) as well as culture mediating leadership and leadership practices needing to change as the stage of a school's development unfolds (Bryk and Schneider, 2002).

Third, if there was one thing above all others that this article throws into sharp relief it is that building leadership capacity and developing leadership are critical to school and system success. At a time when national and international belief in leadership, in all sectors of work and life, has never been higher, it follows that the development of leadership is important. Furthermore, the challenges that the school system is now facing such as the need to grow tomorrow's leaders in greater numbers and ensure that these individuals are able to lead new forms of organizations such as: (1) multidisciplinary schools or campuses; (2) those that provide strong leadership of learning; (3) those that take executive responsibility for federations of schools; or (4) a multisite organization, are effectively developmental challenges.

None of this should mask the fact that the insights here show that school leadership today is more nuanced and diverse than it was formerly. Unquestionably, we not only need strong leaders, that is, resilient and determined individuals and teams, but also need more emotionally intelligent ones too. Indeed, the picture outlined here is of leaders and leadership becoming increasingly intelligent. Intelligent leadership rests on learning to lead at many sites, in a range of settings, and in differing ways.

Therefore, we need to look much more closely at how leaders develop most productively and powerfully, under what conditions, over what time scales, and with

what outcomes; in addition, we need to find out which leadership strategies yield the greatest outcomes and benefits.

School Leadership Standards

L Ingvarson, Australian Council for Educational Research, Camberwell, VIC, Australia

© 2010 Elsevier Ltd. All rights reserved.

Introduction

This article is based on a review of international developments in leadership standards. The review focused on five countries where leadership standards were being used for purposes such as professional learning and recognition of achievement through some form of certification or accreditation.

The review indicated an increasing number of initiatives in this area over recent years and closer links between leadership standards and research. After summarizing purposes and international developments for leadership standards, the article illustrates the steps involved in developing valid leadership standards for professional learning and certification purposes.

Purposes for School Leader Standards

The context of school leaders' work has become increasingly complex. Expectations of school leaders as agents for school improvement, and even transformation, have increased, as have demands for accountability. As a result, greater attention is being given to effective methods and programs for preparing school leaders and supporting their continuing professional learning.

Standards have an important role to play in clarifying what the central goals of such programs should be. Well-written and valid standards synthesize the implications of research for what school leaders need to know and be able to do to be effective.

Recruitment and retention of effective school leaders are also concerns common to many countries. Greater attention is therefore being given to career paths and conditions of work that attract and retain effective teachers and school leaders. These include methods for identifying and rewarding teachers and school leaders who attain high performance standards.

Standards have a central role to play here also. A complete set of standards not only describes what school leaders should know and be able to do, but it also describes how performance against the standards will be assessed and what levels of performance meet the standards. In other words, well-written standards are assessable as well as valid; they point to observable features of what school leaders know and do.

In summary, the main purposes for school leadership standards are to increase the effectiveness of professional

preparation and development for school leaders, and to provide better systems for recognizing and rewarding effective school leaders.

International Developments in Standards for School Leaders

The growing interest in leadership standards since the early 1990s can be linked to standards-based approaches to educational reform (Smith and O'Day, 1990; Sykes and Plastrik, 1993). The new curriculum standards for students had obvious implications for the kinds of knowledge and skills needed by their teachers. This in turn created pressure for greater clarification about the capacities school leaders needed if they were to enable teachers and students to meet the goals of educational reform.

The National Council of Teachers of Mathematics (NCTM), for example, produced a set of challenging curriculum standards for mathematics in 1989, and followed this with its Professional Standards for Teaching Mathematics (NCTM, 1991). The first major effort to develop leadership standards, initiated by the Council of Chief State School Officers in the USA, led to the Interstate School Leaders Licensure Consortium (ISLLC) standards in the early 1990s (Murphy and Shipman, 1999). The production of standards has proliferated rapidly since that time. Gronn (2003) contrasts the role of standards in the preparation of headteachers in England and school principals in the USA. Huber (2004) compares approaches to preparing school principals in 15 countries.

Ingvarson *et al.* (2006) provide a critical review of recent international developments in leadership standards. They focused on five countries where leadership standards were being used as a part of a system that linked the standards to professional learning and to some form of recognition or certification that the standards had been attained. These countries, and the responsible agencies, included:

- England: the National Standards for Headteachers (National College for School Leadership (NCSL) and Department for Education and Skills).
- USA: Standards for School Leaders (Council of Chief State School Officers ISLLC as applied by the Connecticut State Board of Education).
- Australia: Performance Standards for School Leaders developed by the Department of Education in Western Australia.

- The Netherlands: Professional Standard for Educational Leaders in Primary Education (Dutch Principal Academy, or Nederlandse Schoolleiders Academie).
- Scotland: The Standard for Headship (Scottish Executive).

The research literature on school leadership provides few clear-cut guidelines for agencies charged with the development of standards. Consequently, writers of standards for school leaders face a considerable challenge in developing profession-wide standards. However, although there was some variation in details across the five countries, there was a remarkable degree of similarity in the sets of leadership standards emerging internationally. Standards did not vary markedly according to what might be thought of as very different national and cultural contexts, although it is important to note most in this review were from English-speaking countries.

Although many sets of standards for teachers and school leaders were being developed internationally, most were specific to particular jurisdictions or employing authorities. In other words, few standards were profession-wide. Apart from the ISLLC standards and those of the Dutch Principal Academy, few were developed by a broad range of stakeholders and professional organizations. Unlike most professions, governments and employing authorities usually played the major role in developing standards for teachers and school leaders, not professional associations of school leaders. In this sense, teaching is almost unique among the professions.

Standards were being used increasingly in these five countries to guide the preparation and development of school leaders. In a few instances, they were also being used to assess performance for aspiring and experienced school leaders for certification purposes.

It was noteworthy that recent versions of school leadership standards resist the temptation to scope out the full practice of leadership and management in schools. They focus first on quality student learning, and move outward to identify implications for what school leaders should know and be able to do. In other words, leadership standards are beginning to look more like professional standards rather than lists of micro-competencies or job descriptions as seen in earlier sets of standards. The latter rarely had a clear guiding conception of school leadership, or how the work of school leaders links to quality learning opportunities for students.

The main organizers in recent sets of leadership standards are more parsimonious and interesting, as researchers and school leaders refine and reorganize their conceptions of what effective school leaders know and do. This effort has been greatly assisted by researchers as they synthesize those aspects of school leaders' work that establish the conditions for effective teaching and learning. Leithwood *et al.* (2004), for example, identify three main categories of effective leadership practice:

- developing a deep understanding of how to support teachers;
- managing the curriculum in ways that promote student learning; and
- developing the ability to transform schools into more effective organizations that foster powerful teaching and learning for all students.

Syntheses of evidence-based research such as these are valuable to standards developers. However, it is one thing to write standards and quite another to ensure the standards become embedded in everyday thought and practice. To have an impact, school leadership standards need to be linked to modes of professional learning that enable school leaders to implement effective leadership practices.

The review identified two main approaches toward linking standards to professional learning. The traditional approach is to develop a course, or even a set of courses for school leaders. In contrast, emerging approaches, such as those used by the National Board for Professional Teaching Standards (NBPTS) in the USA, focus on developing a rigorous system for providing certification to teachers and school leaders who demonstrate they can meet the performance standards, and on developing recognition of that certification.

Recent criticisms of the quality of traditional course-based programs for preparing school leaders, particularly in the US (e.g., Levine, 2005), highlight the need for alternative routes and opportunities for professional learning in school leadership. An accumulation of academic credits and courses is no guarantee of capability or achievement in the workplace. Professional associations of school leaders are increasingly providers of a wider range of alternative professional learning activities. Particularly important are the activities, networks, and other forms of support that associations provided locally to support candidates preparing for national professional certification.

An emerging approach to professional learning is to develop a system for providing certification based on evidence of meeting the standards – a standards-based professional learning system.

In this approach, an independent standards agency develops a rigorous assessment and professional certification process based on evidence of performance. Employing authorities who come to regard the certification as credible may choose to provide support and incentives for teachers and school leaders to undertake the certification process. The process of applying for professional certification places teachers and school leaders in a more proactive role in relation to planning and providing their own professional learning, such as seeking courses that will help them directly to prepare for certification. The processes of preparing evidence of leadership initiatives, such as building professional community or leading and managing change projects, necessarily engage teacher leaders

in activities highly consistent with effective modes of professional learning.

Evidence is accumulating that the certification system established by the NBPTS, for example, provides an effective approach toward linking standards to professional learning (Ingvarson and Hattie, 2008). Most teachers who complete the NBPTS certification process, for example, say it was the most significant professional learning they had ever experienced.

Finally, the review of international developments examined approaches used by each of the five national systems to judge whether school leaders had met the standards. Needless to say, it is vital that such a judgment process is rigorous and fair. They found that the validity of the certification process in most systems remains unknown or uncertain, as it is usually based on course completion, not evidence of performance.

Writing Valid Standards for School Leadership

The purpose of this section is to describe the steps that would be involved in the development of a valid set of professional standards for school leaders.

Definition of Standard

The *Shorter Oxford Dictionary* gives two definitions of the word standard:

- distinctive flag (often figure of principle to which allegiance is given or asked; the royal and c-raise the – of revolt; free trade, and c) and
- specimen or specification by which the qualities required of something may be tested, required degree of some quality, levels reached by average specimens (attrib.) serving as test, corresponding to the – of recognized authority or prevalence.

Both definitions can be applied to the development of standards for school leaders. In the first, standards would aim to articulate professional principles and values. Similar to the flag on ancient battlefields, they would provide a rallying point and, perhaps, inspiration.

Standards are also measures, as indicated by the second definition – “the required degree of some quality,” for example. Standards are tools that are used often in making judgments and making improvements in many areas of life and work, whether measuring length, evaluating writing, or critiquing restaurants. Standards provide the context of shared meanings and values that is necessary for fair, reliable, and useful judgment.

Standards as principles

In the first sense, writers of leadership standards would aim to arrive at a consensus on the principles and values

that drive practice and pervade professional relationships. A straightforward example might be: Highly accomplished school principals are committed to their students and their learning.

In the process of developing standards, standards writers endeavor to identify the distinctive features and aspirations of their profession – in this case, the unique things that effective school principals know and do. The process of writing standards for school leadership, understood in this sense, unites people around shared ideals and values, and encourages the reconciliation of divergent approaches to practice. Standards are statements about those features of leadership that are most valued in the profession.

Standards for school leaders, similar to those for classroom teachers, ultimately rest on professional norms and values relating to interpersonal relationships and the kinds of learning that are valued in a society. Education is ultimately and inescapably a moral enterprise. Standards developers need to articulate a vision of quality learning that will guide their more detailed work of describing what teachers and school leaders should know, believe, and be able to do to provide opportunities for that kind of learning.

Among the five systems reviewed by Ingvarson *et al.* (2006), the ISLLC Standards for School Leaders document was the most explicit about the principles that the writers used to guide the development of their standards for school leaders. Members of the consortium decided that standards for school leaders should:

- reflect the centrality of student learning;
- acknowledge the changing role of the school leader;
- recognize the collaborative nature of school leadership;
- be high, upgrading the quality of the profession;
- inform performance-based systems of assessment and evaluation for school leaders;
- be integrated and coherent; and
- be predicated on the concepts of access, opportunity, and empowerment for all members of the school community (Council of Chief State School Officers, 1996).

Reaching a consensus about principles is a necessary part of standards development, but it is a consensus that needs to be justified in terms of research and the wisdom of expert practitioners. Additionally, standards developers must also reach agreement on the scope of school leaders' work – they must set boundaries as it were – if that work is to be realistic and feasible for average mortals.

Standards as measures

To be useful for purposes such as professional learning and recognition, standards must also be understood in the second sense of the dictionary definition, as a valid basis for making assessments of performance and providing useful feedback. Standards should aid discernment and

discrimination. To value something, it helps to know how to evaluate its main attributes. A standard is incomplete if it cannot be used to assess practice, whether that is self-assessment or assessment by peers. If it cannot be used to assess practice, it will be of little use for professional learning or recognition.

Sykes and Plastrik (1993) point out that the word standard carries different usages and nuances. One of these is the idea of a standard as a legally recognized unit, such as that of Greenwich Mean Time, or the Gold Standard, or the Standard Metre in Paris for measuring length. Another is the notion of a standard as “an authoritative or recognised exemplar of perfection,” such as the sacred books of a religious organization. Yet another usage refers to “a definite level of excellence, attainment, wealth or the like” such as standard of living or a particular level of proficiency.

From their analysis, Sykes and Plastrik (1993) provide this useful definition of a standard: “A standard is a tool for rendering appropriately precise the making of judgments and decisions in a context of shared meanings and values” (p. 4).

Developing Standards

Sykes and Plastrik’s definition is a useful reminder that standards are pragmatic tools to achieve certain defined purposes. When standards are used in assessing performance, for purposes such as professional learning, recognition, and certification, there are three essential steps in their development:

- Defining what is to be assessed (i.e., what is school leadership? What are the essential elements of good leadership); these are often called content standards.
- Deciding how it will be assessed; that is, how valid evidence about (leadership) practice will be gathered.
- Assessing the evidence and identifying what counts as meeting the standard (i.e., how good is good enough?). This leads to performance standards, which specify the level of performance that meets the standards.

A complete definition of standards needs all three components above. A full set of standards also needs to describe how evidence about capability and performance will be gathered, and how decisions will be made about whether the standards have been met.

While content standards define the scope of (a school leader’s) work, performance standards are needed to tell us how good a (school leader’s) performance needs to be to meet the standard. The international review found few examples of leadership standards that are complete in this sense. Consequently, few were used extensively for professional learning. Fewer still could (or should) be used in making selection or certification decisions in ways that were valid, reliable, or fair.

Guiding Conception of Leadership

Every set of content standards for school leaders needs a guiding conception of what leadership is. It is not sufficient for a set of standards to spell out or map the territory of school leadership, like a job description or a list of responsibilities, yet this is what many sets of leadership standards tended to be in the past. It was still possible to read some present sets and be none the wiser about the meaning of leadership that underpinned them.

Fullan provides an example of a guiding conception of leadership that might be considered by standards developers:

The litmus test of all leadership is whether it mobilises people’s commitment to putting their energy into actions designed to improve things. It is individual commitment, but above all it is collective mobilisation (Fullan, 2001).

The work of many other researchers could be drawn upon. However, Fullan’s conception is useful because it points to school leadership practices that would be observable. To illustrate, Fullan elaborates his concept of leadership into five components, including:

- having a clear moral purpose;
- relationship building;
- understanding and managing change;
- knowledge creation and sharing; and
- ensuring coherence and alignment of structures.

These five components provide standards writers with a basis for elaborating and operationalizing Fullan’s conception of school leadership. They also provide school leaders with a clear guide in planning their professional development and in preparing an account of their practice. It is possible to imagine, for example, asking a school leader to provide an account of an instance when they led and managed a change initiative in some area of school functioning – one that led to improved teaching and learning. Further, the school leaders might be asked to include evidence related to Fullan’s five components in their account.

The five components could then form the foundation of a rubric for self-assessment, or assessment by peers, for professional recognition or certification. It would then be possible to imagine asking a group of carefully trained peers whether, in their view, the account provides clear and convincing evidence of the five components of Fullan’s concept of leading and managing change. That is, whether the school leader has shown that they have met the standard – that they have demonstrated the capacity to lead and manage change in an educational setting. These would be the steps involved in operationalizing a leadership standard.

Finally, and most important, the process and the experience of completing the assessment task should be

constructed so that it promotes professional learning. The task of putting together such an account in something similar to a portfolio entry should engage people in effective modes of workplace learning. Completing a well-prepared assessment task, with all the steps involved in learning about the standards, preparing the evidence and reflection on one's practice, can provide an excellent vehicle for active, school-based professional development. As a result, assessment and learning then go together.

As measures therefore, standards not only describe what practitioners need to know and be able to do to put these values into practice, but they also describe how attainment of that knowledge is to be assessed, and what counts as meeting the standard. A standard, in the latter sense, is the level of performance on the criterion being assessed that is considered satisfactory in terms of the purpose of the evaluation.

Content Standards

Standards that describe the nature and scope of a professional's work are usually referred to as content standards. As in educational measurement generally, content standards set out the domain of what is to be assessed. Ideally, they set out the main areas of effective practice and provide elaborations on what the standards mean in terms of what practitioners should know and be able to do.

Leithwood and Jantzi (2005) and Leithwood *et al.* (2004) provide a set of four core leadership practices grounded in research on how leadership influences student learning that could form part of the content domain of a set of school leadership standards. Each could be seen as an area within which a school leader could exercise leadership and lead and manage a change initiative:

- building vision and setting directions;
- understanding and developing people;
- redesigning the organization (e.g., building professional community/culture); and
- managing the teaching and learning program.

Each standard is elaborated on in the reports. Together they form a strong set of organizers for the content in a set of leadership standards. As the research reviewed by Leithwood and Jantzi (2005) indicates, these core practices are related (indirectly) to student achievement. It is possible to argue therefore that, as standards, they have content validity; the standards arguably identify the knowledge, skills, and attitudes possessed by effective leaders. Other reviews of effective leadership practices could also be used to define content standards for school leaders (e.g., Mulford, 2003a, 2005b).

Another example of content standards is the Standards for Headteachers from the NCSL in England (NCSL, 2004). In contrast to Leithwood *et al.*, these have six main organizers of the content of the standards:

- shaping the future;
- leading, learning, and teaching;
- managing the organization;
- developing self and working with others;
- securing accountability; and
- strengthening community.

While each of these lists from Leithwood *et al.* and the NCSL provides a powerful group of organizers for a set of school leadership standards, this is only the first step in developing standards. Each standard needs explication and elaboration in a full set of content standards. Standards writers need to drill down deeper to capture what effective school leaders know and do in relation to each standard to promote good teaching and provide quality learning opportunities for students.

For example, most recent sets of standards for school leaders usually have a standard that refers to the importance of building professional community, or culture, along the following lines:

Research indicates that the knowledge and skills of its teachers are the most important educational resource that a school possesses in meeting its mission to provide quality opportunities for students to learn. Highly accomplished principals establish a strong professional culture in their schools that nurtures and develops this resource. . . .

(Ingvarson *et al.*, 2006)

Echoes of such a standard can be found under Leithwood's *Developing People* organizer above, or in the *Developing Self and Working with Others* organizer from the NCSL. The standard can be justified in terms of research over the past 20 years indicating that an active, accountable professional community within a school is important for effective teacher development and high-quality teaching (Little and McLaughlin, 1993; Louis *et al.*, 1996).

Ingvarson *et al.* (2006) provide an elaboration of a Building Professional Community standard developed by the Australian Council for Educational Research (ACER). The elaboration teases out the various facets of the professional community concept, illustrates the areas where school leaders might take action, and points to types of evidence that one should see in, for example, a portfolio entry that a school leader was submitting to show that they had met this standard through leading and managing a project to strengthen professional community in their school.

Characteristics of Well-Written Standards

Several features of a standard such as Building Professional Culture and its elaboration are noteworthy. The first is that it points to a large, meaningful, and significant chunk of school leaders' work – it is an example of the purposes they are trying to achieve. It is not a microlevel competency, or a personality trait. School leaders readily identify this type of standard as an authentic (i.e., valid)

example of the kind of work they do (or should do). The standard is well grounded in research on the characteristics of effective schools.

The second is that the standard is context free, in the sense that it describes a practice, which most agree, accomplished principals should follow, no matter where the school is. By definition, a professional standard applies to all contexts in which professionals work (which is not to say that context does not affect practice). No matter where a school is, building professional culture in that school over time is likely to be regarded as a core responsibility of a school leader.

The third feature is that the standard is nonprescriptive about how to build professional culture; it does not standardize practice or force school leaders into some kind of straightjacket. There are many ways to build a professional culture. While the standard identifies an essential element of good leadership, it does not prescribe how the standard is to be met. In this way, the standard also allows for diversity and innovation.

The fourth is that, as a standard, with its elaboration, it points to something that is measurable, or observable. It is possible to imagine the types of evidence that a principal might assemble over time to show that they have strengthened the various components of professional community in their school and met the standard.

In summary, well-written standards:

- are grounded in clear guiding conceptions of leadership;
- are valid; that is, represent what school leaders need to know and do to play in promoting quality learning opportunities for students;
- identify the unique features of what school leaders' know and do;
- delineate the main dimensions of development the profession expects of its members – what school leaders should get better at over time, with adequate opportunities for PD; and
- are assessable; that is, point to potentially observable leadership actions.

Leithwood and Steinbach (forthcoming) provide a critical review of several existing sets of standards and propose an overarching set of seven meta-level principles, or standards for standards, that might be used to evaluate a set of school leadership standards.

The process by which a set of standards is developed is also a critical issue, not only for the validity of the assessment procedures, but also for their legal defensibility. If the procedures for developing standards are to be regarded as valid and legally defensible, it is important to ensure:

- the integrity and independence of the body responsible for developing the standards;
- that the standards developing body is composed primarily of those who are already highly accomplished practitioners;

- that the diversity of perspectives in the profession is represented;
- that the process of defining the standards is developed on a sound scientific basis and that the process of developing the standards is formally documented; and
- that a wide sampling of agreement is sought for the standards from the major professional groups and other interested parties regarding the appropriateness and level of the standards (Hattie, 2008).

Few developers of standards, apart from those who developed the ISLLC standards, make explicit the procedural principles on which they developed their standards (Ingvarson *et al.*, 2006), but that is likely to change as the teaching profession becomes more involved in developing profession-wide standards that it wants key stakeholders to regard as credible.

Methods of Assessing Performance against the Standards

Although a trend toward performance-based methods for assessing teachers and school leaders against standards is noticeable, most are still based on evidence of course completion. A trend toward more authentic forms of assessment for professional certification is found generally across other professions, both for initial registration and for advanced levels of professional certification. The term performance, as used here, refers to an authentic instance of a school leader's work over time, situated in a specific context (such as Building Professional Community in an English Department around collaborative assessment of student writing).

This trend is closely related to research on more effective modes and designs for learning and program delivery. These emphasize the need to create a wide range of opportunities to gain leadership experience through taking on and documenting small-scale leadership projects, such as leading and managing a change initiative in a particular area of school functioning that improves learning opportunities. This kind of experience creates stepping stones for teachers from the classroom to school leadership.

Here, for example, is a summary of an authentic assessment task referred to as leading and managing change, under development by the ACER, which a teacher might complete and enter into a portfolio of evidence:

This portfolio task invites you to document an initiative in which you led and managed a change effort with colleagues in your school. The project will have aimed to meet an important need related to student learning by enhancing the quality of teaching in your school. In your entry, you will provide evidence for: the need; your project plan to meet that need; what happened during the implementation of your project; and the improvements in

teaching and learning that took place. Finally you will reflect on what you have learned about leading and managing change and yourself as a leader (pp. 8–10).

Teachers and school leaders are very good at creating assessment tasks similar to this, which are authentic examples of what school leaders should know and be able to do. Completing such portfolio tasks provides opportunities for collaborative reflection on practice with colleagues and learning in the workplace. To increase reliability in the assessment, school leaders need to complete several such tasks, and each task should provide evidence relevant to several standards. Rather than engendering more work, authentic assessment tasks should be based on the natural harvest of evidence gathered in the course of conducting normal school functions and responsibilities.

In summary, here is a list of principles to guide the development of valid tasks for gathering evidence about school leader performance:

- tasks should be authentic and, therefore, complex;
- tasks should allow for the variety of forms that sound school leader practice can take;
- tasks should be open-ended, allowing school leaders to show their own practice;
- tasks should be fair; that is, they should give school leaders a fair chance to demonstrate the quality of their practice;
- tasks should provide ample opportunity and encouragement for analysis and reflection;
- research-based knowledge should underlie all performances;
- tasks should encourage school leaders to exemplify good practice;
- each task should provide evidence relevant to a cluster of standards; and
- each standard should be assessed by more than one task (Pearlman, 2008).

Specification of required evidence – spelling out what evidence school leaders need to provide and how to present it – needs to be precise for an evaluation to be valid and feasible, and fair. This requires carefully structured portfolio tasks with guiding questions, not an open-ended invitation to fill a wheelbarrow. Vague or imprecise requirements often result in teachers and school leaders presenting an oversupply of evidence that bears little or no relation to the relevant standards, making reliable and fair judgments difficult or impossible.

Assessing the Evidence and Setting Performance Standards

The final stage in developing a complete set of standards is setting performance standards. While content standards

define the scope of school leaders' work, they do not tell us how good a school leader's performance needs to be in relation to the standards. Or, put another way, content standards alone do not tell us what a satisfactory level of performance is on the assessment tasks. The key questions to be answered in setting performance standards are: How good is good enough? or What counts as meeting the standard?

Setting standards, and training teachers and school leaders to use them in assessing evidence can be just as complex as identifying the content standards. Evidence gathered by ACER over recent years suggests that teachers and school leaders can do this very well. The process involves developing scales and scoring rubrics, weighting different tasks and sources of evidence, identifying benchmark performances, and training assessors. Recent experience indicates that teachers and school leaders can reach high levels of reliability assessing evidence of performance in relation to the standards.

Conclusion

The main reasons for establishing school leadership standards are to:

- increase the effectiveness of professional preparation and development for school leaders, and
- provide better systems for recognizing and rewarding effective school leaders.

Although our review of international developments in leadership standards indicated a high level of standards development activity, few had gone beyond developing content standards to develop performance standards. Few elaborated deeply on what the standards meant in terms of practice; few could be used to assess performance; and few were accompanied by research programs on the validity of the standards or the reliability of assessments based on the standards.

Standards that are observable and assessable are more useful for self-assessment and professional learning. It is primarily by engaging future school leaders and experienced principals in more effective professional learning that standards can make a major contribution to improving student learning. Well-written standards can provide the basis for a standards-based professional learning and recognition system (Ingvarson and Kleinhenz, 2006a, 2006b), which includes four basic components:

1. standards that describe what effective leaders know and do thereby providing long-term goals and direction for professional learning;
2. an infrastructure for professional learning that enables school leaders to develop the attributes and capabilities embodied in the standards;

3. a credible system for assessing school leader performance against the standards that provide certification to school leaders who meet the standards; and
4. selection procedures and career paths that provide recognition and incentives from school authorities for those who gain professional certification.

Taken together, these components form a standards system of interdependent and mutually supportive parts. The four elements of standards, professional learning, certification, and recognition are interlinked. They can be applied to any profession. Take one away and the system loses its capacity to function effectively as an instrument for encouraging and recognizing evidence of professional learning.

Standards can be a means by which a profession exercises more control over its professional learning system. Engagement in standards development builds ownership and can be a powerful form of professional learning in itself. The capacity to develop standards gives the profession the ability to play a stronger role in defining the long-term goals of their own professional learning.

Responsibility for the development and application of professional standards also enables the profession to play a more significant role in providing recognition to members who meet its standards. As writers of standards must synthesize the implications of research on effective leadership practices, responsibility for the development and application of professional standards also enables the profession to play a stronger leadership role in relating research to practice.

Effective Leadership in Challenging Schools

Introduction

The challenge of improving schools in the most disadvantaged contexts is currently high on the political agenda in many countries. It remains the case that many schools face acute levels of socioeconomic deprivation compounded by sets of external factors that adversely affect their ability to perform (West and Pennell, 2003). Schools located in disadvantaged areas are often the recipients of higher-than-average numbers of students with diverse ethnic backgrounds and low literacy levels. The net result of the powerful amalgam of social and economic problems means that it is more difficult to improve schools in challenging contexts because of the multiple problems they face. As Power *et al.* (2002: 26) conclude, “educational outcomes in deprived areas are worse than those in non-deprived area, whether they are measured in terms of qualification, attendance, exclusions or ‘staying on’ rates. Inner-city areas in particular feature as having low outcomes.” They also point to the need to reduce the “compositional effects that appear to result from high concentrations of disadvantaged students” (p. 65).

Students from disadvantaged backgrounds can challenge teachers’ conceptions of what to teach, what to expect of students, and even how to communicate with them (Knapp, 2001). This is not to suggest a deficit model of teaching in schools in difficult circumstances,

but simply to acknowledge the extent of the task in securing the levels of performance that schools in more affluent areas take for granted. Research has shown that in order to achieve and sustain improvement in schools in challenging contexts, teachers must exceed what might be termed as normal efforts (Maden, 2001). They have to work much harder and be more committed than their peers in more affluent schools. In addition, teachers in challenging schools have to maintain that effort in order to sustain improvement over time. Research has consistently shown that success can be short-lived and fragile in schools in difficult or challenging circumstances (Whitty, 2001: 109).

Is Improvement Possible?

The question of whether sustained improvement is really possible in schools in challenging circumstances remains. The school improvement movement has often been criticized for ignoring powerful socioeconomic influences that impact schools and for offering naive and, sometimes, simplistic solutions to complex social and economic problems (Thrupp, 1999). While there is undoubtedly some truth in this, a number of researchers working in this field have engaged with issues of context and context-specific

improvement (e.g., Hopkins, 2001; Reynolds *et al.*, 2001; Harris *et al.*, 2003; Teddlie *et al.*, 2000; Townsend *et al.*, 2007).

The emerging evidence base points toward the range of difficulties that high-poverty schools face in simply getting to the starting line for improvement (Harris and Chapman, 2002; Stoll and Myers, 1998). High staff turnover, poor facilities, lack of resources, falling student numbers, and a constant stream of supply teachers are pressures that schools in more prosperous areas simply do not face (Reynolds *et al.*, 2004; Harris *et al.*, 2006). Factors such as geographical isolation – particularly of rural schools – weak support at the district level, low levels of formal qualifications in the local adult population, and poor employment opportunities, all serve to compound the problem and make the extent of the educational challenge facing these schools significantly greater (Reynolds *et al.*, 2004).

It is clear that the performance of schools in challenging contexts remains stubbornly low despite successive, determined, and well-intentioned efforts to alter the odds through targeted resources and strategic support. Initiatives aimed at supporting schools in disadvantaged areas have had variable success. Although resource to such schools may have increased, subsequent improvements in educational performance have not materialized (McKinsey, 2007). Some improvement initiatives or interventions have simply underestimated the power of the socioeconomic context or applied a standard formula for improvement in a nonstandard context. Others have failed to fully appreciate the need for differentiated intervention and support in schools in these circumstances. While schools might face similar socioeconomic difficulties, this does not mean that the same improvement strategies can be applied across all schools categorized as challenging (Harris *et al.*, 2006).

The research evidence suggests that while the powerful effect of the socioeconomic conditions cannot be ignored, the fact remains that schools can and do improve despite their context or circumstances. Evidence shows that schools in challenging circumstances can improve the levels of student performance and achievement (Borman, 2000; Harris *et al.*, 2003), and that the quality of leadership is a major contributory factor of this success (Reynolds *et al.*, 2001 and Hopkins, 2001). The importance of leadership in securing school improvement in schools in difficult contexts should not be surprising. The research base is unequivocal about the importance of leadership in securing effective school change, development, and improvement, particularly in challenging school contexts (Maden and Hillman, 1993; Maden, 2001; Leithwood *et al.*, 2004). The evidence reinforces that effective school leaders exercise an indirect but powerful influence on the effectiveness of the school and on the achievement of students, explaining up to a quarter of the school-level variance in student achievement (Mulford, 2007a, 2007b).

Effective Leadership in Challenging Schools

Research studies are beginning to offer some important insights about effective leadership in schools in challenging circumstances. First, many principals and teachers actively choose to work in schools in difficult contexts. Second, the type of leadership found in schools in difficult contexts is driven by a powerful sense of moral purpose and a central concern for the learning of all young people. Third, leadership in challenging schools has to be more centrally focused on raising expectations about performance than in schools in more affluent areas.

Contemporary research studies (Harris and Chapman, 2002; Harris *et al.*, 2006) have identified some common features or characteristics of effective leadership in schools in challenging circumstances. While it is clear that more research is needed, these studies offer an insight into successful leadership practice in schools in challenging circumstances.

Vision and Values

Of central importance to leaders in all schools, but particularly for schools in challenging circumstances, is the cooperation and alignment of others to a shared set of values and vision. Establishing a clear vision and communicating a sense of direction for the school is a critical task for leaders. A lack of direction or common purpose can be a contributory factor to a downward spiral of performance among staff in schools in challenging circumstances. Reestablishing direction and regaining staff confidence is essential if subsequent changes are to be effectively implemented.

The vision and practices of effective principals in challenging schools tend to be organized around a number of core personal values: the modeling and promotion of respect (for individuals); fairness and equality; caring for the well-being and whole development of students and staff; and integrity along with honesty. It is clear that the leadership values and visions of effective principals in challenging schools are primarily moral (i.e., dedicated to the welfare of staff and students (with the latter at the center)), rather than primarily instrumental (for economic reasons) or noneducative (for custodial reasons).

The emphasis upon core values such as respect, fairness, equality, integrity, and honesty is a way of defining or redefining the moral code of the school and setting in place minimum standards of conduct. With a well-defined vision and established values in place, the possibility of raising staff and student expectations of performance is enhanced.

Distributing Leadership

Evidence suggests that highly creative approaches to tackling complex problems are required in challenging schools

and the leadership task is one that cannot be undertaken by an individual. This implies distributed or shared forms of leadership where tasks are not the sole responsibility of one person or, indeed, the leadership team (Harris, 2007). Highly effective principals tend to invest in the leadership of others. The overarching message is one of building the community of the school in its widest sense, that is, through developing and involving others.

In many schools in difficult circumstances, the decision to work with and through teams as well as individuals is a common and effective response to the management of change. Effective principals tend to distribute certain strategic leadership responsibilities or core developmental work to teams or individuals within the school. While all principals clearly recognize the need to take ultimate responsibility for all decisions made, they also acknowledge the importance of empowering staff to lead important initiatives or developments within the school.

Learner-Centered Leadership

Effective principals in challenging schools are quick to dispel the cultural deficit notion and are strongly committed to improving teaching and enhancing learning. They place a strong emphasis upon student achievement and learning and those conditions that can lead to higher student performance. They set high expectations for students, emphasizing consistency in teaching practices, and provide clear rules about behavior and discipline. Their central developmental focus is on improving the quality of teaching and learning. In this sense, they are also effective instructional leaders.

In short, effective leaders in schools facing challenging circumstances ensure that improving the quality of teaching and learning is at the center of all development work and ensure that all teachers focus upon this central priority.

Investing in Staff Development

Effective leaders in all schools recognize the importance of staff development as a powerful lever for change and development. In schools in difficulty, staff development is also a very important means of maintaining staff morale and motivation. The emphasis placed on the continuing development of teachers is not only a clear endorsement that teachers are valued within the school, but is also recognition that their professional learning is important. It also secures and maintains positive relationships between staff as it encourages the collaboration and sharing of ideas. In schools in difficulty, the building of positive relationships between teachers, students, and parents is the most important leadership task. It is clear from the research evidence that schools with a collaborative culture are more likely to be able to improve student performance and achievement.

In challenging school contexts, it is important that time is allocated for staff development and that teachers have opportunities to meet. It is also important that teaching quality is monitored and reviewed. Internal accountability processes need to be firmly in place. It is clear that effective leaders do not ignore or tolerate poor teaching within their schools. Where it does exist, it is confronted, and ways are sought to improve performance. In the majority of cases, a combination of structured support, monitoring, and an individual development program can tackle the problem of ineffective classroom practices. To summarize, effective leadership in challenging schools is primarily about securing high-quality teaching and taking every opportunity to enhance the learning of all students.

Community Building

Effective leaders in schools in difficult contexts are acutely aware of the need to engage their community. This is achieved, in part, by communicating regularly with parents and engendering trust by showing genuine care for young people. They understand the forces within the community that impede learning, are aware of the negative forces of subcultures, and listen to parents' views and opinions regularly. Effective leaders recognized that family, school, and community relationships directly affected student outcomes; hence, the need to connect with the community is of paramount importance to them.

As Hall (1997: 237) notes, "it has become increasingly evident that multiple forms of inequality do not exist as separate or merely additive influences...different forms of disadvantage are experienced more or less as working together." The implication here is that schools cannot operate in isolation from other agencies or the wider community they serve, but must positively engage with the wider community.

Strategies for Improvement

The strategies used by effective principals across a range of challenging school contexts were:

- School leaders identified and pursued an important, yet attainable, first goal. They used this success to set more ambitious goals.
- School leaders redirected time and energy away from conflicts between adults, and appealed to teachers, support staff, and parents to put aside their own interests and focus on teaching and learning.
- School leaders created a collective sense of responsibility for school improvement. The shared sense of responsibility was nurtured by joint planning processes and reinforced by efforts to involve everyone in key components of the school's work.
- School leaders created opportunities for teachers to work, plan, and learn together around instructional issues.

- School leaders created additional time for instructional issues during the school day.
- School leadership purposefully distributed leadership and created opportunities for the staff to lead initiatives.

In summary, effective leadership in schools in difficulty builds sustainable capacity and has a relentless focus on teaching and learning. The evidence points toward leaders who create strong internal accountability processes and set high expectations in terms of attainment and achievement. They are also leaders who recognize the importance of sharing responsibility and generating the cultural conditions where individuals feel valued and are willing to take responsibility.

Context-Specific Improvement

We undoubtedly need to know much more about improving schools in challenging circumstances and, particularly, how such schools sustain improvement over time. We also need to know what particular combinations of external support and internal development are optimum for generating positive change and development. Increasingly, the evidence base is pointing toward the possibilities and potential of professional learning communities to generate the capacity for school improvement (Hargreaves, 2004; Stoll and Seashore Louis, 2007). Such communities offer opportunities for teachers to work together without being dependent upon external initiatives or interventions. However, much depends upon a school's internal capacity to become a learning community in the first place. It is clear that not all schools have this capacity and that those schools which would benefit most from teachers working together are least able to make this happen.

As Elmore (2003) points out, to meet performance targets, "schools must develop successively higher capacities" (p. 14), and that this is achieved by generating internal accountability rather than responding to external accountability. It is clear that many accountability systems require schools with the lowest capacity to improve most through a combination of compliance and sanctions. In the long term, this strategy is destined to fail unless capacity-building measures are simultaneously put in place. Gray (2004) argues that schools that create the capacity for improvement move through three phases of school improvement – "catching up, consolidation and moving ahead" (p. 306). He notes, however, that our ignorance about their starting points serves as a block to improvement and suggests that "we tend not to see these schools accurately because our frameworks are too limited." Consequently, we need more sophisticated ways of diagnosing the needs of schools in challenging circumstances and offering differentiated rather

than standardized approaches to improvement (Chapman and Harris, 2004).

As the long-term pattern of educational inequality looks set to remain, to rely on standardized approaches to school improvement would seem unwise. In schools in challenging contexts, such approaches are more likely to exacerbate the problem rather than solve it. The evidence would suggest that more locally owned and contextually sensitive improvement strategies are more likely to succeed (Teddle *et al.*, 2000). If the goal of raising performance in schools in challenging circumstances is to be achieved, school improvement approaches that ignore the inherent diversity and variability across and within schools will be guaranteed to fail. More context-specific and contextually sensitive approaches to improving these schools are urgently needed.

Nevertheless, how is context-specific school improvement achieved in practice? Lupton's (2004) work argues that there are serious policy issues that need to be embraced to generate a greater alignment between the needs of the school and the forms of improvement interventions employed. In terms of funding, she argues that current funding mechanisms are based on measures that are too crude and therefore mask deep differences between schools. In short, broad poverty or ethnicity measures may not be the optimum way of allocating extra resources to schools in disadvantaged contexts.

Another implication for policymakers is to recognize that the practice in schools in disadvantaged contexts might vary from the practice in other schools and that the aim of replicating the teaching and learning processes in a good school may not be appropriate. As Lupton (2004: 35) argues, "at the level of the school we need a better understanding of effective practice in particular circumstances, in addition to the generic practice lessons that are already available." For example, what is the optimum size of groups for students in difficult school contexts with emotional and behavioral needs? What are the benefits to different groups of students from mixed-ability or streamed groups in such schools? How are parents engaged most effectively in challenging circumstances? More radically, we may need to consider alternative models of schooling for students who find it difficult to learn within the standard organizational framework of a school.

A contextualized school improvement program would undoubtedly need a high degree of flexibility and diversity to meet the needs of the different types of students in different types of school. As Hargreaves (2004) has suggested, there is an "apartheid of professional development and school improvement" which has been generated by default, rather than design. He argues that schools that are performing well enjoy "earned autonomy", while those categorized as "failing or close to failing have prescribed programmes and endlessly intrusive monitoring and

inspection” (Hargreaves, 2004: 190). He notes that, often, schools in difficulty are in receipt of multiple innovations, “while the cruising schools with coasting teachers who ride in the slip stream of middle class academic achievers get off scot free” (Hargreaves, 2004: 190)

The implication of a contextualized approach to school improvement is to reverse this trend and allow schools in the most disadvantaged contexts the opportunities to innovate, experiment, and divert, if necessary, from the educational norms of schools in more favorable settings. It also implies a steady supply of well-qualified teachers who are recruited and retained in poorer areas. As Lupton (2004) notes, this will only be achieved if there are the right financial and career incentives in place to attract the best teachers to some of the most difficult teaching contexts. It is also possible that both initial training and ongoing professional development programs need to be more carefully differentiated to prepare teachers for the particular challenges of disadvantaged schools.

Final Word

Leadership is a complex undertaking in any school, but for schools in challenging circumstances, it presents extra challenges. The core message about effective leadership in schools facing difficult or challenging circumstances is one of building capacity through empowering, involving, and developing others and by providing systems of learning support, guidance, and assistance. Capacity building should be the central aim of all schools, but for those in challenging circumstances, it is imperative to ensure that school improvement is long term rather than short-lived.

While gains in student outcomes are hard fought, and sustainable improvement is particularly difficult to achieve in such challenging contexts, both are possible. However, to succeed in these difficult circumstances requires a school improvement process that fits the individual school context and is underpinned by an unrelenting focus on improving conditions at the learning level. The resilience, sheer capacity for hard work, and continuing adherence of principals and teachers under the most challenging circumstances to provide the best opportunities for the learning and achievement for students have been shown to make a significant difference to a school’s ability to improve.

To conclude, effective leaders in challenging school contexts are constantly managing tensions and problems directly related to the particular circumstances of the school. The main leadership task is one of coping with unpredictability, conflict, and dissent on a daily basis without discarding their moral purpose and core values. Effective leaders of schools in challenging circumstances tend to be, above all, people centered, combining a

willingness to be collaborative and to promote the highest levels of teaching and learning. The evidence suggests that while the difficulties facing such leaders are considerable, the personal and professional benefits far outweigh them and, in the majority of cases, change their school for the better.

Esthetics, Educational Leadership and Management

The study of organization, administration, and leadership has largely ignored the important field of esthetics. This is as true in the field of education as in the parent disciplines of organizational, administrative, managerial, and leadership theory. This is surprising, as esthetics, being concerned with the appreciation and exploration of different ways of seeing and with the imaginary exploration of possible worlds and selves is, as Dewey suggested, fundamental to learning. Indeed, an exploration of esthetics as a foundation for organizational leadership in education might well provide grounds for a proper educational theory of administration.

It is possible, however, to trace a variety of attempts to link esthetics with organizational theory within the parent fields as well as in education. These attempts fall generally into six categories:

- esthetics and organizational contexts;
- esthetics and organizational artifacts;
- esthetics and organizational leadership;
- esthetics and organizational culture;
- esthetics and organizational power; and
- esthetics and organizational capital.

Esthetics and Organizational Contexts

The most obvious relationship between esthetics and organization is that of the built environment within which organizations operate. Fundamental to such environments is the envisaging of architectural form through an exploration of the nature of the organization of work. But this is not simply a matter of idiosyncratic design but also a reflection of the needs of the client and the contemporary zeitgeist. Larson, for instance, argues that architecture is a social art, one that is public and useful, one that "... must convince a client, mobilize the complex enterprise of building, inspire the public ... and work with the culture, visual skills, and symbolic vocabulary not of the client but of its time" (Larson, 1993: 16). Leadership, exercised through the design of physical settings is, therefore, both a response to particular needs and a bridging of those needs with the broader culture within which organizations operate.

One of the most interesting examinations of this relationship during the twentieth century is that of Guillen who explores the relationship between organization and esthetics through the specific instance of "the formulation by modernist artists of an aesthetic based on the beauty of

the machine and on the new scientific management methods of the turn of the [twentieth] century" (1997: 682). As he suggests, Taylorist scientific management had a profound impact on organizational studies and the management of work, including educational work, in the United States. This impact, however, was largely the effect of the profession of engineering and regarded as an essentially technical exercise. In Europe and Russia a differing esthetic tradition combined with scientific management to produce quite a different architectural tradition. For instance, while in the United States the professions of engineering and architecture developed separately, with engineering following the principles of scientific management and architecture clinging to "... the old fashioned taste for superfluous ornamentation" (Guillen, 1997: 684), in Europe "... modernist architects found an aesthetic message in scientific management, producing an unlikely synthesis between art and the mechanical world" (one which) "succeeded in combining technology with style, science with history, management with creativity, and functionality with aesthetic" (1997: 683).

Such a perspective was rejected in England and Spain where the traditions of William Morris and Antoni Gaudi and the Arts and Crafts movements held sway but in the rest of Europe, new forms of modernist architecture developed where form followed function. In France, Le Corbusier, Benoit-Levy, and Leroy; in Germany Gropius, Meyer, and Wagner; in Russia Arvatov, Krinsky, and Lissitzky among others articulated an architecture that found inspiration:

... not in nature but in the rationalized or Taylorized world of machine production. They showed us that scientific management contained an aesthetic message emphasizing regularity, continuity and solidity. In their eyes, monotony and standardization had become beautiful. (Guillen, 1997: 698)

In the United States, however, much building had come under the influence of engineers rather than architects. Callaghan (1962) showed how Taylorist engineering principles underlay the cult of efficiency in education, while Tyack and Hansot (1982) showed how regularity, monotony and standardization became fundamental to the practice of education and educational leadership. Indeed an educational esthetic based on engineering and the principles of scientific management but without the esthetic of the European modernist architects had come to dominate the construction and management of schools. In school design as in educational practice, "Thorndike won

and Dewey lost” (Lageman, 1989: 185). The result was, as Klein and Diket suggest, that “Universities and schools were built according to the factory metaphor, not designed to address the needs of their inhabitants” (Klein and Diket, 2006: 99).

Adopting an alternative esthetic for leaders as architects and architects as leaders, Klein and Diket argue for an educational approach to leadership in design where “... visionaries of change ... create portals and paths ... [and] ... alter spaces and beliefs about the way people view themselves, others and society” (2006: 104). This argues for quite a different approach to architecture in general and schools in particular – one where creativity, flexibility, and possibility take the place of regularity, monotony, and standardization. Leadership in their view should be exercised on the basis of a creative approach to education and design that opens up possibilities for learning and imagination.

Esthetics and Organizational Artifacts

A second approach to the esthetics of leadership is that advocated by Gagliardi (1996), and Strati (2001) as well as by Rafaeli and Pratt (2006). Their approach is both a way of studying organizations through the ways in which leaders demonstrate commitments through the employment of particular artifacts, and an assessment of organizations through the artifacts that they produce.

In the first place, organizational leaders are seen to demonstrate particular commitments through the ways in which they display particular esthetic artifacts: such displays announce the culture of the organization preferred by the leaders. As Strati suggests:

... aesthetic objects are not simply appreciated on the basis of their artistic workmanship alone; they are special principally because of the emotions, insights, and feelings that they arouse in the cultures of those who use them or talk about them. (Strati, 2001: 573)

Gagliardi argues further that the ways in which leaders employ esthetic artifacts both affect the perceptions of reality held by organizational members and either facilitate or hinder organizational action (Gagliardi, 1996: 568). In fact “... artefacts are pathways of action in the sense that they structure sensory experience and enlarge or narrow the range of behaviour that is materially possible” (1996: 569).

Rafaeli and Pratt provide a comprehensive analysis of the ways in which artifacts are used by leaders to manage organizational problems, especially those related to the construction of collective identity, strategies of communication with the market and environment, and the creation of work settings that foster behaviors consistent with corporate purposes (Rafaeli and Pratt, 2006; Gagliardi, 2006).

Dean *et al.* (1997) consider not only the ways in which organizations use esthetic objects to manage their internal processes, but also the ways in which organizations generate esthetic artifacts in order to interact with their environment. They show how leadership is focused on the production of artifacts that will generate esthetic appreciation and through such appreciation, commitment to the organization:

... such potential objects of aesthetic appreciation could include products (an automobile) and services (an airline flight), organizational settings (the ambience of a restaurant) and processes (fabrication in a manufacturing cell). It could also include jobs (the role of a team leader), computer programs (the look and feel of a graphic interface), “performances” (resolution of a messy conflict), and even teams (that work together “beautifully”). (1997: 424)

Oddly enough, such esthetic phenomena are often ignored or trivialized in the study of organizational leadership. As Witkin argued:

... the exclusion of the aesthetic from conceptualisations of ... modern organizations ... has meant that phenomena which are clearly recognized to be aesthetic tend to be conceptually trivialized. (Witkin, 1990: 327)

Yet, the communication of purpose through esthetics is a major component of leadership through the vision of organizational mission and the harmony of organizational coherence through the engineering of consent. Similarly, the relationship of the organization to its wider environment (public, market, politics, etc.) is managed through esthetic artifacts in terms of both products and communication systems (such as logos and advertising).

In education, esthetic artifacts are used continuously by leaders as they attempt to generate particular commitments and outcomes both internally within educational organizations and externally in terms of the way in which their organization is perceived.

Esthetics and Organizational Leadership

Perhaps the one enduring tradition of esthetics in leadership is the notion of leadership as performance, or, as Weber (1968) called it, charisma. For Weber, charisma was a form of authority distinct from other types of traditional, legal-rational, or bureaucratic authority in that it engaged leaders and followers in an intensity of relationship and commitment uncommon in these other forms. As Samier suggests:

Charisma potentially exceeds any other authority type. ... in its personal effect through emotional intensity, inspirational capacity, and sacrificial character – all of which are

creative processes taking recognisable and analysable expressive form. (Samier, 2006: 172)

While charisma has been involved in the great-man theory of leadership and its modern version – transformational leadership – most theories of organizational leadership assume a benevolent relationship between charisma and organizational and social outcomes (for instance Deal and Peterson, 1999; Saphier and King, 1995). But as Gronn, (2006) and Bates (2006b) point out, the cult of heroic leadership can serve ill purposes as well as good. However, there seems little doubt that such charisma depends very much on the presentation of self and the rituals of face-to-face encounters (Goffman, 1959, 1972). Indeed, Goffman's dramaturgical analysis was a precursor to the analysis of cult leadership and spin and imagemaking in the second-half of the twentieth century.

As Gardener (1992) points out, impression management is an important part of organizational dramaturgy where "... skilful players ... take great care in defining and playing their roles, because they realize the importance of their performance" (p. 34). Duke explores the importance of such impression management where "The artistry of leadership encompasses leaders' purposeful efforts to foster the impression of leadership [through] dramatics, design and orchestration" (Duke, 1986: 20) and Howard suggests that "leadership is less a process or a thing-in-itself than a matter of performance success" (Howard, 1996: 34).

Starratt (1990, 1993) explores the drama of leadership through consideration of leaders as players, directors, stage managers, critics, and educators (1993) arguing that leadership is both a dramatic performance and a bridge between organizational life and the social dramas of the wider society. Leadership as a performance is therefore a bridge between internal and external dramas.

The question arises therefore as to whether leadership in this sense of performance can be taught. Some, like Howard, don't believe so:

... however many skills of leading we may identify, however much we may learn about leading and leadership from the experience of others, leadership as an achievement, like virtuosity in the deployment of musical skills, cannot be taught. (1996: 34)

Others, like Duke, take a somewhat neutral ground, suggesting that one of the chief virtues of an esthetic approach to leadership is appreciation, in that "like beauty, leadership deserves to be enjoyed for its own sake" (1996: 24).

Greenfield, however, argues that experience of the esthetic is fundamental to the performance of leaders in that, first, esthetic experience gives us insights into the human condition that cannot be captured through rational thought and, second, that esthetic performance speaks

of human involvement in the world. "It gives us the highest form of authentic human expression embedded in the very fabric of human intention, human communication and human understanding" (in Harris 1996: 494). Here, there is an argument that without an appreciation of esthetic traditions through which understanding and intention are communicated most vividly, leadership is likely to be an impoverished, inauthentic activity where performance is divorced from humanity and esthetics divorced from ethics. For Greenfield both leadership and esthetics fundamentally "speak to questions of how to live a life" (in Greenfield and Ribbins, 1993: 430).

Harris develops this thesis with reference not only to Greenfield, but also to Greene (1995), Eisner (2002), and Collingwood (1958), putting the position that artistry both enlarges our experience and provides "an emancipatory potential ... that draws us towards envisioning the world as it could become" (Harris, 2006: 48). It is this emancipatory potential, that shows us how things might be but are not, that is at the heart of both art and leadership.

The issue of how art changes perception of reality and can inform leadership, in terms of imagining and articulating possibilities, is taken up by several commentators. For instance, Samier and Stanley in their exploration of legacy of the Romantic tradition argue that:

Romanticism is both an ideal and a caution for administration and leadership. ... it provides a liberationist ethic for rising above the mundane, the profane, and the conventional in which educational administration is mired, in its promise of heightening the human potential towards self-determination, self-actualisation and authenticity. It also includes a critique of power, authority educational mediocrity and political stagnation. (2006: 42)

Educational leadership is then, at its best, characterized by "the cultivation of a deep and broad sensibility, rather than a narrow rationality or self-interest characterised by the lust for power or money" (Samier and Stanley, 2006: 43). This is an esthetic ideal for the creation of character as a work of art among both educational leaders and the other inhabitants of educational organizations. The Romantic tradition also, however, warns of the slide into the ugly and grotesque through novels such as Mary Shelley's *Frankenstein* and the works of Edgar Allan Poe (see also Strati and Montoux, 2002).

Others speak specifically of the role of literature (Brieschke, 1990; Stanley, 2006), theater (Mangham and Overington, 1987; Meyer, 2001), and cinema (Stockton, 2006) in the preparation of educational leaders and the ways in which such esthetic experiences can both deepen insight into the human condition and bring about an understanding enlivened by the contradictions of culture, not the unities or harmonies (Brieschke, 1990: 389) as well

as a confrontation with the moral nature of decision making in contradictory circumstances (Meyer, 2001; Bebeau *et al.*, 1999).

Esthetics and Organizational Culture

The literature on leadership and organizational culture comes to education through two routes, anthropology and organizational studies. The anthropological perspective sees organizations as cultures, that is, as communities and as manifestations of human consciousness (Smircich, 1983: 347). In this view, the realization of organizational culture is a manifestation of both the commonality and diversity of the knowledge and beliefs of its participants through material artifacts, events, behavior, and emotions. On the other hand, organizational studies have tended to see organizational culture as something that an organization has: a shared system of beliefs and values that conveys a sense of identity, facilitates commitment, and enhances organizational stability (Smircich, 1983: 345–46). In this second sense, culture is seen as another critical lever or key by which strategic managers can influence and direct the course of their organizations (Smircich, 1983: 346).

These alternative approaches are articulated in education by, for instance, Bates (1987, 2005b, 2006a) and Angus (1993), who argue the anthropological view, and Beare (1982); and Deal and Peterson (1999) who argue the managerial view. The difference in view is one of conflict between the anthropological concern for understanding and the managerial concern with manipulation (Bates, 2006b: 161). The implications are not trivial as the managerial view produces a drive toward consensus – contrived through the exercise of authority – while the anthropological view acknowledges the struggle between diversity and coherence and the need in education, as elsewhere, to acknowledge the complexity of the dynamics of cultural interactions both within schools and across their boundaries with various communities (Bates, 2005b, 2006b).

This does not deny the role of cultural entrepreneurs or their role within organizations, or the importance of their role in helping construct ceremonies, myths, and rituals (Pettigrew, 1979), but it does suggest that such an entrepreneurial role is not necessarily restricted to organizational leaders. The anthropological approach also illuminates the cultural dynamics of organizations that provoke resistance as well as compliance and describes rituals that celebrate both identity and difference (Bernstein *et al.*, 1966; Samier, 1997). In short, such a perspective can help to

... reveal heterogeneity in educational organizations, identify the bases of both conflict and a shared or common culture, suggest resolutions for leaders of the adverse effects of cultural conflict, and demystify and clarify educational ethos and values for establishing intellectual

standards and integrity for planning and policy-making. (Harman, 1989 in Samier, 1997: 433)

Again, the power of the esthetic may well lie not solely in its ability to offer us shared cultural experience, but even more so in its power to help us cross cultural boundaries both within organizations and between organizations and other cultures. If the problem of contemporary society is indeed to answer Touraine's question "Can we live together?" (Touraine, 1990; Bates, 2005b) then we might well accept Schein's assertion that "We will not learn about the power of culture unless we cross real cultural boundaries" (Schein, 1996: 239).

Esthetics and Organizational Power

Weber was the great theorist of organizational power in the modern world, arguing that the increasing rationalization of organizational life generated by the spirit of capitalism spilled over and captured every other area of social, ethical, and esthetic activity (Weber, 1930, 1968). Rationalized, bureaucratic, and calculative organizations were, for Weber, instrumental in the displacement of cultured people from positions of leadership and their replacement by technical experts: "specialists without spirit, sensualists without heart" (1946: 182). This new form of organizational power – that of bureaucracy – set up a conflict between specialized expertise and the cultivated personality, a conflict that "is determined by the irresistibly expanding bureaucratisation of all public and private relations of authority and by the ever-increasing importance of expert and specialized knowledge. This fight intrudes into all intimate cultural questions" (Weber, 1946: 243).

As Samier (2002) and others have shown, and in contradiction to the continuing misrepresentation of Weber in organizational and educational studies (e.g., Bush, 2000), Weber increasingly viewed the iron cage brought about by such calculative rationalization with despair. The pessimism of his later work contrasts with the optimism of his earlier work which lauded the demystification of traditional society and the increasing autonomy of science, ethics, and esthetics (see Pusey, 1987, Bates, 2003).

Habermas, in his reinterpretation of Weber argues that, rather than the rationalization of ethical and esthetic values analyzed in Weber's early work being displaced by the rationalization of interests that became the focus of his later work, the process of rationalization in each of these spheres continues alongside each other in the conflicts between what Habermas calls the life-world and the system (Habermas, 1989).

This conflict is played out within organizations where, on the one hand, individuals search for utility "which becomes the predominant value that directs the deployment of technical rationality [and] where the exchange and consumption of commodities becomes the main

object of social action” and, on the other hand, they search for meaning through “substantive values, emotion and authentic self-expression [in] morality, ethics, culture, art and aesthetics” (Milley, 2006: 83). The result, in educational organizations as elsewhere, is “a fine balancing act between substantive cultural work and instrumental action” (Milley, 2006: 91).

Organizational power, and the theorization (or as Foucault (1980, 1998) would call it, the normalization) of organizational power, has, for the most part been justified by appeals to utility and efficiency. However, as Maxcy (2006: 64) points out, leadership that asserts organizational power that is vainglorious, value neutral, and programmatic is deeply problematic, for leading does not occur in a vacuum, but rather, is rooted in our deepest beliefs about humankind, nature, and the real world around us (2006: 65).

Cairns (2002) takes a similar position when he explores the relationships between esthetics, morality, and power in organizations. In his exploration of the redesign of a particular workplace, he examines the multiple, conflicting meanings constructed by individuals and groups with regard to the change. The esthetics of the redesign were supposedly guided, not so much by the principles of scientific management discussed earlier, but by consideration of interpersonal relations as a key driver of organizational design (2002: 800). However, the changed esthetics of the workplace produced a situation where various individuals and groups held divergent and conflicting beliefs simultaneously and without contradiction (2002: 817). These beliefs, about the power relationships embedded in the esthetics of the redesign of the workplace by their masters, were, for instance, argued by staff to be both genuine reforms directed at staff empowerment and the implementation of fashionable management models for managerial self-advancement (2002: 815).

Even at the level of the design of physical environments then, esthetics are capable of holding contradictory meanings in tension. In terms of the exercise of power by different groups in organizations, esthetics may in fact be important in allowing individuals and groups to relate the system and life-world within the organization in ways that produce “. . . not a state of consensus, [but] rather a state of divergent equilibrium” (Cairns, 2002: 815).

This is a particular consideration in education where typically members of such organizations have diverse and multiple goals as well as hold various definitions of reality. They are likely, therefore, to be sites of competing esthetics that need constantly to be rebalanced into Cairns divergent state of equilibrium.

Esthetics and Organizational Capital

Recently, attempts have been made to explore the place of educational management and leadership in the (re)

production and distribution of symbolic (esthetic) capital and the role of education in esthetic self-realization. This is an area of investigation that follows from the work of Bourdieu (1984, 1993) and his exploration of the ways in which symbolic capital is distributed throughout society and the role played by various cultural institutions, such as museums, art galleries, theaters, publishing houses, and foundations, in organizing, adjudicating, and distributing such capital. The effect of such institutions is to produce a hierarchy of taste (Bourdieu, 1984), access to, and ownership of which constitutes symbolic capital that in turn legitimates the position of the owner in social space (Bourdieu, 1984, 1993).

Schools play a vital role in the consecration of symbolic capital and the maintenance of hierarchies of taste and power. Educational leaders, therefore, inasmuch as they articulate particular notions of cultural/symbolic capital (classical as against popular culture, for instance) and, through the assessment systems of their institutions, certify the possession (or absence) of such capital. Typically, schools act to conserve traditional notions of symbolic/cultural capital. In this way the school simply

. . . maintains the pre-existing order, that is, the gap between pupils endowed with unequal amounts of cultural capital. More precisely, by a series of selection operations, the system separates the holders of inherited cultural capital from those who lack it. Differences in aptitude being inseparable from social differences according to inherited capital, the system tends to maintain pre-existing social differences. (Bourdieu, 1998: 20)

As Bates (2006b) suggests, advocates of high culture (Eliot, Leavis, Bloom) and popular (working class) culture (Hoggart, Willams, Hall) articulate very different versions of symbolic capital. Educational institutions that adopt particular versions of symbolic capital therefore label their graduates in particular ways. For many, such distinctions mark off the sacred from the profane (Bourdieu, 1998) and purity from danger (Douglas, 1970; Durkheim, 1971). The placing of individuals in symbolic space therefore depends upon both the differences in the location of institutions and the processes by which they associate particular differences with particular individuals.

The work of educational administrators is, therefore, esthetic, not only in terms of their vision of school culture and their embodiment of that vision in the esthetic performance of the self, but also in the act of consecration of a particular esthetic distinction between purity and danger, between the noble and the mundane, and their classification of individuals according to such categories (Bates, 2006: 212).

In the contemporary world however, the struggle to maintain clear hierarchies of symbolic capital and power is confused by the anarchy of cultures that now rub up against each other in various media. This is not to suggest

that such hierarchies are less important than they once were, but rather that the competition for places within and between hierarchies is more intense (McKee, 2005). Educational institutions and educational leaders are, therefore, increasingly caught up in debates about the production and reproduction of such hierarchies of symbolic capital and arguments over what particular esthetic (as well as ethical and instrumental) values they should transmit.

Conclusion

The application of esthetic theories to educational leadership and to the study of educational institutions has hardly begun. There are some promising leads in both organizational and educational literature, but much work remains to be done at both theoretical and empirical levels. As Samier (2006: 5) suggests, following Hostadter (1965) “art is the means by which the three functions of symbolism, expression, and meaning are integrated.” Such integration is at the heart of the educational process. It is also at the heart of organizational and social processes as Dewey (1916) acknowledged. But, for Dewey, such processes were fundamentally an exercise in consensual value formation across boundaries and always with the potential that things could be other than what they are. The exercise of such an esthetic imagination is important in both organizational and educational leadership.

Leader Mistreatment of Teachers

J Blase and J Blase, University of Georgia, Athens, GA, USA

© 2010 Elsevier Ltd. All rights reserved.

Introduction

The problem of school leader workplace mistreatment of teachers has only recently provoked scholarly attention. This article reviews the major conceptual, typological, and theoretical approaches to the general problem of workplace mistreatment/abuse and superordinate mistreatment/abuse of subordinates in particular. This is followed by a presentation of the findings of empirical research focusing on abusive behavior and its effects on the personal–professional lives of workers in organizational settings. Major findings from the two existing published studies of school leader mistreatment/abuse of teachers are also presented. A brief methodological critique of the general workplace mistreatment/abuse literature and discussion of further research conclude this article.

Internationally, research on workplace mistreatment/abuse has increased substantially during the past two decades. Most of the theoretical and empirical work has been published in Western Europe, particularly in countries such as Finland, Sweden, Great Britain, France, and Norway, as well as Australia and Canada. Although slow to start, scholars in the United States have made significant contributions to the rapidly emerging international research base on workplace mistreatment/abuse (Blase and Blase, 2002, 2003a, 2003b; Einarsen *et al.*, 2003; Rayner *et al.*, 2002). In some countries, significant legislation and organizational policies have been created to prohibit abusive conduct by superordinates and co-workers and provide opportunities for redress (Irish Taskforce on the Prevention of Workplace Bullying, 2001; Lynch, 2002; Office of the Employee Ombudsman, 2000; Queensland Government Department of Industrial Relations, 2004). Despite this proliferation of research and legal analyses that support the development of organizational policies and legislation addressing this serious problem, such policies and legislative proposals are only beginning to emerge in the United States (Yamada, 2000, 2004). Unfortunately, only two studies of school leader mistreatment/abuse of teachers have been published, both in the United States (Blase and Blase, 2002, 2003a, 2003b; Blase *et al.*, 2008), despite the fact that several large-scale studies of workplace mistreatment/abuse across occupations in Sweden (Leymann, 1990), Norway (Matthiesen *et al.*, 1989), Great Britain (Hoel and Cooper, 2000), Ireland (Irish Taskforce on the Prevention of Workplace Bullying, 2001), and Australia (Queensland Government Workplace Bullying Taskforce, 2002) indicate

that teaching is one of the highest-risk occupations for mistreatment/abuse.

Concepts of Workplace Mistreatment/Abuse

A range of concepts has appeared in the scholarly literature to define workplace mistreatment/abuse; generally, these concepts refer to the same phenomenon. Björkvist *et al.* (1994) used the term work harassment to describe repeated actions intended to provoke emotional pain against individuals or groups unable to defend themselves. Price-Spratlen (1995) used the more inclusive terms, mistreatment and abuse, interchangeably, to identify actions perceived as excessive, inappropriate, and unwanted by a target. Mobbing was used by Leymann (1990) to refer to communication by one or more individuals acting together toward a target over a long period of time that produces substantial emotional, physical, and social damage. Bullying, a concept used by Einarsen and Skogstad (1996), describes a pattern of harassment of one or more persons by an individual of superior power.

A handful of concepts specifically describe administrator (superordinate and superior) mistreatment/abuse of subordinates. Abusive supervision, as discussed by Tepper (2000), refers to a prolonged use of harmful verbal and nonverbal behaviors as well as physical contact. Ashforth (1994) described petty tyranny as the behavior of one who lords power over others, behaves in self-aggrandizing and arbitrary ways, demeans employees, is inconsiderate, discourages initiative, and arbitrarily dispenses punishment. In both the works of Hornstein *et al.* (1995) and Hornstein (1996), abusive supervision has been described as transgressions, including coercion, selfishness, deceit, cruelty, and disregard, by administrators toward subordinates. Blase *et al.* (2008) produced a broad-based inclusive definition of school administrator mistreatment/abuse drawn directly from studies of abused teachers: typically, a pattern of verbal, nonverbal, and physical behaviors (excluding physical violence) by an administrator over an extended period of time that, in the teacher's perception, causes psychological–emotional, physical–physiological, and profession-life and personal-life harm; racial and sexual harassment are included in this definition of school administrator mistreatment/abuse (Blase and Blase, 2002, 2003a, 2003b; Blase *et al.*, 2008). Under certain circumstances, a single behavior

may be considered mistreatment/abuse, depending on its type, frequency, and severity (Yamada, 2004).

Keashly's (1998) comprehensive definition of workplace emotional abuse identified verbal and nonverbal behaviors used to elicit compliance from others; specifically, abusive behavior is unwanted by the target, intended to harm the target, constitutes a pattern of abuse, violates norms for appropriate conduct and individual rights, produces harm, and occurs in the context of an unequal power relationship. It should be mentioned that organizational scholars generally agree that frequency and duration are critical and strong elements of a definition of workplace mistreatment/abuse; however, a perpetrator's intentions and an unequal power relationship are less critical, weaker elements of such a definition. Put differently, definitions of workplace mistreatment/abuse may and should vary with regard to context. In addition, the inclusion or exclusion of race-based and sex-based harassment in such definitions, although appropriate to teachers' perspectives of mistreatment/abuse, remains inconsistent in the scholarly literature (Blase and Blase, 2002, 2003a, 2003b; Hoel *et al.*, 1999; Einarsen *et al.*, 2003; Einarsen and Skogstad, 1996; Irish Taskforce on the Prevention of Workplace Bullying, 2001; Rayner, 2000; Westhues, 2004).

Typologies of Abusive Behaviors

A handful of typologies of abusive behavior in the work setting that are constructed from empirical research have been aptly employed to classify abusive leader behavior. The applicability of a particular typology would vary according to context. Baron and Neuman (1996) developed a three-factor model of workplace aggression that is based on Buss's (1961) seminal model of human aggression and identifies manifestations of hostility, obstructionism, and overt aggression. Manifestations of hostility include verbal and symbolic behavior, such as obscene physical gestures, dirty looks, staring, silent treatment, ridiculing a target's work, belittling an individual's opinion, giving unfair negative information to higher-level administrators, flaunting status, and delivering unwarranted reprimands. Obstructionism describes conduct that is aggressive but passive in nature; this includes stonewalling, not returning phone calls or responding to e-mails and memos, interfering with the target's work, withholding permission or resources, failing to provide needed information, and soliciting others to delay needed decisions and actions. The third factor, overt aggression, refers to threats or acts of physical violence or destruction or the theft of property. Note that acts of physical violence are excluded from most perspectives of workplace mistreatment/abuse.

Ryan and Oestrich's (1991, 1998) model of leader mistreatment/abuse describes abrasive (i.e., less harmful) and abusive (i.e., more harmful) behavior, including silence,

glaring, abruptness, ignoring or snubbing, insults, blaming, discrediting, aggressive control, threats, shouting and yelling, angry outbursts, and threats of physical harm. Consistent with the workplace mistreatment/abuse literature in general, Ryan and Oestrich argued that the degree of harm caused by a behavior will vary in terms of frequency, place of occurrence (e.g., public vs. private context), and timing. Robinson and Bennett's (1995) typology of workplace deviance conceptualizes various types of behavior by two dimensions, minor versus serious and interpersonal versus organizational. Minor types of deviance are described in terms of two quadrants, including productive deviance (e.g., taking excessive breaks and leaving early) and political deviance (e.g., blaming subordinates, favoritism, and gossiping). More serious types of deviance are described as property deviance (e.g., lying about hours worked and damaging equipment) and personal aggression (e.g., endangering subordinates, stealing from subordinates, verbal abuse, and sexual harassment).

Theories of Workplace Mistreatment/Abuse

Several important theories of leader abuse of subordinates deserve attention. Hornstein *et al.* (1995) developed a perspective on supervisory disrespect based on theoretical work in organizational justice, symbolic interactionism, stress theory, and the general psychological literature. These scholars soundly argued that an individual's feelings of self-worth and security are influenced by how they are treated by others and that these feelings affect one's psychological/emotional well-being. Hornstein *et al.* used the Boss Behavior Questionnaire (BBQ), a valid and reliable measure of respect and disrespect. They have demonstrated that disrespectful behavior by leaders toward subordinates violates an individual's dignity and produces a loss of self-esteem and a range of adverse stress-related conditions (e.g., anxiety and depression).

Likewise, Folger's (1993) theoretical work – which is based on exchange theory and, specifically, referent cognitive theory (RCT) – is another insightful explanation of how subordinates come to feel mistreated by superordinates. This theory defines employment as both the economic and social exchanges of material goods (e.g., wages and benefits) and relational goods (e.g., treatment by superiors with regard to interpersonal processes, such as politeness and respect). Folger contended that in addition to equitable treatment with regard to the application of policies and procedures, superordinates have a moral obligation to treat employees with dignity in accordance with normative standards. During an exchange, respectful conduct by a superordinate enhances a subordinate's feelings of dignity, self-respect, and self-worth, responses essential to the perception that one has been treated as a person, not as

an object. Subordinates can be expected to have a hostile reaction (e.g., moral indignation) when a superordinate's interpersonal treatment has placed their dignity in jeopardy.

By comparison, Ashforth (1994) proposed a model of petty tyranny based on antecedents and effects. He maintained that petty tyranny results from an interaction of the predispositions of superordinates (i.e., beliefs about the organization, such as believing that it is a bureaucratic one), beliefs about subordinates (e.g., in the theory X approach, superordinates believe that the average person dislikes work, lacks ambition, requires direction, and is resistant to change; such beliefs often lead to a close, coercive leadership style (McGregor, 1960)), and situational facilitators (i.e., macro-level factors, such as institutional values and norms, and micro-level factors, such as power). Ashforth hypothesized that such antecedents interact to produce petty tyranny (e.g., arbitrariness and self-aggrandizement, belittling subordinates, lack of consideration, and non-contingent punishment). This approach to leadership causes low leader endorsement; high frustration, stress, and reactance; high helplessness and work alienation; poor work performance; and low work-unit cohesiveness. Ashforth described feedback loops that connect the effects of tyranny with its antecedents and behavior. Subordinate alienation, for example, may enhance negative dispositions toward subordinates (an antecedent) and increase the likelihood of greater use of coercion (behavior). More important, subsequent research by Ashforth (1997) suggested that petty tyranny may be accurately described as a gestalt (i.e., syndrome), a set of mutually reinforcing individual dispositions, situational facilitators, leader behaviors, and subordinate effects that interact to create a coherent cluster.

Several phase models of workplace mistreatment/abuse are particularly valuable. Leymann's (1990) seminal model of mobbing differentiates between and among various phases of workplace mistreatment: briefly, in phase 1, there is a triggering event that initiates a conflict; in phase 2, the individual is stigmatized and subjected to repeated injurious actions over an extended period of time; in phase 3, the management becomes involved, identifies the conflict as official and, because the victim has been stigmatized, predictably assumes the negative attitudes and prejudices of the abusers, which suggests a serious violation of a victim's rights by the management; and in phase 4, the victim is expelled from the organization. Similarly, Björkvist (1992) described a three-phase model of mistreatment that emphasizes the severity and escalation of mistreatment, and Zapf and Gross (2001) discussed the applicability of Glasl's (1994) three-phase model of conflict, including rationality and control, severing the relationship, and aggression and destruction. Although phase-escalation models of workplace mistreatment/abuse include contextual variables (e.g., organizational leadership and the organization of work), such inclusions tend to be limited.

In contrast, prominent causal models view workplace mistreatment/abuse as a more complex phenomenon consisting of a host of personal (perpetrator and victim), social, and organizational variables (i.e., potentially multiple causes (reasons) that explain the mistreatment/abuse phenomenon). Neuman and Baron's (1998) theoretical model contends that the antecedents of aggression, that is, social factors (e.g., privation and unfair treatment) and situational factors (e.g., organizational culture and climate and restructuring) influence personal determinants (e.g., type A behavior – being irritable and impatient (Glass, 1977), control oriented (Miller *et al.*, 1985), emotional, and overly aggressive (Holmes and Will, 1985); self-monitoring problems), which, in turn, affect an individual's internal state (e.g., hostile feelings) and cognitive appraisal (e.g., was I attacked or treated improperly?) and produce an aggressive or nonaggressive response. Notwithstanding this, Zapf's (1999) causes and consequences model of mobbing posits greater complexity and multidirectionality. In brief, Zapf argued that organizational factors (e.g., leadership and culture) and social group factors (e.g., hostility and envy) influence a perpetrator to exhibit mobbing behaviors (e.g., rumors, social isolation, and verbal aggression). Such behaviors affect the victim's actions, and such actions, in turn, affect the perpetrator's actions. In effect, the causes of mistreatment/abuse are multilateral and interactive processes that produce consequences (e.g., depression and anxiety) and such consequences influence the organization, perpetrator, social group, and victim variables. Within this dynamic-interactive and multidirectional mistreatment/abuse process, causes become consequences and consequences become causes. Needless to say, leading-edge theories of workplace mistreatment/abuse suggest that one-sided, simplistic explanations of workplace mistreatment are misguided (Keashly, 1998; Rayner *et al.*, 2002; Zapf, 1999).

Additional theoretical knowledge directly relevant to mistreatment/abuse in organizations is available in the general leadership literature (e.g., Adams and Balfour, 1998; Hodgkinson, 1991; Kets de Vries, 1989, 1993), social psychological literature (e.g., Baumeister, 1996; Haney *et al.*, 1973; Katz, 1993; Kekes, 1990; Kipnis, 1972, 2001; Lee-Chai and Bargh, 2001), human aggression literature (e.g., Bandura, 1973; Berkowitz, 1993; Buss, 1961; Geen, 1999; Giacalone and Greenberg, 1997; Glick and Roose, 1993; Goldstein, 1994; Potegal and Knutson, 1994; Rizzuto *et al.*, 2004), organizational justice literature (e.g., Bies, 1987; Cropanzano, 1993), and work stress literature (e.g., Barling *et al.*, 2005).

Abusive Behaviors

A great deal of empirical research on workplace mistreatment/abuse has focused on determining the types of verbal, nonverbal, and physical behaviors that harm victims. Typical verbal forms of mistreatment/abuse include

scapegoating, threats, put-downs, false accusations, swearing, name calling, unfounded criticism (public and private), gossiping, deceit, dishonesty, favoritism, unfair evaluations, taking credit for another's accomplishments, unwarranted reprimands, unfair reassignments or terminations, and racial and sexual harassment. Nonverbal forms of mistreatment/abuse include ignoring, snubbing, aggressive eye contact (e.g., the silent treatment), staring, and physical gestures (e.g., finger pointing and foot stomping). Withholding essential resources and the destruction of property are examples of physical forms of mistreatment/abuse (Baron and Neuman, 1996; Björkvist *et al.*, 1994; Blase *et al.*, 2008; Blase and Blase, 2002, 2003a, 2003b; Glomb, 2002; Harlos and Pinder, 2000; Hoel and Cooper, 2000; Irish Taskforce on the Prevention of Workplace Bullying, 2001; Keashly and Jagatic, 2000; Leymann, 1990; Namie, 2000; Price-Spratlen, 1995; Queensland Government Workplace Bullying Taskforce, 2002; Salin, 2001; WBTI, 2003; Westhues, 1998, 2004). It is important to emphasize that, by definition, victims of workplace mistreatment/abuse are subjected to a range of the aforementioned behaviors over extended periods of time.

Effects of Abuse

Research on workplace mistreatment/abuse has also emphasized the deleterious effects of such behavior on a victim's psychological-emotional and physical-physiological well-being, work performance and relationships with colleagues, and one's personal and family life well-being. Harmful effects on psychological-emotional well-being include feelings of desperation, incompetence, shame, self-doubt, loneliness; obsessive thinking, distrust, anxiety, disorientation, shock, panic attacks, depression, and posttraumatic stress disorder (PTSD). Examples of the effects on physical-physiological well-being are hair loss, back and neck pain, headaches and migraines, significant weight changes (loss or gain), ulcers, chronic fatigue syndrome, high blood pressure, irritable bowel syndrome, and heart attacks. Effects on work performance and relationships with colleagues include work impairment (e.g., decreases in initiative, creativity, risk taking, and commitment; tardiness), absenteeism, mistakes made at work, impaired group decision making, and withdrawal from extra-role and social involvements. Negative effects on personal and family life include increases in family conflict and deterioration of relationships with spouses, children, and friends (ACTU, 2000; Björkvist *et al.*, 1994; Blase *et al.*, 2008; Blase and Blase, 2002, 2003a, 2003b; Einarsen *et al.*, 1994; Glomb, 2002; Hoel *et al.*, 2001; Hornstein, 1996; Irish Taskforce on the Prevention of Workplace Bullying, 2001; Keashly, 2001; Leymann and Gustafsson, 1996; NNLI, 1993; Pearson *et al.*, 2000; Price-Spratlen, 1995; Queensland Government Workplace Bullying Taskforce, 2002; Tepper, 2000; WBTI, 2003; Westhues, 1998, 2004).

Leader Mistreatment/Abuse of Teachers

To date, only two studies of school principal mistreatment/abuse have been published. Blase and Blase (2002, 2003a, 2003b) conducted a series of in-depth interviews with 50 exemplary teachers in the United States and Canada who had been repeatedly mistreated/abused by their school principals for substantial periods of time (6 months to 9 years). They produced descriptive and conceptual knowledge focusing on abusive principal behaviors and effects on teachers, teaching, teachers' relationships with students and colleagues, and teachers' personal life.

In a subsequent study, Blase *et al.* (2008) administered a comprehensive survey to 172 teachers from the United States and Canada. The results of this study confirmed those of their first study and provided greater detail on abusive principal behavior and its deleterious effects on teachers. Research participants had been mistreated from 1 to 3 years (40.1%) and over 3 years (25.6%).

Blase *et al.* (2008) reported that some of the most frequently occurring and most intensely harmful mistreatment behaviors were failing to recognize or praise teachers for work-related achievements, favoring other teachers, intimidation, and failure to support teachers in difficult interactions with parents and students. Other high-frequency and intensely harmful behaviors were nitpicking about time and micromanaging, unjust criticism, overloading with work, lying, isolating teachers from colleagues, gossiping to other teachers/parents/students, and unwarranted reprimands. Over 70% of the teachers studied disclosed that their principals abused them very frequently. Female teachers, as compared with male ones, experienced principal mistreatment which was more frequent as well as more intensely harmful. Blase *et al.* (2008) found that the ten most frequent effects of mistreatment (in rank order) were stress, resentment, anger, insecurity, a sense of injustice and moral outrage, self-doubt, anxiety, a sense of powerlessness, and maintenance of silence and bitterness. Over 50% of the research participants identified additional effects, including damaged relationships with colleagues, fear, decreases in self-confidence and self-esteem, reduced motivation to teach, and depression. Over 77% of teachers reported that principal mistreatment significantly undermined teaching, that is, reduced the characteristics of motivation, innovation/creativity/risk taking, and caring/patience/tolerance of students and increased the use of rigid, authoritarian, ineffective teaching methods. Of the total number of research participants, 51% indicated that they sought medical or psychological treatment (or both) for illnesses related to their mistreatment/abuse.

Blase *et al.* (2008) also found that 50% of their research participants attributed at least half of their total life harm to a principal's mistreatment and that 50% of them wanted to leave the teaching profession altogether as a result of principal mistreatment. This suggests that school principal

mistreatment of teachers should be considered one of life's major sources of harm. These scholars also described findings related to how teachers cope with principal mistreatment (i.e., teachers' predominant use of passive strategies) as well as perceived reasons (e.g., primarily political reasons as well as demographic factors such as gender and race) for mistreatment.

A Methodological Note

During the 1990s, most research on organizational abuse centered on attempts to clearly define the construct of abuse and its components. Multi-item behavioral scales determined abusive behaviors, frequencies, intensity of harm, effects, and coping strategies (see, e.g., studies with reliability and validity information, including those of Sheehan *et al.* (1990), Björkvist *et al.* (1994), Keashly *et al.* (1994), and Baron and Neuman (1996)); little research was undertaken to determine the responses of victims to abuse and factors that influence these responses (see, e.g., Kahn and Byosièrè's (1992) study of the victims' perceptions of personal and organizational resources that influence their responses to abuse).

In the past decade, researchers have begun to examine the relationship between the intensity and frequency of abuse (Blase *et al.*, 2008); the nature of harm (e.g., Blase and Blase's (2003b) qualitative descriptions of victims' experiences and Tepper's (2000) factor and regression analyses of the consequences of abuse and implications for organizational justice theory); antecedent conditions, or what contributes to the presence of abusive behaviors (e.g., highly hierarchical organization, local norms, and management style; see Glomb's (2002) qualitative interviews on antecedents to abuse and Zapf's (1999) psychometric properties of scales that determine multicausality from the organization, social system, victim, and perpetrator); and the nature of conflict escalation and coping (see Zapf and Gross's (2001) interviews and questionnaire).

Despite nearly two decades of empirical work in the field of organizational abuse, researchers are still using a limited, though slowly expanding, range of methods to investigate, define, and operationalize the construct. Moreover, research samples tend to be self-selected, and some investigators continue to use nonvalid measures of effects and responses to organizational abuse.

Further Research

To date, only two empirical studies of principal mistreatment of teachers have been published. Like most research on workplace mistreatment, both have investigated the victim's perspective on abusive behaviors, deleterious

effects, teachers' coping responses, and causes (antecedents and contributors) to mistreatment. Much more research is needed to understand each of the aforementioned dimensions of this deeply disturbing problem. Research aimed at examining the causes (i.e., antecedents, reasons, and contributors) of teacher mistreatment/abuse, using a comprehensive theoretical approach (i.e., one that subsumes the individual, dyadic, group, and organizational levels) would be particularly valuable (Rayner *et al.*, 2002). At this early stage, case studies using multiple methods would be especially useful in generating needed descriptive, conceptual, and theoretical knowledge. More research on how teachers cope with school leader mistreatment would make an important contribution, given the significance of coping to determine the degree of harm to individuals or groups and their work (Cox, 1980). In addition, large-scale national and international studies are essential to determine the frequency and pervasiveness of the principal mistreatment problem. Most research on workplace mistreatment, in a broad sense, and on existing published research on teacher mistreatment specifically, has examined the victims' perspective. Research focusing on the perpetrator's perspective is critical; however, given the sensitivity of the topic, such research will be difficult to implement. Finally, following the development of deeper understandings of the school leader mistreatment/abuse problem, research centered on both preventative measures (e.g., university preparation for educational leaders and teachers) and protective measures (e.g., development of organizational policies and laws) to ameliorate the problem would be valuable.

Internationally, the problem of workplace mistreatment/abuse has been generally ignored by organizational scholars. This is particularly true with regard to school leader mistreatment/abuse of teachers; indeed, the essential knowledge base about this problem is not yet available for enhancing school leader-/teacher-preparatory programs or challenging the *status quo* in education on a national or international level. Yamada wrote:

...contemporary attitudes toward workplace bullying parallel those toward sexual harassment several decades ago. Long before "sexual harassment" entered into everyday usage, the underlying behavior had been a staple of too many workplaces. Its targets often suffered in silence, and many paid dearly in return for keeping a job. The notion that such conduct should be illegal had little support. ...[I]n view of the growing body of evidence documenting the harm done by bullying to workers and employers, this is a measure whose time has come. (Yamada, 2004: 515–516)

Leadership and Gender

J Blackmore, Deakin University, Burwood, VIC, Australia

© 2010 Elsevier Ltd. All rights reserved.

It is well recognized that conceptualizing leadership is problematic, and that much of the leadership literature is Western centric (Sander, 1993). Gender has also become an ongoing issue in leadership studies as well as in educational policy and practice. Politically, the lack of women and dominance of men in formal leadership positions are troubling for policymakers: symbolically, in democratic societies that seek to be seen to be representative and fair, and, practically, in terms of recruiting and retaining effective leaders in a numerically feminized profession of education. Epistemologically, how the gender and leadership nexus is understood and explained is reliant, first, upon how the problem has been defined and, second, the theoretical and conceptual frames that are utilized to analyze the problem.

Framing the Woman Problem

Two traditions exist within the research and policy literature on gender and leadership that frame research and policy – one in which gender is treated as a category of analysis or a factor to be considered within mainstream educational leadership studies and the second that is a critical strand of theory and research informed by feminist and, later, postcolonial theory that argues that leadership is shaped by wider cultural, social, and political belief systems, sociocultural practices, and discourses that are gendered, each with different policy trajectories (Marshall, 1997).

Mainstream Studies

To understand how gender and leadership has been constructed discursively within the field, as a research issue and a policy problem, it is necessary to understand the emergence of administration as a disciplinary field in education. Scholars and practitioners in educational administration in the early twentieth century sought legitimacy, initially by aligning with business theories of scientific management, and, subsequently, post-1945, with a narrow positivist tradition of science. Both perspectives assumed the Enlightenment binaries representing that which was rational, objective, and universal as masculine, and that which was subjective, emotional, and particular as feminine, further embedding legacies of early twentieth-century psychological and biological theories essentializing women, depicting them deficient as leaders because of their lack of the necessary physical, mental, moral, and emotional attributes (Shakeshaft, 1987; Blackmore, 1989).

This naturalization of the male/female division of labor was reinforced by existing patriarchal social, political, and economic structures and norms delineating the public, work, and leadership as masculine domains and the private, family, and teaching as feminine domains.

The structural functionalist sociology of the 1950s theory movement that dominated well into the 1960s institutionalized these binaries with epistemological claims that fact was separate from value and that the scientific method was objective and the nonscientific method subjective, while simultaneously claiming a universal gender-neutral subject and epistemology. Within this frame, gender was treated as a subcategory, a pattern emerging from large statistical analyses that identified sex differences in behaviors of leaders and outcomes of schooling, or as a variable to be controlled to measure the effects of other variables such as class (e.g., Jones, 1990). The theories of sex differentiation and socialization of this time relied on sociological and psychological studies of male leaders that largely ignored organizational and cultural contexts. Both the theories and the practices of educational administration were largely premised upon hierarchical organizational structures, whether bureaucratic or corporate, equating leadership with formal position and/or individual attributes, thus constructing binaries between leadership and the management, and leaders and followers. Such perspectives treated leadership as a set of generic competencies acquired and required to manage organizational and educational change to produce more efficient and effective schools, including definitions of merit that favored the experiences of men over those of women.

The mainstream tradition during the 1970s and 1980s increasingly drew on guru change management, human resource management, and psychological and economic literatures, but less so on sociological and political literatures or on the teachers' work. Administration was being constructed as different from teaching. Leadership research within this paradigm continued to generalize from the experience of men to women, with the leadership norm being an idealized male type: rational, autonomous, unemotional, and with higher-level intellectual and moral attributes. Both theoretical and social norms justified, and were justified by, the naturalness of the gendered division of educational labor between leading and teaching.

Mainstream research shifted its focus from the individual attributes of leaders to consider the role of context, culture, and community in managing organizational change during the 1980s, and, subsequently, on how to lead learning organizations in the context of emerging knowledge-based

economies and increasing cultural diversity during the 1990s. Whereas historically, leadership featured as a subset of educational management and administration, it now came to subsume administration as the lexicon of reform. The effective schools literature equated the successful principal to the effective school and, in an era of school self-management, the key solution to neoliberal educational reform. Within this context, and under pressure from equal opportunity legislation, policies, and programs, women were moving into middle management in schools. However, again, the dominant school effectiveness, school improvement, and learning organization paradigms ignored gender by either assuming the self-maximizing and autonomous gender-, race-, and class-neutral individual or by treating women as a unitary category who had specific needs, wants, and interests. Discourses produced from feminist research about women's styles of leading were readily and unproblematically appropriated into the mainstream, producing incremental changes (e.g., Celikten, 2005). In the early twenty-first century, emerging research fields, such as internationalization, address cultural diversity as an issue, and either ignore gender or treat it as an issue for other cultures.

Gender within mainstream educational administration has therefore become a factor to be addressed in policy, for example, teacher career paths restructured to attract more women. In general, the tendency is to position gender as particularist, largely irrelevant to the mainstream, often cordoned off in texts in sections categorized under alternative perspectives or equity, or largely ignored (as in the *Second International Handbook of Leadership and Administration* published in 2006). Mainstream leadership research on gender therefore falls into four categories:

- that which ignores gender by universalizing the experience of men;
- that which treats gender as a variable to be explained in studies focusing on other issues (e.g., lack of aspirants for principalship);
- that which draws on feminist (and critical) theory without recognition of the politics of its origins, for example, collapse of emotional/rational binary and transformational leadership; and
- that which treats gender as a problem for/with women.

All such approaches neglect wider structural and cultural factors as well as the gender order that is socially, politically, and economically constructed.

Feminist Studies

The mainstream social theory was challenged epistemologically and politically by the women's, civil rights, and student social movements during the late 1960s. However, such disruption failed to penetrate mainstream educational

and administration literature until the 1980s (Weiler, 1993). While feminist theorists initially drew from the sex-role socialization theory, increasingly, gender and the production of knowledge came to be understood within the field of leadership (as in sociology, philosophy, psychology, and history) to be socially constructed and about relations of power. Leadership (as feminism) was therefore a political and personal issue – how one came to be, to know, and to act, and with what intent. Initially, feminist researchers identified, mapped, and sought to explain the historical patterns of women's unequal representation in leadership (Shakeshaft (1987), Yeakey *et al.* (1986), Marshall and Ortiz (1988) for the USA; Gaskell and McLaren (1991) for Canada; Blackmore (1989) for Australia; Al-Khalifa (1989), Acker (1989), Grant (1989), Deem (1990) for the UK; and Nixon (1987) and Court (1998) for New Zealand). Researching women leader's experiences provided a knowledge base and the missing empirical evidence tracking gender inequality. Working within the individualistic framework of liberal feminism (Schmuck, 1996; Adler *et al.*, 1993) and the traditional notions of professionalism (Glazer, 1991; Strachan, 1993), the focus was on women's continuing underrepresentation in leadership, nurturing women's aspirations, skills, and confidence to take up leadership, and procedural and legalistic approaches to provide access for individual women into leadership through equal opportunity (in Australia and New Zealand) or affirmative action (in the USA) legislation.

Interpretivist traditions of the new sociology of knowledge, and radical and cultural feminist theories that focused on women's ways of doing, being, and thinking emerged during the 1980s. These shifted the focus from the individual to the collective, and from women's lack to what women collectively could contribute to leadership in terms of particular moral positions, an ethics of care, a democratic disposition, and a focus on student learning, while collapsing the public/private binary (Noddings, 1992; Beck, 1994; Marshall and Anderson, 1995). As with the mainstream management theory, this focus on organizational culture explained not only collective resistance to educational reform, but also how women continued to be excluded from masculinist leadership cultures (Blackmore, 1993). While mainstream literature treated culture as homogeneous and static (Hall, 1996), feminist literature (as critical theorists drawing on Habermas) viewed organizational culture as contested in terms of values, belief systems, and practices (du Billing and Alvesson, 1989). Cultural theories also shifted focus onto the social relations of gender and how different masculinities (bureaucratic and entrepreneurial) and femininities (caring and sharing) were constructed in relation to each within a wider gender order, explicating how hegemonic masculinities reinvented themselves over time to subordinate other masculinities (e.g., homosexual) and most femininities (Connell, 1987).

Context and culture were thus seen to simultaneously frame societal expectations and perceptions of women leaders as the other (Ozga, 1993).

Radical (cultural) feminism sat comfortably within the wider politics of recognition of the 1980s in which women, as other marginalized groups, sought both voice and recognition within pluralist Western societies by asserting the positive aspects of different cultures and value systems of specific social groups (Capper, 1993; Marshall, 1993; Dunlap and Schmuck, 1996). However, women leaders in education were repositioned ambiguously – either as outsiders – inside dominant organizational cultures and, therefore, as good change agents, or as complementing and softening the hard-nosed masculine attributes of reason and decision making through women's styles of leadership. Both positionings reproduced the essentializing binaries of rationality/care and hierarchy/democracy. Neither stance challenged the mainstream theory or practice because such approaches were readily appropriated as a complementary add-on (Blackmore, 1999a; Marshall *et al.*, 1996).

The linguistic turn toward poststructuralism in the 1990s synchronized with black and postcolonial feminists contesting the dominance of white middle class feminist perspectives in theory and practice (Sleeter, 1993; Tuhiwa-Smith, 1993). Leadership identity formation now came to be understood in terms of multiple subjectivities discursively constituted, in a constant state of formation, being, and becoming (Mirza, 1993; Dillard, 1995). Women leaders were now seen to have agency and be positioned, but also positioning themselves, within a range of discursive constraints and possibilities as educational change was seen to be uneven, unpredictable, irrational, and emotionally charged (Blackmore, 1995; Boler, 1999). This perspective foregrounded, for women leaders, their feelings of contradiction and ambivalence; collapsed false binaries between reason and emotion; recognized how women leaders were positioned in contradictory ways as women and as leaders according to their gender, race, language, ethnicity, and sexuality (Chase, 1995; Blount, 1994; Skrla and Scheurich, 2000); and challenged the authenticity of mainstream theories and knowledge base in educational administration and leadership (Shakeshaft, 1995; Ikpa, 1995; Ortiz and Ortiz, 1995).

Paradoxically, this poststructuralist focus on identity diverted attention from wider historical and materialist analyses at the time that relations between the individual and the state in education with neoliberal restructuring in both Anglophone and developing nation states were being fundamentally transformed (Blackmore, 1999b; Stromquist and Monkman, 2000). Women became the new source of, and resource for, leadership in the neoliberal restructuring of education in the 1990s as teaching became more feminized and casualized internationally (Goldring and Chen, 1994; Court, 1998). Research indicates how women leaders,

particularly feminists, have been ambiguously situated by the new contractualism of marketized and managerialized school systems, producing significant ethical dilemmas as often, but not always, women's preference due to their experience is for more democratic and collegial rather than contractual and entrepreneurial relationships (Chase, 1995; Blackmore, 1999a; Grogan, 1999; Reynolds, 2002; Young, 2003).

The first decade of the twenty-first century now sees schools confronted with multiple demands: greater cultural and linguistic diversity; the changing social relations of gender and families as more women enter paid work; greater extremes of poverty and wealth; increased student mobility with flows of refugees, migrants, and third-culture kids; and the emerging effects of internationalization of schooling on local provision (Grogan, 2002; Blackmore and Sachs, 2004). In particular, the voices of indigenous feminists (Battiste, 2005; Fitzgerald, 2006; Ahnee-Benham, 2003) and marginalized women from religious and linguistic minorities in the Anglophone nation states (Mendez-Morse, 2003; Shah, 2006) are challenging white middle class women and men in leadership to consider the privilege and advantage that accompanies their whiteness. As black, Muslim, or indigenous women leaders, they are expected to not only negotiate the complexity of localized gender, race, and class politics within their cultural groups and communities, but also mediate between cultures transnationally and intranationally (Ngururwutthun and Stewart, 1996). Their alternative histories, epistemologies, and experiences of, and in, educational leadership confront mainstream administrative theory and practice because many claims reach beyond (and before) the nation state, and dominant (recently reinvigorated) scientific paradigms, as well as outside schools and systems as organizations, drawing on community-based activism and social movements (Mendez-Morse, 2003).

Feminist theorists now struggle with how globalization impacts women, educational management, and leadership at the macro level (Stromquist and Monkman, 2000; Blackmore, 1999b), while addressing the ways in which culture, race, gender, and class interplay within local community and organizational politics in terms of who leads, how women lead, and with what effect. Culture, nationhood, citizenship, and religion are being foregrounded within the feminist literature (e.g., Oplatka and Hertz-Lazarowitz, 2006). In this context, feminist research on leadership is best depicted now as a series of interconnected or transnational inquiries with a familial resemblance, articulated differently within particular cultural, historical, and material contexts in terms of the relationship between education, the individual, the state, other social movements, and equity discourses and strategies (Stromquist and Monkman, 2000; Grogan, 2002). The paradox is that as education becomes critical in terms of promoting human rights internationally

along with social justice for girls and women, and for improving individual and collective life chances, there is significant evidence that the number of women in formal leadership in the Anglophone nation states is on the decline.

Reframing Gender and Leadership

Many feminists have argued that the focus on leadership is itself the problem for research, policy, and practice around the issue of gender and leadership. Treating leadership as the solution and equating it to a formal position individualize what is a collective practice. Research evidence and theories of distributive leadership illustrate that effective organizational change in complex network societies and learning organizations requires multiple modes of leadership across multiple sites, in particular teacher leadership. However, regardless of the type of leadership, feminist theories foreground the purpose of leadership as social justice and equity (Grogan, 2002).

Significantly, the issue of gender and leadership is still constructed as a woman's problem. Focusing on women and leadership fails to recognize how educational organizations produce gender identities and are structured by the wider social relations of gender in culturally specific ways (Aailto and Mills, 2002; Oplatka and Hertz-Laraeowitz, 2006). There is little research that problematizes the ongoing dominance of men in educational leadership from the perspective of the new sociology of masculinity (Lingard and Limerick, 1995; Lingard and Douglas, 1999). A relational sociology of gender would question how different masculinities and femininities are produced in relation to each other from a range of subject positions inflected by class, race, and ethnicity, and question the enduring nature of white masculinism.

Furthermore, class and race, as religion and culture, fragment, fracture, and shore up dominant social relations of gender. The critical organizational theory argues that organizational structures, processes, and cultures are socially constructed to advantage some and not others, and are not gender, race or class neutral. Gender, race, and ethnicity are not variables, problems, or issues, but integral in structuring effective leadership and organizations (Hearn and Parkin, 1992; Aailto and Mills, 2000).

The gender and leadership question is symptomatic not only of the lack of diversity in leadership generally with regard to race, class, and culture, but also of the difference in terms of values and politics (Blackmore, 2006). Women gaining a critical mass in school leadership will not necessarily change values and practices. First, women as a group, similar to men, take different political and value stances (Weiner, 1995). Second, it is generally underestimated how context (confluence of political economy, governance, cultural practices, and organizational culture) shapes the conditions of possibility of,

and for, democratic/inclusionary/emancipatory leadership practices. Democratic nations have to consider leadership not only for social justice (Grogan, 1999), but also for diversifying images, practices, and theories of leadership and management. Western education systems currently face increased disengagement of teachers with the principalship not only because of the complexity and overwhelming nature of the job, but also because women, as have men in the past, no longer view teaching as a lifetime career option but more as an episode in their career portfolio with more lucrative and family-friendly career options available. Thus, diversity in leadership requires wider systemic shifts in governance and value systems (Blackmore, 2006). Yet, research and policy continue to focus on women's underrepresentation in leadership, when they should be encouraging diversity in leadership to meet the challenges of democratic, globalized, cosmopolitan societies.

Leadership and Student Voice

Contemporary Thinking and Practice

Earlier Commitments

Educational practices which promote student voice and student leadership are not new: some independent (i.e., nonstate) schools in the early twentieth century developed a view of schooling in which the role of the student was radically re-thought. Despite the diversity of their ideological and political perspectives, the leaders of these schools shared a dislike of what they perceived to be a narrow educational outlook and undemocratic practices in existing schools and they established initiatives to enable students to participate in the collective leadership of the school community and the personal leadership of their own learning. Accounts of their experiences provide a useful reference point for reflection on contemporary thinking and practice.

In these schools, opportunities for students to express their opinions were considered integral to developing leadership skills. The most common arena for the expression of student voice was the school council, parliament, or moot where in some cases, students had an advisory role while in others they had a direct input onto strategic decision making. At Summerhill, perhaps the best known of these schools, every student had the same right to raise agenda items and to vote, as did each member of staff, including the school principal – A. S. Neill himself (Neill, 1992: 16–20). Student voice and student leadership – although not necessarily referred to in those terms – flourished in the protected context of mainly small residential schools with passionately upheld principles and with the autonomy to devise their own curricula. Recently, however, we have witnessed a resurgence of interest in student voice among state schools, despite the strongly performance-oriented climate.

Student Voice and Leadership Today

At one level, the annexing of student voice and student leadership is the outcome of a potentially transformative – or potentially trivializing – bringing together of two high-profile movements in educational policy and research – one supporting student rights and participation and the other exploring new conceptions of leadership, often as a solution to problems of underperforming schools. Some institutions are merely following the fashion in proclaiming

leadership opportunities for students but the small print of definition or description is often unconvincing; in others, it is the outcome of serious reflection on the purpose and possibilities of leadership in a context in which recognition of young people's capacity for insightful commentary and responsible action is central to the contemporary youth agenda. The current positions of leadership and student voice are explained below:

1. *Leadership.* Leadership has recently grown in prominence both as a set of practices and a field of enquiry. Levin (2006: 38) documents its extended remit – the noticeable shift in educational policy from expecting (school) leaders to be effective fiscal, organizational, and political managers to making them accountable for student, staff, and school performance. Mulford (2003: 4) also notes a marked shift from maintenance functions to activities that promote school improvement and explicitly seek to raise standards of achievement. The concept of distributed leadership – leadership that is not located in one person, but can be dispersed within the school (Mulford, 2003: 2), opens the door to the possibility of teacher and student leadership. Maden (2001: 327), in her 5 years on study of schools that appeared to be succeeding against the odds, identifies student participation as one of three crucial conditions for improvement, mentioning in particular the nurturing of leadership opportunities for teachers – and for students.
2. *Student voice.* Student voice has also achieved a high profile although there is an acknowledged gap between rhetorical advocacy and the realities of practice in schools and classrooms. It tends most commonly to take the form of consultation, which is a distinctive feature of the wider move toward greater student participation. The reasons why different groups – governmental and nongovernmental – endorse the idea of consultation and participation vary, but together they appeal to the following:
 - the principle of democracy in school as a way of preparing young people for their role in society;
 - the principle of young people's rights including their rights as members of the school community;
 - the idea that schools need to be more inclusive and to review the status of the student group;
 - concern for students' personal and social development which, it is argued, is nurtured by the respect and confidence that making a contribution and making a difference can bring; and

[†]Deceased

- the possibility of enhanced commitment to learning in that, students can help define a practical agenda for improvement that they themselves could respect and feel some ownership toward.

Although the reasons for supporting the student-voice movement may be different for different groups, all of them contribute to a growing awareness of the importance of listening to young people and strengthening their involvement in the various communities – including the community of the school – that they inhabit.

Different Interpretations

There are two main ways of interpreting the idea of student voice and school leadership and a third which is embryonic. First, it can refer to the ways in which students' voices can inform the understanding of school leaders, both the teacher in the classroom and the teacher(s) responsible, in either a hierarchical or a distributed-leadership model, for the management of the school and the well-being of those who work there.

Second, student voice and school leadership can refer to students' actual experience as leaders within and outside the classroom, whether in relation to their support for their peers or to the development of their own learning.

There is a third interpretation which is not yet well formulated and the examples of good practice which might give it stronger credibility are relatively few: it is about students' learning from experience what is entailed in being members of the school as a democratic working community, where they know that that they can contribute to decision making, and feel that they are sharing in the governance of the school.

All three interpretations demand a radical shift of perspective on the part of both student and nonstudent members of the school, particularly in terms of relationships and in ways of addressing issues of identity and power. Teachers must be ready to recognize young people as expert witnesses in the business of school improvement; and to accept that the traditional power structures of schools need to change in order to reflect new ways of seeing and positioning young people. The three main interpretations are discussed below:

Student Voice and School Leadership

1. *Consulting students: Ways in which students' voices can inform the understanding of classroom teachers.* There is a robust tradition of consultation which was particularly prominent in the 1970s and which continues today where external researchers go into schools, talk to students, write up what they have to say, and make their accounts available through publication. The tradition is an important one: it rests on the analytic expertise of the

professional researcher who must also, of course, be skilful in talking and listening to young people. Although such research provides a legitimate space for students to talk about their learning, there is often no attempt to feed back the outcomes of the enquiry to the students involved and no guarantee that opportunities for students to talk about their experiences as learners will be kept open. Another tradition exists within subject teaching, where consultation claims kinship with constructivist pedagogies and where students' subject knowledge is the main focus.

Giroux (1981: 150) said that what went under the name of educational innovation was often little more than the recycling and repackaging of old ways of doing things; it is important to be clear what is new about the current approach to consultation. Three things stand out:

- students are explicitly invited to comment on frameworks for classroom learning including, for example, teaching strategies and feedback and support systems;
- students have a more consciously analytic stance, knowing that they are contributing to school improvement and that their voices can make a difference; and
- students' expertise as insightful commentators on teaching and learning is recognized and respected.

Students may want to talk about their experiences of learning in a particular lesson or subject and explain what they find engaging, stimulating, satisfying, bewildering, difficult, or off-putting. Teachers may want to learn what students have to say, for instance, about a new teaching strategy or a new way of assessing learning, or the system of incentives and rewards used to motivate students and recognize their progress. Students involved in consultation know that their views are being sought because it is expected that they will have something useful to contribute.

2. *Consulting students: Ways in which students' voices can inform the understanding of school leaders.* Here the focus is not so much on aspects of teaching and learning – unless a school-wide issue has been identified that cannot be appropriately explored through student consultation at classroom level – but instead on aspects of school structures, procedures, regimes, and behaviors.

Student observations may be invited by school leaders or, particularly in schools where student voice and participation are already well established, students may themselves take the initiative in identifying and working on issues that concern them and seeking occasions to present their views/data/recommendations to school managers. In many schools, the student council will routinely offer proposals for action on issues of concern within the school community, and managers may set up task groups of students, possibly with one or more teacher members, to work on such issues.

A willingness on the part of the school principal or senior management team (assuming here a traditional organizational hierarchy) to take serious note of what students have to say and to demonstrate their receptiveness in practical ways, is the foundation of this approach. But student observations can sometimes make for uncomfortable learning for school managers – they tend to say it straight:

The management – they're very isolated from the rest of the school. It's more like there's the school and then there's the management who control the school rather like a business.

Sometimes I feel very much like just a statistic. They just want students to go through with good grades, more for the school's benefit than the students' – to keep the school having a high reputation and stuff.

I think it's easy when you're at somewhere like (school name) to lose you're your identity, just become one of the masses. (Rudduck *et al.*, 2006: 13)

Students as Leaders

In this construction, leadership can mean that students are taking on responsibility for the learning and/or social guidance of some of their peers but it can also be about the serious pursuit and shaping of students' own learning – a responsibility that students in some schools want to, and are being encouraged to, accept for themselves.

Students as leaders: Leadership roles that involve the regulation and/or support of others

Traditionally leadership roles for students have tended to be restricted to those that require them to act as extensions of teachers, whether to monitor conduct (i.e., as prefects) or to support learning (i.e., as reading mentors), or as ambassadors (i.e., talking about the school to outsiders). Recently, possibly as an outcome of the growing interest in student participation, schools have explored different ways of helping students to feel that they have a part to play in the daily running of the school. They may be responsible for displays of student work in different subjects, for designing and carrying out surveys of student opinion (the student-as-researcher role), for planning and leading learning walks so that teachers understand more about the different local environments that students come from, for acting as mediators (usually after receiving some training in conflict resolution). The roles are more about leading people than about leading learning. Students seem to value the chance to do something for the school and also the sense of being trusted; the challenge is to find tasks that are real rather than contrived and to make sure that many students become involved and not just the articulate and virtuous few.

Students as leaders: Leadership roles in relation to students' own learning

Here the concept of leadership is quite different and implies a degree of autonomy and trust that is absent in many classrooms (Rudduck and Flutter, 2000: 84). Brooker and Macdonald (1999: 86) see this form of leadership as requiring students to take a proactive role in the planning, implementing, and evaluating of their own learning. Flecknoe (2004: 406) suggests that student leadership is about young people participating in their own learning and in the organization of their learning context. Mulford (2003: 26) sees students' task, as leaders of their own learning, as being about controlling the learning process, including figuring out what they need to learn, working out as they go what concepts they have not understood, looking for additional information when they do not understand, (and) checking whether they remember what they have learned. The idea of students taking responsibility for their own learning in these ways is not new but is still not convincingly realized in the practice of most schools (Rudduck, 2004: 1).

Students as Co-Leaders in the Governance of the School

This interpretation remains somewhat distant from the current everyday realities of most schools: it may be a utopian vision whose day is coming or it may be a mirage. This, the third way, brings together several strands of thinking: a recognition of young people's maturity and capability; the ideal of partnership between teachers and students; a belief among teachers that students should be able to contribute significantly to decisions that affect the student body; a belief that students should be enabled to understand and critique the organizational and power structures of their school as a community; an acceptance that students have a right to have their voices heard and to ensure, where necessary, that basic community principles, such as inclusion, are respected. The culture of the school would be such that the student body is expected to support and also contribute to the development of democratic practice.

It is essentially about students learning about and exemplifying the principles of citizenship through their experiences in the everyday community of the school. As Hodgkin (1998: 11) argued, democracy is not something which is taught; it is something which is practiced.

There seem to be relatively few concrete examples of school practices in this category and Davies (1999: 39) suggests how tough the democratic agenda is to put into practice: it entails "a continuous political process whereby the operations of the decision making are transparent and open to challenge; whereby all members participate in the organization of the school; whereby rules and laws are consensually drawn up and members agree to abide by

those contractual rules . . . ; and whereby the human rights of all participants are upheld.” Gunter (2001: 129) refers briefly to a school researched by Smyth *et al.* (1998) which may meet the criteria and where, it is claimed, “dialogue about teaching and learning is ongoing and central, where people feel safe to challenge ideas and where teaching as a political process is accepted” (Gunter, 2001: 129). Little seems to be known about how easy it is to sustain such patterns of student involvement.

Impact

There is as yet little reporting of the effects of student leadership on students, teachers, and schools but evidence of the impact of student consultation and participation is reasonably consistent across reports (Davies *et al.*, 2006) and could well be similar in many respects for student leadership. Key outcomes for students appear to be these:

- a stronger sense of membership with students feeling more positive about school and more included in its purposes;
- a stronger sense of respect and self-worth so that students feel positive about themselves;
- a stronger sense of self-as-learner so that students are better able to manage their own learning; and
- a stronger sense of agency so that students see it as worthwhile to contribute to improvements in teaching and learning and wider school matters.

The impact of hearing students talk about aspects of teaching, learning, and schooling can also be considerable for teachers and for the school as an organization. Teachers have said that they gain:

- a more open perception of young people’s capabilities and attitudes;
- the capacity to see the familiar from a different angle;
- a readiness to change in the light of new perceptions;
- a renewed sense of excitement in teaching; and
- a practical agenda for improvement.

The benefits for schools can include the following:

- a basis for self-evaluation;
- an agenda for change that can make a difference;
- a stronger sense of the school as an inclusive learning community; and
- the basis for committing itself to enacting democratic principles in the daily life of the school.

However, such benefits – to students, teachers, and schools – only become fully realized when the process of involving students reflects authentic commitment, when students feel that school and classroom leaders’ interest in what they have to say is genuine, and when both teachers

and students feel that mutual trust is opening up the possibility of a more partnership-oriented way of working together.

Issues

The transformative potential of student voice can, it seems, be considerable but it is often difficult to implement, largely because of the power issues involved; similar issues could well be raised by attempts to introduce opportunities for student leadership. The following issues feature in research reports on student voice.

Inclusivity

A key issue is who is valued and whose voices are heard in the acoustic of the school. In a climate which celebrates high academic achievement, less-successful students can feel marginalized and/or that not much is expected of them. It is not surprising therefore if such students are cautious about believing that opportunities to express a view and to influence decisions are for them. Some predict, from past experience, that teachers only want to listen to or work with those who do well or those who are more articulate in the language of the school. Brice-Heath (2004) argues that many young people who have not participated extensively at home or at school in open discussions or small group conversation and as planners and thinking partners will not be confident in telling their stories or in representing their peers and may therefore miss out. In some circumstances therefore, the consultation process can affirm rather than challenge existing dividing practices in schools and the regimes which lead to some students being valued above others.

Again, where teachers anticipate a negative response from their colleagues to the idea of student voice and student leadership, the only way to build support may be to work with a small group of students and to demonstrate their achievements but this pioneering group can become an elite – and its status is often rooted in competence in talk which may, in turn, be linked to social class.

Uncertainty and Anxiety

Ellsworth (1992: 197) warns against the naivete of acting as if our classroom were a safe space in which democratic dialog was possible. It can take time to build the degree of trust that teachers and students claim is the cornerstone of learning to work together in new ways and there is evidence that both teachers and students new to student voice and student leadership can feel unsure about where the boundaries lie and whether retaliation might follow from getting them wrong. Such anxiety can lead both teachers and students to play it safe – students by saying what they think teachers will want to hear about

their lessons and teachers by finding ways of limiting the agenda of what students can talk about to things that are not professionally or personally threatening for them as teachers.

Credibility

As Fielding and Prieto (2002) warn, students will quickly lose trust in the potential of consultations if their opinion is sought on topics that are only of importance to teachers or that students see as important but which do not lead to change. They added: "We ... regard it as crucial for student perceptions and recommendations to be responded to, not merely treated as minor footnotes in an unaltered adult text" (p. 20). Hart (1997) identifies three forms of inauthentic use of student voice – which might also apply to student leadership. At the bottom of his ladder of participation are three rungs where the process is manipulative, decorative, or tokenistic:

1. *Tokenism*. Children seem to have a voice but have little or no choice in the subject or style of communication and no time to formulate their own opinions.
2. *Decoration*. Children are used to promote a cause but have no involvement in organizing the occasion.
3. *Manipulation*. Adults consciously use children's voices to carry their own message.

If schools are to build open and trusting relationships as a basis for constructive dialog and partnership, then students need, at the very least, to know what is happening as a result of what they have told the visiting researcher or the researching teacher in school: if they have made specific proposals, they need to know what is possible and what is not possible.

Other Issues

In addition to these issues that reflect the deep-rootedness of power-based relationships in schools are four others that deserve mention. First, in a climate where performance is privileged, teachers say that they have difficulty in making space for innovations that do not directly raise standards. Second, in a climate which endorses restless innovation, it is difficult for schools to practice the discipline of ensuring that all their initiatives support the same core values; this can mean that there might, at any one time, be a diversity of initiatives in a school, each reflecting different concerns and values. Third, while there may be a rhetoric of encouragement for student voice and student leadership from the senior management team, the level of practical commitment in terms of resources for effective implementation may remain low. Fourth, while student leadership and voice may appear to have a firm base in the school, they may be contained in designated spaces such as citizenship education or in meetings

of the student council and they may not permeate the everyday exchanges of the school as a community.

Comment

The implications of translating the idea of student voice and student leadership into practice are considerable but the fundamental changes involved are not easily accomplished. As Cook-Sather (2002: 4) makes it clear, "power issues structure the twin challenges to the status quo: '(a) changing the structures in our minds that have rendered us disinclined to elicit and attend to students' voices; (b) changing the structures in educational relationships and institutions that have supported and been supported by this disinclination.'" Orner, taking a similar perspective, urges educators to discard notions of monarchical power and shift to notions of power as productive and present in all contexts' (1992: 83; in Brooker and Macdonald, 1999: 88). These more open notions of power extend the possibilities of leadership and this in turn creates spaces for developing roles for students as expert witnesses and as leaders and co-leaders in matters of school governance and classroom learning. At the moment, however, in this unsettled field, examples of carefully thought-through practices seem to lag behind the urgent patronage of the movement's various supporters. What has been achieved, however, is the placing of the issues firmly on the educational agenda so that teachers, school managers, and researchers can explore forms of leadership that will engage capabilities in young people that often go unrecognized in conventional structures and pedagogies. And, as Smyth (2006: 279) says, we are at last learning to listen to and attend to the voices of the most informed, yet marginalized witnesses of schooling – the students.

Leadership and Urban Education

K A Riley, Institute of Education, University of London, London, UK

© 2010 Elsevier Ltd. All rights reserved.

Introduction

Context and community shape leadership – but no more so in challenging urban localities. The argument presented in this article is that urban school leaders and policymakers need to understand more about the context, challenges, and opportunities of our cities. Given this underlying premise, the first part of the article explores the broad context for urban leadership, highlighting the ways in which our cities can change rapidly, and conceptualizing the challenges of urban education as well as the characteristics of urban schools.

Urban school leaders face the additional leadership challenges of developing insights into the daily lives of children and young people, and finding new ways of connecting to local communities. These challenges emerge because urban communities are very diverse; they change rapidly; and staff in urban schools rarely live locally to be sufficiently aware of these changes in the community.

The second part of the article focuses on the development of systematic ways that can be adapted by school leaders to understand the nature and complexity of local communities and connect this knowledge and understanding with the school's internal community. It offers a tool, which strengthens the school leaders capacity to read and interpret the unique community context of their own schools: the physical characteristics of a locality in terms of housing and transport; the socioeconomic features; issues about race, ethnicity, and cultural diversity; and patterns of mobility and transformation. These historical and contemporary factors influence the social context and the expectations and beliefs that children and their families bring to their educational experience. The article concludes with a brief discussion about how urban school leaders can apply this knowledge to their leadership.

Making Sense of the Big Picture

Cities Today

Cities across the globe attract large and diverse populations. They may be migrants from within their own countries, or immigrants from countries facing social, political, or military upheaval, or seeking new economic opportunities. Many cities are maelstroms, whirlpools of excitement, energy, and risk. They become the focal points of societal struggles for the distribution of resources, epicenters for the

overthrow of accepted social norms, and seed beds for the creation of new ideas. Typically, they also contain conservative forces which may strive to maintain the influence of the elite and the wealthy. The contrasts between rich and poor raise issues about how societies educate the children of the most deprived in close proximity to those of the most advantaged. Given the complexity of cities, it is important that policymakers and school leaders understand the diversity and the mobility.

In the late nineteenth and early twentieth century, rural populations flocked to the industrial cities of Europe or North America, seeking jobs and food. In the twenty-first century, the rural populations of sub-Saharan Africa and East and Southeast Asia congregate in Dakar or Vientiane. Cities today bear first witness to the social transformations of societies acting as the interface between the poor, the aspirational, the established, and the elite. In South America, cities such as San Paulo and Rio have become the melting pots which attract the creative, as well as the displaced. About one in three of the world's urban population now lives on the edges of cities in developing countries, and the urbanization of poverty is on the increase (UN-Habitat, 2005).

Our cities can become transformed, seemingly overnight, as new immigrant groups move in – bringing traditions which can enrich host communities but which can also generate prejudice (see e.g., Winder, 2004) or result in established communities becoming dispersed. In the 1950s, Michael Young and Peter Willmott documented the impact of redevelopment on East London's indigenous communities in Bethnal Green, criticizing planners and policymakers for breaking up families and communities (Willmott and Young, 1957). In the 1960s, Herbert Gans wrote the parallel American story: the decanting of Italian-Americans from their tenement community in Boston's West End, to make way for luxury housing (Gans, 1962).

Regeneration continues apace, raising contemporary but comparable challenges. For example, central parts of the city of Birmingham England are being redeveloped. Established multiracial urban communities are being replaced by the young and upwardly mobile. In 2006, as part of a project on urban leadership (The headteacher was part of an ongoing research and development project Leadership on the Front-Line which is led by Professor Kathryn Riley. See page x and Riley *et al.*, 2004.) UK headteachers and school principals visited an early years' center located at the center of this redevelopment.

Reflecting on the impact of this development (in terms not unfamiliar to Young, Willmott, or Gans) one London headteacher commented:

It's social engineering, ethnic cleansing in a way... What they're doing there is destroying the community. There are generations of families and the daughter's got a house down there... and the daughter's being moved away. And what they've done is they've separated that link. And sometimes those communities need those links. The structure of the family unit – they've destroyed that. And that's going to create social problems.

Yet, urban regeneration also implies a sense of possibilities and opportunities. For example, children and young people in Newham, North London, are enthralled by the rebuilding and development which is part of preparation for the 2012 London Olympic Games.

The contradictions of our cities seem endless: the rich cultural contexts versus the day-to-day challenges of life in the inner city or in social housing estates; the creativity and vibrancy of the children versus the unremitting pressures on our city schools; or the employment attractions of city life for high flyers versus the difficulties which many city schools face in attracting and retaining staff. These contradictions and contrasts not only create major social and economic problems but also provide many positive features to urban life which have implications for the provision of education.

Cities are key economic centers, with diverse economic and employment opportunities. Cities and capital cities in particular, are centers of government, political, and social activity which attract a wide range of organizations and agencies that require proximity to the center of policymaking. Almost invariably, they are a focal point for education and arts. Their ethnic, linguistic, and religious diversity serve to attract a rich range of internal and external migrants who contribute to social, economic, and cultural developments (Riley and West-Burnham, 2004).

Conceptualizing the Challenges of Urban Education

We can conceptualize the educational challenges of our city schools in radically different ways: solely in terms of malfunction and the collapse of school systems, part of a picture of unremitting failure; or in terms of the successes and richness of our city schools, their potential as seed beds of innovation, within contexts that are challenging and ever changing. Our starting point will influence not only what we are looking for from our schools, in terms of aspirations and outcomes, but also the policy options and strategies we choose to adopt.

While many features of urban education are connected to broader educational, social, and economic issues which extend beyond the immediate urban context (see Riley,

1998; Whitty *et al.*, 1998), to a considerable degree, politicians on both sides of the Atlantic have focused on the negative aspects of urban schooling. The policy discourse, particularly in the United States of America, has tended to center on the perpetual crisis of urban education: teacher shortages and cutbacks in services. For some, the term urban has become synonymous with “poverty, non-white violence, narcotics, bad neighbourhoods, an absence of family values, crumbling housing and failing schools” (Kincheloe, 2004: 2). But are these problems due to schools, or due to governments?

Contributors to a review of education in the United States of America (intended for the President, George W. Bush), then argued that government spin has obscured the nature of the crisis of US urban education, projecting it as a failure of public organizations, rather than as a failure of political will (Glickman, 2004). (In an introduction Bill Cosby argues, “I’m assuming that the President of the United States never went to a poor and neglected public school – where books have missing pages, walls having peeling paint, children have nothing to draw or write with, and where there is no library for reading a story doing homework” (Cosby, 2004: xii.) The authors pointed to major discrepancies in funding across schools in America – between those serving the most advantaged and disadvantaged communities – and argued that high-stakes testing and overreliance on marketplace solutions (such as vouchers, incentives, competitions, and privatization), had done little for the most disadvantaged students (Oakes and Lipton, 2004). (They point out that schools serving African American and Latino students typically offer fewer advanced classes, and have more outdated text books, materials, and science laboratories than other schools. Their school buildings are likely to be older and in greater disrepair, and they are far more likely to be crowded, unhealthy, and uncomfortable. Teachers in those schools are more likely to have less experience, to not have their state’s highest teaching credential, or to not have a degree in the subject they teach. In addition, low-income students and students colored are placed disproportionately in low-level programs (Oakes and Lipton, 2004: 188).) While contributors to a parallel review in the United Kingdom (intended for the newly elected Prime Minister of the day, Tony Blair) welcomed increased investment in education from previous Labor Administrations. (They also welcomed major initiatives in child care, such as Sure Start which focuses on the needs of children and their families in the most deprived areas (Wragg, 2005)). They too, raised major issues about equity and the allocation of resources, drawing attention to the relatively low percentage of school resources allocated to tackling social disadvantage. Prof. Tim Brighouse, senior adviser to London Schools, pointed out that Additional Education Needs (AEN) range between 1% and 8% of the total school budget. He proposes

allocating resources to secondary schools in relation to the performance of children (on national tests) on entering the school (Brighouse, 2005).

Defining the Characteristics of Urban Schools

Although there are many distinctive differences between our city schools, there are probably a number of defining characteristics of the educational landscape. Writing about the urban context in the United States, Joe Kincheloe identifies common features such as high population density, areas of profound economic disparity, and higher levels of ethnic, racial, religious, and linguistic diversity (Kincheloe, 2004). The school population of US urban schools is increasingly black and Hispanic (Olmedo, 1997). The American urban-education landscape, Kincheloe argues, is also likely to include schools that are typically larger than elsewhere (which means that students can be overlooked and may find it difficult to develop a sense of identity); school districts which face a concentration of problems; and school boards which “experience factionalized infighting . . . over resources and influence” (Kincheloe, 2004: 6).

A UK review of schools in urban and challenging contexts concluded that while formal definitions were difficult to find, there appeared to be a “myriad of complex and socially related problems” which characterized the schools (Keys *et al.*, 2003: 7). (Despite the complexity and challenges of urban contexts, initial teacher training does little to prepare teachers to work in urban contexts (Ash *et al.*, 2006).) Schools had a range of negative indicators in terms of educational potential and capacity, including high proportions of pupils on free school meals (an indicator of poverty and social disadvantage). Social and economic factors included ill-health, financial pressures, family stress, and poor housing (Ash *et al.*, 2006). Dislocation, social disaffection, high levels of drug and alcohol abuse, and high crime rates are also common community features. There are also school factors such as management, resourcing, and schools’ interactions with their local community which characterize a number of challenging urban schools (Hopkins, 2001; Learmonth and Lowers, 1998).

Nevertheless, the cultural and community diversity of many of our city schools is often a source of great strength. Schools reap the benefits of multiplicity in our societies: the creativity, the energy, and the resilience and exuberance of the children; and the rich cultural understanding and experiences of their parents. However, cultural and community diversity also has many other implications for schools. This is equally true of many urban schools in the United States which have to respond to significant changes in the demographic terrain (Louis, 2003). There are issues about:

- the ability of newly arrived immigrant groups to engage with society;

- the concentration of socially disadvantaged children, and the demands that this creates on resources;
- how to work with an underclass with very low expectations, high levels of disaffection from society, and a dismissive attitude toward learning; and
- poverty and mental health problems, for both pupils and their families, which serve to increase the complexity and nature of the challenges.

Making Sense of the Locality

Having examined the big picture, school leaders need to focus on their particular locality.

As part of the project, Leadership on the Front-Line, we brought together over 60 headteachers and principals from a range of schools in challenging urban contexts across the United Kingdom and Eire – Belfast, Birmingham, Cardiff, Dublin, London (Greenwich, Hammersmith and Fulham, Newham and Tower Hamlets), Londonderry, Liverpool, and Manchester. (The schools are cross-phase (nursery, primary, secondary, and special) and reflect the range of types of schools in urban contexts: denominational, integrated, county, girls, and boys. The development of Leadership on the Front-Line was stimulated by concerns about the gaps in understanding about the challenges of urban schools, and due to a recognition of the importance of developing a more focused community-based approach to leadership.) The schools have been subject to flux, through changes in the policy environment: housing, policing, and regeneration. They are being rebuilt and restructured: their communities can change fast, with a speedy exodus of the upwardly mobile. When the affluent move in, they rarely boost the local state-school population.

While poverty, deprivation, and high incidences of mental ill-health are features of the community context in which these schools are located, there can be contrasts: a school’s population can include children of doctoral students, as well as those of refugees. Some of the urban schools located in inner-city areas have typically been the most deprived parts of our cities; however, a number of schools are also located on the outer rim of cities and serve white working-class communities housed in postwar social housing, areas of high unemployment which may lack good transport or infrastructure.

As part of the project Leadership on the Front-Line we wanted to enable headteachers and school principals to gain greater insights into the local community context of their schools and we asked them to carry out their own local-community audit based on three core questions:

- How do I read my community?
- What is changing?
- What is my role within it?

Using a tool designed for the project, they mapped their school community on four axes: population (stable

or mobile e.g., with refugees and immigrants); community profile (single or multiple communities); levels of engagement (engaged with education or disengaged); and community identity (integrated with a strong community identity, or fragmented with disparate communities). Once participants had undertaken the mapping exercise they were left with a shape which related to their own community context. This exercise generated considerable discussion and helped create a shared language to discuss the complexities of context.

Based on the mapping exercise, we were able to distinguish four types of urban schools, those that serve:

- an inner-city single, relatively homogenous community;
- multiple and diverse communities within a locality;
- an estate community; and
- multiple and diverse communities over an extended area.

Single/Homogenous Communities

The label single or homogenous community covers a range of possibilities. It can mean that the school serves a predominantly white working-class community, or a single ethnic group, for example, Bengali. In Northern Ireland, this community can be Catholic or Protestant. **Figures 1 and 2** illustrate the complexities of the label single community. **Figure 1** depicts the makeup of a school in Londonderry which serves a white Protestant community which, according to the principal, while not necessarily engaged with education, can become engaged with the school.

Figure 2 has many similarities. It depicts a school in Tower Hamlets, London, which draws its pupils from a predominantly Bengali, Muslim community and which has greater mobility than the Londonderry school. While the social and cultural worlds of the two school communities shown in **Figures 1 and 2** are very different, school

leaders in both contexts share the challenge of working with communities which (on the surface) appear to be unified by one culture and set of beliefs but may, nevertheless, contain many differences in views and perceptions.

Multiple Communities

The community context of schools that draw from multiple communities can be complex and subject to rapid change. A headteacher from Greenwich in London described these changes as follows:

From the time I started as the head in 1992 until about three years ago, we had 32% bilingual pupils and about 46% children from minority ethnic groups. And that has now changed. We've gone up to nearly 47% bilingual pupils and sixty something minority ethnic groups.

Relationships within a community can also be subject to significant shifts, as one headteacher from Tower Hamlets in London commented:

It's a community in which, in the 10 years or so that I've been here, has undergone quite significant change. And 10 years ago the tensions were between the Bangladeshi community and the White and Afro-Caribbean community. To a large degree that's changed. Although our school mirrors [the Borough] almost exactly in its ethnic make-up, so we're about 55% Bangladeshi, 30% English, Welsh, Scottish, Irish, 10% Afro-Caribbean and the rest is a mixture of other groups like Turkish, Somali, Vietnamese. . . although that's the case, touch wood, there isn't a great deal of violence among or between the White and the Bangladeshi community. Where the violence tends to be now, quite often, is between different groups of Bangladeshi males and that gang behaviour among young Bangladeshi males is probably one of the most difficult problems facing [the Borough] at the moment. It's one that's impacting on schools to a quite a significant extent.

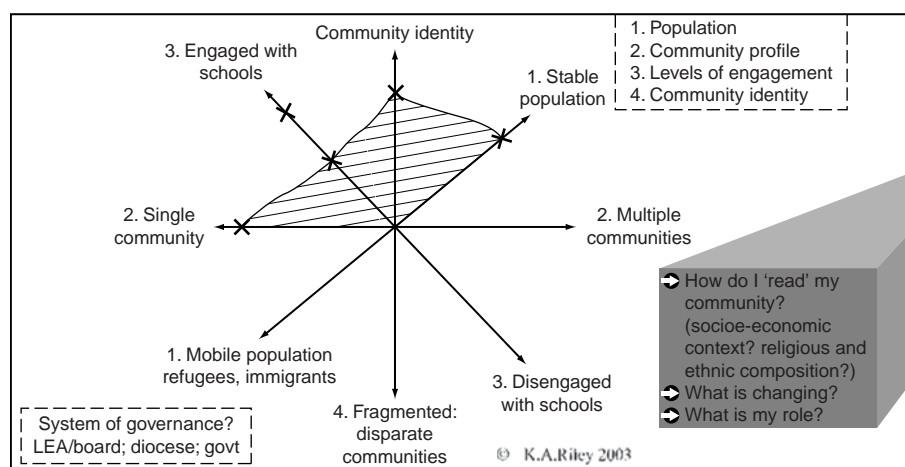

Figure 1 City of Derry school. Single community, predominantly Protestant white working-class.

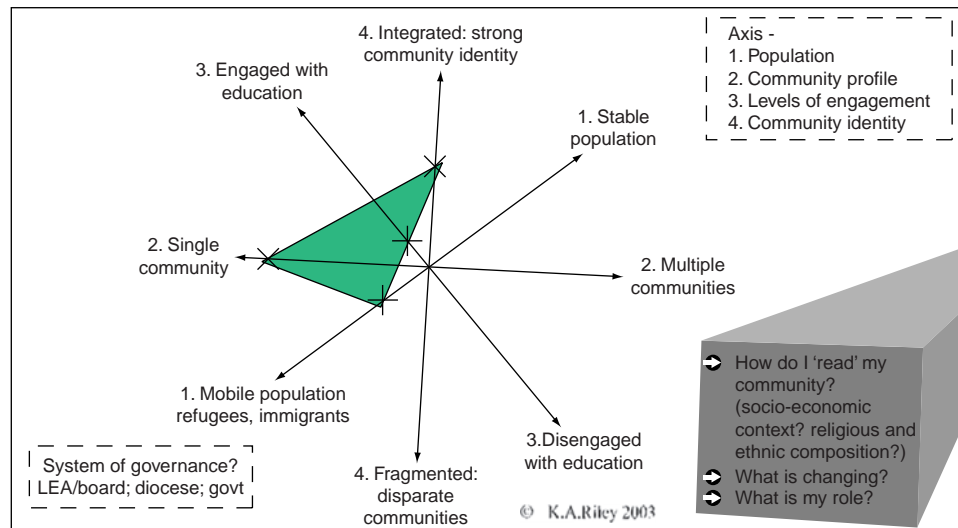

Figure 2 Tower Hamlets School, Phase II. Single community, predominantly Bengali.

Within these varied and multiple communities, some groups may be engaged with education and others not. In the Tower Hamlets, for example, the white working-class families are more likely to be disaffected than immigrant groups, a situation common to other inner-city areas. The Tower Hamlets' headteacher continued her analysis of the context as follows:

...In the white working-class population, often the families have had a negative view of education themselves and they transpose that onto their children and they see that education has done nothing for me, therefore my child doesn't particularly need it. ...And perhaps they live in the past. ...the days when you could leave school on Friday and go to work on a Monday.

The Bangladeshi families ... have a sense that education will somehow give them a way out of this and a value for education, although there is a willingness to try and participate in the educational process, there is a lack of knowledge on how to do that and it's up to us to try and help them to understand the educational process because I think what often happens is, they've had very limited education themselves and what they have had would have been in a very different setting.

In other contexts, whole sections of a community can be struggling (Figure 3), as is described in the following extract from an interview with a Liverpool headteacher:

It's a very dysfunctional community, really I think. It's coming to the bottom of a very deep hole of deprivation, problems with drugs, arms, related crime. A lot of disaffected youth in gangs, children between 10 and 16 or 17 maybe. Causing a lot of problems for the people living here. ... I've been a headteacher here for 9 years, It was a very stable area ... but I've seen it go down and down, possibly due to the

Figure 3 Liverpool School (serving multiple disadvantaged communities). School headteacher's perceptions of the community using the mapping exercise.

housing policy here where housing is being used to decant people who are having difficulties but the effect has been to move people out of this area who were very stable. Into that mix, I think, comes a lot of people just recently, asylum seeking families, who are having quite a lot of difficulty here.

It's quite a racist area, but there is a lot of short-term housing here. So currently in the school, I think, it's 19% of the children are from asylum seeking families. The mobility rate here is 41% – it's very high. ... There are 17 different languages amongst that group, but what we're finding is that people are coming in and going out, some of them because economically, they are moving around the area. That tends to be Czech Roma families, but there are other families who really are finding it very difficult to come to terms with the aggression.

Estate Schools

Estate schools are another facet of urban schooling. Typically, they serve communities that have moved from traditional inner-city areas. This can be through major post-World War II re-housing (as in the cases of Manchester's Wythenshawe Estate, or Cardiff's Ely Estate), or through re-housing related to sectarian violence, as in the case of Belfast, described below:

The school originally would have served the area of T which was a new housing estate developed in the 60s and, at that time, it was an area basically that was to house people who had been burnt out, frightened out of their original area, and certainly during the 70s it was a very fragmented community because there was no ownership, no community feel, as well as that there was no infrastructure shopping centre. So people at that time . . . were very poorly served and it was also on the outskirts of West Belfast. It's now a more settled environment The area would be in the top 10% of wards with multi-deprivation and the social/economic deprivation is severe. Within the school itself, which is the only secondary school in this particular area, although there are quite a number of schools which people can gravitate to. . . . There is over 70% free school meals.

Across all of the cities involved in Leadership on the Front-Line, there are remarkable similarities between the ways in which school leaders of the estate schools have depicted their schools. **Figure 4** depicts a typical drawing. This particular school is located in Cardiff.

The Cardiff headteacher responsible for **Figure 4** described the context of the school in the following terms:

It takes its catchment from one indigenous location; it's predominantly an estate, so it's fairly homogenous . . . predominantly white. There's a strong identity of all

the pupils with this area geographically. . . . There are sections of the community who create difficulties. The school's playing fields were littered with burnt out cars and there was damage done to the building. . .

A Manchester headteacher described the estate community served by his school as follows:

It's 52% free school meals. We serve the poorest, officially the most socially deprived ward in England. . . . So we've got severe urban poverty. . . . but in terms of cleverness, we actually do get some of our brightest children from x (the most deprived ward). They really, really are bright kids. In terms of the estate, its 70,000 housing units.

If you want to talk about an inverted snobbery form of evaluating how tough the context is here . . one of our ex-students was murdered. He left school two years ago last summer and we had his friend who was shot dead just before Christmas. . . One of our parents was killed in a motorcycle accident. So there seems to be lots of deaths in the area. For the last 4 years, every summer I've gone to a funeral, to do with our children.

The crime rate is high, there is a drugs problem, but we do have squirrels on the ground, we do have our own pond. But it is a tough community. It is white working-class, we have about 1% from different ethnic groups, very few, less than 10% but it is on the increase, because they're pulling down flats and building start-up homes. . .

Multiple Communities over an Extended Area

Each of these three types of community discussed so far (i.e., single; multiple or diverse; and estate) has its own distinctive challenges. However, schools without obvious and immediate communities, and which serve a wide

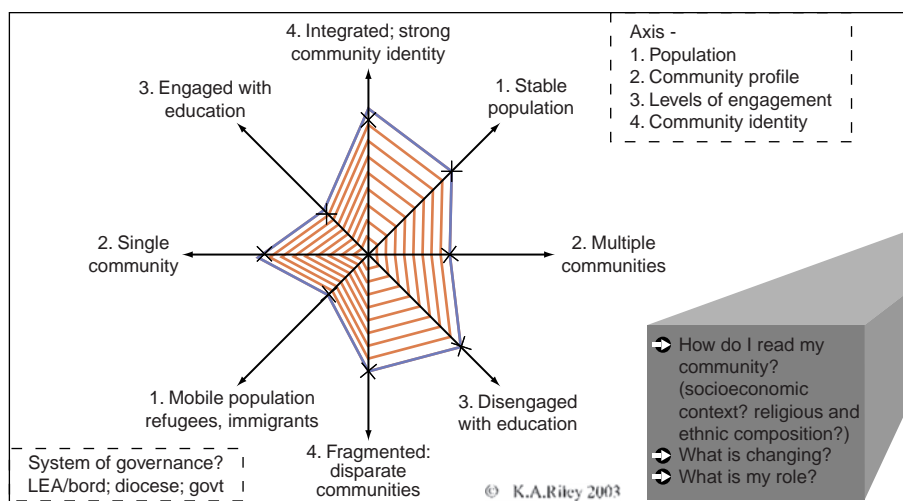

Figure 4 Estate School, Cardiff (serving relatively stable population).

catchment area face a different set of challenges. In the following extract, a Birmingham headteacher describes the complexity of the community context of his school:

We are the first step out as receivers of the urban doughnut so whilst we're in lovely grounds and Mosley which is near by, is one of the more affluent pleasant bits of central Birmingham. 70% of our pupils come from the top 2% areas of deprivation across the European community. . . . 76% of our pupils are in the poorest quintile of society by multiple deprivation figures. . . . We have an incredible diversity in terms of economic background, class. I have the son of a member of the House of Lords, and a government minister and I have 35% Muslim community predominantly Pakistanis but some Bengali. . . . Generally, Muslim families come from backgrounds of very low literacy levels and with a deficit starting point. We have some very needy white working-class families. . . . Significantly, the families come from very different areas so we have an official catchment area of 3.2 km which for a dense urban area is quite big but actually we have quite a lot of youngsters who come from outside that circle. . . . and so there is a lack of identity on our campus.

What Do You Do with What You Know?

So far in this article, the broad urban context as well as the ways in which urban localities can vary have been explored. Having taken stock of their community context – the challenges and the opportunities – what options are then available to school leaders? There appear to be at least three possible responses (Riley and Stoll, 2005). (See Riley (2008) for a more detailed account of how school leaders can draw on children's knowledge and experience to develop connections between schools and communities and create shared beliefs about what can be achieved for, and by, the young people of our cities):

- *Response 1: evade.* Here, the school leader attempts to weaken the links between the school and its immediate catchment area which is seen to be too problematic. The leadership strategy is directed toward attracting more middle-class pupils into the school to help push up test scores. This is not an uncommon response and can have some benefits to the local children remaining in the school, but not to those denied access.
- *Response 2: ignore.* The school leader attempts to insulate the school from the community. There are probably two versions of this approach. The first is the fortress model – an approach favored by some secondary and high schools and designed to keep the local community at bay. The second is the bubble model – a favorite for those working with younger children and designed to

protect them from malign influences. Both models are motivated by worthy intents – to provide children and young people with space, opportunities, and safety. Both models have their success stories but there are also downsides. Children can feel torn between two cultures and communities which never meet.

- *Response 3: engage.* Here the school leader attempts to reach out to understand the complexities of community and bring the school and the community into closer alignment. This notion of alignment is an important one. It implies developing an understanding and reaching an agreement, based on trust and mutual respect, about how schools and communities will work together. This can be a complex undertaking in pluralist and multi-racial societies and school leaders can find themselves mediating with the community on faith, cultural, and value issues. A school's cultural beliefs and expectations may be at odds, not only with those of newly immigrant communities but also with long-established communities.

Urban school leaders have to grapple with issues and pressures which may confront other schools and communities in future years. What school leaders in challenging contexts have to know and be able to do now is what their counterparts (in less pressing contexts) will have to contend with in future years.

What we have learned from the project Leadership on the Front-Line is that successful urban leadership is about passion, beliefs, and possibilities. It is about building connections between schools and communities, and creating some shared beliefs about what can be achieved for and by children and young people. Where communities are dispersed, complex, and fragmented, the leadership challenge is to create and recreate community within the school by bringing young people to work together to appreciate the richness and diversity of each others' lives.

Providing school leaders with approaches that will develop their capacity to understand their local community better, and to work together with that community more effectively, can unleash their creativity and potential. It is not a burden for school leaders but something that can be extremely beneficial. It supports their leadership in contexts that are both challenging and rewarding and enables them to reap the rewards, as one leader, who involved rewarding in the project Leadership on the Front-Line concluded:

Being an urban school leader is like being on a roller coaster. It can be full of highs and lows. It is full of teamwork and feels very supportive. The sense of volatility and the unexpected is addictive. Understanding more about the local area and learning to listen to what pupils have to tell us about their lives has given my leadership an enormous boost. It has given me a clearer focus about how to work with communities.

Leadership for Learning

J MacBeath, University of Cambridge, Cambridge, UK

© 2010 Elsevier Ltd. All rights reserved.

In the last decade leadership for learning has become commonplace within the educational discourse, yet has been accompanied by little empirical research able to identify what that phrase means either in theoretical terms or in day-to-day school practice. It is perhaps taken simply as self-evident that in an educational milieu this is what leadership is for and is what leaders do. Yet, the connections remain problematic and largely untheorized.

The first systematic attempts to gather data came from researchers working within a school effectiveness paradigm (Brookover, 1979; Mortimore *et al.*, 1988), seeking to identify characteristics that distinguished more-effective from less-effective schools. The proxy measure for learning employed was value-added student attainment aggregated to whole school level, while the proxy for leadership tended to refer to the qualities or behaviors of principal or senior school leaders.

Within this genre one of the most frequently quoted studies is that by Sammons *et al.* (1994), who conducted a meta-analysis of two decades of research, identifying 11 characteristics of more-effective schools. The first of these was professional leadership. This, however, left a great deal unsaid as to the nature of leadership, nor did it (located as it was within a positivist effectiveness paradigm) problematize the nature of learning. As these studies worked within a correlational framework, the connecting tissue between leading and learning remained largely unexplored.

The challenge taken up by researchers in the leadership field was to try to get closer to an understanding of forms of leadership that are most likely to contribute to student learning. Following in the effectiveness tradition, student outcomes were taken as the proxy measure for learning, while leadership was approached through qualitative exploration of what people in positions of leadership actually did or said that they did. Successive studies by Leithwood and colleagues (Leithwood and Riehl, 2003; Leithwood *et al.*, 2004; Leithwood and Jantzi, 1999) identified clusters of leadership practices which were associated with raised student achievement, such as setting directions, developing people, creating strong collaborative communities in school, nurturing the development of educational cultures, redesigning the organization, and building powerful forms of teaching and learning. These effects were described as indirect, or mediated. That is, raised achievement was explained by good teaching, which was in turn made possible by a climate of support and continuing professional development.

In Australia, Mulford's research (Mulford and Silins, 2003; Silins *et al.*, 2002) also identified indirect effects, or intervening variables, describing practices very similar to those found in Canadian and American studies, for example, collaborative climate, shared and monitored mission, and initiative and risk taking supported by appropriate professional development.

These professional cultures were associated with transformational leaders who sought to create conditions within which others would become more committed and motivated to work toward the improvement of the school. This model of leadership, it is argued (e.g., Mulford and Silins, 2003), does not address the principal's responsibility for managing the technical core of the school (teaching and learning). Instead, it is assumed that the principal is empowering others (e.g., teacher leaders and administrators) who directly manage these classroom-based processes (Hallinger, 2003). "You cannot empower people," argue Binney and Williams (1997) but one can, they suggest, create conditions in which people feel empowered to take ownership and initiative.

Underpinning much of the literature on mediation is the assumption that student learning, or more specifically enhanced outcomes, is the singular end purpose of effective leadership. In other words, mediation, as the term suggests, is simply instrumental to the primary goal (the technical core) of student achievement.

This brings sharply into the foreground the nature of learning and the question "Who is learning for?" Knapp *et al.* (2003) offer a tripartite model of learning, referred to as the wedding cake because of its layering of interconnected forms of learning (**Figure 1**).

In this model, student learning is not the singular purpose of schooling. While it is nourished through the iterative process of professional and system learning, these are not simply means to an end but ends in themselves. Indeed, it is argued that professional learning vouchsafes a longer term educational future than by focusing on the achievement of any single cohort of students. A system that is able to go on learning is one that can serve and sustain a much wider constituency of stakeholders.

In Wenger's (1998) conception of communities of practice, the emphasis is on the interchange of craft and professional skill and knowledge, enhancing teacher learning, and building systemic capacity. Capacity is a key idea in theories of organizational learning, the primary goal being the cultivation of a continuing search for

Figure 1 The Learning Wedding Cake.

understanding and meaning, whether in a business enterprise (Senge, 1990), a public agency, or a school (Hargreaves, 2003; 1995). An organization committed to learning is one which challenges its own premises, its structural conventions, its curriculum rationale, and the very nature of learning itself. Argyris and Schön (1978) describe a process of double-loop learning, a form of conceptual escape from the single loop of planning, implementation, and evaluation into a more reflective and self-critical cycle.

Organizational learning is a slippery concept, and difficult to realize within an education policy context counsel. Silins *et al.* (2002) arguing that an organization cannot learn and suggested that it is people who learn. However, the case for sustainability rests on a belief that in a learning organization people build structures and create cultures which prevail beyond the lives of the individuals who created them. Hargreaves (2006) goes on to argue that a preeminent task of leadership is to recognize one's own mortality and to invest in succession planning for a future in which one will personally play no part. Working counter to that ethic, however, is the tendency for a new principal to wish to leave his or her own deep imprint on the school, yet in the process potentially disempowering and disabling the organization. Senge (1990) categorizes a number of organizational learning disabilities among which he cites "I am my position," that is, a disabling of agency by reference to status and institutional authority as encapsulating leadership. The fallibility of heroic and charismatic leadership is documented in a military context by Dixon (1994) who categorized 15 incompetences, all of which are antithetical to individual, group, or organizational leadership for learning and have been found to be applicable in both a business and school context (MacBeath, 2006).

This stream of literature with its focus on systemic and hegemonic factors invites us to revisit conceptions of both leadership and learning and to reconsider whether

researchers may be starting from two false premises – on the one hand, equating leadership with those at the apex of the organizational pyramid (Murphy and Forsyth, 1999) and, on the other, equating learning with what students achieve through the relatively crude measures of school-administered tests (Fielding, 2001).

Leadership for Learning as Distributed

In the last half decade, distributed leadership is a concept that has been much written about although relatively little researched. It pushes the locus of leadership beyond principals, and senior managers, extending leadership roles (Spillane, 2006) to middle management and to teachers both as individuals and groups – Gronn (2003) characterizes this as the additive conception of distribution. It is a formal and essentially hierarchical form of distribution in which leadership is handed out by those in senior positions of responsibility to people in given roles, clearly defined and bounded by individual responsibility and accountability. By contrast, holistic distribution looks for a synergy arising through concertive action, stretching leadership function across the social and situational contexts of the school (Gronn, 2003). In other words, rather than defining leadership by reference to where people are located in the hierarchy, team leadership is essentially different. Rather than downward delegation to specific individuals (Katzenbach and Smith, 2003), it celebrates individual differences and sees these as fostering collective strengths. In a similar vein, Mulford and Silins (2003) argue that distribution is concerned with achieving the right dynamics among people, developing social trust, an essential precondition for development and learning for change.

Teacher Leadership for Learning

Literature on teacher leadership comes at the issue from both an additive and a holistic perspective. In 1986, a seminal document titled *A Nation Prepared: Teachers for the Twenty-First Century* argued that curriculum leadership should lie with those closest to student learning and that the real power to improve achievement lay with teachers, who should be entrusted with new responsibility and accountability for change. While the empowerment of teachers, together with an emphasis on accountability, may be seen as something of a double-edged sword, it is also one which positions teachers as leading and shaping the purpose of learning in a new millennium.

The holistic perspective, as represented by Lieberman and Miller (2004), posits a major transformational shift in respect of three interrelated strands: first, a shift from individualism to professional community; second, a shift from teaching at the center to learning at the center; and,

third, a shift from technical and managed work to inquiry and leadership. Taken together, these represent a pendulum swing from prescription of curriculum to capacity building of teachers, construing teachers as members of professional communities and assuming collective leadership which is learning centered. In Mitchell and Sackney's (2000) description of learning teams, they are initiators in discussion of "tough problems and deep mysteries of teaching and learning."

This unrealized capacity is referred to by Katzenmeyer and Moller (1996) as a sleeping giant, because both leadership and learning potential lie dormant, constrained by inert ideas (Whitehead, 1929) and by the inertia of traditional structures. Mindset and structures are, to an extent inseparable, an example of which is cited by Frost (2005) who describes conventional approaches to professional development as being provided for, or done to, teachers rather than teachers as the prime movers.

If teachers do not see themselves as prime movers, as leaders of learning, in their school and not just their classrooms, it may be due to deeply institutionalized conceptions of upward accountability. An alternative narrative proposes lateral accountability (Fullan, 2001), which comes through teachers focusing collectively on student learning with discussion and planning of what it will take to get there. The induction of new members into such a learning community allows opportunities for rehearsing new roles and taking risks in a community of support and assistance (Lieberman and Miller, 2004). Leadership is open to even the neophyte who may bring in new, perhaps naive but fresh, perspectives to the organization he or she is joining.

Without such opportunities, teaching may become a lonely and disempowering activity. For new entrants to the profession from industry, Johnson (2005) found that they brought with them an expectation of teamwork, seeking opportunities for expanded influence, and sharing leadership responsibility, as they were accustomed to in their previous settings. Yet, they found themselves working in isolated classrooms, robbed of the initiative and latitude of decision making they had previously enjoyed. As Elmore (2003: 18) argues, "these environments can operate to pull the organization toward higher levels of collective action and higher levels of student learning, or they can operate to pull schools apart into highly variable and weak learning environments." This stress on synergetic properties of leadership for learning is echoed in the work of Spillane *et al.* (2001), in which collective cognitive properties of a group working together to enact a particular task, forge out of their work a leadership practice greater than the sum of each individual's practice. "Consequently, to understand the knowledge needed for leadership practice in such situations, one has to move beyond an analysis of individual knowledge and consider what these leaders know and do together" (Spillane *et al.*, 2001: 12).

Student Leadership for Learning

Students are the largest untapped knowledge source in a school, writes SooHoo (1993: 23) "the treasure in our very own backyard," arguing that a school which overlooks that intelligence source is inevitably poorer as a consequence. Historically, students have been the last to be consulted about school quality and effectiveness, the last to be commentators on learning, and the last to assume leadership roles; yet, as a developing literature attests, they may get closest to the heartbeat of the school (Fielding, 2004).

Jorgensen's (2004) ladder of participation offers a practical framework for identifying how student voice and leadership are conceptualized and operationalized within a school. The six rungs of the ladder represent a hierarchy of participation from the lowest level – adults decide and inform students – to the highest level – students decide and adults support. The intermediate rungs ascend in turn from adults use students as decoration (a ritualistic illusion of participation); adults consult, then decide on their own premises; adults decide and take students' views into account; and students decide together. As Fielding and Rudduck (2002) comment, it is a strategy of the fearful to limit student involvement to aspects of school life which are seen as relatively safe or which do not have significant impact on the work of adults in the school. However, each rung may be seen as a successive stage in the maturing of a learning school in which thought is given to the nature of tasks or opportunities which might fall into any one of those six categories. In English primary and secondary schools, it is increasingly common for students to be involved in the interviewing of new staff, to conducting classroom observation, taking a lead in evaluation, as well as in the design and refurbishment of playgrounds, toilets, common rooms, and classrooms. In recent years, it has been increasingly recognized that they have an important contribution to make in evaluating the quality of teaching and learning (MacBeath and Sugimine, 2002).

Such learning and leadership opportunities often reflect Gronn's additive model, a trickle-down conception of leadership, casting students within a respondent or consultative frame, their place clearly demarcated as the lowest rung in the organizational hierarchy with ritual occasions in which their viewpoint may be heard.

Hearing what pupils have to say about teaching, learning and schooling enables teachers to look at things from the pupil perspective – and the world of school can look very different from this angle (Rudduck and Flutter, 2004).

In the holistic model, however, the roles of student, teacher, and senior leader are less neatly circumscribed. There will be occasions when students teach and teachers learn (exploring the scope and potential of information and communication technology (ICT) is an obvious example), times when teachers lead and senior leaders

follow (e.g., around issues of pedagogy), and occasions when there is collective enterprise as, for example, when schools are engaged in projects, productions, community activities, school trips, or residential experiences. Musical and sporting events are often viewed as peripheral extra-curricular activities but are potentially rich in opportunities for student leadership, for new ways of learning and leadership for learning (MacBeath *et al.*, 2001). Collective enterprise of this nature can build social capital founded on establishing trust and mutual respect rather than deference and knowing one's place.

Social capital flows from the endowment of mutually respecting and trusting relationships, which enable a group to pursue its shared goals more effectively than would otherwise be possible. . . It can never be reduced to the mere possession or attribute of an individual. It results from the communicative capacity of a group (Szreter, 2004: 575).

Leadership for Learning, Without Limits

The more leadership for learning is conceptually, and in practice, locked within the black box of the schools, the greater the limitations it places on learning and leading for learning. Not only does most of learning occur outside of the school walls, in family and community (Epstein, 1999; Weiss and Fine, 2000; Castells, 2000), but many young people and teachers are leaders in other out-of-school contexts, in families and extended families, in clubs and sporting activities, in uniformed organizations, such as Guiding and Scouting, and in the gray economy, through gangs and entrepreneurial activities which offer routes back into society through the backdoor, what Castells (2000) refers to as perverse integration.

A recent 3-year study in England of schools in exceptionally challenging circumstances (MacBeath *et al.*, 2006) found that despite heavy government investment and support to turn these schools round, it was the impact of what happened outside of schools that explained rises in student achievement over a 3-year period. The most successful leadership was in schools that built strong community links and invested in interagency collaboration, seizing opportunities for sharing leadership with voluntary community and social workers.

In these schools on the edge, leadership for learning was outward looking, to parents, community, to public opinion, to media influence, and to local and national policy. It raises the question of how far does the responsibility of school leaders extend? Should school leaders have a core role in ensuring young people and their families value what is really important in life? As defining and shaping public opinion and public expectations as to the nature of learning, effects, and outcomes of schooling? For some (Starratt, 1998; Carmichael *et al.*, 2006) this

wider impact is considered to be one of the key tasks and moral responsibilities of school leadership.

A 3-year study in England for the Economic Social and Research Council (ESRC) (James *et al.*, 2006) was able to show that individuals, who had a role in external initiatives, were able to create links through their own personal and social networks outside the school. These intensional networks were not *ad hoc* but created, managed, and sustained deliberately. One conclusion of the research was that effective leaders found ways of creating opportunities for staff to create and exploit those intensional networks, supplementing those of the senior leadership team. "We know from the literature," conclude Carmichael *et al.* (2006) "that these different kinds of links, networks, and network roles are important in knowledge creation and sharing."

Leadership for Learning in International Perspective

Issues of leadership at student, teacher, organizational, and system level were the focus of a 3-year international project (MacBeath, 2006), seeking to explore what leadership for learning meant to schools in eight different sites in seven countries. What became immediately apparent from the outset was that of all of the three words contained in that short phrase – leadership, learning, and "for" were understood very differently in the 24 schools from eight world cities – Athens, Brisbane, Copenhagen, Innsbruck, London, Oslo, Seattle, and Trenton (New Jersey).

There was, for example, no English equivalent to the Germanic concept of *Bildung* or the Danish concept of *Dannelse*, the latter broadly equivalent to the conditions which help children to become citizens in a democratic society, a notion deeply embedded in a Nordic culture. American terminology of instruction and instructional leadership proved problematic not only to non-English speakers but to English and Australian participants as well. For the Austrians, translations of leader and leadership (*Fubrer* and *Fubrung*) were ideas off-limit, while the Danes and Norwegians shared an antipathy to conceptions of individualistic, or heroic, leadership. Working through these differing perspectives to forge a common vocabulary and shared understanding, led to a set of principles, tested by teacher and students in the daily round of school and classroom life and progressively reframed over the last 2 years of the project.

Five Principles of Leadership for Learning

The five principles which have been elaborated elsewhere (MacBeath, 2006) not only arose from grounded work with schools, but also owed much to theoretical work discussed above. A focus on learning was the first and

guiding principle, framed as a process of continuing exploration and deepening understanding as to what learning is most worth, how it plays out in practice, and who the learners are. This main principle was elaborated in a set of subprinciples emphasizing that everyone can be a learner, that the effective interplay of emotional, social, and cognitive processes is highly sensitive to context and to the differing ways in which people learn, and that the capacity for leadership arises out of powerful learning experiences.

The second principle was framed in terms of leadership for learning as creating and sustaining conditions favorable to learning as an activity in which the culture of the school nurtures the learning of all its members; creates physical and social spaces that stimulate and celebrate learning, enabling everyone to take risks, cope with failure, and respond positively to challenges; and developing tools and strategies which enhance thinking about learning and the practice of teaching.

The third principle emphasizes the role played by dialog – the process by which learning and leadership are made explicit, discussable, and transferable, not only conceptually but also in practical application. Collegial inquiry focuses on the link between learning and leadership, addressing factors which inhibit and promote learning, celebrating the differing perspectives that arise through networking with researchers and practitioners across national and cultural boundaries.

The fourth leadership for learning principle practice involves the sharing of leadership by creating structures which invite participation, encouraging all members of the school community to take the lead as appropriate to task and context; drawing on the experience and expertise of staff, students, and parents as resources and promoting collaborative patterns of work and activity across boundaries of subject, role, and status.

The fifth principle holds that leadership for learning implies accountability by taking account of political realities and exercising informed choice as to how the school tells its own story to external audiences. This is founded on developing a shared approach to internal accountability as a precondition of accountability to external agencies, maintaining a focus on evidence and its congruence with the core values of the school; reframing policy and practice when they conflict with core values; embedding a systematic approach to self-evaluation at classroom, school, and community levels and maintaining a continuing focus on sustainability, succession, and leaving a legacy.

The Policy Imperative

The common strand across all five principles is a sense of agency. It is agency that connects leaders and learners and leading and learning as activities. The further school

leaders progressed in their shared understanding of agency as the connecting tissue between leadership and learning, the more acutely it brought to the surface the dilemmas facing practitioners, directly in the line of fire of social and political forces that placed sharply defined limits on their freedom to act according to their professional judgment or conviction. While the degree of constriction of movement differs considerably from one country context to another, as Giddens' (1984) has argued in his theory of action, structures can be modified by the agency of individuals if there is a will, a source of support, and a commitment to a set of uncompromised values.

Both leadership and learning are social activities, in schools rich in opportunities for reflection and celebration and in which learning dispositions and behavior are modeled, made visible, and internalized. This is the hallmark of a learning community (Mitchell and Sackney, 2000) in which there is a transparent openness to learning of all its members and which is accessible from the behaviors and intelligences of people with whom we share and create ideas, who lead, and who follow. Dialog (meaning flow through it; Bohm, 1983) is something qualitatively different from conversation, discussion, and debate. It is a big idea and hard to achieve in a school environment in which deep listening is not commonplace and in which there has traditionally been a low level of tolerance for dissent. In a school devoid of dialog, Elmore argues:

The transfer of agency from teacher to student is minimal because the nature of the task locates the knowledge with the teacher and the obligation to learn with the student—knowledge is transferred, agency over learning is not (Elmore, 2003: 8).

Leadership for learning, with the added edge of international dialog, challenges the assumptions that are brought to how and what we see and the judgments we bring to it. Czarniawska coins the term *outsidedness* to denote a form of knowing – by difference rather than by similarity.

It aims at understanding not by identification ('they are like us') but by the recognition of differences – 'we are different from them and they are different from us; by exploring these differences we will understand ourselves better' (Czarniawska, 1997: 62).

Self-evaluation is the process by which schools make their the intellectual and moral journey, measuring the distance they have traveled not in the simplistic trajectory of aggregated attainment scores, summative tools that say little about deep learning. The tools of authentic, professionally driven self-evaluation, by contrast, are set in a social context. They encourage dialog; serve a primarily formative purpose; are congenial, flexible, and adaptable to new situations and new challenges; are not restricted to what happens in classrooms or to students' learning; apply

to teacher and organizational learning; measure how teachers are progressing in their thinking and practice and how the school is developing as a community of learners; and they relish accountability because it is the platform for telling a story rooted in evidence of the most profound kind.

Leadership in Diverse Cultures

A Walker and P K Yu-kwong, Hong Kong Institute of Education, Hong Kong SAR, People's Republic of China

Introduction

Successful schools, regardless of their location or situation, require good leadership and management. What this entails, and indeed what it looks like, however, differs in important ways across and between different societies and cultures. Awareness that leadership may be conceptualized differently in diverse contexts has prompted calls for more explicit analysis of educational leadership using wider, less restrictive lenses, such as societal culture (Bajunid, 1996; Cheng, 1995a; Dimmock and Walker, 1998a; Hallinger and Leithwood, 1996). Leadership in diverse cultures is taken here to refer to leading in cultures outside Anglo-American societies where the vast majority of widely articulated and disseminated leadership theory emanates. Focusing on diversity between societies does not imply that diverse cultures do not also reside within societies, and indeed schools. Although this article does not delve into leadership within national intercultural settings, it may contribute messages for leaders in such circumstances (Walker and Chen, in press).

The worth of investigating leadership in diverse cultures rests on at least three basic, interrelated assumptions. The first is that leadership makes a difference in schools, even as we remain unsure of exactly how this works. This assumption is founded on international literature that confirms the centrality of school leadership to school improvement and quality schooling; and that it most effectively influences school outcomes indirectly through multiple variables (Hallinger and Heck, 1999; Leithwood *et al.*, 2006; Southworth, 2005). It is also now widely accepted that how leaders make a difference is contingent upon the context within which they lead. The second assumption therefore is that multiple contexts influence how school leaders lead. In other words, what leaders do is mediated and moderated by both their personal internal states as well as the organizational and external milieu of the school (Leithwood *et al.*, 2006; Cheung and Walker, 2006). This context is not only complex, but is also constantly shifting and evolving in response to factors such as personality, ethnicity, gender, politics, history, economics, and culture (Rizvi, 1997). The interplay between these value sets plays out in an assortment of forms in schools as leaders attempt to make sense of what is needed (Bottery, 2004).

Third, given that leadership is centrally concerned with the interpretation and enactment of values, it is reasonable to assume that one influential contextual factor on how

leadership is conceptualized and exercised is the cultural values, norms, and beliefs which help to define the group or society within which they live and work. Although a contested construct, culture can be broadly defined as patterns of shared values, beliefs, and norms held by a particular group and/or society which combine in various ways to influence behavior and action. An acceptance that culture matters, however, as with leader effects, still leaves us unsure just how much it matters – this will probably never be definitively resolved. However, the bottom line appears to be that even though cultural values exist within a complex and vibrant globalizing context, they continue to exert a strong influence on people's lives (House *et al.*, 2004). As such, they form a key element of the environment within which leaders lead and on how they lead. As Dorfman *et al.* state:

While we acknowledge that global communication, technical innovation and industrialisation can create a milieu for cultural change, a convergence among cultural values is by no means assured. In fact, cultural differences among societies may be exacerbated as they adapt to modernisation while simultaneously striving to preserve their cultural heritage. (Dorfman *et al.*, 2004: 709)

Growing Interest in Leadership in Diverse Cultures

Interest in educational leadership across diverse societal contexts has until recently been of peripheral interest only to scholars in the field. The majority of available literature on school leadership relates to the social and organizational structures and values prevalent in Western English-speaking societies. This often fails to adequately recognize that these structures and cultures can look very different across systems and societies. With some exceptions, the same has been true of international studies in both school effectiveness (Teddie and Reynolds, 2000) and school improvement (Reynolds, 2000).

Over the last decade or so researchers shifted some attention to leadership in diverse international settings and cultures (e.g., Beare and Boyd, 1993). This interest has been prompted partly by the heightened visibility of large-scale international comparative studies, such as Program for International Student Assessment (PISA) (Ho, 2006) and Trends in International Mathematics and Science Study (TIMSS) (Baker and LeTendre, 2005), acknowledgement

that good leadership is essential if schools are to improve, regardless of their context, the increasing diverse makeup of Western societies themselves and the vast expansion of electronic, written, and physical access to diverse knowledge.

Investigation has taken a number of forms and traversed various national and cultural terrains. For example, scholars have argued broadly and persuasively for recognition of indigenous approaches to educational administration (Hallinger and Leithwood, 1996), the synthesis of Western with indigenous understandings (Sapre, 2000), the dangers of simplistic knowledge transfer across cultures (Shaw, 2005; Walker and Dimmock, 1999), and the need for cross-cultural comparative frameworks to guide research in the area (Hallinger and Leithwood, 1996; Dimmock and Walker, 1998b, 2005; Heck, 2002).

Others have examined the principalship in specific cultural contexts through the lens of politics (Palomares and Castillo, 2004), philosophy (Begley, 2000; Wong, 2001), international schooling (Jabal, 2006), gender (Celikten, 2005; Oplatka, 2002, 2006; Oplatka and Hertz-Larowitz, 2006), social justice (Jansen, 2006), and democracy. The latter has been used, for example, for analysis of the roles of principals in Spain and Nordic Europe, where it appears to infuse most discussions of educational policy and leadership (Moller, 2006, 2007; Persson *et al.*, 2005). In Spain, Llamas and Serrat (2002) decried the advancement of education leadership as opposed to organizational control in Spanish schools. This finding is mirrored across other more-developed (Shen, 2001) and developing societies (Bush and Oduro, 2006).

Empirical work has also begun to appear in English from diverse societies largely unsighted in the literature a decade ago. Examples included Saitis and Menon's (2004) research in Greece into teacher perceptions of future principals and Al-Hamdan and Al-Yacoub's (2005) investigation into the evaluation of educational leaders in Kuwait. Research into the principalship is also beginning to emerge from the Chinese Mainland (Cheng and Wong, 1996; Ribbins and Zhang, 2004; Wong, 2006), Hong Kong (Law and Walker, 2005; Walker and Dimmock, 2002), Portugal (Pashiardis *et al.*, 2005), Malta (Bezzina, 1998), and into school management and related areas in Cyprus (Pashiardis and Ribbins, 2003).

Studies of leadership in diverse cultures written in English are by nature comparative. An emerging body of literature has set out to more explicitly compare different notions of leadership across a number of societal contexts. Such approaches, or collections of work, include a focus on successful principals (Jacobson *et al.*, 2005), beginning principals (Walker, 2006b), leadership in developing societies (Oplatka, 2004), leadership and values (Begley and Wong, 2001), leadership and ethics (Begley, forthcoming), leadership development (Hallinger, 2003; Huber, 2004), and leadership and reform (Townsend and Cheng, 2000), to name but some. Although comparisons

are yet to match either the scope or sophistication of international business studies such as those by Hofstede (2005), Trompenaars and Hampden-Truner (2000), or the more recent Global Leadership and Organizational Behaviour Effectiveness (GLOBE) Study (House *et al.*, 2004), which investigated the influence of cultural values on leadership across 62 societies, the trend is certainly in motion.

Leadership in Diverse Cultures

Five themes – leadership for change, leadership in developing societies, successful leadership across diverse cultures, leader development, and the influence of societal cultures – can be used to illustrate recent work on school leadership in diverse cultures. Whereas these themes are addressed under separate headings for ease of presentation, and reflect the general state of play in the area, they are somewhat artificial in that equally strong patterns cut across as well as between them. For example, although the influence of culture is discussed separately, it certainly influences how leaders deal with change, frame their own professional development, and lead successfully, or otherwise. It also influences leadership in diverse developing societies. Themes, therefore, should be viewed as interrelated and overlapping (as they are often presented in the literature). What they hold in common is that they seek to capture some of the intricacies of what leadership looks like across diverse cultures, how it is enacted, and why it plays out in particular ways. The task as set by Stambech is:

not one of identifying what is universal or converging, nor to label and minutely specify what is unique about each situation, but to address how locally interpreted narratives give force to universal categories and how universal categories give force to local narratives.

(Stambeck, 2003: 157)

Leadership for Change in Diverse Cultures

The place of the principal in education reform has sparked considerable interest internationally (Hallinger, 2004). Much of this relates to the role of principals in increasingly decentralized systems (Hanson, 2000) and more school-specific changes such as school-based management (Hui and Cheung, 2006).

Although decentralizing reforms come in an assortment of shapes and sizes and follow varying rationales across diverse cultures, they basically aim to transfer greater responsibility from central authorities to the principal and, often simultaneously, teachers and the wider community (Walker, 2004). This has had a marked impact on principals' jobs in societies such as Singapore (Chew *et al.*, 2000), Taiwan, and Hong Kong. Yang (2001) explains that the role of Taiwanese principals has become diverse

and paradoxical as these principals are not only charged with control and responsibility for curriculum, personnel, and budget, but also expected to share decision making with parents, teachers, and communities.

In a study of education reform in Southeast Asia over a 10-year period, Hallinger (2004) identified a list of obstacles for effective change. These included the lack of a systematic perspective, coordination and implementation, and communication and vision. While noting that such blockages also typically emerge from research in the US, he made the key point that, “more significant than differences in the *types* of obstacles encountered were differences in their *character as presented in practice*” (p. 5). The obstacles sprouted from a mixture of instrumental, political, and cultural factors which, on their own, neither enhance nor retard change. Thus, differences in leadership across diverse cultures stem from both deeply held values and their enactment in practice.

Leadership in Developing Societies

Oplatka (2004, 2006) heads a number of scholars focusing specifically on leadership in developing societies – an emerging area of study which digs deeper than traditional single-site, regional, or large-scale cross-national studies conducted by international agencies. Oplatka (2004) defines developing societies as those outside of Europe and North America (and a few other nations such as Australia, New Zealand, and Japan). “These (developing countries) countries were ruled by Europeans for a long time (with the exception of countries such as Thailand), their economy is more agricultural-based, and are usually characterized by high mortality rates, high birth rates, high levels of poverty and large gaps between rich and poor” (p. 428).

Oplatka (2004) analyzed English-language articles from a wide range of journals published since about 1990. Her review produced a rich portrait of principals across diverse cultures and identified a number of common similarities and differences both within developing societies and between these developed societies. One marked similarity between developing societies was the limited authority held by principals, at least beyond their immediate organizations, and a related tendency to adhere strictly to central directions and superiors’ instructions. The same was identified within schools, that is, principals both expect and are expected to practice a strong almost autocratic style of leadership (Cheung, 2000). The research by Hallinger *et al.* (2000) in Thailand supports this:

Sometimes even if we want to involve staff more actively in determining the direction and procedures for change they misunderstand us. If we really spend a lot of time asking their opinions, they even begin to think we don’t

know how to do our job! It’s as if they say, “You’re the principal. If you have to ask me, it must mean that you don’t know what you’re doing.”

(Hallinger *et al.*, 2000: 218)

A further similarity (excluding some East Asian societies) was that principals in developing countries focused predominantly on routine-control mechanisms, rarely involved others in decision making and did not appear to focus on areas such as instructional leadership, vision building, or shared leadership, as are widely espoused in Anglo-American literature (Oplatka, 2004).

A major difference between principals in different developing societies was that leaders in East Asia were perceived as playing a major role in large-scale reform efforts, whereas African, Moslem, and Mexican principals played a rather minor role. Cheng *et al.* (2003) support this finding, “[in the Asia-Pacific region] leaders are often perceived as the key actors mobilising their institutions and members at the site-level to face up with those challenges and make educational services and provision more quality effective and accountable” (p. 922). A similar difference between East Asian and other developing societies was the exercise of instructional leadership and community involvement in schools; this was linked to rapid economic growth.

When concluding her analysis of principals in developed and developing societies, Oplatka summarized:

When role expectations and position are compared, the two groups of nations vary substantially in terms of the image of principalship, its position and status, principals autonomy, attitudes towards change initiation and parental involvement in school life. . . . there were great differences between role behaviours of principals from developed and developing countries. In contrast to the democratic spirit in the former, non-western principals are likely to employ autocratic, non-participative, summative evaluation. . . this may be ascribed to different contextual and cultural features in both group of nations. (Oplatka, 2004: 441,442)

Successful Leadership in Diverse Cultures

Principals’ leadership practices are common across contexts in their general form but highly adaptable and contingent in their specific enactment (Leithwood, 2005: 622).

Another approach to understanding leadership in diverse cultures is being undertaken under project titled International Successful School Principals Project (ISSPP) (see Jacobson *et al.*, 2005). In simple terms, ISSPP set out to “investigate whether ‘success’ in one country was ‘success’ in another”, how customs, ideologies, and practices affect leadership, how success is measured, and how it plays out in the lives of principals (Day, 2005: 533). Although ongoing, the study is beginning to produce insights into leadership

across seven different societies. Leithwood (2005) pulled together and analyzed 63 qualitative ISSPP case studies around four key questions: "What practices are used by successful principals and do these practices vary across contexts; What gives rise to successful principal leadership?; Under what conditions are the effects of such practices heightened or diminished?; Which variables effectively 'link' principals' influence to student learning?" (p. 620).

He reached a number of conclusions. Among the more general of these were that principals across cultures and policy environments used a set of basic leadership practices, for example, developing a shared vision, consensus building, distributing leadership, or demonstrating high expectations, but the way these were enacted was linked in various ways according to their context. In other words, this finding echoed assertions that even though concepts may be similarly named, how they were perceived and operationalized are influenced by a principal's value sets and other internal and external mediating and moderating variables. Leithwood draws on Wong's (2005) Shanghai-nese case as an example:

The two Chinese cases (do) illustrate the range of meanings associated with concepts of collaboration and leadership distribution. . . In such cultures, people demonstrate greater respect for hierarchy, position, age and formal authority than do those in low power distance cultures. Not surprisingly, then, although the Chinese principals involved their staffs in decisions making, theirs were more often decisions about how than what. (Leithwood, 2005: 621).

Cross-societal studies into educational leadership effectiveness and success may be informed by the recent GLOBE study which investigated the influence of cultural values on leadership across 61 societies over 11 years (House *et al.*, 2004). The study aimed to develop an empirically based theory to describe, understand, and predict the influence of cultural variables on leadership and organizational processes. It attempted to show that both individuals and groups of individuals in certain societies possess an implicit leadership theory. In other words, it, "wanted to show that societal and organizational culture influences the kind of leadership found to be acceptable and effective by people within that culture" (Grovewell, 2005: 4). Whereas it is not possible to discuss in detail the study's outcomes, it identified ways in which people worldwide distinguish between leaders who are effective and ineffective, and, perhaps more importantly, the extent to which the differences in leader styles and effectiveness across societal clusters could be explained in terms of the values that prevailed in those clusters. Although certainly not without critics, the study showed quantitative differences in perceptions held about leadership across clusters of societies and, as such, may inform work in school leadership.

Leader Development in Diverse Cultures

If we accept that leadership is conceptualized and exercised differently in diverse cultures, it is axiomatic that it must also impact the values, design, and operation of Education Leader Development Programs (ELDPs) (Walker, 2006a). While describing the state of leader development internationally, recent cross-societal analysis by Wales and Welle-Strand (2005), Huber (2004), Hallinger (2003), Lin (2001, 2003), Walker *et al.* (in press), and individual studies by Slater *et al.* (2003), Brundrett and Derling (2006), Wang (2007) and Wong (2004) have begun to explore this area. Huber (2004) reported a 15-country international comparative study of ELDPs where programs emphasized finding a balance between theory and practice, involving appropriate trainers and facilitators and the importance of relating learning opportunities to diverse contexts. In a similar review of ELDPs internationally, Hallinger (2003) identified a number of themes describing current best practices in 12 (East Asian, European, and North American) societies. The themes included the movement from passive to active learning, connecting training to practice, crafting an appropriate role and tools for using performance standards, supporting effective transitions into the leadership role, evaluating programs, and, importantly, developing and validating an indigenous knowledge base across cultures (also see Walker and Dimmock, 2005).

As alluded to by Hallinger, when taken to a more microlevel, however, much development conducted outside Western contexts is still driven by frameworks, content, and pedagogies that may lack cultural validity because of the absence of an indigenous knowledge base (Walker, 2006a). For example, when discussing content used by the Center for Creative Leadership (CCL) in cross-national LDPs, Jones (2006) highlights this thus:

Simulations are, in effect, prefigured with 'rational' decisions made by 'rationale' actors with whom participants must interact. Such normative assumptions are not culturally neutral; rather, they are distinctly western in their assumptions about human behavior and the psychological backdrop of decision making. (Jones, 2006: 485)

There is considerable movement in this area internationally, and understanding is getting sharper in terms of what EDLPs look like in diverse societies. However, investigation needs to stretch beyond description to deeper understanding, including the implementation of emerging work-based approaches (Lumby *et al.*, forthcoming; Webber and Robertson, 2004). Important philosophical and technical questions remain about how such approaches travel, or the shape they may take in different societies depending on values, political structures, or resource availability. Such questions may include: Are the models and practices of leader development being used by

context-specific organizations and development programs applicable across cultural contexts? What adjustments need to be made in methods, practices, assessment, and philosophies so that they will work in or across cultures? What can be done to successfully transfer Western (or other) leadership development models and practice? And, indeed, should Western (or other) leader development models and practices be transferred? And, if so, how? (Walker (2006a), adapted from Hoppe (2004)).

Influence of Culture on Leadership

As is apparent throughout the preceding discussion, any investigation of leadership in diverse cultures is at least partly underpinned by the seemingly perpetual question of whether, and the extent to which, societal culture influences what leaders do (Emihovich, 2006); this calls specifically for greater recognition of the influence of larger macro-societal cultural values on school leadership across diverse societies arrived in the mid-1990s and followed widespread recognition in the link between school leadership and organizational culture, and the importance of context to successful school leadership. Almost simultaneously, Cheng (1995b) and Hallinger (1995) advocated the analytical properties of societal culture and its potential for expanding understanding in the field. Cheng (1995a) argued that, “the cultural element is not only necessary, but essential in the study of educational administration” (p. 99). He continued to elaborate that the literature on organizational culture could be extended to intercultural understanding, “if (the) external cultural factorsare taken into account” (p. 99). By external cultural factors, Cheng referred to national or societal cultural characteristics.

Four questions posed from outside the Western English-speaking academic world summarize some of the enduring issues driving increased understanding. These were: Is the wholesale acceptance of Western educational practices appropriate to their national goals? Are the educational practices they have adopted from the West consistent with and sustaining of their cultural heritage? What are their own intellectual traditions and indigenous approaches to education and cultural transmission? How does the indigenous knowledge embedded in their culture fit with the theories, assumptions, and practices embedded in our Western-derived educational programs? (Bajunid (1996), cited in Hallinger and Leithwood, 1996).

Recent work has asserted the influence of societal culture on school leadership and organization (Dimmock and Walker, 2005). Hallinger *et al.* (2005), for example, assert that indigenous approaches to school leadership in East Asia have been and continue to be fundamentally concerned with the moral development of individuals and the creation of community. However, in East Asian and Latin American societies the community metaphor

manifests in cultural contexts that differ markedly and systematically from North America and Europe. This contrast between diverse cultures challenges scholars to suspend assumptions as they seek to deepen the understanding of educational leadership. The wealth of richness here appears to lie in the influence of culture on how leadership is understood, constructed, and enacted.

For example, scholars such as Begley (2000) and Walker and Hallinger (in press) point out that current Western notions of democratic learning communities constructed within culturally restricted understandings may be at best puzzling for school leaders in vertically aligned culture systems, where democracy may hold very different meanings (Walker and Hallinger, in press; Jansen, 2006; Leung and Chan, 2001; Hallinger and Kantamara, 2002). Roles in and modes of participation in community building differ in a number of ways. One of these is the more distinct power gaps that exist among people in many Asian and Middle Eastern cultures. These are reflected in the daily cultural practices of schools. For example, vertically aligned cultural systems exert significant influence upon social relations in the workplace. Persons of lower status (i.e., age, position, and seniority) naturally defer to those of higher status, accepting differences in power as a normal feature of social relations. Educational leaders and followers consequently tend to be more conscious of status and hierarchy than colleagues in Western contexts, even as they are more conscious of the need to foster community. Leaders are granted respect by followers based on age, formal position, and seniority. There is tacit acquiescence among followers as long as the leader’s behaviors remain aligned with these cultural norms. This normative reciprocity preserves relationships and promotes surface harmony among the members of social groups (Hallinger *et al.*, 2005).

East Asian, Middle Eastern, and Latin American societies, be it in different ways, are recognized for their collectivist orientation. Although the meaning of collectivism is widely debated, a high collectivist orientation suggests that people form personal perspectives first and foremost in terms of their significant group associations (Hofstede, 1994). In terms of behavior in schools, this implies that individual teachers and mid-level leaders, as well as the principal, subjugate their needs, ambitions, and, if necessary, opinions for the greater good of the school.

A combination of high power distance and collectivism creates a rigorous interplay, for example, when applied to conceptions like distributed leadership and empowerment. While high power distance reinforces the formal authority accorded to principals, collectivist tendencies shape the enactment of that power (Walker and Dimmock, 2005). It is the consensus building in which leaders engage within the values and norms of their school communities that creates the legitimacy needed to act. Within a school, this may mean that teachers interact with their leaders

without engaging in open disagreement. However, this does not mean that discontent does not agitate below the surface, but to emerge it must follow often informally ascribed tracks before it is addressed. Leadership, therefore, may be sometimes more concerned with maintaining illusory rather than actual harmony. When viewed through Western leadership lenses, it can appear as if the desire for smooth relationships interferes with task achievement (Hallinger *et al.*, 2005).

Conclusion

On the back of numerous scholarly and more pragmatic interests, research into educational leadership in diverse cultures is on the move, but still has a long way to go (Heck, 1996). Despite increased output, there is still a dire shortage of studies, especially written in English, on principalship and educational leadership in non-Western cultures. This is not surprising given the difficulties of understanding and interpreting, for example, the influence of culture on leadership, the critical lack of even the most basic resources for schools in many societies, and the political and religious divisions which continue to divide them.

Uncovering cultural nuance is a difficult task, mainly because much of what shapes and reflects how leaders think and what they do is difficult to find or see. This blindness is because people are often not only unaware of the influence of culture on other groups, but also of their own culture on themselves. Hoppe (2004) explains that developing cross-cultural self-awareness is complex because culture, in essence, is internalized patterns of thinking and behaving that are believed to be natural – or merely the way things are. This is compounded by the dynamic state of culture and development internationally, nationally, and locally.

This observation highlights the permeable nature of the cultural and other boundaries that exist between schools and their surrounding societies. This is the nexus at which principals worldwide are located today. Cultural values and other contextual conditions differ between and within societies, and these differences carry over into education. To push research onward, different values must be respected, even if not fully understood. This does not suggest that every culture's values are equally desirable simply because they are the culture's values. For example, in too many locations, cultural, economic, and social stratification continues to legitimate institutionally unacceptable inequities in access to education among the poor, minorities, and females. Identification and elimination of these inequities, however, is near impossible unless we increase the understanding of why they exist across diverse contexts. In terms of educational leadership, this means working across as well as within

cultures in order to better understand how, why, and, indeed, whether, leaders make a difference.

Finally, it is noteworthy that there are many contested issues around whether and how societal culture influences leadership. Such a debate includes issues such as whether there are indeed a set of values, for example, which can be classified as Asian. For discussion of some of these, see Emihovich (2006), Pye (2000), Rizvi (1997), and Walker (2003). While acknowledging ongoing debate in the area and that there is no single set of Asian value that are represented in equal intensity across all Asian nations. We do assert that there is more commonality among the strongest values extant within Asian societies than when compared with Western societies.

Leading Diverse Schools

J Ryan, The Ontario Institute for Studies in Education, Toronto, ON, Canada

© 2010 Elsevier Ltd. All rights reserved.

Many scholars and educators believe that leadership has an important part to play in our increasingly diverse schools. Contemporary schools are more visibly diverse than they used to be, the consequence, in part, of changing immigration patterns and burgeoning local populations. Many Western countries, for example, are receiving more immigrants from non-Western countries than they did 20 and 30 years ago, just as nonwhite populations in Western countries have steadily increased. However, diversity has more dimensions than just race/ethnicity. School populations also display other kinds of differences that have always been with us. These include those that revolve around gender, sexual orientation, age, social class, religion, and ability, among others. What is significant about this diversity, however, is not so much the differences themselves, but the particular ways in which they are configured. Indeed, the meanings that are often attributed to these differences have the power to influence how schools are run and how students learn. More specifically, they can routinely enable or disable students, educators, and parents. The task for educators then becomes one of recognizing, understanding, and critiquing the deleterious meanings and associated practices that disenfranchise particular groups and, ultimately, acting to change the structures associated with them so that everyone can benefit from education.

Leadership can play a key role in this process. The right leadership practices can help marginalized groups get the most out of their schools. However, not all approaches to leadership are able to address disabling practices. Individualistic and technical approaches, for example, are the least able in this regard. On the other hand, leadership perspectives that emphasize the collective nature of leadership and promote social justice and inclusion are in a better position to counter such disabling practices. This article elaborates on these diversity-related leadership issues. It is organized in the following manner. First, it provides an account of the nature of diversity in contemporary schools and the consequences of the inequitable ways in which the difference is configured. This is followed by a critique of one common approach to leadership and a description of key dimensions of leadership. The last section describes leadership practices that are consistent with the pursuit of social justice and inclusion.

Diversity and Education

Diversity has increasingly become a matter of concern for many in the contemporary world. This is because humanity is now more aware of social difference than it was a mere two or three decades ago. There are many reasons for this increased sensitivity. One is the ease in which goods, communications, images, and people can move around the globe. A person who lives in London, England, can sample genuine Japanese cuisine, purchase a hat manufactured in Singapore, communicate instantaneously with a colleague in New York, and view images of urban life in Johannesburg, South Africa, in his/her living room. While these facilities have most certainly heightened awareness of diversity, it is perhaps the flow of humanity and, in particular, the changing immigration patterns that have sensitized us the most. For example, more people now immigrate to Western countries from developing countries than ever before (Census Canada, 2003; Australian Department Immigration and Multicultural Affairs, 2006; Government of the United Kingdom, 2005; US Census Bureau, 2001). However, this awareness of racial difference does not just emanate from the presence of foreign-born people; native-born nonwhite populations are also burgeoning in Western countries. In the United States, for example, people of African and Hispanic heritage constituted 16.6% of the total population in 2000 (US Census Bureau, 2001). One consequence of these patterns is that communities and schools do not seem to be what they did 20 years ago. This is particularly evident in larger cities where schools may have upward of 60 ethnicities represented in their student populations (Ryan, 2006a). Another consequence is that these changes have altered the way in which educators do, or should do, their work.

While immigration and changing local populations have sensitized us to human diversity, race/ethnicity constitutes only one dimension of difference. Many other kinds of diversity pervade our schools and communities. In addition, even though they have been around for some time now, they have not always been recognized or acknowledged in appropriate ways. These differences include those associated with gender, sexual orientation, age, social class, religion, and ability. To take one example, social class continues to persist as a significant difference within and between communities in a world where poverty shows few signs of disappearing. In Western countries, such

as the United States, Canada, and the United Kingdom, the gap between the rich and the poor has steadily increased since the 1970s. In 1995, the richest 1% of the population of the United States owned 47.3% of the financial assets, while the poorest 40% owned less than nothing –1.3% (Keister, 2000). In 2003, the number of people below the poverty line was 35.9 million (US Census Bureau, 2004). The figures in Canada and the United Kingdom tell the same story (Toronto Star, 2002; Byrne, 1999). This disparity, however, pales in comparison to the difference in wealth between Western countries, such as Canada, the United States, and the United Kingdom, and developing nations. For example, the European Union and the United States have gross national products (GNPs) of 13 502 800 and 12 455 825 (millions of USD), respectively, while African countries such as Liberia, Sierra Leone, and the Central Africa Republic record meager levels of 530, 1213, and 1377, respectively (International Monetary Fund, 2004).

These differences have consequences for student experience. More pointedly, the ways in which these differences are configured – interpreted, valued, and judged – can have a decisively positive or negative affect on how students learn in school. For example, differences associated with culture, ethnicity, social class, sexual orientation, gender, and ability can mean the difference between success and failure, enrichment and impoverishment, and hope and despair for students (Ryan and Rottman, *in press*). In most contemporary schools in the Western world, nonwhite, female, gay, lesbian, poor, and differently abled students frequently do not have as positive an educational experience as their white, male, straight, middle-class, and physically able counterparts. Many of the former tend to achieve at lower levels, drop out in greater numbers, and are less likely to attend post-secondary institutions than the latter (see e.g., Bennett, 2001; Natriello *et al.*, 1990; Paquette, 1990). Of course, not all students in the aforementioned groups follow this path. However, even those who perform well academically suffer from other significant consequences of this differential evaluation. They are systemically subjected to harassment, exclusion, and discrimination both in school and later, when they leave to venture into the working world (see, e.g., Datnow, 1998; Lugg, 2003; Orenstein, 2002; Ryan, 2006a; Stein, 2002). Difference makes a difference for students and their parents. A crucial task for leadership in the twenty-first century then is to recognize, understand, critique, and change the structures that generate the inequities that revolve around such differences.

Leadership Orientation and Diversity

Some leadership approaches are better equipped to meet the challenges of diversity and inequity than others.

More often than not, more traditional orientations are not able to acknowledge and confront the structures that marginalize groups of students and their parents. One approach that is poorly equipped for diversity is the so-called managerial orientation – both contemporary new managerialism (Gewirtz, 2002) and the more traditional forms. The weaknesses of managerial approaches reside in the ways proponents envision and practice (1) relationships among organizational members, (2) the roles that they occupy, and (3) the ends for which leadership is geared. Managerial proponents view administration as a technical practice mediated by an individual who occupies a position of authority and is responsible for putting any number of policies – whatever they may be – into practice (Ryan, 2006a). This view of leadership, however, is unable to promote the interests of the marginalized in the hierarchical relationships that it favors between managers and others, in the way in which it invests leadership power with individuals in particular positions, and in the way in which it promotes efficiency and productivity at the expense of more specific ends, such as social justice or inclusion (Blackmore, 1999; Marshall, 2004). In a managerial world, those who are not in management positions will be excluded from decision-making processes because they supposedly do not merit this inclusion. Vesting the power that comes from formal leadership in single individuals also excludes others who are not in these positions. Finally, the values of efficiency and productivity do little to promote the cause of inclusion or equity if leadership activities do not specifically target the latter.

Other approaches to leadership are better prepared for diverse contexts than managerial ones. This is due, in part, to the fact that their proponents are not content to be idle or neutral bystanders or merely describe what they study in a clinical or detached manner. They care deeply about what is happening to already-marginalized groups in diverse schools and are determined to do something about it. These sentiments figure prominently in their approaches to inquiry. Many of these scholars and practitioners believe that their work in leadership can provide the foundation for action that can rectify these unfair practices. Even though these approaches share many elements, they adopt a number of labels. They include emancipatory (Foster, 1989; Corson, 2000), democratic (Woods, 2005), social justice (Brown, 2004; Furman and Gruenewald, 2004; Marshall, 2004), feminist (Blackmore, 1999; Grogan, 2002), and inclusive (Ryan, 2006a) approaches to leadership.

Many scholars who champion these approaches reject hierarchical views of leadership. They correctly point out that these kinds of arrangements both reflect and reinforce wider social hierarchies and injustices (Corson, 1996). Some contend that these educational

organizational hierarchies themselves display class and gender overtones (Blackmore, 1989; Grace, 1995). Feminists have been the most articulate about this. They have argued that this hierarchical division of labor is masculine in nature and criticized the ideals of power and control that are part of this corporate management view (Blackmore, 1999; Grundy, 1993; Ozga, 1993). The point that they and others make is that hierarchies marginalize those not privileged enough to occupy formal positions of authority and those who do not possess the personal characteristics needed to influence others. For leadership to successfully counter practices that disadvantage some students, it must foster equitable and horizontal relationships that also transcend wider gender, race, and class divisions.

Leadership approaches that serve diverse populations best operate collectively rather than individually. Proponents argue that concentrating leadership power in a single individual – who may more often than not be an administrator – leaves out those who are not considered leaders from leadership-related activities (Foster, 1989; Ryan, 2003; 2006a). Go-it-alone individuals also leave problems in their wake when they move on to other positions (Hargreaves and Fink, 2006). Others make the point that the influence of single individuals on institutions is generally limited, and, as a consequence, it does not make sense to rely so heavily on single leaders. Debunking the heroic view of leadership, these and other scholars point out that individual men and women who occupy formal positions are seldom capable, on their own, of creating fundamental and long-lasting changes. As a consequence, they call not for heroes, but for modest men and women to step forward (Foster, 1989). Schools will serve the needs of their diverse populations not necessarily as the result of individual people doing remarkable things in isolation, but from a variety of people working together in many different ways and roles, using the multitude of different resources that are available to them (Leithwood *et al.*, 1999; Smylie *et al.*, 2002). Leadership that works best in diverse settings then, resides in the hands of the many rather than the few (administrators).

Leadership approaches best suited for diverse settings also emphasize the importance of clearly specifying the ends for which leadership should be directed, which in this case are inclusion, equity, and social justice. These contrast with other approaches to leadership that revolve around vague platitudes about efficiency and productivity. A number of the approaches cited above are organized to pursue the former goals. The proponents of emancipatory and feminist approaches, for example, are first and foremost concerned with social justice (Foster, 1989; Marshall, 2004). They believe that leadership activities need to be organized to pursue these ends on both a local and a global scale, and they view leadership processes as only one element of this enterprise. These scholars see leadership as the means for getting people to recognize these

injustices and for working together to change them. For leadership to be able to work for marginalized students, then, it needs to be seen and practiced as an inclusive, equitable, and collective process that is also organized to promote inclusion, social justice, and equity.

The Practice of Leadership in Diverse Contexts

School communities can do many things to advance collective leadership processes that promote equity and social justice. Among other things, they can encourage alternate ways of thinking about leadership; explore ways to include members of their school communities in school activities; advocate for inclusion and equity; educate students, parents, teachers, and administrators; promote critical consciousness; encourage dialog; emphasize the importance of student learning; promote inclusive decision- and policy-making processes; and ensure that equity initiatives become part of whole-school practices.

There are many ways to think about and practice leadership. Unfortunately, as mentioned above, many administrators follow more or less traditional patterns of leadership, that is, they tend to look at leadership as an individual and hierarchical practice. It is easy to understand why they do this. Among other things, they work in hierarchical bureaucratic organizations. By law, they are responsible for just about everything that occurs in their organizations – from ensuring that the drink machines are working to seeing that the province- or state-wide testing is carried out to guaranteeing that everyone is safe within the school walls. Therefore, many administrators may be unwilling to trust others to perform tasks for which they – and not these others – are responsible. However, if they are interested in ensuring that all students have meaningful educational experiences, they and everyone else in their school communities need to consider other ways of approaching leadership. Understanding and confronting practices that unfairly put students at a disadvantage require that they consider collective forms of leadership that move away from disabling hierarchies. Only when leadership is organized to give everyone a voice can the business of education proceed in a fair way.

School communities ought to also consider the many ways in which members can be included in school activities. If schools are to be equitable places, then students, teachers, and parents alike need to be included in their various influences and learning processes; there are many ways in which this can be done. Some roles can be formal, such as being part of committees or school councils. Others can be more informal, such as sharing expertise, volunteering, and accepting responsibility. Members of school communities can also be included in many areas of responsibility, including more administrative-like areas

such as hiring, teacher evaluation, the budgeting, promotion, and retention, as well as teaching-related areas such as instruction, curriculum, student behavior, and student placement (Ryan, 2006a, 2006b). However, not all areas or forms of inclusion may be appropriate for everyone. The respective dispositions, skills, and positions of parents, students, and parents will dictate that they may be included in different ways and at different times. Moreover, tasks that demand immediate action do not always lend themselves to collective decision making.

One of the reasons that it is not always easy to include students, teachers, and parents in leadership processes or to promote equity is that not everyone may favor them. Some may actively oppose these sorts of initiatives. For example, administrators may be reluctant to admit to the presence of racism in their schools (Ryan, 2003), just as some teachers condone sexism (Datnow, 1998). In order to counteract this opposition, those involved in leadership activities need to advocate for social justice and marginalized groups. In this regard, they can establish alliances with like-minded others (Bishop, 2002), make inclusion non-negotiable (Keys *et al.*, 1999) and create cognitive dissonance, discomfort, and a sense of urgency among members of the school community (Thousand and Villa, 1994). They may also share with others the theoretical, ethical, and research-based rationales for inclusive education and leadership (Thousand and Villa, 1994), trade and bargain with resisters (Gale and Densmore, 2003), stall and maneuver to counter exclusive policies (Gale and Densmore, 2003), establish links between educators and disadvantaged groups (Oakes and Lipton, 2002), and involve school and community stakeholder groups in formulating objectives for supporting all students (Thousand and Villa, 1994).

In order for school communities to embrace inclusion and equity, they need to be educated about these issues and the various groups in their communities. This is important because administrators, teachers, students, and parents generally know too little about each other and about debilitating practices such as racism (Ryan, 2003). In order to acquire the necessary knowledge, understandings, and attitudes, all members of the school community will have to assume the role of both teacher and learner. Educators can help parents and students learn about the school system and community, while parents can assist educators in learning about themselves and their communities. This can be accomplished in both informal and formal ways – in the day-to-day interactions among members of the school community and in more formally organized developmental activities. Parents can learn about the school through newsletters, brochures, handbooks, formally and informally organized meetings, and face-to-face interaction (Ryan, 2006a, 2006b). With regard to sensitive matters such as racism, schools need to find a balance that maintains pressure to be reflective about current assumptions and practices, without being

confrontational in a way that merely reproduces and amplifies current conflicts. The best route to take is one that is positive without being comfortable and that prompts people to not only reflect on the present state of affairs, but also does not produce the fear and guilt that trigger further conflict. This strategy recognizes that people make mistakes, and that these mistakes should be acknowledged and discussed in a constructive manner (Gillborn, 1995).

It is not enough to simply educate members of the school community about equity issues. This education also needs to be critical, that is, leadership needs to promote a critical consciousness in students, teachers, administrators, and parents (Anderson, 1990; Blasé and Anderson, 1995; Foster, 1989; Grundy, 1993). This involves helping people to look at the school and community context through a critical lens so that they can see many of the things, such as racism, which they normally take for granted, in a new light. In order for individuals to break out of their usual patterns of thinking that obscure exclusion, they need to engage others – particularly different others – in critical conversations. These critical conversations can help school communities acknowledge, recognize, critique, and change those invisible practices that impede inclusion (Ryan, 2006a, 2006b). One of the strategies that school communities can do to promote these critical conversations is to provide an atmosphere that supports the posing of critical questions. Questions such as What is happening here? What do we know about this? Who says this is the way things should be? What overall purposes are being served? Whose vision is it? Whose interests are being served? Whose needs are being met? Whose voices are being silenced, excluded, or denied? How come some viewpoints always get heard? Why is this particular initiative occurring now? What kind of prudent and feasible action can we adopt? Who can we enlist to support us? How can we start now? How are we going to know when we make a difference? (Smyth, 1996) can help school communities look at their practices critically and take action to do something about those that disadvantage students.

In order for school communities to engage in critical conversations, they will need to find ways to nurture dialog. These conversations will work only if people are able to communicate with one another on an equal footing, that is, when everyone has a voice. This means that those who have power need to develop strategies to help them communicate with those with less power. Listening is important in this context. It is vital that listeners from dominant groups provide as much comfort as possible so that the latter can speak their minds (Levine-Rasky, 1993). To do this, it helps to displace oneself as a knower and evaluator, abandon a desire to overtly assign a relative worth to observations, reflect on one's privileges, suspend personal authority, be willing to experience vulnerability,

and admit one's ignorance. Dialog can also be nurtured when educators position themselves in ways that bring them into contact with others (Ryan, 2003). Dialog, however, is not a panacea (see, e.g., Ellsworth, 1989; Boler, 2004). There is no guarantee that its use will ensure that the marginalized will be meaningfully included in school activities and processes. Nevertheless, even the critics acknowledge that it can be useful in a number of respects, such as helping groups form alliances (Ellsworth, 1989) or simply continuing conversations (Burbules, 1993).

Inclusion and equity are best achieved in schools that emphasize the importance of student learning and classroom teaching. One important task for leadership then is to find ways to improve the capacities and commitment of professional educators. The latter is best achieved when educators are aware of practices that work in diverse settings and are given the chance to talk critically about their teaching (see e.g., Ryan, 2006a: 123). It is easiest for teachers to adopt these teaching strategies in schools where goals are clearly understood, collaboration is supported, risk taking is encouraged, and the monitoring of progress is fair. Teaching in diverse contexts is best developed when teachers and their supervisors have opportunities to talk about it and critically reflect upon it (Blasé and Blasé, 2000). These critical conversations occur most often in contexts where school goals are developed collaboratively and clearly communicated to everyone. This is particularly important in diverse settings because members of various groups may not understand what others in more homogeneous contexts simply take for granted. All this occurs most often in schools that spend time making sure that student learning is a priority (Kleine-Kracht, 1993).

In order for diverse schools to ensure that everyone has a voice, and that alternate perspectives and worldviews are fairly represented, they need to adopt inclusive policy-making processes. Policy deliberations can work toward inclusion in two ways. The first is by promoting policies that favor inclusive values. The second is by organizing policy-deliberation processes that are themselves inclusive. This requires that all interests in the school community be fairly represented in these processes and that everyone have equally fair opportunities to influence the outcome of these processes. To accomplish this, schools need to know their communities, seek fair representation from all segments of the community to participate, establish an appropriate place for deliberations, pay particular attention to the power dynamics, ensure that everyone is heard in policy deliberations, help policy makers see problems from others' viewpoints, consult with the people affected by the policy, and be prepared to engage in ongoing process of monitoring and adjusting the policies (Corson, 1996; Gillborn, 1995; Ryan, 2006a, 2006b).

Finally, if inclusion and equity are to be successfully promoted in schools, then leadership practices need to be organized to ensure that they become firmly entrenched

in day-to-day activities, that is, in the culture of schools (Gillborn, 1995; May, 1994; Ryan, 2003). In order to accomplish this task, schools need to involve whole-school communities. This entails making equity an essential and routine part of educational practice in ways that ensure its longevity and protect it against wider changes in educational policy. For schools to promote cultures that foster inclusion, they will have to acknowledge the complexities of culture and be sensitive to the ends to which their efforts are directed. An approach to leadership that is suited to diverse settings demands that the school community's efforts should promote everyone's interests – not just those of management or of dominant groups. School vision statements, for example, ought to emanate not only from management or powerful individuals and groups, but also, equitably, from all segments of the school community. The shared values that emerge from whole-school efforts must represent all groups and all groups must benefit equally from these values (Ryan, 2006a, 2006b).

Conclusion

Leadership is more important than ever in today's diverse schools. It can be a powerful tool in confronting and changing the practices that disable certain groups of students. In order to be able to do so, though, it needs to be practiced as a collective, inclusive, and equitable process that is also organized to promote equity and inclusion. However, the strategies associated with this approach should not be seen as a panacea or as prescriptions that apply equally to all contexts. The nature of diversity itself precludes such a conclusion; schools, communities, and the people who attend and live in them will display many differences. Therefore, we need to be cautious when putting the above strategies into practice. The best way to approach them is to view them as part of a general framework that is sensitive to the local context and flexible enough to be adapted to a wide range of circumstances. If educators are able to do this, they will be taking an important step toward making schools places of learning from which all students can benefit.

© 2010 Elsevier Ltd. All rights reserved.

Glossary

Centralization – The concentration of administrative functions at a central location.

Compensation – The payment of salary and/or benefits for services rendered.

Decentralization – The transfer of administrative functions to local authorities.

Equity – Fundamental fairness to all parties.

Human resources – A more current term for personnel administration, emphasizing that people are a critical resource to education.

Induction – A means of introducing and socializing an employee to a new position and organization.

Particularism – The practice of focusing on the characteristics of a person that are distinct such as religious, ethnic, or political affiliations.

Professional development – Learning experiences that are intended to increase the knowledge and skills of educators.

Professional learning communities – Groups of individuals who engage in reflection and dialog about their practice to improve their collective performance.

Recruitment – The strategies and process of attracting applicants to an organization.

Retention – The ability to keep or retain employees over time.

Scientific management – The movement of the early twentieth century that emphasized a technical approach to management that was formalized, standardized, and specialized.

Selection – The process of choosing the most qualified person for a position.

Supervision – The process of working with individuals to improve performance.

Universalism – The practice of focusing on the characteristics of a person that match objective criteria for a position.

Introduction

Supervision and personnel administration serve fundamental purposes in the educational experience of 1.5 billion children worldwide. It is with and through people that

organizations both maintain and develop their professional capacity and respond to governmental goals and societal changes. While there is a global commitment to education, it is not universally available, particularly in developing countries where the average secondary enrollment is only 19% (Foskett and Lumby, 2003). Hence, there are substantial differences in the underlying beliefs about and realities of the educational experience throughout the world, but it is the individuals in schools, particularly teachers, who engage and motivate students in the learning process. The manner in which these adults are treated by state or school officials influences the daily experiences of children and adolescents in schools and, ultimately, their economic futures.

The purpose of this article is to provide an overview of personnel administration from an international perspective. Given that much of the literature and research on personnel administration emanates from English-speaking countries, such as the United States, it is necessary to acknowledge that the reported research reflects personnel practices based on a narrow set of cultural values. Where possible, a cross-cultural perspective will be provided. The topics to be addressed are the purposes and functions of personnel administration, current challenges and promising strategies, and future directions.

Purposes, Historical Perspective, and Policy Context

The primary purposes of personnel administration are the recruitment, selection, induction, development, supervision, evaluation, and compensation of the most competent individuals to create learning environments for students. While the functions are largely constant across settings, personnel practices and the concepts which drive them greatly differ based on cultural beliefs, norms, and customs.

Purposes and Significance

Despite differences in personnel practices in different countries and locales, there are commonalities in the types of issues to be resolved, such as: (1) how to define the ideal educator, (2) how to recruit and identify the ideal educator, (3) how best to prepare a sufficient supply of capable educators, (4) how to support the ongoing learning and development of educators, (5) how to evaluate effective job performance, (6) how to structure compensation to

attract, retain, and reward competent educators, and (7) how to provide supportive working conditions (Thomas, 1990). Issues and values such as equity, quality, accountability, decision-making control regarding employment, efficiency, economic conditions, legal constraints, and labor supply conditions influence most employment policies and practices in education across the spectrum of cultures.

An example of cultural influence on actual practices is illustrated by the concept of an ideal candidate. In the United States, a universalistic approach is used and applicants are judged by professional qualifications (e.g., professional licensure or certification, appropriate degree attainment, and classroom teaching performance recommendations). This is viewed as nondiscriminatory and more objective by Americans. In other parts of the world, particularism is valued to a greater extent and an emphasis is placed on particular characteristics, such as ethnicity, religious affiliation, and kinship, which are viewed as more critical to serving community needs. Where a school is situated along this continuum, from universalism to particularism, reflects an intricate weave of cultural and community considerations (Foskett and Lumby, 2003).

Historical Perspective

Personnel administration is deeply rooted in a bureaucratic orientation to school organization and functioning. Growing out of the scientific management movement during the early 1900s, personnel administration became a core function of the central administration of larger school districts in the United States to respond to the growing complexity of schools due to urbanization, immigration, and industrialization. Personnel procedures were characterized by formalization and specialization which led to a standardized approach to filling positions through job analysis, position descriptions, selection criteria, application procedures, and reference checks. In the 1940s, the human relations movement shifted the discourse to one of valuing individuals as human resources and as a means of achieving organizational goals. Greater attention was given to working conditions as well as to psychological and social underpinnings of worker motivation. The application of systems theory in the 1970s suggested interplay between individual needs and institutional goals that could be aligned for optimal organizational effectiveness. More recently, the concept of learning organizations in the business world has laid the groundwork for professional learning communities within schools (Hall and Hord, 2001). From this perspective, people are viewed as integral to shaping the cultural fabric and contributing to the professional capacity of a school and school system.

In many ways, this historical perspective from the United States describes a developmental sequence through which many educational systems travel. While some emerging countries are still struggling to simply manage

school employees, in other places, schools have re-created themselves as high-functioning learning communities. For example, in many parts of Africa, the relationship between supervisor and teacher is described as a master-servant relationship, suggesting an industrial-era mentality in contrast to the push elsewhere for a human resource approach that is responsive to the needs of individuals.

The influence of various schools of thought on personnel administration has contributed to systematic approaches in identifying and meeting staffing needs, understanding motivational workplace practices, the necessary balance between organizational goals and individual needs, and the reconceptualization of schools as learning organizations. Collectively, these trends have shaped both the technical and humanistic aspects of personnel administration. In some parts of the world, such as South Africa, the basic challenge of filling positions with instructors who are familiar with the curriculum remains the primary purpose of personnel administration, while in other countries, the focus of personnel administration is to facilitate and support professional communities of practice.

Today, personnel administration is shaped by a research base that draws from a broad range of theoretical perspectives in education and business. They include social systems theory, organization theory, change theory, communications theory, leadership theory, decision theory, motivation theory, adult learning theory, group dynamics theory, and others. While researchers began to focus on personnel issues specific to educational settings in the 1970s and 1980s, an international perspective was absent until the early 1990s when greater attention was given to comparative international practices (Brewster and Tyson, 1991). Comparative analyses have helped highlight educational commonalities as well as reveal the underlying beliefs and meanings of practices due to cultural differences.

Policy Context for Personnel Administration

People constitute the single, largest, and most expensive resource in schools (70–90% of most educational budgets) and, therefore, are the focus of most current reform efforts around the world. In the United States, the No Child Left Behind Act of 2001, has mandated accountability for student achievement and has identified highly qualified teachers as a critical contributor to increased student performance. Similar top-down accountability efforts have been applied to education in other countries as the business forces of globalization exert pressure on educational systems to compete in the knowledge arena. How policy mandates and incentives affect individual schools and their inhabitants, however, is a complex interaction of national, regional, community, and family expectations as well as legislative, cultural, and economic factors. Often, collective bargaining agreements between employee

unions and employing educational agencies further influence personnel administration policies and practices.

Functions of Personnel Administration

At a minimum, the central administration for schools is responsible for the functions of strategic planning, compensation, and collective bargaining associated with personnel administration. Depending on the level of centralization within an educational system, the functions that are shared sometimes with school heads are employee selection, induction, professional development, supervision, and evaluation. This is certainly the case in many parts of the United States and China. This push for decentralization of personnel functions is evident not only in increased self-determination at the school level, but also at the teacher level with greater empowerment to be active participants in selection efforts and professional development.

One descendent of scientific management is the planned and systematic approach most education entities use to determine future goals for the organization. Strategic planning involves the identification of system goals, strategies for achieving goals, resource requirements, and contextual variables that will enhance or limit goal attainment. Planning encourages the systematic determination of personnel requirements, allows for a proactive focus on programs and students, and targets resources, financial and human, to prioritized goals. By better aligning personnel practices with high-priority organizational goals, school systems are better able to improve performance by evaluating, developing, and compensating individuals in ways that contribute to clearly identified objectives.

Recruitment and Selection

Well-planned recruitment efforts can enhance the defensibility and effectiveness of employee hiring practices. A rich and diverse applicant pool increases the probability of finding candidates who have both the personal qualities and professional expertise that are sought by the employer. Affirmative efforts, however, are required to attract a broader range of candidates and many school systems are actively seeking protected class members to diversify the employees within the organization. This effort is especially critical to teacher hiring in districts enrolling large numbers of students of color.

Significantly, more research has focused on employee selection, particularly the selection interview, than on recruitment. Research findings from industrial/organizational psychology and business management have provided much of the foundational knowledge on personnel selection. It documents the historically weak reliability and predictive validity of the selection interview due to non-job-relevant factors (Delli and Vera, 2003).

This body of research has resulted in employee selection methods designed to increase the reliability, and to a lesser degree the predictive validity, of selection decisions. These methods include clarification of the hiring criteria before conducting the interview, use of a structured interview format, formulation of questions to elicit experience-based responses, use of a scoring rubric for responses, multiple trained interview raters, and review of other data sources (Campion *et al.*, 1988). Greater reliance on more objective evaluation of the person's qualifications and experiential knowledge increases inter-rater reliability and reduces the biases that have been documented in less-structured dyadic interviews.

Selection methods requiring evidence of actual job performance may strengthen the predictive power of selection decisions (Pounder, 1988). Consistent with this thinking, some school systems ask applicants to submit evidence of job performance through videotaped teaching, substitute teaching, or actual teaching observations. Research has not documented the predictive validity of these strategies but they have strong face validity.

It is critical to note that the American concern for objectivity is both a legal and a cultural concern that is not shared with other cultures. China, for example, is much more comfortable with subjectivity in personnel matters and would be more concerned with the ability of the applicant to serve the school and the wider community in an agreeable manner. In addition, commitment to existing political entities is expected. These values reflect China's collectivist nature which contrasts with the emphasis on the individual in most Western European cultures (Walker and Dimmock, 2002).

Induction

Induction programs provide new employees with their first opportunity to acquire context-specific information about the system and school in which they will work and fill the gap between preservice preparation program and ongoing in-service professional development. School districts have been found to play meaningful roles as teacher educators. They determine the assignments given to new teachers, the resources they are provided, and the opportunities for learning that affect the quality of novice educators' teaching (Grossman and Thompson, 2004). For these reasons, the growth of such programs in the United States has been dramatic with 83% of teachers from public schools reporting participation in 2000 (Smith and Ingersoll, 2004). The programs vary in terms of content, characteristics, duration, and intensity but common elements exist such as mentors, beginners' seminars, extra resources, and common planning time.

If effective, induction activities can assist individuals who are new to a school to appreciate the values, professional

expectations, and social networks that define it. The effects of such programs are typically measured in terms of teacher attitudes and teacher retention. Research has confirmed their success in increasing job satisfaction, efficacy, and retention. Retention is a major issue in the United States with 29% of all first-time teachers in 1999–2000 either changing schools or leaving teaching. While only a small percent of beginning teachers in the United States experience a comprehensive induction program, those who do are half as likely to leave teaching or change schools.

Supervision and Evaluation

Supervision and evaluation are often used in tandem in the literature implying that they are reciprocal processes, but effective evaluation subsumes supervision as one of its primary purposes. Supervision is conceptualized as a formative process with the primary purpose being the improvement of instruction and includes classroom observation, group development, and professional development. Evaluation is conceptualized as both formative and summative with the dual purposes of performance improvement and accountability. Summative purposes of evaluation include making decisions regarding retention, teacher tenure, promotion, and sometimes differentiated pay. Most Western school systems develop evaluation systems that emphasize both the improvement and accountability aspects of evaluation; however, in some countries, such as China and Hong Kong, evaluation is used primarily to reward teachers or make promotion decisions. A greater emphasis on the improvement aspects of evaluation are expected in the future.

To enhance both effectiveness and defensibility of evaluation policies and practices, criteria and methods for performance evaluation are typically tied to specific job requirements. In the United States, these job expectations tend to focus on classroom activities but this is not the case in all cultures. As a point of contrast, morality, diligence, abilities, and student performance are major areas of evaluation in the People's Republic of China (Teddlie *et al.*, 2003). Research on teacher evaluation suggests that more highly structured evaluation systems increase the consistency of summative judgments on performance and the level of discussion about instruction. Components of an evaluation system that increase its effectiveness and legal defensibility include a written policy on evaluation that is compatible with existing legal requirements and collective bargaining contracts, prior notification of job-related expectations, trained evaluators who are familiar with both the content and procedural aspects of the evaluation policy, equitable treatment of all employees across schools and locations, collection of a broad sampling of performance across time, documentation of performance that is shared with the employee, and an opportunity to improve in areas of concern (Tucker and DeSander, 2006). These minimal

guidelines reflect an approach to evaluation that is fundamentally fair and one that is ethical and supportive of professional growth. More extensive guidelines for the development of evaluation systems for educators can be found in *The Personnel Evaluation Standards* (Joint Committee on Standards for Educational Evaluation, 1988).

Although many countries have elaborate evaluation systems (e.g., India, South Africa, China, New Zealand, and the United States), personnel evaluation practice does not meet these standards consistently and thus may not provide meaningful feedback for performance improvement. In the Netherlands, for example, the high level of school autonomy results in local definitions of teacher evaluation and weakly conceptualized approaches to it. In the People's Republic of China, teacher evaluation is highly structured but focuses on political variables along with teaching duties and does not promote professional development (Liu and Teddlie, 2003). Without meaningful implementation by skilled supervisors, professional growth remains an unrealized goal of supervision and evaluation in many schools.

Professional Development

The provision of in-service professional development acknowledges the need for educators to continue learning once they have been hired. Depending on the quality of preservice preparation, professional development can be used to address training gaps, expand knowledge and skills, explore new strategies to promote student learning, and respond to ubiquitous change. The possible delivery models are numerous but they tend to cluster around four dominant strategies: (1) knowledge transmission, (2) demonstration or modeling of the skill or concept, (3) practice of the skill or application of the knowledge, and (4) peer coaching or collaborative work with other teachers to implement the new skills or knowledge as an integral part of teaching (Joyce and Showers, 2002). Professional development is often delivered through workshops based on the needs determined by the central administration and may have minimal impact on performance. Evidence suggests that teachers learn best from each other through collaborative work around self-identified problems of practice.

The actual content of the professional development can be open-ended, organized around school-wide goals, or based on individual needs as identified by self-assessment or supervisor feedback. Ideally, it should be a natural outgrowth of supervision and evaluation that is intended to improve individual performance. Without systemic support and opportunities to develop new skills, evaluation does not contribute to individual or organizational growth. In the current context of results-driven education, effective professional development should be informed by research on teacher and learning, guided by coherent long-term planning, based at the building level, and structured to be

continuous and ongoing. Most important, however, is the enlistment of teachers as agents, and not as objects, in their own professional development.

Compensation

Although considerable research has been done on the development of effective and defensible compensation policies and practices in the private sector, many of these findings have had only marginal applicability to compensation practices in public schools. Nonetheless, there are some broad principles of equity (and effectiveness) that deserve attention in public school employee compensation systems, including issues regarding internal equity, external equity, and personal equity. First, internal equity, salary comparisons between and among different jobs in the same organization, has applicability to decisions about compensation levels between and among administrators, teachers, professional support staff, and various types of service personnel. Job-evaluation methods identifying appropriate compensable factors (based on job requirements) and their compensation value for each major job cluster in an organization enable school districts to analyze the internal equity of their compensation structures.

Second, external equity, salary comparisons between similar jobs in different organizations, has implications for an organization's ability to attract and retain employees due to competitive salary levels. Salary data comparing teaching salaries to those of other degree-holding occupational groups have been used to argue for increased salary levels in education. Due to the widespread process of collective negotiations in most American public school districts, teacher unions often utilize comparative salary data from other relevant school districts to bargain for salary increases. This influence often results in teacher compensation schedules that are externally competitive with neighboring school districts. Where this influence does not exist, as with nonteaching jobs or with educational organizations that do not bargain collectively, educational organizations may need to conduct market wage surveys to obtain comparative salary data on key jobs within various job clusters. These data may be used to adjust salary levels within the organization to maintain a competitive edge in attracting and retaining employees.

Finally, performance-based pay in teacher compensation has received a considerable amount of attention during the last two decades. This practice is still quite controversial, but it does speak to a final type of equity: personal equity, which addresses an employee's perception of his or her performance and worth relative to that of referent others. Although the single salary scale dominates most school systems, there is mounting pressure based on models from business to consider differentiated pay based on subject-area knowledge, specific skills, student

outcomes, and willingness to teach in difficult-to-staff locations. In the United States, the US Department of Education has committed millions of dollars to funding innovative incentive proposals from states, cities, and individual schools which plan to use funding to enhance recruitment and retention in schools serving poor children. Many of the proposals will reward teachers for better student achievement in their own classrooms or in schools as a whole.

Current Challenges

With the tremendous strides that have been made in access to education for most countries, the current focus for educational organizations is on improvement of the quality of instruction for children. This requires economic support, knowledge about the teaching and learning process, and capable educators in central administrations, schools, and classrooms. The challenges for the field of personnel administration include generating an adequate supply of high-quality and diverse educators, decentralizing educational decision making, and responding to the increasing pressure for greater student achievement.

Teacher and Administrator Shortage Issues

Most countries are struggling to recruit and retain an adequate number of teachers and other professionals for schools (Toole and Louis, 2002). Many countries (e.g., United States, United Kingdom, India, and Philippines) are experiencing notable shortages of trained teachers or shortages in specific subject areas, such as math, science, and special education. There are also staffing gaps between high- and low-poverty schools. Even when trained teachers are hired, issues of retention are rampant due to a lack of satisfaction with existing working conditions and compensation. The quality of leadership in a school and working relationships with colleagues are major factors which influence commitment and motivation to remain in or leave a school (Day *et al.*, 2006).

In the United States, there is also a dramatic shortage of teachers of color – far fewer than the proportion of students of color in many classrooms. Although this shortage has been evident for decades, dramatic increases in the proportion of K-12 students of color and students who are English-language learners have drawn renewed attention to the need for a more diverse teaching staff. Colleges and universities must work collaboratively with K-12 schools to recruit diverse high school graduates into teacher-education programs so that they can earn educator credentials to work in K-12 schools. Historically, educators have been mostly first-generation college graduates and professionals, often coming from working-class families. Thus, recruiting future educators from among

lower income, students of color, or second-language learners may reduce the teacher shortage as well as address the need for greater diversity in the education profession.

In many Western European countries and the United States, long working hours and the increasing demand for student achievement are concerns among teachers and administrators alike but much more common in other countries (e.g., East Asia, Africa, and South America) are the low salaries, large class sizes, and poor facilities. Many educators must work two jobs to make a livable wage. In Mexico and Chile, teachers often teach in two different schools during the day and taxi between them to fulfill their assignments. Classes of 40–60 are the norm in many Asian countries, such as China and the Philippines, in contrast to 20–30 in the United States. Facilities in many places are overcrowded with insufficient materials, such as textbooks and desks. In some rural areas of Africa and other developing countries, there may be no facilities at all by Western standards. Teachers toil in all these circumstances, however, and provide instruction by any means possible.

Efforts are being made to address these problems by offering a whole range of inducements and supports. Signing bonuses have been used in the United States and the United Kingdom; induction programs are becoming commonplace in the United States; salaries are increasing, especially in East Asia due to improving economic conditions; and greater attention is being given to the quality of professional development. None of these is a panacea for the legitimate concerns of teachers worldwide but they reflect a responsive effort on the part of many countries to improve support for education.

Push for Business-Based Forms of Accountability

The forces of globalization that are shaping the business world have permeated the education field through accountability-driven national policies, which have shifted the focus from the processes of service delivery to the outputs of student achievement. These policies are top-down and threaten the professional prerogatives of educators at the local level by yoking accountability demands with prescribed curricula and policies. For example, most Asian countries have a centralized form of personnel administration which is described as a pyramid model with a central ministry of education that promulgates policy, programs, and logistics. Headmasters at individual schools are responsible for implementation of ministerial mandates in addition to school management, school and community relations, and instructional supervision. The pressure to improve student learning is substantial but is often constrained by the very programs and policies which are designed to extract it from the system.

Decentralized Leadership

Simultaneous to the push for greater accountability, there has been the contradictory trend toward greater decentralization with the hope that educators who are closer to the community will be more responsive to local conditions and that there will be greater community participation and support for the schools. This goal depends on the knowledge and skills of school leaders to negotiate these boundaries and, yet, often they have had little preparation for this increased autonomous role. In countries such as Denmark, New Zealand, and the Netherlands, this ideal is closer to a reality than in more hierarchical systems like those in the United States, France, and Germany where local autonomy is still relatively weak in most locations (Mulford, 2003).

Quality Instructional Improvement

Widespread changes throughout the world are taking place due to immigration, globalization, and economic restructuring; South Africa, Eastern Europe, and Asia are a few examples of these shifts. In many Asian countries, there has been increasing access to and quality of education due to improved economic conditions and a strong public commitment to education over the last 30 years. Enrollment of primary students is close to 100% in most countries but this rapid expansion has led to predictable problems with teacher and administrator quality. Central administrations are bloated and services, such as professional development, have not kept pace with the growth. While there are long-standing traditions of professionalism, especially in China and Japan, a greater focus on the understanding and delivery of high-quality instruction is predicted in the coming years for China, Pakistan, Vietnam, Indonesia, and other East Asian countries (Chapman, 2000) not unlike the current push for more effective instructional practices in the United States.

Summary

Personnel administration, as a specialization within educational administration, is a young and dynamic field of study encompassing a host of issues and considerations. The primary purposes of personnel administration, to attract, retain, develop, and motivate personnel to achieve organizational goals, are promoted currently through a complex array of personnel processes, policies, and practices reflecting its bureaucratic roots. Commonalities exist in the purposes and structural components of personnel administration across countries, but a host of converging expectations and pressures, especially cultural, shape the different meanings of those activities for educators. As a result, there are few best practices with universal utility due to the contextual interpretations of these activities but a push for greater decentralization and local autonomy to establish

professional learning communities seems to have wide appeal and shifts responsibility for many of these formerly centralized functions down to the school level so that personnel decisions are made to fit the local context and serve the needs of the existing learning community.

The Big Challenge: Leadership for Inclusion

M Ainscow and A Sandill, University of Manchester, Manchester, UK

© 2010 Elsevier Ltd. All rights reserved.

The issue of how to develop more inclusive forms of education is arguably the biggest challenge facing school systems throughout the world. In economically poorer countries, the priority has to be with the millions of children who never see the inside of a classroom. Meanwhile, in wealthier countries some young people leave school with no worthwhile qualifications, while others are placed in various forms of special provision away from mainstream educational experiences, and some simply choose to drop out since the lessons seem irrelevant to their lives.

Faced with this challenge, there is evidence of an increased interest in the idea of inclusive education. However, the field remains confused as to what actions need to be taken in order to move policy and practice in a more inclusive direction. Here, we explore possible ways forward, looking at what organizational conditions are needed in order to foster inclusive policies and practices, and what this means for the role of leadership.

Inclusive Education

In some countries, inclusive education is thought of as an approach to serving children with disabilities within general-education settings. Internationally, however, it is increasingly seen more broadly as a reform that supports and welcomes diversity among all learners. The argument developed here adopts this broader formulation. It presumes that the aim of inclusive education is to eliminate social exclusion that is a consequence of attitudes and responses to diversity in race, social class, ethnicity, religion, gender, and ability. As such, it starts from the belief that education is a basic human right and the foundation for a more just society.

More than a decade ago, the United Nations Educational, Scientific and Cultural organization (UNESCO) World Conference on Special Needs Education, held in Salamanca, endorsed the idea of inclusive education. Arguably, the most significant international document that has ever appeared in the special needs field, the Salamanca Statement argues that regular schools with an inclusive orientation are the most effective means of combating discriminatory attitudes, building an inclusive society and achieving education for all. Furthermore, it suggests that such schools can “provide an effective education for the majority of children and improve the efficiency and ultimately the cost-effectiveness of the entire education system” (p. ix).

During the subsequent years, there has been considerable activity in many countries to move educational policy and practice in a more inclusive direction but there is still considerable uncertainty as to how best to proceed. The confusion that exists arises, at least in part, from the fact that inclusion can be defined in a variety of ways. It is also important to remember that there is no one perspective on inclusion within a single country or school.

Given the confusion and uncertainties that exist as policymakers and practitioners seek to make sense of different perspectives, advancing toward the implementation of inclusive education is far from easy. Moreover, it must not be assumed that there is full acceptance of the inclusive philosophy. Consequently, as we consider ways of developing schools that are effective in reaching all children, it is necessary to recognize that the field itself is riddled with uncertainties, disputes, and contradictions. However, what can be said is that throughout the world, attempts are being made to provide more effective educational responses for all children, whatever their characteristics, and that, encouraged by the Salamanca Statement, the overall trend is toward making these responses within the context of general-educational provision (see the special edition of the *European Journal of Psychology of Education*, December 2006).

Inclusive Practice

A recent study, carried out by Ainscow, Booth, and Dyson in the United Kingdom, attempted to throw light on what needs to happen in order to develop inclusive practices in schools. It concluded that the development of inclusive practice is not, in the main, about adopting new technologies of the sort described in much of the existing literature. Rather, it involves social learning processes within a given workplace that influence people's actions and, indeed, the thinking that informs these actions. This led the authors to seek a deeper understanding of what these processes involve, using the ideas of Etienne Wenger, who provides a framework that can be used to analyze the development of practices in social contexts. At the center of this framework is the concept of a community of practice, a social group engaged in the sustained pursuit of a shared enterprise. This suggests that practices are ways of negotiating meaning through social action. Wenger argues, for example, that a particular strategy may be developed as part of a school's

planning activities and summarized in a set of guidance for action, providing a codified reification of intended practice. However, the meaning and practical implications of the strategy only becomes clear as it is used and discussed between colleagues.

The implication is that a methodology for developing inclusive practices must take account of such social processes of learning that go on within particular contexts. It requires a group of stakeholders to look for a common agenda to guide their discussions of practice and, at much the same time, a series of struggles to establish ways of working that enable them to collect and find meaning in different types of information.

Similarly important, therefore, is the development of a common language with which colleagues can talk to one another and indeed to themselves about detailed aspects of their practice. It seems, moreover, that without such a language, teachers find it very difficult to experiment with new possibilities. It has been noted, for example, that when researchers report to teachers what has been observed during their lessons they will often express surprise. Much of what teachers do during the intensive encounters that occur in a typical lesson is carried out at an automatic, intuitive level, involving the use of tacit knowledge. Furthermore, there is little time to stop and think. This is perhaps why having the opportunity to see colleagues at work is so crucial to the success of attempts to develop practice. It is through such shared experiences that colleagues can help one another to articulate what they currently do and define what they might like to do. It is also the means whereby taken-for-granted assumptions about particular groups of students can be subjected to mutual critique.

Research has drawn attention to certain ways of engaging with evidence that seem to be helpful in encouraging such dialog. This can help to create space for reappraisal and rethinking by interrupting existing discourses, and by focusing attention on overlooked possibilities for moving practice forward. Particularly powerful techniques in this respect involve the use of mutual observation, sometimes through video recordings, and evidence collected from students about teaching and learning arrangements within a school. Under certain conditions, such approaches provide interruptions that help to make the familiar unfamiliar in ways that stimulate self-questioning, creativity, and action. In so doing they can sometimes lead to a reframing of perceived problems that, in turn, draws the teacher's attention to overlooked possibilities for addressing barriers to participation and learning.

Here, the role of the school principal in providing leadership for such processes is crucial. Indeed, as a result of their extensive literature review, Leithwood and Riehl contend that developing people by providing intellectual stimulation has to be one of the core practices of effective

leaders. Lambert and her colleagues seem to be talking about a similar approach when they stress the importance of leaders gathering, generating, and interpreting information within a school in order to create an inquiring stance. They argue that such information causes disequilibrium in thinking and, as a result, provides a challenge to existing assumptions about teaching and learning.

All of this underlines the way norms of teaching are socially negotiated within the everyday context of the communities of practice within schools. In this sense, it is evidence of how the culture of the workplace affects how teachers see their work and indeed their students. It underlines the idea that the development of more inclusive approaches does not arise from a mechanical process in which any one specific organizational restructuring, or the introduction of a particular set of techniques, generates increased levels of participation. Rather, as we have argued, the development of inclusive practices requires processes of social learning within particular organizational contexts.

Organizational Factors

What, then, are the organizational conditions that can help foster such social learning? In other words, how can schools become more inclusive? Where writers have addressed these questions, they tend to give particular emphasis to the characteristics of schools which stimulate and support processes of interrogation and reflection. For example, Skrtic argues that schools with what he calls *adhocratic* configurations are most likely to respond to student diversity in positive and creative ways. Such schools emphasize the pooling of different professional expertise in collaborative processes. Children who cannot easily be educated within the school's established routines, are not seen as having problems, but as challenging teachers to re-examine their practices in order to make them more responsive and flexible. Other authors suggest organizational conditions – distributed leadership, high levels of staff and student involvement, joint planning, a commitment to enquiry, and so on – that promote collaboration and problem solving among staff, and which, therefore, produce more inclusive responses to diversity. Literature regarding educating children in multicultural contexts also highlights similar processes of meaning making, such as openness to experiment and innovate when resolving issues as they emerge, focusing on the needs of the individual child, and giving teachers the freedom to take initiative.

These themes are supported by a recent international literature review, carried out by Dyson and his colleagues, that examines the effectiveness of school actions in promoting inclusion. It concludes that there is a limited but by no means negligible body of empirical evidence about the relationship between school action and the participation of

all students in the cultures, curricula, and communities of their schools. In summary, it suggests that:

- Some schools are characterized by an inclusive culture. Within such schools, there is some degree of consensus amongst adults around values of respect for difference and a commitment to offering all pupils access to learning opportunities. This consensus may not be total and may not necessarily remove all tensions or contradictions in practice. On the other hand, there is likely to be a high level of staff collaboration and joint problem solving, and similar values and commitments may extend into the student body, and into parent and other community stakeholders in the school.
- The extent to which such inclusive cultures lead directly and unproblematically to enhanced student participation is not clear. Some aspects of these cultures, however, can be seen as participatory by definition. For instance, respect for diversity from teachers may itself be understood as a form of participation by children within a school community. Moreover, schools characterized by such cultures are also likely to favor forms of organization (such as specialist provision being made within the ordinary classroom, rather than by withdrawal from lessons) and practice (such as constructivist approaches to teaching and learning) which could be regarded as participatory by definition.
- Schools with inclusive cultures are also likely to be characterized by the presence of leaders who are committed to inclusive values and to a leadership style which encourages a range of individuals to participate in leadership functions. Such schools are also likely to have good links with parents and with their communities.
- The local and national policy environment can act to support or to undermine the realization of schools' inclusive values.

On the basis of this evidence, the Dyson review team suggest that attempts to develop inclusive schools should pay attention to the development of inclusive cultures and, particularly, to the building of some degree of consensus around inclusive values within school communities. This leads them to argue that school leaders should be selected and trained in the light of their commitment to inclusive values and their capacity to lead in a participatory manner.

In summarizing the current knowledge base on educational leadership, Leithwood and Riehl conclude that in diverse student environments, particular forms of leadership can be effective in promoting school quality, equity, and social justice through more powerful forms of teaching and learning, creating strong communities of students, teachers and parents, and nurturing educational cultures among families. Such approaches are congruent with the view that inclusion is essentially about attempts to embody particular values in particular

contexts. Unlike mechanistic views of school improvement, they acknowledge that decisions about how to improve schools always involve moral and political reasoning, as well as technical considerations. Moreover, they offer specific processes through which inclusive developments might be promoted. Discussions of inclusion and exclusion can help, therefore, to make explicit the values which underlie what, how, and why changes should be made in schools. Inclusive cultures, underpinned by particular organizational conditions, may make those discussions more likely to occur and more productive when they do occur. A helpful list of indicators in relation to this analysis is provided by the 'Index for inclusion,' a review framework for examining school factors that constitute barriers to learning and participation, developed by Booth and Ainscow.

Culture and Leadership

All of this underlines the importance of cultural factors. Cultures are about the deeper levels of basic assumptions and beliefs that are shared by members of an organization, operating unconsciously to define how they view themselves and their working contexts. The extent to which these values include the acceptance and celebration of difference, and a commitment to offering educational opportunities to all students, coupled with the extent to which they are shared across a school staff, relate to the extent to which students are enabled to participate.

Cultures can be seen as having a reality-defining function, enabling those within an institution to make sense of themselves, their actions, and their environment. Hargreaves argues that a current reality-defining function of culture is often a problem-solving function inherited from the past. In this way, today's cultural form created to solve an emergent problem often becomes tomorrow's taken-for-granted recipe for dealing with matters shorn of their novelty.

Changing the norms that exist within a school is difficult to achieve, particularly within a context that is faced with so many competing pressures and where practitioners tend to work alone in addressing the problems they face. On the other hand, the presence of children who are not suited to the existing menu of the school can provide some encouragement to explore a more collaborative culture within which teachers support one another in experimenting with new teaching responses. In this way, problem-solving activities gradually become the reality defining, taken-for-granted functions that are the culture of a school that is more geared to fostering inclusive ways of working.

The implication of all of this is that becoming more inclusive is a matter of thinking and talking, reviewing and refining practice, and making attempts to develop a more

inclusive culture. Such a conceptualization means that inclusion cannot be divorced from the contexts within which it is developing, nor the social relations that might sustain or limit that development. This suggests that it is in the complex interplay between individuals, and between groups of individuals, that shared beliefs and values and change occur, and that it is impossible to separate those beliefs from the relationships in which they are embodied.

Alternatively, some researchers argue that in order to bring about the cultural change that inclusion demands, it is essential to consider the values underlying the intended changes. Thus, cultural change is directed toward a transformative view of inclusion, in which diversity is seen as making a positive contribution to the creation of responsive educational settings. This involves developing the capacity of those within schools to reveal and challenge deeply entrenched deficit views of difference, which define certain types of students as lacking something. Writers who are involved in facilitating and evaluating such processes in schools repeatedly identify the role of leadership as critical for bringing about and sustaining such changes.

It seems, then, that the principle of inclusion is likely to require challenges to the thinking of those within a particular organization and, inevitably, this raises questions regarding forms of leadership. Lambert and her colleagues argue for constructivist leadership as a strategy for responding to learner diversity. This involves reciprocal processes that enable participants in an educational community to construct common meanings that lead toward a common purpose about schooling. They use this perspective to argue that leadership involves an interactive process entered into by both students and teachers. Consequently, there is a need for shared leadership, with the principal seen as a leader of leaders. Hierarchical structures have to be replaced by shared responsibility in a community that becomes characterized by agreed values and hopes, such that many of the control functions associated with school leadership become less important or even counterproductive.

Leithwood and Riehl refer to two approaches to school leadership, one with an orientation to student achievement and the other with a focus on meeting the needs of individuals. They contend that leaders serving diverse schools need to use both approaches in order to perform their role effectively. Others argue that school leaders need to strike a continual balance between concern for people, including teachers, students, parents, and the community that the school serves, and accountability toward government mandates.

Much of the literature on the role of leadership in relation to school improvement places emphasis on the importance of social relationships. It has been argued, for example, that leaders may structure staff working relationships in one of three ways: competitively, individualistically,

or cooperatively. Within a competitive structure, teachers work against each other to achieve a goal that only a few can attain; an individualistic structure exists when teachers work alone to accomplish goals that are unrelated to the goals of their colleagues; whereas, a cooperative structure exists when teachers coordinate their efforts to achieve joint goals. This means that, to maximize the productivity of a school, principals have to: challenge the *status quo* of traditional competitive and individualistic approaches to teaching; inspire a clear mutual vision of what the school should and could be; empower staff through cooperative team work; lead by example, using cooperative procedures and taking risks; and encourage staff members to persist and keep striving to improve their expertise.

The most helpful theoretical and empirical leads, however, are provided by Riehl, who, following an extensive review of literature, develops a comprehensive approach to school administration and diversity. She concludes that school leaders need to attend to three broad types of tasks: fostering new meanings about diversity; promoting inclusive practices within schools; and building connections between schools and communities. She goes on to consider how these tasks can be accomplished, exploring how the concept of practice, especially discursive practice, can contribute to a fuller understanding of the work of school principals. This analysis leads the author to offer a positive view of the potential for school principals to engage in inclusive, transformative developments. She concludes: "When wedded to a relentless commitment to equity, voice, and social justice, administrators' efforts in the tasks of sensemaking, promoting inclusive cultures and practices in schools, and building positive relationships outside of the school may indeed foster a new form of practice" (p. 71).

The Role of Networking

What emerges from the evidence we have summarized is the importance of forms of leadership that encourage social learning processes within particular contexts. Such processes can, we have argued, be stimulated by inquiry which fosters a greater capacity for responding to learner diversity. Achieving a deeper and more sustainable impact on the culture of schools is, however, much more difficult. This necessitates longer-term, persistent strategies for capacity building at the school level. It also requires new thinking and, indeed, new relationships at the systems level. In other words, efforts to foster inclusive school development are more likely to be effective when they are part of a wider strategy.

This has led to an increasing emphasis on the idea of sharing expertise and resources between schools. Such an approach is consistent with what has been called public

value management, with its emphasis on network governance. The origins of this approach can be traced to criticisms of the current emphasis in some Western countries on strategies drawn from private-sector experience. The formulation of what constitutes public value can only be achieved through deliberation involving key stakeholders and actions that depend on mixing in a reflexive manner a range of intervention options. Consequently, networks of deliberation and delivery are seen as key strategies. In education services, this implies the negotiation of new, interdependent relationships between schools, administrations, and communities. With this in mind, some researchers argue for system leadership. This requires senior staff to widen their sphere of engagement by interacting with other schools in order to develop lateral capacity building toward sustainable development.

Drawing on a series of studies, Ainscow and West present evidence from England suggesting that school-to-school collaboration can strengthen the capacity of individual organizations to respond to learner diversity. However, this does not represent an easy option for schools, particularly in policy contexts within which competition and choice continue to be the main drivers. Recent studies, for the most part, have focused on situations where schools have been given short-term financial incentives linked to the demonstration of collaborative planning and activity. They suggest that collaboration between schools can help to reduce the polarization of schools, to the particular benefit of those students who are marginalized at the edges of the system and whose performance and attitudes cause concern. There is evidence, too, that when schools seek to develop more collaborative ways of working, this can have an impact on how teachers perceive themselves and their work. Specifically, comparisons of practices can lead teachers to view underachieving students in a new light. Rather than simply presenting problems that are assumed to be insurmountable, such students may be perceived as providing feedback on existing classroom arrangements. In this way they may be seen as sources of understanding as to how these arrangements might be developed in ways that could be of benefit to other members of the class.

Concluding Remarks

This article has addressed what we see as the biggest challenge for countries around the world: that of developing more inclusive education systems. The approach we have outlined is not about the introduction of particular techniques or organizational arrangements. Rather it places emphasis on processes of social learning within particular contexts. The use of evidence as a means of stimulating experimentation, and collaboration within

and between schools, are seen as key strategies. Copland argues that inquiry can be the engine to enable the distribution of leadership that is needed in order to foster participation, and the glue that can bind a school community together around a common purpose.

All of this has major implications for leadership practice at different levels within schools and education systems. In particular, it calls for efforts to encourage coordinated and sustained efforts by whole staff groups around the idea that changing outcomes for all students is unlikely to be achieved unless there are changes in the behaviors of adults. Consequently, the starting point must be with staff members: in effect, enlarging their capacity to imagine what might be achieved, and increasing their sense of accountability for bringing this about. This may also involve tackling taken-for-granted assumptions, most often relating to expectations about certain groups of students, their capabilities, and behaviors.

Our argument is, then, based on the assumption that schools know more than they use and that the logical starting point for inclusive school development is with a detailed analysis of existing arrangements. This allows good practices to be identified and shared, while, at the same time, drawing attention to ways of working that may be creating barriers to the participation and learning of some students. However, as we have stressed, the focus must not only be on practice. It should also address and sometimes challenge the thinking behind existing ways of working.

The Educational Leader's New Work

P Gronn, University of Cambridge, Cambridge, UK

© 2010 Elsevier Ltd. All rights reserved.

Introduction

The term educational leader includes a potentially large and diverse category of people who exercise both formal and informal responsibilities for training, development, growth, and learning. Not only may such people be located in a range of educational settings and at a number of points in the life cycle of learning (i.e., from nurseries and preschools through to higher education), but they may also be employed in different workforce sectors of the economy. In the face of this scope and variety, some caution is therefore required to avoid oversimplified understandings of leadership. While the hallmark of leaders who warrant the description educational is probably an overarching commitment to the intrinsic worth of learning and development in the realization of human potential, the particular features that distinguish educationalists as leaders are less straightforward. Traditionally, leadership discourse has attributed the attainment of human purposes through collectively organized activity to the influence of one or a small number of strategically positioned individuals. Such attributions operate both retrospectively and prospectively: they provide explanations for the outcomes of past actions and are also expressed as expectations of people's future activities. Each set of attributions entails implicit theories of causation with regard to human conduct. In recent educational reform, particularly policies and measures concerned with the modernization of school education, where an imperative for change has become so strong, the weight of expectations attached to the agency of leaders and their leadership is large, perhaps even grossly inflated. Moreover, as indicated by a recent interest within the school leadership field in distributed leadership and organizational capacity building, expectations of the exercise of leadership have also spread well beyond the customary preserve of a few individuals. In Scottish schools, for example, it is currently anticipated that leadership will not only be provided by headteachers, but also by depute headteachers and principal teachers. Nationally, there are more than 14 000 educators in these three groups who, together, are officially designated as Scottish educational leaders (Scottish Executive Education Department, 2007: para 5.3.1).

Notwithstanding this heightened expectation of organizational leadership being diffused from senior level to mid-level and beyond in schools, in this article, attention is mainly focused on the work of headteachers

(an interchangeable title with principals). Apart from limitations of space, there are two reasons for this choice of focus. First, the amount of overall responsibility and accountability required of headteachers has become exceedingly high and demanding. Indeed, in a governance era of outcome-based and target-driven service delivery, the leadership anticipated of headteachers is also high-stakes leadership and arguably, the prominence accorded school leadership has never been greater. Second, perversely perhaps, at the same time as these role pressures on headteachers have increased, there is also accumulating evidence of difficulties in recruiting headteachers and principals of schools in both the government and nongovernment sectors in a number of countries; examples are Australia (Anderson *et al.*, 2007: 47–57), and England and Wales (Howson, 2007: 142–145). There may be a paradox in the uneasy coexistence of these two trends. That is, one unintended consequence of a strengthened attachment to leadership may be a diminution of teachers' willingness to become leaders – at least in sufficient numbers to replenish current and anticipated shortfalls of headteachers. In short, insofar as there is evidence of a global leadership conversation in education, this is occurring at two countervailing levels: vociferous exhortations about the salience of leaders and leadership on the one hand, yet nagging evidence of disengagement from leadership on the other. In the remainder of the article, I try to account for this paradox by developing the idea that educational leadership might profitably be understood as a form of greedy work (Gronn, 2003: 147–156).

Nature of Leadership Practice

All leadership practice is contextualized. Contexts for understanding leadership practice range from the global through societal to the immediate or situational. Globally and societally, a large and accumulating body of literature has emerged in the last two decades or so that has promoted the idea of leadership as virtuous conduct. Some of this material has been written for nonspecialist audiences and is widely accessible in magazines and books, while some of it is confined to scholarly publishing outlets. Still more of it has emanated from think piece discussion documents distributed by influential public sector agencies (e.g., Audit Scotland, 2005). Much of this overall corpus of publications, along with published memoirs and autobiographies of leaders, has provided a fertile

source for quotable quotes about leadership, recipe-style advice, and widely circulating and highly appealing claims to the effect that leadership matters, that leaders do the so-called right things, and that leaders turn around ailing and failing organizations. In conjunction with an extensive market for consultancy advice, this literature is evidence of the existence of a leadership industry. What may have commenced life in this industry as the promotion of a simple virtue, however, often ends up fueling a false promise of heroic leader exceptionalism (Gronn, 2004: 352).

There are two main ways in which this wider climate of expectations has filtered through to situational contexts of school leadership, in particular to redefine the role of headteachers. First, as school leaders, the work practices of heads are increasingly governed by performance standards. Second, the productivity of heads and their schools has been radically reshaped by a learning improvement agenda. Both developments reflect the significance that politicians, policymakers, and opinion leaders generally have attached to accountability.

Standards are a means of measuring the quality of performance, although they serve different purposes for different groups. When they are utilized by professional bodies, for example, standards provide a vehicle for professional learning and recognition of quality and in the case of leadership, an assumption is that "prospective and established school leaders should keep up with developments in research and knowledge in their area of teaching and meet standards for accomplished practice" (Ingvarson *et al.*, 2006: 41). If they are adopted by employing authorities and agencies, on the other hand, standards are a means by which leaders fulfill their contractual obligations as employees. In the second sense, standards offer an alternative to satisfactory tertiary course completion as evidence of professional competence. They may be used by employers not merely to accredit and regulate the actions of incumbent school heads, but also to influence their ongoing professional preparation, selection, and appointment. To some extent, these latter developments express the willingness of employers to commit to preferred normative prototypes or profiles of headteachers and embody these in statements of standards. This trend has been characterized as designer leadership (Gronn, 2003: 7).

The notion of an improvement agenda refers to the link that is increasingly being made between leadership and learning. Improvement lends itself to a number of different interpretations. Equally, there are different ways of measuring and providing evidence of improvement. Essentially, improvement is about the benefits and gains, both immediate and long term, that accrue to students as a result of their learning. At the heart of the leadership-learning link, there is a presumption about causality; that is, directly through their own actions and/or through the indirect influence of their actions on colleagues, school

leaders will enhance the learning of students. Typically, performance assumptions and targets in relation to improvement find practical expression in national curriculum statements. An example from Scotland is the *Curriculum for Excellence* (Scottish Government, 2006). Here, the leadership for learning connection finds practical expression in two ways: fostering an environment for learning and providing arrangements for learning that enshrine five core curriculum values, which in turn are consistent with a series of seven curriculum design principles. In regard to these two measures (i.e., culture building and the management of learning), the expectation of school heads by those responsible for monitoring school performance (in Scotland, Her Majesty's Inspectorate in Education) is that heads will initiate site-based changes to facilitate improved learning. These might entail new structures, processes, procurement of additional resources, and other measures that may be calculated to build school-wide capacity.

Determinants of Leadership Practice

To what extent may these kinds of expectations about the causal role of leaders be justifiable? Much of the thinking that underpinned the euphoria associated with the leadership of high-profile individuals in the recent past was grounded in questionable assumptions. The main reason for this claim is that expectations of leaders rest on a cognitive misattribution, namely an exaggerated understanding of the agency of leaders and their scope for autonomous action. (Interesting in this connection is the fact that in Australia, sections 14k and 31k of the Schools Assistance (Learning Together – Achievement through Choice and Opportunity) Act, 2004 (Act No. 135) specify as one of the conditions of federal funding of schools a commitment to strengthened principal autonomy by state governments and nongovernment authorities.) The reality of leadership practice, by contrast, is that the autonomy of leaders is never absolute and is always circumscribed. This is partly because there are limits to individual and collective human capacity. As Simon (1976/1945), an early writer in the field, pointed out, due to their inherent cognitive limitations, executives typically satisfice rather than maximize when they make decisions. That is, because human rationality is bounded and because it operates within an environment of information that is less than optimal, a particular course of action can only ever hope to be "satisfactory or good enough" (Simon, 1976/1945: xxix). Writing at about the same time as Simon, Hayek (1945: 520) reinforced this point when he exposed the fallacy of what he termed omniscient minds. That is, there is no one mind that is capable of knowing all that needs to be known about a particular problem or a range of problems. In addition to these inherent limitations on

capacity, Stewart's (1982) model of managerial practice has highlighted the highly contingent and circumscribed nature of leader autonomy. (Although this model was originally couched in the language of management, in a recent symposium on her work, Stewart (2003: 202) has affirmed that it applies equally to leaders.)

In Stewart's model, the choices made by managers and leaders are determined by the demands and constraints that shape their work. Demands refer to the components of a role that, as it were, go with the territory. These set the framework within which leaders act and are primarily manifest in job descriptions and role prescriptions. They are "what must be done" (Stewart, 1982: 9). Thus, in the early 2000s in the state of Victoria, Australia, there were 52 bullet-point accountabilities in 11 program areas for principals (Department of Education, Employment and Training, 2001: 47–51). Constraints impinge on leaders at a number of contextual levels (e.g., systemic, organizational, and situational). These constraints comprise factors that are both internal and external to an organization, and which impose limits on what jobholders can do. Some constraints, particularly external factors, may be standardized across a system and are experienced uniformly, regardless of particular settings. Examples include legal frameworks (e.g., industrial relations, health and safety) and national and local authority policies and procedures (e.g., personnel, curriculum, evaluation, and finance). Other factors, such as the quality and quantity of a school's overall resources, may be experienced as more or less constraining. Examples of such relativities and their impact might include the collective body of expertise and experience of teachers, rates of teacher retention and turnover, and the strength of community support and social capital, all of which contribute to the improvement (or nonimprovement) of students' learning. For Stewart (1982: 9), choices represent a domain of opportunities. Choices may be understood in two senses. First, there may be discretion for managers and leaders to do different things (i.e., perform self-chosen, nonmandated work). In this way, proactive or innovative individuals may modify their immediate or wider role sets' expectations of what they should do (Fondas and Stewart, 1994: 97). Second, there may be scope for leaders and managers to do things differently. As an example, two executives who are required to perform the same work may do so in sharply contrasting ways (see, e.g., De Roche, 1994).

It is the latitude for choice and discretion that provides leaders with their sources of work satisfaction, fulfillment, and self-actualization. On the other hand, it is when the incentives to perform their work begin to dry up, and the constraints and demands cease to be enabling and become burdensome, that leaders come to experience their work as greedy and all-consuming. At that point, some form of disengagement may become an option.

Satisfaction in Leadership Practice

In addition to the expectations, demands, constraints, and choices that frame the work of leaders, leadership practice requires a significant investment of personal resources. In keeping with other forms of service work, perhaps the most important of these resources is emotional labor (Hochschild, 1983). As with other occupational commitments, people tend not to become leaders by default or to fall automatically into leadership roles. Rather, they make conscious decisions to commit themselves to undertake role responsibilities. For that commitment to occur, they have to engage in the emotion work associated with role transition and the requirements of career mobility.

There are at least two senses in which leadership entails emotional labor. First, to the extent to which leadership is a people-centered activity, the work itself requires the self-aware management of one's own emotions as a leader along with those of one's colleagues and other groups. This requirement may entail the conscious containment (or even denial) of one's own feelings and emotional needs, and it may also mean that one becomes an object of or container for the projected and displaced emotions (both positive and negative) of colleagues. Second, leadership also entails emotional labor because it is about identity work. That is, to be able to make the transition to leadership and undertake the psychological commitment that is required necessitate a depth of self-engagement and identification with a role such that self and role become integrated. It is for this reason that individuals may sometimes be said to lose themselves in their work (Kahn, 1992: 326). Thus, in one study of principals and deputy principals in Australia (Victoria, Department of Education and Training, 2004), 750 principal class respondents were found to have a very high sense of vocationalism (i.e., in the traditional sense of a calling to serve other people). That is, they claimed that they experienced their jobs as a way of life to which they were very strongly committed personally and professionally. Such a depth of commitment, however, was found to leave people potentially vulnerable to emotional overload or stress. With about 80% of the respondents in this same study reporting high levels of stress (Victoria, Department of Education and Training, 2004: 31), there was a strong possibility that their current vocational commitments might be transferred to other occupations (Victoria, Department of Education and Training, 2004: 26). These findings suggest that the point at which sources of dissatisfaction begin to outweigh sources of satisfaction in service work such as leadership, particularly in a high-stakes accountability climate, is very finely balanced. If so, then a key question that arises is: When do self-actualization, the realization of one's values as a leader, and the desire to give expression to one's identity and to serve others begin to give way in the face of emotional wear and tear, a sense of lack of support, and perhaps even abandonment?

Dissatisfaction in Leadership Practice

There are a number of discontents which may cause leaders, particularly headteachers, to experience their work as a form of servitude. In instances where this servitude is sufficient for heads to disengage, their decisions to do so rest on a combination of factors (Lacey and Gronn, 2007). In light of current concerns about headship shortages, however, two factors are especially worthy of comment. These are work intensification and risk.

In relation to Stewart's three-mold model of managerial and leadership work, intensification refers to an increase in the volume and complexity of the demands on leaders. There are three reasons why such an increase tends to be experienced as intensified: first, expansion of the demands that occupy a leader's role space is unlikely to be accompanied by the augmented resources required to complete them; second, the time frames within which these demands have to be accomplished are invariably short; and third, numerous colleagues with expertise relevant to the particular task demands have to be consulted. School heads compensate for the existence of role overload by working longer hours and by encroaching on times otherwise set aside for personal and family matters. This mode of response to greedy work demands has fueled concerns with work-life balance and with occupational well-being. Moreover, experienced heads are conscious of the potentially negative impact of their modeling of work routines on prospective leaders within their own schools (Gronn, 2003: 51–60). Work intensification also has serious consequences for the size and sustainability of headteacher roles. That is, the design of headship may need to be rethought with a view to reducing the level and scale of its demands; otherwise, the widespread negative impact of heads' intensified work may be compounded if and when teachers feel discouraged from becoming leaders. Risks may provide a further disincentive to becoming a leader. With the devolution of responsibilities to schools, headteachers find themselves enmeshed in a set of unresolved tensions concerning risk taking. Encouraged to take risks by apologists with high expectations of leadership, on the one hand, the reality for them, on the other, is that some risks may be more acceptable (politically and in other ways) than others. Their difficulty is in not knowing in advance which those risks are likely to be. With the possibility that actions or initiatives may go pear shaped, and with the onus on a headteacher in such circumstances to show cause, there is a strong incentive in an accountability culture which names, blames, and shames, for school heads to play safe. In short, with proactivity and risk aversion potentially at odds, the kinds of heightened expectations of leadership identified at the outset of this article may prove self-defeating.

Summary

This article has reviewed a range of recent developments which have redefined the work of headteachers. This redefinition process has been a core component of the modernizing of schooling and has occurred primarily as a result of recasting the work of headteachers as leaders in preference to an older, established discourse of managers or administrators. The focus was mainly on some key situational imperatives experienced by headteachers, along with a number of intended and unintended consequences that have emerged from this new work order of leadership. These outcomes have forcefully highlighted a gap between the rhetoric of plausibility invoked by its apologists to justify the reform and reconstruction of site-based activity and the reality of on-the-ground leadership practice experienced by role incumbents. The indications are that this gap is likely to persist into the foreseeable future.

PREFACE

A preface usually provides a brief introduction to a work, intended to set the stage, provide some background insight, and whet the appetite of the reader. In our case, however, this preface has to address a fundamental question, one that was in our minds at the time we were recruited as Editors-in-Chief for the International Encyclopedia of Education. The question was “Why do we need an Encyclopedia? Its subtext was inspired by the ever-growing, ever-popular Internet. We believe that *this* Encyclopedia is desperately needed and will become a valued resource in education and associated social sciences and arts. The reasons are intellectual and procedural. Anyone with a modicum of knowledge knows that finding and trusting information gleaned from the Internet are two separate actions. The reliance on browsers to help discover references and comments result in resources based on popularity not quality. Pithy titles catch the eye and references rise in the ranks of browser searchers. Related to this is the “editing” in the Internet realm of populist efforts at encyclopedia, references, and other compilations. Once again, after removing offensive material, the accuracy, completeness, lack of bias, and other provenance for entries simply do not exist. Experienced researchers in education can sort through and make intelligent choices. Novices and many journeyman, or practitioners, parents, and policy makers cannot. Contrast how this Encyclopedia was built. Key domains of educational research were identified, and a tentative list of sub-domains or useful applied areas was posited. Then the Editors-in-Chief (apologies for the awkwardness of the term) identified the leading researcher in a particular domain, and with surprisingly little effort, recruited them to participate. They in turn identified the two best researchers in a sub-domain, such as formative assessment or the training of pre-school teachers. The authors of the sections of the Encyclopedia do not represent a collective group of friends and acquaintances, although friendships have been made. Rather they embody a deep and broad scholarly community. The difference from compiled Internet resources is the built-expertise and intellectual engagement of the authors. The summary of the developments and futures in their personal areas of scholarship have been filtered through their years of experience, both as scholars and communicators. Quality, then, is endemic to each piece, developed through this top-down identification of expertise, and made indelible by the bottom-up application of high standards from people leading the sub-domains – the authors, and the domains themselves, the section editors.

On a procedural level, the publishers early committed to the notion that this Encyclopedia would also be an online resource, and access would be available through print, for those with strong bookcases and the persisting love of turning real pages. The Internet version will allow multiple prisms through which the reader may access articles and provide, as it were, an emulation of the Internet in our field, albeit bounded by expertise and high quality.

What must be underscored in the assessment of this effort are the Editors-in-Chief and the publishers’ commitment to find excellence worldwide. We tried very hard to persuade notable scholars from all parts of the world to make contributions. Less than to fulfill the title of “International,” we were on the hunt for perspectives that would enrich the scope and depth of the sections. Our section editors put in enormous time attempting to find the best in the field, wherever they resided. Yet, not everyone is in the volume. Some were overcommitted. Many were not fully confident of their English, and the automated translation software has not yet met standards for technical writing. We believe that such writing and editing tools will make the outreach to an even broader International group of scholars possible in future revisions, or online updates. Furthermore, the birth of the World Educational Research Association (in 2009) will provide a better set of interlocking networks to find and evaluate scholarship from any place on the globe.

Finally, the scope of the effort must be acknowledged: 28 section editors, 926 articles were commissioned, drafted, reviewed, redrafted, edited, and put together in the space of four years. The publishers underwent some internal changes, and alterations in management. We as Editors-in-Chief, changed roles, moved, and also had to keep our own research and development enterprises afloat. Deadlines wobbled; authors dropped from view and had to be replaced.

Yet, at times frustrating as all development is, we find the final product exhilarating. We are enthusiastic not simply because it came into being at all, but because the collective light of the minds that wrote have left a bright resource for the future, one that will impact the way our colleagues understand and experience the educational knowledge, improvement, and impact in the future.

HOW TO USE THE ENCYCLOPEDIA

The International Encyclopedia of Education is intended for use by students, research professionals, and interested others. Articles have been chosen to reflect major disciplines in the study of education and common topics of research by academics in this domain. Each article serves as a comprehensive overview of a given area, providing both breadth of coverage for students, and depth of coverage for research professionals. We have designed the encyclopedia with the following features for maximum accessibility for all readers.

The contents of the encyclopedia are arranged alphabetically by section, and within sections, alphabetically by article. The Subject Index is located in Volume 8. Some topics are covered in a multitude of articles from differing perspectives, while other topics may have only one entry. We encourage use of the index for access to a subject area, rather than use of the Contents list alone, so that a reader has a full notion of the coverage of that topic.

The articles include cross-references to other related encyclopedia articles, suggested further readings where applicable, and many contain relevant websites for additional information. We encourage readers to use the cross-references to locate other encyclopedia articles that will provide more detailed information about a subject.

The Further Reading sections include recent secondary sources to aid the reader in locating more detailed or technical information. Review articles and research articles that are considered of primary importance to the understanding of a given subject area are also listed. These suggested further readings are not intended to provide a full reference listing of all material covered in the context of a given article, but are provided as next steps for a reader looking for additional information.

VOLUME 1

A

Adult Education

Adult Education Overview	<i>K Rubenson</i>	1
--------------------------	-------------------	---

Adult Education – Adult Learning, Instruction and Program Planning

Adult Learning	<i>S B Merriam</i>	12
Adult Learning and Instruction: Transformative Learning Perspectives	<i>P Cranton</i>	18
Adult Learning in a Biographic Perspective	<i>L West</i>	25
Adult Learning, Instruction and Programme Planning: Insights from Freire	<i>P Mayo</i>	31
Characteristics of Adult Learning	<i>K Illeris</i>	36
Informal Learning: A Contested Concept	<i>P Hodgkinson</i>	42
Organizational Learning	<i>P-E Ellström</i>	47
Program Planning	<i>A L Wilson and R M Cervero</i>	53
Workplace Learning Frameworks	<i>S Billett</i>	58

Adult Education – as a Field of Study

Class Analysis in Adult Education	<i>T Nesbit</i>	64
Gender Analysis	<i>J Stalker</i>	70
Race and Ethnicity in the Field of Adult Education	<i>J Johnson-Bailey and D Drake-Clark</i>	77
Trends in Workplace Learning Research	<i>T Fenwick</i>	83

Adult Education – Concepts

Lifelong Learning	<i>J Field</i>	89
Rewriting the History of Adult Education: The Search for Narrative Structures	<i>B J Hake</i>	96

Adult Education – Domains and Provision

Adult Basic Education: A Challenge for Vocational Based Learning	<i>R Höghelm</i>	102
Adult Literacy Education	<i>L Tett and R St.Clair</i>	107
Citizenship and Immigrant Education	<i>D Schugurensky</i>	113
Community Based Adult Education	<i>B Connolly</i>	120
Continuing Professional Education: Multiple Stakeholders and Agendas	<i>R M Cervero and B J Daley</i>	127
Financing of Adult and Lifelong Learning	<i>Å Sohlman</i>	133
Labor Education	<i>K Forrester</i>	139
Learning Cities and Regions	<i>C Duke</i>	144
Museums as Sites of Adult Learning	<i>R S Grenier</i>	150
Overview of Lifelong Learning Policies and Systems	<i>D-B Kwon and C H O Daeyeon</i>	156
Popular Adult Education	<i>S Tøsse</i>	162
Provision of Prior Learning Assessment	<i>P Andersson</i>	169
The Age of Learning: Seniors Learning	<i>P Jarvis</i>	175
University Adult Continuing Education: The Extra-Mural Tradition Revisited	<i>M Slowey</i>	183

Adult Education – Economy and Society

Adult Education and Civil Society	<i>J Crowther and I Martin</i>	191
Adult Education and Nation-Building	<i>S Walters</i>	198
Economic Outcomes of Adult Education and Training	<i>A Ferrer and W C Riddell</i>	204
Health and Adult Learning	<i>P Bélanger and M Robitaille</i>	211
Modernization Processes and the Changing Function of Adult Learning	<i>H S Olesen</i>	217
The Political Economy of Adult Education	<i>G Rees</i>	223
Wider Benefits of Adult Education	<i>R Desjardins and T Schuller</i>	229

Adult Education – Participation

Barriers to Participation in Adult Education	<i>K Rubenson</i>	234
Participation in Adult Learning	<i>R Desjardins</i>	240

C**Comparative Education**

Comparative and International Education: English-Language Scholarly Publications	<i>D Post and M Fedri</i>	251
Comparative Education: Philosophical Issues and Concepts	<i>M Mason and C W Evers</i>	257
Comparative Education: Societies and Associations	<i>M Bray</i>	266

Curriculum Development

Curriculum and Religion	<i>C Kapitzke and P Graham</i>	272
Gender and Curriculum	<i>J Marsh</i>	277
Local Teacher-Based Curriculum Development	<i>M D Osborne and H B Barker</i>	283

Curriculum Development – Contexts

Curriculum and Human Rights	<i>C Lohrenscheit</i>	287
Curriculum and the Education of Cultural and Linguistic Minorities	<i>S May</i>	293
Curriculum in Postcolonial Contexts	<i>A Hickling-Hudson</i>	299
Curriculum, Economic and Cultural Development	<i>A Rampal</i>	307
Globalization and Curriculum	<i>R Dale</i>	312
Popular Culture	<i>K Schultz and R Throop</i>	318

Curriculum Development – Evaluation and Research

An Overview of Research in Curriculum Inquiry	<i>F M Connelly and S J Xu</i>	324
Curriculum Evaluation: Approaches and Methodologies	<i>V Klenowski</i>	335
Curriculum Studies, Discourse Analysis, and the Construction of Historical Time	<i>J Laspina</i>	342
Curriculum Use in the Classroom	<i>M Ben-Peretz and B Eilam</i>	348
The Roots and Routes of Teacher-Based Action Research and Curriculum Inquiry: An Historical Perspective	<i>L G Putney and J L Green</i>	355

Curriculum Development – Planning and Development

Curriculum and Syllabus Design	<i>A Woods, A Luke, and K Weir</i>	362
Curriculum and the Publishing Industry	<i>J Larson, A-R Allen, and D Osborn</i>	368
Curriculum and Teacher Change	<i>J G Ladwig</i>	374
Curriculum Governance and Planning	<i>B Levin</i>	379
Curriculum Planning and Systems Change	<i>Z Deng</i>	384
Curriculum, Digital Resources and Delivery	<i>Y Zhao, G Zhang, and C Lai</i>	390
Textbook Development and Selection	<i>P Shannon</i>	397

Curriculum Development – Subject Matter

Curriculum and Globalization: Higher Education	<i>K H Mok</i>	403
Curriculum Development as Subject Matter: Social Studies	<i>J Brophy and J Alleman</i>	411
Curriculum Development in the Area of Reading	<i>C L Madda and T E Raphael</i>	415
Curriculum in the Arts	<i>C M Thompson, L Bresler, and T E Costantino</i>	423
Curriculum: Foreign Language Learning	<i>Angel M Y Lin</i>	428
First Language Learning	<i>T Rogers and L Moffatt</i>	435
Learning a Second Language in First Language Environments	<i>E Bernhardt and D J Tedick</i>	441
Literature	<i>S Hynds</i>	447
Mathematics	<i>B Kaur and C P Vistro-Yu</i>	453
Physical Education and Sports	<i>D Kirk</i>	459
Primary and Elementary/Middle Grades Reading	<i>D E Alvermann and C A Mallozzi</i>	464
Science	<i>Y Kali and M Linn</i>	468

Curriculum Development – Theory

Bilingual Learning (Learning L1 and L2 in an L1 and L2 Environment)	<i>D Schwinge</i>	475
Curriculum and Complex Systems Theory	<i>W-M Roth and J Thom</i>	481

Curriculum and Constructivism	<i>B Davis and D Sumara</i>	488
Curriculum and Critical Theory	<i>L Yates</i>	494
Curriculum and Poststructuralist Theory	<i>J L Miller</i>	499
Curriculum and Structuralist Sociology: The Theory of Codes and Knowledge Structures	<i>J Muller and J Gamble</i>	505
Curriculum Reform	<i>R Gilbert</i>	510
Early Childhood Curriculum and Developmental Theory	<i>S M-Y Lim and C Genishi</i>	514

D

Demography and Social Change

An Evaluation Framework for E-Learning Effectiveness in the Arab World	<i>W AbuSneineh and M Zairi</i>	521
Globalization and Social Justice in Higher Education	<i>E Kimura-Walsh</i>	536
Racial Inequality and the Economic Payoffs of Higher Education	<i>S A Lachtman</i>	542
School Health Education	<i>J S Yang</i>	547

Demography and Social Change – Demography

A Paradigm of Contradictions: Racism and Science Education	<i>B A Brown and J W Mutegi</i>	554
Africana Studies: Past, Present And Future	<i>B R Hare, A Young, J B Stewart, and D P Aldridge</i>	565
Beyond Black Nationalism to Black Internationalism: The Compelling Case for Examining Black Educational Challenges Globally	<i>K Freeman</i>	573
Beyond Racial, Ethnic, and Gender Bias in Education Statistics	<i>J T Lott and C Bennett</i>	581
Caste and Education in India	<i>G G Wankhede</i>	589
Demography, Community, and the Education of Asian American and Pacific Islander Students	<i>R T Teranishi</i>	595
Educational Attainment and Mortality Differentials	<i>H D Horton, L Hixson, and S M Monnat</i>	602
Educational Opportunity and Latino/Chicano College Choice: New Findings, and Theoretical Perspectives	<i>M A Ceja and P A Pérez</i>	610
Ethnic Minority Identity and Educational Outcomes in a Rising China	<i>G A Postiglione</i>	616
Ethnic Studies and Women's Studies: From the Past to the Present, Providing a Space in the Academy for Scholarship Focused on the Histories and Experiences of Marginalized People	<i>C A Brown</i>	623
Gender Equity in Higher Education: Challenges and Celebrations	<i>L Morley</i>	629
Locating Space and Place in the College Access Debate: New Tools for Mapping and Understanding Educational Inequity and Stratification	<i>B Cantwell and J F Milem</i>	636
Public Policy and Inequality in Postsecondary Opportunity: Educational Statistics and the Failure of Education Reform	<i>E P St. John, K Williams, and K Moronski</i>	649
The Education of Indigenous Students	<i>J W Tippeconnic and S C Faircloth</i>	661
The Health Advantages of Educational Attainment	<i>G Y Dinwiddie</i>	667
To Go or Not to Go: Access and Barriers to Ethnic Minority Participation in Higher Education within the United Kingdom	<i>P Brug and T L Oliver</i>	673
Universal Secondary Education and the Two-Tiered School System in the English-Speaking Caribbean	<i>P Anderson and J Devonish</i>	679
Women of Color in Science, Technology, Engineering and Mathematics (STEM): Refining the Concepts, Reframing the Issues	<i>C B Leggon</i>	686

Demography and Social Change – Social Change

Educational Diversity in U.S. Law Schools	<i>C E Daye, A T Panter, W R Allen, M E Deo, and L F Wightman</i>	691
Educational Reform	<i>F Lopez-Segrera</i>	698
Emergence of For-profit Higher Education	<i>X Li</i>	705
Engaged Education: Experiential Learning, Intensive Field Experiences, and Social Change	<i>T R Rone</i>	711
Higher Education and Social Change in Mexico	<i>A Mungaray, G Estrella, P Moctezuma, and M Ramírez-Urquidy</i>	719
The Changing Role of the State in Higher Education	<i>K Gürüz</i>	728
The Role of the State in School Reform: Responding to Increasing Ethnic Diversity in Britain	<i>P Ratcliffe</i>	737
Transforming Mindsets Through Education for Sustainable Development	<i>V M Segovia</i>	746

Demography and Social Change – Sociology

Achievement Motivation in Ethnic Minority Youth	<i>S Graham and E Bryant</i>	753
Affirmative Action and Higher Education in Brazil	<i>J T dos Santos and D M Queiroz</i>	760
Black in White: Black Students at White and Black Colleges	<i>L Evans and J R Feagin</i>	767
Bologna Process: On the way to a Common European Higher Education Area	<i>A V Rezaev</i>	772
Critical Race Theory in Education Research	<i>R Vue and C B Newman</i>	779
Cultural Diversification and Japanese Education: Social Constructions of the New Diversity	<i>R Tsuneyoshi</i>	787
Education in War Countries: A Disempowerment of Society	<i>J L Nkata</i>	793
Educational Attainments of U.S. Black Males and Females: 1971 to 2003	<i>F B Bonner, M-C Jipguep-Akhtar, and R J Harrison</i>	799
Educational Preparation: Fostering the Self-Efficacy and Resilience of Urban Adolescent Youth	<i>M B Spencer and B Tinsley</i>	806
HIV Education for Low-Literate People: Transforming Students and Communities through Paulo Freire's Praxis and the Pedagogy of Action	<i>N Z Haniff</i>	814
How Are Discussions of Interdisciplinary Studies Linked to Diversity Discourse?	<i>C N Spence</i>	823
Identifying Patterns of Doctoral Attrition Across Academic Fields	<i>A James, K J Fosnacht, E B Stolzenberg, and D Thirumalai</i>	827
Male Underachievement in Education Across the Globe: A Shift in Paradigm for Gender Disparities Regarding Academic Achievement	<i>J F L Jackson, J L Moore III, and R A Leon</i>	838
Noncognitive Measures for Higher Education Admissions	<i>W E Sedlacek</i>	845
Peace Education	<i>J Page</i>	850
Remote Control: Africa's Development and Outflow to Developed Nations of Technical Talent	<i>F Haniff</i>	855
Scholar-Baller®: Student Athlete Socialization, Motivation and Academic Performance in American Society	<i>C K Harrison, S Bukstein, J Mottley, E Comeaux, J Boyd, C Parks, and D Heikkinen</i>	860
Service-Learning and Diversity as Mediums to Foster Civic and Community Engagement in Undergraduates	<i>L Oseguera</i>	866
Success and Failure in Education and Criminal Justice: Identifying Common Mechanisms	<i>S Ramirez and A Harris</i>	874
The History of Education: Race and Education	<i>J O Jewell</i>	881

Education of Professionals

An Overview of Accreditation, Certification, and Licensure Processes <i>J J Norcini and M van Zanten</i>	1
Educating America's Military Officers <i>M H Adamshick</i>	7
Education for Architecture in the United States and Canada <i>S Schreiber</i>	13
Education for Medicine <i>M B Anderson</i>	19
Education for the Legal Profession <i>J W Wegner</i>	25
Education of Clergy <i>D O Aleshire</i>	31
Framing Professions Education <i>P S O'Sullivan</i>	37
Issues in Accounting/Business Education <i>W H Gijsselaers and R G Milter</i>	39
Professions – Engineering <i>J Heywood</i>	45
Professions – Health-Related <i>G M Jensen and C B Royeen</i>	51
Professions – Pharmacy <i>D E Beck</i>	58
Teaching for the Complex Practice of Nursing <i>P Benner and M Sutphen</i>	65
Veterinary Education <i>K M Edmondson</i>	71

Education Research Methodology: Quantitative Methods and Research

Abductive Research Methods <i>B D Haig</i>	77
Field Experimentation in Education <i>M A Constan</i>	83
Internal Validity <i>M H Clark and S C Middleton</i>	90
Methods for Approximating Random Assignment <i>B Schneider and S-K McDonald</i>	97
Methods for Approximating Random Assignment: Regression Discontinuity and Propensity Scores <i>L M Scheier</i>	104

Multitrait–Multimethod Designs	<i>M Bong and S Hong</i>	111
Multivariate Longitudinal Data Analysis	<i>H Liu and L Chang</i>	120
Quasi-Experimentation: Two Group Design	<i>E Hong</i>	128
Regression Discontinuity Designs	<i>A Kelava, S Rohrmann, and V Hodapp</i>	134
Sampling	<i>R S Brown</i>	142
Statistical Conclusion Validity	<i>P L Busk</i>	147
Survey Research Methods	<i>A Fink</i>	152

Educational Assessment

An Overview of Educational Assessment	<i>M James</i>	161
Assessment and the Evaluation of Institutional Effectiveness	<i>S M Thomas</i>	172
Assessment in Schools – Dispositions	<i>R D Crick</i>	181
Assessment in Schools Related To Literacy: Reading	<i>K J Topping</i>	189
Impact of Assessment on Students' Learning Strategies and Implications for Judging Assessment Quality	<i>M Segers, F Dochy, and D Gijbels</i>	196

Educational Assessment – Assessment Activities

Alternative Assessment	<i>G Stobart and C Gipps</i>	202
Classroom Assessment Tasks and Tests	<i>J Phelan and J Phelan</i>	209
Dynamic Assessment	<i>J G Elliott, E L Grigorenko, and W C M Resing</i>	220
Instructional System Provided Feedback	<i>H F O'Neil, S Chuang, and T Huang</i>	226
Peer and Self-assessment	<i>C Harrison</i>	231
Portfolio Assessment	<i>V Klenowski</i>	236
Records of Achievement: Beyond Traditional Tests	<i>P Broadfoot</i>	243

Educational Assessment – Assessment in Domains

Assessment in Higher Education	<i>D R Sadler</i>	249
Assessment in Schools – Affective Domain	<i>M Ventura, R D Roberts, and M Zeidner</i>	256
Assessment in Schools – Creative Subjects	<i>T E Costantino and L Bresler</i>	262
Assessment in Schools – Learning to Learn	<i>A Hautamäki, J Hautamäki, and S Kupiainen</i>	268
Assessment in Schools – Literacy Writing (Extended)	<i>J M Parr and L Earl</i>	273
Assessment in Schools – Mathematics	<i>M Brown and J Hodgen</i>	279
Assessment in Schools – Oracy	<i>A L Bailey</i>	285
Assessment in Schools – Primary Science	<i>W Harlen</i>	293
Assessment in Schools – Secondary Science	<i>J Shemwell, A Fu, M Figueroa, R Davis, and R Shavelson</i>	300
Assessment in Schools – Technology Education and ICT	<i>A Jones, B Cowie, and J Moreland</i>	311
Assessment in the Early Years	<i>M J Drummond</i>	316
Assessment in the History, Civics and Social Studies Domains	<i>P G Avery</i>	323
Assessment in the Workplace of Performance, Developing Expertise and Competence	<i>A J Brown</i>	330
Assessment in Vocational Education	<i>K Ecclestone</i>	337

Educational Assessment – Concepts and Issues

Assessing Group Work	<i>M Galton</i>	342
Assessment and the Regulation of Learning	<i>L Allal</i>	348
Challenges of Developing and Implementing Formative Assessment Practices in Schools	<i>R Sutton</i>	353
Formative Assessment	<i>P Black</i>	359
Formative Assessment and Instructional Planning	<i>B Marshall</i>	365
Progression and Assessment: Developmental Assessment	<i>M Forster and G Masters</i>	369
Students' Rights in Assessment and Evaluation	<i>J Gardner and B Holmes</i>	378
Summative Assessment by Teachers	<i>R Daugherty</i>	384
The Multiple Purposes of Assessment	<i>P E Newton</i>	392
The Relationship between Assessment and the Organization and Practice of Teaching	<i>L B Resnick, D William, R Apodaca, and E S Rangel</i>	397

Educational Assessment – Enhancing Quality and Use

Assessment Conversations: Reading and Writing Conferences with Students and with Parents	<i>M Barrs</i>	403
Assessment: Pre-service and In-service Teacher Education	<i>A Davies</i>	410
Classroom Assessment in Policy Context (Australia)	<i>J J Cumming</i>	417
Classroom Assessment in Policy Context (England and France)	<i>M Osborn and M Raveaud</i>	425
Classroom Assessment in Policy Context (French Sources)	<i>D Laveault</i>	432
Classroom Assessment in Policy Context (Hong Kong)	<i>D Carless</i>	438
Classroom Assessment in Policy Context (New Zealand)	<i>T J Crooks</i>	443
Classroom Assessment in Policy Context (Sub-Saharan Africa)	<i>S J Howie, L Zimmerman, and K Draper</i>	449
Moderation of Student Work by Teachers	<i>G S Maxwell</i>	457
School Policies and Practices to Support Effective Classroom Assessment for Learning	<i>D Pedder</i>	464
Student Assessment: Policy and Practice in Eastern Europe	<i>G Bethell</i>	472

Educational Assessment – Key Relationships

Assessment Practice in Policy Context: Latin American Countries	<i>F M Rizo</i>	479
Impact of Assessment on Learner Groups (Boys/Girls)	<i>J Elwood</i>	486
Impact of Assessment on Learner Groups (Disabilities)	<i>M Rouse</i>	492
Impact of Assessment on Students' Test Anxiety	<i>P Buchwald and C Schwarzer</i>	498
Impact of Assessments on Classroom Practice	<i>J L Herman</i>	506
Social Practices in School Assessment and their Impact on Learner Identities	<i>A Pollard and A Filer</i>	512

Educational Evaluation – Concepts, Practice, and Future Directions

Educational Evaluation: Concepts, Practice, and Future Directions	<i>Y J Ni</i>	518
---	---------------	-----

Educational Evaluation – Contemporary Themes in Evaluation

Evaluating E-Learning	<i>D D Williams and C R Graham</i>	530
Evaluating Schools as Learning Communities	<i>S M Thomas</i>	539
Evaluation of Adult Education and Training Programs	<i>G McNamara, P Joyce, and J O'Hara</i>	548
Evaluation of Integrated Health Programs in School	<i>T M Franke</i>	555

Formative Assessment in Teacher Education and Teacher Professional Development	<i>H Tillema</i>	563
Informal Education and Evaluation	<i>T Jeffs</i>	572
Methods to Evaluate Technology	<i>W L Bewley</i>	578

Educational Evaluation – Contexts of Educational Evaluation

Cost Analysis in Evaluation Studies	<i>J D Fletcher</i>	585
Cultural Issues that Can Affect the Validity of Educational Evaluations	<i>R P Durán</i>	592
Evaluation and Accountability	<i>E Sato and S N Rabinowitz</i>	600
Evaluation Governance and Planning	<i>R Picciotto</i>	607
Evaluation Use	<i>V G Thomas</i>	614
Moral and Ethical Issues in Evaluation	<i>M Morris</i>	622
The Role of Stakeholders in Educational Evaluation	<i>S Taut and M C Alkin</i>	629

Educational Evaluation – Evaluation Domains

Curriculum Evaluation	<i>T Levin</i>	636
Evaluating Education in Three Policy Eras	<i>M A Peters, R Britez, and S M Weber</i>	645
Evaluation of Mathematics Education Programs	<i>J Cai</i>	653
Evaluation of Science Education Programs	<i>G Berberoğlu</i>	660
Evaluation of Social Studies and Civic Education Programs	<i>S G Grant</i>	667
Evaluation of Teacher Quality and Practice	<i>W Robinson and J Campbell</i>	674
International Evaluations	<i>A Schleicher</i>	681
National Assessment Programs: The Example of the U.S. National Assessment of Educational Progress	<i>M Schneider</i>	690
Principal Evaluation: Concepts, Needs and Realities	<i>N S Glasman and L D Glasman</i>	698
Program Evaluation	<i>C A Christie and L A Fierro</i>	706
School Based Evaluation: Purposes, Protocols and Processes	<i>J MacBeath</i>	713
School Inspection/External School Evaluation	<i>C Chapman and P Earley</i>	719
The International System for Teacher Observation and Feedback: A Theoretical Framework for Developing International Instruments	<i>L Kyriakides, B P M Creemers, C Teddlie, and D Muijs</i>	726

Educational Evaluation – Evaluation Methods

Evaluation Methodology	<i>M Chatterji</i>	735
Evaluation Reporting and Communicating	<i>R T Torres</i>	746
Longitudinal Evaluation Designs	<i>X Ma</i>	757
Meta-evaluation: Purpose, Prescription, and Practice	<i>L A Wingate</i>	765

Educational Evaluation – Purposes and Models of Educational Evaluation

Defining Quality in Evaluation	<i>P Dahler-Larsen</i>	775
Internal and External Evaluation	<i>D Nevo</i>	781
Needs Assessment in Education	<i>J W Altschuld and T L Lepicki</i>	786
The Purpose of Educational Evaluation	<i>S Mathison</i>	792
Understanding Approaches to Evaluation	<i>A J Love</i>	798

VOLUME 4**Educational Measurement**

Ability Testing	<i>P B Tymms</i>	1
Admissions Testing	<i>R Zwick</i>	7
Appropriateness Measurement: Person Fit	<i>R R Meijer and A M Weekers</i>	15
Automated Essay Scoring: Writing Assessment and Instruction	<i>M D Shermis, J Burstein, D Higgins, and K Zechner</i>	20

The Washington Accord on Engineering Curriculum	<i>E Ko</i>	209

H

Higher Education

Higher Education: An Overview	<i>P Scott</i>	217
-------------------------------	----------------	-----

Higher Education – Management, Leadership and Governance

Academic Managers – Heads of Departments/Schools	<i>S Marshall</i>	229
Leading and Managing the University – Presidents and their Senior Management Team	<i>R Middlehurst, T Kennie, and S Woodfield</i>	238
Management of and in Higher Education Institutions	<i>B Sporn</i>	245
Managerialism and Collegialism in Higher Education Institutions	<i>M Shattock</i>	251
Strategic Planning in Higher Education	<i>L Zechlin</i>	256
The Changing Role of University Presidents, Vice-Chancellors and Rectors	<i>M F Green and P D Eckel</i>	264
The Changing Roles of University Governing Boards and Councils	<i>J Fielden</i>	273

Higher Education – Research and Scholarship

Funding of University Research	<i>G Harman</i>	279
Mobility of PhD Students and Scientists	<i>S Avveduto</i>	286
National Science Policy and Universities	<i>M Henkel and U Kogan</i>	294
Research Commercialization	<i>S Slaughter</i>	300
Research Quality Assessment	<i>I McNay</i>	307
The Management of University Research	<i>J Kirkland</i>	316
The Training of New Scientists	<i>R Neumann</i>	322

Higher Education – Society

Academic Freedom	<i>S F Macintyre</i>	328
Access and Equity in Higher Education	<i>G Baldwin and R James</i>	334
Boundaries of Institutional Autonomy and their Impact on Higher Education	<i>V L Meek</i>	341
Diversity of Higher Education	<i>U Teichler</i>	347
Employability of University Graduates and Graduate Outcomes	<i>J Brennan</i>	354
Higher Education and the Knowledge Society	<i>J Välimaa</i>	360
Higher Education and the Labor Market	<i>J Enders</i>	365
Higher Education and the Transformation of Society	<i>P Scott</i>	370
Quality Assurance in Higher Education – Practices and Issues	<i>D Dill</i>	377
The Role of Accreditation of Higher Education Institutions	<i>J S Eaton</i>	384
Universities and Regional Development	<i>J Goddard and J Puukka</i>	390
Universities' Engagement with Society	<i>D Watson</i>	398

Higher Education – Teaching and Learning in Higher Education

Distance Education and Open Universities	<i>A Kanwar and J Daniel</i>	404
Education Development in Higher Education	<i>Y Ryan and K Fraser</i>	411
Effective Use of Technology in Teaching and Learning in HE	<i>D Laurillard</i>	419

Facilitating Students' Success – Student Support and Learning Resources in Universities	<i>E Woodberry and C Barnes</i>	427
Faculty Values and Expectations and Their Implications for Teaching, Learning and the Organization of Higher Education Institutions	<i>K Harman</i>	433
Flexible Learning in Higher Education	<i>S Alexander</i>	441
Innovation in Teaching and Curriculum Design	<i>J M Dearn</i>	448
Productivity of University Faculty Staff	<i>S Kyvik</i>	455
Promoting Effective Student Learning in Higher Education	<i>K Trigwell</i>	461
Student Attrition from Higher Education Institutions	<i>M Hayden</i>	467
University Students' Experiences of Higher Education	<i>C McInnis</i>	473
What Do University Students Learn?	<i>G D Kuh and B K Bridges</i>	479

Higher Education – Tertiary Education in a Globalized World

Associations of Universities	<i>G F Moodie</i>	485
Collective Bargaining in Higher Education	<i>C Allport, K McAlpine, and S Roberts</i>	491
Financing of Higher Education	<i>B Chapman and P Tulip</i>	499
Higher Education Crossing Borders	<i>J Knight</i>	507
Higher Education in Post-Conflict Societies	<i>M Daxner</i>	514
Higher Education in the New Economies	<i>J Fielden</i>	520
Human Resource Issues in Higher Education	<i>E El-Khawas</i>	527
International Accreditation in Higher Education	<i>A Stella and D Woodhouse</i>	533
Internationalization of Higher Education	<i>M van der Wende</i>	540
National and International Rankings of Higher Education	<i>S Marginson</i>	546
Steering of Higher Education Systems – The Role of the State	<i>K Yokoyama and V L Meek</i>	554
Student and Faculty Transnational Mobility in Higher Education	<i>U Lanzendorf and B M Kehm</i>	559
The Bologna Process in European Higher Education	<i>D Rich</i>	566
The Economics and Finance of Higher Education	<i>A Wolf</i>	573
The Role of the OECD in the Development of Higher Education in a Globalized World	<i>R Yelland</i>	584
Transforming Higher Education in Developing Countries: The Role of the World Bank	<i>J Salmi and R M Bassett</i>	590
UNESCO's Role in the Development of Higher Education in a Globalized World	<i>S Uvalić-Trumbić</i>	597

Higher Education – The Organization and Financing of Higher Education

Higher Education in Federal Systems	<i>M A M Cortés and U Teichler</i>	603
Pathways and Articulation into Higher Education	<i>G F Moodie</i>	609
Unitary, Binary and other National Systems of Higher Education	<i>L Goedegebuure</i>	616
Viewing Private Higher Education: How Much, Where, Why, and What?	<i>D C Levy</i>	622

I

Immigration

Children of Migrant Populations	<i>M M Suárez-Orozco and C Suárez-Orozco</i>	629
Third Culture Kids	<i>R E Van Reken</i>	636

International Comparisons

IEA Studies in ICT	<i>N Law</i>	644
IEA Studies in Mathematics and Science	<i>F K S Leung</i>	650
IEA Study in Civic Education	<i>J Torney-Purta, J-A Amadeo, and J Schwillie</i>	656
IEA: Globalization and Assessment	<i>H Wagemaker</i>	663

International Organizations in Education

Education and the European Union	<i>S Hegarty</i>	669
National University on Educational Planning and Administration, New Delhi	<i>J B G Tilak</i>	676
On School Management – International Council on School Effectiveness and Improvement, Commonwealth Council on Educational Administration and Management	<i>A Walker and T Townsend</i>	681
UNESCO's International Institute for Educational Planning	<i>S J Hite and M Bray</i>	688

L**Leadership and Management**

Leadership and Management Overview	<i>B Mulford</i>	695
------------------------------------	------------------	-----

Leadership and Management – as a Field of Study

Contexts for Leadership at the Beginning of the 21st Century	<i>M Bottery</i>	704
Educational Leadership: Philosophical Issues	<i>C W Evers</i>	710
Ethical/Moral Issues in Educational Leadership	<i>R J Starratt, L Langlois, and P Duignan</i>	717
History of Educational Leadership/Management	<i>R Bates</i>	724
Educational Leadership as a Field of Study: Professional Journals 1994–2006	<i>A R Thomas</i>	731
Research on Educational Leadership – Approaches/Promising Directions	<i>W A Firestone and V M J Robinson</i>	740

Leadership and Management – Leader Preparation

Leaders for Productive Schools	<i>J Murphy, S N Elliott, E B Goldring, and A C Porter</i>	746
New Approaches in Preparing School Leaders	<i>S G Huber</i>	752
Research for Leaders: The National College for School Leadership	<i>G Southworth</i>	762
School Leadership Standards	<i>L Ingvarson</i>	768

Leadership and Management – Leadership Issues

Effective Leadership in Challenging Schools	<i>A Harris</i>	777
Esthetics, Educational Leadership and Management	<i>R Bates</i>	783
Leader Mistreatment of Teachers	<i>J Blase and J Blase</i>	790
Leadership and Gender	<i>J Blackmore</i>	797
Leadership and Student Voice	<i>C Lanskey and J Rudduck</i>	803
Leadership and Urban Education	<i>K A Riley</i>	809
Leadership for Learning	<i>J MacBeath</i>	817
Leadership in Diverse Cultures	<i>A Walker and P K Yu-kwong</i>	824

Leading Diverse Schools	<i>J Ryan</i>	832
Supervision and Personnel Administration	<i>P D Tucker and D G Pounder</i>	839
The Big Challenge: Leadership for Inclusion	<i>M Ainscow and A Sandill</i>	846
The Educational Leader's New Work	<i>P Gronn</i>	852

VOLUME 5

Leadership and Management – Leadership Types

A Distributed Perspective on School Leadership and Management	<i>J P Spillane</i>	1
Leadership: Authentic	<i>P T Begley</i>	7
Leadership: Democratic	<i>J Møller</i>	12
Leadership: Instructional	<i>P Hallinger, K Leithwood, and R H Heck</i>	18
Leadership: Transformative	<i>C M Shields</i>	26
Strategic Leadership	<i>B Davies and B J Davies</i>	34
Teacher Leadership and Organizational Development	<i>A Harris</i>	40
Understanding How Leadership Influences Student Learning	<i>K Leithwood and B Levin</i>	45

Leadership and Management – Politics and Governance

Equity and Educational Effectiveness	<i>P Sammons</i>	51
Leading/Managing Schools in Communities Made Poor	<i>P Thomson</i>	58
Principals Role in Restructuring Schools	<i>G M Crow and K D Peterson</i>	66
School Reform and Restructuring: Self Managing School	<i>B J Caldwell</i>	72
System Leadership	<i>D Hopkins and R Higham</i>	78

Leadership and Management – School and Community

Educational Leadership and Social Capital	<i>J West-Burnham</i>	85
Networked Learning Communities School-to-School Collaboration as an Essential Component of a System Reform Strategy	<i>D Jackson</i>	92
Networks and Communities of Knowledge	<i>T Schuller and H Theisens</i>	100
School Community Relations	<i>R L Crowson and E B Goldring</i>	106
Social Capital, Educational Institutions and Leadership	<i>S Kilpatrick, S Johns, and B Mulford</i>	113

Leadership and Management – School Effectiveness and Improvement

Leadership and Technology	<i>C F Webber</i>	120
Leadership in the Implementation of Innovations	<i>I E Bogotch, T Townsend, and M Acker-Hocevar</i>	128
Leadership: School Improvement	<i>R H Heck and P Hallinger</i>	135
Organizational Learning in Schools	<i>B Mulford and H Silins</i>	143
Professional Learning Community	<i>L Stoll</i>	151
Transformational School Leadership	<i>K Leithwood</i>	158

Learning and Cognition – Issues and Concepts

Attention in Cognition and Early Learning	<i>M Heimann, T Tjus, and K Strid</i>	165
Concept Learning	<i>S J Unsworth and D L Medin</i>	172
Cooperative Learning	<i>R E Slavin</i>	177
Intelligence	<i>R J Sternberg</i>	184
Learning from Multiple Information Sources	<i>H I Strømsø and I Bråten</i>	191
Memory	<i>S Magnussen and T Brennen</i>	197
Metacognition	<i>L Baker</i>	204
Personal Epistemology in Education: Concepts, Issues, and Implications	<i>I Bråten</i>	211
Piaget: Recent Work	<i>L Smith</i>	218
The Adult Development of Cognition and Learning	<i>E A L Stine-Morrow and J M Parisi</i>	225
Vygotsky and Recent Developments	<i>J V Wertsch</i>	231

Learning and Cognition – Issues and Concepts – Focus on Cognition

Cognition and Emotion	<i>F Pons, M de Rosnay, and F Cuisinier</i>	237
Cognition: Overview and Recent Trends	<i>J Wiley and B D Jee</i>	245
Development of Creativity	<i>M A Runco</i>	251
Knowledge Domains and Domain Learning	<i>L Maggioni and P A Alexander</i>	255
Problem Solving and Human Expertise	<i>T J Nokes, C D Schunn, and M T H Chi</i>	265
Problem Solving and Reasoning	<i>R E Mayer</i>	273
Reasoning, Moral and Social	<i>N S Jampol, C B Richardson, and M Killen</i>	279
Remembering as Social Activity	<i>D Middleton</i>	285

Learning and Cognition – Issues, Concepts, Types

Computer-Supported Collaborative Learning: Basic Concepts, Multiple Perspectives, and Emerging Trends	<i>S R Ludvigsen and A I Mørch</i>	290
Learning as Inquiry	<i>S R Goldman, J Radinsky, S Tozer, and D Wink</i>	297
Learning Through Narrative Socialization	<i>A Fasulo</i>	303
Neuroscience Bases of Learning	<i>M H Immordino-Yang and K W Fischer</i>	310
The Neuroscience of Reading	<i>U Goswami</i>	317

Learning and Cognition – Issues, Concepts, Types – Focus on Learning

Learning Strategies	<i>C E Weinstein, J Jung, and T W Acee</i>	323
Learning Through Play	<i>K Aronsson</i>	330
Situated View of Learning	<i>A Collins and J G Greeno</i>	335
The Neuroscience of Aging and Cognition	<i>W J Hoyer and B Bessette-Symons</i>	340

Learning and Cognition – Language, Literacy and Subject-Related

An Overview of Language and Literacy in Educational Settings	<i>V G Aukrust</i>	345
Bilingualism and Learning	<i>L S Verplaetse and E Schmitt</i>	355
Classroom Discourse and Student Learning	<i>L Hemphill</i>	361
Early Writing	<i>B E Hagtvet</i>	367

First Language Acquisition	<i>N B Ratner</i>	375
Foreign Language Learning	<i>C Kinginger</i>	382
Learning Science	<i>J Leach and P Scott</i>	387
Learning to Read	<i>M S Burns and J K Kidd</i>	394
Mathematics Learning	<i>L Verschaffel, B Greer, and E De Corte</i>	401
Music Learning	<i>S Hallam</i>	407
Reading Comprehension: Reading for Learning	<i>C E Snow</i>	413
Second Language Learning	<i>J S Arnfast, J N Jørgensen, and A Holmen</i>	419
Writing: Advanced	<i>R Andrews</i>	426

Learning and Cognition – Other Issues

Gender and Learning	<i>L Yates and J McLeod</i>	432
Parent–Child Relationships in Early Learning	<i>C P Edwards, S M Sheridan, and L L Knoche</i>	438
Peer Interaction and Learning	<i>S Blum-Kulka and S Dvir-Gvirsman</i>	444

Learning and Cognition – Places of Learning

Learning in a Cross-Cultural Perspective	<i>L-F Zhang and R J Sternberg</i>	450
Learning Outside of School	<i>T Nunes</i>	457
Reasoning and Explanatory Talk: Learning in Everyday Settings	<i>D E Beals</i>	464

Learning and Cognition – Theoretical Perspectives – Learning

Apprenticeship Approach to Learning	<i>K Nielsen</i>	469
Connectionism and Learning	<i>T R Shultz</i>	476
Constructivism and Learning	<i>S Sjøberg</i>	485
Cultural–Historical Activity Theory	<i>A Havnes</i>	491
Learning in a Sociocultural Perspective	<i>R Säljö</i>	498
Self-Regulated Learning and Socio-Cognitive Theory	<i>P H Winne and A F Hadwin</i>	503

N

National Systems of Education

Australia	<i>C N Power</i>	510
Austria	<i>M J Gaertner</i>	517
Bangladesh	<i>R Z Dewan</i>	524
Barbados	<i>R Rudder</i>	534
Bulgaria	<i>A Chavdarova and D Vesselinov</i>	540
England	<i>C Whatford</i>	550
Estonia	<i>M Keränen and J Kõrgesaar</i>	555
Fiji	<i>I Senibulu</i>	563
Finland	<i>J E Tuovinen</i>	569
France	<i>M Sellier</i>	576

Germany	<i>A Hüfner and K Hüfner</i>	582
Ghana	<i>R Palmer</i>	590
Greece	<i>K Toura and A Karagiannis</i>	599
Iceland	<i>M Hardardottir and M Gunnlaugsdóttir</i>	605
Indonesia	<i>A C Alwasilah and Furqon</i>	611
Israel	<i>A Volansky</i>	618
Jamaica	<i>E Hannam</i>	627
Latvia	<i>A Joma</i>	630
Lebanon	<i>N A Mneimneh</i>	636
Lithuania	<i>J Navickaitė, L Paurienė, R Zablackė, A Tijūnelytė, and V Kožemiakina</i>	656
Malawi	<i>F R Mkandawire and D Mulera</i>	666
Malta	<i>C Farrugia</i>	673
Mongolia	<i>B Yembuu</i>	681
Namibia	<i>J Ellis</i>	687
New Zealand	<i>R Baker and C Wylie</i>	692
Niger	<i>A A I Daouda</i>	699
Norway	<i>H Farstad</i>	709
Oman	<i>S A Issan</i>	718
Pakistan	<i>N Mahmood and R Malik</i>	727
Poland	<i>A Janowski</i>	737
Qatar	<i>S R Salman</i>	744
Russia	<i>V M Filippov and G F Tkach</i>	750
Rwanda	<i>E Bahizi</i>	758
Scotland	<i>D Raffe</i>	770
Singapore	<i>P T Ng</i>	776
Slovenia	<i>T Plevnik and A B Lakota</i>	782
Solomon Islands	<i>D P Malasa</i>	790
South Africa	<i>P Kgobe and J Pampallis</i>	799
Spain	<i>A Tiana</i>	806
Sri Lanka	<i>B M J Balasooriya, M M Wehella, and S U Wijeratne</i>	813
Suriname	<i>H R Ori</i>	826
Taiwan	<i>C-M Lee</i>	834
Tanzania	<i>R Wedgwood</i>	841
Thailand	<i>C Rukspollmuang</i>	847
The Gambia	<i>Y A-M Jobe</i>	858
The Philippines	<i>E A P Valenzuela</i>	865
Uruguay	<i>B Guinovart and C Troncoso</i>	873
USA	<i>B Pusser and M E R Lloyd</i>	888
Zanzibar	<i>I M Hija</i>	896

VOLUME 6**P****Philosophy of Education**

Philosophy of Education: Overview	<i>P Enslin</i>	1
-----------------------------------	-----------------	---

Philosophy of Education – Contemporary Issues

Neoliberalism, the Market and Performativity	<i>M A Peters</i>	11
Parents and Children's Rights	<i>M Clayton</i>	17
Peace Education	<i>I Gur-Ze'ev</i>	22
Philosophy and Educational Research	<i>D Bridges</i>	29
Race, Critical Race Theory and Whiteness	<i>B Applebaum</i>	36
School Choice and the Common School	<i>G Haydon</i>	44

Philosophy of Education – Philosophical Perspective

African Philosophy of Education	<i>K Horsthemke</i>	50
Feminism	<i>L Stone</i>	56
Hermeneutics	<i>C Bingham</i>	63
Islamic Education	<i>Y Waghid</i>	69
Liberalism and Education	<i>W Feinberg</i>	74
Phenomenology and Existentialism	<i>B Levering</i>	80
Pragmatism	<i>B Thayer-Bacon</i>	86
Psychoanalysis and Education	<i>P Smeyers</i>	92
Social and Cultural Capital in Education	<i>M Print</i>	97
The Aims of Education	<i>R Marples</i>	103
The Analytical Tradition	<i>D Carr</i>	108

Philosophy of Education – Philosophical Themes

Adult Learning: Philosophical Issues	<i>D Beckett</i>	114
Autonomy	<i>C A Wringe</i>	121
Bildung	<i>J Masschelein and N Ricken</i>	127
Critical Theory and Pedagogy	<i>M Mason</i>	133
Critical Thinking	<i>H Siegel</i>	141
Environmental Education	<i>M Bonnett</i>	146
Identity	<i>M S Merry</i>	152
Inclusion	<i>R Cigman</i>	158
Justice and Care	<i>M Tjiattas</i>	164
Lifelong Learning	<i>J Halliday</i>	170
Post-Structuralism and Education	<i>M Mason and M Clarke</i>	175
Reason and Rationality	<i>P Hogan</i>	183

Religious and Spiritual Education	<i>J C Conroy and S J McKinney</i>	189
The Capabilities Approach	<i>L Terzi</i>	194

Primary and Secondary Education – Learning and Teaching in School Age Education

Class Size – Arguments and Evidence	<i>P Blatchford and K C Lai</i>	200
Continuing Professional Development of Teachers	<i>P Earley</i>	207
Homeschooling	<i>P Farenga</i>	214
Innovations and Early Intervention in the Teaching of Literacy	<i>R E Slavin</i>	221
Personalized Learning in School Age Education	<i>D Hopkins</i>	227
Perspectives on Schooling in the Middle Years	<i>V J Russell</i>	233
Reform of the School Workforce	<i>H M Gunter and G Forrester</i>	242
Secondary Education in Developing Countries	<i>P Hughes and A Walker</i>	249

Primary and Secondary Education – Social Justice Issues in School Age Education

Community Focused Schools	<i>A Dyson</i>	255
---------------------------	----------------	-----

Primary and Secondary Education – The Effectiveness of School Systems

Reforming the American School System	<i>M Barber</i>	261
School Effectiveness in Developed Societies	<i>D Reynolds</i>	269
School to School Collaboration: Innovation and Improvement	<i>R Higham</i>	274
Studies of School Improvement in Developing Countries	<i>S E Anderson</i>	281
Sustainable Educational Reform	<i>A Hargreaves</i>	289
The Role of the District in Tri Level Reform	<i>M Fullan</i>	295
Whole School Designs for Enhancing Student Achievement	<i>S Stringfield and J Nunnery</i>	303

Q

Qualitative Research

Action Research in Education	<i>E Stringer</i>	311
Classroom Ethnography	<i>F Erickson</i>	320
Computer Assisted Qualitative Data Analysis	<i>C Silver and A Lewins</i>	326
Conversational Analysis	<i>H G Levine</i>	335
Critical Ethnography	<i>D Foley</i>	337
Critical Race Theory	<i>D Gillborn and G Ladson-Billings</i>	341
Critical Theory	<i>J J Ryoo and P McLaren</i>	348
Cultural Studies	<i>R Gaztambide-Fernández and K Cairns</i>	354
Cultural–Historical Activity Theory	<i>Laboratory for Comparative Human Cognition</i>	360
Design Experiments	<i>A Collins</i>	367
Discourse Analysis	<i>P Nikander and S Vehviläinen</i>	373
Document Analysis	<i>T Rapley and K N Jenkins</i>	380
Ethnography	<i>M Hammersley</i>	386

Ethnomethodology in Education Research	<i>D Macbeth</i>	392
Focus Groups	<i>D L Morgan and K Hoffman</i>	401
Grounded Theory	<i>K Charmaz and A Bryant</i>	406
Hermeneutics	<i>J Dyer</i>	413
Interpretive Research	<i>E Rauscher and M E Graue</i>	419
Interviews and Interviewing	<i>A Marvasti</i>	424
Life History	<i>J A Hatch and S K Newsom</i>	430
Narrative Inquiry	<i>D J Clandinin and J Huber</i>	436
Participant Observation	<i>J Schostak</i>	442
Phenomenology	<i>M van Manen and C A Adams</i>	449
Qualitative Case Studies	<i>S B Merriam</i>	456
Qualitative Data Management	<i>C Grbich</i>	463
Semiotics	<i>M Danesi</i>	475
Symbolic Interactionism, Naturalistic Inquiry, and Education	<i>J A Forte</i>	481
The Quality of Evidence in Qualitative Research	<i>S K Biklen</i>	488
Visual Data in Education Research	<i>J Wagner</i>	498

Qualitative Research – Standards of Proof

Validity: Mapping Diverse Perspectives	<i>G B Rossman, S F Rallis, and A M Kuntz</i>	505
--	---	-----

Quantitative and Qualitative Approaches to Research – Integration

Mixed Methods	<i>A Tashakkori and I Newman</i>	514
---------------	----------------------------------	-----

Quantitative Methods and Research Design

External Validity	<i>G E Matt, A Brewer, and M Sklar</i>	521
-------------------	--	-----

R

Role of NGOs in Globalization

NGOs and Globalization of Education	<i>M Ahmed</i>	529
-------------------------------------	----------------	-----

S

Social and Emotional Aspects of Learning

Achievement Goal Theory: Definitions, Correlates, and Unresolved Questions	<i>T Urdan</i>	537
Affect, Mood and Emotions	<i>S Schnall</i>	544
Anxiety	<i>M Zeidner</i>	549
Attribution Theory	<i>B Weiner</i>	558
Children's Friendship	<i>S R Asher and K L McDonald</i>	564
Coping with Stressful Situations: An Important Aspect of Self-Regulation	<i>M Boekaerts</i>	570
Culture in Motivation Research: A Challenging and Enriching Contribution	<i>K Kimmel and S Volet</i>	576
Early Social Development and Schooling	<i>G M van der Aalsvoort</i>	585

Emotion in Educational Contexts	<i>P A Schutz, P D Quijada, S de Vries, and M Lynde</i>	591
Empathy	<i>R Arnold</i>	597
Flow in Education	<i>J A Schmidt</i>	605
Interest	<i>M Ainley</i>	612
Intrinsic and Extrinsic Motivation	<i>C Levesque, K J Copeland, M D Pattie, and E L Deci</i>	618
Motivating Students in Classrooms	<i>J Brophy</i>	624
Motivation Regulation	<i>C A Wolters and S A Mueller</i>	631
Peer Learning in the Classroom	<i>N M Webb</i>	636
Poverty, Effects of on Social and Emotional Development	<i>N Philipsen Hetzner, A D Johnson, and J Brooks-Gunn</i>	643
Seeking Help as an Adaptive Response to Learning Difficulties: Person, Situation, and Developmental Influences	<i>S A Karabenick and R S Newman</i>	653
Self-Concept in Learning: Reciprocal effects model between academic self-concept and academic achievement	<i>H W Marsh and L F Scalas</i>	660
Self-Efficacy Beliefs	<i>D H Schunk and F Pajares</i>	668
Social and Emotional Outcomes of Learning	<i>J Vorhaus</i>	673
Social Aspects of Collaborative Learning	<i>M Arvaja and P Häkkinen</i>	685
Social Development and Schooling	<i>G W Ladd</i>	691
Social Interaction and Learning	<i>K Littleton</i>	698
Social Networks and the Education of Children and Youth	<i>B Schneider, T G Ford, and L Perez-Felkner</i>	705
Sociocultural Issues in Motivation	<i>R A Walker</i>	712
Socioemotional Aspects of Technology-Supported Learning	<i>S Järvelä</i>	718
Volitional Control of Learning	<i>J Husman and L Corno</i>	724
Wellbeing	<i>T Hascher</i>	732

VOLUME 7

Statistics

An Overview of Statistics in Education	<i>S Sinharay</i>	2
Analysis and Interpretation of Multivariate Data	<i>D J Bartholomew</i>	12
Analysis of Covariance	<i>N T Longford</i>	18
Analysis of Extreme Values in Education	<i>J Beirlant, G Dierckx, K Luwel, and P Onghena</i>	25
Analysis of Variance	<i>B M King</i>	32
Bayesian Statistical Analysis	<i>G Kokolakis</i>	37
Bootstrap Method	<i>K Singh and M Xie</i>	46
Canonical Correlation	<i>A Basu and A Mandal</i>	52
Categorical Data Analysis	<i>S E Fienberg and B W Junker</i>	58
Causal Inference	<i>D B Rubin</i>	66
Cluster Analysis: Overview	<i>S Landau and I Chis Ster</i>	72

Cognitive Psychology and Educational Statistics	<i>H S Kim and S Embretson</i>	84
Computational Statistics	<i>J E Gentle</i>	93
Continuous Probability Distributions	<i>S Sinharay</i>	98
Correspondence Analysis	<i>M Greenacre</i>	103
Data Mining	<i>R S J d Baker</i>	112
Decision Theory	<i>M Mendoza and E Gutiérrez-Peña</i>	119
Design of Experiments	<i>C A Albers and T R Kratochwill</i>	125
Discrete Probability Distributions	<i>S Sinharay</i>	132
Discrimination and Classification	<i>R C Neath and M S Johnson</i>	135
Empirical Bayes Methods	<i>E Ip and G Molenberghs</i>	142
Evaluation Research	<i>T Kellaghan</i>	150
Exploratory Data Analysis	<i>A Unwin</i>	156
Factor Analysis: An Overview and Some Contemporary Advances	<i>F A N Alhija</i>	162
Generalized Linear Mixed Models	<i>S Rabe-Hesketh and A Skrondal</i>	171
Generalized Linear Models	<i>J J Faraway</i>	178
Generating Random Numbers	<i>P J Pashley and A Amodeo</i>	184
Goodness-of-Fit Testing	<i>A Maydeu-Olivares and C García-Forero</i>	190
Graphical Models	<i>R G Almond</i>	197
Growth Modeling	<i>I Plewis</i>	203
Hierarchical Linear Models	<i>D Rindskopf</i>	210
Hypothesis Testing and Confidence Intervals	<i>T R Konold and X Fan</i>	216
Instrumental Variables	<i>E P Bettinger</i>	223
Jackknife Methods	<i>S Sinharay</i>	229
Large-sample Statistical Methods	<i>J M Singer and D F Andrade</i>	232
Latent Class Models	<i>J K Vermunt</i>	238
Markov Chain Monte Carlo	<i>A M Johansen</i>	245
Matrix Algebra	<i>H Yanai and H Ishii</i>	253
Measure of Association	<i>G-H Huang</i>	260
Measures of Central Tendency	<i>D Clark-Carter</i>	264
Measures of Dispersion, Skewness and Kurtosis	<i>D Rindskopf and M Shiyko</i>	267
Meta Analysis	<i>J Sánchez-Meca and F Marín-Martínez</i>	274
Missing Data	<i>C A W Glas</i>	283
Model Selection	<i>S J Haberman</i>	289
Monte Carlo Methods	<i>A M Johansen</i>	296
Multidimensional Scaling	<i>Z Zhang and Y Takane</i>	304
Multiple Comparisons	<i>C Lewis</i>	312
Multivariate Analysis of Variance	<i>N T Longford</i>	319
Multivariate Linear Regression	<i>S Ganesh</i>	324
Multivariate Normal Distribution	<i>J Tacq</i>	332

Nonlinear Regression Analysis	<i>H-H Huang, C K Hsiao, and S-Y Huang</i>	339
Nonparametric Statistical Methods	<i>K Sijtsma and W H M Emons</i>	347
Observational Studies	<i>P R Rosenbaum</i>	354
Order Statistics	<i>I Bairamov</i>	360
Point Estimation Methods with Applications to Item Response Theory Models	<i>F Bartolucci and L Scrucca</i>	366
Principal Components Analysis	<i>D J Bartholomew</i>	374
Probability Theory	<i>T Rudas</i>	378
Recursive Partitioning	<i>S Landau and S Barthel</i>	383
Sampling	<i>J Qian</i>	390
Sequential Probability Ratio Test	<i>T J H M Eggen</i>	396
Sequential Testing	<i>H J Vos</i>	401
Signal Detection Theory	<i>H Abdi</i>	407
Small Area Estimation	<i>A Noble</i>	411
Statistical Analysis of Functional Data	<i>F Ferraty, P Sarda, and P Vieu</i>	417
Statistical Inequalities	<i>H M Mahmoud and J L Gastwirth</i>	426
Statistical Paradoxes	<i>Y-K Tu</i>	429
Statistical Power Analysis	<i>L V Hedges and C Rhoads</i>	436
Statistical Significance Versus Effect Size	<i>X Fan and T R Konold</i>	444
Stochastic Processes	<i>F Baudoin</i>	451
Structural Equation Models	<i>S-Y Lee and X-Y Song</i>	453
Survival Data Analysis	<i>A F De Champlain</i>	459
The Normal Distribution and its Applications	<i>J Tacq</i>	467
Time Series Analysis	<i>P J Brockwell</i>	474
Univariate Linear Regression	<i>M L Hazelton</i>	482
Value-Added Models	<i>D F McCaffrey</i>	489

T

Teacher Education – Evaluation in the Teacher Education Program

Accreditation and Standards in Teacher Education	<i>R J Yinger and K L Daniel</i>	495
Determining Long Term Effects of Teacher Education	<i>C N Brouwer</i>	503

Teacher Education – Evaluation of the Prospective Teacher

The Evaluation of Prospective Teachers in Teacher Education	<i>D E H Tigelaar and J van Tartwijk</i>	511
---	--	-----

Teacher Education – Macro Factors

Diversity in Teacher Education	<i>T Wubbels</i>	518
Social and Cultural Influences on Teacher Education	<i>M Ben-Peretz and R Lotan</i>	525
The Role of Governance in Teacher Education	<i>G E Karlsen</i>	532

Teacher Education – Post-Initial Professional Development

Action Research as a Tool for Teachers' Professional Development	<i>P Ponte</i>	540
Contemporary Approaches to Teacher Professional Development	<i>H Borko, J Jacobs, and K Koellner</i>	548
School Development for Teacher Learning and Change	<i>P Sleegers and K Leithwood</i>	557
Teacher Induction	<i>D Beijaard, J Buitink, and C Kessels</i>	563
Teacher Learning as Workplace Learning	<i>J Imants and K van Veen</i>	569
Teacher Learning with Lesson Study	<i>A Murata</i>	575
Teachers Career Stages and Professional Development	<i>R Fessler and E Rice</i>	582

Teacher Education – Preservice Teacher Education

A Pedagogy of Teacher Education	<i>J Loughran</i>	587
Case Methods in Teacher Education	<i>M Sato and C Rogers</i>	592
Conceptions of Teacher Education	<i>J A Whitcomb</i>	598
Inquiry-Oriented Teacher Education	<i>R Schulz</i>	604
Narratives and Biography in Teacher Education	<i>G Kelchtermans</i>	610
Supervision in Teacher Education	<i>J McCarthy and L F Quinn</i>	615
Taking Prospective Teachers' Beliefs into Account in Teacher Education	<i>M Valcke, G Sang, I Rots, and R Hermans</i>	622
Teacher Education and Models of Teacher Reflection	<i>V K LaBoskey</i>	629
Teacher Education as Teaching for Understanding with New Technologies	<i>M S Wiske and D E Spicer</i>	635

Teacher Education – Preservice: The Knowledge Base

Experienced Teachers' Craft Knowledge	<i>P C Meijer</i>	642
Moral Values in Teacher Education	<i>W Veugelers</i>	650
Pedagogical Content Knowledge	<i>J H Van Driel and A Berry</i>	656
Teacher Education and the Educational Foundations Knowledge Base	<i>F B Murray</i>	662
The Relationship Between Theory and Practice in Teacher Education	<i>F A J Korthagen</i>	669

Teacher Education – Teacher Educators

Characteristics, Scholarship and Research of Teacher Educators	<i>M Lunenberg</i>	676
Professional Development of Teacher Educators	<i>P K Smith</i>	681
Self-Study by Teacher Educators	<i>T Russell</i>	689

Teacher Education – Teaching Specific Domains

Arts Teacher Education	<i>L Beudert</i>	695
Mathematics Teacher Education	<i>K Krainer and S Llinares</i>	702
Music Teacher Education	<i>M W-y Wong</i>	706
Science Teacher Education	<i>J H Van Driel and S K Abell</i>	712
Social Studies Teacher Education	<i>A-L Halvorsen and S M Wilson</i>	719
Teacher Education for Elementary Education	<i>K D Brown and G N Carnes</i>	725

Teacher Education for Teaching the Gifted	<i>A Y Baldwin</i>	732
Teacher Preparation in Mother Tongue Education	<i>M Kooy and H Hulshof</i>	738
Vocational Teacher Education	<i>S Johansson</i>	744

Teacher Education – The Cooperating School

Mentoring in Teacher Education	<i>P D Tomlinson, A J Hobson, and A Malderez</i>	749
Partnerships Between Schools and Higher Education	<i>C Day and L Smethem</i>	757

VOLUME 8

Technology and Learning

An Overview of Technology and Learning	<i>B Means and J Roschelle</i>	1
Educational Data Modeling	<i>S Iksal</i>	11
Student Data Systems and Their Use for Educational Improvement	<i>J C Wayman, V Cho, and M P Richards</i>	14
Technology and Learning: Access in Schools Around the World	<i>R Anderson and J Ainley</i>	21

Technology and Learning – as a Subject of Instruction

Conceptions of Technology Literacy and Fluency	<i>O Erstad</i>	34
--	-----------------	----

Technology and Learning – Assessment

Technology and Formative Assessment	<i>J W Pellegrino</i>	42
Technology for Large-Scale Assessment	<i>R E Bennett</i>	48
Technology Supports for Assessment Design	<i>R J Mislevy, F I Winters, I I Bejar, R E Bennett, and G D Haertel</i>	56

Technology and Learning – Education Reform and Economic Development

National Strategies to Build a Technology Workforce	<i>H-M Cheah</i>	66
Public–Private Partnerships for Educational Reform	<i>V Quah, C P Lim, and C Brook</i>	73
Relating Technology, Education Reform and Economic Development	<i>R B Kozma</i>	81

Technology and Learning – Evaluating Technology

Examining the Effects of Educational Technology Programs: Challenges and Strategies	<i>M Russell</i>	88
---	------------------	----

Technology and Learning – Global Trends

Equity in Technology Access and Opportunities	<i>T Matuchniak and M Warschauer</i>	95
Internet-Based Education	<i>M Bakia</i>	102

Technology and Learning – Issues

Media Use and School Achievement	<i>K Roe</i>	109
Technology and Physical and Social Health	<i>K Subrahmanyam</i>	112

Technology and Learning – Meeting Special Students’ Needs

Universal Design for Learning *D H Rose and J W Gravel* 119

Technology and Learning – School Leadership for Technology Integration

Technology as a Support for School–Community Connections *K M Culp* 125

Technology and Learning – Supports for Managing Instruction

Classroom Uses of Technology to Manage Instruction *W R Penuel* 133

Technology and Learning – Supports for Skill Learning

New Media, Learning from *W Schnotz and H Horz* 140

Reading and Technology *N DeFrance, D Khasnabis, and A S Palincsar* 150

Technological Supports for Acquiring Twenty-First-Century Skills *C Dede* 158

Technology Supports for Acquiring Inquiry Skills *T de Jong* 167

Technology Supports for Acquiring Mathematics *M J Nathan* 172

Technology Supports for Lifelong Learning *A Collins and R Halverson* 184

Technology and Learning – Supports for Student Collaboration

Knowledge Communities in the Classroom *J D Slotta and H Najafi* 189

Technology and Learning – Supports for Subject Matter Learning

Technology Supports for Science Learning *C Delgado and J Krajcik* 197

Technology Supports for Second Language Learning *D Nunan* 204

Technology and Learning – Teacher Learning

Teacher Skills and Knowledge for Technology Integration *N Law* 211

Technology in Preservice Teacher Education *N Davis* 217

Technology Resources for Teacher Learning *J E Hinojosa, C Labbé, and L López* 222

V

Vocational Education and Training

An Overview of Vocational Education and Training *T Karmel* 229

Understanding How Leadership Influences Student Learning

A Distributed Perspective on School Leadership and Management

J P Spillane, Northwestern University, Evanston, IL, USA

© 2010 Elsevier Ltd. All rights reserved.

Distributed leadership has garnered much attention from policymakers, practitioners, philanthropists, and researchers over the past decade (Hammersley-Fletcher and Brundrett, 2005; Storey, 2004). The concept, or at least the term, has easily and rather effortlessly entered the discourse about school leadership and management from Australia to America and many places in between.

The usage of the term varies widely. For some, distributed leadership is a conceptual lens or theoretical framework for studying or diagnosing the phenomena of leadership and management, whereas others use it as a prescription – an improvement strategy for schools (Bennett *et al.*, 2003; Harris, 2005; Spillane *et al.*, 2001; Spillane, 2006). Those who use distributed leadership as a conceptual lens do not do so uniformly: some focus exclusively on who takes responsibility for key organizational functions, whereas others add to this a consideration of the practice of leading and managing. Yet, even when scholars take the practice aspect into account some equate leading and managing practice with the actions or behaviors of individuals (Leithwood *et al.*, 2007), whereas others see this practice as a dynamic system or web of interactions (Spillane, 2006; Spillane and Diamond, 2007). Similarly, as a prescription for school improvement, distributed leadership has come to mean everything from simplistic mantras such as everyone is a leader in the schoolhouse, to more sophisticated models that center on work redesign (Mayrowetz and Smylie, 2004; Mayrowetz *et al.*, in press).

The appeal of distributed leadership lies partially in the ease with which it can mean many things to diverse users, but, therein also lies its Achilles' heel as a concept.

Distributed leadership's user-friendliness may portend trouble and seriously undermine its usefulness to the fields of policy, practice, and research. Regardless of whether distributed leadership is a conceptual framework or strategy for improvement, clarity about what it means is critical. Without such clarity, it is impossible for the field to use a distributed perspective to amass a knowledge base, test hypotheses, replicate studies, develop improvement strategies, and move forward. A distributed perspective will have limited utility in improving practice if policymakers and practitioners use the term to mean different things, talking past one another in their efforts to improve schools and school systems. Variance is inevitable and potentially productive as long as it is recognized and acknowledged – too often it is not.

We examine what it means to take a distributed perspective to school leadership and management. Focusing on distributed leadership as a conceptual or diagnostic frame, we examine some core elements paying attention to variation in usage. This discussion is organized around the leader plus and practice aspects of a distributed frame. Within both subsections, we also consider the empirical knowledge base, though the review is not exhaustive. While the empirical knowledge base is sparse (Bennett *et al.*, 2003), the situation is changing with numerous studies currently underway using some version of a distributed perspective to frame their investigations. Next, we consider the question of effectiveness. Finally, we take up the issue of what a distributed perspective is not by examining some common synonyms for distributed leadership.

A Distributed Perspective: Conceptual and Empirical Work

Over the past decade, scholars have worked at fleshing out a framework utilizing a distributed perspective for examining school leadership and management (Gronn, 2000, 2003; Spillane *et al.*, 2001, 2004; Spillane, 2006). A distributed perspective is a conceptual or analytical framework for researchers involved in investigating school leadership and management. Of course, it can just as easily be used as a diagnostic instrument for practitioners and interventionists working to improve practice, drawing their attention to particular dimensions of school leadership and management (Spillane, 2006). Scanning the theoretical literature, at least two aspects of a distributed perspective, are evident – the leader plus aspect and the practice aspect.

Leader Plus Aspect

Conceptual

A distributed perspective acknowledges that the work of leading and managing schools involves multiple individuals, not just those with formally designated leadership and management positions but also individuals without such designations. A distributed perspective then presses us to take into account the work of all the individuals who may have a hand in leadership and management work. Acknowledging that anyone in the school organization might have a hand in the working of leading and managing the organization is not to argue that everyone does or even should be leaders or managers. Taking a distributed perspective cautions us against investigating school leadership and management by focusing chiefly on the work of formally designated leaders.

While allowing for heroes and heroines, a distributed perspective presses us beyond the heroics of leadership paradigm (Yukl, 1999: 292; also Heller and Firestone, 1995; MacBeath 2003; Spillane, 2006). Thus, the leader plus aspect acknowledges, something that organizational scholars have long recognized, that investigations of leadership and management must move beyond those at the top of the organization and pay attention to shifting coalitions of decision makers (Cyert and March, 1963; Katz and Kahn, 1966; Barnard, 1968). Teacher leaders and other professionals are important in understanding school leadership and management (Smylie and Denny, 1990; Heller and Firestone, 1995). The distribution of responsibility for leadership and management spans across formally designated leaders and informal leaders. It is achieved through at least three arrangements that coexist in schools—division of labor, co-performance, and parallel performance (Gronn, 2003; Heller and Firestone, 1985; Spillane, 2006).

Empirical

Recent empirical work sheds considerable light on the distribution of responsibility for leadership and management

work. Multiple individuals typically perform leadership work, including formally designated leaders and individuals without these designations. One recent study of 120 geographically dispersed US elementary schools found that the responsibility for leadership functions was typically distributed among three to seven formally designated leadership positions (Camburn *et al.*, 2004). Other studies show that teachers with no formally designated leadership positions as well as school district personnel and external consultants take responsibility for leadership and management functions and organizational routines (Frost, 2005; Heller and Firestone, 1995; Portin *et al.*, 2003; Spillane, 2006; Spillane and Diamond, 2007). Even studies that focus exclusively on the school principal's workday point to the important role played by other formally designated leaders and individuals, who have no formal leadership designations in leading and managing the schoolhouse (Spillane *et al.*, 2007). Some recent studies of school leadership also underscore the need to extend investigations beyond the schoolhouse walls to school districts (Mayrowetz and Smylie, 2004; Firestone and Martinez, 2007; Leithwood *et al.*, 2007).

The distribution of responsibility for leadership and management differs depending on the organizational function or routine, school type, the school subject, school size, and a school's stage of development. The responsibilities differ depending on the formally designated position (Camburn *et al.*, 2004; Heller and Firestone, 1995). School administrators tend to take responsibility for a broad array of functions, whereas curriculum and reform specialists focus chiefly on instruction-related functions. District administrators typically were not involved in functions such as monitoring program implementation or handling disturbances in schools.

These patterns of distribution, however, also depend on the school type – public, private, charter, Catholic, or magnet. A study of 21 US schools found that the responsibility for critical areas of leadership (e.g., instruction, culture, management, human resources, and external development) differed depending on the school type (Portin *et al.*, 2003). Principals in private and entrepreneurial schools, for example, were more likely to distribute leadership for culture, strategic vision, and human resources. The distribution of responsibility for leadership and management also depends on the school subject. The number of individuals involved in the performance of organizational routines, and the extent to which formally designated leaders were involved, differed by the school subject (Burch, 2007; Sherer, in press; Spillane, 2005; Spillane *et al.*, 2003a). The developmental stage of the school or school leadership team is yet another factor that appears to influence the distribution of responsibility for leadership and management work (Copland, 2004; Frost, 2005; Harris, 2002).

Research studies are also generating knowledge about how responsibility for leadership and management gets

distributed in schools. The distribution of responsibility for leadership can result by design, default, and by crisis. The design decisions of formally designated leaders – to create a new position or organizational routine, join a particular comprehensive school reform model, hire a particular individual to fill a formally designated leadership position, and to change the responsibilities of a formally designated position – can influence the distribution of responsibility for leadership and management (Camburn *et al.*, 2004; Heller and Firestone, 1995; Spillane, 2006; MacBeath *et al.*, 2004). The distribution of responsibility for leadership and management also evolves over time as individuals understand one another's skills and weaknesses and step up to the plate when they see particular needs (Gronn, 2003; Spillane, 2006; Hargreaves and Fink, 2003); sometimes, it is in response to default. Responsibility also gets distributed through crisis when a school encounters an unanticipated problem or challenge and formal leaders and teachers find themselves working together to address it (Gronn, 2003). Of course, a crisis is in the eye of the beholder, and could be a situation where a new administration wants to fundamentally change business as usual in a school that triggers a group of veteran teachers in opposition to their plans (Hallet, 2007). One recent study of 11 schools in three local authorities in the UK identified six ways in which the distribution of responsibility for leadership and management was conceived and effected. These styles ranged from the formal designation of official top-down hierarchy positions to a more bottom-up opportunistic taking on of leadership and management functions by those without formally designated positions, including students (MacBeath *et al.*, 2004). These patterns of distribution include: formal, pragmatic, strategic, incremental, opportunistic, and cultural distribution. Pragmatic distribution, for example, is frequently in reaction to external stimuli with headteachers asking the staff to take up responsibility in order to ease the burden and to spread the workload (MacBeath *et al.*, 2004).

Practice Aspect

Conceptual

While the leader plus aspect has achieved the lion's share of the attention from scholars and practitioners, who take a distributed perspective, the practice aspect is critical. The practice of leadership and management has not been a major pursuit in research (Hallinger and Heck, 1996). Some readers may find this claim overdrawn, pointing to a larger literature on leadership styles and approaches that characterize collections of practices. While helpful, this literature extracts practice from its temporal context and in so doing ignores the urgency of practice (Bourdieu, 1981: 310). A focus on practice necessitates attention to the immediacy and improvised nature of practice.

A distributed perspective frames practice in a particular way – as a product of the interactions of school leaders, followers, and aspects of their situation. This framing departs from the rather narrow psychological view that equates practice with the actions of individuals. From a distributed perspective, leading and managing practice is stretched over the work of two or more leaders and followers. Interactions are key to understanding practice. Further, aspects of the situation including tools, artifacts, organizational routines, and language (among others) define practice by enabling and constraining interactions among leaders and followers. While scholars have long recognized that the situation is a critical consideration in studying leadership and management (Murphy, 1991; Hallinger and Murphy, 1987a; Bossert *et al.*, 1982; Rosenholtz, 1989), from a distributed perspective, aspects of the situation do not simply affect what school leaders do or moderate the impact of what they do. Rather, the situation is one of the three core constituting elements of practice. At the same time, aspects of the situation are a product of practice (Spillane, 2006; Spillane and Diamond, 2007). Viewed this way, the practice of leading and managing is an emergent phenomenon (Gronn, 2000).

Work on the practice aspect of a distributed perspective draws on various theoretical traditions, including socio-cultural activity theory, distributed cognition, and situated cognition. An emerging emphasis in psychology and related fields is recognizing how social context is an integral component for activity. Work in situated and distributed cognition argues that the study of human cognition must attend to purposeful activity in its natural habitat (Hutchins, 1995; Pea, 1993; Latour, 1987; Leont'ev, 1981). Cognition is not purely a function of mental capacity because it is enabled and constrained by the circumstances in which it happens (Resnick, 1991). This work shifts the unit of analysis from an exclusive focus on the individual's knowledge structure to the practice system (Greeno, 1998). Sociocultural activity theorists argue that language, number systems, theories of action, and interpretive schema provide mediational means that enable intelligent social activity (Wertsch, 1991; Vygotsky, 1978; Leont'ev, 1975, 1981; Rogoff *et al.*, 1995). These material and cultural artifacts form identifiable aspects of the sociocultural context as products of particular social and cultural situations (Cole and Engeström, 1993; Engeström and Middleton, 1998; Wertsch, 1991; Vygotsky, 1978).

Empirical

The empirical knowledge base is thin with respect to applying the practice aspect of a distributed perspective to investigations of school leadership and management. Based on earlier work on interdependencies between activities and resources (Malone and Crowston, 1994; March and Simon, 1958; Thompson, 1967), one line of work

centers on identifying the interdependencies among leaders and followers in interactions. One typology identifies three types of distribution – collaborated, collective, and coordinated (Spillane *et al.*, 2000, 2003b; Spillane, 2006). Collaborated distribution refers to practice that is stretched over the work of two or more people working in the same place and same time to perform the same organizational routine. Collective distribution refers to situations where people work separately in place and time but interdependently to perform an organizational routine or function. Coordinated distribution refers to organizational routines where the tasks or activities have to be performed in a particular sequence; in order for task b to be performed, task a must be performed first. Each distribution type involves different sorts of interdependencies that pose unique challenges for practice. A single organizational routine could involve more than one type of distribution.

Distinguishing between additive models of distributed leadership and distributed leadership as concertive action, Peter Gronn identifies three forms of concertive action – spontaneous collaboration, intuitive relations, and institutionalized practices (Gronn, 2003, 2004). Each of these forms represents a stage in an institutionalization process. Further, the people who make up the group or unit act conjointly in that they synchronize their actions by paying attention to their own goals, their peers' goals, and their sense of belonging to the group or unit. Spontaneous collaboration refers to impromptu collaborations that are frequently transient and motivated by particular challenges. Intuitive relations refer to those working relations that develop over time as two or more people work together and learn to trust and rely on one another. Finally, institutionalized practices are represented in new structures that enable two or more individuals to co-perform.

Recent work has also started to explore how aspects of the situation (e.g., tools, artifacts, and organizational routines) define the practice of leading and managing by framing and focusing the interactions among leaders and followers (Coldren, 2007; Sherer, 2007; Spillane and Diamond, 2007). Further, there have also been some efforts to explore the prevalence of co-performance of leadership and management work in schools. One recent study of 42 school principals in a mid-sized urban district in the US found that school principals co-performed almost half (47%) of administration and instruction as well as curriculum-related activities for which they had some responsibility. These school principals reported co-leading with just one other individual 63% of the time, while they reported co-leading with two or more individuals 37% of the time with classroom teachers, having no formal leadership designation, being the most frequent co-leaders (Spillane *et al.*, 2007). This work, focused exclusively on the school principal's workday, suggests that situations involving collaborated distribution are prevalent in schools.

Effects

Considering that efforts to develop a distributed perspective are relatively new, the thin empirical knowledge base is understandable. Moreover, over the past 5 or 6 years, a growing number of empirical studies have used a distributed perspective to frame some part of the work. Some researchers express concern about the effectiveness of a distributed perspective wanting evidence that supports strong causal inferences; however, such thinking is problematic. To begin with, a distributed perspective is a conceptual frame for studying leadership and management, not a well- or even moderately specified approach to leading and managing schools. Hence, what is most salient in trying to tease out the effects a distributed perspective is not that the work of leading and managing the schoolhouse is distributed, but how it is distributed. Theory-building and hypotheses-generating work that will generate evidence about how the work of leading and managing is distributed and how these arrangements vary across schools is an important precursor to hypotheses-testing research and any serious attempts at tackling questions of effectiveness. Further, understanding the factors that might account for these different arrangements is also important and some of the work reviewed earlier offers important hints.

Based on the available empirical evidence, we might examine the relationship between the prevalence of co-performance of leading and managing and different outcome variables. Similarly, we might examine whether the concentration of responsibility for leadership and management work in a few individuals versus the dispersion over many individuals is related to particular outcomes. It is important to remember, however, that the influence of these arrangements is likely to differ, depending on various factors such as where a school or school leadership team is in some developmental trajectory. An example of this hypothesis generating and testing work is Ken Leithwood and his colleagues' recent research in which they focus on the extent of conscious alignment across different sources of leadership for the performance of organizational functions (Leithwood *et al.*, 2007). They identify four different leadership distribution arrangements – planful alignment, spontaneous alignment, spontaneous misalignment, and anarchic misalignment. Based on these four conceptualizations of leadership distribution patterns, they articulate a series of hypotheses for testing. For example, they hypothesize that planful alignment will contribute more than other patterns to organizational productivity over time.

The Problem with Synonyms

Efforts to generate valid evidence about how leadership and management are distributed in schools will be thwarted

unless scholars are precise about what they mean and do not mean when they say they are studying distributed leadership or taking a distributed perspective. Collaborative leadership, democratic leadership, and co-leadership, among others, are sometimes used interchangeably with distributed leadership. We hope we have made it clear in the preceding pages that a distributed perspective is not synonymous with democratic or collaborative leadership.

By definition, collaborative leadership is distributed; however, a distributed perspective can be used to analyze leadership and management situations that are not necessarily collaborative. While some see a distributed perspective as implying agreement and collegial arrangements among those doing the leading and managing, this is problematic. A distributed perspective applies just as well to situations where leaders do not see eye to eye or get along with one another (Hallett, 2007). Hence, a distributed perspective applies to situations where leaders have different or contrary goals as easily as it does to situations where leaders are striving for the same goal.

Similarly, a distributed perspective on leadership allows for democratic leadership or autocratic leadership or something in between. Examined from a distributed perspective, the leadership and management in a school can be stretched over leaders but not necessarily democratically (Woods, 2004). While co-leadership involves distribution or responsibility among two or more leaders, a distributed perspective urges us to consider how leadership practice takes shape in the interaction of leaders, followers, and aspects of the situation. Finally, a distributed perspective differs from transformational leadership; it applies as easily to situations involving transactional leadership as it does to situations involving transformational leadership.

Conclusion

Distributed leadership is certainly popular with researchers, practitioners, and policymakers. However, popularity is a poor measure of usefulness. A key issue for any conceptual frame is whether it adds value to the field by enabling scholars to generate new insights and helping practitioners think about a familiar phenomenon in new ways. The growing number of studies that are framed from a distributed perspective suggests the frame has value in investigating school leadership and management; however, more empirical work is necessary. Armchair theorizing about distributed leadership is plentiful. While theorizing is necessary for solid empirical work, future theorizing would benefit from a firm grounding in empirical data.

Generating empirical knowledge about school leadership and management from a distributed perspective will also necessitate attention to methodological challenges. These challenges are especially acute with respect to using the practice aspect of a distributed perspective to

frame investigations of leadership and management. Currently, we rely mostly on ethnographic studies, structured observations, and video data collection methods to study the practice of leading and managing. These methods generate rich insights into practice, but they are limited by cost and small sample size that make generalization to a population of schools difficult. Annual surveys address some of these challenges but they face another problem with respect to capturing practice. Research in survey methodology shows that annual surveys often yield flawed estimates of behaviors as respondents cannot accurately remember whether or how often they engaged in a behavior (Tourangeau *et al.*, 2000). In responding to an annual survey, respondents must often consider many different episodes of behavior that may have occurred weeks or months in the past. As one might expect, surveys that are administered closer to when a behavior occurs (e.g., logs and diaries) are more accurate than surveys that are given further away from when a behavior occurs (e.g., annual surveys; Hilton, 1989; Lemmens *et al.*, 1992). Hence, developing logs and diaries for school leaders, both formally designated leaders and informal leaders, offer some promise. Moreover, these methods can be supplemented with more intensive observational, interview, and video methodologies.
