NHS scholarships are awarded each year to outstanding graduating senior members of local chapters. NASSP organized this program in 1945, and since then more than \$10 million has been dispensed. Two hundred scholarships of \$1,000 each were distributed to the membership in 2001. In addition to the NHS Scholarship, the national office administers the following scholarship and award programs: the Principal's Leadership Award, sponsored by Herff Jones, Inc.; the Prudential Spirit of Community Awards; and the Wendy's High School Heisman Awards.

In the early twenty-first century, because it is the oldest, largest, and most prestigious school-based student recognition program in the country, the National Honor Society is considered the highest honor that can be bestowed upon students in secondary schools.

## NATIONAL MERIT SCHOLARSHIPS

---

Established in 1955, the National Merit Scholarship Corporation (NMSC) is an independent, not-for-profit organization that conducts the National Merit Scholarship Program. NMSC was initially funded by a \$20 million Ford Foundation grant and a \$500,000 grant from the Carnegie Corporation of New York. The National Merit Scholarship Program's purpose is to recognize academic achievement and grant undergraduate college scholarships to able high school students, based on their performance on the Preliminary SAT/National Merit Scholarship Qualifying Test (PSAT/NMSQT). Students take the PSAT/NMSQT for guidance purposes, to practice for the SAT, and to enter the competition for National Merit Scholarships. Though some sophomore students take the exam, typically only students in their third year of high school are eligible for the National Merit Scholarship competition. Additional eligibility requirements for the competition include full-time enrollment as a high school student with plans to enter college no later than the fall following completion of high school and one of the following: U.S. cit-

izenship, permanent U.S. resident status, or current involvement in the U.S. citizenship-qualification process.

### **Recognition and Awards Program**

NMSC recognizes students who earn high scores on the PSAT/NMSQT through press releases to the news media and by sharing their information with colleges and universities to assist with recruiting academically able students. Students who meet rigorous scholarship criteria are also recognized by receiving monetary scholarships. The National Merit Scholarship program offers several different types and levels of recognition and scholarships, including commended students, semifinalists, finalists, and Merit scholars. In addition, students compete for corporate- and university-sponsored Special Scholarships and the National Achievement Scholarship program.

Because there is a lengthy screening process throughout the scholarship competition (approximately eighteen months), high school juniors who took the PSAT/NMSQT in October 2000 would not receive scholarships until spring 2002, the student's senior year. Of the 2.9 million students who took the test in 2000 (an estimated 45% of the projected 2002 high school graduates), 1.2 million were eligible to enter the competition for scholarships. From this smaller group, approximately 50,000 of the highest-scoring students qualified for merit-program recognition. Of the 50,000 highest scorers, approximately 34,000 students received letters of commendation to recognize their academic potential. Though they were no longer eligible for the Merit Scholarship, some students in this group were eligible for Special or National Achievement Scholarships.

The remaining 16,000 students were notified that they qualified as semifinalists, which allowed them to remain eligible to be Merit scholars. The National Merit Scholarship Corporation then sent scholarship applications to the semifinalists to compete for finalist standing. About 90 percent of semifinalists who met academic and all other requirements then progressed to finalist standing. As finalists, students were then eligible for approximately 7,900 Merit Scholarships, which include the following three types of awards: National Merit Scholarships (one-time \$2,500 awards), corporate-sponsored Merit Scholarships, and college-sponsored Merit Scholarships. Corporate- and college-sponsored scholarship awards vary in amount and duration, depending on the sponsors.

In addition to granting 7,900 National Merit Scholarships, the National Merit Scholarship Program awards approximately 1,700 Special Scholarships to high-scoring applicants who did not qualify to be Merit scholars but met specific criteria designated by scholarship sponsors, such as businesses or corporations. For example, a company might fund a fixed number of scholarships for its employees' children who achieved a high score on the PSAT/NMSQT. The NMSC reviews the eligible students' applications and selects the recipients.

The third type of scholarship program coordinated by NMSC is the National Achievement Scholarship program. Established in the early 1960s as the National Achievement Scholarship Program for Outstanding Negro Students, the Achievement Scholarship competition seeks to honor outstanding African-American students and improve their opportunities for higher education. Thus far, awards worth about \$70 million have been offered to student participants. Though it is run simultaneously with the National Merit Scholarship program, and the two programs appear parallel in design, the National Achievement Scholarship is operated and funded independently. The participation requirements for the Achievement Scholarship are the same as those for the National Merit Scholarship awards, with one addition: African-American students must request entry into the Achievement Scholarship program when they fill out the PSAT/NMSQT answer sheet.

Approximately 110,000 students enter the National Achievement Scholarship program each year, and about 1,500 of the top-scoring students (represented regionally) are designated as semifinalists. Semifinalists complete an Achievement Scholarship application, and more than 1,200 then advance to finalist standing. From this group, Achievement Scholarship recipients are selected.

NMSC, professional organizations, corporations, and college sponsors fund more than 700 Achievement Scholarships each year. The three types of Achievement Scholarship awards are: National Achievement Scholarship (\$2,500), corporate-sponsored Achievement Scholarships, and college-sponsored Achievement Scholarships. Students can compete in the competitions for both the National Merit Scholarships and the National Achievement Scholarships in the same year, but they can only receive one monetary reward.

## The Test

Cosponsored by NMSC and the College Board, the PSAT/NMSQT comprises five sections: two verbal, two mathematical, and one writing-skills section. The verbal sections include sentence completions, analogies, and critical-reading questions. The mathematical sections include multiple choice questions, quantitative comparisons, and student-produced responses. Finally, the writing portion includes identifying sentence errors, improving sentences, and improving paragraph items.

The PSAT/NMSQT is administered in October, and the score reports are usually sent to high school principals by Thanksgiving. The range of scores for each section of the PSAT/NMSQT is 20 to 80. The scores for the PSAT/NMSQT can be compared to an estimated SAT score by multiplying the PSAT/NMSQT score by 10. For example, if a student's combined score for the verbal section was 48, the corresponding SAT score would be 480. Based on the PSAT/NMSQT results, the individual's test report provides estimates for SAT scores.

In 1999 the average PSAT/NMSQT results for juniors were 48.3 (verbal), 49.2 (mathematics), and 49.2 (writing skills), for a Selection Index of about 147 (the sum of the verbal, mathematics, and writing scores). The Selection Index ranges from 60 to 240, and those students with the highest Selection Index scores are eligible for recognition and scholarships coordinated by the National Merit Scholarship Corporation.

AMY HIRSCHY

## NATIONAL PTA

National PTA is the oldest and largest volunteer child advocacy organization in the United States. Founded in 1897, National PTA is a not-for-profit organization of parents, educators, students, and other citizens who are active in their schools and communities. Membership in National PTA is open to anyone who is concerned with the education, health, and welfare of children and youth.

National PTA's 6.5 million members work in 26,000 local chapters in all 50 states, the District of Columbia, the U.S. Virgin Islands, and in Department of Defense schools in Europe and the Pacific. The association's bylaws govern its affairs; a twenty-eight-member board of directors, including National PTA officers, other PTA leaders, and members at-large, oversees National PTA's business. Professional staff at the association's headquarters in Chicago, Illinois, and its office in Washington, D.C., carries out National PTA's day-to-day operations and lobbying efforts.

### History

From its founding in 1897 in Washington, D.C., as the National Congress of Mothers by Alice McLellan Birney and Phoebe Apperson Hearst, National PTA has spoken out in support of children and their families. Among its earliest efforts, the Congress called for the establishment of a public health bureau to stem the tide of child mortality caused by childhood illnesses such as measles, whooping cough, and diphtheria; encouraged juvenile justice reforms; and began serving hot lunches to children in schools across the country in 1912. These efforts were rewarded at the state and federal levels with the establishment of the U.S. Public Health Service in 1913, emerging state laws establishing juvenile courts and probation systems in the first decade of the twentieth century, and the passage of the National School Lunch Act in 1946.

Throughout the remainder of the twentieth century, National PTA continued to champion children's rights. In the 1950s, the PTA promoted participation in the field testing of the Salk polio vaccine, initiated a nationwide campaign to prevent youth smoking in cooperation with the U.S. Department of Health, Education, and Welfare in the 1960s, sponsored a project to combat violence on television in the mid-1970s, launched an HIV/AIDS education project in cooperation with the Centers

for Disease Control and Prevention in Atlanta in the 1980s, and made sure the parent voice was represented in major education reforms put forth by the U.S. government in the 1990s. As the PTA moved into the twenty-first century, it focused its efforts in three broad areas as identified by its 1999 strategic plan. These areas include promoting parent involvement, advocating for safe and nurturing environments for children and youth, and continuing support of public education.

### Parent Involvement

At the root of all PTA work is its commitment to parent involvement in education; one of the association's founding objectives was to bring the home and school into closer relationship. National PTA worked with Congress to initiate the Parent Act, which sought to strengthen the parent participation policies in the Elementary and Secondary Education Act (ESEA). In January 2002 the ESEA was signed into law as the No Child Left Behind Act, authorizing more than 40 programs that provide federal funds to nearly every school district in the nation. This law includes many of the parent involvement provisions of the Parent Act and, for the first time, defines the term *parent involvement* based on National PTA's standards for parent/family involvement programs. These standards, developed and published in 1997 and based on research from Johns Hopkins University that affirmed that parent and family involvement increases student success, guide the development of quality parent involvement programs in schools and to help evaluate their effectiveness.

In 2000 National PTA published a comprehensive work, *Building Successful Partnerships: A Guide for Developing Parent and Family Involvement Programs*, which incorporates the six standards and field-tested strategies for building effective parent involvement programs. The PTA created a nationwide training program based on the book, as well as a complementary parent education program *How to Help Your Child Succeed*, which focuses on ten practical strategies for helping children succeed in school and in life.

National PTA has long supported arts education as an essential element in the education of children and has encouraged parents to nurture their children's artistic expressions. As a result, for more than thirty-two years National PTA has sponsored a nationwide arts recognition initiative, Reflections Pro-

gram, which encourages young artists in grades pre-K–12 to express themselves through literature, musical composition, photography, or the visual arts. In 2000 almost 700,000 young people participated in the program through their local PTA chapters.

### Safe and Nurturing Environments

In response to the issue of intolerance purported to be at the heart of such violence as the September 11, 2001, tragedy and the rash of U.S. school shootings in 1998 and 1999, the PTA published the *Respecting Differences Resource Guide* in 2001. The guide is intended for use by PTAs and schools to promote diversity and inclusiveness in their communities in the hopes of eliminating episodes of intolerance, discrimination, and violence. It reflects the PTA's long-standing commitment to the individual worth of all people as articulated by founder Alice Birney, "The National Congress of Mothers, irrespective of creed, color, or condition, stands for all parenthood, childhood, homehood."

An early example of this commitment was seen in the PTA's support of parent teacher associations in African-American schools in the segregated south during the first quarter of the twentieth century. This support evolved into the creation of the National Congress of Colored Parents and Teachers (NCCPT) in 1926, headed by Selena Sloan Butler.

The PTA responded to the television industry's increasing promotion of violence, sex, and stereotyping in programming by launching its *Take Charge of Your TV* project in 1995. Developed in cooperation with the National Cable and Telecommunications Association and Cable in the Classroom—cable TV's educational arm—the project is a workshop that teaches parents to become more discriminating viewers of television so that they, in turn, can educate their children.

In collaboration with the International Truck and Engine Corporation (a manufacturer of school bus chassis), the PTA created a school bus safety program, *Be Cool. Follow the Rules* in 1993. The program uses a host of resources that convey multiple messages promoting school bus safety to multiple audiences including parents, schoolchildren, school administrators, and school bus drivers.

### Support of Public Education

Throughout its history, National PTA has advocated for a strong public education system. Its efforts have

focused on adequate federal funding of public schools, education equity, ongoing teacher training, and support of comprehensive education reforms among other issues. The PTA consistently has fought against voucher and tax credit programs that would divert federal money away from public schools. Currently, National PTA supports federal education policies that expand parent involvement, promote equity, and help states and schools build the capacity they need to provide high quality educational services for all children.

### Child Advocacy

As identified in National PTA's strategic plan, a primary objective of the PTA is to train all 6.5 million members to be effective advocates for children and youth by the year 2020. Part of that objective will be accomplished through National PTA's programming and training efforts, and through its advocacy and legislative work in Washington, D.C. With a network of 6.5 million advocates, the PTA will be an even more powerful voice to express its concerns regarding children in classrooms, in communities, in state legislatures, and on Capitol Hill.

### Other Resources

Through its many resources, National PTA keeps members and the public apprised of the issues affecting children and youth, and provides the means to help parents, teachers, and others work effectively for children. Some of these resources include *Our Children*, National PTA's magazine for members and others concerned about the health, education, and welfare of children; *Building Successful Partnerships: A Guide for Developing Parent and Family Involvement Programs*; and the *National Standards for Parent/Family Involvement Programs*.

National PTA's online presence, [www.pta.org](http://www.pta.org), includes parent involvement information and tips, resources regarding children's health and safety, and updates on legislation affecting families. There is also a password-protected members' area filled with materials exclusively for PTAs, including several electronic newsletters providing timely information on a range of child- and member-related topics.

Each June, National PTA holds a convention, enabling PTA members and nonmembers from across the country to attend workshops and other education sessions on a range of subjects focusing on National PTA's three-fold mission of child advocacy, parent education, and parent involvement. National

PTA also hosts a biannual legislative conference in Washington, D.C., where participants hone their advocacy skills and legislative knowledge.

### Raising Awareness of the PTA

To better identify itself as the national association, in the summer of 2001 National PTA launched a nationwide media campaign to raise public awareness of its identity as the oldest and largest volunteer child advocacy association in the United States.

PAMELA J. GROTZ

## NATIONAL SCHOOL BOARDS ASSOCIATION

---

The National School Boards Association (NSBA) is the nationwide organization representing public school governance. NSBA's mission is to foster excellence and equity in public elementary and secondary education through school board leadership. NSBA achieves its mission by representing the school board perspective before federal government agencies and national organizations that affect education and by providing vital information and services to state associations of school boards and local school boards throughout the nation.

Founded in 1940, NSBA is a not-for-profit federation of state associations of school boards across the United States and its territories. NSBA represents the nation's 95,000 school board members who govern nearly 15,000 local school districts serving the nation's more than 47 million public school students. Nearly all school board members are elected; the rest are appointed by elected officials.

A 150-member delegate assembly of local school board members determines NSBA policy. The board of directors, which comprises twenty-five members, translates this policy into action. The NSBA executive director and staff administer programs and services.

NSBA advocates local school boards as the ultimate expression of grassroots democracy. The orga-

nization supports the capacity of each school board—working with the people of its community—to envision the future of education, to establish a structure and environment that allows all students to reach their maximum potential, to provide accountability for the people of its community on performance in the schools, and to serve as a community advocate for children and youth and their public schools.

### History and Development

The advantages of forming an association of school boards were recognized as early as 1895. Pennsylvania became the first state to organize a state association in 1895; New York followed in 1896. Although some states organized associations in the years immediately following, it was not until 1913 that numerous other associations emerged. After 1913 the school board association movement showed steady growth. In the 1950s fifteen associations were organized, making this decade the time of greatest development.

The idea of establishing a national organization of school boards took shape during the 1938 convention of the National Education Association. The first name given to this group was the National Association of Public School Boards. However, the NSBA was formally organized in St. Louis, Missouri, on February 28, 1940, as the National Council of State School Boards Association. The name was later changed to the National School Boards Association.

### Program

NSBA's major services include:

- The National Affiliate Program, which enables school boards to work with their state association and NSBA to identify and influence federal and national trends and issues affecting public school governance.
- The Council of Urban Boards of Education (CUBE), which serves the governance needs of urban school boards. CUBE publishes *Urban Advocate*, a quarterly newsletter that addresses the programmatic, fiscal, and governance challenges of urban public schools on behalf of its members and the 7.5 million students they serve.
- The Federal Relations Network, which helps school board members from each congressional district actively participate in NSBA's federal and national advocacy efforts.

- ITTE: Education Technology Programs and Technology Leadership Network, which helps advance public education through best uses of technology in the classroom and school district operation. Formerly known as the Institute for the Transfer of Technology to Education (ITTE) the organization publishes *Technology Leadership News* nine times per year. NSBA's technology publication *Electronic School* is produced in cooperation with ITTE.
- The Council of School Attorneys (COSA), which focuses on school law issues and services to school board attorneys. COSA publishes *Inquiry and Analysis (I&A)*. Published ten times per year, *I&A* keeps members up-to-date on the latest developments in the field of school law.
- The National Education Policy Network, which provides the latest policy information nationwide and a framework for public school governance through written policies.
- *School Board News (SBN)*, NSBA's member newspaper, which began publication in 1981. *SBN* covers trends in public education and has won many awards for its content.
- *American School Board Journal (ASBJ)*, which is an award-winning, editorially independent education magazine housed at NSBA's offices. *ASBJ* began publication in 1891 and in the early twenty-first century had a circulation of more than 35,000 paid subscribers.
- NSBA's Annual Conference and Exposition, which is the nation's largest policy and training conference for local education officials on national and federal issues affecting the public schools in the United States.
- NSBA's Technology + Learning (T+L) Conference, which brings together school district leaders, technology specialists, and the leading vendors in education technology.

### Organizational Structure

The NSBA is a federation of state school boards associations, which includes the school boards of the fifty states, the District of Columbia, and the U.S. Virgin Islands.

Local school boards are eligible for membership in their own state school boards association and are not district members of the NSBA. However, the NSBA maintains contact with local school boards and their members through the National Affiliate program.

The National Affiliate program is a partnership that includes NSBA, its federation of state school boards associations, and local school districts across the country, which is dedicated to ensuring education excellence and improved student achievement through effective school board leadership. Official association publications supplement state association publications in helping to supply school board members with vital educational information. The National Affiliate program began in 1980 and now boasts more than 2,500 member districts.

The major policymaking body of the association is the delegate assembly, which meets during the annual conference. Two voting delegates, who are chosen at the state level, represent each member association. The delegate assembly determines official NSBA policies and resolutions. Policy decisions require a two-thirds vote and resolutions a majority vote.

### Goals

NSBA and its federation members are dedicated to educating every child to his or her fullest potential and are committed to leadership for student achievement. This commitment has coalesced into a strategic vision for the NSBA as a powerful, united, energetic federation; as an influential force for achieving equity and excellence in public education; and as a catalyst for aligning the power of the community on behalf of education.

Underlying this shared vision are certain fundamental convictions:

- belief that effective local school boards can enable all children to reach their potential
- conviction that local governance of public education is a cornerstone of democracy
- belief in the power of local school boards to convene the community around education issues
- conviction that together, local school boards can influence education policy and governance at the state and national levels
- commitment to the principle that through collaboration comes impact
- belief that the strength of local school board leadership arises from the board's capacity to represent the diversity of students and communities

Central to NSBA's vision is the "Key Work of School Boards" initiative. The "Key Work of School

Boards" is NSBA's framework for raising student achievement through community engagement. It is designed to give school boards the concrete action tools to be even more effective in the role of school board member and community leader and is based on the premise that excellence in the classroom begins with excellence in the boardroom.

The "Key Work" initiative is framed around eight key areas: vision, standards, assessment, accountability, alignment, climate, collaborative relationships, and continuous improvement. It means engaging the community, identifying priorities, and setting standards for student performance. It requires establishing assessment and accountability measures, demanding student data to drive decision-making, and aligning district resources to support priorities. All of this involves setting the right climate for learning, forming collaborative relationships, and always continually improving performance.

Through these goals and its longstanding commitment to excellence and equity in public education through school board leadership, the NSBA is a powerful force in education policy.

ANNE L. BRYANT

## NATIONAL SCHOOL PUBLIC RELATIONS ASSOCIATION

---

The National School Public Relations Association (NSPRA) defines itself in its mission statement as "a professional organization dedicated to building support for education through responsible public relations that leads to success for all students." Founded in 1935, NSPRA is the professional association for school communications specialists, superintendents, and others who are responsible for improving communication within school districts and between districts and the citizens they serve.

The association's Articles of Incorporation state that its primary purposes are to serve the citizenry

of the nation by promoting a better understanding of the objectives, accomplishments, and needs of public education. It seeks to accomplish those purposes by: (1) developing materials that will assist educational leaders in building both an increased public understanding of the role of education and increased awareness, knowledge, and understanding of current management practices and educational development; (2) placing before the public facts and viewpoints that will lead to a better understanding, appreciation, and support of public education; and (3) encouraging the use of sound public relations procedures by all those at work in education.

### Programs and Activities

NSPRA had approximately 1,800 members in 2001, comprising both individual and organizational memberships. Members are eligible for discounted prices on association publications and seminars. In addition, the association has approximately thirty-five state chapters throughout the United States, which enable national members and chapter members to create local networks and programs for professional development.

A four-day NSPRA annual seminar is held each July, attracting more than 600 participants to different locations each year. NSPRA offers other professional development opportunities, including two print newsletters, several electronic newsletters, and workshops. In 2000 the association initiated hour-long conference calls featuring experts in various areas of communication who make brief presentations and discuss participants' questions. One of the association's print newsletters, *Network*, is designed primarily for school public relations practitioners and superintendents, while the other, *PRincipal Communicator*, is designed for elementary and middle school principals.

NSPRA initiated an accreditation program for school public relations professionals in 1976. More than 150 members achieved accredited status before the program was combined with that of the Universal Accreditation Board's Accredited in Public Relations (APR) program. The association continues to urge its members to become accredited. In 2001 NSPRA was also developing standards of good practices that educational organizations could strive for in improving their communication efforts.

The association has been a publisher of documents to help improve educational public relations

since its founding. *School Public Relations: Building Confidence in Education*, published in 1999, gives education leaders a comprehensive overview of what school public relations is and what it can do for schools and communities. Other association publications include *Dream Big: Creating and Growing Your School Foundation*, *Principals in the Public: Engaging Community Support*, *The Complete Crisis Communication Management Manual for Schools*, *Win at the Polls*, and many others. In addition to its own publications, the association's catalog lists public relations and communications products created by other organizations.

In 1985 the association created the Flag of Learning and Liberty and coordinated an introductory campaign that saw the flag raised over all fifty state capitols on the Fourth of July that year. The flag is a visible reminder that education is critical to continuing a healthy, democratic society.

Another important service that NSPRA provides to local and intermediate school districts is a communication audit. For a modest fee, the district collects samples of its communication efforts and sends them to NSPRA for inspection by experienced public relations professionals. One or two of these professionals then conduct fifteen to twenty focus group sessions in a site visit to the district. Based on the review of district communication efforts and comments from the focus groups, the association provides an audit report with recommendations that will help improve the district's communication efforts.

### Organizational Structure

NSPRA is an incorporated, not-for-profit organization. It has a twelve-member board of directors, consisting of a president, president-elect, and ten vice presidents, eight of whom are elected by association members. Of these elected vice presidents, who serve three-year terms, seven represent geographic regions of the United States and Canada, while one represents ethnic and racial minorities. Two vice presidents, representing specific constituencies, are appointed by the board to two-year terms. The first two of these vice presidents' constituencies were urban school districts and superintendents of schools.

The board, which meets three times annually, hires an executive director to carry on the business and program of the association. It develops and ap-

proves association policies, conveys ideas and interests from the membership, and approves an annual association budget. In addition to the executive director, the association has a staff of eight.

### History

Initially, NSPRA was part of the National Education Association's (NEA's) Division of Press and Radio, created to help teachers and schools improve their communication efforts. It became an NEA department in 1950 and retained that status until the early 1970s, when it became independent.

KENNETH K. MUIR

## NATIONAL SCIENCE FOUNDATION

---

The National Science Foundation (NSF) is an independent agency of the federal government, created by the National Science Foundation Act of 1950, as amended (Pub. L. 81-597). The agency is responsible for promoting the progress of science and advancing the nation's health, prosperity, welfare, and security by supporting research and education in all fields of science and engineering. It is also responsible for monitoring the status of the U.S. science and engineering enterprise and for collecting and analyzing data that support the formulation of national policy.

By statute, NSF consists of the National Science Board and the director. These twenty-five eminent scientists, engineers, and administrators are appointed by the president and confirmed by the U.S. Senate. The board is responsible for establishing NSF's policies and is mandated to advise the president and the U.S. Congress on policy matters related to science and engineering research and education. The director, who is a member of the board *ex officio*, is responsible for directing the programs of the agency.

Unique among federal agencies, NSF is devoted to strengthening the overall health of the science and engineering enterprise. Other federal agencies sup-

port research and education related to their specific missions, such as energy or defense. NSF's mission is to support scientific inquiry in all fields, encourage emerging areas of research, and help ensure an adequate supply of scientists, engineers, and science and engineering educators. In any year, more than 200,000 people receive support through NSF programs and activities nationwide, and millions more benefit from NSF investments in education and other areas.

With a budget of \$4.7 billion for fiscal year 2002, NSF accounts for 4 percent of the total annual federal expenditure on research and development and 23 percent of federal support for all basic research performed at academic institutions. NSF provides more than a third of all federal funding in the physical sciences and about 50 percent in environmental sciences and engineering. In some fields, NSF provides the preponderant support: approximately two-thirds in mathematics and computer science research and nearly 100 percent in anthropology.

### Scope of Programs

NSF investments act as a catalyst to expand new knowledge. NSF supports cutting-edge research and education in the core disciplines, ranging from mathematics, the physical and life sciences, and engineering to the social, behavioral, and economic sciences. Its investments support three goals: to provide the nation with the necessary

- people—developing a diverse, internationally competitive, and globally engaged work force of scientists, engineers, and well-prepared citizens;
- ideas—enabling discovery across the frontiers of science and engineering, connected to learning, innovation, and service to society; and
- tools—providing broadly accessible research and education tools.

NSF is organized into directorates and offices, which support research and education in the various fields and administer grants to lead researchers and institutions. The directorates include biological sciences; computer and information science and engineering; education and human resources; engineering; geosciences; mathematical and physical sciences; and social, behavioral, and economic sciences.

In addition to support for core fields, NSF funds interdisciplinary research teams and centers, such as its science and technology centers, which encourage the integration of research and education. NSF also

provides grants to small businesses through its Small Business Innovation Research Program to encourage them to focus on important science, engineering, and education problems and opportunities with potential for commercial and public benefit.

Partnerships among academic institutions, industry, and government entities are integral to the way NSF implements its mission. Partnerships foster the use of new knowledge to stimulate innovation that will create new wealth and benefit the public. Some major programs are the Engineering Research Centers, Partnerships for Advanced Computational Infrastructure, and the U.S. Global Change Research Program.

Since its beginning, NSF has recognized that the conduct of science is intrinsically global, and the agency has encouraged international cooperation. NSF supports cooperative international activities, such as research collaborations, data sharing, and international partnerships in large-scale research facilities.

Although NSF itself operates no laboratories or research facilities, it provides funding for large, multiuser, state-of-the-art facilities, such as the Laser Interferometer Gravity Wave Observatory, the National Superconducting Cyclotron Laboratory, the International Gemini Observatory, and the Terascale Computing Facility. NSF also is the designated federal manager of the U.S. Antarctic Program.

Within NSF's broad portfolio, a few opportunities emerge that are so revolutionary that they promise to reshape science and engineering and ultimately change the way people think and live. Typically, these opportunities cross disciplinary boundaries, encompass the full range of NSF programs, and require coordination with other federal agencies. NSF investments that evolved into high-performance computing exemplify this type of emerging opportunity.

Priority areas that NSF has selected for increased attention during the early years of the twenty-first century are:

- information technology research: support for the people who will create new knowledge, and an upgrade of computational infrastructures;
- nanoscale science and engineering: research and technology at the confluence of the smallest human-made devices and the largest molecules of living systems;

- biocomplexity in the environment: the dynamic web of often-surprising interrelationships that arise when components of the global ecosystem interact; and
- learning for the twenty-first century: building and sustaining a competent, diverse work force and integrating research and education to produce that work force.

### **Involvement with the External Scientific Community**

Researchers and educators in all fifty states and the U.S. territories receive NSF support through competitively awarded grants and cooperative agreements. More than 2,000 colleges, universities, academic consortia, pre-kindergarten through grade twelve (pre-K–12) school systems, small businesses, nonprofit institutions, informal science organizations, and other research institutions receive such support.

Funding decisions are made through the process of competitive merit review, in which expert evaluation by external peer reviewers contributes to recommendations by NSF program managers. Each year, NSF receives approximately 30,000 proposals, solicits reviews from approximately 50,000 scientists and engineers, and funds approximately 10,000 proposals. Reviewers evaluate proposals according to two criteria:

- the intellectual merit of the proposed activity: the importance of the proposed activity to advancing knowledge and understanding within its own field or across different fields; the extent to which the proposed activity explores creative, original concepts; and
- the broader impacts of the proposed activity: how well the activity promotes teaching, training, and learning; how well it broadens the participation of underrepresented groups; and the extent of benefits to U.S. society.

In addition to the use of external reviewers, NSF recruits outstanding scientists, engineers, and mathematicians to serve on advisory committees or to join the NSF staff for short periods through the Intergovernmental Personnel Act and the Visiting Scientists, Engineers and Educators programs. Through these mechanisms, NSF involves thousands of working scientists in evaluating emerging opportunities for new knowledge and ensures its access to cutting-edge ideas in all fields of science and engineering.

## Support for Education

NSF's support for research is highly integrated with its investment in science and engineering education. Thousands of students at the undergraduate, graduate, and postdoctoral levels contribute to research activities at their education institutions and benefit from involvement with them. In addition, each year NSF provides graduate research fellowships to approximately 900 outstanding graduate students in science, mathematics, and engineering. To provide teaching experience for graduate students and strengthen pre-K–12 education, NSF provides graduate teaching fellowships to graduate students who assist teachers with the content of their mathematics and science classes. NSF's Integrative Graduate Education and Research Traineeships help prepare doctoral candidates for a broad spectrum of career opportunities in education. Through its Experimental Program to Stimulate Competitive Research, NSF provides funding to educational institutions to increase the research and development competitiveness of twenty-one states and the Commonwealth of Puerto Rico.

Although the integration of research and education is most obvious at the graduate and postdoctoral levels, NSF also funds pre-K–12 science and mathematics education in state, urban, and rural school systems and invests in comprehensive reform of undergraduate science, technology, engineering, and mathematics (STEM) education. NSF supports the development of high-quality instructional materials, teacher enhancement, and the use of learning technologies in the classroom. Its funding encourages educational systems to prepare all students—not just STEM majors—for the demands of a highly technological society.

NSF's systemic initiatives in education have catalyzed change in the teaching of mathematics and science by cultivating partnerships between local school systems and other organizations involved in education. Each partnership addresses curriculum, professional development, assessment, policies, resources, stakeholder support, evaluation, and improved student performance as the ultimate goal of any reform effort. As of 2001 NSF had encouraged experiments in comprehensive reform in twenty-six states, fifty-eight urban school districts, and twenty-eight rural initiatives in regions usually composed of more than one state. In the 1999/2000 school year, NSF systemic initiatives affected 227,000 teachers in

11,900 schools with approximately 4.6 million students.

In fiscal year 2002 NSF began implementing the Math and Science Partnerships program, which provides funds for states and local school districts to join with institutions of higher education in strengthening mathematics and science education. The goals are to improve mathematics and science standards, provide teachers with mathematics and science training, and create innovative ways to reach underserved schools and students.

## NATIONAL SCIENCE TEACHERS ASSOCIATION

---

The National Science Teachers Association (NSTA) promotes excellence and innovation in science teaching and learning for all. Its guiding principles are to model excellence; to embrace and model diversity through equity, respect, and opportunity for all; to provide and expand professional development to support standards-based science education; to serve as a voice for excellence and innovation in science teaching and learning, curriculum and instruction, and assessment; to promote interest in and support for science education collaboratively and proactively throughout society; and to exemplify a dynamic professional organization that values and practices self-renewal. NSTA was founded in 1944 and is headquartered in Arlington, Virginia. Its 2001 membership of more than 53,000 included science teachers, science supervisors, administrators, scientists, business and industry representatives, and others involved in science education.

The association publishes professional journals, a newspaper, and many publications for teachers, and it conducts world-class conventions that attract more than 30,000 attendees annually. NSTA offers many services for science educators, including the NSTA Institute, which provides online and site-based professional development programs; teacher recognition and grant programs; and competitions for students. NSTA also maintains a website that provides grade-specific resources for teachers, the latest news and information affecting science education, and opportunities for educators to connect with one another. NSTA participates in cooperative working arrangements with numerous educational organizations, government agencies, and private industries on a variety of projects.

### History

NSTA originated in Pittsburgh, Pennsylvania, on July 4, 1944. It was created by a merger of the American Council of Science Teachers and the American Science Teachers Association, both of which ceased to exist after the merger. At the time, the organizations had approximately 2,000 members combined. Years later, NSTA became an affiliate organization of the National Education Association (NEA) and was housed with NEA and its affiliates in downtown Washington, DC. Eventually becoming an independent organization, NSTA purchased and moved into

its own headquarters on Connecticut Avenue in 1974. In 1994 NSTA moved its headquarters to Arlington, Virginia.

### Legal Status and Governance

The National Science Teachers Association is a 501(c)(3) organization, incorporated under the laws of the District of Columbia by Articles of Incorporation filed on July 1, 1960. The association filed a Statement of Election to Accept Title 29, Chapter 10 of the District of Columbia Code, and a Certificate of Acceptance was issued on January 30, 1974. NSTA is governed by bylaws, which are amended from time to time.

The organization is governed by a board of directors with two advisory bodies: the NSTA Council and NSTA Congress. The board of directors consists of elected officers, including a president (chair), president-elect, and retiring president, as well as ten division directors. The council serves as the advisory body to the board of directors and consists of eighteen elected district directors and presidents from each of NSTA's seven affiliates. The council receives reports from NSTA committees and the congress and makes recommendations to the board. The congress is composed of a large body of science education leaders who gather to discuss and bring forth recommendations of interest to NSTA. Members include delegates from each NSTA state chapter and each NSTA-associated group.

### Membership

NSTA offers both individual teacher memberships and institutional memberships for schools and libraries. Special discount memberships are also given to students and retired educators. Members receive their choice of one of four award-winning journals, a newspaper, discounts on more than 300 books and publications, and reduced prices at NSTA regional and national conventions.

### Publications

NSTA publishes four award-winning, peer-reviewed journals geared to the specific needs of science educators at every level. They include *Science and Children* for elementary teachers, *Science Scope* for those at the middle and junior high level, *The Science Teacher* for high school science educators, and the *Journal of College Science Teaching* for educators at the college level. Considered a popular benefit of NSTA membership, these journals help teachers

learn about the latest teaching strategies and identify new activities to use in the classroom.

NSTA's news publication, *NSTA Reports!*, has been a timely source of news and information about science education. The newspaper is published six times a year as a free member service. It includes national news on science education and education in general; information on teaching materials; announcements of programs for teachers; and advance notice about all NSTA programs, conventions, and publications.

NSTA is also a major publisher of quality science materials for teachers. In 2000 the association revamped its publishing division, calling it *NSTA Press* to reflect its efforts to deepen its involvement in the science publishing arena. NSTA Press produces a wide variety of books, websites, CD-ROMs, and posters on popular science topics, including astronomy, biology, chemistry, earth science, environmental science, and physical science. Resources also focus on the diverse curriculum needs of teachers, such as teaching in alignment with the National Science Education Standards, mentoring, and assessment, as well as on creative teaching strategies, such as organizing science fairs and addressing questions about evolution.

### **Influence and Significance**

With more than 53,000 members worldwide, NSTA is a major voice of science teachers and strong supporter of quality science education. It is the largest member organization in the world committed to quality science teaching and learning for all and is a key player in setting the nation's science education agenda. In the mid-1990s, the organization was instrumental in the development of the National Science Education Standards, which guide the science education community in improving science teaching and learning. The association is an ardent advocate for long-term, sustained professional development for all teachers of science.

NSTA has a presence on Capitol Hill. The organization works closely with key members of the U.S. Congress and their staff, and is asked to present testimony to Congress and provide input to legislators on key issues. NSTA reaches more than 40,000 educators with its electronic *Legislative Update*, which reports the latest news of legislative and regulatory activities affecting science education. Through the *Legislative Update*, the association encourages its

members to contact members of Congress to voice their support for legislation bolstering quality science education. As a result of these efforts, NSTA has helped to maintain a high level of federal funding for science teaching and learning.

The association keeps its members and the general public informed on national issues and trends in science education. NSTA conducts and disseminates national surveys on science teaching. Many of these surveys, along with other NSTA opinions, have been featured in major news media outlets. In addition, NSTA has position statements on issues, such as teacher preparation, evolution, and laboratory safety that help guide policies and practices in education institutions around the country.

NSTA also has an impact on science education through its resources and programs. One successful program is *Building a Presence for Science*. Sponsored by the Exxon Education Foundation, this national education program seeks to strengthen the quality of science teaching and learning by creating a network of science advocates in public and private schools nationwide. It promotes standards-based science teaching instruction and hands-on, inquiry-based learning. A key component of the program is its dynamic national electronic network that enables information sharing among teachers and serves as a viable two-way communications conduit that is used by state and federal agencies and other organizations to share information with science teachers. As of 2001 the program had been implemented in twenty-four states and the District of Columbia.

*See:* LIABILITY OF SCHOOL DISTRICTS AND SCHOOL PERSONNEL FOR NEGLIGENCE.

## NEIGHBORHOODS

The *neighborhood* has long been an icon of school quality, local responsiveness, and home/parent centeredness in U.S. education. The mythology of the neighborhood has been heavily reinforced by the deep popularity of the long-running children's television show *Mr. Rogers' Neighborhood*. A romantic image of the neighborhood has also often been at the heart of opposition to busing, school closings, redefined attendance areas, or reallocations of personnel. Nostalgia connects the neighborhood school to the *old-time schoolhouse*—a facility remembered as being at the very center of the community, with its potluck suppers, spelling bees, family softball games, and Fourth of July picnics.

Reality, of course, has been a different story. Desegregation policies, population growth, magnet schooling, diversity goals, *pairings* of schools, and an increasing array of other choice options have reduced significantly the percentage of schools that have an identifiable neighborhood flavor. Nevertheless, at the start of the twenty-first century the significance of the neighborhood is returning to discussions of and inquiry into matters of school improvement.

Among the forces spurring this rediscovery of the neighborhood are: (1) a new appreciation of out-of-school (alongside in-school) learning and development; (2) a return in many communities to neighborhood assignment patterns under renegotiated desegregation agreements; (3) a renewed interest in cultural elements, and matters of cultural diversity, in varied patterns of development among children; and (4) a realization that school-centered learning (typically academic) and neighborhood-based learning (heavily social and emotional) can be, but are not necessarily, effectively linked.

### A New Linkages Lexicon

The renewed fascination with the neighborhood has been accompanied by a re-explored lexicon of linkages terminology and neighborhoods-centered theorizing. The most commonly employed term is *social capital*, which captures the notion that the strengths of families and their surrounding neighborhoods can provide a social foundation of norms, networks, and relationships upon which the schools can build. In pushing the concept of social capital, James Coleman has suggested that, in neighborhoods lacking or weak in social capital, it should be the job of the local

school to reach out to families with sets of capital-creating activities.

Other terms gaining an increased frequency of use are: *social cohesion*, *agency*, and a *sense-of-place*. Social cohesion proceeds beyond matters of capital toward an interest in the connective tissues of neighborhoods, as well as between neighborhoods and schools. Connective “webs,” collaborative endeavors, and ecological systems are key elements—as are such administrative acts as networking and a building of civic capacity.

Social cohesiveness exists when members of a school community adhere to the understood cultural norms of that community, and when members display tolerance in interactions across social groups. Stephen Heyneman suggests schools perform five essential functions in fostering social cohesion: (1) teach the “rules of the game” (i.e., principles underpinning good citizenship and consequences for not adhering to these principles) through curriculum content; (2) support school and classroom cultures; (3) decrease the distance between individuals of different origins, thus building social capital; (4) provide an equality of opportunity for all students, thus creating the public perception that the available opportunities for education are distributed fairly; and (5) adjudicate disagreements across social groups.

The concept of *agency* reflects a closer attention to the centeredness of a school within its neighborhood, reflecting a deep cultural embeddedness between school and community, as well as the agency work of the school in both preserving and passing on the values of the community. In like manner, the idea of a *sense-of-place* includes notions of social and cultural embeddedness, but adds a territorial, or *boundary*, dimension to the discussion—just what is a central part of each neighborhood, and what is not?

### A New Set of Neighborhood Models

To the extent that the neighborhood was “modeled” in past years, the central image was that of an entity of importance in the immediate environment around the school, but not *of* the school. Important were studies of neighborhood and community structures (e.g., community type, socioeconomic status); distributions of power and specialized interests; the array of concerns and issues in the community; and varying sources of support in the surrounding community (e.g., financial, public opinion). The neigh-

borhood, with its structures, issues, and supports, was regarded as an important context around the work of the school, but it was still external and “outside.”

More recent modeling (as with the above lexicon) has emphasized a more interactive set of neighborhood theories. Among these are: (a) an activism, or *alliances*, approach, (b) community-development modeling, (c) *regime* theorizing, and (d) a family-preferences, or *choice*, model. Alliance schools have been under experimentation for some time in the state of Texas. The central concept in the alliance approach has been an in-reach from neighborhood-to-school, rather than the other way around. A mobilization of the resources and strengths of the neighborhood and its institutions (including religious organizations) has been employed in the program to reach into the schools and assist the schools to reach back out to the community.

An initiation of alliances, but starting with the school, is also central to community-development modeling. Neighborhood revitalization has become a front-burner endeavor in many communities across the United States. Lizbeth Schorr, among others, would place the neighborhood school at the heart of the development effort. Indeed, Schorr advises that an improvement of learning opportunities in low-income neighborhoods requires nothing less than a key place for the school “at the table where community reform is being organized” (p. 291). In like fashion, William Boyd, Robert Crowson, and Aaron Gresson have suggested an extended role for the local school as an *enterprise school*, in which it joins an array of other community institutions in the regeneration of the neighborhood environment.

A third model takes the political science term *regime* as its central idea. From a regime perspective, the essential strengths, and indeed the power, of a neighborhood are to be found in a deeply structural embodiment of the neighborhood’s own culture and overall ecology (e.g., its essential lifeways, social institutions, local history, values, norms, expectations, and market forces). While activism and redevelopment are at the heart of the earlier two models, regime theorizing looks more closely at the neighborhood and its various institutions (including the schools) as participants in a *sustaining habitat*—a notion not unlike the centeredness celebrated in agency theorizing or the collective memories built into a sense-of-place. A key role for persons exercising leadership, from this perspective, may be action

as a cultural broker who bridges between the lifeways of a community and the institutions that serve it.

Finally, a neighborhood model that is extremely problematic but must be addressed is the *effects* model, which is based heavily upon the steadily increasing opportunities for choice found in modern-day schooling. An argument in favor of choice of schooling (e.g., through magnets, charters, transfer options, or vouchers) is that families are no longer locked in to underperforming neighborhood schools in poverty-stricken settings. A counterargument is that it is usually the families in a neighborhood with the most social capital and greatest intellectual resources and expectations who will avail themselves of choice—leaving the rest of a neighborhood even less empowered and enabled than before. A caveat is that at least these families stay in the neighborhood physically, if not educationally.

Interestingly, there have been comparative analyses of the effects upon neighborhoods when there are large disparities in the availability of community and social service resources (e.g., playgrounds, libraries). There have not yet been comparable studies of the neighborhood effects of differences in the availability of human capital resources at a family-to-family level.

### Neighborhoods and the Development of Children

There are still some neighborhoods to be found that can elicit memories of an old-fashioned bonding, familiarity, stoop-sitting, watching-one-another’s-children, stopping-to-chat-awhile community. More common in the early twenty-first century, however, are neighborhoods where the streets are considered danger zones rather than playgrounds, where social interaction is minimal, and where there seems to be little sense of communal responsibility for children. Under these altered and less-cohesive conditions of life, it becomes difficult to conceptualize, and more difficult to study, a set of neighborhood effects upon the development of children and their success in school.

Nevertheless, the recognition is that if a new lexicon of linkages and new models of alliances, regimes, and the like are to bear fruit, then attention must be paid to what have been called “connection impacts.” There is evidence, for example, that there are connections of significance to be found in the re-

cent and rapid expansion of out-of-school connections, or when-school-is-out programming that provides activities for children outside of regular school hours. After-school options (e.g., tutoring, recreation, art and music education) are on the rise nationally—with public libraries, Boys and Girls Clubs, YMCAs and YWCAs, youth groups, faith-based organizations, and some private businesses leading the charge. While there is some disagreement regarding the effectiveness of many after-school programs, interest and experimentation has continued to build.

Halpern has observed that it is a lack of old-fashioned connectiveness in neighborhoods that is reflected in the expansion of after-school activities, including a belief that such public spaces as streets and playgrounds are no longer safe, and that it is “stressful and unproductive for children to be left on their own after school” (p. 81). A growing literature on out-of-school connections has identified as key developmental effects progress in identity-building for youngsters, in emotional support and guidance, in helping to bridge and broker cultural challenges for immigrant youth, in overcoming loneliness, and in providing protection against negative neighborhood influences.

A second major category of connections pays attention to the in-school effects of the neighborhood. A 1999 review by Wynn, Meyer, and Richards-Schuster, for example, has explored the steadily growing case-study literature on the in-school developmental effects of partnerships, service relationships, parental involvement, and community volunteerism. Among the specific benefits can be a sense of *the village*, meaning a broadened arena of support and caring; improved relationships between home and school; enhanced access to such learning-related services as counseling or medical care; increased school attendance; and improved student perceptions of the community’s interest in school. In one of the few empirical studies of neighborhood influences, Lee Shumow, Deborah Vandell, and Jill Posner discovered that a broad exposure to positive adult role models throughout a neighborhood can contribute to better academic performance for children in school.

### Summary

Public schools have often been *in* but not *of* their neighborhoods. The late twentieth century saw a re-discovery of the importance of neighborhood—both

as a potentially vital complement to the work of the school and as an important educator in its own right. Linkages between the many components of neighborhoods and between neighborhoods and their schools are receiving new emphasis, including establishing a linkages terminology ranging from concepts of social capital to social cohesion, agency, and sense-of-place. Models of neighborhood involvement are also surfacing anew, including community activism and special alliances, the effects of community revitalization, the idea of *regime*, and a better understanding of the effects of individual family preferences. Although the notion of neighborhood effects upon the development of children is still an emerging arena for research interest, there are indications that neighborhood connections (both out-of-school and in-school) represent a productive line of inquiry.

ANDREW J. FINCH  
ROBERT L. CROWSON

---

### NEILL, A. S. (1883–1973)

---

Alexander Sutherland Neill flouted educational convention with utopian faith in individuals' ability to direct their own learning. His romantic Progressive beliefs concerning students' rights and freedoms, his refusal to conform to popular moral and intellectual standards, and his emphasis on social and character

development led him to found his own school, Summerhill, in 1921. Neill's radically humanistic, Freudian-based work later joined with Jean-Jacques Rousseau's natural philosophy to greatly influence the free/alternative schools movement of the 1960s and 1970s.

### Early Life and Career

A. S. Neill was born in Forfar, Scotland. Working as a pupil teacher in his father's school, Neill's experiences as a young educator were colored by traditional educational expectations: strict discipline, teacher-centered learning practices, and excessive control. At the age of twenty-five, Neill enrolled in Edinburgh University, where he studied English and later became a journalist. In 1915, while working as headmaster, or *dominie*, at a small school in Scotland he wrote the first book in his *Dominie* series, *A Dominie's Log*. This five-book series, which also included *A Dominie Dismissed* (1917), *A Dominie in Doubt* (1921), *A Dominie Abroad* (1923), and *A Dominie's Five* (1924) represented Neill's informal diary interspersed with stories and observations of people, places, and adventures. Most importantly, Neill used the series to explore his thoughts concerning freedom and children—chronicling dramatic transformation in his own ideology from his early teaching experiences.

Although Neill's vocabulary in *A Dominie's Log* connected to traditional psychoanalysis, it was not until he visited "Little Commonwealth," educator Homer Lane's community for delinquent adolescents, that he became familiar with the work of Austrian psychoanalyst Sigmund Freud. There, Lane introduced Neill to Freud's New Psychology, to the notion that children possessed innate goodness, and to the pedagogical practice of student self-government. Neill's emerging understanding of education seemed to be heavily influenced by other psychologists of his time as well, including Wilhem Stekel and Wilhem Reich.

Dissatisfied with traditional schooling—with its lack of freedom, democracy, and self-determination—Neill began searching for a place to establish his own school and to experiment with his developing ideas. In 1921 Neill became involved as co-director of the Dalcroze School in Hellerau, a suburb of Dresden, Germany. Part of an international school called *Neue Schule*, the Dalcroze supported the study of Eurythmics. Yet despite the school's bohemian atmosphere, Neill soon began to

feel that the staff was more interested in education than children, and that the conflict between freedom and rigor was untenable. Additionally, the political climate after World War I caused financial difficulties for many of his students' families and contributed to feelings of anti-Semitism. When parents began removing their children from the school Neill decided it was time to leave Germany.

Once again, Neill was off in search of a site for his experimental educational venture. Neill, together with Lillian Neustatter (who later became Neill's first wife), opened a school in a scenic Austrian mountaintop town called Sonntagsberg. However, conflicts with townspeople over the teaching of religion combined with financial difficulties caused Neill to dismantle the school and renew his search for a suitable location.

### Significance to Education

By 1923 Neill had returned to England, to the town of Lyme Regis in the south, to a house called Summerhill. There, he re-established his experimental school and enrolled a variety of so-called problem children in Summerhill. In 1926 Neill departed from his *Dominie* series and wrote *The Problem Child*. In this book, Neill clarified his ideology of freedom as a protest of his experiences both as a child and as a pupil teacher. As a result of this publication, Summerhill garnered greater attention and more students.

The school moved in 1927 to Leiston in the county of Suffolk, which would continue to be its location into the twenty-first century. Despite the move, Neill's ideals and aims remained firm: allowing children freedom to grow emotionally; offering children power over their own lives; giving children the time to develop naturally; and creating a happier childhood by removing fear of and coercion by adults. Summerhill offered numerous activities to help students work toward the above aims. In particular, students took part in private lessons or therapy sessions with Neill. Moreover, students participated in *Schulgemeinde*, or weekly community meetings designed to help them define limits and establish community rules. Following the lead of Homer Lane, Neill viewed these meetings as a way for children to transfer their emotions onto the community. Because freedom and self-determination were of utmost priority, the learning of lessons became a necessary concession at Summerhill. As such, Neill was less concerned with hiring teachers with strong ped-

agogical skills than he was with hiring teachers who cared about children and who followed the aims and vision of Summerhill.

Neill's first wife, Lillian, died in April 1944. Soon after her death, Neill married Ena Wood, and together they oversaw Summerhill until Neill's death in 1973. Upon his second wife's retirement in 1985, Zoe Readhead, the daughter of A. S. Neill and Ena Neill, took over as headmistress of Summerhill.

Critics argue that A. S. Neill interpreted education in an overly romantic and apolitical fashion, suggesting that offering a stimulating environment with minimum direction was not a proper way to run a school. Also under review are Neill's beliefs about his Freudian-based pedagogy as well as those concerning the innate goodness of children. Despite his critics, Neill's book *Summerhill* (1962) gained him a worldwide audience.

## NEW AMERICAN SCHOOLS

New American Schools (NAS) is a business-led non-profit organization whose mission is to significantly

increase student achievement through comprehensive school improvement. Comprehensive school improvement is an effort to support high student achievement at the school, district, and state levels through the coherent alignment of five essential components: (1) leadership, management, and governance; (2) resource allocation; (3) professional development; (4) evaluation and accountability; and (5) educator, family, and community engagement.

### History

In 1991 NAS began investing in specific approaches, later known as "designs," to help turn around low-performing schools. The idea behind this concept was to launch comprehensive approaches to improve student performance by applying the best research available on what works in classrooms in as many schools as possible throughout the country. Through a national competition, NAS selected the best research-based ideas in the country. With private and public partners, NAS then invested more than \$130 million in these efforts and others. By the beginning of the twenty-first century, these designs had been implemented in almost 4,000 schools and collectively were in every state in the United States.

In 1997 in response to NAS's initial successes and the long-term potential for comprehensive school improvement, the U.S. Congress passed the Comprehensive School Reform Demonstration (CSRSD) program. Since its passage, almost \$900 million has been appropriated to help schools and districts start comprehensive school improvement efforts. As a result, hundreds of organizations have begun to offer systems-based school reform services and products. In its 2001 reauthorization of the Elementary and Secondary School Education Act, Congress identified comprehensive school reform as a key strategy in turning around low-performing schools. Congress also authorized new funding streams and provided greater flexibility of education dollars for comprehensive school reform efforts.

In 1999 NAS convened a highly respected panel of educational and business leaders to develop a set of national guidelines of quality to assist consumers. NAS provides the resulting guidelines to educators, parents, and others in an effort to help stakeholders make decisions about an array of educational programs.

In 2001 NAS built on the work of the panel by helping to form the Education Quality Institute. The

aim of this independent organization is to help consumers of education products and services select programs that meet locally defined needs and adhere to quality guidelines, are research based, and have been proven to work. Importantly, that same year, NAS shaped a decade's worth of classroom experience, extensive research, and independent evaluations into a coherent set of consulting and operational services, products, and tools, offered through two new divisions within New American Schools—the Education Performance Network and the Center for Evidence-Based Education Development Network—and through the organization's funding arm, the Education Entrepreneurs Fund, which launched a School Funding Services unit.

### **Education Entrepreneurs Fund**

The Education Entrepreneurs Fund operates as a financial intermediary for social investment in education. It seeks grants from corporations, foundations, and government; leverages these funds with social capital loans and program-related investment; and uses the funds to make loans to and investments in education organizations. The fund invests in organizations that contribute to raising student achievement and that have the potential to achieve sustained quality at scale. The fund also provides technical consultation to education entrepreneurs. Additionally, the fund assists educators in identifying and accessing the billions of federal, state, and private dollars available for education improvement programs through its School Funding Services unit launched in 2002.

### **Education Performance Network (EPN)**

The mission of the Education Performances Network is to align education policies and practices to foster strong organizational performance and high student achievement. EPN assists clients in the following areas: accountability and evaluation, charter and contract schools, special education, and community engagement.

### **Center for Evidence-Based Education**

The Center for Evidence-Based Education conducts applied research on the use of school improvement strategies in schools and at the state and district levels. It also supports the development of successful leaders for quality reform and promotes the use of evidence-based approaches to school improvement nationally.

### **Legal Status and Governance**

New American Schools is a nonprofit 501 (c)(3) organization. It is guided by a fourteen-member board of directors.

### **Membership**

New American Schools does not have members but is affiliated with independently operating design teams. Schools and school districts contract with design teams to provide comprehensive school improvement services on a fee basis. In 2002 nine design teams were affiliated with New American Schools: Accelerated Schools Project, ATLAS Communities, Co-nect Schools, Different Ways of Knowing, Expeditionary Learning Outward Bound, the Bernstein Center for Learning, Modern Red Schoolhouse, Turning Points, and Urban Learning Centers.

### **Publications**

New American Schools offers several publications to assist in the implementation of comprehensive school improvement. NAS offers a “how-to” series that provides current research about comprehensive school improvement. This series includes the following papers: *Design-Based Assistance as Cornerstone of a School Improvement Strategy*; *How to Create and Manage a Decentralized Education System*; *How to Rethink School Budgets to Support School Transformation*; *Strategies for Improving Professional Development: A Guide for School Districts*; *How to Make the Link between Standards, Assessment, and Real Student Achievement*; *How to Create Incentives for Design-Based Schools*; *How to Build Local Support for Comprehensive School Reform*; *How to Evaluate Comprehensive School Reform Models*; and *Revising School Schedules to Create Common Planning Time and Literacy Blocks*. NAS also offers several publications helpful in design selection, including *Guidelines for Ensuring the Quality of National Design-Based Assistance Providers*; *Design Teams Portfolio*; and *Working toward Excellence: Examining the Effectiveness of New American Schools Designs*.

### **Influence**

By the most meaningful objective criteria, “comprehensive school reform” has become the dominant school reform effort in the nation's public school classrooms. By the early twenty-first century, public schools were investing some \$1 billion every year in the staff working with comprehensive school reform designs. Almost 6 percent—more than 5,400—of the

nation's 92,000 public schools have used the federal CSRD program to finance design implementation. Thousands more schools have paid for work with comprehensive school reform models from other funding sources, including Title I. Comprehensive school reform is even part of the charter school movement. From 1999 to 2001 the design teams alone entered into partnerships with sixty-five charter schools. Comprehensive school improvement is considered one of the best hopes for the U.S. public school system to make significant progress on a national scale in the near term.

LOUISE KENNELLY

### NEWLON, JESSE (1882–1941)

Superintendent of Denver, Colorado, schools, director of the Lincoln Experimental School of Teachers College, Columbia University, and president of the National Education Association, Jesse Homer Newlon was one of the most well known progressive educational administrators of the early twentieth century.

Born in Salem, Indiana, Newlon graduated from Indiana University in 1907. He earned a master's degree in 1914 from Columbia University, and began a series of educational appointments as teacher, principal, and superintendent of schools in Indiana, Illinois, and Nebraska. In 1920, he accepted the position for which he is best known—superintendent of schools in Denver, Colorado. In this role, Newlon had the opportunity to further develop his ideas of progressive education and administration. Whereas many academics explored the implications of progressive educational thought at a conceptual level, Newlon, more than any other educator of his generation, proved that an educational administrator could adhere to progressive ideals and, at the same time, involve himself in the community while overseeing the operation of a large school complex.

During the early 1920s in the United States, the ideals of progressive education, espoused by John Dewey and others, were inspiring curriculum reform efforts in a number of public schools. In 1922

Newlon persuaded the Denver school board to support such a project with the argument that he could make the curriculum of the Denver schools more efficient. What set Newlon's plan apart from any other curriculum reform effort of the time was his inclusion of teachers into the curriculum revision process. He believed that teachers, not school boards, should be involved in curriculum development, and he appointed teacher committees to revise curricula and courses of study. Teachers, not administrators, chaired these committees, and Newlon scheduled time during the school week for teachers to work on these revision processes with administrative and supervisory personnel. Newlon thus orchestrated official acknowledgment of the significance of teachers' collaborative participation in curriculum development.

The Denver Plan attracted considerable attention from teachers and administrators as well as community members across the country. Teachers especially applauded Newlon's insistence that the Denver school board provide support and structure for the teachers' labor outside the classroom. For example, Newlon proposed that teachers who served as members or chairs of curriculum revision committees be provided relief from regular classroom work, with a few days to a few months release time. He also insisted on the formation of a clerical staff to support all committee work, thus freeing teachers from those clerical responsibilities.

Throughout the duration of the Denver Curriculum Project, committees worked to reconstruct courses of study in subject areas at each of the three instructional levels: elementary, junior high, and high school. Newlon also secured funds to print the courses of study completed by the committees. By 1923, a professional library was completed and was staffed by a full-time librarian. According to Newlon and his committees of teachers, administrators, and supervisory staff, curriculum revision needed to be a continuous process and therefore needed also to draw on the latest educational research and theories.

Further, Newlon posited that development and enactment of the curriculum were simultaneous: curriculum was shaped not only by committees outside the classroom but also by the interactions of teachers and students who used—and therefore reshaped according to their particular situations and needs—those courses of study.

At the same time, Newlon concluded that teachers' and students' participation in curriculum devel-

opment and revision did not obviate the need for curriculum specialists. During his tenure as Denver superintendent, Newlon appointed the first district-wide curriculum administrator in the nation. Some argue that because that district-wide curriculum administrator was educated in a department of educational administration (at Teachers College, Columbia University), the ensuing first generation of curriculum specialists established the bureaucratic and administrative character of the curriculum development paradigm. That administrative character finally was challenged in the 1970s by a group of curriculum theorists intent on the reconceptualization of the field.

Nonetheless, Newlon's conceptions of curriculum development and school administration attracted national attention, not only through his support of teachers and students as curriculum creators, but also through his establishment of an equal salary schedule, development of an exceptional school library system, and organization of a permanent curriculum department. These accomplishments all took place during his overseeing of the construction of fifteen schools in the Denver area.

By 1933 the Denver Plan and the materials generated by teachers, administrators, supervisors, and students were widely known, circulated, and used nationally. As a result, the Denver high schools were selected to be participants in the Progressive Education Association's Eight-Year Study (1934–1942). Although Newlon had resigned as Denver superintendent of schools in 1927 to become professor of education at Teachers College, Columbia University, most viewed his foundational work as the major reason the Denver schools were selected as one of the six most experimental and successful schools in the study.

From 1927 to 1941 Newlon served as professor of education at Teachers College, Columbia University, and from 1927 to 1934 as director of the Lincoln Experimental School at Columbia. The Lincoln School, under his directorship, also participated in the Eight-Year Study. During his tenure at Teachers College, Newlon served as director of the Division of Instruction (1934–1938), and of the Division of Foundations of Education (1938–1941). He participated in the Teachers College discussion group "The Social Frontier," the Committee for Academic Freedom of the American Civil Liberties Union, and the American Historical Association's Commission on Social Studies.

Newlon visited the Soviet Union in 1937, and as a result of that visit, became increasingly fearful of rising totalitarianism abroad. Upon his return, he devoted himself further to spreading the ideals of Progressive education by speaking frequently about the values of democracy and the school's role in the preservation of freedom. Some note that Newlon became so distraught over the loyalty oaths and authoritarian conditions he witnessed in the schools that his health seemed to be adversely and permanently affected. He died on September 1, 1941.

## NO CHILD LEFT BEHIND ACT OF 2001

---

On January 8, 2002, President George W. Bush signed into law the No Child Left Behind Act. This act was a congressional reauthorization of the Elementary and Secondary Education Act of 1965 (ESEA) and is also known technically as Public Law 107-87.

In April 1965, almost thirty-seven years prior to the enactment of Public Law 107-87, the 89th Congress and President Lyndon Baines Johnson had overseen enactment of the original ESEA (Pub. L.

89-10). This federal government statute proved enormously important for American education. It also proved enormously difficult to implement and manage. The nature and complexity of the No Child Left Behind Act suggests that it too will be both equally important and equally challenging to those charged with overseeing its operation.

### The Original ESEA

The significance of the original ESEA resided in its emphasis on the schooling of students from low-income households. The ESEA, through a remarkably creative financing formula, distributed federal funds to states, and thence to counties and school districts, proportionate to the number of enrolled students from low-income households. By the turn of the twenty-first century, this act was responsible for distributing more than \$13 billion each school year to public and, through a few minimal provisions, private and religious K–12 schools. The act also supplied substantial financial subsidies for the operation of state education departments.

Prior to 1965, not only did the federal government have only the most minimal presence in education, education also had only a minimal presence in the lives of low-income students. These were children who had legal access to public schooling. But public schooling had few mechanisms, other than the dedication of certain teachers and principals, for educating them. Low-income students were permitted to stay in school, often being promoted from one grade to the next. Prior to the ESEA, however, there were few expectations that schools would expend on their behalf the added resources that might be necessary to compensate for the poverty-impacted nature of their neighborhoods and households. The ESEA was, if nothing else, a powerful symbolic message that even poor children were to be schooled.

Administration of the ESEA proved challenging. School districts frequently did not realize that the added federal funding was intended for low-income children. They accepted the money as “general financial aid,” suitable for whatever purpose they chose to spend it. Congressional amendments in 1968 made the statute’s purposes more clear. Nevertheless, these new regulations were so strict that it became equally clear that the federally funded poverty programs, however much needed, were intruding deeply into the operation of schools. The narrowly focused instructional programs they financed were

at best wasteful and possibly counterproductive to the education of children.

By the mid-1990s, Congress undertook another midcourse correction and began to permit schools to deploy the ESEA funds with greater local discretion. Still, by 1998, a General Accounting Office report suggested that only fifteen states were adequately implementing the ESEA. This was more than three decades after its enactment.

### The New Act

The No Child Left Behind Act promises to be as important as the original ESEA not only because of the added federal funding it authorizes for education but also because of the pathbreaking measures required of states accepting the money.

The new ESEA is also symbolic of a major shift in American education. Until the latter part of the twentieth century, it was generally sufficient simply to offer schooling and to ensure that all children had equal access to it. By the turn of the twenty-first century, however, global economic changes had so altered that societal landscape that Americans were expecting far more of their education systems. Now, simple access was no longer sufficient. Learning was coming to be expected—and not simply learning for the slender elite that for more than a century had graduated from privileged public and private schools and attended the nation’s highest-ranking universities. Now learning was expected of all children, and performance was expected of all schools. The No Child Left Behind Act is filled with accountability provisions to ensure that states and participating schools understand the new expectations.

The No Child Left Behind Act is symbolic of the transition in American education from a period where the main concern was that the inputs of schooling be present to a period where it is the outcomes of schooling that matter. To accomplish this new purpose—to render schools effective—the reauthorized ESEA provides added funding to school districts, through states. In addition, it requires that states have learning standards and testing programs capable of assessing each child’s performance in achieving those standards. The accountability mechanisms in the statute provide for negative sanctions to schools and districts that persistently fail to elevate student achievement.

However important practically, financially, or symbolically, the No Child Left Behind Act will

doubtless prove difficult to implement. The statutory language offers only the most rudimentary solutions to a number of issues and questions, such as the comparability of testing forms across states, or whether improvement in student achievement is sufficient or must a school attain absolute standards of achievement to be approved.

In that the original ESEA was not fully understood nor faultlessly managed even three decades after its enactment, it is unlikely that the 2002-enacted version, which if anything is even more complicated, will achieve success at a faster pace.

JAMES W. GUTHRIE

## NONGOVERNMENTAL ORGANIZATIONS AND FOUNDATIONS

---

Nongovernmental organizations (NGOs) are entities, usually international nonprofits, which work in an independent fashion yet complement the work of governments for the benefit of constituencies in civil society. The nature of NGOs runs the gamut from lobbying and advocacy to operations and project-oriented organizations. Their mandates often but not always include working to complement the efforts of state and local governments. Since becoming players in the international economic development world in the early 1980s, NGOs have proliferated in both developed and developing countries.

Foundations are institutions through which private wealth is contributed and distributed for public purposes. They are institutions financed by charitable contributions or endowments and can either be for-profit or nonprofit entities depending on the manner in which their money is invested and managed. Foundations generally grant funds to certain causes in keeping with their mandate and mission. In the case of education, foundations often supplement the public provision of financing for education, many times specifically channeling funds to needy or underserved populations. The board of a given foundation establishes the grant-making poli-

cies from which the programming agenda is then derived. Foundations provide grant money to a variety of types of organizations, including nonprofits and NGOs, as well as to universities and schools. The programming agenda is periodically revised to keep abreast of changes in society. For example, following the 2000 U.S. presidential election controversy, the Carnegie Foundation changed its programming agenda to include strengthening U.S. democracy as one of its four main programmatic areas.

Although the work of foundations may be regarded collectively, several people have written scholarly pieces on the work of specific foundations (Robert F. Arnove on the Carnegie, Ford, and Rockefeller foundations; Jeffrey Puryear on the impact of the Ford Foundation's programs in Chile; and James S. Coleman and David Court on the Rockefeller Foundation's impact in Africa). The debate about foundations includes the position that foundations promote the causes that the elite and powerful determine worthwhile (Arnove) versus the argument that they facilitate institution building (Puryear, Coleman, and Court). Although these two positions may seem diametrically opposed, they both start with the premise that social change and development—as a result of the planning, research, expertise, and leadership of people interested in particular social causes—becomes more viable with funding from private charitable contributions. It is frequently NGOs that are conduits or tangential beneficiaries of the programming decisions or internal policies of these very foundations. Without trying to resolve the debate, it is imperative to recognize the role in international development that both foundations and NGOs play, together with the multilateral development banks, bilateral aid agencies, and governments. The descriptions that follow provide details on the individual organizations, their mandates, objectives, programming agendas, and target populations.

### Nongovernmental Organizations

**CARE.** The Cooperative for Assistance and Relief Everywhere (CARE) is a nonprofit, nonsectarian federation of agencies and NGOs devoted to channeling relief and self-help materials to needy people in foreign countries. Originally organized in the United States in 1945 to help war-ravaged Europe, CARE soon expanded its program to include developing nations in Asia, Africa, and Latin America. Famous for its "CARE packages" of food and other

necessities, CARE in now also involved in population, health care, land management, and small economic activity. It is an international organization with ten member countries and headquarters in Brussels, Belgium.

CARE's goal is to build self-sufficiency by helping families meet three basic needs: income, education, and health and population services. Its work in education includes promoting literacy, numeracy, and school attendance, particularly among girls who are often denied schooling. Programs improve education for all children, with an emphasis on keeping girls in school. Groups are created so parents and teachers can discuss traditional educational barriers, such as housework or baby-sitting, which keep girls from attending school. CARE also provides economic incentives to help parents cover the cost of keeping their daughters in school.

CARE first began its education program in 1994 with pilot projects in Peru, Guatemala, India, and Togo. Within four years of its inception, it expanded this number to twenty-nine projects in eighteen countries.

**Education International.** Located in Brussels, Belgium, Education International (EI) has become an important organization for many NGOs, such as teachers unions, in their advocacy work at the national and international level. As an international association of teacher unions, with local teacher associations or unions as members, EI's mission is based on a growing conviction that basic education is a key factor in the eradication of poverty and a cornerstone of freedom, democracy, and sustainable human development. Education also plays a role in eliminating the worst forms of child labor.

Through the Global Campaign for Education (GCE), this NGO brings together organizations working in 180 countries and seeks to hold governments accountable for the fact that 125 million children are denied an education. Education International, Action Aid, Oxfam International, and Global March Against Child Labor jointly launched this program. In terms of teacher evaluation, EI advocates a type of evaluation that is perceived by teachers as being affirmative and supportive as well as balanced and fair and that can contribute to promoting quality in education.

**Education Trust.** Located in Washington, D.C., the Education Trust is an independent, nonpartisan, nonprofit organization. Established in 1990 by the

American Association for Higher Education as a special project to encourage colleges and universities to support K–12 reform efforts, in the early twenty-first century it strives to promote high academic achievement for students at all levels from kindergarten through college (K–16). The organization functions on the premise that in order to achieve significant change in K–12 it must simultaneously change the way that postsecondary education does business. Similarly, the Education Trust maintains that postsecondary education needs as much improvement as the K–12 level.

The Education Trust works for the high academic achievement of all students. It abides by the tenet that all children taught at high levels will learn at high levels. The students and institutions most often left behind in plans to improve education are its focus, in particular those institutions serving low-income Hispanic, African-American, and Native American youth. Education Trust strives to close the achievement gaps that separate poor and minority students from their more advantaged peers. Efforts to improve elementary and secondary education must be undertaken in conjunction with postsecondary education. The organization places emphasis on high standards, rigorous curriculum, good teaching, and accountability for results. Participating in education debates at the national and state policy level, the Education Trust works alongside policymakers, parents, education professionals, and community and business leaders in communities across the United States to transform schools and colleges into institutions that genuinely serve all students.

**Oxfam International.** Oxfam International is an international confederation of eleven autonomous NGOs committed to working together to fight poverty and injustice around the world. Each shares the commitment to end waste and the injustice of poverty, in long-term development work and during times of urgent humanitarian need. The common mandate for all of the Oxfams is to address the structural causes of poverty and related injustices and create lasting solutions to hunger, poverty, and social injustice through long-term partnerships with poor communities around the world. The organization has an advocacy office in Washington, D.C., which lobbies the World Bank, the International Monetary Fund, and the United Nations on issues agreed upon by the eleven member organizations. As a privately funded organization, it strives to speak “with conviction and integrity to challenge the

structural barriers that foster conflict and human suffering and limit people from gaining the skills, resources, and power to become self-sufficient.”

Oxfam invests privately raised funds and technical expertise in local organizations around the world that hold promise in their efforts to help poor people move out of poverty. These projects are characterized by partnerships with local organizations, a unique and highly successful approach that ensures lasting change. Through the local partnerships, Oxfam listens to the local needs and works jointly toward solutions that enable communities to prosper and organize for economic stability and democratic opportunity. Oxfam is committed to these long-term relationships in search of lasting solutions to hunger, poverty, and social inequities. As part of this commitment, Oxfam is dedicated to educating the public worldwide on the realities of poverty and the universal obligation to establish a future that is equitable, environmentally sustainable, and respectful of the rights of all peoples.

In education, Oxfam plays an active role in ensuring that aid resources are channeled to education, which plays a vital role in poverty reduction, economic growth, and democracy. The organization plays an advocacy role, regularly issuing policy and position papers that react to the policies of G8 countries, large donor organizations, and international summits.

**Save the Children.** Save the Children is an international nonprofit child-assistance organization (or NGO) based in Westport, Connecticut, which works in forty-six countries worldwide, including the United States. Its mission is to make lasting, positive change in the lives of children in need. Save the Children is a member of the International Save the Children Alliance, a worldwide network of twenty-six independent Save the Children organizations working in more than 100 countries to ensure the well-being of children everywhere.

Nearly seventy years of experience working alongside families and communities in the United States, Latin America, the Caribbean, the Middle East, Eurasia, Africa, and Asia has convinced Save the Children that poverty “need not be a life sentence.” To help children get the best possible start in life, Save the Children promotes locally appropriate programs in education, health care, environmentally sound agriculture, and economic productivity.

In a world where the majority of illiterate adults are women, improving access to education for girls

is urgent. At the outset of the twenty-first century, nearly two-thirds of the 125 million children not attending primary school are girls. The cycle of illiteracy traps millions of girls and women throughout the developing world. But with education, this cycle can be broken. Studies show that an educated mother is more likely to provide her children with adequate nutrition, seek needed health care, and send her girls, as well as boys, to school. Save the Children focuses on education as a critical means of improving the quality of life for both mothers and their families.

In an effort to address the lack of access to quality education experienced by more than one billion people, Save the Children’s programs support communities in the development of quality education programs. Working with communities, the organization explores initial concepts to bring Strong Beginnings programs to the area. The programs include research and project development in each community, which leads to the implementation of active intergenerational-learning programs for all ages, early childhood development, primary education, and youth and adult nonformal education.

Save the Children’s education programs have produced many dramatic results in the lives of women and girls around the world. In Afghanistan, where prior to 2002 girls were kept in seclusion and not allowed to attend formal school, the program has established home-based classrooms to provide basic education that would otherwise be denied. More than 20,000 girls in remote villages of Mali, where schools were once rare, are learning to read and count. And women participating in literacy programs in Guatemala are learning to manage their lives and take on leadership roles in their communities.

**World Vision.** Based in the United Kingdom, World Vision is an international Christian relief and development NGO, which works to promote the well-being of all people, especially children. World Vision strives to enable families and communities to transform their conditions and gain self-reliance in a sustainable manner. It achieves this by working with the poor in their communities; it helps them gain access to clean water, better agricultural production, improved health care, and primary education.

World Vision’s advocacy initiatives draw on the expertise and experience of staff throughout the world who work in countries and communities that

are afflicted by poverty. World Vision works to raise their concerns in the United Kingdom, with ministers and members of Parliament, through meetings, briefing papers, a discussion paper series, and special reports. World Vision has policy staff working on the areas of child rights, conflict, peace building, and also global economic issues. Each of these advocacy themes has the potential to bring real benefits to ordinary communities in developing countries.

Although World Vision is a Christian organization, the organization has child-focused projects that are offered freely, regardless of belief, ethnic background, or gender. The organization's literature claims that "faith fuels our work and supplies our staff with wisdom and ability, our donors with the resources they share, and enables our recipients to work toward the fulfillment of their dreams."

## Foundations

**The Broad Foundation.** Located in Los Angeles, California, and established in 1999, the Broad Foundation supports innovative efforts to strengthen local, state, regional, and national initiatives to improve governance, management, and labor relations in large urban school systems. The foundation is dedicated to building K–12 educational leadership capacity, strengthening union-management relations, and supporting aggressive, systemwide strategies to increase student achievement. It aims to infuse a new kind of school system leadership in order to strengthen the state of public education.

The Broad Foundation's investments are targeted toward the following five program areas: (1) support for entrepreneurial and nontraditional leaders; (2) leadership training; (3) recruitment and selection strategies; (4) visibility for high performers; and (5) venture philanthropy.

The area of support for entrepreneurial and nontraditional leaders provides funding to current innovators, such as superintendents, school boards, union presidents, and other leaders in the K–12 public education system, through rewards for high performance, grants for specific district and union projects, and funding for ongoing networking and assistance. A leadership training area provides grants for the support and development of training for aspiring and current innovators. The area of recruitment and selection strategies provides assistance to districts and to business and community organizations interested in securing the next generation of

entrepreneurial educational leaders and managerial talent. Visibility for high performers is an area that permits the foundation to engage in public visibility campaigns that showcase the results of systemwide improvements in urban districts. The foundation also supports research and dissemination projects that actively communicate the results of high-potential endeavors. Finally, the venture philanthropy area funds entrepreneurial ideas from inside and outside the current system that offer high-leverage opportunities to improve K–12 education.

**Carnegie Corporation of New York.** Founded in 1911 by Andrew Carnegie for the "advancement and diffusion of knowledge and understanding among people of the United States," the Carnegie Corporation is a general-purpose, grant-making foundation. Charter amendments made subsequent to its founding permit the corporation to channel close to 7.5 percent of its income for the same purpose in countries that are currently or have been members of the British Commonwealth. Most such grants are in British Commonwealth Africa. As a grant-making foundation, the corporation seeks to carry out Carnegie's vision of philanthropy, which he said should aim "to do real and permanent good in this world."

The focus of the corporation's work has evolved over time, adapting its program areas to changing circumstances as Andrew Carnegie wished. Although current program directions have been designed to correspond with the corporation's historic mission and legacy and to maintain the continuity of its work, they are also intended to serve as catalysts for change. A current challenge facing the Carnegie Corporation is how to support the development of a global community in an age when both isolationism and nationalism seem to be fostering a fractured view of the world. This raises the question of how to use the current glut of information to foster a sense of community, rather than letting it disintegrate community.

After a review of the foundation's management structure and grant programs under the leadership of Vartan Gregorian, the corporation refined its programmatic focus, which in the early twenty-first century includes education, international peace and security, international development, and strengthening U.S. democracy. In addition, a new program, Carnegie Corporation Scholars Program, strives to support fundamental research by young scholars with outstanding promise and also by established ex-

perts who stand to contribute significantly to the corporation's mission.

In education, the Carnegie Corporation dedicates a large majority of its funds to education reform ranging from early childhood education to higher education. The education program focuses on three key areas: early childhood education, urban school reform, and higher education. Within these areas, the corporation's goals are to promote the creation of high-quality early learning opportunities on a large scale; accelerate urban school reform; strengthen the education of teachers; and stimulate an examination and strengthening of liberal arts education. In education, the corporation has traditionally had a significant impact on public policy for children, teachers, and other stakeholders in the educational process. Through its focus on education, Carnegie has successfully convened special bodies of experts and opinion leaders to study related issues and publish several key reports.

**Carnegie Foundation for the Advancement of Teaching.** The Carnegie Foundation for the Advancement of Teaching is a national and international center for research and policy studies about teaching and is an ancillary philanthropy of the Carnegie Foundation. With a focus on the scholarship of teaching, the foundation seeks to generate discussion and promulgate sustainable, long-term changes in educational research, policy, and practice. Foundation programs are designed to foster deep, significant, lasting learning for all students and to improve the ability of education to develop students' understanding, skills, and integrity.

**The Ford Foundation.** Established in 1936 by Henry Ford, the founder of Ford Motor Company, and his son Edsel, the Ford Foundation is one of the most important and prominent foundations in the field of education. From 1936 to 1950 the foundation made grants mostly to organizations in its home state of Michigan. In 1951 the foundation moved to New York City and began its focus on national and international giving.

The Ford Foundation is a private philanthropic institution, which seeks to improve the well-being of people around the world by funding "experimental, demonstration, and developmental efforts that give promise of producing significant advances in various fields."

The foundation is governed by a board of trustees and administered by a professional staff. The

board of trustees includes CEOs, senior officials in higher education, and people involved in Native American interests. The trustees determine general policies and budgets. The staff evaluates grant applications, identifies institutions to administer programs, and makes recommendations for grants.

The foundation has identified certain program areas in which it is interested in funding projects. It generally does not make grants for normal operating costs of an organization, construction of buildings, or for strictly religious activities.

The foundation has identified six broad categories of programs in which it is interested: urban poverty, rural poverty and resources, human rights and social justice, governance and public policy, education and culture, and international affairs.

The type of work the foundation funds is equally diverse. The foundation funds projects, which involve direct assistance to the needy, and grants to organizations, which seek to influence public policy. Over the years the foundation has provided grants to establish new organizations, found new academic departments at universities, fund demonstration projects, and assist other philanthropies. The foundation has organized coalitions with other philanthropies, government, and nonprofit organizations to work on projects. It also administers its own projects.

In some cases the foundation has funded programs on an ongoing basis, which over time become established institutions, such as community development corporations (CDCs). Since the late 1960s it has made grants of nearly \$200 million to CDCs in depressed urban areas, which initiate economic development projects; raise additional funds; offer job training, day care, and credit; and advocate for improved government services.

The Ford Foundation has sixteen offices overseas. Approximately 35 percent of the annual budget is allocated for overseas projects. Programs include agricultural development in Latin America, Africa, and Asia; a training program for judges in China; international studies in Chile; and philanthropy in Egypt.

**The Bill and Melinda Gates Foundation.** The William H. Gates Foundation (founded in 1994 with a focus on health issues in developing countries) and the Gates Learning Foundation (founded in 1997 but renamed the Gates Library Foundation) merged in August 1999 to become the Bill and Melinda

Gates Foundation, which encompasses those two foundations and the Gates Center for Technology Access. The Gates Foundation ranks as one of the wealthiest private foundations in the world. Established by the Microsoft cofounder and chief executive officer, the Seattle, Washington-based foundation is led by Bill Gates's father, William Gates Sr., and supports initiatives in education, technology, global health, and community giving in the Pacific Northwest.

Although many benefit from the linking of the globe in a digital web of communications and information flow, the foundation strives to pay attention to those who have not shared in the promise of the digital age. The Bill and Melinda Gates Foundation is dedicated to sharing the promise of new technologies with all citizens. The foundation is focusing its efforts in three critical areas: (1) U.S. education; (2) libraries; and (3) public access to information.

In its work on education, the foundation perceives the education system as an immensely important strategic front for forging a future in which all children can participate in the opportunities of the digital age. In March 2000 the foundation announced a \$350 million, three-year investment in a series of education grants designed to help all students achieve at high levels by improving teaching and learning and enhancing access to technology.

In 1999 Bill and Melinda Gates made a defining gift of \$1 billion to establish the Gates Millennium Scholars program, which will provide scholarships for academically talented minority students (African-Americans, Asian-Americans, Hispanics, and Native Americans) who would otherwise not have the financial resources to attend college. Additional scholarships are available for minority scholars pursuing graduate degrees in science, mathematics, engineering, education, or library science.

**The Charles Stewart Mott Foundation.** Based in Flint, Michigan, the Charles Stewart Mott Foundation was the brainchild of the sailor, automotive engineer, industrial pioneer, banker, educational innovator, and community leader by the same name. In addition to these attributes, Mott was also a philanthropist.

The grant-making activities of the foundation focus on four main areas: civil society; the environment; development in Flint, Michigan; and pathways out of poverty. In addition, the Exploratory and Special Projects program permits the founda-

tion to explore new opportunities. About 20 percent of the foundations grants are international in scope.

Of particular interest to educators are the program for civil society and the efforts to decrease poverty. The mission of the civil society program is to "strengthen citizen and nonprofit-sector engagement in support of free and pluralistic democratic societies," with primary geographic focus on the United States, central and eastern Europe, Russia, South Africa, and at the global level. In the United States the efforts focus on strengthening the fabric of civil society in the face of public apathy and cynicism, extremist forces, and an economically and racially divided society.

Within the program area of Pathways Out of Poverty, efforts include improving community education, expanding economic opportunity, building organized communities, and special initiatives. The mission for the programmatic area of improving community education is to "ensure that community education serves as a pathway out of poverty for children in low-income communities by building a continuum of quality learning opportunities that stretches from the preschool years through preparation for higher education and the work force." This includes promoting school readiness, success in school, and learning that spans beyond the classroom.

**Lilly Endowment.** Founded in 1937 by pharmaceutical manufacturer Josiah K. Lilly, this foundation, based in Indianapolis, Indiana, grants funds for religious, educational, and charitable purposes. Of special interest to the foundation are programs designed to foster the growth and development of Christian character.

Its endeavors in education include aid to Protestant theological seminaries, other colleges, and elementary and secondary education. Most of the foundation's work in education focuses on raising the educational-attainment level of citizens of the state of Indiana. The endowment also provides grants to private, historically black colleges and universities (HBCUs) throughout the United States. In addition, the endowment focuses on positive development of youth by providing support to direct-service organizations, building the capacity of intermediary organizations, and providing professional development for staff members in such organizations.

**The Pew Charitable Trusts.** Based in Philadelphia, Pennsylvania, the Pew Charitable Trusts support

nonprofit activities in the areas of culture, education, the environment, health and human services, public policy, and religion. The trusts consist of seven individual charitable funds established between 1948 and 1979 by two sons and two daughters of Sun Oil Company founder Joseph N. Pew and his wife, Mary Anderson Pew. Though the trusts are separate legal entities, their grant-making activities are managed collectively and guided by a single set of program priorities. The trusts make strategic investments that encourage and support citizen participation in addressing critical issues and effecting social change.

The work of this foundation in education seeks to raise the performance of students at all levels of education, especially the capabilities of students to learn for understanding and to acquire the types of literacy necessary for productive employment and effective citizenship in an increasingly complex society. The foundation's broad efforts in education include an interest in publicly funded preschool education programs, standards-based reform in K-12 education, other K-12 reform efforts, and support to higher education. In higher education, the foundation is interested in issues of access to higher education, the quality of higher education, and the means for keeping the United States competitive in the emerging global and technology-intensive economy.

**Rockefeller Foundation.** Based in New York City, the Rockefeller Foundation is a knowledge-based, global foundation with a commitment to enrich and sustain the lives and livelihoods of poor and excluded people throughout the world. The foundation seeks to identify, and address at their source, the causes of human suffering and need. The foundation's approach to current global challenges focuses on poor people's daily existence, and how the process of globalization can be turned to their advantage. Program funding is focused on grant-making areas that reflect the interconnections between people's health, food, work, creative expression, and the impact of globalization on the poor. The Rockefeller Foundation's central goal is to "give full expression to the creative impulses of individuals and communities in order to enhance the well-being of societies and better equip them to interact in a globalized world."

Within the unit that encompasses education, knowledge, and religion, the foundation seeks to enhance educational opportunity, especially for low-

income and chronically disadvantaged groups, and to address the challenges of pluralism and diversity using interdisciplinary and collaborative approaches. Through education reform, the foundation seeks to enhance the capacity of schools and higher education institutions to broaden access and increase levels of student achievement, particularly for historically unserved populations. In higher education and scholarship, the foundation seeks to build fields of knowledge that deepen scholarship and public understanding of pluralism and identity. The foundation emphasizes the importance of social science training as a means to educate a new generation of leaders and scholars who can be more effective in their civic roles.

**Smith Richardson Foundation.** H. Smith Richardson, son of the founder of Vicks Family Remedies, and his wife, Grace Jones Richardson, created the Smith Richardson Foundation in 1935. Located in Westport, Connecticut, the Smith Richardson Foundation seeks to "help ensure the vitality of our social, economic, and governmental institutions," and "assist with the development of effective policies to compete internationally and advance U.S. interests and values abroad." This mission is embodied in its international and domestic grant programs.

The foundation has two grant programs: the International Security and Foreign Policy Program, which supports research and policy projects on issues central to the strategic interests of the United States; and the Domestic Public Policy Program, which supports research, writing, and analysis on public policy issues and strives to help inform policymakers and the public on domestic issues. Education policy and school reform are two of the foundation's most important areas of grant making. Such grants support research at universities, think tanks, and research organizations on important education policy issues, such as charter schools, school choice, teacher training and pay, class size, and educational standards. This grant making is focused on policy debates in the United States. Although the grant-making efforts do not include a particular focus on certain levels of education, research on higher education is not supported.

**Soros Foundation.** American stock trader and philanthropist George Soros has used his wealth to create a network of foundations, most of which are intended to aid former Communist countries in creating an "open society." Other Soros foundations

fund health initiatives and aid immigrants in the United States.

In the parlance of the Soros foundations network, the term *national foundation* refers to an autonomous nonprofit organization founded by George Soros in a particular country to promote the development of open society in that country. National foundations are located primarily in the countries of central and eastern Europe and the former Soviet Union, although there are some in other parts of the world. A local board of directors comprising distinguished citizens from different ethnic, geographic, political, and professional backgrounds determines the specific priorities and activities of each foundation. Given the diversity of social, political, and economic conditions in the countries of the network, programs vary greatly in nature and urgency from one foundation to another. Yet all of the foundations' activities share an overarching common mission: to support the development of an open society. The local nature of the decision-making process at the foundations is one of the distinctive features of George Soros's approach to philanthropy.

In promoting an open society, education plays a role in the work of most of the foundations; however, the focus varies from country to country. For example, the Soros Foundation provided education to 300,000 Burmese refugees in Thailand, India, and Bangladesh, serving otherwise underserved populations. In Armenia the Internet and National Education programs, redesigned in 1999, increased school outreach and community involvement in education. A network of schools and organizations provided the training and support required to develop the idea of community schools. The aim is not only to strengthen community participation but also to improve the quality of the education system by introducing modern methodology and criteria for curriculum development.

In other countries such as Latvia, the Soros Foundation emphasizes the importance of raising critically thinking, tolerant, and creative young people. In such countries the foundations provide continued support to primary and secondary education while simultaneously devoting efforts to the strengthening of higher education, especially in terms of the study of law and pedagogy.

**Stuart Foundation.** Based in San Francisco, California, the Stuart Foundation's overarching purpose is to help the children and youth of California and

Washington states become responsible citizens. The foundation's approach is to help strengthen the public systems and community supports that contribute to children's development. Three grant program areas exist: (1) strengthening the public school system; (2) strengthening the child welfare system; and (3) strengthening communities to support families.

The Stuart Foundation employs a systemic approach to change. The following themes characterize the foundation's approach to strengthening public systems and communities in all three grant-making programs: (1) making public policies more effective by supporting efforts to improve statewide or local policies so that public systems and communities can support the development of children and youth more effectively; (2) policy analysis and policy development by supporting projects that examine the effectiveness of policies for children and youth; that improve the quality of information available to policymakers, stakeholders, and the public; and that provide a nonpartisan forum for discussion and dialogue to build understanding and consensus for improvements; (3) standards or accountability through support to the development of standards and systems for measuring results that promote greater accountability and program improvements, and that can gain the support of policymakers, practitioners, communities, and business leaders; and (4) making connections and building understanding to solve social problems by uniting people and organizations with different perspectives (e.g., educators, parents, policymakers, business people, and service providers) to build a shared understanding and reach agreement on what needs to be done.

The foundation seeks to foster stronger connections among policymakers, practitioners, and researchers to foster information exchange, fresh thinking, and creative solutions. It promotes collaboration across agencies and disciplines in which closely related programs integrate their work to achieve greater benefits for children and youth. It strives to build public understanding of key issues in education, child welfare, and community well-being, and to secure a more supportive environment for effective policies and practices. It seeks to improve practice through the development and dissemination of more effective practices, through the promotion and dissemination of successful innovations, and through effective methods to promote widespread improvements in practice.

**Spencer Foundation.** Located in Chicago, Illinois, the Spencer Foundation was established by Lyle M. Spencer, founder of the educational publishing firm Science Research Associates. The foundation investigates “ways in which education, broadly conceived, can be improved around the world.” A basic research foundation with both international and domestic interests, the foundation supports high quality investigation of education through its research programs by promoting scholarship through various grant programs for research, postdoctoral fellowships, predissertation research, conferences, and training. Such grants are open to people from an array of backgrounds—researchers, practitioners, and young professionals.

The foundation’s programs are organized within three divisions: Research, Fellowships, and Training. In addition, a handful of programs are also operated out of the office of the vice president. Programs in the research division support work that shows promise of contributing new knowledge, understanding, and improvement of educational thought and practice. Programs in the fellowship division support educational researchers at different stages of their professional careers, providing resources to both beginning and senior researchers to pursue concentrated intellectual activity. Programs in the training division are aimed at improving the work and performance of agencies and institutions, mainly universities and graduate schools of education at universities, which hold a mission of training and apprenticing educational researchers. Funding programs within the vice president’s office are experimental or developmental, spanning and augmenting the other divisions’ programmatic objectives. The majority of the programs administered within the training division and the office of the vice president are invitational.

## NONGRADED SCHOOLS

---

This entry will seek to identify and clarify the opposite of graded schools, for which the term *nongraded schools* is used. Although there are secondary schools that also seek to develop nongraded structures, the primary beneficiaries of the arrangement are children at the elementary school level.

### Brief Definition

Briefly, nongradedness is defined in terms of respect for, and optimism about, individual differences. It calls for the provision of a pleasurable, challenging, and rewarding learning atmosphere where there are maximum opportunities for productive interaction between the learners. Within a nongraded setting the curriculum is both integrated and flexible. Similarly the timetable for the academic progress of each unique child is flexible. The learning of facts, although important, is recognized as subordinate to the mastery of concepts and methods of inquiry. The assessment of students is holistic and individualized, and evaluation is continuous, comprehensive, and diagnostic. The entire program within the nongraded setting, especially if there is a team of teachers involved, is more under the control of the teacher(s) than is the case in grade-structured situations. Research and experience generally support the conclusion that pupils in nongraded settings work harder, albeit more comfortably, and achieve more and better results than graded students do. There is also rather strong research evidence that children in nongraded settings enjoy better physical and emotional health.

### Development of Graded Education

Graded education was introduced and developed during the years 1848 to 1870, beginning with the Quincy Grammar School in Boston. The Quincy school came into being largely to provide a manageable school organization at a time when schooling in expanding cities became a much larger enterprise than had existed in the familiar one-room school serving pupils of multiple ages. It also grew out of assumptions that undergirded and made possible efforts toward universal education. Because little was known or believed in those years about stages of human development and the unevenness of readiness within age groups, the assumption was made that students may logically be grouped together by age, or actually within a twelve-month span, and

taught a specific and common body of skills and subject matter.

Well into the twentieth century, the patterns of fairly rigid gradedness, with attendant nonpromotion/promotion practices, launched at the Quincy school became, in effect, universal. All the same, at that point in social history the system was in fact a significant and creative advance, appropriate to the assumptions and perceptions involved. The teachers were usually quite uneducated and insufficiently trained, and therefore there evolved the system of requiring them to master only a one-year segment of the educational program. In this way, a form of primitive specialization occurred. There was also a pattern of very strict supervision by the employers.

### Search for Other Models

Before long, the disadvantages of the graded system's rigidity had become apparent, and by the end of the nineteenth century there were various efforts to create different schooling models and achieve greater flexibility. These efforts continued well into the twentieth century, handicapped to some extent by the publishing industry's success in producing age-graded textbook series that made it easier for teachers to manage their work. In the same period, so-called normal schools and later, colleges, produced teachers whose preparation assumed that each would work alone in a self-contained classroom and, except for those in smaller multigraded schools, with materials deemed suitable for one age-group of children.

Along with the search for more appropriate, flexible, and child-oriented arrangements to replace the entrenched gradedness, several influential and helpful developments occurred. Progressive education was very likely the most dramatic example. Also influential were some well-known examples of nongradedness in Europe, which in the 1920s caused many venturesome American teachers, especially from cities in Wisconsin and New York, to visit pilot programs that were located in Jena, Germany, and in several cities in Holland. Some of these programs continue to flourish in the early twenty-first century.

Over the years the label "nongraded" proved to be slightly confusing and insufficiently informative, and scholars and administrators found that labels such as "continuous progress" were more descriptive. Beginning with milestone research and related articles by Walter Rehwoldt and Warren W. Hamil-

ton in 1956 and 1957, the discussion of nongradedness increasingly involved reference to interage or intergrade grouping, for which the term *multiage* was soon frequently substituted. Also in the 1950s, the nation's first experience with formally organized team teaching, and with a related notion, the use of teacher aides/helpers, redefined the organizational framework within which, it was increasingly argued with the support of research evidence, a demonstrably preferable setting could be provided not only for the pupils but also for the collaborating adults who worked with them.

Some elementary schools chose to organize classes in a pattern similar to departmentalization, with each teacher responsible for one content area, such as math or social studies; but it was not until 1957 when there was a sudden burst of interest, nurtured by seventeen universities being funded by Ford Foundation grants to support teacher-teaming and related arrangements, that the virtues of self-containment came to be seriously questioned. Some of the funded model projects, which soon sparked nationwide interest, called for aggregating multiage pupil groups (e.g., children six to seven and eight years of age) to be taught by teams of four to eight collaborating teachers. This development led to a kind of architectural revolution, because standard-size classrooms could no longer accommodate various-sized pupil aggregations. It is of interest to note that, as of the beginning of the twenty-first century, it seems probable that a great many elementary schools continue to provide at least some space flexibility to accommodate teaming arrangements.

### Research Findings

The 1993 book *Nongradedness: Helping It to Happen* presents what is probably the most comprehensive analysis/summary of research about nongradedness. It provides a conservative yet positive story about the "substantial and generally favorable body of research on nongradedness." Not surprisingly, several of the studies show that benefits increase over time: that is, the longer that pupils are in such programs, the greater the improvement in achievement scores. Another conclusion of interest is that boys, African Americans, underachievers, and lower-socioeconomic pupils perform better and feel more positive toward themselves and their schools in a nongraded environment. Mental health and school attitudes also benefit.

In summary, then, both logical analysis and examination of the sparse but convincing research now available support the organizational arrangement that calls for (1) multiage pupil grouping to permit numerous learning opportunities, (2) teacher teaming to enable both specialization of functions and continuous professional partnerships and exchanges, (3) flexible architecture to permit a great variety of instructional groupings, and (4) the absence of grade-related nomenclature and the psychological pressure it presents. It is to be noted and appreciated that the classroom procedures and the flexible structure of a multiple-year curriculum enhance the atmosphere and, as research indicates, stimulate both good learning and what can accurately be described as the mental health of all participants.

## NONTRADITIONAL STUDENTS IN HIGHER EDUCATION

The term *traditional students* describes the characteristics of most students attending colleges and universities before 1970. These included: age between the late teens and early twenties; immediate entry to higher education following high school; full-time attendance and completion of a four year degree in four to five years; residence at the college or in its vicinity; and primary financial dependence on family sources. Traditional students also generally were neither married nor responsible for other family members.

In North America, beginning about 1970, higher education institutions began to see an influx of significantly different students, to whom the term *nontraditional students* was applied. The most prominent differences were that these students were older and had interrupted formal education either before or after finishing secondary school. Postsecondary schools in other developed countries, for instance Organisation for Economic Co-operation and Development (OECD) members, also experienced increases in older students. In the early twenty-first century, some believe nontraditional students have become the new majority, and traditional students the exception.

Direct comparisons of nontraditional students across countries are difficult because of varying frameworks of data collection. Examples can be seen from the United States, United Kingdom, and selected OECD countries such as Canada, Germany, and Japan. Initially, the simple age criterion of twenty-five years of age or older was used to define nontraditional students. According to the National Center for Education Statistics (NCES), by the mid-1990s the proportion of these students in institutions of higher education had grown to more than 40 percent. A later mid-1990s NCES study of beginning undergraduates broadened the factors to seven characteristics, including later than usual initial enrollment, financial independence, full-time employment, part-time attendance, responsibility for dependents other than a spouse, being a single parent, and high school equivalency by means other than a diploma. It also classified nontraditionals as minimally (one factor), moderately (two or three factors), or highly (four or more factors) nontraditional. The study described nearly three-quarters of beginning undergraduates as at least minimally non-

traditional. A Canadian-American association concerned with nontraditionals even proposed a new classification, *New Trads*, to include younger students attending part-time but lacking extensive adult life experience.

Elsewhere, other factors applied. A 1997 United Kingdom study described nontraditional students as having later age on entry, but also included ethnic, disability, and socioeconomic level factors. Germany explicitly counted senior students and part-timers, but its university system is difficult for part-time students to access. Ireland and Japan increased access for nontraditional students only in the 1990s, so their rates of increase are smaller than other countries. Clearly, nontraditional students are somewhat older and have alternative qualifications for admission than do traditional students, and, depending on country, perhaps other adult-like or situational factors.

### Types of Nontraditional Students in the United States

In 1997, using only the age criterion of twenty-five or older, nontraditional enrollments numbered 6,149,000, or nearly 43 percent of all students in higher education. Such a broad group probably includes some representation of all aspects of the total population, but in important considerations, such as gender, ethnicity, socioeconomic status, and regionalism, nontraditional learners do not mirror American society precisely. Some salient characteristics of the group have implications for how providers plan, design, and conduct programs for nontraditional learners, and the supporting services they should provide.

Even including younger people with adult characteristics of autonomy and financial independence, nontraditional learners generally are older than traditional students at the same level. This accounts for why so much of the discussion of nontraditional learners takes place in the context of adult learning, although counselors should be sensitive to the varying circumstances of younger students. Adults are likely to have maturity and experience that can benefit their study, but they may also have formed fixed convictions that restrict their openness. Nontraditional learners often lead complex lives with many responsibilities that compete with their educational goals. They tend to be employed full-time or for extensive part-time periods. Similarly, many are married with demanding family responsibilities and

community involvements. Demands on their time often limit them to part-time enrollment and longer times to complete degree and certificate sequences.

Adult women have entered at a higher rate than men, and are helping to outnumber the greater proportion of male enrollment that prevailed before 1970. Women are more likely than men to be responsible for younger or older dependents and a larger portion of them attend part-time.

Other situational factors affect participation. Nontraditional learners are more likely to reside in urban or suburban areas, rather than rural areas. This may be related to the proximity of educational institutions and could be relieved by the growth of distance learning systems. Proportionally, more nontraditional students come from the western or Rocky Mountain states than the rest of the United States, and fewer come from the New England and the mid-Atlantic states. In addition, the ethnicity of nontraditional students does not parallel that of the national population. Asian and non-Hispanic white students enroll at a higher rate than their proportion of the general population, while African Americans and Hispanics participate at a lower rate. In their thirties, however, the proportion of African Americans enrolled in higher education is higher than that of the general population, which suggests that gap may be closing for them. The same is not true of Hispanics, whose numbers may be affected by the immigration of less educated persons. Immigrants make up an increasing number of nontraditional participants in higher education, with needs ranging from English as a second language to revalidation of high-level professional qualifications for certification or licensure in the United States.

Surveys over several decades confirm that the primary motivation for nontraditional enrollment has been career improvement. For younger participants, obtaining credentials necessary to enter desired employment has been critical. People between thirty-five and fifty years of age often seek to improve their career prospects with expanded qualifications. This marks an important shift in motivation toward growing one's capabilities to keep up with changing knowledge demands or to assume greater responsibility. People in their later years, on the other hand, are more likely to pursue personal enrichment goals, and even to seek degree credentials for their own sake. A great many nontraditional learners come to higher education with credit earned in earlier enrollments and are eligible for assessment

of informal learning for credit. Nontraditional learners are likely to take longer to complete their degrees than traditional students and to have higher attrition in their first year. Those who continue to the second year have persistence rates closer to traditional students.

### **Support for Nontraditional Learners**

The greater maturity of most nontraditional learners, and the complexity of their daily lives, means that they have different expectations for their learning experiences and different needs for services responsive to their circumstances. Many institutions have made adjustments to assist nontraditional learners, and that practical experience can be an invaluable resource to others who wish to follow their example.

Innovations have involved three major shifts in perspective. These changes have their roots in an emphasis on fulfilling human potential and realizing individual autonomy. Leading exponents have been Malcolm Knowles, Jerold Apps, and Stephen Brookfield.

First, there has been an effort to remove barriers, both situational and dispositional, to nontraditional learner participation. The most daunting of these has been a rigidity in attendance requirements that are incompatible with the other responsibilities of these students. New time and place options have brought much greater choice and flexibility. The growth of asynchronous distance-learning offerings through electronic technology could eliminate this barrier entirely. More flexible access to other important services has become more common as well. Clearer information on institutions and the specific programs needed for career or other learning goals is available. Access and guidance to financial aid has improved. Programs for nontraditional learners provide reentry or orientation workshops to reacquaint applicants with college level study or to reduce anxiety about reentry after an interruption. Some of these are linked to resources to refresh college study skills.

The second major change has been to reorient the learning transaction to focus on learners. Instructors assume roles as facilitators or mentors to work with learners to design individualized curricula. Often working in groups, they establish a climate of mutual respect, trust, and feedback. These groups take account of the contribution that previous exper-

rience can offer, but try to foster a spirit of critical reflection and openness to new ideas and information. According to Brookfield, “the aim of facilitation is the nurturing of self-directed, empowered adults” (p. 11).

Finally, nontraditional institutions increasingly provide continuing academic and personal support to sometimes-vulnerable nontraditional learners. On the academic side, there is greater recognition of the value of ongoing counseling and developmental monitoring, in addition to close attention at entry. The support can include preparation for leaving the program, such as career counseling and exit seminars to deal with the anxiety of a new transition.

Learners also may need a variety of nonacademic services throughout the program. These include food or refreshment services and lounge spaces at late afternoon or evening times, convenient parking and campus security, child care for young children, and perhaps personal counseling to assist with stress or unanticipated emergencies.

The recognition of, and the adaptation to, nontraditional learners since the 1970s has been impressive. Any institution that pretends to serve society must take responsibility for nontraditional learners in the knowledge age. The National Association of State Universities and Land-Grant Colleges (NASULGC) recognized this in their 1999 report *Returning to Our Roots: A Learning Society*. Yet there is much more many higher education institutions can do to serve nontraditional learners with full commitment.

## NTL INSTITUTE FOR APPLIED BEHAVIORAL SCIENCE

---

The NTL Institute for Applied Behavioral Science originated in the 1940s as an experiment in group relations called the National Training Laboratory. Directed toward the adult learner, NTL, which is a not-for-profit membership corporation, designs and delivers programs to reeducate adults to help them become better leaders at the group and systems level and to become sensitive to interpersonal dynamics.

NTL's original mission was to train and develop *change agents*, as they came to be called. NTL's T-Group methodology, along with other innovations—such as experiential learning (“learning by doing”), sensitivity training, and the feedback method—have influenced social institutions, industry, and organizations of every variety worldwide. The NTL Institute also developed methods and programs to link teacher training and classroom teaching.

Four scholars are directly associated with NTL's beginnings. Kurt Lewin, considered by many as the father of NTL, began a project in 1946 in which forty-one community leaders examined interracial and intergroup conflict in their home settings—and learned skills to deal with those conflicts. This workshop led to the discovery of the T-Group and eventually to the founding of NTL; however, Lewin died before the first workshop was held in Bethel, Maine, in 1947. Other founders were educational psychologist Leland P. Bradford, who was director of the Division of Adult Service of the NEA before cofounding NTL; Kenneth Benne, who had an interest in teaching techniques as a faculty member in the College of Education at the University of Iowa; and Ronald Lippitt, who is recognized for his early work in group leadership and analyzing group processes and who became a research assistant to Kurt Lewin at Iowa.

Lewin's research and work played a key role in NTL's *reeducation of the adult learner*, a process where people alter, replace, or transcend their usual patterns of thinking. It is a process more complex than learning anew. Lewin's field theory, “human behavior is the function of both the person and the environment, expressed in symbolic terms,  $B=f(P, E)$ ” led to development of actual field research on human behavior and was incorporated into all NTL training.

NTL developed and perfected the Work Conference model during the 1940s and 1950s. This model

continues to influence conference and meeting design. NTL helped transform the field of applied behavioral science and made seminal contributions to the field of organizational development, including *The Journal of Applied Behavioral Science*, which was founded in 1965 to advance the field of applied behavioral science and to foster NTL's core values.

From NTL's most widely recognized innovation, the T-Group method—the basic method of laboratory learning about self, groups, and interpersonal relations—emerged the concept of sensitivity training, which psychologist Carl Rogers, who revolutionized the course of therapy, regarded as “perhaps the most significant social invention of the century . . . it is one of the most rapidly growing social phenomena in the United States. It has permeated industry and education and is reaching families and professionals in the helping fields and many others.” Sensitivity training is a technique that uses intense small-group discussion and interaction to increase individual awareness of self and others.

Besides NTL's wide array of training and education programs in personal and professional development, NTL offers certificate programs in advanced technology for senior organization-development practitioners; change management and diversity leadership; experience-based learning and training; and organization development. In addition, through partnerships with American University and Cleveland State University, NTL provides a graduate program that culminates in a master's degree in organization development or diversity management. NTL works internationally as well, offering programs and training in Asia and other areas.

NTL straddles many contradictions. It began as an organization of academics who wanted to extend their praxis beyond the academy and who were intrigued with the possibility of bridging the divide between social science and social action. Thus, NTL occupied a unique place between the behavioral and social sciences. Through NTL, researchers, scholars, educators, and activists are brought together to solve social problems, to create programs of human change, and to integrate action, education, and research.

NTL has grown since its inception and, like other educational entities, is reexamining its market to discover the provocative possibilities of human interaction across time and space; to answer the questions raised by the dynamics of human interac-

tion in an electronic environment; to continue to meet the challenge of unraveling the possibility of work-life balance; to manage rapid change, rather than react to it; and to continue a focus on managing and valuing diversity and various societal problems, while at the same time strengthening the design and delivery of its training to meet a changing environment.

## NURSING EDUCATION

---

To place nursing education into perspective, it is helpful to reflect on the health care environment and the role of the nurse in that environment. The health care landscape in the United States has been changing at an unprecedented rate. Nursing education also has undergone changes to keep pace and to prepare leaders who are highly educated and technically sharp decision-makers and clinicians. What is most noteworthy, however, is not that change has occurred but rather that the rate of change since 1980 has been greater than during similar periods. Factors driving the transformations include new medical and technological advances, new health care delivery systems, and expanded roles for nurses.

Nurses are the largest single group of health care professionals but they do not practice in isolation. Rather they are an integral part of health care teams, institutions, and systems. As health care continues to move outside the hospital, the demand for nurses who can function across systems and direct a continuum of care is rising. The changing health care environment has not only changed the role of the nurse, it has also affected the supply–demand ratio. Hospitalized patients have multiple health problems, are more acutely ill, and are discharged sooner. This has

increased the demand for nurses in acute care institutions at the same time that more nurses are needed in home and community settings. Given trends that emphasize health promotion and disease prevention, the need for acute and chronic care is skyrocketing.

The Federal Division of Nursing predicts that by 2010, the growing demand for nurses with bachelor of science in nursing (B.S.N.) and master of science in nursing (M.S.N.) degrees will outstrip the supply and that by 2020, the demand for B.S.N. and M.S.N. graduates will grow nearly twice as fast as the expected increase in the workforce. The predicted need for nurses is sobering, yet it is important to acknowledge that the impending crisis is not solely numbers based. The question is not only how many nurses will be available, but more importantly, will their educational preparation be appropriate to meet future health care needs. Based on the Federal Nursing Division's data, the answer is to increase the number of bachelor's, master's, and doctorate-level nurses.

### Bachelor of Science in Nursing Degree

In 1996 the American Association of Colleges of Nursing affirmed nursing's place in American higher education by stating that the minimum educational requirement for professional nursing is the bachelor of science in nursing (B.S.N.) degree. B.S.N. programs are offered by four-year colleges and universities. Most generic B.S.N. programs are four academic years, although some students who have other responsibilities may choose to extend their programs. The term *generic* refers to a program designed for students studying nursing for the first time. By comparison, some B.S.N. programs have degree completion tracks for registered nurses (RNs) and licensed practical nurses (LPNs) who have completed basic nursing programs in hospitals or community colleges. Some programs also offer tracks for individuals with bachelor's degrees in other majors. B.S.N. programs must be approved by the state board of nursing.

A B.S.N. degree enables graduates to not only launch a successful career in nursing, but also to appreciate a more meaningful life. Therefore, the curriculum includes courses in nursing as well as the arts and sciences. Because the B.S.N. graduate is prepared as a generalist, nursing courses include both theory and clinical experiences and in most specialty areas, such as adult, community, maternal-child, pediatric, psychiatric, and critical care nursing. In

some B.S.N. programs, students enroll in nursing courses at the freshman or sophomore level with courses in the major along with arts and sciences integrated throughout the program. In other programs, nursing courses are concentrated at the junior and senior levels. The number of credit hours required for a B.S.N. degree usually ranges from 120 to 130. Upon completing the degree, graduates are eligible to take the National Council Licensing Examination (NCLEX) to become licensed as a registered nurse. By law, nurses must be licensed to practice in the state where they work.

A strong background in science, mathematics, and verbal skills is needed to succeed in nursing. The admission process varies among institutions but typical criteria include: official transcripts with a minimum grade point average (GPA) of 2.0; SAT or ACT Assessment score, and TOEFL (Test of English as a Foreign Language) for foreign students; essay; and letters of recommendation. Some B.S.N. programs admit students directly into the major. Others admit students initially to the institution and require students to apply for admission to the major after completing prerequisite courses including the sciences.

### Master of Science in Nursing Degree

Whereas bachelor's degree graduates are generalists, master's degree graduates are specialists. The master of science in nursing (M.S.N.) degree program prepares graduates to be advanced practice nurses (APNs) with in-depth theory and practice in a clinical specialty. Some M.S.N. programs combine both clinical and functional roles (e.g. education, administration, case management). However, the American Association of Colleges of Nursing (1996) concluded that the clinical role should be the primary focus for all master's programs.

Most master's students select one of four tracks or primary roles: clinical nurse specialist (CNS), nurse practitioner (NP), certified registered nurse anesthetist (CRNA), or certified nurse midwife (CNM). The CNS is an APN with expertise in theory and research-based clinical nursing practice. In addition to clinical practice, major roles of the CNS include teaching, research, consulting, and management, all within an area of specialization, such as acute care, adult health, community health, critical care, gerontology, maternal-child, mental health, neonatology, oncology, pediatrics, or women's health. The NP is an APN who is a primary care provider to individuals and families in multiple settings.

Originally developed to function as a physician extender, the NP role has evolved to incorporate a more holistic nursing approach to illness prevention and health promotion. NPs assess, diagnose, treat, prescribe, monitor, and refer patients as appropriate. The CRNA works closely with a physician and administers anesthesia in hospitals and outpatient settings. The CNM manages routine obstetrical cases. APNs have a collaborative agreement with a physician.

Although M.S.N. programs offer a wide choice of clinical specialties, most curricula include core courses such as statistics, research, professional role, concepts and theories, health policy, ethics, and economics. Other required courses include advanced study in physiology and pathology, pharmacology, and health assessment. The number of clinical hours is program specific but ranges between 500 and 750 are common. M.S.N. programs may require a thesis or other culminating project, and a comprehensive examination. The number of credit hours required for the M.S.N. degree typically ranges from 36 to 48. Although the master of science in nursing (M.S.N.) is the degree awarded most frequently, some institutions award a master of nursing (M.N.), a master of science (M.S.), or a master of arts (M.A.) degree. The difference is more a function of institutional organization, not the graduate nursing curriculum.

The admission process is institution specific but typical admission criteria include the following: official transcript verifying a B.S.N. degree from an accredited program with a minimum GPA of 3.0; undergraduate courses or demonstrated competency in health assessment, statistics, and informatics; practice in nursing; Graduate Record Exam (GRE), Miller Analogy Test (MAT), or TOEFL for foreign students; letters of recommendation; résumé; and an essay. The above discussion assumes that a M.S.N. applicant has a B.S.N. degree, but it is possible for nurses with no bachelor's degree or a non-nursing bachelor's degree, and for individuals with no background in nursing to be admitted into some graduate nursing degree programs.

After completing a master's degree or post-master's certificate, CNSs and NPs may take national certifying examinations such as those offered by the American Nurses Credentialing Center (ANCC) providing their programs included the requisite content and hours in a clinical specialty. This credentialing system further demonstrates nursing's ever-increasing standards and commitment to excellence.

## Doctoral Degrees in Nursing

The quality of nursing education has increased further as evidenced by the fact that doctoral degree programs in nursing, and even postdoctoral programs, have become an integral part of American higher education. Prior to 1960 there were no doctoral programs in nursing. During the 1960s nursing was added as a minor to other Ph.D. degree programs. It was not until 1970 that Ph.D. programs in nursing emerged, but the number of programs has increased significantly. At the beginning of the twenty-first century, there are more than seventy-five doctoral programs in nursing leading to a Doctor of Philosophy (Ph.D.) or a Doctor of Science in Nursing (D.N.S., D.S.N., or D.N.Sc.) degree.

Both the Ph.D. and D.N.S. degree programs focus on research and “prepare students to pursue intellectual inquiry and conduct independent research for the purpose of extending knowledge” (American Association of Colleges of Nursing, 2001b, p. 2). Stated differently, doctoral programs in nursing enhance the scientific foundation for nursing theory and practice. A research-focused doctoral degree prepares graduates for a variety of positions within higher education, health care, government, and the private sector, such as educator, researcher, administrator, and advanced practice. Career options for nurses prepared at the doctoral level are virtually limitless.

Directed toward preparing graduates for a wide range of scholarly pursuits, most doctoral programs require courses in history, philosophy, and theory of nursing; informatics; research; and in related issues from health care ethics to economics. However, curricula do vary depending upon philosophy, faculty expertise, and other resources. Other requirements include a dissertation, oral defense, and comprehensive examination. The number of credit hours required for the doctoral degree is institution specific.

Criteria for admission to a doctoral program are similar to those for a master’s program. Typical criteria include an official transcript verifying a M.S.N. degree with a minimum GPA of 3.0; a strong foundation in statistics; GRE score; practice in nursing; curriculum vitae; letters of recommendation; essay; and interview by a faculty committee.

Higher education is a lifelong investment. Undergraduate and graduate students should investigate several programs to determine which one correlates best with their academic and clinical inter-

ests and career goals. Students also should carefully assess multiple institution and program characteristics, especially accreditation status. Colleges and universities are accredited by nationally recognized, regional accrediting associations. Undergraduate and graduate nursing programs may apply for specialty accreditation by the Commission on Collegiate Nursing Education (CCNE) or the National League for Nursing Accrediting Commission (NLNAC). Although accreditation is voluntary, it demonstrates an institution’s and program’s commitment to continuous improvement and quality education.

## NUTRITION AND CHILDREN'S PHYSICAL HEALTH

---

Proper nutrition is crucial for the appropriate growth and development of children. Undernourished children are at risk for illness, cognitive delay, and poor social skills. Overnourished children are at risk for obesity, diabetes, heart disease, and a shortened life span.

Proper nutrition implies adequate caloric intake for optimal growth and development. At birth, a child's metabolic rate per unit weight is at its peak. This period is coincidental with the highest rate of brain growth and development. Therefore, it is imperative that newborns be adequately nourished. Human breast milk is the ideal food for newborns, and remains the gold standard by which all formulas are measured. Breast-fed infants are healthier, have better cognitive development, and are provided with a more secure mother–infant bond. Research has shown that breast-fed infants are less prone to infection and food allergies, and have IQ scores three to five points higher than their non-breast-fed counterparts. The American Academy of Pediatrics recommends breast-feeding for the first twelve months of life. Solid foods should be introduced around age six months, and supplemented with breast milk. It is recognized, however, that most of the immunologic and cognitive benefits of breast-feeding decrease after the first six months. Thus, the first six months of life provide the greatest return on breast-feeding.

In the newborn period, babies require approximately 100 kilocalories per kilogram of body mass each day. This requirement decreases approximately

10 kilocalories per kilogram every three years, until reaching adult needs of approximately 40 kilocalories per kilogram of lean body mass. It is important to ensure that in addition to adequate energy intake each child has a well-balanced diet to provide appropriate vitamins and minerals as well. The U.S. Department of Agriculture has provided a "food pyramid" as a guide to healthy eating for adults and older children. It suggests that a daily regimen consist of six to eleven servings of bread, rice, cereal, or pasta; two to four servings of fruit; three to five servings of vegetables; two to three servings of dairy products; two to three servings of meat, beans, eggs, or nuts. Sweets and fats are to be consumed sparingly.

Research in the decade 1989–1998 has shown that undernutrition, even in a mild form, can have detrimental effects during childhood, and the younger the child, the more at risk he or she is for undernutrition. It is clear that the greater degree of malnutrition, the worse the outcomes. Inadequate nutrition ranges from the starvation states seen during famines, to the more familiar mild undernutrition common among children of poor socioeconomic standing. The body, when in a starvation state, preserves vital functions first. Thus, energy is shunted to basic metabolic tasks, leaving little energy for cognitive development and social activity. Two distinct types of starvation are recognized: marasmus, or general caloric insufficiency, and kwashiorkor, or protein deficiency. Marasmus results from inadequate caloric intake. Physically, children with marasmus have a wasted appearance throughout the body. Generally, in the face of inadequate calories, weight is first lost, then vertical growth becomes stunted, and the last growth parameter affected is the head circumference. Although correction of this condition with adequate calories can be achieved, cognitive abilities and height may remain stunted. Kwashiorkor results from inadequate protein intake. The appearance of kwashiorkor is a skinny child with a protuberant belly. This appearance is due to the fatty infiltrate of the liver and water retention of the surrounding tissues. The treatment of this condition is to provide adequate protein. As with marasmus, the damage done while in this state is often not reversible.

Mild to moderate undernutrition is a threat to a child's achieving his or her potential cognitive abilities. Undernourished children are typically easily distracted and fatigued. A 1998 study demonstrated

that children who skip breakfast perform worse on tasks of memory and concentration than when they eat breakfast. Other studies have suggested that children with inadequate amounts of protein in the diet had lower achievement scores than their counterparts with adequate protein intake.

Iron deficiency is the most common nutritional deficiency in the United States. Anemia, or decreased red blood cell mass, results from a lack of adequate iron in the body. This lack of iron causes an irreversible decrease in IQ. One of the most common reasons for anemia in toddlers is a crowding out of iron-rich foods by excessive milk intake. In older children, iron deficiency likely results from dietary inadequacies as well as from menstruation in females. Lower socioeconomic classes are at particular risk for iron deficiency.

During the 1990s overnutrition became a concern in industrialized nations. In the United States obesity is the most common preventable health problem affecting both children and adults. Fourteen percent of children and adolescents in the United States were obese in 1999. This represents an increase of 50 percent from the previous decade. Obesity is usually a result of chronic mild overeating, as opposed to repeated binge eating. Consuming five hundred kilocalories more than needed each day will result in a weight gain of approximately one pound per week. Obesity has not only negative psychological effects on the individual, but also negative health effects. People who are obese have shorter life spans, higher than average blood pressure, higher cholesterol levels, increased incidence of diabetes, and more difficulties with the hip and knee joints. Obesity is most effectively treated when interventions are at an early age. Only 25 percent of children who are obese at age six years will go on to be obese adults.

However, 75 percent of obese teenagers will go on to be obese adults. Treatment includes increased exercise, decreased food intake, and family counseling about good food choices. As of the year 2002 there are no safe and effective drug therapies for obese children. Despite millions of dollars spent every year in the weight loss industry, it still appears that the best way to combat obesity is to prevent it.

PAUL D. HAIN

## **OPEN CLASSROOM SCHOOLS**

Open education is a philosophy which values the natural development and experience of the child as the primary determinants for the appropriate curriculum and methods. During the 1960s the world witnessed a remarkable amount of social change and the emergence of new philosophies in various aspects of society. Groups seeking reform challenged many institutional practices. Criticism from these groups often reflected their lack of trust in decision-making structures. Educators were prompted to examine issues of control within their traditional philosophy, notions of curricula, and protocols of teaching and learning. Educators began a search for an institutional model of child-centered pedagogy.

In the mid-1960s Americans visited the English infant schools, which promoted self-determination. These elementary schools advocated “informal” or “open” education and the “integrated day.” The “integrated day” refers to an interdisciplinary approach in which content from various subjects is woven and presented in a hands-on, problem-solving context. Educators from several continents adapted and applied these concepts in new open space or open plan facilities.

The open classroom school generally had an architectural configuration of large pods containing six to twelve classrooms, each with an outside access and no interior walls. Children were not assigned individual desks; they sat in cooperative small groups at tables. Teachers usually defined their workspace by their arrangements of bookshelves and cabinets. The lack of hallways meant more space was available for instructional use. The outside accesses and lack of walls allowed for greater accessibility. These de-

sign changes also resulted in a more efficient use of energy at a time when energy was becoming more costly.

The changes in the internal structure of the pod accommodated changes in the philosophical approach taken by educators. Without traditional rooms, teachers could redefine the nature of their role. The teacher shifted from the dispenser of knowledge to the facilitator of learning. Teachers were no longer isolated from each other. They were better able to confer and plan. Learning became an activity that was child centered rather than teacher-oriented. Standard grade-level skill checklists were set aside and the differences in individual needs provided the rationale for the curricula. Students’ progress was not based on rankings, which define success in a competitive context; instead, evaluation of progress was reported in terms of the individual’s achievement in relation to growth from previous levels and the individual’s initiative and responsibility as demonstrated in academic and related arts areas.

As the role of the teacher changed, methods of instructional delivery were necessarily challenged. Traditional instruction involved discrete subject areas with generalized class expectations for performance. The open space philosophy altered the format of instruction. Classes were replaced with interest centers, which offered topical activities. Center choices promoted the discovery method, a precedent to constructivism. Learners were prompted to explore and develop their own connections in order to promote concept development and the scientific method. Students moved among the centers largely by choice and often without specific schedules.

Class composition was reminiscent of the one-room schoolhouse. Teachers arranged flexible multi-age grouping within the interest centers. Mindful of individual needs, teachers were challenged to maintain fluid group membership. In this manner, they could naturally develop a disposition towards diversity and citizenship. In some open classroom schools, homerooms or “family groups” were not configured by grade level. A class may have contained five students at each level, kindergarten through fourth grade. Each year, five would enter, and five would graduate. The stability of relationships over a number of years allowed a different social dynamic. The homeroom was designed to reflect the cooperative nature of learning. Over time the teacher could develop a richer knowledge of each student and serve as a long-term counselor and mentor.

The construction of open classroom schools declined by the mid-1970s. Concerns about noise and distraction encouraged educators to return to a traditional approach. Although the open classroom movement lost popularity, certain aspects of its philosophy and methods were reshaped and used. Many open-space facilities have been remodeled with the addition of inside walls, or become magnet programs, which have located technology labs and computer stations conveniently in the open spaces. Schools with open space classrooms varied to the degree in which the philosophies were operationalized. This variability limits the degree to which one evaluates the concept’s effectiveness. Research has indicated that the open classroom approach may not have significantly improved learning, but it certainly did not impede achievement. Additional research suggested that children in open classroom programs did score higher than traditional classroom students in self-concept, attitudes towards school, and creativity.

## OPEN EDUCATION

---

Open education refers to a philosophy, a set of practices, and a reform movement in early childhood and elementary education that flourished in the late 1960s and early 1970s in the United States. It received support from similar work that had been developing for many years in England, where it was simply termed *modern* education. Its development in both countries relied upon the long tradition of Progressive education.

Known for its spirited, child-centered classrooms, open education was viewed by proponents as a humane, liberating alternative to the more formal classrooms of its day. To detractors, its informalities represented an abdication by teachers of their duty to instruct, an indulgence that failed to hold students or teachers accountable. Where adherents saw independent, individualized learning, critics saw chaos. At the height of its popularity, the ideas of open education influenced at most 20 percent of infant (ages 5–7) or junior (ages 8–11) schools in England and perhaps half that number of comparable schools in the United States.

### The Classroom

The open classroom, at its best, is a busy laboratory, richly provisioned with materials for learning. Alone or in small groups, children move from one work area to another, using balance beams, colored beads, blocks, and other hands-on material in the mathematics corner; working on art projects in paint, clay, or construction scraps; reading quietly or aloud to others from books or from their own illustrated reports. The room itself is arranged into several separate learning centers, a functional organization that invites choice of participation in a variety of activities. The school day is flexibly scheduled, allowing students to determine for themselves when an activity merits more time and when it is completed. Class meetings often start and end each day, providing time to give announcements and news, negotiate assignments, and share projects. The teacher rarely calls the entire class together for group instruction. Classes are composed of mixed ages, a vertical group

setting in which children encounter points of view and abilities other than their own. This “family grouping” also encourages cooperative learning and social responsibility, with older students helping younger ones. Within the classroom, the teacher circulates among students, extending their learning by commenting and responding to their work, asking leading questions, and suggesting further directions for them to explore. The curriculum is necessarily flexible, responsive, and organic.

### Philosophical Underpinnings

Open education believes in the following tenets:

- Children’s fundamental desire and capacity to conduct their own inquiries and to learn in their own way from direct experience
- The right of children to take significant responsibility for their own education
- A “whole child” approach that includes the emotional and social aspects of learning
- A reciprocal relationship between school and community
- School as an environment for personal choice and fulfillment, not as mere training ground for pre-selected social roles
- The curriculum as better learned through direct experience than from textbook formulation
- Teachers functioning as observers, guides, and providers of resources, materials, and experiences suited to the needs and interests of students

A general optimism prevails, both about children’s capacity to respond positively to freedom and independence, and about school as a miniature democracy preparing a self-motivated, responsible citizenry.

These ideas are grounded in the Progressive philosophy of American educator John Dewey (1859–1952), and in the developmental psychology of Swiss clinician and theoretician Jean Piaget (1896–1980). Dewey believed that learning results from the real-life experiences of a growing mind; it is the “process of learning to think through the solution of real problems” (Dworkin, p. 20) by means of active inquiry and experience, not by memorization and recitation. The school is a microcosm of society, not to be separated from the child’s familiar context of family, community, social norms, daily life—all areas that children need to confront and comprehend. Education is a process of living in the here and

now, not a preparation for future life. If each child is brought into “membership within a little community, saturating him with the spirit of service, and providing him with the instruments of effective self-direction, we shall have the deepest and best guarantee of a larger society which is worthy, lovely, and harmonious,” Dewey wrote (Dworkin, p. 49). Throughout, he emphasized the value and importance of childhood and the influence of social environment upon individual development. All this reflects a long-standing American faith in the civilizing power of education via the common school.

As a “genetic psychologist,” Piaget studied the quality, sequence, and development of mental concepts in children. Through exploration and interaction with things around them, children build structures that explain the world and how it works. New experience and deeper understanding force modification of earlier formulations, as the child’s inner framework is reshaped and restructured to accommodate new realities. This process commences in very concrete ways when the child is small; later, at ages seven or eight, the mind begins to develop more structured thought, and in early adolescence moves on to abstract conceptualization. Every child goes through this process: the sequence is invariable, though the speed, style, and quality of growth vary. According to Piaget, children are the architects of their own individual intellectual growth, and this concept provides the link to Dewey and Progressive education: children are born with the natural ability to do their own learning, a capability that in part defines the evolutionary heritage of the human race.

### English Beginnings

In England, the formative period of open education was protracted. Before 1900, some teachers had begun to work in less formal ways, often in isolated, one-room village schools, and with little official or administrative support. By 1931 the Consultative Committee on the Primary School proclaimed in the Hadow Report, “The curriculum is to be thought of in terms of activity and experience rather than of knowledge to be acquired and facts to be stored” (p. 1). World War II was also an influential factor, as children and their teachers were taken out of the cities into the countryside where they were left to improvise. But it was with the release of *Children and Their Primary Schools* (the Plowden Report) in 1967 that these “modern methods” received their most authoritative support. “At the heart of the educa-

tional process lies the child,” began the Central Advisory for Education, “Children need to be themselves . . . . The child is the agent in his own learning” (paragraphs 2.6 and 2.7). Educators such as Sir Alec Clegg in the West Riding of Yorkshire, Edith Moorhouse and John Coe in Oxfordshire, and Stewart Mason in Leicestershire asserted strong personal leadership. In-service teacher centers, Her Majesty’s Inspectorate, and key teacher training colleges, especially the Froebel Institute with its demonstration school and influential publications, and Goldsmiths’ College at the University of London, provided institutional support.

### The American Experience

By the mid-1960s many Americans were considering basic educational change. Motivated by the launching of *Sputnik* by the Soviet Union in 1957 and cold war competition, business leaders called for the revitalization of mathematics and science curricula. Meanwhile, rebellious youths challenged many social institutions for their fairness and “relevance.” Schools were portrayed as racist, sexist, and oppressive. Teachers hoped to rekindle their sense of creativity and love of teaching by turning to less formal methods and materials. Parents responded both to the high quality of student work and to their children’s obvious enthusiasm for school.

On learning that informal, child-centered classrooms were already established in Britain, Americans flocked to see for themselves. Some, like Joseph Featherstone, wrote about their experiences; others, such as Lillian Weber and Edward Yeomans, set about to educate or reeducate teachers. Soon open education took its place alongside schools without walls, schools within schools, storefront academies, community schools, and other alternative practices. Some new converts understood the underlying philosophy and recognized the enormous demands open education placed on the classroom teacher; others copied carelessly.

### Questions, Controversies, and Criticisms

Criticism of open education was of two sorts. Some disagreed with its basic aims, finding the goals of self-actualization, independence, and social responsibility to be seriously misguided. This was a philosophical, ideological opposition that was part of a longstanding debate about the aims of education. Others questioned its effectiveness, especially in public schools. They challenged its appropriateness

for all students; they queried whether its open structure produced discipline problems; they worried that school transfer would be complicated by the absence of a structured curriculum; they wondered whether students would really learn the “basics.” They also perceived inefficiency, unclear objectives, and what seemed a lack of accountability.

In England, such questions had begun in the late 1960s; and, by 1971, a collection of “Black Papers” was published by a group of Oxford and Cambridge intellectuals. They were especially critical of Progressive assumptions about children’s learning and about the absence of any agreed-upon common body of knowledge that all educated people should possess. Evaluation was the focus of intense debate. To adherents, proof of success was to be found in the children’s enjoyment of school and the high quality of their work. To critics, however, neither this raw data, nor the potential of portfolio assessment, nor positive testimonials from school administrators sufficed: they required objective, quantifiable evidence.

In fact, for many reasons, open education defied empirical evaluation, as it favored:

- Collaborative learning, where it is difficult to determine individual achievement
- Student participation in planning and in setting goals
- An evolving curriculum rather than the set scope-and-sequence chart of a more traditional school
- Standardized testing to be used only as a diagnostic tool
- Process over product, long-term goals over short, and affective as well as academic ends.

Because open education included a variety of similar but not identical classrooms, no standard measure of “openness” was ever established. For researchers, it proved impossible to establish clear experimental and control groups, a basic necessity for conventional studies.

Thus on the one hand, there was considerable misunderstanding of open education; on the other, there were some very real methodological problems in evaluating its effectiveness. Both left the movement vulnerable to attack. In the end, several factors account for the failure of open education to thrive:

- Miscalculation of the demands of teaching in this manner

- Failure to understand the centrality of teacher support services in the effort to reform schools
- Institutional inertia.

The movement failed to develop sufficient political strength to override its critics' concerns, and the times simply changed, as the mid-1970s saw a general shift toward more conservative social policies, and, in education, a call for increased structure and formal accountability. Nonetheless, the influence of open education remains in American schools, the lasting legacy of a promising effort at Progressive educational reform.

## OUTCOME BASED EDUCATION

Few educational concepts have sparked as much interest, enthusiasm, misunderstanding, and controversy during the 1990s as Outcome Based Education (OBE). In one form or another, and sometimes against their political wills, educators the world over are increasingly focusing their efforts on what are variously being called outcomes, results, performances, competencies, or standards.

Whether proposed by national governments, as in Scotland, South Africa, or the United Kingdom; by state or provincial policy bodies, as in Australia, Canada, and the United States; or by local jurisdictions and institutions, as is happening on virtually every continent, how these changes are being applied to traditional forms of education vary as much as the terms themselves.

### The Dilemma of Defining Outcome Based Education

One can begin to bring some clarity to this melange of meanings and models, however, by looking systematically at the term *outcome based education* itself. At face value, the concept is quite simple and straightforward: Start by developing a clear picture of what learners should ultimately be able to do successfully at the end of a significant educational experience (i.e., the outcome). Then base (i.e., develop) the curriculum, instruction, assessment, and reporting (i.e., education) directly on that clear picture. This is a simple matter of clearly defining what one

wants learners to be able to do (the end) before the beginning, teaching them how to accomplish that end, and then assessing and documenting the end they were to achieve in the first place. Notice the fundamental cause-and-effect logic of this model: Education (the means) is based on the outcome (the end), not the other way around.

When are learners successful in such a system? When or whenever they can demonstrate the intended learning outcome. How many chances are they given to succeed? Usually there is more than one and sometimes there are several chances.

**Real world examples.** If these basic ends/means elements of OBE sound simple and straightforward, they are, and there are many examples from the “real world” to illustrate them. They include skill and technical training of all kinds (that sometimes reaches back hundreds of years to the craft guilds of the Middle Ages in Europe); ski schools; Boy Scouts’ merit and honor badges; pilot and transportation licenses of all kinds; first-aid training; almost all military and athletic training; and virtually all licensure programs in the practical arts.

What is the essence of each of these examples? In some cases successful performance is a matter of life and death, but in all cases two factors stand out: (1) A clear criterion of success or standard of performance (the intended end) guides both instructors and learners; and (2) there is variability in the time and number of opportunities (critical means) that learners might take to achieve the standard. Having learners successfully demonstrate the outcome is what counts the most in these models. In OBE language, successful learning or performance (the end) is the constant, and the time required to attain it is flexible.

**The education system reversal.** But in virtually all formal educational systems across the globe, just the opposite configuration of these two defining conditions prevails. There, time is the constant, and learning or performance is the variable. Consequently, defining exactly what is and is not OBE on the education scene is extremely problematic in formal education because the two factors that most fundamentally define OBE are not only not present, they are actually reversed.

As William Spady described it in both 1994 and 1998, the world’s education systems are time based: that is, they are defined by, organized around, focused on, and managed according to the calendar

and clock, not outcomes. Virtually everything that happens within them is forced to exist within fixed, predefined blocks of time, no matter how much actually needs to be accomplished by either instructors or learners. When an official time block ends, so does the learner’s opportunity to pursue the outcomes and improve performance on them.

From this perspective, introducing outcomes into a time-based system is like trying to force soft, large, round pegs into rigid, small, square holes. To date, the holes have emerged the overwhelming winners. Across the globe time has remained the given and the constant, even though outcomes have increasingly been emphasized as the reason the time blocks exist.

The other set of rigid square means—holes into which outcomes are being forced—is the curriculum, and it too has prevailed as a dominant force in this implementation dynamic. Although some countries and states have adopted frameworks of outcomes that reach across or go beyond existing curriculum areas—frameworks that contain complex kinds of performance abilities, which link to eventual career and life performances—the overwhelming approach to OBE across the globe has been one of developing outcome frameworks for the major subject areas in the existing curriculum. The latter are variously called program outcomes, specific outcomes, learning area outcomes, curricular outcomes, and standards. In this approach, the curriculum’s content structures are the givens, and outcomes are derived from them, resulting in a “tail-wags-dog” approach. As a result the system’s means are used to determine its ends, even though the term outcome-based implies just the opposite.

**Better to call it “CBO”?** Given the fundamental discrepancy between what the term OBE implies and how it has been so overwhelmingly applied, it is wise to distinguish between its conceptual meaning and its implementation realities. Those interested in upholding the inherent meaning of the OBE concept and its reform ideals view the broad sweep of imitation implementation practices in a skeptical light, often referring to them as “CBO” rather than OBE. Among other things, CBO stands for curriculum-based outcomes, calendar-based organizations, content-bound objectives, convention-bound orientations, and convenience-based operations.

### Objective Based Education as a Reform Ideal

Those who generated the OBE movement in the United States during the 1970s through the 1990s were deeply influenced by the research and concepts of two key individuals: John Carroll (1963) and Benjamin Bloom (1968). Carroll's revolutionary ideas about *aptitude* as rate of learning rather than fixed ability opened the door to an expanded view of learner potential, which Bloom promoted and tested over the next twenty years. The resulting reform initiative was both a philosophy of expanded learning success for all learners and a classroom instructional strategy called *mastery learning*.

Based on the documented successes of a variety of mastery learning initiatives in the 1970s, a coalition of researchers, practitioners, and reformers founded an organization called the Network for Outcome Based Schools (NOBS) in 1980. The NOBS and its members generated major interest in both mastery learning and the expanded notion of OBE throughout North America during the 1980s and early 1990s, hosting many national and regional conferences featuring practitioners who had achieved major improvements in student learning through the systematic application of the network's key operating premises and principles. Several of the most notable of these local successes are documented in Spady's 1994 book.

#### Objective based education's four power principles.

The spirit and intent of the NOBS operational philosophy was to convince educators that they could dramatically improve student learning success and their professional effectiveness by consistently, creatively, and simultaneously applying four key operating principles in their schools and classrooms. These power principles are:

1. clarity of focus on culminating outcomes of significance,
2. expanding opportunity and support for success,
3. high expectations for all to succeed,
4. designing down from ultimate outcomes.

Over time the network's members became convinced that if any form of OBE was to exist, it needed to consistently embody these four principles because without them educators would lose the leverage these principles gave them in expanding what NOBS called the *conditions of success*—the basic ground rules around which learning and learning opportunities are fundamentally structured.

Do all learners have a clear picture of what they are ultimately expected to demonstrate before a learning experience begins? Is every learner given more than one routine chance or block of time in which to reach or exceed the expected standard? Are positive and challenging expectations for learning success applied equally to all learners, with no bell curves or success quotas applied? Has the curriculum been systematically designed back from the end point that learners are expected to reach, so that there is a clear path for getting there? If the answer to any of these four questions is no, then constraining conditions of success are deemed to exist and, as such, the model in question falls short of the substance, integrity, and spirit of the four power principles. For more than a decade, models of OBE were held to this exacting standard.

#### Outcomes as Competence

By the mid-1980s the leaders of the rapidly growing OBE movement had come to understand that outcomes were culminating demonstrations of learning, which required learners to do things of significance with what they knew and understood. As such outcomes required both complex mental processing and the ability to carry out visible and accessible processes—processes that were specified by the verbs used in defining the outcome (e.g., describe, explain, design, negotiate, organize, produce, disseminate), this demonstration component brought skill, competence, and performance to center stage in outcome-based models and sent implementation efforts down three quite distinctive paths, depending on the designer's conception of a learning demonstration.

**The disciplinary path.** The disciplinary path focused on student mastery of quite specific skills, often the skills and tasks imbedded in daily lessons and multiweek units of instruction. Usually these were skills inherent in the curriculum content itself. This approach was quite consistent with the original mastery learning model, was subject-focused and disciplinary in nature, and invited minimal change in curriculum structures and instructional delivery patterns. The application of the power principles took on a distinctive "micro" focus, usually within self-contained classrooms.

Because of its focus on specific content and skills, the disciplinary path eventually led to the development of standards in the subject areas and to the standardized testing efforts being employed by education systems worldwide in the late 1990s and

early 2000s. Its proponents, however, see in the latter efforts virtually no attempt to systematically address OBE's four power principles and would in no way regard these initiatives as real OBE.

**The interdisciplinary path.** A second path took a much more interdisciplinary and change-oriented tack, prompted by its proponents' conviction that learning performance could and should take more complex forms than content-focused skills. In the main these were educators who saw what many called higher-order skills as having no exclusive disciplinary home—abilities such as communication, critical thinking, planning, and problem solving. Nor did these abilities fall into age-specific categories. These higher-order competencies, they argued, were fundamentally developmental, increasing in complexity as learners matured, and needed to be taught that way. Consequently they needed to be addressed and fostered in all subject areas and grade levels for all learners.

By connecting the concepts of higher-order, interdisciplinary abilities with outcomes, these reformers intended to take both OBE and educational change to a new level. That level involved an elevated, more complex notion of learning and competence; a developmental approach to curriculum design and instruction; an authentic approach to assessment and reporting; a dramatic expansion of what was meant by instructional time and opportunity; a frontal challenge to traditional tracking, streaming, and promotion systems; and an intensive connection and collaboration among all players within the education system in addressing student learning and success. It forced both thinking and practice out of the traditional square holes, and it gave the four power principles a whole new meaning and expanded scope of application.

Much of this approach is embodied in the cross-disciplinary outcomes of the national system in South Africa, several of the states or provinces in Australia and Canada, as well as numerous local districts in North America. Because of its developmental, interdisciplinary nature, however, it is fundamentally inconsistent with national and state policy emphases on content standards and time-based standardized testing.

**The future-focused path.** The third path represents an even more dramatic break from the small, square holes of time-based, curriculum-bound traditional educational practice. The future-focused path

emerged in the late 1980s as some leaders of the OBE movement took the notion of culminating demonstrations of learning to its logical limit, recognizing that real outcomes matter and occur after students have finished their formal educational experiences. In other words, authentic outcomes are only known after all of the instructional preparation is complete, and for graduates that means they will be played out in the future they face, not simply in the schooling they have had.

This transformational departure from the norm further elevated the notion of competence beyond education itself to the life and role performances in which individuals engage in their career, family, and community lives. Life, not school, is the real measure of an education's significance and impact, argued these future-focused proponents, and the design of outcomes and learning systems must begin precisely there: with the challenges and conditions that the constantly evolving future inevitably offers.

This future-focused approach to OBE both invited and challenged educators to look far beyond the curriculum and system structures in which they were currently immersed, to examine the kinds of performance abilities required of successful adults in this world, and to design and model their efforts on this dynamic and expansive template. Only then could they ensure that the education their students were getting was actually aligned with the realities and challenges they faced in a world of continuous discovery and constant change. In so doing, they would add a third critical dimension to the OBE learning model: content, competence, and context—the actual settings and conditions in which performance abilities are ultimately tested.

Without question this third role-performance conception of competence represents a radical departure from the standards-based models of reform that have taken such a powerful hold of education in the 2000s. It further expands the meaning, applications, and implications of OBE's four power principles, and it openly challenges the very paradigm on which the education systems of the past century are based.

### **The Future of OBE**

The enormous inertia that surrounds and pervades traditional education systems leaves the widespread implementation of authentic Outcome Based Education very much in doubt. Because they are under

enormous public pressure to show results, public systems will continue to advocate outcomes, but almost inevitably in a CBO format. Externally imposed accountability reforms will keep things constrained in small, rigid means holes, with educators compelled to find ways to engage and empower a very diverse population of learners within those inflexible constraints.

Consequently, in the early twenty-first century, trends suggest that true OBE may only survive in alternative settings—schools that are given the flexibility to meet the needs of nontraditional learners in ways that transcend the constraints and inflexibilities of traditional education as we have known it. Outcome Based Education is fundamentally about system change, but the forces of system inertia are prevailing in the accountability-driven world of the 2000s.

## OUTDOOR AND ENVIRONMENTAL EDUCATION

Outdoor education and environmental education are separate but closely related areas of study within the field of education. They share some common content and processes, although they are distinctive in other important ways. Various interpretations have appeared in the literature, but their original purposes have changed very little since their inception. This article will define the terms and show their relation to each other and to other related educational movements, describe their objectives and purposes, outline their commonly used instructional methods, briefly trace their historical development in the United States and abroad, discuss their status in American school curricula, and suggest several key issues, controversies, and trends.

### Defining Terms

The term *outdoor education* emerged in the early 1940s to describe the instructional use of natural and built areas to meet student learning objectives in a variety of subject-matter disciplines through direct experiences. This type of contextual learning involving the local surroundings has also been referred to as taking field trips, excursions, journeys, or doing field studies. During the late nineteenth century in the United States, some educators realized that taking students out of the classroom to teach appropriate concepts, skills, attitudes, and values could improve education. Some of the early outdoor educators used camp settings during the regular school year to meet academic objectives and to improve students' social development and leisure skills. Because outdoor education activities were usually tied closely to the school curriculum, the field has adapted to early-twenty-first century reforms affecting the broader educational field.

The term *environmental education* arose in the late 1960s in the United States as a result of a national social phenomenon called the environmental movement. The classic definition, developed by William B. Stapp and his graduate students, appeared originally in the 1969 issue of the *Journal of Environmental Education*: "Environmental education is aimed at producing a citizenry that is knowledgeable concerning the biophysical environment and its associated problems, aware of how to help solve these problems, and motivated to work toward their solution" (Hungerford et al., p. 34).

Although public concern for improving and preserving quality environments existed earlier when national parks were set aside, and windblown soil created the dust bowl of the 1930s, resource use or conservation education increased in the 1970s. Some historians point to Rachel Carson's book *Silent Spring*, published in 1962, as one event that helped to spawn the first Earth Day in April 1970. Spurred by federal legislation during the next several decades, environmental education expanded in public and private schools across the nation. Some critics accused educators of simply changing the names of their outdoor science, nature study, or outdoor education programs to environmental education but continuing the same programs as in the past. This practice of changing the names of these closely related fields in order to modernize the program content, methodology, or focus continues today.

Some of the practices in outdoor and environmental education programs do overlap. Although both fields are interdisciplinary, one difference is that outdoor education can be applied to any discipline that can be effectively taught and learned outside. For example, outdoor education could mean teaching the concept of an acre by measuring a playing field (mathematics); or visiting a park to write poetry or draw pictures inspired by the setting (language arts and art); or recording the information found in a cemetery to learn about past events (history); or testing the pH to determine if a nearby stream is acid or alkaline (science); or climbing a hill to calculate student heart rates (physical education). It could also mean visiting zoos, parks, museums, fire stations, factories, water treatment plants, or any other built environment to create more effective learning opportunities. Environmental education can take place outside as well as inside classrooms and take local as well as global perspectives, but the focus is usually on studying an issue such as water, air, and soil pollution; solid waste and toxic disposal; urban sprawl and population; deforestation; endangered plants and animals; or drought and flooding, especially at upper grade levels. The line separating the two fields is blurred when teachers take students outside to study nature awareness and culture's impact on ecosystems. It makes little sense to argue over which label to apply to these kinds of outdoor lessons when their purposes blend.

### Objectives and Purposes

The definitions of these fields reveal several similarities and differences. Simply stated, outdoor educa-

tion programs are designed to help make the learning of certain knowledge more effective through firsthand experiences outside the school. According to Lloyd B. Sharp (1895–1963), outdoor education pioneer, a key principle is “that which ought and can best be taught inside the schoolrooms should there be taught, and that which can best be learned through experience dealing directly with native materials and life situations outside the school should there be learned” (Knapp 1996, p. 77). Most environmental education programs are designed to prepare students to investigate environmental problems. The question of whether or not students should try to resolve these problems is controversial. Gregory A. Smith (2001) and others critique this debate in detail. Although both fields advocate the use of broad subject-matter content, environmental education is generally taught within the social studies and/or sciences at the upper grades. At elementary levels activities usually span more of the academic curriculum and also incorporate social and recreational objectives leading to teamwork, cooperative and service learning, citizenship skills, and lifelong outdoor pastimes. Nature awareness activities can be justified at all levels as integral aspects of both fields. One indication that these are distinct fields of study can be found in the organizational structure of the U.S. Department of Education's Educational Resources Information Center (ERIC) system. Across the country there are sixteen information clearinghouses covering the field of education. Outdoor education informational services are offered through the Clearinghouse for Rural Education and Small Schools (CRESS), and environmental education informational services are offered through the Clearinghouse for Science, Mathematics, and Environmental Education (CSMEE). Each clearinghouse is responsible for collecting and disseminating a wide variety of educational resources in their assigned areas, although some overlap does occur. The CRESS center also has assumed the responsibility for collecting information from adventure or experiential education, another similar but distinctive field.

### Instructional Methods

Although both outdoor education and environmental education are offered mainly through schools, nature centers, and outdoor residential facilities, the instructional methodologies are selected from the general field of education. Environmental and outdoor educators primarily advocate experiential

(hands-on) learning strategies. Although both fields draw from conventional instructional technologies, such as textbooks, periodicals, computers, videos, and overhead transparencies, these educators stress the importance of contextual, direct, and unmediated experiences used in problem-based learning situations. They want their students to use a variety of senses in exploring the content to maximize active learning.

### **History and Status in the United States and Abroad**

Both fields are considered as innovative, educational reforms designed to accomplish specific objectives that are not being met effectively by traditional practices. Although the idea of using direct experiences existed for hundreds of years in Europe (e.g., the Czech theologian and educator Johann Comenius [1592–1670], the French philosopher and author Jean-Jacques Rousseau [1712–1778], and the Swiss educational reformer Johann Pestalozzi [1746–1827]), little was written in the professional literature. Beginning in the early 1900s the American nature study and camping movements gained momentum. Their purposes were to expand the students' cognitive and affective connections with basic processes, such as obtaining food, shelter, recreation, spiritual inspiration, and other life needs. These nature contacts countered the negative effects of increased urbanization and more complex technologies. Attempts were made to make learning conditions more active and less passive, more closely linked with community activities and less abstract, and more focused on practical knowledge for immediate social use rather than only for the future. These and other goals were incorporated into the Progressive education movement, which was introduced in some U.S. schools during the first half of the twentieth century. The American philosopher, psychologist, and educator John Dewey's Laboratory School, operating in Chicago from 1896 to 1904, exemplified this Progressive philosophy. As Progressivism began to wane in the public schools in the 1940s and 1950s, outdoor education gained in importance. American outdoor education reformers looked to Germany, Britain, Australia, South Africa, British Honduras, and Scandinavia for program models. Because many outdoor educators saw the value of immersion-type programs, camp settings were used in the beginning. Lloyd B. Sharp, who earned his doctorate at Columbia University in 1930, was instrumental in estab-

lishing leadership programs for many future outdoor educators in 1940. As residential outdoor education programs grew throughout the nation (mainly in Texas, Indiana, Illinois, California, Washington, Michigan, Ohio, Georgia, New York, and New Jersey), the field flourished. During the late 1940s and early 1950s selected colleges and universities established camping and outdoor education courses to prepare teachers. Another key leadership development occurred in Michigan when the W. K. Kellogg Foundation pioneered community school camps in 1940 and supported further experimentation over the next few decades. Julian Smith (1901–1975), a Michigan administrator, was also influential as a pioneer outdoor educator. Additional support for outdoor education was given through state departments of conservation and education, as well as national educational agencies, professional teacher organizations, and other nongovernmental groups.

By the late 1960s conservation education was also contributing to the outdoor experiences and knowledge of many American and Canadian youth through federal, state, and provincial conservation agencies, although it maintained its largely rural focus. In the U.S. the funding of the Elementary and Secondary Education Act in 1965 led to many innovative outdoor-related programs. The stage was now set for the emergence of environmental education. The U.S. Department of Health Education and Welfare established an office of environmental education in 1968. In 1971 the National Association for Environmental Education (later the North American Association for Environmental Education) was formed to serve as one of the leading professional organizations. From then on, environmental education received federal, state, and local support to promote education about the many complex interrelations between culture and ecosystems. Because of the politics of environmental decision making, the field has faced numerous controversies. Some debates have centered on questions such as: What is the correct definition and purpose of environmental education? Should the curriculum include environmental values and ethics as well as ecological and economic concepts and skills? What is the role of student action projects in remedying environmental problems? What is the proper role for teachers in conducting lessons about the environment? At what ages should students be introduced to environmental problems? What types of educational experiences should urban, suburban, and rural youth receive?

What kinds of technologies can slow ecological destruction?

### Issues and Trends

Some of the issues facing outdoor and environmental educators have already been suggested. Because of the politics inherent in many educational and environmental decisions, the field of outdoor and environmental education has never been static. Educators continually devise better ways to define and refine their philosophies and practices. One way to accomplish this has been to change the names of the fields and redesign their theories and practices. Some early-twenty-first century terms include earth education, bioregional education, Expeditionary Learning Outward Bound, use of the environment as an integrating context for learning, ecological education, nature awareness, locally focused teaching, and place-based education. The more than sixty labels for educational movements related to the outdoors and the environment demonstrate the importance and vitality of the fields. One promising development has been the identification of an eighth category of human multiple intelligences by Harvard professor Howard Gardner—the *naturalist intelligence*. This way of demonstrating expertise in recognizing and classifying the flora, fauna, and other physical and cultural artifacts is important because it provides another justification for integrating outdoor and environmental education into curriculum and instruction.

### Summary

Outdoor education has served as a significant educational reform since the early 1940s by promoting the use of outdoor learning settings. When environmental education emerged in the 1970s, it focused more directly on knowledge leading to quality local and global environments. Their forerunners—camping, nature study, conservation, and adventure education—paved the way for early school and community leaders to develop experiential programs aimed at living well on earth though understanding how it works.

## OUT-OF-SCHOOL INFLUENCES AND ACADEMIC SUCCESS

From birth to age eighteen, children spend just a fraction of their lives in school. Thus it is not surprising that many factors outside the school environment can significantly influence students' prospects for academic success in school. These factors are in play both during the years before children begin formal schooling and while they are actually enrolled in elementary and secondary school.

A diverse array of issues, including (but not limited to) parents' beliefs and expectations about education; the availability and quality of child care; family economic status; the persistence, or absence, of violence in a child's life; access to social services; physical and mental health issues; opportunities for constructive, healthy activities outside of school; and the nature and strength of school-community connections, can make a difference in a child's opportunities to do well in school.

### Background

Much of the work concerning out-of-school influences on students' prospects for academic success

stems from James Coleman's 1966 study of racial and ethnic segregation, student and family characteristics, and student achievement. In *Equality of Educational Opportunity* (1966), prepared for the United States Department of Education, Coleman found that family factors such as household composition, socioeconomic status, and parents' level of education were stronger predictors of students' educational attainment than were direct school-related factors.

The Coleman study gave rise to decades of research and writing, particularly in the 1970s and 1980s, on so-called family effects on students' academic achievement. These studies generally concluded that the factors Coleman identified do exert enormous influence on students' achievement, though they are not necessarily deterministic of it. Students who come from backgrounds that would seem to doom them to school failure often find a way to beat the odds and achieve at high academic levels. And some students who hail from seemingly ideal life situations never thrive academically.

During the 1990s, as the United States education system was focused intensely on raising academic achievement across the board under the banner "All Students Can Learn," many educators, researchers, and policymakers began to adopt the *no excuses* philosophy. Regardless of a child's life circumstances, they asserted, an effective education environment can overcome other challenges and enable all children to achieve at high levels.

As is the case with most complicated issues, both points of view have considerable merit. All (or nearly all) students can learn. But the circumstances of a child's life, the social indicators that paint a cumulative picture of a child's total environment, are important signposts pinpointing conditions that either make learning possible or present challenges that must be overcome to pave the way for learning.

### Parental Influence

A commonly used phrase, but one that has the ring of substantial truth, is that parents are their children's first teachers. The home environment shapes a child's initial views of learning. Parents' beliefs, expectations, and attitudes about education and their children's achievement have a profound early impact on students' conceptions of the place of education in their lives. What parents think about the importance (or unimportance) of doing well in

school is often mirrored in student results. A study by the Metropolitan Life Insurance Company found that nearly all students (97%) who earned mostly A's and B's on their report cards reported that their parents encouraged them to do well in school. Among students who earned mostly C's, nearly half (49%) said they received little parental encouragement.

Some families clearly have more resources to devote to their children and can more easily find time to spend nurturing and encouraging them. When both parents work (an increasingly common phenomenon) or when a child is being raised by a single parent, finding time to read to the child, to encourage the completion of homework, or to participate in school functions—all known to have a salutary effect on student success in school—become more difficult. The problem is often compounded for parents who speak limited or no English.

However, regardless of family composition or circumstance, the research is clear. Children whose families provide supervision and support, and who have aspirations for their children, tend to multiply those children's chances of being successful students.

### **Family Economic Status**

Many children grow up in homes with an abundance of fiscal and material resources. But not all do. As of 1998, 13 million children in the United States (19% of children age eighteen or younger) lived below the federally established poverty line. Children eighteen and under make up just 26 percent of the total U.S. population, but they represent 40 percent of the population living in poverty. Stated more starkly, the United States, the richest nation in the world, ranks highest in childhood poverty among all the industrialized nations of the world.

Poverty takes a toll on students' school performance. Poor children are twice as likely as their more affluent counterparts to repeat a grade; to be suspended, expelled, or drop out of high school; and to be placed in special education classes.

Family composition and economic circumstance are often intertwined. More than half of the poor families in the United States are headed by an unmarried mother who must balance employment issues (these women are often trapped in low-wage jobs) with child care and parenting responsibilities. In sum, children from more economically affluent home circumstances have a leg up in many areas of life, including education.

### **Preparing for School**

Children begin learning from the time they are born. Where children spend their time before they enter kindergarten has an effect on both their readiness for school and their chances for good long-term achievement results.

Six in ten children in the United States, or nearly 12 million children younger than age five, spend part of their waking hours being cared for by someone other than their parents. There are a variety of care circumstances. Sometimes young children are looked after by a relative, such as a grandmother or an aunt. Some young children spend part of their day in the care of a licensed provider who may watch over several children at the same time. Some preschoolers attend organized preschool or early childhood education programs.

Studies show that early childhood care and education make a difference. The quality of care young children receive establishes the foundation for their future academic success. Young children who are exposed to high-quality care settings, geared to their social, emotional, and intellectual development, exhibit better language and mathematics skills, better cognitive and social skills, and better relationships with classmates than do children in low-quality care.

The nature of quality of early care has been shown to have lasting impacts. Children in high-quality care environments are less likely than children in low-quality care circumstances to repeat a grade, require special education services, drop out of school, or find themselves in future trouble with the law.

For many families, the child-care issue revolves around two central concerns: cost and access. Even if quality care is available, many families cannot afford to pay for it. And for many families, quality care is simply not available.

### **Physical and Mental Health**

Overall, children's health improved substantially during the last decades of the twentieth century. Infant mortality rates went down, and many childhood diseases once thought incurable attained high cure rates or became preventable altogether.

Health—both physical and mental well-being—has obvious links to students' prospects for doing well in school. Children who are physically ill fail to attend school regularly, and when they do attend they are often unable to focus on their schoolwork.

Children with untreated mental health problems experience a range of school-related difficulties, from acting-out behavior in the classroom to an inability to make friends and develop collegial attachments.

Research shows that attention to children's health is important even before a child is born. Low-birthweight babies, often born to mothers who smoke, drink, or eat unhealthy diets during pregnancy, are at greater risk of becoming children with a host of developmental difficulties.

Despite the compelling importance of robust physical and mental health to students' prospects for academic success, large numbers of American children have inadequate access to appropriate health care services. Not surprisingly, access to quality services is often a function of family income. The less financially stable the child's family, the less likely the child is to have regular medical care.

Children covered by health insurance are more likely to have better access to health care than are children not covered by such insurance. As of 1999, 10 million children in the United States (14% of the child population) were uninsured.

Other significant risk factors, particularly for adolescents, are drugs and alcohol. Drinking, smoking cigarettes, and using harder drugs, from marijuana to cocaine, can cause substantial long-term physical and mental health problems. In the short-term, use of many of these substances can cause reduced school attendance and general inattention to school studies.

### **The Impact of Violence**

Violence in children's lives can come in many forms. Sometimes it is violence children witness, such as violence between their parents or caregivers, or violence in the communities in which they live. Sometimes children themselves are the victims of violence, whether it be abuse by a parent or relative, or physical (or verbal) attacks in their neighborhoods. These kinds of violence have long-term impacts on children, affecting their expectations about life and their views of the world.

Violence outside of school can shape students' attitudes about school. A child surrounded by a violent environment who does not expect to live to adulthood may see little purpose in completing an education. Violence in the home increases the likelihood that a student will spend at least part of childhood and/or adolescence in the child protective

services system, perhaps in foster care. For children who live with violence, the situation is quite often just one of a constellation of challenging circumstances. Violence is often a partner to poverty and an unstable home life.

One of the most prevalent contemporary milieus for youth violence is gangs. Gang activity exists in all fifty states. Membership in gangs—often seen by adolescents as a kind of badge of honor or admission to a privileged club—increases the likelihood of involvement in criminal activities. Effective anti-gang programs have been shown to include intervention by police and officers of the juvenile justice system, family and youth education programs, and providing alternative outlets for youths' time and energy.

An important research finding is that gang activity, or at least attraction to it, begins early. As early as the third or fourth grade, students (particularly boys) can be lured into believing that becoming a member of a gang is an important social goal. Thus, programs to prevent students from joining gangs need to begin in elementary school.

### **Out-of-School Activities: Recreation and Employment**

How students spend their time when they are not in school can have a significant impact on their opportunity to succeed in school.

**Youth organizations.** Research suggests that participation in various kinds of youth organizations contributes to better behavior in school, improved social skills, more self-confidence, and higher academic expectations. Organizations such as the YMCA and YWCA, Boys and Girls Clubs, 4-H, and Boy Scouts and Girl Scouts often provide academic support as a complement to activities designed to foster social and emotional development. Athletic programs, such as Little League and those organized by local recreation and parks departments, offer healthy outlets for children's and adolescents' energy, while also building skills such as personal responsibility and teamwork.

Mentoring relationships can ensure that a caring adult is part of a child's life, and they have been shown to offer important benefits. Research has shown that programs such as the Big Brothers and Big Sisters of America contribute to lower rates of drug and alcohol use, reduced violence, and better school attendance, performance, and attitudes.

**Youth employment.** As many as 76 percent of youth in the United States are working, or have worked, in paid employment by age sixteen. Researchers differ regarding the impact of work on adolescents' academic achievement. Some studies conclude that work provides students with useful skills and attributes, among them instilling a sense of responsibility and heightening students' sense of self-efficacy, and that these have a positive spillover effect in school. However, other research concludes that work is just a distraction for most students, in that it competes with school for students' time and attention.

Of course, students work for different reasons. Some students are significant breadwinners for their families. Their earnings represent an important part of the families' income. Some students work specifically to save money for college. Most studies, however, show that the vast majority of students who work do so to earn spending money for things they want to buy.

Research has shown that the amount of time a student works is a factor in determining employment's impact on educational performance. For students working twenty or fewer hours per week, few problems seem to arise. But for students working more than twenty hours per week, work can present education-related problems where the job takes precedence over school.

### Connecting Schools, Families, and Neighborhoods

For most students, school creates an important community setting—a safe place where time is structured (which children and teens do crave, even if they do not always appreciate it) and friends are present. Families and neighborhoods complete a student's community, and consciously connecting schools, families, and neighborhoods offers significant advantages for students, particularly those at academic risk.

Students who are struggling in school are often plagued by a host of problems outside of school. Offering students the best opportunity to succeed in school may require helping not just the student, but also treating the student's entire family.

Among the systems devised for this purpose are school-linked and school-based programs of social services. The goal of these programs is to directly connect family support services—such as health care, income support, English language acquisition,

and job training—with schools as a way of increasing families' access to these services. Located either on school grounds (school-based) or nearby in the surrounding neighborhood (school-linked), these efforts foster partnerships between schools and social services agencies, ideally giving each a chance to do what it does best.

Despite the promise of such programs, they have not been problem-free. Difficulties arise around allocation of resources, turf (who is in charge of what?), and misunderstandings about the roles and responsibilities of various involved professionals. Research has shown that for school-based or school-linked programs to produce the desired results, social services need not just to be linked to schools, but must be integrated into schools' activities and functions, creating new pressures for schools regarding what they are expected to do and under what circumstances. Whatever kind of program is employed, what is important is for services to reach students and their families so that education can be a student's primary responsibility.

### Conclusion

Schools do not exist in a vacuum. A host of factors contribute to students' prospects for academic success. Some students come to school with all they need: stable and supportive families, adequate financial resources, and good health. For students who do not enjoy these advantages, making provision to help them meet outside-of-school challenges can provide just the boost they need to succeed in school.

## PAIDEIA PROGRAM

---

In 1982 a group of scholars and educators headed by philosopher Mortimer Adler published *The Paideia Proposal*, and it is difficult to name a leading educational reform program since that has not been directly or indirectly influenced by Paideia principles. *Paideia* is the Greek word for the nurturing of children, and the Paideia Group was dedicated to providing a powerful public education for all. In the years immediately following the proposal, Adler and the original Paideia Group published two more books—*Paideia Problems and Possibilities* (1983) and *The Paideia Program* (1984)—intended in part to answer practical questions about program implementation. The National Paideia Center was established at the University of North Carolina in 1988, and in 1992 began working in close, classroom-based partnership with schools. By the year 2000 the center was working with well over a hundred schools in over a dozen states, and the list was growing continually. Paideia has grown steadily since the early 1990s for several reasons.

The first reason is that the original Paideia principles have appealed to many as a powerful condensation of the best thinking about public education. Adler focused on the profound connection between school reform and the United States as a functional democracy. The Paideia philosophy stated a litany of principles that in 1982 seemed radical but by 1995 had become accepted wisdom. Such principles as “all

children can learn” and “therefore they deserve the same quality, not just quantity, of education,” anticipated many of the later American reform movements, and documented Paideia’s origin in a philosophy of human development.

The second reason why interest in Paideia has continued to grow rapidly is that the program marries a fundamentally conservative idea, the beneficial rigors of a classical education, and a fundamentally liberal one, inclusive teaching and learning practices. These seemingly contradictory ideas—intellectual rigor and equal access to a quality education—are the bedrock upon which successful Paideia schools have been built.

Perhaps the most important reason for Paideia’s steady growth is that the program includes all subjects and embraces important curriculum from diverse cultures. Increasingly, the National Paideia Center has provided schools with curricular information on how to use Paideia instructional techniques in mathematics, science, music, literature, writing, and physical education—all the subjects in a strong core curriculum. In addition, the center has broadened the use of the term *classical* to include the study of texts by African Americans, Hispanics, Asians, and representatives of other cultures.

### Implementing the Paideia Program

The recent work of the National Paideia Center is based on a mix of teaching strategies called the “three columns” of teaching. They are made up of the didactic instruction of curricular information, intellectual coaching of the skills necessary to manipulate and apply information, and seminar discussion of the ideas and values inherent to that information. Paideia does not require a specific cur-

riculum, but rather provides a system for fostering student engagement with the standard curriculum of a state or district. In contrast to the heavy use of teacher-centered, didactic instruction characterizing traditional American schools, the Paideia program focuses on limiting didactic instruction to less than 15 percent of classroom time and devoting the remaining 85 to 90 percent to increased student learning activity.

Typically, in the first year of partnership with the center, a school focuses on implementing the Paideia seminar schoolwide. The Paideia seminar is a formal discussion of a text in which the leader of the seminar (the teacher) simply asks open-ended questions, leaving it up to the students to generate a dialogue about the ideas and values inherent to the text. (The text may be a map or historical document, a chart or skeleton, a math problem or a poem, a photograph or painting.) In this way, students are brought into active engagement with the conceptual framework behind the curriculum.

In the second year of implementation, Paideia schools focus on implementing the Paideia-coached project, revising traditional units of study in each classroom to make them much more product-oriented, resulting both in more authentic assessment and active student learning. "Product-oriented" means that most or all student work is produced for an authentic audience (parents or other community members) and will be assessed by that audience. Typically, this phase of Paideia implementation takes several years as teachers move from teaching a few units each year as coached projects to developing an entire curriculum based on the production of real work for authentic audiences. In the third year of partnership with the center, most Paideia schools implement more student-centered assessment practices in the classroom, and the entire school community develops a cyclical plan for continuous improvement.

Detailed program evaluations, notably one comprehensive study by the Center for Research and Evaluation at the University of North Carolina at Greensboro, have shown that Paideia schools consistently produce a greater increase in standardized test scores for all students than do non-Paideia schools. In addition, Paideia schools consistently show an improved school climate, including a more inviting environment for minority students.

The eventual goal of the Paideia program is schools that offer every student access to a rigorous

education. To accomplish this goal, the Paideia program prescribes schools that are themselves communities of thought, where adults and students alike focus on the skills and attitudes of lifelong learning and continuous improvement.

#### PALMER, ALICE FREEMAN (1855–1902)

The first female college president and the first president of Wellesley College, Alice Freeman Palmer was the founding dean of women at the University of Chicago.

Born on a farm in mid-state New York, Palmer grew up with the rural expectation that women would work hard to help support their families. At age fifteen she surprised her parents by announcing that she intended to go to college. She was already engaged to the only college graduate she had ever met, a teacher at the local academy where she was a star student, and when he discouraged her plans she broke the engagement. A college education, she insisted to all opponents, would best prepare her to serve others and to earn money by teaching. Palmer matriculated at the University of Michigan in 1872,

two years after the university was first forced to admit women. During and after college she took a variety of teaching positions, and a year after graduation she became her family's primary support when her father went bankrupt.

In 1879 Palmer accepted a position as professor of history at Wellesley College, which had opened four years earlier with an all-female faculty. Wellesley's founder, Henry Durant, was greatly impressed by Palmer's intellectual abilities, charismatic leadership, and persistent yet charming personality. She became his protégé, and when he died in 1882 the trustees appointed her president even though, at age twenty-seven, she was the youngest member of the faculty.

Palmer soon gained a national reputation as a promoter of women's higher education. She strengthened Wellesley's faculty, student body, and financial status, established a network of secondary schools to prepare girls for college work, and insisted that Wellesley pursue high intellectual standards. College education, she argued at every opportunity, prepares women for civic leadership as well as self-knowledge and self-respect. She expected many of her students to support themselves, as she had. The rest she expected to lead libraries and museums, serve on school boards and town governments, and pursue other forms of civic service.

In 1887 Palmer shocked her colleagues by marrying George Herbert Palmer, a professor of philosophy at Harvard University, and resigning from Wellesley's presidency. She spent the next year recovering from her active tuberculosis, and then renewed her career as a public speaker. For the next four years she toured the country to preach the importance of women's higher education to university audiences, women's clubs, religious societies, and anyone else who would pay her. A powerful and passionate speaker, she presented herself as a model of an educated woman: intellectual yet emotional, dedicated to serving others yet happy in her personal life, willing to work hard for causes she believed in, yet retaining the feminine graces of beauty, wit, and attentiveness to others. Many people still believed that education de-sexed women, and Palmer intended to prove them wrong.

Palmer also joined the Massachusetts State Board of Education, eventually becoming its most senior member, and gained a reputation as a formidable lobbyist on Beacon Hill. She served as a trustee

for several educational institutions, including Wellesley College, was active in several education-oriented voluntary associations, including the forerunner of the American Association of University Women, and was one of five people chosen to represent Massachusetts at the 1893 World's Fair. With her husband, George Palmer, she tried to persuade Harvard to admit women on equal terms with men. After she led a campaign to create a \$250,000 endowment for female students, Harvard reneged on its agreement to admit women if the money were raised.

In 1892, when the University of Chicago was preparing to open, Palmer was the most prominent woman in the field of higher education. Chicago was then a rough western city, and the university's president, William Rainey Harper, feared that parents would refuse to send their daughters to a new university in a city best known for its stockyards. If Palmer were dean of women, Harper believed, her reputation would help give the young university the stamp of approval it desperately needed. He hoped to hire both Palmers—George as well as Alice—but when George decided to remain at Harvard, Harper continued to court Alice persistently. Finally she agreed to his suggestion that she commute from Cambridge to Chicago and be in residence only twelve weeks a year.

Palmer was one of the few Chicago founders with solid administrative experience, so she quickly became involved in every aspect of the new university. Harper repeatedly claimed that he would not have survived the university's first year without her. Palmer gave special attention, however, to making the university an appealing intellectual and social environment for women. She succeeded. When Chicago opened, women were 24 percent of its student body. The next year they were 33 percent, and the percentage climbed each year until 1898, when 43 percent of the students were women. Many male students, faculty, administrators, trustees, and donors—including Harper—were alarmed by this trend, which they interpreted as the "feminization" of the university, and university policies quickly shifted to attract men and discourage women. Palmer, not surprisingly, was marginalized and her policy suggestions ignored. After three years she decided to resign.

Palmer never again held a paid, professional position. Instead, she gave all of her time to the Massachusetts Board of Education, the numerous insti-

tutions of which she was trustee, and other cultural and political activities. She always, even during her Wellesley years, preferred coeducation to single-sex education. Men and women, she believed, belonged beside each other, working and learning together as peers. After her experiences at Harvard and Chicago, however, she lost her early optimism that men needed only a few years of adjustment and then would be happy to treat women as equals. For the rest of her life, she nurtured institutions—schools, colleges, and scholarships for advanced graduate work—that would enable other women to pursue education and professional work.

## PARENTAL INVOLVEMENT IN EDUCATION

---

Although widespread support for parental involvement is reflected in current educational policies and practices, what this means is not always clear. Parental involvement includes a wide range of behaviors but generally refers to parents' and family members' use and investment of resources in their children's schooling. These investments can take place in or outside of school, with the intention of improving

children's learning. Parental involvement at home can include activities such as discussions about school, helping with homework, and reading with children. Involvement at school may include parents volunteering in the classroom, attending workshops, or attending school plays and sporting events.

### Research on Parental Involvement

Research on the effects of parental involvement has shown a consistent, positive relationship between parents' engagement in their children's education and student outcomes. Studies have also shown that parental involvement is associated with student outcomes such as lower dropout and truancy rates. Whether or not parental involvement can improve student outcomes is no longer in question.

Researchers have begun to focus on how parental involvement affects students, why parents do and do not get involved in their children's education, and what role schools and teachers can play in creating parental involvement. Three frameworks for exploring the precursors to and effects of parental involvement have been the foundation of a majority of the research on parental involvement. Each approach highlights a different aspect of the dynamics that exist in school-home-community relationships.

Wendy S. Grolnick and her colleagues, in articles published in 1994 and 1997, conceptualized three dimensions of parental involvement based on how parent-child interactions affect students' schooling and motivation. Behavioral involvement refers to parents' public actions representing their interest in their child's education, such as attending an open house or volunteering at the school. Personal involvement includes parent-child interactions that communicate positive attitudes about school and the importance of education to the child. Cognitive/intellectual involvement refers to behaviors that promote children's skill development and knowledge, such as reading books and going to museums. Parental involvement, according to this theory, affects student achievement because these interactions affect students' motivation, their sense of competence, and the belief that they have control over their success in school.

Kathleen V. Hoover-Dempsey and Howard M. Sandler, in articles published in 1995 and 1997, defined parental involvement broadly to include home-based activities (e.g., helping with homework, discussing school events or courses) and school-

based activities (e.g., volunteering at school, coming to school events). They argued that parental involvement is a function of a parent's beliefs about parental roles and responsibilities, a parent's sense that she can help her children succeed in school, and the opportunities for involvement provided by the school or teacher. In this theory, when parents get involved, children's schooling is affected through their acquisition of knowledge, skills, and an increased sense of confidence that they can succeed in school.

Joyce L. Epstein, in a 1995 article and a 2001 book titled *School, Family, and Community Partnerships*, argued that school, family, and community are important "spheres of influence" on children's development and that a child's educational development is enhanced when these three environments work collaboratively toward shared goals. Epstein encouraged schools to create greater "overlap" between the school, home, and community through the implementation of activities across six types of involvement: parenting, communication, volunteering, learning at home, decision-making, and collaboration with the community. By implementing activities across all six types of involvement, educators can help improve student achievement and experiences in school.

### Effects on Parental Involvement

Research has shown that student and family characteristics affect levels of parental involvement. Working-class families and families in which mothers work full-time tend to be less involved in their children's education. Also, parents of elementary school students tend to be more involved in their children's education than parents of older students. Other factors, however, have been shown to be more important predictors of parental involvement than family income or structure.

Schools play a significant role in getting parents and family members involved in students' education. In their study published in the 1993 book *Families and Schools in a Pluralistic Society*, Susan L. Dauber and Joyce L. Epstein found that school and teacher practices were the strongest predictors of parental involvement. Specific practices that have been shown to predict parental involvement include: assigning homework designed to increase student-parent interactions, holding workshops for families, and communicating to parents about their children's education.

Parental beliefs and perceptions have also been shown to be a strong predictor of parental involvement. Parents' educational aspirations and level of comfort with the school and staff have been shown to predict levels of involvement. In addition, parents' beliefs about their responsibilities as a parent, their ability to affect their children's education, and their perceptions of their children's interests in school subjects have been shown to predict their involvement at home and at school.

### Obstacles to Parental Involvement

Important obstacles that constrain parents' ability to become actively involved in their children's education include teachers' attitudes and family resources. These obstacles, however, can be overcome by schools and through teacher training. Each is discussed below.

Teacher attitudes may be one obstacle to parental involvement. For example, teacher beliefs about the impact of their efforts to involve parents in students' learning predict their efforts to encourage family involvement. In a study published in 1991, Epstein and Dauber found that, compared to middle school teachers, elementary school teachers more strongly believed that parental involvement is important for students and provide more opportunities and help for parents to be involved in their children's education. Low levels of parental involvement at some schools may be the result of the staff's perceptions of parents or the degree to which they feel parental involvement is important for their students.

Although all families want their children to succeed in school, not all families have the same resources or opportunities to be involved in their children's education. Families in which all caregivers work full-time, where there are multiple children, or where English is not spoken or read well face significant barriers to participation in their children's education. It is important for schools to understand the demands that exist on the families of their students and to work to overcome them. In her 1995 article Epstein argued that schools need to overcome these challenges by providing opportunities for school-to-home and home-to-school communications with families; providing communications to families in a language and at a reading level all families can understand; ensuring adequate representation of the entire community of parents on school advisory committees; and distributing information provided at workshops to the families who could not attend.

Schools that work to meet these challenges and try to make involvement easier and more convenient for all families will gain support from parents and improve student achievement.

One approach to overcoming these obstacles to parental involvement is to increase the degree to which teacher training covers the topic of parental involvement. Teacher-training programs spend very little time helping students understand the impact of parents in student learning and how teachers can help parents become involved in their children's education. Without this training, teachers may not understand the importance of parental involvement or how to facilitate it. As a result, working with parents can become one of the greatest challenges faced by new teachers.

### Controversies

In spite of the evidence to suggest parental involvement can help improve student achievement and educational attainment, many are skeptical of parent-involvement programs. Michelle Fine, in a 1993 article, and Annette Lareau, in her 1989 book *Home Advantage*, raise concerns about the widespread implementation of parent-involvement policy and practices. Their concern about the effect of parent involvement programs stems from their observations that many schools and teachers use a "one-size-fits-all" approach. The result is that schools reinforce white, upper- and middle-class values and disadvantage students from other backgrounds.

Research has shown differences in parental involvement, parental beliefs, and the home-school relationship across socioeconomic, ethnic, and racial groups. The existence of different beliefs between parents and teachers can lead to misperceptions and the development of negative home-school relationships. Whether and how parent-involvement programs can be sensitive and equitable to families from all backgrounds remains an issue of discussion.

### Current Issues

An area of research on parental involvement emerging in the late 1990s and early twenty-first century is the systematic examination of the role of community. Mavis G. Sanders, in an article published in 2001, reported that schools have a wide range of community resources available but use only a small percentage of these in their efforts to educate students. Also, Sophia Catsambis and Andrew Beveridge, in a 2001 article, showed that neighborhood

conditions can dilute the effect of parental involvement and argued that this has an indirect effect on student achievement. The full role of community, and its impact on schools and families, is still unclear.

Understanding parental involvement as a developmental phenomenon is also emerging as an important issue. Research is needed to understand the most appropriate forms of involvement given students' age and maturation. Although parental involvement is an important influence on students throughout their schooling, effective elementary school parent-involvement activities may not be appropriate with high school students. Related to this issue, schools need to understand how parent-involvement activities can help students and families successfully transition from one level of schooling to another. Understanding the influences and effects of parental involvement and different forms of involvement as students move through school remains an understudied process.

The importance of having parents and family members support students' efforts in school is well known and well documented. Research shows a positive connection between parental involvement and student achievement. Furthermore, when schools and teachers work to involve parents, studies show that they can increase student achievement. Concern that schools may not be reaching out to all families and that they may not be aware of how families from different cultures perceive schools and school staff have raised questions about the effects of parental involvement for some students. Nevertheless, it appears that when schools reach out, understand the needs of all families, and create parental involvement, children are more likely to experience success in school.

## OVERVIEW

The study of parenting and its impact on children and adolescents has long been a central concern to scholars interested in child development and education. Although some contemporary commentators have suggested that social scientists have overestimated the influence of parents on their children's development and have underemphasized the importance of genetic factors and forces outside the family, most experts continue to believe that children's emotional, cognitive, and behavioral development is profoundly affected by the ways in which their parents have raised them.

This confidence in parental influence notwithstanding, it is important to note that much research on parenting and child development, which tends to be correlational in nature, leaves open the question of causal direction. The observation that children with certain characteristics are more likely than not to come from parents who engage in certain ways of parenting can be accounted for with a variety of explanations, of which parental influence is just one. Consider, for example, the commonly observed correlation between parental harshness and childhood aggression. Although it is reasonable to suggest that this observation reflects the fact that parental hostility creates aggressive children, it is also reasonable to suppose that parents are influenced by their children (i.e., that aggressive children elicit harsh parenting), that other environmental or genetic factors influence both parents and children in certain directions (e.g., that poverty makes parents harsh and children aggressive, or that harsh parents and aggressive children share a genetic predisposition for violence).

Researchers interested in disentangling these different accounts have generally followed one of three approaches. First, through the use of longitudinal designs, researchers have studied the links be-

tween parenting and child adjustment over time, examining whether certain types of parenting precede, rather than simply accompany or follow from, the emergence of certain child characteristics. Second, in studies of animals, researchers have been able to randomly assign infants and juveniles to rearing environments in which adults vary in their parenting practices, and by doing so, scientists have been able to examine the impact of variations in parenting on adjustment through experimentation. Finally, a number of investigators have studied the impact of parent-focused interventions on child adjustment. In these studies, parents' behavior is changed through some sort of psychoeducational treatment, and any resultant change in child adjustment is examined in relation to the parenting intervention. All three designs (longitudinal, experimental, and interventional) have buttressed the findings from correlational work.

Parenting, of course, encompasses many different phenomena. Nancy Darling and Laurence Steinberg (1993) have suggested that researchers distinguish between parenting style and parenting practices. They define *parenting style* as a constellation of attitudes toward the child communicated to the child by the parent, that taken together create an emotional climate in which the parent's behaviors are expressed. These behaviors include both the specific, goal-directed behaviors through which parents perform their parental duties (what Darling and Steinberg refer to as *parenting practices*) as well as non-goal-directed parental behaviors, such as gestures, changes in tone of voice, or the spontaneous expression of emotion. The focus of the current entry is on parenting style. Information on specific parenting practices, especially those related to parenting practices designed to influence educational achievement, may be found in other entries.

### Dimensional Approaches to Research on Parenting

Whether through correlational, longitudinal, or experimental designs, research on parenting style and its impact has traditionally followed one of two approaches. In the *dimensional* approach, researchers isolate critical dimensions of parenting along which parents differ and examine the relations between variability on one or more of these dimensions and variability in one or more child outcomes. The most frequently studied dimensions of parenting have been warmth (sometimes referred to as acceptance

or responsiveness), firmness (sometimes referred to as demandingness or behavioral control), and restrictiveness (sometimes referred to as intrusiveness or psychological control). Four broad sets of child adjustment indicators have been examined in relation to each of these dimensions of parenting: psychosocial development (including social competence, self-conceptions, and self-reliance); school achievement (including school performance, school engagement, and academic motivation); internalized distress (including depression, anxiety, and psychosomatic problems); and problem behavior (including delinquency, aggression, and drug and alcohol use).

Generally speaking, research shows that children and adolescents fare better when their parents are warm, firm, and nonrestrictive. Although variability in parental warmth has been associated with variability in all four areas of child adjustment listed in the preceding paragraph, it appears that variations in parents' firmness and restrictiveness contribute relatively more to some aspects of children's development than to others. In general, variations in firmness are linked most strongly to variations in problem behavior (with children whose parents are low in firmness exhibiting more problem behavior than their more vigilantly reared peers), whereas variations in restrictiveness are linked most strongly to variations in internalized distress (with children whose parents are high in restrictiveness scoring higher on measures of depression, anxiety, and the like). Thus the distinction between behavioral and psychological control is important not only because each is related to different outcomes but also because optimal child development is associated with high levels of one type of control (behavioral) but low levels of the other (psychological).

### Configurational Approaches to Research on Parenting

The dimensional approach attempts to separate various aspects of parenting from one another, to isolate their independent relations to child outcomes. In contrast, the *configurational* approach to parenting attempts to identify particular types or styles of parenting that are defined by certain constellations of parenting characteristics (e.g., a group of parents who are high on warmth, low on behavioral control, and low on psychological control; a group who are high on warmth, high on behavioral control, and low on psychological control, etc.). This has been

done by using configurations that are defined a priori on the basis of theory as well as by identifying naturally occurring clusters of parents whose parenting has been assessed on several of the key dimensions identified earlier. The advantage of the a priori approach is that all possible constellations of parents are identified, even those that are relatively rare. The advantage of identifying naturally occurring clusters of parents is that the end result is a categorization system that accurately reflects the type of parenting found within the particular ecological niche studied. This can be an important consideration for researchers who are interested in cultural groups whose parenting may not be easily classified using preexisting configurational models. Some critics, for example, contend that the most commonly used configurational models of parenting have greater applicability within white, middle-class, American samples than within samples of parents from other backgrounds.

The most widely used configurational model of parenting is one that derives from the work of Diana Baumrind (1971), whose theory of parenting style has been enormously influential. Although Baumrind's initial conceptualization of parenting styles was not explicitly based on the dimensions of parental warmth, behavioral control, and psychological control, more contemporary models of parenting, such as those of Darling and Steinberg, have attempted to bridge Baumrind's configurational approach with research on these three dimensions of parenting. Within this parenting-style framework, parents are classified as authoritative (high in warmth, high in firmness, and low in restrictiveness), authoritarian (low in warmth, high in firmness, and high in restrictiveness), or indulgent (high in warmth, low in firmness, and low in restrictiveness). Contemporary variations of this framework have also included a fourth group, indifferent parents, who are characteristically low in warmth, low in firmness, and low in restrictiveness. Although it is theoretically possible to derive additional configurations of parents based on other combinations of warmth, firmness, and restrictiveness, most empirical research suggests that, at least in contemporary Western cultures, the authoritative, authoritarian, permissive, and indifferent styles account for the vast majority of parents.

**Authoritative parents.** These four general styles of parenting can be distinguished in many respects beyond their scores on measures of parental warmth, firmness, or restrictiveness. For example, in addition

to being both warm and firm, authoritative parents set standards for the child's conduct but form expectations that are consistent with the child's developing needs and capabilities. They place a high value on the development of autonomy and self-direction but assume the ultimate responsibility for their child's behavior. Authoritative parents deal with their child in a rational, issue-oriented manner, frequently engaging in discussion and explanation with their children over matters of discipline.

**Authoritarian parents.** In contrast, authoritarian parents place a high value on obedience and conformity, favoring more punitive, absolute, and forceful disciplinary measures. Verbal give-and-take is not common in authoritarian households, because the underlying belief of authoritarian parents is that the child should accept without question the rules and standards established by the parents. They tend not to encourage independent behavior and, instead, place a good deal of importance on restricting the child's autonomy.

**Indulgent parents.** Indulgent parents behave in an accepting, benign, and somewhat more passive way in matters of discipline. They place relatively few demands on the child's behavior, giving the child a high degree of freedom to act as he or she wishes. Indulgent parents are more likely to believe that control is an infringement on the child's freedom that may interfere with the child's healthy development. Instead of actively shaping their child's behavior, indulgent parents are more likely to view themselves as resources that the child may or may not use.

**Indifferent parents.** Finally, indifferent parents try to do whatever is necessary to minimize the time and energy that they must devote to interacting with their child. In extreme cases, indifferent parents may be neglectful. They know little about their child's activities and whereabouts, show little interest in their child's experiences at school or with friends, rarely converse with their child, and rarely consider their child's opinion when making decisions. Rather than raising their child according to a set of beliefs about what is good for the child's development (as do the other three parent types), indifferent parents are "parent centered"—they structure their home life primarily around their own needs and interests.

In light of research findings linking positive child adjustment to the presence of parental warmth and firmness, and to a lack of parental restrictiveness, it is not surprising to find that child adjustment

varies as a function of parenting style, with children from authoritative households exhibiting relatively healthier adjustment than their peers and children from neglectful homes exhibiting poorer functioning on virtually all measured indicators. More specifically, children and adolescents from authoritative homes score better than their peers on measures of psychosocial development, school achievement, internalized distress, and problem behavior, whereas those from neglectful homes score worse across all four sets of outcomes. Youngsters raised in authoritarian or permissive homes score somewhere between the two extremes, with authoritarian parenting associated with special problems in self-reliance, social competence, and internalized distress, and permissive parenting associated with somewhat lower school achievement and elevated rates of problem behavior.

Although occasional exceptions to these general patterns have been noted from time to time, the evidence linking authoritative parenting and healthy child and adolescent development is remarkably strong, and it has been found in studies of a wide range of ethnicities, cultures, regions, social classes, and family structures. At the other extreme, parenting that is indifferent, neglectful, or abusive has been shown consistently to have harmful effects on the adolescent's mental health and development, leading to depression and a variety of behavior problems, including, in cases of physical abuse, aggression toward others.

### **The Power of Authoritative Parenting**

Why is authoritative parenting so consistently associated with healthy child and adolescent development? First, authoritative parents provide an appropriate balance between restrictiveness and autonomy, giving the child opportunities to develop self-reliance but providing the sorts of standards, limits, and guidelines that developing individuals need. Authoritative parents, for instance, are more likely to give children more independence gradually as they get older, which helps children develop self-reliance and self-assurance. Because of this, authoritative parenting promotes the development of and enhances their ability to withstand a variety of potentially negative influences, including life stress and exposure to antisocial peers.

Second, because authoritative parents are more likely to engage their children in verbal give-and-take, they are likely to promote the sort of intellec-

tual development that provides an important foundation for the development of psychosocial competence. Family discussions in which decisions, rules, and expectations are explained help the child to understand social systems and social relationships. This understanding plays an important part in the development of reasoning abilities, role taking, moral judgment, and empathy.

Finally, because authoritative parenting is based on a warm parent-child relationship, adolescents are more likely to identify with, admire, and form strong attachments to their parents, which leaves them more open to their parents' influence. Adolescents who have had warm and close relationships with their parents are more likely, for example, to have similar attitudes and values. Adolescents who are raised by indifferent parents, in contrast, often end up having friends their parents disapprove of, including those involved in antisocial activity.

### **Cultural Differences in Parenting**

A number of researchers have asked whether parents from different ethnic groups vary in their child rearing and whether the relation between parenting and child and adolescent outcomes is the same across different ethnic groups. These, of course, are two different questions: The first concerns average differences between groups in their approaches to parenting (e.g., whether ethnic minority parents are firmer than white parents), whereas the second concerns the correlation between parenting practices and child adjustment in different groups (e.g., whether the effect of firmness is the same in ethnic minority families as it is in white families).

In general, researchers find that authoritative parenting is less prevalent among African-American, Asian-American, or Hispanic families than among European-American families, no doubt reflecting the fact that parenting practices are often linked to cultural values and beliefs. Nevertheless, even though authoritative parenting is less common in ethnic minority families, its *effects* on adolescent adjustment are beneficial in all ethnic groups. In other words, ethnic minority youngsters for the most part benefit just as much from parenting that is responsive and demanding as do their nonminority peers.

Research has also indicated that authoritarian parenting is more prevalent among ethnic minority than among white families, even after taking ethnic differences in socioeconomic status into account. As

opposed to research on authoritative parenting, however, which suggests comparable effects across ethnic groups, research on authoritarian parenting indicates that the adverse effects of this style of parenting may be greater among white youngsters than among their ethnic minority counterparts. Several explanations have been offered for this finding.

First, some writers have suggested that because ethnic minority families are more likely to live in dangerous communities, authoritarian parenting, with its emphasis on control, may not be as harmful and may even carry some benefits. Second, as several researchers (Ruth Chao, 1994; Nancy Gonzales, Ana Mari Cauce, and Craig Mason, 1996) have pointed out, the distinction between “authoritative” versus “authoritarian” parenting may not always make sense when applied to parents from other cultures. For example, nonwhite parents frequently combine a very high degree of restrictiveness (like white authoritarian parents) with warmth (like white authoritative parents). If they focus too much on parents’ strictness when observing family relationships, European-American researchers may mislabel other ethnic groups’ approaches to child rearing (which appear very controlling, but which are neither aloof nor hostile) as authoritarian.

In the last years of the twentieth century, new models of parenting began to emerge, which attempted to move beyond the traditional, often stale, debates between those who believe that parents are relatively impotent in the face of genetic and non-familial influence on child development and those who believe that parents’ influence is limitless. These new models emphasize the importance of studying parenting as a bidirectional process, in which parents both influence and are influenced by their child, and as an embedded process, in which a range of forces in the proximal and distal environment influence the parent-child relationship. New research on parenting examines such questions as whether and in what ways the child’s temperament moderates the impact of certain types of parenting on child adjustment; whether and how the impact of parenting varies across neighborhood and community contexts; and whether and through what processes the influence of parents on their children is itself affected by the other settings in which the child spends time, such as the peer group, day-care center, or classroom.

#### HIGH-RISK NEIGHBORHOODS

Avenues of inquiry regarding successful parenting in high-risk neighborhoods, particularly as it relates to students’ ability to succeed in school, include the following: How do researchers define “high-risk,” and how does the concept differ from “disadvantaged”? What is known about the socio-demographic conditions associated with individuals and neighborhoods characterized by “risk”?

To answer these questions, three intersecting lenses of analysis are examined: (1) individual: parenting and resilience; (2) community: social capital and capacity; and (3) interinstitutional: ecology of schooling. The discussion focuses upon the elements associated with educational management functions among families in high-risk neighborhoods.

### Definition of “At-Risk”

The concept of a high-risk neighborhood is derived from the set of social and economic conditions that place individuals “at-risk” of failure, or of encountering significant problems related to employment, education, self-sufficiency, or a healthy lifestyle. At-risk conditions include both environmental or community characteristics, such as crime and limited employment opportunities, and individual qualities, such as poverty and low educational attainment. The problems or failures encountered by those labeled at-risk are oriented toward the future but linked to current conditions.

The understanding that interactions between particular environmental and individual characteristics may lead to a heightened risk of negative outcomes is rooted in the health and medical literature, and is widely examined in studies of social stratification, educational inequality, and social policy. Common arguments, such as those of sociologists Karl Alexander and Doris Entwisle, among others, suggest that individuals “disadvantaged” by low socioeconomic status are more susceptible to adverse environmental or community conditions, such as unsafe housing and poor quality schooling. Decades of social science research provide compelling evidence that the extent and concentration of neighborhood poverty and the presence (or absence) of affluent neighbors are associated with an array of outcomes, including rates of teenage pregnancy and school dropout. But policymakers and social scientists also underscore the finding that in socially depleted neighborhoods, residents are often constrained in their efforts to transmit positive values and productive norms because of a lack of community structure and effective social controls.

### High-Risk Neighborhoods

Historically, neighborhoods have functioned as the social, political, and cultural webbing for families and children. This context links families and individuals to a set of norms, routines, and traditions. The social scripts embedded in the geography and

culture of the neighborhood, if well known and well defined, become institutionalized practices for children and adults. Social actions flow from perceptions of safety and opportunity, expectations regarding appropriate parenting styles and child behavior, norms regarding home maintenance and respect for property. The neighborhood environment defines the formation of particular social networks among families and the levels of trust, familiarity, and face-to-face engagement among members.

Clusters of interlocking and corrosive conditions are persistent in high-risk neighborhoods, and are evidenced by the dense and dilapidated housing, a real and constant threat of violent crime, inadequate and inaccessible health care, a lack of employment opportunities that pay a living wage, and unreliable and limited public transportation. These concrete indicators of poverty and social isolation give rise to an insidious and entrenched culture of fear, disconnection, and distrust in high-risk neighborhoods. Families may be paralyzed by fear of gangs and guns. Omnipresent drug traffic and a constant threat of victimization minimize opportunities for interdependence and delimit social interaction among neighbors within the community. High transience rates in these neighborhoods lead to blocks of unstable and abandoned housing.

How does this social fabric influence children’s well-being, particularly their success in schooling, when the population is so heavily marked by concentrated poverty, unemployment, low levels of education, and large numbers of struggling, single parents? How is a parent’s pattern of involvement in home- and school-based learning activities affected by these neighborhood-level conditions—beyond individual characteristics (income, education, family structure)? These community-level conditions frame the challenging conditions for parents engaged in managing their children’s educational experiences at home and at the school site. Researchers agree that these out-of-school environments constitute vital components that are deeply connected but external to students’ experiences in formal school settings.

### Resiliency and Community Capacity

Although it is clear that certain family conditions are associated with higher rates of poverty—low parent education, young parental age, and single parent status—it is less well understood how parenting practices in circumstances of poverty may overcome or mediate these “high-risk” conditions to produce

successful educational outcomes for children. Emerging research findings point to the important role of resiliency in guiding the actions of individuals. Resiliency research refers to a long tradition of studies aimed at understanding how individuals or groups overcome high-risk conditions, such as poverty, or succeed despite severely adverse family situations, such as an alcoholic or abusive parent.

Certain elements present in the individual or community, known as “protective factors” function to assist people in high-risk environments to overcome the adverse conditions. Internal protective factors include social competence (ability to form positive and productive relationships with others); problem solving (the ability to identify problems and apply appropriate resources to solving them); autonomy (an ability to act independently and with control over their environment); and sense of purpose (the disposition to set goals, persist in achieving them, and maintain a focus). These internal elements function in partnership with external protective factors to produce resiliency and positive outcomes. Thus, schools and neighborhoods that offer resiliency to individuals include the following properties: a sense of caring and heightened familiarity for individual members or students; high expectations coupled with appropriate resources to reach these goals; opportunities for meaningful participation and demands for personal responsibility.

The research literature on community capacity extends and elaborates upon the important influence that neighborhood conditions exert in shaping social action in positive ways that lead to productive outcomes among members. Robert Chaskin has identified four central elements that are often weak or tenuous in high-risk neighborhoods.

1. A sense of community or degree of connectedness among neighbors—their sense of being similarly situated socially, economically, and geographically
2. Level of commitment among neighbors who view themselves as stakeholders and assume responsibility for collective outcomes
3. A mechanism for problem identification, planning and priority-setting, and problem solving
4. Access to financial, political, and human resources

Community capacity focuses upon the significance of social interaction across individuals, organiza-

tions, and networks of organizations. A central asset required for community capacity is human capital—the skills, knowledge, and dispositions among individual members of a community that are profitable for both individuals and the neighborhood in optimizing the processes outlined in the community-building literature. As James Coleman and Thomas Hoffer note, residents in high-risk neighborhoods who fit the traditional definition of “disadvantaged,” that is, are marked by low levels of education and low income, have little human capital and face challenging obstacles in their efforts to build community capacity.

Social capital bridges human capital theory, which underscores the economic value of individuals for collective purposes, and social organization theory. The capacity of neighborhoods to provide constructive assets for parents engaged in managing their children’s educational success can be examined through the concepts embedded in social capital.

### Social Capital

The concept of social capital emphasizes the role of organizational (e.g., school) relationships in establishing social ties between members who share similar attitudes, norms, and values instrumental in promoting a strong sense of obligation, shared expectations, and trust. These critical elements of social capital help promote trust, facilitate open and fluid communication, and produce purposeful and meaningful activities that benefit students and adults alike. Social capital is sustained when there is “a sense of community” or a set of organizational and institutional affiliations (e.g., civic, religious, professional) that bind families in stable, predictable, and enduring social ties.

The economic and social environments in high-risk neighborhoods may militate against the development and sustainability of social capital. These neighborhoods often reflect their social and economic context: scarce economic resources, unstable social networks, limited social trust, and a perceived lack of consensus on parenting. There are few after-school programs, church-related youth groups, or recreation/civic programs for children, youth, and families. Research studies of parenting practices in high-risk neighborhoods—community contexts bereft of social capital assets—describe parenting as a highly private, protected, and isolated set of activities. Under manifestly dangerous conditions, parents in high-risk neighborhoods manage risk and oppor-

tunity by adopting stringent child monitoring and youth control, or “lock-down” strategies. These individual patterns of confinement and insularity in childrearing and parenting reflect the larger, collective neighborhood dynamics. As more and more parents adopt these defensive tactics, increasing numbers of neighbors are disconnected and social networks of support dissolve.

Thus, the capacity of parents in high-risk neighborhoods to manage and promote educational success and healthy outcomes for their children is powerfully influenced by the nature of, and the ability to activate, social capital assets and community capacity-building in the neighborhood. Successful parents, that is, parents whose children are thriving socially and academically despite the distracting and disabling conditions in their neighborhood environments, demonstrate resiliency and an ability to activate internal protective factors. These parents manage to capture “scarce opportunities” in ways that suggest “super motivation” and “unusual diligence,” according to Frank Furstenberg and his colleagues, who have studied urban neighborhoods and youth development for decades in Baltimore.

What role do schools play in promoting enduring social ties between families and educators in high-risk neighborhoods? Against this backdrop of distracting and disabling social contexts, how does a school community bind families in networks of support that enhance parents’ abilities to promote positive educational outcomes for their children?

### **School Community**

Research suggests that the type and strength of community in schools differentially affects the critical social connections that bond families and schools in the joint enterprise of education. This concept of community refers to two types: functional and value. Functional communities are characterized by structural consistency between generations in which social norms and sanctions arise out of the social structure itself, and both reinforce and perpetuate that structure. Functional communities exhibit a high degree of uniformity and cohesion within geographical, social, economic, and ideological boundaries. Value communities describe a collection of people who share similar values about education and childrearing but who are not a functional community; they are strangers from various neighborhoods, backgrounds, and occupations united around an educational organization—their children’s school. Re-

search findings indicate that Catholic schools often reflect the elements of functional communities; magnet schools sometimes suggest the elements of a value community.

The families of students in high-risk neighborhoods, however, may possess few if any of the constitutive elements of either a functional or value community. Although public neighborhood schools a century ago served residential areas that were functional communities, social, economic, and technological changes have transformed many of these communities from enclaves of shared values and daily face-to-face talk, to somewhat disparate sets of interests and weak affiliations.

### **Parent Involvement**

Substantial research evidence indicates the positive effects of both home- and school-based parent involvement programs for all parents, teachers, and students. Findings, such as those of Carole Ames in 1993, indicate that parent involvement enhances parents’ attitudes about themselves, school, school personnel, and the role each plays in the development of the child. This increased understanding promotes greater cooperation, commitment, and trust between parents and teachers. Finally, evidence, such as that of James Comer in 1980 suggests that students’ achievement and cognitive development increases when effective parent involvement practices are in place.

Most significant in the generally positive and optimistic reports on parent involvement may be the evidence that patterns of parental participation are related to differences in socioeconomic status: Higher income and more educated parents participate at higher rates than lower class parents, both in terms of school-based activities and home learning exercises. Studies have identified educative enrichment activities that are crucial for children’s cognitive development and school success (reading to children, taking children to the library, attending school-based events) that middle-class parents engage in more frequently than lower class parents. Beyond the benefit of home-based activities (reading, math games, inquisitive conversation) on children’s learning, there are strong indications of the connection between teachers’ expectations for student performance and the actions and attitudes of parents. Decisions regarding retention/promotion and ability grouping may well hinge on teachers’ perceptions of parental interest and commitment.

Research by Deborah Vandell and colleagues in 1999 suggests that parents' patterns of participation (as reported by teachers) may be an important factor in mediating the negative impact of neighborhood risk on academic performance of elementary school students. The types of involvement reported by teachers to benefit children in high-risk neighborhoods include visiting the school for discussions with teachers, supervising homework, and providing children with enrichment activities at home. Vandell and colleagues point to resilience factors evidenced among parents to explain these families' active and purposeful participation in a range of home and school-based activities that benefit their children's academic performance.

### School-Linked Social Services

The critical interaction between social structure and school organization in high-risk neighborhoods is amplified by the school-linked social services movement launched more than 100 years ago and rekindled with new programmatic priorities in the late 1980s. The school-linked social services movement has triggered a shift from a model of education based upon separate spheres between home and school to an ecological perspective of family life that considers the human context of need and locates the school as the nexus for expanded social and economic services.

Rebuilding community-based groups and youth development organizations, such as neighborhood centers, recreation programs, youth groups, and after-school art and educational enrichment programs, is critical to improved family functioning in high-risk neighborhoods. The research on family functioning, poverty, and neighborhoods is clear: A multipronged community-capacity building effort is necessary to enhance the ability of parents who are embedded in a context of economic survival and social isolation. Only then can parents overcome the daunting array of formidable obstacles to manage successfully their children's educational experiences in the neighborhood and inside the classroom.

## INFLUENCE OF PARENTS' LEVEL OF EDUCATION

Traditionally, family status variables such as parents' level of education have been regarded as predictors of children's academic achievement. Increasingly, research has suggested that, rather than having a di-

rect association with children's academic achievement, parents' level of education is part of a larger constellation of psychological and sociological variables influencing children's school outcomes.

Attendant on higher levels of education may be access to resources, such as income, time, energy, and community contacts, that allow for greater parental involvement in a child's education. Thus, the influence of parents' level of education on student outcomes might best be represented as a relationship mediated by interactions among status and process variables.

The literature also suggests that level of education influences parents' knowledge, beliefs, values, and goals about childrearing, so that a variety of parental behaviors are indirectly related to children's school performance. For example, higher levels of education may enhance parents' facility at becoming involved in their children's education, and also enable parents to acquire and model social skills and problem-solving strategies conducive to children's school success. Thus, students whose parents have higher levels of education may have an enhanced regard for learning, more positive ability beliefs, a stronger work orientation, and they may use more effective learning strategies than children of parents with lower levels of education.

While many theorists and researchers argue that student attributes conducive to achievement are deeply rooted in processes of socialization, such as learning through observation of parental modeling, others contend that through their personal qualities, children actively shape the parenting they receive: Parents socialize their children, but children also influence their parents. Supporting both theoretical perspectives is research indicating that the combination of learning behavior and intelligence exceeds the contributions of any single source in predicting children's scholastic achievement.

Parents with higher levels of education are also more likely to believe strongly in their abilities to help their children learn. A recent study exploring the relationships between level of parent education, parent self-efficacy, children's academic abilities, and participation in a Head Start program found that level of parent education and program participation was significantly related to parental self-efficacy. In turn, parental self-efficacy beliefs significantly predicted children's academic abilities.

However, examinations across varied cultural and ethnic groups within the United States suggest

that level of education does not appear to determine the value parents place on education, their interest in their children's schooling or their aspirations for their children's academic success. For example, in a 1997 study comparing the relative value of varied predictors of parental involvement, Thomas Watkins found that parents' efficacy for involvement and educational goals for their children were stronger predictors of school success than parental level of education and ethnicity. Additionally, this study found that teacher communications to parents predicted parental involvement, suggesting that, regardless of education level, parents need encouragement from educators to become involved in their children's education.

In sum, it appears that process variables, or factors susceptible to the influence of parents, their children, and school personnel (e.g., educational expectations, level of involvement, child attributes conducive to achievement, and teacher invitations for parental involvement) are more predictive of children's school success than status variables such as parental level of education. This is an important conclusion, for while educators and researchers cannot influence the status of students' families, they may improve students' educational outcomes by influencing selected mediating process variables.

CLAIRE SMREKAR

## INFLUENCE ON CHILD'S EDUCATIONAL ASPIRATIONS AND ATTAINMENT

A considerable body of research conducted within the United States and across countries has overwhelmingly demonstrated the profound influence of parents' beliefs and behaviors on children's educational aspirations and academic achievement. What remains unclear is how parental belief systems are

transmitted to and manifested in children, and how belief systems function among families of varied socioeconomic and ethnic backgrounds.

### Effects of Socialization

Many theorists and researchers regard the development of student beliefs and behaviors conducive to achievement (e.g., belief in one's ability, effective learning strategy use, motivation for academic tasks, strong work orientation) as the product of socialization processes. In a 1996 study, Manuel Martinez-Pons tested a theoretical model indicating that parental belief and behavior systems induce their children's educational aspirations—through parental modeling of attitudes and strategies, encouragement and facilitation of academically related goals and activities, and reinforcement or rewarding of student achievement.

Examples of specific parental behaviors that may influence children's educational aspirations can be found in recent reviews of parental involvement in homework. This literature suggests that parents use a wide array of cognitive and social strategies to facilitate their children's learning. These strategies range from simple efforts such as creating a physical space for completing homework and providing general oversight and encouragement of the homework process to interacting with the child's school or teacher about homework and engaging in homework tasks with the child. Parents also appear to use more sophisticated strategies that are designed to create a "fit" between a particular task and the child's abilities (e.g., breaking tasks into discrete, manageable parts), support children's understanding of specific homework tasks (e.g., helping the child organize personal thinking about the assignment), and support their understanding of strategies conducive to achievement (e.g., developing problem-solving skills).

### Parenting Styles

In addition to their involvement in specific aspects of their children's education, styles of parenting also affect children's attitudes toward academic achievement. For example, adolescents who described their parents as "warm, democratic, and firm" (i.e., a parenting style characterized as *authoritative parenting*) were more likely than their peers to develop positive attitudes toward and beliefs about their achievement. These results, however, were true for a predominantly white middle-class to upper-middle-

class population. Investigation of links between parenting practices and academic achievement among varied ethnic groups have suggested that the relationship between parenting style and achievement is more complex.

Students' educational aspirations appear to be influenced not only by parents, but also by peers. For example, Laurence Steinberg, Sanford Dornbusch, and B. Bradford Brown (1992) found that high-achieving white students benefited from the combination of authoritative parenting and peer support for achievement, while lower-achieving Hispanic students suffered from a combination of *authoritarian* parenting (characterized by high demands and low warmth) and low peer support. For African-American students, the benefits of authoritative parenting appeared to be offset by low peer support for achievement, while the negative consequences on Asian-American students of authoritarian parenting were tempered by peer support.

### Theories of Influence

The combined influence of parents and peers supports theorists who argue that parents' educational aspirations for their children, and children's own aspirations, stem from socially constructed roles. *Role theory* suggests that beliefs are derived from expectations held by groups for the behavior of its individual members (e.g., a family's expectations for a child's academic achievement). Roles are also sets of behaviors characteristic of specific kinds of group members (e.g., minority elementary-school students). As such, role construction involves three interactive processes: (1) structural demands (i.e., What do others expect of me?), (2) personal role conceptions (i.e., What do I expect of myself?), and (3) role behavior (i.e., What do I/should I do?). Put simply, *role* can be characterized by two components: beliefs individuals hold and actions that individuals take.

Because it accounts for interactions among varied psychological and sociological factors experienced by members of different races, social classes, and ethnicities, role theory is a valuable tool for explaining the conflicting evidence surrounding parents' influence on children's educational aspirations. Further, some researchers speculate that understanding how parental roles are constructed may enhance educators' abilities to effectively involve parents in their children's education, and thus enhance student outcomes.

Another useful theoretical tool for disentangling differential patterns of parental belief and behavior systems is John U. Ogbu's *cultural ecological theory*. From this perspective, within minority groups, students' choice of strategies for succeeding in school are believed to stem from their desire to take the path of least resistance to the dominant social group, and to improve their status within their own peer group. Further, Ogbu characterizes minority groups' status as voluntary (i.e., immigrant families) and involuntary (i.e., native-born families), and he contends that voluntary minorities have more social pressure to do well in school than involuntary minorities. His argument is supported by a collection of ethnographies and other qualitative studies describing the combined influence of self, peer, and parental expectations and valuing of education among immigrant students and their native-born peers.

Specifically, these studies have noted that while many immigrant students invest personal time and energy in studying and seeking extra help, what appears to drive these self-regulatory efforts is a constellation of self, peer, and parental values that place great importance on the role of education. Moreover, when voluntary and involuntary minority families are compared, the children of immigrant families appear to have higher educational aspirations and academic achievement than their native-born peers.

Compounding the difficulty in understanding how parental aspirations influence children's ability beliefs and learning behaviors is the fact that children receive and require differing levels of support and guidance from parents and peers according to their cognitive, social, and emotional development. In general, educational psychologists view the development of beliefs and behaviors conducive to achievement as a movement from largely socially regulated experiences in the early grades to more self-regulated learning experiences in middle and high school. Thus, the quality and quantity of parental influence on students' positive aspirations for achievement differ as children move from elementary to high school.

## PEACE EDUCATION

Peace education encompasses the key concepts of education and peace. While it is possible to define education as a process of systematic institutionalized transmission of knowledge and skills, as well as of basic values and norms that are accepted in a certain society, the concept of peace is less clearly defined. Many writers make an important distinction between positive and negative peace. Negative peace is defined as the absence of large-scale physical violence—the absence of the condition of war. Positive peace involves the development of a society in which, except for the absence of direct violence, there is no structural violence or social injustice. Accordingly, peace education could be defined as an interdisciplinary area of education whose goal is institutionalized and noninstitutionalized teaching about peace and for peace. Peace education aims to help students acquire skills for nonviolent conflict resolution and to reinforce these skills for active and responsible action in the society for the promotion of the values of peace. Therefore, unlike the concept of conflict resolution, which can be considered to be retroactive—trying to solve a conflict after it has already occurred—peace education has a more proactive approach. Its aim is to prevent a conflict in advance or rather to educate individuals and a society for a peaceful existence on the basis of nonviolence, tolerance, equality, respect for differences, and social justice.

### The Development of Peace Education and Its Basic Principles

The understanding of the concept of peace has changed throughout history, and so has its role and importance in the educational system from the very beginnings of the institutionalized socialization of children. When discussing the evolution of peace education, however, there have been a few important points in history that defined its aims and actions. The end of World War I (1914–1918) brought powerful support for the need for international cooperation and understanding and helped instill a desire to include these ideas in educational systems. The League of Nations and a number of nongovernmental organizations worked together on these ideas, especially through the International Institute of Intellectual Cooperation, an organization that was the predecessor of the United Nations Educational, Scientific and Cultural Organization (UNESCO).

World War II (1939–1945) ended with millions of victims and the frightening use of atomic weapons against Japan, at Hiroshima and Nagasaki. In 1946 UNESCO was founded as an umbrella institution of the United Nations, and it was charged with planning, developing, and implementing general changes in education according to the international politics of peace and security. The statute of this organization reinforced the principle of the role of education in the development of peace, and a framework was created for including and applying the principles of peace in the general world education systems. The cold war division of the world after World War II and the strategy of the balance of fear between the so-called West and East blocs redirected the peace efforts. The peace movement began concentrating on stopping the threat of nuclear war, halting the arms race, and encouraging disarmament. Somewhat parallel to this, the issues of environmental protection and development found their place in peace education programs. The contemporary sociopolitical environment (particularly the events in eastern Europe since the early 1990s, the fear of terrorism, and the increasing gap between developed and undeveloped countries) has created new challenges for the understanding of peace and for the development of the underlying principles of responsibility and security.

A 1996 book by Robin Burns and Robert Aspeglagh showed that the field and the themes that are included in peace education are diverse. The diversity is evident in theoretical approaches, underlying philosophies, basic methodology, and goals. Within the field of peace education, therefore, one can find a variety of issues, ranging from violence in schools to international security and cooperation, from the conflict between the developed world and the undeveloped world to peace as the ideal for the future, from the question of human rights to the teaching of sustainable development and environmental protection. A critic could say that the field is too wide and that peace education is full of people with good intentions but without a unique theoretical framework, firm methodology, and an evaluation of the outcomes of the practical efforts and programs of peace education. Some within the field would generally agree with this criticism. Nevertheless, the importance of accepting the specific situations in which programs for peace are being implemented and held should be emphasized. Owing to these specifics, difficulties emerge when one tries to define the unique

approach, methodology, and evaluation of the efficiency of applied programs. The complex systems of society, the circumstances, and the context make the peace education field very active and diverse.

### **Peace Education Discrepancies: Individual, Group Conflict**

In the active process of achieving positive peace, peace education is faced with a few basic discrepancies: discrepancy between the individual and the group, discrepancy between groups within one society or from different societies, and the discrepancy of conflict as an imbalance of different interests that need to be resolved without violence.

**Discrepancies between individual and group.** The modern liberal theory puts the individual's equality, values, and rights in the center of a successfully functioning society. This basic thesis is the beginning of the philosophy and practical protection of human rights. From the individual psychological point of view one thinks in terms of educating a complete person. In the educational system this does not mean transmitting only the facts, but it includes the complete social, emotional, and moral development of an individual; the development of a positive self-concept and positive self-esteem; and the acquisition of knowledge and skills to accept responsibility for one's own benefit as well as for the benefit of society. The development of a positive self-concept is the foundation for the development of sympathy for others and building trust, as well as the foundation for developing awareness of interconnectedness with others. In that sense a *social individual* is a starting point and a final target of peace education efforts.

**Discrepancies between groups.** People are by nature social beings, fulfilling their needs within society. Many social psychologists believe that there is a basic tendency in people to evaluate groups they belong to as more valuable than groups they do not belong to. This ingroup bias is the foundation of stereotypes, negative feelings toward outgroups, prejudices, and, finally, discrimination. In the psychological sense, the feeling of an individual that his or her group is discriminated against, or that he or she as an individual is discriminated against just for belonging to a particular group, leads to a sense of deep injustice and a desire to rectify the situation. Injustice and discrimination do not shape only the psychological world of an individual but also shape the collective world of the group that is discriminated against—shaping the group memory that is trans-

mitted from generation to generation and that greatly influences the collective identity. Belonging to a minority group that is discriminated against could have a series of negative consequences on the psychological and social functioning of its members, for example, leading to lower academic achievement or negatively influencing the self-concept and self-esteem. Therefore, peace education is dealing with key elements of individual and group identity formed by historical and cultural heritage, balancing the values of both of these, and trying to teach people how to enjoy their own rights without endangering the rights of others, and especially how to advocate for the rights of others when such rights are threatened. This motivating element of defense and advocating for the rights of others is the foundation of shared responsibility for the process of building peace.

**Conflict and its role in peace education.** Conflict is a part of life, and its nature is neither good nor bad. On the interpersonal and intergroup level, conflict describes an imbalance or an existence of difference between the needs and interests of two sides. It becomes negative only when the answer to a conflict is aggression. It is possible, however, to resolve the difference positively, by recognizing the problem and recognizing one's own needs and interests and also acknowledging the needs of the opposing sides. In this way, constructive nonviolent conflict resolutions are possible. An important aspect of conflict is that it includes potential for change, and it is in this context that peace education addresses the issues of conflict and conflict resolution by teaching students how to take creative approaches to the conflict and how to find different possibilities for the conflict resolution. Thus students gain knowledge and skills that encourage personal growth and development, contribute to self-esteem and respect of others, and develop competence for a nonviolent approach to future conflict situations.

### **Peace Education in Schools**

From the very beginnings of the development of systematic peace education, there has been discussion about whether it should be added as a separate program in the schools, or if the principles of peace education should be applied through the regular school subjects. The variety of approaches and attitudes on what peace education actually is leads to the introduction of a series of titles, such as multicultural training, education for democracy and human

rights, and education for development. Many in the field, however, believe that the implementation of *principles* of peace education into the institutionalized educational system is a better approach, especially within the subjects encompassing the cultural heritage of the dominant society and the ethnic groups belonging to it. Consistent with this view, Aspeslagh in 1996 wrote about the need to internationalize national curriculum. For example, including within the curriculum the contributions of minority groups to literature, history, art, the general cultural heritage, and the development of the particular nation-state may significantly contribute to intercultural closeness and understanding.

### **The Principles and Theoretical Foundations of Peace Education Programs**

Since the psychologist Gordon Allport formulated his well-known contact hypothesis in 1954, this theoretical framework became the most applicable principle for programs whose main goal is to change the relationships between groups in conflict. According to Allport's theory, for the intergroup contact to be successful and accomplish positive changes in attitudes and behavior, it must fulfill four basic conditions: the contact groups must be of equal status, the contact must be personal and manifold, the groups must depend on each other working for a superordinate goal, and there must be institutional support for the equality norm. The numerous research projects that tried to verify the predictions of the contact hypothesis provided contradictory results, raising serious doubts about the major cognitive, affective, and behavioral shifts that occur as a result of organized meetings between representatives of conflicting groups. Almost every new study added new conditions that must be fulfilled in order for the contact to be successful.

Even if there is a positive change in the attitude toward members of the outgroup in direct contact, there is a question of the generalization of the newly formed attitude to the other members of the outgroup. The key problem of peace education is not the interpersonal conflict but the collective conflict between groups, races, nations, or states. Therefore, the issue of transferring the positive attitudes toward members of other groups—attitudes achieved in safe environments such as classrooms, schools, workshops, and the like—to all members of the outgroup and all other outgroups remains the pivotal issue of peace education. Children learn about peace and the

need for peace in safe protected environments and then return to a wider society where there is still injustice, asymmetry of power, a hierarchical structure, discrimination, and xenophobia. Therefore, each program for peace education must not only strengthen the capacity of an individual for critical thinking but also strengthen the individual's ability to resist the majority, if the majority is one that discriminates. As stated by Ervin Staub in 1999, for change to happen and spread there is a need for a *minimum mass of people* who share attitudes, a culture in which they can express those attitudes, and a society that accepts the attitudes.

Based on the contact hypothesis, a very successful technique was developed for improving the relations among groups, highly applicable as a general teaching and learning method. It is the *cooperative learning technique* in which a smaller group of students study in face-to-face interaction, cooperating to complete a common task. This technique was very successful both in lower and higher grades of elementary school, not only as a teaching method but also for creating a positive atmosphere in the classroom, reinforcing students relationships, and creating intergroup friendships.

On the other hand, based on the idea that adopting knowledge and developing skills is the basis for gaining positive attitudes and behavior, *intercultural training programs* were also developed. These basically involve a group of techniques that accept the primary notion that differences between cultures are what lead to misunderstandings and conflicts between groups. Such programs assume that information about the values, customs, and practices of the members of a different culture contributes to better understanding of others, thereby reducing prejudices, negative stereotypes, and tensions between people who belong to different cultures. Research has shown that ignorance about others plays a significant role in the development and perpetuation of prejudices. Educating students about both cultural similarities and differences is a significant factor in reducing prejudice.

### Conclusion

Peace education is a diverse field that includes the theoretical, research, and practical activities of experts from many disciplines assembled in a number of professional and research associations. The best known among these is the International Peace Research Association, which was founded in 1964.

The programs of peace education exist within the academic discipline of peace studies on many universities, especially in the United States. The dissemination of research results and theoretical approaches is ensured by the existence of a number of periodicals, for example *Peace and Conflict: Journal of Peace Psychology*; *Journal of Peace Research*; and *Peace and Change*. The measure of the success of these efforts will be seen in the ending of conflicts between countries and nations, in a more just distribution of goods, and in reducing the differences in economic development and life standards between the countries of the underdeveloped and developed worlds. For the culture of peace to become established, it is necessary to accept the principles of uniqueness in diversity and to establish the social norms of respect, dignity, and the rights of every individual.

## PEER GROUPS

See: ADOLESCENT PEER CULTURE; PEER RELATIONS AND LEARNING.

## PEER RELATIONS AND LEARNING

Influences on student learning in an academic environment can be numerous and contradictory. Determining the accuracy and relevance of information from teachers, friends, and classroom materials can be overwhelming. Which classroom features an individual student attends to depends, in part, on what that student values and prioritizes.

The interactions among peers in the classroom are a normal and essential part of the learning process that influence the lifelong learning habits of students. The potential effects of peer relationships are

reciprocal: Some students are more receptive than others. On one extreme, for example, is the student who values and seeks peer input on every decision; on the other is the social isolate who avoids interaction in and out of the classroom. This entry examines selected variables that can influence learners, including developmental differences, motivational and learning considerations, and the function of the classroom contexts.

### Peer Relationships

In a 1953 book, Henry Stack Sullivan outlined a developmental theory describing the changes in interpersonal needs as an individual matures. He observed that elementary school students tend to work with larger peer groups, which are usually the whole class with whom the young student spends their academic days. Classroom peer groups give way to same-sex "chums" in early adolescence. These same-sex chums fit the best friend/confidant role. Late-elementary and middle school students usually confine their social activities to include these one or two friends. High school and early adulthood individuals seek out and spend time with love interests who satisfy emotional and physical intimacy needs.

With entrance into education, the influence of the family plateaus, if not decreases, as the importance of peers increases. Adolescence marks the peak of peer influence. The demands and opinions of friends can overwhelm the needs of family and, at times, can overwhelm the individuals themselves. As the individual matures biologically and cognitively, the culture of education also changes, moving the student through a system marked by a single class in early elementary school to a system of hour-long classes in middle and high school. Student peer preferences also change during these years. Friendships of two to three students give way to larger group networks.

It comes as no surprise, then, that the relative consistency of peers allows them to take precedence over academics and educators in later education. In addition to school structure, factors such as biology, home life, and increased personal responsibilities have also been explanations for students' decreased academic motivation and increased receptivity to peer influence. Whatever the causes, the subculture of the peer group can be very telling in determining students' motivation to succeed in academics.

In short, the relative influence of peers or peer groups typically increases with the age and development of the student. So, too, do the multiple functions of peers increase. A younger student may be able to find the motivation and desire to learn apart from classmates and friends, looking instead to values from home and teacher. Older students are more apt to seek out those who have similar interests and values.

### **Motivation, Learning, and Relationships**

Age of the student is one consideration in weighing the importance and application of motivation to learn. Human relationships have varying degrees of importance in motivational and learning theories. Most approaches tend to agree, however, that students who surround themselves with peers and influences who value learning and the educational process will also value their own learning and strive to enhance their education.

Abraham H. Maslow viewed the need for love and belongingness as a step toward achievement in his hierarchy of motivation model, which he described in 1954. In this view, the deprivation of more basic needs hinders progress along the path to achievement. In Maslow's model, people must have love and belongingness issues satisfied in order to address needs of achievement. For example, a student with deprived relationship concerns will be less able to participate in classroom learning opportunities. The ability to learn is built on a foundation of comfortable relationships with others, including peers and family, and classroom learning is all about learning with and in the presence of others.

"Expectancy by value" theories define motivation as the product of the amount of success on a task that an individual expects to earn times the amount of value the individual places on the task. Thus, a task that the individual values and expects to be successful at will be motivating compared to a task with lower expected success or value. Whereas past experience can predict the expectancy aspect of this model (e.g., the student has done well on prior essay exams), the value placed on the task is more mediated by outside factors, such as peers and family (e.g., the student's opinions are respected). Related motivational theories include the incentive or rewarding aspects of motivation, which may also stem from relationships with others.

Behaviorism provides one way to explain the association between motivation to learn and peer

interactions. In basic behaviorist theories, relationships between people affect learning only as much as people reinforce each other (or not) in the academic arena. For example, if the peer group encourages education and learning, then the individual student within that group will value learning, because the individual is reinforced, or rewarded, for behavior that indicates that learning is valued. Students in peer groups that do not value education lack the stimulation and reinforcement needed to encourage personal learning. These peer groups presumably stimulate and reinforce other values.

Albert Bandura's social learning theory speaks precisely to the human interactions involved in learning. Observational, or "vicarious" learning is based upon learning by watching then "modeling" or acting similarly to others. If the student views and works with people who appreciate learning by engaging in learning activities, then the student too will engage in learning and might work harder at learning. Peers with positive attitudes and behaviors toward education will allow and teach each other to set goals that include opportunities to learn and achieve. If peer models do not convey positive attitudes toward learning, then the students observing these models will not prioritize learning in their own lives. They will learn to prioritize other goals.

In 1978 Lev Vygotsky also presented ideas on the facilitation of learning through experiences mediated by other people. In his explanations, the learner cannot reach full potential without the aid of others. The processes of guiding the learner to higher stages of cognitive functioning rely on interactive human relationships. Mentors—for example, teachers or more capable peers—can raise the student's competence through the zone of proximal development (ZPD). ZPD is defined as the gap between what a student can do alone and what the student can achieve with assistance. In this view assistance is transitional, a "scaffold" that is removed when it is no longer needed and the student has internalized another's support.

In sum, varied theories agree that the values and attitudes of the peer group are essential elements in motivation and learning. Students who surround themselves with academically focused, goal-oriented peers will be more likely to appreciate, internalize, and exhibit these features themselves.

## Classroom Dynamics

With consideration of these social determinants, how then can the educational process be structured to boost the learning of individuals? For younger students, providing a whole-class environment that enriches learning opportunities with teachers who model positive learning values will set the new learner on a path toward academic achievement. Encouraging elementary students to interact with peers, adults, and family members who have strong learning desires can support the students' development as learners. Although peer influences may not yet be as powerful as they will become in student achievement motivation, the effects of young students' interactions cannot be disregarded.

As the learner matures, the importance of how peers view the learner's actions and decisions may well supercede the opinions of others, possibly even the views of the learners themselves. The academic environment needs to be structured in a fashion that allows for student interaction but sets boundaries that afford pro-social behavior. Students who are concentrating on unresolved issues in their social life, whether these issues result from social isolation or from social or home crisis, will be less able to profit from classroom opportunities. Recognition of the strategic effort required to maintain classroom social and academic order can help both the learner and the teacher decide how to approach problems addressed in either domain.

Within the classroom, time and organization can be established to focus students on their learning. Pairing and grouping students by their devotion to academics, for example, may benefit all involved. Those who value learning can share their enthusiasm and act as mentors for those who have other priorities. Students who motivate themselves in nonacademic directions can view and appreciate the choices of peer learners.

These dynamics must include consideration of the types of classroom curricula. The well-known and intended analytic curriculum taught to pre-service educators and recorded in the lesson plans and assignments may easily disregard the underlying informal curriculum of social and human interaction. As Mary McCaslin and Tom L. Good noted in 1996, "Learning is socially situated" (p. 642); the achievement of the student is a small part of who the student is and what she does. The responsibilities of education include helping students recognize their

own place as social contributors and maximizing the resources available to them through interpersonal relationships. For example, cooperative learning and help-seeking behaviors are essential resources for students in the classroom that facilitate both student achievement and social competence. Some students and educators view help-seeking as a sign of dependence or weakness, but research supports the contention that help-seeking is a sign of social competence that increases students' chances of academic success. Negative attitudes toward help-seeking may discourage low-achieving students from approaching peers and teachers and may further isolate them. This is especially detrimental to older students.

Students are not isolated in the pursuit of knowledge. They are social beings who need to interact and establish social contacts. Social learning is as much a part of any classroom curriculum as the printed guidelines. At a minimum, the influence of peers and a student's relationships with them can be understood as a function of student age, motivation, learning, and classroom opportunities.

## **PEOPLE WITH DISABILITIES, FEDERAL PROGRAMS TO ASSIST**

Programs to assist people with disabilities initiated by the federal government in the early decades of the twentieth century were designed strictly with vocational rehabilitation in mind, that is, with an emphasis on assisting men injured in military service or work-related injuries to sufficiently overcome disabling conditions to return to the work force. Other programs were developed to provide income assistance to workers who were temporarily or permanently disabled and unable to earn an income. The last decades of the twentieth century increased the magnitude of federal programs to protect the rights of people with disabilities in such areas as employment, education, public transportation, and building accessibility. (The term *disability* instead of *handicap* and the phrase *individual with a disability* instead of *individual with handicaps* reflects legislative language and accepted terminology in the late twentieth and early twenty-first centuries. As with racial and ethnic epithets, the choice of terms to apply to a person with a disability is overlaid with stereotypes, patronizing attitudes, and other emotional connotations. Many individuals with disabilities, and organizations representing such individuals, object to the use of such phrases as *handicapped person* or *the handicapped*. Congress has recognized this shift in terminology in all legislative actions since about 1990.)

### **Federal Vocational Rehabilitation Programs**

The earliest federal programs created to develop some level of aid for people with disabilities date to the period following World War I. The Smith-Sears Veterans' Rehabilitation Act of 1918 initiated a program to vocationally rehabilitate veterans who were disabled during the war. The Smith-Fess Act of 1920 (the Civilian Vocational Rehabilitation Act) established the first broad-based federal program to provide vocational assistance to people whose disabilities were not the result of war. This program provided federal funds at a 50 percent matching rate to state rehabilitation agencies for counseling, vocational training, and job placement services for people with physical disabilities.

After the 1920s federal rehabilitation systems initially conceived to serve injured veterans expanded in magnitude. The Social Security Act of 1935 gave permanent status to these federal programs for the first time. Subsequent legislative changes expanded the nature of vocational rehabilitation programs, including the provision of medical services and prosthetic devices; creation of programs to serve people with mental disabilities, migratory workers, and disadvantaged youth; and provision of assistance to families of people with disabilities. The focus of vocational rehabilitation programs remains true to its original foundation of attaining and maintaining employment, although the definition of employment has expanded to support efforts of people with disabilities to gain access to their communities, live independently, and direct the course of their own lives.

### **Federal Income Support for People with Disabilities**

As the United States became more industrialized and sophisticated in its understanding of the role of the federal and state governments in increasing the American standard of living, services for people with disabilities also developed beyond their original mission to include programs that provided support through direct income subsistence to individuals born with disabilities. The Social Security Act of 1935 provided funds to states to assist indigent dependent children, elderly adults, and people who are blind. In the early 1930s, people who were blind, and shortly thereafter, those who were deaf, were the first disability advocates to organize and work collectively to advance their own positions at the federal level. For this reason, the first disability-related institu-

tions in many states, including disability-specific schools, were those that served people who were blind or deaf. While the act also initiated unemployment and old age insurance programs, it did not create a permanent program of disability insurance, although the idea was considered at the time.

As with other disability programs, amendments to the original legislation served to expand the program, in this case by removing the age limitation for eligibility and changing the definition of disability in the Social Security Act. In 1972 Congress created another federal income support program, Supplemental Security Income, that authorized uniform national benefits for people with disabilities, regardless of geographic location. Thus, the next stages in federal involvement led to the beginning of financial assistance and the right of children with disabilities to public education.

### **Federal Involvement in Access to Education for Children with Disabilities**

Federal government involvement in educating children with disabilities generally parallels the development of federal support for elementary and secondary education as a whole. Until the 1960s elementary and secondary education was viewed almost entirely as a state and local function and federal intervention was almost nonexistent. The Elementary and Secondary Education Act (ESEA) of 1965 (Pub. L. 80-10) was amended in 1966 to specifically provide federal support for the education of children with disabilities through the creation of Title VI. Title VI authorized funds to assist states in the initiation, expansion, and improvement of programs for the education of children with disabilities. Over the next five years, interest groups representing children with disabilities amassed major political support sufficient to expand federal involvement.

The legal underpinnings of the right to education for children with disabilities stems from the civil rights movement and the landmark *Brown v. Board of Education* (1954) and the Civil Rights Acts of 1964 and 1968. By the early 1970s the foundation was established for federal legislation ensuring the special education of disabled children. Active litigation and legislative efforts enacted from 1964 to 1974 produced strong legal and political support for expanded federal oversight of the education of children with disabilities, most significantly through *Pennsylvania Association for Retarded Children (PARC) v. Commonwealth of Pennsylvania* and *Mills v. Board of Edu-*

*cation of the District of Columbia*. The Rehabilitation Act of 1973 provided the initial protections to children with disabilities in public schools. This act requires nondiscrimination on the basis of disability in all federally conducted and assisted programs. State and local educational agencies (i.e., public school districts) that receive federal funding are required to provide programmatic access for children and others with disabilities. The Rehabilitation Act did not mandate special education services, but set the foundation of civil rights protections for people with disabilities.

The late 1960s and early 1970s saw a dramatic increase in federal involvement for children with disabilities. In 1966 the Bureau of Education of the Handicapped was created within the Office of Education and in 1975 the Education for All Handicapped Children Act (EAHCA; Pub. L. 94-142) was enacted for the education of children with disabilities needing special education and related services. Since 1975 EAHCA, now renamed the Individuals with Disabilities Education Act (IDEA), has evolved and remains the most significant legislation for special education.

IDEA mandates “a free appropriate public education” for all children with disabilities that require special education services. All fifty states, the District of Columbia, and freely associated states accept federal funding under IDEA and are thus compelled to implement all of IDEA’s requirements. IDEA specifies that children with disabilities be educated in the “least restrictive environment” with their nondisabled peers to the maximum extent appropriate. IDEA serves all eligible children with disabilities from birth through age twenty-one, and moves beyond the traditional school-age population aged five to seventeen or eighteen. IDEA extends federally mandated education to all children with disabilities from birth through age three through early intervention services and to young adults with disabilities aged eighteen to twenty-one who have not graduated with a regular high school diploma.

IDEA, together with the Rehabilitation Act of 1973 and the Americans with Disabilities Act of 1990 (ADA; Pub. L. 101-336), represent the world’s most comprehensive civil rights initiatives, providing inclusion in regular educational environments for children with disabilities in public and private elementary and secondary education and for adults with disabilities in public and private colleges and universities in the United States. An exception ap-

plies to religiously affiliated or controlled schools, which may be exempt from coverage depending on the specific circumstances.

ADA extends the right to public and private education for all individuals with disabilities in previous areas not covered by federal law, such as activities open to parents or other individuals with disabilities, graduation ceremonies, parent-teacher organization meetings, plays, and adult education classes regardless of the source of funding.

## PERSONAL AND PSYCHOLOGICAL COUNSELING AT COLLEGES AND UNIVERSITIES

---

College and university students must adapt to environments plagued by rapid change, ambiguity, uncertainty, and depleted support systems. Students must also cope with a myriad of personal and psychological problems that range from basic adjustment and developmental, academic and learning, and career concerns to clinical-level mental illness. Within higher education, there exists general consensus that the ubiquitous role of personal and psychological counseling is to contribute to student development, adjustment, and learning while preventing dangerous and self-defeating behavior, thus enabling the individual to thrive in the college community. The mechanisms that colleges and universities utilize to achieve this goal vary dramatically from one institution to another, depending heavily on the institution's philosophy or mission, available resources, and campus need.

American colleges and universities confront the daunting task of serving the needs of a highly diverse campus. Within this environment, personal and psychological counseling incorporates an expanded interpretation of its role and responsibility. A comprehensive view of counseling within higher education reveals a set of role domains that include psychotherapy, career, academic and learning, and educational and psychological outreach. Not all institutions of higher education share this systemic perspective. Some schools define counseling within the strict confines of academics, devoid of a mental health dimension, offering only educational, career, and developmental services. Others adopt a more inclusive perspective of counseling in higher education—one that incorporates all domains. This holistic view of counseling enables services to reach and assist a vast majority of the campus community while contributing to an environment of support and encouragement.

#### Psychotherapy

Students arrive on campus with personal and psychological problems centered on dysfunctional family situations; anxiety around social, academic, and career concerns; and mental health issues. For many students, transition and adjustment to college is

marked by debilitating stress and anxiety. Deleterious effects result from personal and psychological problems stemming from these experiences and often manifest during the college experience, requiring psychotherapeutic attention. At an alarming rate, students are also experiencing serious mental disorders diagnosed prior to or following their admittance to college. Mood, anxiety, eating, substance, or other disorders complicate adjustment and the ability to meet personal, familial, and collegiate expectations.

The traditional-aged student typically presents developmental, career, and adjustment issues and crises. Identity development, sexuality, intimacy, relationships, substance use, grief and loss, family dysfunction, and values clarification denote challenges this group encounters. Generally, the adult returning student tackles different dilemmas, which focus on stress and time management, career and life transition and changes, family and relationship issues, and financial stress. Minority and other groups on campus require continual attention and support pertaining to such issues as racism, discrimination, marginalization, and academic and social integration.

Personal and psychological problems interfere with innumerable aspects of a student's life, causing significant impairment and distress. Attending to these mental health concerns, psychotherapy represents a viable mechanism in providing support and guidance across cognitive, affective, and spiritual dimensions within a confidential and safe environment. Utilizing individual, group, couples, and children and family counseling opportunities, therapists attend to the whole individual. Assessment, referral, and treatment extend the mental health counselor's ability to meet students' disparate needs. Collaborations with community mental health providers, support groups, and Twelve Step programs allow students to access services the college or university does not furnish.

### **Academics and Learning**

The general role of counseling, within the realm of academic and learning, is to improve academic proficiency. Programming and support services place considerable attention on strengthening basic reading and writing skills, while addressing issues of time management, test taking, comprehension and retention, and study strategies. With the advent of novel research aimed at enhancing campus programming

and student services, diagnostic criterion and tools, supportive programs, and medication, students diagnosed with varying degrees of learning disabilities and attention-deficit disorders are better equipped to successfully matriculate and prosper in higher education. Encouraging student interactions with academic advisers, faculty, and campus learning centers significantly strengthens a student's chances of being successful and contributes to a student sense of academic and social connection.

### **Career Counseling**

Counseling on a college and university campus inevitably involves issues encompassing career and vocational exploration. Within this domain, counseling assists individuals in selecting an area of study, choosing a career, or clarifying attributes that facilitate or detract from their present work. Exploration of personal values, goals, and characteristics, combined with assessments of career interests, enhance the student's successful transition through higher education. Facilitating student-faculty interactions represents another essential facet of career counseling. Such significant relationships are positively associated with changes in students' occupational values.

### **Educational and Psychological Outreach**

Educational and psychological outreach is critical if college counselors desire to serve as initiators and catalysts for change on the campus and in surrounding communities. Education and prevention comprise the foundation of outreach initiatives. Via thematic presentations, decimation of educational materials, special events, and educational programs counselors effectively address topics such as stress and time management, eating disorders, substance abuse, depression, study skills, career issues, and cross-cultural adjustment.

College counseling services typically acknowledge the scope of problems for which students seek assistance, yet disagree as to the resource feasibility and the level of responsibility schools have in meeting all these counseling provisions. Balancing the needs of traditional-aged students, returning adult students, minority students, and other groups represents a challenging and resource-exhaustive process.

The prevalence of developmental and adjustment problems as well as various forms and degrees of mental illness on college and university campuses cannot be ignored. Within the context of higher ed-

ucation, the role counseling assumes depends largely on the specific needs of the individual and the broad requirements of the campus community. Abetting student adjustment, development, and learning, counseling provides the means for clients to explore problems related to normal developmental issues such as careers, academics and learning, relationships, and identity. For a large number of students, problems of mental illness require more intensive therapy in order to maneuver life's daily tasks and successfully meet personal, parental, and school expectations. In recognizing the comprehensive role of personal and psychological counseling in higher education, colleges and universities substantially counteract student's perception of academic, social, and personal isolation by addressing all facets of the human being.

## PERSONAL AND PSYCHOLOGICAL PROBLEMS OF COLLEGE STUDENTS

An increasing amount of attention is being directed to the transition to higher education as experienced by traditional-age and adult students. It is a movement that incorporates a great deal of stress and challenge. Although some students are able to experience this transition as a challenge to personal growth, other students are overwhelmed by the changes and experience emotional maladjustment and depression.

Issues of adjustment and general development require persistent attention by campus professionals due to the immediate relevance to college success. Complex psychological histories often underpin these problems, further complicating treatment. These difficulties are often present as inefficiencies in coping with familial separation, time and stress management, basic study techniques, goal setting, relationship formation, handling emotions, and self-esteem crystallization. Personal, academic, social, and professional success depend on the student's ability to manage these aspects of their lives.

### Family Dynamics

Families in the United States are experiencing significant stress and functional discourse marked by unparalleled changes in family structures. The home environment for many young people represents a place of instability and emotional upheaval where security, caring, and nurturing are depleted or non-existent. Separation, divorce, death, or abandonment removes one or both parents from the family. The lack of attention and affection that may accompany such change adversely impacts children. Subsequent emotional and financial difficulties of a single parent household further strain the family dynamic.

Substance abuse; domestic violence; emotional, physical, and sexual abuse; and mental illness plague some families. At an alarming rate, young people enter higher education with dysfunctional family backgrounds that evoke stress and trepidation in students. For children of alcoholics, for example, the college social climate that is impressed by alcohol use produces significant anxiety as the student grapples with the personal and familial implications of watching and participating in drinking practices. It is imperative that schools recognize the existence

and impact of family discourse and childhood trauma on students, and provide them with the support necessary to enable them to cope with their situations and succeed within the collegiate environment.

### **Depression**

With a lifetime prevalence rate of 17 percent in the general population, a significant number of men and women suffer from a clinical episode of depression at some time in their lives, according to Chris Segrin and Jeanne Flora in 2000. An estimated 7 million women and 3.5 million men can be diagnosed with major depression in the United States; similar numbers are diagnosed as experiencing dysthymia, or minor depressive symptoms. College students are twice as likely to have clinical depression compared to people of similar ages and backgrounds in the workforce, according to Wayne A. Dixon and Jon K. Reid in 2000.

Depression manifests in varying degree from general symptomology to a clinical disorder. Symptoms occur in four general domains of human functioning: emotional, cognitive, physical, and behavioral, with mood disturbance being the predominant feature. Typical symptoms of depression include a change in appetite or weight, sleep, and psychomotor activity; decreased energy; feelings of worthlessness or guilt; difficulty thinking, concentrating, or making decisions; or recurrent thoughts of death or suicidal ideation. Anhedonia, or a loss of interest in activities that were once considered pleasurable, accompany social withdrawal. Depression is a risk factor for a number of other negative health outcomes including diminished immune function and poor illness recovery.

Depression constitutes a problem of enormous personal and social significance, and its impact on American college students is indisputable. Depression interferes with intra- and interpersonal processes, academic and social integration, and retention. Some depressed individuals may evince a hostile, uncooperative, and self-criticizing interpersonal style eliciting negative responses from others. Poor social skills and social acuity are thought to make people vulnerable to the onset of depressive symptomology and other psychosocial problems pursuant to the experience of negative stressful life events.

### **Eating Disorders**

Typically developing between the ages of twelve and twenty-five, eating disorders are a life-threatening

reality for 5 to 10 percent of American women and girls past puberty. An estimated 64 percent of college women exhibit some degree of eating disorder behavior, a situation that pushes the body image issue to the forefront of concern in higher education. Although most people diagnosed with anorexia or bulimia nervosa are women, men also suffer from these disorders.

Problematic eating behavior is best conceptualized on a continuum that illustrates the range of eating behavior from normal to weight-preoccupied to chronic dieter to subthreshold bulimia/anorexia and full bulimia/anorexia. Compulsive dieting and over-eating behaviors fail to meet the clinical criteria for a label of disorder. These practices, however, often intensify and reach eating disorder status.

Eating disorders stem from a complex interaction of biological, psychological, sociological, spiritual, and cultural factors. American culture's emphasis on thinness and physical beauty, the prevalence of dieting, myths about food and nutrition, and perfectionistic expectations contribute to this growing problem. Eating disorders often start when an individual experiences a major problem and feels helpless and out of control. It is not uncommon for a student suffering from an eating disorder to report a personal or family history of eating or mood disorders. They typically possess a character profile of achievement-oriented personality, low self-esteem, and drive for perfectionism. Obsession, loneliness, anxiety, depression, guilt, fear of sexual maturation, and feelings of inadequacy are psychological correlates often associated with problematic eating behaviors.

### **Substance Use**

Alcohol, tobacco, and other drug use on college and university campuses poses tremendous concern for parents, students, higher education professionals, governmental officials, and the general community. No school is immune to substance use and resulting adverse consequences. Alcohol, tobacco, and marijuana are the most commonly used drugs on college campuses, but this use encompasses drugs of varying forms including amphetamine, caffeine, cocaine, hallucinogen, inhalants, opioid, phencyclidine, sedative, hypnotic, anxiolytic, steroids, and polysubstances. An essential feature of substance abuse is a maladaptive pattern of substance use leading to recurrent and clinically significant impairment or adverse consequences. Substance use and abuse are

characterized by noted inefficiencies in life functioning, impaired relationships, high-risk behavior, and recurrent legal troubles. Substance dependency emerges from repeated use of the substance despite significant problems related to its use.

Substance abuse appears to be etiologically linked to “complex interactions of genetic predisposition, psychological vulnerability, and sociocultural influences” (Archer and Cooper, p. 77). Extensive family history of addiction, poor self-esteem, negative emotional orientation, and few coping skills actively play a role in substance dependency. Skewed perceptions of social norms, peer values and behaviors, and pre-college substance use influence a student’s use patterns. Many students who abuse substances are unready to recognize how their life is being adversely affected by their use, and believe substance use to be a part of normal development and experimentation.

The negative effects of student substance use are not campus centered, and impact both the campus and wider communities. Substance use is associated with increased absenteeism from class and poor academic performance. The majority of injuries, accidents, vandalism, sexual assaults and rape, fighting, and other crime on- and off-college campus are linked to alcohol and other drug use. Unplanned and uninhibited sexual behavior may lead to pregnancy, exposure to sexually transmitted diseases, and HIV/AIDS. Driving under the influence, tragic accidents, alcohol poisoning, overdosing, and even death from accidents, high-risk behaviors, and suicide carry tremendous, life-threatening implications for all involved. Tobacco use is associated with severe health risks and illness, physical inefficiency, and even death. Fires caused by careless smoking practices place all students at risk.

Students who abstain, use legally, or use in moderation often suffer secondhand effects from the behaviors of students who use substances in excess. Nonbinging and abstaining students may become the targets of insults and arguments, physical assaults, unwanted sexual advances, vandalism, and humiliation. Sleep deprivation and study interruption results when these students find themselves caring for intoxicated students.

### **Other Psychological Disorders**

Summer M. Berman and colleagues estimated in 2000 that 37 percent of Americans between the ages

of fifteen and twenty-four, many of whom are college students, have a diagnosable mental illness. The fact that the age of onset for many major illnesses is the years from eighteen to twenty-four, the range in which most traditional-age students fall, further complicates the matter. Higher education must realize that a large percentage of college students are, or will be, affected by mental illness. These disorders range from mild and short-lived to chronic and severe, including such illnesses as depression, anxiety, schizophrenia, and bipolar disorder, and appear at varying rates on campuses.

The early-twenty-first-century student brings a set of experiences and personal and psychological problems that may predispose them to mental illness. It is not unusual for a college counseling and mental health center to diagnose students with anxiety, mood, eating, impulse-control, personality, substance-related or other mental disorders. Students may enter college with challenges originating from learning, attention-deficit, and disruptive behavior disorders that are first diagnosed in infancy, childhood, or adolescence. Dual diagnosis further complicates students’ social and academic integration and success.

If detected, most mental illnesses are treatable or manageable, allowing the individual to proceed effectively through life’s daily routines. Unfortunately, many cases are not diagnosed or treated, and the consequences for the college student are life altering. Many students diagnosed with mental illness withdraw from college before earning a bachelor’s degree; however, with proper attention and support they may have been successful in the collegiate environment.

### **Campus Services**

The services that institutions provide to address students’ personal and psychological problems depend heavily on the school’s philosophy, available resources, and campus need. Colleges and universities of all types should develop and implement confidential services that span multiple policy arenas in order to sufficiently address these problems. Creating partnerships with various facets of the institution, such as the college counseling and mental health center, student health services, women’s center, learning center, spiritual and religious organizations, and other associations, expands the scope of programs offered and students affected.

Comprehensive initiatives that incorporate the domains of psychotherapy, treatment, prevention, outreach, academics and learning, and career, enable institutions of higher education to sufficiently ensure that services are meeting the diverse personal and psychological needs of students. Individual, group, couples, and children and family counseling opportunities address issues related to family, relationship, and personal dynamics. Psychological, neuropsychological, alcohol and drug, and career assessments provide information necessary to better serve the student. Colleges and universities also disperse self-help and educational materials as well as employ standardized programs and interactive computer systems. Schools may outsource counseling services or develop a referral system to direct students to services offered in the community. Connections with twelve step and support groups within the community further assist students. Outreach within and outside the campus enables schools to educate society about the issues surrounding personal and psychological problems and programs.

LEIGH Z. GILCHRIST

#### PESTALOZZI, JOHANN (1746-1827)

In the history of education, the significant contributions of Johann Heinrich Pestalozzi are (1) his educational philosophy and instructional method that encouraged harmonious intellectual, moral, and physical development; (2) his methodology of empirical sensory learning, especially through object lessons; and (3) his use of activities, excursions, and nature studies that anticipated Progressive education.

#### Career and Development of Educational Theory

The development of Pestalozzi's educational theory is closely tied to his career as an educator. Born in Zurich, Switzerland, Pestalozzi was the son of Johann Baptiste Pestalozzi, a middle-class Protestant physician, and Susanna Hotz Pestalozzi. Pestalozzi's grandfather, Andreas Pestalozzi, a minister in the rural village of Hongg, inspired his evolving philanthropic mission to uplift the disadvantaged Swiss peasantry.

Pestalozzi, who had an overly protected and isolated childhood, considered himself to be socially inept and physically uncoordinated as an adult. His formal education was in institutions in Zurich. He first attended a local primary school and then took the preparatory course in Latin and Greek at the Schola Abbatissana and the Schola Carolina. His higher education was at the Collegium Humanitatis and the Collegium Carolinum, where he specialized in languages and philosophy.

With other university students, Pestalozzi was influenced by Jean Jacques Bodmer, an historian and literary critic, whose reformist ideology urged regenerating Swiss life by renewing the rustic values of the Swiss mountaineers. Pestalozzi joined the Helvetic Society, an association committed to Bodmer's ideals, and wrote for *The Monitor*, a journal critical of Zurich's officials. Pestalozzi was jailed briefly for his activities, which the authorities deemed subversive.

In 1767 Pestalozzi studied scientific agriculture with Johann Rudolf Tschiffeli, a physiocrat and experimental farmer near Kirchberg. Pestalozzi married Anna Schulthess, daughter of an upper-middle-class Zurich family in 1769. His only child, named Jean Jacques after Rousseau, was born in 1770. After using Rousseau's work *Émile* as a guide to educating his son, Pestalozzi revised Rousseau's method in *How Father Pestalozzi Instructed His Three and a Half Year Old Son* (1774). Though still committed to Rousseau's natural education, Pestalozzi began to base instruction on a more empirically based psychology.

In 1774 Pestalozzi established his first institute, a self-supporting agricultural and handicraft school at Neu Hof. At its height, the school enrolled fifty pupils, many of whom were indigent or orphaned. Here, Pestalozzi devised *simultaneous instruction*, a group method to teach reading, writing, and arithmetic. However, financial indebtedness forced the school's closing in 1779.

Pestalozzi published *Leonard and Gertrude*, a popular didactic novel in 1781, which was followed by a less successful sequel, *Christopher and Elizabeth* in 1782. Between 1782 and 1784 he wrote educational essays for *Ein Schweizer Blatt*, the Swiss newspaper. His *On Legislation and Infanticide*, (1783), condemned killing or abandoning unwanted children. He wrote two children's books: *Illustrations for My ABC Book* (1787) and *Fables for My ABC Book*

(1795). Pestalozzi's *Researches into the Course of Nature in the Development of the Human Race* (1797) was a pioneering work in educational sociology.

Pestalozzi re-entered active educational service in 1799 when the Napoleonic-backed Helvetic Republic appointed him director of the orphanage at Stans. Here, he developed his concept of a residential school in which children were educated within an emotionally secure setting. Operating for less than a year, the orphanage closed when French and Austrian armies battled in its vicinity.

Pestalozzi then conducted a residential and teacher training school at Burgdorf from 1800 to 1804. He trained such educators as Joseph Neef, who would introduce Pestalozzianism to the United States, and Friedrich Froebel, the kindergarten's founder.

Pestalozzi's most systematic work, *How Gertrude Teaches Her Children* (1801) was a critique of conventional schooling and a prescription for educational reform. Rejecting corporal punishment, rote memorization, and bookishness, Pestalozzi envisioned schools that were homelike institutions where teachers actively engaged students in learning by sensory experiences. Such schools were to educate individuals who were well rounded intellectually, morally, and physically. Through engagement in activities, students were to learn useful vocations that complemented their other studies.

Pestalozzi's method rested on two major premises: (1) children need an emotionally secure environment as the setting for successful learning; and (2) instruction should follow the generalized process of human conceptualization that begins with sensation. Emphasizing sensory learning, the special method used the *Anschauung* principle, a process that involved forming clear concepts from sense impressions. Pestalozzi designed object lessons in which children, guided by teachers, examined the form (shape), number (quantity and weight) of objects, and named them after direct experience with them. Object teaching was the most popular and widely adopted element of Pestalozzianism.

Pestalozzi developed two related phases of instruction: the general and special methods. The general method in which teachers were to create an emotionally secure school environment was a necessary condition for implementing the special method. Emphasizing sensory learning, the special method, using the *Anschauung* principle, involved forming

clear concepts from sense impressions. Pestalozzi designed an elaborate series of graded object lessons, by which children examined minerals, plants, and animals and human-made artifacts found in their environment. Following a sequence, instruction moved from the simple to the complex, the easy to the difficult, and the concrete to the abstract.

Pestalozzi's object lessons and emphasis on sense experience encouraged the entry of natural science and geography, two hitherto neglected areas, into the elementary school curriculum. On guided field trips, children explored the surrounding countryside, observing the local natural environment, topography, and economy. A further consequence of Pestalozzi's work was the movement to redirect instruction from the traditional recitation in which each child recited a previously assigned lesson to simultaneous group-centered instruction.

In 1804 Pestalozzi relocated his institute to Yverdon, where he worked until 1825. He died on February 17, 1827 and was buried at Neuhof, site of his first school.

### Diffusion of Educational Ideas

Pestalozzianism was carried throughout Europe and America by individuals he had trained as teachers and by visitors who were impressed with his method. After Gottlieb Fichte promoted Pestalozzianism in his *Addresses to the German Nation* in 1808, Prussia incorporated selected elements of Pestalozzi's method in its educational reform of 1809 and dispatched teachers to study with him. In the United Kingdom, the Home and Colonial School Society in 1836 established a Pestalozzian teacher training school.

William Maclure, a philanthropist and natural scientist, began Pestalozzianism's introduction to the United States in 1806, when he subsidized Neef's school near Philadelphia. Neef's *A Sketch of a Plan and Method of Education* (1808) and *The Method of Instructing Children Rationally in the Arts of Writing and Reading* (1813) promoted Pestalozzian education in the United States. Under Maclure's auspices, Neef, Marie Duclos Fretageot, and William D'Arusmont conducted Pestalozzian schools at Robert Owen's communitarian experiment at New Harmony, Indiana, from 1824 to 1828.

Other American proponents of Pestalozzianism were Henry Barnard and Edward A. Sheldon. Barnard (1811–1900), a common school leader and U.S. Commissioner of Education, endorsed Pestalozzian

education in *Pestalozzi and Pestalozzianism* (1859). Sheldon (1823–1897) incorporated the Pestalozzian object lesson in the teacher education program at the Oswego normal school in New York. In 1865 a report of the National Teachers' Association endorsed object teaching.

Certain Pestalozzian elements could be found among American progressive educators of the late nineteenth and early twentieth centuries who, like Pestalozzi, opposed traditional schools' formalism and verbalism and emphasized children's interests and needs. Such educational emphases as the *child-centered school*, *child permissiveness*, and *hands-on process learning* had their origins with Pestalozzi.

Pestalozzi's paramount contribution to education was his general philosophy of *natural education* that stressed the dignity of children and the importance of actively engaging children in using their senses to explore the environment.

Specifically, his legacy to later educators was his emphasis on children's holistic physical, mental and psychological development; his emphasis on empirical learning; his reforms of elementary and teacher education; and his anticipation of child-centered progressivism.

# PHILOSOPHY OF EDUCATION

## HISTORICAL OVERVIEW

William K. Frankena

## CURRENT TRENDS

Nicholas C. Burbules

Nathan Raybeck

## HISTORICAL OVERVIEW

The word *education* is used sometimes to signify the activity, process, or enterprise of educating or being educated and sometimes to signify the discipline or field of study taught in schools of education that concerns itself with this activity, process, or enterprise. As an activity or process, education may be formal or informal, private or public, individual or social, but it always consists in cultivating dispositions (abilities, skills, knowledges, beliefs, attitudes, values, and character traits) by certain methods. As a discipline, education studies or reflects on the activity or enterprise by asking questions about its aims, methods, effects, forms, history, costs, value, and relations to society.

### Definition

The philosophy of education may be either the philosophy of the process of education or the philosophy of the discipline of education. That is, it may be part of the discipline in the sense of being concerned with the aims, forms, methods, or results of the process of educating or being educated; or it may be metadisciplinary in the sense of being concerned with the concepts, aims, and methods of the discipline. However, even in the latter case it may be thought of as part of the discipline, just as metaphilosophy is thought of as a part of philosophy, although the philosophy of science is not regarded as a part of science. Historically, philosophies of education have usually taken the first form, but under the influence of analytical philosophy, they have sometimes taken the second.

In the first form, philosophy of education was traditionally developed by philosophers—for example, Aristotle, Augustine, and John Locke—as part of their philosophical systems, in the context of their ethical theories. However, in the twentieth century philosophy of education tended to be developed in schools of education in the context of what is called *foundations of education*, thus linking it with other parts of the discipline of education—educational history, psychology, and sociology—rather than

with other parts of philosophy. It was also developed by writers such as Paul Goodman and Robert M. Hutchins who were neither professional philosophers nor members of schools of education.

### Types

As there are many kinds of philosophy, many philosophies, and many ways of philosophizing, so there are many kinds of educational philosophy and ways of doing it. In a sense there is no such thing as *the* philosophy of education; there are only philosophies of education that can be classified in many different ways.

Philosophy of education as such does not describe, compare, or explain any enterprises to systems of education, past or present; except insofar as it is concerned with the tracing of its own history, it leaves such inquiries to the history and sociology of education. Analytical philosophy of education is *meta* to the discipline of education—to all the inquiries and thinking about education—in the sense that it does not seek to propound substantive propositions, either factual or normative, about education. It conceives of its task as that of analysis: the definition or elucidation of educational concepts like teaching, indoctrination, ability, and trait, including the concept of education itself; the clarification and criticism of educational slogans like “Teach children, not subjects”; the exploration of models used in thinking about education (e.g., growth); and the analysis and evaluation of arguments and methods used in reaching conclusions about education, whether by teachers, administrators, philosophers, scientists, or laymen.

To accomplish this task, analytical philosophy uses the tools of logic and linguistics as well as techniques of analysis that vary from philosopher to philosopher. Its results may be valued for their own sake, but they may also be helpful to those who seek more substantive empirical or normative conclusions about education and who try to be careful about how they reach them. This entry is itself an exercise in analytical philosophy of education.

Normative philosophies or theories of education may make use of the results of such analytical work and of factual inquiries about human beings and the psychology of learning, but in any case they propound views about what education should be, what dispositions it should cultivate, why it ought to cultivate them, how and in whom it should do so,

and what forms it should take. Some such normative theory of education is implied in every instance of educational endeavor, for whatever education is purposely engaged in, it explicitly or implicitly assumed that certain dispositions are desirable and that certain methods are to be used in acquiring or fostering them, and any view on such matters is a normative theory of philosophy of education. But not all such theories may be regarded as properly philosophical. They may, in fact, be of several sorts. Some simply seek to foster the dispositions regarded as desirable by a society using methods laid down by its culture. Here both the ends and the means of education are defined by the cultural tradition. Others also look to the prevailing culture for the dispositions to be fostered but appeal as well to experience, possibly even to science, for the methods to be used. In a more pluralistic society, an educational theory of a sort may arise as a compromise between conflicting views about the aids, if not the methods, of education, especially in the case of public schools. Then, individuals or groups within the society may have conflicting full-fledged philosophies of education, but the public philosophy of education is a working accommodation between them. More comprehensive theories of education rest their views about the aims and methods of education neither on the prevailing culture nor on compromise but on basic factual premises about humans and their world and on basic normative premises about what is good or right for individuals to seek or do. Proponents of such theories may reach their premises either by reason (including science) and philosophy or by faith and divine authority. Both types of theories are called philosophies of education, but only those based on reason and philosophy are properly philosophical in character; the others might better be called theologies of education. Even those that are purely philosophical may vary in complexity and sophistication.

In such a full-fledged philosophical normative theory of education, besides analysis of the sorts described, there will normally be propositions of the following kinds:

1. Basic normative premises about what is good or right;
2. Basic factual premises about humanity and the world;
3. Conclusions, based on these two kinds of premises, about the dispositions education should foster;

4. Further factual premises about such things as the psychology of learning and methods of teaching; and
5. Further conclusions about such things as the methods that education should use.

For example, Aristotle argued that the Good equals happiness equals excellent activity; that for a individual there are two kinds of excellent activity, one intellectual (e.g., doing geometry) and one moral (e.g., doing just actions); that therefore everyone who is capable of these types of excellent activity should acquire a knowledge of geometry and a disposition to be just; that a knowledge of geometry can be acquired by instruction and a disposition to be just by practice, by doing just actions; and that the young should be given instruction in geometry and practice in doing just actions. In general, the more properly philosophical part of such a full normative theory of education will be the proposition it asserts in (1), (2), and (3); for the propositions in (4) and hence (5) it will, given those in (3), most appropriately appeal to experience and science. Different philosophers will hold different views about the propositions they use in (1) and (2) and the ways in which these propositions may be established.

Although some normative premises are required in (1) as a basis for any line of reasoning leading to conclusions in (3) or (5) about what education should foster or how it should do this, the premises appearing in (2) may be of various sorts—empirical, scientific, historical, metaphysical, theological, or epistemological. No one kind of premise is always necessary in (2) in every educational context. Different philosophers of education will, in any case, have different views about what sorts of premises it is permissible to appeal to in (2). All must agree, however, that normative premises of the kind indicated in (1) must be appealed to. Thus, what is central and crucial in any normative philosophy of education is not epistemology, metaphysics, or theology, as is sometimes thought, but ethics, value theory, and social philosophy.

### Role

Let us assume, as we have been doing, that philosophy may be analytical, speculative, or narrative and remember that it is normally going on in a society in which there already is an educational system. Then, in the first place, philosophy may turn its attention to education, thus generating philosophy of

education proper and becoming part of the discipline of education.

Second, general philosophy may be one of the subjects in the curriculum of higher education and philosophy of education may be, and presumably should be, part of the curriculum of teacher education, if teachers are to think clearly and carefully about what they are doing.

Third, in a society in which there is a single system of education governed by a single prevailing theory of education, a philosopher may do any of four things with respect to education: he may analyze the concepts and reasoning used in connection with education in order to make people's thinking about it as clear, explicit, and logical as possible; he may seek to support the prevailing system by providing more philosophical arguments for the dispositions aimed at and the methods used; he may criticize the system and seek to reform it in the light of some more philosophical theory of education he has arrived at; or he may simply teach logic and philosophy to future educators and parents in the hope that they will apply them to educational matters.

Fourth, in a pluralistic society like the United States, in which the existing educational enterprise or a large segment of it is based on a working compromise between conflicting views, a philosopher may again do several sorts of things. He may do any of the things just mentioned. In the United States in the first half of the twentieth century professional philosophers tended to do only the last, but at the end of the twentieth century they began to try to do more. Indeed, there will be more occasions for all of these activities in a pluralistic society, for debate about education will always be going on or threatening to be resumed. A philosopher may even take the lead in formulating and improving a compromise theory of education. He might then be a mere eclectic, but he need not be, since he might defend his compromise plan on the basis of a whole social philosophy. In particular, he might propound a whole public philosophy for public school education, making clear which dispositions it can and should seek to promote, how it should promote them, and which ones should be left for the home, the church, and other private means of education to cultivate. In any case, he might advocate appealing to scientific inquiry and experiment whenever possible. A philosopher may also work out a fully developed educational philosophy of his own and start an experimental school in which to put it into practice, as John Dewey did;

like Dewey, too, he may even try to persuade his entire society to adopt it. Then he would argue for the desirability of fostering certain dispositions by certain methods, partly on the basis of experience and science and partly on the basis of premises taken from other parts of his philosophy—from his ethics and value theory, from his political and social philosophy, or from his epistemology, metaphysics, or philosophy of mind.

It seems plausible to maintain that in a pluralistic society philosophers should do all of these things, some one and some another. In such a society a philosopher may at least seek to help educators concerned about moral, scientific, historical, aesthetic, or religious education by presenting them, respectively, with a philosophy of morality, science, history, art, or religion from which they may draw conclusions about their aims and methods. He may also philosophize about the discipline of education, asking whether it is a discipline, what its subject matter is, and what its methods, including the methods of the philosophy of education, should be. Insofar as the discipline of education is a science (and one question here would be whether it *is* a science) this would be a job for the philosopher of science in addition to one just mentioned. Logicians, linguistic philosophers, and philosophers of science may also be able to contribute to the technology of education, as it has come to be called, for example, to the theory of testing or of language instruction.

Finally, in a society that has been broken down by some kind of revolution or has newly emerged from colonialism, a philosopher may even supply a new full-fledged normative philosophy for its educational system, as Karl Marx did for Russia and China. In fact, as in the case of Marx, he may provide the ideology that guided the revolution in the first place. Plato tried to do this for Syracuse, and the philosophes did it for France in the eighteenth century. Something like this may be done wherever the schools “dare to build a new society,” as many ask schools to do.

Dewey once said that since education is the process of forming fundamental dispositions toward nature and our fellow human beings, philosophy may even be defined as the most general theory of education. Here Dewey was thinking that philosophy is the most general normative theory of education, and what he said is true if it means that philosophy, understood in its widest sense as including theology and poetry as well as philosophy proper, is what tells

us what to believe and how to feel about humanity and the universe. It is, however, not necessarily true if it refers to philosophy in the narrower sense or means that all philosophy is philosophy of education in the sense of having the guidance of education as its end. This is not the whole end of classical philosophy or even of philosophy as reconstructed by Dewey; the former aimed at the truth rather than at the guidance of practice, and the latter has other practical ends besides that of guiding the educational enterprise. Certainly, analytical philosophy has other ends. However, although Dewey did not have analytical philosophy in mind, there is nevertheless a sense in which analytical philosophy can also be said to be the most general theory of education. Although it does not seek to tell us what dispositions we should form, it does analyze and criticize the concepts, arguments, and methods employed in any study of or reflection upon education. Again it does not follow that this is all analytical philosophy is concerned with doing. Even if the other things it does—for example, the philosophy of mind or of science—are useful to educators and normative theorists of education, as, it is hoped, is the case, they are not all developed with this use in mind.

#### CURRENT TRENDS

Philosophy of education is a field characterized not only by broad theoretical eclecticism but also by a perennial dispute, which started in the mid-twentieth century, over what the scope and purposes of the discipline even ought to be. In the "Philosophy of Education" article that was included in the previous edition of this encyclopedia, William Frankena wrote, "In a sense there is no such thing as *the* philosophy of education" (p. 101). During certain periods of the history of the philosophy of education, there have been dominant perspectives, to be sure: At one time, the field was defined around canonical works on education by great philosophers (Plato of ancient Greece, the eighteenth-century Swiss-born Frenchman Jean-Jacques Rousseau, and others); at other times, the field was dominated, in the United States at least, by the figure of John Dewey (1859–1952) and educational Progressivism; at other times, the field was characterized by an austere analytical approach that explicitly rejected much of what had come before in the field as not even being proper "philosophy" at all. But even during these periods of dominance there were sharp internal disputes within the field (such as feminist criticisms of the "Great Man" approach to philosophy of education and vigorous critiques of the analytical method). Such disputes can be read off the history of the professional societies, journals, and graduate programs that institutionalize the field, and they can be documented through a succession of previous encyclopedia articles, which by definition attempt to define and delimit their subject matter.

These sorts of struggles over the maintenance of the disciplinary boundary, and the attempt to define and enforce certain methods as paramount, are hardly unique to philosophy of education. But such concerns have so preoccupied its practitioners that at times these very questions seem to become the substance of the discipline, nearly to the exclusion of thinking about actual educational problems. And

so it is not very surprising to find, for example, a book such as *Philosophers on Education*. Consisting of a series of essays written by professional philosophers entirely outside the discipline of philosophy of education, the collection cites almost none of the work published within the discipline; because the philosophers have no doubts about the status of the discipline of philosophy of education, they have few qualms about speaking authoritatively about what philosophy has to say to educators. On the other hand, a fruitful topic for reflection is whether a more self-critical approach to philosophy of education, even if at times it seems to be pulling up its own roots for examination, might prove more productive for thinking about education, because this very tendency toward self-criticism keeps fundamental questions alive and open to reexamination.

Any encyclopedia article must take a stance in relation to such disputes. However much one attempts to be comprehensive and dispassionate in describing the scope and purpose of a field, it is impossible to write anything about it without imagining some argument, somewhere, that would put such claims to challenge. This is especially true of “categorical” approaches, that is, those built around a list of types of philosophy of education, or of discrete schools of thought, or of specific disciplinary methods. During the period of particular diversity and interdisciplinarity in the field that has continued into the twenty-first century, such characterizations seem especially artificial—but even worse than this, potentially imperial and exclusionary. And so the challenge is to find a way of characterizing the field that is true to its eclecticism but that also looks back reflexively at the effects of such characterizations, including itself, in the dynamics of disciplinary boundary maintenance and methodological rule-setting that are continually under dispute.

One way to begin such an examination is by thinking about the *impulses* that draw one into this activity at all: What is philosophy of education for? Perhaps these impulses can be more easily generalized about the field than any particular set of categories, schools of thought, or disciplinary methods. Moreover, these impulses cut across and interrelate approaches that might otherwise look quite different. And they coexist as impulses within broad philosophical movements, and even within the thought of individual philosophers themselves, sometimes conflicting in a way that might help explain the tendency toward reflexive self-examination

and uncertainty that so exercises philosophy of education as a field.

### The Prescriptive Impulse

The first impulse is prescriptive. In many respects this is the oldest and most pervasive inclination: to offer a philosophically defended conception of what the aims and activities of teaching ought to be. In some instances, as in Plato’s *Republic*, these prescriptions derive from an overall utopian vision; in other instances, such as seventeenth-century English philosopher John Locke’s *Some Thoughts Concerning Education* or Rousseau’s *Émile*, they derive from a fairly detailed reconception of what the day-to-day activities of teaching should look like; in still other instances, such prescriptions are derived from other social or moral principles, as in various Kantian views of education (even though eighteenth-century German philosopher Immanuel Kant himself had very little to say on the subject). These prescriptive inclinations are in many respects what people expect from philosophy of education: a wiser perspective, a more encompassing social vision, a sense of inspiration and higher purpose. It is what people usually mean when they talk about having a “philosophy of education.”

A broad range of perspectives in the field share this prescriptive impulse: many of these perspectives can be comprised in what was once called the “isms” approach (perennialism, idealism, realism, Thomism, and so on)—the idea that a set of philosophical premises could generate a comprehensive and consistent educational program. For many years, working out the details of these “philosophies of education” was considered the main substance of the field, and the debates among the “isms” were typically at the very basic level debates among fundamentally different philosophical premises. An implication of this approach was that disagreements tended to be broadly “paradigmatic” in the sense that they were based on all-or-none commitments; one could not, of course, talk about a synthesis of realist and idealist worldviews.

One wag has suggested that the “isms” have more recently been replaced by the “ists”—less purely philosophical and more social/political theories that now typify many scholars working in philosophy of education (Marxists, feminists, multiculturalists, postmodernists, and so on). These will be characterized as critically oriented philosophies below, but at this stage it is important to see that

these perspectives can be equally driven by the prescriptive impulse: many writers (for example, neo-Marxist advocates of Paulo Freire's "critical pedagogy") offer quite explicit accounts of how education ought to proceed, what it is for, and whose interests it ought to serve.

### The Analytical Impulse

The second impulse that drives much of philosophy of education is analytical. In a broad sense this includes not only philosophical approaches specifically termed "analytical philosophy" (such as conceptual analysis or ordinary language analysis), but also a broader orientation that approaches the philosophical task as spelling out a set of rational conditions that educational aims and practices ought to satisfy, while leaving it up to other public deliberative processes to work out what they might be in specific. In this enlarged sense, the analytical impulse can be seen not only in analytical philosophy per se but also in studies that focus on the logical and epistemological criteria of critical thinking; in the diagnosis of informal fallacies in reasoning; in certain kinds of liberal theory that spell out broad principles of rights and justice but that remain silent on the specific ends that education ought to serve; and even in some versions of German philosopher Jürgen Habermas's theory, which proposes a structure of communicative deliberation in which conversations must satisfy what he calls a set of general "validity" claims, but which does not specify or constrain in advance what that process of deliberation might yield.

The analytical impulse is often seen as expressing a certain philosophical modesty: that philosophers do not prescribe to others what their educational choices ought to be, but simply try to clarify the rational procedures by which those choices should be arrived at. Here metaphors such as referees who try to adjudicate an ongoing activity but remain nonpartisan within it, or groundskeepers who pull up weeds and prepare the soil but do not decide what to plant, tend to predominate in how this version of philosophy of education is presented and justified to others. The idea that philosophy provides a set of *tools*, and that "doing philosophy of education" (as opposed to "having a philosophy of education") offers a more workmanlike self-conception of the philosopher, stands in sharp contrast with the idea of philosophy as a system-building endeavor.

Of course, it must be said that this impulse is not entirely free of the prescriptive inclination, either. For one thing, there is a prescriptiveness about the very tools, criteria, principles, and analytical distinctions that get imported into how problems are framed. These are implicitly (and often explicitly) presented as educational ideals themselves: promoting critical thinking or fostering the conditions for Habermasian communication in the classroom, for example. However rationally defended these might be, they will undoubtedly appear to some as imposed from "on high." Moreover, at a deeper level, the analytical/prescriptive distinction is less than clear-cut: a theory of logic, or a theory of communication, however purely "procedural" it aspires to be, always expresses conceptions of human nature, of society, of knowledge, of language, that contains social and cultural elements that might appear "natural" or "neutral" to the advocates of those procedures, but that will be regarded as foreign and particularistic by others ("why must I justify my educational choices by *your* criteria?"). This is not meant as a criticism of the analytical orientation, but it just shows how these impulses can and do coexist, even within accounts that regard themselves as primarily one or the other.

### The Critical Impulse

Similarly, the third impulse, a critical orientation, can coexist with either or both of the others. The critical impulse, like the analytical one, shares the characteristic of trying to clear the ground of misconceptions and ideologies, where these misrepresent the needs and interests of disadvantaged groups; like the prescriptive impulse, the critical impulse is driven by a positive conception of a better, more just and equitable, society. Where the critical impulse differs from the others is in its conception of the contribution philosophy can play in serving these ends. From this orientation, philosophy is not just a set of tools or an abstract, programmatic theory; it is itself a substantive personal and political commitment, and it grows out of deeper inclinations to protect and serve the interests of specific groups. Hence the key philosophical ideas stressed in critically oriented philosophies of education (reflection, counterhegemony, a critique of power, an emphasis upon difference, and so on) derive their force from their capacity to challenge a presumably oppressive dominant society and enable put-upon individuals and groups to recognize and question their circumstances and to be moved to change them.

As there are prescriptive and analytical elements in critically oriented philosophies of education, so there can be critical elements in the others. Philosophers of education more driven by a prescriptive or analytical impulse can and do share many of the same social and political commitments as critically oriented philosophers of education; and some of them may see their work as ultimately serving many of the same goals of criticizing hegemonic ideologies and promoting human emancipation. This is why these three impulses or orientations must not be seen as simple categories to which particular philosophies (or philosophers) can be assigned. Stressing their character as impulses highlights the motivational qualities that underlie, and frequently drive, the adoption of particular philosophical views. While philosophers tend to stress the force of argument in driving their adoption of such views, and while they do certainly change their minds because of argument and evidence, at some deeper level they are less prone to changing the very impulses that drive and give vigor to their philosophical investigations. By stressing the ways in which all three impulses can coexist within different philosophical schools of thought, and even within the inclinations of a given philosopher, this account highlights the complex and sometimes even contradictory character of the philosophical spirit. When philosophers of education teach or speak about their views, although they certainly put forth arguments, quotations of and references to literature, and so forth, at a deeper level they are appealing to a shared impulse in their audience, one that is more difficult to argue for directly, and without which the arguments themselves are unlikely to take hold.

### Implications of the Impulses for Philosophy of Education

Given the existence of these three impulses, how can they help in providing an overview of the field of philosophy of education that does not fall into arguments about disciplinary boundary maintenance? First, these very broad orientations are in many respects easier to generalize within the field than would be any specific set of disciplinary criteria; many different kinds of philosophy of education can manifest these sorts of inclinations. Indeed, it makes for strange bedfellows when people consider that despite their vigorous paradigmatic differences they are actually motivated by very similar underlying philosophical commitments. Perhaps this recogni-

tion might create a stronger incentive for them to engage one another respectfully across those differences.

Second, it is beneficial for philosophers to consider that the validity they attribute to certain kinds of arguments may not be driven simply by the objective force of those arguments, but also by a particular appeal those kinds of arguments have *for them*. This sort of reflectiveness might be fruitful for various reasons, but a significant benefit could be in raising a person's appreciation for why others may not be moved by the arguments that seem so patently obvious to that person; and why the force of argument alone may not be sufficient to generate philosophical agreement or reconcile disagreement. Given the pervasively eclectic and interdisciplinary nature of the field of philosophy of education, such a spirit of tolerance and inclusiveness, while not needing to be unbounded entirely, would be a valuable corrective to the historical tendency to establish *the* methods or *the* philosophical school that will separate proper philosophy of education from the imposters.

Advocates of more prescriptive approaches typically buttress their case for dominance by reference to canonical Great Works (Plato, ancient Greek philosopher Aristotle, Locke, Rousseau, Dewey). This sort of system-building across epistemological, ethical, and social/political issues is what the great philosophers *do*, and it is revealing that for them philosophy of education was rarely seen as a distinct area of inquiry but merely the working out in practice of implications for teaching and learning that were derived from their larger positions about truth, value, justice, and so on.

Advocates of more analytical approaches, as noted, tend to put more reliance upon the tools of philosophical investigation, and less on particular authors or sources. In the twentieth century, versions of these approaches tended to dominate philosophy of education, especially in the English-speaking world, as they have many departments of philosophy itself. Indeed, when one surveys accounts of the field of philosophy of education from the 1990s forward, they nearly all chart the history as one of the rise to dominance of an analytical approach and then a succession of critiques and attacks upon it.

Advocates of more critical approaches suffer from a particular difficulty—carrying out their philosophical work in a way that is consistent with

their broader commitments. Naturally, any philosophical approach aspires to consistency of some sort; but to the extent that critically oriented philosophers are concerned with challenging power structures, hegemonic belief systems, and universalisms that obscure, not to say squelch, the particular beliefs, values, and experiences of those whom they seem to empower, such philosophers must also endeavor to avoid these potentially oppressive tendencies in their own writing and teaching. This tension is perhaps felt most acutely by contemporary post-modern philosophers of education, but it can be seen in much of the work of neo-Marxists, critical theorists, feminists, and Foucauldians as well: how to argue for and promote an emancipatory approach to education that does not itself fall into the habits of exclusionary language, authoritative (if not authoritarian) postures, and universalizing generalizations that are excoriated when detected in the work of others.

### Summary

This entry has tried to provide an overview of how the field of philosophy of education has seen itself, and it has recounted major elements in the narratives by which the history of the field has been traced by others. At the same time it has tried to reveal problems with the ways in which these different accounts have been driven in part by various agendas to define a scope and boundary for the field, and often to privilege one or another approach to philosophy of education, even when they have endeavored to be comprehensive and fair to all views. This entry has taken a different approach, first, by resisting the temptation to provide a single definition or characterization of the field; and, second, by stressing not schools of thought or methodological divisions as the categories for thinking about the field, but rather the underlying inclinations, or impulses, that animate philosophical inquiry. As noted, for a field that tends to resist and argue over every attempt to define it, such caution is probably prudent, but it has an added benefit as well. When philosophers think about the impulses that motivate their areas of inquiry and ways of thinking about them, they relate their philosophical work not solely to an abstract order of truth but to themselves; and it is a short step from that recognition to extending that way of thinking to others as well. The generosity of outlook that results might be the one thing that all philosophers of education can share.

## PHYSICAL DISABILITIES, EDUCATION OF INDIVIDUALS WITH

---

In special education, physical disabilities are physical limitations or health problems that interfere with school attendance or learning to such an extent that special services, training, equipment, materials, or facilities are required. In the early twenty-first century, approximately 500,000 school children in the United States were classified as having physical disabilities or other health impairments for special education purposes. Since 1975, federal law (under the Education for All Handicapped Children Act, and since 1990, the Individuals with Disabilities Education Act [IDEA]) has mandated special education and related services for all students with physical disabilities that interfere with their education. Major classifications include neurological conditions, musculoskeletal conditions, and other health impairments.

### Types and Causes of Physical Disabilities

Neurological conditions involve damage to the central nervous system (brain or spinal cord). In 1990

traumatic brain injury became a separate category of disability under IDEA. Other major neurological conditions include cerebral palsy, seizure disorder (or epilepsy), and spina bifida, a congenital condition in which the spinal cord protrudes through the backbone resulting in partial or total paralysis below the site of the nerve damage. Disabilities associated with neurological conditions vary from very mild to severe and may involve physical, cognitive, speech-language, or sensory abilities, or a combination thereof.

Musculoskeletal conditions include muscular dystrophy, juvenile rheumatoid arthritis, limb deficiencies or amputations, and a wide variety of other deformities or degeneration of muscles or bones affecting the ability to move, walk, stand, sit, or use the hands or feet normally. Other health impairments include a wide variety of infectious diseases and chronic problems such as diabetes, asthma, cystic fibrosis, immunodeficiency (including HIV and AIDS), hemophilia, fetal alcohol syndrome, and the malfunction or failure of vital organs.

Causes include infectious disease, congenital conditions or malformations, and developmental problems or chronic health problems that are poorly understood. A wide variety of disabilities, especially those associated with traumatic brain injury, result from vehicular accidents, gunshot wounds, burns, falls, and poisoning. Substance abuse and physical abuse by caretakers, infectious diseases, and substance abuse by the child or by the mother during pregnancy cause some disabilities. Advances in medicine and related treatments are reducing or eliminating physical disabilities resulting from some diseases, injuries, and chronic conditions. Advances in medicine, however, also increase the number of children surviving congenital anomalies, accidents, and diseases with severe disabilities.

### The Basics and History of Special Education

Special education includes helping students have as normal an experience as possible in school. Much depends on access to the typical curriculum and use of adaptive devices when necessary. Emphasis is on overcoming attitudinal barriers among persons without disabilities to participation of students with physical disabilities in school and the community. Special educators must understand the operation of prostheses (artificial body parts), orthotics (braces and other corrective devices), and adaptive devices

(wheelchairs, communication boards, and other gadgets enabling people to accomplish tasks).

Special education in public schools dates from the early twentieth century. Programs have emphasized major health problems of the era. In the first half of the twentieth century the focus was on crippling conditions and the effects of infectious diseases, particularly tuberculosis and polio. After antibiotic drugs and vaccines dramatically reduced or eliminated many infectious diseases in the mid-twentieth century, the focus changed to cerebral palsy, spina bifida, and other congenital conditions or chronic health problems. In the late twentieth century, increasing attention was given to traumatic brain injury, spinal cord injuries, and AIDS.

### Trends and Controversies

Trends in the field are determined largely by changes in epidemiology and advances in medicine. The number of students needing special education and the focus of programs may change because of a resurgence of an infectious disease (e.g., tuberculosis), an advance in immunology (e.g., an effective vaccine for AIDS), or medical advances such as gene therapy, transplants, artificial organs, or extremely effective new treatments that reduce or eliminate a chronic health problem (as may occur for such conditions as diabetes, cystic fibrosis, and asthma). Advances in medicine and related services, such as physical therapy, technological applications, and adaptive devices that allow more normal functioning, may reduce or eliminate the need for special education or make education in a typical classroom feasible.

Issues and controversies include the extent to which placement in typical school environments is appropriate. Many students with even severe physical disabilities can attend regular schools and classes, given improved accessibility of school buildings, the use of technologies of treatment and adaptive devices, and improved attitudes of acceptance of disabilities in the school. Some students need highly specialized medical care and are thought to need education in the hospital where they are being treated or in a special class or school. A controversial issue is whether to include in regular schools and classes students who are near death or who have extreme physical and cognitive disabilities that leave them unresponsive to typical instruction.

## PHYSICAL EDUCATION

---

### OVERVIEW

B. Ann Boyce

### PREPARATION OF TEACHERS

Murray Mitchell

### OVERVIEW

"Physical education is the study, practice, and appreciation of the art and science of human movement" (Harrison, Blakemore, and Buck, p. 15). While movement is both innate and essential to an individual's growth and development, it is the role of physical education to provide instructional activities that not only promote skill development and proficiency, but also enhance an individual's overall health. Physical education not only fulfills a unique role in education, but is also an integral part of the schooling process.

### Historical Perspectives

From the late 1700s to the mid-1800s, three nations—Germany, Sweden, and England—influenced the early development of physical education in the United States. German immigrants introduced the Turner Societies, which advocated a system of gymnastics training that utilized heavy apparatus (e.g., side horse, parallel and horizontal bars) in the pursuit of fitness. In contrast, the Swedish system of exercise promoted health through the performance of

a series of prescribed movement patterns with light apparatus (e.g., wands, climbing ropes). The English brought sports and games to America with a system that stressed moral development through participation in physical activities. The influence of these three nations laid the foundation for sport and physical education in America.

The 1800s were an important time for the inclusion of physical education in schools across America. The Round Hill School, a private school established in 1823 in Northampton, Massachusetts, was the first to include physical education as an integral part of the curriculum. In 1824 Catherine Beecher, founder of the Hartford Female Seminary, included calisthenics in her school's curriculum and "was the first American to design a program of exercise for American children" (Lumpkin, p. 202). She also advocated the inclusion of daily physical education in public schools. However, physical education was not offered in the public schools until 1855, when Cincinnati, Ohio, became the first city school system to offer this type of program to children.

In 1866 California became the first state to pass a law requiring twice-per-day exercise periods in public schools. Beecher's influence started the American system of exercise, and, along with her contemporaries Dio Lewis, Edward Hitchcock, and Dudley Allen Sargent, she was an early leader in physical education. In the profession's early years, between 1855 and 1900, there were several debates, referred to as the *Battle of the Systems*, regarding which system (American, Swedish, German, or English) could best provide a national physical education program for America.

During the 1890s traditional education was challenged by John Dewey and his colleagues, whose educational reforms led to the expansion of the "three R's" to include physical education. It was also during this time that several *normal schools* (training schools for physical education teachers) were established. All of these schools offered a strong background in the sciences that included courses in anatomy and physiology, with many of the early professors holding medical degrees.

In 1893 Thomas Wood stated that "the great thought of physical education is not the education of the physical nature, but the relation of physical training to complete education, and then the effort to make the physical contribute its full share to the life of the individual" (National Education Associa-

tion, p. 621). During the early twentieth century, several educational psychologists, including Dewey, Stanley G. Hall, and Edward Thorndike, supported the important role of children's play in a child's ability to learn. In line with the work of Wood in physical education, and the theoretical work of prominent educational psychologists, *The New Physical Education* was published in 1927 by Wood and Rosalind Cassidy, who advocated *education through the physical*.

This position supported the thesis that physical education contributed to the physical well-being of children, as well as to their social, emotional, and intellectual development. However, Charles McCloy argued against this expanded role of physical education, arguing that *education of the physical*, which emphasized the development of skills and the maintenance of the body, was the primary objective of physical education. The testing of motor skills was a part of McCloy's contribution to physical education, and his philosophy of testing paralleled the scientific movement in education.

The evolution of physical education, along with other educational professions, reflected contemporary changes in society. Throughout the early twentieth century, into the 1950s, there was a steady growth of physical education in the public schools. During the early 1920s many states passed legislation requiring physical education. However, shifts in curricular emphasis were evident when wars occurred and when the results of national reports were published. For example, as a result of the bombing of Pearl Harbor and the United States' entrance into World War II, the emphasis in physical education shifted from games and sport to physical conditioning. Similar curricular shifts were noted in 1953 when the Kraus-Weber study found that American children were far less fit than their European counterparts. As a result of this report, the President's Council on Physical Fitness was established to help combat the falling fitness levels of America's youth.

During the 1950s and the 1960s, physical education at the elementary level experienced tremendous growth. Today, many physical education programs emphasize overall fitness, referred to as *wellness*, as well as skill development. However, since the 1970s the number of schools offering daily physical education has drastically decreased—1995 statistics from the Centers for Disease Control and Prevention (CDC) show a drop from 43 percent in 1991 to 25 percent in 1995.

## Rationale

In the 1990s three national reports—*The Surgeon General's Report on Physical Activity and Health* (1996), *Healthy People 2000* (1990), and the CDC's *Guidelines for School and Community Programs* (1997)—have focused on the deplorable physical condition of Americans. These reports cited physical inactivity as a national health risk, based on statistics such as: (1) 13 percent of young people are classified as overweight; (2) only half of all youths are physically active on a regular basis (and this percentage decreases with age); and (3) inactivity and poor diet cause at least 300,000 deaths per year.

These reports advocated the need for daily physical activity, citing the following health benefits from moderate participation: improved strength and endurance, healthier bones and muscles, weight control, reduced anxiety and increased self-esteem, and, often, improved blood pressure and cholesterol levels. Physical education is the major vehicle for improving the health and fitness of the nations' youth. *Healthy People 2000* recommended the increase of daily physical education to a level of at least 50 percent of students in public schools by the year 2000.

In addition to the health benefits, cognitive performance can also be enhanced through physical education. There is a growing body of research that supports the important relationship between physical activity and brain development and cognitive performance. C. Edwin Benckraft (1999) found that "sensory and motor experiences play a prominent role in reinforcing . . . synaptic connections and neural pathways" (p. 45). Eric Jensen's 1998 research revealed that the cerebellum is not solely dedicated to motor activity, but includes both cognitive and sensory operations. Further, Jensen points out the strong relationship of the cerebellum to memory, perception, language, and decision-making, citing physical activity as a way to enhance cognition. In a summary of research findings, Benckraft suggests providing the following applications that could increase cognitive performance: (1) challenging motor tasks before the age of ten can increase cognitive ability due to a heavier, more dendrite-rich brain; (2) aerobic exercise improves cognitive functioning by increasing the number of capillaries serving the brain through the delivery of more oxygen and glucose and removal of carbon dioxide; (3) cross-lateral movements increase the communication ability between the brain's hemispheres; and (4) physical ac-

tivity reduces the production of stress chemicals that inhibit cognitive processing.

From the mounting evidence favoring physical activity, it appears that physical education in schools plays a dual role in serving both mind and body. The challenge to physical educators will be to implement programs that address the health crisis while building the child's mind through physical activity.

## Curriculum

According to the American Alliance for Health, Physical Education, Recreation and Dance (AAHPERD), a quality physical education program for grades K–12 includes instructional periods totaling at least 150 minutes per week at the elementary level and 225 minutes at the secondary level, qualified physical education specialists, and adequate equipment and facilities. In general, the curriculum should consist of: (a) instruction in a variety of developmentally appropriate motor skills that challenge students to develop physically, cognitively, socially, and emotionally; (b) fitness activities that educate and help students understand and improve or maintain optimal fitness levels; (c) instruction in concepts that lead to a better understanding of motor skills and fitness development; (d) opportunities to engage in experiences that enhance cooperation and develop multicultural awareness; and (e) experiences that foster the desire for lifelong participation in physical activity.

More specifically, the elementary curriculum should include many enjoyable activities that lead to the acquisition and refinement of fundamental motor patterns (e.g., running, skipping, jumping, catching, throwing, striking, balancing) that can be applied in game, sport, dance, and gymnastics contexts. The *movement-based curriculum* proposed and adapted by George Graham, Shirley Ann Holt/Hale, and Melissa Parker in 1998 introduces skill themes (fundamental motor patterns) and movement concepts that describe how a movement is performed (e.g., speed, direction, relationship). This curriculum pattern teaches children to move while challenging them to explore, modify, and refine motor patterns, and it can be used as a vehicle for teaching physical education. The *activity based* approach is the most common curriculum pattern used in both middle schools and high schools. This curricular pattern uses activity units in sport, fitness, and dance (e.g., volleyball, aerobic dance, swimming) to teach physical education.

Middle school curriculums should include a wide variety of team and individual sports utilizing motor skills introduced and refined at the elementary level. High school curriculums should focus on lifetime sports skills (e.g., golf, tennis, aerobic dance), with a secondary emphasis on team sports. During the high school years, students should become highly proficient in one (or more) sport and/or fitness activity of their own choosing. However, regardless of the level of schooling, fitness forms the base of the curriculum and it is an integral part of the program.

### Trends, Issues, and Controversies

School accountability, a major trend of the 1990s, has driven the need for national assessment (testing) and standards. This trend has become an issue and has created debate throughout education, including physical education. Proponents on both sides have valid points to make. Those who oppose national testing point out the need for people to enjoy physical activity. They believe that testing does not foster the desire for lifelong participation. In contrast, proponents of testing think it would parallel work completed in other disciplines, such as math and science, while helping students gauge their progress towards a national standard for fitness and/or skill competence.

The National Association for Sport and Physical Education has provided guidelines in the form of grade-level benchmarks, as well as an operational definition of the *physically educated person*. Such a person is skillful in a variety of physical activities, physically fit, participates regularly in physical activity, knows the benefits of physical activity, values physical activity and its contributions to a healthy lifestyle, respects diversity, and acts in a socially responsible manner. The question remains, however, of how much direction and specificity in the form of standards and assessment are needed.

In many school programs and business settings, the term *wellness* has replaced *fitness* and *health*. In general, this term refers to optimal health and well-being, but it has been broadened to include the dimensions of emotional, mental, spiritual, social, and environmental well-being.

There are many issues that are of interest to all educators, issues that pose a challenge to all of those who seek to teach children. These include discipline problems, student drug abuse, violence, insufficient

resources, lack of parental support for education, large classes, teacher burnout, and perhaps most importantly, a concern for the health and well-being of all children.

By far the greatest issue facing physical education in K–12 institutions is the reduction of time in the curriculum allotted to this important subject. The need for daily physical education is obviously important for the well-being of students, but it presents a dilemma for those who must balance academics, accountability, and what is best for the child's overall education. Given the support for the physical and psychological contributions of exercise, along with the health risks associated with inactivity, it is clear that daily physical education plays a crucial and unique role in each child's cognitive, psychological, and physical development.

B. ANN BOYCE

## PREPARATION OF TEACHERS

In the United States, teacher preparation in physical education originally had close links to medicine. A program of study would commonly include anatomy, physiology, health, first aid, history and philosophy, educational psychology, and various physical skills—from gymnastics through dance, games, and sport. Major shifts across time have largely involved the length of programs of study on each of these topics.

## A Brief History

The early roots of physical education teacher preparation in the United States can be traced to the northeastern part of the country during the latter part of the 1800s. In 1952 Charles Bucher described a ten-week course at the Normal Institute of Physical Education in Boston (founded by Dio Lewis) as graduating the nation's first class of physical education teachers in 1861. A one-year course of study was developed in 1866 in New York City under the name of the North American Turnerbund. The Sargent School in Cambridge, Massachusetts, under the direction of Dr. Dudley Allen Sargent, began preparing teachers in 1881, and in 1886 the Brooklyn Normal School for Physical Education was opened.

In 1886 the International Young Men's Christian Association College at Springfield Massachusetts began operations. This institution, which evolved into the Springfield College, began with the mission to prepare physical education teachers for the Young Men's Christian Association (YMCA). Later, degrees at the bachelor's, master's and doctoral levels for study in physical education were awarded by this institution. In general, the preparation of physical education teachers in the late 1800s and early 1900s ranged from as little as two months to as much as five years.

Prior to World War I, preparation to teach physical education was primarily completed in normal schools. The poor condition of many of the men in the country who were called to serve in the war heightened interest in physical education. As a result of such concerns, there was some form of compulsory public school physical education in thirty-eight states by 1930.

At the beginning of the twenty-first century, the requirements for physical education teachers vary somewhat by state, since education is governed at that level rather than by national standards. The National Association for Sport and Physical Education (NASPE) has published guidelines for beginning teachers in an attempt to provide some professional leadership. These guidelines are not binding on either institutions preparing teachers or on state governments, where the responsibility of licensing teachers rests. In a collaborative effort with one of the major accrediting agencies for teacher preparation programs, the National Council for Accreditation of Teacher Education (NCATE), NASPE has created guidelines for programs seeking accredita-

tion in the preparation of physical educators for initial certification.

### Current Structure

Physical education teacher education (PETE) programs in the United States are designed around at least three models and five conceptual orientations. One model is delivered at the undergraduate level and two at the graduate level. At the undergraduate level, programs are usually delivered in a four-year program with course work in three major areas: general education (e.g., the broad concepts in many fields that the general public associates with an educated citizen), professional education (e.g., concepts specifically linked with what is known about teaching and learning), and content knowledge (e.g., the information unique to the field, often represented in a variety of subdisciplinary areas such as exercise physiology, biomechanics, and motor learning). The actual number of credits and sequence of these courses varies and is often dependent upon the philosophical orientation of the program and resources available to the faculty.

One type of graduate PETE program has evolved from various reform efforts, including the Holmes Group initiative. In this approach, students study for a four-year degree in the content area supporting the type of licensure they seek. In physical education, an undergraduate degree could be in sport studies, exercise physiology, biomechanics, or some other related subdisciplinary field. At the master's level, students then study the pedagogical content to learn how to deliver the content knowledge to students. This approach is a response to perceived needs of teachers to be better prepared in the content knowledge of their field.

A second type of graduate PETE program is sometimes characterized as a response to teacher shortages. In this approach, candidates have typically acquired an undergraduate degree in some field other than physical education. Graduate programs for this approach must include a combination of content knowledge and professional education. Students changing careers are often attracted to this model.

In 1990 Sharon Feiman-Nemser described five conceptual orientations to teacher education, regardless of the model; three years later Judith Rink provided adaptations to these models using examples appropriate to PETE programs. Both authors

suggest that the conceptual orientation guides the delivery of content. In contrast to Feiman-Nemser, however, Rink suggests that it is possible for parts of each orientation to exist in any program.

The *academic* orientation holds that the subject matter knowledge is central. The focus of these programs is on games, sports, dance, and fitness knowledge. In the *practical* orientation, experience and conventional wisdom are the focal points. Field experiences are key parts of these programs, where students are given ample practice time with practice-proven methods of teaching. The *technological* orientation has also been characterized as systematic, science-based instruction where there is an emphasis on mastering teacher effectiveness skills. Instruction is based on research-based teaching for student skill development. The *personal* orientation is a more humanistic approach where the teacher and learner are considered as people first; teaching, learning, and content are secondary concerns. Individualization, nurturing personal meaning, and growth are hallmarks of this approach to teacher education. In the *critical/social* orientation, the relationship between schools and the structure of society becomes central. Attention is drawn to the moral obligations of teachers to include all members of society, regardless of age, gender, race, religion, skill level, or socioeconomic level.

Michael Metzler and Bonnie Tjeerdsma (2000) suggest that teacher educators have a responsibility to assess the effectiveness of what they do, with whatever model or conceptual orientation is selected. They suggest that few teacher educators have spent much effort doing this type of assessment. In an effort to be of assistance, Metzler and Tjeerdsma provide a variety of tools for assessing and improving program delivery.

Daryl Siedentop and Larry Locke provided an alternative perspective on assessing PETE programs in 1997. They describe the minimum conditions necessary for the effective operation of a PETE program, and also suggest that the responsibility of PETE programs goes beyond educating new recruits and includes a duty to "create and sustain good school programs" (p. 27). These authors go on to lament that few PETE faculty have assumed any responsibility for the quality of programs in schools, instead adopting an "us" (e.g., faculty in higher education) versus "them" (e.g., teachers in the K-12 schools) mentality. The outcome of this adversarial relationship has been a declining level of competent

program delivery, with national health-related consequences. In 1990 John Goodlad identified a similar concern when he suggested that the reform or renewal of schools, teachers, and teacher preparation programs has to occur simultaneously.

### In-Service and Staff Development

Most states require some sort of ongoing accumulation of continuing education credits for teachers to retain their licensure. Most school districts create opportunities for continuing education related to topics relevant to the purposes of schools and needs of students in their community. Unfortunately, these opportunities are often too generic to address the specific needs of physical educators, and are often perceived to be ineffective.

Beyond state and school district requirements, there is a key challenge for licensure programs: convincing graduates that their preparation to become true professionals has not ended, but has just begun. Without an internal commitment to ongoing professional growth, few in-service or staff development efforts are effective at eliciting change. Indeed, although specific examples of successful change efforts can be cited, Linda Bain (1990) describes practice in physical education as “generally resistant to change” (p. 771).

Michael Eraut (1987) describes four approaches to in-service education that can be used to categorize some of the work in physical education. The *defect* approach involves behavioral training to build skills that teachers lack. In physical education, targets of this approach have included different verbal behaviors (e.g., feedback, prompts, questions, use of student names, etc.), teacher movement, task selection, and others. The *growth* approach is about helping teachers seek greater fulfillment, rather than helping them simply become competent. In physical education, this approach is difficult to distinguish from the *problem-solving* approach, where efforts are made to help teachers diagnose problems in their own instructional setting. Program research from places like Teachers College at Columbia University and the University of Massachusetts would be examples of this kind of in-service program. Lastly, the *change* paradigm involves efforts to make changes in programs that are responsive to greater societal needs. Attention to gender equity, mainstreaming, and nondiscrimination would be examples of this work in physical education.

### Trends and Controversies

The most critical concern facing physical educators in the United States is the viability of physical education programs as a required subject in schools. As opportunities for advanced placement courses; electives in art, music, and foreign languages; and other varied courses have occurred, time in the required curriculum for physical education has declined. There are consequences to this on at least two levels. First, the health of the nation is at risk when the most equitable delivery system for ensuring active lifestyles is curtailed. Second, there is a declining need for teacher education programs when there are fewer teaching positions available for program graduates.

Related to the time available for physical education programs in schools is an ongoing debate over the most appropriate content for programs. In some states (e.g., West Virginia and Florida) there is a major emphasis on student performance on fitness tests as an indication of physical education program effectiveness. In other states (e.g., Missouri) there is more of an emphasis on the demonstration of written competence in health-related fitness knowledge. In at least one other approach (South Carolina), there is an attempt to hold teachers accountable for fitness levels and fitness knowledge, as well as out-of-class behaviors and movement competence. There are obvious implications for teacher preparation programs in each of these states with respect to what will be expected of program graduates. It is also worth noting that none of these approaches is an exact match with NASPE guidelines.

Part of the debate over appropriate content for teacher preparation can be traced back to a classic 1964 work by Franklin Henry, where physical education was first conceptualized as an academic discipline in the United States. For the first time, the study of human movement spawned viable areas of study, leading to degrees and careers other than teaching. Today, locating departments of physical education in colleges and universities is a challenge, partly because such departments can go by so many different names: 114 have been counted by P. Stanley Brassie and Jack Razor, including Biomechanics, Kinesiological Studies, Kinesiology, Sport Science, and Sport Studies, to cite just a few. Approximately half of these departments are in colleges of education, while others are in colleges of liberal arts, applied sciences, health, or elsewhere. This identity

crisis has lead to marginal status for physical educators at all levels.

A common trend in teacher preparation programs is for early and frequent field-based experiences for students. The challenge is to find (or create) placements where desirable practices are being modeled. An additional challenge is to determine the amount and type of training required to prepare school-based supervisors.

The last major controversy that warrants mention in teacher preparation involves determining the most appropriate level for initial licensure. In some institutions (e.g., the Ohio State University), initial licensure in physical education is only available at the graduate level. In other schools (e.g., University of South Carolina), initial licensure is available at both the undergraduate and graduate level. In most of the rest of the country, initial licensure is predominantly delivered at the undergraduate level. There is no definitive evidence on which (if any) of these approaches is the most appropriate way to prepare physical education teachers.

## PHYSICAL EDUCATION: ADAPTED

*See:* ADAPTED PHYSICAL EDUCATION.

### PIAGET, JEAN (1896–1980)

Director of the Institute of Educational Science in Geneva and professor of experimental psychology at the University of Geneva, Jean Piaget was the most influential developmental psychologist of the twentieth century. Many of Piaget’s concepts and research methods have become so much a part of the conventional wisdom and practice that psychologists are often unaware of their origin. The stages of development that Piaget observed and conceptualized are given extended treatment in every introductory psychology and developmental psychology textbook. In addition, much of contemporary research on infancy grows directly out of Piaget’s innovative studies of his own three infants. Moreover, a great deal of present day research and theory regarding adolescence starts from Piaget’s demonstration of the appearance of new, higher level, mental abilities during this age period. In these and in many other ways, Piaget’s research and theory continue to be a powerful stimulus in many different fields and areas of investigation.

Piaget’s work, however, has had an impact on other disciplines as well. The contemporary emphasis upon constructivism in education, for example, stems directly from Piaget’s theory of intellectual development. According to Piaget the child does not copy reality, but rather constructs it. Reality is developmentally relative; it is always a joint product of the child’s developing mental abilities and his or her experiences with the world. Piaget’s research and theory has also had considerable impact upon psychiatry. His description of the intellectual stages of development has provided a very important complement to the psychosexual stages of development outlined by the Austrian psychologist Sigmund Freud. In these, and in many other ways, the power of Piaget’s work continues to be felt in many diverse fields.

Jean Piaget was born in Neuchâtel, Switzerland. His father was a classics professor at the University of Neuchâtel while his mother was a deeply devout Christian. In his autobiography, Piaget suggests that the ongoing conflict between his father’s scientific beliefs and his mother’s spiritual convictions contributed to his theory of mental development. He came to regard the development of intelligence as motivated by the progressive resolution of conflicting ideas. Be that as it may, Piaget showed his genius early. At the age of fourteen he published his first scientific paper, his observations of an albino sparrow. He also became, thanks to the mentorship of the curator of the Neuchâtel natural history museum, a student of mollusks. He began experimenting with crustaceans and publishing his findings in the biological journals. These articles were so well received that he was offered the curatorship of a natural history museum in another Swiss canton. Piaget, however, had to refuse because he had not yet graduated from high school.

Once at the university, Piaget took courses in both philosophy and biology and struggled to find some way to reconcile his philosophical interests with his commitment to science. He hit upon a unique solution in an unexpected place. After receiving his doctorate, Piaget explored a number of different professions including psychiatry. He eventually took a position in Paris, translating some of the intelligence tests created by the English psychologist, Sir Cyril Burt, into French. As part of this endeavor, it was necessary for Piaget to test a number of children in order to ensure that his translations had not made the items easier or more difficult than they were for English children of comparable age. While administering these tests, Piaget became fascinated with the children’s wrong answers. To Piaget, these wrong answers did not seem random. Rather they appeared to be generated by a systematic way of seeing things that was not wrong, but simply reflected a different world view than that held by adults.

Piaget was fascinated by his unexpected discovery that children’s perception of reality was not learned from adults, as had heretofore been assumed, but was constructed. Children’s conception of the world, Piaget reasoned, was different than that of adults because their thought processes were different. Piaget assumed that he would pursue this problem, the development of children’s thinking, for a few years and then move on to other things. In-

stead, this pursuit of the ways in which children construct reality, became the foundation of a lifelong professional career. Piaget came to realize that the study of the development of children's adaptive thought and action, of their intelligence, was a way of pursuing both his philosophical and his scientific interests.

One field of philosophy is epistemology, the study of how people come to know the world. Most philosophers approach this topic by means of introspection and logical analysis. Piaget, however, believed that he could put epistemological questions to the test by studying the development of thought and action in children. Accordingly Piaget created his own new discipline with its own methods and problems. The field was genetic epistemology, the study of child development as a means of answering epistemological questions. Piaget's career exploration of genetic epistemology can be roughly divided into four different stages.

### Stage 1: The Sociological Model of Development

During this first stage, roughly corresponding to the 1920s, Piaget investigated children's heretofore unexplored conceptions of the world, the hidden side of children's minds. To further this exploration Piaget made use of a combination of psychological and clinical methods that he described as the *semiclinical interview*. He began with a standardized question, but followed up with nonstandard questions that were prompted by the child's answer. In order to get what Piaget called children's "spontaneous convictions" he often asked questions that the children neither expected nor anticipated. In his study of children's conception of the world, for example, he asked children whether a stone was alive and where dreams came from. He made a comparative study of children's answers and found that for these and for similar questions there was a gradual progression from intuitive to scientific and socially acceptable responses.

During this early period, Piaget published *The Language and Thought of the Child*, *The Child's Conception of the World*, *The Child's Conception of Physical Causality*, and *The Moral Judgment of the Child*. Each of these books was highly original and they made Piaget world famous before he was thirty. In these books he elaborated his first theory of development, which postulated the mental development was fueled by a social dynamic. He proposed that children moved from a position of egocentrism (a fail-

ure to take the other person's point of view into account) to sociocentrism (the recognition that others see the world differently than they do). Children moved from the egocentric to the sociocentric position thanks to social interaction and the challenge to younger children's ideas by the ideas of those children who were more advanced. Piaget made it clear, however, that the young children's egocentric ideas were not wrong, but merely different from those of the older children. Egocentric ideas are developmentally appropriate for young children, if not for older ones.

### Stage 2: The Biological Model of Intellectual Development

In 1928 Piaget married one of his graduate students and started a family in the 1930s. Having his own infant children set the stage for the second phase of Piaget's work, the exploration of the development of intelligence in infants. During this period, Piaget studied his own three offspring. The semiclinical interview was clearly not of much use with infants who could not talk. Piaget, therefore, invented a number of ingenious experiments to test the infant's knowledge about the world. For example, he placed a cloth over a toy that the infant was playing with to see whether or not the baby would try to remove the cloth to recover the toy. If the baby removed the cloth this would be evidence that he or she had some mental representation of the toy. If the baby did not remove the cloth, but merely cried in frustration, this would be evidence that the infant had not yet attained representational thought.

During this second period of his work, Piaget elaborated a biological model of intellectual development, which he combined with the sociological model of the earlier period. He now described intelligence as having two closely interrelated facets. One of these, carried over from the earlier period, was the content of children's thinking. The other, new to this period, was the process of intellectual activity. Piaget now introduced a truly powerful idea, namely, that the process of thinking could be regarded as an extension of the biological process of adaptation.

He argued, for example, that the child who sucked on anything and everything in his or her reach was engaging in an act of assimilation, comparable to the assimilation of food by the digestive system. Just as the digestive system transforms a variety of foodstuffs into the nutriment needed by the body, so the infant transforms every object into an

object to be sucked. At much higher level, whenever one classifies an object, say a dog, he or she in effect assimilates this exemplar to their more general dog concept. In so doing the particular dog is transformed into the universal, conceptual dog. At all stages of development, therefore, whenever one transforms the world to meet individual needs or conceptions, one is, in effect, assimilating it.

Piaget also observed that his infant children not only transformed some stimuli to conform to their own mental structures but also modified some of their mental structures to meet the demands of the environment. He called this facet of adaptation *accommodation*. At the biological level the body accommodates when, for example, its blood vessels constrict in response to cold and expand in response to heat. Piaget observed similar accommodations at the behavioral and conceptual levels. The young infant engages primarily in reflex actions, such as sucking the thumb or grasping. But shortly thereafter the infant will grasp some object and proceed to put that in his or her mouth. In this instance the child has modified his or her reflex response to accommodate an external object into the reflex action. That is to say, the infant's instinctual thumbsucking reflex has been adapted to objects in the environment. Piaget regarded this behavioral adaptation as a model for what happens at higher intellectual levels as well. Whenever one learns new facts, values, or skills, he or she is, in effect, modifying mental structures to meet the demands of the external world.

In Piaget's view, assimilation and accommodation are the invariant processes of intellectual processing and are present throughout life. Furthermore, because the two are often in conflict they provide the power for intellectual development. The child's first tendency is to assimilate, but when this is not possible, he or she must accommodate. It is the constant tension between assimilation and accommodation and the need for some form of equilibrium between them that triggers intellectual growth. For example, in the "hiding the toy experiment" described above, the six-month-old infant simply cried while the one-year-old infant lifted the cloth to reveal the hidden object. This initial upset, and failure of assimilation, thus led to the infant's construction of a mental image of the object. This new construction allows the child to solve the problem and remove the cloth from the toy. At each level of development, the failure of assimilation leads to a new accommodations that result in a new equilib-

rium that prepares for yet another level of disequilibrium.

Piaget published the results of these infant studies in three books, *The Origins of Intelligence in the Child*, *The Construction of Reality in the Child*, and *Play Dreams and Imitation*. These books continue to stimulate a wide range of investigations into the developing abilities of infants.

### **Stage 3: The Elaboration of the Logical Model of Intellectual Development**

During the third period of his work, from the 1940s through the 1960s, Piaget explored the development of many different physical and mathematical concepts in children and adolescents. To explore the physical and mathematical conceptions of children and adolescents, Piaget returned to the semiclinical interview, but in modified form. He decided that the way to test children's level of conceptual development was to challenge their understanding of conservation, that is, their understanding that an object's physical or mathematical properties do not change despite a change in its appearance. Piaget based this methodology on the fact that scientific progress occurs when judgments of reason win out over judgments based upon appearance. The discovery of the roundness of the earth is a good example. The ancients believed that the world was flat. It was only from later observations and reasoning about the disappearance of ships on the horizon and the shadow of the earth on the moon that the perception of flatness could be overcome.

To test children's understanding of conservation, Piaget presented children with a wide array of tasks in which the child had to make a judgment on the basis of either perception or reason. Only when the child made his or her judgment on the basis of reason was the child said to have attained conservation. For example, in his studies of children's conception of number, Piaget confronted children with two rows of six pennies, one spread apart so that it was longer than the other. Young children judge the longer row to have more pennies, while older children judge both rows to have the same amount. Older children have attained the conservation of number while younger children have not.

With this conservation methodology, Piaget and his longtime colleague, Barbel Inhelder, explored how children constructed their concepts of number, space, time, geometry, speed, and much more. In

this third phase of his work, Piaget introduced a logical model to explain children's attainment of conservation in different domains and at different age levels. It is this logical model of intellectual development for which he is perhaps best known. Piaget argued that intelligence develops in a series of stages that are related to age and that are progressive in the sense that each is a necessary prerequisite of the next. There is no skipping of stages. In addition, he contended that each stage was characterized by a set of mental operations that are logical in nature but vary in complexity. At each stage of development the child constructs a view of reality in keeping with the operations at that age period. At the next stage, however, with the attainment of new mental abilities the child has to reconstruct the concepts formed at the earlier level in keeping with his or her new mental abilities. In effect, therefore, Piaget conceived of intellectual development as an upward expanding spiral wherein the child must constantly reconstruct the ideas formed at an earlier level with new, higher order concepts acquired at the next level.

The first stage, infancy or the first two years of life, Piaget described as the *sensori-motor period*. In the first two years of life, the baby constructs elementary concepts of space, time, and causality but these are at the visual, auditory, tactual, and motoric level, and do not go beyond the here and now. At the next stage of development, the *pre-operational level*, children acquire the symbolic function and are able to represent their experience. Children now begin to use words and symbols to convey their experience and to go beyond the immediate. Concepts of space, time, and causality, for example, begin to be understood with terms like *now* and *later*, as well as *day* and *night*. Once the child's thought moves from the sensori-motor to the symbolic level, it has much more breadth and depth.

By the age of six or seven children attain a new set of mental abilities that Piaget termed *concrete operations*, which resemble the operations of arithmetic and which lift school-age children to a whole new plane of thinking. Concrete operations enable young children to reason in a syllogistic way. That may be the reason the ancients called these years the age of reason. Concrete operations enable children to deal with verbal rules and that is why formal education is usually begun at about this time. Following rules is in effect reasoning syllogistically. Consider the classic model of the syllogism.

All men are mortal.

Socrates is a man.

Therefore Socrates is mortal.

This is the same form of reasoning the child must employ if he or she is to follow the rule that says "when two vowels go walking, the first one does the talking."

When two vowels go walking the first one does the talking.

In the word *ate* there are two vowels and the first is an *a*.

In this word, *a* does the talking.

Concrete operations enable young children to construct their conceptions of space, time, number, and causality on a higher quantitative plane. It is during the elementary years that children are able to learn clock and calendar time, map and geographical space, and experimental causality.

At about the age of eleven or twelve young people develop yet a higher level of mental operations that Piaget labeled *formal*. These operations are formal in the sense that they are no longer tied to the here and now and are abstract in the sense that they can be in conflict with reality. For example, if you ask a younger child to imagine a world in which snow was black and to guess what color, in that world, Mickey Mouse's ears would be, the child would have trouble saying they were white. Adolescents who have attained formal operations have no trouble with this problem. Formal operations enable young people to understand celestial space, historical time, and multivariable causality. They can construct ideals, think in terms of possibilities, and deal with multiple variables at the same time. Formal operations move young people to a new plane of thought, which is on a level with adult thinking.

#### Stage 4: The Study of Figurative Thought

During the last stage of Piaget's work, which lasted until his death in 1980, Piaget explored what he called the *figurative facets of intelligence*. By figurative Piaget meant those aspects of intelligence such as perception and memory that were not entirely logical. Logical concepts are completely reversible in the sense that one can always get back to the starting point. The logical addition of concepts, such as "boys plus girls equals children," can be undone by logical subtraction, such as "children minus boys equals girls" or "children minus girls equals boys." But perceptual concepts cannot be manipulated in

this way. The figure and ground of a picture, for example, cannot be separated because contours cannot be separated from the forms they outline. Memory too is figurative in that it is never completely reversible. Piaget and Inhelder published books on perception, memory and other figurative processes such as learning during this last period of his work.

### Conclusion

Jean Piaget is clearly the giant of developmental psychology. His experimental paradigms have been replicated in almost every country in the world and with quite extraordinary comparability of results. Piaget's observations, then, are among the hardest, if not the hardest, data in all of psychology. No other research paradigm has received such extensive cross-cultural confirmation. In the early twenty-first century there has been a tendency of investigators to dismiss Piaget's work as passé. This would be a mistake. While it is important to challenge Piaget and to build upon the foundation he has provided, it would be wrong to discount his work without having a comparable database on which to found such a rejection. Indeed, the opposite is more likely the case, namely, that the value of much of Piaget's work both for developmental psychology education and for other disciplines is yet to be fully realized.

## PLATO (427?–347 B.C.E.)

Plato (427?–347 B.C.E.) was a prominent Athenian philosopher who posed fundamental questions about education, human nature, and justice.

A student of the famous philosopher Socrates, Plato left Athens upon his mentor's death in 399 B.C.E. After traveling to other parts of Greece, Italy, and Sicily, Plato returned to Athens in 387 B.C.E. and founded a school of mathematics and philosophy called the Academy, which became the most prominent intellectual institution in all of ancient Greece. Plato authored a number of dialogues that often depicted Socrates engaging in the educational mode of dialectic. Like his mentor, Plato suspected that most people did not know what they claimed to know, and hence wondered why rigorous qualifications for rulers did not exist. Challenging the Sophists' claims that knowledge and truth were relative to the perspective of each individual, Plato developed an epistemology and metaphysics that suggested an absolute truth that could only be gleaned through rigorous self-examination and the development of reason—skills crucial for enlightened political leaders.

### The Ideal State

Plato's educational ideas derived in part from his conception of justice, both for individuals and for the ideal state. He viewed individuals as mutually dependent for their survival and well-being, and he proposed that justice in the ideal state was congruent with justice in the individual's soul.

Plato's ideal state was a republic with three categories of citizens: artisans, auxiliaries, and philoso-

pher-kings, each of whom possessed distinct natures and capacities. Those proclivities, moreover, reflected a particular combination of elements within one's tripartite soul, composed of appetite, spirit, and reason. Artisans, for example, were dominated by their appetites or desires, and therefore destined to produce material goods. Auxiliaries, a class of guardians, were ruled by spirit in their souls and possessed the courage necessary to protect the state from invasion. Philosopher-kings, the leaders of the ideal state, had souls in which reason reigned over spirit and appetite, and as a result possessed the foresight and knowledge to rule wisely. In Plato's view, these rulers were not merely elite intellectuals, but moral leaders. In the just state, each class of citizen had a distinct duty to remain faithful to its determined nature and engage solely in its destined occupation. The proper management of one's soul would yield immediate happiness and well-being, and specific educational methods would cultivate this brand of spiritual and civic harmony.

### The Dialectical Method

Plato's educational priorities also reflected his distinct pedagogy. Challenging the Sophists—who prized rhetoric, believed in ethical and epistemological relativism, and claimed to teach “excellence”—Plato argued that training in “excellence” was meaningless without content and that knowledge was absolute, certain, and good. As a result, teachers assumed a high moral responsibility. Plato doubted whether a standard method of teaching existed for all subjects, and he argued that morally neutral education would corrupt most citizens. He preferred the dialectical method over the Sophists' rhetorical pedagogy. For Plato, the role of the teacher was not to fill an empty reservoir with specific skills, but to encourage the student to redirect his or her soul and to rearrange the priorities within it to allow reason to rule over the irrational elements of spirit and appetite.

In the *Meno*, Plato examined a paradox that challenged the dialectical method of education: if one knows nothing, then how will one come to recognize knowledge when he encounters it? In response, Plato's Socrates proposed a different idea. Through a geometry lesson with a slave boy, he attempted to demonstrate that all possessed some minimal knowledge that served as a window into one's eternal and omniscient soul. Through dialectic, the teacher could refute the student's false opin-

ions until the student pursued a true opinion that survived the rigors of critical examination. Unacquainted with the storehouse of knowledge in one's soul, a person needed to learn how to access or “recollect” it. Plato distanced himself further from the Sophists by distinguishing knowledge (eternal and certain) from opinion (unreliable and ephemeral).

Plato developed this idea more fully in the *Republic*, declaring knowledge superior to opinion in both an epistemological and ontological sense. Opinion reflected a misapprehension of reality, while knowledge belonged to an essential or “intelligible” realm. In particular, Plato proposed a linear hierarchy of knowledge starting with the “visible” realms of imagination and then belief, and moving to the “intelligible” realms of reason, and ultimately, knowledge. In his celebrated cave metaphor, Plato's Socrates depicted chained prisoners, who presumed shadows of representations cast by artificial light to be real. The first step of education, then, was to turn one's soul away from this artificial world of shadows and toward the representations of objects and ideas themselves—leading one to the realm of belief. The objects of belief, however, were still empirical, and thus, ephemeral, relative, and unreliable. Beyond the cave lay the intelligible realm of reason and knowledge. Plato asserted that ideas did not possess any physical qualities, and to ascend beyond the world of tangible objects and ideas, one needed to develop the power of abstract thinking through the use of postulates to draw conclusions about the universal essence or “form” of an object or idea. Mathematics constituted a particularly useful tool for the development of reason, as it relied heavily on logic and abstract thought. The ultimate stage of awareness for Plato was knowledge of the “form of the good”—a transcendence of all postulates and assumptions through abstract reasoning that yielded a certain and comprehensive understanding of all things.

### Educational Programs

Plato also made clear that not all citizens of the ideal state possessed the same capacity to realize the “form of the good.” As a result, he proposed distinct educational programs for future artisans, auxiliaries, and philosopher-kings. Plato favored mathematics as a precise and abstract model for the development of thought in the future rulers of the just state. Knowledge, however, could only be attained through the use of dialectic to shed all assumptions and to glean the first principle of all, the “form of

the good.” After many years of mathematical and dialectical study, followed by fifteen years of public service, the best of this group would have come to understand the “form of the good” and have become philosopher-kings. Cognizant of the interrelationship of all things and confident of the reasons behind them, the intellectually and morally elite would be equipped to rule the just state in an enlightened manner.

### The Cultivation of Morals

In addition, Plato advocated the removal of all infants from their natural families to receive a proper aesthetic education—literary, musical, and physical—for the development of character in the soul and the cultivation of morals necessary for sustaining the just state. Suspecting that most writers and musicians did not know the subjects they depicted—that they cast mere shadows of representations of real objects, ideas, and people—Plato feared that artistic works could endanger the health of the just state. Consequently, he wanted to hold artists and potential leaders accountable for the consequences of their creations and policies. This is why Plato advocated the censorship of all forms of art that did not accurately depict the good in behavior. Art, as a powerful medium that threatened the harmony of the soul, was best suited for philosophers who had developed the capacity to know and could resist its dangerous and irrational allures. Exposure to the right kinds of stories and music, although not sufficient to make a citizen beautiful and good, would contribute to the proper development of the elements within one’s soul. For Plato, aesthetics and morality were inextricable; the value of a work of art hinged on its propensity to lead to moral development and behavior.

### A Less-Ideal State

In the *Laws*, Plato considered the possibility that not only the majority, but all citizens could be incapable of reaching the “form of the good.” He thus envisioned a second-best state with rulers ignorant of the “form of the good” but capable of thought. Such a society had absolute and unyielding rulers who eradicated any idea or thing that questioned their authority. Acting as if they possessed wisdom, such leaders established laws that reflected their opinions and their imperfect conception of the good.

### Modern Scholarship

Contemporary advocates of popular democracy have criticized Plato’s republican scheme as elitist and tyrannical in prizing order over individual liberty. Indeed, Plato believed that individuals could not stand alone, and as most would never reach internal harmony or virtue, the majority needed to be told how to conduct its life by those who possessed that knowledge. Incapable of understanding the reasons behind the laws, most citizens needed merely to obey them.

Some scholars have also questioned Plato’s treatment of women in his just state. For instance, Jane Roland Martin has argued that although he did not differentiate education or societal roles on the basis of sex, Plato was not committed to gender equality. Despite his abolition of the family, gender distinctions would have likely persisted, as Plato did not seek to ensure the equal portrayal of men and women in literature. According to this view, Plato’s female guardians-in-training warranted a distinct education from men to help mitigate the cultural, symbolic, and epistemological assumptions of female subordination. Identical education, then, did not necessarily constitute equal education, a point that holds significant implications for contemporary assumptions about the effects of coeducation.

These criticisms illustrate the longevity of Plato’s educational, metaphysical, and ethical ideas. In addition, other scholars have eschewed the tendency to evaluate the modern implications of Plato’s specific educational doctrines, and instead have highlighted his assumption that education could address fundamental social problems. They view Plato’s method of inquiry—critical self-examination through the dialectical interplay of teacher and student—as his primary contribution to educational thought. Indeed, perhaps education itself embodied the highest virtue of Plato’s just state.

## POLICY

*See:* EDUCATIONAL POLICY.

## POPULATION AND EDUCATION

The relationship between education and population has attracted the attention of both scholars and policymakers, especially since the mid-1970s. The rate of population growth and the number of people living on earth have both increased spectacularly since the beginning of the nineteenth century. During the twentieth century, the human population increased at an average annual rate that was about fifty times as fast as the rate over the previous 10,000 years. Between 1800 and 2000, the number of people alive increased nearly seven-fold. Following World War II, the rate of population growth exploded—during the 1970s it was about four times as great as it had been a century earlier. By 2000, the living population exceeded the entire population born between the beginning of settled agriculture and the year 1900—a period of 10,000 years.

The implications of this explosive growth for both the physical environment and human well-being alarmed many observers and prompted an intense public policy debate. Many scholars and policymakers noted that high levels of educational achievement were associated with more moderate rates of population growth, suggesting that important opportunities for alleviating population pressures might be found in ensuring greater access to

education, particularly for females. The ensuing public policy debate has prompted an examination of how education affects the birth rate.

The explosive growth of the human population in the nineteenth and twentieth centuries was the result of a historically unprecedented decline in the rate of mortality, rather than an increase in the birth rate. The proportion of children dying before reaching the age of five fell from nearly one in three in most of the world to less than one in one hundred in the most advanced societies over this period, and to one in ten in low-income countries. In the wealthiest countries, birth rates adjusted quickly to restore a balance between births and deaths and establish a rate of population growth of less than 1 percent a year. In economically advanced societies, the average number of children born to each woman over her reproductive life has fallen from about seven to less than two. However, in the poorest countries, a sharp drop in death rates has not been accompanied by a corresponding fall in birth rates. As a result, the rate of population growth—the difference between the average birth rate and the average mortality rate—has increased dramatically in most of the world. The growth of population has been greatest in countries that are both poorest and least able to invest in social and educational services. The combined effects of these forces seem to imply that the gulf between rich and poor is likely to widen over the foreseeable future if aggressive policy measures are not introduced.

These facts suggest that the key to ensuring a sustainable rate of population growth lies in reducing the fertility rate. However, in a highly influential 1979 review of the research literature on the relationship between education and fertility, the economist Susan Hill Cochrane concluded that too little was known about the mechanisms through which education affects population growth to allow policymakers to rely on improvements in educational opportunities to slow the rate of population growth. Since 1976 a large number of scholars have focused on the impact of education—especially the education of the girl child—on fertility, mortality, and population growth. The central purpose of these studies has been to determine whether the nearly universal association of low fertility and high levels of educational attainment are causally linked or merely the result of their association with other forces that directly affect fertility. For example, the inverse relationship between female literacy and fer-

tility might have nothing to do with education as such, but might instead simply reveal that societies that seriously attempt to educate females also care about the welfare of women and therefore seek to control fertility in order to protect their health.

### Social and Economic Factors

The research literature has sought to identify the causal pathways that link education and fertility. The scholars working in this area have been drawn primarily from the disciplines of economics, sociology, and demography, and they have brought with them the conceptual and methodological traditions of their respective disciplines. Economists have suggested that the issues be organized around the familiar (for economists) ideas of supply and demand. They have argued that the number of children actually born to a couple is determined by the capacity to bear children, the factors that determine desired family size, and the couple's ability to achieve its aims. The capacity for meeting fertility goals is determined by such factors as age at marriage, the health of the woman, her fertility, and customs and taboos that affect sexual relations. Women who marry early or enter into sexual unions at a younger age have a greater potential for childbearing than those who marry late. Nutritional status and disease history affect a woman's ability to conceive or to carry a pregnancy to full term. Cultural prohibitions against sexual relations for a prescribed period following childbirth or during breast-feeding reduce the period during which a woman may become pregnant. Failure to ovulate during breast-feeding also reduces the period during which a woman might become pregnant.

The demand for children (the number of children that a couple desires) is also the outcome of complex calculations. Economists have predictably focused on the net contributions of children to the income and material welfare of the family. In very-low-income communities, children typically become contributors to the economic welfare of the family at a very young age. Small children care for younger siblings, thereby releasing their mothers to work either in the fields or in shops. Often, very small children also assist in the herding of small animals and in the care of kitchen gardens. In addition, children provide parents with economic security in their old age. As average incomes and aspirations rise, parents typically seek to have fewer children and to provide these children with more and better education.

Labor market demands and the cultural values of higher-income communities stress education as a requisite of social success. Therefore, as incomes rise, families tend to have fewer children but to invest much more in the nurturing and education of each child. The demand for children is also affected by the costs of providing daughters with dowries and wedding celebrations.

The ability of a couple to achieve its desired family size depends in part on access to contraception. The decision to control fertility is affected by a very complex set of customs and interpersonal forces. Cultural norms that value large families make the limitation of fertility a very difficult choice for many couples living in traditional societies. The social status of the couple and its autonomy relative to mothers-in-law and other members of the extended family, clan, or community influence the choices that are made. The research literature has focused on the impact that formal education has on the decision-making autonomy of women concerning contraception and fertility choices. The literature posits that women who are better educated are not only more knowledgeable about the available options for limiting fertility, but also better equipped to negotiate these subjects with husbands and extended families. The impact of educational status on the openness of communication between husband and wife has received particular attention.

A second approach to the organization of discussions of the determinants of fertility has relied on a framework based on macrosociological theories. Researchers have argued that the average educational attainment of members of a community, and the values and aspirations that emerge as a result, affect desired family size and access to contraception. These researchers have suggested that more-educated communities value smaller, higher-quality families. They have further argued that communities that have adopted modern values are more supportive of decisions to limit fertility.

### Conclusions

Empirical research into the relationship between education and fertility has drawn varied conclusions. At the most aggregate level—comparisons of countries—the conclusion is fairly consistent: countries in which women are better educated typically have smaller families and lower rates of population growth. However, when efforts are made to examine the relationship between education and fertility at

the level of the household, the findings become more ambiguous. The World Fertility Survey and the Demographic and Health Surveys (large-scale international surveys of the characteristics and behavior of individual households) have revealed that cultural norms play a significant role in mediating the impact of education on fertility. The inverse relationship between female education and fertility cannot be found in nearly half of the fifty countries that the two surveys have covered. The failures have been most notable in the Middle East, where Islamic cultural values appear to collide with efforts to limit fertility, and in sub-Saharan Africa, where education levels are often very low. A common generalization arising from research based on these surveys is that the education of females does not affect fertility until an average of four or five years of schooling is provided to most girls.

Quantitative research into the relationship between education and fertility has focused primarily on the relationship between girls' schooling and achieved family size. Efforts to examine simultaneously the impact of boys' education on fertility suggest that perhaps a third of the effect of education on family size operates through boys' education.

The extensive research literature on female education and fertility has been undertaken primarily in order to document the likely effect of additional investments in the education of girls on the rate of population growth. The literature has grown enormously since the mid-1970s. The complexity of the forces that determine desired and actual family size has grown more apparent as a result of this research. However, until a more powerful way of organizing and interpreting the facts can be developed, it will remain impossible to predict with reasonable accuracy the impact of improvements in girls' education on fertility, family size, or population growth. Nonetheless, the contributions that education makes to the economic productivity and the quality of life for both individual women and their families argue persuasively for investing in the education of girls.

## POSTDOCTORAL EDUCATION

As graduate students complete their doctoral training, they have several options for employment. A natural step for a new Ph.D. is to enter the professoriate by accepting a faculty position at a college or university. Others choose to accept nonacademic positions in either private or public businesses. A third option is to enter a postdoctoral position (postdoc), with opportunities for continued research as neither a graduate student nor a permanent university employee.

The National Research Council notes that the "postdoc is difficult to quantify and describe because it is both 'further study' and 'employment'" (p. 2). A senior faculty member supervises (or mentors) the postdoc for a period of one to several years as the postdoc continues to research and expand her knowledge base. The postdoc receives a stipend or salary for the position and in most cases will also receive some benefits such as medical insurance. However, the postdoc is not a permanent position. There is also no standard job description for postdocs as each university, department, and supervisor may have different expectations of postdoctorate education. In the right situation, a postdoc can provide extra time for the new Ph.D. to hone research skills and increase publication productivity. In other cases, it is the best path to choose because of a poor job market and increased competition for faculty positions.

For years, postdoctorate positions have been standard in high-consensus disciplines such as chemistry and other science-based fields. Only at the end of the twentieth century did disciplines within

the humanities begin to offer postdoctoral positions to recent graduates in their fields, in order to give these graduates the opportunity to begin a strong research program prior to the start of tenure-track responsibilities.

There are several considerations one must take into account before pursuing and accepting a postdoctoral position. The first is what will ultimately happen to the new Ph.D. by delaying entry into the workforce. Will the position make the new Ph.D. a stronger candidate for future positions, or is she decreasing her chances of finding the best-ranking position by not pursuing a "real" job? Second, it is also important to consider the scope of the postdoctoral position. Will the postdoctorate education allow a Ph.D. to have responsibilities for all areas of a typical faculty position or will he be limited to one or two specific jobs? Either of these scenarios could hinder or assist a new faculty member as he pursues a chosen career path. Finally, those in the hard sciences may have the option to continue a project after the end of the postdoctoral job. This could make the candidate more marketable for prime faculty positions, but the postdoc supervisor may be reluctant to allow this.

Although postdocs have traditionally been temporary appointments under seasoned researchers at universities, a growing trend is for industry to offer postdoctoral opportunities to scholars in fields such as chemistry, biology, and physics. Industry jobs can provide a steady supply of funds and research equipment that may lead to more collaboration with other researchers because of reduced competition for research funds. However, these positions often afford the new Ph.D. less autonomy as companies often have specific research goals set for their researchers. Proprietary research may limit what the postdoc is allowed to publish as well.

The number of recent graduates actively searching for postdoctorate positions is contingent on several factors; the most prominent is the condition of the job market. In the hard sciences, for example, the number of research jobs available each year may be limited due to several factors, including industrial restructuring and reductions in the growth of federal research and development spending. At the same time, the number of Ph.D.s continue to rise in both the hard sciences and the humanities. Thus a greater number of new Ph.D.s are forced to compete for openings, leading many to pursue a postdoc as an alternative.

#### CHILDREN AND ADOLESCENTS

Rebecca C. Fauth  
Christy Brady-Smith  
Jeanne Brooks-Gunn

#### OVERVIEW

In 1998, more than 13 million children (19 percent of all children) under age eighteen lived in families with incomes below the official poverty threshold. Although children age eighteen and under represent 26 percent of the United States population, they comprise nearly 40 percent of the poverty population. Despite a steady decrease from 1993 (23%) to 1999 (17%) in the rate of children in poverty, the United States still ranks highest in childhood poverty among all industrialized nations.

In the United States, income poverty is defined by the poverty threshold, developed in 1959 and based on expected food expenditures (thrifty food basket) for families of varying sizes. Each year the threshold is adjusted for the Consumer Price Index cost of living. In 1999, the poverty threshold for a single mother raising two children was \$13,423. Researchers have criticized the poverty threshold on numerous counts. First, government transfers such as food stamps and housing subsidies as well as tax benefits (e.g., the Earned Income Tax Credit) and

tax payments are not included when assessing the poverty threshold. Second, regional and urban differences in the cost of living are not considered when computing the poverty threshold. Despite the criticisms levied against the way poverty is assessed in the United States, the current review highlights research that has used this definition of poverty, while acknowledging its weaknesses.

This article reviews the literature linking family poverty to children's cognitive and educational outcomes such as achievement tests, grade completion, and high school graduation. Timing of poverty has been shown to make a difference *vis-à-vis* child outcomes; thus, the discussion focuses on three stages of childhood: early childhood (age two to four), middle childhood (age five to twelve), and adolescence (age thirteen to eighteen). For each stage, we examine the effect of income poverty on children's cognitive ability and school achievement. Depth and duration of poverty are also considered, as these features have been linked to numerous domains of child development.

### **Consequences of Income Poverty on Children's Educational Outcomes**

Simple comparisons between children in poor families and children in non-poor families using national datasets indicate that poor children are more likely to do worse on indices of school achievement than non-poor children are. Poor children are twice as likely as non-poor children to have repeated a grade, to have been expelled or suspended from school, or to have dropped out of high school. They are also 1.4 times as likely to be identified as having a learning disability in elementary or high school than their non-poor counterparts.

As with many studies examining the effect of poverty on children, correlational research is deficient in many ways. Simple comparisons between poor and non-poor children do not account for other family or child characteristics—such as single-parent households, maternal education, or child health problems—that may contribute to child development apart from the effect of poverty itself. Selection bias is another potential problem. Some researchers, such as Susan Mayer (1997), argue that poverty status often depends upon decisions made by family members, such as whether to apply for government services or seek employment, resulting in upwardly biased estimates of the relationship between income and child outcomes. Few feasible

strategies are available that are capable of completely eliminating the problem of selection bias, though some are more successful than others are.

Recently released national data sources address many of the inherent problems in research on family income and child development. These studies include longitudinal indicators of socioeconomic variables (e.g., occupational status and prestige, years of schooling, and family and neighborhood income), measures of family income, and numerous child development assessments. Utilization of the data from these longitudinal studies has made possible the distinction between family income and its correlates on child development and outcomes. Moreover, longitudinal designs allow for an assessment of how the timing (early vs. late) and duration (transient vs. persistent) of poverty may differentially affect children's outcomes. When possible, this discussion presents finding from studies that used standardized tests of school readiness, achievement, and cognitive ability, and controlled for key family and child characteristics, in its review of the impact of poverty on children's educational outcomes.

**Early childhood.** During the 1990s, the nation was inundated with reports on the importance of the early years on children's brain development and later cognitive achievement. While some of the reports may have overstated the issue and understated the importance of a child's later years on development, evidence suggests that the early years may be a critical period of development in which family poverty has particularly strong effects on young children. As seen in Table 1, poverty occurring early in a child's life (age two to four) is associated with large effects on indices of child school readiness and cognitive outcomes.

Judith Smith and colleagues (1997), using data from two national datasets, showed that family poverty was significantly associated with lower scores on several measures of child cognitive and school readiness outcomes for children age three to four years, even after controlling for the effect of mother's education, family structure, and child race, birth weight, and gender. Moreover, according to Pamela Klebanov (1998), the effect of poverty was seen among children as young as two years of age.

Judith Smith, Jeanne Brooke-Gunn, and Pamela Klebanov (1997) found that children living in families with incomes less than half the poverty threshold (deep poverty) scored nine to ten points lower on

TABLE 1

## Effects of family income on measures of children's ability and achievement by developmental period

Developmental Period	Size of Effect		
	None	Small or Moderate	Large
Early childhood (age 2–4)			BSID PPVT-R Stanford-Binet
Middle childhood (age 5–12)		Completed schooling Behind in grade for age	PPVT-R PIAT-Math PIAT-Reading
Adolescence (age 13–18)	Self-reported grades Completed schooling Odds of completing high school Odds of attending college	Completed schooling Odds of completing high school Odds of attending college AFQT score	

**Note:** Analyses control for mother's education, family structure, and other demographic characteristics.

Large effects: all income coefficients from income-based models were significant at  $p \leq .05$  and effect size was  $\geq$  one-third of a standard deviation.

Small to moderate effects: most income coefficients were significant at  $p \leq .05$  and effect size was consistently  $<$  one-third of a standard deviation.

None: few or no income coefficients were significant at  $p \leq .05$ .

BSID: Bayley Scales of Infant Development; PPVT-R: Peabody Picture Vocabulary Test-Revised; PIAT: Peabody Individual Achievement Test; AFQT: Armed Forces Qualification Test.

SOURCE: Adapted from Duncan, Greg J., and Brooks-Gunn, Jeanne. 1997. "Income Effects across the Life Span: Integration and Interpretation." In *Consequences of Growing Up Poor*, ed. Greg J. Duncan and Jeanne Brooks-Gunn. New York: Russell Sage Foundation Press.

cognitive ability than children in near-poor families (150 percent to 200 percent of the poverty threshold) at age three to four. Persistently poor children, those who spend all of their childhood years in poverty, experience more negative cognitive and educational outcomes than their peers who encountered only short-term or transient poverty. Children who lived in persistent poverty scored six to nine points lower on measures of cognitive ability and school readiness than children who were never in poverty. Although transient poverty was associated with worse child outcomes, the effect was not significant—children who had experienced short-term poverty scored only two to three points lower, on average, than children who were never in poverty.

**Middle childhood.** Measures of child educational outcomes in elementary school typically include school achievement test scores, grade failure, and learning and attention problems. Among school-age children, the effect of family poverty on child achievement parallels the findings for young children. Family poverty was significantly associated with lower reading and mathematics achievement scores for children at age five to eight. Other researchers, such as Thomas Hanson, Sara McLanahan, and Elizabeth Thomson, have found modest

associations between family income-to-needs ratio (income divided by poverty threshold for family) and school performance and grade point average.

Children living in deep poverty scored ten to twelve points lower than near-poor children on measures of achievement and cognitive ability at age five to six. This effect was also found for older children—those in deep poverty scored seven to nine points lower on the achievement measures at age seven to eight. The differential effects of persistent and transient poverty were also seen in middle childhood. Five- to eight-year-old children who lived in persistent poverty scored six to ten points lower on measures of cognitive ability and school readiness than children who were never poor. Children who had experienced transient poverty scored three to six points lower, on average, than children who were never in poverty. A study in Canada by Linda Pagani and colleagues also found that persistent poverty was significantly related to academic failure. Children who had experienced poverty throughout their lives were twice as likely as never-poor children to be placed in a non-age-appropriate classroom.

**Adolescence.** Academic measures of adolescent educational outcomes include high school dropout and graduation rates, school engagement, GPA, and

achievement test scores. Overall, the effect of poverty in adolescence on educational outcomes is relatively small. Findings suggest that a 10 percent increase in family income is associated with a .2 percent to 2 percent increase in the number of school years completed. Income poverty in the early years, however, is more strongly associated with high school completion than poverty during later childhood and adolescence, and most pronounced among those in deep poverty.

### **Pathways through Which Poverty Affects Children's Educational Outcomes**

Poverty's effect seems to be the strongest when it occurs early in the child's life, when it is persistent, and when children live well below the poverty threshold. Poverty may influence child development through at least five pathways: (1) child health and nutrition, (2) parent mental health and affective interactions, (3) provision of a stimulating home environment, (4) school and child care quality, and (5) neighborhood conditions. Emerging evidence suggests that the influence of family poverty on children's cognitive outcomes may be entirely mediated by these pathways. The latter four pathways are briefly reviewed below.

**Parental mental health and affective interactions.** Parents who are poor or who have a history of welfare receipt are more likely to have worse emotional and physical health than those who are not poor. Researchers such as Rand Conger and colleagues, using the family stress model, have linked parental depressive symptoms to more conflict with adolescent children, which in turn results in less optimal emotional, social, and cognitive outcomes. Poor parental mental health also is associated with less stimulating home environments and more discordant parent-child interactions.

**Provision of a stimulating home environment.** Family income directly influences the material resources available to children in their homes. Higher income children benefit from higher levels of cognitively stimulating materials available in their homes compared to low-income children. The provision of a stimulating home environment, in turn, accounts for much of the effect of income on the cognitive development of preschool and elementary school children and may be the most important pathway through which poverty operates.

**School and child care quality.** Children from poor families are also exposed to lower quality school and

child care settings compared to their non-poor counterparts. Findings from two national child care studies, as described by Deborah Phillips et al. (1994), indicate that up to 60 percent of subsidized and low-income child care centers failed to conform to legal child to staff ratios in toddler classrooms and most (70%) received low ratings on scales of appropriate caregiving and the provision of appropriate activities. Lower quality child care is associated with lower math and language ability, negative peer interactions, and more behavior problems.

**Neighborhood conditions.** The neighborhoods in which poor families reside are another pathway through which income poverty may negatively affect children's educational outcomes. Financial strain limits the housing and neighborhood choices available to low-income families, constraining these families to live in neighborhoods characterized by high levels of crime and unemployment, low levels of resources, and a lack of collective efficacy among the residents. Neighborhood residence, in turn, is associated with child and adolescent school outcomes above and beyond the effect of family poverty.

### **Conclusion**

The challenge currently facing researchers is how to accurately estimate the effect of income poverty net of other factors, such as measured and unmeasured family and individual characteristics. There are several statistical options available that may provide upper and lower bounds of effects. Regressions, such as those reviewed above, that control for a host of demographic and parental characteristics are one option that provide an upper bound of effects. Including more specific controls, such as maternal verbal ability or IQ scores (which most of the findings in this article did not do), would provide a more accurate estimated effect of poverty on child outcomes. Another option is to control for assets or permanent income. Sibling analyses, which control for many unmeasured family characteristics, also provide a more accurate effect of poverty. Experimental studies, in which participants were randomly assigned to receive income supplements or the usual welfare program, provide some of the most powerful evidence thus far that income influences child achievement. Parents randomly assigned to programs that increased earnings had elementary school-aged children who scored consistently higher in the area of school achievement, compared to those in the control program.

Although the complex pathways through which family poverty affects child educational outcomes have yet to be fully understood, it is clear that childhood poverty compromises the educational prospects of children and adolescents. Many poor children begin life at a disadvantage, due to family income, low maternal education, single parents, young parents, or a combination of these factors. The level of disadvantage may become exacerbated through the lack of cognitively stimulating or safe home environments, conflicted parent-child interactions, poor school and child care environments, and poor neighborhood conditions. As knowledge of the pathways through which income poverty affects child cognitive and educational outcomes expands, this nation will come closer to understanding how best to address the problem of childhood poverty.

## CHILDREN AND ADOLESCENTS

Although the percentage of children ages 18 and under living in poverty in the United States dropped from 18.9 percent in 1998 to 16.9 percent in 1999, children in the United States are more likely to be poor than any other age group. Moreover, U.S. child poverty rates are well above those in other industrialized nations, such as Spain, Canada, and Australia. Put simply, 12.1 million children in the United States are living in families with earnings at or below the conservative income poverty line (\$17,601 or less for a family of four, according to the U.S. Census Bureau's 2001 guidelines), indicating they are likely to be lacking the finances to fund basic needs such as food, shelter, and clothing.

The rise in both divorce rates and out-of-wedlock births in the last quarter of the twentieth century is partially responsible for the staggering number of poor children in the United States. One-third of U.S. births in the early 1990s were to unmarried mothers. Single-parent families are more likely to be poor due to both their dependence on a single wage earner for income and the probability that the household heads are younger and less educated than their dual-parent counterparts. Given this information, it is not surprising that 53 percent of poor families are headed solely by a female adult.

Changes in employment patterns, declines in the manufacturing sector, relocation of jobs into the suburbs, and wage polarization may also explain the

high national poverty rates. The Personal Responsibility and Work Opportunity Reconciliation Act (PRWORA) of 1996 also has the potential to affect U.S. poverty rates. With PRWORA's prescribed time limits, work requirements, sanctions, and categorical restrictions for cash assistance, many families may find themselves unable to receive needed benefits. Moreover, the current welfare legislation does not offer a safety net for parents facing difficulties transitioning into full-time work.

### Effects of Income on Child Outcomes

Findings are modest but significant regarding the direct role of poverty in influencing children's cognitive and school-related outcomes throughout early, middle, and late childhood. Children reared in conditions of poverty face more adverse developmental outcomes than their non-poor counterparts. Much of the research prior to the mid-1990s on the impact of poverty status on children suffered from shortcomings such as flawed measures or unrepresentative samples. Additionally, the differences between income and socioeconomic status (SES) were often blurred, elevating the risk of using inappropriate indicators of SES such as occupational prestige or level of maternal education (fairly stable variables) as proxies for income (which is often quite volatile). Large, longitudinal studies such as the National Longitudinal Survey of Youth (NLSY), the Infant Health and Development Program (IHDP), and the Panel Study of Income Dynamics (PSID) have remedied many of these methodological problems and include adequate child development assessment instruments, measures of family income, and socioeconomic status indicators. A common current practice of researchers is to calculate an income-to-needs ratio, which takes into account family size relative to the current poverty line; a ratio of one or below denotes living in poverty. Utilization of this poverty measure compared with a two-pronged (poor versus not poor) approach allows for a more thorough analysis of how different depths of poverty affect children's outcomes.

**Physical health.** Beginning prior to birth, poor children experience more health problems than their non-poor counterparts, even after adjusting for potentially confounding factors. Controlling for mothers' age, education, marital status, and smoking status, women with incomes below the federally established poverty line were found to be 80 percent more likely to bear an infant at low birth weight

(2500 grams or less) than women whose incomes remained above the poverty line. Children born at a low birth weight are at risk for negative outcomes well into their childhoods. Compared to full-term children, neurologically intact very-low-birth-weight children (1500 grams or less) present more impairments in arithmetic, motor and spatial skills, language, and memory, and perform worse on measures of achievement. Children with birth weights of less than 1000 grams are at the highest risk. One study revealed that 34 percent of low-birth-weight children were either repeating grades or placed in special education classrooms in school; only 14 percent of normal-birth-weight children experienced the same outcomes. Other research also reports elevated levels of grade repetition as a result of low birth weight. One study of siblings found that low birth weight reduces children's chances of graduating high school by nearly 75 percent when compared with their full-term siblings regardless of family income. Sibling studies control for unmeasured family characteristics and for selection bias—the fact that families with low-birth-weight children may be different in important ways from those who do not have low-birth-weight children—and therefore may provide more nuanced results and greater effects. The detrimental effects of low birth weight remain intact, though diminished, through the adolescent years and possibly into adulthood.

Although the rates of child malnutrition are lower in the United States compared with other countries, poverty is associated with nutrition-related disorders. Often linked with nutritional deficits, poor children in America experience higher rates of growth stunting (low height-for-age) and wasting (low weight-for-height) than their non-poor counterparts (13% and 5% respectively). These height and weight differences between poor and non-poor children are greater when long-term rather than single-year measures of income are used. Stunting and wasting are associated with lower cognitive test scores; short-term memory is especially diminished. Chronic malnutrition, often the cause of stunting, is associated with low cognitive test scores even after controlling for poverty status and its correlates. Children who are born both at low birth weight and short for their age have lower test scores than children who fit in only one of these categories.

Exposure to lead poisoning presents yet another heightened risk for poor children. The prevalence of

elevated blood lead levels (20 to 44  $\mu\text{g}/\text{dL}$ ; per deciliter) was four times greater for children from low-income families (16.3%) compared with their peers from high-income backgrounds (4.0%). Rates were especially high (28.4%) for low-income black children. The deleterious effects of lead exposure on children vary depending on the severity of exposure, and also on the developmental stage of the child. At young ages, elevated blood lead levels are associated with stunted growth, decreases in IQ, and various physical impairments. A study conducted by Walter J. Rogan and his colleagues explored the effect of chelation therapy to reduce blood lead levels in poor children ages twelve to thirty-three months. The study found that although the treatment did lower children's blood lead levels, IQ scores were lower and parent-reported behavior problems were higher for treated children than for controls who only received a placebo at a thirty-six-month follow-up. Chelation therapy proved unable to successfully prevent deleterious outcomes for lead-exposed children; therefore, prevention of lead exposure for poor children needs to be a priority.

Health problems and nutritional deficits are important ways through which poverty affects children's cognitive and school-related outcomes. Poor children face an increased probability of being born at a low birth weight and experiencing both nutritional deficits and elevated blood lead levels. Past research suggests that the prevalence of these conditions in addition to other health problems can account for as much as 20 percent of the difference in IQ scores between poor children and their non-poor peers during preschool. Efforts to improve the health and well-being of poor children, including improved access to affordable health care and the provision of nutritional supplements and food stamps, are necessary to promote school-related success and competence.

**Mental health.** Children's mental health can be assessed via dimensional scales that screen children for various types of less severe subclinical symptoms (e.g., behavior problems) or with scales that more formally determine whether or not a child's behavior falls within a clinical diagnostic category according to the *Diagnostic and Statistical Manual of Mental Disorders—Fourth Edition* (DSM-IV). Most large national studies contain measures that assess dimensionality/level, such as the Child Behavior Checklist. Parental reports of behavior problems are the most common indicator of children's mental health and

are generally classified along two dimensions: *externalizing* or undercontrolled behaviors including aggression, fighting, and acting out, and *internalizing* or overcontrolled behaviors such as depression, anxiety, and withdrawal. The reliance on maternal reports of behavior problems is a shortcoming in many of the large national studies. While these studies do control for maternal mental health and other characteristics that may influence how parents rate their children's behavior, higher instances of teacher-rated behavior problems are needed to corroborate mothers' responses.

Studies have established a negative link between income and behavior problems, although modest in size compared to the effects of income on both physical and cognitive outcomes. After controlling for a host of family-level variables including maternal education and single parenthood, the effects of income or poverty on children's emotional and behavioral outcomes are often muted or dissipate altogether. Some researchers, however, have found significant effects of poverty on children's mental health.

Using data from both the IHDP and the NLSY, researchers found that kindergarten-aged children growing up in persistently poor homes had substantially higher internalizing behavior problem scores than their peers who were never poor. Lower self-esteem, which is related to internalizing problems, most notably depression, may also result from persistent poverty, although mothers who are actively involved in their children's lives may lessen this effect. The timing of poverty in children's lives may also be relevant. Children who suffered from persistent poverty early in their lives maintained heightened levels of depression through the age nine in one study. Children who experienced economic hardship were also less popular among their peers than those who did not face economic adversity, possibly due to their higher levels of behavior problems.

Research is mixed as to whether current poverty status or persistent poverty contributes to children's externalizing behavior problems, including antisocial behavior. Data from the Charlottesville Longitudinal Study, examining elementary-school-aged children, found that children who endured even one year of family economic hardship possessed higher levels of externalizing behaviors than children who did not experience poverty; boys were more adversely affected than girls. Other research, using an income-to-needs ratio as an index of family poverty, reported a link between poverty and delinquency for

young boys studied longitudinally between the ages of 6 and 16 years. Boys experiencing transitory poverty were at greater risk of engaging in extreme delinquent acts than boys who were never poor. Less severe manifestations of externalizing behavior were not influenced by family poverty in this particular study. Thus, families' poverty status may have its greatest impact on externalizing behaviors in their most severe form.

Due to the confounding of race/ethnicity and class and the fact that poverty rates among blacks and Hispanics living in the United States are two to three times higher than that of non-Hispanic whites, it is important for researchers to consider children's racial/ethnic backgrounds when examining links between poverty and child outcomes. One line of research suggests that the effects of persistent poverty on children's behavior problems, both internalizing and externalizing scales, may be stronger for white than for African-American children, possibly explaining some of the discrepancies regarding the relationship between poverty and externalizing problems. Other research found the opposite pattern emerging with internalizing scores. For black children, internalizing behaviors increased with the number of years spent in poverty, whereas the inverse was found for persistently poor white children.

Thus far, the direct impacts of income on children's mental health have been considered. Risk indices, which take into account other factors correlated with family poverty status (i.e., low maternal education, single parenthood, and parental substance abuse and mental health), provide an alternate way of examining the effects of poverty on children. Not surprisingly, the more risk factors children experience, the greater the number of behavioral problems they show at six and seven years of age. Moreover, behavioral maladaptation is more likely to occur for children experiencing numerous risk factors simultaneously rather than one individually. Parental attributes or behaviors such as substance abuse, antisocial behavior, negative life events, and psychiatric episodes tend to be the most devastating risks for children. Thus, it may not be poverty per se that has a negative impact on poor children, but other risks experienced more frequently by poor children than by their nonpoor counterparts.

**Parenting behavior and parent mental health.** The Family Stress Model has been used by researchers to examine the indirect links between poverty and child

development. According to this model, stress generated by economic hardship and income loss results in parenting that is less consistent, less supportive, less involved, and more coercive and harsh. These lower quality parent-child interactions lead to higher rates of behavioral and school-related problems among poor children. Maternal mental health, most notably depression, is also negatively affected by poverty. The higher incidences of maternal depression and distress in poor families most likely drives the use of these less effective parenting styles. Many studies have documented the link between maternal depression and children's internalizing and externalizing behavior problems, indicating that the emotional detachment and disengagement resulting from depression is quite harmful to children. Other indirect influences include the home environment, child care and schools, neighborhoods, health care, and exposure to violence.

**Implications of mental health on children's educational outcomes.** Poor children's academic performance may be hindered due to the higher rates of behavior problems within this group. A large body of research has established a link between behavior problems and outcomes in the academic or cognitive domain early and late in children's school careers. Difficulty in paying attention, a form of externalizing behavior, is highly associated with underachievement for younger, elementary-school-aged children. Aggression toward peers in fifth grade has been found to predict school dropout. Compared with peers who were never poor, persistently poor children were found to be most at risk for fighting with peers in the sixth grade, even after teacher-rated behavior problems in kindergarten are taken into account. These same children were two times more likely than their never-poor peers to be in a non-age appropriate classroom and to be at risk for experiencing academic failure.

Other studies indicate that both externalizing and internalizing symptoms (including hyperactivity, intrapersonal adjustment, lethargy, and withdrawn behaviors) in kindergarten or first grade may be associated with poor reading and math achievement the following academic year. Early behavior problems have been found to have relatively long-term effects on reading skills, IQ, and class placement during later school years, possibly even into high school. Teacher-reported ratings of internalizing and externalizing symptoms in second and fifth grades predicted grade point averages and achieve-

ment test scores during children's freshman and senior years of high school.

Past research has shown that teachers at high socioeconomic level who teach poor children tend to regard their pupils in a more negative light, in terms of behavioral characteristics (maturity/immaturity), academic expectations and performance, even in the early school years. These teachers were also more likely to view the school and classroom contexts less positively than teachers of children at higher socioeconomic levels, possibly creating a self-fulfilling prophecy in which these children begin to act, behaviorally and academically, in line with their teachers' thoughts at very early ages. Some have argued that in order to mitigate the powerful effects of poverty and its correlates on children's school outcomes, teachers must allow students greater autonomy and decision-making, have positive expectations for all of their students, possess good management, disciplinary control, and exemplary organizational skills, and provide a variety of challenging, yet meaningful tasks.

### Policy Implications

It is always important to contemplate how government social policy concerning income transfers, employment, child care and schooling, social services, housing, and health care can potentially help or hinder our nation's poor families. Preliminary results from ongoing research examining the effects of mothers transitioning off welfare and obtaining employment suggest that job earnings often are not lifting families out of poverty. Without a significant increase in earnings, it is likely that these working families may not see any marked improvements in children's well-being. Moreover, if these families continue to live in high-poverty neighborhoods with elevated crime rates and inferior public schools, are unable to afford high-quality child care for their children, and do not receive family health benefits, the situation seems dire still. Policy efforts may need to go beyond cash transfers and concentrate instead on the provision of high-quality services such as medical care (e.g., Medicaid), the provision of nutritional information and supplements (e.g., food stamps; Women, Infants, and Children; and the National School Lunch Program), early childhood education (e.g., Head Start and Early Head Start), and housing (e.g., Section 8 vouchers). It is not clear whether programs that target some of the indirect effects of poverty, such as in-home interventions, are

effective in improving adults' parenting skills and their ability to facilitate literacy and learning within the home, which are crucial for children's school success. Continued investment in creating new and unique policies and programs that are aimed at either preventing economic deprivation altogether or help to assuage its negative effects are needed.

### Conclusion

The effect of poverty on children's physical and mental health begins early and often continues to leave its mark well into the adolescent years. While many researchers have examined the connections between growing up poor, children's health, and their cognitive and school-related outcomes, few independent research efforts have made similar connections between the pernicious effects of low income on youngsters' mental health and the subsequent impact of poor mental health and behavior problems on children's academic performance. The association between income poverty and mental health is not as strong as its effects on physical and cognitive and/or academic outcomes. In fact, when effects are found, they are often mediated by parenting and parental mental health. Children are negatively affected by poverty throughout their lives in many domains, especially when the poverty occurs at a young age and in severe form. Policy efforts to assist poor families in order to bolster children's chances of succeeding in school need to start early and target the entire family and their environs.

## PRESIDENCY, COLLEGE AND UNIVERSITY

The chief executive officer of an institution of higher education in the United States is commonly known as *president*. There are some campuses, however, which use the titles of chancellor, dean, or chief executive officer in lieu of president. The diversity of higher education institutions in the United States has resulted in chief executive officers at U.S. colleges and universities with a wide variety of background characteristics and job responsibilities.

### Characteristics

Historically, college presidents have been overwhelmingly white, Protestant, and male. By the late 1990s more than 19 percent of college presidents were women and 11 percent were members of other minority groups. The average age for presidents was 57.6 years, with 30 percent never having served as a full-time faculty member. More than 80 percent hold an earned doctorate, with the single largest field of study being education. Most college and university presidents are members of their institution's governing board, although not all have voting rights. The average length of service for a president is seven years.

### Career Path

The path to the college presidency was historically pursued by ordained ministers. This held true especially for those institutions created to educate future religious leaders. As institutions began to educate beyond theology and law, presidents with educational backgrounds in the arts and sciences became predominant. These academic presidents still constitute the single largest type of all college presidents, particularly at four-year institutions. In the latter half of the twentieth century great changes occurred in higher education, shifting the role of the U.S. college president. Two-year public community college sys-

tems were created in most states as a means to provide greater access to higher education, and a number of four-year institutions were founded to accommodate the rising number of students going on to college. This exponential growth required the addition of many presidential positions. Many of those named to the presidency of the two-year colleges came from the ranks of professional educators, in particular from the staff of local school systems. Selection of presidents at four-year institutions shifted from academic ranks to mostly those from administrative positions at a college or university.

Increasingly, more chief executive officers are arriving at the presidency from areas other than the traditional vice president of academic affairs position. These nontraditional presidents are typically individuals who have worked in other areas of college or university administration, such as finance, institutional advancement, or student affairs. Some institutions have even gone to the business community for individuals to fill the presidency. This shift stems from the need of higher education institutions to run more like a business and to use skills of management and finance that are not as prevalent in academe.

Even with these changes in a president's educational and experiential background, it is still uncommon for college presidents to shift between different types of institutions. Individuals who have worked at two-year colleges typically remain at two-year institutions. The same is true for doctorate-granting, comprehensive, baccalaureate, and specialized institutions. For all institutional types, presidents are usually hired from another institution rather than from within the same institution. Due to the extensive nature of the position, the search process to select a college or university president often involves a number of individuals with a vested interest and often takes an entire year.

### **Roles and Responsibilities**

The college president is typically responsible to a governing board for the successful operation of the institution. Some presidents lead an institution affiliated with a church denomination or a state system, and may therefore report to the chief executive officer of that particular organization. The president's relationship with the institution's board of trustees is critical. One of the board's primary duties is to hire and fire the president, and thus it is important

for the president to be attentive to the needs and desires of the board.

Many presidents gain the full trust and support of their boards, which allows them to establish and carry out a vision for the institution. The construction of a vision for an institution by the president is critical because it tells the story of where an institution has been and provides direction for where the institution is headed. "This vision, if believed in by the faculty, administrators, staff and students, has the potential to transform an institution. The degree to which the president is respected and admired by the faculty will be the extent to which he or she is able to inspire trust and confidence, the extent to which he or she is believable, and can deliver" (Fisher, p. 101). Although the president is the voice for the vision, the president does not usually create this vision alone. The college or university president must identify, and be attentive to, the strengths and weaknesses of the institution. Understanding the capacity of those who work for the college or university and how the institution fits within the larger higher education sector allows the president to determine what the institution can achieve. The president must craft this vision, with members of the college community taking ownership in its development. Once the vision is crafted, the president must share it at every opportunity.

A significant aspect of the college president's role is symbolic in nature. Whether it is leading the opening convocation, dedicating a new facility, or presiding over commencement ceremonies, the president represents the institution. Within the college community, the president can use the influence derived from the symbolic nature of his or her position to move the institution in a given direction. Out in the greater community the president's role is often more prominent. Individuals not directly involved with the college typically believe a college or university president has authority and control over more than he or she really does. As a result, presidents may find themselves under greater pressure from external constituents than internal constituents. The resulting role for many presidents becomes one of mediator, facilitator, and consensus maker for issues both internal and external to the institution.

Internally, a college president is responsible for the effective operation of the institution. Most presidents have an advisory cabinet composed of vice presidents and potentially one or two other key indi-

viduals who help the president ensure that the goals and vision are being implemented in a positive fashion. The president's broad areas of responsibility include academic affairs, which encompasses development of the curriculum and new educational programs; oversight and maintenance of facilities; fund-raising and communicating the image of the institution through institutional advancement; enrollment management, which tracks graduation, admission rates, and financial aid to ensure stable student enrollment; the finances of the institution; and finally, the management of out-of-classroom issues in student affairs, such as judicial hearings, residence life, and health services. Although there are countless variations in the organizational structure and scope of responsibilities, these areas, in most instances, are overseen by a vice president. For example, many institutions combine facilities and finance into one functional area. The organizational structure of the president's cabinet reflects institutional as well as presidential values and goals.

Although the president has vice presidents and their staffs to carry out each functional role, the president will be involved at varying levels at different times, depending on the issue at hand. A president may serve as the final arbiter for a student judicial hearing, determine whether a faculty member receives tenure, or assist in the detailed development of a new facility for the campus. However, it is a rare campus where the president has developed authority in a top-down fashion. The president relies on the expertise and experience of his or her staff to accomplish the details of the institutional vision.

For most presidents their power is derived through their influence with the various campus and community constituents. In working with the curriculum and other components of the educational programs, the president typically encourages faculty to take the lead and reserves specific input for those items that are absolutely critical for the fulfillment of the institution's vision. As the college or university representative, the president's views typically carry significant weight. This significance allows for the opinion of the president to steer decisions in a manner perceived as beneficial to the college or university.

From the vision comes the task of strategic planning to enable an institution to achieve its goals. The president must look beyond next year's class size, the goal for the upcoming annual fund, and other short-term concerns of the institution to see beyond the

horizon and craft a path for the college or university on its way to fulfilling the vision. Crafting a long-range plan constitutes one of the major areas of time spent by a president. He or she must also spend considerable time on and off campus raising money for the institution, visiting with alumni in areas with significant numbers, and meeting with key individuals who may have the ability to support the institution.

ALAN P. DUESTERHAUS

### PRESSEY, SIDNEY L. (1888–1979)

Father of the teaching machine, author of the first book on standardized testing, and founder of the Division on Adult Development and Aging of the American Psychological Association, Sidney Leavitt Pressey was an innovator. Although twenty-first century educators and psychologists are constantly rediscovering Pressey's contributions to their fields, few are aware of the range of topics that he explored.

Pressey was born in Brooklyn, New York; his father was a minister in the Congregational Church

and his mother was a teacher. Because of his asthma, the family eventually moved to a suburb of St. Paul, Minnesota, where he spent most of his childhood and youth. He received his B.A. from Williams College, his father's alma mater.

Although he majored in American history, a course in social psychology led him to attend graduate school at Harvard University in 1912. At Harvard he studied with several notables, Robert M. Yerkes chief among them. With Yerkes's assistance, Pressey became an intern at Boston Psychopathic Hospital while still in graduate school. During his internship he met Luella Cole who, for fifteen years, would be his wife and collaborator.

After receiving his doctoral degree in 1917, Pressey obtained an appointment as a special research assistant at Indiana University. After four years, he accepted an invitation to Ohio State University as an assistant professor and remained on the faculty of Ohio State for the next thirty-eight years, achieving the rank of full professor in 1926 and retiring from the university in 1959. During his retirement, Pressey remained very productive, authoring eighteen papers between 1959 and 1967.

Pressey was rather unique because he grounded his research in the problems that he encountered on a daily basis, rather than in theory or prior research. This "grounding" was evident very early in his career. While interning at Boston Psychopathic Hospital he studied ways of empirically differentiating among psychotics, alcoholics, and "feble-minded" individuals.

During his four years as a research assistant at Indiana University, he began studying children whom modern psychologists would term as having below normal IQs, but soon became interested in those possessing superior abilities. This research led to the publication of several journal articles and *Introduction to the Use of Standard Tests*. Following World War II, he returned to this line of research and published *Educational Acceleration: Appraisals and Basic Problems*. By "acceleration" Pressey suggests a means of accommodating the needs of academically gifted students.

During his initial years on the faculty at Ohio State University, he was concerned with the quality of graduate education, particularly the teaching of psychology. He investigated the study methods used by superior and failing students in an attempt to identify the most effective and least effective meth-

ods. He designed a teacher education program, the central feature of which was a project involving actual work in the school or with young people.

After retirement he would declare:

Now at the age of eighty, I am still battling long-continuing gross faults in our schools which first irked me as a boy in the grades. Trained as a laboratory psychologist, I was soon declaring the laboratory too piddling artificial and psychology either too biological or too theoretical to come helpfully to grips with major human problems. (Pressey 1971, p. 231)

Finally, as he aged, he began to study aging. Initially, he reflected on his experiences with the experiences of those he had studied at the Boston Psychopathic Hospital. Eventually, his writing became more personalized and introspective. He initiated the first American Psychological Association division—on maturity and old age—in 1945 to 1946.

Although Pressey's impact on educational thought and practice was substantial, it could have been even greater had he not been so far ahead of his time in so many respects. Pressey invented and patented the first teaching machine in 1924, fully thirty years before B. F. Skinner's popularization of teaching machines. Skinner based his machine on the behaviorist theory of learning that was prevalent at the time, and Pressey was amazed by the learning theorists' ignorance of the body of research concerning learning in school. He criticized Skinner and his associates for applying concepts derived primarily from rats that had learned to run mazes and students who had memorized pairs of letter combinations. Pressey was a cognitive psychologist who rejected a view of learning as an accumulation of responses governed by environmental stimuli in favor of one governed by meaning, intention, and purpose. In fact, he had been a cognitive psychologist his entire life, well before the "mythical birthday of the cognitive revolution in psychology" (Bruner, p. 780).

In commenting on Pressey's second autobiography, Geraldine Clifford wrote that "despite Pressey's participation in national meetings, his even greater national involvement in work on aging, and his frequent visiting teaching posts at various campuses, the impression persists that his environment was essentially an immediate one: that of his institution, department, his courses, his students, recognized

duties.” Clifford concluded: “Sidney Pressey probably would be an idol of today’s students—clamorously seeking from their professors involvement, dedication to teaching, meaningful guidance, and personal concern—as he indeed was to many among earlier generations of students” (p. 275).

LORIN W. ANDERSON

## PRINCIPAL, SCHOOL

---

The school principal is the highest-ranking administrator in an elementary, middle, or high school. Principals typically report directly to the school superintendent, but may report to the superintendent’s designee, usually an associate superintendent, in larger school districts. The highest-ranking school level administrator in some private schools is called the head master. Head masters have many of the same responsibilities as principals, but they may engage in additional activities such as fund-raising. In some school districts, a single person functions as

superintendent and principal. Principals, head masters, and others who are responsible for the overall operation of a school are often called school leaders. In an era of shared decision-making and site-based management, the term *school leader* may also be used in reference to other school administrators and leaders within the school such as assistant principals, lead teachers, and others who participate in school leadership activities.

Schools have not always had principals. Around the beginning of the twentieth century, as schools grew from one-room schoolhouses into schools with multiple grades and classrooms, the need arose for someone to manage these more complex organizations. This need was filled initially by teachers, who continued to teach while also dealing with their school’s management needs. These teachers were called principal teachers. As schools continued to grow, principal teachers became full-time administrators in most schools. Most principals soon stopped teaching because of the many demands their management responsibilities placed on their time. As managers, principals were responsible for financial operations, building maintenance, student scheduling, personnel, public relations, school policy regarding discipline, coordination of the instructional program, and other overall school matters. The management role included some curriculum and instruction supervision, but overall school management was the primary role principals played until the early 1980s. As the accountability movement gained momentum, the role of the principal changed from school manager to school instructional leader and then to the school reform leader. With this shift in role focus, principals retained their management roles. Principals currently play multiple roles: school manager, instructional leader, and the leader of school reform.

### The Role of Elementary and Secondary School Principals

Principals are responsible for the overall operation of their schools. Some of their duties and responsibilities are delineated in state statutes. States and school districts have also set expectations for principals through their principal evaluation criteria and procedures. During the latter part of the twentieth century, as schools began to be held more accountable for the performance of their students on national and state assessments, the duties and responsibilities of principals changed. Principals became

more responsible for teaching and learning in their schools. In particular, their duty to monitor instruction increased along with their responsibility to help teachers improve their teaching. With this change in responsibilities, principals discovered the need to more effectively evaluate instruction and assist teachers as they worked to improve their instructional techniques. The principal's duty to improve the school instructional program is mandated by legislation in some states. Some state legislation requires the removal of principals when schools are classified as low performing (students do not meet achievement expectations) for a specified period of time.

### **Principal Duties and Responsibilities**

With schools facing increased pressure to improve teaching and learning, the duties and responsibilities of principals expanded further to include the responsibility for leading school reform that would raise student achievement. Success in leading reforms to increase student achievement often hinged upon a principal's ability to create a shared vision within the school community and success in implementing new organizational structures that engage teachers in shared decision-making. Principals have discovered that engaging the entire school staff in making decisions results in more commitment to school reform initiatives.

Principals are also responsible for facilitating their school's interactions with parents and others in the school community. This responsibility includes working with parents when disciplinary issues arise, when students are not succeeding academically, and when parents have concerns. Principals also interact with parents who serve on school advisory boards, parent/teacher organizations, and booster clubs. Principals report that they spent a significant part of their time working with parents of students who have been identified as needing special services through the Individuals with Disabilities Education Act Amendments of 1997 (IDEA).

Principals continue to be responsible for the management of their schools even though their primary responsibility has shifted. One major management responsibility is school safety. This responsibility includes ensuring that facilities and equipment are safe and in good working order, the development of overall school discipline policies and the enforcement of those policies, and the assignment of supervisory responsibilities among school

personnel. At the elementary level, principals are cognizant of their responsibility to ensure constant supervision of the very young children in the school. As students advance into the higher grades, the need for supervision changes as students mature. The responsibility for supervision remains high for older students who are handicapped; who are in areas where the potential for injury is greater such as labs, shops, and athletic facilities; and who are in situations (field trips, athletic events, etc.) where additional caution is required.

### **Principal Qualifications**

A license is required for those who seek employment as principals in most states. Licensure requirements vary from state to state, but the requirements generally include experience as a teacher, graduation from a state accredited principal preparation program, and a passing score on a nationally validated licensure exam. Principal qualifications have been the subject of considerable debate during the 1980s and 1990s as pressure increased to make schools more accountable for student achievement.

The national organizations representing principals and other school administrators have actively engaged in the debate over appropriate qualifications for principals. The National Association of Secondary School Principals (NASSP) took an active role in identifying principal qualifications in the 1980s through the creation of an assessment process. This process focused on the leadership skills that were determined to most significantly impact their ability to effectively lead their schools, and the procedure was based on a task analysis conducted in cooperation with the American Psychological Association (APA). The skills assessed through the NASSP Assessment Center included leadership, sensitivity, organizational ability, judgment, problem analysis, range of interest, motivation, decisiveness, educational values, oral and written communication, and stress tolerance. Later the National Association of Elementary School Principals (NAESP) created an assessment process that assessed similar skills.

In the mid-1990s the National Policy Board for Educational Administration (NPBEA) decided to review principal qualifications. The NPBEA included most of the major national organizations that represent education administrators from state superintendents to principals. The NPBEA also included organizations that represent professors who prepare

school administrators. One of the members, the Council of Chief State School Officers (CCSSO), took on the major role of developing a set of standards for school leaders. Working with the member associations and representatives from thirty-seven states, the CCSSO led the effort to identify a new set of standards for principals. This group was known as the Interstate School Leaders Licensure Consortium (ISLLC).

The six standards that were created by ISLLC were designed to influence the preparation of principals, guide states in the development of their own state principal standards, and serve as a tool for licensure or evaluation. The six standards address a principal's need to promote the success of all students through the following:

- The creation and implementation of a shared school vision
- The nurturing and sustaining of a culture and instructional program conducive to learning and staff development
- The ensuring of the management of school operations to produce a safe and effective learning environment
- The collaboration with families and the diverse communities schools serve
- The promotion of integrity, fairness, and ethical behavior
- The interaction with larger political, social, legal, and cultural contexts of schooling

The ISLLC Standards became the basis upon which the Educational Testing Service (ETS) developed a licensure assessment for use by ISLLC member states. A number of states use this ETS-developed School Leaders Licensure Assessment (SLLA) along with other criteria to license principals.

### Research on School Leadership

Research has consistently shown that principals play a significant role in school reform efforts. As the accountability movement gained momentum during the 1980s and 1990s, research on school effectiveness, generally referred to as effective schools research, focused on principals and their role. These studies consistently found that the principal was the key to an effective school. Research found that the unique position principals hold, as the one person in a school who is responsible for and empowered to oversee the entire school, places them in a power-

ful position to coordinate the entire school operation and move it forward. The research further revealed that the most effective principals had a clear vision of how the school could serve its students; had aligned resources and priorities with the vision; and could engage other key players, within and outside the school, in achieving the goals embedded in the vision.

Other studies have supported the key roles principals play in their school's success and point to other leader characteristics as critical to the principal's success. These characteristics include high energy, initiative, tolerance for ambiguity, sense of humor, analytical ability, and common sense. As society grows more diverse, researchers are beginning to look into the principal's role in leading schools that are increasingly diverse.

Research on the principalship is focused on the changing role of school leaders in a changing society. Thus far, research has shown the principal to be a key to a school's successful transition into an institution that will adequately prepare students. This research was based upon an existing system of public and private education. As society continues to change and technological advances change the tools available for teaching, the role of the principal will likely change. Vouchers, charter schools, and technology have the potential to change schooling in fundamental ways. As these changes take place, the role of the principal will also change. The principal of an online school will function in very different ways than the principal of a traditional school.

### Demographic Profile of School Principals

Demographics on the principalship are collected and reported by the United States Department of Education. The National Center for Education Statistics collected data on the public and private school principal population in 1987 through 1988, 1990 through 1991, and 1993 through 1994. These data show a 2.2 percent growth in the number of public school principals from 1987 through 1988 to 1993 through 1994. There was no significant change in the number of private school principals over the same period. In 1993 through 1994 the number of public elementary school principals was almost triple the number of secondary school principals (71.9% to 24.4%).

The majority of principals at all three levels of public schooling (elementary, middle, and high

school) are males; however, the percentage of female principals increased from 24.5 percent to 34.5 percent from the 1987 through 1988 survey to the 1993 through 1994 survey. The most significant increase in the number of female principals occurred at the elementary level during this period. In 1993 through 1994, 41 percent of public elementary school principals were female. The number of female public school principals will continue to increase in the future based on data showing that 48.1 percent of the new public school principals hired in 1993 through 1994 were female.

Data on the principalship at the private school level shows that the majority of principals are female and the percentage of female principals is increasing. Female elementary principals of private schools outnumber their male colleagues three to one; however, this ratio is reversed at the secondary level. The number of private school female principals has increased from 1987 through 1988 to 1993 through 1994.

Public and private school principals are predominately white non-Hispanics. The 1993 through 1994 survey revealed that 84 percent of public school principals and 92 percent of private school principals were white non-Hispanics. The percentage of minority principals in public schools increased between 1987 and 1988 and 1993 through 1994 from 13 percent to 16 percent. Most minority public school principals (35%) were in central city schools in the 1993 through 1994 survey. There are few minority principals in school districts with less than 1,000 students. The number of minority principals increases as school district size increases. The percentage of private school principals has remained consistent at around 8 percent, and the number of new minority private school principals indicates the percentage is not going to change significantly in the future.

## PRIVATE SCHOOLING

Considerable diversity was evident among the 27,223 private elementary and secondary schools that existed in the United States in the autumn of 1999. "Other religious schools" were the most numerous at 49 percent; followed by Catholic schools, at 30 percent; and then nonsectarian schools, accounting for 22 percent of all private schools. Parochial (parish) schools were the most numerous among Catholic schools, followed by diocesan and then private religious order schools. There were more conservative Christian or unaffiliated schools than affiliated ones (those affiliated with a specific denomination) in the "other religious" category. Regular schools, followed by special emphasis and then special education schools, were the most numerous among the schools not affiliated with a denomination or religious association.

The region with the most private schools, but not necessarily with the highest enrollment, was the South (30%); the West had the fewest (20%). Most private schools (82%) maintained a regular elementary/secondary program.

Private school students numbered 5,162,684 in the fall of 1999, representing approximately 10 to 11 percent of the total elementary and secondary enrollment in the United States. Approximately 49 per-

cent of these students were in Catholic schools, about 36 percent were in other religious schools, and about 16 percent were in schools not affiliated with any religious denomination. Approximately 77 percent of private school students were white, non-Hispanic; 9 percent were black, non-Hispanic; 8 percent were Hispanic; 4 percent were Native American/Native Alaskan; and 5 percent were Asian/Pacific Islander. About half (49%) attended schools that were in urban areas, approximately 40 percent attended schools that were located in an urban fringe or a large town, while only 11 percent attended schools in rural America.

These students were taught by 395,317 full-time equivalent (FTE) teachers. Catholic schools employed 38 percent and other religious schools had 39 percent of FTE teachers. The remainder were in schools that were not affiliated with any religious denomination.

### What Is a Private School?

Private schools (sometimes known as nonpublic schools) exist in the United States as corporate entities separate from public schools, which are supported by the government. Though they differ widely in function, geographical location, size, organizational pattern, and means of control, these schools have two features in common—they are ordinarily under the immediate control of a private corporation (religious or nonaffiliated), not of a government agency or board; and they are supported primarily by private funds. They are characterized by a process of double selection because the schools select their teachers and students and the parents select the schools for their children.

### History of Private Schools in the United States

Private schools date back to the schools opened by Catholic missionaries in Florida and Louisiana in the sixteenth century, which predated the beginning of formal education in Massachusetts. These Catholic schools were the offspring of missionary zeal. The distinction between public and private, of such importance during the second half of the nineteenth century and throughout the twentieth century, was not an issue in colonial North America. Schools quite frequently were the products of combined efforts of ecclesiastical and civil authorities, along with parental support, the latter often constituting the primary factor in the schooling of the young. No one pattern existed across the colonies; the government

had no de facto monopoly in the operation of schools anywhere. Some schools were free, some were supported by a combination of financial sources, and some relied solely on tuition. There were “old field” schools (schools that existed in abandoned fields in the South), and proprietary schools, which taught trades. In New England there were town schools, which existed alongside private schools; there were dame schools (taught by literate women in their homes) and writing schools. The Latin Grammar School, such as the one in Boston, often was the crown of the schools. In some places denominational schools were, in effect, public schools, operating under civil and religious supervision, with the goals of inculcating the essentials of faith and knowledge and making good citizens of the church and commonwealth. By the end of the colonial period the institution of school was firmly rooted on the American continent. But nothing resembled the modern concept of secular, free, compulsory, universal schooling.

**The national period.** Men such as Benjamin Franklin, Thomas Jefferson, Benjamin Rush, George Washington, and Noah Webster were among the leaders of the new nation who saw the need for intelligent leadership, an informed citizenry, and an educated professional class. Their proposals, however, had little impact on schooling arrangements. Quasi-public town schools, charity schools for the poor, and a variety of private schools for those who could afford them existed. As the nineteenth century opened, schooling was widely available without a government mandate. The line between public and private remained blurred; diversity of schooling persisted.

**The common school period—the age of the academies.** The combination of industrialization, urbanization, and immigration (mainly Irish) into the northeast, complemented by the civil disarray in Europe, led Horace Mann, Henry Barnard, and others to push for a “common school” that would forge an American identity. Private schools, especially those of a religious nature, were looked upon as divisive, even un-American. The universal, free, compulsory primary school, open to all, allegedly religiously neutral (but in practice Protestant) was the result. Meanwhile, the academies, both in the North and South, functioned as the major educational institutions at the “middle” level. Ranging from boarding schools for the upper class to institutions that barely surpassed, if at all, the common schools, the academies

mies reached their peak about 1850 when they numbered approximately 6,000. As was the case with the colonial schools, the distinction between “public” and “private” was largely meaningless then. Often popular, local, and with a rural character, the academies overlapped curricular levels, offered a variety of subjects, were flexible with regard to the individual student, and served as an “opener-upper” for girls for formal schooling beyond the elementary level. They often received tax and land subsidies, and sometimes tuition assistance, from local and state governments. They were to succumb in popularity, with some exceptions, to the rise of the public high school that accompanied the growing industrialization and urbanization following the Civil War (1861–1865).

**In the wake of the Civil War.** Following the Civil War, universal public schooling, separate by race and unequal, began at the primary level in the South. In the North, government regulatory activity increased. Private schools, especially those religiously affiliated, were often looked upon as being “un-American.” This allegation was hurled at Roman Catholic schools, in particular, founded as a defense against first the pan-Protestant nature of public schools, and second the secular, “Americanizing” school, each of which was perceived as a threat to the faith of a poor, besieged, immigrant population. Despite the widespread poverty of its members, the Catholic Church continued to found and operate parish elementary schools, able to do so because of the dedication of a teaching corps of vowed religious women, commitment from its members, the drive of its leaders, and ethnic concerns. The sometimes violent activities of the Know-Nothing Party, the American Protective Association, and the Masons that were directed against Catholics testified to the depth and breadth of anti-Catholic prejudice in American society, prejudice that was fanned by some statements of Catholic leaders, for example, the *Syllabus of Errors* by Pope Pius IX in 1864. Other denominations had also established private elementary schools. The Old School Presbyterians, for example, established almost 300 schools in the mid-nineteenth century, mainly because of concern over the alleged secularism of the common schools. For the most part, with the exception of the Lutheran Church-Missouri Synod, the schools founded by Protestant denominations did not endure.

Statistics for the percentage of enrollment in American K–12 private schools in the latter part of

the nineteenth century reveal that in 1879 private secondary enrollment made up 73.3 percent of the total; by 1889–1890, in the wake of the growth of public secondary education, that figure had dropped to 31.9 percent. By 1900, 7.6 percent of the total school enrollment was in private schools.

In the latter years of the nineteenth century, government regulatory activity in educational affairs increased. Doubts were cast on the ability and desire of some private schools, especially those with an “old-world” connection, to foster citizenship among their pupils. Laws were passed, as in Wisconsin and Illinois, that attempted to control or perhaps eliminate private schools. In 1889, for instance, Wisconsin passed the Bennett Law, which defined a school as a place where the subjects were taught in the English language and which required students to attend a school in the public school district within which they resided. Following a bitter political campaign, the law was repealed, in large measure because of the efforts of a Catholic-Lutheran alliance, many of whose schools were threatened because of their adherence to the German language and customs.

**The impact of World War I.** World War I (1914–1918) provided a major impetus to patriotism and an espousal of all things “American.” The nation looked to its schools to instill loyalty and civic virtue in its youth. The decade following the war witnessed a startling rise of membership in the Ku Klux Klan, a “Red Scare,” and vitriolic anti-Catholicism in the presidential campaign of 1928. Private schools, especially those connected with anything foreign, in particular German, were under suspicion of being disloyal. Government regulation of these schools grew; parental rights in the schooling of their children were under duress. Three U.S. Supreme Court decisions in the 1920s stand as testimony to the struggles that engulfed private schools and parental rights in those years, struggles against the allegations of some in government and their allies, who attempted to eradicate or at least minimize them. The first decision (*Meyer v. Nebraska*) was issued in 1923 as a result of a Nebraska law that forbade the teaching of a foreign language to any student prior to the ninth grade. Robert Meyer, a teacher in a Lutheran school, disregarded the law and tutored a boy in German. The Court upheld Meyer’s right to teach and the parents’ right to engage him, maintaining that the allegation by the state that a given practice endangered it was not sufficient to limit Meyer’s and

the parents' rights; Nebraska had not shown proof of any such danger.

The second decision, even more crucial for the rights of parents in education and of private schools came in Oregon as a result of *Pierce v. Society of Sisters* in 1925. Following a referendum, Oregon enacted a statute that required all Oregonians between the ages of eight and sixteen to attend a public school while such was in session, on the grounds that such attendance was necessary to produce good citizens (private schools were, obviously, socially divisive under this interpretation). The Court struck down the Oregon law on the basis of the Fourteenth Amendment, because the law's enforcement might have resulted in the closure of the appellee's primary schools, thus violating their due process rights. In interesting further comments, the Court declared that parents have the right to send their children to private schools that provide religious as well as secular education. The child, the Court held, "is not the mere creature of the state."

The third decision was issued in 1927 in *Farrington v. Tokushige*. This decision again limited the rights of the government and protected the rights of parents and private schools, this time Japanese-language schools in Hawaii. The decision was based on the Fifth Amendment. The court held that the law would have violated the due process property interests of the parents and schools that might have led to the schools' closure.

**The mid-twentieth century.** Private schools experienced phenomenal growth in the years during and following World War II (1939–1945), increasing by 118 percent, compared with 36 percent in the public sector, and enrolling 13.6 percent of the total elementary-secondary school population in 1959–1960, up from 9.3 percent in 1939–1940 and 11.9 percent in 1949–1950. Assuming an average cost of \$500 per pupil in the 1960s in public schools, private schools saved state and local governments roughly \$31 billion during that decade. Private schools also became embroiled in a number of legal struggles during that period, struggles that focused on religiously affiliated private schools. In the next several decades the Supreme Court upheld public bus transportation to private schools and the loan of secular textbooks to the schools, and forbade most other kinds of aid on the grounds that such aid violated the establishment clause of the First Amendment that requires the separation of church and state. The basic legal principles on which the Court based its

decisions were that: (1) the legislation must have a secular legislative purpose; (2) the principal or primary effect of the legislation could not violate religious neutrality; and (3) the legislation could not foster "excessive entanglement" between church and state (these were collectively known as the "Lemon Test," because of *Lemon v. Kurtzman*, 1979). The Court also invoked the "child benefit" principle, which identifies the child as the principle beneficiary of government aid. Indirect aid that flowed to the parents and through them to the schools had a better fate than direct aid to the private schools themselves.

In the midst of the debate regarding the legality of government aid to nonpublic or private schools, Catholic schools reached their all-time enrollment high in 1965–1966 with 5.6 million pupils, constituting 87 percent of private school enrollment. Catholic enrollment plummeted in the years following, stabilizing some years later. Meanwhile, Christian Day Schools, founded by evangelical and fundamentalist Christians, were established and proliferated. The number of these private school institutions founded between the mid-1960s and the early 1980s has been calculated at between 4,000 and 18,000, with an enrollment range from 250,000 to more than 1.5 million. The best estimates seem to be between 9,000 and 11,000 schools with a student population of around 1 million.

**The charge of elitism.** One of the most serious charges leveled at private schools of all types by their opponents is that they are "elitist." Several major studies were conducted in the 1980s that would seem to belie that accusation. One of these was *Inner-City Private Elementary Schools*, conducted in 1982, which was sponsored by the Catholic League for Religious and Civil Rights. Using a randomly selected sample of sixty-four schools in eight cities, fifty-four of which were Title I recipients, and with a minority population of at least 70 percent, this study found strong support for these schools by their patrons. Residing in rundown facilities, beset with financial problems, the majority operated under Catholic auspices, but with a third of the student body Protestant, these schools provided a safe environment, emphasized basic learning skills, and fostered moral values in their pupils. The academic achievement of minority students in Catholic secondary schools, which surpassed that of minority students in their public counterparts, was reported by the priest-sociologist Andrew Greeley. Further, the overall minority enrollment (African American, Hispanic

American, Asian American, and Native American) had grown from 4 percent of the total private school population in 1970 to 11.2 percent in 1987.

But it was two controversial studies headed by the noted sociologist James S. Coleman that occupied center stage for private schools in the 1980s. The first, *High School Achievement: Public, Catholic, and Private Schools Compared*, which was published in 1982 and which Coleman cowrote with Thomas Hoffer and Sally Kilgore, produced results indicating not only that students in Catholic high schools and possibly other private secondary schools academically outperformed those in public schools, but also that these schools were more integrated racially than were their public counterparts. Coleman, Hoffer, and Kilgore claimed to have controlled for “selection bias” in this study; they also maintained that private schools provided a safer, more disciplined, and orderly environment than public schools. The second book, *Public and Private High Schools: The Impact of Communities*, which was published in 1987 and written by Coleman and Hoffer, continued the line of reasoning present in the 1982 work. In this second report the authors stated that the goals of education are determined by the social organization of schools, their communities, and the families that they serve. In “functional communities,” in which the parents, teachers, and students know one another, schools—whether public or private—are more likely to be successful. “Social capital,” the relationships that exist among parents, and the parents’ relations with the institutions of the community that result promote high levels of academic achievement, particularly among students most at risk of school failure.

### Types of Private Schools at the Dawn of the Third Millennium

As noted in the beginning of this entry, the private sector includes Catholic, “other religious,” and independent private schools. There are three types of Catholic schools: parochial (parish), diocesan, and private (operated by a religious order). Other religious schools are those operated by other denominations, including various Protestant, Islamic, and Jewish organizations. Independent schools are conducted by groups that are not affiliated with any religious body. In addition, the nation witnessed the advent of proprietary “for-profit” schools in the 1990s. The Edison Company, for example, operated seventy-nine charter schools (which are nonreligious public schools) under several models with 37,000

students at the end of 2001. Other firms have joined Edison; some have predicted that by 2010 for-profit schools’ share of spending on K–12 education will increase considerably. Oftentimes these commercial firms seek out schools with academic problems. Sylvan Learning Center, for instance, looks to contract with Title I schools to raise the reading achievement of low-achieving students. Teacher unions have been in the forefront of the opposition to this “privatization” move.

Another form of schooling, a direct result of parental choice, is home schooling. While home schooling is not an institution of schooling per se, it is the direct result of parental choice and a consequence of parental rights in schooling. Home schooling has been a rapidly growing phenomenon since the 1970s, and estimates put the number of youngsters who were home schooled in 1998 at 750,000 to 1.7 million.

### Current Trends and Controversial Issues

Private, as well as public, schools were all but engulfed with controversy at the beginning of the twenty-first century. Among the debated issues were accreditation, minority enrollment, privatization, and school choice and vouchers.

**Accreditation.** States are responsible for the licensing or chartering of all educational institutions within their borders. A license is an authorization to operate, while accreditation certifies that a school meets minimum standards of quality adopted by the accrediting agency. Licensing and accrediting are means of controlling or regulating private schools; hence, they may become the source of conflict between government and private schools. Some private schools, for instance, operate without seeking government licensure of personnel or accreditation of programs. Where state approval is necessary to operate, the private school may not legally open until officially approved, and noncompliance may be a misdemeanor. States may exempt private schools from certain provisions, for example, because they are operated by a church. States may also offer tax exemptions to private schools because they perform a public service, are not operated for profit, or are conducted by a religious organization. Current accountability measures enacted by states may pose a threat to private schools via required curricular content, standards of measurement, and tests.

The most widely recognized accreditation of private nonprofit schools is conducted by six region-

al accrediting associations, founded between 1885 and 1924. The first of these was the New England Association of College and Secondary Schools, the last the Western Association of Schools and Colleges. A more recent organization, the National Council for Private School Accreditation, was founded specifically for the purpose of accrediting private schools. In 2002 it consisted of fourteen state and national accrediting organizations representing more than 2,500 accredited schools with more than 650,000 students. It was recognized, or was in the process of being recognized, by as many as fifteen states.

**Minority enrollment.** In the autumn of 1999, private school enrollment was approximately 9 percent African American, 8 percent Hispanic, 4 percent American Indian/Alaskan Native, and 5 percent Asian/Pacific Islander. Of the students enrolled in Catholic schools in 1999–2000, 24.9 percent were minorities; in inner-city and urban areas, that percentage was significantly larger. Urban Christian schools, which like the Catholic schools were founded to better meet the needs of students in urban centers, experienced an ever-increasing enrollment in the 1990s; the Association of Christian Schools International has a goal of establishing Christ-centered schools in each of the approximately 600 urban school districts in the United States. Minority parents, African American and Hispanic/Latino, are increasingly embracing school choice, thus confounding the contention that private schools are the haven of upper and upper-middle class whites seeking elitist schooling opportunities for their children. Furthermore, Jay Greene's studies suggest that private schools, on average, are more racially integrated than public schools.

**Privatization.** Some people fear that a trend toward privatization in education may have harmful effects on civic participation. Writing in 1999, the North Carolina sociologists Christian Smith and David Sikkink pointed out, however, that such is not necessarily the case. While private education and home schooling are not panaceas, these researchers suggested that private school families are considerably more involved in the public square than are their public school counterparts. If Smith and Sikkink are correct, then, private schooling will help renew participation in public affairs and advance, rather than harm, the public weal.

**School choice and vouchers.** School choice, both within and without the public school structure, has become a major issue since the 1990s. Vouchers, es-

pecially publicly funded ones, are the most controversial issue in American education. The controversy is said to be a struggle over America's educational future. Basically, a voucher means that the government issues a credit for education of children to their parents, who then take that credit to the school of their choice.

The concept of vouchers is not new. Catholic leaders, upholding the primary rights of parents in the education of their children, argued in the latter half of the nineteenth century that it was the responsibility of the state in distributive justice, the concept of giving to everyone what is their due, to support parents in the choice of schooling for their offspring. Under anti-Catholic attacks from Nativists and their allies, the Catholic bishops soft-pedaled their advocacy. There were other pre-1990 movements to have government acknowledge the primacy of parents (or in the case of adults as in the G.I. Bill, the adults themselves) in the education of their children. In the 1950s, basing his argument on the free market approach, the Nobel laureate economist Milton Friedman argued for the voucher. In the 1970s John Coons and Stephen Sugarman lent their support to the movement on social justice grounds. Others, such as Charles Glenn, emphasized parental liberty in their advocacy for the voucher. The publication of *A Nation at Risk* in 1983, followed by reforms such as site-based management, contributed to the growing sentiment that, at least in some instances, especially in inner cities, public schools were failing, and that enabling parents to have the means to be able to choose the appropriate school for their children would truly reform American K–12 education. The very system, which was publicized in the late nineteenth and early twentieth centuries as guaranteeing educational success to all students who sought it, was being criticized as an inept, cumbersome bureaucracy that contributed to student failure and, in the case of inner-city schools, often to their neglect and personal danger. John Chubb and Terry Moe called for implementation of the voucher in 1990, under the auspices of the free market.

It is well to note that school choice options exist within the public school system, namely, charter schools, magnet schools, and open enrollment. In addition to publicly funded vouchers, school choice options include privately funded schools, where individuals and corporations provide scholarships to children from low-income families. Deductions, tuition tax credits, and "child-care certificates" are

other public means of aiding students in private schools. Such programs are most notably operating in Indianapolis, New York City, and San Antonio.

Also worth noting is that not all private school groups are in favor of vouchers. Some are concerned that vouchers may make the private school subject to excessive government regulation and control and thereby negate the unique quality of their private school.

Advocates advance a number of arguments in support of the voucher. Dale McDonald noted in 2001 that the United States is the only Western democracy that does not provide parents with a share of their education tax dollars that would enable them to choose the school for their children. Some argue for the voucher (or other aid) on the basis of the value of competition in a free market. Others contend that the voucher would recognize the primacy of parents in the schooling of their children. Some maintain that the voucher is called for by distributive justice. Yet others hold that government should not have a *de facto* monopoly of pre-K–12 schooling. The call for vouchers (or other means of school choice) is especially strong in situations where poverty is widespread and where urban public schools are in serious trouble. Other school choice programs, such as those available in Illinois and Minnesota, tend to favor tax credits for educational expenses, which lessen the threat of government entanglement and regulation.

Opponents to the voucher advance a variety of reasons for their opposition. Some aver that the voucher would destroy the public school system, privatizing it. Others contend that in the case of religiously affiliated private schools the voucher would violate the establishment clause of the First Amendment. Some say that in the cases of the urban poor, the voucher does not cover the entire cost of schooling and so the very poor are eliminated from participation, while yet others hold that the voucher helps only a select few in those cities and ignores the plight of the majority of the poor. Some say the voucher would result in the balkanization of education and of the United States. Finally, some contend that the practice of vouchers does not make their adherents accountable to the public in the use of tax dollars as is the case with public education.

Proponents and opponents disagree as to the effect of the vouchers on the school achievement of children. Some scholars hold that research on the ef-

fects of voucher programs in Milwaukee and Cleveland is inconclusive. Others point to high levels of parental satisfaction with voucher schools and to the improving test scores of their students. In June 2002 the U.S. Supreme Court, which in effect upheld the constitutionality of the Milwaukee plan by not reviewing a lower court decision, ruled that Cleveland program is constitutional, thereby upholding the use of public funds for religious school tuition. It is interesting to note that the Black Alliance for Educational Options, headed by Howard Fuller, former superintendent of schools in Milwaukee, filed a brief on behalf of the parents who were participating in the program. Seventy percent of the students were minorities; 73.4 percent came from homes that were headed by a single mother, whose average annual income was \$18,750.

### Conclusion

Private education in the United States is undergirded by parental choice. That choice has been an essential, though not always respected, feature of the educational landscape since colonial times. Indeed, for a considerable time the concept of parental rights in the schooling of their young was all but submerged under the rising tide of public school bureaucracy. This often led to a conflict between the professional authority of the school and the moral authority of parents. The relationship between parents and school authorities became adversarial in many instances; in others, parents were allowed to participate in the education of their children in a way and at a level determined by school authorities. The balance of power between government officials and parents may, however, be changing. Parents in the early twenty-first century may choose from an increasing variety of educational options. Regardless of their economic status, parents may be able to choose from a growing number of institutions for the education of their children and for the accomplishment of public purposes such as preparation for citizenship. If such is the case, the line between public and private schooling may become blurred, as it was in the colonial period, and the focus of public policy in education may shift from public education to the education of the public.

## PROFESSIONAL DEVELOPMENT SCHOOLS

Professional development schools (PDSs) are innovative institutions formed through partnerships between teacher education programs and pre-K–12 schools. Their mission, like that of a teaching hospital in the field of medicine, is complex, consisting of strong professional preparation through intensive clinical experience, enhanced learning opportunities and outcomes for pre-K–12 students, and continuing education and development for experienced professionals. Their strategy for achieving this complex mission is also analogous to that used by teaching hospitals: professional education in the context of practice.

Unique demands are made on partners in a PDS. They are called upon to share responsibility for adult and children's learning, to commit and reallocate their resources to a new setting and new kinds of work, and to be accountable professionally and publicly for outcomes for all participants. Like their medical counterparts in teaching hospitals, PDS partners believe that by working together in these ways, the learning outcomes will be better for teacher candidates, faculty, and students.

Children's learning is at the core of all PDS work. Candidates and school and university faculty engage together in identifying and meeting children's learning needs. It is through this inquiry and implementation process that adult learning occurs and children's needs are met. Research thus becomes a tool for improving outcomes.

PDSs look different than traditional schools with student teachers. The use of alternative staffing patterns that incorporate candidates into instructional teams provides both unique learning opportunities for candidates and release time for school faculty to work as teacher educators that observe, mentor, and assess novice teachers. Faculty are selected and trained for their roles as mentors and supervisors. They meet high standards for professional

practice and they uphold high standards for candidates and pre-K–12 students. University faculty spend most of their time in the school setting working with candidates, supporting staff development, engaging in collaborative research with school faculty, and participating in the planning, instruction, and problem-solving activities of the school.

### **The Creation of Professional Development Schools**

Professional development schools grew out of efforts in the 1980s and 1990s to reform teacher education and to restructure schools. The Holmes Group, an organization of the deans of schools of education in research universities committed to the reform of teacher education, recommended in 1990 the creation of professional development schools to provide intensive clinical preparation to teacher candidates and create a bridge between academia and the schools.

At about the same time, school reformers called for students in the nation's schools to learn more and for teachers to teach for understanding. Educators realized that this would require a different kind of teaching and a new approach to teacher preparation. Professional teachers needed to be well prepared in their subject areas, but they also needed clinical experiences to reinforce the desired dimensions of professional practice. This included knowledge-based decision-making, work with colleagues, an orientation to problem solving and inquiry, and accountability for enhanced learning outcomes. PDS partnerships were developed, in part, to create clinical experiences grounded in these values and designed to provide the kinds of learning experiences associated with developing expertise in professional practice.

The second impetus for the creation of professional development schools originated from a desire to bridge the long-standing gap between universities and schools. Educators in both sectors pointed to the distance between research and practice, and to the lack of fit between professional preparation and the real world of schools. University educators believed that teacher education needed to be informed by practice. School faculty sought ways to make university-generated knowledge more accessible to teachers, and PDSs created a needed link between the sectors.

### **The Impact of Professional Development Schools**

Several hundred PDSs have been developed since the Holmes Group recommendations in 1990. The National Network for Education Renewal, organized by John Goodlad, was formed to support these partnerships, and they were endorsed by the National Commission on Teaching and America's Future as an approach to quality teacher education. The American Federation of Teachers and the National Education Association have supported major PDS projects, and the National Council for Accreditation of Teacher Education (NCATE) developed standards and an assessment process for PDS partnerships. In 2001 approximately 30 percent of the 525 institutions accredited by NCATE reported having PDS partnerships. PDS partnerships may involve elementary, middle, and secondary schools in urban, suburban, and rural communities. Public and private universities are involved in PDSs, as are large and small institutions, four- and five-year teacher education programs, and one-year certification or master's degree programs. In 2001 thirty-one states had school/university partnership initiatives supported by various federal higher education grants.

Early research on PDS partnerships consisted mostly of self-reports or case studies. In the late 1990s research on PDS effectiveness began appearing in the literature. Studies conducted in various partnerships using observational data, teacher competency test scores, and teacher attrition data suggest that teacher learning and retention are enhanced in PDS partnership schools. Similarly, studies have begun to indicate that student achievement, using a variety of measures, goes up in PDSs over a period of time.

### **Trends, Issues, and Controversies**

**Standards.** In 1996 NCATE initiated a project to develop PDS standards. Working with PDS practitioners, researchers, and policymakers, NCATE developed and field-tested standards in eighteen representative partnerships. The standards were endorsed by NCATE and are being used by many PDS partnerships and several states across the country.

**Institutional support.** Gaining institutional support can be a challenge for PDS partnerships. It is critical that leaders of universities, schools, and teacher's unions be committed to the innovation. Changes in roles and responsibilities require institutional sup-

port and incentives, and often require the removal of cultural and policy barriers. For example, universities must address promotion and tenure requirements, ensuring that they value clinical work and research. Schools, on the other hand, must restructure their programs to include teacher education as part of the responsibility of the school.

**Policy issues.** PDSs are part of the long-term teacher quality agenda. The standards movement of the 1990s introduced a new level of professional and public accountability to teacher education, and PDS partnerships have a critical role to play in that arena. For PDSs to be sustainable, teacher quality initiatives in teacher testing, licensing, mentoring, and induction must be consistent with the underlying vision of the PDS—teaching as professional practice.

The greatest opportunity for PDS development, however, may occur as states and school districts seek to address a growing teacher shortage. PDSs may be able to provide a viable alternative to placing underprepared individuals in classrooms. When PDSs are established in high-needs schools where shortages are most acutely felt, they can bring cadres of candidates into the school under the expert supervision of university and school faculty members.

**Controversies.** Because PDS partnerships require major restructuring in both the university and school, they often meet with opposition. The selection of PDS sites, in particular, can be contentious.

PDSs remain somewhat controversial within the teacher education community. The requirement of a full-year internship as part of professional preparation introduces an additional cost to teacher candidates, many of whom are already beginning low-paying careers with significant debt. The added value of the full-year internship in terms of teacher competency and retention is beginning to be documented, and salaried internships or stipends (supported by school districts) may be a way of addressing this issue in the future, particularly in the context of teacher shortages.

In the early part of the twentieth century, the education of doctors, the practice of medicine, and the hospital as an institution were all radically reformed by the creation of a new institution: the teaching hospital. PDSs have the potential for playing a similar role in the preparation of teachers, the practice of teaching, and the school as an institution that supports both professional and pre-K–12 student learning.

## PROGRESSIVE EDUCATION

Historians have debated whether a unified progressive reform movement existed during the decades surrounding the turn of the twentieth century. While some scholars have doubted the development of a cohesive progressive project, others have argued that while Progressive Era reformers did not march in lockstep, they did draw from a common reform discourse that connected their separate agendas in spirit, if not in kind. Despite these scholarly debates, historians of education have reached a consensus on the central importance of the Progressive Era and the educational reformers who shaped it during the early twentieth century. This is not to say that historians of education do not disagree—in fact, they disagree intensely—on the legacy of Progressive educational experiments. What they do agree on is that during the Progressive Era (1890–1919) the philosophical, pedagogical, and administrative underpinnings of what is, in the early twenty-first century, associated with modern schooling, coalesced and transformed, for better or worse, the trajectory of twentieth-century American education.

### Philosophical Foundations

The Progressive education movement was an integral part of the early twentieth-century reform im-

pulse directed toward the reconstruction of American democracy through social, as well as cultural, uplift. When done correctly, these reformers contended, education promised to ease the tensions created by the immense social, economic, and political turmoil wrought by the forces of modernity characteristic of fin-de-siècle America. In short, the altered landscape of American life, Progressive reformers believed, provided the school with a new opportunity—indeed, a new responsibility—to play a leading role in preparing American citizens for active civic participation in a democratic society.

John Dewey (1859–1952), who would later be remembered as the “father of Progressive education,” was the most eloquent and arguably most influential figure in educational Progressivism. A noted philosopher, psychologist, and educational reformer, Dewey graduated from the University of Vermont in 1879, taught high school briefly, and then earned his doctorate in philosophy at the newly formed Johns Hopkins University in 1884. Dewey taught at the University of Michigan from 1884 to 1888, the University of Minnesota from 1888 to 1889, again at Michigan from 1889 to 1894, then at the University of Chicago from 1894 to 1904, and, finally, at Columbia University from 1904 until his retirement in 1931.

During his long and distinguished career, Dewey generated over 1,000 books and articles on topics ranging from politics to art. For all his scholarly eclecticism, however, none of his work ever strayed too far from his primary intellectual interest: education. Through such works as *The School and Society* (1899), *The Child and the Curriculum* (1902), and *Democracy and Education* (1916), Dewey articulated a unique, indeed revolutionary, reformulation of educational theory and practice based upon the core relationship he believed existed between democratic life and education. Namely, Dewey’s vision for the school was inextricably tied to his larger vision of the *good society*, wherein education—as a deliberately conducted practice of investigation, of problem solving, and of both personal and community growth—was the wellspring of democracy itself. Because each classroom represented a microcosm of the human relationships that constituted the larger community, Dewey believed that the school, as a “little democracy,” could create a “more lovely society.”

Dewey’s emphasis on the importance of democratic relationships in the classroom setting neces-

sarily shifted the focus of educational theory from the institution of the school to the needs of the school's students. This dramatic change in American pedagogy, however, was not alone the work of John Dewey. To be sure, Dewey's attraction to child-centered educational practices was shared by other Progressive educators and researchers—such as Ella Flagg Young (1845–1918), Dewey's colleague and kindred spirit at the University of Chicago, and Granville Stanley Hall (1844–1924), the iconoclastic Clark University psychologist and avowed leader of the child study movement—who collectively derived their understanding of child-centeredness from reading and studying a diverse array of nineteenth and twentieth-century European and American philosophical schools. In general, the received philosophical traditions employed by Dewey and his fellow Progressives at once deified childhood and advanced ideas of social and intellectual interdependence. First, in their writings about childhood, Frenchman Jean Jacques Rousseau (1712–1778) emphasized its organic and natural dimensions; while English literary romantics such as William Wordsworth (1770–1850) and William Blake (1757–1827) celebrated its innate purity and piety, a characterization later shared by American transcendentalist philosophers Ralph Waldo Emerson (1803–1882) and Henry David Thoreau (1817–1862). For these thinkers, childhood was a period of innocence, goodness, and piety that was in every way morally superior to the polluted lives led by most adults. It was the very sanctity of childhood that convinced the romantics and transcendentalists that the idea of childhood should be preserved and cultivated through educational instruction.

Second, and more important, Dewey and his fellow educational Progressives drew from the work of the German philosopher Friedrich Froebel (1782–1852) and Swiss educator Johann Pestalozzi (1746–1827). Froebel and Pestalozzi were among the first to articulate the process of educating the “whole child,” wherein learning moved beyond the subject matter and ultimately rested upon the needs and interests of the child. Tending to both the pupil's head and heart, they believed, was the real business of schooling, and they searched for an empirical and rational science of education that would incorporate these foundational principles. Froebel drew upon the garden metaphor of cultivating young children toward maturity, and he provided the European foundations for the late-nineteenth-century kinder-

garten movement in the United States. Similarly, Pestalozzi popularized the pedagogical method of object teaching, wherein a teacher began with an object related to the child's world in order to initiate the child into the world of the educator.

Finally, Dewey drew inspiration from the ideas of philosopher and psychologist William James (1842–1910). Dewey's interpretation of James's philosophical pragmatism, which was similar to the ideas underpinning Pestalozzi's object teaching, joined *thinking* and *doing* as two seamlessly connected halves of the learning process. By focusing on the relationship between thinking and doing, Dewey believed his educational philosophy could equip each child with the problem-solving skills required to overcome obstacles between a given and desired set of circumstances. According to Dewey, education was not simply a means to a future life, but instead represented a full life unto itself.

Taken together, then, these European and American philosophical traditions helped Progressives connect childhood and democracy with education: Children, if taught to understand the relationship between thinking and doing, would be fully equipped for active participation in a democratic society. It was for these reasons that the Progressive education movement broke from pedagogical traditionalists organized around the seemingly outmoded and antidemocratic ideas of drill, discipline, and didactic exercises.

### **Pedagogical Progressivism**

The pedagogical Progressives who embraced this child-centered pedagogy favored education built upon an experience-based curriculum developed by both students and teachers. Teachers played a special role in the Progressive formulation for education as they merged their deep knowledge of, and affection for, children with the intellectual demands of the subject matter. Contrary to his detractors, then and now, Dewey, while admittedly antiauthoritarian, did not take child-centered curriculum and pedagogy to mean the complete abandonment of traditional subject matter or instructional guidance and control. In fact, Dewey criticized derivations of those theories that treated education as a mere source of amusement or as a justification for rote vocationalism. Rather, stirred by his desire to reaffirm American democracy, Dewey's time- and resource-exhaustive educational program depended on close student-teacher interactions that, Dewey argued, required

nothing less than the utter reorganization of traditional subject matter.

Although the practice of pure Deweyism was rare, his educational ideas were implemented in private and public school systems alike. During his time as head of the Department of Philosophy at the University of Chicago (which also included the fields of psychology and pedagogy), Dewey and his wife Alice established a University Laboratory School. An institutional center for educational experimentation, the Lab School sought to make experience and hands-on learning the heart of the educational enterprise, and Dewey carved out a special place for teachers. Dewey was interested in obtaining psychological insight into the child's individual capacities and interests. Education was ultimately about growth, Dewey argued, and the school played a crucial role in creating an environment that was responsive to the child's interests and needs, and would allow the child to flourish.

Similarly, Colonel Francis W. Parker, a contemporary of Dewey and devout Emersonian, embraced an abiding respect for the beauty and wonder of nature, privileged the happiness of the individual over all else, and linked education and experience in pedagogical practice. During his time as superintendent of schools in Quincy, Massachusetts, and later as the head of the Cook County Normal School in Chicago, Parker rejected discipline, authority, regimentation, and traditional pedagogical techniques and emphasized warmth, spontaneity, and the joy of learning. Both Dewey and Parker believed in learning by doing, arguing that genuine delight, rather than drudgery, should be the by-product of manual work. By linking the home and school, and viewing both as integral parts of a larger community, Progressive educators sought to create an educational environment wherein children could see that the hands-on work they did had some bearing on society.

While Progressive education has most often been associated with private independent schools such as Dewey's Laboratory School, Margaret Naumberg's Walden School, and Lincoln School of Teacher's College, Progressive ideas were also implemented in large school systems, the most well known being those in Winnetka, Illinois, and Gary, Indiana. Located some twenty miles north of Chicago on its affluent North Shore, the Winnetka schools, under the leadership of superintendent Carleton Washburne, rejected traditional classroom practice in

favor of individualized instruction that let children learn at their own pace. Washburne and his staff in the Winnetka schools believed that all children had a right to be happy and live natural and full lives, and they yoked the needs of the individual to those of the community. They used the child's natural curiosity as the point of departure in the classroom and developed a teacher education program at the Graduate Teachers College of Winnetka to train teachers in this philosophy; in short, the Winnetka schools balanced Progressive ideals with basic skills and academic rigor.

Like the Winnetka schools, the Gary school system was another Progressive school system, led by superintendent William A. Wirt, who studied with Dewey at the University of Chicago. The Gary school system attracted national attention for its *platoon* and *work-study-play* systems, which increased the capacity of the schools at the same time that they allowed children to spend considerable time doing hands-on work in laboratories, shops, and on the playground. The schools also stayed open well into the evening hours and offered community-based adult education courses. In short, by focusing on learning-by-doing and adopting an educational program that focused on larger social and community needs, the Winnetka and Gary schools closely mirrored Dewey's own Progressive educational theories.

### Administrative Progressivism

While Dewey was the most well known and influential Progressive educator and philosopher, he by no means represented all that Progressive education ultimately became. In the whirlwind of turn-of-the-century educational reform, the idea of educational Progressivism took on multiple, and often contradictory, definitions. Thus, at the same time that Dewey and his followers rejected traditional methods of instruction and developed a "new education" based on the interests and needs of the child, a new cadre of professionally trained school administrators likewise justified their own reforms in the name of Progressive education.

Administrative Progressives shared Dewey's distaste for nineteenth-century education, but they differed markedly with Dewey in their prescription for its reform: administrative Progressives wanted to overthrow "bookish" and rigid schooling by creating what they believed to be more useful, efficient, and centralized systems of public education based

on vertically integrated bureaucracies, curricular differentiation, and mass testing.

Professional school administrators relied on managerial expertise in order to efficiently supervise increasingly large public school systems. Significantly, the new administrators, borrowing the language and practice of efficiency experts like Frederick W. Taylor, attempted to rationalize disparate school districts within one hierarchically arranged system of primary, middle, and high school institutions. Powerful school boards—often comprising elite business and civic leaders—hired professionally trained school superintendents to implement policies and to oversee the day-to-day operations of these vast educational systems. The superintendent, often a male, distanced himself from the mostly female corps of teachers, not to mention the students the school was intended to serve. In the name of efficiency, superintendents relied on “scientific,” if often sterile, personnel management techniques, which had been developed by and for private industry and imported to the school setting by way of business-friendly school boards and through graduate training at the newly developed schools of education.

The school’s turn toward bureaucratic efficiency directly shaped curricular construction. In particular, the idea of *differentiation* became a new watchword in administrative Progressive circles, reflecting the burgeoning economic and status markers signified by the attainment of educational credentials. By differentiating the curriculum along academic and vocational tracks, school administrators sought to meet the needs of different classes and calibers of students, and to more tightly couple educational training with educational outcomes. While administrators justified this curricular innovation (which was most often used in the high schools) on the basis of equal opportunity for all students based on ability, it reflected a larger, more significant shift in the basic aims and objectives of American education. Where the school once provided intellectual and moral training, in the face of an increasingly diverse student population, Progressive administrators took their chief professional administrative responsibility to be the preparation of students for their future lives as workers in the American labor force.

For many contemporary observers, however, curricular differentiation was little more than a euphemism for “social control,” which critics suggested curtailed liberal education in order to meet the labor demands of America’s budding industrial soci-

ety. While this is a cynical view of the Progressive administrative drive, there is much justification for it. Founded in 1906 by a committee of educators and business and industrial leaders, the National Society for the Promotion of Industrial Education (NSPIE) helped organize vocational education programs in high schools around the country during the first several decades of the twentieth century. Vocational education, which critics conveniently, if incorrectly, linked to Progressive education, was expressly designed to train students for immediate employment following, and often in lieu of, graduation.

On the other hand, administrative Progressives justified the rise of vocational tracks by pointing to the relatively miniscule college-going population and by proclaiming it as an effective means of assimilating newly arrived immigrants into American life and institutions. That these students’ high school education was essentially terminated before it ever started was of little concern, for in the face of rapid social upheaval, which reformers believed eroded the traditional institutions of church and family, the school was the last best hope to inculcate immigrants with American values, while simultaneously providing industry with a consistent influx of trained workers.

The interest in the efficient management of bureaucratic school systems and students was strengthened further by developments in educational psychology and intelligence testing. Among the twentieth century’s prominent educational psychologists, E. L. Thorndike (1874–1949)—who studied under William James at Harvard, and taught at Columbia University’s Teachers College during Dewey’s tenure—was undoubtedly the most influential. Presaging the rise of post–World War I mass intelligence testing by relying on intelligence tests in his own studies as early as 1903, Thorndike’s research advanced a narrowly focused stimulus-response definition of intelligence that justified the spread of worker training through vocational education at the same time that his mechanistic conception of intelligence corrupted Dewey’s own ideas about the organic connection between thinking and doing. Thorndike, relying on data gathered from his study of 8,564 high school students in the early 1920s, labeled his theory of intelligence *psychological connectionism*. Thorndike likened the mind to a “switchboard” where neural bonds (or connections) were created between stimuli and responses. He believed that students of higher intellect formed more

and better bonds more quickly than students of lower intellect.

For the administrative Progressives, Thorndike's findings were nothing short of revolutionary: By emphasizing the preponderant role of native intelligence through the statistical analysis of mass-administered intelligence tests, Thorndike and his fellow testers—H. H. Goodard, Lewis H. Terman, and Robert M. Yerkes, among them—provided school officials and policymakers with scientifically incontrovertible evidence in favor of increased psychometric testing and pupil sorting. In comparison with Dewey's more human and material-intensive approach to education, which required individualized student attention and creative pedagogy, Thorndike's conception helped reify separate curricula and perpetuate patterns of unequal access. Precisely (if paradoxically) because of the malleability of the idea of Progressive educational reform, it was possible for both pedagogical and administrative Progressives to advance their radically different agendas in the name of democracy during the first several decades of the twentieth century.

### Life-Adjustment Progressivism

Yet the internal contradictions and ideological inconsistencies of the pedagogical and administrative Progressives in many ways forecast the demise of the Progressive education movement. A system of education that championed both child-centeredness and individuated attention on the one hand, and explicit curricular differentiation through intelligence testing on the other, was perhaps destined to collapse; and with the introduction of life-adjustment education during the 1940s and 1950s, the Progressive education movement did just that.

Life-adjustment education emerged on the scene during the 1940s and witnessed its heyday during the early days of the cold war. The cause of life-adjustment education was advanced by leaders of the vocational education movement like Charles Prosser, who helped pass the monumental 1917 Smith-Hughes National Vocational Education Act, who believed that the school's main function should be to prepare students for the work world. To this end, the life adjusters borrowed generously from the pedagogical and administrative Progressive lexicon by advocating that schools should test and track students at the same time that they should improve students' physical and emotional well-being. Ultimately, the United States Office of Education's

Commission on Life Adjustment Education for Youth co-opted the mantle of Progressive education. Using commission reports published in 1951 and 1954 as its blueprint for action, the life adjustment movement succeeded in instituting its therapeutic curricula—geared toward the development of personal hygiene, sociability and personality, and industrious habits of mind—at thousands of schools around the country.

Critics denounced the public school's shift toward an overtly custodial function as both anti-American, anti-intellectual, and, ironically, antidemocratic. In the shadow of Joseph McCarthy's communist witch hunt, the Progressive's sponsorship of international understanding through education, the perceived penchant for feel-good classroom instruction, and the alleged liberal political orientation of Progressive educators cut against the grain of 1950s conservative America. The alleged anti-intellectualism of adjustment pedagogy, however, fueled even more criticism. Among others, the historian Arthur Bestor led the charge against life adjustment's anti-intellectualism. In his *Educational Wastelands* (1953) and *The Restoration of Learning* (1955), Bestor argued that life adjustment's emphasis on vocational instruction and life management skills marginalized the place of traditional core subjects. According to Bestor, it was impossible to be a fully educated person in the absence of at least some exposure to traditional liberal studies.

In this traditional view, most similar to the nineteenth century concept of education as mental discipline, Bestor was joined by other neotraditionalist educational luminaries, including Robert Maynard Hutchins, president of the University of Chicago and advocate of the great books curriculum, and James Bryant Conant, the highly respected and influential president of Harvard University. All three men agreed on the fundamental aimlessness and futility of life adjustment education in particular, and American high school education in general. Thanks to these men's efforts, the tenor of the national conversation on education changed dramatically, as more educators and public officials came to believe that it was once again time to think anew about the direction of American education.

Not surprisingly, in the midst of intense neotraditionalist scrutiny and growing public dissatisfaction with life-adjustment education, the Progressive Education Association, the principal administrative organ of the Progressive education

movement, closed its doors in 1955; two years later, following the Soviet Union's successful launch of *Sputnik I*, the general orientation of American education shunned life adjustment pedagogy and embraced traditional academic studies in the liberal arts, mathematics, and the hard sciences. With the communist threat looming ever larger, the neotraditionalists believed the future of American democracy depended on a return to traditional academic studies.

Progressive education did not entirely disappear, however. The fundamental tenants of Progressive education's pedagogical and administrative functions continue to inform contemporary educational debates. What is the relationship between education and democratic citizenship, between teachers and students? Are school districts too large? To what extent is the school responsible for the emotional as well as intellectual development of its pupils? Do achievement tests provide valid and reliable measures of student learning? Is the core curriculum sacrosanct or amenable to change? These are just some of the questions Progressive educators attempted to ask and answer, and they are questions that educators still wrestle with at the beginning of the twenty-first century.

## PROJECT METHOD

The project method is an educational enterprise in which children solve a practical problem over a period of several days or weeks. It may involve building a rocket, designing a playground, or publishing a class newspaper. The projects may be suggested by the teacher, but they are planned and executed as far as possible by the students themselves, individually or in groups. Project work focuses on applying, not imparting, specific knowledge or skills, and on improving student involvement and motivation in order to foster independent thinking, self-confidence, and social responsibility.

According to traditional historiography, the project idea is a genuine product of the American

Progressive education movement. The idea was thought to have originally been introduced in 1908 as a new method of teaching agriculture, but educator William H. Kilpatrick elaborated the concept and popularized it worldwide in his famous article, “The Project Method” (1918). More recently, Michael Knoll has traced the project method to architectural education in sixteenth-century Italy and to engineering education in eighteenth-century France. This illustrates that the project of the architect—like the experiment of the scientist, the sandbox exercise of the staff officer, and the case study of the jurist—originated in the professionalization of an occupation.

The project method was first introduced into colleges and schools when graduating students had to apply on their own the skills and knowledge they had learned in the course of their studies to problems they had to solve as practitioners of their trade. With some simplification, five phases in the history of the project method can be differentiated:

- 1590–1765: At the academies of architecture in Rome and Paris, advanced students work on a given problem, such as designing a monument, fountain, or palace.
- 1765–1880: The project becomes a regular teaching method; newly established schools of engineering in France, Germany, and Switzerland adopt the idea. In 1865, the project is introduced by William B. Rogers at the Massachusetts Institute of Technology into the United States.
- 1880–1918: Calvin M. Woodward adapts the project concept to schoolwork. At his Manual Training School students actually produce the projects they designed. Gradually the idea spreads from manual training (Charles R. Richards) to vocational education (David S. Snedden, Rufus W. Stimson) and general science (John F. Woodhull).
- 1918–1965: Kilpatrick conceives the project broadly as “whole-hearted purposeful activity proceeding in a social environment.” After being criticized by Boyd H. Bode, John Dewey, and other leading American Progressive educators, Kilpatrick’s approach loses its attraction in the United States, yet receives general approval in Europe, India, and the Soviet Union.
- The 1970s: Kilpatrick’s project method, now taken as the only adequate method of teaching

in a democratic society, is rediscovered in Germany, the Netherlands, and other European countries. Under the influence of British primary school education, U.S. educators attempt to redefine the project, viewing it as an important supplement to the traditional teacher-oriented, subject-centered curriculum.

There are two basic approaches for implementing the project method. According to the historically older approach, the students take two steps: initially, they are taught in a systematic course of study certain skills and facts, then they apply these skills and knowledge, creatively and self-directed to suitable projects. According to the second approach, the instruction by the teacher does not precede the project but is integrated in it. In other words the students first choose the project, then they discuss what they need to know for solving the problem and learn the required techniques and concepts. Finally they execute the chosen project by themselves. In both approaches, time for reflection should be provided during all phases of project learning, giving students the opportunity to evaluate their progress. Many teachers—especially vocational and industrial arts educators—use a series of small-scale projects to help students develop continuously increasing competence in practical problem solving.

## PROSSER, CHARLES (1871–1952)

An important figure in the vocational education movement, Charles Allen Prosser is particularly known as the architect of the 1917 Smith-Hughes Act and as the figurehead of the 1945 campaign for life adjustment education.

Prosser, born as a steelworker's son in New Albany, Indiana, received B.A. (1897) and M.A. (1906) degrees from DePauw University, the LL.B. (1899) from the University of Louisville, and a Ph.D. (1915) from Teachers College, Columbia University. He worked as superintendent in the post office, practiced as lawyer in Missouri, served as teacher, principal, and superintendent in Indiana, went to New York for doctoral studies, became, under David S. Snedden, assistant commissioner of education in Massachusetts (1910–1912), and acted as executive secretary of the National Society for the Promotion of Industrial Education (1912–1915). From 1915 to 1945, the rest of his professional life, he served as director of the William H. Dunwoody Institute in Minneapolis, interrupted only by a short but crucial period as the first executive director of the Federal Board for Vocational Education (1917–1919).

Beginning in 1903 Prosser, like all Progressive educators, criticized the high school curriculum with its traditional emphasis on scholarship and college preparation. After the sixth grade, he argued, education should be differentiated because of marked difference in interests, aptitudes, and occupational opportunities that were open to the young. What the great majority of pupils needed was vocational education, that is, "real vocational education" and explicitly not manual training, homemaking, or industrial arts, since the traditional practical subjects had failed to help children "to get a job, to hold it, and to advance to a better one."

Like Edward Thorndike, Prosser believed that knowledge could not be transferred from one field of learning to another; like David Snedden, he maintained that learning, to be effective, had to be specific and directed to immediate ends; and following Georg Kerschensteiner, he pled for separate secondary schools which—apart from the traditional high school—offered as many specific vocational courses or groups of courses as there were occupations. In 1911 Prosser began campaigning for federal funds to provide social and economic opportunities for practically inclined children above fourteen years of age through the creation of specific vocational schools

and programs. From his view, the duties, tasks, and problems of shop, home, and farmwork had to be learned in practical ways, preferable by the activity and project method. Pointing to the German model, he propagated a system of "dual control," that is, the vocational schools and courses were to be administered not by the general boards of education which already existed, but by separate boards of vocational education, which had to be newly established. For the most part, Prosser wrote the influential *Report of the National Commission on Aid to Vocational Education* (1914), and many of the ideas and proposals he expressed there were included into the Smith-Lever Act of 1914 and the Smith-Hughes Act of 1917—federal laws that he shepherded through Congress. At Dunwoody, the school for workers he directed, Prosser made sure that the students carried out their exercises and projects under conditions as much like those of real work in industry as possible. Since he was convinced that specific industrial methods changed rapidly in the face of changing science and technology, he institutionalized in his school short-term courses for retraining and updating skills and knowledge.

In the "Prosser Resolution" of 1945 he once again accused the secondary schools of failing to prepare the great majority of children to take their place in adult society. He claimed that 20 percent of the high school population was receiving an appropriate college-entrance education and another 20 percent was being well served by vocational programs, but that the remaining 60 percent desperately needed "life adjustment education"—they needed practical training that included personality, etiquette, health, home, and family living. In essence, the resolution revived Prosser's old idea that the principal function of schooling should be the adjustment of individuals to the social and occupational circumstances in which they live. In the long run, most of Prosser's initiatives did not prevail; nevertheless, more than any other single person, he was responsible for the fact that vocational education in the United States became the most successful curricular innovation of the twentieth century.

MICHAEL KNOLL

**PROTESTANT SCHOOL SYSTEMS**

Protestant schools are a small but dynamic and diverse part of the landscape of education in the United States. These institutions, which are usually much smaller than their state-controlled counterparts and depend heavily on private financing, enroll about 3 percent of all K–12 students. In 2000 approximately 1.6 million students attended nearly 12,400 elementary and secondary Protestant schools (excluding pre-kindergarten and kindergarten-only schools) operated by churches affiliated with more than twenty denominations, institutions of higher learn-

ing, or groups of individuals committed to particular Protestant belief systems. These figures represent about 30 percent of the 5.2 million students in K–12 nonpublic schools and 45 percent of the nearly 27,400 private schools in the United States.

**Colonial and Nineteenth-Century Protestant Schooling**

Protestant schooling is not new to education in the United States. Prior to the advent of state school systems in the middle decades of the nineteenth century, the rich religious diversity that characterized overwhelmingly Protestant colonial and early national America was manifested in an equally rich diversity of Protestant schools. Throughout these years, Lutherans, Quakers, Presbyterians, Moravians, Mennonites, German and Dutch Reformed, Baptists, Methodists, and Anglicans established elementary schools and academies. Even the so-called town schools of colonial New England and the quasi-public district schools and charity schools of the early 1800s were de facto Protestant schools.

The mid-1800s marked an era of intense debate and reform focusing on issues of control, finance, and curriculum that led to major changes in education in the United States. By the 1850s in the North and the 1870s in the South, states had established public or common school systems. Student enrollment shifted significantly to the free common schools, the earlier practice of distributing tax dollars to schools under private control for the accomplishment of public purposes was sharply curtailed, and nonpublic schools were increasingly cast as un-American and divisive. During the period several Protestant denominations, such as the Methodist and Episcopalian, considered establishing alternative school systems, and in the case of the latter, a number of dioceses, mostly in the South, encouraged the establishment of schools. In the 1840s and 1850s, the Old School Presbyterians attempted to establish a system of schools to transmit orthodox beliefs. Although nearly 300 schools were founded, a schism bred by intersectional strife ended the experiment by the time of the Civil War. Individual churches continued to maintain schools, but with the exception of the Lutheran Church–Missouri Synod, Protestant denominations and most of their members accepted state provision of elementary schooling, though not without occasional expressions of concern about secularization of public education. They did so in large measure because nineteenth-century public

schools were general Protestant schools and were thought to be a principal means to creating and maintaining a moral, disciplined, and unified Protestant citizenry. Furthermore, as Roman Catholics asked for tax dollars to support their schools and complained about Protestant practices such as Bible reading in the common schools, a majority of Protestant denominations and their members set aside their denominational differences and supported the purportedly “nonsectarian” common school.

By the end of the nineteenth century, most Protestant denominations no longer discussed the possibility of establishing an alternative to the state school system. Only the Lutheran Church–Missouri Synod (which was founded in 1847 with a strong commitment to Christian education and by 1897 boasted 1,603 schools with an enrollment of 89,202); the Wisconsin Evangelical Lutheran Synod (which operated eighty-five elementary schools in 1875, twenty-five years after its creation); the Seventh-day Adventist Church (which committed itself to a system of elementary schools in the 1890s and by 1900 claimed more than 200 schools with an enrollment of about 5,000); and the Christian Reformed Church (whose commitment to Christian schools in the Calvinist tradition was only slowly realized—fourteen schools by 1900) maintained a significant denominational emphasis on Christian schooling to preserve or protect confessional and/or cultural distinctives. Though most denominations decided not to construct alternative systems, individuals, churches, and parishes sponsored Protestant schools, including a significant number of secondary institutions. Exact enrollment figures for Protestant-oriented schools in the late 1800s are not available. A 1985 study by the scholar Thomas Hunt, however, used the U.S. census of 1890 to arrive at the following figures: Lutheran, 151,651; Methodist, 58,546; Presbyterian, 37,965; Baptist, 29,869; Congregational, 27,453; and Episcopal, 21,650.

### Early Twentieth-Century Protestant Schooling

Compared to public school figures, enrollment in Protestant schools had declined markedly in the 1800s as tax-supported education became more widely available and a growing number of Protestants claimed the public schools as “theirs” and even asserted that all children, Protestant and Catholic alike, attend them. By 1900, 15,503,000, or about 92 percent of the 16,855,000 elementary and secondary students in the United States, were enrolled in public

schools, while 1,352,000, or approximately 8 percent, attended private institutions. About 854,000, or 63 percent of these students, were enrolled in the burgeoning Roman Catholic institutions. Most of the rest, about 3 percent of the total K–12 enrollment, attended Protestant schools, according to Otto Kraushaar’s 1972 study.

Charges that nonpublic schools were undemocratic and assertions that all children should attend schools run by the state, which had been voiced since the 1840s, as well as a rising tide of nativism in the late 1800s and early 1900s led to several efforts to restrict or eliminate Catholic and Protestant schools. In 1889, for example, Wisconsin and Illinois passed the Edwards and Bennett laws. Directed primarily at Catholic and Lutheran schools, which were heavily populated by children of German-speaking parents, the Edwards law defined a school as a place where subjects were taught in English and required children to attend school in the district in which they resided. The Bennett law mandated that all children between the ages of seven and fourteen attend a public school in the district in which they resided for at least sixteen weeks (eight of which had to be consecutive) per year. Catholics, Lutherans, and other religions joined forces to bring about the repeal of both laws within two years. The gravest threat came in Oregon in 1922 with a referendum-based law that required children between the ages of eight and sixteen to attend a public school. Three years later, the U.S. Supreme Court in *Pierce v. Society of Sisters* struck down the law, affirming the right of private schools to exist and right of parents to “direct the upbringing and education” of their children.

Spurred by the *Pierce* decision (often called the Magna Carta of private schools), a brief period of prosperity, and a gradual softening of the xenophobia of the 1910s and early 1920s, nonpublic school enrollment began to rise slowly from about 7 percent of all K–12 students in 1920 to 9.4 percent in 1930, declining only slightly to 9.3 percent in 1940. During the interwar years, however, Protestant school enrollment accounted for between only 1 and 2 percent of all K–12 students.

While enrollment remained fairly stable throughout the 1920s and 1930s, reforms were underway that brought many Protestant schools closer to the public school model. For example, the Lutheran Church–Missouri Synod, the Seventh-day Adventist Church, and the National Union of Christian Schools (renamed Christian Schools International in

1979), founded in 1920 to represent parent-governed Calvinist Christian schools, undertook efforts to upgrade teacher preparation and curriculum as well as prepare their schools for accreditation. In Missouri Synod schools, English replaced German as the primary language of instruction. Some critics, however, asserted that their schools were becoming too much like their public counterparts.

### Post-World War II Protestant Schooling

Private school enrollment increased significantly between the end of World War II and 1960, the year that nonpublic school enrollment reached a twentieth-century high of 13.6 percent of all K–12 students. Although the lion's share of the growth occurred in the Roman Catholic system, enrollments in most Protestant school groups grew during these years and, in some cases, beyond. By 1961, for example, the Lutheran Church–Missouri Synod (LCMS), which at that time operated the largest “system” of Protestant schools, claimed 1,323 schools with an enrollment of 150,440. (The term *system* is used loosely here as the control of most Protestant schools is very decentralized with local churches or boards owning the buildings and setting policy with denominations or national and regional associations providing services, resources, and accreditation.) According to Jon Diefenthaler's 1984 study, by 1983, LCMS figures had increased to 1,603 schools and 198,061 students. During the 1990s, however, K–12 enrollments have fluctuated between 165,000 and 172,000.

The much smaller, more conservative Wisconsin Evangelical Lutheran Synod also has maintained its historic commitment to Lutheran education. Its schools and enrollment have grown slowly from 239 and 27,448 in 1965 to an estimated 375 and 36,656 in 1999. On the other end of the theological spectrum, the congregations of the 5.1 million member Evangelical Lutheran Church in America, which was formed from a merger of three North American Lutheran bodies in 1988, operated an estimated 122 schools with an enrollment of 18,000 students in 1999. Like LCMS schools, ELCA institutions enrolled a significant minority of non-Lutheran children at the beginning of the twenty-first century.

Episcopal schools operated by parishes, independent corporations, or dioceses have increased rapidly since World War II. In 1951 approximately 100 Episcopal schools existed in the United States, more than half of which were long-established

boarding institutions. As a result of the increase in parish elementary schools, by 1966, 347 Episcopal schools enrolled 59,437 students. By 1981, 320 schools enrolled 76,888 students, and in 1999, 346 schools enrolled 92,466 students. Like their Quaker (Society of Friends) counterparts whose 76 broadly inclusive schools enrolled almost 19,000 students in 1999 (up from about 11,000 in 1966 and 13,000 in 1989), many Episcopal schools identify closely with the more secular, academically oriented independent school sector. More than two hundred members of the National Association of Episcopal Schools, a voluntary organization that provides support and services, also hold membership in the National Association of Independent Schools or one of its regional associations.

According to George Knight, though a relatively small denomination, the Seventh-day Adventist Church operated more than 5,500 schools worldwide in 1999. Following a century-long trend, enrollment in U.S. Adventist schools, which stress cooperation rather than competition and a biblical worldview, increased from 64,252 in 884 schools in 1966 to 81,507 in 1,324 schools in 1983. Since the mid-1980s, however, enrollment has declined. In 1999 the church operated approximately 1,013 schools with an enrollment of about 64,000.

Christian Schools International (CSI), which claims the Bible as explained in Reformed creeds as its organizational basis, provides services and support to Calvinist Christian schools. These schools have their roots in the Netherlands and emphasize the development of students who are capable of applying Christian principles to all realms of life. Once populated by students of Dutch descent, member schools now enroll students from a variety of ethnic and theological backgrounds. According to Peter DeBoer, though enrollment remained around 50,000 in the 1960s and 1970s, it increased significantly in the 1980s. Between 1981 and 1989 CSI membership grew from 217 schools with 51,849 students to 295 schools with 87,215 students. In 1999, 395 member schools enrolled approximately 88,000 elementary and secondary students.

Though Amish and Mennonites share a common Anabaptist heritage from the Protestant Reformation, their education philosophies differ. The education of Amish children is limited to elementary schooling in basic subjects, excluding science and physical education, followed by vocational training (an approach that brought persecution until the

Yoder decision of 1972 granted the Amish relief from laws that required schooling beyond the eighth grade). It is designed to prepare them for participation in a separate, nonconformist life in the Amish community. Most Mennonites, on the other hand, look to elementary and secondary schools to promote academic excellence as well as Mennonite distinctives such as peacemaking and service to the wider community. Until around 1900 Amish and most Mennonites sent their children to local public schools within their community that reflected their beliefs. Enforcement of compulsory attendance laws, increasing secularization, and consolidation prompted them to found their own schools in the 1920s through the 1940s. The National Center for Education Statistics estimated that in 1999, 414 Mennonite schools enrolled around 24,262 students, while 709 Amish schools enrolled 26,473 students.

Since the mid-1960s, when Lutheran, Calvinist, Episcopal, and Seventh-day Adventist schools dominated this segment of private education, fundamentalist and evangelical Protestants and their churches, few of which are members of "mainline" denominations, have been establishing alternatives to public education that are often referred to as independent Christian day schools. As many as 150 of these institutions were founded between 1920 and 1960. It was not until the 1960s, however, that disenchantment with the ongoing secularization of state schools, a resurgent evangelical faith, and, in some cases, fears related to desegregation sparked the rapid increase in the number of these schools, all of which profess centrality of Jesus Christ and the Bible in their educational endeavors and attempt to inculcate a Christian worldview, but are quite diverse in facilities, size, and ethos. The National Center for Education Statistics reports that approximately 10,000 Christian day schools were founded between the 1960s and 1990s, most of which were racially integrated by the end of the century. Furthermore, in the 1980s and 1990s a small but growing number of these schools were established by and for African Americans. In 2000 enrollment in Christian day schools, most of which are affiliated with either the Association of Christian Schools International or the more conservative American Association of Christian Schools, exceeded 1 million.

As is the case with Christian day schools, Protestant schooling as a whole is a diverse segment of education in the United States. Some schools endeavor to transmit orthodox beliefs, some to evangelize stu-

dents, some to promote academic excellence, and some to craft Christian citizens. Despite their differences, however, most Protestant schools face at least three questions in the early twenty-first century. First, how will they remain affordable to their middle-class clientele, not to mention poor families? Second, how religiously pluralistic can schools rooted in particular theological traditions become before they lose their identity? Finally, how will Protestant schools respond to the availability of tax dollars for private education expenses? Given the nature of Protestant schooling, responses will likely be many and varied.

JAMES C. CARPER

## PSYCHOLOGIST, SCHOOL

School psychology is the application of psychological principles and techniques to the education of children. Drawing upon its own knowledge base and that of related fields, including clinical and educational psychology, school psychology focuses on the individual study of children's learning and adjustment primarily in educational settings.

School psychology originated in the late nineteenth century. Its origins are closely connected to those of special education, clinical and educational psychology, the rise of psychological science, the development of psychoeducational tests, and the implementation of special education programs in response to the needs of atypical children required to attend school under state compulsory attendance laws.

### Roles and Functions

The major roles and functions of practicing school psychologists include psychoeducational assessment, consultation, interventions, research and evaluation, in-service education, and administration.

**Psychoeducational assessment.** School psychologists spend at least 50 percent of their time administering psychological and educational tests, conducting observations and interviews, and gathering relevant information in the assessment of students experiencing learning and adjustment problems. The assessment often includes tests of cognitive ability, school achievement, psychomotor skills, adaptive behavior, social skills, and personal-social adjustment. Such assessments also involve interviews with parents and teachers, observations in school, and inspection of school records. Each case study is summarized in a written report.

**Consultation.** School psychologists spend about 20 percent of their time in consultation. This is an indirect method of providing services in which the psychologist works to alter the attitudes and behaviors of others (usually parents and teachers) to affect changes in student behavior, school curriculum, or school system policies.

**Interventions.** Practitioners spend about 20 percent of their time in direct interventions, including remediation and therapy, that involve referred children. Conducted individually or in groups, these services are intended to alleviate academic and behavior problems.

**Research and evaluation.** About 3 percent of practitioner time is devoted to research and evaluation. Although this is an important role for school psychologists, other priorities preclude much involvement in the design of research and evaluation projects that might better assess the efficacy of referral methods, assessment techniques, therapeutic outcomes, and the evaluation of district programs.

**In-service education.** Less than 3 percent of practitioner time is devoted to in-service education of dis-

strict personnel or parents. This activity may be directed at many topics, including reducing systemic problems in child study and improving teaching or parenting skills.

**Administration.** Modern-day services require an unusual amount of record keeping, accounting, and administrative tasks. This role may account for 5 percent of practitioner time.

### Employment Settings

Most school psychologists are employed in schools, colleges and universities, or private practice.

**Schools.** Surveys have consistently shown that at least 80 percent of school psychologists are employed in public school settings. Perhaps an additional 5 percent are employed in related settings such as private schools, correctional schools, residential treatment centers, and boarding schools.

**Colleges and universities.** About 4 percent of school psychologists have their primary employment in academic settings, usually as faculty members assigned to the training programs for school psychologists. Some hold positions in the institution's psychological services center or agency for assisting students with disabilities.

**Private practice.** About 4 to 5 percent of school psychologists work in private practice, many on a part-time basis. Some are independent practitioners, whereas others work within a group practice with pediatricians, psychiatrists, social workers, and other psychologists.

### Relationship to Special Education

School psychology practice is closely linked to special education programs. The need for psychologists to help determine student eligibility for placement and to recommend subsequent educational programs and interventions is formalized in federal and state regulations (e.g., the Individuals with Disabilities Education Act Amendments of 1997). Practitioners spend about two-thirds of their time in activities related to special education; these activities may include any of the roles mentioned above.

### Relationship to Other Pupil Personnel Workers

In most school districts, the school psychologist works with a pupil personnel services team. Other team members may be school counselors, social workers, nurses, and speech and language therapists. The team works with teachers, parents, and adminis-

trators to try to alleviate specific problems, and it consults with school personnel on district-wide prevention programs.

### Training

School psychologists are prepared in programs leading to master's (M.A., M.S., M.Ed.), specialist (Ed.S.), or doctoral (Ph.D., Ed.D., Psy.D) degrees. Approximately 220 institutions provide school psychology training in about 90 doctoral and 200 non-doctoral programs.

The National Association of School Psychologists (NASP) considers the specialist degree or its equivalent (a graduate program of at least sixty semester hours including internship) as the appropriate entry-level training for school psychology practice. The American Psychological Association (APA) considers the doctoral degree as the appropriate entry-level training for school psychology practice. The department of education in the program's home state typically approves programs. The NASP approves programs according to its standards at the specialist and doctoral levels and participates in the accreditation process of the National Council for Accreditation of Teacher Education. The APA has an accreditation office that accredits professional psychology programs at the doctoral level only.

### Credentialing

Practice credentials are available in every state, usually from two separate agencies. Credentials offered through the state's department of education are almost always required for employment in the settings under its jurisdiction, typically all public educational facilities in the state and often private schools as well. Each state's board of examiners in psychology offers a credential for practice in the settings under its jurisdiction, typically all nonschool settings. In some states these two agencies have overlapping authority to issue credentials. These agencies issue either a certificate or a license to practice.

### Growth and Current Status

The rapid development of the field is observed in the growth in the number of practitioners, organizational developments and memberships, expansion of professional literature, and the importance of professional regulation through accreditation and credentialing.

**Number of school psychologists.** School psychology has seen enormous growth since the 1950s.

Whereas there were only 1,000 people in the field in 1950, the number of practitioners grew to 5,000 by 1970, 22,000 by 1990, and to at least 25,000 by the early twenty-first century. Female representation among school psychologists rose from about 50 percent in the 1960s to 70 percent in the early twenty-first century. Minorities comprise less than 10 percent of the work force.

**Organizational representation.** The field of school psychology is represented at the national level by the NASP and by the Division of School Psychology within the APA. The NASP's membership is approximately 22,000, whereas that of APA's Division of School Psychology is about 2,500. Each group holds an annual convention, provides products and literature for its members, and advocates for school psychology according to its policies. Each state has a NASP-affiliated association that provides similar services. These associations are generally independent of the state's APA-affiliated psychology association, although in some states the school psychology association is a part of the state psychology group. There may also be local and regional groups of school psychologists that affiliate with the state groups.

**Literature.** Two journals specifically for school psychologists were founded in the 1960s: *Journal of School Psychology* and *Psychology in the Schools*. Additional journals for school psychologists in North America include *School Psychology Review*, *School Psychology Quarterly*, *Canadian Journal of School Psychology*, and *School Psychology International*. School psychologists also subscribe to related journals (e.g., *Journal of Psychoeducational Assessment*, *Journal of Clinical and Consulting Psychology*, *Exceptional Children*). State and national associations provide newsletters and other publications. Books specific to school psychology date to 1930, but most have been published since 1960.

**Employment and salaries.** There is a shortage of practitioners in almost every state. Opportunities for employment are greatest in urban and rural school districts, as well as in academic settings. Suburban school districts also have many job opportunities.

Salaries have followed inflation for several decades. According to Daniel J. Reschly, the median salary of NASP members was in the \$35,000 to \$40,000 range in 1990 and in the \$48,000 to \$50,000 range by the late 1990s.

**Future perspectives.** Demand for school psychologists is expected to outweigh supply indefinitely.

School settings will continue to be the primary practice locale, though job opportunities will be plentiful in other settings. Employment opportunities in training programs for persons holding doctoral degrees will be very attractive. Salaries will continue to increase at a gradual but steady rate.

Traditional practice roles will persist although the technical adequacy of test and intervention techniques will improve. The specialist level of training will continue to be the entry level for practice in school settings, but doctoral training will increasingly be expected in other settings. The number of training programs is not likely to rise by any significant extent, but more doctoral programs are expected to be established, especially in freestanding schools of professional psychology.

Credentialing for school-based practice will continue to be regulated by the state departments of education, most of which will continue to require nondoctoral training. Credentialing for nonschool practice will continue to be regulated by state boards of psychology, granting credentials mainly at the doctoral level, with increasing expectations for postdoctoral training.

The importance of diversity in school psychology training and practice will be a priority. Female representation among school psychologists may grow to 80 percent. The recruitment of males and minorities of either gender will become increasingly important.

## PUBLIC EDUCATION, CRITICISM OF

Despite several decades of reform, public education in the United States is criticized by some as not teaching all children effectively. Consistently poor test results and low graduation rates attest to this. As a result, many taxpayers criticize public schools and demand better results. At the same time, many Americans express a deep faith in the ability of public education to address the needs of the greater society.

There are five issues that cloud the public's perception of the public schools and fuel criticism.

While more than five issues could be identified by the public—who consistently rate the performance of schools as less than optimal—these are central issues found in schools across the country. Two of these issues are long-standing characteristics of the public education system: inequality of opportunity and the burden of bureaucracy. Two are highly debated, more recent movements that attempt to address these characteristics: achievement-based outcomes and school choice. The fifth issue concerns how these movements contribute to American public education reform.

### Inequality of Opportunity

Public education in the United States has long promised quality education for all children, regardless of ethnicity, race, or income. However, critics of public education argue that many children do not have equal opportunities to learn and are not likely to attend a quality school. In fact, critics suggest that the education system perpetuates poverty and disadvantage, providing rich and poor schools with stark contrasts in learning environments and physical surroundings. Impoverished neighborhoods typically house run-down schools with less money and poor conditions, while affluent neighborhoods house newer and safer schools providing better learning environments. Furthermore, ethnic minority students are more likely to attend the lower-quality urban schools. While there have been many efforts to improve this inequality of opportunity, such efforts are only the first step in achieving equity, even with millions of dollars invested in federal programs.

Since the 1950s, federal compensatory education efforts have tried to achieve equity in education with programs such as Head Start, giving preschoolers from low-income families a chance to start kindergarten at the same level as their middle- and upper-class peers. Other major federal policy efforts created categorical programs—such as Title I, bilingual education, and special education initiatives—to promote equity for children with economic disadvantages, language barriers, and physical or mental disabilities.

A groundbreaking federal commitment, the Elementary and Secondary Education Act of 1965, and subsequent amendments, supports education achievement and equity by providing federal funds to states and school districts. The Bilingual Education Act (1968), the Education for All Handicapped Children Act (1975), and Title IX (1972), which re-

moved barriers to women in education institutions, also serve as examples of early and sustained commitments by the federal government to achieve equity in schools.

Data from the National Assessment of Educational Progress (NAEP) reports that 63 percent of fourth graders perform at only basic, or below basic, levels in reading. Sixty-nine percent perform at these levels in mathematics. African-American, Hispanic, and Native American fourth graders perform consistently lower than their white counterparts. Furthermore, schools in the United States fail to teach higher-order skills to about half of the student population. And once again, this “bottom half” comprises primarily the poor and ethnic minorities.

The inequalities of access to quality schools and achievement of children in public schools have been the source of years of debate and millions of dollars in programs attempting to achieve equity for all students. Yet, as shown above, critics of public education cite ample evidence that inequality and inequity exists and that little has been done to level the playing field. NAEP data, however, does show that the gap in reading and mathematics between white students and their African-American and Hispanic counterparts narrowed between 1973 and 1999 at all grade levels.

### Highly Bureaucratic Systems

Critics of American public education argue that the United States is unable to educate all children effectively, partly because of the highly bureaucratic nature of its governance structure. Attached to most federal government funding are layers of rules burdened by paperwork and regulation; thus, federal programs become difficult to implement or change. This institutionalized problem of excessive bureaucracy shuffles funds and responsibility around to various bodies and, in the case of public education, shifts the responsibility of academic achievement onto parents, administrators, teachers, and students. The result of public education being tied to the agendas of so many stakeholders—voters, politicians, school boards, administrators, teachers, unions, parents, and students—has been fragmentation and lack of control, leaving the public to wonder who has the authority in the system.

The same burden of bureaucracy also exists at the state, district, and school level. Critics assert that oversight of public schools is unnecessarily heavy.

The state boards of education and administrative regulation by state departments of education add yet another layer to the policymaking process. Locally, elected school boards attempt to maintain the mission and vision of the district, yet they are often accused of micromanaging and adding layers of bureaucracy. District administrations, with central authority over the schools, are often fighting for control with the school boards.

One way to decrease bureaucracy is to decentralize control to the district or site level, known as *site-based management*. Not only will bureaucracy decrease when control is local, say proponents, but administrators, teachers, and the community will have a greater influence on the needs of their children, as well as strategies to serve those needs. Another way to lessen bureaucratic weight is to add competition and choice in public schools through charters and vouchers. Advocates of school choice believe, among other things, that some of the bureaucratic burden causing inefficiency and ineffectiveness will be lifted when schools are run more like businesses and parents can choose their children’s schools—more like consumers. Yet, these ideas of choice and localized control meet resistance from the education establishment, who often argue that maintaining and adding to current practices is the best bet for improving public education. This resistance to change also fuels criticism from the public.

### Achievement-Based Outcomes

To ensure students are mastering the skills necessary to successfully enter either the workforce or institutions of higher learning, measures of academic success have emerged. Most indicators come in the form of standardized tests, administered at several grades throughout elementary and secondary school. NAEP state performance indicators have confirmed that students are not learning and succeeding at the level expected by parents, taxpayers, and policymakers. In addition, some critics regard these high-stakes tests as unfair, citing data showing cultural bias against students from low-income families and racial/ethnic minorities, who often perform lower in these measures. However, most racial and ethnic subgroups of children have improved their scores over time, performing better on mathematics, reading, and science measures. Nevertheless, the gap in achievement, measured by these widely used tests, causes critics to blame the public education for failing to teach students.

Indicators of achievement on mathematics and science, such as the Third International Mathematics and Science Study (TIMSS) comparison of students in the fourth and eighth grades from forty nations (and twelfth-grade students from twenty nations), have revealed that the overall achievement of students in the United States is low compared to students in other industrialized nations. Twelfth graders in the United States were outperformed by fourteen of twenty nations in mathematics and science, according to TIMSS results, initiating a flurry of debate and concern nationwide about public education. Others have debunked criticisms of achievement in the United States based on TIMSS data since cross-national comparisons do not consider the dramatically different student diversity and pluralism in America and the varying governance serving its diverse population. Still, the aftermath of TIMSS resulted in government pressure on students to enroll in more difficult math and science classes, and also forced the nation to reevaluate its place among competing nations in the global economy. Despite all of this concern about students and their ability to perform in the economy of the early twenty-first century, data from 1990 to 2000 showed steady economic growth in the United States, the strongest in several decades, in fact.

State-level accountability systems have emerged across the country during the 1980s and 1990s. These systems include rules for state-administered standardized tests and curriculum standards for all grade levels. In these accountability systems, some states reward students, teachers, and school and district leaders for improving academic achievement. Part of the criticisms came when leaders had difficulty implementing these systems of accountability, often due to having standards not aligned with tests and curriculum not aligned with standards. Efforts to improve these disparities and ultimately improve achievement outcomes have been slow to show results. For example, experts continue to change the measures themselves, putting teaching strategies and curriculum used to teach them in constant flux. In addition, where schools are consistently performing very poorly on high-stakes tests, the state intervenes by way of sanctions or takeover of the school or district. Critics say these interventions and accountability systems are presented with little evidence of their likelihood to positively change the system. Seldom are these changes backed with research-based rationale.

## School Choice

Many believe competition among schools can solve the problems of poor student achievement, inequity, and government bureaucracy. Since the 1990s, school choice has gained enormous momentum, providing a variety of enrollment options for children, such as charter schools, voucher programs, district/school open enrollment, and tax credits/deductions. Advocates of school choice feel that when parents become consumers of education, schools will compete, forcing public schools to improve student academic performance or risk closure. They also believe that public schools are unable to reform successfully because of too much government oversight. Critics of school choice argue the lack of a monitoring mechanism will mean far less accountability with no guarantee that all children are learning basic skills. Others challenge the constitutionality of some choice programs, arguing that including religious schools in a choice program—particularly when vouchers with public funds are involved—violates the separation of church and state. A brief description of each of the various school choice options follows.

**Charter schools.** Charter schools are independent public schools formed by communities, and they are therefore relatively free from state and local laws and regulations. The school operates under the framework of a contract, or *charter*, established by the parents, businesses, and the community the school serves. Less controversial than vouchers, charter schools and their enrollment have grown tremendously since 1994 when Congress authorized the Public Charter School Program through Title X of the Elementary and Secondary Education Act. Since 1991, thirty-seven states have passed charter school legislation. Although there is some evidence that charters may improve academic achievement, the research is mixed. Early studies cited higher achievement for some groups in some grades when compared to conventional schools, as well as lower achievement for others.

**Vouchers.** Vouchers are public funds given to families and organizations to provide tuition for children at any public, private, or parochial school they choose. Advocates of voucher programs say they expand options for low-income parents. Critics claim that vouchers divert public funds away from already ailing public schools and into private and religious institutions. Furthermore, they argue that vouchers “skim” off the best students, thereby further stratify-

ing and segregating schools. Moreover, legal disputes related to the constitutionality of vouchers pervade state and federal courts. Capacity and cost are two major barriers to the implementing of a sound voucher program. While there is a demand for school choice, the supply of schools and their capacity to enroll additional students depend on their ability to expand, which adds to teaching staff, class size, and administrative faculty. In addition, private schools vary widely in their tuition costs. Because vouchers are given based on state per-pupil expenditures, many families may still have to pay significant costs to send their children to the school of their choice, and many families will be unable to afford to send their children to the school of their choice.

**District/school open enrollment.** Sometimes referred to as intradistrict/interdistrict choice, District/school open enrollment allows families to choose a school in their area other than the one the student was assigned, dependent on availability of space. Open enrollment laws can be either mandatory or voluntary.

**Tax credits/deductions.** Tax credits and deductions allow families to recoup money on their taxes spent on private education costs, including tuition, textbooks, transportation, and other direct school expenses. Since these deductions can only be taken after the money is spent, through deductions of taxes owed, many low-income families are not able to participate.

A strongly debated issue, criticisms of school choice come from many angles. Some criticisms have been aimed at the idea of competition among schools in general, while others criticize those in the system who are opposed to this promising effort to improve education for many American children.

### Reform after Reform

As educators and legislators continue to believe in the power of change through education reform, dollars will be spent on one innovative idea after another to improve academic performance, efficiency, or other structural characteristics of the schools. American public education has, since 1980, endured reform after reform, with few reforms sustained over the long-term, and little to show for the effort except frustration and lack of clarity in the mission of the reforms. Instructional reforms (e.g., whole language vs. phonics instruction in reading), pedagogical reforms (e.g., constructivist vs. direct instruction), and

management reforms (e.g., centralized decision making vs. site-based control) create a *reform build-up* in schools and districts. Even after years of reforms, some assert that classroom practices have changed very little. Yet, states, districts, schools, and classrooms have periodically seen positive outcomes from their reforms. This often results in countless efforts to replicate success stories when the context may not be conducive to the same effects. Research shows that effective reforms are gradual and incremental, suggesting that change and reform is a step toward progress, not progress itself. Educators and reformers are then charged with the task of asking the public to be patient in seeing results. Too often, this reform build-up creates doubt and mistrust among those inside and outside of the system.

Public education in the United States has historically been both the panacea for societal ills and the target for criticism and disapproval. For every critic pointing out the failures of the system, there's a success story to be told that outlines the progress public education has made. Given the many failed reforms and less than successful attempts to create a more equal and fair system, there is no evidence that eliminating the entire system would improve the system or halt any criticisms. Instead, like every other institution in America, educators, policymakers, and reformers learn from the mistakes of the past and continue to pave new ways of helping students learn and succeed.

JOY W. LEWIS

## PUBLIC SCHOOL BUDGETING, ACCOUNTING, AND AUDITING

The three major financial functions in education—budgeting, accounting, and auditing—are separate, discrete operations, but they are nonetheless closely interrelated. They are required activities in providing reliable fiscal information, guidance, and accountability in the use of the \$365 billion raised and

expended in 2001 on preschool through grade twelve public education in the United States. Budgeting is a process and plan for determining how money is to be raised and spent, as well as a document—the budget—developed and approved during the budgeting process.

Money is organized and spent according to an accounting system, using a general ledger that standardizes each spending category and accounts for its use. The National Center for Education Statistics published the *Financial Accounting for Local and State School Systems*, commonly called *Handbook II, Revised* (1990), by William J. Fowler. *Handbook II, Revised* is an accounting system with line codes for each category and function to make it easier for external agencies to analyze and audit school spending to ensure the legal and appropriate use of public funds.

### Budgeting

William Hartman, author of *School District Budgeting* (1999), defines education budgeting as a "working tool" for the successful operation of states and local school districts, and as a "significant opportunity to plan the mission, improve their operations, and achieve their education objectives" (p. 1). As such, the budgeting process allows various levels of government to "make better financial and program decisions, improve operations, and enhance relations with citizens and other stakeholders" (National Advisory Council on State and Local Budgeting, p. 2).

In more technical terms, a budget is a statement of the total educational program for a given unit, as well as an estimate of resources necessary to carry out the program and the revenues needed to cover those expenditures. A *vertical budget* includes the various income and expenditure estimates (by line item, function, object, and cost center) in a given fiscal year, while a *horizontal budget* will include current estimates for a given fiscal year, compared to prior audited income and expenditures, and a projection of costs into the future. Hence, the budget is a statement of purpose and a review of income and expenditures by function—with a timeline to explain past, current, and future financial practices.

Education agencies, like businesses and other enterprises, have experimented with various forms of budget organization: line-item and function/object budgeting are basic to all systems; and plan-

ning-programming-budgeting systems, zero-based budgeting, and site-based budgeting are attempts to link the budget to goals and objectives while devolving the budgeting process to the school level.

**Line-item budgeting.** Barry Mundt et al. define line-item, or “traditional,” budgeting as “a technique in which line items, or objects of expenditures—e.g., personnel, supplies, contractual services, and capital outlays—are the focus of analysis, authorization, and control” (p. 36). While helpful in tracking costs, line-item budgeting is virtually useless for planning or management, since the functions of the expenditures are not explained and the particular need, school site, and type of students being served are lost in spending aggregated by “line.” Thus, *teachers’ salaries*, for example, is a budget line-item; but which teachers, at which schools, teaching which types of students (e.g., bilingual special needs) is not explained.

**Function/object budgeting.** Most districts use function/object budgeting, since it organizes spending around the basic functions of the system, such as instruction, student support, operations, administration, and transportation. In addition, functions are subdivided (e.g., into elementary instruction, high school operations), while the object being purchased (e.g., elementary textbooks, high school cleaning equipment) is also specified. Personnel services or salaries and benefits may be handled by function; that is, for instructional, support, or plant maintenance staff, for example.

While these broad categories, objects, and processes are generally the same for education budgeting across the country, a strategic attempt has also been made to determine the most effective and efficient uses of resources. These efforts have led to such innovations as zero-based, program-planning, and site-based budgeting, which attempt to be more mission-driven and constituent-friendly than traditional types of budgeting in education.

**Zero-based budgeting (ZBB).** Popular in the 1950s and 1960s, ZBB began with the assumption that the school system starts out yearly with a “clean slate.” Thus, each function, program, and agency has to justify its expenditures annually, relating all costs to system goals and objectives to avoid habitual spending. Because so many costs, such as tenured teachers’ salaries and benefits, are “fixed” across annual budgets, and because the programs are so complex, zero-based budgeting becomes more an exercise

than a practical reality. As Hartman explains, “ZBB . . . forces comparisons of and choices among programs and activities that are often difficult to compare adequately” (p. 49). In addition, most programs are not “up for grabs” on an annual basis, since, for example, schools cannot eliminate their elementary school classes, making such a requirement difficult to justify.

**Program-planning-budgeting systems (PPBS).** Used by the U.S. Defense Department during the Vietnam War, PPBS seek greater efficiency by attaching spending to particular programs (e.g., the development of a new multipurpose fighter jet aircraft that might be used jointly by the Army, Navy, and Air Force—thus saving costs, but failing, in fact, to meet the needs of any of the armed services very well). While rarely used in education, PPBS would require school districts to spell out their mission and goals, lay out alternatives to reach these objectives, attribute costs to each choice, analyze the costs, select the best option, and then build the budget around this outcome, and finally feed data back to adjust the costs to the results. While this method sounds ideal, it often becomes so complex, and the programs so numerous, that school districts and states cannot readily sustain this approach.

**Site-based (school-site) budgeting (SBB).** SBB is concerned with who will do the budgeting and where in the organizational hierarchy the decisions will be made. In attempts to bring the budgeting process closer to “end-users”—the teachers, parents, and school administrators—SBB encourages, if not requires, decision-makers in each school to examine their programs and to set their budgets to meet their particular needs as part of the process of shared decision-making. Allan Odden et al. explain that school reform may require greater decentralization, a step “in which teams of individuals who actually provide the services are given decision-making authority and held accountable for results” (p. 5). Under site-based budgeting, districts must determine who will serve on SBB committees; which decisions and resources are devolved to schools—and using what formulas; how much autonomy is granted to spend for local school needs; exactly how to analyze the budget at each school; and what training and support are needed to make SBB work effectively.

In practice, school districts or divisions thereof will utilize variations of many, if not all, of the above methods in compiling their budgets. For example, a school principal may require teachers to justify their

individual budget requests (zero-based) in the development of a school (site-based) budget. A component of the district's budget may include a proposal for a new educational program, including all anticipated expenditures, revenues, and cost savings (program-planning budget). The entire district budget may be compiled onto a state-mandated format that requires line items to be categorized by fund, function, program, and object (function/object budgeting). Once the fiscal year begins, the budget is transformed from a financial plan into the initial baseline data for a working, dynamic financial accounting system.

### Accounting

Related to budgeting is the accounting system. If a school district's budget is a financial reflection of its educational mission, goals, and philosophies, then the accounting system becomes the method by which a district can assess the overall effectiveness of the financial plan. In fact, the accounting structure (line items, spending categories, costing and spending procedures) is reflected in the budget, and will later be used in auditing the system for legal, appropriate, and responsible spending.

David Thompson and Craig Wood explain five purposes for the use of accounting in schools. The first purpose is to "set up a procedure by which all fiscal activities in a district can be accumulated, categorized, reported, and controlled" (p. 111). The second function is to assess the alignment of the district's financial plan (budget) with the district's educational programs. An accounting system allows the district's management to assess whether a district has the financial resources to meet the needs of its programs.

The third function relates to the state and federal reporting requirements to which school districts must adhere. States have the constitutional authority for the provision of education, and, as such, they bear the final responsibility for fiscal accountability. Likewise, federal funds are distributed to local districts—through the states—and require adequate accounting and reporting procedures. These reporting requirements have led to the development and adoption of uniform budgeting procedures and accounting standards. The Governmental Accounting Standards Board (GASB), operating under the auspices of the Financial Accounting Foundation (FAF), is responsible for the establishment and revi-

sion of Generally Accepted Accounting Principles (GAAP) for local and state governments.

One significant difference in the utilization of GAAP for school districts and GAAP for private business is that school districts utilize fund accounting that classifies spending into three broad fund categories: governmental, proprietary, and fiduciary. Governmental funds represent those activities typical of district operations such as instruction, special revenues (grants), and debt service funds. Proprietary funds include those activities that are similar to private enterprise, such as food service and transportation funds. Fiduciary funds are utilized when the district is acting directly for a third party, including private trusts (scholarships), pension trusts, investment trusts, and agency (payroll) funds.

Budget preparation is the fourth purpose of accounting. By accumulating accurate baseline data, accounting provides the budget with the information necessary for a horizontal comparison (prior year, current year, and future annual revenues) of actual vertical (line-item) expenditures and budget performance. The fifth and final purpose of accounting, as proposed by Thompson and Wood, is to provide proper fiscal controls and accountability, which, in turn, build public trust and confidence.

Critics of the current system of accounting utilized in public schools have claimed that the collection and reporting of financial data no longer provides adequate information to policymakers. Jay G. Chambers asserts that the desire for programmatic cost information, the need for data compatibility, and the importance of understanding the relationship between educational inputs and outputs all point to the need for improving the standards for organizing and reporting educational resource data. To measure resources adequately in education, Chambers proposes a system that is related more to economics rather than accounting.

The *resource cost model*, which Chambers recommends, "places paramount importance on measuring productivity and the cost-effectiveness analysis, the economist's stock in trade" (p. 26). Several states, including Hawaii, South Carolina, and Rhode Island, have adopted another reporting tool that integrates with the existing GAAP accounting systems utilized at the school and district level. This financial analysis model allows expenditure data to be reported on a school-by-school basis and actually tracks dollars spent on the classroom for "classroom

instruction.” The reporting program allows policy-makers to “explore the equity, efficiency, and effectiveness of spending”(Cooper et al. 2001, p. 28) between schools as opposed to school districts.

Accounting is thus the tool by which school district management can structure, organize, and operationalize the district’s financial plan (the budget). Accounting also provides the roadmap by which fiduciary entities, such as board of education members, public citizens, and state government officials can evaluate a school’s financial status. In addition, school district accounting provides the necessary procedures and data to enable an independent, certified public accountant to conduct the district’s annual financial audit.

### Auditing

Since schools are public agencies, their raising and spending of money must be reviewed and audited on a yearly basis—and on an as-needed basis, as determined by the governing body. In addition, an effective management system would include internal reviews and audits on a continuous basis to ensure accuracy and prevent fraud. Thus, two broad categories of audits—external and internal—are important in holding schools accountable for the use of public funds.

An external audit is an objective, systematic review of resources and operations, followed by a written or oral report of findings. Robert E. Everett et al. (1995) define three basic types of external audits. *Financial compliance audits* address the “fairness of presentation of basic financial statements in conformity with Generally Accepted Accounting Principles (GAAP)” (p. 4). This type of audit is most commonly associated with the annual independent audit that most states require: namely, a Comprehensive Annual Financial Report (CAFR) to be prepared by the school district that conforms to standards developed by the Governmental Accounting Standards Board and state reporting requirements. It is the auditor’s responsibility to render an opinion of the financial statements contained in the CAFR, based on their audit of district records.

A *program compliance audit* is a review of a local education agency’s (LEA) adherence to the educational and financial requirements of a specific funding source, such as a discretionary federal grant. The third type of audit is a *performance audit*, which addresses the “economy and efficiency of the LEA”

(Everett et al., p. 4), examining an LEA’s internal controls for weaknesses, which would expose possible mismanagement or fraud.

Internal audits, on the other hand, are usually incorporated into a district’s internal control procedures, a system of checks and balances designed to ensure ongoing accountability by requiring certain members of the organization to perform a financial audit on an individual or department. For example, board of education members perform an audit each month on the financial statements submitted to them for their approval. The requirement of multiple signatures for the approval of a purchase order constitutes an internal audit of purchasing. The accounting or bookkeeping department may also perform an audit on the general ledger prior to closing the financial statements at the end of each month.

### Future Trends

The school finance system, with its budgeting, accounting, and auditing sub-systems, was designed to support the operation and improvement of public education. When a public budget is aligned to the needs and programs of the nation, state, district, or school; when the accounting structure is clear and well constructed to reflect the way money is collected and spent; and when the auditing process determines that money was managed legally and appropriately, then school should have the tools to use funds effectively, efficiently, and productively. With new technologies, a popular drive to improve the funding of education, greater interest in schools as the decision-making unit, increased privatization of education, and the growing influence of federal agencies in determining accounting and budgeting principles, the nation faces an interesting and challenging future in school finance. There are four key issues facing school finance: changing federal-state-local dynamics; privatization, expanding technology; and a move to funnel resources to students.

**Changing federal-state-local dynamics.** The drive to standardize accounting practices in education across the nation can lead to some interesting future developments. For example, in 1999 the General Accounting Standards Board (GASB), issued Statement 34, which requires, among other changes, that districts and states combine all funds that would account for their debt against the value of their monetary assets and fixed assets (e.g., land, buildings, and equipment). In some states, the balance between district assets and district debt is negative,

although presumably the ability of districts to borrow funds (backed by the relevant cities and state) will not allow school systems to go bankrupt. However, this subtle change in accounting requirements may have far-reaching effects for school districts, as their bond ratings may be affected negatively, thus limiting the amount of funds they may borrow for capital improvements. Future developments in budgeting, accounting, and auditing will see greater standardization as the levels of government work together to improve school spending, accountability, and performance.

**Increasing privatization of school provision.** Private provision of education, with public tax support, appears to be increasing. The number of charter schools, for example, has grown exponentially and U.S. President George W. Bush's national policies place "parental choice" and private provision as keys to school reform. As more and more public dollars are diverted to private providers—as a result of national, state, and local political decisions—the money will be placed into the hands of private organizations unaccustomed to the budgeting, accounting, and auditing in which public schools have developed expertise.

Further, the mingling of public funding and private (even for-profit) management will make budgeting-accounting-auditing systems even more complex, blurring the lines between public and private provision, funding, and accountability. As budgets are being approved by local school boards, for example, and funding is reaching individually-managed schools (i.e., charter schools), more profit-making corporations, such as the Edison Schools or Knowledge Is Power Program, will become part of the education budgeting-accounting-auditing process.

**Expanding technology and public awareness.** *Sunshine laws*, requiring that all official meetings in publication education be announced in advance and to open to the public, are converging with advances in technology, heightening the possibility of financial information becoming real-time data for public inspection. With computers, Internet accessibility, and growing public interest, one can assume that budgeting-accounting-auditing procedures will become more systematic, accessible, and transparent to stakeholders of education nationwide.

**Funneling resources to students.** The future will also include an increasing interest in school-site and

student-centered budgeting and accounting. Driven by interest in such devices as vouchers, whereby funding would be awarded to each student (family), future systems will include revising current budget and accounting models that link resources to students. Agencies as different as the State of Hawaii and the New York City Public Schools now account for spending by individual school, function, and program, creating greater interest in equity and productivity at the school and classroom levels. Whatever future financial structures U.S. schools adopt, the budgeting-accounting-auditing system will be required to plan, allocate, and hold decision-makers accountable for the enormous resources of the nation's largest public service: education.

## PUTNAM, ALICE (1841–1919)

A leader in the American kindergarten movement, Alice Putnam was a Progressive educator who trained many teachers and helped establish public kindergartens in Chicago. The daughter of Chicago Board of Trade founding member William Loring Whiting and Mary Starr, she was educated privately in a school run by her mother and sister, and at the

Dearborn Seminary. She married Joseph Robie Putnam, a businessman, on May 20, 1868, and became a Swedenborgian (members of a church basing its theology on the work of the philosopher and theologian Emanuel Swedenborg), like her husband. The mother of four children, she started a parents' group to discuss Friedrich Froebel's kindergarten pedagogy. Putnam then began a home kindergarten, a kindergarten organization, and a training school, and became involved in kindergarten and educational reform in Chicago and nationally. Although little known because of her self-effacing humor, Putnam was a major figure within the group of Progressive educators and social reformers whose radical ideas were the force behind child-centered education.

Putnam came by her interest in the kindergarten, one of the most successful and lasting of all Progressive reforms, through her concerns about the education of her two eldest children. The parents' group, which she began in her home in 1874, was made up of a dozen or so of her friends, including three men, and focused on Froebel's *Mother Play and Songs*, a book of finger plays, games, and songs intended for the home education of young children. Putnam then trained as a kindergarten teacher herself, at a school run in Columbus, Ohio, by Anna J. Ogden. In 1880, Putnam took over the training class Ogden had started in Chicago. Other influential kindergarten leaders, such as Anna Bryan (who revolutionized American kindergarten methods by including more activities based on children's actual lives) were trained by Putnam, who ran the class until 1910.

A model of the maternalistic, social housekeeping ideal in which women extended the private sphere of domestic caring to public good works, Putnam moved her training class to Hull-House, at the request of Jane Addams—the founder of the settlement that was the seedbed for so many progressive reforms. For seven years, Putnam commuted between her home on Chicago's suburban West Side to the South Side slum where Hull-House was located, and did fundraising to support the Children's Building at Hull-House. John Dewey was a frequent guest lecturer at Putnam's training school, and gained some of his knowledge about educational methods from her.

In 1880 Putnam's original parents' group became the Chicago Froebel Association, which further promoted the kindergarten cause. By this time the kindergarten movement was becoming faction-

alized into a conservative Froebelian, a progressive American, and a more radical scientific wing. Although she received training from Susan Blow in St. Louis and from Maria Kraus-Boelte in New York City, both traditional Froebelians, Putnam's pragmatic attention to the needs of her own children and those of other parents from different backgrounds had a liberalizing, stabilizing effect. Later, in 1901, Putnam became president of the International Kindergarten Union, the group that tried to mediate dissension within the kindergarten movement.

A strong believer in civic pride and stewardship, Putnam expanded her kindergarten work to serve the city of Chicago as a whole. In 1886, under Putnam's auspices and with the permission of the Chicago Board of Education, the Chicago Froebel Association began a kindergarten housed in a public school. By 1892, when the association successfully petitioned the school board to adopt the kindergarten, there were twelve private kindergartens in public schools. These classes were incorporated into the public system, as was usual in the transition from charity to public kindergartens. This evolution of private good work into public services, through the advocacy and support of energetic individual leaders or private foundations, was a hallmark of the establishment of social welfare programs in the United States, an endeavor in which Putnam played a major role in the city of Chicago.

Like many Progressives, Putnam was influenced by the growth of the new science of child psychology. In 1894, Putnam, along with a number of other charity, or "free kindergarten," directors, attended G. Stanley Hall's Clark Summer School of Higher Pedagogy and Psychology in Worcester, Massachusetts. There she was introduced to Hall's experimental child study methods and participated in educational research. Hall asked Putnam and her former student, Anna Bryan, to design a special kindergarten survey, or *topical syllabus*, that was sent out to kindergarten teachers' to find out their views on subjects such as hygiene, music, and stories. Putnam's and Bryan's questions about whether teachers felt free to deviate from Froebel's formal educational routines showed how American kindergarten teachers were beginning to modify his sequenced educational materials, or "gifts," and handwork "occupations." Unlike younger modern kindergarten leaders such as Patty Smith Hill, who became closely allied with developmental psychology, Put-

nam continued to focus on children primarily from the perspective of family life.

Putnam's personal, practical motivation and lack of dogmatism won her great respect within the kindergarten movement. She worked especially closely with Elizabeth Harrison, who shared Putnam's interest in parent education and was also a moderate within the kindergarten movement. In 1883 Putnam and Harrison started the Chicago Kindergarten Club, which many affluent mothers joined along with their children.

In addition to her kindergarten leadership, Putnam was a key member of the group of educational Progressives who made turn-of-the-twentieth-century Chicago a hotbed of social reform. Putnam was directly responsible for getting Francis Parker, one of the main architects of child-centered progressivism, appointed to the principalship of the Cook County Normal School. Eagerly open to new educational ideas, Putnam had attended a summer school that Parker had held on Martha's Vineyard, where she learned about Parker's Quincy Method, in which reading and language arts were integrated with other subjects. Always seeking to combine her private and public life, Putnam moved her family to a house near Cook County Normal School, so that her three daughters could attend the laboratory school attached to the school. Putnam herself taught a kindergarten class at Cook County Normal School for some years and was the kindergarten trainer there. She joined with other pedagogical progressives, such as John Dewey and Ella Flagg Young, who clustered around Parker and helped spread Dewey's child-centered educational philosophy. Dewey was a frequent lecturer in Putnam's training classes.

A woman of affluence and intelligence with little formal education, Alice Putnam had a great impact on the kindergarten movement and on Progressive education through her own ideas and work and through the way she supported and connected other educators with differing views and backgrounds. She wrote articles, some of which appeared in the *Kindergarten Review* and other kindergarten publications; gave speeches, some of which were published in *National Education Association Proceedings*; and maintained a voluminous correspondence. In 1906 she began teaching two correspondence courses at the University of Chicago, "The Training of Children (A Course for Mothers)" and "Introduction to Kindergarten Theory and Practice." Putnam designed this coursework to inform parents and teach-

ers about how children's learning could be integrated with children's lives, the central theme in Putnam's educational thinking. Putnam's work as a parent educator and kindergarten teacher, trainer, and leader and her involvement with Progressive education in Chicago had an important impact on the shift from subject-centered to child-centered pedagogy that was, and remains, the central dividing issue in American educational philosophy and methods.

## CULTURAL EXPECTATIONS AND STUDENT LEARNING

Students learn—whether in school or out. Of significance for the educational and scholarly communities is the extent to which certain kinds of learning are conducive to mainstream academic achievement within the context of formal educational institutions. The presumption is that a student's ability to acquire mainstream academic content and then demonstrate mastery of the content (often defined as learning and usually measured by standardized assessments) will lead to greater knowledge and to social and economic benefits in the dominant society. In multiracial and multiethnic societies such as the United States, a pressing issue is the various ways in which race, ethnicity, and culture might influence student learning in formal educational settings. This concern emanates from the fact that scores of students from some racial and ethnic minority groups do not "achieve" in schools at rates comparable either to those of European-American students or to those of students from other racial and ethnic minority groups. In order to examine how students'

race, ethnicity, and culture might influence learning, however, one must first examine the assumptions that underlie these concepts.

Race is not a biological category but a social construction that is given meaning and significance in specified historical, political, and social contexts. Historically, race has been predicated on phenotypic characteristics that mark "racial differences" in order to legitimate prejudice and discrimination on the basis of these supposed differences. As noted by Michael Omi and Howard Winant in their influential book *Racial Formation in the United States* (1994), the formation of race is social and historical in nature. At the dawn of the twenty-first century, most within the scholarly community no longer use biosocial terms such as *race* and embrace *ethnicity* instead. In the United States and Europe, ethnicity is commonly associated with membership in a non-dominant group (not of predominant European ancestry) and is perceived as constituting a different culture—in terms of language, style of dress, political consciousness and worldview, foods, music, and so on—than that of the dominant group. Membership status within ethnic groups can sometimes be negotiated, situational, or optional, particularly for some white ethnics. In comparison to the concept of race, ethnicity is a mutable and more flexible category.

Embracing ethnicity in place of race has shifted the discourse around human difference from one that is biological in nature to one that is greatly shaped by nurture, culture, and historical experiences. The change in terminology, however, does not automatically change the privileges and social disadvantages of being identified and categorized as a member of a particular group. Historically, such

identities and categories shaped a number of theoretical perspectives that attempted to explain academic school success or failure among various groups of students. While these perspectives are chronologically outlined below, the fact that one particular paradigm was the dominant paradigm during a particular time period does not mean that other (and equally convincing) paradigms did not also exist. Nor does it mean that theories that once predominated are no longer appropriated as explanatory models.

### Theoretical Explanations of Differing Academic Achievement and Learning

Of the proponents of different theoretical perspectives used to explain student achievement, the ones that have provoked the greatest degree of controversy—the geneticists—place ethnicity and race at the center of their thesis. In general, geneticists view race as static and as a major determinant of one's intellectual capabilities.

**Geneticists.** The geneticists consider the differences in academic achievement among various groups of students (often measured by test scores) as indicative of the innate intelligence of certain groups, rather than a product of socioeconomic, historical, and cultural factors. During the first half of the twentieth century, geneticists such as Lewis Terman and Henry Goddard considered the low performance on intelligence tests of some racial, ethnic, and linguistic minorities to be a reflection of these groups' genetic inferiority. These theorists attempted to "prove" that some European ethnic minorities (Jews, Hungarians, Italians, and Russians) and Native Americans, Mexican Americans, and African Americans were inferior. This perspective, however, did not go unchallenged. African-American social scientists, in particular Horace Mann Bond, W. E. B. Du Bois, and Allison Davis, critiqued the studies that tried to prove African-American intellectual inferiority. Nevertheless, remnants of this belief continue to germinate within the academy, as exemplified by Richard J. Herrnstein and Charles H. Murray's 1996 book, *The Bell Curve*. For instance, in this book the authors assert that a major reason why some groups in society today do not achieve in schools might be connected more to rank-and-file notions of intellectual inferiority than to persistent economic, structural, cultural, and historic forces.

**Cultural deprivation.** Emanating out of the thrust to eradicate poverty in the United States and reject-

ing the geneticists' arguments, cultural deprivation theorists during the 1960s viewed academic differences on standardized measures as a result of nurture—or lack thereof—rather than nature. Proponents of cultural deprivation theories attributed the academic failure among some ethnic and racial minorities to the failure of some students' families to transmit the values and cultural patterns necessary for the students to achieve in mainstream academic institutions. The deprivation paradigm guided the formulation of most programs and pedagogies for low-income populations during the 1960s such as Head Start and other compensatory educational programs.

Considered enlightened during its time, cultural deprivation theorists believed that schools should assist low-income and racial and ethnic minority students in overcoming deficits caused by their families and communities; the best time to intervene was early childhood. A landmark Research Conference on Education and Cultural Deprivation convened in Chicago, Illinois, in 1964 and included participants such as Benjamin Bloom, Erik Erikson, Edmund Gordon, and Thomas Pettigrew. Influential books that focused on addressing the needs of the "culturally deprived" included *The Culturally Deprived Child*, by Frank Riessman, published in 1962; *Education in Depressed Areas*, edited in 1963 by A. Harry Passow; and *Compensatory Education for Cultural Deprivation*, edited in 1965 by Benjamin Bloom, Allison Davis, and Robert Hess.

**Cultural difference and learning styles.** Also during the 1960s, anthropologists began to challenge cultural deprivation theories by positing an alternative view of the academic failures of ethnic and racial minority students. This new group of theorists argued that the extent to which students learned or did not learn in schools reflected the cultural differences of the groups, which were either congruent with or incongruent with the dominant culture of schools. Building on this view, sociolinguists during the 1970s followed by asserting that differences in culture resulted in cultural and linguistic conflicts between students and their teachers, many of whom were white. This shifted part of the discourse from the notion that some groups' cultures were deficient toward the notion that cultures varied. An assumption, therefore, was that racially and ethnically diverse students' learning could be enhanced if there was cultural congruence or synchronization between the home and the school, and if the schooling expe-

riences resonated with the unique cognitive or learning styles and cultural patterns of students.

Examples of the scholarship that documented this variation among cultures include Manuel Ramírez III and Alfredo Castañeda's 1974 book *Cultural Democracy, Bicognitive Development, and Education*, which describes Mexican-American students as field-dependent learners, in comparison to white students who are described as field independent. Native American and African-American students are also considered field-dependent learners. The research on African-American students' cognitive styles has generated much debate in the scholarly community. Significant scholarly contributions include Janice Hale-Benson's 1986 book, *Black Children: Their Roots, Culture, and Learning Styles*; Barbara J. Shade's 1982 article, "Afro-American Cognitive Styles: A Variable in School Success?"; and A. Wade Boykin's 1986 chapter, "The Triple Quandary and the Schooling of Afro-American Children." In general, these scholars assert that the instructional strategies used in schools do not work well with African-American students, and consequently, many do not experience academic success. Teaching strategies proposed to increase students' academic achievement include creating settings that are conducive to their learning styles such as cooperative environments, informal class discussions, a focus on larger concepts, and the de-emphasis of competition. Nevertheless, while these scholars find great value and potential in the research into learning styles for enhancing the achievement of students from diverse cultural backgrounds, Jacqueline Jordan Irvine and Darlene Eleanor York, in their exhaustive literature review from 1995, "Learning Styles and Culturally Diverse Students: A Literature Review," cautioned against using this body of research to automatically categorize students' styles of learning primarily on the basis of cultural characteristics.

Nevertheless, the cultural difference view of students' schooling experiences will remain a viable explanation because of an increasingly heterogeneous student population in which nonwhite students accounted for more than 30 percent of the school-age population at the end of the twentieth century. On the other hand, the teaching force in the United States is more than 90 percent white. Whereas proponents of the cultural difference paradigm would not assume that all white teachers are unable to teach these students, they would, however, continue to assert that for some students, this imbalance fos-

ters the kind of cultural incongruence that leads to school failure. The curriculum and the school environment serve as major areas in which this incongruence becomes manifested.

**Multicultural perspective.** With roots in the ethnic studies movement of the 1960s, multicultural education and cultural-centered approaches suggest infusing a multicultural ethos into schooling experiences, so as to reaffirm the social, cultural, and historical experiences of students from diverse cultural backgrounds. Though varied in the extent of the infusion and the scope of their critique of mainstream education, in general, multiculturalists such as James A. Banks, Geneva Gay, and Carl Grant, as well as proponents of ethnic-centered paradigms such as Molefi Asante (an advocate of Afrocentric education), assert that the European-American culture of schools distorts the history, culture, and background of students from non-European backgrounds. They note that the knowledge that school officials and society expect children to acquire often invalidates these students' cultural experiences. These scholars believe that an infusion of multicultural education and/or cultural-centered education can be part and parcel of the solution to improving the academic achievement of students from these diverse cultural backgrounds. They propose teaching students in ways that are culturally synchronized, culturally centered, empowering, and culturally relevant. This infusion would move beyond an additive approach and would transform the entire schooling experiences for students. Published sources that capture the arguments and critiques of multicultural and cultural-centered education include *Multicultural Education: Transformative Knowledge and Action*, edited by Banks and published in 1996, and *Handbook of Research on Multicultural Education*, edited by Banks and Cherry A. McGee Banks and published in 1995.

**Structural explanations.** Still another view subscribes to the notion that larger societal forces are key determinants of student learning, as are the cultural forces within a particular ethnic or racial community. For example, this view asserts that race, ethnicity, and culture are more likely to predict what educators and schools expect of students, rather than whether students will learn and achieve in schools. Proponents of this view note how some educators often create a self-fulfilling prophecy in relation to students from diverse racial and ethnic backgrounds: Teachers' expectations of students

greatly shape student learning and achievement. Structural inequalities that can have deleterious consequences for students' learning may entail the limited access to knowledge and resources, the systematic denial of formal schooling, state-sanctioned discrimination, and gross disparities in the level of school funding. Moreover, proponents of this view assert that contemporary examples of structural inequalities include differential levels of quality teaching for some students, as well as the disproportionate placement of some racial and ethnic minority group members into the lowest academic tracks. African-American and Latino students are disproportionately placed in lower academic tracks, in comparison to white and Asian students. Jeannie Oakes's book on academic tracking, *Keeping Track: How Schools Structure Inequality*, published in 1985, and Kenneth J. Meier, Joseph Stewart Jr., and Robert E. England's 1989 book on second-generation discrimination, *Race, Class, and Education: The Politics of Second-Generation Discrimination*, were pivotal in bringing to light the structural inequalities embedded in schooling students from diverse racial and ethnic groups.

**Differing cultural expectations and the impact on school experiences.** Another position within this range of theories suggests that students' learning and achievement in schools reflect the values, beliefs, and traditions of some racial/ethnic groups, which may place a greater or lesser emphasis on achieving in the dominant educational context. John U. Ogbu's scholarship captures the essence of this view by asserting that the extent to which many members of some minority groups fail in mainstream schools can be linked to the way different minority groups enter into a society and, thereby, approach schooling. Ogbu's comparative research on immigrant and nonimmigrant minorities radically shifted the discourse by suggesting that a macro level of analysis should be considered when investigating why students from some minority groups achieve in school at greater rates than others.

Using a cultural ecological model to explain school failure, Ogbu developed a typology of ethnic groups based on the groups' entry into the dominant society: voluntary or immigrant minorities (which include Asian Americans, recent African immigrants, and immigrants from the Caribbean) and involuntary or nonimmigrant minority groups such as African Americans and Native Americans. In general, Ogbu noted that voluntary immigrant groups are

more likely to accept the dominant achievement ideology, which holds the meritocratic view that hard work and motivation pay off. For example, although Asian-American students might come from different countries and also embrace cultural practices that starkly contrast with the dominant Anglo-American culture of schools, in general these students are more likely to be academically successful in the host society because of the way they approach the schooling process. On the other hand, students from nonimmigrant or involuntary minority groups are least likely to accept the dominant achievement model and are, therefore, more likely to resist schooling.

Building on Ogbu's theory were two 1986 publications: the highly cited article "Black Students' School Success: Coping with the Burden of Acting White," written by Signithia Fordham and Ogbu, and the book *To Be Popular or Smart: The Black Peer Group*, written by Jawanza Kunjufu. The latter work asserted that dominated (involuntary) minority groups develop secondary cultural characteristics as a resistive measure to a dominant white framework. Because of secondary cultural characteristics, some of these students do not achieve for fear of being labeled as trying to "act white." For many of these students, schooling becomes a culturally subtractive, rather than an additive, process.

Ogbu's thesis has been criticized as a "blaming the victim" approach because of its heavy emphasis on those factors and practices of the cultural group that contribute to school failure. Some scholars criticize Ogbu's model for being overly deterministic, note that it fails to capture the variation within groups, and assert that it overgeneralizes about some populations of students. In particular, Carla O'Connor posited in 1999 that ethnographic studies of involuntary immigrant groups (e.g., African-American students) should address the multiplicity of ways that students approach schooling, by also noting the heterogeneity that is present within social groups.

### The Future

The literature on how race, ethnicity, and culture affect the learning of students from non-European minority groups in the United States has overwhelmingly focused on school failure, rather than resilience. Nevertheless, an understanding of the various theoretical perspectives that have been used to explain the school performance of students from some racial and ethnic groups provides a backdrop

for anticipating future schooling prospects for these children. The issues are complicated because notions of race, ethnicity, and culture are not static concepts and are not so easily definable. Therefore, proceeding with caution is essential when appropriating any one particular paradigm to explain how these concepts influence student learning. Clearly some paradigms can be dismissed, while others might be most appropriate given certain contexts. Nevertheless, the influence of race, ethnicity, and culture on students' schooling experiences will continue to be debated well into the twenty-first century.

JEROME E. MORRIS

## LATINO GROWTH

The 2000 U.S. census counted 35.3 million Latinos in the fifty states (and counted 39.1 million if the Commonwealth of Puerto Rico is included). By 2010, the Latino population of the United States is projected to be 45.1 million, at which time this country will have a larger Spanish-speaking population than Spain, Colombia, or Argentina, and will trail only Mexico. By 2050, the U.S. Latino population is projected to be around 96.5 million, and one out of every four U.S. residents will be a Latino.

During the last half of the twentieth century, the Latino population was concentrated in nine states. In 2000, these nine states still had the largest Latino population (11.0 million in California, 6.7 million in Texas, 3.8 million in Puerto Rico, 2.9 million in New York, 2.7 million in Florida, 1.5 million in Illinois, 1.3 million in Arizona, 1.1 million in New Jersey, and 1.0 million in New Mexico), and 82 percent of all Latinos in the United States lived in those areas. However, Latino population growth has occurred in many states not traditionally thought of as Latino population strongholds, such as Georgia, Iowa, and Pennsylvania.

Most Latino population growth is due to births, rather than immigration. As a result, the school-age population in many areas will have a higher percentage of Latinos than the overall population. In California, 43.8 percent of all children age eighteen and under are Latino; 40.5 percent in Texas; 50.8 percent in New Mexico; and 36.1 percent in Arizona.

Immigration has been a secondary, but important, factor in Latino population growth. Some states such as California and Florida received a large number of Latino immigrants from 1960 through 2000, while others such as New Mexico and Colorado received relatively few.

### Educational Attainment

The educational attainment of the Latino population in 2000 was generally lower than non-Latino populations in the same area. Nationally, a lower percentage of Latino adults (57.0%) age twenty-five and older have graduated from high school, compared

with 88.4 percent of non-Hispanic whites. However, the Latino figure needs to be taken with caution, for it combines the educational attainment of two very different Latino groups: the U.S.-born and immigrant Latino adults.

Generally, Latino immigrants have far lower educational attainment than U.S.-born Latinos. In the 1998 California Current Population Survey conducted by the U.S. Census, 75.1 percent of U.S.-born Latinos age twenty-five and older had graduated from high school, while only 38.1 percent of immigrant Latino adults had done so. In California, of Latino adults age 20 to 39, 62.2 percent are immigrants. Combining the educational attainment levels of both groups gives a blended picture that misses important educational dynamics: Latino immigrants tend to be young adults who do not immigrate to seek education, but to join the labor force. Hence, even though they have low educational levels, their behavior—high labor force participation, low welfare utilization, strong family formation—is not typical of high school dropouts. U.S.-born Latinos who do not complete high school are closer to the image of the high school dropout, in that their labor force participation is lower, welfare utilization rates higher, and family formation lower than immigrants with far lower educational levels.

### Language

U.S.-born Latinos are usually either monolingual English speaking or are bilingual, but with an ability to speak English very well. Immigrant Latinos usually start as monolingual Spanish speakers, but over the course of the years acquire some facility in English. School-age Latino children are overwhelmingly U.S.-born; 90.2 percent of Latino children age five through nine in California were U.S.-born in 2000. Not surprisingly, most Latino children speak English well, in addition to speaking Spanish. In the 1990 census, 85 percent of Latino children age five through seventeen in Los Angeles spoke English well, as did 87 percent of children in Miami, 86 percent of children in Chicago, 92 percent of children in San Antonio, and 88 percent of Latino children in New York.

While Latino children are predominantly U.S.-born, in states such as California, Texas, Florida, and New York, the parents are largely immigrant (in 2000, 62% of Latino children in California had at least one immigrant parent). These largely immigrant parents are less fluent in English. As measured

by the 1990 census indicator of limited English proficiency (not to speak English at all, or not to speak it very well) in Latino adults age nineteen to sixty-four, 37 percent in Los Angeles, 35 percent in Miami, 32 percent in Chicago, and 28 percent in New York were not functional in English. Only in San Antonio were few parents—12 percent—not able to communicate well in English.

Latino parents want their children to learn English. A survey conducted in Los Angeles County in 2000 showed that 98 percent of U.S.-born Latino parents and 96 percent of immigrant Latino parents agreed that their children should be taught English in the schools. However, Latino parents also want their children to know how to speak Spanish. In the same Los Angeles county survey, 96 percent of U.S.-born Latino parents and 98 percent of immigrant Latino parents wanted their children to speak Spanish. Interestingly, 86 percent of non-Hispanic white parents and 90 percent of African-American parents also wanted their children to learn to speak Spanish. In that population-based survey, the only group that did not agree with the notion of children learning to speak Spanish were non-Hispanic whites who were not parents of children.

### Latinos and Race

The largely “mixed race” (or *mestizo*) Latino population has never fit comfortably into the U.S. biracial algorithm. In the 1930 census, Latinos of Mexican origin were considered a separate race, distinct from white, black, Indian, or Asian. Certainly, racial exclusion policy such as segregated schools, segregated public facilities, and restricted residential areas treated Latinos as a race. But in 1940, the Census Bureau reversed itself and counted Latinos as members of the white race. In spite of being classified racially as white, Latinos were still subject to racial restrictions.

In 1973 the Federal Office of Management and Budget developed a definition of the word *Hispanic* that was not a racial category, nor a national origin category, but a *sui generis* category, defined by the U.S. Census in 1993 as “those who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Hispanic origin.” In the 1980 and 1990 censuses, a person had to choose first a racial category, then declare if he or she were Hispanic, in addition to the chosen racial category. In the 2000 census, all respondents were asked first to determine if they were Hispanic, then later to select a race, or combination of races. As La-

tinians may be any combination of Indian, European, African and Asian, the majority in many states (such as California) did not choose any of the racial categories offered (white, black, Indian, or Asian) but instead chose the residual category “Other,” often writing in terms such as *mestizo* or “*raza*.” In 1993 the U.S. census reported that “it should be noted that persons of Hispanic origin may be of any race.” The Mexican author Carlos Fuentes best summed up the *mestizo* background of many Latinos when he described that he was “Indo-Afro-Ibero-American.”

### Latinos and Culture

Modern Latino culture is the outgrowth of the meeting of indigenous, Iberian, African, and some Asian populations in most of the western hemisphere. The proportion of these elements varies from place to place in Latin America, with some regions more markedly indigenous (Mexico, Peru, Bolivia), others more markedly African (Dominican Republic, Puerto Rico, Cuba) others more markedly European (Argentina, Uruguay, Chile). Unlike the “Indian removal” policy followed in the United States, during the colonial period the Spanish Crown sought to incorporate indigenous populations into its realms, where they provided a population base for cultural development. The devastating smallpox epidemics of the sixteenth and seventeenth centuries reduced the native populations by nearly 95 percent. The hemisphere became gradually repopulated, but with an increasingly *mestizo* population that embodied a fusion of the various population, hence cultural, inputs. While Castilian Spanish was imposed as an official language spoken by a small ruling minority shortly after the Conquest, it is spoken by around 95 percent of residents of Latin America in the early twenty-first century, but with distinctive vocabulary and accents in various regions, again reflecting the process of cultural fusion unique to each region.

In the southwest United States, Latino culture antedated the arrival of Atlantic-American culture, hence the names of many towns are in Spanish, such as Los Angeles, San Antonio, Nogales, and Santa Fe. The meeting of Latino and Atlantic-American cultures in that region gave rise to the “cowboy culture,” often considered worldwide to be the quintessential American image. In the northeast, Latino culture arrived during the last half of the twentieth century, along with the waves of immigrants from Latin America. Modern communications such as television, radio, telephones, coupled with a glo-

balization of population made possible by modern transportation, allow Latino cultural regions in the United States to communicate with one another, with the rest of the hemisphere, and with Atlantic-American cultural communities.

While the expectation in the mid-twentieth century was that Latinos would assimilate as had other immigrant groups, the perhaps unique dynamics and nature of Latino culture (a culture of fusion) coupled with population and economic growth, makes it unlikely that it will simply disappear. Instead, it will likely have a two-way dialogue with Atlantic-American culture, which will probably result in some new cultural fusions wherever there are large Latino populations.

### RACIAL AND ETHNIC MINORITY STUDENTS IN HIGHER EDUCATION

Since the 1960s, profound changes have occurred in minority-student patterns of college attendance and degree attainment in the United States. This change has led to a growing number of racial and ethnic minority students making up a considerable amount of the student population on American college campuses. In 1997 the National Center for Education Statistics (NCES) reported that African-American students, Hispanic students, Asian or Pacific Islander students, and Native American/Native Alaskan students constituted approximately 27 percent of the total college enrollment at degree-granting institutions. African-American students, Hispanic students, Asian or Pacific Islander students, and Native American /Native Alaskan students constituted 11

percent, 9 percent, 6 percent, and 1 percent, respectively, of all college students attending two-year and four-year institutions.

According to the U.S. Department of Education, the number of racial and ethnic minority students who were awarded degrees increased dramatically between the years of 1976 and 1998. Specifically, the number of bachelor's degrees awarded to racial and ethnic minority students increased as follows: African Americans, 58,636 to 98,132; Native American/Native Alaskan students, 3,326 to 7,894; Asian or Pacific Islander students, 13,793 to 71,592; and Hispanic Americans, 18,743 to 65,937. In 1997, 19.4 percent of all bachelor's degrees were awarded to racial and ethnic minority students. In 1998, 20.5 percent of all bachelor's degrees were awarded to racial and ethnic minority students.

Due to the growth in racial and ethnic minority participation in higher education, institutions of higher learning are being asked to provide optimal learning environments, equitable admission standards, and a welcoming environment for students representing a variety of multicultural and ethnic backgrounds. To that end, colleges and universities are confronted with many complex issues, such as addressing the diverse academic and social needs of racial and ethnic minority students in higher education, improving the admission process to account for past legally sanctioned discrimination, helping minority students cope with issues they may face on campus, and offering suitable programs and instituting appropriate policies to help racial and ethnic minority students make successful transitions to college from high school.

#### The Admissions Process for Racial and Ethnic Minority Students

To be sure, the admissions process for racial and ethnic minority students is similar to the admissions process for all students and includes such phases as making the initial decision to attend college, selecting the type of college to attend, and completing the necessary applications and admissions test required by the college or university. However, due to past racial discrimination and previous legal barriers, colleges and universities have had to consider innovative ways of trying to level the playing field in order to increase the number of racial and ethnic minority students in higher education—and to diversify the U.S. workforce to make it more representative of American society. Accordingly, colleges and univer-

sities have instituted two types of programs to aid in the enrollment of racial and ethnic minority students: enrollment programs and transition programs.

Enrollment programs are based on legislative mandates or statutes (e.g., Civil Rights Act of 1964, Higher Education Act of 1965). Enrollment programs are primarily instituted to ensure that a percentage of college or university incoming enrollments are members of a racial or ethnic minority group. An example of an enrollment program is the education component of the One Florida Initiative, which mandates that 20 percent of each high school senior class in Florida will receive guaranteed admission to any of the state-supported colleges or universities in Florida. This enrollment program makes it possible to enroll racial and ethnic minority students from low-performing high schools, as well as students that may not otherwise gain admission to college.

Transition programs are defined as programs and related services designed to assist students who may not gain admittance to a college or university through traditional channels. The College Transition Program at Virginia Commonwealth University is an example of a summer transition program designed for high school students who have low scores on admission tests and low high school grade point averages. Transition programs, which enroll a large number of racial and ethnic minority students, also offer cultural enrichment activities that promote college readiness and social integration on campus. Though transition programs vary in type and length, most of them offer a study skills component and courses in mathematics, reading, and/or English composition, which gives students a jump-start on earning college credit. Students who complete a transition program at a particular university are usually guaranteed admission into that university. As such, transition programs also serve to increase the enrollment of racial and ethnic minority students by offering preparatory college instruction to students who may not otherwise be admitted to college.

### **Issues Faced by Racial and Ethnic Minority Students on Campus**

Prior to 1973, the overwhelming majority of African-American college students were enrolled in historically black colleges and universities. In the early twenty-first century, however, predominantly white institutions grant the majority of baccalaureate de-

grees awarded to African Americans (and other racial and ethnic minority students). This dramatic shift in postsecondary education patterns among minority students naturally leads to questions about their educational experiences and outcomes.

Racial and ethnic minority students face a considerable number of problems once they arrive on campus. Research evidence suggests that racial and ethnic minority students are more likely to experience problems of alienation, marginalization, and loneliness than white students are. Additional evidence suggests that these and other challenges on campus may have either a direct or indirect impact on their academic performance and social development. These students continue to be severely disadvantaged, relative to white students, in terms of persistence rates, academic achievement levels, enrollment in advanced degree programs, and overall psychological adjustments. Some other problems include monocultural curricula, professors' expectations and attitudes, cultural conflicts, institutional racism, lack of support services, isolation, and problems involving socialization and motivation. While college students of all races face many of these challenges, minority students face them in a compounded manner, resulting in higher dropout rates.

### **Programs and Services for Racial and Ethnic Minority Students on Campus**

Many services exist on college campuses to help facilitate a smooth transition for racial and ethnic minority students on campus. These services can be divided into two groups: campus-based programs and federally funded programs.

**Campus-based programs.** Inequality in higher educational attainment between different racial and ethnic groups continues to be a critical problem. Accordingly, many institutions have developed programs and implemented policies to address the academic and social challenges that many minority students encounter. Though it is the case that minority students are less likely to persist in college than white students are, the persistence gap can be traced to differences in legal discrimination and in the quality of secondary education of both groups. As a group, minority students are more likely to come from poorer backgrounds and have experienced inferior education than their white counterparts. This is not to suggest that all racial and ethnic minority students are disadvantaged, or that all disadvantaged students are members of racial and eth-

nic minority groups. Some racial and ethnic minority groups (e.g., Asian Americans) have higher rates of educational success than do groups commonly classified as belonging to the ethnic and racial majority. Thus, it is sometimes necessary for institutions to develop programs targeted to the needs of distinct groups of students.

Early contact and transition programs are important not only because they help cement personal affiliations that tie students into the fabric of student culture, but also because they enable the students to acquire useful information about the informal character of institutional life. Thus, to ensure successful programs, it is critical that institutions integrate programs and services within the mainstream of the institution's academic, social, and administrative life. One important component to successful retention programs for racial and ethnic minority students is the establishment of specialized advising and counseling services. Several institutions have established advising programs and designated offices to which racial and ethnic minority students go for many different services. An example of such a program is the New Vision Program at the University of New Orleans. This retention program focuses on academically at-risk students and students who have not met the university's academic standards and subsequently left the institution. To increase graduation and retention rates, these students are allowed to re-enroll at the University of New Orleans and participate in special academic development programs that offer advising sessions, orientations, and instructional assistance.

Having counselors and advisers of like ethnicity is not a requirement of these programs; however, experience has shown that racial and ethnic minority students are inclined to utilize these services when people of color are present. To the degree that racial and ethnic minority students represent a distinct minority on campus, they also face distinct problems in seeking to become integrated into the life of what may appear to be a foreign and hostile college community. The use of support programs and mentor programs has proven to be quite effective in increasing student retention. In many cases, these programs are designed to provide racial and ethnic minority students with faculty mentors or advisers who can provide useful information and advice. In other instances, faculty, and sometimes upper-class students, of similar ethnicity are asked to guide newly arrived racial and ethnic minority students through

the institution, or at least through the first year of college. For example, ALANA—which is an acronym for Asian, Latin, African, and Native American—is a mentoring program developed at St. Clair County Community College in Port Huron, Michigan. This multifaceted support program focuses on providing academic and social support to freshman students of color through the use of peer mentors.

Many of the challenges that racial and ethnic minority students face on a predominantly white campus reflect the behaviors and attitudes that the students, faculty, and staff have about them. For that reason, an increasing number of institutions have instituted programs designed to educate the broader community on issues of racism and the diversity of cultural traditions that mark American life. Some institutions have even established programs to broaden the repertoire of teaching skills faculty use in the education of diverse student bodies. For example, the Center for Research on Learning and Teaching at the University of Michigan offers consulting services, seminars, and workshops to faculty members who seek to learn more about how to integrate multiculturalism in the college classroom and how to develop a welcoming and inclusive learning environment. Realizing the many possible categories of institutional types, there is much to be gained from understanding how similar types of institutions have successfully addressed the issue of retention. However, it falls upon the individual institution to assess for itself the most effective approach. The beginning point of any institutional policy consists of an assessment of institutional mission and institutional priorities, as well as an assessment of racial and ethnic minority students' experiences on campus.

**Federally funded programs.** There are many types of proactive intervention strategies for racial and ethnic minority students. Some are long-term; others focus on the first-year experience. Many of these programs seek to encourage capable students to pursue postsecondary degrees. One such initiative is the federally supported Upward Bound program, established in 1965. Upward Bound was designed to help disadvantaged students enroll in and graduate from postsecondary institutions. A product of the Economic Opportunity Act of 1964, Upward Bound targets youth between thirteen and nineteen years of age who have experienced low academic success. High school students from low-income families whose parents have not earned a bachelor's degree

and military veterans with only a high school diploma are eligible to participate. The program provides fundamental support, such as help with the college admissions process and assistance in preparing for college entrance examinations. It engages students in an extensive, multiyear program designed to provide academic, counseling, and tutoring services, along with a cultural enrichment component—all of which enhance their regular school program prior to entering college.

Most Upward Bound programs also provide participants with college experience through a five-to eight-week, full-time residential summer program at a postsecondary institution. The summer experience is reinforced with weekly tutorial and mentoring services during the school year. Upward Bound, along with four other federal initiatives that are collectively called the *TRIO programs*, receive funding under Title IV of the Higher Education Act of 1965. Upward Bound currently supports more than 560 projects serving approximately 41,000 students nationwide. The other TRIO initiatives are Talent Search, the Student Support Services program, Educational Opportunity Centers, and the Ronald E. McNair Postbaccalaureate Achievement program. These programs have much to offer institutions of higher education that seek to improve the educational outcomes of first-generation college students, racial and ethnic minority students, and low-income students.

Taken as a whole, the demographic in institutions of higher education has been changing and becoming increasingly more diverse. There is still a great need for innovative programming and policies to provide realistic guidance and counseling to assist minority students in dealing with academic, social, and economic challenges in college. Minority students come from different backgrounds with different orientations, ideologies, and perspectives—and with different perceptions of success and failure. When institutions properly recognize these differences and deal with them constructively, then they will be better able to address the problems faced by racial and ethnic minority students.

### READABILITY INDICES

For several decades researchers have been concerned with the question of determining how easy or difficult a text will be for a particular reader to comprehend. For example, if a teacher is assigning a textbook to an eighth-grade class, how would the teacher determine whether the class will actually comprehend the book? Writers may also want to consider the comprehensibility of their texts during the writing and revision process. To address these goals, researchers have developed readability indices, which are tools or methods that provide assessments of the comprehensibility of texts. The term *readability indices* has also been used to describe the legibility of writing or the interest value of texts, but these aspects of readability will not be discussed here. The most effective readability indices for assessing comprehensibility are those that take into account how people actually go about processing the information in texts.

#### Readability Formulas

Beginning in the 1920s, many efforts were undertaken to describe the readability of texts in terms of objective characteristics that could be measured and analyzed. First, researchers tabulated surface characteristics of written texts that may be related to how difficult the texts would be to comprehend. Some examples of these characteristics are the difficulty or frequency of the words in a text, the average number of syllables per word, and measures of the length or complexity of sentences. These data were then compared with predetermined standards, such as the average grade level of students who could correctly answer a certain percentage of questions generated from the text passage. Text characteristics that provided the most accurate predictions of the standards were judged to be indices of readability. These characteristics were then developed into readability formulas, which were equations that specified how much weight to assign to each characteristic. Probably the most widely used readability formula was one of Rudolf Flesch's, which used the number of syllables per 100 words and the average number of words per sentence.

Readability formulas also gained favor as guidelines for revising texts to improve comprehensibility. The Flesch formula, for example, implies that texts can be made more comprehensible by using shorter words and shorter sentences. Such guidelines have been used in many contexts and are appealing at least in part because they provide concrete feedback and can be automated. The value of readability formulas is limited, however, because these surface characteristics do not *cause* texts to be easy or difficult to comprehend. Long words and sentences simply happen to be typical characteristics of texts that are hard to comprehend. This limitation is particularly problematic when considering text revision. In fact, George R. Klare, in a 1963 book titled *The Measurement of Readability*, reviewed efforts to improve comprehensibility by revising texts to lower the readability scores, and he found this method to be ineffective.

#### Readability and Comprehension Processes

Since the 1970s, researchers have made great advances in understanding the psychological processes that are involved in reading, and thus the factors that make a text comprehensible. As readers take in information from a text, they attempt to construct a coherent mental representation of the information. Semantic and causal coherence are critical factors that contribute to this process. When current text information is not coherent with previous text information, a reader must generate an inference in order to make sense out of the new information. More coherent texts require fewer inferences and are therefore easier to comprehend. Walter Kintsch and colleagues developed an index of semantic coherence based on the extent to which concepts are repeated across sentences. Tom Trabasso and colleagues have indexed events in a text according to the extent to which they are integral to the causal structure described in the text. Both of these indices of coherence are highly predictive of comprehension. In addition, generating inferences requires readers to use their own knowledge, such that readers with a lot of relevant knowledge will find texts more readable than readers with little knowledge. Readability is therefore not just determined by the text itself but is a product of the interaction between the text and reader.

Semantic and causal indices of readability can also be effectively used in revising texts to make them more readable. According to their 1991 article

Bruce K. Britton and Sami Gülgöz revised a textbook passage by repairing semantic coherence breaks (which incidentally did not alter the readability formula score). In another revision, they shortened words and sentences to lower the score on readability formulas. Comprehension improved for the coherence revision but not for the readability revision, indicating that readability indices based on psychological processes provide better guidance for revision than readability formulas.

Although textual coherence and reader knowledge can be effective readability indices, they are quite labor intensive to analyze and are impractical for use with long texts. Thomas Landauer and his colleagues, however, developed a computer model that provides a potential solution to this problem: Latent Semantic Analysis (LSA) estimates the semantic similarity of words and sets of words derived from their use in the context of large amounts of natural language. As reported in a 1998 article, Peter W. Foltz, Landauer, and Kintsch used LSA to assess the semantic coherence of texts by calculating the similarity between adjacent sentence pairs. The LSA model showed very high correlations between semantic coherence and comprehension, thereby suggesting an automatic measure of readability based on coherence. LSA has also been used to automatically assess knowledge about a particular topic by calculating the similarity between the content of short essays and standard texts on the topic. These LSA knowledge assessment scores were also predictive of comprehension, according to a 1998 article by Michael B. W. Wolfe and colleagues. LSA can therefore provide readability indices related both to the coherence of a text itself and to the interaction between the text and the knowledge of a particular reader.

In order to be truly useful, a readability index should be grounded in the psychological processes of reading. The LSA model represents a promising new technique for determining the readability of texts because it has psychological validity and can be automated. Nevertheless, LSA has not yet been developed into a practical index of readability for particular texts and readers. Only further testing on a broad range of texts and readers will reveal its potential.

VALUE OF READING ENGAGEMENT FOR CHILDREN  
Anne Cunningham

## BEGINNING READING

Beginning reading encompasses acquisition of the multiple acts, skills, and knowledge that enable individuals to comprehend the meaning of text. Reading is a complex psycholinguistic activity and thus beginning reading is a lengthy and complex process whereby the learner acquires expertise in the various perceptual, sensory, linguistic, cognitive, metacognitive, and social skills that are involved in literate behavior. Through this process the child gains functional knowledge of the purposes, uses, and principles of the writing system.

### Experiences before Formal Reading Instruction

Although a large portion of literacy acquisition occurs within the context of formal reading instruction, literacy-related awareness and knowledge start developing long before formal schooling, through pre-reading activities and interactions with print in the home and environment. The accomplishments before formal schooling prepare the child for later school-related literacy development.

There are important differences among children's early literacy experiences. Some children are exposed to a wide array of early literacy experiences. They are frequently and regularly read to, they are exposed to oral and written language activities such as playing on the computer or playing word games, they experience the functional use of print materials in their home and preschool environments, and they have model adults who value reading and use reading in various purposeful ways. In 1990 Marilyn J. Adams estimated that children from these mainstream homes are exposed to thousands of hours of pre-reading activities before they enter first grade. In contrast, there are children who are never or rarely read to, live in homes with few books, are rarely exposed to rich oral and written language activities, and interact with few adult models who use reading and writing for their own purposes. These two groups of children differ widely in their awareness and knowledge of literacy-related concepts.

**Concepts about print.** Through repeated interactions with literacy materials and activities children develop an awareness of the nature and function of text. Social routines practiced during one-on-one book reading between parents and children facilitate

children's acquisition of concepts about print. Very early on children learn about the way books are handled, the differences between pictures and print, the directionality of print, and the characteristics of written-language-like routines. Shared book reading allows children to develop a sense of story structure where characters, the setting, and the plot make up the story. By observing adults' functional use of literacy, children also learn the different purposes of different literacy activities such as writing a grocery list versus writing a letter. So, by the time they are four years old, children also learn quite a lot about the nature of print, including the names and sounds of some letters, and will pretend to "write" by scribbling as part of play activities.

The acquisition of the concepts about print is important, and several studies have shown that such awareness predicts future reading achievement and is correlated with other measures of reading achievement. Thus, the development of concepts about print early in life seems to create the foundation upon which more sophisticated skills are built.

**Language development.** Spoken language develops naturally and effortlessly within the context of social interactions in a community. With the exception of those who have some physical challenges all children can produce and comprehend spoken language naturally early in life. They exhibit developments in phonology, morphology, syntax, semantics, and vocabulary. Engagement in literacy activities provides children with added opportunities to experience and experiment with language. Book reading, for instance, offers multiple opportunities for the child to use language at a more abstract and complex level than would be possible through spoken language experiences. Children learn to have a decreased reliance on immediate context for communication. This decontextualized language is the language that they will need to rely on in most school activities later on. Early literacy experiences also set the ground for growth in meta-linguistic skills. Children learn to think about, play with, talk about, and analyze language in addition to using it effectively.

**Phonological awareness.** Alphabetical writing systems are based on the representation of speech sounds by letters. In order to understand the alphabetic principle, children need to be aware that the spoken message can be broken down into smaller units such as words, syllables, and phonemes. Phonological awareness is the awareness of and the ability to manipulate phonological segments such as

syllables, phonemes, and other intrasyllabic units such as onset-rimes in words. When phonological awareness refers to children's sensitivity to the phonemes in words, it is called phonemic awareness.

Tasks in which children are asked to isolate, segment, blend, or combine phonological segments have been typically used to assess phonological awareness. Phonemic segmentation and phonemic manipulation tasks yield particularly strong predictions of and correlations with beginning reading acquisition. There are also studies on phonemic awareness that point out that there is a bidirectional relationship between learning to read and phonemic awareness.

While studies on children's early experiences with print converge on the conclusion that these experiences and phonological awareness facilitate and set the ground for further development in the acquisition of reading, other research has investigated the relationship between IQ and reading achievement. These studies conclude that IQ is only weakly related to early reading achievement.

### **Instruction in Reading**

Children are immersed in formal instruction in reading once they enter kindergarten. Children come to school with different levels of awareness about print, and they encounter in school new expectations, new routines, and new experiences that dramatically broaden their concept of literacy. For children whose language and literacy experiences are closer to those in the school setting, this transition to school is relatively easy.

**Understanding the alphabetic principle.** Before formal instruction in reading begins, children can already recognize certain words, especially those occurring frequently in their environment, such as Coca-Cola or McDonald's. Nevertheless, a 1984 study by Patricia E. Masonheimer and colleagues investigating the features to which children attend to when they recognize these words showed that when the words were presented without the contextual cues, such as logos, most children up to five years of age failed to correctly identify them. Other studies also suggest that young children recognize words based on selective parts of the printed word. Thus, before formal reading instruction has begun, most young children cannot grasp how the writing system functions.

A dramatic change occurs when children are exposed to systematic reading instruction. Before they

begin to decode independently, children start using the phonetic values of letter names in identifying words. Although this is not yet an efficient word recognition strategy, it is a big step toward using the systematic relationships that exist between speech and the printed word. Full decoding becomes possible when children begin to use the full array of letters in words and map them unto phonemes, thus demonstrating an understanding of the alphabetic principle.

**Productivity and automaticity in word recognition.** It is not possible to characterize children's reading as productive unless they can recognize words that they have not encountered before. As children experience a growing number of letter patterns during reading, they gradually accumulate a large number of orthographic representations. Thus, instead of using single letters for word recognition they begin relying on letter strings and their corresponding phonologies. This growing knowledge of letter sequences and spelling patterns gradually allows readers to process words quickly and easily.

Every time a reader encounters a spelling pattern and attends to the particular sequence of letters in it, the pattern acquires more strength and is thus recognized faster and more efficiently during the next encounter. If on the other hand instead of focusing on the entire sequence, the reader's concentration is focused on resolving a single letter, or if one or some of the letters in the sequence cannot be correctly identified, the sequence may not be remembered as an entity. As the young reader's knowledge of the relationships between spelling and sound grows, this knowledge allows the child to form stronger associations between visual and phonological representations. Through experience with words in print, especially those of increasing complexity, word recognition becomes an automatic psychological process, enabling the reader to gain increasing levels of fluency. Thus, differences in exposure to print lead to differences in reading skill.

**Comprehension.** Reading comprehension is a complex skill that requires an active interaction between text elements and the reader. Since comprehension of text is the ultimate goal in reading, understanding comprehension processes is critical to the study of beginning reading.

Children beginning to read already have a well-developed system for oral language comprehension. By the end of preschool most children have well-

developed vocabulary and world knowledge as well as morphological, semantic, and syntactic processes that make oral language comprehension possible.

There is considerably less research on comprehension processes in beginning readers, compared to studies on word processing. One of the consistent findings in comprehension research is that compared to more skilled comprehenders, unskilled comprehenders are also less skilled in decoding. In fact, during the early stages of beginning reading, text comprehension is limited to children's skill in decoding. Until decoding processes are rapid and efficient, high-level comprehension processes are severely limited. There is now converging evidence that for both children and adults, difficulties in comprehension are related to difficulties in decoding as well as to problems with working memory.

Besides being better at decoding, skilled comprehenders also have better global language skills than less skilled comprehenders. Studies have shown a causal relationship between vocabulary and comprehension. There is evidence showing that vocabulary instruction leads to gains in comprehension and improvement on semantic tasks. It is also clear that both direct and indirect instruction in vocabulary lead to comprehension gains.

Skilled comprehenders also have better metacognitive skills than less skilled comprehenders. Skilled comprehenders are aware of how well they are comprehending and use various comprehension strategies that guide them as they attempt to understand text.

Young readers benefit from cognitive strategy instruction. Instruction in cognitive strategies usually involves helping students be aware of their own cognitive processes in reading. Usually a teacher either models the use of comprehension strategies or guides the students in the use of strategies. Many approaches to cognitive strategy instruction allow readers to practice their newly acquired cognitive strategies with the teacher until the readers master their use.

In short, beginning reading instruction needs to focus on children's acquisition of letter-sound relationships, as well as comprehension strategies to assure that both word recognition and comprehension skills can develop simultaneously.

## COMPREHENSION

From 1997 to 2000 the National Reading Panel (NRP) carried out a review of research-based knowledge about reading and instruction, especially in the early elementary grades. The research topics relevant to early reading and instruction that the NRP concentrated on were phonemic awareness instruction, phonics instruction, fluency, vocabulary instruction, text comprehension instruction, teacher preparation, and comprehension strategies instruction.

The group that focused on text comprehension instruction located more than 500 studies on the teaching of comprehension instruction. Using scientific criteria such as whether a study of a strategy instruction included a control group, they found that just over 200 of these studies were conducted sufficiently well to be confident that the conclusions based on them are scientifically trustworthy.

Comprehension strategy instruction fosters active reading. The strategies are designed to guide a reader to become more self-aware of one's self-understanding during reading, to become more in control of that understanding, to create images related to contents, to make graphic representations, to write summaries, and to answer or to make up questions. Depending on what type it is, a strategy can be implemented *before*, *during*, or *after* the reading of a text.

Skilled readers may invent strategies that help them understand and remember what they read. Most readers, however, do not spontaneously invent these strategies. Unless they are explicitly taught to apply cognitive procedures they are not likely to learn, develop, or use them. Readers at all levels, in

fact, can benefit from explicit comprehension strategy instruction. A teacher begins by demonstrating or modeling a strategy. In some cases, the instruction is *reciprocal* or *transactional*, meaning that the teacher first performs the procedures and then the students gradually learn to implement them on their own. The process by which a student adopts the strategy—a process that is called "scaffolding"—is often a gradual one. Readers are first able to experience the construction of meaning by an expert reader, the teacher. As readers learn to take control of their own reading by practicing and acquiring cognitive strategy procedures, they gradually internalize the strategies and achieve independent mastery.

## History of Comprehension Strategy Instruction

Interest in reading comprehension strategies began to grow as a part of the new scientific understanding of cognition that emerged in the latter decades of the twentieth century. In 1978 Walter Kintsch and Teun A. van Dijk observed that a reader is an active participant with a text and that a reader "makes sense" of how ideas based on the text relate to one another by interpretive interactions between what the reader gleans from the text and what the reader already knows. They proposed that a reader actively builds meaning as *mental representations* and stores them as semantic interpretations held in memory during reading. These representations enable the reader to remember and use what had been read and understood.

In a landmark 1979 study Ellen M. Markman wondered whether readers would detect obvious logical contradictions in passages they read. She gave readers a passage about ants that indicated that when ants forage away from their hill they emit an invisible chemical with an odor that they use to find their way home. The passage also indicated, however, that ants have no nose and are unable to smell. Would readers notice that the passage did not make sense? Would they recognize that they did not understand the passage? What would they do? Her disturbing finding was that young and mature readers alike overwhelmingly failed to notice either logical or semantic inconsistencies in the texts. What instruction would help readers to be more conscious of their understanding and to learn strategies that would overcome these comprehension failures?

At about the same time Dolores Durkin observed reading instruction in fourth-grade classrooms over the course of a school year. For many

student readers, fourth grade is a transition year from “learning to read” to “reading to learn.” In a 1979 article Durkin reported that there was very little comprehension instruction in the classrooms. Teachers assigned questions and told students about content. But in seventy-five hours of reading instruction Durkin observed that year, teachers devoted only twenty minutes, less than 1 percent of the time, to teaching readers how to comprehend and learn new information from reading. Her studies and the others cited above anticipated an intense interest in helping students learn strategies to comprehend and learn from reading.

In the 1970s and early 1980s investigators generally focused on teaching an individual strategy to help readers construct meaning. There were literally hundreds of studies of individual comprehension strategies. One example is Abby Adams and colleagues’ 1982 research applying the SQ3R (survey, question, read, recite, and review) technique to fifth-grade classrooms. SQ3R is a text pre-reading *graphic organizer* instruction developed in 1941 for World War II military personnel undergoing accelerated courses. It is considered a “text previewing” comprehension strategy instruction in that it guides readers to look for the meaning *before* reading the text. In this instruction, readers learn to use the text’s headings, subheads, introductions, and summaries to construct graphic schemata of the text content. As did many of the other comprehension strategy instruction researchers, Adams and her colleagues obtained positive results, finding that students with the pre-reading instruction performed significantly higher on factual short-answer tests than did control group students.

Generally, many types of individual comprehension strategy instructions appeared to be successful in improving readers’ ability to construct meaning from text. With the observed success of various individual strategy applications, there were several reviews of this growing body of scientific literature. In 1983 P. David Pearson and Margaret C. Gallagher categorized cognitive strategies by what teachers do to teach the strategies, and Robert J. Tierney and James W. Cunningham’s 1984 review subdivided the cognitive strategies into pre-reading, during-reading, and post-reading activities.

With the success of individual strategy instruction in improving reading comprehension measures documented by research, focus shifted to using combinations of strategies to facilitate text comprehen-

sion, primarily in experimental situations rather than in natural classrooms. Among these was a very influential 1984 study of “reciprocal teaching” of comprehension by Annemarie S. Palincsar and Ann L. Brown. Reciprocal teaching is a method that involves the gradual release of responsibility for carrying out a strategy to the readers. It combines teacher modeling and student practice on four cognitive strategies: prediction, clarifying, summarizing, and question generation. Students who received this instruction showed marked improvement on a number of comprehension measures.

Success of teaching multiple strategies led to the study of the effectiveness of preparing teachers to teach comprehension strategies in natural, classroom settings. Two approaches are noteworthy, namely Gerald G. Duffy and Laura R. Roehler’s 1987 direct explanation model and Rachel Brown, Michael Pressley, and colleagues’ 1996 transactional instruction approach. Direct explanation emphasizes teacher-directed problem solving, whereas transactional instruction, similar to reciprocal teaching, employs teacher-directed actions with interactive exchanges with students in classrooms. Both direct and transactional approaches to training teachers have produced positive results.

### Strategies that Work

The NRP identified twelve categories of comprehension instruction that have scientific support for the conclusion that they help readers to construct meaning and thereby improve reading comprehension, including two categories involving the preparation of teachers in cognitive strategy instruction. These strategies stimulate both audio and visual perception, activate memory and semantic processing, enhance perception, engage syntactic knowledge and processing, teach narrative structure, and promote reasoning. The strategies of active listening, comprehension monitoring, and prior knowledge use all serve to promote listening and awareness of one’s thinking or “inner speech,” a process emphasized by the Russian psychologist Lev Vygotsky in the 1920s. Mental imagery, mnemonic, and graphic organizer instruction, on the other hand, make use of readers’ visual imagination and memory. Vocabulary instruction increases word and semantic knowledge and problem solving. Question answering and question generation require the access of what is known or understood and the prediction of future events. Story structure and summarization instruction

create awareness of the organization of ideas and what is important. Finally, multiple strategy instruction combines the use of several of these processes together in flexible and appropriate ways. Research conducted in the late 1990s also suggests that teachers can learn to integrate these kinds of strategy instructions in classroom settings and that peers working in cooperative learning situations can effectively tutor each other in comprehension strategies.

**Active listening.** To instruct active listening, teachers guide readers in learning to listen while others read. The listening reader follows the text as another student reads aloud. The teacher may also pose questions for the readers to answer while they listen. Active-listening training improves listening and reading comprehension. It increases a reader's participation in discussions, engenders more thoughtful responses to questions, increases memory for the text, and focuses the reader's attention and interest on material. For example, in Gloria M. Boodt's 1984 study of training critical-listening strategies with fourth-grade to sixth-grade remedial readers, there was a gradual increase over the eighteen weeks of the study in students' willingness to participate in group discussions and provide more thoughtful responses to direct questions. Overall, four studies of this strategy met NRP scientific criteria. The students in the active listening studies ranged from first grade through sixth grade; they improved in critical listening, critical reading, and general reading comprehension.

**Comprehension monitoring.** One can learn to listen to one's own reading and to monitor one's own comprehension. Instruction in comprehension monitoring during reading helps readers manage their inner speech as they read. Self-listening and self-monitoring of one's own understanding during reading promote more careful reading and better comprehension.

To teach comprehension monitoring, a teacher, when reading aloud to a class, demonstrates the strategy by interrupting her own reading to "think aloud." She articulates to the class her own awareness of difficulties in understanding words, phrases, clauses, or sentences in a text. When a text poses potential comprehension breakdowns, such as unfamiliar concepts or logical inconsistencies in a passage, the teacher might look back in the text to try to solve a problem, restate the text content in more familiar terms, or look forward in the text to find a solution. After observing a teacher model the

comprehension monitoring strategy, readers are encouraged to carry out the same procedures—first with teacher scaffolding and then on their own. Eventually the student readers take responsibility for recognizing comprehension difficulties and for demonstrating ways to overcome them (e.g., by guessing and looking back or reading forward in the text).

The teaching of comprehension monitoring is very effective. The NRP found twenty studies of comprehension monitoring instruction with readers in grades two through six that met scientific criteria. In them, readers who were taught to self-monitor comprehension improved one of the following: their detection of text inconsistencies, their memory for the text, or their performance on standardized reading comprehension tests.

**Prior knowledge.** Prior knowledge instruction is designed to assist readers in bringing to mind their own knowledge that is relevant to understanding the text. A teacher can activate prior knowledge by asking students to think about topics relevant to the passage, by teaching the requisite relevant knowledge, by using pre-reading activity on related but better-known topics, by having the readers predict what will happen in the text based on personal experience, by having readers make associations during reading, and by previewing the story or text.

In fourteen studies with students spanning grades one through nine reviewed by the NRP, prior knowledge instruction helped readers improve on recall, in question answering, and in content area and standardized reading comprehension performance. For example, in a 1988 study, Teresa A. Roberts found that prior knowledge instruction had a positive effect on both factual and inferential comprehension performance with students in grades five and nine.

**Mental imagery.** Mental imagery instruction teaches readers to construct images that closely represent the content of what was read and understood. In 1986, after instructing less-skilled fourth- and fifth-grade readers in imagery training, Linda B. Gambrell and Ruby J. Bales had them read stories with inconsistencies like those in the 1979 Markman study mentioned above and instructed them "to make a picture in your mind to help determine if there is anything that is not clear and easy to understand about the story." Control students, that is, those without the imagery training, were simply asked to "do whatever you can do to help determine if anything is not clear

and easy to understand about the story.” The results were that imagery-trained readers were more likely to detect inconsistencies than the controls. In four studies with students in grades two through eight, the NRP found that mental imagery instruction led to modest increases in memory for the text that was imaged and improved reader detection of text inconsistencies.

**Mnemonics.** Like mental imagery instruction, mnemonic instruction teaches readers to use an external memory aid, but unlike mental imagery instruction, the mnemonic image can be one that does not necessarily closely represent the text. A teacher demonstrates how to construct a picture, keyword, or concept as a proxy for a person, concept, sentence, or passage—such as using an image of a “tailor” to remember the name “Taylor.” These keywords and images aid later recall. In five studies examined by the NRP, mnemonic instruction improved reader memory of the assigned keywords and recall for the passages read. For example, in 1986 Ellen E. Peters and Joel R. Levin gave mnemonic instruction to good and poor readers and then gave them passages about “famous” people. As compared to the control subjects, the mnemonic-trained students were more likely to learn and remember information about new concepts and people who were unfamiliar to them.

**Graphic organizers.** Graphic organizer instruction shows readers how to construct displays that organize one’s ideas based on a reading of the text. Graphic organizers aim at creating awareness of text structures, concepts and relations between concepts, and tools to represent text relationships visually. They also assist readers in writing well-organized summaries. Diagrams, pictorial devices, and story maps can all be used to outline the relationships among text ideas. This instruction is useful for expository texts in content areas such as science or social studies.

In eleven studies reviewed by the NRP that used graphic organizers with readers in grades four through eight, readers generally benefited in remembering what they read, in improved reading comprehension, or in improved achievement in social studies or science courses. For example, in 1991 Bonnie Armbruster and her colleagues compared the effectiveness of a graphic organizer instruction that taught fourth- and fifth-grade social science students to visually represent the important ideas in a social science text. In contrast, the control students’ instruction consisted of workbook activity directions

recommended in the teacher’s edition of the social science textbook. The fifth-, but not necessarily the fourth-grade students, who received the graphic organizer cognitive strategy instruction scored higher on recall and recognition measures than the controls who received the workbook activity instruction.

**Vocabulary instruction.** There are many studies on teaching vocabulary but few on the relationship between vocabulary instruction and comprehension. In the context of comprehension strategy instruction, vocabulary instruction promotes new word meaning knowledge by teaching readers semantic processing strategies. For example, students learn to generate questions about an unknown word by examining how it relates to the text or noticing how a word changes meaning depending on the context in which it occurs. The teacher may model being a “word detective,” looking for contextual clues to find a word’s meaning, analyzing words and word parts, and looking at the surrounding text for clues to a word’s meaning. For instance, the word *comprehension* combines *com*, meaning “together” with *pre-hension*, meaning “able to grasp in one’s hand.” From this, an operational definition of *comprehension* can be constructed (e.g., putting together individual word meanings to grasp an idea).

In three studies of vocabulary instruction in a cognitive strategy context with fourth-grade students reviewed by the NRP, the instruction led to success in learning words, in use of word meanings, and in increased story comprehension. For example, in a 1982 study involving fourth-graders receiving vocabulary instruction, Isabel L. Beck and her colleagues taught the students to perform tasks designed to require semantic processing. These students performed at a significantly higher level than pre-instruction matched controls on learning word meanings, on processing instructed vocabulary more efficiently, and in tasks more reflective of comprehension. In the three NRP-reviewed studies, however, learning to derive word meanings did not always improve standardized comprehension performance.

**Question answering.** Question answering focuses the reader on content. *Why* or *how* questions lead the student to focus on causes and consequences. Question answering guides students and motivates them to look in the text to find answers. Instruction on question answering leads to improvement in memory for what was read, to better answering of

questions after reading, or to improvement in finding answers to questions in the text during reading.

In a 1985 study, Taffy E. Raphael and Clydie A. Wonnacott trained fourth-grade and sixth-grade readers to analyze questions, distinguishing those questions that could be answered by information in the passage from questions that required prior knowledge or information not in the text. The results were that students who had received this instruction provided higher quality responses to questions than a control group of students. In seventeen studies examined by the NRP for this strategy, the results were usually specific to experimenter tests of question answering and were greater for lower-grade than for upper-grade readers and greater with average and less-skilled readers than with high-achieving readers.

**Question generation.** Teachers demonstrate this strategy by generating questions aloud during reading. Readers then practice generating questions and answers as they read the text. Teachers provide feedback on the quality of the questions asked or assist the student in answering the question generated. Teachers teach the students to evaluate whether their questions covered important information, whether questions related to information provided in the text, and whether they themselves could answer the questions.

The scientific evidence that question generation cognitive strategy instruction is effective is very strong. In 1996 Barak Rosenshine and his colleagues conducted meta-analysis of twenty-six question generation studies with students from third grade through college. Like individual experimental studies, a meta-analysis applies scientific criteria to obtain a quantitative assessment of an instruction's effectiveness. A meta-analysis differs from single studies, however, in that it obtains a quantitative impact of a particular strategy by looking at effectiveness across a group of studies. In addition to the Rosenshine meta-analysis, the NRP examined twenty-seven question generation studies with students from grades three through nine. Question generation instruction during reading benefited reading comprehension in terms of improved memory, in accuracy in answering questions, or in better integration and identification of main ideas. The evidence that it improved performance on standardized comprehension tests is mixed.

**Story structure.** Story structure instruction is designed to help readers understand the who, what,

where, when, and why of stories, what happened, and what was done and to infer causal relationships between events. Readers learn to identify the main characters of the story, where and when the story took place, what the main characters did, how the story ended, and how the main characters felt. Readers learn to construct a story map recording the setting, problem, goal, action, and outcome of the story as they unfold over time.

Story structure instruction improves the ability of readers to answer questions, to recall what was read, and to improve standard comprehension test performance. The instruction also benefits recall, question answering, and identifying elements of story structure. For example, in 1983 Jill Fitzgerald and Daisy L. Spiegel found that instruction in narrative structure enhanced story structure knowledge and had a strong positive effect on reading comprehension with average and below-average fourth-grade students who had been identified as lacking a keen sense of narrative structure.

The NRP examined seventeen studies using story structure instruction with readers ranging from third grade through sixth grade. Story structure instruction improved readers' ability to answer short-answer questions and retell the story. In three of the studies, standardized tests were used for assessment. Story structure instruction led to improved reader scores in two of those studies.

**Summarization.** Teaching readers to summarize makes them more aware of how ideas based on the text are related. Readers learn to identify main ideas, leave out details, generalize, create topic sentences, and remove redundancy. Through example and feedback, a reader can be taught to apply these summarization rules to single- or multiple-paragraph passages by first summarizing individual paragraphs and then constructing a summary or spatial organization of the paragraph summaries.

In eighteen studies on summarization with students from grades three to eight examined by the NRP, readers improved the quality of their summaries of text not only by identifying the main ideas but also by leaving out detail, including ideas related to the main idea, generalizing, and removing redundancy. Further, the instruction of summarization improves memory for what is read, both in terms of free recall and answering questions. For example, in 1984 Thomas W. Bean and Fern L. Steenwyk examined whether training sixth-grade readers in rules for

summarization developed in 1983 by Ann L. Brown and Jeannie D. Day would improve comprehension. They found that readers receiving summarization instruction either by rule-governed or intuitive-summarization techniques performed better than controls who were told to find main ideas but who had no explicit instruction. The summarization-trained students significantly outperformed the control group in the quality of their summaries and on a standardized test.

**Multiple-strategy instruction.** Readers can learn and flexibly coordinate several comprehension strategies to construct meaning from texts. Palincsar and Ann L. Brown's reciprocal teaching method, described in 1984, instructs readers to use four main strategies during reading: generating questions, summarizing, seeking clarification, and predicting what will occur later in the text. Additional strategies may also be introduced, including question answering, making inferences, drawing conclusions, listening, comprehension monitoring, thinking aloud, and question elaborating. The teacher models strategies and, in some cases, explains them as they are modeled. Then the reader, either alone or as a leader of a group, applies the strategies.

The evidence indicates that demonstration and repeated use of the strategies leads to their learning by readers and improvement in comprehension. In 1994 Rosenshine and Carla Meister conducted a meta-analysis of sixteen reciprocal teaching studies with students in grades one through eight. Most of the readers were above grade three. Weaker and older readers benefited most from reciprocal teaching. In eleven studies of reciprocal teaching in grades one through six reviewed by the NRP but not covered by Rosenshine and Meister, reciprocal teaching produced clear positive improvement on tasks that involve memory, summarizing, and identification of main ideas.

Multiple-strategy programs that do not use reciprocal teaching mainly have the student practice strategies with modeling and/or feedback from the teacher. In explicit, direct approaches, the teacher always explains a strategy before the teacher models it during reading.

**Teacher preparation for text comprehension instruction.** Teachers have to learn strategy instruction in order to interact with students at the right time and right place during the reading of a text. Teachers also need to know about cognitive process-

es in reading and how to teach strategies through explanation, demonstration, modeling, or interactive techniques; how to allow readers to learn and use individual strategies; and how to teach a strategy in conjunction with several other strategies.

Four studies conducted in the late 1980s and 1990s indicated that teachers who learn multiple comprehension strategy instruction and use it in their classrooms improve the reading comprehension of their students, especially those who are below average in skill. Improvements occurred in subject matter learning and in performance on standardized reading comprehension tests. In 1996 Rachel Brown, Michael Pressley, and colleagues taught teachers to use transactional strategy instruction in a yearlong program where students made comprehension gains. Transaction instruction involves teacher-directed actions with interactive exchanges with students in classrooms.

**Cooperative learning by peers.** Readers may learn best when they are in social situations in which they are actively engaged with other learners who are near their same level of understanding. Cooperative learning involves readers reading together with a partner or in small groups. As they read aloud and listen to others, the teacher can guide them to use any of the various strategies for effective reading comprehension. At first the teacher may model reading through her demonstrated use of a strategy. Then the student readers carry out the demonstrated activities with a partner or in small reading groups. Readers take turns reading and listening, asking questions, answering questions, summarizing, recognizing words, predicting, and clarifying. The readers are encouraged to tutor each other on strategies. Group cooperative instruction has been found to promote intellectual discussion, increased student control over their learning, increased social interaction with peers, and savings in teacher time.

For example, in 1998 Janette K. Klingner, Sharon Vaughn, and Jeanne S. Schumm investigated the effectiveness of a cooperative learning approach designed to encourage culturally and linguistically diverse general education fourth-grade students to use strategic reading by employing various summarization and clarification procedures during reading. Students in the cooperative learning classes made greater gains in reading comprehension and equal gains in content knowledge than controls in measures that included a standardized reading test, a social studies unit test, and audiotapes of group work.

In ten studies on cooperative learning of comprehension strategies reviewed by the NRP, students successfully learned the reading strategies. Cooperative learning can also be effective for integrating students with academic and physical disabilities into regular classrooms. The social interaction increases motivation for learning and time spent by the learners on tasks.

### Implications for Future Research and Practice

Instruction of cognitive strategies for reading comprehension has been successful across a wide number of studies for readers in grades three to eleven. Despite these successful demonstrations, there are many unanswered questions. Among these are whether certain strategies are more appropriate than others for readers of certain ages or different abilities, whether comprehension strategy instruction would improve performance and achievement in all content areas, whether successful instruction generalizes across different types of texts, and whether comprehension strategies work better if what is being read engages the readers' interests. Researchers also need to find out more about important teacher characteristics that influence successful instruction of reading comprehension, especially in regard to decision-making processes (e.g., knowing when to apply what strategy with which particular student[s]). Finally, there has been little research that directly compares different methods of teaching comprehension. More needs to be known about "best approaches" to comprehension instruction and the circumstances under which they are successful. How does one best develop independent readers who have the abilities to understand what they read on their own?

### Conclusion

Cognitive strategy instruction does work to improve readers' comprehension performance. In her 2000 address to teachers, Carol Minnick Santa, president of the International Reading Association, noted that "teaching [comprehension] is a lot harder and more abstract than teaching phonemic awareness or language structures. Moreover, effective comprehension instruction . . . demands extensive teacher knowledge." In 1993, after a five-year study of teaching teachers to implement comprehension strategy instruction, Gerald G. Duffy, a developer of the direct-instruction approach to cognitive strategy instruction, concluded that teaching students to

acquire and use strategies requires a fundamental "change in how teacher educators and staff developers work with teachers and what they count as important about learning to be a teacher" (p. 244). Successful comprehension teachers must be strategic themselves, coordinating individual strategies and altering, adjusting, modifying, testing, and shifting tactics appropriately until readers' comprehension problems are resolved. For readers to become good reading strategists requires teachers who have appreciation for reading strategies.

#### CONTENT AREAS

Reading in content areas is also referred to as subject matter reading and disciplinary reading and embodies what educators call "reading to learn." These terms refer to reading, understanding, learning, and using content area, subject matter, or disciplinary texts such as texts in science, history, or literature, for the purpose of gaining, demonstrating, and possibly creating knowledge in that discipline. Proficiency in reading content area materials is influenced by: (1) the dispositions of individuals who read in the disciplines (including such influences as their levels of background and strategy knowledge, their understanding of the discipline, their attitudes and interest in the subject matter, and their ability levels); (2) the goals that students adapt for learning and the degree to which those goals are similar to the goals that their teachers have for their learning; (3) the structure, difficulty level, and tone of the texts; (4) the level of understanding required of the individuals (for example, memorization versus critical thinking); and (5) the form in which that understanding is displayed (such as written versus oral or recall versus recognition). Thus, reading content area materials involves complex processes.

Educators often state that "reading to learn" is different from "learning to read." When students learn to read, the focus is often on the pronunciation and comprehension of narrative texts. Comprehension of these narratives does not usually require expertise in literary criticism and interpretation, although teachers seek literal, inferential, and evaluative/applied understandings. Reading to learn, however, focuses on the understanding and use of largely informational texts in disciplines such as history and science and a mix of informational and literary texts in English. Reading to learn *does* require disciplinary expertise. When reading a literary text, for example, students benefit from knowing how literary critics think about and discuss literature as a guide to their own interpretation and discussion of that text. When reading a history text, students benefit from understanding the way that historians gather and interpret data and write about historical events. Reading to learn science requires a different set of understandings than reading to learn history, literature, or any other subject matter.

Level of background knowledge, interest, goals, and other student characteristics make a difference in how well students are able to understand and use the information in texts, but content area reading specialists disagree about the degree to which the approach to reading differs depending upon the discipline. Strategies for understanding and applying what is read will have some commonalities across disciplines; generally, however, the understanding of disciplinary texts is inextricably tied to understandings of the discipline.

In a 1997 article Patricia Alexander posited that disciplinary expertise is gained as a function of three interdependent influences—knowledge, interest, and strategy use. That is, as one increases, the others do as well. Alexander described three levels of disciplinary expertise. At the level of *acclimation*, knowledge is unorganized, strategies are general, and interest is extrinsic. At the level of *competency*, knowledge becomes organized (such as into processes in science), strategies become more specific, and interest becomes more intrinsic. At the level of *proficiency*, one may even create knowledge, strategies will not only be more specific but also become fluid and very efficient, and interest will be very closely tied to one's inner desires. Students may move from acclimation to competency because they get hooked on a topic and that hook helps them become more interested in other topics, because they develop

strategies that help them learn more effectively, or because they may learn more and, thus, understand how better to use strategies for learning. In any event, knowledge, interest, and strategy use are tied to the discipline rather than being seen as general constructs.

### Reading in Three Disciplines: History, Science, and Literature

Disciplines differ in their methods for creating and displaying knowledge. In addition, teachers in the disciplines expect students to understand those differences and to use them in learning information from texts.

**The case of history.** History texts are traditionally written as narratives that are sometimes interspersed with interpretation. For example, an event such as the Tonkin Gulf incident of the Vietnam War may be described sequentially, followed by a paragraph discussing the importance of the event in determining U.S. involvement in the war. Students often read historical texts as if they were “baskets of facts” to be memorized in sequential order, but this strategy is naive. Historians, when asked to read historical texts, read them differently. In a 1992 article Samuel Wineburg reported that historians read historical texts as arguments. When reading several historical documents, they engaged in *sourcing* (determining the expertise of the author and the source of the material), *contextualization* (determining when it was written and what surrounding influences there might be), and *corroboration* (determining whether or not the texts agreed).

The differences in the way students and historians read the documents can be attributed to differences in disciplinary expertise. That is, historians know the way that historical evidence is collected. They understand that there is the danger of bias in the selection process of that evidence. They also know that original documents are sometimes difficult to interpret. The documents are like pieces of a puzzle that must be assembled without a preexisting border, with the final picture being a creation of the historian. In interpreting those original documents historians are influenced by the time period in which they live, the political and philosophical approaches they have embraced, and past historical interpretations, to name a few influences. In addition, historians understand the power relations that exist among historians. They know what counts as good historical writing, model their own writing on that of oth-

ers, and examine the writing of their fellow historians accordingly. Historians understand the elements of their discipline and thus read historical texts with a critical eye.

But the processes of selecting and interpreting historical evidence and writing about historical events is hidden from the reader of historical texts. In presenting history as a coherent story, this information is obscured. Therefore, it is up to teachers of history to call to the attention of students the elements of the discipline that will help them engage in reading history.

What are students required to do when they read history texts? Typically, students are expected to engage in several levels of understanding of history as a result of reading historical texts. These include a mastery of the “facts” of history. They include understanding consensual interpretations of history, such as understanding various historians’ ideas of the causes and effects of important events. They also include students’ engagement in thinking about these interpretations for themselves. Students in history classes are often asked to make comparisons and contrasts and to discuss possible cause-and-effect relationships that have not been made explicit in the texts. Students are also often required to synthesize information across several texts. For instance, they may be required to read Benjamin Franklin’s writings and decide in what ways his ideas had embodied the principles of the Enlightenment. Sometimes students are asked to look at history from different perspectives. For instance, they may be required to read several versions of an event to consider how the context of those writings influenced understanding about it. Students sometimes are asked to engage in the gathering of and interpretation of historical evidence and to write their interpretations in report form, such as in a term paper. Finally, students are sometimes required to engage in thinking about the philosophical aspects of historical understanding. For example, they may be asked to consider whether important people create noteworthy events or whether noteworthy events create important people.

The tradition in history classes for demonstrating these various understandings turns increasingly toward essay writing as students move from naivete to expertise and from lower-level mastery of factual information to higher-level critical thinking and interpretation. Thus, students need to have a complex array of strategies for understanding historical texts

and for demonstrating that understanding. These include strategies for remembering the facts of historical events, engaging in historical research, making comparisons and contrasts, synthesizing information across texts, writing essays, and thinking critically about the nature of history and historical writing. Whereas these strategies share common elements with strategies needed for other disciplines, they are, in the end, discipline specific.

**The case of science.** The hard sciences such as physics and biology rest on the assumptions of the scientific method. Scientists understand and use the scientific method in their search for “truth.” They adhere to the principle of objectivity, understanding that their own biases and perceptual shortcomings may cause misinterpretations of evidence. Thus they engage in experimentation using controlled conditions whenever possible and rely on numerical rather than qualitative assessments of data as the main determinants of scientific principles. Yet, as scientists, they are still influenced by several constraining elements. The selection of research topic, the use of certain measurement devices, the importance assigned to various scientific findings, and the previous understandings of the research topic are all examples of constraints that are in part culturally and socially based. Which topics get studied and which findings gain acceptance in the scientific community are functions of power relations among scientists, of necessity, and of the veracity of the findings. As an example, consider that it took hundreds of years for the ideas of the seventeenth century Italian astronomer and physicist Galileo Galilei to be accepted by the scientific community, or that sterilization procedures were staunchly resisted by the scientific community despite evidence that such procedures were necessary.

Also in science, information is always partial and relational. Because the workings of the natural world are obscured for individuals by the limits of their perceptual and sociocultural understandings, scientific understandings are always in a state of flux. For example, the ideas about gravity and motion formulated by the English mathematician and physicist Isaac Newton (1642–1727) are functional on Earth but have become outmoded based upon newer conceptions of quantum physics. Scientists understand this flux; they have the disciplinary knowledge necessary to help them critically read and evaluate scientific texts. They also know what counts as written proof of a scientific finding. For example, they know

that the reporting of a scientific finding in the journal *Science* requires adherence to certain traditional rules for scientific reporting and has been anonymously reviewed (refereed) by a group of distinguished scientists. They know that such a report counts more than the accounting of similar findings in a local, nonrefereed publication. Students, however, do not have the disciplinary knowledge necessary to make these evaluations. Skillful reading of science is in part dependent upon students gaining that disciplinary knowledge.

What are students required to do as they read science texts? Typically, they are required to master a knowledge base that represents the current understandings of the scientific community. These understandings involve the identification of various elements and their function in carrying out common processes. For example, students are required to identify the parts and understand the workings of the human digestive system. They are also often required to solve problems or to make predictions about processes based upon their scientific understandings. For example, a student who understands the path of a projectile and how it is calculated might be asked to determine the time it would take a projectile to reach the ground if it were launched at a certain speed at a certain trajectory from a certain height. In other words, students must be able to understand the vocabulary and concepts of what they read and apply that understanding in new contexts.

In trying to understand the processes of science, students may need to suspend their own ideas in favor of scientific evidence. In the study of gravity, for example, students often have erroneous conceptions of how gravity works based upon their intuitive but scientifically disproven assumptions. Students may believe that a heavier object will fall faster than a lighter one, when, in reality, weight or mass do not influence the speed of a projectile as it falls to Earth. Scientists know that weight has no influence because they have performed controlled experiments. Students must suspend their intuitive beliefs to learn the scientific information, and those who understand the assumptions of the scientific method will more likely engage in that learning than students who do not.

Science texts are often seen as difficult to understand. Students complain that concepts are not sufficiently elaborated, the material assumes a level of background information that exceeds theirs, the vocabulary is too dense, and the content is dull. Texts

are even harder to understand when students begin their reading harboring misconceptions about the content that interfere with their understanding. Researchers have found that refutational text, or text that explicitly describes erroneous understandings and explains why they are erroneous, is more effective at helping students to learn counterintuitive ideas.

The procedures in science classes for demonstrating students' understandings are varied, including answering literal, inferential, and applied questions on multiple-choice tests; solving numerical problems; writing descriptive essays; writing field notes; making charts, graphs, and diagrams; and writing scientific reports. Students are required to have elaborative understandings of current conceptions of the working of the natural world, and they must have a number of strategies for learning at their disposal.

**The case of literature.** Literature has its own disciplinary traditions. Knowledge of the way that literary experts refer to such elements as genre, characterization, theme, conflict, symbolism, and language use is important. In addition, experts in literature often engage in various kinds of interpretation, for example, putting a feminist, Marxist, Freudian, or post-modern spin on the interpretation of a piece of literature. Experts in literature understand the different perspectives that are part and parcel of the field. They understand that literary criticism has evolved over time; that the relationship of the author, the text, and the reader and their importance in interpretation have fluctuated; and that arguments rage over what is important for students to read (the canon versus multicultural literature, for example). Students may not have this disciplinary knowledge but would benefit by it.

Students need to develop a common language with which they can discuss and write about their interpretations of text, and the tradition in literature classes is for the demonstration of disciplinary expertise to be in essay form. In addition, they are often expected to apply their knowledge of the elements of certain genres by engaging in writing literary texts themselves, such as in writing poetry or short stories. And they are sometimes required to write reports about authors or certain literary traditions. The strategies for engaging in these activities are quite complex, and, although they require literal, interpretive, and applied/evaluative thinking, the

way in which this thinking is used is different from the way it is used in history and science.

The three disciplines—science, history, and literature—are similar in that all require thinking at literal, inferential, and applied/evaluative levels. In addition, reading texts in these disciplines requires vocabulary knowledge and strategic effort. But the disciplines are different. For example, science is well-structured, history less well-structured, and literature relatively unstructured in relation to what is agreed upon as being “known.”

### Strategies for Reading Content Area Texts

When discussing strategy use, educators find it useful to make a distinction between teacher-generated and student-generated strategies. In both cases, however, content area specialists argue about whether general strategies can be used and applied across subject areas or whether strategies must be discipline specific. In reality, probably both ideas are true.

An example of a teacher-directed strategy is list-group-label. In this pre-reading strategy, the teacher solicits and makes a list of all the information students already know about the content of what they are about to read. Then, she directs the students to group the items in the list into meaningful groups and to label each meaningful group. From this activity, the teacher finds out what the students already understand and can, thus, be more effective in bridging any gaps between information in the text and student knowledge. In addition, the activity can be used to generate a list of questions that might be answered by the text. These questions would then make reading a more directed and interesting activity. The strategy can be applied across contents, but the lists that are generated and the way the lists are used might differ depending upon the discipline. For example, in a history class, groups may include events, policies, and people. In science they may include patterns of behavior or processes.

Regarding student-generated strategies, to be successful in classes in any discipline, students must read with the purpose of understanding and thinking about the information at deep levels, organizing the information into meaningful units, remembering the information, and displaying their knowledge in various ways. Strategies such as previewing, annotating, and outlining help students identify important information to study; strategies such as charting, mapping, and concept cards help students

to organize material across sources in meaningful ways; strategies such as verbal rehearsal help students to remember and think about the material; and strategies such as predicting and answering exam questions help students prepare for displaying their knowledge. If students think at literal, inferential, and applied/evaluative levels, they will be more likely to truly learn new information. But even though all of these strategies can be applied across content areas, they will, in practice, be different depending upon the content of the material. Evidence that strategy use in one discipline can be transferred to other disciplines without explicit instruction in strategy modification is rare, and so it seems necessary that students should get explicit strategy modification instruction in each discipline.

In conclusion, the more discipline knowledge they possess, the more content knowledge they have, the more they are interested in the subject matter, the more familiarity they have with the way knowledge is created and structured in a particular discipline, and the more closely their goals for learning match disciplinary goals, the more likely it is that students will be able to adapt general strategies or create new ones to meet their discipline-specific needs for learning and applying the information in their content area texts.

#### INTEREST

The powerful facilitative effect of interest on academic performance in general has been well estab-

lished. For the purpose of this entry, the current conceptualization of interest is overviewed, followed by a review of interest research on reading.

#### The Conceptualization of Interest

Among the many conceptualizations of interest the most common are to consider interest as a state and/or as a disposition. It has also been demonstrated that interest has both cognitive and affective (emotional) components. Researchers also distinguish between individual and situational interest, with the former targeting personal interest and the latter focusing on creating appropriate environmental settings.

Individual interest has been viewed as a relatively long-lasting predisposition to reengage with particular objects and events. Increased knowledge, value, and positive affect have been connected with individual interest. Students bring to their academic experience a network of individual interests, some similar to and some incompatible with classroom learning. Social categories such as gender and race also function as individual interest factors that may affect classroom engagement.

Situational interest refers to a psychological state elicited by environmental stimuli. The state is characterized by focused attention and an immediate affective reaction. The affective component is generally positive, although it may also include some negative emotions. Once triggered, the reaction may or may not be maintained. Situational sources of interest in learning contexts may be particularly relevant for educators working with students who do not have preformed individual interests in their school activities.

Although differences exist between situational and individual interest, they are not dichotomous phenomena. First, both situational and individual interest include an affective component and culminate in the psychological state of interest. Such a state is characterized by focused attention, increased cognitive functioning, and increased and persistent activity. Second, investigators concede that both types of interest are content specific and emerge from the interaction of the person and aspects in the environment. Third, numerous researchers recognize that situational and individual interests may interact. In the absence of the other, the role of individual or situational interest may be particularly important. For example, individual interest in a sub-

ject may help individuals deal with relevant but boring texts, while situational interest generated by texts may sustain motivation even when individuals have no particular interest in the topic. In addition, situational interest may develop over time into individual interest.

It has been found that topic interest has both situational and individual components. Topic interest may have an especially significant role in reading and writing in schools because students usually have to deal with text on the basis of topics provided by teachers.

### **Interest and Reading Research**

The most important questions raised in the literature on interest and reading concerned the influence of interest on readers' text processing and learning, the factors that contribute to readers' interest, and the specific processes through which interest influences learning. These issues are considered next.

**The influence of interest on readers' text processing and learning.** Up to the early 1980s, the prevalent view in educational research was that proficient readers process and recall text according to its hierarchical structure. Thus it was believed that readers could recall best the more important ideas at the higher levels of text structures. Since the early 1980s, however, research has shown that readers' well-formed individual interests and their situational interests (evoked by topics and text segments) contributed to their reading comprehension and learning. Several studies have demonstrated that personally interesting text segments and passages written on high-interest topics facilitate children's as well as college students' comprehension, inferencing, and retention.

Researchers have also demonstrated that interest affects the type of learning that occurs. Specifically, beyond increasing the amount of recall, interest seems to have a substantial effect on the quality of learning. Interest leads to more elaborate and deeper processing of texts. In 2000 Mark McDaniel, Paula Waddill, Kraig Finstad, and Tammy Bourg found that readers engaged with uninteresting narratives focused on individual text elements, such as extracting proposition-specific content, whereas readers of interesting texts tended to engage in organizational processing of information. Furthermore, their research suggests that text differing in interest may affect the degree to which processing strategies benefit memory performance.

**Factors contributing to readers' interest.** Another important educational issue is to increase the amount of interesting reading that students engage in. The bulk of the research in this area examined text characteristics that contribute to making reading materials more interesting. In his seminal 1979 paper, Roger Schank indicated that certain concepts (e.g., death, violence, and sex) can be considered "absolute interests" that almost universally elicit individuals' interest. In 1980 Walter Kintsch, referring to these interests as "emotional interests," distinguished them from cognitive interests, which result from events that are involved in complex cognitive structures or contain surprise. Subsequent research has suggested that a variety of text characteristics contribute in a positive way to the interestingness and memorability of written materials. Features that were found to be sources of situational interest include novelty, surprising information, intensity, visual imagery, ease of comprehension, text cohesion, and prior knowledge.

Text-based interest can also be promoted by altering certain aspects of the learning environment such as modifying task presentations, curriculum materials, and individuals' self-regulation. For example, in 1994 Gregg Schraw and R. S. Dennison were able to change the interestingness and recall of text materials by assigning for reading various perspectives on the same topic. In addition, research has indicated that presenting educational materials in more meaningful, challenging, and/or personally relevant contexts can stimulate interest. Modifying the presence of others in the learning environment can also elicit interest. For example, German researchers Lore Hoffman and P. Haussler demonstrated that mono-educational classes in physics can contribute to girls' increased interest in the subject area. Finally, Carol Sansone and colleagues in a series of studies showed that individuals can self-regulate in order to make tasks more interesting and subsequently to develop individual interest in activities initially considered uninteresting. Although these studies did not deal specifically with interest in reading, they indicated that interest in reading could also be increased by similar methods.

**Specific processes through which interest influences learning.** Gregg Schraw and colleagues suggested in 1995 that interest should be thought of as a complex cognitive phenomenon affected by multiple text and reader characteristic. A critical question is how the elicitation of interest leads to improved

recall. One possibility is that interest activates text-processing strategies that result in readers being engaged in deeper-level processing. Suzanne Wade and colleagues reported in 1999 that the connections readers made between information and their prior knowledge or previous experience increased their interest.

Mark Sadoski and colleagues suggested in 1993 that interacting but separate cognitive systems (verbal and nonverbal) can explain the relationships among interest, comprehension, and recall. When verbal materials are encoded through both of these systems, comprehension and memory increase. The dual coding suggested by Sadoski and colleagues seems to account for the effects of some of the sources of interest that have been found to be associated with increased comprehension and memory, such as the processing of concrete, high-imagery materials. Nevertheless, some highly concrete and easily imaginable information is more interesting than other similar information. In addition, the informational significance of intensity, novelty, surprise, high personal relevance, and character identification reported in the literature to elicit interest do not seem to promote dual encoding prompted by concrete language and mental imagery. Another factor that has been associated with interest, reading, and increased learning is attention. Suzanne Hidi argued that interest is associated with automatic attention that facilitates learning. More specifically, she argued that such attention frees cognitive resources and leads to more efficient processing and better recall of information. In 2000 McDaniel, Waddill, Finstad, and Bourg reported empirical data supporting this position. Finally, as interest undoubtedly has a strong emotional component, this aspect may play a critical role in how interest influences learning. The effect of emotions on interest, however, is yet to be fully investigated in educational research.

## LEARNING FROM TEXT

Text allows people to communicate their ideas with one another across time and space. Indeed, a large part of what each person knows comes from reading texts. People who never discover how to learn from text have strong constraints on what they can know and do. On careful reflection, however, learning from text is a more controversial topic than is readily obvious. Learning may be of higher quality when students experience the world directly rather than read about it. Fourth graders who construct electric circuits or twelfth graders who enact a mock trial may well understand more about the underlying principles of electricity or the judicial system than if they had read chapters from their science or social studies textbooks. As appealing as learning by doing may seem, it has its own limitations. It is unrealistic to assume that students would be able to acquire the understanding of electricity that the nineteenth-century German physicist Georg Ohm had or the understanding of the law that John Marshall, chief justice of the U.S. Supreme Court from 1801 to 1835, had by repeating the same school activities even countless times. Through reading, students can experience the thinking of these experts and come to know some of what they knew or know without completing the same years of study or possessing equal amounts of academic insight. Successful learning depends on a close match among reader goals, text characteristics, reader proficiencies, and instructional context.

### Reader Goals

People read for many reasons. A mystery lover reads a new novel to be intrigued and entertained. A cook reads a recipe to prepare a new dish successfully. A caller reads the telephone book to find a telephone number. The mystery lover, cook, and caller will have connected the words, sentences, and paragraphs of their texts together to be entertained, follow the set of prescribed steps, or locate the information they seek. In other words, they will have comprehended successfully. Nevertheless, they

probably will not have learned much. The goal of the mystery lover is to be entertained, not to learn. While the cook and caller read to find information, this information probably will remain in the text where it can be accessed again when needed rather than become a part of each reader's knowledge.

Comprehension, memorizing, and learning require different processes and different amounts of effort. Walter Kintsch, a cognitive psychologist who has studied text comprehension and learning, has shown that children can comprehend, or recall, an arithmetic problem without being able to solve it correctly and that adults can recall a set of directions without being able to find a particular location. To comprehend, readers connect the separate ideas in a text into a coherent whole that resembles the text. They know the meanings of most words and are able to draw necessary inferences between sentences, paragraphs, and larger sections of a text. As they draw these inferences, they distinguish superordinate topics or ideas from details. If asked to recall a text soon after reading it, they will tend to remember the superordinate topics, but not the details.

Memorizing requires rehearsal and therefore more effort than comprehension. Readers who reread a text several times, focusing attention on the superordinate ideas and some of the details, will be better able to reproduce what they have rehearsed, particularly if prompted. Memorization is often what students do when they study for an exam. If the test has multiple choice or true and false questions, memorization can be an effective strategy. Neither text comprehension nor memorization alone, however, will result in learning, according to Kintsch.

Kintsch found that children were able to solve a problem if they could apply what they know about arithmetic and life in general to imagine a situation that represents the details in the problem. He suggested that learning occurs when readers can use their own relevant knowledge to think about, perhaps rearrange, critique, and retain or discard the content in a text. Picture the master chef following a new recipe for a type of dish that she has cooked many times. Because of her knowledge about ingredients, preparation choices, cooking temperatures, and heat sources, this chef would notice any new features, critique the recipe, keep what she likes, and add to what she already knows about preparing the dish. Learning brings about a change in what readers know, understand, and can do rather than simply what they remember or comprehend.

## Texts for Learning

Learning requires more from a text than comprehensibility. To be sure, comprehensibility serves as a gatekeeper. Readers who comprehend a text have a chance at learning from it. Those who fail to comprehend will learn little without substantial intervention from the teacher. Centuries of scholarship on the features of effective writing accompanied by decades of comprehension research have revealed the characteristics of comprehensible text. Organization is important. Coherent texts are easier to comprehend than incoherent, poorly organized texts. In coherent texts sentences and paragraphs are organized around clear subtopics, and the overall text follows a well-known genre, such as argument or explanation. If the text has introductions, transitions, conclusions, paragraph topic sentences, and signal words that highlight this organization, readers will comprehend it better than they will a text without these features. In addition to organization, comprehension is affected by familiarity and interestingness. Readers comprehend texts better that are maximally informative, neither too familiar nor too unfamiliar, and that include vivid details and examples to capture interest. As important as text comprehensibility is, however, it does not address *what* students will learn from their reading or *whether* they will learn anything at all.

What is worth learning? The philosopher Alfred North Whitehead saw in schooling the potential to teach important understandings that students could use to make sense of the chaotic stream of events that make up experience. In his 1974 book *The Organisation of Thought*, he warned educators, “Do not teach too many subjects, [and] what you teach, teach thoroughly, seizing on the few general ideas which illuminate the whole, and persistently marshalling subsidiary facts round them” (Whitehead, p. 3.) The difficulty, of course, arises in choosing the few understandings to teach.

Ralph W. Tyler, in his classic 1949 book *Basic Principles of Curriculum and Instruction*, proposed five types of important understandings. First, subject specialists believe that the major understandings should come from the design of the knowledge domains themselves. Second, progressives and child psychologists maintain that the goal of education is to produce well-adjusted adults and that student needs should guide the choice of understandings. Third, sociologists, aware of the needs of society, argue that the understandings should be based on

whatever the pressing societal problems are; the goal of schooling is to produce good citizens. Fourth, educational philosophers point to important basic life values as a guide, because they believe that the goal of education is to produce an ethical populace. Fifth, educational psychologists explain that the understandings must be developmentally appropriate; the goal of schooling is to teach something. No curriculum could effectively incorporate everything worthwhile. Therefore, Tyler suggested that curriculum designers use their philosophy of education and what they know about educational psychology to decide which understandings to include from student needs, society needs, and the domain.

Besides being comprehensible and presenting valuable content, certain types of texts are intentionally instructional, designed specifically to enhance reader learning. Argument and explanation, two familiar genres, are particularly effective instructional text types. Both genres marshal subsidiary facts around general ideas, the optimal instructional approach for teaching important understandings according to Whitehead. Argument offers facts and examples to support a claim, or general statement. Twelfth graders studying the judiciary might read a text that presents details about court decisions in order to argue, “Through its decisions, the Supreme Court has a major influence on how the trials in lower courts are conducted.” Explanation presents facts, examples, illustrations, and analogies ordered logically to guide a reader from an everyday understanding toward the understanding of an expert. Fourth graders might read an explanation of electricity that introduces the scientific model of electric circuits. The explanation could begin by describing the everyday experience of turning a light switch on and off. Next it could present the steps for building a simple circuit and examples of circuits that light lamps, houses, and entire towns. The explanation could display diagrams with arrows that show how electricity moves in each of the circuits. It could conclude with a description of the atomic model and accompanying diagrams. Text features can substantially affect student learning.

## Reader Characteristics

In order to comprehend a text, integrate the ideas in the text with what they already know and understand, and then construct a model of the situation in the text, readers must be able to capitalize on a text’s comprehensibility and instructional features.

Reader knowledge is crucial. Readers who are familiar with a text's topic can rely on what they know to recognize important ideas and distinguish them from details. They can readily identify the meanings of familiar words in the text and can use what they already know to infer the meanings of unknown words. If they also know common text patterns and how they are signaled in introductions, conclusions, transitions, and topic sentences, readers can connect the separate ideas in the text into a coherent whole that resembles the text. Knowledge about arguments and explanations may be particularly important. Readers who expect to recognize and learn new ideas from reading these two genres will be far more likely to learn the ideas than readers who are oblivious to them.

But learning requires special reading strategies beyond what readers must know to be able to comprehend. In a 1997 article Susan R. Goldman, a cognitive psychologist, reviewed the extensive work on learning strategies, including some of her own work. She concluded that readers who explain and elaborate what they are reading and who have flexible comprehension strategies learn more from reading than readers who do not. The effective explainers actively search for the logical relationships among the ideas in a text. Thinking about the relationships reminds successful learners of related facts and examples from their own knowledge. These strategies lead readers to construct a model of the situation in the text closely intertwined with what they already know.

### The Learning Context

Contexts that effectively promote learning from text set learning as the goal for reading, provide students with comprehensible and "learnable" texts, draw connections between student knowledge and reading, and support and promote student thinking about text. Students may read to complete tasks, to understand activities more fully, to teach ideas to one another, to figure out the important ideas in a text, and to prepare reports, arguments, and explanations. Each of these learning goals requires that readers connect the ideas in the texts to what they already know. Teachers can promote connections by brainstorming with the students, reminding them of relevant experiences in and outside of class, encouraging them to read from several related texts, and pairing reading and experiential activities. Learning also requires readers to search for the logical

relationships among ideas in a text. Contexts that encourage students to formulate questions, summarize, explain, construct graphic organizers, and apply generic writing patterns teach students to seek out and identify the logical organization in a text. Because these strategies require conscious effort, successful learning contexts include time for students to reflect on the connections that they are making, the logical relationships that they are identifying, and whether they are successfully learning from the text.

The same instructional features that promote learning in general will also support successful learning from text. The text must be comprehensible and present significant content, however, and at least some of the instruction must focus on the ideas presented in the text. For fourth graders learning about electric circuits or twelfth graders learning about the judicial system, whether they learn from reading text will depend on the match among their goals for reading, the characteristics of the text, their reading strategies, and the entire instructional context within which their reading occurs.

## PRIOR KNOWLEDGE, BELIEFS, AND LEARNING

For most students, the process of learning is strongly dependent on their ability to make sense of linguistic information presented in either written or oral form. That is, for most students the process of learning is fundamentally the process of learning from text. The importance of text-based learning is as old as formal education. Yet, during the last three decades of the twentieth century, the concepts of text and learning underwent transformations that significantly influenced the nature of student academic development.

Traditionally, *text* has been viewed as the linear connected discourse typified by textbooks, magazines, or newspapers. This textual form remains a centerpiece of human learning and the source of most of the research in text-based learning. In the 1980s and 1990s other forms of text became increasingly important components in school learning. Specifically, students were also required to learn from the less linear, more dynamic, and more transient messages encountered daily in discussions and online. Thus, students must become conversant with all modalities of text if they are to learn effectively in the decades to come.

Moreover, when considering student *learning*, one must think beyond simple notions about the acquisition of declarative (i.e., factual) knowledge and procedural knowledge (i.e., knowing how to do something). Instead, learning is essentially the process of instigating deep and enduring changes in students' knowledge, beliefs, motivations, and problem-solving abilities. The focus in this entry is on the dimensions of knowledge and belief and their relationship to learning from text. As will become evident, learning from any text is a process inevitably intertwined with one's knowledge and beliefs, both in terms of the knowledge and beliefs one brings *to* the text, as well as the knowledge and beliefs one derives *from* it.

### The Text

Not surprisingly, the process of learning from text depends significantly on the genre, structure, and quality of the messages students encounter in books, in discussions, and online. For example, students must deal with texts written to tell a story (i.e., narrative), those that convey information (i.e., exposition), and those that are some combination of both (i.e., mixed text). Each of these genres affects student

learning in different ways. Further, some texts offer only one perspective on a topic or issue, whereas others present multiple, competing views. These varied structures have been shown to influence students' knowledge and beliefs differently. Finally, whether narrative or expository and whether one-sided or multisided in perspective, texts can be comprehensible and coherent or difficult and inconsiderate of their audiences. Such qualities can facilitate or frustrate student learning.

**Text genres.** Research has shown that text genre influences student learning. Narratives, such as myths and novels, are expressions of actual or fictitious experiences. Because of their common story structure and overall appeal, narratives are often easier forms of text to process. Also in narration, interesting segments are often important ideas to be learned. This perhaps explains why most students learn to read using narrative texts.

In contrast, expository texts (e.g., newspapers, encyclopedias) present information that explains principles and general behavioral patterns. Many subject-matter textbooks employ exposition. They are characteristically dense with facts and concepts and are often considered to be rather dry in style. Also, interesting and important content are likely to diverge in exposition. While exposition becomes increasingly prevalent as students move out of the early elementary grades, students are given little explicit instruction in how to learn from such texts, which might help explain students' difficulties in learning from their course textbooks.

A mixed text, by comparison, possesses properties of both narration and exposition, as when textbooks incorporate personally involving information about central figures. Biography is one of the most common examples of mixed text. One problem with mixed texts is that students are often uncertain about what is factual versus what is fiction. Interesting and important content might also diverge in mixed texts as it does in exposition.

**Argument structure.** Within each genre, texts can be written to conform to particular text structures (e.g., essay or argument). Texts characterized by an argument structure, for example, often open with a claim about a topic and then follow with supporting evidence. This format closes with a warrant, restatement, or summary of the claim and supporting evidence. Texts with an argument structure are often employed to alter students' knowledge and beliefs,

so studies employing various forms of argument structure appear in the literature on changing knowledge and beliefs.

In addition, a given text can have multiple arguments embedded in it. For instance, a substantive finding in the change literature is that texts presenting both sides of an argument and then refuting one side of the argument (i.e., two-sided refutational texts) are more likely to influence students' knowledge and beliefs than other argument structures. By comparison, texts that present only one side of the argument or present both sides in a more neutral fashion may be less likely to alter students' conceptions. Finally, the content or supporting evidence within a given argument also plays a significant role in learning. Students are more likely to believe and comprehend the argument if the supporting evidence comes in multiple forms (e.g., graphs, stories, and examples) or if the evidence includes personally relevant scenarios rather than consisting only of graphs and statistical data.

**Textual quality.** Among the multiple factors that contribute to text quality and subsequent learning are comprehensibility and text credibility. Simply put, when students understand the intended message in the text, text-based learning is more likely to take place. In a 1996 article Patricia A. Alexander and Tamara L. Jetton suggested that problems in text comprehension limit the acquisition of knowledge. Also, students must be able to judge the communication as coming from a reliable source. While students will likely judge textbooks as credible, this may not be the case for online materials, magazines, or newspapers. Text credibility is enhanced, however, when the message is judged as unbiased and if the author or communicator is perceived as an expert.

### The Learner

In addition to the genre, structure, content, and quality of the text, characteristics of the learner also play an influential role in text-based learning. Specifically, learning from text is mediated by a number of variables including one's prior knowledge and preexisting beliefs.

**Knowledge.** Of all the factors relevant to text-based learning, none exerts more influence on what students understand and remember than the knowledge they already possess. This background or prior knowledge serves as a scaffold for obtaining new knowledge. The term *prior knowledge*, in effect, rep-

resents individuals' mental histories or their "personal stock of information, skills, experiences, beliefs, and memories" (Alexander, Schallert, and Hare, p. 317).

Moreover, both the accuracy and extent or depth of one's knowledge seem to be critical factors in learning from text. For instance, changing students' understanding about a rather well-defined concept (e.g., the speed of falling objects) is more difficult when an individual's prior knowledge is less sophisticated or runs counter to the scientific knowledge presented in the text. The use of a two-sided refutational text that specifically counters students' naive or ill-formed concepts has proven effective under such circumstances.

The amount or level of an individual's knowledge also plays an influential role in the learning. It is relatively easier to change individuals' ideas about a particular topic if they possess some, but not too much, relevant knowledge. Individuals who are or who believe they are quite knowledgeable about a topic may feel that they have less to gain from engaging with a text message on that topic. Indeed, several studies have found that readers' perceptions of what they know (i.e., perceived knowledge) is critical and possibly even more predictive of learning than the amount of relevant knowledge they actually display (i.e., demonstrated knowledge).

**Beliefs.** Like knowledge, beliefs play a fundamental role in what students learn from text. One's beliefs are idiosyncratic, the result of the accumulation of experiences over the course of one's life. Unlike knowledge, however, definitions of beliefs vary widely from philosophy to psychology to education. Most agree that beliefs generally pertain to psychologically held understandings, premises, or propositions about the world that are felt to be true. As such, beliefs have much in common with concepts such as attitudes, values, judgments, opinions, dispositions, implicit theories, preconceptions, personal theories, and perspectives. In fact, the word *belief* is often used interchangeably with these terms. Also, the valence of truthfulness often associated with beliefs seems to give them even greater importance within text.

Perhaps one of the most important aspects about beliefs and text is the degree to which one is aware of them. While students have many beliefs that guide their actions, these beliefs may reside at the tacit level, and students may be unaware of their existence. Indeed, researchers contend that beliefs

are organized in such a way that certain beliefs—the more central ones—become connected to other beliefs and are more resistant to change. Further, beliefs may be organized in clusters, allowing incompatible beliefs to be held apart in separate clusters and thus protected from each other.

The more embedded individual beliefs or clusters of beliefs become in one's belief system, the more difficult it is to change them. Nevertheless, when individuals are presented with causal explanations concerning people, objects, or events, they are likely to change or alter their beliefs, even if they are deeply embedded. It would seem that the reading and discussing of argument texts helps to bring embedded beliefs to an explicit level where they are more open to alteration. Finally, as is the case for changing or altering one's knowledge, belief change is more likely to occur when individuals read well-written, comprehensible texts. Certainly, the learning and processing of written or oral text is an intricate endeavor involving the interaction of the learner *with* the text.

#### TEACHING OF

Reading instruction began in the United States in the early and mid-1600s with the ABC method exemplified by the hornbook, a paddle-shaped board on which were inscribed the alphabet, a few syllables, and the Lord's Prayer. *Webster's Blue-Backed Speller* replaced the hornbook, but instruction retained an emphasis on the alphabet and the Bible. *Webster's* remained at the center of reading instruction for more than a century and served mainly the upper class, as few others attended school. Those who did not attend received their education by being read to by those who did. Thus, a focus of instruction was on oral reading skills.

When the United States expanded westward, the widely dispersed people could not be serviced by a

few who attended school, and everyone, those on the eastern seaboard and elsewhere, needed to learn geography and history. In 1842, in an effort to make learning to read easy for the diverse students who now attended school, Horace Mann introduced his word-to-letters approach, which employed the opposite sequence for instruction as the letters-to-words approach (that of the ABC method and *Webster's*). Eventually Mann's approach became the whole-word approach, where little attention was given to letters.

The most common texts during this time were the McGuffey Readers, 122 million copies of which were sold between 1836 and 1920. The selections not only taught history and geography but also praised the virtues of hard work and honesty. They were read orally in classrooms and were the only source of knowledge and literature for many Americans.

In 1875 Francis Parker entered the picture with his emphasis on silent reading for the purpose of greater understanding. The pronunciation of words while reading orally was no longer a sign of a good reader. When World War I began, however, 24.9 percent of the soldiers could not read and write well enough to perform the simple tasks assigned to them. Instruction needed to change, and John Dewey led the way with an emphasis on a child-centered curriculum designed to accommodate individual differences.

Discontent with the numbers of students who continued to experience difficulty in learning to read, however, led William S. Gray to move away from student-centered instruction to a model where all students received identical lessons. He developed basal readers and created the first manuals with instructional advice for teachers. His "Dick and Jane" series, launched in 1930s, consisted of passages with increasingly difficult words instead of selections of literature. His characters, drawn from successful, suburban families, became the symbols of reading instruction at the time when the United States was emerging from the depths of World War II.

In the 1960s many reading instructors, worried about the students who continued to experience difficulty, started to return to a version of the old ABC method; they placed great importance on the sounding out of words. Phonetically spelled words in reading instructional materials became increasingly popular. Selections became even further removed from the literature selections that were favored in previous decades.

Also in the 1950s and 1960s, the differences among students expanded dramatically, and the civil rights movement brought African Americans into the mainstream public schools. As always, the evolution of the nation influenced reading instruction; many students experienced difficulty, and the search for the best method of instruction continued. In 1968 Robert Dykstra conducted a nationwide survey to find the most effective means of reading instruction, but he concluded that teacher behaviors were more influential than any particular instructional method in determining student success as a reader.

A few years earlier, in 1965, Kenneth S. Goodman's report on miscue analysis practices started to influence instruction; teachers were no longer to correct every error a student made when reading orally. If an error did not affect meaning, it was considered a sign of good comprehension. In the late 1970s Dolores Durkin, in an effort to further refine comprehension instruction, observed in classrooms and found that teachers were not teaching students strategies to use in order to compose meaning as they read. Instead, teachers asked students questions to find out if they understood what they read.

Instruction in comprehension evolved as schema theorists studied the influence of students' previous experiences on their comprehension. Teachers started to focus more attention on the inferences students needed to draw between their prior knowledge and the texts they were reading. By the late 1990s dual emphases on phonemic awareness and composition brought both comprehension (the act of composing meaning) and skills (attention to the details of letters and words) to the forefront of reading instruction.

### Research on Reading Instruction

The first research on reading instruction was in the form of surveys of teaching methods and was begun in the early 1900s. In 1915 the results of reading tests were first used to compare teaching methods, and in 1933 Gray used reading tests to measure improvements in several Chicago schools.

In 1963 researchers Mary C. Austin and Coleman Morrison surveyed more than 1,000 U.S. school administrators about reading instruction and found a high reliance on basal readers and ability grouping (separating students into reading groups based upon their reading achievement levels). They recommended that teachers use a wider variety of instructional

approaches and more flexible grouping plans, as differences will exist in any group despite efforts to achieve homogeneity. This survey was modified and replicated in 2000 by James F. Baumann and colleagues, and the results were compared to the original. The results of the 2000 surveys showed that basals were being used in combination with trade books and that the predominant mode for instruction had become whole-class instruction. Thus, the 2000 survey hearkened back to the earlier study where the researchers found “teachers who ignore the concept of individual difference” (Austin and Morrison, p. 219).

Large-scale, systematic comparisons of various approaches to beginning reading instruction, using objective measures of outcomes, were conducted in the 1960s and 1970s. The U.S. Office of Education sponsored the Cooperative Research Program in First Grade Reading Instruction, finding that no one program or single instructional method was superior for all classrooms or teachers. Project Follow Through, a second government study of the same era, sought specifically to determine which instructional approaches worked best to foster and maintain the educational progress of disadvantaged children through the primary grades. Again, no one instructional approach was strong enough to raise reading test scores everywhere it was implemented.

The quest for the best methods of reading instruction has continued into the twenty-first century. In 1997 the U.S. Congress authorized a national panel to assess the effectiveness of various instructional approaches to teaching reading. The National Reading Panel (NRP) conducted a meta-analysis of the effects of scientific research (experimental or quasi-experimental research) on reading instruction. The NRP limited their review to the major domains of instruction deemed essential to learning to read by the National Research Council. These domains included alphabets (phoneme awareness, phonics instruction), fluency (oral reading accuracy, speed, and expression), and comprehension (vocabulary instruction, text comprehension instruction, strategy instruction).

In the domain of alphabets, the NRP reported that teaching children to manipulate phonemes in words was highly effective under a variety of teaching conditions with a variety of children. In addition, systematic phonics instruction produced significant benefits for students in kindergarten through the sixth grade. In the domain of fluency, the panel con-

cluded that guided, repeated oral reading procedures yielded significant and positive impacts on word recognition, fluency, and comprehension across a range of grade levels. In the domain of comprehension, the panel concluded that vocabulary instruction led to gains in reading comprehension and that seven types of comprehension instruction were supported by the scientific research.

Another form of research in reading instruction consists of qualitative, descriptive research within classroom settings. It includes observational studies that link classroom procedures and interactions to student outcomes and teacher behavior. Such research has the potential to distinguish between the characteristics of an instructional method and how it is actually used. According to Rebecca Barr, descriptive research “complements the research on effectiveness by revealing how an instructional approach works and how teachers differ in using it” (2001, p. 406).

Classroom observational research linked critical features of the Project Follow Through studies to student outcomes. These studies revealed high correlations between the amount of time that students were engaged in academic tasks and their academic growth. The work of these researchers influenced much of the research on effective teaching practices conducted in the late 1970s and 1980s.

Ethnographic, sociolinguistic, and other descriptive studies of reading instruction view teaching and learning as responsive, interactive forms of socially constructed activity, and such studies capture a more complete picture of instructional contexts than research labeled scientific does. Qualitative, descriptive research has revealed that interactive learning produces more growth than instruction in which students are passive. Active engagement appears to be more important than the exact method of reading instruction.

### **Reading Instruction within the Overall Curriculum**

Prior to the 1980s reading instruction barely existed within the content areas of the curriculum; reading was taught during times of the day called *reading* and/or *language arts*. Within the content areas, students were given textbooks and were expected to be able to read them. But because one textbook did not accommodate the reading levels of all learners, secondary teachers often used the textbooks to deter-

mine the content they would teach and delivered lectures accordingly. Elementary students often engaged in round-robin reading as their way of using the text. At all levels, students wrote answers to end-of-the-chapter questions, so that teachers could assess their student's retention of the content.

During the early 1980s the textbook began to lose its position as the sole source of subject area knowledge. Teachers started to use manipulatives (small objects such as beans and buttons that students count and move about into various groupings) to teach math, hands-on activities to teach science, and community resources to teach social studies. They supported this instruction with a variety of children's literature, rather than a single textbook. Based upon a new view of reading largely influenced by theories on meaning-making in reading that Goodman and Frank Smith put forth, even the basal readers used to teach reading started to contain more natural-sounding language.

In the 1990s falling test scores and a new political climate forced a reexamination of reading instruction within the curriculum. Researchers, teachers, administrators, and government officials formed a set of national education goals called Goals 2000. They did not agree, however, upon the approaches needed to meet these goals. Various approaches, therefore, continue to influence the direction of reading instruction in the curriculum.

One of these approaches advocates the teaching of a specific body of knowledge found within state curriculum standards. Educators create these standards to reflect the content they believe is essential to the formation of a common knowledge, and teachers use these standards to guide their instruction. Teachers across grade levels work in collaboration to ensure that the content builds in a manner that allows students to use prior knowledge and make meaningful connections across the curriculum. Teachers access online resources and handbooks for a multitude of instructional suggestions.

Thus, reading instruction related to state-directed content involves the use of textbooks, trade books, computer programs, lectures, demonstrations, specific writing models, and hands-on activities, thereby providing students with opportunities to learn the material in a variety of ways. Reading materials on many reading levels address much of this content, and schools provide additional support to students who struggle. In these various instruc-

tional arrangements, students learn the reading and writing strategies they need in order to learn about and share knowledge.

Another approach to reading instruction across the curriculum focuses on the contexts present in the classroom, rather than upon a body of content. Researchers and teachers explore interactions among the learners, the teacher, the classroom, and the texts. These interactions lead to instructional arrangements unique to individual classrooms, in which the students use their own knowledge, interests, and personal cultures to make the curriculum meaningful and to create new understandings.

In 1998 Vivian Gadsden endorsed this contextual approach in response to the increasing diversity of classroom populations. In her collaborations with primary-grade teachers, the teachers incorporated a wide range of literacy experiences specific to the cultures of the students and involved students' extended families and community in planning the endeavors. These literacy events crossed the curriculum, becoming part of the family histories students wrote with family members. Students compared their histories to texts found in the classroom, building critical literacy.

Similarly, students in some urban high schools study U.S. history in accordance with their personal histories. They move beyond textbooks, using personal artifacts, historical documents, magazine articles, and photographs in their compositions. In these different grade level contexts, reading instruction involves learners in making connections among various texts, themselves, and the world.

Text-based and context-based approaches continue to define the role of reading instruction in the curriculum during the early part of the twenty-first century. New programs advocating a core curriculum, developed outside the classroom, arise at the same time that teachers and researchers develop new instructional arrangements based upon classroom contexts. In 1992 Judith A. Langer and Richard L. Allington urged researchers to reconceptualize reading and writing instruction within the curriculum, to abandon fragmentation of study, and to consider "the relative roles of content, skills, discipline-specific thinking, and the student in the instructional agenda" (p. 717).

### **Trends, Issues, and Controversies**

Increased immigration in the early twenty-first century is bringing more changes to U.S. schools. In

1993 Kathryn H. Au wrote about the need for teachers to consider the various forms of literacy that are significant in the lives of students of diverse backgrounds and to include critical literacy in their instruction.

Paulo Freire, a Brazilian educator, brought the notion of critical literacy to his country in the late 1960s, and at the turn of the millennium his work began to influence reading instruction in the United States. It is becoming increasingly important for students to critique power relationships within U.S. society.

In 2002 Arlette Ingram Willis reported on her study of the complex relationships among literacy, knowledge, privilege, and power through the lens of one institution, the Calhoun Colored School in Alabama from 1892 to 1945. She showed how the school's white founders controlled the aspirations of the school's students. Willis acknowledged the failure of countless attempts to discover the best methods of reading instruction but implored educators to remember the relationship between knowledge and power. She urged literacy instructors to critically examine the ways by which they provide opportunity for all.

This call for complexity in instruction becomes even more complicated when the nature of research enters the picture. Of the three types of research on reading instruction, the scientific method has predominated since the early twentieth century. Increases in the quantity of experimental studies have paralleled increases in immigration and scientific advances, from the beginning (the Industrial Revolution) to the end (the Technological Revolution) of the twentieth century.

According to Barr, however, this methodology treats teaching as a unidirectional variable, "an activity introduced to observe its effect on some outcome" (2001, p. 406). While outcome-based research on reading instruction yields important information about the effectiveness of instructional approaches, it does not reveal how the instructional approach works and how teachers differ in using it. Observations are necessary to elucidate the reality that scientific methods are supposed to discover. Socioconstructivist approaches to research in reading instruction examine teaching and learning in an interactive context and allow interactions among the teacher, student, and text to be seen.

These approaches have their dangers too, for if all classrooms are unique, then teachers will never

benefit from the generalizations made possible from broad-based conceptualizations of teaching that guide the critical decisions teachers make in providing instruction. Detailed descriptions are helpful when they show the day-to-day decisions teachers make when they select appropriate reading materials; achieve an effective balance of reading, writing, and word study instruction; differentiate instruction to meet diverse student needs; and empower students to take ownership of their own learning.

This call becomes complicated in the context of the standardized tests that influence reading instruction across the curriculum at the beginning of the twenty-first century. Given that many states use the results of the tests to determine school funding, teachers and school administrators often base the curriculum on the knowledge needed to answer specific items found within the tests. Teachers choose reading materials pertinent to the test content and focus reading instruction on retention of this material in the subject areas.

Educators use various kinds of reading materials to teach the above information, but textbooks occupy an important position in many classrooms. In 2000, however, Suzanne E. Wade and Elizabeth B. Moje reported on the lack of engagement of secondary school students in textbook reading. Wade and Moje advocated change and described classrooms that integrate the textbook with government documents, magazines, student-generated texts, novels, and hypermedia to provide students with opportunities to expand their perspectives on curricular concepts.

Also in 2000, the National Reading Panel reported on the lack of research into the use of technology in reading instruction in the curriculum. Given the workplace emphasis on accessing, processing, and communicating information via computers, and the increasing number of schools and homes with computers and Internet access, the roles of hypermedia and the Internet remain important areas for future exploration.

## VALUE OF READING ENGAGEMENT FOR CHILDREN

Educators have become increasingly interested in the role that reading engagement or volume—the

amount of print children are exposed to—plays in the growth of academic achievement. In the early twenty-first century, it is believed that reading activity itself serves to increase the achievement differences among children. Children who are exposed to more literacy experiences early in their development are positioned to take advantage of the educational opportunities presented to them in preschool and elementary school. In contrast, children who are largely unfamiliar with print find themselves less able to take advantage of those same educational opportunities. This reciprocal relationship is observed in the social and cognitive contexts of school and home. A model of these effects in reading has been emerging in the literature. Reading engagement is thought to be deeply intertwined and a contributing factor to the escalating differences observed among children in their reading achievement. Thus, on the basis of available evidence, there appears to be a strong rationale for educators and policymakers alike to call for increased amounts of reading volume or engagement in young children as means to improve their reading achievement.

### **The Importance of Reading Aloud to Children**

Reading aloud to children has been broadly advocated as an important educational practice in which to foster reading volume. Parents and teachers have been increasingly encouraged to read aloud to young children as a developmentally appropriate practice by professional societies such as the International Reading Association for the Education of Young Children. These reading experiences have been shown to provide a host of benefits to the young child. In addition to the socioemotional benefits of sitting in a parent's lap, many aspects of language and cognitive development are thought to be facilitated. For example, reading aloud to children has been found to facilitate the growth of vocabulary in preschool-age children and elementary-age students. Reading aloud has been shown to promote children's understanding of academic language of text, which differs significantly from oral language. This practice also introduces novel concepts of text structure and story grammar and provides an important avenue for learning about the world. One of the most commonly held beliefs regarding the value of reading aloud to young children is that such exposure will introduce them to the world of print and motivate them to seek out these experiences on their own. These outcomes are all important predictors of

children's reading achievement, yet it appears the effects of reading aloud to children are limited to certain facets of language and literacy.

### **Does Reading Aloud to Children Teach Them How to Learn to Read?**

A common hypothesis, held by many educators and parents, is that one of the primary benefits of reading aloud to children is the promotion of children's literacy development. Specifically, some researchers have argued that reading aloud to children is an effective and natural way for them to learn to read. Via a series of successive approximations while being read to, the young child will learn how to decode and recognize words. That is, the practice of reading aloud to children is thought to be an important mechanism (and for some the primary one) in learning to read and can explain individual and group differences in literacy growth among children. Although it makes sense intuitively that reading aloud should facilitate general literacy development, this hypothesis merits empirical investigation to understand under what conditions and for what readers reading aloud facilitates children's reading development. While it is difficult to isolate the literacy gains that accrue from reading aloud to children, one must attempt to compare this variable to the impact of other educational practices or experiences when inferring causality about certain practices.

Although many studies have shown a strong to moderate relation between reading aloud to children and their subsequent reading achievement, these studies failed to control for numerous mediating variables. The studies that attempted to tease apart the relative contribution of the time parents spend reading aloud to their children and determine the effect of this practice have demonstrated relatively low correlations when compared with other predictors such as promoting phonemic awareness (the ability to attend to the sounds of language and manipulate them) and letter-name knowledge (the ability to quickly name letters). David Share and colleagues' comprehensive study from 1984 indicted that parents reading aloud to their children made a weak indirect contribution to developing literacy and that children's phonemic awareness was a far more potent indicator. In the early 1990s Hollis Scarborough and her colleagues determined that other variables—such as early language, interest in solitary book reading, and emergent literacy skills—were significantly more predictive of later reading achievement. The

results of yet another large-scale study by Jana Mason suggested that when compared to other individual differences in children's abilities, reading aloud to children was a less direct and relatively weaker predictor of children's reading achievement. Parallel results have been observed through the examination of the contribution of teachers' reading aloud to their students and the students' subsequent growth in decoding and word recognition skills. Many of the studies demonstrate weak or moderately facilitative effects, whereas a few have even observed negative effects of reading aloud to children, which should be interpreted as largely owing to the displacement effect of reading to children instead of teaching them to read.

In the domain of children's beginning word recognition skills, the research is demonstrating that read-alouds by parents and teachers play a limited role. Yet when parents and teachers scaffold or help a child's attempts to read the words in a story (compared to reading the words out loud to the child), stronger effects are observed. The National Reading Panel Report in 2000 summarized the research demonstrating that the primary mechanism for acquiring fluent word recognition skills (e.g., letter knowledge, sound-symbol correspondences, decoding words and recognizing them automatically) is not through being read to but via methods that entail guided or direct instruction.

### Guided Reading and Reading Aloud to Children

In addition to direct instruction, guided oral reading is emerging as an important form of reading volume, particularly for beginning readers. Guided oral reading encourages children to read text orally and includes systematic, explicit guidance and feedback from their parent or teacher. In 1999 Linda Meyer and colleagues juxtaposed the practice of teachers reading *with* children (guided oral reading) versus reading *to* them (read-alouds) as different mechanisms for increasing reading engagement. In contrast to reading aloud to children, reading with children is a more effective practice for promoting reading skill and fluency. In 1997 Steve Stahl and colleagues provided further support for this conjecture. They observed significant differences in students' reading fluency and comprehension levels as a result of teacher-guided reading practices in a comprehensive study of second-grade students. Meta-analyses of guided oral reading have further demonstrated the value of this instructional practice

in promoting word recognition, fluency, and reading comprehension across a range of grade levels.

In conclusion, the emphasis on immersing children in literature and increasing their exposure to print is an educational practice that makes sense. Nonetheless, there are multiple purposes and mechanisms for fostering reading engagement and volume that must be considered. When discussing the value of reading engagement and volume, one should attempt to specify the purposes of these practices, especially when making causal attributions. Reading aloud to children is an important educational practice that promotes vocabulary growth, understanding of text and genre, general knowledge, and hopefully motivation to read. In contrast, guided oral reading is a practice that has been found to be a more effective method of promoting children's word recognition, fluency, and comprehension. The primary aim of these educational practices is to foster independent reading.

The variability in children's levels of reading volume serves to further exacerbate the growing disparities between good and poor readers. It is therefore essential to provide multiple reading experiences for young children: reading aloud to them from a variety of genres, reading with them and facilitating their oral reading with tailored feedback and guidance, and promoting extended independent reading opportunities at home and after school. If reading makes one smarter (as some research has found) and if reading is important for a child to get off to a successful early start for future reading ability and engagement, then the value of early reading engagements, as Anne Cunningham and Keith Stanovich have found, and volume across a variety of venues cannot be overestimated.

ANNE CUNNINGHAM

## READING DISABILITIES

The concept of reading disability, while widely accepted, is not clearly understood. Traditionally, reading disability has been defined as unexpected underachievement characterized as a discrepancy between achievement and intellectual aptitude, despite adequate opportunity to learn and in the absence of sensory difficulties or cultural deprivation. This discrepancy is typically defined operationally in terms of a difference between IQ and scores on a test of reading achievement. The specific discrepancy necessary to qualify varies from state to state. Children who conform to this definition qualify for special education services under the learning disabilities label, whereas children who do not conform do not qualify, even though they may experience serious difficulties in becoming competent readers. While some low-achieving students who do not demonstrate the stipulated achievement-aptitude discrepancy may receive supplemental reading instruction in compensatory education or dyslexia programs, in

many locations they receive no extra attention. A small number of schools qualify students as having learning disabilities based on professional judgment rather than IQ-achievement discrepancies, so that these students can receive reading assistance.

### Historical Context

The concept of unexpected underachievement has appeared in the literature since the middle of the nineteenth century. The term *learning disability* (LD) first appeared in 1962, when Samuel Kirk applied it to unexpected difficulties in the areas of language, learning, and communication. In 1969 the Learning Disabilities Act made special education services available to students with LD. The category was reaffirmed in 1975 with the passage of the Education for All Handicapped Children Act. The concept of LD remains basically unchanged in the current authorization of the Individuals with Disabilities Education Act (IDEA). In the early twenty-first century more than 80 percent of students classified as learning disabled are identified as having a reading disability.

### Types of Reading Disabilities

The most widely recognized and researched reading disability is associated with difficulty with reading single words. This type of difficulty is the most pervasive characteristic of dyslexia. These single-word-reading problems are thought to be based on an underlying phonological processing core deficit. Persons with dyslexia experience great difficulty in applying the alphabetic principle to decode words quickly and efficiently. The result is that decoding is labored, fluency is poor, and comprehension is negatively affected.

A less common and poorly researched reading disability is associated with poor language comprehension. While much less frequent than decoding difficulty, this disability affects some persons who have normal phonological processing skills but who demonstrate difficulty in formulating main ideas, summaries, and inferences. This difficulty is demonstrated when listening to, as well as reading, text.

A third group of students who experience great difficulty in learning to read are those who experience both decoding problems and language comprehension problems. So far, little research has been conducted with these students. It can be argued, however, that students in this last category have the greatest needs and the most severe reading disabilities.

### Validity of the Discrepancy Model

Educational leaders and researchers have been questioning the validity of the definition of reading disability in terms of an aptitude-achievement discrepancy. Proposals under study in the early twenty-first century would identify a student as having a reading disability based on the growth of reading performance across time in response to quality instruction.

A convergence of research evidence has called into question the validity of the discrepancy models. Three groups of researchers have conducted meta-analyses of studies addressing the question of differences between students identified as having LD and other struggling readers.

Doug Fuchs and his colleagues examined seventy-nine studies that compared poor readers with and without the LD label. Across studies, and across many substantive and mythological variables associated with the studies, the mean-weighted effect size describing the difference between students identified as having LD and other low-achieving readers was 0.6 of a standard deviation. In other words, the LD-identified students on average performed worse on measures of reading than other low-achieving readers. The effect sizes were more pronounced on timed reading tests, and they were larger for students at higher grade levels. Interestingly, the difference between LD and low-achieving readers was greatly diminished when analyses were run only on researcher-identified LD samples, thereby eliminating school-identified samples. This finding suggests that schools identify LD as the lowest of the low performers.

The difference between school-identified and researcher-identified LD samples is an important distinction. Researchers are much more likely to apply IQ-achievement discrepancy criteria. Schools, however, are more likely to identify students who have IQs in a range that identifies them as having mild mental retardation or to use professional judgment, despite lack of a discrepancy, to label students as having LD. Thus, it would seem that schools are actually identifying more seriously impaired readers as having LD than strict application of the definitions would permit.

Looking specifically at the validity of discrepancy models, Maureen Hoskyn and H. Lee Swanson (2000) coded nineteen studies that met certain criteria for the definition of the IQ-discrepant and

IQ-consistent (nondiscrepant low-achieving) groups. Hoskyn and Swanson found that students in the two groups had minimal differences on measures of reading and phonological processing and had larger differences on measures of vocabulary and syntax.

Similarly, K. K. Stuebing and colleagues, in another study, coded forty-six studies that clearly defined groups of readers as IQ-discrepant or IQ-consistent, with the primary research question focusing on the validity of the use of aptitude-achievement discrepancies to categorize struggling readers. The researchers found little support for the validity of discrepancies for the classification of students as LD. There were negligible differences between the IQ-discrepant and IQ-consistent groups on measures most closely associated with reading. Taken together, these three syntheses suggest that there is little basis for continuing to base qualifications for special services on current discrepancy models.

Beyond the fact that the current model lacks validity, it tends to favor students with higher IQs, as it is difficult for a student with a low IQ to exhibit achievement scores low enough to qualify for the discrepancy. There is at best, however, a questionable relationship between IQ and the way students respond to early intervention. Five studies conducted between 1997 and 2000 found no relationship between IQ and intervention outcomes. One study found a small relationship between IQ and outcome on one of three outcome measures. David Francis and colleagues found in 1996 that IQ-discrepant and IQ-consistent groups had no significant differences in progress from kindergarten through high school.

Further, the use of the exclusionary criteria in the current definition of LD can result in the withholding of services to students from culturally different or impoverished backgrounds. Given the strong correlation between oral language development and socioeconomic level, it is likely that many children from impoverished families would experience difficulties with phonological processing and in language comprehension. Further, factors associated with inadequate instruction, emotional disturbance, and poverty may actually cause differences in neurological and cognitive development that lead to severe learning difficulties. The current definition of LD makes it all too likely that students experiencing difficulties stemming from these situations will be excluded from receiving services.

Another problem with using a discrepancy model to identify reading disabilities is that it is very difficult to detect discrepancies early. Typically, children have to fall behind before the discrepancy is identified. Thus, the use of IQ-achievement discrepancy is inherently a “wait to fail” model. The problem with waiting until a child fails is that reading problems become intractable as children age. Thus, it is important to begin intervention with children very early.

### **Changing Criteria for Reading Disability**

Rather than focus on whether a child has an IQ-achievement discrepancy, current proposals recommend that determination of reading disabilities be made based on an examination of response to quality intervention. This response to treatment would be determined using ongoing, frequent measures of word recognition, fluency, vocabulary, and comprehension, as well as subskills that correlate strongly with reading development, including phonological awareness (the ability to blend and segment sounds in speech), rapid naming, and phonological working memory.

A convergence of research indicates that early intervention in the primary grades is effective in preventing reading problems for most children and that, for those who continue to experience difficulty, the depth of the reading problem can be greatly reduced. In their 2001 analysis of response rates to interventions in five studies, G. Reid Lyon and colleagues estimated that the number of students experiencing serious reading problems could be reduced from about 20 percent to 5 percent or less of the school population through quality early intervention.

### **A Three-Tiered Approach to Intervention**

Current proposals recommend a three-tiered model of reading intervention. On the first tier, classroom-level general education instruction is improved. Research suggests that this first level of intervention is adequate to reduce substantially the large numbers of struggling readers. For example, in 1998 Barbara Foorman and colleagues found that classroom-level explicit instruction in phonological awareness and the alphabetic principle as part of a balanced approach to reading brought the majority of students in grades one and two in eight Title I schools to national averages. More recently, in 2002, Joseph Torgesen and colleagues demonstrated that the vast

majority of struggling first-grade readers in middle-class schools could attain above-average reading performance through quality classroom reading instruction alone.

Children who still experience difficulty after quality classroom-level instruction move into the second tier, which incorporates more intense interventions presumably delivered within general education in small groups. There are many examples of successful secondary-level interventions. In 1997 Torgesen and colleagues identified children in kindergarten who had poor phonological awareness. By second grade, intervention brought 75 percent of these children to grade-level reading. Frank Vellutino and colleagues in 1996 identified middle-class children with very low word recognition skills at the beginning of first grade. After one semester of intervention, 70 percent were reading at grade level. After two semesters, more than 90 percent were at grade level.

In the three-tiered intervention model, only after these two levels of interventions have failed would a child be considered reading disabled, requiring tertiary intervention. Tertiary intervention is typically described as having greater intensity and duration than secondary intervention. Presumably, at this point special education services would be provided.

Under this three-tiered model, there would be provisions for (1) early identification of children at risk for reading failure, followed by (2) carefully designed intense early reading instruction incorporating an emphasis on systematic, explicit instruction in alphabetic reading skills balanced with meaningful experiences with authentic texts and writing, and (3) continued support beyond the initial acquisition of reading skill to ensure continued academic growth into the upper grades. Thus, all students who are identified as at risk for possible reading problems would be provided with intervention within general education. Only children who do not make adequate progress would be considered for a reading disabilities label. This label, however, would not be based on IQ-achievement discrepancies, but rather on inadequate response to intervention.

### Quality of Intervention

The success of the three-tier model hinges on ensuring that instruction at each of the three levels is of high quality. As a result, it would unify general, spe-

cial, and compensatory education services into one adaptable unit and would require that all teachers involved in the process be provided with ongoing staff development and mentoring in the critical content of effective reading instruction. This critical content includes instruction that supports the development of phonological awareness, letter knowledge, and concepts of print in emergent readers. This type of curriculum ensures acquisition of accurate and quick word recognition skills and increases the speed and ease of reading connected text. Instruction linked to extensive engagement with authentic literature gives students the opportunity to learn new vocabulary and to acquire strategies such as making inferences, identifying main ideas, and summarizing text.

### Lingering Questions

Although there is substantial research evidence regarding effective models of reading intervention at the primary (classroom) and secondary levels, it is not yet known whether a three-tiered reading intervention model can be consistently implemented to identify students in need of more intense special services. Further research is necessary to validate this model as practical and accurate. A primary question focuses on how such a model based on instructional practices that have been validated in research projects can be “scaled up” to be implemented successfully within many school contexts.

Research has focused on classroom-level and secondary-level intervention that impacts the majority of students. What is much less clear is the content of tertiary instruction. Little has been done to follow up and provide additional services with the few children who have made poor progress in secondary intervention models. Thus, there is little guidance as to what will be required to promote adequate progress among this small set of impaired readers.

Likewise, the bulk of research on the prevention of reading difficulties has focused on the most common type of reading problems, those associated with phonological processing problems. Much less is known about how to appropriately intervene with students who experience language comprehension problems.

### Conclusion

Knowledge about reading disability is evolving. It is clear that many students struggle to develop reading competence. Although most of these students exhib-

it common characteristics related to difficulties in processing the sounds of language, researchers have yet to satisfactorily answer the question, "When is a reading difficulty a serious reading disability?" The current practice of identifying reading disability according to a discrepancy between IQ and achievement scores, although relatively easy to implement, has the potential to underidentify many students who need special services. A more useful way to identify reading disability may be through the evaluation of a student's response to well-implemented, quality intervention. Much remains to be learned, however, regarding the implementation of this type of identification system.

## RECORDS AND REPORTS, SCHOOL

---

The information presented here is based on the Family Educational Rights and Privacy Act of 1974 (FERPA or the Buckley Amendment) and the Illinois School Student Records Act.

Public school records fall into two general categories. The first is the organizational records of the school district, which parallel those that any business or organization would ordinarily keep. Financial and personnel records, minutes of meetings, contracts, and schedules are generally open to the public under the provisions of the Freedom of Information Act.

The second category is student records. Their administration is governed by FERPA, or as it is also known, the Buckley Amendment. FERPA is intended to protect the privacy and confidentiality of a student's school records and to allow parents, guardians, and students access to those records. It affords a wide range of rights and privileges to students and parents and places great responsibilities on the schools. Individual states have statutes that govern the administration of student records and individual school districts have student record management policies. These statutes and policies generally mirror the language of FERPA but may not change the intent of the federal legislation. The following are the key provisions that outline students' protections, parents' rights, and the school's obligations.

### Records Custodian

Each school must designate an official records custodian who is responsible for the maintenance, care, and security of student records, whether or not that person has actual physical control of the student records. The building principal generally serves as records custodian because he has the authority to meet the responsibilities of record maintenance and is specifically charged with assuring that school personnel are informed of the provisions of the law.

### Categories

Student records fall into three basic categories: permanent, temporary, and directory information.

Permanent records shall contain the following information:

- Basic identifying information, including both the student's and parent's names and addresses, and student birth date, birthplace, and gender
- Academic transcript, including grades, class rank, graduation date or grade level achieved, and scores on college entrance examinations
- Attendance record
- Health record and accident reports
- Record of release of permanent record information

- Honors and awards received
- Information concerning participation in school-sponsored activities or athletics, or offices held in school-sponsored organizations

No other information shall be placed in the student's permanent record. FERPA has no provision for the length of time permanent records must be maintained, but states generally do. Illinois, for example, requires they be kept for sixty years.

Temporary records must contain a record of release of temporary record information and may include the following:

- Family background information
- Intelligence test scores, both group and individual
- Aptitude test scores
- Elementary and secondary achievement level test results
- Reports of psychological evaluations, including information on intelligence, personality, and academic information obtained through test administration, observation, or interviews
- Participation in extracurricular activities, including any offices held in school sponsored clubs or organizations
- Honors and awards received
- Teacher anecdotal records
- Disciplinary information, including information regarding serious disciplinary infractions that resulted in expulsion, suspension, or the imposition of punishment or sanction
- Special education files, including the report of the multidisciplinary staffing on which placement or nonplacement was based and all records and recordings related to special education placement hearings and appeals
- Any verified reports or information from non-educational persons, agencies, or organizations
- Other verified information of clear relevance to the education of the student

Although FERPA does not specify, most states require that temporary records must be maintained for at least five years after the student transfers, graduates, or withdraws from the school.

Directory information is that information that may be released to the general public in publications such as athletic programs or news articles, and in school publications, such as yearbooks. This information is limited to the following:

- Identifying information to include name, address, gender, grade level, birth date and birthplace, and parents' names and addresses
- Academic awards and honors
- Information in relation to school-sponsored activities, organizations, and athletics
- Major field of study
- Period of attendance in the school

Parents have the right to request that any or all directory information not be released for their child. Prior to the release of directory information, school districts must notify affected parents in writing and the notification must include date of notification, parents' names, student's name, directory information to be released, and scheduled date of release.

Although not an official category under the language of the Family Education Rights and Privacy Act, personal anecdotal records should be mentioned here. These are the written notes that school personnel keep for their own use. A principal, for example, may make notes that record the details of a disciplinary situation to aid in future decisions concerning that student. As long as they are used only by that principal for that purpose, they remain personal anecdotal records outside of the provisions of the act. If, however, they are shared with other personnel, or are used to upgrade or annotate the student's discipline record, those notes must become part of the student's temporary record.

### Access

The Freedom of Information Act has no bearing on student records, and only persons authorized by FERPA and the state's act shall be granted access. Access to student records is granted to parents or their designated representative and to the student. Access must be granted to students or parents within fifteen days of the request to inspect or copy records. All rights of access by parents cease and pass exclusively to the student when the student turns eighteen years of age, becomes legally emancipated, marries, graduates from high school, or enters into military service.

The following persons also have access to student records: (1) employees or officials of the school district on a "need to know" basis; (2) the records custodian of another school where the student is, or will become, enrolled; (3) legitimate researchers, provided no student is identified by name; (4) persons designated by court order; (4) persons required

by state or federal law; (5) in connection with an emergency, when information contained in the records is necessary to protect the health or safety of the student or other persons; and (6) government or social agencies who are investigating the student's attendance in connection with the compulsory attendance law.

Notification of rights regarding student records include a number of specific administrative regulations that require, upon the student's initial enrollment or transfer, that the school shall notify the student and their parents of their rights under the act. The notification shall be in English and in the language of the child's primary speaking ability if they are of limited English-speaking ability. The notification must include definition of student records (permanent versus temporary), inspection rights and procedures, right to control access to records, challenge procedures, maintenance procedures, and destruction schedule.

Upon graduation, transfer, or permanent withdrawal of a student, the school must notify the student and parents of the destruction schedule for both permanent and temporary records, and of their right to request copies of the records anytime prior to their scheduled destruction. Notification must include the notification date, names of the student and parents, scheduled destruction date, and the name of the records custodian.

Policies for transfer of student records between schools specifies that within fourteen days of enrolling a transfer student, the enrolling school must request directly from the student's previous school a certified copy of the student's records. Within ten days of receiving a request for records, the school must forward an unofficial record. Within ten days after all fees and fines are paid, the official records shall be forwarded to the requesting school.

Before records are sent, the student and parents must be notified of their right to inspect, challenge, and copy records. They may not challenge academic grades or references to expulsions or out-of-school suspensions. Appropriate records must be kept of any transfer.

### Review

A review of records must be made every four years or upon a student's change in attendance centers, whichever occurs first. The purpose of the review is to verify entries and to eliminate or correct all out-

of-date, misleading, inaccurate, unnecessary, or irrelevant information.

## RECREATION PROGRAMS IN THE SCHOOLS

---

As early as 1918 the relationship between the school and recreation was identified when the National Education Association (NEA) adopted the "Seven Cardinal Principles of Education," one of which was the "worthy use of leisure." Today, schools are involved in the provision of recreation using three approaches: school-sponsored activities, community-sponsored activities, and school-community cooperative partnerships.

### School-Sponsored Recreation

School-sponsored recreation often relates to course material taught within the school system, but it provides learning experiences in addition to academic studies. Programs aimed at the school's student population are called *extracurricular activities* and include such things as bands, debating teams, choral groups, athletics and intramural activities, hobby groups, and interest clubs. For many students, these activities fill an important need in their school experience.

Schools also offer programs for adults within the community, and these are commonly referred to as *continuing education*. Historically, the intent of these programs was to enable adult learners to enhance career-related skills and knowledge. Continuing education programs have expanded, however, to include a variety of lifelong learning opportunities and currently include language classes, computer courses, fitness programs, auto mechanics classes, public speaking programs, and travelogues.

### Community-Sponsored Recreation

Community-sponsored programs are activities that are planned and implemented by various community groups for all residents within the community. Local schools are used as the program site during evening and weekend hours when the school would otherwise be empty. When one considers that the typical school timetable occupies only 18 percent of the hours available in the school year, the potential for increased use is obvious. Schools, situated in neighborhoods and close to residents, provide excellent satellite locations for community-based programs because of their accessibility. Examples of these types of programs include recreational sports leagues, ballroom dancing classes, card clubs, neighborhood festivals, and local theater groups.

### School-Community Cooperative Partnerships

Partnerships between schools and community agencies is a third way that leisure-related programs are aligned with the schools. The Kids at Hope program is one example of a national program where multiple community agencies form partnerships with the schools to develop extracurricular programs for youth. Sharing a belief that all children can succeed, the teachers and community volunteers, who implement the program, seek to affirm the skills, abilities, and talents of children to boost their self-esteem in a safe and supportive environment. Similarly, the Partnership for Civic Change (PCC) program in Waco, Texas, is a partnership among agencies and schools organized to provide positive after-school and summer recreation alternatives for youth. The programs offered through PCC are aimed at preventing at-risk youth from becoming involved in the juvenile justice system.

### Current Trends

There are three key trends emerging in the early twenty-first century that are affecting recreation programs in the schools: fiscal restraint in the public sector, changing family demographics, and the development of innovative programs.

**Fiscal restraint in the public sector.** The climate of fiscal restraint prevailing in the early twenty-first century presents a challenge for school administrators whose primary mandate is the delivery of academic programs. Increasingly, schools have fewer resources for school-based recreation, and there is a recognition that a decrease in recreation programs in the schools could result in an increase in activities

that are commonly perceived to be a negative use of leisure time (drug use, vandalism, and high-risk activities). As a result, there is a growing impetus to find ways to ensure the future of recreation programs in the schools. Creative ways to meet this challenge are emerging and include such things as increased relationships with community agencies, the development of unique partnerships, the use of volunteers, and an increase in corporate support.

**Changing family demographics.** North American family structures are changing radically. With the increase of single-parent families and parents who hold jobs outside the home, schools and community agencies have a shared role in child care extending beyond the usual class times. Of particular concern are children and youth from economically disadvantaged households with few resources available to them for positive recreation activities or constructive play. For these families, dependence on extracurricular programs in the schools has been increasing.

**Innovations.** A number of innovations are emerging in regard to recreation programs in schools. In 1940 the NEA urged school districts to make their facilities available for community use. This has led to the common practice of joint facility planning. This trend is growing with the inclusion of a broader range of partners, including the school board, local government, community groups, individual donors, and the private sector. For example, a library may be planned so that the school and all members of the community have shared access to the collection and the library staff. Another common partnership is the development of parkland adjacent to school lands so that outdoor athletic fields can be developed for the use of both the school and community members.

In addition to joint facility and site planning initiatives, some schools and communities are developing funding partnerships so that building expenditures can be met. These partnerships can include funding from corporations, public sector organizations, local service clubs, and private donors.

It is apparent that recreation in the schools has grown beyond the traditional extracurricular programming. There is a greater understanding of the important role that recreation plays in the quality of community life. It is through the combined efforts of schools and community partners that recreation in the schools continues to play a key role in the provision of positive alternatives for children and families as they attempt to find channels for individual and creative expression.

## REGIONAL LABORATORIES AND RESEARCH AND DEVELOPMENT CENTERS

---

The U.S. government authorized formation of research and development (R&D) centers and regional educational laboratories (RELs) in 1965 under Title IV of the Elementary and Secondary Education Act (ESEA). Labs were reauthorized in 1994 under Title IX of the Goals 2000: Educate America Act.

During the Johnson administration's War on Poverty, the centers and laboratories were intended to be a network of institutions designed to revitalize American education through strategic research, development, and dissemination of new programs and processes. Since their inception, such external issues as the federal role in education and the allocation of

funding, along with such internal issues as the challenge of applying research to real-world school settings, have significantly affected the mission and operation of these institutions. Nevertheless, laboratories and centers continue to house the federal government's most concentrated efforts to improve U.S. education through research and development.

#### The 1960s and 1970s

At the outset, legislators envisioned R&D centers as conducting sustained scientific research concentrated on academic subject matter content (e.g., mathematics), skills (e.g., writing), or processes (e.g., instruction). In July 1964, John W. Gardner, then president of the Carnegie Foundation for the Advancement of Teaching, headed a presidential task force that proposed establishment of the RELs as a vital link to interpret, shape, and communicate the centers' research findings; tailor them for practical school use; and infuse them into the nation's classrooms, including college classrooms. This staged delivery system supplanted a diffused project-by-project strategy on research topics previously proposed for funding by university faculty.

Title IV of the Elementary and Secondary Education Act called for well-funded, large-scale institutions similar to atomic energy laboratories, the archetypes of R&D; however, appropriations for education R&D fell significantly short of that goal. Additionally, the legislation did not specify the number of laboratories and centers to be created, nor did it determine how they would be organized. By 1969, twenty RELs and eleven centers had been founded. The U.S. Office for Education closed fourteen of the laboratories in the next few years because of budget concerns and lack of confidence in their work.

In 1972 the National Institute of Education (NIE) was created, and the RELs and R&D centers were transferred to its jurisdiction. From 1973 to 1976, laboratories bid on individual projects defined by NIE through a program-purchase policy, rather than on contracts for institution-wide support. This process allowed for greater federal control, but reduced the laboratories' ability to address regional concerns. In 1979 education became a cabinet-level department. Laboratories and centers were placed under the jurisdiction of the Office of Education Research and Improvement (OERI) within the new Department of Education.

## The 1980s and Beyond

In the 1980s a fundamental change occurred in the government's attitude towards educational research: while it had been assumed in the 1960s that the government should shape the research agenda, it was now felt that state departments of education and private foundations should take the lead. The new role of the laboratories was to work "with and through" these other agencies instead of pursuing their own programs (Guthrie, pp. 9–10).

In 1984 and 1985 the first recompetition since the founding of the labs in the 1960s was held. RELs were required to submit five-year plans for their research, development, and dissemination activities. This recompetition also ensured that nine RELs would cover all regions of the nation. A tenth REL, which served Hawaii and islands in the Pacific Basin, was awarded in 1990. The contract period of 1990 to 1995 saw development of the Laboratory Networking Program (LNP), which allows the RELs to share their knowledge and experience as they collaborate on common issues.

The Request for Proposal for projects to be conducted between 1995 and 2000 initiated laboratory specialty areas, requiring that each laboratory exert substantial effort and resources toward providing national leadership in an area that reflects the laboratory's expertise and that is of national importance. Another focus of the contract was assisting states in designing and implementing Comprehensive School Reform Demonstration (CSR) programs. RELs provided technical assistance and created national resources, such as a database of all CSR awards across the country and a catalog of school reform models. The 2001–2005 contract focused on developing and codifying knowledge about how to improve the academic achievement of students in low performing schools.

The number of R&D centers has fluctuated from eleven in 1966 to a high of twenty-five in 1990 and to twelve in 2001. At the outset of the twenty-first century, the university-based centers focus on such topics as at-risk students, testing, teaching, early development and learning, and improving student learning in the content areas. Descriptions of the centers and their areas of research are detailed on the National Research and Development Centers page of the U.S. government's Office of Educational Research and Improvement (OERI) website. A description of the labs and their national leadership

areas may be found on the Regional Educational Laboratories page of the OERI website.

Besides the relatively low levels of funding for RELs and R&D centers compared to scientific laboratories, the laboratories and centers have "suffered from declining budgets: In 1973 NIE provided \$80 million for their operations (in 1990 constant dollars); by 1979 that had declined to \$52 million; and in 1991 the amount was \$47 million. For individual laboratories and centers, the effect has been more dramatic because there are now twice as many of them as there were in 1973" (Atkinson and Jackson, pp. 96–97). As a consequence, laboratories have had to become entrepreneurial almost from the beginning in order to secure sufficient operational funding.

While critics have pointed to laboratories' shortcomings, as noted by reviewers, no "systematic assessment of the laboratories' work" has yet been produced (Atkinson and Jackson, p. 78). After more than three decades, with the support of their regions and congressional representatives, laboratories and centers continue to receive funding from Congress.

# RESEARCH GRANTS AND INDIRECT COSTS

---

During the later half of the twentieth century, the federal government of the United States invested heavily in research. Unlike other countries, such as Russia and Japan, which produce research within governmental laboratories, the research supported by the U.S. government primarily takes place within universities. To entice universities and their researchers to conduct the government's desired research projects, the federal government traditionally promises to cover much of the costs. The government pays the university the estimated cost of the project and allows the school to keep all funds whose occurrence can be documented.

This policy of cost-reimbursement is easy to implement for the expenses that are definitively associated with the particular project. These costs, often called direct costs, include such items as the equipment, materials, and personnel used during the project, and are relatively easy to measure and can be fully assigned to that project. Hence, the governmental policy toward direct costs receives little notice despite these expenditures accounting for 70 percent of the cost of research grants on average.

The other source of expenses in research grants are items that benefit other activities in the universi-

ty, such as education or extension, as well as federally funded research. These costs, usually called indirect or overhead costs, are partially assigned to several activities and include items such as building maintenance, library materials, utility costs, and central administrative staff. Unfortunately, deciding which portion of these costs should be assigned to federally funded research grants is not a straightforward task. The complexity of indirect costs ensures that any method used to allocate them among activities is likely to receive some criticism, explaining why much of the debate over governmental policy for research funding focuses on overhead.

The system used in the United States to measure the costs of research grants has not changed in principle since 1958. For each grant, the direct costs are estimated and then multiplied by the indirect cost rate of the university to compute the total indirect costs. The method used to determine the indirect cost rate contains the complexity and controversy of the policy. Before 1958, the same rate was used for all universities, but this simple policy was abandoned because it ignored the varying character and resources among schools. To better account for these differences, the revised policy computes a unique indirect cost rate for each institution in two steps. First, each university estimates the level of indirect costs due to federal grants for the next year by conducting elaborate and complicated costing studies. Then, this total is divided by their expected level of direct costs (excluding some categories) to compute that year's rate. The average indirect cost rate in 1997 was 56 percent for private institutions and 47 percent for public institutions. The lower rate for public schools is partially due to weaker incentives for aggressive cost recovery caused by state policies that require public institutions to return indirect cost payments to the states.

Although the theory of cost-reimbursement guides the policy for research funding, the federal government uses alternative methods to purchase other products such as office furniture. For these other goods, the government selects a producer through a competitive bidding process and then pays the company by their level of output. This method is not used for research because it is impossible to accurately measure the output of research. Although one can measure the quantity and quality of furniture in an objectively verifiable fashion, one cannot do the same for most types of research.

Therefore, payment for research is based on inputs, which can be objectively measured, as opposed to outputs. As just discussed, measuring inputs is complicated because some inputs simultaneously benefit other activities in the university, such as education. It is important, however, for research grants to include these indirect costs because overhead reimbursement encourages quality research in the universities in two ways. First, the funds provide universities with the resources necessary to maintain a strong research infrastructure. Second, the extra compensation increases the value of research grants to universities, and subsequently, provides incentives for universities to devote their efforts toward building a strong reputation for quality research.

Partly for these reasons, most agree that indirect costs should be covered in research grants, but no similar consensus exists on the proper method of indirect cost measurement. Critics of the current system have several grievances; the most prominent criticism suggests that inappropriate items are sometimes included in research grants as overhead. Politicians wishing to lower governmental spending usually voice this complaint, or researchers concerned that high indirect cost rates at their university limit their ability to win grant funding. This grievance received much attention in the press in the early 1990s when federal auditors questioned some of the indirect costs claimed by Stanford University. While the costs questioned by auditors are only a small part of the total level of federally funded research, the publicity from the case caused the federal government to more closely scrutinize the costs suggested by universities and to enact additional regulations that more specifically outlined which costs are acceptable.

To much less fanfare, the method utilized in the early twenty-first century for measuring indirect costs is also criticized for encouraging cost increases in institutions of higher education. Universities incur large administrative costs when they determine their indirect cost rate because the computation requires periodic costing studies that are expensive. Because these rates vary little across institutions of similar types, the information obtained from the studies may not justify the costs. In addition to creating additional costs, the system may also not adequately encourage universities to limit other costs. Universities are not rewarded for cost containment and are sometimes penalized for frugal behavior through lower indirect cost rates. To minimize

these weaknesses in the system, economists Roger Noll and William Rogerson suggest a more simple approach where universities of the same type use a fixed indirect cost rate that is based on an audit of a sample of peer universities.

## OVERVIEW

How do people learn to be effective teachers? What percentage of American students has access to computers at home? What types of assessments best

measure learning in science classes? Do college admission tests place certain groups at a disadvantage? Can students who are at risk for dropping out of high school be identified? What is the impact of new technologies on school performance? These are some of the many questions that can be informed by the results of research.

Although research is not the only source used for seeking answers to such questions, it is an important one and the most reliable if executed well. Research is a process in which measurements are taken of individuals or organizations and the resulting data are subjected to analysis and interpretation. Special care is taken to provide *as accurate an answer as possible* to the posed question by subjecting “beliefs, conjectures, policies, positions, sources of ideas, traditions, and the like . . . to maximum criticism, in order to counteract and eliminate as much intellectual error as possible” (Bartley, pp. 139–140). In collecting the necessary information, a variety of methodologies and procedures can be used, many of which are shared by such disciplines as education, psychology, sociology, cognitive science, anthropology, history, and economics.

### Evidence—The Foundation of Research

In education, research is approached from two distinct perspectives on how knowledge should be acquired. Research using *quantitative* methods rests on the belief that individuals, groups, organizations, and the environments in which they operate have an objective reality that is relatively constant across time and settings. Consequently, it is possible to construct measures that yield numerical data on this reality, which can then be further probed and interpreted by statistical analyses. In contrast, *qualitative* research methods are rooted in the conviction that “features of the social environment are constructed as interpretations by individuals and that these interpretations tend to be transitory and situational” (Gall, Borg, and Gall, p. 28). It is only through intensive study of specific cases in natural settings that these meanings and interpretations can be revealed and common themes educed. Although debate over which perspective is “right” continues, qualitative and quantitative research share a common feature—*data* are at the center of all forms of inquiry.

Fundamentally, data gathering boils down to two basic activities: Researchers either *ask* individuals (or other units) *questions* or *observe behavior*. More specifically, individuals can be asked about

their attitudes, beliefs, and knowledge about past or current behaviors or experiences. Questions can also tap personality traits and other hypothetical constructs associated with individuals. Similarly, observations can take on a number of forms: (1) the observer can be a passive transducer of information or an active participant in the group being observed; (2) those being observed may or may not be aware that their behavior is being chronicled for research purposes; and (3) data gathering can be done by a human recorder or through the use of technology (e.g., video cameras or other electronic devices). Another distinction that is applicable to both forms of data gathering is whether the data are developed afresh within the study (i.e., primary data) or stem from secondary sources (e.g., data archives; written documents such as academic transcripts, individualized educational plans, or teacher notes; and artifacts that are found in natural settings). Artifacts can be very telling about naturally occurring phenomena. These can involve trace and accretion measures—that is, “residue” that individuals leave behind in the course of their daily lives. Examples include carpet wear in front of exhibits at children’s museums (showing which exhibits are the most popular), graffiti written on school buildings, and websites visited by students.

What should be clear from this discussion so far is that there exists a vast array of approaches to gathering evidence about educational and social phenomena. Although reliance on empirical data distinguishes research-based disciplines from other modes of knowing, decisions about what to gather and how to structure the data gathering process need to be governed by the purpose of the research. In addition, a thoughtful combination of data gathering approaches has the greater chance of producing the most accurate answer.

### Purposes of Research

The array of questions listed in the introductory paragraph suggests that research is done for a variety of purposes. These include exploring, describing, predicting, explaining, or evaluating some phenomenon or set of phenomena. Some research is aimed at replicating results from previous studies; other research is focused on quantitatively synthesizing a body of research. These two types of efforts are directed at strengthening a theory, verifying predictions, or probing the robustness of explanations by seeing if they hold true for different types of individuals, organizations, or settings.

**Exploration.** Very little may be known about some phenomena such as new types of settings, practices, or groups. Here, the research question focuses on identifying salient characteristics or features that merit further and more concerted examination in additional studies.

**Description.** Often, research is initiated to carefully describe a phenomenon or problem in terms of its structure, form, key ingredients, magnitude, and/or changes over time. The resulting profiles can either be qualitative or narrative, quantitative (e.g.,  $x$  number of people have this characteristic), or a mixture of both. For example, the National Center for Education Statistics collects statistical information about several aspects of education and monitors changes in these indicators over time. The information covers a broad range of topics, most of which are chosen because of their interest to policymakers and educational personnel.

**Prediction.** Some questions seek to predict the occurrence of specific phenomena or states on the basis of one or more other characteristics. Short- and long-term planning are often the main rationale for this type of research.

**Explanation.** It is possible to be able to predict the occurrence of a certain phenomenon but not to know exactly why this relationship exists. In explanatory research, the aim is to not only predict the outcome or state of interest but also understand the mechanisms and processes that result in one variable causing another.

**Evaluation.** Questions of this nature focus on evaluating or judging the worth of something, typically an intervention or program. Of primary interest is to learn whether an organized set of activities that is aimed at correcting some problem (e.g., poor academic skills, low self-esteem, disruptive behavior) is effective. When these efforts are targeted at evaluating the potential or actual success of policies, regulations, and laws, this is often known as policy analysis.

**Replication.** Some questions revolve around whether a demonstrated relationship between two variables (e.g., predictive value of the SAT in college persistence) can be again found in different populations or different types of settings. Because few studies can incorporate all relevant populations and settings, it is important to determine how generalizable the results of a study to a particular group or program are.

**Synthesis.** Taking stock of what is known and what is not known is a major function of research. “Summing-up” a body of prior research can take quantitative (e.g., meta-analysis) and qualitative (narrative summaries) forms.

### Types of Research Methods

The purpose or purposes underlying a research study guide the choice of the specific research methods that are used. Any individual research study may address multiple questions, not all of which share the same purpose. Consequently, more than one research method may be incorporated into a particular research effort. Because methods of investigation are not pure (i.e., free of bias), several types of data and methods of gathering data are often used to “triangulate” on the answer to a specific question.

**Measurement development.** At the root of most inquiry is the act of measuring key conceptual variables of interest (e.g., learning strategies, intrinsic motivation, learning with understanding). When the outcomes being measured are important (e.g., grade placement, speech therapy, college admission), considerable research is often needed prior to conducting the main research study to ensure that the measure accurately describes individuals’ status or performance. This can require substantial data collection and analysis in order to determine the measure’s reliability, validity, and sensitivity to change; for some measures, additional data from a variety of diverse groups must be gathered for establishing norms that can assist in interpretation. With the exception of exploratory research, the quality of most studies relies heavily upon the degree to which the data-collection instruments provide reliable and valid information on the variables of interest.

**Survey methodology.** Survey research is primarily aimed at collecting self-report information about a population by asking questions directly of some sample of it. The members of the target population can be individuals (e.g., local teachers), organizations (e.g., parent–teacher associations), or other recognized bodies (e.g., school districts or states). The questions can be directed at examining attitudes and preferences, facts, previous behaviors, and past experiences. Such questions can be asked by interviewers either face-to-face or on the telephone; they can also be self-administered by distributing them to groups (e.g., students in classrooms) or delivering them via the mail, e-mail, or the Internet.

High-quality surveys devote considerable attention to reducing as much as possible the major sources of error that can bias the results. For example, the target population needs to be completely enumerated so that important segments or groups are not unintentionally excluded from being eligible to participate. The sample is chosen in a way as to be representative of the population of interest, which is best accomplished through the use of probability sampling. Substantial time is given to constructing survey questions, pilot testing them, and training interviewers so that item wording, question presentation and format, and interviewing styles are likely to encourage thoughtful and accurate responses. Finally, concerted efforts are used to encourage all sampled individuals to complete the interview or questionnaire.

Surveys are mainly designed for description and prediction. Because they rarely involve the manipulation of independent variables or random assignment of individuals (or units) to conditions, they generally are less useful by themselves for answering explanatory and effects-oriented evaluative questions. If survey research is separated into its two fundamental components—sampling and data gathering through the use of questionnaires—it is easy to see that survey methods are embedded within experimental and quasi-experimental studies. For example, comparing learning outcome among students enrolled in traditional classroom-based college courses with those of students completing the course through distance learning would likely involve the administration of surveys that assess student views of the instructor and their satisfaction with how the course was taught. As another illustration, a major evaluation of *Sesame Street* that randomly assigned classrooms to in-class viewing of the program involved not only administering standardized reading tests to the students participating but also surveys of teachers and parents. So, in this sense, many forms of inquiry can be improved by using state-of-the-art methods in questionnaire construction and measurement.

**Observational methods.** Instead of relying on individuals' self-reports of events, researchers can conduct their own observations. This is often preferable when there is a concern that individuals may misreport the requested information, either deliberately or inadvertently (e.g., they cannot remember). In addition, some variables are better measured by direct observation. For example, in comparing direct

observations of how long teachers lecture in a class as opposed to asking teachers to self-report the time they spent lecturing; it should be obvious that the latter could be influenced (biased upward or downward) by how the teachers believe the researcher wants them to respond.

Observational methods are typically used in natural settings, although, as with survey methods, observations can be made of behaviors even in experimental and quasi-experimental studies. Both quantitative and qualitative observation strategies are possible. Quantitative strategies involve either training observers to record the information of interest in a systematic fashion or employing audiotape recorders, video cameras, and other electronic devices. When observers are used, they must be trained and monitored as to what should be observed and how it should be recorded (e.g., the number of times that a target behavior occurs during an agreed-upon time period).

Qualitative observational methods are distinctly different in several ways. First, rather than coding a prescribed set of behaviors, the focus of the observations is deliberately left more open-ended. By using open-ended observation schemes, the full range of individuals' responses to an environment can be recorded. That is, observations are much broader in contrast to quantitative observational strategies that focus on specific behaviors. Second, observers do not necessarily strive to remain neutral about what they are observing and may include their own feelings and experiences in interpreting what happened. Also, observers who employ quantitative methods do not participate in the situations that they are observing. In contrast, observers in qualitative research are not typically detached from the setting being studied; rather, they are more likely to be complete participants where the researcher is a member of the setting that is being observed.

Qualitative strategies are typically used to answer exploratory questions as they help identify important variables and hypotheses about them. They also are commonly used to answer descriptive questions because they can provide in-depth information about groups and situations. Although qualitative strategies have been used to answer predictive, explanatory, and evaluative questions, they are less able to yield results that can eliminate all rival explanations for causal relationships.

**Experimental methods.** Experimental research methods are ideally suited for examining explanato-

ry questions that seek to ascertain whether a cause-and-effect relationship exists among two or more variables. In experiments, the researcher directly manipulates the cause (the independent variable), assigns individuals randomly to various levels of the independent variable, and measures their responses (the expected effect). Ideally, the researcher has a high degree of control over the presentation of the purported cause—where, when, and in what form it is delivered; who receives it; and when and how the effect is measured. This level of control helps rule out alternative or rival explanations for the observed results. Exercising this control typically requires that the research be done under laboratory or contrived conditions rather than in natural settings. Experimental methods, however, can also be used in real-world settings—these are commonly referred to as field experiments.

Conducting experiments in the field is more difficult inasmuch as the chances increase that integral parts of the experimental method will be compromised. Participants may be more likely to leave the study and thus be unavailable for measurement of the outcomes of interest. Subjects who are randomly assigned to the control group, which may receive no tutoring, may decide to obtain help on their own—assistance that resembles the intervention being tested. Such problems essentially work against controlling for rival explanations and the key elements of the experimental method are sacrificed. Excellent discussions of procedures for conducting field experiments can be found in the 2002 book *Experimental and Quasi-Experimental Designs for Generalized Causal Inference*, written by William R. Shadish, Thomas D. Cook, and Donald T. Campbell, and in Robert F. Boruch's 1997 book *Randomized Field Experiments for Planning and Evaluation: A Practical Guide*.

**Quasi-experimental methods.** As suggested by its name, the methods that comprise quasi-experimental research approximate experimental methodologies. They are directed at fulfilling the same purposes—explanation and evaluation—but may provide more equivocal answers than experimental designs. The key characteristic that distinguishes quasi experiments from experiments is the lack of random assignment. Because of this, researchers must make concerted efforts to rule out the plausible rival hypotheses that random assignment is designed to eliminate.

Quasi-experimental designs constitute a core set of research strategies because there are many instances in which it is impossible to successfully assign participants randomly to different conditions or levels of the independent variable. For example, the first evaluation of *Sesame Street* that was conducted by Samuel Ball and Gerry Bogatz in 1970 was designed as a randomized experiment where individual children in five locations were randomly assigned to either be encouraged to watch the television program (and be observed in their homes doing it) or not encouraged. Classrooms in these locations were also either given television sets or not, and teachers in classrooms with television sets were encouraged to allow the children to view the show at least three days per week. The study, however, turned into a quasi experiment because *Sesame Street* became so popular that children in the control group (who were not encouraged to watch) ended up watching a considerable number of shows.

The two most frequently used quasi-experimental strategies are time-series designs and nonequivalent comparison group designs, each of which has some variations. In time-series designs, the dependent variable or expected effect is measured several times before and after the independent variable is introduced. For example, in a study of a zero tolerance policy, the number of school incidents related to violence and substance use are recorded on a monthly basis for twelve months before the policy is introduced and twelve or more months after its implementation. If a noticeable reduction in incidents occurs soon after the new policy is introduced and the reduction persists, one can be reasonably confident that the new policy was responsible for the observed increase if no other events occurred that could have resulted in a decline and there was evidence that the policy was actually enforced. This confidence may be even stronger if data are collected on schools that have similar student populations and characteristics but no zero tolerance policies during the same period and there is no reduction in illegal substance and violence-related incidents.

Establishing causal relationships with the nonequivalent comparison group design is typically more difficult. This is because when groups are formed in ways other than random assignment (e.g., participant choice), this often means that they differ in other ways that affect the outcome of interest. For example, suppose that students who are having problems academically are identified and allowed to

choose to be involved or not involved in an after-school tutoring program. Those who decide to enroll are also those who may be more motivated to do well, who may have parents who are willing to help their children improve, and who may differ in other ways from those who choose not to stay after school. They may also have less-serious academic problems. Such factors all may contribute to these students exhibiting higher academic gains than their nontutored counterparts do when after-tutoring testing has been completed. It is difficult, however, to disentangle the role that tutoring contributed to any observed improvement from these other features. The use of well-validated measures of these characteristics for both groups prior to receiving or not receiving tutoring can help in this process, but the difficulty is to identify and measure all the key variables other than tutoring receipt that can influence the observed outcomes.

**Secondary analysis and meta-analysis.** Both secondary analysis and meta-analysis are part of the arsenal of quantitative research methods, and both rely on research data already collected by other studies. They are invaluable tools for informing questions that seek descriptive, predictive, explanatory, or evaluative answers. Studies that rely on secondary analysis focus on examining and reanalyzing the raw data from prior surveys, experiments, and quasi experiments. In some cases, the questions prompting the analysis are ones that were not examined by the original investigator; in other cases, secondary analysis is performed because the researcher disagrees to some extent with the original conclusions and wants to probe the data, using different statistical techniques.

Secondary analyses occupy a distinct place in educational research. Since the 1960s federal agencies have sponsored several large-scale survey and evaluation efforts relevant to education, which have been analyzed by other researchers to re-examine the reported results or answer additional questions not addressed by the original researchers. Two examples, both conducted by the National Center for Education Statistics, include the High School and Beyond Survey, which tracks seniors and sophomores as they progress through high school and college and enter the workplace; and the Schools and Staffing Survey, which regularly collects data on the characteristics and qualifications of teachers and principals, class size, and other school conditions.

The primary idea underlying meta-analysis or research synthesis methods is to go beyond the more traditional, narrative literature reviews of research in a given area. The process involves using systematic and comprehensive retrieval practices for accumulating prior studies, quantifying the results by using a common metric (such as the effect size), and statistically combining this collection of results. In general, the reported results that are used from studies involve intermediate statistics such as means, standard deviations, proportions, and correlations.

The use of meta-analysis grew dramatically in the 1990s. Its strength is that it allows one to draw conclusions across multiple studies that addressed the same question (e.g., what have been the effects of bilingual education?) but used different measures, populations, settings, and study designs. The use of both secondary analysis and meta-analysis has increased the longer-term value of individual research efforts, either by increasing the number of questions that can be answered from one large-scale survey or by looking across several small-scale studies that seek answers to the same question. These research methods have contributed much in addressing policymakers' questions in a timely fashion and to advancing theories relevant to translating educational research into recommended practices.

## QUALITATIVE AND ETHNOGRAPHIC

A qualitative approach to research generally involves the researcher in contact with participants in their natural setting to answer questions related to how the participants make sense of their lives. Qualitative researchers may observe the participants and conduct formal and informal interviews to further an understanding of what is going on in the setting from the point of view of those involved in the study. Ethnographic research shares these qualitative traits, but ethnographers more specifically seek understanding of what participants do to create the culture in which they live, and how the culture develops over time. This article further explores what it means to conduct qualitative and ethnographic research by looking at them historically and then by describing key characteristics of these approaches.

### The Context in Education

Qualitative and ethnographic research developed in education in the late 1970s. Ethnographic researchers drew on theory and methods in anthropology and sociology, creating a distinction between ethnography of education (work undertaken by anthropologists and sociologists) and ethnography in education (work undertaken by educators to address educational issues). Other forms of qualitative research drew on theories from the humanities and other social and behavioral sciences, adapting this work to educational goals and concerns, often creating new forms (e.g., connoisseurship, a field method approach, interview approaches, and some forms of action research).

In the early development of these traditions, educational researchers struggled for acceptance by both other professionals and policymakers. This phase was characterized by arguments over the value of qualitative methods in contrast to the dominant paradigms of the time—quantitative and experimental approaches. Qualitative and ethnographic researchers argued that questions important to education were left unexamined by the dominant paradigms. Some qualitative researchers argued for the need to include and represent the voices of people in their research, particularly voices not heard in other forms of research involving large-scale studies.

Questions asked by qualitative and ethnographic researchers generally focus on understanding the local experiences of people as they engage in their everyday worlds (e.g., classrooms, peer groups, homes, communities). For example, some researchers explore questions about ways in which people gain, or fail to gain, access to ways of learning in a diverse world; others focus on beliefs people hold about education and learning; while still others examine how patterns learned within a group are consequential for participation in other groups and situations.

A broad range of perspectives and approaches exist, each with its own historical tradition and theoretical orientation. A number of common dimensions can be identified across these perspectives and approaches. Qualitative and ethnographic researchers in education are concerned with the positions they take relative to participants and data collected. For example, many qualitative and ethnographic researchers engage in observations over a period of time to identify patterns of life in a particular group.

The theoretical orientation chosen guides the design and implementation of the research, including the tools used to collect (e.g., participant observation, interviewing, and collecting artifacts) and analyze data (e.g., discourse analysis, document analysis, content analysis, and transcribing video/audio data). Theory also guides other decisions, including how to enter the field (e.g., the social group, classroom, home, and/or community center), what types and how much data to collect and records to make (e.g., videotape, audiotape, and/or field notes), who to interview (formally and/or informally), how long to remain in the field (e.g., for ethnography, one or more years), and what literature is relevant. It also influences relationships researchers establish with people in local settings, which in turn influences what can be known. Some theoretical perspec-

tives guide researchers to observe what is occurring from a distance by taking the role of passive observer, recording information for analysis once they leave the field. Such researchers often do not interview participants, preferring to “ground” their observations in patterns in the data, without concern for what members understand. These descriptions are called *etic*, or outsider descriptions, because the observer is not concerned with members’ understandings.

This approach is in contrast with ones in which researchers join the group and become active participant-observers, at times participating directly in events. Such researchers also make videotape records that enable them to step back from what they thought was occurring to examine closely what resulted from those actions. Those not using video or audio records reconstruct events by constructing retrospective field notes, drawing on their memories of what occurred to create a written record to analyze when they leave the field. Just which type of approach and position researchers take depends on their research goal(s) and theoretical orientation(s) as well as what participants permit.

### Approaches to Research Questions

Research questions in a qualitative study are generated as part of the research process. Qualitative and ethnographic researchers often begin a study with one or more initiating question(s) or an issue they want to examine. Qualitative and ethnographic research approaches involve a process of interacting with data, reflecting on what is important to members in the local setting, and using this to generate new questions and refine the initial questions. This interactive and responsive process also influences the data that are collected and analyzed throughout the study. Therefore, it is common for researchers to construct more detailed questions that are generated as part of the analysis as they proceed throughout the study, or to abandon questions and generate ones more relevant to the local group or issues being studied.

For example, in one study of a fifth-grade classroom, the initial research questions were open ended and general: (1) What counts as community to the students and teacher in this classroom? (2) How do the participants construct community in this classroom? and (3) How is participating in this classroom consequential for students and the teacher? As the study unfolded, the research questions became more

directed toward what the researcher was beginning to understand about this classroom in particular. After first developing an understanding of patterns of interactions among participants, the researcher began to formulate more specific questions: (1) What patterns of practice does the teacher construct to offer opportunities for learning? (2) What roles do the social and academic practices play in the construction of community in this classroom? and (3) What are the consequences for individuals and the collective when a member leaves and reenters the classroom community? This last question was one that could not have been anticipated but was important to understanding what students learned and when student learning occurred as well as what supported and constrained that learning. The shifts in questions constitute this researcher’s logic of inquiry and need to be reported as part of the dynamic design of the study.

### Approaches to Design and Data Collection

In designing qualitative studies, researchers consider ways of collecting data to represent the multiple voices and actions constituting the research setting. Typical techniques used in qualitative research for collecting data include observing in the particular setting, conducting interviews with various participants, and reviewing documents or artifacts. The degree to which these techniques are used depends on the nature of the particular research study and what occurs in the local group.

Some studies involve in-depth analysis of one setting or interviews of one group of people. Others involve a contrastive design from the beginning, seeking to understand how the practices of one group are similar to or different from another group. Others seek to study multiple communities to test hypotheses from the research literature (e.g., child-rearing practices are the same in all communities). What is common to all of these studies is that they are examining the qualities of life and experiences within a local situation. This is often called a situated perspective.

### Entering the Field and Gaining Access to Insider Knowledge

Entering the research setting is one of the first phases of conducting fieldwork. Gaining access to the site is ongoing and negotiated with the participants throughout the study. As new questions arise, the researcher has to renegotiate access. For example, a re-

searcher may find that the outcomes of standardized tests become an important issue for the teachers and students. The researcher may not have obtained permission to collect these data at the beginning of the study and must then negotiate permission from parents, students, teachers, and district personnel to gain access to these scores.

Qualitative research involves a social contract with those participating in the study, and informed consent is negotiated at each phase of the research when new information is needed or new areas of study are undertaken. At such points of renegotiation, researchers need to consider the tools necessary and the ways to participate within the group (e.g., as participant-observer and/or observer-participant, as interviewer of one person or as a facilitator of a focus group, or as analyst of district data or student products). How the researcher conducts observations, collects new forms of data, and analyzes such data is related to shifts in questions and/or theoretical stance(s) necessary to understand what is occurring.

### Research Tools

One of the most frequently used tools, in addition to participant observation, is interviewing. For ethnography and other types of field research, interviews occur within the context of the ongoing observations and collection of artifacts. These interviews are grounded in what is occurring in the local context, both within and across time. Some interviews are undertaken to gain insider information about what the researcher is observing or to test out the developing theory that the researcher is constructing.

In contrast, other forms of qualitative research may use interviews as the sole form of data collection. Such interviews also seek meanings that individuals or groups have for their own experience or of observed phenomena. These interviews, however, form the basis for analysis and do not require contextual information from observations. What the people say becomes the basis for exploration, not what was observed.

Other tools used by qualitative and ethnographic researchers include artifact and document analysis (artifacts being anything people make and use). The researcher in a field-based study collects artifacts produced and/or used by members of the group, identifies how these artifacts function for the indi-

vidual and/or the group, and explores how members talk about and name these artifacts. For some theoretical positions, the artifacts may be viewed as a type of participant in the local event (e.g., computer programs as participants). Some artifacts, such as documents, are examined for links to other events or artifacts. This form of analysis builds on the understanding that the past (and future) is present in these artifacts and that intertextual links between and among events are often inscribed in such documents. In some cases, qualitative researchers may focus solely on a set of artifacts (e.g., student work, linked sets of laws, a photograph collection, or written texts in the environment–environmental print). Such studies seek to examine the range of texts or materials constructed, the patterned ways in which the texts are constructed, and how the choices of focus or discourse inscribe the views that members have of self and others as well as what is possible in their worlds.

Although some qualitative studies focus solely on the documents, field-based researchers generally move between document analysis and an exploration of the relationship of the document to past, present, and future actions of individuals and/or groups. These studies seek to understand the importance of the artifact or document within the lives of those being studied.

### Ongoing Data Analysis

While conducting fieldwork, researchers reread their field notes and add to them any relevant information that they were not able to include at the time of first writing the notes. While reviewing their field notes, researchers look for themes and information relevant to the research questions. They note this information in the form of theoretical notes (or write theoretical memos to themselves) that may include questions about repeated patterns, links to other theories, and conceptual ideas they are beginning to develop. They also make methodological notes to reconstruct their thinking and their logic of inquiry. Sometimes they make personal notes that reflect their thoughts and feelings about what they are observing or experiencing. These notes allow them to keep from imposing their own opinion on data, helping them to focus on what is meaningful or important to those with whom they are working.

Researchers constantly use contrast to build interpretations that are grounded in the data, within and across actors, events, times, actions, and activi-

ties that constitute the social situations of everyday life. Many qualitative (particularly ethnographic) researchers examine material, activity, semiotic (meaning-carrying), and/or social dimensions of everyday life and its consequences for members. The analytic principles of practice that they use include comparing and contrasting data, methods, theories, and perspectives; examining part-whole relationships between and among actions, events, and actors; seeking insider (*emic*) understandings of experiences, actions, practices, and events; and identifying through these what is relevant to the local group.

### Reporting Research Findings

The final step in qualitative and ethnographic research is writing an account. The researchers make choices about how to represent the data that illustrate what was typical about the particular group being studied. Another choice might be to highlight actions of the group that were illustrative of their particular patterns of beliefs. In some studies, several cases are chosen to make visible comparisons across different activities within the group, or across different groups that may have some activities in common. For example, researchers who study classroom interactions might bring together data from different classrooms to make visible principles of practice that are similar in general terms such as asking students to understand various points of view. However, in each classroom, the actions of juxtaposing points of view will be carried out differently due to the different experiences within each classroom.

Researchers also select genres for writing the report that best enable the intended audience to understand what the study made visible that was not previously known or that extended previous knowledge. The researcher does not seek to generalize from the specific case. Rather, qualitative or ethnographic researchers provide in-depth descriptions that lead to general patterns. These patterns are then examined in other situations to see if, when, and how they occur and what consequences they have for what members in the new setting can know, do, understand, and/or produce. In qualitative and ethnographic studies this is often referred to as transferability, in contrast to generalizability.

## SCHOOL AND PROGRAM EVALUATION

Program evaluation is research designed to assess the implementation and effects of a program. Its purposes vary and can include (1) program improvement, (2) judging the value of a program, (3) assessing the utility of particular components of a program, and (4) meeting accountability requirements. Results of program evaluations are often used for decisions about whether to continue a program, improve it, institute similar programs elsewhere, allocate resources among competing programs, or accept or reject a program approach or theory. Through these uses program evaluation is viewed as a way of rationalizing policy decision-making.

Program evaluation is conducted for a wide range of programs, from broad social programs such as welfare, to large multisite programs such as the preschool intervention program Head Start, to program funding streams such as the U.S. Department of Education's Title I program that gives millions of dollars to high-poverty schools, to small-scale programs with only one or a few sites such as a new mathematics curriculum in one school or district.

### Scientific Research versus Evaluation

There has been some debate about the relationship between "basic" or scientific research and program

evaluation. For example, in 1999 Peter Rossi, Howard Freeman, and Michael Lipsey described program evaluation as the application of scientific research methods to the assessment of the design and implementation of a program. In contrast, Michael Patton in 1997 described program evaluation not as the application of scientific research methods, but as the systematic collection of information about a program to inform decision-making.

Both agree, however, that in many circumstances the design of a program evaluation that is sufficient for answering evaluation questions and providing guidance to decision-makers would not meet the high standards of scientific research. Further, program evaluations are often not able to strictly follow the principles of scientific research because evaluators must confront the politics of changing actors and priorities, limited resources, short timelines, and imperfect program implementation.

Another dimension on which scientific research and program evaluation differ is their purpose. Program evaluations must be designed to maximize the usefulness for decision-makers, whereas scientific research does not have this constraint. Both types of research might use the same methods or focus on the same subject, but scientific research can be formulated solely from intellectual curiosity, whereas evaluations must respond to the policy and program interests of stakeholders (i.e., those who hold a stake in the program, such as those who fund or manage it, or program staff or clients).

### How Did Program Evaluation Evolve?

Program evaluation began proliferating in the 1960s, with the dawn of social antipoverty programs and the government's desire to hold the programs accountable for positive results. Education program evaluation in particular expanded also because of the formal evaluation requirements of the National Science Foundation-sponsored mathematics and science curriculum reforms that were a response to the 1957 launch of *Sputnik* by the Soviet Union, as well as the evaluation requirements instituted as part of the Elementary and Secondary Education Act of 1965.

### Experimentation versus Quasi-experimentation

The first large-scale evaluations in education were the subject of much criticism. In particular, two influential early evaluations were Paul Berman and Milbrey McLaughlin's RAND Change Agent 1973–

1978 study of four major federal programs: the Elementary and Secondary Education Act, Title VII (bilingual education), the Vocational Education Act, and the Right to Read Act; and a four-year study of Follow Through, which sampled 20,000 students and compared thirteen models of early childhood education. Some of the criticisms of these evaluations were that they were conducted under too short of a time frame, used crude measures that did not look at incremental or intermediate change, had statistical inadequacies including invalid assumptions, used poorly supported models and inappropriate analyses, and did not consider the social context of the program.

These criticisms led to the promotion of the use of experiments for program evaluation. Donald Campbell wrote an influential article in 1969 advocating the use of experimental designs in social program evaluation. The Social Science Research Council commissioned Henry Riecken and Robert Boruch to write the 1978 book *Social Experimentation*, which served as both a “guidebook and manifesto” for using experimentation in program evaluation. The best example of the use of experimentation in social research is the New Jersey negative income tax experiment sponsored by the Office of Equal Opportunity of the federal Department of Health, Education, and Welfare.

Experiments are the strongest designs for assessing impact, because through random sampling from the population of interest and random assignment to treatment and control groups, experiments rule out other factors besides the program that might explain program success. There are several practical disadvantages to experiments, however. First, they require that the program be a partial coverage program—that is, there must be people who do not participate in the program, who can serve as the control group. Second, experiments require large amounts of resources that are not always available. Third, they require that the program be firmly and consistently implemented, which is frequently not the case. Fourth, experiments do not provide information about how the program achieved its effects. Fifth, program stakeholders sometimes feel that random assignment to the program is unethical or politically unfeasible. Sixth, an experimental design in a field study is likely to produce no more than an approximation of a true experiment, because of such factors as systematic attrition from the program, which leaves the evaluator with a biased sample of partici-

pants (e.g., those who leave the program, or attrite, might be those who are the hardest to influence, so successful program outcomes would be biased in the positive direction).

When experiments are not appropriate or feasible, quasi-experimental techniques are used. Set forth by Donald Campbell and Julian Stanley in 1963, quasi-experimentation involves a number of different methods of conducting research that does not require random sampling and random assignment to treatment and control groups. One common example is an evaluation that matches the program participants to nonparticipants that share similar characteristics (e.g., race) and measures outcomes of both groups before and after the program. The challenge to quasi-experimentation is to rule out what Campbell and Stanley termed internal validity threats, or factors that might be alternative explanations for program results besides the program itself, which in turn would reduce confidence in the conclusions of the study. Unlike experimental design, which protects against just about all possible internal validity threats, quasi-experimental designs generally leave one or several of them uncontrolled.

### Implementation

In addition to focusing on the relative strengths and weaknesses of experiments and quasi-experiments, criticisms of early large-scale education evaluations highlighted the importance of measuring implementation. For example, McLaughlin and Berman’s RAND Change Agent study and the Follow-Through evaluation demonstrated that implementation of a specific program can differ a great deal from one site to the next. If an evaluation is designed to attribute effects to a program, varying implementation of the same program reduces the value of the evaluation, because it is unclear how to define the program. Thus, it is necessary to include in a program evaluation a complete description of how the program is being implemented, to allow the examination of implementation fidelity to the original design, and to discover any cross-site implementation differences that would affect outcomes.

In 1967 Michael Scriven first articulated the idea that there were two types of evaluation—one focused on evaluating implementation, called formative evaluation, and one focused on evaluating the impact of the program, called summative evaluation. He argued that emerging programs should be the subject of formative evaluations, which are designed

to see how well a program was implemented and to improve implementation; and that summative evaluations should be reserved for programs that have been well-established and have stable and consistent implementation.

Related to the idea of formative and summative evaluation is a controversy over the extent to which the evaluator should be a program insider or an objective third party. In formative evaluations, it can be argued that the evaluator needs to become somewhat of an insider, in order to become part of the formal and informal feedback loop that makes providing program improvement information possible. In contrast, summative evaluations conducted by a program insider foster little confidence in the results, because of the inherent conflict of interest.

### Stakeholder and Utilization Approaches

Still another criticism of early education evaluations was that stakeholders felt uninvolved in the evaluations; did not agree with the goals, measures, and procedures; and thus rejected the findings. This discovery of the importance to the evaluation of stakeholder buy-in led to what Michael Patton termed stakeholder or utilization-focused evaluation. Stakeholder evaluation bases its design and execution on the needs and goals of identified stakeholders or users, such as the funding organization, a program director, the staff, or clients of the program.

In the context of stakeholder evaluation, Patton in 1997 introduced the idea that it is sometimes appropriate to conduct goal-free evaluation. He suggested that evaluators should be open to the idea of conducting an evaluation without preconceived goals because program staff might not agree with the goals and because the goals of the program might change over time. Further, he argued that goal-free evaluation avoids missing unanticipated outcomes, removes the negative connotation to side effects, eliminates perceptual biases that occur when goals are known, and helps to maintain evaluator objectivity. Goals are often necessary, however, to guide and focus the evaluation and to respond to the needs of policymakers. As a result, Patton argued that the use of goals in program evaluation should be decided on a case-by-case basis.

### Theory-Based Evaluations

Besides stakeholder and goal-free evaluation, Carol Weiss in 1997 advocated for theory-based evaluations, or evaluations that are grounded in the pro-

gram's theory of action. Theory-based evaluation aims to make clear the theoretical underpinnings of the program and use them to help structure the evaluation. In her support of theory-based evaluation, Weiss wrote that if the program theory is outlined in a phased sequence of cause and effect, then the evaluation can identify weaknesses in the system or at what point in the chain of effects results can be attributed. Also, articulating a programmatic theory can have positive benefits for the program, including helping the staff address conflicts, examine their own assumptions, and improve practice.

Weiss explained that theory-based approaches have not been widespread because there may be more than one theory that applies to a program and no guidance about which to choose, and because the process of constructing theories is challenging and time consuming. Further, theory-based approaches require large amounts of data and resources. A theory-based evaluation approach does, however, strengthen the rigor of the evaluation and link it more with scientific research, which by design is a theory-testing endeavor.

### Data Collection Methods

Within different types of evaluation (e.g., formative, stakeholder, theory-based), there have been debates about which type of methodology is appropriate, with these debates mirroring the debates in the larger social science community. The "scientific ideal" of using social experiments and randomized experiments, which supports the quantification of implementation and outcomes, is contrasted with the "humanistic ideal" that the program should be seen through the eyes of the clients and defies quantification, which supports an ethnographic or observational methodology.

Campbell believed that the nature of the research question should determine the question, and he encouraged evaluations that have both qualitative and quantitative assessments, with these assessments supporting each other. In the early twenty-first century, program evaluations commonly use a combination of qualitative and quantitative data collection techniques.

### Does Evaluation Influence Policy?

Although the main justification for program evaluation is its role in rationalizing policy, program evaluation results rarely have a direct impact on decision-making. This is because of the diffuse and political

nature of policy decision-making and because people are generally resistant to change. Most evaluations are undertaken and disseminated in an environment where decision-making is decentralized among several groups and where program and policy choices result from conflict and accommodation across a complex and shifting set of players. In this environment, evaluation results cannot have a single and clear use, nor can the evaluator be sure how the results will be interpreted or used.

While program evaluations may not directly affect decisions, evaluation does play a critical role in contributing to the discourse around a particular program or issue. Information generated from program evaluation helps to frame the policy debate by bringing conflict to the forefront, providing information about trade-offs, influencing the broad assumptions and beliefs underlying policies, and changing the way people think about a specific issue or problem.

### Evaluation in the Early Twenty-First Century

In the early twenty-first century, program evaluation is an integral component of education research and practice. The No Child Left Behind Act of 2001 (reauthorization of the U.S. government's Elementary and Secondary Education Act) calls for schools to use "research-based practices." This means practices that are grounded in research and have been proven through evaluation to be successful. Owing in part to this government emphasis on the results of program evaluation, there is an increased call for the use of experimental designs.

Further, as the evaluation field has developed in sophistication and increased its requirements for rigor and high standards of research, the lines between scientific research and evaluation have faded. There is a move to design large-scale education evaluations to respond to programmatic concerns while simultaneously informing methodological and substantive inquiry.

While program evaluation is not expected to drive policy, if conducted in a rigorous and systematic way that adheres to the principles of social research as closely as possible, the results of program evaluations can contribute to program improvement and can provide valuable information to both advance scholarly inquiry as well as inform important policy debates.

## VERBAL PROTOCOLS

Since the early 1900s, researchers have relied on verbal data to gain insights about thinking and learning. Over the years, however, the perceived value of verbal data for gaining such insights has waxed and waned. In 1912 Edward Titchener, one of the founders of structural psychology, advocated the use of introspection by highly trained self-observers as the only method for revealing certain cognitive processes. At the same time, this technique of observing and verbalizing one's own cognitive processes drew much criticism. Researchers questioned the objectivity of the technique and the extent to which people have knowledge of and access to their cognitive processes. With behaviorism as the dominant perspective for studying learning in the United States, verbal data were treated as behavioral products, not as information that might reveal something about cognitive processing. From about the 1920s to 1950s, most U.S. researchers abandoned the use of introspective techniques, as well as most other types of verbal data such as question answering.

While U.S. learning theorists and researchers were relying almost solely on nonverbal or very limited verbal (e.g., yes/no response) techniques, the Swiss cognitive theorist Jean Piaget was relying primarily on children's verbal explanations for gaining insights into their cognitive abilities and processes.

Piaget believed that children's explanations for their responses to various cognitive tasks provided much more information about their thinking than did the task responses alone. United States theorists, however, were not ready to consider Piaget's work seriously until about 1960, when cognitive psychology was beginning to emerge and there was declining satisfaction with a purely behavioral perspective.

With the rise of cognitive psychology beginning in the 1950s and 1960s, educational and experimental psychologists became interested once again in the usefulness of verbal data for providing information about thinking and learning. Cognitive researchers rarely use Titchener's original introspective technique in the early twenty-first century. Since the 1980s, however, researchers have increasingly used verbal protocol analysis, which has roots in the introspective technique, to study the cognitive processes involved in expert task performance, problem solving, text comprehension, science education, second language acquisition, and hypertext navigation.

### What Are Verbal Protocols?

Verbal protocols are rich data sources containing individuals' spoken thoughts that are associated with working on a task. While working on a particular task, subjects usually either think aloud as thoughts occur to them or they do so at intervals specified by the researcher. In some studies, researchers ask subjects to verbalize their thoughts upon completion of the task. The verbalizations are recorded verbatim, usually using a tape recorder, and are then coded according to theory-driven and/or empirically driven categories.

Verbal protocols differ from introspection. Subjects are not instructed to focus on the cognitive processes involved in task completion nor are they trained in the self-observation of cognitive processing. The goal is for subjects to express out loud the thoughts that occur to them naturally. Researchers use these data in conjunction with logical theoretical premises to generate hypotheses and to draw conclusions about cognitive processes and products.

### What Can Verbal Protocols Reveal about Thinking and Learning?

In order to verbalize one's thoughts, individuals must be aware of those thoughts and the thoughts must be amenable to language. Thus, verbal protocol analysis can reveal those aspects of thinking and learning that are consciously available, or activated

in working memory, and that can be encoded verbally.

One major advantage of verbal protocol data is that they provide the richest information regarding the contents of working memory during task execution. In studies of reading comprehension, for example, verbal protocols have provided a detailed database of the types of text-based and knowledge-based inferences that might occur during the normal reading of narrative texts. Data using other measures such as sentence reading time and reaction time to single-word probes have corroborated some of the verbal protocol findings. For example, corroborating evidence for the generation of causal inferences and goal-based explanations exists. Verbal protocols have also provided information about the particular knowledge domains that are used to make inferences when reading narratives, and about differences in readers' deliberate strategies for understanding both narrative and informational texts.

Verbal protocols have been used extensively in the study of expert versus novice task performance across a variety of domains (e.g., cognitive-perceptual expertise involved in chess, perceptual-motor expertise such as in sports, science and mathematical problem-solving strategies, skilled versus less-skilled reading). While the specific insights about the differences between expert and novice approaches vary from domain to domain, some generalities across domains can be made. Clearly, experts have more knowledge and more highly organized knowledge structures within their domains than do novices. But the processes by which they solve problems and accomplish tasks within their domains of expertise also differ. Verbal protocols have revealed that experts are more likely to evaluate and anticipate the ever-changing situations involved with many problems and to plan ahead and reason accordingly. Knowledge about expert and novice problem-solving processes has implications for developing and assessing pedagogical practices.

Another advantage of verbal protocol analysis is that it provides sequential observations over time. As such, it reveals changes that occur in working memory over the course of task execution. This has been useful in studies of reading comprehension where the information presented and the individual's representation of the text change over time, in studies of problem solving where multiple steps are involved in reaching a solution and/or where multiple solutions are possible, in studies of expert versus novice

task performance, and in studies of conceptual change.

### Limitations of Verbal Protocol Data

As is the case with most research methods, verbal protocols have both advantages and limitations. Obviously, subjects can verbalize only thoughts and processes about which they are consciously aware. Thus, processes that are automatic and executed outside of conscious awareness are not likely to be included in verbal protocols, and other means of assessing such processes must be used. Also, nonverbal knowledge is not likely to be reported.

Most authors of articles examining the think-aloud procedure seem to disagree with the 1993 contention of K. Anders Ericsson and Herbert A. Simon that thinking aloud does not usually affect normal cognitive processing. It is thought that the think-aloud procedure may lead to overestimates and/or underestimates of the knowledge and processes used under normal task conditions. The need to verbalize for the think-aloud task itself might encourage subjects to strategically use knowledge or processes that they might not otherwise use. Alternately, the demands of the think-aloud task might interfere with subjects' abilities to use knowledge and/or processes they might use under normal conditions. Self-presentation issues (e.g., desire to appear smart, embarrassment, introversion/extroversion) might affect subjects' verbal reports. Finally, the pragmatics and social rules associated with the perception of having to communicate one's thoughts to the researcher might also lead to overestimates or underestimates of knowledge and processes typically used.

Unfortunately, it is not possible to know if a verbal protocol provides a complete picture of the knowledge and processes normally used to perform a task. Typically, however, no single research technique provides a complete picture. Only the use of multiple measures for assessing the same hypotheses and for assessing various aspects of task performance can provide the most complete picture possible.

A final limitation of verbal protocol methodology is that it is very labor intensive. The data collection and data coding are extremely time consuming as compared with other methodologies. The amount of potential information that can be acquired about the contents of working memory during task performance, however, is often well worth the time required.

### Optimizing the Advantages and Minimizing the Limitations

Several suggestions have been put forth for increasing the likelihood of obtaining verbal protocol data that provide valid information about the contents of working memory under normal task conditions. The most frequent suggestions are as follows:

- Collect verbal protocol data while subjects are performing the task of interest.
- Ask subjects to verbalize all thoughts that occur. One should not direct their thoughts or processing by asking for specific types of information unless one wishes to study the planned, strategic use of that type of information.
- Make it clear to the subjects that task performance is their primary concern and that thinking aloud is secondary. If, however, a subject is silent for a relatively long period as compared to others during task execution, prompts such as “keep talking” may become necessary.
- To minimize as much as possible the conversational aspects of the think-aloud task, the researcher should try to remain out of the subject’s view.

## RESEARCH MISCONDUCT

Research encompasses a broad range of activities that are bound together by the common goal of advancing knowledge and understandings. Its usefulness to society rests on the expectation that researchers undertake and report their work fairly, accurately, and honestly. Researchers who fail to fulfill this expectation lack integrity and can be accused of engaging in research misconduct.

### Policies and Procedures

In 1981 when Congress convened its first hearing to investigate fraud in biomedical research, researchers expressed confidence in their ability to police their own affairs. The fact that researchers who engaged in misconduct were caught seemingly justified this confidence. A few professional societies subsequently issued reports discussing the importance of integrity in research, including the Association of American Medical Colleges, which published *The Maintenance of High Ethical Standards in the Conduct of Research* in 1982, and the Association of American Universities, which published its *Report . . . on the Integrity of Research* in 1983. A small number of research universities also adopted research misconduct policies—primarily the ones directly affected by misconduct cases, such as Yale and Harvard universities. However, neither government nor the majority of research universities saw any pressing need to make major changes. Through the mid-1980s, research misconduct remained largely undefined on most university campuses and was policed only through the informal mechanisms of peer review and general policies governing academic conduct.

The Health Research Extension Act of 1985 changed this situation and required government and universities to take a more aggressive approach to investigating research misconduct. In response to this call for action, the Public Health Service (PHS) published an Interim Policy on Research Misconduct in 1986 and adopted a final policy in 1989. The latter established two offices to investigate and adjudicate research misconduct cases: the Office of Scientific Integrity (OSI) as part of the National Institutes of Health (NIH) and the Office of Scientific Integrity Review (OSIR), affiliated with the Office of the Assistant Secretary of Health (OASH). The National Science Foundation (NSF) also published *Final Regulations for Misconduct in Science and Engi-*

*neering Research* (1987) and assigned administration of its regulations to the NSF Office of the Inspector General (OIG). These actions established policies and procedures for investigating research misconduct. They also required research universities to establish their own policies and procedures for handling research misconduct cases, which they slowly did over the course of the 1990s.

The responsibility for administering research misconduct policies on most university campuses is assigned to the chief research officer, although in a few cases universities have established research integrity or misconduct committees. On campuses with large research budgets, one staff person, sometimes called the “research integrity officer,” is assigned primary responsibility for initiating inquiries, setting up investigation committees, making timely reports, and handling other matters relating to research misconduct. The process for determining whether misconduct has been committed usually follows the three-step model outlined by the federal government—inquiry, investigation, and adjudication. During inquiry, charges are informally assessed to determine whether there is enough evidence to proceed with a formal investigation. If there is, a formal investigation follows, after which decisions about innocence or guilt and appropriate penalties or exoneration are made (adjudication).

Proper handling of misconduct cases proposes three challenges for universities. First, since state and federal governments provide no funds to comply with research misconduct regulations, other sources of support are needed. Second, misconduct cases often pit one university employee against another, making it difficult for the university to provide equal justice and protection to all concerned. Third, universities have conflicts of interest when they confront reports of research misconduct.

Several factors can make it tempting for universities to dismiss cases early in the process prior to fair and complete investigations. Investigations can be expensive and divisive. Findings of misconduct can require that funds be returned to a funding agency, even if some or all of the funds have already been spent. Reports of research misconduct can also erode public confidence in a university. However, in addition to the clear responsibility universities have to assure that public research funds are used properly, the costs of cover-ups can be high and may lead to further regulation. Therefore universities must

take their responsibility for conducting fair and complete investigations seriously.

### Definitions

The first formal government definition of research misconduct was published in the 1986 PHS Interim Policy. This initial definition framed all subsequent discussions of research misconduct in two important ways. First, in rejecting the use of the term “fraud” for describing inappropriate behavior in research, PHS officials helped assure that all subsequent discussions would be framed in terms of “research misconduct.” Second, the three key terms used in the Interim Policies to describe research misconduct—“fabrication, falsification, and plagiarism,” or FFP—have been used in all subsequent federal and many university definitions.

As important and long-lasting as the framework established in the Interim Policy turned out to be, it raised points of contention that to this day continue to polarize discussions of research misconduct. Most importantly, PHS proposed and the National Science Foundation (NSF) soon officially included, in 1987, one additional phrase in the government definition of research misconduct: “other practices that seriously deviate from those that are commonly accepted within the scientific community for proposing, conducting, or reporting research.” The “other practices” phrase turned out to be very controversial. Scientists worried that professional disagreements over methods or theories might be construed as *other practices that seriously deviate from those that are commonly accepted*. They wanted a tight, unambiguous definition that left no room for arbitrary interpretation. Government officials, particularly at NSF, felt they needed some flexibility to investigate behavior that did not constitute FFP but that nonetheless was clearly inappropriate and undermined the public’s investment in research. NSF officials backed up their claim with several examples, including a widely publicized case of inappropriate sexual behavior by an anthropologist who had an NSF grant to train students in field research.

Two efforts to resolve disagreements over the definition of misconduct in the 1990s failed to produce a consensus. The first, led by a subcommittee of the National Academy of Sciences, dropped the “other practices” phrase from the formal definition of research misconduct, but agreed that there were “other questionable research practices” that needed to be investigated, not by government but by re-

search institutions and professional societies. The second effort to produce a consensus definition by a specially appointed PHS Commission on Research Integrity failed to win serious support and was largely ignored. The failure of these efforts and the lack of a common government definition led eventually to a new government effort to produce a uniform federal definition for research misconduct, coordinated this time by the Office of Science and Technology Policy (OSTP) in the Executive Office of the President.

The new OSTP policy, which was published in the *Federal Register* in December 2000, defines “research misconduct” as “fabrication, falsification, or plagiarism in proposing, performing, or reviewing research, or in reporting research results.” It also sets three criteria for proving misconduct, which further narrow the definition of research misconduct. When adopted, the new definition will require evidence that the behavior:

- [represents a] significant departure from accepted practices of the relevant research community; and
- [was] committed intentionally, or knowingly, or recklessly; and
- [can be] proven by a preponderance of evidence.

With the publication of the OSTP Policy, nearly two decades of intense debate over the definition of research misconduct reached a tentative conclusion, assuming the federal agencies that fund research follow through and adopt the proposed OSTP definition.

### Misconduct Cases

The evolution of research misconduct policy has unquestionably been driven by a small number of prominent cases. In the early 1970s, William Summerlin, working at the Sloane Kettering Institute, tried to pass off black patches painted on white mice as genuine skin grafts that he had applied using a new technique. Elias Asabati, while at Temple University and Jefferson Medical College in Philadelphia and the Anderson Hospital in Houston, took published articles, replaced the authors’ names with his own name, made occasional minor modifications in the text, and then submitted them to other journals for publication. His misdeeds, which eventually included the submission of eighty fraudulent articles, became public in 1978. A junior researcher at Yale

University, Vijay Soman, used information from an unpublished article from another laboratory being reviewed by his mentor, Philip Felig, to publish his own, supposedly original findings on the same topic. Yale initially ignored the charges of plagiarism and data falsification brought by the researcher whose work Soman used. The charges were confirmed in 1980 by an investigation conducted by the NIH. The 1981 Congressional hearings on fraud in biomedical research were convened specifically to investigate these cases.

Reports of new cases of research misconduct and the 1982 publication of *Betrayers of the Truth: Fraud and Deceit in the Hall of Science*, by *New York Times* writers William Broad and Nicholas Wade, guaranteed that the problem of research misconduct did not disappear after the 1981 hearings. One case, which involved data falsification by John Darsee, a promising young cardiovascular researcher at Harvard, dragged on for five years, due not to uncertainty about the actual misconduct but to a dispute over the responsibilities of others who oversaw Darsee's work. A paper by NIH researchers Walter Stuart and Ned Feder raised serious questions about the role of Darsee's chief mentor, Eugene Braunwald, in reviewing publications he coauthored with Darsee. Disagreement over the publication of Stuart and Feder's paper kept the Darsee case alive through most of the 1980s.

As the Darsee case was slowly coming to an end, two new cases assured continued public interest in research misconduct. The first involved disputed data published in an article in *Cell* in 1986, based on research conducted by Tufts University researcher Thereza Imanishi-Kari. A postdoctoral student working in Imanishi-Kari's laboratory, Margot O'Toole, raised questions about research misconduct when she was unable to replicate some of the results reported in the *Cell* article. Eventually, the article's most prominent co-author, Nobel scientist and Whitehead Institute Director David Baltimore, was drawn into the dispute. After numerous investigations by the Massachusetts Institute of Technology (MIT) and the Office of Scientific Integrity (renamed the Office of Research Integrity in 1992), the charges against Imanishi-Kari were dismissed by a Health and Human Services appeal board in 1996, ten years after the original article was published and five years after the article had been retracted by four of the five co-authors, including Baltimore. (David Baltimore was never formally charged with miscon-

duct.) The bitter dispute between Baltimore and his supporters on the one hand and Congressman John Dingell of Michigan and research critics on the other seriously polarized the debate over the importance of and ways to deal with research misconduct.

The second prominent case involved NIH AIDS researcher Robert Gallo, a researcher in his laboratory, Mikulas Popovic, and their 1984 article published in *Science* claiming discovery of the AIDS virus. At issue was whether Gallo's team had isolated the virus described in the article or whether they had improperly used samples supplied by the Institut Pasteur in France. A series of articles by *Chicago Tribune* reporter John Crewdson and reports issued by the ORI and a subcommittee headed by Representative John Dingell cast serious doubts on Gallo's claims. However, the charges against Popovic were dismissed in 1995 by the same HHS appeal board that had dismissed the charges against Imanishi-Kari. ORI therefore decided to drop its charges against Gallo, arguing that the appeal board had adopted a new definition of misconduct that ORI was not prepared to meet.

In the late 1990s the focus of interest in research misconduct shifted to clinical research, following the report of the death of a young subject, Jesse Gelsinger, in 1999, during a gene therapy trial at the University of Pennsylvania. In this and other cases involving clinical research, the questionable research behavior does not constitute research misconduct, narrowly defined as FFB, but rather raises questions about conflicts of interest, misleading or incomplete reports on past research, the failure to inform research subjects of risks, and noncompliance with federal rules. These new concerns have raised questions about the way researchers are trained and steps that can be taken to foster the "responsible conduct of research."

### Responsible Conduct of Research

Interest in instruction in the "responsible conduct of research" (RCR) emerged in the late 1980s as one solution to growing public concern about research misconduct. Although a number of earlier reports had stressed the importance of education in research training, few substantive changes in the way researchers are trained were made prior to the 1989 Institute of Medicine report *The Responsible Conduct of Research in the Health Sciences*. Within a year, NIH and the Alcohol, Drug and Mental Health Administration (ADAMHA) published rules that required

researchers seeking a special type of award known as a “training grant” to include a description of “activities related to the instruction about the responsible conduct of research” in their applications.

Over the course of the 1990s the modest NIH/ADAMHA training grant requirement fostered the development of a growing number of RCR courses on university campuses and related instructional materials, such as textbooks, videos, and Internet resources. This development was given a considerable boost in 2000, when NIH implemented *Required Education in the Protection of Human Research Participants* and ORI published an RCR requirement that would have affected all PHS funded research, had it not been suspended due to Congressional questions about the way it was developed. However, even without the broad ORI RCR requirement, efforts continue on university campuses to formalize instruction in the responsible conduct of research, relying more and more on web-based training.

### Future Considerations

When research misconduct first emerged as a public concern in the late 1970s, it was seen primarily as an aberration that did not typify the conduct of most researchers. By implication, it was therefore assumed that most researchers adopted high standards for integrity in their work. Since the early 1980s, research misconduct has continued to occur, but its overall rate of occurrence is still small in comparison to the total number of active researchers. Research misconduct, defined as intentional FFP, still seems to be an aberration that does not typify the conduct of most researchers. However, based on a growing body of research on research integrity, it can no longer be assumed that most researchers do in fact adopt high standards for integrity in their work.

Studies of peer review, publication practices, conflicts of interest, bias, mentoring, and other elements of the research process consistently report that significant numbers of researchers (defined as 10% or higher) do not adhere to accepted norms for the responsible practice of research. Significant numbers inappropriately list their names on publications, are unwilling to share data with colleagues, use inappropriate statistical analyses, provide inaccurate references in publications, fail to list conflicts of interest, and engage in other practices that fall short of ideal standards for the responsible conduct of research. There has been widespread agreement that these other “questionable research practices” as

titled in the 1982 NAS report should not be considered research misconduct. However, whether classed as misconduct or not, these practices unquestionably waste public research dollars, undermine the integrity of the research record, and can even endanger public health. As a result, the focus of attention both in government and on university campuses is slowly shifting from confronting misconduct to fostering integrity through education and the serious appraisal of what it means to be a research university.

## RESEARCH UNIVERSITIES

Research universities are postsecondary institutions that devote a large portion of their mission, resources, and focus to graduate education and research. Currently, there are more than 250 of these institutions in the United States. Research universities such as Harvard, Stanford, Berkeley, and Michigan are often mentioned in the media due to their size, resources, status, and athletic teams. These are among the best-known, but there are many different kinds of research universities.

Research universities in the United States vary according to size, control, focus, selectivity, and the number of degree programs offered. They include public universities, such as the universities of Michigan and Virginia, and private universities, such as Duke University and MIT (Massachusetts Institute of Technology). They range in size from very large universities such as the University of Minnesota, which has almost 60,000 students enrolled at three campuses, to small universities such as Rice University in Houston, which has fewer than 4,500 students. A few research universities are very focused in mission and offer degree programs in specialized areas, such as The Rockefeller University, which offers graduate programs, including a Ph.D., in biomedical sciences only. Others, like Michigan State University, offer a dizzying portfolio of undergraduate and graduate degrees across seventeen colleges and hundreds of undergraduate and graduate degree programs. Some research universities embrace open admissions policies, while others are very selective and admit less than 20 percent of those students that apply.

What all research universities have in common—and what makes them research universities—is an emphasis on graduate education and research. All research universities offer advanced degrees, up to and including the doctorate. Most research universities also enroll a sizeable number of undergraduates in a comprehensive set of bachelor's degree programs.

### Faculty and Students

Research universities occupy a unique position within the United States higher education system. For example, unlike students enrolled at liberal arts colleges, undergraduate students attending research universities generally pursue a specialized curriculum with a very large number of requirements for

the major and a smaller number of electives and general education requirements. Due to the large size of most research universities, students who attend these institutions are likely to have large lower-division classes, some of which may be taught by graduate students who serve as teaching assistants.

Faculty members at research universities are expected to devote a larger amount of their time to research than are faculty members at liberal arts colleges and comprehensive universities, where the faculty's primary role is that of teacher rather than researcher. At research universities, faculty members are sometimes researchers first and teachers second, and are expected to publish articles and books and secure research grants from external sources.

While these qualities have provoked some criticism of research universities, they remain a very popular option for postsecondary students. As of 1998, for example, research universities enrolled more than one out of every five students attending a college or university in the United States. Research universities also attract a large percentage of the best and brightest students. Annually, research universities enroll the largest numbers of National Merit Scholars. These students are attracted to research universities because of their high-profile faculty members, the prestige associated with these institutions, and their resources, including state-of-the-art labs and technology.

### **Beyond Academics**

The U.S. research university is much more than academics, however. The research university is a far-flung and complex organization with multiple campuses, extension centers, research centers and institutes, multiple campuses, student services and programming for diverse student groups, and often high-profile athletics teams. The Big Ten, Big 12, and PAC-10 athletic conferences consist entirely of research universities, for example. It is not unusual for research universities to establish their own research parks where private companies and the university engage in technology transfer and spin off new businesses. In the early twenty-first century, it is difficult to think of something in which research universities are not involved.

In this sense, Clark Kerr refers to the modern U.S. research university as a "multiversity" and a "community of communities" where the complexity and sheer number of goals the organization strives

to achieve creates great specialization and multiple communities of actors who share little in common, except for the fact that they work for the university. Similarly, higher education researchers Michael Cohen and James March refer to research universities as "organized anarchies" where, at times, there appear to be no rules governing the organization, and no recognized leaders, only a sort of chaos that someone familiar with the research university can sort out.

### **The History of the Research University**

The lineage of the U.S. research university can be traced to the great German and English universities and their respective forms and traditions. In fact, throughout most of the nineteenth century, there were no true research universities in the country. It was during the latter portion of the 1800s that several influential higher education leaders, including Daniel Coit Gilman of Johns Hopkins University, William Rainey Harper of the University of Chicago, and G. Stanley Hall of Clark University, established universities devoted to the primacy of research and specialized graduate education. These universities were modeled after the German traditions and structures found at Berlin and Heidelberg, including the graduate seminar and academic freedom (*Lehrfreiheit*). Before this time, earned Ph.D.s were largely unheard of in the United States. These leaders and their universities adopted the Germanic university form, and other universities followed. Soon after the founding of Johns Hopkins, Chicago, and Clark, universities that were founded during the colonial period were adopting and adapting the forms legitimated by Johns Hopkins and others.

Yet the U.S. research university also functions like an English university in many ways. For example, the research university in the United States almost always features a comprehensive undergraduate curriculum with a residential component that is more akin to Oxford and Cambridge than it is to Berlin. Similarly, student development and providing student services occupies a significant focus for U.S. research universities. This is a function of the fact that colonial colleges were organized according to an Oxbridge model, and their graduate education and research functions were superimposed on this existing organizational structure and culture.

### **Classifying and Ranking Research Universities**

Given the variance in the characteristics of research universities, how can the different types of research

universities be categorized? Traditionally, this has been accomplished by the Carnegie Foundation for the Advancement of Teaching through its *Classification of Institutions*. Begun in 1973, and continuing throughout the classifications of 1976, 1987, 1994, and 2000, this scheme categorized all postsecondary institutions in the United States. As part of this larger classification, the Carnegie Foundation placed research universities in one of two categories, Research Universities I and Research Universities II, prior to the 2000 classification. Research universities were placed within these two categories depending upon the number of doctorate degrees they awarded and the amount of federal research funding they received. For the 2000 classification, these categories were expanded and renamed Doctoral/Research Universities—Extensive and Doctoral/Research Universities—Intensive, respectively. According to this classification, there are 261 research universities in the United States.

There are other recognized ways of determining what a research university is, and which are of the highest quality. There are organizations such as the Association of American Universities, a prestigious, invitation-only group of sixty-one American and two Canadian universities, all of which are high-quality research universities. Historically, organizations such as the National Research Council have also worked to qualitatively and quantitatively describe the relative quality of research universities and their various academic departments. Most recently, magazines such as *U.S. News and World Report* have introduced very popular rankings of postsecondary institutions, including research universities. These rankings are quite controversial, however, because of the great weight they place on inputs and reputation, and because they attempt to rank what is arguably a very diverse set of colleges and universities.

## RESIDENTIAL COLLEGES

Islamic in origin, the residential college may well be the oldest organizational model in Western higher education. Established as foundations to provide support for advanced students, residential colleges first appeared at the University of Paris and Oxford University in the twelfth century. From these medieval roots, the residential colleges of Oxford and Cambridge University evolved to become academic communities made up of students and faculty sharing living quarters, meals, and tutorial study. Oxford and Cambridge served as models for colleges and universities throughout the former colonies of England and beyond.

### Defining Residential Colleges and Related Terms

Residential colleges have evolved over the centuries and under different local conditions. As a consequence, there is a range of variation in their structures and a lack of consensus about the meaning of the term *residential college*. In its most generic sense, the term may be used to refer to an institution that houses most of its students on-campus as opposed

to an institution with a large commuter or off-campus population. Many small, independent, liberal arts colleges conform to this definition of residential college. In a more restricted sense, the term residential college may be used interchangeably with terms such as *living-learning center*, *theme house*, and *residential learning community*. This usage, however, may obscure important differences between the classical model of residential college, conventional residence halls, and other types of contemporary residence education programs.

Conventional residence halls are on-campus facilities intended to provide low-cost, attractive, safe, and convenient living quarters for undergraduate students in close proximity to academic buildings. Residents may participate in dining plans provided by centralized dining facilities and services. Conventional halls are usually supervised by undergraduate resident advisers and professional staff members trained in student affairs administration. Staff members are trained to assist students with adjustment and developmental issues or to make appropriate referrals to other campus professionals. Conventional residence halls may offer a range of social, recreational, and educational programming organized by their staffs.

Contemporary residence education programs attempt to more completely integrate out-of-class experiences with in-class learning. In a 1998 opinion paper, the Residential College Task Force of the Association of College and University Housing Officers presented a number of models of existing residence education programs. There is considerable overlap among these models; the differences are often matters of emphasis. These programs are generally the result of partnerships between student affairs professionals, academic staff, and faculty.

Living-learning centers are programs with direct connections to specific academic programs such as foreign languages, premedical studies, or science. For instance, the McTyeire International House at Vanderbilt University clusters students interested in studying one of five foreign languages on halls with native speakers as program coordinators. Faculty advisers guide the programming of each language hall.

Theme houses offer opportunities for students with special interests to live and work together. Stanford University offers a variety of theme halls. Casa Zapata (Chicano/Mexican-American theme) and Ujamaa (black/African-American theme) are cross-

cultural theme halls exploring issues of ethnic identity, culture, and history. Other halls offer programs for students with interests in community service and environmental issues.

*Academic residential programs* provide academic support services, such as academic advising, career planning, tutoring, and programming in study skills, to residential students. At Washington State University, the Academic Resource Center is located in the freshman residential complex. The center provides a computer lab, academic advising, tutoring, and programming on study skills, career planning, and time management. Specially trained, upper-level residents are assigned as academic peer advisers to freshmen.

Residential learning communities create opportunities for students attending the same classes to live in the same residence hall. Participants in the Scholars Program at the University of Maryland—College Park are grouped so that they can take fourteen to seventeen credits of curricular theme courses together over the first two years of college and participate in a colloquium on their theme.

*Freshman Year Experience housing* provides specialized housing configurations to focus delivery of student affairs and academic services to first-year students. At the University of Missouri—Columbia, groups of up to twenty freshmen take three courses together and live on the same floor with a peer adviser assigned to help first-year students with adjustment issues.

### **The Classic Residential College**

Residential colleges and the aforementioned forms of contemporary residence education programs share a common goal of seeking to integrate in-class learning with out-of-class experiences in residential settings. What distinguishes classic residential colleges from other forms of residence education is the level and quality of faculty involvement. In residential colleges found in leading universities, faculty and students live and work in shared residential facilities. Further, the program is staffed and directed by the affiliated and resident faculty. In rare instances, the college is itself a degree-granting institution.

While the functions, nomenclature, and organizational structures of colleges differ from university to university, leading institutions in the United States share certain general patterns. In institutions such as Harvard, Yale, Princeton, and Rice Universi-

ties, residential colleges are decentralized academic societies or associations composed of faculty and student members. They range in size from 250 to 500 members. A distinction is usually drawn between senior and junior members of the college. The senior membership includes faculty, selected staff, and distinguished members of the local community. The junior membership includes undergraduate and graduate students. Residential colleges are microcosms of their universities. Senior members are drawn from all schools and departments; care is taken to achieve a balance in disciplinary representation. The junior members of a college reflect the full range of academic interests and backgrounds present in the university as a whole. Some schools randomly assign junior members to their colleges. Others take into consideration the preferences of junior members but also take measures to ensure that students do not self-segregate on the basis of demographic characteristics.

A faculty member is appointed to serve as the master of the college and has oversight responsibility for the college as a whole. The master reports to the chief academic officer or the chancellor or president of the university. A college dean is also appointed from the faculty and is responsible for academic advising and the personal welfare of student members of the college. Affiliated senior members are expected to attend college functions, dine frequently at the college, and take an interest in the life of the college. Senior members are appointed for specific terms and periodically reviewed. Resident tutors are selected from the graduate student members of the college and serve as intellectual role models, mentors, and advisers for the undergraduate students. They are supervised by the dean.

In a residential college, the staff works to create an orderly, satisfying, and nurturing environment that fosters a sense of belonging, promotes positive relationships among all members of the community, and is organized around the experience of learning. The master, the dean, and, especially, the resident tutors are visible and available members of the community; they closely observe their students, listen to their concerns, and respond as needed. Colleges have active student governments and seek to provide leadership opportunities for all junior members. The senior members of the college and the resident tutors are expected to participate in the evening activities, both formal and informal, of the college.

A residential college has its own character and culture; a conscious effort is made to create and sustain a tradition and a sense of history. A college program has a measured temporal structure providing for regular interactions of its members and for special events with ritual significance. Colleges hold regular weekly, monthly, and annual meetings. A common meal plan for students and staff plays a central role in establishing the college community. Welcoming events are held for new members as well as commencement events for departing members. Colleges create unique identities by celebrating selected events such as specific holidays or anniversaries. The pattern of events and activities is intended to be meaningful for its members; the program fosters shared norms, values, and expectations. These shared meanings may even be embodied in artifacts such as murals, facebook (containing photographs of and biographical information on the college's residents), commonplace books, insignia, and mascots.

The central purpose of the college is academic. Colleges may provide academic advising for their junior members, offer for-credit classes or not-for-credit study, and organize opportunities for formal and informal discussions with faculty and visiting scholars and artists. Social activities are organized around opportunities for learning. Poetry readings, recitals, theatrical productions, scientific experiments, reading groups, field trips, and attendance at cultural and artistic events are common activities in residential colleges.

The architecture of the classic residential college promotes its educational mission. College buildings and gardens generally demarcate some sort of an enclosed space, such as a quadrangle. The enclosure helps foster a sense of communal identity and can be used to create traffic patterns promoting positive interaction among the college's members. The master, the dean, the resident tutors, and their families are provided with living quarters. Each college has an office complex to support the master, dean, and resident tutors. Central to the life of a college is a dining commons large enough to seat all of the members of the college. The dining commons can be used for announcements, college meetings, social activities, and special events. Separate meeting or social rooms are provided for senior and junior members. Libraries, classrooms, guest apartments, art studios, computer labs, kitchens, and laundries are often included in college facilities.

## Benefits of Residential Colleges

The benefits for students derived from simply living on campus, as opposed to living off campus, are well documented. Living on campus has been linked to increases in aesthetic, cultural, and intellectual values; increases in self-concept, intellectual orientation, autonomy, and independence; gains in tolerance, empathy, and interpersonal skills; persistence in college; and degree attainment. According to a 1991 book by Ernest T. Pascarella and Patrick T. Terenzini, there is little evidence linking living in a conventional residence hall with knowledge acquisition or cognitive growth. A 1998 meta-analysis by Gregory Blimling of studies published from 1966 through June 1997 shows, however, that residential colleges, as compared to conventional halls, increase students' academic performance and retention and enhance the social climate of the living unit. Blimling's study does not distinguish clearly between classic residential colleges and living-learning centers.

According to studies conducted in 1991 by George D. Kuh and associates and in 1993 by Jerry A. Stark, faculty participating in residential colleges or living/learning centers report improvement in their teaching skills and enhanced relationships with faculty from other disciplines. Frances Arndt reported in 1993 that faculty also held positive attitudes about opportunities offered by residential colleges for teaching a variety of special and experimental courses.

## Challenges and Prospects

In the 1996 book *Importing Oxbridge*, Alex Duke analyzed factors affecting the failure of residential college systems in North America. While attempting to model their colleges after the exemplars of Oxford and Cambridge, North American educators did not understand the historical development or social context of these institutions. Further, the departmental organization of academic disciplines does not cohere with the interdisciplinary character of residential colleges. Finally, the rapid postwar growth in enrollment simply outstripped the ability of institutions to provide housing for students. In a chapter in the 1994 book *Realizing the Educational Potential of Residence Halls*, Terry B. Smith argued that institutional reward structures focus on disciplinary achievement in the form of scholarly research, publication, and grant awards. There is little incentive for faculty to work with students in out-of-class contexts. Will

Koch reported in a 1999 article in *College Student Affairs Journal* that students may prefer conventional housing assignment practices that permit self-segregation by demographic characteristics. Finally, residential colleges require considerable investments in personnel and facilities. Funding for programming and space requirements as well as compensation for participating faculty make residential college programs more expensive than conventional residence halls.

Since the publication of the landmark study *Involvement in Learning: Realizing the Potential of Higher Education*, published by the National Institute of Education in 1984, numerous reports have called for increased emphases on improving teaching and learning, increasing student involvement in learning, and integrating in-class and out-of-class learning. Residential colleges are clearly one way to achieve these goals. There is evidence of growing interest in living-learning centers and residential college models. The future of the residential college model may depend on its cost-effectiveness relative to other means for achieving these educational goals.

## RESOURCE ALLOCATION IN HIGHER EDUCATION

---

Institutions of higher education—be they large public universities or small private colleges—are not homogeneous organizations. Because of differing missions, goals, programs, histories, traditions, laws, and explicit procedures, they obtain and expend revenues, or financial resources, in myriad ways. Therefore, there is no universal model about the best way to allocate financial resources within higher education. Nevertheless, there is general consensus within the U. S. higher education community about the meaning of certain terms pertaining to resource allocation, as well as a general consensus about certain methods and processes for channeling financial resources into specific programs and projects.

### Budgetary Concepts and Terms

For the layperson, the terms *budget* and *allocation* are often confused. Although the two terms are certainly related, and often synonymous, there are differences that one should be aware of in order to gain an appreciation of the resource allocation process.

Broadly interpreted, the term *budget* represents both an institution's revenue sources and its expenditures. For public institutions, this side of the coin is usually comprised of legislative appropriations; tuition based on the number of credit hours and level of courses taken; contracts and grants—which comprise revenues received from external sources for research and certain types of off-campus program development; auxiliary operations—which refer to on-campus operations that are self-supporting, for-profit enterprises (such as the campus bookstore, cafeteria, and laundry); and local funds. Local funds, particularly within public universities, refer to those revenue sources not kept within the state treasury, but within local banks. Local funds may be comprised of fees and assessments charged against students for the support of campus-wide student activities, intercollegiate athletics revenues, concessions, and financial aid monies.

Taken together, these revenue sources make up an institution's operating budget. They represent the totality of monies required to finance the institution's normal and recurring expenses (its core operations). However, this is not the complete picture, for the operating budget does not include fundraising revenues, which are monies donated to the

O'HARA, ROBERT J. 2001. "How to Build a Residential College." <<http://collegiateway.org/howto.html>>.

MARK BANDAS

institution by private donors, usually for specific purposes (such as endowed academic chairs, athletic scholarships, or a new academic program that is acceptable to the institution and a priority of the donor). Although fund-raising revenues have become ever more critical for institutional operations, they are rarely considered part of the traditional operating budget.

Expenditures represent the most common understanding of the term *budget*. In this sense, the budget formally represents the institution's strategic priorities and associated costs. That is, the budget is a detailed plan for expending revenues for various institutional purposes. Moreover, these purposes are, or should be, focused on long-term strategic imperatives that parallel and support the accomplishment of the institution's most critical needs and aspirations.

Traditionally, expenditures for the operating budget fall into certain main categories that apply to both public and private institutions. Certainly, the largest slice of the budget pie is earmarked for instruction and research (I & R)—the core activities of any college or university. At Florida State University, for example, approximately 70 percent of the operating budget is designated for I & R purposes. Other large slices of the budget pie include administrative support services, such as centralized computing and accounting services; student services, such as the registrar's office and financial aid; plant operations and maintenance, including grounds, building services, and utilities; and libraries.

Expenditures from the operating budget are generally *unrestricted*. That is, there is some flexibility in allocating resources within and between the various categories that make up the operating budget. However, there are also restricted budgets, both within and external to the operating budget. *Restricted* means just that—monies can only be expended for strict, narrowly defined purposes. For example, within I & R, a public university could receive a restricted legislative appropriation to fund a Title IX (gender equity) program. Likewise, restricted budgets outside the operating budget may include monies earmarked for sponsored research or financial aid monies received from external sources, such as the federal government.

For most core operations, whether financed by unrestricted or restricted budget expenditures, one should be aware of exactly how the monies are ear-

marked within the major expenditure categories. Generally, the monies fall into three main activities: (1) salaries and benefits, which are certainly the most costly activities; (2) capital outlay, which refers to major purchases of expensive equipment, such as computer systems; and (3) expense items, which include less expensive items and continuing costs such as office furniture, service contracts, expendable supplies, and travel.

One critical budgetary category that is not considered a part of the traditional operating budget is *fixed capital outlay*, which comprises the monies earmarked for major construction and renovation projects. The *auxiliary budget*, also kept separate from the core, concerns the receipt and expenditure of monies obtained from revenue producing campus enterprises (e.g., a bookstore). Institutions with medical schools and teaching hospitals often have separate budgets for these purposes.

Some institutions have service-center budgets, which refers to certain centralized services such as photography, printing, and copying. These services are not financed by operating budget expenditures. Rather, units under the umbrella of the service-center budget are reimbursed for their services by charging operating budgetary units, which, in turn, pay the service-center unit from operating budget expenditures, usually from the expense category.

### Allocation Concepts and Terms

For the purpose of understanding the differences (and nuances) between the concepts of *budget* and *allocation*, one could say that the formal budget is the architecture (or basic plan per category) of how monies will be expended. *Allocation*, however, refers to the actual funneling of dollars to various units within an institution. In some instances, allocation flows will exactly mimic the expenditure categories. However, were this always the case, the descriptive analysis of budgets and allocations would end here. Rather, allocations often do (and should) have an element of flexibility built within them to reflect changing environmental conditions—including both internal and external environments, such as political circumstances, economic exigencies, and the strategic direction of the institution.

Although most institutions do permit some flexibility within their allocation decisions, many eminent higher education leaders, such as Dr. James J. Duderstadt, the former president of the University

of Michigan, have publicly noted that far too many allocation decisions have become overly mechanistic. This has become particularly true within large, public institutions, which have also publicly expressed their collective concern over the ineffective and inefficient ways that monies are allocated. In addition, the National Association of College and University Business Officers (NACUBO) has also publicly expressed concern about the deficiencies currently inherent within internal allocation systems and processes.

Before discussing normative issues concerning how such deficiencies may be corrected, one must first understand the basic processes of allocations, particularly within the unrestricted I & R category. Historically, both academic and administrative units have relied upon incremental budgeting for determining allocations. Incremental budgeting simply means that the unit will sum the dollars contained within its current (annual) salary and benefits, capital outlay, and expense activities, and then increase the sum by a percentage to cover inflation and other expected cost increases. Incremental budgeting certainly simplifies the allocation process and facilitates accounting. With limited exceptions, incremental budget requests are accepted as forwarded to the central budget authority, funds are allocated according to the three major activities, and the unit lives within the allocations. At some institutions, academic and administrative units, with approval of a central budget authority, are able to transfer a minimal percentage of funds among salaries and benefits, capital outlay, and expense—if critical exigencies so demand. Nevertheless, this type of allocation system remains basically static.

The problem with static allocation systems is that they are inherently unable to anticipate change. Duderstadt duly notes that within large public universities, legislative appropriations, in terms of real dollars, have continuously diminished since the 1970s. Diminishing public appropriations, coupled with the opportunities and threats posed by a volatile environment, limit an institution's ability to adapt. During extreme economic situations, static allocations based upon incremental budgeting could actually spell the death of a public institutions' major academic offerings.

Another allocation process, often coupled with incremental budgeting, is formula-based allocation. This can be more flexible than simple incremental budgeting, because such formulas are usually based

upon total credit hours or full-time head count per academic unit. This type of allocation process rewards those academic units that are most popular with students, and therefore does provide flexibility to fund those programs that are most in demand. Conversely, if an academic program is critical to a university's mission, but does not attract large numbers of students, it is automatically punished by formula-based allocations. In short, this is a market-based allocation process. While a for-profit organization can and should allocate its resources into the maintenance and expansion of its most profitable offerings, higher education institutions are striving for both tangible and intangible successes that may not necessarily be popular among students.

Colleges and universities, recognizing the inadequacies of incremental and formula-based budgeting, have enacted certain allocation adjustments to enhance flexibility and the quality of certain programs. At one university, for example, a 1 percent flat tax was charged against the allocations to all academic units to replenish a central reserve fund and enhance certain graduate programs. However, according to a report by that university's provost, this type of allocation mechanism proved itself insufficient to meet most challenges facing the institution.

In order to meet institutional objectives, and depending upon the authority granted to an institution by its governing board or its state legislature, an institution may be required to reduce allocations in one area to cover allocation demands in another. In order to meet the salary needs of the faculty, for example, resource allocations may be significantly diminished for libraries, computing systems, or facilities maintenance.

Flat taxes and other short-term options, such as hiring adjunct faculty or downgrading positions, can only operate at the margin, however, because not enough financial resources are generated, particularly on a long-term basis, to solve problems resulting from a lack of allocation flexibility. Similarly, wholesale raiding of funds from one allocation category to fill the coffers of another, if permitted, can only serve to weaken the entire university structure over time. Whether the allocation process is incremental, formula-based, or stopgap in nature, such processes focus only upon short-term, year-to-year allocations.

In 1999, Drs. Edward Ray and William Shkurti, the provost and senior vice president for finance, re-

spectively, at Ohio State University, succinctly stated the problems accruing to that particular institution as a result of allocation inefficiencies:

- Current practices were not supportive of the instructional mission.
- Current practices were not supportive of the research mission.
- Current practices did not provide sufficient incentives to reduce costs and/or generate additional revenues required to address academic priorities.
- Current practices did not provide sufficient accountability for the costs of individual unit decisions that impact the entire university.

### **Achieving Normative Consensus**

The problems inherent within traditional budgetary and allocation processes indicate the need for a new approach. Notwithstanding the fact that public institutions are further hampered by legislative mandates, private institutions also face the same problems inherent within incremental and formula-based allocations.

The challenge facing higher education is to embrace new philosophies and outlooks that take a long-term, wide-ranging view of what the institution is, what it should be, and how it can move from what is to what should be.

Appropriate, sufficient, and equitable resource allocation processes simply can no longer be based on what worked in the past. In this sense, most colleges and universities have embraced strategic planning—a long-range, holistic examination of what the overall mission of the institution should be; in other words, a vision. To better define this vision, one must further ascertain the specific goals that should be set to accomplish the mission, and what environmental factors exist—internally and externally—that can either enhance or inhibit the accomplishment of the vision. Specific questions need to be asked, such as: What does the university plan to accomplish over the next several years? How does the university plan to accomplish its goals and objectives? What resources are needed to carry out this plan? What are the funding sources from which the institution can obtain the necessary financial support?

To best answer these questions, institutions should first examine their decision-making struc-

tures. Colleges and universities are not pyramidal, hierarchical structures ruled by an autocracy at the top that transmits decrees downward through the chain of command. Conversely, colleges and universities cannot be anarchistic organizations where decision-making is randomly conducted by individual units. The problem, thus, is to create a decision-making structure that seeks consensus through participation.

At one Eastern university, for example, allocation decisions remain the basic prerogative of university executives, such as the president, provost, vice president for finance, and the deans. Nevertheless, to reach its highest-priority strategic objectives, faculty and staff members from colleges and departments are invited to submit their own ideas on how best to achieve the institution's overall mission, long-term strategic initiatives, and specific goals—all within the context of maintaining and enhancing the quality of priority programs identified by strategic planning. Specifically, faculty and staff members are requested to review the allocation and adequacy of resources vis-à-vis the quality of programs relative to peer institutions, the centrality of programs to the university's mission, and the cost-effectiveness of programs relative to the best practices of higher education and the private sector. To facilitate and direct this endeavor, a university-wide committee, the Strategic Plan Advisory Committee (SPAC) was formed. SPAC not only identified allocation problems in detail, it helped develop a long-term, multi-year plan that will enable the university to respond to special opportunities and eventually solve the most basic and continuing allocation problems.

Similarly, at the small, private-college level, Wheaton College in Massachusetts has set up a formal group—the Budget Advisory Committee—similar to the SPAC. Wheaton's committee, consisting of faculty and staff members, reports directly to the college president, and operates with the long-term view that allocations should be treated as strategic investments, not simply as annual costs. Hence, it has determined that allocations should regularly include reallocations from lower priorities to higher priorities, and that cost savings should be actively pursued in order to increase the college's strategic flexibility.

In short, if realistic and successful allocation processes are to be developed and accepted throughout the institution, structural arrangements must be

designed to facilitate the participation of stakeholders and attainment of consensus.

Once consensus on basic allocation–decision parameters is achieved, a second consideration includes the formal allocation structures and processes that might be adopted. To help identify these means, decision-makers and participants in the decision-making process should be provided with feasible and workable alternatives.

One alternative, as suggested by Duderstadt, is an institution-wide, integrated resource-allocation model he calls *Responsibility Center Management*. Resource-allocation decisions are shared between academic units, administrative units, and the central administration. After determining strategic priorities, this alternative allows critically-important units to keep the resources they generate, makes them responsible for meeting costs they incur, and then levies a tax on a unit's expenditures to provide a central pool of resources for supporting central operations and facilitating flexibility funding. This alternative has the potential to reduce some of the inequities and inefficiencies inherent within formulaic or incremental allocation processes.

Another alternative is *substitution*, or the elimination or reduction of noncritical activities to release allocations for more critical, strategically oriented activities. This alternative not only reallocates resources to those programs deemed most critical for strategic purposes, it also alerts the public and the institution's stakeholders that the college or university has taken cost effectiveness very seriously.

Other structural and process alternatives for resource allocations include: differential tuition rates based upon program popularity; using foundation allocations to replace traditional allocations; permitting the carry-over of surpluses from one year to another; and permitting the most productive research units to retain a large portion of the overhead (indirect) costs assessed against their research awards. The point is that viable and reasonable alternatives should be presented at the start of the analysis in order to preclude time being wasted.

### Conclusion

Traditional budgetary and resource allocation procedures that have been utilized for decades in America's colleges and universities are rapidly losing their functionality. Indeed, reliance upon their continued use can cause irreparable damage to the system of higher education.

Budgets and resultant allocations are complicated subjects. Because of their complexity and a reliance on the fact that they worked well enough in the past, inertia exists. However, in light of the volatile higher education environment of the early twenty-first century, the increasing inequities and inefficiencies of current systems and processes, and greater demands for accountability by legislative bodies and institutional stakeholders, structures and procedures for budgeting and allocating financial resources must be re-examined. The task is not easy—the problems are complex, and consensus about what should be done is difficult to attain. Nevertheless, to ignore the problem can, and will, have a negative impact upon public and private higher education systems.

JOHN R. CARNAGHI

## RICE, JOHN A. (1888–1968)

Founder and first rector of Black Mountain College, a renowned experimental and progressive endeavor in higher education (1933–1956), John Andrew Rice Jr., was a major figure in debates during the 1930s and early 1940s among educators concerning the appropriate means and methods of a liberal education. Through magazine articles and his book *I Came Out of the Eighteenth Century* (1942), he became known as an eloquent and harsh critic of a variety of approaches to education such as lecture, over-reliance on "great books," memorization, and counting credits by time in seat; and a proponent of Progressive education philosophies concerning student centered curriculum and classroom community.

Born in Lynchburg, South Carolina, Rice was the son of John Andrew Rice Sr., a Methodist minister who eventually became the president of Columbia (South Carolina) College and a founding faculty member at Southern Methodist University (Dallas, Texas). His mother, Annabelle Smith, was the sister of U.S. Senator Ellison Durant ("Cotton Ed") Smith. Two years after her death in 1899, the senior Rice married Launa Darnell who became stepmother to Rice and his two younger brothers.

Rice attended the Webb School, a highly regarded college preparatory boarding school in Bell Buckle, Tennessee, from 1905 to 1908, where he encountered the teacher he would revere all his life, John Webb. Webb's penchant for open and wide-ranging classroom discussion sparked young Rice's first interest in learning. Rice then attended Tulane University and, after graduating in three years with a bachelor of arts degree, won a Rhodes scholarship to Oxford University.

At Oxford Rice met Frank Aydelotte, future president of Swarthmore College, and the latter's sister Nell. Rice and Nell Aydelotte were married in 1914, after Rice graduated from Oxford with first honors in jurisprudence. He began his teaching career at Webb School, but left after a year to pursue doctoral studies in classics at the University of Chicago.

Although Rice never completed his doctoral dissertation, he secured a faculty position at University of Nebraska, where he and Nell Rice and their two young children lived from 1920 to 1927. Rice proved brilliant in the classroom and in counseling individual students. His Socratic style and ability to provoke free-ranging conversations drew students to his courses in increasing numbers. His methods aimed at their emotional and intellectual maturity rather than their store of subject knowledge and he began writing articles that criticized American higher education for teaching unconnected course subjects with pedagogy that emphasized lecture and response. As he insisted in an article in Harper's in 1937, "What you do with what you know is the important thing. To know is not enough" (p. 590).

When Rice's candid and critical opinions extended to his immediate surroundings, he could seem audacious and insulting. His stay at the University of Nebraska ended when the president who hired and protected him fell ill. Next, at New Jersey College for Women, he quickly managed to rankle Dean Mabel Smith Douglass and was forced to resign after two years. After a year in England on a Guggenheim fellowship, he landed a faculty position at Rollins College in Winter Park, Florida.

At Rollins, Rice would eventually earn a national reputation as the subject of an early and highly publicized investigation by the American Association of University Professors (AAUP). He managed to polarize faculty and students by speaking out against fraternities and sororities and by objecting to various policies of Rollins president Hamilton Holt. Students and colleagues found him either brilliant and charismatic or argumentative and insulting. After three years, President Holt asked Rice to resign, an act that resulted in a nationally reported AAUP investigation that eventually censured Rollins and exonerated Rice. A number of supportive Rollins faculty and students resigned during the fracas and, along with Rice, began planning the learning community that would become Black Mountain College, located near Asheville, North Carolina, on the campus of a YMCA summer conference facility in the town of Black Mountain.

### **Black Mountain College**

The college opened in 1933 with twenty-one students and eventually grew to nearly 100 students. It quickly gathered national notice for testing a number of innovative ideas about the means and ends of

American higher education. Among these were the following: (1) the centrality of artistic experience to support learning in any discipline; (2) the value of experiential learning; (3) the practice of democratic governance shared among faculty and students; (4) the contribution of social and cultural endeavors outside the classroom; and (5) the absence of oversight from outside trustees.

Rice recruited artist Josef Albers and weaver Anni Albers from Germany's famed Bauhaus Art and Architecture Institute after it was closed by the Nazi regime. They were joined by Bauhaus stage designer and graphic artist Xanti Schawinsky. Although students might select economics, foreign languages, mathematics, or music as major areas in their individually tailored programs of study, all were required to take Josef Albers's drawing course and Rice's classics course. As the college gained national renown for its art program and its experimental approaches to education, numerous well-known visitors joined the community for days or weeks at a time, including John Dewey, Buckminster Fuller, Marcel Breuer, Thornton Wilder, Aldous Huxley, Henry Miller, and others.

Rice enjoyed incorporating visitors into classes, evening seminars, even campus dramatic productions or community work projects. He committed the college to the practice of participatory democracy among students, faculty, staff, and families in order to prepare students for life in a democratic society. Although formal degrees or graduation ceremonies were absent, students needed to pass oral examinations by outside examiners in their chosen areas of emphasis in order to complete their course of study. Those who did had little problem entering graduate programs at selective universities.

### Life as a Writer

Rice's outspoken and polarizing personality contributed to his resignation from the college, requested by the faculty, in 1940. He and Nell Rice divorced; he later married Dikka Moen with whom he had two children. Rice forged a second career in writing, starting with a collection in 1942 of his own memories and essays, *I Came Out of the Eighteenth Century*, named by his publisher as a winner of its one hundred and twenty-fifth anniversary prize for best non-fiction. Rice then turned to fiction, writing short stories mostly about life and race relations in the South for *The New Yorker*, *Saturday Evening Post*, *Collier's*, *Harper's*, and others. His stories also ap-

peared in several anthologies and were collected in his book *Local Color* (1957).

When financially struggling Black Mountain College closed in 1956, Rice exchanged correspondence with final rector Charles Olson in an attempt to retrieve books he had left for the college library. However, he was never directly involved with teaching or educational ideas after his departure from the college.

## RICE, JOSEPH MAYER (1857–1934)

Physician, journal editor, education critic, and originator of comparative methodology in educational research, Joseph Mayer Rice is recognized, along with Lester Frank Ward and John Dewey, as a major figure in the Progressive education movement in the United States.

Rice was born in Philadelphia, Pennsylvania, the son of Mayer and Fanny (Sohn) Rice, natives of Germany who immigrated to America in 1855. Rice at-

tended public schools in Philadelphia and New York City, where his parents and older brother, Isaac Leopold Rice, relocated in 1870. He attended the City College of New York, and in 1881 received a degree in medicine from the College of Physicians and Surgeons of Columbia University. Rice, having established a successful private practice in pediatrics in New York City, became interested in the physical fitness programs offered by the New York City public schools. His research into these programs led to an interest in the schools as educational institutions.

In 1888, Rice traveled to Europe to observe the school systems of various countries. He settled in Germany for two years to study psychology and pedagogy at the universities of Jena and Leipzig. Although specific reasons for his decision to remain in Germany for these two years remain speculative, Rice's studies paralleled other American academics and educators who traveled to Germany during this time to learn the rudiments of empirical research and foundations for scientific pedagogy.

Rice observed the first laboratory of experimental psychology, directed by Wilhelm Wundt at the University in Leipzig, and studied Herbartism as it was conceptualized and enacted at the University of Jena and its laboratory school. The theories of German educator and philosopher Johann Freidrich Herbart, known as the originator of the science of education and of modern psychology, focused on the development of a cultured human being who strove to discover as well as be guided by the highest ethical values. Education, then, was a moral enterprise for Herbart. Although the corpus of Rice's writings extend well beyond this particular focus, Rice returned home from Germany in 1890, greatly influenced by his studies and with strong ideas about ways to improve elementary education in the United States.

An interview with Rice, focused on his school reform ideas, ran for three issues in the New York City weekly *Epoch* in July 1891, and the weekly published another series of articles by Rice from October through December of that same year. The *Forum*, a monthly magazine owned by Rice's brother, also published an article in 1891 in which Rice proposed two essentials for the natural development of the child: proper training of the teacher and a curriculum based on sound psychological principles. Rice maintained that these could be assured only when those who managed educational systems were themselves trained educators.

At the time, the *Forum* was edited by Walter Hines Page. Under Page, the monthly had published articles on education and social reform. Page was intrigued with Rice's ideas about pedagogy; thus, in 1892, under the sponsorship of the *Forum*, Rice conducted a six-month tour of thirty-six cities in the United States, visiting six to eight urban public elementary schools in each city. During this survey, Rice spent the school hours of every day observing actual classroom events. He talked with approximately twelve hundred teachers, met with school officials and school board members, interviewed parents, and visited twenty teacher-training institutions.

Rice devoted the summer of 1892 to the analysis of data from his survey of schools. From October 1892 through June 1893, the *Forum* published a series of nine articles by Rice, where he reported tedious, pedantic teaching in traditionally structured schools, unassisted superintendents responsible for the supervision of hundreds of teachers, and board of education reports portraying deplorable conditions of schools. As anticipated by Page, Rice's study generated outraged reactions among a public that heretofore had assumed a fully functioning and effective educational system. Rice's articles earned him a reputation (not a pleasant one among many professional educators) for bringing the topic of schooling into the public's eye, and, in effect, introducing muckraking to the field of education.

In the spring of 1893, Rice undertook a second survey of schools. This five-week tour focused on those schools said to represent new (Progressive) education. He visited schools in Indianapolis, Minneapolis, St. Paul, La Porte (Indiana), and Cook County (Illinois). These were schools that had expanded their curricula, as recommended by Herbartian theory, beyond the traditional "Reading, Writing, and Arithmetic," and had encouraged an integrated approach to curriculum and pedagogy. This study was reported in *The Public-School System of the United States* (1893) along with the nine original *Forum* essays, and continued Rice's critique of the public schools and their inadequate pedagogical knowledge.

Rice returned to the University of Jena in the summer of 1893. Upon his return, he was determined to further document his conviction that the wider curricula of the Progressive schools enhanced rather than detracted from students' overall achievement. Thus, Rice embarked on another *Forum*-

sponsored tour of classrooms in 1895. This time he was armed with the first comparative test—a school/student survey—ever used in American education or psychology. During sixteen months of study, Rice administered his survey to nearly 33,000 fourth- to eighth-grade children, and he carefully tabulated modifying conditions such as age, nationality, environment, and type of school system. The survey focused, in part, on the pedagogy of spelling. Rice found no link between the time spent on spelling drills and students' performance on spelling tests. His study was far ahead of its time, not only methodologically but also pedagogically, as he pointed to "the futility of the spelling grind."

Rice served as editor of the *Forum* from 1897 through 1907. He retired in Philadelphia in 1915, the same year that he published his last book, *The People's Government*. He had married Deborah Levinson in 1900; they had two children. He died in Philadelphia, June 1934.

## DRUG USE AMONG TEENS

Substance abuse is an international problem of epidemic proportions that has particularly devastating effects on youth because the early initiation of alcohol, tobacco, or other drug (ATOD) use within this population is linked to abuse and related problem behaviors among adults. The cost of alcohol abuse to society is estimated to be \$250 billion per year in health care, public safety, and social welfare expenditures. Key trends in substance use by twelfth graders are displayed in Table 1.

### Causes

A number of models and theories address the causes of adolescent ATOD use. The most salient of these is the "Risk and Protective Factor" framework, which has identified a variety of psychosocial factors associated with ATOD use. In the *individual* domain, substance use has been linked to values and beliefs about and attitudes toward substances, genetic susceptibility, early ATOD use, sensation seeking, and various psychological disorders including anti-social, aggressive, and other problem behaviors. In

the *family* domain, ATOD use has been associated with familial substance use, poor parenting practices including harsh or inconsistent discipline, poor intrafamilial communication, and inadequate supervision and monitoring of children's behaviors and peer associations. In the *peer* domain, substance use has been linked to social isolation and association with ATOD-using and otherwise deviant peer networks. In the *school* domain, ATOD use has been linked to poor academic performance and truancy, as well as a disorderly and unsafe school climate and lax school policies concerning substance use. In the *community* and *environmental* domains, ready social and physical access to ATODs has been associated with use, as has lack of recreational resources (especially during the after-school hours).

### Protective Factors

Protective factors, or factors that promote resiliency, have also been identified in these various domains. Among those most frequently cited are religiosity or spirituality, commitment to academic achievement, strong life skills, social competencies, and belief in self-efficacy. Protective factors in the family and school domains include strong intrafamilial bonds, positive family dynamics, and positive attachment to school. In the community and environmental domains, strongly held adult values antithetical to substance use constitute protective factors, as do clearly communicated and consistently enforced regulations concerning use.

### Prevention Strategies

A variety of strategies have demonstrated effectiveness in preventing or reducing ATOD use. Project Alert, described by Phyllis Ellickson and colleagues in a 1993 article, and Life Skills Training Program, described by Gill Botvin and colleagues in 1995, are the two most-prevalent effective *classroom-based curricula*. The "Reconnecting Youth" Program, described by Leona Eggert and colleagues in 1994, is designed for high school students who manifest poor academic achievement or who are at high risk for dropping out and other problem behaviors. In the family domain, the Iowa Strengthening Families Program, described by Richard Spoth and colleagues in 1999, has received considerable attention. In the community and environmental domains, strategies have been developed to increase the enforcement of public policies and ordinances that inhibit adolescent substance use. These include efforts targeting

tobacco and alcohol outlets, including restrictions on their location and density and on alcohol and tobacco advertising. Also effective is the vigorous enforcement of laws governing sales to minors, including using underage youth to buy alcohol and tobacco products in "sting" operations. Increasing excise taxes on alcohol and tobacco products has also been associated with reductions in use, as has linking apprehension for infractions of laws related to purchasing and consuming ATODs to suspension or revocation of driver's licenses. Other preventive measures that target youth drivers include "zero tolerance" laws linking evidence of alcohol on the breath with suspension or revocation of driving privileges.

The results of two decades of evaluative research have yielded considerable information suggesting that a number of approaches to adolescent ATOD use prevention do *not* work. Scare tactics, designed to frighten adolescents into avoiding drugs, are often recognized as such by their target audiences and can even be counterproductive. Efforts to raise self-esteem as a drug prevention strategy have long been discredited given the lack of association between self-esteem and ATOD use. Strategies designed to increase knowledge and convey information about the risks and dangers of drug use are generally recognized to be failures, in part because of the lack of association between knowledge and use. Indeed, all largely didactic approaches to prevention education, such as Project "Drug Abuse Resistance Education" (Project DARE), are widely understood to be ineffective, especially if they concentrate on long-term risks. Mass media campaigns are of dubious value, especially if they are brief, aired in contexts that are unlikely to reach their target audience, and uncoordinated with a comprehensive, community-wide strategy.

Unfortunately, relatively little is also known about prevention on college campuses. Many college campuses have cultures that are at least covertly supportive of alcohol consumption, and many administrators treat the issue with benign neglect. While most drinking on college campuses occurs in neighborhood bars and residential contexts such as fraternities, relatively little has been done to develop and implement demonstration programs that increase enforcement of, and penalties for, selling or otherwise supplying liquor to underage students.

It is known that even the most effective and comprehensive school-based strategies, and even

those that reinforce their messages across multiple grade levels, are only slightly more effective than school-based programs that are generally discredited in the early twenty-first century. There has evolved a consensus among both practitioners and researchers that school-based programs, by themselves, are insufficient. Such efforts should be part of a broad and comprehensive array of prevention approaches that integrate both supply and demand reduction strategies in the family and community, as well as the individual, domains.

CHRISTOPHER L. RINGWALT

## HIV/AIDS AND ITS IMPACT ON ADOLESCENTS

Acquired immunodeficiency syndrome (AIDS) is a significant threat to youth and young adults. It is the seventh leading cause of death among U.S. youth aged fifteen to twenty-four. More than 126,000 cases of AIDS among individuals ages twenty to twenty-nine had been diagnosed in the U.S. through June 2000. Given the long latency period between infection and symptoms, most of these individuals were infected as adolescents. Estimates of human immunodeficiency virus (HIV) among adolescents range from 112,000 to 250,000 in the United States, although actual prevalence is not known because representative data are not available. Estimates of HIV incidence in the early twenty-first century suggest that at least 50 percent of the 40,000 new infections in the United States each year are among individuals under twenty-five years old, and 25 percent are among persons aged twenty-one or younger.

### HIV Transmission

The majority of HIV infections among adolescents are contracted through sexual activity. Among HIV positive thirteen to nineteen year-old females who had not developed AIDS, 49 percent of the cases were associated with exposure through sexual contact, 7 percent through injection drug use, 1 percent through blood exposure, and 43 percent through a risk not reported or identified. Among males in the same age group, 50 percent were associated with male to male sex, 5 percent with injection drug use, 5 percent with both male to male sex and injection drug use, 5 percent with hemophilia or coagulation disorder, 7 percent with heterosexual exposure, 1 percent with blood exposure, and 28 percent with an unreported or unidentified risk.

Many adolescents are sexually experienced, but the extent of experience and risk varies for different groups of adolescents. Youth Risk Behavior Survey (YRBS) data indicate that about half of all high school students report having engaged in intercourse at least once. Almost 10 percent of youth were younger than age thirteen at first sexual intercourse, and by twelfth grade, 65 percent of students have become

sexually active. Sexual risk increases with the number of partners and the failure to use condoms. In the YRBS data, about 16 percent of high school students report having had sex with four or more partners; 48 percent of adolescent African-American males report four or more sexual partners. Forty-two percent of sexually active respondents did not use a condom at last intercourse.

The presence of other sexually transmitted infections (STIs) can also facilitate HIV transmission. Adolescents and young adults are physiologically and behaviorally at higher risk for acquiring STIs. An estimated three million cases of STIs other than HIV are acquired each year among persons between ten and nineteen years old. Youth under the age of twenty-five account for two-thirds of the total number of cases of STIs diagnosed annually. Rates of chlamydia, gonorrhea, and human papillomavirus are particularly high among sexually active female teens. An individual's risk is affected by STI prevalence among the pool of potential sex partners. African-American and Hispanic teens, for example, are disproportionately overrepresented among AIDS cases and cases of other STIs. Given that sexual networks tend to be homogeneous by race, these youth are more likely to face greater prevalence of HIV among their sex partners.

Drug use also places young people at risk for HIV. The most direct route is through sharing needles. Addicts may engage in sex with multiple partners to obtain drugs or money to buy drugs, and may thus increase the spread of infection to otherwise low-risk individuals. Non-injected drugs may also reduce inhibitions, influencing the individual to engage in risky sexual activity. Studies show that there are positive relationships between substance use and various facets of sexual behavior, such as timing of initiation, frequency, persistence, and risk taking, for both adolescents and young adults. However, findings regarding this pathway are mixed and may vary by race/ethnicity. For example, the link between substance use and sexual activity may be less strong among African Americans. Alcohol consumption has been linked to sexual risk taking among white adolescents, but a more recent study found that young women's condom use patterns were not linked to pre-coital substance use.

### Pathways to HIV Prevention

Longitudinal studies that follow high-risk youth into adulthood provide a way for researchers to under-

stand the developmental pathways of problem behavior. Greater involvement with problem behavior as a youth is predictive of greater involvement in young adulthood. However, problem behavior in the teen years does not necessarily lead to poor adult outcomes. For most adolescents, drug use and sexual activity reflect behavior that is experimental and socially normative. Longitudinal studies have shown that a “maturing out” process typically occurs, particularly if the individual is embedded in conventional institutions such as marriage.

Although most adolescents will grow out of many risk behaviors, prevention efforts are needed to reduce the risk of HIV infection during adolescence. As has been found with other risk behaviors, studies have demonstrated that knowledge about risk is not sufficient for the prevention of HIV risk behavior. This is not really surprising, given the variety of individual and contextual factors that contribute to motivation and the persistence of risk behaviors into young adulthood. For example, substance abuse, suicidality, and depression in adolescence are strong predictors of increasing or maintaining HIV high risk behaviors in young adulthood. Other contributing factors are problems in relationships with parents, friends’ misbehaviors, stressful events, and neighborhood violence and unemployment.

Given the complexity of factors that contribute to risk behavior, prevention efforts that focus exclusively on knowledge are unlikely to be successful. However, there are effective school-based HIV prevention programs, which typically rely on principles of Social Cognitive (Learning) Theory. These principles include the use of experiential activities that allow for the modeling and practicing of skills, and the reinforcement of group norms against unprotected sex. A focus on reducing sexual risk behaviors and the use of trained motivated teachers enhance program effectiveness. However, adolescents live and learn in a variety of social contexts, and it is important to expand the scope of HIV prevention to include contextual interventions. For example, consistent adult monitoring can reduce opportunities for risky behaviors, and religious involvement protects adolescents from premature sex and drug use behaviors. Although they are currently very limited, school-based or school-linked clinic services, such as condom distribution and STI diagnosis and treatment, can be another important strategy for prevention.

### SEXUAL ACTIVITY AMONG TEENS AND TEEN PREGNANCY TRENDS

Adolescent sexuality is often viewed from a negative perspective that focuses primarily on sexual behavior and its association with other high-risk behaviors. Youth are sometimes negatively viewed as sex-crazed, hormone-driven individuals who want the perceived independence of adulthood without the responsibility of adulthood. On the other hand, psychosexual development is a critical developmental process during adolescence. P. B. Koch has identified the need for research identifying healthy psychosexual development in adolescents. As children emerge into adolescence, their developing gender identity shapes whom they interact and associate with, especially peers. Negative media images that appear to promote lustful, irresponsible sexual behavior are often associated with early sexual activity among adolescents. However, it is crucial to identify what protective factors can shape positive psychosexual development, including delaying the onset of sexual activity. Research has yet to identify gender-specific strategies that can promote positive psychosexual development in boys and girls.

#### Early Sexual Activity

Early sexual activity is a growing issue in adolescent development. According to both the National Sur-

vey of Family Growth and the Youth Risk Behavior Survey, adolescents are engaging in sexual activity at earlier ages. In general, older adolescents (age fifteen and older) demonstrate a reduction in early sexual activity, whereas adolescents younger than thirteen demonstrate an increase in sexual activity. In addition, two-thirds of high school students report having sex before graduating from high school. These findings persist in the face of an apparent leveling off of sexual activity in adolescents.

Peer pressure to engage in adult-like activities can encourage adolescents to engage in various levels of sexual experimentation. Adolescents who engage in sexual experimentation are at increased risk for sexually transmitted diseases, including HIV/AIDs, and pregnancy. Moreover, risk for early sexual experimentation is associated with other high-risk behaviors in adolescence, including sexual abuse and drug and alcohol use, and emotional adjustment.

In regard to puberty, early-maturing adolescents are more likely to engage in early sexual experimentation than are later-maturing adolescents. They confront their emerging sexuality at younger ages than their peers do, and are more likely to be pursued by older peers in social settings because they appear physically older than their chronological age.

For both male and female adolescents, adolescence represents, in part, a time for pressure to engage in sexual intimacy. As girls enter adolescence (typically a few years before boys), they begin to grow into womanhood and become sexualized objects. Within the media, images of sexuality and overly thin body images can socialize girls into seeing themselves as sexual objects. On the other hand, boys are pressured to exhibit their manhood through sexual conquests.

Much of the research on early sexual activity in adolescents does not address early patterns of noncoital sexuality. Noncoital sexuality is defined as involvement in sexual contact that does not include the exchange of body fluids. Research suggests that by middle adolescence most youths have begun to engage in sexual experimentation, including kissing, with 97 percent of adolescents experiencing their first kiss by age fifteen. Understanding the onset of noncoital sexuality and factors influencing its timing is vital to delineating patterns of early sexual activity in teenagers.

Adolescent condom use has increased for both males and females. The decline in teenage pregnancy

is, in part, attributable to an increase in contraceptive use. However, since psychosexual development is a new challenge faced during adolescence, some youths are ill informed, and even though they may choose to use contraceptives, they may use these methods incorrectly.

### Teenage Pregnancy

The association of early sexual activity with teenage pregnancy has been a societal concern for decades. For females, teenage pregnancy can complicate adolescent development and contribute to a troublesome transition to young adulthood, which involves a potential future as a single parent with limited educational and economic opportunities. Since the 1990s the overall teenage pregnancy rate has declined, though, according to the National Campaign to Prevent Teen Pregnancy, four out of ten girls still get pregnant before their twentieth birthday. The United States has the highest teen pregnancy, birth, and abortion rates of any industrialized nation.

Teenage mothers are at risk for poverty and school failure, while their offspring are at risk for low birthweight, poor access to health care, poverty, and early childhood developmental problems. Programs such as Aid to Families with Dependent Children (AFDC), which were created to support single parent mothers, have been criticized as being an incentive for the birth of children out of wedlock in poor communities. Consequently, poor teen mothers have sometimes been blamed for their circumstances and negatively portrayed within the media and the public arena. Yet the overall decline in teenage pregnancy has occurred across all ethnic groups, including the poor ethnic minority groups that are most likely to be demonized in the media as having excessive teenage pregnancy rates.

A significant risk factor for early sexual experimentation is a history of sexual trauma. This is true for both males and females, though the level of risk is increased for females. Adolescent girls who have a history of sexual trauma during childhood and/or adolescence may try to cope during their adolescent years by being sexually provocative. This coping mechanism is negative; however, victims of sexual abuse may try to control future sexual encounters by initiating sexual contact. This may influence the likelihood of their involvement in prostitution and other sexually exploitative illegal activities.

Girls with a history of sexual trauma are also at great risk for involvement in the juvenile justice sys-

tem, particularly if they do not have supportive home environments that allow them the opportunity to heal from their traumas. Girls within the juvenile justice system are likely to exhibit runaway behaviors in an effort to get out of abusive home environments. Through these runaway patterns, some girls are introduced to sexual exploitation in their effort to survive on the street. Boys who are victims of sexual abuse are at risk for offending behaviors if they lack supportive home environments, and they are also at risk for involvement in the juvenile justice system.

The use of alcohol and drugs reduces inhibitions, and can therefore influence participation in unprotected sexual activity. Boys and girls with a history of smoking and alcohol use have an increased risk for early sexual activity, in part because the use of these substances can influence the decision making of adolescents in social contexts.

Efforts to conduct sexuality education within the home environment have been found to be insufficient. Parents need to provide supportive learning environments in which children can develop a healthy understanding of their sexuality, particularly during their adolescent years. Adolescence represents a time of fundamental change, as adolescents are introduced to new reproductive capacities that have to be understood cognitively, socially, and emotionally.

### **Pregnancy Prevention**

Adolescents receive most of their information about sexuality from peers, which often leads to misinformation. Adolescents need structured formal and informal learning environments with age-appropriate peers to address issues of sexuality. These programmatic models may be available within school and community-based settings. Most pregnancy prevention programs fall within three categories: knowledge interventions, access to contraception, and programs to enhance life options. Lisa Crockett and Joanne Chopack suggest three categories of programs: programs that focus on sexual antecedents, programs that focus on nonsexual antecedents, and programs that focus on a combination of both sexual and nonsexual antecedents. Programs that focus on sexual antecedents directly target sexual behavior and often focus on reducing sexual activity, minimizing the number of sexual partners, and contraceptive use. Programs that focus on nonsexual antecedents indirectly target sexual activity by focus-

ing on other outcomes, such as academic achievement, youth development (including leadership skills), and service-learning models.

Joy Dryfoss has proposed the need for comprehensive health-promotion models as the best practice within sexuality education. This practice not only seeks to minimize risk, but to provide leadership and prosocial skills development to shape the changing lives of young people. Scholars and activists continue to debate the usefulness of abstinence versus education, including birth control strategies. Abstinence-based models show mixed results when rigorously researched, with a limited demonstrated effect on sexual behavior. Many abstinence-only proponents believe that birth control education increases the likelihood of teen sexual activity; however, the evaluations do not support this notion. Sex education models designed to support the psychosocial development of adolescents have been extensively debated, based on religious, moral, family, and community values and attitudes. Educational systems have been permitted to provide abstinence-based education to combat historically high teenage pregnancy rates. Those that propose that birth control education should include life-skills development assert that interventions need to be grounded in the realities of those who are at greatest risk for premature sexual activity and associated negative consequences.

Young people from poor, underserved, inner-city communities are at risk for poor access to health care, including health education, which increases their risk of negative developmental outcomes related to early sexuality activity. Programmatic efforts need to take into account the social context of these communities. Young people living in such an environment particularly need increased life options rooted in effective decision making, which may lead to a delay in early sexual activity in the adolescent years. According to Saul Hoffman, author of "Teenage Childbearing Is Not So Bad After All . . . Or Is It? A Review of the New Literature," teenage pregnancy prevention programs targeting teen mothers in poor, underserved communities may yield indirect effects in addition to reducing teen pregnancy. These programs may represent pathways out of poverty for these poor populations of teen mothers.

Within inner-city communities of color, program models such as the I Have a Future program founded by Dr. Henry Foster provide a supportive learning community for youths residing in economi-

cally deprived communities with high rates of multi-generational teen pregnancy and sexually transmitted diseases. Such families often remain trapped in poverty, poor health care systems, and economic deprivation. The I Have a Future model provides comprehensive adolescent health services, prosocial skills development, leadership development, alcohol and drug education, gender and ethnic identity development, and academic support. In addition, participants gain exposure to positive role models within the supportive staff and through community linkages to colleges and universities. This program represents a mixed-gender context in which both males and females adolescents can develop positive decision-making skills regarding delayed sexual activity, and it provides a promising framework for effective interventions for high-risk youth.

Positive psychosexual development is important in making a successful transition through adolescence. Adolescents need safe opportunities to relate to peers and develop meaningful attachments without bringing harm to themselves. Psychosexual development is shaped by media, family, community, and peer contexts, and comprehensive strategies that address these contexts are needed to fully support adolescent development. Media literacy can be incorporated into intervention models in order to increase understanding of gender stereotypes. Girls must confront the overwhelming stereotypes of thin, sexually provocative body images of females, whereas males must confront macho images reinforcing masculine control.

### **The Role of Parents**

Parents need resources to support their vital role in shaping the lives of adolescents. Families, and parents in particular, need help in learning effective ways of supporting their adolescent's psychosexual development. In the face of declining teenage pregnancy rates, it is imperative that research focus on targeted evaluations of promising practices that can influence positive developmental outcomes. Some communities and individual programs are strapped for funds to establish and maintain programming, while evaluation goals are deferred because of limited funding. Academic communities can partner with local communities and health promotion agencies to assist in the development of rigorous research paradigms that can increase knowledge of effective interventions that can be potentially replicated in other communities.

In the face of community efforts to address teenage pregnancy, some parents may be apprehensive about other adults influencing their children regarding personal, sensitive issues. For parents who feel comfortable and equipped in addressing these issues with their children, the National Campaign to Prevent Teen Pregnancy offers several tips for parents, including being aware of their own personal values and attitudes regarding sexuality and how they want their children to be introduced to the sensitive topic of sexuality. Effective parent-child communication regarding love and intimacy, as well as family rules and standards about teenage dating, can provide needed support for adolescents who are confronting the social and emotional challenges related to puberty. Parents are encouraged to introduce the topic of sexuality and sex education early in a child's development. How early this occurs is again influenced by the personal values and attitudes of the parents. Parents can also assist as interpreters of negative media images that foster inconsistent and controversial attitudes toward early sexual activity and promiscuity.

In addition, parents are encouraged to become knowledgeable about their children's social contexts. Monitoring children's activities includes not only knowing where one's children are, but also who are the friends and peer associates of one's children. It is also important to provide life options that provide children with constructive, safe opportunities for personal growth.

Other effective models of service include gender-specific interventions that assist adolescents in understanding positive manhood and womanhood development. Through the development of positive gender identity, adolescents can fully consider their role in relationships with family, peers, and community.

There has been some debate regarding gender-specific versus mixed-gender programs to address the issue of teenage pregnancy. Programs are encouraged to be intentional in their efforts to maximize opportunities for education and life-skills development, whether in same-gender or mixed-gender environments. Same-gender programs can provide safe learning environments in which groups can fully consider the challenges facing adolescents to engage in early sexual activity. In particular, for girls who may have been traumatized by males, it is critical that they have opportunities to voice their concerns and experiences without any perceived

threat by male counterparts. On the other hand, in the absence of trauma-related experiences, adolescents may benefit from healthy, mixed-gender programs that focus on the shared responsibility of both sexes in family planning. Otherwise, the burden for safe sex, including contraceptive use, is often perceived as the responsibility of the female. Even though females are more likely to experience pubertal changes earlier than their male counterparts, these females are not necessarily advanced in their emotional maturity to the point that they can assume sole responsibility for sexual behavior.

In order to address premature sexual activity among teenagers effectively, comprehensive community strategies are needed to address the myriad of issues involved and the diversity in social and community contexts. In 2002, thirteen community partnerships within eleven states were implementing comprehensive youth preventive interventions to combat teenage pregnancy. These partnerships distribute the responsibility for sexuality education across the family, community, and school.

## SEXUALLY TRANSMITTED DISEASES

Sexually transmitted diseases (STDs) are viral and bacterial infections passed from one person to another through sexual contact. In 1960 there were two common STDs; by the beginning of the twenty-first century, there were more than twenty-five. In 1980 alone, eight new STD pathogens were recognized in the United States. In 1995 STDs accounted for 87 percent of cases reported among the top ten diseases in the United States.

The Institute of Medicine coined the phrase "the hidden epidemic" to describe the problem of STDs in the United States. STDs disproportionately affect women and young people. In 1996 an estimated 15 million new cases of STDs occurred in the United States, of which at least one-quarter were among adolescents between the ages of fifteen and nineteen. Adolescents are at a higher risk for contracting sexually transmitted disease because of biological and behavioral factors.

### Biological Factors

During each sexual encounter, women are at an inherently greater risk of acquiring an STD than men are. Young women are especially vulnerable to infec-

tion because of the increased amount of immature ectopic tissue on the endocervix, which increases the likelihood of acquiring certain STDs such as chlamydia, gonorrhea, and HIV. Adolescent women also have “immature” or unchallenged local immune systems that make them more vulnerable to STD infections. Most sexually transmitted diseases are asymptomatic and go undiagnosed, further promoting the spread of infection.

### **Behavioral Risk**

Behavioral risk factors that predispose individuals to STDs include age at initiation of sexual activity, having multiple sexual partners or a partner with multiple partners, use of barrier protection, and use of diagnostic and treatment services. Furthermore, risk of STDs may be compounded by additional socioeconomic factors, though this relationship is unclear. Many markers of STD risk (e.g., age, gender, race/ethnicity) are associated with fundamental determinants of risk status (e.g., access to health care, residing in communities with high prevalence of STDs) to influence adolescents’ risk for STDs. Since the early 1980s the age of initiation of sexual activity has steadily decreased and age at first marriage has increased, resulting in increases in premarital sexual experience among adolescent women and an increasing number of women at risk. Multiple (sequential or concurrent) sexual partners rather than a single, long-term relationship increases the likelihood that a person may become infected. The Centers for Disease Control and Prevention (CDC) showed that almost 45 percent of women who initiated sexual activity before the age of sixteen had more than five lifetime sexual partners. Among women who delayed first sex until after the age of twenty, however, only 15 percent had more than five lifetime sexual partners. Of women who delayed their first sexual activity until after the age of twenty, close to 52 percent had only one lifetime sexual partner, compared with about 19 percent of women who had initiated sex before the age of sixteen. The risk of STDs increases with the total number of lifetime sexual partners, whether over a short time period or spread over a life course.

In addition to having more than one sexual partner, adolescents may be more likely to engage in unprotected intercourse or engage in high-risk sexual activities such as anal sex. They may also select partners at higher risk. For example, young women are more likely than women in other age groups to

choose a partner who is older than themselves. Additionally, oral sex and mutual masturbation may also lead to the spread of infection and should be considered risky activities.

Studies have shown that adolescents who are involved in one risky behavior are more likely to be involved in others. Adolescent boys and girls who have had sex are also more likely to drink alcohol, take drugs, and smoke cigarettes than adolescents who have not had sex. A quarter of adolescents interviewed reported that they were under the influence of drugs or alcohol when they last engaged in sexual intercourse. There is evidence that young people who avoided risky behavior had positive influences in their lives, such as a strong relationship with their parents.

The high prevalence of STDs among adolescents may also reflect multiple barriers to quality STD prevention services. Adolescents may lack insurance or the ability to pay for such services. They may lack transportation to reach an adequate facility. Additionally, they may feel uncomfortable in facilities and with services designed for adults. Adolescents may also be concerned about the confidentiality of their visits. Most studies following adolescents who have been diagnosed and treated for STDs by health care providers show a high incidence of reinfection at follow-up visits.

### **Prevalent Bacterial STDs**

The most prevalent bacterial STDs are gonorrhea and chlamydia. Ongoing surveys of women in clinic settings has shown that adolescent women consistently have higher rates of chlamydia infection when compared to other age groups. In 2000 women aged fifteen to nineteen years old had the highest rates of chlamydia infection among all women even when overall prevalence declined. Chlamydia rates are low among men. Though the rates of gonorrhea decreased among adolescent women ages ten to nineteen years between 1996 and 2000, in 2000 the highest age-specific gonorrhea rates were among women in the fifteen- to nineteen-year-old age group. Adolescent men ages fifteen to nineteen years had the third-highest rates of gonorrhea when compared to other age groups of men.

### **Prevalent Viral STDs**

Genital herpes simplex virus (HSV-2) and human papillomavirus (HPV) are prevalent among sexually experienced adolescents. Furthermore, infection

with HSV-2, HPV, or HIV may result in negative reproductive morbidity, including neonatal transmission of these infections, cervical and genital cancer, and even premature death. As of yet, there are no effective cures for these viral infections.

Studies indicate that one in six Americans is infected with HSV-2, reflecting a ninefold increase since the early 1970s. An estimated 4 percent of Caucasians and 17 percent of African Americans are infected with HSV-2 by the end of their teenage years. One study of low-income pregnant women found an HSV-2 infection rate as high as 11 percent in women fifteen to nineteen years of age and 22 percent in women twenty-five to twenty-nine years of age.

Based on data from twenty-five states with integrated HIV and AIDS reporting systems, the CDC reported that for the period from January 1996 to June 1999 young people (aged thirteen to twenty-four) accounted for a much greater proportion of HIV (13%) than AIDS cases (3%). Though the number of new AIDS cases diagnosed during the period declined, no decline was observed in the number of newly diagnosed HIV cases among youth. Because progression from HIV infection to AIDS may be on the order of years, the reported number of AIDS cases may not reflect the actual rate of HIV infection among adolescents. At least half of all new HIV infections in the United States are among people under age twenty-five, and the majority of young people are infected sexually. In 1999 there were 29,629 cumulative cases of AIDS among those aged thirteen to twenty-four years. The CDC further reported that in 1999, of the cases of AIDS in young men aged thirteen to twenty-four years, 50 percent were among men who have sex with men; 8 percent were among injection drug users; and 8 percent were among young men infected heterosexually. Among young women aged thirteen to twenty-four years, 47 percent of cases reported were acquired heterosexually and 11 percent were acquired through injection drug use.

### Impact

STDs prevent adolescents from leading healthy lives. They lead to declines in school performance, increased poverty, and higher crime rates. The financial cost of STDs runs in the billions each year. As a consequence of STDs, many adolescents experience serious health problems that often alter the course of their adult lives, including infertility, diffi-

cult pregnancy, genital and cervical cancer, neonatal transmission of infections, and AIDS.

ANGELA HUANG

## SMOKING AND ITS EFFECT ON CHILDREN'S HEALTH

The impact of tobacco use in the United States and worldwide is staggering. According to the World Health Organization, 1.1 billion people worldwide regularly smoke tobacco products, and smoking accounts for 10,000 deaths per day. In 1990 there were 418,000 deaths in the United States alone attributed to smoking and its effects. Smoking kills two and one-half times more people than alcohol and drug use combined. In the United States 25 percent of the population regularly uses tobacco, with 6,000 new adolescent smokers each day—half of whom will go on to be regular smokers. Every day more than 15

million children are exposed to smoke in their homes. Environmental tobacco smoke (ETS), also known as "second hand smoke," poses significant risks to children. The United States Environmental Protection Agency (EPA) has classified ETS as a class A carcinogen, which means that ETS is known to cause cancer in humans. Exposure to ETS before the age of ten will increase a child's chances of developing lymphoma and leukemia (i.e., cancers of the blood) as an adult. The effects of ETS are actually worse than those acquired from smoking cigarettes directly.

### **Pregnancy/Perinatal/SIDS**

It has been estimated that 19 percent to 27 percent of pregnant women smoke during their pregnancy. The pregnant woman who smokes not only affects her own health, but she harms the baby she is carrying as well. A major risk of smoking during pregnancy is the increased rate of premature delivery of the baby. Infants who are born prematurely can have many severe medical problems, including lung immaturity and brain injury. Maternal smoking contributes to 5 percent of all perinatal deaths (i.e., 2,800 deaths per year). Pregnant women who smoke are at a greater risk of miscarriage and low-birth-weight infants, as well as higher rates of long-term behavioral and mental problems in her child. Infants born to mothers who smoked during pregnancy have a much higher rate of Sudden Infant Death Syndrome (SIDS) than infants born to mothers who did not smoke during pregnancy. There is a dose-dependent relationship between ETS exposure during pregnancy and the rate of SIDS: The greater the exposure of cigarette smoke to an unborn baby, the higher their risk of SIDS. Cigarette smoke exposure is one of the few preventable risk factors for SIDS.

Newborn infants are in a unique situation when it comes to exposure to their mothers' smoke. Cotinine, a metabolite of nicotine, is found in newborn babies' blood at levels almost equivalent to their mothers'. There are significant levels of cotinine in a newborn's blood even if the mother herself does not smoke, but simply lives in a household where there is ETS exposure. There is a direct relationship between the maternal and newborn infant's blood levels of cigarette smoke products. The mother who smokes during pregnancy transfers the products in cigarette smoke to the fetus through the placenta, as well as to the newborn infant through breast-feeding. In fact, breast-fed infants have the same urinary cotinine levels as active adult smokers.

### **Childhood Diseases**

The risks of ETS are not simply restricted to the newborn infant. There are many childhood illnesses that are dramatically worsened by exposure to smoke. A 1994 study by Joan Cunningham and colleagues showed that there was an increased risk of colds, wheezing, shortness-of-breath, and emergency room visits by children living in households where there is a smoker. There is also a significant increase in the risk of ear infections in children who live in households where there are smokers. Children born to mothers who smoke have a higher risk of developing asthma. Along with an increased risk of asthma, children of mothers who smoked during pregnancy will be at a greater risk of have problems with environmental allergies (e.g., hay fever). These effects can be seen in newborn infants as well as school-aged children.

### **Adolescence**

Between 4 million and 5 million adolescents in the United States smoke daily. Each year more than 1 million people under eighteen years of age become daily smokers. Ninety percent of adults who regularly smoke began smoking before they were nineteen years of age. Throughout the 1990s the age at which children began smoking became increasingly younger. In 1990, 31 percent of all twelfth graders reported recent (within the last month) tobacco use while 21 percent were daily smokers. Shockingly, 8 percent of all eighth graders reported daily tobacco use. By the end of the 1990s the percentages of twelfth and eighth graders who recently used cigarettes was up to 36 percent and 21 percent, respectively. The younger and younger beginning smoker is reflected in the higher percentage of adolescent smokers as compared to the adult population. Besides the negative health effects of smoking itself, adolescents who smoke are fifteen times more likely to use drugs than their peers who do not smoke.

There are many reasons why a child or adolescent will begin to smoke. The most common influence is family and peer pressures, but the most potent factor is the media portrayal of "glamorous" smoking. The top three most popular brands of cigarettes amongst adolescents were the top three companies that spent the most on advertising. In 1993 these companies collectively spent \$153 million dollars on advertising. Many popular sporting events are still sponsored by tobacco companies, and there is some evidence that advertising had been directed

toward recruiting new child or adolescent smokers. To combat the draw of the media for adolescents to begin smoking, the Centers for Diseases Control and Prevention (CDC) began, in the fall of 2000, the *Surgeon General's Report for Kids on Smoking*. This was an attempt to enlist celebrities and sports figures to promote an antismoking message to young people. It involves posters and media advertisements directed toward children and adolescents, informing them of the health damages caused by cigarette smoking.

### Costs

The true cost of smoking is incalculable, but there are some very practical measures that can be seen. In 1997 American children made more than 500,000 doctor visits for asthma, and 1.3 million visits for cough that were directly attributed to smoke exposure. This does not include the 115,000 cases of pneumonia, 260,000 cases of bronchitis, and more than two million ear infections. The annual cost of ear infections in children in the United States caused by smoke exposure is \$1.5 billion. The actual total financial costs, directly related to the exposure of American children to ETS, are broken into direct medical costs and the loss of life costs. In 1997 the total medical cost of the complications of cigarette smoke on American children was \$4.6 billion. The loss of life cost (calculated based upon loss of earnings and costs needed to prevent disease) was \$8.2 billion. The true cost of cigarette smoking, however, is in the impact smoking has on the health of infants and children.

## SUICIDE

School-age children can engage in many behaviors of concern to adults as a function of their development as well as the changing culture and environments in which they live. Perhaps the most concerning and baffling of these risk behaviors are the tendencies in some to consider ending their own lives at so young an age. Why children and adolescents consider these self-destructive actions is a complicated puzzle to understand and solve. Such behaviors must be considered in light of young people's vulnerability to external models, their increased anxiety related to issues of social acceptance, their desire to develop a unique identity, and the existence of unstable and abusive families.

In 1999 the surgeon general of the United States, David Satcher, issued a call to action to prevent suicide. Satcher noted the continuing increase in suicide rates among the young, with the rate tripling from 1952 to 1996. He stated that Americans under the age of twenty-five accounted for 15 percent of all completed suicides and that risk factors for suicide attempts among the young included depression, alcohol or drug use disorders, and aggressive and disruptive behaviors. Suicide was not just a mental health problem but a public health problem as well.

### Occurrence

Suicide rates for children and adolescents are regularly reported by the National Center for Health Sta-

tistics in the U.S. Department of Health and Human Services. These reports count only those for whom suicide is listed as the cause of death. For this reason it is believed that suicides may be underreported. Those who sign death certificates (family physicians, emergency room staff, and medical examiners) may not always list the cause of death as intentional in order to avoid stigma for the family or because evidence of suicide may not be immediately present. It is suspected that vehicular accidents and deaths related to substance abuse, for instance, may in some cases be suicides, but they may not be recorded as such.

A review of statistics regarding rates of suicide reveal a number of facts. For those aged fifteen to twenty-four, suicide stands as the third-leading cause of death behind accidents and homicides. As of 1996, the rate of suicide deaths for Americans aged ten to fourteen was 1.6 deaths per 100,000 population (2.3 per 100,000 for males and 0.8 per 100,000 for females). For fifteen- to nineteen-year-olds the rate was 9.7 deaths per 100,000 (15.6 per 100,000 for males and 3.5 per 100,000 for females), and for those aged twenty to twenty-four the rate was 14.5 deaths per 100,000 (24.8 per 100,000 for males and 3.7 per 100,000 for females). Young males (aged fifteen to nineteen) are more likely to succeed at killing themselves than females by a ratio of at least five to one. Reports from the surgeon general also suggest that gay and lesbian youth may be two to three times more likely to commit suicide. Although accomplished suicide rates were highest for white males, young African American males showed the greatest increase during the 1980s and 1990s. White females had the next highest rates, followed by African-American females. Research on Hispanic populations indicated that rates of suicide in young men and women may be higher than for whites.

Suicides can be completed using a variety of means. Nearly 63 percent of suicides occur using firearms. Most other deaths are a result of more passive means such as drug poisonings or hangings. Suicide attempts are less likely to involve firearms and may, therefore, provide opportunities for discovery and rescue.

In addition to completed or accomplished suicides, many young people attempt suicide. Accurate rates for this group of attempted suicides, often called *parasuicides*, are even more difficult to obtain. Hospitals and emergency rooms may identify attempters, but many *parasuicides* go completely un-

detected or are confided only to the closest of friends. Possible ratios of attempts to completions may range from 10:1 to 150:1, depending upon the research and the definition of attempts. The continuum of suicidal behaviors, which includes actual suicide on one end and attempted suicides in the middle, includes on the other end the least severe form of self-destructiveness, usually identified as suicidal ideation or intent. The idea of killing oneself may occur quite frequently in young people, but it becomes serious only when there is intent to actually act. Such suicidal intent often includes a plan and a timetable in the person's mind.

### Risk Factors

Many factors have been examined as contributors to the likelihood that a school-age child will become suicidal. Some factors appear to be historical or situational whereas others are psychological. A large percentage (perhaps as high as 90 percent) of those who are victims of suicide have diagnosable psychiatric disorders at the time of death. Many suffer from mood disorders, and a large percentage have made previous suicide attempts. Risk factors may include: psychiatric disorder, previous suicide attempt, co-occurring drug use and mental disorder, family history of suicide, impulsive or aggressive tendencies, feelings of hopelessness, loss of significant relationship, loss of job, physical illness, stress, lack of access to mental health treatment, availability of lethal means (e.g., guns or drugs), feelings of isolation and alienation, influence of peers or family members, unwillingness to seek help, cultural or religious beliefs or traditions, influence of the media, current epidemics of suicidal behaviors, and being a victim of bullying.

In the case of children and adolescents, two major themes related to increased risk for suicide are fears of humiliation by others and feelings of invisibility. Additional themes may also include general levels of stress, breakdown of psychological defenses, self-deprecatory thoughts, and a negative personal history.

### Protective Factors

Just as some factors seem to increase the incidence of self-destructive suicidal intent, so also there appear to be conditions that make these thoughts and behaviors less likely. Such circumstances or characteristics are considered to be protective. Among those cited by the surgeon general in 1999 were: ef-

fective and appropriate clinical care; access to treatment and support for seeking help; restricted access to lethal means; family and community support; ongoing medical and mental health care relationships; learned skills in problem solving, conflict resolution and nonviolent dispute management; and a belief system, either cultural or religious in nature, that discourages suicide. Skills in anger management, impulse control, and appropriate action in the face of victimization have been also cited as protective factors.

### Warning Signs

The warning signs of imminent suicidal behaviors can appear in many forms. They can be verbal, spoken to others; written as poems, songs, diary entries, or suicide notes; or made as threats directly ("I am going to kill myself") or indirectly ("You won't have me to kick around anymore"). Other warning signs include social withdrawal, getting things in order, giving things away, constant crying, or an angry or hostile attitude. Some signs occur in the person's environment, such as the death of someone close, family problems, or failure in school or at work. Lastly, some signs are those characteristic of depression or general mental and emotional difficulties. These latter signs might include sleep disturbance, feelings of despair, appetite change, or radical and abrupt changes in behavior or personality.

### Formulation of the Problem

According to Jerry Jacobs, writing in 1971, early research into suicide examined five major stages seen in suicidal children. These included a history of problems, an escalation of problems, the failure of coping, the experience of helplessness, and finally, a justification for taking a self-destructive action. Although these stages may be present, in many cases adults do not observe them, but rather they are shared with peers. Adults may merely see the final behaviors.

It is important to realize that suicidal behavior can best be seen not as a disease (although it may in some cases be the manifestation of one), but rather as a symptom with many different possible underlying causes. Just as a headache could be caused by many things, so the action to end one's own life can be a result of any number of causes: depression or other mental illness, stress, grief or loss, unresolved conflict, substance use, unexpressed anger or rage, social pressure, lack of problem-solving or conflict

resolution skills, hopelessness or frustration, chronic victimization, a desire for visibility or respect, the need to avoid humiliation, or the desire to be noticed.

### Prevention

The best strategies for the prevention of suicide are those that reduce the number of risk factors and increase protective factors. This means making resources available to families and schools to aid in this process. In some cases early intervention is needed. Prevention or primary interventions need to: develop strategies for detecting suicidal individuals, treat all threats seriously, educate those who work with kids about suicide, increase peer education about suicide, teach families and communities to look for warning signs, reduce the availability of lethal means, make twenty-four-hour hotlines available, and use the media to teach the public how to recognize those at risk.

Finally, it must be acknowledged that the problem of self-destructive behavior affects everyone. Parents, schools, and communities must make a commitment to work to end this behavior and its causes.

## TEEN PREGNANCY

In the United States, teen pregnancy is an important problem. In 1997, the last year for which accurate estimates are available, about 896,000 young women under the age of twenty became pregnant. Among women aged fifteen to nineteen, 94 per 1,000 (or about 9%) became pregnant. This rate is much higher than that in other Western industrialized countries. In addition, according to a 1997 publication of the National Campaign to Prevent Teen Pregnancy, more than 40 percent of young women in the United States become pregnant one or more times before they reach twenty years of age.

The U.S. pregnancy rate is higher for females aged eighteen and nineteen (142 per 1,000) than for females fifteen to seventeen (64 per 1000). It is also higher for African Americans (170 per 1,000) and Hispanics (149 per 1,000) than for non-Hispanic whites (65 per 1,000). Much of this ethnic variation, however, reflects differences in poverty and opportunity.

On the positive side, the 1997 teen pregnancy rate in the United States was the lowest pregnancy rate since it was first measured in the early 1970s. The rate fluctuated considerably over the course of the 1970s, 1980s, and 1990s, however, reflecting both changing percentages of youth who have sex and improved use of contraception among those having sex.

While the teenage pregnancy rate is, by definition, based upon female teenagers, this does not

mean that all the males involved in these pregnancies are teenagers. Indeed, in 1994, whereas 11 percent of fifteen- to nineteen-year-old females became pregnant, only 5 percent of fifteen- to nineteen-year-old males caused a pregnancy.

About four-fifths of teen pregnancies are unintended. Accordingly, in 1997, 15 percent of all teen pregnancies ended in miscarriages, 29 percent ended in legal abortions, and 55 percent ended in births.

Among mothers under the age twenty, the percentage of births that occur out of wedlock has risen dramatically—from 15 percent in 1960 to 79 percent in 2000. This large increase in and high rate of non-marital childbearing has alarmed many people and motivated many efforts to reduce teenage pregnancy.

## Consequences of Teen Childbearing

According to a 1996 report written by Rebecca A. Maynard, when teenagers, especially younger teenagers, give birth, their future prospects decline on a number of dimensions. Teenage mothers are less likely to complete school, more likely to have large families, and more likely to be single parents. They work as much as women who delay childbearing for several years, but their earnings must provide for a larger number of children.

It is the children of teenage mothers, however, who may bear the greatest brunt of their mothers' young age. In comparison with those born to mothers aged twenty or twenty-one, children born to mothers aged fifteen to seventeen tend to have less supportive and stimulating home environments, poorer health, lower cognitive development, worse educational outcomes, higher rates of behavior problems, and higher rates of adolescent childbearing themselves.

Although the greatest costs are to the families directly involved, adolescent childbearing leads to considerable cost to taxpayers and society more generally. Estimates of these costs are in the billions.

## Adolescent Sexual and Contraceptive Behavior

Obviously, teens become pregnant because they have sex without effectively using contraception. In the United States, the proportion of teens who have ever had sexual intercourse increases steadily with age. In 1995, among girls, the percentage increased from 25 percent among fifteen-year-olds to 77 percent among nineteen-year-olds, while among males it in-

creased from 27 percent among fifteen-year-olds to 85 percent among nineteen-year-olds. Among students in grades nine through twelve across the United States in 1999, 50 percent reported sexual experience.

Most sexually experienced teenagers use contraception at least part of the time. Condoms and oral contraceptives are the two most common methods, but small and increasing percentages of teens use long-lasting contraceptives such as Depo-Provera or Norplant. Like some adults, however, many sexually active teenagers do not use contraceptives consistently and properly, thereby exposing themselves to risks of pregnancy or sexually transmitted diseases (STDs).

### **Factors Associated with Sexual Risk-Taking and Pregnancy**

While nearly all youth are at risk of engaging in sex and thus girls becoming pregnant, many risk and protective factors distinguish between youth who engage in unprotected sex and sometimes become pregnant and those who do not. For example, when teens have permissive attitudes toward premarital sex, lack confidence to avoid sex or to use contraception consistently, lack adequate knowledge about contraception, have negative attitudes toward contraception, and are ambivalent about pregnancy and childbearing, then they are more likely to engage in sex without contraception.

Other more indirect environmental factors, however, also affect teen sexual risk-taking, either by decreasing motivation to avoid sex or through other mechanisms. For example, teens are more likely to engage in unprotected sex and become pregnant (1) when they live in communities with lower levels of education, employment, and income and thereby have fewer opportunities and encouragement for advanced education and careers; (2) when their parents also have low levels of education and income; (3) when they live with only one or neither biological parent and believe they have little parental support; (4) when they feel disconnected from their parents or are inappropriately supervised or monitored by their parents; (5) when they have friends who obtain poor grades and engage in nonnormative behaviors; and (6) when they believe their peers are having sex and are failing to use contraceptives consistently.

Furthermore, teens are more likely to engage in sex when they, themselves, (1) do poorly in school

and lack plans for higher education; (2) use alcohol and drugs, engage in other problem or risk-taking behaviors, and are depressed; (3) begin dating at an early age, go steady at an early age, have a large number of romantic partners, or have a romantic partner three or more years older (the latter being a particularly telling factor); or (4) were previously sexually abused. These individual and environmental, sexual and nonsexual, risk and protective factors are the factors that programs try to change when they attempt to reduce teen sexual risk-taking and pregnancy.

### **Family Planning Services**

The efforts most directly involved with preventing pregnancy among sexually experienced teens are family planning services. The primary objectives of family planning clinics or family planning services within other health settings are to provide contraception and other reproductive health services and to provide patients with the knowledge and skills to use their selected methods of contraception.

Large numbers of sexually active female teenagers obtain family planning services each year. Many of these young women receive oral contraceptives and to a lesser extent other contraceptives that are more effective than condoms or other non-prescription contraceptives. Accordingly, these family planning services prevent large numbers of adolescent pregnancies.

In addition to those practicing at family planning clinics, some clinicians in health clinics also focus upon the adolescent's sexual behavior. Several studies have found that these visits can increase contraceptive use when clinicians spend more time focusing upon the teen patients' sexual behavior; give a clear message about always using protection against pregnancy and STDs; show videos or provide pamphlets and other materials; discuss patients' barriers to avoiding sex or using contraception; and model ways to avoid sex or use condoms or contraception.

### **Sex and HIV Education Programs**

To reduce teen pregnancy and also STDs, including HIV, most schools have implemented sex and HIV education programs. Typically, these programs emphasize that abstinence is the safest method of avoiding pregnancy and STD, but they also encourage condom and contraceptive use if teens do have sex. Contrary to the fears of some people, a large number

of studies have demonstrated that these programs do not have negative behavioral effects, such as increasing sexual behavior. To the contrary, many studies have demonstrated that some, but not all of these programs, delay the initiation of sex, decrease the frequency of sex, and increase the use of contraception once youth have sex. They thereby reduce risk of pregnancy, as well as STD. Some sex and HIV education programs have been found to be effective in multiple states in the country, and some have found positive behavioral effects for almost three years.

Programs that are short and that focus upon knowledge increase knowledge, but they tend not to change behavior. In contrast, programs that effectively reduce sexual risk-taking (1) focus on changing specific sexual or contraceptive behaviors; (2) are based on health theories that specify the risk and protective factors to be addressed by the program; (3) give a clear message about avoiding unprotected sex; (4) provide basic, accurate information about the risks of teen sexual activity and about methods of avoiding intercourse or using contraception; (5) address social pressures that influence sexual behavior; (6) provide modeling and practice of communication, negotiation, and refusal skills; (7) employ a variety of teaching methods designed to involve the participants and help them personalize the information; (8) are appropriate to the age, sexual experience, and culture of the participants; (9) last a sufficient length of time to complete important activities adequately; and (10) select teachers or peer leaders who believe in the program they are implementing and then provide them with training.

Many people have proposed abstinence-only programs as a solution to reducing teen pregnancy and STDs. Such programs emphasize that abstinence is the only acceptable method of avoiding pregnancy, and they either fail to discuss contraception or emphasize its limitations. Although some abstinence-only programs might delay sex, there is thus far simply too little research to know which abstinence-only programs are effective.

In an effort to reduce teen pregnancy and STDs, including HIV, hundreds of high schools have made condoms available or have opened school-based health centers that provide reproductive health services. Although studies have demonstrated that these services do not increase teen sexual behavior, they have also found inconsistent results on improved contraceptive use.

### Service-Learning Programs

Whereas the programs summarized above focus primarily on changing the sexual risk factors of adolescent sexual behavior, some programs focus primarily on the *nonsexual* risk and protective factors. In 1997 researchers Joseph P. Allen and associates found the strongest evidence for teen pregnancy reduction for one type of program, service learning.

By definition, service-learning programs include voluntary or unpaid service in the community (e.g., tutoring, working in nursing homes, helping fix up recreation areas) and structured time for preparation and reflection before, during, and after service (e.g., group discussions, journal writing, composing short papers). Often the service is voluntary, but sometimes it is prearranged as part of a class.

Although service learning does have strong evidence for reducing teen pregnancy, other youth development programs have not reduced teen pregnancy or childbearing (e.g., the Conservation and Youth Service Corps, the Job Corps, JOB-START). Thus, it remains unclear why some programs are effective and others are not.

### Comprehensive and Intensive Programs

A few programs designed to reduce teen pregnancy have been designed for high-risk youth and are both intensive and comprehensive. One of them, the Children's Aid Society Carrera program, is an intensive program operating five days per week and lasting throughout high school. It includes family life and sex education, medical care including reproductive health services, individual academic assessment and tutoring, a job club, employment, arts, and sports. Research demonstrates that it reduced both pregnancy and birthrates over a three-year period.

### Conclusion

Despite declines in the teen pregnancy rate in the United States in the 1990s, teen pregnancy remains an important problem and diminishes the well-being of both teen mothers and their children. Fortunately, by the beginning of the twenty-first century there were a diverse group of programs that were demonstrated to be effective in reducing teen sexual risk-taking or pregnancy. These include reproductive health services and clinic protocols focusing upon patient sexual behavior, sex and HIV education programs, service-learning programs, and intensive and comprehensive programs for higher risk

youth. The diversity of these programs increases the choices for communities. To reduce teen pregnancy, communities can replicate much more broadly and with fidelity those programs with the greatest evidence for success with populations similar to their own; replicate more broadly programs incorporating the common qualities of programs effective with populations similar to their own; and design and implement programs that effectively address the important risk and protective factors associated with sexual risk-taking in their communities.

## RISK MANAGEMENT IN HIGHER EDUCATION

During the late twentieth century, American society and higher education experienced a substantial increase in lawsuits resulting from some form of personal injury, according to John F. Adams and John W. Hall. A response to the trend of litigiousness, risk management seeks to control exposure to legal risk, thus limiting the negative impact of liability on the institution. In 1995 William A. Kaplin and Barbara A. Lee described four of the most common methods

of risk management: risk avoidance, risk control, risk transfer, and risk retention. Risk avoidance entails an effort on the institution's part to limit risk by eliminating programs or activities or avoiding creating those that involve risk. A less extreme approach is risk control, which seeks to manage liability by structuring activities and programs in ways that reduce or limit institutional risk. There are several methods of transferring risk to other parties including insurance, indemnification agreements, and releases and waivers. Risk retention describes the self-insurance as a means to prepare for the financial implications of legal liability.

### Tort Liability

One of the primary areas of legal liability that risk management addresses is tort liability, which is generally defined as "a civil wrong, other than a breach of contract, for which the courts will allow a damage remedy" (Kaplin and Lee, p. 98). The area within tort liability with which institutions of higher education must most often deal is negligence. Most of these cases involve lawsuits by students and others who suffered injuries that they claim the institution should have prevented through the exercise of reasonable care. The four elements of negligence are duty, breach of that duty, injury (physical or emotional), and proximate cause.

In addition to duties commonly associated with any business enterprise, colleges and universities, according to some courts and authors, have a special relationship with students that demands a higher level of care. Many of the cases heard in the 1980s and 1990s rejected this claim of a higher duty. For example, in *Beach v. the University of Utah* (1986) the institution was freed from any legal responsibility for the injuries that befell Donna Beach while on a university-sponsored field trip where underage students, including Beach, were served alcohol in the presence of the faculty member supervising the trip. The Utah Supreme Court ruled that no special relationship existed between Beach and the university to prevent her injuries. This decision was not anomalous during this period. In rulings in such cases as *Bradshaw v. Rawlings* (1979), *Baldwin v. Zoradi* (1981), and *Rabel v. Illinois Wesleyan University* (1987), the courts continued to reject the idea that college and universities had any heightened duty for the safety of their students and others on campus.

These cases and a number of others led Robert D. Bickel and Peter F. Lake in 1999 to describe this

period and line of reasoning as the bystander university that "cast the university in the legal and cultural role of helpless 'bystander' to student life and danger" (p. 49). During this time, colleges and universities were often seen as having no duty to their students, and as a result no legal liability for the harm their students may suffer. However, not all courts embraced this no-duty reasoning. For example in *Mullins v. Pine Manor College* (1983) and *Tarasoff v. Board of Regents of the University of California* (1976), the courts clearly articulated heightened duties for colleges and universities to their students and others. In *Mullins* the Massachusetts Supreme Court found Pine Manor College liable for the rape of a student in a residence hall by a third party, noting that a residential college has a general duty to provide for campus security and noting that efforts by the college to provide for campus security (including fences around the campus) represented a voluntary assumption of a duty as well. A series of cases in the 1990s including *Furek v. The University of Delaware* (1991) and *Nero v. Kansas State University* (1993) continued in the view of earlier duty cases as courts ruled that institutions had an obligation in the prevention of foreseeable harm. In cases such as *Tanja H. v. Regents of the University of California* (1991), however, the courts continued to reject any heightened duty owed to students by the institution. In their analysis, Bickel and Lake suggested that cases such as *Furek* and *Nero* should be viewed as beginning a larger body of cases that redefine the duty that institutions owe their students, "Duty is owed if danger is foreseeable from prior indicia or assumption of duty and reasonable precautions could prevent harm" (p. 145). Throughout these cases from the 1970s to the early twenty-first century, several common sources of institution liability can be seen with multiple elements present in many cases such as those involving alcohol, fraternities, and campus crime—particularly sexual assault.

### Other Sources of Risk

Risk management in higher education does not end with the consideration of tort liability and negligence. Public and private institutions must address the issue of potential institutional contract liability in the enforcement of contracts in which its agents enter the institution. Public institutions may also face lawsuits brought under 42 USC 1983 for intentional violations of federal constitutional rights. Additionally, institutions must pay careful attention to

compliance with federal legislation and regulations governing higher education, which expand and grow more complicated with each congressional session.

Much of the legislation directly affecting higher education passed in the late 1980s and 1990s must be viewed in the context of the negligence cases involving harm to students. Congress passed legislation related to both alcohol (Drug-Free Schools and Communities Act) and campus crime (Jeanne Clery Disclosure of Campus Security Policy and Campus Crime Statistics Act). In 1998 Congress authorized the use of fines by the Department of Education to enforce the Campus Security Act. Under federal law, another significant concern for institutions is sexual harassment, which is a form of sexual discrimination prohibited under Title IX of the Educational Amendments of 1972. The Supreme Court has allowed students to recover monetary damages for both quid pro quo (*Gebser v. Lago Vista Independent School District*, 1998) and hostile environment sexual harassment (*Davis v. Monroe County Board of Education*, 1999). In order to win monetary damages, the student must show that a school official with authority to take corrective action had actual knowledge of the sexual harassment and responded with deliberate indifference. However, the Department of Education's Office of Civil Rights holds institutions of higher education to even higher standard in administrative enforcement of the legislation.

Risk management is an issue that demands careful attention by all institutions of higher education. In the fall of 2000 the Massachusetts Institute of Technology settled the lawsuit brought by the parents of Scott Krueger, a freshman who died as a result of excessive alcohol consumption at a fraternity, for \$6 million. This is a clear indication of the profound financial implications of educational institutions' lack of response to this important issue.

### ROGERS, CARL (1902-1987)

---

American psychologist and therapist, Carl R. Rogers relied on personal experience as well as scientific inquiry to guide his methodology, much of which foreshadowed late-twentieth-century practice of psychotherapy.

Rogers was born in Oak Park, Illinois, to a prosperous and quite religiously conservative Protestant upper-middle-class family. He was a precocious child, reading bible stories before he entered school, achieving an A grade average through high school, and testing near the top of every intellectual aptitude test he took. As an adolescent some of his interests in science and agriculture were crystallized in work-

ing on his father's farm and reading a major book on scientific farming. A five-month YMCA trip to China while still a twenty-year-old college student confirmed his religious interests, but also gave him a chance to begin to formulate his own personal philosophy independent of his parents. During the following year, he remembered in 1967, he spoke of the trip as "the greatest experience of my life." After college (University of Wisconsin), he attended the liberal Union Theological Seminary, but he completed his Ph.D. at Teachers College, Columbia University, in 1931.

Intellectually Rogers was liberal, idealistic, and optimistic. In a very critical biography David Cohen, drawing on unpublished notes, letters, and essays in the 140 boxes of the Rogers archives in the Library of Congress, painted a different picture of Rogers: a troubled man, often in conflict with his parents, siblings, wife, children and their spouses, and a number of colleagues. Rogers, in more temperate terms, made public only an inkling of his problems, in some brief comments in his chapter in the *History of Psychology in Autobiography* by David Boring and Gardner Lindzey. In contrast, Howard Kirschenbaum in a biography based on many interviews with Rogers and others presents what he, Kirschenbaum, views as "a balanced picture of the man" (p. xvi).

### Counseling and Clinical Practice

Rogers's concern for making clinical work in psychology scientific appeared early in his dissertation "Measuring Personality Adjustment in Children Nine to Thirteen Years of Age" (1931). He developed a paper and pencil objective test with six kinds of item formats, which were derived heavily from clinical interview questions and four subscales of adjustment, and summarized into an overall score. The test was empirically developed, cross-validated, and had norms based on elementary school children from New York City. One group of items required the children to rate perceived self versus ideal self, a conception that would be increasingly a part of Rogers's long-term view of personality.

The dozen years he spent doing clinical work and directing what became the Rochester Guidance Center resulted in the *Clinical Treatment of the Problem Child* (1939). He dealt with testing, interviewing, camps, foster homes, families, and schools, and the beginning of "relationship therapy," with an acknowledgment of the work of Otto Rank, Jessie Taft, and Frederick Allen. The comprehensiveness of the

book along with Rogers's developing point of view presages an intellectual and writing style in his later efforts.

He became a candidate for, and accepted, a full professorship at the Ohio State University, teaching courses in mental hygiene and counseling practices and guiding Ph.D. students in their dissertations. There he wrote what is arguably his most important and provocative book, *Counseling and Psychotherapy* (1942). Significantly it carried the subtitle, 'Newer concepts in practice,' which accented the shift from diagnosis to therapy that was occurring in several of the helping disciplines. The audience was broadly construed: psychologists, college counselors, marital advisers, psychiatrists, social workers, and high school guidance counselors. Methodologically, his intent was to present his extensive personal experience in the practical work of counseling in a number of settings over the 1930s and 1940s—increasingly important, personal experience as well as scientific research became a major baseline for his ideas and practices.

More recent theorists and methodologists might have labeled his efforts "action research," "a discovering/generating grounded theory," and "reconstructions." The seeds of nondirective and client-centered counseling are readily apparent, as are the beginnings of basic conceptions of fully functioning, authenticity/congruence, unconditional positive regard and acceptance, and empathy. Transcripts of phonographic recordings of counseling interviews document every idea in the text. The back-and-forth dialogue between the data and the conjectures is stimulating. The apex of the recording thrust appears in part four, "the case of Herbert Bryan." All eight counseling interviews were recorded, a full 178 pages. The verbatim transcripts carry interpolated reactions, thoughts, hunches, criticisms, and suggestions, and the reader is able to follow along and make his or her own interpretations.

Less than a decade later, Rogers edited *Client-Centered Therapy: Its Current Practice, Implications, and Theory* (1951), and was teaching at the University of Chicago. The preface acknowledges the large group of counselors at the Chicago Counseling Center whose thought and effort had contributed to his thinking. The preface, in emotional and near spiritual terms, thanks the clients from whose struggles and concerns he and his colleagues have learned. Mostly though, the book is a treatise on Rogers's evolving point of view, almost an intellectual autobiography.

Beyond the continuity and the elaboration of issues in nondirective counseling or client-centered therapy, several other aspects stand out: discussions of group-centered therapy and leadership, a move toward student-centered teaching, and a theory of personality and behavior. The chapter on theory of personality and behavior formalized much of Rogers's contribution to what came to be called "third force psychology," a complex set of alternatives to behaviorism and psychoanalysis. He commented: "Like Maslow, the writer would confess that in the early portion of his professional life he held a theoretical view opposed at almost every point to the view he has gradually come to adopt as a result of clinical experience and clinically oriented research" (Rogers 1951, p. 482).

### The Move beyond Individual Counseling

One of Rogers's most significant contributions involved his concern for the education of children and adolescents, as well as adults. *Freedom to Learn: A View of What Education Might Become* (1969), represents an attack on traditional formal schooling. In one chapter, Rogers based the work on a diary kept by a teacher about her efforts to refocus her sixth-grade class toward better learning. Interpreting her actions, Rogers recounted the realities of a class experiencing apathy, discipline problems, and parental concerns, and the teacher who, after reading an account of student-centered teaching—"an unstructured or non-directive approach"—worked to build a more exciting and stimulating classroom. The diary is supplemented with responses written to questions raised by Rogers. In another chapter Rogers extended his ideas to the college level, using a college professor's descriptive account and adding his own interpretations. Then he wrote of his personal experience in teaching a course, "Values in Human Behavior Including Sensitivity Training," at the Western Behavioral Sciences Institute. One of the most fascinating chapters in the book is a four and a half page statement, "Personal thoughts on teaching and learning," which was a very radical document that received major criticism. Rogers began, "I find it very troubling to think, particularly when I think about my own experiences and try to extract from those experiences the meaning that seems genuinely inherent in them." He then stated thirteen propositions/hypotheses with five consequences. His first proposition is "My experience has been that I cannot teach another person how to teach." His

fourth is "I have come to feel that the only learning which significantly influences behavior is self-discovered, self-appropriated learning." After a baker's dozen of these, the consequences include doing away with teaching, examinations, and grades.

In 1970, he joined the faculty of the Western Behavioral Sciences Institute and later the Center for the Study of the Person, writing another major book *Carl Rogers on Encounter Groups* (1970). He and the times had shifted dramatically. The book continues his personal and autobiographical style, this time his experiences with the nature, process, and impact of groups on the lives of individuals. Quickly he grounds the reader in prior key figures (e.g., Kurt Lewin), in prior labels (e.g., T-groups), sensitivity training, and encounter groups. Notes, letters, stories, and individual accounts illustrate processes, changes, and personal experiences. He then turns autobiographical, "Can I be a facilitative person in a group?," to ward off a brief general statement that "would have to be so homogenized that every truth in it would also be so some extent a falsehood" and also to minimize "the flavor of expertise in it, that I did not want to emphasize" (p. 43). Then, too, the more traditional scientist in him leads to a chapter "What we know from research." The book has a persuasive rhetorical quality in the mix of vivid data, startling personal experiences from leaders and participants, and broad useful practical ideas and suggestions.

### An International Dialogue

Rogers was at the forefront of psychology, engaging in discussions with international scholars. He discussed individual psychotherapy as an approach to the "I-Thou" relationship with the eminent Jewish intellectual Martin Buber in 1957, asking him "How have you lived so deeply in interpersonal relationships and gained such an understanding of the human individual without being a psychotherapist? (Buber laughs)" (Kirschenbaum and Henderson, p. 45). A long elaborate answer followed and the dialogue continued. A discussion with the theologian Paul Tillich moved into a major give-and-take on the nature—multiple natures—of man. With the behaviorist psychologist B. F. Skinner, the issue of freedom and control in human life became central. Others would argue that the soul of psychology was in debate. Discussions with Gregory Bateson, Michael Polanyi, and Reinhold Niebuhr enlarged the scope of the discussions. With Rollo May, the role

of evil and the daimonic and demonic came to the fore and cut to the heart of Rogers's central tenets of the goodness of man versus man having the potentiality for goodness and evil. In short, one finds Rogers, a brilliant psychologist and therapist, in contention with some of the most important minds of the twentieth century, over issues that have puzzled human beings for centuries—millennia, really.

LOUIS M. SMITH

## ROUSSEAU, JEAN-JACQUES (1712–1778)

A political and moral philosopher during the Enlightenment, Jean-Jacques Rousseau developed pro-

vocative ideas about human nature, education, and the desired relationship between individuals and the ideal society.

Born in the city of Geneva, Switzerland, Jean-Jacques Rousseau lost his mother hours after his birth and was abandoned by his father at the age of seven. After many years of failed apprenticeships and employments, Rousseau rose to intellectual prominence in 1750 upon winning first prize in an essay contest in France. This marked the beginning of a long period of scholarly production in which he authored a number of philosophical treatises that addressed the problem of individual and collective freedom—and how education might help to resolve the dilemma by producing enlightened citizens who would uphold an ideal state. Forced to flee France and Switzerland as a result of the social criticisms inherent in his work, Rousseau found temporary refuge in England and then surreptitiously returned to France where he remained until his death.

#### Social Inequalities

Rousseau's discontent with contemporary society became evident in his *Discourse on the Arts and Sciences* (1750). Addressing the question of whether progress in the arts and sciences had abetted or detracted from morals, Rousseau portrayed civilization as evil, and he chastised scholars for pursuing knowledge for fame instead of social progress. Similarly, in his *Discourse on Inequality* and his article on political economy written for Denis Diderot's *Encyclopédie* (both published in 1755), Rousseau lamented man's departure from the state of nature and his consequent preoccupation with artificial social customs and institutions—all derived from vain and illusory desires to dominate others. Although he accepted individual or innate differences among human beings, Rousseau attacked the existence of social and civil inequalities in which people crushed the spirits of others in attempting to control them.

In the wake of these social criticisms, Rousseau sketched his vision for an ideal society. Particularly in *The Social Contract* and *Émile*, both published in 1762, Rousseau delineated a society without artificial social constraints or civil inequality. Ruled by a "general will" that encapsulated the essential commonality of all men, citizens would utilize reason to reconcile their individual interests with the laws of the state. Educated to be self-interested and self-reliant, a citizen would not measure himself against other people nor seek to control them. He would es-

chew selfish inclinations in favor of social equality. How, then, could such an ideal state emerge? For Rousseau, it required the complete education of a child.

### *Émile*

Echoing his disdain for contemporary culture and politics in *The Social Contract*, Rousseau begins *Émile* by declaring: “God makes all things good; man meddles with them and they become evil.” Society held man hostage in artificial institutions and traditions, thereby corrupting the natural goodness of human nature. This proclamation contradicted the notion of original sin, widely accepted in eighteenth-century Europe. It implied that a complete social revolution—not mere pedagogical reform—was necessary to replace the artificial social mores of the bourgeoisie with a new class of natural, self-reliant citizens. In accordance with John Locke’s empirical epistemology, moreover, Rousseau believed that children were born ignorant, dependent, impressionable, without rational thought, and gained all knowledge through direct contact with the physical world.

As a result, Rousseau removed his fictional pupil, *Émile*, from his family and placed him in rural isolation. The first three stages of a child’s development (infancy, boyhood, and pre-adolescence) required a kind of “negative” education. Protected from the artificial and pernicious influences of contemporary society, *Émile* would not develop unrealistic ambitions and feelings of jealousy or superiority with regard to other men (*amour propre*). In such a way, the tutor would encourage the child’s physical development, shield him from social and religious institutions, prevent the formation of bad habits and prejudices, and preserve his natural inclination of self-interest (*amour de soi*).

Educated free from the manipulations and desires of others up to this point, Rousseau wanted *Émile* to remain ignorant of social duty and only to understand what was possible or impossible in the physical world. In such a way, his student would learn to obey the immutable laws of nature. For instance, if *Émile* were to break the window to his room, he would face the consequences of sleeping with a cold draft. If *Émile* were to ignore his astronomy lesson, he would endure the panic of losing his way in the woods at night. Through this kind of trial and error, the child would gradually develop reason,

adapt to different situations, and become an autonomous man.

The only appropriate book for Rousseau’s future citizen was *Robinson Crusoe*, as it depicted the independent activities of a man isolated in a natural setting. And to abet *Émile*’s self-reliance, Rousseau exposed his student to a variety of artisan trades. Thus, the child would not crave things he could not get, nor would he engage in a vain desire to control other people. An independent and rational young man, *Émile* learned to accept what was available to him. It is important to note, however, that although the tutor was always behind the scenes, he constantly manipulated conditions to give *Émile* the illusion of freedom.

Having developed the power to reason by the age of fifteen, the child then needed to develop his morality by understanding society and God. Through the safe and detached medium of historical study, Rousseau wanted his pupil to construct his understanding of human character. Detailed historical accounts of men’s spoken words and actions would allow *Émile* to recognize the universality of natural human passion. As a self-confident and rational adolescent, he would neither envy nor disdain those in the past, but would feel compassion towards them.

This was also the time to cultivate *Émile*’s religious faith. Rousseau did not want his pupil to become an anthropomorphic atheist. Nor did he want his pupil to fall under the authority of a specific religious denomination, with its formal rituals and doctrines. Such trappings smacked of the very artificial social institutions from which *Émile* was to be freed. Instead, *Émile* was to recognize the limitations of his senses and to have faith that God—the supreme intelligent will that created the universe and put it into motion—must in fact exist. In this respect, Rousseau deviated from the Enlightenment faith in man’s reason as the sole vehicle for understanding God. Rousseau also alienated himself from formal religious institutions in demeaning their authority and asserting the original goodness of human nature. The corrupt codes and institutions of society had tarnished the purity of human nature, fueled a quest to rule over others, and made man a tyrant over nature and himself. The only salvation, however, rested not with God but society itself. A better society, with civil equality and social harmony, would restore human nature to its original and natural state and thereby serve the intent of God. In this way, Rousseau’s

brand of religious education attempted to teach the child that social reform was both necessary and consistent with God's will.

In Rousseau's final stage of education, his pupil needed to travel throughout the capitals of Europe to learn directly how different societies functioned. *Émile* also needed to find an appropriate mate, Sophie, who would support him emotionally and raise his children. Assuming that women possessed affectionate natures and inferior intellectual capacities, Rousseau relegated Sophie to the role of wife and mother. In direct contrast to *Émile's* isolated upbringing for developing his reason and preparing him as a citizen, Sophie's education immersed her in social and religious circles from the outset, thereby ensuring that she would not become a citizen. Despite this inequality, Rousseau believed that *Émile* and Sophie would comprise a harmonious and moral unit in the ideal state and produce future generations who would uphold it.

### Gender Considerations

Some scholars have explored the implications of Rousseau's gender-distinct education and have suggested that *Émile's* societal isolation rendered him inadequate as a husband and citizen. Raised in social isolation and without family, *Émile* developed the capacity to think rationally, but at the expense of affectionate and empathetic feelings necessary to sustain a relationship with his future wife or with the ideal state. As delineated in *The Social Contract*, Rousseau's ideal state required not merely rational thinkers, but citizens who empathized with one another and the state. Thus, according to this view, Rousseau's gender-distinct assumptions produced an inadequate education for Sophie (whose reason had not developed) and *Émile* (emotionally cold and prey to his wife's manipulations). The family, fragmented and incomplete, could not sustain the ideal state.

A number of scholars have doubted whether *Émile's* isolation in the countryside could necessarily be free of social forces and whether the tutor could exemplify abstract principles without alluding to examples from conventional society. On the other hand, generations since Rousseau have altered their child-rearing practices and adopted his developmental view of childhood as a period of innocence. Some have accused Rousseau, in his manipulation of *Émile* and stress on the general will, of advocating a proto-totalitarian state. On the other hand, many scholars

have identified Rousseau's faith in the agency of individuals to make rational and enlightened decisions both for themselves and their society as a precursor to democracy. Indeed, this lack of consensus about Rousseau's legacy speaks less to his inadequacies than to his profound contributions to the fundamental, enduring, and controversial questions about human nature, self, society, and education.

SEVAN G. TERZIAN

### RUGG, HAROLD (1886–1960)

Harold Rugg, a longtime professor of education at Teachers College, Columbia University, was one of the best-known educators during the era of Progressive education in the United States. He produced the first-ever series of school textbooks from 1929 until the early 1940s.

Rugg was born in Fitchburg, Massachusetts, the son of a carpenter. His early poverty seemed to pre-

clude his attending college. Nevertheless, he was able to matriculate at Dartmouth College, graduating in 1908 with a bachelor's degree in civil engineering and earning a graduate civil engineering degree from Dartmouth's Thayer School of Civil Engineering in 1909. Rugg worked briefly as a civil engineer, then taught civil engineering at Milliken University in Decatur, Illinois, where he grew interested in how students learn. This interest inspired him to gain a doctorate in education at the University of Illinois in 1915, and he began a college teaching career at the University of Chicago, where he taught until 1920. He then went to Teachers College at Columbia University, where he taught until his retirement in 1951. After his retirement he continued publishing books in education and also served as an educational consultant in Egypt and Puerto Rico.

The field of education was still in its formative stages when Rugg began his career, and he proceeded to have a major impact in a number of areas. Although Rugg was trained as an engineer and educational psychologist, his major initial impact was in the field of curriculum. Rugg applied his training to reassessing how curriculum was created. His editing of and writing in both the twenty-second and twenty-sixth yearbooks of the National Society for the Study of Education provided groundbreaking syntheses of the fields of social studies and general curriculum, respectively.

Rugg was a cofounder of the National Council for the Social Studies and edited yearbooks for a number of respected educational organizations. Rugg, however, did not get very involved in the duties and tasks of such organizations, instead concentrating on his own research and writing projects.

In 1922 Rugg assembled a team to create his Social Science Pamphlets, a series of booklets that comprised the social studies materials for junior high school (grades six to eight). These materials were adapted and published by Ginn and Company starting in 1929. Over the course of the next fifteen years Rugg and Ginn and Company would sell over 5 million textbooks, and the pattern of creating textbook series became a model in publishing still used in the early twenty-first century. With Louise Krueger, Rugg also developed an elementary education (grades one through eight) social studies textbook series in 1939. Unfortunately, Rugg's junior high textbooks were the subject of censorship efforts headed by the National Association of Manufacturers and the American Legion. In this controversy,

these groups accused Rugg of anti-Americanism, socialist or communist leanings, as well as anticapitalism. He was not the only target of such accusations, with other Progressive educators also being so accused. Rugg, however, gained more notoriety because of the enormous popularity of his textbooks. In the 1940s the texts ceased to be published.

In 1928 Rugg cowrote his first major work, *The Child-Centered School*, which described the historical and contemporary basis for "child-centered" education. This work had a major impact on Progressive educators and remains an excellent explanation and critique of this topic. It also was one of the first treatises on the two major emphases within Progressive education—child centeredness and social reconstruction.

As Rugg's career progressed he became as much a critic and discussant of contemporary American culture as an educator. He was an outspoken Social Reconstructionist and a strong advocate of the reform programs of President Franklin Roosevelt. Indeed Rugg was outspoken in much that he did. He was a large man with a commanding presence. People had strong feelings about him, both negative and positive. Despite criticism, he was not easily intimidated and remained confident and hard driving in his work.

Rugg directed his attention primarily toward teacher education and foundations of education in the last years before his retirement. His books in these areas were well respected and received but did not have the lasting impact of his curriculum work. At his death Rugg was attempting to understand and explain creative thought, and his last book, *Imagination*, focused on this area and was published posthumously, not fully completed.

## RURAL EDUCATION

---

### OVERVIEW

Hobart L. Harmon

### INTERNATIONAL CONTEXT

Sheldon G. Weeks

### OVERVIEW

Rural education reflects the circumstances, challenges, and context of places in America called "rural." Rural America has been and continues to be a vital part of the nation. As of 2001, rural America comprised 2,288 counties, contained 83 percent of the nation's land and was home to 21 percent of its population (51 million people). The United States, like the rest of the world, is steadily becoming more urban. Two national censuses illustrate the point dramatically. For the first 140 years of the nation's existence, most Americans lived in open country and small towns. The 1920 census was the first to record that urban people outnumbered those living in open country and small towns. Just seventy years later, the 1990 census recorded not only that most Americans lived in urban areas but also that they lived in metropolitan areas of 1 million or more people.

#### The Changing Nature of Rural America

Rural America has changed in many ways. The rural economy in particular has changed—shifting from a dependence on farming, forestry, and mining to a

striking diversity of economic activity. Improvements in communication and transportation between urban and rural areas have reduced rural isolation and removed many of the cultural differences between the two areas. Television, phone service, and transportation systems have helped bring rural and urban dwellers much closer together in terms of culture, information, and lifestyles. And while it continues to provide most of the nation's food and fiber, rural America has taken on additional roles, providing labor for industry, land for urban and suburban expansion, sites for hazardous activities and the storage of waste, and natural settings for recreation and enjoyment.

No one industry dominates the rural economy, no single pattern of population decline or growth exists for all rural areas, and no statement about improvements and gaps in well-being holds true for all rural people. Many of these differences are regional in nature. That is, rural areas within a particular geographic region of the country often tend to be similar to each other and different from areas in another region. Some industries, for example, are associated with different regions: logging and sawmills in the Pacific Northwest and New England, manufacturing in the Southeast and Midwest, and farming in the Great Plains. Persistent poverty also has a regional pattern, concentrated primarily in the Southeast. Areas that rely heavily on the services industry are located throughout rural America, as are rural areas that have little access to advanced telecommunications services. Many of these differences—regional and nonregional—are the result of a combination of factors including the availability of natural resources; distance from and access to major metropolitan areas and the information and services found there; transportation and shipping facilities; political history and structure; and the racial, ethnic, and cultural makeup of the population. As a result, rural areas differ in terms of their needs and the resources they possess to address those needs.

Understanding rural America is no easy task. It is tempting to generalize and oversimplify, to characterize rural areas as they once were or as they are now in only some places. Still, there is an overall pattern of economic disadvantage in rural areas. The historical and defining features of rural economies often constrain development. Regardless of other differences, efforts to assist rural areas must take into account three common rural characteristics: (1) rural settlement patterns tend to be small in scale

and low in density; (2) the natural resource-based industries on which many rural areas have traditionally depended are declining as generators of jobs and income; and (3) low-skill, low-wage rural labor faces increasingly fierce global competition.

Connecting rural America to the digital economy and raising the skills of workers and leaders found there will be essential for rural America to compete more effectively. A third of all rural counties captured three-fourths of all rural economic gains in the 1990s. This concentration of economic activity is the result of powerful shifts in demographics, technology, and business practices. And while rural America has often based its development on relatively low labor costs, future opportunity will be based more on skilled workers and capital investments. Many rural schools need to raise their standards and become fully integrated into telecommunication networks.

Some observers point to technology as the driving force of the rural economy in the twenty-first century. Others believe a significant portion of today's rural America will be "metropolitanized" in the years ahead, continuing the trend in which the fastest growing portion of the U.S. economy from the 1970s into the twenty-first century was the part that was "formerly rural." That is, rural areas adjacent to the nation's metro areas, or ones growing fast enough to become a metro area in their own right, probably have very bright economic futures.

Rural areas suffer from the out-migration of both young and highly skilled workers, leaving an aging population and strained public services (including public education). Most areas have difficulty providing the capital and infrastructure to encourage and sustain new rural entrepreneurs. As a result, many rural areas are searching for local features that can spur new growth, such as scenic amenities, environmental virtues, or unique products that reflect the cultural heritage of a particular region. Expanding agricultural opportunities will be important, through value-added processing and new specialized crops. Better educated residents and improved rural economic networks are essential to the development of new rural businesses.

### Defining Rural Schooling

No single definition exists to define rural America and rural schools. All that is not metropolitan is often said to be rural. As noted earlier, one should

remember that rural America is quite diverse from one part of the country to another. Issues and trends in rural education may be place (region) specific for any number of factors. Generalizations about education in one rural area of the United States may or may not be true for another. Nevertheless, generalizations can provide a foundation of information for examining issues and trends in a regional and local area.

The *Common Core of Data* (CCD), maintained by the National Center for Education Statistics, uses information on two locale classification schemes to identify every school and district in the nation. The first locale scheme consists of seven types of locale codes created in the late 1980s, ranging from a large city to rural. The categories of *rural* and *small town* are often used to describe the rural segment of American schooling. In 1997–1998, nearly 64 percent of all school districts were classified as rural or small-town districts. The second locale classification scheme in the CCD is *metropolitan location*, divided into three categories: a central city of a metropolitan area, metropolitan but not central city, and non-metropolitan. About 53 percent of all districts were located in nonmetropolitan areas. Interestingly, in these two schemes, rural and small-town schools were found in both metropolitan and non-metropolitan areas. Of the 9,249 districts identified as rural and small town, 1,693 were located in metropolitan areas. Lastly, fewer than 1,000 kindergarten through grade twelve unit schools remained in the United States, that is, schools with all grades—kindergarten through twelve—located in the same building.

In 1998 the National Education Association used data primarily from studies conducted by federal agencies to describe public education in rural areas and small towns compared to central city schools and urban fringe schools. A few of the findings were as follows:

- Approximately one-half of the nation's 80,000 public schools and approximately 40 percent of the 41.6 million public school students were located in rural areas and small towns. Rural schools were smaller, less likely to have minority students, and less likely to provide bilingual education, English as a second language, magnet schools, and job placement programs. But rural schools were more likely to offer remedial programs and Title I programs that serve high poverty populations.

- Of the approximately 2.56 million public school teachers, approximately 40 percent were in rural and small town schools. Compared to teachers in central city schools and urban fringe schools, rural teachers tended to be less well educated, slightly less experienced, younger, and less likely to belong to a minority group. Rural school principals were more likely to be male and less likely to belong to a minority group compared to principals in central city schools and urban fringe schools.
- Teachers in rural and small town schools spent more time with students at school and outside school hours, had smaller incomes, and were less likely to have benefits of medical insurance, dental insurance, group life insurance, and pension contributions.
- Teachers in rural and small town schools perceived student use of alcohol to be a more serious problem and were less likely to perceive a serious problem in student absenteeism, tardiness, verbal abuse of teachers, and student disrespect for teachers. Teachers in rural schools were less likely than teachers in central city schools, but more likely than teachers in urban fringe schools to perceive poverty as a serious problem in their schools.

In his 1982 book *Rural Education: In Search of a Better Way*, Paul Nachtigal contended that the important factors that differentiate a rural community in one part of the country from a community of similar size and isolation in another part of the country appear to be related to the availability of economic resources, cultural priorities of the local community, commonality of purpose, and political efficacy. Nachtigal described some basic differences between rural and urban areas, which are listed in Table 1.

Perceptions of all rural schools as inferior schools are incorrect. States with a predominance of small, community-centered schools do rather well. For example, on achieving the National Education Goals, in 1998, eight of the top ten states on math and science performance, six of the top seven on student achievement in the core subjects, and all top five on parent involvement were rural states. In fact, many of education's so-called best practices were born out of necessity long ago in the rural school. Examples include cooperative learning, multigrade classrooms, intimate links between school and community, interdisciplinary studies, peer tutoring,

**TABLE 1**

Basic differences between rural and urban areas	
Rural	Urban
Personal/tightly linked	Impersonal/loosely coupled
Generalists	Specialists
Homogeneous	Heterogeneous
Nonbureaucratic	Bureaucratic
Verbal communication	Written memos
Who said it	What is said
Time measured by seasons of year	Time measured by clock
Traditional values	Liberal values
Entrepreneur	Corporate labor force
Make do/respond to environment	Rational planning to control environment
Self-sufficiency	Leave problem solving to experts
Poorer (in spendable income)	Richer (in spendable income)
Less formal education	More formal education
Smaller/less density	Larger/greater density

block scheduling, the community as the focus of study, older students teaching younger ones, site-based management, and close relationships between teachers and students.

### Challenges and Issues

Many of the challenges and issues that confront rural schools are not new, and in large measure they are linked to regional and local circumstances of change and reality in rural areas.

**Adequate funding.** Rural school districts, with their modest fiscal bases, usually cannot generate sufficient local resources to supplement adequately the state school finance programs the way that more affluent localities can. In at least sixteen states, supreme courts have ruled that their state system of school funding is unconstitutional and have ordered that new systems be developed. While equity and efficiency arguments have been prevalent in most of these cases, these court challenges also highlight the need to provide a level of funding for providing adequate educational opportunities if students are expected to meet state-mandated standards of performance.

**Setting standards.** Americans want schools where students must meet some standard of achievement. But who sets the standard is a critical issue being debated in rural schools and their communities. Local versus state (or federal) control of public schools is at the center of the controversy of setting standards. Rural schools and community advocates, such as the

Rural School and Community Trust, believe that standards should originate within the community in which the students live. Others argue that the state should set standards because local schools in some rural areas traditionally have low expectations for student achievement and because taxpayers in some rural areas have low interest in funding high standards for all students. Rural interests also argue that rural communities cannot afford to fund the requirements for state-mandated standards and that school consolidation—in the name of fiscal efficiency—is the likely result. Some policymakers also believe federal and state interests in having an educated citizenry for competing in a global economy compels standards be set at the state level, with local schools having flexibility to decide how to teach the content rather than what to teach.

**School size.** The majority of schools in rural settings are small, enrolling fewer than 400 students. Only 2 percent have enrollments exceeding 1,200 students. Research reveals that a high school with an enrollment of 400 is able to offer a reasonably comprehensive curriculum and that high schools ought not to enroll more than 600 to 1,000 students. Schools with high populations of students from low-income families do best academically in small schools. Public concerns regarding school safety issues also reinforce the need for small schools, where teachers know students well and students have a feeling of belonging in the school and community.

**School facilities.** While rural schools may be located in some of America's most beautiful areas, in 1996 about 4.6 million rural students were attending schools in inadequate buildings. Three out of ten rural and small-town schools have at least one inadequate building. One in two schools have at least one inadequate building feature, such as a roof, a foundation, or plumbing. Approximately one-half have unsatisfactory environmental conditions in the buildings. Approximately 37 percent have inadequate science laboratory facilities, 40 percent have inadequate space for large-group instruction, and 13 percent report an inadequate library/media center.

Technology needs also force building modifications. Many older schools lack conduits for computer-related cables, electrical wiring for computers and other communications technology, or adequate electrical outlets. Without the necessary infrastructure, schools cannot use technology to help overcome historical barriers associated with ruralness and isolation. In 1990 rural schools expressed a need for an

estimated \$2.6 billion for funding maintenance on existing buildings and almost \$18 billion to replace obsolete rural schools.

**Diversity and poverty.** Addressing issues of education in rural areas includes confronting the realities of people in poverty and the growing diversity of rural America. Geographic diversity best defines the issue of diversity in rural America. Using 1990 census data, 333 of the 2,288 rural counties have a minority group that makes up one-third of the population. These counties contain only 12 percent of the total rural population. They are geographically clustered, however, according to the residents' race or ethnic group. Rural minorities often live in geographically isolated communities where poverty is high, opportunity is low, and the economic benefits derived from education and training are limited. Rural counties in which African Americans make up one-third or more of the total population are found only in the South. Native American (American Indian, Alaskan Native) counties are clustered in three areas: the northern High Plains, the Four Corners region in the Southwest, and Alaska. Most of the Hispanic counties lie near the Rio Grande, from its headwaters in southern Colorado to the Gulf of Mexico. Hispanics are the fastest growing rural minority group. Agricultural areas in Washington, ski resorts in Colorado, and meatpacking centers in Kansas, Nebraska, and Iowa saw new or greatly expanded Hispanic settlements in the 1990s.

Nearly 10 million poor people live in rural America, comprising almost one of every five rural residents. A poverty gap exists between rural minorities and the white population. Rural minorities are significantly more impoverished as a percentage of the population. Nevertheless, the overwhelming majority of poor people living in rural America are white (72.9%). Fewer than one-fourth (23.6%) are African Americans, and Hispanics make up only 5.4 percent of the total. Less than 5 percent are Native Americans. These facts contradict the widely held notion that poverty in the United States is a minority problem. These people are the working poor in rural America. Addressing rural education will require solutions to both the poverty gap of minority groups and the persistent impoverished conditions of all rural poor, especially those who work for low wages.

**School improvement capacity.** Major initiatives in the 1990s—such as the National Science Foundation's Rural Systemic Initiative, the federal government's Comprehensive School Reform Demon-

stration Program, the Annenberg Foundation's Rural Challenge (now the Rural School and Community Trust), and the U.S. Department of Education's Regional Educational Laboratory program—have each in their own way attempted to give assistance to rural school systems. Increasingly, rural school districts are relying on regional educational service agencies (ESAs) in their respective states as vital partners in school improvement efforts. In his 1998 book *Expanding the Vision: New Roles for Educational Service Agencies in Rural School District Improvement*, E. Robert Stephens called on ESAs to pursue strategic goals that will enable them to be the first line of school improvement support for their rural school districts. ESAs are particularly important in giving rural schools the capacity to educate students with special and exceptional learning needs. The Association of Educational Service Agencies is the national professional organization serving ESAs in thirty-three states.

**Teacher recruitment and retention.** Attracting and retaining quality teachers will be critical in creating and implementing higher standards for student academic achievement. According to Said Yasin's report "The Supply and Demand of Elementary and Secondary School Teachers in the United States," during the 1998–1999 school year there were 2.78 million teachers in public schools. More than a million of those teachers (approximately 40%) were in six states: California, Florida, Illinois, New York, Ohio, and Texas. These six states also have almost 1,400 rural school districts. The number of elementary and secondary school teachers was projected to increase by 1.1 percent annually to a total of 3.46 million by 2008. Urban and poor communities will have the greatest need for teachers, with more than 700,000 additional teachers needed by 2010.

The rural teacher shortage affects all subject areas but particularly math, science, and special education. According to the National Association of State Boards of Education, an adequate number of teachers is trained each year. The problem is one of distribution. Causes for a teacher shortage in rural areas include: social and cultural isolation, poor pay and salary differentials, limited teacher mobility, lack of personal privacy, rigid lockstep salary schedules and monetary practices, the luring of teachers away by higher paying private sector businesses and industries, strict teacher certification and licensure practices and tests, lack of reciprocal certification and licensure to enable teaching in another state, re-

cruitment cost (time/costs to gather information), and a high rate of teacher turnover (30% to 50% in some areas).

**Leadership.** The most critical issues in managing and running small rural school districts are finances, regional economic conditions, state regulations, salaries, and providing an adequate variety of classes. The greatest turnover among superintendents occurs among the smallest districts, those with fewer than 300 students. An environment of high-stakes testing and increasing public accountability for student and school success is placing a premium on persons who can effectively lead schools (and school districts). As is noted in the 1999 book *Leadership for Rural Schools: Lessons for All Educators*, edited by Donald M. Chalker, being an effective principal in a rural area means building positive relationships with the people in the rural community. The school in the rural community is still a respected institution, with much more focus on people than on business. Building trust and finding ways to make the curriculum incorporate the strengths of the community are key features of successful school leaders in rural areas. In the decades ahead, leading rural schools and school systems in ways that contribute to community and economic development appear essential for sustaining a prosperous school and community in much of rural America.

**Policy action.** Lack of a precise demographic rural definition frustrates those who work in setting educational policy. In 2000, for the first time in history, an organization—the Rural School and Community Trust—systematically attempted to gauge and describe the relative importance of rural education in each state. This first effort used both *importance* and *urgency* gauges. The results revealed a cluster of seven states where rural education is crucial to the state's educational performance and where the need for attention is great: Alabama, Arkansas, Kentucky, Mississippi, North Dakota, South Dakota, and West Virginia. These states are in regions that are chronically depressed, suffer large areas of out-migration, and are deeply distressed by changes in the global economy. Louisiana, Montana, and Oklahoma rounded out the top ten states where rural education was important and the need for policy action was urgent. That twenty-five states now have affiliate organizations with the National Rural Education Association also reflects the growing trend for rural education interests to unite and seek solutions to public education issues.

**Research.** In 1991 Alan J. DeYoung pointed out in his book *Rural Education: Issues and Practices* that rural educational issues rarely attract the attention of prestigious colleges of education and their professorates. Part of the reason is that rural areas are places with traditions and cultures of labor and of working, rather than demand for intellectual understanding and for abstract scholarship. In 1996 rural education researchers Hobart L. Harmon, Craig B. Howley, and John R. Sanders reported in the *Journal of Research in Rural Education* that only 196 doctoral dissertations were written between 1989 and 1993 on the topic of rural education.

Since 1997, the U.S. Department of Education's Office of Educational Research and Improvement has operated Regional Educational Laboratories. These labs were authorized by federal law to devote 25 percent of their funding to meeting the needs of rural schools, part of which has been the conduct of applied research. In 1996 the Education Department designated one of the labs to operate the National Rural Education Specialty, a practice that ended with the start of a new five-year contact period for the labs in 2001. The need for research and evaluation of practice in rural education is likely to increase as more accountability and results are expected from public investments in education.

### **Educational Services in Rural Areas**

Public elementary and secondary schools are the greatest provider of educational services in most local rural communities, and often are the community's largest employer. In 1917, passage of the Smith-Hughes Act by the U.S. Congress provided funds for teaching agriculture to boys in high school, as well as to young farmers and to adults who came to school on a part-time basis. In the 1960s, Congress initiated many educational programs, including Title I of the Elementary and Secondary Education Act, which provided funds for educating disadvantaged children. In the 1970s, federal vocational funds helped establish regional vocational centers in rural areas. Federal school-to-work funds in the 1990s encouraged school systems, including rural school systems, to better connect the school curriculum with the workplace. By the mid-1990s, the U.S. Department of Education operated more than 140 elementary and secondary assistance programs, of which twelve specifically targeted or included rural schools.

Passage of the Morrill Act in 1862 provided an opportunity for persons interested in agriculture and the mechanical arts to attend a land-grant college. In 1914 Congress passed the Smith-Lever Act, which created the Cooperative Agricultural Extension Service, arguably the agency that has provided more educational opportunities for rural adults than any other agency. The Cooperative Extension's 4-H youth program has also been a leading educator of young people in rural America. Like much of rural America itself, these traditional agricultural-focused agencies have been responding to the need to serve a broader constituency in rural areas, in addition to agriculture.

Rapid expansion of community colleges in the 1960s and 1970s greatly expanded higher education and adult education opportunities to many rural communities. These efforts expanded the informal adult education opportunities made available by organizations such as the National Grange, the National Farmers Union, the American Farm Bureau Federation, and the National Farmers Organization.

In addition to the U.S. Department of Agriculture, the Appalachian Regional Commission, the U.S. Department of Health and Human Services, the U.S. Department of Labor, the U.S. Department of Commerce, and a host of other federal agencies operate programs serving the educational needs of rural America.

HOBART L. HARMON

## INTERNATIONAL CONTEXT

Rural education is always considered in comparison to urban education. There are other dichotomies, including government versus private or mission schools; access to the first year of schooling for male versus female pupils; the standard of facilities and resources; the education and experience of teachers; and the quality of education offered and the language of instruction (the national language is often a foreign tongue to people in rural areas).

### The Challenges of Rural Education

When outside teachers who do not speak the local language staff rural schools, cultural conflict occurs. Often they feel superior to the local people and refuse to take the time to learn about the culture of their host community. Teachers posted to rural schools usually apply for transfers and if denied them simply "run away." Even when "at post," they often teach only a portion of their load, as they find excuses to leave—to collect their pay, to go to the health center, to attend funerals, and so on. Teacher absenteeism is a major problem in rural areas.

In the Majority World (or Third World, the South, where the majority of the peoples of the world live) there exists a range of possibilities that are encompassed by *rural*. Population densities vary but are usually small and scattered. The environment is also diverse, ranging from plains and deserts to mountain areas with deep valleys and flowing rivers, to places with small islands scattered across large areas of open sea. "Remote" and "isolated" are other categories of rural. Schools in rural areas tend to lack amenities. Electricity is either not available or limited. Where education systems rely on interactive radio and television to deliver primary school class-

es, the isolated schools are left out. Even if they have batteries for radios, the signal either does not reach them or is too weak to be understood. If the community must construct the classrooms and teachers' houses, they are often built out of local or temporary materials, which are perceived as inferior by outsiders. School supplies may never arrive, so teachers fall back on teaching from their kit from their training college days and rely more on rote learning.

Rural schools tend to harbor untrained or unqualified teachers. School inspectors do not like walking or riding in canoes for a number of days, so remote schools rarely get visited. Where population densities are small, rural schools tend to need only one or two teachers. This requires either staggered intakes—a class every two or three years—or multi-grade teaching (as in the old one-room, one-teacher schoolhouses in rural America that went from kindergarten to grade twelve, which are now museums as they have been replaced by busing and regional schools).

The solution to this problem in the Majority World has been boarding schools or primary schools with hostels for students from remote communities. Most secondary schools still rely on boarding students from far away.

Some countries, such as Jamaica, Papua New Guinea, and Tanzania, have experimented with "quotas" to control the transition from primary to secondary school so that a fair proportion of those pupils in rural schools are able to continue their education (or to ensure that females are represented at the next level). Selection systems employing quotas have lasted for only a few years because urban elites, who make the decisions, find rural children taking places in schools where their children might have gone.

Where rural schools are inferior in facilities and the quality of teachers (for example, the majority of South African farm schools, which enroll 40 percent of the primary pupils), the consequence is that students tend not to get selected for the next level of schooling. The examinations—the item banks written by educators who live in cities—contain clear urban biases and favor the progression of urban children. "First-past-the-post" examination systems in rural areas have tended to favor the children of outsiders (such as health professionals, police officers, extension officers, and teachers) over local children.

It has been found, when intelligence tests have been administered, that bright rural children do not

get admitted into secondary schools, whereas duller urban children do. This is because first-past-the-post selection systems based on formal primary-school-leaving examinations favor children from urban areas where there are better facilities, equipment, and teachers, and more diverse experiences. All of this contributes to the vicious cycle of rural poverty and neglect. The policy debates are never ending. Where successful, the best students who excel on examinations generally leave their communities, never to return. This results in a leadership vacuum in rural areas. Even youth who have been barred from further studies often migrate to gain experience or seek employment in unskilled jobs that are not available at home.

### Changing Strategies

Some policymakers believe that in order to keep young people in rural areas, rural education should be different from urban education. It is claimed that if schooling is more relevant to local conditions and designed to contribute to rural development, the youth may not want to migrate. They also assume, usually fallaciously, that teachers can become community development workers and assist in the transformation of rural areas. The change in name from primary to community schools, which has occurred in many countries, reflects this bias. Planners often ignore the aspirations that rural parents have for their children—to become educated, obtain a job in a city, and send remittances home to their aging parents.

Ways of adapting primary education to local conditions, while maintaining standards and permitting the quality of learning and supporting upward mobility for the brighter children, are being explored in many countries. An example is integrating school gardens with agricultural and nutrition education and school lunch programs. Another is new programs in minority education that address local needs without undermining quality or equality of opportunity.

Urban elites may clamor for “vocalization,” but for other people’s children, not their own. Generally there has been a rejection of vocalization of primary schooling. Rural education must not become “unequal” education. The conviction remains that primary schooling must be a firm foundation for further education, while being terminal for those who are unable to continue to the next level. This was the key message in the 1967 book *Ed-*

*ucation for Self-Reliance*, written by Julius Nyerere, president of Tanzania. The challenge of how to achieve both objectives at once continues to exist in the early twenty-first century.

The distribution of school supplies and materials remains a critical issue. Urban schools tend to get supplied first and rural and remote schools last. This syndrome is found in the delivery of most government services and prompted Richard Chambers, a leading rural sociologist, to call in 1997 for “the last first” as fundamental policy to support rural development. It is perhaps unlikely that central ministries of education, either nationally or in regions or districts, will provide isolated schools with computers, solar power, and communication dishes before they have provided the new panacea of information technology or e-learning to their urban schools. The gap between the poor and undereducated in rural areas and their urban counterparts is bound to increase.

Other strategies that have been employed with varying degrees of success include the Book Flood in Fiji, in which schools were given large numbers of storybooks, intended to attract students’ attention and to expose them to a wide variety of subjects. The Book Flood was endorsed by the World Bank and has spread to other countries (reading enhances learning, no matter what is read). Inducement allowances have been used to attract and hold qualified teachers in isolated schools. In some countries a “bridging” or extra year of schooling is provided to help children from remote communities catch up. Indonesia has relied on nonformal education centers. In New Zealand and Papua New Guinea vernacular preschools, where reading and writing is taught before grade one, has enhanced the capacity of rural pupils to comprehend formal schooling and to excel in school. In some places, particularly in Central and South America, missionaries run private schools that are of a better quality than those provided by the government. More than 160 countries are struggling with issues related to developing rural education. Rarely do the policymakers strive for a comparative perspective or try to learn from each other. Therefore the policies employed are very diverse.

## SANCHEZ, GEORGE I. (1906–1972)

Reformer and activist, George I. Sanchez is recognized for his contributions to educational equity, especially for Mexican-American children. Sanchez was born in Albuquerque, New Mexico, and attended schools in Arizona and New Mexico before graduation from high school in Albuquerque. He taught for eight years in rural schools while working on his bachelor's degree and taking weekend and summer courses at the University of New Mexico. After graduation Sanchez received a fellowship for graduate study from the General Education Board (GEB), a foundation funded by the Rockefellers, and the funding provided the means for him to receive his master's degree in education with specializations in educational psychology and Spanish, and his Ed.D. in educational administration from the University of California at Berkeley. His master's thesis concerned the inequity of using I.Q. tests developed for English-speaking children for evaluation of Spanish-speaking children.

### **Career**

The GEB provided the funding for his first position as director of the Division of Information and Statistics of the New Mexico State Department of Education (1931–1935). Sanchez's abilities were noticed by prestigious, national foundations. In 1935 the Julius Rosenwald Fund (founded by the owner of Sears Roebuck) asked Sanchez to conduct field studies concerning rural and Negro education in the south and in Mexico. The latter resulted in *Mexico: A Revolution by Education*, which remained the definitive source on education in Mexico for many years. Two years later Sanchez was invited to become a member

of the Venezuelan Ministry of Education and to be responsible for organizing a normal school for secondary teachers. After serving as director of the Instituto Pedagógica Nacional from 1937 to 1938, he returned to New Mexico and to the renewal of a battle over school finance reform. Prior to leaving for Venezuela, he had served as president of the teachers association in New Mexico. In that capacity, he led the fight for the equalization of school finance through legislation. Sanchez had been told that he would be offered a tenured position at the University of New Mexico on his return, but after the school finance controversy, his politically powerful opponents blocked his appointment.

From 1938 to 1940 he surveyed Taos County, New Mexico, for the Carnegie Foundation (a survey that resulted in Sanchez's book, *Forgotten People: A Study of New Mexicans*) and taught at the University of New Mexico. *Forgotten People* brought about a public awareness of the severity of inequities for the school children of New Mexico. Sanchez pointed out that two-thirds of the other states had higher literacy ranking compared with New Mexico, with an illiterate population of 13.3 percent. He emphasized the lack of literature in rural schools, the low enrollment of Spanish-speaking children, the low expenditures per pupil, and the highest infant mortality rates in "counties where more than half of the population is Spanish-speaking" (Sanchez 1940, p. 29).

Sanchez's most productive years as an activist with national influence began after he came to Austin, Texas, in 1940 as a tenured, full professor at the University of Texas. His outspoken political opinions and actions exasperated many members of various boards of regents, but he never allowed himself to be pressured into denying his principles. Sanchez

was hired as the first professor of Latin American studies and later served as chair of the History and Philosophy of Education Department.

In 1946 and 1947 Sanchez conducted a survey of Navajo education for the U.S. Department of the Interior. His findings, as presented in *The People: A Study of the Navajo*, pointed out the inequities of the education of Navajo children. Only about 25 percent of eligible children attended school, the schools were inadequate in materials and facilities, and most were located by traveling through roads that he described as gullies. He stated, "The Navajos are people—Americans worthy of a dignified, American way of life" (Mowry, p. 152).

After World War II Sanchez began a period of unceasing activism on behalf of equity for Mexican Americans, especially Mexican-American children in public education. In 1941 he was national president of the League of United Latin American Citizens (LULAC), and while he appreciated the contributions of LULAC, he saw a need for a more active approach to civil rights. The end of the war and return of veterans, the G.I. Bill, and Sanchez's foundation contacts all came together to assist him in his mission. Mexican-American men returned from World War II with a feeling that they should have equal rights in the country for which they risked their lives. Also, many had an opportunity for higher education not possible previously; many entered law school. Both undergraduates and law school students sought out Sanchez, and he later worked with them on court cases affecting the right of Mexican-American children to equity. His dedication to civil rights influenced many to become active in challenging discrimination in the courts. At this time Sanchez began to look for funding and court cases concerning equal rights. Throughout his career he was involved in causes that received support, moral and/or monetary, from Alianza Hispano-Americana, the American G.I. Forum, the American Council of Spanish-Speaking People, American Civil Liberties Union, the Marshall Trust, and the Mexican-American Legal Defense and Education Fund. During the 1950s Sanchez received funding from the Marshall Trust to found an organization to work for equity for Mexican Americans. This organization, the American Council of Spanish-Speaking People, funded several court cases and provided encouragement and support for Mexican-American concerns, especially in the area of education.

## Contribution

The University of California at Berkeley recognized Sanchez in 1984 with a retrospective honoring him as the leader in laws affecting Mexican Americans. He was involved as advisor, expert witness, or investigator concerning legal issues throughout his life, and two cases are considered to be landmark cases. In *Delgado v. Gracy* (1948), a case that resulted in an agreed judgment, Sanchez and Gustavo Garcia, an attorney, were specifically given credit by the Texas State Board of Education for the formal policy adopted by the state board to oppose segregation of Mexican-American children in schools because of their Spanish surnames. The Delgado case set a precedent—the legality of separating and treating Mexican-American children as a class apart had been successfully challenged.

The other case, *Hernandez v. Texas* (1954), was the first U.S. Supreme Court case concerning Mexican-American rights and was decided unanimously in favor of the plaintiffs. Although the appeals concerned equity in jury selection, the final ruling could be applied to public education. Again the concern had been the treatment of Mexican Americans as a class apart. Garcia and Carlos Cadena were the lead attorneys, and Cadena gave credit to Sanchez for developing the theoretical basis for the brief—Sanchez's class apart theory—that it was illegal to discriminate and segregate based on Spanish surname. In numerous other cases Sanchez was called as an expert witness because of his research and publications on the misuse of I.Q. tests to place Mexican-American children. Besides his expert testimony, Sanchez's major contributions to legal cases were the following: (1) to advise attorneys to use the precedent of the class apart theory; (2) always to ask for one dollar in damages because opponents will rarely appeal since it would open the case back up for damages; and (3) to sue the members of the state board of education in each case because they usually will make a deal in order to have their names dropped. None of the cases in which he was involved was appealed.

As an individual Sanchez was a man of many interests. *Arithmetic in Maya* was written by him. His papers at the Benson Latin American Collection at the University of Texas contain his drawings of a computer—an unknown device for most people—and he corresponded with Walt Disney about making educational movies.

Professionally, Sanchez wrote books on education in Mexico, higher education in Mexico, education in Venezuela, and the education of New Mexicans and Navajos, as well as many journal articles. For many years he was on the editorial board of the *Nation's Schools*. He also wrote several textbooks.

National recognition was widespread. Sanchez served in the following capacities: member of John F. Kennedy's Committee of Fifty on New Frontier Policy in the Americas; National Advisory Committee for the Peace Corps; Latin American Consultant to the U.S. Office of Civil Defense as well as to U.S. Office of Indian Affairs; U.S. Office of Education on Migrants; U.S. Office of Interior; and Navajo Tribal Council.

After Sanchez's death in 1972 schools were named for him in Texas and California, as well as a room in the U.S. Office of Education. On May 2, 1995, the University of Texas at Austin named the College of Education after him. In life he was considered an all too vocal radical by university presidents and regents; in death a new, more enlightened leadership recognized him as a pioneer reformer.

## SCHEDULING

In 1994 the National Education Commission on Time and Learning found the issue of how time is spent in schools to be a matter of urgency. Likewise, the National Education Association reported that "across the nation in schools and districts engaged in transforming schools into more effective learning communities, the issue that has emerged as the most intense and the one that universally dominates discussion is time" (p. 9). To spend the "time budget" more wisely, schools use a variety of scheduling arrangements. Discussed here are the various types of schedules that schools use to make optimum use of the school day.

### Historical Background of Scheduling

In the early nineteenth century, teachers typically had a limited education and were expected to function well in all subject areas. Staff at all levels taught any subject at any time of the day. In the late 1800s, the *Carnegie unit*—comprised of approximately fifty-minute class periods in which a single subject is taught, and for which teachers specialize in particular subject areas—became the most frequently used scheduling format. J. Lloyd Trump's *An Image of the Future*, published in 1958, caused schools to experiment with ungraded instruction, long periods of independent study, and large group instruction. The plan failed, however, partly due to the large amount of unstructured, independent study time for students.

Other scheduling experiments have also failed. In the 1970s, the notion that flexibility in scheduling is beneficial to staff and students led to the Open School concept. Divisions between classrooms in elementary schools were eliminated and students were able to progress at their own speed, moving from one grade area to another. During the 1960s and 1970s, some schools modified the traditional seven-period day, breaking the day up into twenty-minute *modules* and calling the plan *modular flexible scheduling*. Neither plan took hold.

In the 1970s, with flexibility continuing to be a priority, *fluid block scheduling* became popular and successful. This scheduling pattern allots a block of two to three hours to teams of teachers from various subject areas, allowing teachers to schedule instruction according to student needs. Another flexible scheduling alternative that began in the late 1980s and continues in popularity is the *zero period schedule*. Designated courses begin an hour earlier than the regular school day, allowing some students to leave an hour earlier or enroll in an extra class.

The 1989 publication of *Turning Points*, by the Carnegie Council on Adolescent Development, brought major changes for middle-level schools. Recognizing that junior high schools were simply mirror images of high schools, the council recommended that schools be reconfigured to fit the developmental needs of young adolescents. Thus, various forms of block scheduling and interdisciplinary teaming took hold in middle schools, and later in high schools as well. With *block scheduling*, teachers are given longer periods of time—usually ninety minutes—to work with students. *Interdisciplinary teaming* is a popular arrangement where a group of teachers (usually four or five) works with 125 to 150 students, essentially creating a school within a school. Interdisciplinary units of study help students' understand the connections between subjects. Teaming is sometimes combined with block scheduling.

Throughout the history of school scheduling, the need for flexibility and the need for teachers to work cooperatively for the benefit of students are recurring themes. These themes impact educators' scheduling choices.

### Selecting a Schedule

Selecting an appropriate school schedule involves some fundamental assessments, including examining what teachers are doing and determining if classroom instruction is improving student achievement. When teachers make instruction optimally effective for students, it is appropriate to consider how use of time could further enhance learning—the schedule must support, not drive, the instructional program. As teachers become more innovative and experimental in their classroom activities, they adopt flexible and cooperative approaches that demand new organizational arrangements.

What students need is another consideration when choosing a schedule. For example, elementary

and middle school students are restless, have short attention spans, and require frequent physical movement, and frequently changing settings allows for such movement. Elementary students need close relationships with adults, and thus need to remain in the care of one teacher, not five or six, during a school day. High school students need opportunities to explore more specialized areas of interest, and thus require a wide variety of courses from which to choose.

Other considerations can impact scheduling. Whether or not to group students by their ability levels is an issue on which parents and teachers do not always agree. If improving student behavior is a priority, reducing the number of times students change classes and interact in the halls is considered. Teachers' preferences for teaching assignments and planning periods, assigning enough lunch periods to accommodate students, arranging for televised classes, including courses that are popular (or eliminating outdated ones), and parents' attitudes about courses all impact scheduling decisions.

### Scheduling Models

Scheduling models are generally described in terms of the amount of time students spend in a specified classroom. The most frequently used scheduling models are (a) the traditional, self-contained classroom, (b) forty-five to fifty-minute class periods, (c) a variety of configurations of block scheduling, and (d) teaming.

**Self-contained classrooms.** Typically seen in elementary schools, self-contained classrooms are settings where a single teacher is in charge of instructing twenty to thirty students for the major portion of the day. The advantages of self-contained classrooms include strong student-teacher and student-to-student relationships; flexibility in time spent on subject areas; and buildings designed for self-contained classes. The cost of this arrangement is in the loss of high-quality instruction for some subject areas, and possibly in all subjects, if the teacher is not a master of instruction and discipline.

**Forty-five to fifty-minute class periods.** The traditional high school and middle school schedule, shown in Figure 1, is of fixed length and classes meet the same hour each day. Benefits include daily drill and practice for such subjects as mathematics; students miss only one period in each subject when they are absent; and schools are likely to be similar when

FIGURE 1

**Traditional seven-period day schedule for seventh and eighth grades**

Period	Math		Science		English		Social Studies		Reading			Electives		
	7th Jones	8th Smith	7th Joe	8th Mims	7th Toms	8th Abbott	7th Sole	8th Hughes	Dunbar	Tool	Typing	Art/Life Skills	P.E./Athletics

students transfer from one to another. The disadvantages are that periods are too short for extended teaching activities such as science labs; there is not enough time to form quality relationships; discipline problems occur during the frequent passing periods; teachers teach 150 or more students each day; and the class period, not the instruction, determines activity length.

**Block scheduling.** Of the many configurations possible under the umbrella of *block scheduling*, the *alternate day block schedule*—sometimes termed the *A/B block*—is the most popular (see Figure 2). Classes meet each day for ninety minutes. Four classes meet on A days, and four meet on B days, with days of the week alternating as A or B. Several combinations of forty-minute and longer periods are possible. For example, with the *fluid block schedule* three periods a day are ninety minutes in length and two are forty minutes long, allowing for such subjects as

mathematics to meet daily, while giving subjects such as science longer periods.

Some other forms of block scheduling are available but infrequently used. The *semester block schedule* allows students to attend just four classes for ninety minutes each day for an entire semester. The following semester students enroll in another four classes. The *75-30-75 plan*, proposed by Robert Canady and Michael Rettig, divides the school year into three blocks of time: two seventy-five-day terms and a thirty-day term. During each seventy-five-day term, the school day includes three 112-minute block classes and one forty-eight-minute period. The thirty-day term offers students the opportunity to study one core course intensively. The *trimester plan* divides the school year into three, rather than two, semesters, and combinations of forty-five-minute and ninety-minute periods are possible. A drawback to all such variations is coordination of schedules for transfer students.

FIGURE 2

Alternate (A/B) day block schedule					
	A Day	B Day	A Day	B Day	A Day
8:30-10:00	Period 1	Period 5	Period 1	Period 5	Period 1
10:10-11:40	Period 2	Period 6	Period 2	Period 6	Period 2
11:40-12:20	Lunch				
12:20-1:50	Period 3	Period 7	Period 3	Period 7	Period 3
2:00-3:30	Period 4	Period 8	Period 4	Period 8	Period 4

All periods are 90 minutes.

SOURCE: Schroth, Gwen. 1997. *Fundamentals of School Scheduling*. Lanham, MD: Scarecrow. Page 83. Reprinted with permission.

Canady and Rettig designed the *parallel block schedule* for elementary and middle schools. To reduce class size for key subjects such as reading and mathematics, small groups are rotated out for special education and talented and gifted classes, as well as for computer labs. Advantages of all types of block scheduling arrangements are:

- The number of subjects students take yearly is increased
- Time is available for developing more meaningful relationships
- Daily homework is assigned for half as many classes
- Passing periods are reduced, which may decrease discipline problems
- Teachers have fewer students to instruct in one day
- Opportunities are available for instructional creativity and in-depth learning

Some disadvantages are:

- Some subjects require daily drill and practice
- New instructional methods are necessary to make full use of longer periods
- Staff, central office, parent, and community support must be sought
- An increased staff is necessary and costly

**Teaming.** For years, elementary school teachers have acknowledged the value of integrating instruction to blur the lines between subject areas and stress the links between fields of knowledge. A shift toward a more student-centered approach to educating middle school students became more prevalent with the publication of *Turning Points* in 1989. Consequently, interdisciplinary teams are formed and provide continuity for group membership and instruction, similar to what exists at the elementary level. When teaming, two or more teachers of two or more subjects share a common group of students. Students can be grouped and regrouped during the shared time period, depending on the activity. Interdisciplinary teaming requires more complex configurations because instruction is coordinated across subjects to offer a less fragmented and more relevant curriculum. Thematic units of instruction are the usual planning tools. The *flexibly blocked team*, sometimes termed the *team block schedule*, incorporates not only the sharing of a common set of students and the opportunity for a coordinated curriculum, but also the flexibility of long class periods, which provide optimum use of the instructional time. Advantages to teaming are:

- Teachers get to know students personally
- Studies report improvement in thinking and learning skills
- Stable friendships can develop
- Class time can be used flexibly
- Changes within the team do not interfere with other teams' plans, such as a scheduled field trip
- The team collectively assumes responsibility for each student's learning and meets with parents as a group

The disadvantages are:

- Ability grouping is more difficult
- Interpersonal problems are intensified
- An adjustment period is required for teachers
- Staff training on integrated instruction is necessary
- Support from central administration, parents, and community must be obtained
- Buildings are not designed for division of classrooms according to teams.

### Staff Development

All types of schedules require staff training. For example, teachers need to be able to teach to a variety

of learning styles, teach higher-order thinking skills, use problem-solving techniques, and use technology in the classroom. In order to vary instruction during the longer block-scheduled class periods, teachers should additionally be trained to move beyond lecture, drill, and practice and include cooperative learning, learning centers, inductive learning, the use of manipulatives, and student-conducted experiments. When teamed, teachers should understand interdisciplinary instruction and be able to address issues that arise when a small group of students and teachers interact intensely with one another. Training can include team building and teaching, consensus building, conflict resolution techniques, and interdisciplinary instruction.

Whatever the scheduling model, finding a schedule that works best for teachers and students while satisfying community needs is important. If instruction and student achievement drive choices, such satisfaction is more likely to be achieved.

## SCHOOL-BASED DECISION-MAKING

---

Since the release in 1983 of the National Commission on Excellence in Education report *A Nation at Risk*, there has been widespread call for education reform. The reform efforts of the 1980s and 1990s focused on organizational, curricular, and instructional changes necessary to improve the quality of education. Almost without exception, national reform reports advocated decentralization and enhanced teacher involvement in decision-making as a means of fostering necessary changes within school.

*School-based decision-making* is a concept based on the fundamental principle that individuals who

are affected by the decision, possess expertise regarding the decision, and are responsible for implementing the decision, should be involved in making the decision. This concept often is attached to the broader school-system reform efforts of decentralization and school-based management (SBM), where decision-making authority is shifted from the district to the local school level. Some educators use the terms *shared decision-making* and *school-based management* interchangeably; others see shared decision-making as a component of SBM or decentralization. In general, the goal of school-based decision-making is to “empower school staff by providing authority, flexibility, and resources to solve the educational problems particular to their schools” (David, p. 52).

### Key Elements

School-based decision-making rests on two well-established propositions:

1. The school is the primary decision-making unit; and its corollary; decisions should be made at the lowest possible level.
2. Change requires ownership that comes from the opportunity to participate in defining change and the flexibility to adapt it to individual circumstances; the corollary is that change does not result from externally imposed procedures. (David, p. 46)

These propositions recognize that those closest to the technical core in education systems, because of their access to information concerning students’ diverse characteristics, needs, learning styles, and performance levels, are better positioned to make decisions about educational programs than those farther removed from the teaching and learning process. Thus, decisions concerning curricula, instructional technologies, and other school initiatives will be most effective and enduring when carried out by those who feel a sense of ownership and responsibility for those decisions.

For school-based decision-making to work, four key resources need to be present to develop the capacity to create high performance organizations:

1. *Knowledge and skills* in new instructional strategies; interpersonal, problem-solving, and decision skills for working together as a team; business knowledge for managing the organization, including budgeting and fiscal planning; and assessment strategies for

analyzing, interpreting, and acting on school performance data.

2. *Information* about the performance of the organization, including student performance data, budgets, and demographic-trend data.
3. *Power and authority* to make decisions, especially in the areas of curriculum and instruction, staffing and personnel, and resource allocation and budgeting.
4. *Rewards* for high performance, including intrinsic and extrinsic rewards, such as salary adjustments, professional development opportunities, performance-based pay, group or team-based rewards, and public recognition for their accomplishments.

### Scope of Decision-Making

In general, three areas of decision-making can be school based: budget, personnel, and curriculum. Regarding school finances, under school-based decision-making models, schools receive either a lump-sum budget or some portion of the district budget from which they may make decisions regarding personnel, equipment, materials, supplies, and professional development. Although budget authority implies a new level of autonomy, because personnel expenditures account for approximately 85 percent of the district budget and other fixed costs cover an additional 5 to 10 percent, few discretionary dollars actually remain for school-level allocation. Therefore, staffing expenditures and decisions regarding staffing structures and assignments are key to schools making decisions that might substantively affect the school’s operation and effectiveness.

In terms of personnel decisions, schools are afforded flexibility and the power to determine how best to staff their schools. Personnel decisions typically fall in two areas: determining staffing needs based on the school’s mission and educational plan and selecting people to fill the positions. Schools are afforded the latitude to decide whether their personnel funds are best spent on teachers, instructional aides, specialists, or clerical support. Once determinations are made regarding staffing needs, schools are actively engaged in the selection of new school personnel.

In the third decision area, decisions regarding the curriculum and instructional strategies are determined at the school level within a framework of district or state goals, while attending to the school’s

unique mission and needs. School-level personnel draw on their professional expertise and localized knowledge in making decisions that affect the school's educational program and instructional system. School personnel monitor the effectiveness of their programs and their students' academic performance. Decisions pertaining to budgeting, staffing, and the instructional program are often restricted and controlled, however, by district policies regarding matters such as class size, tenure, hiring, firing, assignment, curriculum initiatives, textbooks, and assessment procedures.

### **Decision-Making Structures**

To operationalize school-based decision-making, structures at the school level need to be implemented to facilitate the involvement of key stakeholders in the decision-making process. Schools embracing shared decision-making typically develop councils consisting of representative stakeholders in the school, such as teachers, parents, support personnel, and administrators. The school's governance structure is supported by guidelines that specify representation, terms of membership, council size, meeting format, and delineated lines of authority. Frequently, site councils further disperse involvement through the use of subcommittees. Subcommittees allow greater numbers of teachers to participate in the formal decision-making process and reduce the overall burden of extended involvement of others.

In addition to decision-making governance councils, schools that embrace shared decision-making understand that reaching collective agreement and consensus around difficult decisions require extended discussions, off-site meetings, and collective planning. Thus, schools that engage in shared decision-making at an authentic level set aside time for teachers to meet and places for them to congregate and talk. In addition, school schedules are often redesigned to facilitate teacher interaction by structuring common planning periods.

### **Effectiveness of School-Based Decision-Making**

Although school-based decision-making is often the centerpiece of school reform, there remains little empirical evidence that relates it to improved school performance. Most of the evidence of effectiveness of decision involvement at the school level focuses on teachers and administrators. Studies exploring organizational variables have generally found positive relationships between decision involvement and

organizational outcomes, such as organizational commitment, job satisfaction, and organizational change. In addition, studies have found that participation enhances communication among teachers and administrators, contributes to the quality of teachers' work lives, and assists in professionalizing teaching and democratizing schools. Other research on school-based decision-making has generally been descriptive, and yet a substantive body of research has not yet explored causative relationships between school empowerment and school improvement or student achievement. Nonetheless, the combined effects related to participative structures that are democratic and collaborative and focus mainly on issues of curriculum and instruction are likely to bring about change at the classroom level.

### **Issues and Controversies**

The successful implementation of school-based decision-making is affected by a number of organizational factors and institutional constraints, including (1) clarity of purpose and access to information; (2) power and authority relationships; (3) administrative support and the changing role of central office personnel; and (4) policies at the district, state, and federal levels. These issues taken singularly or collectively affect the long-term effectiveness of decentralizing decision-making at the school level.

**Clarity of purpose and access to information.** Schools that are active in decision-making have a vision statement that focuses their decision-making process on the technical core of schooling—teaching and learning. Determining the school's vision is a schoolwide effort affording the faculty the opportunity to understand the power of their commitment to decisions they make. Those involved in decision-making understand the necessity of using school-based and student-centered data to inform their decisions. In districts where data are limited or not disaggregated at the school level, the decision-making process is limited and curtailed to issues that hold less promise of impact on the school's educational program.

**Power and authority relationships.** Frequently, when decision-making authority is delegated, the degree of authority given to the site is often limited and ambiguous. In schools where there is confusion over decision-making authority, issues addressed at the school level tend to focus on secondary-level issues, such as school climate, scheduling, safety, and parent involvement, rather than on primary con-

cerns, such as instructional programs and strategies, student achievement, and school performance. In order to focus on the primary issues affecting school success, decision-making authority in the areas of curriculum, staffing, and budgeting must be real and authentic.

**Administrative support and the role of central office personnel.** District-level support of school-based decision-making is critical to its success. Superintendents play instrumental roles in moving central offices from a directive function toward a service orientation and resource support network. This shift in roles from a bureaucratic orientation to a service organization is often difficult and misunderstood by those occupying various roles in the district office and in the schools.

**Policies at the district, state, and federal levels.** In a similar manner, decision-making latitude is often restricted at the school level by various state and federal policies or mandates. Under school-based decision-making, schools are encouraged to make decisions regarding the curriculum and supporting instructional strategies. These decisions should be made within a framework of district goals or the core curriculum required by the district or state. Yet schools are often limited by state mandates affecting their educational programs and are similarly restricted by compliance requirements related to federally funded programs within their school or district. Thus, these competing and often contradictory policies constrain school-based decision-making.

### Conclusion

School-based decision-making provides a framework for drawing on the expertise of individuals who are interested in and knowledgeable about matters that affect the successful performance of students. This process depends heavily on the district's leadership to define the parameters of decision-making, to define overarching goals, and to provide the information and professional development necessary to make effective, long-lasting decisions.

## RELATION OF SCHOOL BOARD TO THE SUPERINTENDENT

Thomas E. Glass

**CONTROL OF THE SCHOOLS**

American public education is uniquely structured: Unlike most other nations that tend to have highly centralized national systems of education, the locus of educational decision-making in the United States has traditionally been local. Some 14,000 local school districts in fifty diverse state systems have had delegated to them much of the operational responsibility for public education. Legally, education is a responsibility of the states, which have historically given local districts broad discretionary latitude to operate their systems. The federal government, until the last decade or so of the twentieth century, has had little overt control over education, but has always had considerable influence as national programs have multiplied through the years.

Beginning in the 1990s, and to some extent before then, these traditional roles of the federal, state, and local governments have been changing. As in so many other policy areas of the American polity, the focus of decision-making in education is shifting from the local to the higher levels of government. Increasingly, educational problems are being discussed and resolved in state capitols and Washington, D.C. Citizens have recognized that the problems confronting the public schools cannot be detached from society's broader social, economic, and political concerns. There has been widespread concomitant acknowledgment that local property taxes cannot be the major source of support for schools and that local boards of education will be compelled to rely increasingly on state and federal governments for fiscal assistance. Thus, issues like inequities in school finance, racial and ethnic disparities in student achievement, the relationship of schools to economic growth and development, and related education problems require attention at the state and national levels.

Although many important issues are now debated and acted upon in state capitols and in Washington, D.C., it would be a mistake to underestimate the continuing influence of local school boards. School boards retain important powers that often are overlooked by education reformers who frequently ignore the district level—a vital, strategic cornerstone of the education governance structure.

Rightly or wrongly, local boards and the administrative staffs whom they employ are often regarded by reformers as part of the problem and not the solution to the complex issues confronting American education. As a result, local school boards and superintendents frequently have been unengaged in the ongoing education reform debate.

Indeed, other than a few studies, the relative strengths and weaknesses of the local governance structure have been remarkably ignored during a period of unprecedented public ferment and national interest in public education. But the school board, a unique grass roots representative institution with 97,000 individuals serving as members in approximately 14,000 local districts, persists as a crucial governance linchpin between the school and state levels.

Local school boards and the superintendents whom they employ do not necessarily have to be proactive, progressive, or creative to influence educational policy in very significant ways. Reformers must recognize that many boards and district administrators also influence and shape policy through their inaction. Indeed, as public polls reflect, in many school systems board members and administrators may be accurately reflecting and translating local values and goals in behaving in ways that do not aggressively push for education reform. In other words, in many communities there is basic acceptance of the status quo in schools; reformers, if they are to be successful in their laudable efforts to institutionalize change in the system, must be sensitive to the importance of such local values and goals. Critics will likely have to work with school boards as they appear to be permanent institutions and will continue in exercise considerable direct and indirect influence over the nation's decentralized and diffused educational system.

Local boards have enormous influence because they have the power to hire and fire the superintendent of schools, and have ultimate budgetary responsibilities and set the policy parameters for the district. Board members set the tone with regard to relationships with teachers, parents, and administrators as well as the community at large. If, for example, decentralization or restructuring (however defined) is to have any meaning, local school boards must support and perhaps prod their superintendents into delegating meaningful personnel and budgetary prerogatives to the building level.

Although it is extremely unlikely that the United States would create a fragmented governance struc-

ture with 14,000 local units if it could build the system de novo, the local board evidently appears to be too much a part of the fundamental political and educational tradition and culture to be structurally tampered with despite widespread apprehensions in the early twenty-first century about the effectiveness of schools and the pervasive and all too often justified criticism of school boards.

Education reformers can work more effectively within the existing structure to implement changes with the support of influential local officials; for example, district officials in their strategic position between state and building levels could serve as brokers or mediators. There are, for example, some definite contradictions between the “restructuring” movement with its emphasis on the importance of building level autonomy and the top-down regulatory nature of many late-twentieth-century state enactments that often have generated a numbing standardization in the educational process. Local boards and superintendents could be well-positioned intermediaries in efforts to reconcile these basic contradictions between top-down state regulations and bottom-up building level initiatives. Other steps could be taken to propel local boards more directly into the forefront of public discourse about education reform designed to increase student achievement. There is widespread civic ignorance about the roles and responsibilities of local boards and their strategic position in the education governance structure. Indeed, many of the new architects of educational policy from the political and business worlds could be given basic grounding in the rudiments of how schools are governed and organized.

More public attention should be focused upon issues such as the rapid turnover of local board members, the abysmally low voter turnout in local board elections, and the serious managerial, policy-setting, and operational problems that confront many local school officials. Educational reformers and the public at large must pay more attention to strengthening a vital institution that will continue to play an important role in shaping the nation’s education future.

### RELATION OF SCHOOL BOARD TO THE COMMUNITY

American public schools are still primarily controlled by local school boards. There are fewer boards than in the past: In the early twenty-first century, 14,000 local school boards govern more than 90,000 schools; in the 1920s, there were 130,000 school boards. Although four out of five school boards are responsible for fewer than 3,000 students, the average size of each board has grown over the years. About a third of all boards are located in five states: California, Texas, Illinois, Nebraska, and New York. While 95 percent of the school boards are popularly elected, school boards in Chicago, Cleveland, Philadelphia, Boston, and several other cities are appointed by the mayor.

#### Characteristics of School Boards

Autonomous school board control can be justified by several widely held views in the literature. First, the school board as an autonomous institution is embedded in strongly held public beliefs in demo-

cratic, nonpartisan control over public education. The public has traditionally equated local control with districtwide board authority in the constitutional-legal framework of educational governance. In contrasting private and public schools, John Chubb and Terry Moe characterized public school governance as “direct democratic control” (p. 2).

From an economic perspective, the presence of multiple school board systems resembles a quasi-market arrangement that can be cost-efficient to the consumers. States and localities with multiple suppliers of services promise a better fit between consumer-taxpayers’ preferences and the level and quality of local services. As Charles Tiebout’s (1956) classic work suggested, taxpayers make residential decisions that would maximize the benefits they expect to obtain from public services and minimize the level of taxes that they have to pay for those services. In particular, middle-class taxpayers who can afford to spend more on goods and services are keenly concerned about the quality of basic services, such as schools. As Albert Hirschman (1970) argued, they are more ready to exit when they perceive a decline in those municipal services that they value. Studies of district-level performance in metropolitan areas suggest that interdistrict competition can improve service quality. The out-migration of middle-class families to suburban school districts seems to provide the empirical support for this line of argument. Recent establishment of quasi-public boards that oversee charter schools also shows the increasing popularity of parental choice when the neighborhood schools are failing.

Yet a third view is based on functional consideration. Thomas Shannon, former executive director of the National School Boards Association, has argued that school boards serve several indispensable functions for the common good. They develop strategic plans, manage the operation of the system, comply with federal and state laws, evaluate educational programs, arbitrate complaints from citizens and employees, and represent the collective interests of the entire district. The boards also negotiate contracts with teachers unions and serve as managerial buffers between individual schools and state and federal agencies. In other words, local school boards make a “non-nationalized” educational system functional.

### Performance-Based Accountability

As the public increases its demands for performance-based accountability in public schools, the quality of school board governance is called into question. *Facing the Challenge: The Report of the Twentieth Century Fund Task Force on School Governance* by the Twentieth Century Fund observed in 1992 that school boards “are facing a serious crisis of legitimacy and relevance” (p. 1). According to a 1988 to 1990 survey by Jacqueline Danzberger and colleagues of school board members in 128 districts in 16 states, even school board members perceived themselves as least effective in “the core elements of governance—leadership, planning and goal setting, involving parents and the community, influence on others, policy oversight, board operations, and board development” (p. 56). For example, the survey showed that boards used inconsistent performance measures to evaluate their superintendents. Further, due to the Progressive tradition of taking politics out of schools, school boards are largely isolated from other lateral institutions (e.g., housing and health care agencies) that affect the well-being of children.

The decline in public confidence over school board leadership seems salient in urban districts. Based on a 1998 survey, the National School Boards Foundation found that “[t]here is a consistent, significant difference in perception between urban school board members and the urban public on a number of key issues” (p. 12). Although 67 percent of the urban board members rated schools in A and B categories, only 49 percent of the urban public did. Whereas three out of four board members rated the teachers as excellent and good, only 54 percent of the public agreed. The public seemed half as likely as the board members to agree that the schools were “doing a good job” in the following areas: preparing students for college, keeping violence and drugs out of schools, maintaining discipline among students, and teaching children who do not speak English. Subsequently, the National School Boards Foundation called upon urban leaders to sharpen the focus on student performance.

In light of these concerns, several reforms have been tried to improve accountability. One reform aims at promoting a sense of “ownership” among parents at the school site. While New York City and numerous urban districts experimented with some form of site-based governance in the 1960s, the most extensive decentralization occurred in Chicago when

1988 state legislation created local school councils in all the public schools in the city. Between 1989 and 1995, each of the 550 Chicago schools was primarily governed by an elected, parent-dominated local school council, whose authority included the selection of principal and the use of a substantial discretionary fund. However, community support for the local school council gradually declined. From 1989 to 1993, turnout among parents and community residents plunged by 68 percent, and fewer candidates signed up for local school council offices. As the reforms of the local school councils failed to turn around low performing schools, the legislature enacted another reform that enabled mayoral control over schools in 1995.

### Race and School Boards

A second type of reform is associated with racial succession in school boards. Many analysts observe that the predominantly white power structure seems less ready to respond to the minority and low-income constituency in urban schools. According to this view, a shift in racial control over governmental institutions would improve school quality and promote student performance. However, this conventional expectation is not empirically supported by a study in 2000 by Jeffrey Henig and colleagues of school reform in four African-American-led cities, namely Atlanta, Georgia; Baltimore, Maryland; Detroit, Michigan; and the District of Columbia. None of the cities were able to produce any measurable educational progress for minority students. The authors found that “racialized politics” has contributed to governance ineffectiveness in both direct and indirect ways. Particularly important is the intensity to which local stakeholders are affected by “fears, suspicions, expectations, loyalties, tactics, and habits related to race” (p. 7). Multiple facets of racialized politics are illuminated by the authors’ careful analysis of interviews with hundreds of actors both outside and inside the formal governmental institutions, including generally influential people (e.g., city council members and business leaders), community advocates, and education specialists.

The four cities provide ample evidence on how racial concerns have constrained the collective behaviors of both black and white elites. For example, African-American community activists are reluctant to criticize African-American city officials because they want to preserve the reputation of black institutions in general. Likewise, white business elites tend

to refrain from criticizing African-American-controlled school systems for fear that their actions are seen in racial terms. In other words, race “complicates” coalition building because it “continues to affect perceptions, calculations, loyalties, and concerns in ways that tug at the thread of collaboration and erode civic capacity to undertake meaningful and sustained reform” (p. 212). Interracial trust and confidence become so limited that civic capacity lacks a solid foundation.

### Integrated Governance

The third strand of reform is “integrated governance,” where there is an integration of political accountability and educational performance standards at the systemwide level. In numerous urban districts, the mayor takes control over schools with an appointed school board and superintendent (for example, Chicago began such a system in 1995). In this regard, mayoral leadership in education occurs in a policy context where years of decentralized reform alone have not produced systemwide improvement in student performance in big city schools. Reform advocates who pushed for site-based strategies may have overestimated the capacity of the school community to raise academic standards. Decentralized reforms are directed at reallocating power between the systemwide authority and the schools within the public school system. However, decentralized initiatives often fail to take into full consideration powerful quasi-formal actors, such as the teacher union and other organized interests. Decisions made at the school site are constrained by collective bargaining agreements. In addition, decentralization may widen the resource gap between schools that have access to external capital (such as parental organizational skills and grants from foundations) and those that receive limited support from nongovernmental sources. In response to these concerns, “integrated governance” enables the mayor to rely on systemwide standards to hold schools and students accountable for their performance. Failing schools and students are subject to sanctions while they are given additional support.

### Measuring Performance

Efforts to improve school board accountability also present a challenge for developing a framework to measure performance of the school boards. Although student performance serves as a useful indicator of the overall performance of a school system,

its aggregated character falls short of specifying the link between the functions of the school boards and school performance. In other words, there is a need to develop indicators of institutional effectiveness to assess the school boards. Toward this goal, Kenneth Wong and Mark Moulton attempted in 1998 to develop an institutional "report card" on various state and local actors, including the school board. Using survey responses from members of the broad policy community in Illinois, Wong and Moulton found that the school board and the central administration in Chicago have significantly improved their institutional rating following mayoral control.

In short, school boards are in transition. While many communities maintain the tradition of non-partisan, popularly elected school boards, urban districts that are perceived as low performing are likely to attempt alternative governance. In the early twenty-first century, a greater number of urban school boards are likely to be appointed by mayors and/or challenged by charter schools. Thus, school boards, regardless of their student enrollment and region, will be driven by public concerns over accountability.

#### RELATION OF SCHOOL BOARD TO THE SUPERINTENDENT

By providing a free public education for rich and poor, local school boards have nurtured and protected American democracy for more than a century. This American institution anchors a local governance model that is unique among the national systems of education throughout the world.

The organization of school districts and school boards has changed little in one hundred years. The

new millennium finds about 14,320 school districts predominantly governed by elected layperson boards of five or seven members. The average school district enrolls 2,200 students and is located in a nonurban setting. Although the majority of Americans live in cities and suburbs, the majority of school districts are located in small towns and rural areas. There are nearly 80,000 school board members but only several hundred urban board members guide policy and management for half the nations' school children. Each decade a higher percentage of children attend schools in suburbs and the cities.

### **School Board Members**

Unfortunately, there is little available data describing demographics and characteristics of local school board members. It can be reasonably assumed from scattered data that about 60 percent of board members are men with a college education who work in white-collar positions. The number of women and minority board members appears to be increasing. It also seems that a minority of board members are parents of school-age children.

The role of local boards is characterized in the literature as the means by which community members can participate in setting educational policies affecting their children and the spending of local tax dollars. The local school board member role involves seeking out the opinions of the community and representing their educational interests through formulation of policy.

### **School Board Service**

Most members serve without pay in positions that require countless hours per week of listening to citizens, reading, and attending meetings. Until the 1960s, most authorities described a typical board members' motivation for serving as filling a community obligation. Boards were comprised of "main street" businessmen, professionals, and occasionally retired school administrators. These boards usually functioned without partisan politics, and seldom did members focus on single or controversial personal agendas.

Many boards in the early twenty-first century are comprised of members who are elected to represent specific interest groups, such as teachers or taxpayer groups. Or, they serve on the board with a single agenda interest, such as special education, bilingual education, school prayer, fixing a school program, or firing a coach or superintendent. Most

authorities agree school boards are considerably more politicized than in the past. Board members with political agendas sincerely believe their actions serve the schools and the public interest.

### **The Superintendent**

The most important action a school board takes is the selection of a superintendent. For the average school district this happens every six or seven years. For districts mired in conflict it might occur every two or three years. Superintendent tenure data suggests that districts with stable boards and communities tend to attract higher quality superintendents and keep them longer. Since a school district is almost a perfect reflection of its community, it is not surprising to find turmoil-ridden boards in communities beset by contentious issues, such as poverty, high unemployment, illiteracy, and racial tension.

The impression, established by media and journal articles, is that constant turmoil and struggle between boards and superintendents exist in all districts. Fewer than 1 percent of superintendents are terminated each year. A larger number, however, move on to other districts after acrimonious relations with the board or certain board members. The American Association of School Administrators study conducted every ten years gives a more realistic picture of the state of school board and superintendent relations. For decades superintendents have reported their annual evaluations given by boards to be "excellent" or "good." In about fifteen percent of the districts reported, however, the superintendent's evaluation does signal a problem in board relations.

The root of many conflicts between boards and superintendents is a "zone of acceptance." This is the zone in which the superintendent may operate and make decisions. Most boards directly and indirectly create the parameters of the zone. Often individual board members try to add to or delete from the actions a superintendent has been led to believe are in the zone. The result is conflict with the board or individual board members. In turn, superintendents generally create "zones of acceptance" within which other district administrators work. When the superintendent's "zone" is altered, sometimes the entire administrative structure of the district is changed.

### **Boards and Superintendents: The Working Relationship**

The relationship between board and superintendent begins prior to hiring. The superintendent search

process for most districts is intensive and includes several visits to the district by each finalist. During these one- or two-day interviews, board members form an initial relationship with the future superintendent. This is probably not true if in-house candidates are being considered. Often one or more board members are not enthusiastic about a candidate later selected by the board majority. This may create a situation where the new superintendent must quickly “prove” himself or herself to the board member(s).

In many districts after initial hiring the superintendent enjoys a “honeymoon” period with the board. This is seldom more than six-months in duration, or until a serious problem arises with the superintendent’s position or an action is opposed by one or more board members. During these first few months the superintendent and board are becoming acquainted with each others’ views about district operations. This is a critical time for board and superintendent to establish parameters of decision-making. Perceptive boards set limits within which the superintendent may make unilateral decisions. The types of decisions that can be made by the board and those that are the responsibility of the superintendent should be clearly understood and respected by each party. By doing this many potential conflicts can be avoided between boards and superintendents. Well-functioning boards appear to have clear role definitions for the superintendent and themselves.

### **Communication**

Communication is the critical element of superintendent and board relations. Many superintendents spend very little time in direct communication with board members. Several national superintendent studies claim the average superintendent spends less than three hours per week in talking or meeting with board members. Not included in direct communication are written memos and letters from the superintendent to the board. Most likely a sizable percentage of the time superintendents do spend in board communication is with the board president.

A 2000 study of 175 of the nation’s leading superintendents showed this group spent three times more effort in direct communication with board members. It was not uncommon for these superintendents to spend more than a full work day each week in talking with board members.

The lack of time spent with board members by some superintendents can be explained by a long-

held negative view of boards and board members. Often educators view boards as “outsiders” possessing power to make unwise or arbitrary decisions affecting schools, students, and staff. Collective bargaining often hardens negative opinion about boards in the eyes of district staff.

An important piece of written communication is the “board package.” In nearly every school district, prior to board meetings, a loose-leaf binder that contains information about each meeting agenda item is distributed by the superintendent’s office. This board package can be voluminous, taking several hours of study time for board members. The content of the board package often serves to initiate communication between board members and the superintendent. A few superintendents take the initiative and personally call board members to ask if they have questions or concerns about the meeting agenda and the information included in the board package. Others wait for board members to call. The flow and type of superintendent and board communication varies from district to district, and is certainly being modified by the use of e-mail.

Some boards desire that the superintendent directly communicate with the board president (or chair), leaving to that board member the responsibility to inform other members. Most boards, however, wish to give each member the opportunity to directly communicate with the superintendent.

Communication problems arise when board members initiate communication directly with principals and staff without giving the superintendent prior notification. Some board members will go so far as to directly, or by insinuation, instruct a principal or staff member. This undercuts the superintendent’s authority and creates confusion in the district. Teachers and administrators often interpret intrusion by board members to mean the superintendent lacks authority. The superintendent and other board members may take offense, and the result may be a severe strain on board and superintendent relations.

School problems of board members’ children are sometimes a source of conflict between superintendents and individual board members. These personal conflicts can permanently damage working relationships. Despite restrictions on nepotism, in some states, board members have spouses or relatives working in the district. This can be the source of another serious personal conflict between the superintendent and board members. Lastly, some

board members may possess direct or indirect business links with district vendors or competing vendors. Board business interests can create conflict with the superintendent and a legal problem for district.

Perhaps the most often encountered superintendent and board conflict area is the "special" interest of board members. Frequently, board members seek board office in order to see a specific objective enacted. This might be the termination of a coach or administrator, or even the superintendent. Or, the special interest might be to have the Ten Commandments posted in classrooms or open the school day with prayer. Superintendents (and other board members) are placed in a difficult position, as they might be required by law or procedure to withhold support of a given special interest. The problem is accentuated many times when the board member is allied with special interest groups in the community. A good example would be a board member who represents the interests of an antitax group. This board member may resist establishing a budget, setting a referendum for a new building, or negotiating with teachers. This type of resistance creates tension within the board, community, and with the superintendent.

Actually, the most serious board and superintendent conflict originates within the board itself. As boards become politicized, identifiable member coalitions emerge and clash with other board members. This is especially the case in large urban districts with boards divided by racial issues.

Conflict among board members often leads to each group trying to receive the superintendent's support for their position. In many conflicts there is little chance for the superintendent to remain neutral and efforts to do so result in alienation on the part of both groups. Internal board politics is a very serious problem in many districts, and there are usually no outside neutral parties available to mediate intraboard differences that are often disguised as superintendent and board conflict. Most likely a majority of superintendents leaving districts in midcontract do so because of intraboard conflict.

The outcome of board conflict, made public when the board votes on an issue, is usually a "split" board, meaning that consensus is very difficult to achieve. Generally, the public interprets the vote supporting a given proposition as reflecting the group of board members who support the superin-

tendent. Some superintendents attempt to insulate themselves from what they consider to be unfair board criticism or interference. A frequent strategy that is used is to create a citizens' advisory group for the superintendent comprised of leaders in the community. Superintendents believe this group can provide protection in the event of conflict with the board or act to stop intraboard squabbling. In addition many of the advisory group members are in a position to be future board candidates, giving the superintendent potential allies in these possible board members.

The superintendent's actions in the community can be a flashpoint for board conflict. Even though superintendents are prohibited from participation in board elections, conflict sometimes arises when board members perceive the superintendent's encouraging a community member to run for a board position. Some board members are also suspicious of a superintendent who serves as chief spokesperson for the district. They perceive this as diminishing their political stature with constituent groups.

### **Putting Together a Superintendent/Board Relations Plan**

Nearly all authorities indicate role conflict to be the leading cause of superintendent and board conflict. In order to reduce the likelihood of conflict it seems important that roles are clarified at the beginning of a superintendent's or a board's tenure. This is difficult to accomplish without a neutral third party facilitator and also because of increased board turnover in thousands of districts.

A potential source of assistance for board members and superintendents is in-service training offered to new board members by state school board associations. Districts that use a strategic planning process have a natural opportunity for the board and superintendent to mutually determine roles and responsibilities.

A majority of superintendents provide orientation sessions for new board members. This is another opportunity for the superintendent to clarify roles with at least one board member. Unfortunately, the politicization of boards has resulted in the increase of sensitive political issues, which makes superintendent and board relations very difficult. In a number of cases, superintendents never even have an opportunity to establish working relations with a board. More often board members are elected on a quasi-

political platform of candidates who are sponsored by special interest groups. When this slate of candidates is elected, they immediately “buy out” the superintendent’s contract in order to hire a person sharing their political views.

One problem contributing to a negative climate between superintendents and boards can usually be adjusted if not eliminated by the superintendent. This is the time required for board members to spend on district governance and activities. Many board members complain board membership is actually a second full-time job. This is nearly true in large urban districts with serious student achievement and political problems. Board time can be dramatically reduced by the superintendent and management team through careful examination of time demands placed on the board. The superintendent must know the board well enough to be able to screen out unnecessary paperwork and meetings. Needless hours of time can be eliminated if the board is willing to trust the superintendent and management team to perform this task.

Board members who give up family and even work time for board business often believe the superintendent and management team are foisting off decision-making and management responsibilities on the board. In districts where board members spend no more than five hours per week on board business, it is quite likely that superintendent and board relations function more effectively.

The relationship between a board and superintendent establishes a tone for the district environment. If the relationship is cooperative and harmonious district employees feel secure as roles are clarified, expectations are clear, and ambiguity does not cloud attempts to change and improve programs. Conflict between the superintendent and board creates tension inside the district and in the community. The situation discourages program innovation and reform, and deters constructive community involvement in the schools. It certainly can be fatal to any bond or tax rate referenda attempts. Unfortunately, many districts are not proactive in meeting the challenge of board and superintendent relations.

- SELECTION AND EDUCATION OF MEMBERS  
Kent M. Weeks

## **DUTIES, RESPONSIBILITIES, DECISION-MAKING, AND LEGAL BASIS FOR LOCAL SCHOOL BOARD POWERS**

Local school boards have been an integral feature of the U.S. public education system for nearly 100 years, and they are widely regarded as the principal democratic body capable of representing citizens in local education decisions. The formal institutional roles assigned to school boards, and the designated position board members play as representatives of the community, would lead one to believe that the school board has a decisive role in public education policy and school system administration. In the minds of many lay citizens, school boards have considerable influence over educational decisions and provide a key social and political connection to the schooling process.

Although research has affirmed the important role that local school boards played in implementing educational reforms such as student testing and graduation requirements, some critics have contended the traditional leadership and policymaking roles of local school boards have been compromised by bureaucratic intransigence, a tendency to micro-manage school system operations, and divisiveness caused by special interest groups. While one researcher has suggested that lay control of schools is a myth, others have argued that the school board is essential to ensure the quality of public education services at the local level.

### **Legal Basis for Local School Board Powers**

The U.S. Constitution contains no mention of education. With the federal government limited to those powers either expressly stated or implied in the Constitution, the federal role in public education is secondary to that of the states. Power over public education is as essential an attribute of state sovereignty as that of the power to tax or to provide for the general welfare of the state's citizens. The state legislative mandate to provide for a system of public schools is found in the state constitution, usually in language requiring a "general," "uniform," "thorough," or "efficient" system of public schools.

Even though power officially resides with the states, concerns about efficiency and local involvement are addressed through the delegation of authority from the legislative branch to the local school board. Although the powers and duties of the local board vary by state jurisdiction, all fifty states except

Hawaii have a two-tiered governance structure and provide for local school districts governed by an elected or appointed board. States also govern through state boards of education, administer through state departments of education, and typically provide for an elected or appointed chief state school officer.

Sources of authority that influence the duties and responsibilities of the local school board include state and federal constitutions, legislative enactments, rules and regulations promulgated by the U.S. Department of Education and the state board of education, and legal interpretations by judges, attorneys general, and administrative agencies. A school board functions locally, within the confines of the state's delegation of power and the geographical boundaries of the district, but is a legal agency of the state and thus derives its power from the state's constitution, laws, and judicial decisions. By state legislative enactment, school boards are delegated power and authority to develop policies, rules, and regulations to control the operation of the schools, including system organization, school site location, school finance, equipment purchase, staffing, attendance, curriculum, extracurricular activities, and other functions essential to the day-to-day operation of schools within the district's boundaries. Boards may also be authorized by the state legislature to levy taxes, invest resources, initiate eminent domain proceedings, acquire land, and assume bonded indebtedness.

School boards are corporate bodies created for the purpose of implementing state legislative policy concerning public schools and locally administering the state's system of public education. Board members are state officers who act under color of state law when conducting the official business of the state. The exercise of the local board's authority must be predicated upon an express or implied delegation of authority from the legislature and must meet a test of reasonableness that avoids a judicial presumption of arbitrary or capricious action. Because the authority of the local board lies in its status as a corporate body created by the state legislature, an actual meeting of the board is an essential prerequisite to official action. Individual board members are not vested with powers outside their role as a member of the local school board, although the board is often vested with power to ratify the actions of its members, agents, or employees if the ratifica-

tion vote occurs in an official board meeting and is documented in the official minutes of the board.

### State and Federal Reform Efforts

The states and the federal government increased their visibility in public education policy from the 1950s into the twenty-first century. The federal role in education was spurred with implementation of the National Defense Education Act of 1958 and the Elementary and Secondary Education Act of 1965. Federal antidiscrimination policy became a crosscutting social issue for public schools and school districts with the passage of the Civil Rights Act of 1964, Title IX of the Education Amendments of 1972, and the Rehabilitation Act of 1973. Federal entitlements to special education were initiated with the Education for All Handicapped Children Act of 1975. Whether in the form of categorical aid designed to meet targeted educational needs or in the form of block grants permitting states discretion in the allocation of funds, federal largess has been influential in shaping educational policy and shifting the locus of control over public schools.

At the same time that the state role in public education expanded to accommodate federal funding initiatives, demands for reform of public school finance systems were being heard in state and federal courts. The Texas school finance system survived a constitutional challenge in the 1973 case of *San Antonio Independent School District v. Rodriguez*, but judges in state courts showed less deference to the state legislature's authority to construct a school finance scheme and a concomitant willingness to interpret state constitutional provisions as a mandate providing for a system of public education. State courts in Kentucky, New Jersey, and Texas have been among those adopting an active role in the reform of school finance. With the possibility of litigation mounting in each state, the momentum for finance reform led state legislatures to embrace changes that centralized education governance and restricted the authority and influence of local school boards.

In 1954, prior to the decision in *Rodriguez*, the U.S. Supreme Court struck down racial segregation in the Kansas public school system in *Brown v. Board of Education of Topeka, Kansas*. The *Brown* decision was followed by a series of cases compelling local school district boards to desegregate public schools under consent decrees that were overseen by court-appointed special masters. As the Supreme Court expanded the desegregation mandate to address the

pattern and practice of segregation in school districts throughout the United States, local school districts found their influence diminished and their actions scrutinized by federal courts intent on addressing a history of international segregative practices in America's public schools.

With the 1983 publication of *A Nation at Risk: The Imperative for Educational Reform*, by the National Commission on Excellence in Education, a dramatic escalation of national concern about public education led state and federal policymakers to advocate for quality and to require rigorous testing, higher graduation requirements, and more demanding academic standards. In a policy environment in which demands for scarce public resources were outstripping the revenue generated by the state's system of taxation, concern for state level accountability and efficient use of resources was magnified. The education reform movement considerably strengthened the power of the states in relation to the historic discretionary power that had been exercised by local school boards. Policies previously left to the discretion of local school boards were increasingly prescribed by the state.

Local school boards have been characterized as the largest losers in the reform efforts of the 1980s and 1990s. State legislatures have generated educational policies and regulations directed to academic standards, professional certification and preparation, and curriculum development. Bypassing local school boards in the haste to reform public education, additional legislation has emphasized choice as well as quality, and encouraged the development of charter schools with limited regulatory ties to the local school system, school-based management, vouchers, tax credits, and home-schooling options.

### Duties and Responsibilities

In most states, it is the local board that is charged with the responsibility to establish and maintain a basic organizational structure for the local school system, develop curriculum, meet federal and state mandates for public schools, appoint a superintendent and key members of the central office staff, adopt an annual budget, and create a climate that promotes educational excellence. Consequently, school boards initiate educational policies at the local level and have a responsibility for implementing a variety of state and federal policies. These boards provide important administrative oversight relative to the educational policies and programs

they institute; play a central role in establishing systems and processes to ensure the school system's fiscal, programmatic, and outcome accountability; and undertake broad human resource functions that include making crucial decisions regarding the district's top-level leadership and key staff. Finally, school boards provide leadership for the local school system, adopting a unifying vision and mission, soliciting and balancing the participation and input of members of the community, and advocating on behalf of the educational needs of children at the local, state, and national levels.

Local school boards function as legislative, executive, and quasi-judicial agencies. They must develop, implement, and assess policy; institute sound employee relations; conduct open meetings; recognize and conform to the legal mandates imposed by state and federal laws; and govern within the limits of a delegation of state authority. Additionally, the board has an obligation to assess its successes and failures; inform the public of all deliberations and decisions; promote accountability; avoid abuse of power; enhance public understanding of its mission; conform to standards of ethical behavior; provide a framework for setting goals; and develop strategic plans for the accomplishment of those goals.

From the myriad tasks that have been delegated to school boards, or which have accrued over their history, three overlapping and often contradictory responsibilities can be distinguished. First, the board is a policymaking entity for the local school district. Second, the board is an administrative agency that must provide oversight for the operation of the local school system and is ultimately accountable for the system's operation. Third, the board is a democratically elected body that provides school system leadership and represents the interests of the community on public education issues.

**Policymaking.** The first responsibility of the local school board is to make policy for the sound operation of the school district. State statute law typically requires that the local school board approve the district's budget; develop long- and short-term goals; establish educational objectives, performance indicators, and pupil assessment systems; and approve curricular frameworks and standards for student achievement. In a rational planning model, board policies begin with the articulation of a shared vision and mission for the school district, followed by the establishment of key goals and strategic objectives. Comparing current outcomes with desired out-

comes and analyzing gaps between current outcomes and desired outcomes should then lead to the development and implementation of strategic plans for the accomplishment of key objectives. In reality, school boards often make policy under conditions in which competing demands and legal imperatives make systematic and rational planning difficult. As a result, board policies cover a vast array of school operations, and the policies may appear ambiguous or contradictory when viewed by those who are charged with the responsibility to implement the policy in practice.

The policy environment in which local school boards operate is complicated by a number of factors. Legal mandates based on state and federal legislation, judicial decisions, and negotiated union contracts may impose substantial constraints on the local board's policymaking authority. Board members may have conflicting and irreconcilable views on the appropriate means to achieve key objectives. Educators may insist that the board defer to the professional expertise of administrators and teachers on matters of educational policy. The degree of board turnover may affect policymaking capabilities because of a loss of institutional or collective memory essential to recall the purpose and intent of previous policies. In addition, the policymaking environment often involves urgent and immediate policy decisions inflamed by public controversy, influenced by local interest groups, and complicated by insufficient time to analyze the policy in light of system objectives.

**Administration.** Another major role of the school board is that of administrative agency. While local boards are discouraged from becoming involved in the day-to-day operation and administration of schools, demands for public accountability dictate some level of involvement in the administration of the school system. Public accountability requires that the board must, at a minimum, provide oversight, adopt standards, and assess progress toward the accomplishment of key district objectives. To some extent, the board's administrative functions require knowledge of the operational procedures and organizational structures instituted to accomplish board policies. This knowledge cannot be achieved without some degree of administrative oversight.

A regular criticism of local boards is the tendency of board members to confuse monitoring of key outcomes and executive performance with prescrib-

ing how to manage the components of the system. A study conducted in West Virginia found that school boards spent 3 percent of their time on policy development and as much as 54 percent of their time on administrative matters. A study of fifty-five randomly selected school boards indicated that financial and personnel issues were among the most frequent areas of decision-making, displacing deliberations on educational policy by a significant margin.

It is axiomatic that school boards should focus on policymaking and eschew micromanagement of the school system. One national report—*Facing the Challenge: The Report of the Twentieth Century Task Force on School Governance*—has proposed that school boards emphasize their role as policy boards instead of collective management committees, with the aim of establishing policies to enhance student academic progress. As a practical matter, many local boards assume time-consuming duties that are primarily administrative. For example, many local boards act as hearing agencies for employee and student grievances. This quasi-judicial role conflicts with the policymaking priorities of the board. It has been recommended that school districts delegate the responsibility to hear complaints and appeals from individual students or employees to administrative law judges or other qualified third parties.

The local school board's responsibility for district personnel is another illustration of the practical difficulty in separating policymaking and administrative functions. In an organization that is labor intensive and commits a substantial portion of its annual operating budget to salaries and benefits for its teachers, administrators, and support staff, the board's administrative responsibility for personnel is unavoidable. State law typically requires that school boards select a superintendent, adopt and implement personnel policies for staff, appraise school and employee performance, ratify individual and collective employee contract agreements, and serve as the final administrative agency in dismissal proceedings. Issues such as recruitment, selection, and retention of teachers; setting compensation levels; and developing contract provisions are recurring agenda items for local school boards.

**Leadership.** The local school board has a vital role in providing leadership for district schools, serving as a forum for citizen input relevant to public education, and inculcating the beliefs, behaviors, and symbolic representations that define the organizational culture of the school system. In this role, the board's

responsibilities include adopting a unifying vision and mission, soliciting and balancing the participation and input of members of the community, and advocating on behalf of the educational needs of children at the local, state, and national levels. Consistent with this leadership responsibility, the local school board should emphasize the standard of continuous improvement for its own operations as well as that of the school system as a whole and undertake to evaluate its performance and improve upon that performance.

As a democratically elected body intended to represent the interests of the community on public education issues, the local school board is a symbol of local control of public education. By providing an accessible forum for discussion of education issues that affect local communities, school boards maintain a key component of their viability. Founded on the belief that citizens should play a dominant role in determining how children in a community are educated, local school boards have been described as a historic linchpin of American educational governance. In a diverse society with a multiplicity of cultures, the board has become the body in which all constituencies find expression, a role seen as crucial to sustaining participatory and representative government.

Though the local school board must provide leadership for the school system, the complexity, ambiguity, and uncertainty clouding the environment for public education in the United States makes assuming this role difficult. Education policymakers at the federal and state level; competing interest groups with substantial influence in the political process; and a multitude of stakeholders, including business organizations, parents' groups, taxpayers, labor organizations, and special-interest groups, complicate the policymaking process. As laypeople with limited experience, board members may hold outdated beliefs about best practices or be focused on a single issue that subsumes the broader responsibility for visionary leadership. Because elected school boards are especially sensitive to public criticism, board members may adopt a posture of reacting to these groups rather than taking a proactive role, resulting in crisis management and a tendency to consider issues on an ad hoc basis rather than in the context of defined goals and objectives.

## Decision-Making

A host of contemporary concerns present challenges to the local school board's pivotal role in the governance structure in American public education. These challenges include declining public confidence in public schools; limited financial and operational support; changing demographics; perceived drops in student achievement and performance; persistent student attrition or dropouts; reports of crime and violence in the school setting; and adversarial relationships with employee groups. At the same time that major challenges confront local boards, centralization of educational policymaking at the state level, initiated by the educational finance reforms of the second half of the twentieth century, when coupled with a heightened federal role in public education, has changed the locus of control over public schools and diminished local board powers.

Given the variety of policy considerations for school boards, the decision-making process of the board will vary depending upon the issues addressed, the parties involved, and the organizational interests, operational procedures, time constraints, and personal values of the decision makers. School boards are political organizations with members elected to serve a broad constituency. Decision-making in this environment is a highly political process in which coalition building, bargaining, competition, and adaptation are common. As with most organizations, it cannot be assumed that school board members are unified actors, and studies of school board decision-making show that individual role interests and social roles often serve as analytical constructs to explain decision-making processes. Local boards typically consist of members who possess divergent individual agendas and a limited set of mutually shared values or beliefs. Nevertheless, existing school board policies, extant procedures, and regularized customs and practices create and then enforce a unifying culture within the school board that is designed to maintain the status quo and has a relatively conservative perspective.

Board meetings follow the policies and procedures traditionally created to manage operations and are often characterized as ritualistic, systematic, and programmed. Although local boards are authorized by state law to adopt their own procedures, they are bound by law to follow those procedures once adopted. For example, procedural rules for establishing a quorum in order to take official action must be followed. A record of minutes of board

meetings must be maintained in order that the board documents its deliberations and actions. Notice of meetings must conform to state sunshine laws, and business must be conducted in public, open meetings unless an exception to state law permits an executive session authorizing the board to deliberate in private.

The work of board members is seldom self-selected and is more likely to be defined for them by the superintendent, other professional educators, community leaders, interest groups, or state and federal actors. Despite the importance of policymaking, board members report that day-to-day responsibilities consume most of their time and complain that they seldom have time for reflection, brainstorming, and long-term planning. Despite concerns for educational equity and quality, boards more often address matters of financial accountability, which tends to enforce a role as steward of the public purse and a perspective of fiscal conservatism.

Models of decision-making emphasize inventing, developing, and analyzing possible solutions before selecting a particular course of action. Selecting a possible course of action is informed by the judgment of the decision maker, the analyses of the alternatives on a logical or systematic basis, and the political bargaining process. A major criticism of decision-making in the context of local school boards is that adequate alternative solutions are not always considered in the decision-making process prior to drafting policies. Educational policymaking is distinctive because of its lack of regular formal procedures for generating alternative proposals to those advanced by professional educators or school officials. School board members are often constrained by limits imposed by existing law and policy and become dependent on school district professionals and administrators for proposals and information. Some authorities contend that school boards perform the function of legitimating the policies of the school system in the larger community rather than representing the various segments of that community to the school system.

JOSEPH BECKHAM  
BARBARA KLAYMEIER WILLS

## SELECTION AND EDUCATION OF MEMBERS

Local control of public education, grounded in the federal constitution, is exercised through local school boards. Although they enjoy some autonomy, local school boards are the product of state legislatures with enumerated powers. The federal government, state legislature, and state boards of education also make policy decisions affecting local schools.

In 2000 about 95,000 school board members adopted policies for some 15,000 public school districts. Due to consolidations and other restructuring, the number of school districts has dramatically declined from 1940, when there were 117,000. The state of Hawaii has only one board of education for the entire state. From 1999 to 2000 public school districts educated about 47 million students in pre-kindergarten through grade 12 with about 3 million teachers, according to the National Center for Education Statistics.

### Elected Versus Appointed Members

Most states prefer to elect school board members: Citizens in school districts elect more than 94 percent of their school board members. Several states both elect and appoint members. There is an increasing trend to appoint and not elect superintendents.

The typical school board member is a college-educated homeowner, who lives in a suburb or small town, and serves a school system enrolling between

1,000 and 5,000 students. Many districts are larger or smaller and reflect a greater diversity in membership. In western states, school boards have a higher percentage of Hispanics than do boards in other parts of the country. In southern states, 16 percent of school board members are African American, the highest percentage in the country, according to the National School Boards Association.

### Advantages and Disadvantages of Selection Processes

Advocates of electing school board members argue that elected boards are more responsive to the public will. In addition, electing members increases public interest in the schools as it ensures that people have a direct voice in the selection of the school system's governing body. Elected school board members have greater independence and freedom to act in the best interests of the school system than do appointed board members. An elected board is in a better position to work closely and effectively with its superintendent and professional staff than an appointed board.

The proponents of appointing board members assert that the appointive method provides opportunity for greater selectivity in choosing board members, thus assuring capable board members with proper motives. Appointment of board members helps ensure harmonious working relationships between the school board and the local government. Appointing board members ensures board stability and continuity of service are better secured by the appointive method. The elective method encourages candidates for board office to develop issues for their public appeal or to make charges against incumbent board members or professional staff in order to secure votes, while appointed board members generate less community controversy. In order to depoliticize the process and to be proactive in candidate selection, some school districts work through a citizen advisory or caucus process in order to identify and seek out qualified school board candidates.

There is no definitive literature on whether elected or appointed school boards are more effective in improving student achievement. Furthermore, governance and organizational changes do not appear to improve classroom instruction.

### Geographic Selection

Most school board members are elected from single-member districts; however, some school board

members are elected at large. It has been argued that single-member districts tend to create a more parochial school board member; however, at large elections a single-member district can generate legal challenges in states covered by the Voting Rights Act of 1965. Several lawsuits alleging minority dilution in the establishment of single member or at large elected board districts have been decided (*Reno v. Bossier Parish School Board* (1997), *Perez v. Pasadena Independent School District* (5th Cir. 1999), and *Valdespino v. Alamo Heights Independent School District* (5th Cir. 1999)).

### Term and Turnover of Office

Most school board members serve terms of three to six years. Most boards have three to nine members; however, some are larger to accommodate large populations or to reflect interests of multiple constituencies. Although in most cases, term limits do not apply to board service, in the 1990s some advocates called for term limits for school board members, arguing that some school board members use their offices for political gain and promotion.

The national tenure for school board members is declining. According to a study by the National School Boards Association, the average term of a board member has dropped from five and a half years in 1982 to five years in 1992. School board members choose not to seek another term because of changing interests, frustrations with the job, and the demands of mounting an election campaign.

### State Takeovers

In the 1990s rising national concerns about the quality of public education led states to adopt laws providing for the takeover of school districts or, in some cases, individual schools. At the beginning of the twenty-first century, twenty-four states have enacted policies that allow them to take over a school district due to academic problems within the school district. These state policies provide for application of progressive sanctions on a school district, with the ultimate sanction being a takeover. State policies may also permit a takeover for reasons other than academic problems: these include fiscal mismanagement, inept administration, corrupt governance, and crumbling infrastructure within the school district. Through state law, policy, or court action, the state designates an entity to manage the school district for a certain amount of time.

The consequences for school board members vary. For example, state officials can relieve school

board members and other high level administrators of their duties and appoint others to manage the school district in their place. Or, school board members and high level administrators might remain in place as an advisory group. In certain large cities, the mayor has governance authority. In cities such as Boston, Chicago, Cleveland, and Detroit, mayors, enabled by state legislation, have taken over the school systems and assumed the governance of them. Mayors either appoint the school board members or the superintendent or appoint the chief executive officer of the system.

The proponents of state takeovers argue that takeovers are a necessary extension of a state's constitutional responsibilities: They provide a good opportunity for state and local decision makers to combine resources and knowledge to improve children's learning and allow a competent executive staff to guide an uninterrupted and effective implementation of school improvement efforts. State takeovers also serve as a catalyst for creating the right environment for the community to address a school district's problems and allow for more radical, necessary changes in low-performing school districts. Finally, takeovers place school boards on notice that personal agendas, nepotism, and public bickering have severe consequences. Typically the new leadership uses achievement data collected from school districts and schools to bolster accountability efforts.

Opponents of this approach assert that state takeovers represent a thinly veiled attempt to reduce local control over schools and increase state authority over school districts. Takeovers imply that the problem lies with the community and it is up to the state to provide the solution; Thus, there is a false assumption that states have the ability to effectively run school districts. States may place poorly prepared state-selected officials in charge, who will not be able to produce meaningful change in the classroom, and will use narrow learning measures (i.e., standardized test scores) as the primary justification for takeover decisions. State takeovers often focus on cleaning up petty corruption and incompetent administration, and do not go to the root of the social problems that face disadvantaged students in urban school districts. Takeovers can foster negative connotations and impressions that hinder the self-esteem of school board members, administrators, teachers, students, and parents. Finally, takeovers encourage confrontation between state and local of-

ficials that slows the overhaul of management practices, drains resources from educational reforms, and reinforces community resentments.

### **Continuing Education of Board Members**

The educational background of school board members varies widely; some members have high school degrees or diplomas and others have doctorates. Formal education by itself does not adequately prepare school board members for their specific functions. Accordingly, many argue that school board training and education should be mandatory for all school board members.

In the 1970s board members attended a national convention, but relatively few attended systematic and targeted programs of continuing education. By 2001, however, more than half of the states required mandatory training for school board members. Typically, the school board member must participate in some recognized form of continuing education for a specified number of hours per year. In a study conducted by Marilyn Grady and Bernita Krumm in 1996, it was determined that of forty-three states in the study, ten states had mandatory training for school board members and thirty-two had voluntary training. In some states, if members do not attend training they could lose their seat on the school board. Often they are compensated for attendance at these required continuing education programs. The programs are provided by state school boards association or other recognized school board agencies such as the National School Boards Association or the Council of Urban Boards of Education.

### **Orientation**

As part of school board training, new school board members need orientation. New board members join a board of existing members who are continuing their service and who have developed a culture and context for their decision-making process. It is important that new school board members understand substantive information on school programs and operations. Without pre-service or orientation programs, it will take at least two years of school board service before board members gain the background and confidence to perform effectively and confidently.

### **Content of Education**

The key topics offered in state training included education law, finance, and board-superintendent

relations. Other topics included negotiations, curriculum management, labor relations, policy development, roles and responsibilities, leadership, legislation, community relations, strategic planning, and special education.

A significant new dimension to school board training is acquainting the school board members with research-based information. The data available to educators to support and assess educational programs is extensive. Many school board members are not accustomed to consulting research materials to inform their decisions. Solid information can also form the foundation for alternative solutions and provide the basis for choosing the best option.

In 2000 the National School Boards Association urged school boards to concentrate on raising student achievement by focusing on eight key areas: vision; standards; assessment; accountability; alignment; climate; collaborative relationships; and continuous improvement. This position undergirds the need for adequate school board training on issues of student expectations, achievement, testing, assessment, and accountability. A school board member also needs to be able to respond to questions from the press regarding achievement measures and the school board's assessment of its progress toward meeting its district's measurable goals.

One of the key challenges for school board education is not only to define its objectives and mission, but also to stay focused on these key issues. Even though many school boards attempt to concentrate on student performance and achievement, in some circumstances, boards might devote a minimum amount of their time to these critical issues. To forestall this, there must be a change in governance structure, culture, and agenda of boards so that they will remain focused on student achievement and performance.

Toward the end of the twentieth century, the role of local boards of education received scrutiny. Although most observers acknowledge that school boards have an important role in maintaining involvement of local citizens and in governing local schools, some confusion regarding the specific functions of boards persists.

In response to the changing demands on school boards, a National School Boards Association task force identified four core decision-making functions that are fundamental to a school system's accountability:

1. The establishment of a long-term vision for the school system.
2. The establishment and maintenance of a basic organizational structure for the school system, including employment of a superintendent, adoption of an annual budget, adoption of governance policies, and creation of a climate that promotes excellence.
3. The establishment of systems and processes to ensure accountability to the community, including fiscal accountability, accountability for programs and student outcomes, staff accountability, and collective bargaining.
4. Advocacy on behalf of children in public education at the community, state, and national levels.

### Training Activities

According to one study, the most common type of activities for training were annual conventions, orientations for new members, regional meetings, board president training sessions, and some summer and winter conferences. Other activities include the reading of appropriate literature, discussions of important issues, visiting schools, and board self-evaluations.

In order to encourage continuing education and training, state associations utilized awards for board members who completed extensive training. The more hours earned in a continuing education, the higher the award to the board member. Further, state school board associations select a “school board of the year” composed of members from the state who have demonstrated leadership including commitment to continuing education.

Superintendents play an important role in training of school board members. They can supply members with position papers, provide members with options and best practice research, conduct special briefing sessions on key issues, and model continuing improvement in the area of professional development.

School board education requires balancing issues of structure such as board–superintendent relations and education law with issues of student achievement and accountability that are part of the national agenda in the early twenty-first century.

## SCHOOL CLIMATE

Anyone who spends time in schools quickly discovers how one school can feel different from other

schools. *School climate* is a general term that refers to the feel, atmosphere, tone, ideology, or milieu of a school. Just as individuals have personalities, so too do schools; a school climate may be thought of as the personality of a school.

The concept of *organizational climate* has a rich history in the social science literature. In the early 1960s George Sterns was one of the first psychologists who saw the analogy with individual personality and used the concept of organizational climate to study institutions of higher education. The use of the concept quickly spread to schools and business organizations, each with a somewhat different conceptual view of climate. Although there are a variety of conceptualizations, there is general agreement that organizational climate arises from routine organizational practices that are important to an organization's members, that it is defined by member perceptions, and that it influences members' attitudes and behavior. Thus, school climate is a relatively enduring character of a school that is experienced by its participants, that affects their actions, and that is based on the collective perceptions of behavior in the school.

### Measuring School Climate

Andrew Halpin and Don Croft's pioneering analysis, *The Organizational Climate of Schools*, has had a great impact on the study of school climate. They developed the Organizational Climate Description Questionnaire (OCDQ), a sixty-four-item Likert-scale questionnaire that is used to assess the teacher-teacher and teacher-administrator interactions found in elementary schools. Teachers and administrators are asked to describe the extent to which key behaviors occur, such as how frequently (rarely, sometimes, often, or very frequently) "The principal stays after school to help teachers finish their work," "The principal looks out for the personal welfare of teachers," and "The teachers accomplish their work with great vim, vigor, and pleasure." Thus, school climate is defined in terms of educators' perceptions of the leadership behavior of the principal and interactions among teachers. Patterns of principal and teacher behaviors are then arrayed along a rough continuum, ranging from *open* to *closed* school climates. An open school climate is one in which teacher and principal behavior is supportive, genuine, and engaged, whereas a closed climate is characterized by lack of authenticity, game playing, and disengaged behavior. There were a number of limitations to

early versions of the OCDQ. For example, it only measured the climate of elementary schools, and the validity of some of its subtests was questioned.

Subsequent revisions of the OCDQ have addressed these issues, and three new and simplified versions of the questionnaire have been formulated for use in elementary, middle, and secondary schools. The revised OCDQ was conceptualized using the same framework of open versus closed climates and behaviors. For example, open principal behavior in elementary schools is measured through items that describe supportive principal behavior that is neither directive nor restrictive, and open teacher behavior is that which is collegial, intimate, and committed to teaching and learning.

Another climate framework uses a health metaphor—school climate is measured in terms of healthy interpersonal dynamics. In the tradition of the OCDQ, the Organizational Health Inventory (OHI) is a set of descriptive statements that tap productive relationships in school. There are three versions of the OHI—elementary, middle, and secondary. This broad climate perspective examines the relationships between the school and environment, the leadership of the principal, relationships among teachers, and relationships between teachers and students. For example, the secondary version maps seven aspects of school climate:

1. *Institutional Integrity* is the extent to which the school is able to manage its constraints from the community
2. *Consideration* is principal behavior that is genuinely collegial, friendly, open, and caring toward the faculty
3. *Initiating Structure* is principal behavior that is oriented toward both tasks and achievements through clearly articulated work expectations and performance standards
4. *Principal Influence* describes the principal's ability to influence superiors
5. *Resource Support* is the ability of the principal to obtain classroom materials and supplies needed by teachers
6. *Morale* is the collective sense of friendliness, openness, and enthusiasm among members of the teaching staff
7. *Academic Emphasis* is the extent to which the teachers and students are committed to academic excellence

A pattern of high scores on these variables defines a healthy school climate. There are, of course, other measures of school climate, but the openness and health frameworks have generated the bulk of the systematic research on school climate.

### School Climate and Outcomes

Empirical evidence has linked school climate with achievement. Though school climate is often defined differently in various studies, the research evidence using the OCDQ and the OHI measures of climate is encouraging. Openness of school climate has been linked primarily to expressive characteristics in schools. For example, the more open the school climate, the more committed, loyal, and satisfied the teachers are. Similarly, the more open the climate of the school, the less alienated students tend to be. School climate, from the health perspective, has been positively related to school effectiveness. Most of the health variables correlate significantly with general subjective measures of effectiveness, and the variable of academic emphasis has consistently been related to student achievement in high schools, middle schools, and urban elementary schools. In fact, the relationships hold even controlling for the effects of socioeconomic status.

### Trends, Issues, and Controversies

School climate has become a global construct that researchers often use loosely to group together studies of school environment, learning environment, learning climate, sense of community, leadership, academic climate, and social climate. This broad application reveals both the strength and weakness of school climate study—it is a useful integrating concept on the one hand, but it also suffers from a lack of clear definition. Like so many other terms that are bandied about, the word *climate* threatens to become meaningless. Because its referents are so diverse, the word sometimes obscures, rather than creates, understanding. *School culture* is a related term that has been used to describe the work environment; in fact, climate and culture are often used interchangeably by some educators to refer to the distinctive workplace of a school. A useful distinction is that culture consists of shared values and assumptions, whereas climate is defined by shared perceptions of behavior.

In many studies, after a small number of “effective” and “ineffective” schools are identified, researchers catalog each school’s organizational

characteristics and attempt to find consistent differences between the two types of schools. Not surprisingly, the differences vary from study to study when such post hoc methods are used, and the list of effective school attributes grows as such studies accumulate. In addition, organizational characteristics are defined differently in each study, so that reviewers use general terms to summarize the characteristics of effective schools—terms such as *positive school climate* and *strong leadership*, which are often defined quite differently in various studies.

What is missing in much of the research on school climate is the theoretical linkage that explains these relationships. It is important, for example, not only to know that climate is related to student achievement, but also to ascertain why this is so. What are the generalizations and mechanisms that explain higher achievement? These are critical questions, and their answers will provide a deeper understanding of the dynamics of organizational life in schools and suggest more effective and lasting solutions to the problems of practice. Evidence is beginning to suggest, for example, that a school climate with open, healthy, and collegial professional interactions and strong academic emphasis empowers teachers and creates norms of collective efficacy that shape the normative environment of schools and influence teacher behavior. When teachers believe that they can organize and execute their teaching in ways that are successful in helping students learn, and when the school climate supports them, teachers plan more, accept personal responsibility for student performance, are not deterred by temporary setbacks, and act purposefully to enhance student learning. It is important to try to understand how specific school climate attributes influence critical teacher behaviors that improve teaching and learning in the classroom.

## SCHOOL FACILITIES

---

### OVERVIEW

Jeffery A. Lackney

### MAINTENANCE AND MODERNIZATION OF

Lawrence O. Picus

### OVERVIEW

An effective school facility is responsive to the changing programs of educational delivery, and at a

minimum should provide a physical environment that is comfortable, safe, secure, accessible, well illuminated, well ventilated, and aesthetically pleasing. The school facility consists of not only the physical structure and the variety of building systems, such as mechanical, plumbing, electrical and power, telecommunications, security, and fire suppression systems. The facility also includes furnishings, materials and supplies, equipment and information technology, as well as various aspects of the building grounds, namely, athletic fields, playgrounds, areas for outdoor learning, and vehicular access and parking.

The school facility is much more than a passive container of the educational process: it is, rather, an integral component of the conditions of learning. The layout and design of a facility contributes to the *place experience* of students, educators, and community members. Depending on the quality of its design and management, the facility can contribute to a sense of ownership, safety and security, personalization and control, privacy as well as sociality, and spaciousness or crowdedness. When planning, designing, or managing the school facility, these facets of place experience should, when possible, be taken into consideration.

### Constructing New Facilities

During strategic long-range educational planning, unmet facility space needs often emerge. The goal of educational planning is to develop, clarify, or review the educational mission, vision, philosophy, curriculum, and instructional delivery. Educational planning may involve a variety of school and community workshops and surveys to identify and clarify needs and sharpen the vision of the district. Long-range planning activities, such as demographic studies, financing options, site acquisitions, and community partnering opportunities are often initiated by the district administration as a response to the results of educational planning. An outcome of long-range planning is the development of a comprehensive capital improvement program to address unmet facility needs.

The district superintendent appoints a steering committee to oversee the details of the capital improvement program. The responsibility of the steering committee includes the selection of various consultants, the review of planning and design options, and the reporting of recommendations to the school board for a final decision. Depending on the needs of the district, one of the first tasks of the

steering committee is to retain a variety of consultants. Educational and design consultants, financial consultants, bond counsels, investment bankers, and public relations consultants are retained to perform pre-referendum planning activities during which project scope, budget, financing, legal issues, and schedule are defined. Once project feasibility is established, a public referendum package is developed and presented to the taxpaying public through public hearings. Upon passage of the public referendum, more detailed facility planning of the school can begin.

An architect is often selected to assist in facility planning in cooperation with the educational planning consultant and in-house facility staff. The school board, as the owner, enters into a contract for services with the chosen architect. The architect, in turn, negotiates contracts with a variety of consultants, including interior designers, landscape architects, mechanical, electrical, and civil engineers, and land surveyors.

The facility planning process at its best involves an assessment of functional needs in light of the educational program developed during educational planning. There are several names for this process: Educators refer to the development of *educational specifications*, while architects refer to it as *facility programming*. Facility planning includes any or all of the following activities: feasibility studies, district master planning, site selection, needs assessment, and project cost analysis. Spatial requirements and relationships between various program elements are established. The outcome of the facility planning process is a public facility program, or educational specifications document, that outlines physical space requirements and adjacencies and special design criteria the school facility must meet.

The design phase of the process, which includes schematic design, design development, and construction documents and specifications, can last from six months to one year. Each step in the design process involves more detailed and specific information about the technical aspects of the building systems, components, and assemblies. The design process requires school board decisions and approval, with each phase offering more detailed descriptions of the scope, budget, and schedule. The products of this phase include sketches, drawings, models, and technical reports, which are shared with the school and community through public hearings, workshops, and other forms of public relations and

community involvement. Community participation during the earliest stages of the design phase can be as critical for stakeholder support as it was in the educational planning process.

There are several construction delivery methods available to the school district: competitive bidding, design/build, and construction management. Each state has evolved its own laws regulating the acceptable forms of construction project delivery. Competitive bidding is still the most common form of construction delivery. It allows contractors in each trade, such as general, mechanical, electrical, and plumbing, to compete for individual prime contracts and form separate contracts with the school district. In principle, it provides the most open and fair competition appropriate for a public sector project; however, project communication and coordination may ultimately affect schedule and budget. Design/build is most popular with private sector owners but is occasionally used in the public sector. Under a design/build contract, the owner contracts with one firm that completes both design and construction of the project under one contract. Cost and time savings are possible but often with a loss in quality of the product. Construction management is a service that often is established simultaneously with the hiring of the architect. A construction manager's responsibility is to act as project manager throughout the design and construction process, coordinating the project budget and schedule along the way. A fourth form of construction delivery is actually a comprehensive project management delivery service, which includes construction management but also extends from pre-referendum through occupancy and even facility management, offering one-stop shopping for facility development. Large school districts that have multiple projects often contract with project management services. Project management firms offer a wide array of financial, legal, and construction services promising economies of scale.

Following the competitive bidding process, the next phase of the school building process is that of bidding and negotiation. An *Invitation for Bids* is publicized to obtain bids from prime construction contractors. Most states require the school district to accept the lowest responsible and responsive bidder. However, the school district reserves the right to reject all bids. Once low bids are accepted, the school district, as owner, negotiates a contract with each prime contractor. The architect represents the owner

in the construction phase, but the contract and legal relationship is between the school district, as owner, and each prime contractor. The construction of the school can last from twelve to eighteen months, depending on the project scope, material selections, lead times for shipment to the site, weather, unforeseen subsurface site conditions, and a variety of other factors. With the use of school buildings being tied to the school year schedule, project phasing is always an issue that needs to be addressed. Other factors that can escalate cost and slow the project are change orders to rectify unforeseen conditions or errors and omissions in the original construction documents. Once the architect is satisfied that the project is complete, a *Certificate of Substantial Completion* is issued and the owner can legally occupy the facility.

### Facility Management

While the planning, design, and construction of the school facility may take two to three years, the management of it will last the entire life cycle of the facility. At the beginning of the twenty-first century, the mean age of a school building in the United States as forty-two years, with 28 percent of school buildings built before 1950. Many of the building materials, furnishings, and equipment will not last half that long and will require constant upkeep, maintenance, and inevitable replacement to defer building obsolescence.

The costs of managing school facilities have historically received much less attention than facility planning. The percentage of the operating budget for the maintenance and management of school facilities has steadily decreased, creating a capital renewal crisis as a result of years of deferred maintenance at all levels of education.

Best practice requires that a comprehensive facility maintenance program be established and monitored by the school district. The maintenance program often includes several distinct programs, including deferred, preventive, repair/upkeep, and emergency maintenance. Responsibility for facility management is divided between the district office and the school site, with the principal being the primary administrator responsible for the day-to-day operation of the school, including custodial, food, and transportation services. Custodians are typically hired by the school district but managed by the principal. Custodial staff is generally responsible for cleaning the building; monitoring the mechanical,

electrical, and plumbing systems; and providing general maintenance of both building and grounds. District staff is responsible for long-term maintenance programs and the procurement of outsourced services for specialized maintenance projects.

Several environmental quality issues have emerged over the past few decades, such as classroom acoustics, indoor air quality, water quality, energy conservation, and abatement of asbestos, radon, and other hazardous materials. Many of these issues require the services of facility consultants hired through the district. Other issues for the building-level administrator include safety and security, vandalism and threats, and acts of violence and terrorism. All of these functions must be conducted within a constantly changing set of government mandates, such as energy deregulation, accessibility guidelines, codes, and other regulations and guidelines at the state and federal levels.

### Trends and Issues

Many communities recognize that in addition to school facilities being cost effective, they should be more learner-centered, developmentally and age appropriate, safe, comfortable, accessible, flexible, diverse, and equitable. By location of new facilities in residential neighborhoods and partnering with other community-based organizations, schools are becoming true community centers. In addition, schools are taking advantage of educational resources in the community, as well as partnering with museums, zoos, libraries, and other public institutions and local businesses.

Based on mounting evidence that smaller schools lead to improved social climate as well as better achievement, school leaders have begun to create smaller schools or have created schools within schools.

The design of safe schools increasingly recognizes the desirability of providing natural, unobtrusive surveillance mechanisms, rather than installing checkpoints and security guards. Smaller scaled school buildings allow for both natural surveillance and territorial ownership, where students and teachers are on familiar terms, thereby decreasing the possibility that any one student is overlooked.

The self-contained classroom can no longer provide the variety of learning settings necessary to successfully support project-based, real-world authentic learning. Research indicates that smaller class

size is a factor contributing to improved achievement. Learning settings are being designed to support individualized, self-directed learning and small informal group learning, in addition to traditional large-group instruction. Rather than lining up classrooms along a long corridor, instructional areas are being organized around central cores of shared instructional support.

A trend in the provision of professional space for teachers has emerged as well. Teacher office space, including desk and storage, phone/fax, and information technologies, is seen as essential to the development of teachers as professionals.

Information technology is precipitating a variety of changes in the organizational and physical form of schools. With respect to instructional processes, technology is facilitating the movement toward project-based, self-directed learning and individualized instruction. As learning becomes increasingly virtual, web-based, and wireless, it still must physically take place somewhere. As information technology is becoming ubiquitous, more schools are decentralizing technology throughout the school building and across the community.

The trend toward *smart buildings*, or buildings that are designed and constructed to integrate the technologies of instruction, telecommunications, and building systems, will have increased responsiveness to occupant needs as well as the educational process.

Finally, because of the recognition that spending too much time in buildings can be detrimental not only to health but also to learning, school buildings will begin to connect more to the natural environment visually, aurally, and kinesthetically by including transitional indoor and outdoor learning spaces.

### Cost Considerations

Estimates of cost to repair and modernize school facilities nationwide continue to grow from the \$112 billion estimated by the U.S. General Accounting Office (GAO) in their landmark 1995 report, to the National Center for Educational Statistics (NCES) estimate of \$127 billion in 1999, to \$268.2 billion estimated by the National Education Association in 2000.

The construction and operation of a school building involves a substantial expenditure of public funds. The investment for construction, however, represents only a fraction of the cost of operating a

school over the life of the building. When life-cycle costs of operating a school are considered (including staff salaries and overhead costs, in addition to maintenance and operation of the facility), the initial cost of the school facility may be less than 10 to 15 percent of the life-cycle costs over a thirty-year period. Properly designing and constructing school buildings for the realities of management can often provide cost savings over time that could in turn provide additional funds for education. Operational costs for power and fuel, water and sewer, garbage disposal, leases and insurance, building maintenance, and custodial staff are important items in the annual budget, competing yearly for funds identified for educational delivery. Building life-cycle cost analysis is admittedly difficult for taxpayers and school boards to comprehend when available building funds are tight, but the rewards in effective facility management are potentially great.

JEFFERY A. LACKNEY

## MAINTENANCE AND MODERNIZATION OF

As public education in the United States entered the twenty-first century, educational leaders and policy-makers were faced with increasing costs for the maintenance and modernization of educational facilities. Driven by two factors—a considerable backlog of deferred maintenance expenditures and needs, and the need to ensure that classrooms have adequate facilities to accommodate the growing use of technology—estimates of the costs for maintenance and modernization of school facilities have soared.

In a 2002 article, Philip E. Geiger stated that as of January 2002 it would cost between \$112 and 150 billion to “bring the nation’s schools up to good condition” (p. 43). The U.S. Department of Education (DoE) estimated that the cost would be \$127 billion. Moreover, the DoE estimated that 30 percent of the country’s schools needed extensive repairs and another 40 percent needed replacement of some major component. This suggests that at the begin-

ning of the twenty-first century some 70 percent of schools across the United States were in need of major repairs.

In 2000 the National Education Association estimated that total school infrastructure needs—including technology—amounted to some \$322 billion. This estimate included costs of new school construction, additions to existing buildings, renovation and retrofitting, deferred maintenance, and major improvements to school grounds, as well as the costs of technology.

Estimating the age of a school building is difficult because many schools have had additions or major remodeling at some point in their history, either to accommodate more students or to update and upgrade the facility. The DoE found that in 1999 the average age of public schools across the United States was forty years. Moreover, on average it had been eleven years since these schools had been renovated. The DoE estimated the functional age of each building and found that the average functional age of school buildings was sixteen years.

Schools in central cities tend to be older than those in other areas. Moreover, in such urban districts, it has often been somewhat longer since a major renovation has taken place. While the differences are relatively small, high minority population schools tend to be in older buildings as well. Many of these older schools need substantial repairs as well as upgrading to meet newer building codes and fire safety standards.

In addition, it is generally these older buildings that do not have sufficient capacity to meet the wiring demands of new technology. Frequently classrooms do not have enough electrical outlets to support more than one or two computers, and many remain without connections to the Internet, even via telephone modem connections. Wiring for school-wide networks is also made difficult because older construction often has solid walls and no false ceilings where wires and networking cable can be installed. This adds yet more to the costs of modernization for technology.

### Maintenance

When faced with a revenue shortfall, most school districts strive to keep major funding reductions away from the classroom. One way to save money in the short term is to defer maintenance on school facilities. While this is often a useful tool for short-

term savings, the deterioration in the condition of an improperly maintained building is very obvious and can often begin within a matter of a few years. Given the high cost of building new schools, this approach may be inappropriate in the long term. California, for example, has an estimated school infrastructure need of more than \$22 billion, with another \$10 billion or more needed for technology.

Much of this could be prevented if proper preventative maintenance procedures are implemented and used by school districts. Geiger provided a list of seven priorities school districts need to consider in developing a high-quality school maintenance program:

1. A commitment on the part of the board, the superintendent, and senior staff to facility maintenance.
2. Development of a comprehensive preventative maintenance program.
3. Adequate funding for both preventative maintenance and capital improvement.
4. A willingness to consider new ideas for construction and maintenance of facilities.
5. Continual search for new and different ways to pay for maintenance and construction needs.
6. Careful review of district goals and policies to make sure facility management receives appropriate levels of funding in the annual budget cycle.
7. A plan to link academic programs to facility needs.

In a 1999 article, Michael Zureich provided evidence of the success of adopting the fourth priority above, that of considering new ideas. Zureich described three schools where a coordinated design and building committee had led to better use of less expensive and easier-to-maintain construction materials, resulting in reduced construction costs and lower life-time maintenance costs. He pointed out that it is important to consider the strength, reliability, and life of all construction materials and to plan for maintenance needs in the initial construction. Zureich suggested that schools using this process have reduced design, construction, and maintenance costs by between 18 and 25 percent.

### Modernization

In addition to maintaining existing school buildings, there is a continual need for modernization. This is

a far broader need than the typical concern over creating an infrastructure for technology. Many schools built in the past do not provide adequate space resources for the way schools educate children in the early twenty-first century. Efforts to reduce class size across the nation along with growth in the number of students have placed a burden on school facilities and increased the demand for more classroom space. Moreover, teacher efforts to use classrooms in different ways to maximize learning often require additional square footage in each classroom. For example, in elementary schools, the traditional room full of tables has often been replaced by a room with desks on one side and a large carpet in another part of the room where students sit on the floor for certain activities. Some rooms have special corners for computers or for quiet reading activities. All of this requires additional space and reorganization of the classroom space.

In earlier periods, schools were built to meet the requirements of educational methods that are no longer in favor. Many schools built in the 1970s relied on the “open classroom” model where there were no walls between classrooms. As teaching moved away from this model, schools had to spend substantial sums of money to reconfigure their facilities.

Other more mundane changes are also an important part of a continuous modernization process. Installation of white boards to replace traditional chalk boards or changing wall surfaces to make it easier to hang displays and teaching aids can make a tremendous difference in the appearance of a classroom. Yet even these simple things can be expensive, and planning for such upgrades is important. Furthermore, as new schools are built with such features as work areas for teachers attached to clusters of classrooms, the school budget needs to provide adequate funds for work materials and equipment for teachers (such as computers, copiers, and telephones) and for reasonable replacement programs for these important tools.

### Technology

The growing use of technology—particularly computers—in instruction has placed a whole new set of demands on the construction, maintenance, and modernization of school facilities. Although technology in schools is a much broader concept than simply the use of computers, it is computers that are most frequently thought of in discussions of educa-

tional technology today. Schools face problems with acquiring adequate numbers of computers, replacing them on a regular and frequent basis, providing the electrical power to operate them in each classroom, and providing and maintaining the wiring infrastructure needed to keep them connected with the school and across the district and the community more generally.

Computers represent a new challenge to school budgeting processes as they have a life span of three to five years, somewhat longer than typical “current” expenditure plans and considerably shorter than the traditional capital funding models used by school districts. As a result, many districts have had difficulty in purchasing and keeping adequate numbers of up-to-date computers. Some have turned to lease programs; others rely on donations of computers—new and used. Other districts have simply not replaced old and obsolete computers in a timely fashion.

Even if a district has managed to develop a purchase plan to provide adequate computer systems for all its schools, there is still the problem of electrical wiring and connections between computers. Older schools simply do not have the capacity to handle the electrical and wiring needs of state-of-the-art computers. Funding for installation of the infrastructure may be available through the e-rate funding, a process whereby telecommunications firms contribute to a fund whose proceeds are distributed on a competitive basis to school districts for technology needs.

Once installed, there are also substantial costs to maintaining computer networks. Updating all of the routers and servers needed to keep the computers communicating as well as repair technicians to fix computers and related peripherals when they break down are essential to successful technology implementation. Funding for all of this needs to be a regular part of a district’s budget.

### Sources of Funding

The maintenance and modernization needs of schools require both one-time and continuing sources of money, with maintenance and modernization requiring different approaches. Maintenance is probably best funded through budget allocations of current resources. This means that adequate funds need to be allocated each year to be sure that the investment a district has made in facilities is not

lost because of premature deterioration of the buildings. Some districts in some states have had some success in getting community redevelopment agencies to provide a portion of the tax increment they receive to stimulate development for school facility needs. Often this money is used to supplement existing allocations for maintenance.

Modernization may require one-time funding options. Some of the alternatives available to school districts include:

- **Bond Issues:** By taking advantage of the tax-exempt status of school district bond issues, education agencies can often borrow funds for capital projects at relatively low interest rates. Bonds typically require voter approval and, depending on state law, may need to be accounted for in a separate budgetary and accounting fund. Nevertheless, they remain a powerful and relatively inexpensive way to fund facility needs.
- **Special Local Option Sales Taxes:** Allowed in some states, these are sales tax increments added to the state and local sales taxes already collected. While such taxes can be a reliable source of funds, local sales taxes may also inhibit development of commercial and retail centers in the district.
- **Voter-Approved Levies or Sinking Funds:** Some states allow school districts to levy special taxes for specific purposes such as technology. Others allow districts to levy taxes for a sinking fund, which collects the revenues and accumulates interest so that construction and/or modernization needs can be funded through the cash balance in the fund.
- **State and Federal Funding:** Special state and federal programs are sometimes available to fund improvements and construction. Individual state programs to help meet deferred maintenance needs are common, and the federal government has provided funding for school facilities through the Qualified Zone Academy Bond program. In each case these programs provide local school districts with funds for improving or building school facilities.

### Conclusion

Maintaining school facilities is important to providing high-quality education programs. More important, by investing in strong preventative maintenance programs, school facilities can continue to

serve students for long periods of time. Modernization of school facilities has faced a number of new challenges in recent years with the advent of the personal computer. As new technologies are increasingly integrated into programs of instruction, the ability to adequately finance the acquisition of this equipment and to have the infrastructure in each school to support this technology is also important.

LAWRENCE O. PICUS

## SCHOOL FOOD PROGRAMS

Food service programs have long been recognized as important components of education in the American schools. "You can't teach a hungry child" has been an accepted principle since the early years of the country, when children were expected to bring lunches from home to get them through the day. However, not all children were able to do so because of financial and other circumstances. In addition, the food brought from home was often lacking in nutritional quality and desirability, and the schools usually lacked the facilities to store milk and other perishable food products. At the same time, food supplies in this country have usually been abundant and, at least during recessionary periods, in excess of market demands.

Particularly during the 1930s, farmers faced extremely low prices and excess food supplies while

people were literally starving. Children were perceived as being in critical need of food support. To solve both problems, the Congress passed Public Law 74-320, authorizing the U.S. Department of Agriculture (USDA) to purchase surplus agricultural commodities and distribute them to needy families and specifically to school lunch programs. At the same time, the Works Progress Administration (WPA), established in 1935, provided labor and trained supervisory personnel for staffing school lunch program on a national scale.

### Early Lunch Programs

Precedents for school lunch programs date back to the mid-nineteenth century in England and western Europe. In 1849, school canteens were established in France, and in 1866 the Destitute Diner Society was established in London. By the beginning of the twentieth century, most western European countries had national laws or extensive municipal legislation providing for school meals.

In 1853, the Children's Aid Society of New York served food to all children who attended its industrial schools, which later became public schools. Serving food became an inducement to children from the slums to attend school. In the economic downturn of 1893, the problem of hungry school children came to public attention. The conviction arose that children in a weak physical and mental state resulting from poverty learned little or nothing at school.

The Star Center Association began school food service in Philadelphia elementary schools in 1894. In 1909, the Philadelphia Board of Education took over all school food service in secondary schools, making Philadelphia the first large city to establish central food control. School lunch programs increased rapidly in the 1920s, as new knowledge of nutrition led to greater concern for the health of children. As a result, the purpose of school food service broadened from provision for the needy and undernourished to provision for all children who need food at school.

### The National School Lunch Program

During World War II, many U.S. draftees were found to be malnourished to such an extent that they were turned down for military service. The realization of this low nutritional state of the general population led to the passage of the National School Lunch Act (NSLA) in 1946, which established the National School Lunch Program (NSLP) in elemen-

tary and secondary schools. This landmark legislation, although amended many times, continues in force today, with its original objectives still in place. These objectives are “to safeguard the health and well-being of the Nation’s children, and to encourage the domestic consumption of nutritious agricultural commodities and other food.”

The NSLA provided annual appropriations to the USDA to purchase surplus foods and apportion them to state agencies, along with certain funds that were to be matched three-to-one with state funds or volunteer labor. Commodities and funds were provided to state educational agencies and to other non-profit agencies participating in the program (private schools in about twenty-five states that could not transmit funds through their state educational agency). These agencies managed the lunch programs at the local level, and sometimes added state funds. They were provided with state operating expenses that covered part, but not all, of their own expenses, also on an apportionment basis. Apportionments after 1962 were made on the basis of state level of participation during the previous year and per capita state incomes relative to the U.S. total. Nonfood assistance for the purchase of food service equipment was also provided selectively in low-income areas by grants authorized by the Child Nutrition Act of 1966 (Pub. L. 89-642).

The Food and Nutrition Service of the USDA operates the NSLP at the national level, and the individual states must sign agreements to operate the program in accordance with the regulations to receive federal reimbursements for meals served. Normally, the state educational agency is responsible for operating the program at the state level. More than 97,700 public and nonprofit private schools and residential child-care institutions operated the program in fiscal year 2002. Among the important requirements for operating the program, NSLP meals served at the local level are required to meet nutritional standards specified in the NSLA. Those requirements originally were called the *Type A* lunch pattern (as opposed to *Type B*, which consisted only of milk). That term, while still in use locally in many places, was replaced in the 1970s with *USDA menu pattern*, which refers to service of specified portions of meat, milk, vegetables or fruits, and bread. The legislation recognized that federal support was only supplemental to total costs, and therefore it was expected that meals would be sold at cost to the chil-

dren that could afford to pay, while low-income children would receive their lunches free.

### More Recent Program Changes

Three key changes have been made in the funding and operations of the NSLP: (1) Public Law 91-248, enacted in 1971, specified that federal dollar appropriations apportioned to the states for the program’s operation were to be replaced with a federal reimbursement entitlement of a certain number of cents in cash and another entitlement value of commodities for each meal served that meets requirements. Funds and commodities provided per meal are updated annually based on changes in prices of *food-away-from-home*, as measured by the Consumer Price Index (CPI). Thus, the program was transformed into an ongoing, performance-based federal obligation. (2) With the same legislation, the federal government assumed the obligation for the full cost of all meals served to needy children, with entitlements updated annually based on price changes reflected in the CPI. Eligibility for free or reduced-price meals was specified by law and measured in accordance with the Federal Income Poverty Guidelines. These guidelines are also updated each year, based on changes in the CPI. (3) In 1995, nutritional requirements were changed from specifying the service of specified portions of specified kinds of food to the requirement that nutritional meals needed to be provided (Pub. L. 103-448). These requirements are tied to the service of meals that meet one-third of the daily Recommended Dietary Allowances (RDAs), as specified by the Food and Nutrition Board of the National Research Council, which is part of the National Academy of Sciences, as well as the Dietary Guidelines for Americans.

Another change occurred in 1998 when Congress expanded the NSLP to include reimbursement for the service of snacks in after-school, educational, and enrichment programs to students up to eighteen years of age. Organized sports activities with limited eligibility of student participation do not qualify for support.

### NSLP Payment Rates

In school year 2001–2002, all qualified meals served, regardless of the income level of the students’ parents, were reimbursed at 20 cents per meal. But if the meals were served in relatively low-income districts, these meals received an extra 2 cents reimbursement. The qualification of “low-income district” is mea-

sured by the percentage of free or reduced-price meals served in the district two years previously. If more than 60 percent of the meals served went to students qualifying for free or reduced-price meals, the district gets the extra 2 cents. If the number is less than 60 percent, they get only the basic reimbursement level.

For student meals served free to qualifying low-income students, an additional federal reimbursement of \$1.89 was made, for a total, including the above 20 or 22 cents, of \$2.09 or \$2.11 per meal depending on whether the meals were served in low-income areas. Reduced-price meals were reimbursed at 40 cents per meal less than for free meals. In total, reduced-price meals were reimbursed at \$1.69 or \$1.71, depending on the income level of the location served.

The above rates were the same in each of the forty-eight contiguous states and the District of Columbia. Higher rates were paid for meals served in Alaska and Hawaii, in recognition of their higher costs. All meals served in Alaska in 2001–2002 received 32 or 34 cents reimbursement. Free meals received a total of \$3.38 or \$3.40, and reduced-price meals received a total of \$2.98 or \$3.00. In Hawaii, the rates were 23 or 25 cents for all meals, for a total of \$2.44 or \$2.46 for free meals and \$2.04 or \$2.06 for reduced-price meals, depending on the income criteria. Note that the 2-cent differential for income level of the district was the same as in the 48 states, and the 40-cent differential between free and reduced-price meals was maintained.

The above payment rates increase by law each year, as noted above. The average increase for school year 2001–2002 year was 2.85 percent, reflecting price increases over the previous year.

In addition to the above cash payments, schools also receive in-kind commodity support. They received an entitlement level of 15.5 cents worth of foods in 2001–2002 for all meals served. These foods are purchased and distributed to the states by the USDA. The types of foods purchased are determined in consultation with the states to be those preferred by program operators, based on feedback from children's preferences. In addition, a variable amount of bonus foods are provided when foods are in surplus from an agricultural supply perspective. The entitlement level of 15.5 cents increases each year based on wholesale food-price increases as measured by the Bureau of Labor Statistics.

### **Free and Reduced-Price Lunches**

Since 1971, free lunches have been available to all children from households with incomes below 100 percent (or more) of the Income Eligibility Guidelines, which were patterned after the Income Poverty Guidelines published by the Office of Management and Budget (OMB). In August 1981, the level of eligibility for free lunches was raised to 130 percent of the guidelines, and reduced-price meals were made available to all children from households with incomes between 130 percent and 185 percent of the Guidelines.

In school year 2001–2002, these guidelines provided free meals to students from four-person households with annual cash incomes (before taxes and other deductions) below \$22,945 in the forty-eight contiguous states and the District of Columbia. Income levels varied by household size, and were about 25 percent higher in Alaska and 15 percent higher in Hawaii. Reduced-price meals were available to students from four-person households with incomes below \$32,653 in the forty-eight states, with similar adjustments by household size and for Alaska and Hawaii. The numbers for 2001–2002 were raised by 3.52 percent from the previous year, based on CPI price changes measured by the Bureau of Labor Statistics.

In order to receive free or reduced-price lunches, a household must return applications sent home with students each Fall soon after school begins. Applications include household income levels, which are used to determine the income criteria given above. Every attempt is made to keep applications confidential, as well as the daily service to students of the free or reduced-price meals. Often, meal coupons are used for this purpose; they are purchased by those paying for their meals and provided free or at reduced price to qualifying students.

All meals are provided free to students in Puerto Rico and the Virgin Islands. Federal reimbursements are based on incomes of households with students, using the forty-eight-state eligibility levels as a benchmark.

### **Nutrient Standards**

Public Law 103-448, passed in November 1995, offered three alternative ways of meeting the new menu standards: (1) NuMenus, or Nutrient Standard Menu Planning (NSMP); (2) Assisted NuMenus, which provides outside assistance in

conducting NSMP; and (3) Food-Based Menu Planning, which consists of a modified set of foods from the traditional USDA menu-planning system. A fourth menu planning system was authorized by the Healthy Meals for Children Act (Pub. L. 104-149), which was passed in May 1996. This system provides a further option that allows schools additional freedom in using various food-based menu planning systems, as long as they ended up meeting the basic nutrient standards.

Even though much flexibility is provided in menu planning, the nutrient-based requirements of Public Law 103-448 remain in effect. Once every five years, each school district is monitored by the state agency, and a week of menus is evaluated for conformance in meeting the nutrient standards. These standards consist of specified levels of energy (calories), fat and saturated fat, protein, calcium, iron, Vitamin A, and Vitamin C. The levels are specified as averages for kindergarten through sixth grade, and for seventh through twelfth grades.

### **The School Breakfast Program**

The School Breakfast Program (SBP) is a federal nonprofit entitlement program that operates independently of, but alongside, the NSLP. It began as a pilot program in 1966, authorized by the Child Nutrition Act of 1966, and was made permanent in 1975. The original purpose of the program was to primarily to provide breakfasts to elementary and secondary school children coming from poor economic areas, and to those traveling long distances to school. After becoming permanent, the program has been equally available to all eligible children. However, reimbursement rates favor those areas in severe need, which are those districts serving a relatively large share of meals at free or reduced prices.

The program is similarly administered at the federal level by the Food and Nutrition Service of the USDA, and usually at the state level by state education agencies. It is still not as broadly available as the NSLP, but operates nationally in 72,000 schools and institutions. All meals served under SBP must meet the recommendations of the Dietary Guidelines for Americans. In addition, they must provide one-fourth of the daily recommended levels of calories and RDAs for protein, calcium, iron, Vitamin A, and Vitamin C.

Any child at a school with an approved program may purchase breakfasts under the program, and

those meeting NSLP requirements may also receive free or reduced-price breakfasts. However, the preponderance of those participating receive their meals free or at reduced prices, which reflects the original purposes of the program. As in the case of lunches, funds for SBP were initially allocated on a state-by-state basis, with a basic grant of \$50,000 per state. The program was later turned into a federal entitlement, with meals reimbursed on the basis of the number of meals served.

Paid breakfasts were reimbursed by the federal government at 21 cents in school year 2001–2002, one cent more than for paid lunches served under NSLP. Free breakfasts received \$1.15 and reduced-price breakfasts received 85 cents under the regular program. However, districts classified as in severe need received \$1.37 for free breakfasts and \$1.07 for reduced-price meals—two-thirds of the total breakfasts served usually meet this criterion. As in the case of lunches, Alaska and Hawaii receive higher reimbursement levels for all breakfasts served.

There have long been strong feelings that the breakfast program provides key nutritional benefits to schoolchildren, perhaps even greater than those provided by the lunch program. In part, these feelings reflect the fact that the lack of breakfast can adversely affect student performance until lunch is served at school. However, no known studies have established a firm basis for this conclusion. The 1992 School Nutrition Dietary Assessment Study found that the availability of a SBP at school did not increase the likelihood of a child eating breakfast. This 1992 study confirmed an earlier study of data from the 1980–1981 National Evaluation of School Nutrition Programs that had found the same result. However, a 1998 Mathematica Policy Research study showed that these conclusions depended heavily on the content definition of a breakfast. The 1992 study defined breakfast as eating any food containing at least fifty calories. The conclusion was that if a breakfast was defined to require the serving of more substantial nutrients, then the SBP would be found to be more useful. Partly for this reason, Congress, in 1998, funded a three-year evaluation of a pilot program in which all children would receive free breakfasts regardless of household income.

### **The Special Milk Program**

The Special Milk Program (SMP) provides federal reimbursements for milk (alone) served to children in nonprofit schools and child-care institutions that

**TABLE 1**

	National School Lunch Program				School Breakfast Program			
	Free	Reduced	Paid	Total	Free	Reduced	Paid	Total
	millions of participants							
Fiscal year 1981	10.6	1.9	13.3	25.8	3.05	0.25	0.51	3.81
Fiscal year 1991	10.3	1.8	12.1	24.2	3.61	0.25	0.58	4.44
Fiscal year 2001	12.9	2.6	12.0	27.5	5.80	0.67	1.32	7.79

SOURCE: Courtesy of author.

do not participate in other federal food service programs. These would include schools without NSLP or SMP food service, as well as those with half-day kindergarten programs where children do not have access to the lunch or breakfast program. The SMP program has declined slightly in scope over time as the NSLP and SBP have expanded, but the SMP has remained a viable niche program. In 2000–2001, SMP milk was served in nearly 7,000 schools and residential child-care institutions, along with 1,100 summer camps and 500 nonresidential child-care institutions.

Those schools or institutions that participate in SMP offer milk on a paid or free basis using the same criteria of eligibility as under the NSLP. Reimbursements of paid milk are made on the basis of the number of half-pints of milk served. In 2001–2002, schools received 14.5 cents per half pint. But for free milk served, they are reimbursed at the net purchase price for the milk. Various kinds of milk—flavored or unflavored, low-fat or whole milk—are eligible to be served.

### After-School Care Program

The After-School Snack Program, which began in 1998, must operate under the school food authority that operates the NSLP. It must provide children with regularly scheduled educational or enrichment activities in an organized, structured, and supervised environment to be eligible for federal reimbursements. It also must be located in a geographic area served by a school in which 50 percent or more of the children enrolled are eligible for free or reduced-price school meals.

Reimbursement rates for 2001–2002 were 55 cents for free snacks, 27 cents for those at reduced price, and 5 cents for those paid. Rates were higher for Alaska and Hawaii, where free snacks were reimbursed at 93 cents and 67 cents, respectively.

### Participation and Costs of School Food Service

Table 1 shows the average daily participation, by payment categories, in the National School Lunch Program and School Breakfast Program for fiscal years 1981, 1991, and 2001. The data represent sums of monthly averages of participation reported by the states, averaged for the federal fiscal years for the months of October through May, plus September. Participation is defined as the number of meals per enrolled student, adjusted for absenteeism.

One can readily see that participation in the NSLP increased slightly between 1981 and 2001, and that the increase in participation is centered on free or reduced-price meal participants. Paid meal participation declined 10 percent. In terms of percentages, the reduced-price category increased the most (more than one-third) but it remained less than 10 percent of total participation. Paid lunch participation accounted for less than one-half (44 percent) of the total in 2001.

In contrast, the SBP increased quite substantially over the two decades. In fact, total participation doubled. This growth was no accident, for considerable attention was focused on growing the School Breakfast Program during this period. Free meals dominate the program, accounting for nearly three-fourths of the total in 2001. Reduced-price participants accounted for another 9 percent, leaving paid participants at 17 percent. SBP participation was small in 2001 in relation to the NSLP, at less than one-third the total number of participants.

Table 2 shows the federal costs of the NSLP and SMP, in millions of dollars, again for fiscal years 1981, 1991, and 2001. Total federal costs for the NSLP doubled over the two decades, with most of the increase in terms of cash payments. Commodity costs increased only slightly, and they included bonus commodities that had shrunk considerably,

TABLE 2

**Federal costs for National School Lunch Program and School Breakfast Program**

	National School Lunch Program			School Breakfast Program
	Cash	Commodities	Total	Total
	millions of dollars			
Fiscal year 1981	2,381	895	3,276	332
Fiscal year 1991	3,526	699	4,224	685
Fiscal year 2001	5,605	963	6,468	1,445

SOURCE: Courtesy of author.

accounting for only \$60 million in 2001, compared with \$316 million in 1981. Entitlement commodities increased from \$579 million to \$802 million over this period. Federal SBP costs increased more than four times over the 20 years, reflecting increases in participation, as well as an increase in reimbursements per meal.

Not included in Table 2 are the costs of the SMP and a relatively small program that provides only commodities to some schools not participating in NSLP. The federal SMP cost \$15.4 million in 2001, down from \$19.8 million in 1981. During this period the number of half-pints of milk served declined from 177 million to 115 million in FY 2001. The commodity-only program cost \$23.3 million in 2001, compared with \$21.9 million a decade earlier.

The data in this section were obtained from unpublished sources from the Food and Nutrition Service of USDA (*Program Information Reports*). However, the primary data were published annually for 1981 through 1995 in the *School Food Service Research Review*.

### Related Food Programs

Child and adult care programs and summer food service programs supported by USDA reimbursements may operate in school locations. These programs are very substantial in many areas, but they are not included in this discussion because they are not directly supporting school educational programs.

## SCHOOL LIBRARIES

The modern school library media center has a professionally trained school library media specialist who manages a central collection of diverse learning resources to support a school's curriculum, meet individual students' needs and interests, and ensure that young people develop information literacy skills within the school's curriculum. This concept of a learning resource center is both a social development of the twentieth century and an evolution of information exchange.

### History

The ancient library in Alexandria, founded in the fourth century B.C.E., was a treasure trove of written manuscripts. Medieval libraries comprised collections of hand-copied, illuminated manuscripts that were typically created and maintained by monks and used by privileged classes; manuscripts were often as valuable as farms or houses. An early print format put into the hands of children and used for reading instruction from the fifteenth to the eighteenth century was the hornbook, typically a small wooden paddle with printed paper pasted on top and covered with translucent horn. By the seventeenth century the concept of books created specifically for young people was established with such works as the first picture book, *Orbis Sensualium Pictus* by Johann Amos Comenius in 1657. The invention of the printing press in 1455 promised young people greater access to printed materials, and philosophers like John Locke (1632–1704) and publishers like John Newbery (1713–1767) promoted materials that were both pleasurable and informative to young people. Yet, well into the twentieth century, books and other learning materials remained expensive and rare for most young people in the United States.

Although Benjamin Franklin envisioned a library in his academy (founded in 1740), widespread public recognition and support for school libraries did not develop until the nineteenth century when state legislatures (beginning in 1835 with New York) acknowledged the value of school library resources and began promoting their funding. By 1876, nineteen states appropriated funding for school libraries. Two factors, however, limited the overall success of these early efforts to support school libraries: the lack of library facilities for maintaining the developing collections within the schools and the lack of trained personnel for selecting, organizing, and cir-

culating the collections. The resources were often overseen in small classroom collections by individual teachers, who could not ensure students had access to materials throughout a school; who were not coordinated with other teachers to track library inventories; and who often took materials from one building to another as they changed teaching positions. Meanwhile, the public library movement was developing in the United States, and trained public librarians reached out to address public school needs. Their outreach efforts coincided with the founding in 1876 of the American Library Association (ALA), and at the close of the nineteenth century, the professional voice for school library services to young people often had a public library perspective.

The twentieth century was a tumultuous one in which school librarians continued to address the challenges of the nineteenth century and developed the vision for school library media programs in the twenty-first century. Setting the stage for changes to come was the dialogue in the early 1900s on such educational principles as the importance of intrinsic motivation, the creation of genuine learning experiences in a field setting or a learning laboratory, and the teacher as a guide not a taskmaster. Even in 1900, these were not new ideas, but the educator and philosopher John Dewey, with the 1899 publication of *School and Society*, envisioned a single concept of Progressive education, comprising these elements, in opposition to rote learning, inflexibility, conformity, and competition. Thus, challenges to nineteenth-century assumptions were an aspect of educational planning as school libraries began their twentieth century transformation that included such milestone events as:

**1900** Mary Kingsbury, librarian at Erasmus Hall High School in New York City, becomes the first professionally trained school librarian.

**1915** The School Libraries Section of ALA holds its first meeting.

**1918** The National Education Association (NEA) adopts Standard Library Organization and Equipment for Secondary Schools of Different Sizes. These first national standards define expectations that a professionally trained librarian should manage a centralized collection that included audiovisual resources.

**1920** ALA adopts the 1918 NEA standards.

- 1925** The Department of Elementary Principals of the NEA and the School Librarians' Section of ALA develops the *Report of the Joint Committee on Elementary School Library Standards*. This first set of national library standards for elementary schools emphasizes the library's support of teaching and learning within a flexible schedule that ensures ready access for students and teachers.
- 1945** ALA publishes *School Libraries for Today and Tomorrow, Functions and Standards*, the first national standards for both elementary and secondary school library programs. These standards link the quality of school library programs to qualitative and quantitative guidelines.
- 1951** ALA adopts Standards for Accreditation, which moves the first professional degree in librarianship to the master's level.
- 1951** The American Association of School Librarians (AASL) becomes a division within ALA.
- 1958** The U.S. Congress passes the National Defense Education Act, which funds major development of school libraries in the 1960s.
- 1960** AASL and the Department of Audiovisual Instruction (DAVI) of NEA publishes *Standards for School Library Programs*, national guidelines that address the integration of library skills into classroom work and provide a descriptive narrative with quantitative recommendations and detailed lists.
- 1962** AASL receives the Knapp Demonstration Project, a \$1.13 million grant supporting a five-year demonstration project of exemplary school libraries.
- 1965** The U.S. Congress passes the Elementary and Secondary Education Act, which supports funding of library resources.
- 1969** ALA and the DAVI of NEA publishes *Standards for School Media Programs*, national guidelines that unify the roles of librarians and audiovisual personnel under the terminology of library media program and library media specialist.
- 1971** The DAVI of NEA becomes the Association for Educational Communications and Technology (AECT).
- 1972** AASL begins publishing *School Library Media Quarterly*, the division's research journal.
- 1975** AASL and AECT publish *Media Programs: District and School*, national guidelines that are the first to focus on district goals and responsibilities in the support of building-level library media programs.
- 1988** AASL and AECT publish *Information Power: Guidelines for School Library Media Programs*, national guidelines that define the mission of the library media program to "ensure that students and staff are effective users of ideas and information" (1988, 1).
- 1988** ALA becomes a specialty organization within the National Council on Accreditation of Teacher Education (NCATE).
- 1988** The DeWitt Wallace—Reader's Digest Fund initiates Library Power, a 10-year, \$40-million-grant project for the revitalization of school library media programs across the United States.
- 1998** AASL and AECT publish *Information Power: Building Partnerships for Learning*, national guidelines that set forth AASL's information literacy standards for student learning.

Milestone markers for progress across the twentieth century are the eight sets of published national standards and guidelines.

### Goals and Purposes

Although school library media specialists collaboratively establish library media program goals relevant to the needs of individual schools, they are guided by a mission such as that articulated by the American Association of School Librarians (AASL) and Association for Educational Communications and Technology (AECT) "to ensure that students and staff are effective users of ideas and information" (1998, p. 6). The authors identify seven library media program goals through which the library media specialists support the mission by providing the following:

- Learning activities that foster in students the abilities to select, retrieve, analyze, evaluate, synthesize, create, and communicate "information in all formats and in all content areas of the curriculum"

- “Physical access to information”
- Learning experiences in “communications media and technology”
- Consultation with teachers in designing instruction
- Learning resources and activities that accommodate “differences in teaching and learning styles, methods, interests, and capacities”
- Access to a “full range of information beyond the school building”
- Learning resources “that represent diversity of experiences, opinions, and social and cultural perspectives and to support responsible citizenship in a democracy” (American Association of School Librarians and Association for Educational Communications and Technology 1998, pp. 6–7).

### Materials and Equipment

The materials and equipment in a library media program provide information that supports active, authentic learning, and thus ensures that young people develop the information literacy skills crucial to their success as students and as lifelong learners. Historically the primary source of information for an entire school was an on-site collection of diverse materials and equipment. However, technological changes have altered this traditional view by increasing the quantity of information, accentuating the need for strong literacy and technology skills, creating new formats and packages of information, and interconnecting worldwide information. Such developments have changed the nature of the local collection, now defined in terms of access to and delivery of information and learning resources within and beyond the school. The early-twenty-first century library media collection includes printed materials, realia (the “real thing,” i.e., living, synthesized, or preserved animal, vegetable, or mineral objects in their natural state), hardware and software, online databases, production equipment, and adaptive resources for students and others with special needs.

Access to and delivery of information and learning resources has two dimensions: physical and intellectual. Physical access to library media resources is ensured when resources are usable from a central location that oversees circulation, distribution, organization, and classification for effective and efficient use, and managed according to policies that ensure flexible scheduling that supports focused and pro-

ductive use of learning resources. Intellectual access to information and learning resources requires that they are matched to individual needs and interests; that students and others can find, evaluate, and use them; and that they are supported by comprehensive reference services, including bibliographies and resource lists.

Physical and intellectual access is guided by principles of intellectual freedom, legal standards, and professional ethics. Intellectual freedom is essential for students to become critical thinkers and lifelong learners who can contribute productively and responsibly in a democratic society. Access guided by legal standards and professional ethics ensures confidentiality in the use of information, respect for intellectual property rights, and equity for all students, regardless of ability or cultural considerations.

### Personnel

Qualified school library media personnel are fundamental to successful programs that contribute to student learning, and a program’s level of professional and support staffing is based upon a school’s instructional program, services, facilities, and the quantity of students and teachers. Basic, building-level staffing for an effective program necessitates at least one certified or licensed school library media specialist per building. The library media specialist should hold a master’s degree in librarianship from a program accredited by the American Librarian Association or a master’s degree with a specialty in school library media from an educational institution accredited by the National Council for the Accreditation of Teacher Education. In addition to the minimum of one school library media specialist, each school program requires qualified clerical and technical support staff. The paraprofessional support staff are key to the library media specialist’s ability to fulfill the position’s professional roles. There is a distinction between a technician, who works with hardware and systems software, and a technologist, who integrates people, learning, and the tools of technology.

According to the American Association of School Librarians and the Association for Educational Communications and Technology, the library media specialist accomplishes the program’s primary charge, to “ensure that students and staff are effective users of ideas and information” (1998, p. 6), by fulfilling four roles: teacher, instructional partner, information specialist, and program administrator.

The four roles focus on instilling nine student information literacy standards across the school's curriculum. According to those AASL/AECT standards, young people should be able to:

- Access “information efficiently and effectively”
- Evaluate “information critically and competently”
- Use “information accurately and creatively”
- Pursue “information related to personal interests”
- Appreciate “literature and other creative expressions of information”
- Strive “for excellence in information seeking and knowledge generation”
- Contribute “positively to the learning community” and recognize “the importance of information to a democratic society”
- Behave ethically “in regard to information and information technology”
- Participate “effectively in groups to pursue and generate information” (American Association of School Libraries and Association for Educational Communications and Technology 1998, pp. 9–43).

Library media specialists value information literacy as the foundation of lifelong learning, and they emphasize the process of learning rather than the accumulation of information. By collaborating with diverse individuals within and beyond the school, by building awareness of the program's contributions, and by applying and introducing instructional and informational technologies, library media specialists promote a clear vision for successful library media programming.

## SCHOOL-LINKED SERVICES

TYPES OF SERVICES AND ORGANIZATIONAL FORMS

Robert L. Crowson

OUTCOMES

Sidney L. Gardner

### TYPES OF SERVICES AND ORGANIZATIONAL FORMS

There has been a rapid expansion of coordinated-services efforts throughout the United States since the late 1980s. Solid historical roots can be found in the Progressive era of the early twentieth century, as well as some of the Great Society interventions of the 1960s. However, the aggressive development of a system of coordinated services for children and families in need received its major impetus in the late 1980s in reports of some service-needs conferencing, the results of some early experimentation, and in reports of the conditions of children and families in poverty. Two of the most influential documents were *The Conditions of Children in California* (1989) by Michael Kirst and *Joining Forces* (1989) by Janet Levy and Carol Copple.

The spread of children's services programs, from the late 1980s on, was so rapid that by 1993 one of its foremost advocates, Sharon Lynn Kagan, was claiming that efforts were "blossoming across the country from Maine to California" (Kagan and Neville, p. 78). Such "blossoming" had already received a solid boost from state legislation in New Jersey (1988), Kentucky (1990), and California (1991); with each establishing statewide family services programs.

In 1993 in the *American Journal of Education*, Robert Crowson published the first in a series of co-authored inquiries into issues surrounding the administration and organization of school-based services. Drawing on the available reports, handbooks, evaluations, and case studies of the time, it was observed that an array of institutional realities presented a difficult, uphill climb for service coordination. Among the problematic elements were mat-

ters of professional control and turf; organizational disincentives to collaboration; legal and budgetary dilemmas; communications and confidentiality barriers; questions of governance and managerial support; and reconceptualizations of professional or organizational roles.

Through the 1990s additional reports and analyses continued to document the deep administrative problems encountered by those attempting to coordinate services. A substantial blow to the movement in the United States occurred in 1994 when the Pew Charitable Trust announced the termination of its then sizeable support of school-linked family centers. The Trust's decision came on the heels of some weak evaluation results.

Just a year later, an assessment by Julie White and Gary Wehlage of the New Futures initiative, then funded by the Annie E. Casey Foundation, added fuel to the no-effects fire. Among the most damaging of the findings was the observation that the outreach programs were invariably of the from-the-top-down variety, and that they ignored family and community expressions of service needs, depending instead upon professionally identified definitions of client need.

However, none of this bad press stopped, or even slowed, the movement. The notion of coordinated services has continued to increase in popularity into the twenty-first century. In a 1997 survey of school-based and school-linked initiatives across some forty states, Mary Driscoll, William Boyd, and Crowson found a particularly heavy emphasis nationwide upon programs in parenting education, family support and advocacy, and family health services. A surprising finding was that nearly a third of the programs surveyed in 1997 reported efforts in employment-related services for families, a feature not highlighted in the existing literature on service integration. Perhaps the greatest growth, however, continues to be in the specialized area of health services. Indeed, another survey in late 2000 reported a more than ten-fold increase during the 1990s in the number of school-based health clinics in operation across the United States.

### Current Directions in Service Provision

Amid its continuing growth, a conception of the central problem behind much of the services effort has undergone a bit of change. The talk of a dangerously fragmented delivery system, and of the need

for a heavy emphasis upon the coordination of children's and family services, has declined. Coordination, it has been discovered, is exceptionally hard to do. Instead, in the United States, there has been a reduced focus upon interagency cooperation and a greater emphasis upon the provision of an array of services, coordinated or not.

There has also been less attention paid to school-centered programs of family assistance. Instead, efforts have gone toward the development of a much greater variety of forms and strategies for outreach, including neighborhood organization-led programs, communities-of-faith efforts, private-sector interventions, and many more school-linked, rather than school-based, programs. Finally, activity in the services movement has been directed toward efforts that bridge pedagogically between schools and families and communities—particularly with programs of after-school activities and after-school tutoring, youth development and assistance programs, summer schooling, arts and music education, and day care.

This changed direction is finding roots in a sense of the ecology of community development activities, as opposed to programs of family assistance. Although interest continues in interagency partnering, the focus has increasingly been on community action rather than the delivery of professional services to a poverty-area clientele.

Lizabeth Schorr, nationally known advocate for children and youth, has argued in favor of this new paradigm, claiming that the added delivery of professional services by themselves falls far short of the full scope of efforts needed to strengthen families and improve learning opportunities in low-income neighborhoods. As Schorr puts it, people increasingly recognize that educational success necessitates a key place for the school “at the table where community reform is being organized” (p. 291).

There have been a number intellectual shifts of consequence in the movement toward a community development approach to family assistance. First, the concept of social capital has grown in importance and application. Much influenced by the work of James Coleman, social capital has, over time, become central to the rationale underlying coordinated services. The claim is that critical cultural resources and supports, as well as so-called hard resources through direct assistance, are passed from institutions to families in full-services programming.

Second, without denying the power and importance of services to children and families, the altered ecological paradigm foresees a much larger program of economic outreach beyond professional, interagency partnering. A services agenda may be necessary but not sufficient—especially in deep-poverty circumstances with major infrastructure needs in housing quality, employment opportunities, recreational outlets, law enforcement, and other areas. Matters of public and private investment, entrepreneurialism, regeneration, rebuilding, resourcefulness, incentives creation, market forces, and assisting self-help efforts can all join in creating a climate of assistance that goes far beyond the narrow scope of activity captured in a purely services agenda.

### New Issues in the Organization of Services

The coordinated-services movement encountered many well-documented difficulties in the ability of cooperating partners to share information, deal with turf issues, retain and reorient participating professionals, mingle resources, merge or blend disciplinary perspectives, and involve the neighborhood clientele. In comparison, however, the newer community ecology approach is by no means without its own set of organizational issues.

As an initial issue, there has been a central question regarding basic assumptions of “approach” in assistance to families. The community development idea assumes that market forces can be effectively introduced to low-income communities—that enterprise and investment, incentives and subsidies, employment and empowerment, and rebuilding and repair can begin a transformation process that trickles down to produce much-improved opportunities for families and their children, and reformed and better-performing schools. In contrast, the earlier and narrower services approach has strong Progressive era roots in efforts to *protect* poor families from the ravages of the market. Healthy homes and neighborhoods, and what was thought to be “good” for families and children, were to be provided by a well-trained cadre of informed and committed persons as a hedge against the horrors of sweatshop industrialism. A residue of distrust against the market forces characterizes much of human-services professionalism.

A second unresolved organizational issue involves questions of ownership. To be sure, ownership emerged as a constraint in school-based

programming—ranging from turf protection to determining just what is involved in partnering and who's in charge administratively. With its much broader scope of linkages and collaborations, with less focusing upon a from-the-school-outward delivery of services, and with overtones of community development and empowerment (as well as assistance), the new ecological paradigm is far from clear on just what, or whose, property rights are to be attended to. Foundations, banks, businesses, and schools may initiate community development activities, but the paradigm calls for a quick shift to grassroots ownership. Institutional controls may well be operative, but the paradigm calls for a full recognition of the controlling forces present in the very culture of each community.

As a key organizational issue, consider that school-based services have typically been backed by the best professional practices and undertaken by highly trained (and usually certified) service providers. Under such a structure, agency services will look much the same whatever the community. But, with lessened professional ownership, local values and some clashes around basic premises can easily introduce into best-practice professionalism some extremely strange elements of local accommodation. Professionals are put to a test around just how much ownership they are comfortable in giving up.

### Implications and Conclusions

In brief recapitulation, the emerging context surrounding service provision in the United States finds less activity than earlier in school-centered programs of generalized assistance to families, and somewhat more interest today in direct pedagogical services to children. Additionally, there is a movement away from fairly narrow services agendas and toward a larger arena of community development activity, as well as a decided movement toward initiatives working up from the community rather than trickling down from professional and academic sources.

Increasingly, community-based organizations, rather than schools, are displaying an initiative in offering an array of after-school services (e.g., after-school child care, youth development programs, tutoring, successful parenting classes). These neighborhood organizations typically cover the institutional waterfront, and include local churches, city parks departments and libraries, Boys and Girls Clubs, YMCAs and YWCAs, community organizers, and banks or local for-profit organizations.

As community institutions have displayed a greater level of initiative, a larger and broader paradigm around interagency partnering has been emerging as well. A definition of the problem has proceeded from community responsiveness, through children's and family services, to cooperation in the regeneration of the community itself. By no means, however, is there less regard than before for the local school. Indeed, an added embeddedness of the school in the culture of its community, and a leadership role for the school as part of an overall community of support for families and children, are both very much a part of the revised agenda.

There are implications in the new scenario for the organization of administrative activities. One administrative implication is the need for rethinking some key mental models of school leadership. A longtime part of the lore of school principalship has been a balancing act in the school-community relationship, usually referred to as *bridging and buffering*. School administrators have been taught to walk the tightrope of bridging to the community while simultaneously buffering the organization and its professionals from undue intrusion by the community.

The result, a number of scholars claim, has been the maintenance over the years of a sizeable gap between schools and their communities. This has created a call for a new role that replaces bridging and buffering with a more outreach-oriented exercise of *civic capacity*. School administrators who exercise civic capacity reach out actively from their schools to help build or develop their respective communities.

A related implication is the need to clarify just what it means to partner in linkages with other community groups. Seymour Sarason and Elizabeth Lorentz argue that partnering in the early twenty-first century requires much more than just a bit of collaboration. It means meaningful boundary crossing—where there is resource exchange, a true network approach to shared objectives, and much more selflessness (or less ownership) than is typical of most interagency relationships. This is the type of partnership activity that was called for by White and Wehlage in 1995. Community services, they argued at that time, should be judged less by their success in providing resources and services and more by their success in reshaping the priorities and practices of schools toward a closer understanding of, and partnership with, the family and the neighborhood.

ROBERT L. CROWSON

## OUTCOMES

School-linked services are health and family services that are provided to students in one or more schools through a variety of linkages. Services may be located at or near a school (e.g., a mobile medical van, a family resource center housed in a modular classroom), provided after school to some students, or students may be referred to services provided by an external agency made available based on an agree-

ment between the school and the provider agency. Appropriate measures to assess the effectiveness of these services differ depending on the form of school-linked services being reviewed.

*School-linked services* is a label that overlaps with earlier phrases that describe school-connected efforts to connect students with community resources they need to perform in the classroom and to address problems that may impair their learning. *Community schools, school-based clinics, full-service schools, learning supports, and family resource centers* located at schools are all labels used currently as well as in earlier eras. The emphasis upon linkage is usually intended to signal that services may not be physically located at schools, but are intended to be connected with schools through a variety of administrative and policy agreements among schools and other agencies.

School-linked services are in addition to those health and social services provided by school staff, including psychologists, counselors, social workers, school nurses, and others. Within the broad field of noneducational learning supports, some policy advocates and practitioners have emphasized the need for better connections among the staff already working for schools, while others have emphasized the relatively small number of these professionals compared to the number of students with noneducational problems that affect their learning. That number may be as high as one-third of all students in some schools who are affected by poor health and other factors, including:

- dental, physical, vision, and other health problems;
- inadequate or no health insurance coverage;
- family stress due to substance abuse, low income, family violence, or behavior by the students themselves that involves high-risk sexual activity, substance abuse, or criminal activity and gang involvement.

The need to tap outside agencies that are funded to work with youth is the basis for the argument that school-linked services are a critical supplement to what the school systems' own professionals can accomplish in addressing these problems.

### Measuring Effectiveness—Which Outcomes?

A question that arises early in the discussions between school and agency over school-linked services is what standards and measures should be used in as-

sessing the effectiveness of these services. Are they to be assessed based on their impact on the core mission of the school—academic performance by students—or are there other, noneducational measures of the impact of school-linked services on students?

Each party to this discussion has a different starting point. Schools naturally begin the dialog stressing the academic outcomes for which they are held accountable, while other agencies with a greater concern for health, family services, and youth development measure what school-linked services do for students and their parents. The negotiations about goals and outcomes among the sponsoring agencies and schools turn on the relative importance of classroom performance compared with interventions aimed at the external causes of classroom achievement gaps.

School-agency-community partnerships eventually need to move toward agreement on the specifics of the outcomes and indicators to be used as fair measures of progress. Three types of outcomes typically emerge from these discussions, each moving out in a wider circle from a core of education-only outcomes and indicators.

For school-based outcomes, the triad of achievement measured by test scores, attendance, and school completion/graduation rates constitutes the standard that most schools would take seriously as basic measures of school-linked services. Some schools would add the number of suspensions and classroom behavior as measured by disciplinary incidents as indicators of effectiveness. These are the core outcomes for most schools.

In the next circle of outcomes, beyond the classroom, the outcomes are still related to academic achievement, but are no longer restricted to what happens in the classroom. These outcomes include parent involvement, help with homework, reading to primary-age children, and parent engagement with teachers in responding to behavior problems in the classroom.

The third circle consists of those outcomes that are further out into the arenas of community building and youth development, and may include such things as schools' success in attracting community volunteers, children's health coverage in the immediate neighborhood, and the effects of early childhood programs that aim at school readiness goals.

These three circles of outcomes, marked by their increasing distance from academic achievement, set

up a further distinction between tightly-linked learning supports, in which the objectives of school-linked services are closely connected with academic achievement and are stronger than in those looser-linked systems in which noneducational goals are given standing independent of their impact on classroom achievement. Experience suggests that the choice of which system is most appropriate should emerge from each district's negotiations with its partners, rather than being mandated by external funders. In a district with weak leadership or strained relations with its surrounding community, academic achievement may be all the partnership can handle. But in a district that has built credibility with its neighbors, parents, and nearby agencies, the wider circles of outcomes may be exactly the right way to take advantage of that history of good relationships.

At the same time, evaluation of school-linked services models in multiple sites underscores the importance of a close fit between what is being measured and what resources are devoted to achieving. To use educational outcomes to measure an after-school program that primarily focuses upon health and recreation goals, rather than academic activities, is not an appropriate use of outcomes. Improved family functioning is unlikely to result from tutoring models and using family functioning scales to measure the effects of such programs is not a good allocation of evaluation resources.

Two other sets of distinctions are also important to keep in mind when evaluating the outcomes of school-linked services.

1. Between short-term and longer-range outcomes, that is, between those outcomes that are markers of movement in the right direction, such as student attendance improvements, and those which are long-term positive results, such as college entrance/completion or mastery of key vocational skills.
2. Between measures of negative behavior—suspensions and expulsions—and measures of positive development. In working with youth, in particular, it is important not to overemphasize those measures that connote negative behavior, as they convey a message that youth are being monitored only for their mistakes. Emphasizing positive accomplishments in developing outcomes provides better feedback to students.

### What Is Known About Outcomes?

A recent compilation of evaluation results from forty-nine different community school models was developed by Joy Dryfoos for the Community Schools Coalition, an organization based at the Institute for Educational Leadership. In forty-six of these reports, positive effects were noted. Thirty-six programs reported academic gains, nineteen reported improvements in attendance, eleven reported a reduction in suspensions, eleven reported reductions in high-risk behaviors, twelve reported increases in parent involvement, and six reported safer communities as a result of the initiative. Another compilation, developed by the UCLA School Mental Health Project, provides information on outcomes from a sample of almost 200 programs. These outcomes were organized into six basic areas that addressed barriers to learning and enhance healthy development: (1) enhancing classroom-based efforts to enable learning, (2) providing prescribed student and family assistance, (3) responding to and preventing crises, (4) supporting transitions, (5) increasing home involvement in schooling, and (6) outreaching for greater community involvement and support—including use of volunteers.

The challenges facing evaluation of these initiatives should not be underestimated. Such evaluations seek to separate the effects of programs that were deliberately designed to combine different interventions, aimed at highly disparate student populations that are hard to compare with students not receiving the interventions, and taking place in complex, partially open systems that include large bureaucracies, complex funding streams, and strongly held professional and community values. These evaluation problems correspond closely to those encountered in evaluating comprehensive community initiatives, which have been the subject of several reports by the Aspen Institute Roundtable on Comprehensive Community Initiatives.

### Enduring Importance

School-linked services are a continuing effort to respond to educational challenges that arise in the wider community, reminding us that children are in school only 9 percent of the time from birth to adulthood at age eighteen. As schools come under increasing pressure for academic outcomes through discussion of statewide and national testing standards, it is important to recognize that the test scores and academic performance of some children are sig-

nificantly affected by problems that arise outside the schools and that cannot be addressed by schools alone. It is crucial that that school-linked services are evaluated as broadly as possible in their impacts on academic outcomes as well as their effects in addressing the underlying problems that some students bring to school.

## SCHOOL PRINCIPAL

*See:* PRINCIPAL, SCHOOL.

## SCHOOL PSYCHOLOGIST

*See:* PSYCHOLOGIST, SCHOOL.

### SCHOOL READINESS

School readiness refers to the extent to which a child exhibits the behaviors, skills, and knowledge necessary to be successful in elementary school. These can be grouped into four categories: social and emotional development, oral language development and pre-reading skills, oral mathematics development and pre-mathematics skills, and general knowledge. Because individual schools vary in the timing with which they introduce academically demanding reading and mathematics instruction in kindergarten and first grade, the skills and habits recommended below are only approximate goals, to be attained to the greatest extent possible during the preschool and kindergarten years.

#### Social and Emotional Development

To be ready for school, the child must develop the social and emotional maturity to participate appropriately and learn from classroom activities. This requires adequate nutrition and health. It also requires that any hearing or speech deficits have been reduced to the greatest extent possible. Physical maturity may also be important and may be interrelated with social and emotional development. For example, the child must be able to care for her own toiletting needs without supervision. Other self-help behaviors that must be developed include the ability to locate and care for personal belongings, to feed oneself independently, to get on and off the school bus with minimal supervision, to avoid obvious dangers, to put on and remove outer clothing within a reasonable length of time, to recognize problems and try strategies for solving them, and to communicate one's own needs and wants.

Beyond self-help, the child must also show appropriate group-oriented social behavior and classroom conduct. He must separate from parents and accept school personnel. The student must learn appropriate means for expressing emotions and feelings and properly play the role of an individual within the group. This includes showing respect for others and their property, playing cooperatively, and sharing and taking turns. The student must initiate and maintain peer interactions, and do so without

aggression, while defending himself as needed. The student should be able to play both independently and with the group. When required, he should imitate peer actions, such as lining up and waiting appropriately. The student should be willing to try something new. The student should follow classroom rules, including voice control. He must respond to warning words (e.g., "No," "Stop") and modify his behavior when given verbal feedback.

Finally, the child must have sufficient maturity to successfully engage in task-related behaviors. This includes finding the materials needed for a task, holding and manipulating the materials, and doing so without disrupting other students. The student must be able to stay in her "own space" during the activity, work on the activity for an appropriate amount of time (e.g., fifteen minutes) with minimal cues and supervision by teachers, and complete the task on time and at a satisfactory performance level. If help is needed, the student should ask peers or the teacher for assistance in an appropriate manner (e.g., raising her hand). She should also replace materials, "clean up" the workspace, and follow classroom routines in the transition to the next activity.

In sum, to be socially and emotionally ready for classroom participation and learning, the child must be able to learn classroom routines and comply appropriately with teacher instructions. The child must maintain appropriate focus on the group's activity, learn from the activity, make choices, and generalize the knowledge gained to future activities.

#### Oral Language and Pre-Reading Skills

The child's understanding and production of oral language is the principal mechanism by which she communicates with others. To be ready for school, the child must be sufficiently skilled in both receptive and expressive language, and in verbal reasoning. In this regard, it is helpful if the child speaks Standard English, including the use of Standard English grammar. Vocabulary knowledge is also important. The child's transition to schooling is facilitated by already being familiar with the words and concepts employed by the teacher. In addition, such vocabulary knowledge can be critically important in learning to read. The size of a child's vocabulary on entering school has been shown to be one of the key predictors of the ease with which the child learns to read.

A rich oral language environment in the home and/or preschool provides the best preparation for

schooling. This includes extensive conversation with adults, in which the child uses language to answer questions and discuss issues. The parent should interact with the child in a way that assists the child to develop reasoning skills and to understand and express more complex ideas.

By being read to and engaging in other print activities, such as playing with magnetic letters, puzzles, games, and so on, the child should have developed a variety of “concepts about print.” These include the purpose of reading, the structure of written text, how stories work, what a word is, how words are composed of letters, and what spaces signify. The child should be able to show the front cover of a storybook and open it to start reading. He should know that one goes from left to right and top to bottom when reading English text. He should be able to identify a few words by sight. He should already have had some practice identifying and writing the letters of the alphabet. This practice, along with related activities in drawing and coloring, should be developing the child’s fine motor skills to prepare for more systematic and demanding writing exercises.

A particularly important aspect of the child’s oral language skill is her *phonemic awareness*. This is the ability to consciously pick out and manipulate from spoken words the smallest sound chunks that make up those words. These chunks are called *phonemes*. Learning to consciously pick these out of the sound stream of spoken language is a form of “ear training” that is very useful for the child’s first major task in school—learning to read. This is because phonemic awareness involves identifying the spoken sound units that correspond to the letters or letter groups in written words. This helps the child to understand the “alphabetic principle”—that any combination of written letters can be “sounded out” and may represent a word that has meaning in the child’s oral vocabulary. That is, groups of letters written together constitute a “code” that can be “decoded” by sounding out and listening for meaning. Another aspect of this principle is the idea that spoken words are composed of sounds that can be represented by letters, which can be written down to “encode” the spoken language into its written form. Thus, reading involves going from written to spoken words, whereas spelling involves going from spoken to written words (or at least to the letters required to write the words). The two together illustrate the one-to-one correspondence between spoken and written language.

Because speech is heard naturally as a continuous stream of sound, and short words and syllables are heard as one sound, children must be taught how to segment these sound chunks. For example, children and adults hear the word *mat* as a whole, even though it is made up of three phonemes. Teaching phonemic awareness to preschool children begins with the ability to hear and reproduce rhymes and alliteration, as in nursery rhymes. It then moves on to the ability to do oddity tasks (which first sound is different in the oral words *big*, *hill*, and *bit*?; which last sound is different in *ball*, *pop*, and *mop*?; or which middle sound is different in words such as *pin*, *fun*, and *sit*?). This skill may also be practiced by asking the child to repeat the first or last sound in a series of words spoken by the teacher or parent. It may help to prolong beginning sounds when pronouncing them for the child—for example, “ssssat” or “mmmmat.”

With kindergarten-age children, one can begin to teach the ability to orally blend separate sounds (what word do the sounds /m/, /a/, and /t/ make?). This is a key skill that will be needed when the child first tries to read by sounding out words. A related ability is phonemic segmentation—skill at breaking a spoken word into its separate sounds. Instruction can begin by having the child tap out the separate phonemes, progressing to having the child actually reproduce the separate sounds after the instructor has said the word (for example, *mat* becomes /m/, /a/, /t/).

Oral vocabulary knowledge and phonemic awareness ability have already been discussed as keys to success in the most important first-grade task—learning to read. Other keys include knowing the names of the letters and the sounds they are associated with. Children should be able to identify most letters of the alphabet upon request and to indicate what sound the letter makes. They should be able to write the letters on request. Kindergartners also can begin to write some easy words. At this point they should begin to fully understand the alphabetic principle underlying the language, that letters combine to make words and that words, properly pronounced, carry meaning.

### Oral Mathematics and Pre-Mathematics Skills

To be ready for first-grade mathematics, preschool and/or kindergarten children need skill, knowledge, and experience with mathematical ways of thinking and performing. It is helpful if children have been

involved in games and activities in which they sort and classify objects by size, shape, and function. They should be given practice recognizing sets of objects and identifying items that belong and do not belong in a given set.

Children should learn to use concepts such as “the same as,” “more than,” “less than,” “most,” and “least.” They should know the first ten or twenty numbers, being able to recite them and use them to count objects. They should recognize these numbers when they are written down and should be able to write them upon request. They should be able to orally respond to simple adding and subtracting tasks. They should understand simple geometric shapes and be able to copy them and answer simple questions about them. (What are their names? Which are alike? Which are different? In what ways?) They should be able to copy more complex geometric figures, such as a star or parallelogram, and be able to answer questions about them. They should know the parts of a whole and be able to identify half of a region, object, or set of objects.

In sum, to succeed in first-grade mathematics students should have as much experience as possible with numbers, counting, and simple geometric concepts. They should be able to count at least to ten, and perhaps to twenty or thirty, both forward and backward. They should be able to identify written numbers and to write down the first ten numbers on request. They should be able to apply this knowledge to simple counting problems. They should know the symbols “+” and “-” and be able to do simple addition and subtraction problems, as well as play games involving pattern recognition and strategic choices. The student should be prepared for first-grade work in both computation and problem solving. She should also be able to copy and identify simple geometric figures (square, triangle, and circle) and discuss their properties.

### General Knowledge

To be ready to be successful at school, children need sufficient general knowledge to orient them properly within the school and the world at large, and to correctly respond to teacher requests. They should be able to tell their full name and age and be learning to write these. They should be able to identify the colors by name. They should know the names of their parents and the city or town where they live. They should be able to draw simple pictures, such as of people, animals, and places.

Children should know that objects have properties, such as length, weight, and capacity. They should have played hands-on games involving counting, comparing, sorting, and ordering objects. They should recognize pennies, nickels, dimes, and quarters. They should have some experience with measurement, using a ruler, a scale, and a thermometer. They should be able to orient themselves in time: morning, afternoon, tomorrow. They should be able to tell time to the hour using a clock face. They should know the days of the week and the months of the year. They should know their left and right hands and be able to explain such contrasts as top/bottom, on/under, and in front/behind.

### Summary

To be ready to be successful in kindergarten and/or first grade, a child must demonstrate adequate social and emotional maturity, oral language and pre-reading skills, oral mathematics and pre-mathematics skills, and general knowledge. Where maturity is concerned, the child must have adequate self-help skills. He must also show appropriate group-oriented social behavior and classroom conduct, including the ability to successfully engage in task-related behaviors. Regarding oral language and pre-reading skills, the child must be skilled in both receptive and expressive language and in verbal reasoning. He should be familiar with “concepts about print” and be developing phonemic awareness (the ability to hear and manipulate the separate sounds in spoken language). For oral mathematics and pre-mathematics skills, the child should be able to understand and use simple arithmetic and geometric concepts. Where general knowledge is concerned, the child needs sufficient command of information to be properly oriented within the school and to correctly respond to teacher requests. When these behaviors and skills are in place, the child is ready to take his place as a member of the learning community in the classroom and the school.

## SCHOOL RECORDS AND REPORTS

See: RECORDS AND REPORTS, SCHOOL.

## SCHOOL REFORM

Two decades of school reform came to a close at the end of the twentieth century. These efforts, led by E. D. Hirsch and Ted Sizer, began in the early 1980s and continued through the 1990s, leading to the development of programs such as Success for All. These programs were aimed at developing comprehensive school reform models. The New American Schools Development Corporation supported many of these models.

This massive education reform effort set out to achieve educational goals never before attempted in the United States. Two major premises drove these ambitious goals. The first premise was that nearly everyone in the United States deserved, was capable of, and should be required to receive academic instruction through high school regardless of race, economic status, or post-high school plans. Second, academic standards needed to be raised considerably for all students. These driving premises were a result of the nation's leaders coming to an understanding that education, the economy, and a sustainable democracy are deeply intertwined in a postindustrial society.

The impetus for these two decades of reform took place in the 1980s, but it was a result of the

major challenges facing education in the years before. In these years the nation's education system realized a major decline in enrollment. The 1970s marked the baby boom's departure from the schools and schools all over the country faced a sharp decline in enrollment. Along with this came a growing disengagement with education. As fewer and fewer residents had children in school, communities became less interested in schools and began resenting funding them through property taxes. This, along with other economic factors, brought on a major property-tax revolt in the late 1970s.

The school system was further challenged by social revolution. Teacher unions, the disabled, students with limited English proficiency (LEP), minorities, and women began to demand fair treatment in schools. Teacher unions in the late 1960s became increasingly active, organizing strikes regularly. Congress and the judiciary became more involved in protecting school-age citizens from discrimination with resolutions such as the Rehabilitation Act of 1973, the Education for All Handicapped Children Act of 1975, and the 1974 Supreme Court decision *Lau v. Nichols*.

Perhaps the most important of all the discrimination decisions was *Brown v. Board of Education* (1954) which demanded that public schools be racially desegregated. In order to desegregate schools busing was mandated. This practice caused major upheaval. As minorities entered traditionally segregated schools looking for stable learning environments, they found themselves amid great chaos and violence. The result of the efforts mainly led to "white flight" from public education to private schools.

Concurrent efforts to make education a place of equal opportunity for all led to a de-emphasis on teaching and learning. Schools across the nation became increasingly bureaucratic as the nation became more litigious. School employees were often more concerned with enforcing and maintaining order and the new regulations than with teaching their students. It was said educators became more concerned with "dodging lawsuits than with the quality instruction in their schools, and they made the broadening of education opportunities rather than the quality of education the priority in much of public schooling" (Toch, p. 7).

As American public education was deteriorating rapidly in the late 1960s and early 1970s, it began to

draw the attention of critics who published many reports detailing the problems in schools and calling for widespread reform. In 1966 James S. Coleman released a study reporting that socioeconomic status was the primary determinant in academic achievement. In other words, schools, teachers, and money had little bearing on the level of academic achievement that a student could reach. Another leading sociologist, Christopher Jencks, reaffirmed Coleman's study by stating that academic achievement was more an indicator of the student's characteristics than of the school input.

Despite more and more public attention to the education crisis, the federal role was still limited. Not until 1979, after a major lobbying effort by the National Education Association (NEA), which later became the largest teacher union in the country, was the U.S. Department of Education created by the Carter administration.

With a cabinet-level education office the problems in education drew more and more public attention. Newspapers reported major declines in students' scores on the SAT and the National Assessment of Educational Progress (NAEP). The National Science Foundation also reported that academic standards were declining in the nation's schools. This news was alarming when compared to the high standards that the United States' economic competitors required of their students. By the early 1980s business leaders, the government, and the general public had decided that public education in the United States was in "parlous trouble" (National Commission on Excellence in Education).

### ***A Nation at Risk***

Major economic problems in the 1980s magnified the public's disenchantment with public education. More and more people began to connect the downturn in the economy to the poor system of education in the United States. Under the direction of President Ronald Reagan, the Department of Education faced sharp criticism and calls for its abolition from the president's own political party. Reagan had appointed Terrel H. Bell to the department as Secretary of Education despite the skepticism of the Republican Party, who considered Bell too moderate. The new secretary of education was sympathetic to the department and was reluctant to entertain efforts to abolish the new cabinet office.

In response to claims that he was too soft on the problems in education, Bell proposed the creation of

a independent presidential commission to investigate the state of education in the United States in a fair and balanced manner. Reagan, who saw little value in presidential commissions, turned down Bell's proposal. As a result, in 1981 Bell commissioned his own cabinet-level panel, to be called the National Commission on Excellence in Education (NCEE), to review education. The eighteen-member panel was composed of representatives from a wide spectrum of political perspectives. The panel produced the report *A Nation at Risk: The Imperative for Education Reform*, which stands as perhaps the most important document in the late twentieth century's history of education reform. *A Nation at Risk* became the impetus for two decades of standards-based reform. Ironically, once the report's themes became known at the White House, Reagan adopted the report as his own.

The seminal report came in the form of an open letter to the American people and President Reagan in April 1983. The report was a serious indictment of education in the United States. It stated, "Our nation is at risk. . . . If an unfriendly foreign power had attempted to impose on America the mediocre education performance that exists today, we might well have viewed it as an act of war" (p. 5). Despite acknowledging some gains in education, the report overall displayed a severely negative portrait of American education. Even though Bell's commission was pessimistic it maintained that if their strict recommendations were followed, they could reverse the declines and restore excellence in education.

*A Nation at Risk* made five recommendations for attaining excellence in education. The recommendations were: (1) that "five new basics" be added to the curriculum of America's schools. The basics included four years of English, three years of mathematics, three years of science, three years of social studies, and half a year of computer science in high school; (2) that more rigorous and measurable standards be adopted; (3) that the school year be extended in order to make more time for learning the "New Basics"; (4) that the teaching be improved with enhanced preparation and professionalization; (5) that accountability be added to education.

*A Nation at Risk* shocked the country. The report galvanized the public to demand action to restore education in the United States. The report was followed by a series of other critical reports on education from organizations such as the Committee for Economic Development and the Education Com-

mission of the States. While no other report had the impact that *A Nation at Risk* did, the accumulation of the reports created the impetus for the start of two decades of education reform. The nation needed to regain its competitiveness among its economic rivals globally.

The calls to arms energized the nation's governors. Education reform became one of the most politically popular agendas for governors regardless of political leanings. The South became the hotbed for education reform led by governors. Progressively minded governors such as Lamar Alexander of Tennessee, William Clinton of Arkansas, James Hunt of North Carolina, and Richard Riley of South Carolina accepted the challenge of reforming education in their states and in turn led the country. The president, who even before *A Nation at Risk* wanted to return the responsibility of education to the states, embraced the new energy of the governors.

Leadership from the nation's "education governors" inserted itself into the National Governors' Association (NGA), which released its own report on the state of education. The NGA report reaffirmed the NCEE notion that without reforming education the nation would not continue to be economically competitive on a global level. This theme was especially provocative for the nation's business leaders, who began to call for improvement in the schools. Business leaders became a strong force in the reform movement and influenced political leaders to allocate more resources to education.

Education reform desperately needed the support of an unlikely ally—the president. Reagan had been opposed to a major federal role in education, had attempted to dismantle the Department of Education, and even denied the creation of the presidential commission, eventually established at the cabinet level by Secretary Bell, that wrote *A Nation at Risk*. After this report, however, Reagan realized the importance of the growing reform movement and began to champion school reform.

Reagan took *A Nation at Risk* on the road for eleven weeks after its release to announce his new emphasis on education. The president's leadership was essential in elevating the movement to the highest level. Reagan was able to use his control of the media to make education reform the highest national priority.

## Reform in Action

With new levels of publicity, recommendations at hand, and ambitious governors, education reform activity was high. In fact some real improvement was taking place. High school curricula broadened and became more focused on academics. High school graduation requirements increased, modeled after the NCEE recommendation, in opposition to old ideas that proposed that intellectual/academic education was not for everyone. Reformers, especially business leaders, recognized that a new postindustrial economy needed skilled workers with higher-order thinking skills. No longer was an uneducated worker needed to stand in an assembly line. Employers demanded workers who could think.

With the reform movement's success in establishing more rigorous intellectual content in American education, students returned to the public schools. Enrollment surged and course work in the academic subjects became standard for almost every student. Students graduated with evidence of solid backgrounds in mathematics, science, history, and foreign languages on their transcripts. Many students even took Advanced Placement tests for college. As a result of the new emphasis of academic subject matter and higher rates of enrollment more teachers prepared with strong content were required. Unfortunately, there were not enough teachers with the content knowledge to meet the demand. Teachers were underprepared and their teaching methods were inadequate. As a result, curricular reform for most students came in name only; most students did not receive real academic training due to the lack of infrastructure to support it.

In addition, watered-down courses began to pop up in the school curricula across the country. In essence a new sequence of courses was created. Students could spend most of their high-school careers without being exposed to academic subject matter in depth. Critics began to note that American education was "an inch deep and a mile wide" for most students. Many students migrated to the easier tracks and many were forced into a shallow education experience. Despite advances in curricular reform, the majority of students felt few real learning gains. At the same time, with the new emphasis on academics, vocational education was fighting to stay alive in schools.

Still the education reforms were mostly undercut by the lack of teachers with the essential content

knowledge to teach students adequately and accommodate the growing enrollment in academic courses. Teachers were being assigned to subjects in which they had no training or experience, just to satisfy the new curricular requirements. Tracking persisted and became more problematic as students in the lower tracks received instruction more often from the least-qualified teachers.

This led to a movement that spawned many initiatives promoting the professionalization of teaching, although the NEA often attacked the movement. Despite much work done to improve teaching and to improve the profession, it remained “business as usual” for most teachers. The NEA preserved the status quo.

### **Better Teachers, Greater Goals, and More Accountability**

In response to the Carnegie Forum on Education report, *A Nation Prepared: Teachers for the Twenty-First Century*, the focus on the teaching profession was magnified. The Carnegie task force responded to *A Nation at Risk* by proposing solutions to improve the teaching profession. The report called for the formation of the National Board for Professional Teaching Standards and later national board certification for exemplary teachers.

With the reform movement well underway in 1987, there was a call by the U.S. Secretary of Education William Bennett for accountability. The significant amount of money and effort spent to reform education required results. Business leaders and state lawmakers led the way in demanding evidence of change in education. The National Governors Association also began demanding greater accountability from the schools.

The nation’s governors had played a large role in education reform since the announcement of *A Nation at Risk*. Their leadership became most prominent in September 1989 when President George H. W. Bush convened them in Charlottesville, Virginia, for an education summit.

The nation had already come to grips with the fact that improvement in education needed to be measurable if all the attention and resources were going to be recognized as worthwhile. In order to be able to recognize educational progress goals had to be established. President Bush and the governors made a commitment to establish measurable goals for education reform that they named America 2000.

They agreed on a process for developing the goals at the education summit that would involve teachers, parents, local administrators, school board members, elected officials, business and labor communities, and the public at large. Their charge was to establish a common mission for improving education for all.

The goals the panel finally agreed upon and released early in 1990 were:

- By the year 2000, all children will start school ready to learn.
- By the year 2000, the high school graduation rate will increase to at least 90 percent.
- By the year 2000, all students will leave grades four, eight, and twelve having demonstrated competency over challenging subject matter including English, mathematics, science, foreign languages, civics and government, economics, arts, history, and geography. Every school in America will ensure that all students learn to use their minds well, so they may be prepared for responsible citizenship, further learning, and productive employment in our nation’s modern economy.
- By the year 2000, the nation’s teaching force will have access to programs for the continued improvement of their professional skills and the opportunity to acquire the knowledge and skills needed to instruct and prepare all American students for the next century.
- By the year 2000, U.S. students will be the first in the world in mathematics and science achievement.
- By the year 2000, every adult American will be literate and will possess the knowledge and skills necessary to compete in a global economy and exercise the rights and responsibilities of citizenship.

The governors and the president accepted responsibility for achieving these measurable goals. The conclusion of their declaration stated that “as elected chief executives, we expect to be held accountable for progress in meeting the new national goals, and we expect to hold others accountable as well . . . . The time for rhetoric is past; the time for performance is now.”

### **Striving to Achieve Measurable Goals**

In response to growing talk of creating academic standards Congress established the National Council

on Education Standards and Testing (NCEST) in June 1991. The council was formed to explore establishing national education standards and to assess progress in reaching these standards. In 1992 NCEST released its report recommending that voluntary national standards be created. This report, combined with statements from the National Council of Teachers of Mathematics (NCTM) and the National Research Council, propelled the creation of rigorous academic standards that would establish the appropriate content for learning grade by grade. It was hoped that the depth and breadth of knowledge would be increased for all students.

In March 1994 President Clinton signed into law the Goals 2000: Educate America Act. Goals 2000 encompassed the goals established at the Charlottesville education summit as well as two additional goals that stated:

- By the year 2000, every school in the United States will be free of drugs, violence, and the unauthorized presence of firearms and alcohol and will offer a disciplined environment conducive to learning.
- By the year 2000, every school will promote partnerships that will increase parental involvement and participation in promoting the social, emotional, and academic growth of children.

The Goals 2000: Educate America Act also established the National Education Standards and Improvement Council (NESIC), which had the responsibility to review and certify voluntary state and national education standards that were being developed. The NCEST and NESIC faced severe opposition, however, from those who raised the specter of federal involvement in education.

Despite opposition to national standards, efforts to develop state standards and assessments continued. The chief executive officer of IBM, Louis Gerstner, and Governor Tommy Thompson of Wisconsin convened the nation's top business leaders, governors, and the White House and Department of Education elite in Palisades, New York, for the 1996 National Education Summit. The summit was a reaction to the declining progress in education reform after Goals 2000.

The participants in the summit continued the work started in Charlottesville. In fact, the summit pushed for a sustained and more directed effort in establishing academic standards and assessments. Participants recognized that some opponents criti-

cized standards as too much federal involvement in education, but noted that state standards were essential for improving education for all. Writing and measuring standards was not enough for the summit participants, however. They recognized that a commitment to helping students achieve the standards was essential. Another outcome of the summit was the call for an independent clearinghouse, free of ties to any federal agency, that would provide information to help the coordinate states' efforts to establish standards and assessments.

In 1997 in a landmark report, *What Matters Most: Teaching for America's Future*, the National Commission on Teaching and America's Future once again established that teachers were critical to improving student achievement. The report challenged the nation to install high quality teachers in every classroom in America by 2006.

### Options for Parents and Students

Throughout this period of reform many suggested school choice as a solution to improving education. School choice can mean several different things. Some of the models are districtwide, or intradistrict, which allow parents to choose from schools within their own district; statewide, or interdistrict, in which students can choose from the entire state's public schools; and perhaps the most controversial, private-school choice, which permits parents to send their children to private schools using public funds.

Although controversial, school choice has been a significant contributor to education reform. Perhaps the most salient examples took place in Wisconsin and Ohio. Since the early 1990s the city of Milwaukee has engaged in an experiment in private-school choice. Milwaukee offers vouchers for children to attend private schools, including religious schools. Although the program has come up against lawsuits, the courts have upheld the practice in Wisconsin. In November 1998, the U.S. Supreme Court declined to take up a case against Milwaukee that claimed that the program led to racial segregation in Milwaukee schools. The U.S. District Court in Ohio questioned the Cleveland school-choice program because 98 percent of the students leaving public schools were migrating to religious schools, raising the issue of separation of church and state. In June 2002 the U.S. Supreme Court overturned the lower court ruling and upheld the use of public money for religious school tuition.

The court decisions have helped proponents of school reform who claim that a free-market approach to education will improve the schools. In addition, the movement has also gained some victories as more and more analysis of data shows some success in educating children through school choice. Studies from Harvard University and Princeton University suggest that children participating in school-choice programs are at least performing as well as their counterparts in traditional public schools and the Harvard study even suggests that privatization might make schools more efficient.

### Staying the Course

The contemporary standards movement that resulted from *A Nation at Risk* continues; in fact the message remains that the nation must “stay the course.” In 1999 another national education summit was convened and it reasserted that the standards movement was the most prudent way to improve education for all. In addition, the participants demanded that action be taken to ensure that all students achieve the rigorous standards that had been set.

Yet the United States continues to be “a nation at risk.” Business leaders, government officials, educators, and the public at large are heeding the Third International Mathematics and Science Study (TIMSS) warning that the United States ranks in the middle of the pack of its global economic competitors in student achievement. Continued focus on raising standards, improving teachers to help students achieve the standards, and holding all stakeholders (parents, teachers, and the business community) accountable for the education of the nation’s future leaders is essential.

President George W. Bush continues to follow the direction of Secretary Bell’s National Commission for Excellence in Education. President Bush’s proposal for education calls for higher standards, annual measurement and accountability, more parental choice, and greater flexibility in federal funding. Perhaps the most significant part of Bush’s proposal is the annual assessment of student achievement from grades three through eight to determine the value added by each school year and increase accountability.

CHRISTOPHER T. CROSS  
M. RENÉ ISLAS

## SCHWAB, JOSEPH (1909–1988)

University of Chicago professor of education and natural sciences, Joseph Schwab was the originator of *The Practical*, a program for educational improvements based on curriculum deliberations.

### Education and Career

Joseph Jackson Schwab was born in Columbus, Mississippi, where he attended a private elementary school. After the sixth grade, Schwab entered the public schools, where he discovered science. As Schwab was virtually alone among his classmates in this interest, the principal of the high school, a former science teacher, encouraged his creative license by giving him free reign in the school laboratory. Schwab became fascinated with the poisonous snakes and other animals kept there, and delighted in setting off homemade gunpowder by pounding it with an ax. He finished high school in three years, and in 1924, at the age of fifteen, he set off for the University of Chicago, where he was to remain for almost fifty years, receiving degrees in English literature

(Ph.B), zoology (S.M.), and genetics (Ph.D). Schwab was also a Visiting Fellow at the Center for the Study of Democratic Institutions.

Since the late 1930s Schwab has had an important impact on educational research and practice, conceptualizing and instigating reform at all levels of schooling. His early work through the 1940s was part of Robert Hutchins's efforts to create an undergraduate curriculum of general education at Chicago. Schwab taught practically every course in the College of the University of Chicago, developed classroom discussion as a viable alternative to lecture, worked on integrating the humanities and natural sciences, and won the award for excellence in teaching twice, the first to do so. In 1942 he began writing comprehensive examinations for the biological sciences, and by 1947 had become chairman of the natural sciences staff.

### Scholarly Work

In the 1950s and 1960s, as the "Hutchins College" period ended, Schwab turned his attention to wider pursuits. From 1959 to 1961 he was chairman of the Committee on Teacher Preparation for the Biological Sciences Curriculum Study, he coauthored the Curriculum's *Biology Teacher's Handbook*, and edited the first editions of its textbooks. He helped found *The Journal of General Education*, and consulted on *The Great Books of the Western World*. He also worked in Jewish education as chairman of the Academic Board of the Melton Research Center at the Jewish Theological Seminary of America.

In *College Curriculum and Student Protest* (1969) Schwab diagnosed student turmoil as symptomatic of failures in schooling. He prescribed curricular changes and teaching devices that were based on liberal arts, which could actively engage students in their education. Arguing against undergraduate education as a body of rote methods or rhetoric of conclusions, he explored the liberal arts as resources for students to find their own questions for texts or problems so they could become their own critics. Most importantly, he showed how the disintegrating college communities could be restored and renewed.

Schwab is best remembered for the last and most comprehensive of his critiques of education, focused on curriculum making. His invited address in 1969 at the annual meeting of the American Educational Research Association challenged the field of curriculum research, which had become moribund

because of inveterate unexamined reliance on direct application of theories, especially from the social sciences. Schwab believed that any given theory was necessarily incomplete in terms of its subject and oversimplified the complexities of problematic situations. His proposal that the field must identify and solve its own practical problems continues to energize curricular debate.

### *The Practical*

*The Practical* requires that five bodies of disciplines and experience be represented in a collaborative group that undertakes the task of curriculum revision. Schwab called four of these the "commonplaces" of educational thinking, which require representatives of the affected learners, teachers, subject matters, and (sociocultural) milieux. The fifth is that of the curriculum specialist, who must work with the other representatives to ensure that the commonplaces are properly coordinated, because changes in any one will have consequences for the others. Unbalanced deliberations, either dominated by a single commonplace or omitting some, lead to successive "bandwagon" curricula, each based on an exclusive theory (e.g., of child development, teacher needs, subject matter innovation, or social change). Schwab designed a set of eclectic arts to join theories across disciplines so that scholarly and research materials could be shaped into teachable curricula. He developed another set of practical arts for the problem-posing and problem-solving activities required by the unsatisfactory curricular situation.

As the members of the curriculum group discover and develop their capacities in an actual deliberation, they turn the commonplaces into "particular places," by perceiving details in the "pinch" of their problem. The process is incremental, local, and ongoing. Institutions need gradual, coherent improvements, not destruction. They must discover their own problems and resources, without dictation by centralized authorities. Ongoing deliberations change a problematic situation into a situation of problems discerned and solutions undertaken and evaluated. The deliberative process develops in a spiral rather than a serial progression as the deliberators discover what solutions can run with which problems, what problems or solutions can be combined with other problems and solutions, and how the effects of solutions can have unintended consequences that create further problems and opportunities.

From 1969 to 1986 Schwab produced six articles (the last two unpublished) on the various dimensions of the *The Practical*, the first three of which are included in a compilation by Ian Westbury and Neil J. Wilkoff. *Practical 1* gives his basic critique in terms of flights from the curriculum field. *Practical 2* demonstrates the proper use of the eclectic arts on theories through an imagined course in educational psychology. *Practical 3* focuses on the constitution and functions of the curriculum group. *Practical 4* gives special attention to the institutional role of the curriculum specialist as chairperson of the group. *Practical 5* and *Practical 6* describe the eclectic arts for development and use of commonplaces that can map pluralistic views of subject matter, using literature and psychology as examples.

### Legacy

As a scholar and teacher Schwab pulled together such wide experience in the five bodies of disciplines necessary for curriculum development that he became a genuine polymath in education. He was quick to trace positions to unexpected consequences. Expressed in a down-to-earth no-nonsense rhetoric, this made him a formidable and provocative presence in public forums and the classroom.

Schwab's concern for education as a deliberative activity connects him to John Dewey and American Pragmatism. His respect for the formulations and proper uses of theories connects him to the Aristotelian distinction between theoretical, practical, and productive activities. Internationally, educational practitioners in the European Didaktik tradition, especially in Germany and Norway, have recognized the *The Practical*.

Overall, Schwab's continuing effect is that of Socratic gadfly whose stinging critiques have stimulated education by pointing out chronic deficiencies and indicating new directions for inquiry and action. The recurring nature of educational problems makes much of his work, such as that on defining and testing objectives, still applicable.

## SCIENCE EDUCATION

---

### OVERVIEW

Robert E. Yager

### PREPARATION OF TEACHERS

Robert E. Yager

### OVERVIEW

Science has become an important component in the K–12 curriculum in American schools—but less so than reading and mathematics. At the end of the twentieth century reading and mathematics received more attention, government support, and focus for testing. It was assumed that reading and mathemat-

ics must be mastered first and that these skills were essential before the study of science and social studies. Science is often not taught daily in elementary schools, does not receive major attention in middle schools, and is often organized around disciplines that emphasize college preparation in high schools.

### The Role of Science and Technology Education

As the twentieth century ended, it was clear that science and technology played significant roles in the lives of all people, including future employment and careers, the formulation of societal decisions, general problem solving and reasoning, and the increase of economic productivity. There is consensus that science and technology are central to living, working, leisure, international competitiveness, and resolution of personal and societal problems. Few would eliminate science from the curriculum and yet few would advance it as a curriculum organizer. The basic skills that characterize science and technology remain unknown for most.

As the twenty-first century emerges, many nations around the world are arguing for the merger of science and technology in K–12 schools. Unfortunately many are resisting such a merger, mostly because technology (e.g., manual training, industrial arts, vocational training) is often not seen as an area of study for college-bound students. Further, such courses are rarely parts of collegiate programs for preparing new teachers. Few see the ties between science and technology, whereas they often see ties between science and mathematics. Karen F. Zuga, writing in the 1996 book *Science/Technology/Society as Reform in Science Education*, outlined the reasons and rationale for and the problems with such a rejoining of science and technology. A brief review of what each entails is important.

Although science is often defined as the information found in textbooks for K–12 and college courses or the content outlined in state frameworks and standards, such definitions omit most essential features of science. Instead, they concentrate wholly on the products of science. Most agree with the facets of science proposed by George G. Simpson in a 1963 article published in the journal *Science*. These are:

1. Asking questions about the natural universe, that is, being curious about the objects and events in nature.
2. Trying to answer one's own questions, that is, proposing possible explanations.
3. Designing experiments to determine the validity of the explanations offered.
4. Collecting evidence from observations of nature, mathematical calculations, and, whenever possible, experiments that could be carried out to establish the validity of the original explanations.
5. Communicating evidence to others, who must agree with the interpretation of evidence in order for the explanation to become accepted by the broader community (of scientists).

Technology is defined as focusing on the human-made world—unlike science, which focuses on the natural world. Technology takes nature as it is understood and uses the information to produce effects and products that benefit humankind. Examples include such devices as lightbulbs, refrigerators, automobiles, airplanes, nuclear reactors, and manufactured products of all sorts. The procedures for technology are much the same as they are for science. Scientists seek to determine the ways of nature; they have to take what they find. Technologists, on the other hand, know what they want when they begin to manipulate nature (using the ideas, laws, and procedures of science) to get the desired products.

Interestingly, the study of technology has always been seen as more interesting and useful than the study of science alone. Further, the public has often been more aware of and supportive of technological advances than those of basic science.

Science (along with technology) in the school curriculum has assumed a central role in producing scientifically (and technologically) literate persons. Since 1980 the National Science Teachers Association (NSTA) has identified such literacy to be the major goal of science instruction. The organization also described what literacy would entail. Its *NSTA Handbook, 1999–2000* defined a scientifically literate person as one who can:

- Engage in responsible personal and civic actions after weighing the possible consequences of alternative options
- Defend decisions and actions using rational arguments based on evidence
- Display curiosity and appreciation of the natural and human-made worlds

- Apply skepticism, careful methods, logical reasoning, and creativity in investigating the observable universe
- Remain open to new evidence and realize the tentativeness of scientific/technological knowledge
- Consider the political, economic, moral, and ethical aspects of science and technology as they relate to personal and global issues

Whatever schools can do to produce graduates who have such skills defines the role for science education in schools. The curriculum is the structure provided to accomplish such goals. The 1996 National Science Education Standards set out just four goals, namely, the production of students who:

- Experience the richness and excitement of knowing about and understanding the natural world
- Use appropriate scientific processes and principles in making personal decisions
- Engage intelligently in public discourse and debate about matters of scientific and technological concern
- Increase their economic productivity through the use of the knowledge, understanding, and skills of the scientifically literate person in their fields

### History of Science Courses in American Schools

Early American public schools did not include science as a basic feature. The purpose of the early school was to promote literacy—defined to include only reading and numeracy. The first high schools primarily existed to prepare students for the clergy or law. Typical science courses were elective and included such technology courses as navigation, surveying, and agriculture. Not until the turn of the twentieth century did the current science program begin to form.

Physics began to be offered as a high school course in the late 1800s. It became even more common when Harvard University required it for admission in 1893; Harvard also required chemistry ten years later. Physics and chemistry were soon identified as college preparatory courses as other universities followed Harvard's lead in requiring both for college entrance. Biology, the third high school course, was not identified until the 1920s—resulting from the merger of such common courses as botany, physiology, anatomy, and zoology.

Traditionally the high school curriculum has consisted of physics in grade twelve, chemistry in grade eleven, and biology in grade ten. Often schools have moved to second-level courses in each of these three disciplines; at times these advanced courses are titled *Advanced Placement* and can be counted toward college degrees if scores on national tests are high enough to satisfy colleges. This focus on school science as preparation for college has been a hindrance to the casting of science courses as ways to promote science and technology literacy.

Science below the high school level (grade ten) has a varied history. Science classes at this level became more common in the middle of the twentieth century with the creation of junior high schools—often grades seven, eight, and nine. In many instances the science curriculum was similar to the high school curriculum except that science was usually termed *general science*, with blocks for each course coming from biology, chemistry, physics, and earth science. There have been attempts to unify and to integrate science in these middle grades. With the emergence of substantial national financial support for curriculum and teacher professional development, however, the major effort in the 1960s was to create life, physical, and earth science courses for the junior high schools. During the 1970s and 1980s, middle schools were created with ninth grade returning to high schools (grades nine through twelve) and sixth grade becoming a part of the middle schools. As the National Science Education Standards emerged in 1996, the middle grades were defined as grades five through eight.

Middle school philosophy calls for teams of teachers (from all facets of the curriculum) to work with a given set of middle school students and to unify and relate all study for those students. Project 2061, formulated in the late twentieth century, is a reform project that ties the curriculum together, especially science, mathematics, technology, and social studies.

Elementary school science was rarely found until the middle years of the twentieth century. Although there were textbooks and courses listed in the offerings, science frequently did not get taught. This was because teachers placed reading and mathematics first, they often lacked preparation in science, and there was no generally accepted way of measuring science learning across grade levels.

During the 1960s and 1970s several national curriculum projects were funded, developed, and of-

ferred across the K–12 years. This continued into the twenty-first century, with many programs that provide ways to meet the visions of the National Science Education Standards supported by the National Science Foundation. Unfortunately not many of these ideas are in typical textbooks offered by the major publishers, who, understandably, are more interested in sales and offering what teachers, schools, and parents want. These textbooks are often quite different from what reform leaders and cognitive science researchers envision for an ideal science curriculum.

### Comparing Science Education Requirements around the World

Reformers in most industrial nations across the world advocate similar school reforms of science with new goals, procedures, materials, and assessment. The United Nations Educational, Scientific and Cultural Organization (UNESCO) has initiated a reform effort for the twenty-first century that is targeted for developing nations and relates science to technology. Many educational teachers across the world call openly for a science curriculum that is responsive to personal needs, societal problems, and attentive to technological as well as scientific literacy. New attention to assessment and evaluation has arisen from the Third International Mathematics and Science Study.

Elementary school science is similar the world over with the focus being hands-on and minds-on activities that are not discipline-based. Often middle schools have science programs that frequently focus on problems. In the United States some of the major science programs include Event-Based Science and Science Education for Public Understanding Program. Similar programs exist elsewhere, especially in the United Kingdom, Israel, the Netherlands, and Australia, and in other European countries.

Although the goals for high school science are the same in most countries, the traditional discipline-based courses (biology, chemistry, and physics) in the United States are typical yearlong courses for grades ten, eleven, and twelve. Most other countries organize the secondary curriculum to respect discipline divisions, but spread the courses over a five- or six-year sequence. They do not delay physics and chemistry to grade eleven or twelve or place biology solely in grade ten.

The interest in international comparisons has never been greater. There is great concern that test-

ing and learning is based on little other than students' ability to recite definitions and/or to solve mathematical problems given to them. Cognitive science research indicates that most of the brightest science students can do little more than to repeat what they have been told or what they read, or to duplicate procedures they have been directed to follow. Educators now want more evidence that students can use information and skills in new situations. Such performance is demanded to assure scientific and technological literacy.

### Trends, Issues, and Controversies

Science education is evolving once again—as it has since the emergence of public schools in the United States—to a focus on mastering basic concepts and skills that can be used in new situations. Yet, in order to truly accomplish this, contexts need to be established first. Concepts and process skills are desirable end points. But if real learning is to occur, concepts and skills cannot be approached directly and used as organizers for courses and instruction. Without the proper background, students do not understand and are rarely able to use the information and skills that are taught. This explains why science lacks popularity and why most students stop their study of science as soon as they are permitted to do so. Little is gained by simply requiring more for a longer period of time.

Another trend is the open inclusion of technology with the study of science. Contrasting the two can help develop an awareness of the history, philosophy, and sociology of both. Since more students are interested in technology than in science, including technology within science education can provide a vehicle for getting students more involved with basic science. Instead of authorities proclaiming science as important and useful, students discover that for themselves as they develop and use new technologies.

Taking statements of goals seriously is another trend. Goals can and should provide the framework for the curriculum, indicate the instruction selected, and provide form and structure for evaluating successes and failures. Each of these critical factors provides a basis for doing science in education.

The involvement of more people and organizations in the process of educating youth is another important trend. Responsibility for setting science goals, choosing instructional strategies, determining

curriculum structure, and defining assessment efforts must rest with teachers as well as with students. Outside agencies—administrators, state departments of education, national governments, professional societies, and the public—all must be involved and are integral to the plan to improve science education.

Major issues include how to evaluate and enlarge goals, how to change instruction, how to move assessment from testing for memory and repetition (copying) of procedures to making these constructs and skills a part of the mental frameworks of the students. When does real learning pass from mimicry to understanding and personal use?

Engaging student minds requires changes that are essential to current reform efforts. According to Vito Perrone, such engagement is accomplished when:

1. Students help to define the content—often by asking questions.
2. Students have time to wonder and to find interesting pursuits.
3. Topics often have strange features that evoke questions.
4. Teachers encourage and request different views and forms of expression.
5. The richest activities are invented by teachers and students.
6. Students create original and public products that enable them to be experts.
7. Students take some actions as a result of their study and their learning.
8. Students sense that the results of their work are not predetermined or fully predictable.

Can science teachers really become major players in cross-disciplinary efforts in schools? Can they embrace technology as a form of science and/or an entry point to it? Can they refrain from telling students what they want them to do and to remember (for tests)? According to the National Research Council's 1998 book *Every Child a Scientist*, Carl Sagan argued that "every student starts out as a scientist." Students are full of questions, ready to suggest possible answers to their questions. Unfortunately, however, most lose this curiosity as they progress through their science studies. In typical schools they rarely design their own experiments, get their own results, and use the results for any purpose. They do not see or practice science in any full sense.

Major controversies remain. But why should this not be so? Science is an activity where there are changes, differences of opinions, differences in designing good experiments or making calculations, and differences in collecting evidence and convincing others of the validity and accuracy of the evidence offered.

Certainly most educators remain committed to the model of relying on the science found in textbooks, state curriculum frameworks, and standards documents. They are committed in spite of the research evidence that highlights the advantages of new approaches to learning and new ways of measuring learning and understanding. Humans tend to resist change—even when they know it will occur. It is sad that science educators do not lead in the attack on the unchanging curriculum and lack of attention and use of the new information on how humans learn.

## PREPARATION OF TEACHERS

Programs for preparing science teachers in the United States are numerous—numbering about 1,250. These programs vary considerably, though most require a major in one discipline of science and a strong supporting area. The professional sequence varies greatly with smaller programs unable to maintain a faculty with expertise in science education per se. The programs generally consist of half the credits in science, a quarter in education, and a quarter in liberal arts requirements. In the 1990s the quantity of preparation in science and in science education increased—often making it difficult to complete

programs as part of a four-year bachelor's degree program. Fifth-year programs that include more time spent in schools with direct experience with students are becoming the norm.

### Historical Background

Early in the 1800s science teachers typically had no formal preparation; often they were laypersons teaching such courses as navigation, surveying, and agriculture in the first high schools. By 1870, with the emergence of the first teacher training colleges, some science teachers completed formal study of science in colleges. Qualifications for specific teaching, however, varied considerably across the United States.

In the early 1890s Harvard University required completion of a high school course in physics for admission. This spurred the beginning of the science curriculum in American schools. Ten years later Harvard added chemistry to its requirements for admission. Many other colleges and universities followed suit. High school science classes became gatekeeper courses for college admission—a situation that turned out to be a continuing problem for science in schools and for the preparation of science teachers.

By the end of World War II, the place of science in school programs had attained universal acceptance. Teacher education programs were standardized to include science methods courses and student teaching after a year of introduction to education and educational psychology courses. School programs were to provide functional science experiences, that is, skills and knowledge that students could use. Faculty at preparatory institutions became the chief proponents for a useful science program for students.

Science education changed in the 1950s as leaders and the general public demanded improvements to match the Soviet successes in space. National spending for improving school science programs and the preparation of science teachers were made a priority in the National Science Foundation (NSF). Scientists were called to provide leadership in the reform of school programs and the development of better-prepared teachers.

In the 1970s these national efforts to improve school programs and teacher education, including the goals for science teaching, were reassessed. The public had become disillusioned with the expendi-

tures for science teacher enhancement and curriculum development projects. The NSF Project Synthesis effort established four new goals: science for meeting personal needs, science for resolving current societal issues, science for assisting with career choices, and science for preparing for further study.

In this climate the NSF established a new program to influence science teacher education directly. Called the Undergraduate Pre-Service Science Teacher Education Program (UPSTEP), its premises included the following:

1. Effective preservice programs integrate science and education and often require five years.
2. Science faculties are important ingredients in program planning, teaching, and program administration.
3. The preparation of an effective science teacher involves more than providing a student with up-to-date content and some generalized teaching skills.
4. Effective programs involve master teachers, school and community leaders, and faculty members.
5. Teacher education can be evaluated and used to improve existing programs.
6. Effective programs should include advances in computer technology, educational psychology, philosophy, sociology, and history of science.

### Current Structure and Organization

Most of the 1,250 institutions that prepare science teachers start with the assumption that an undergraduate major in one of the sciences is a must. Many teacher education programs merely require science courses (typically about one-half of a degree program) and increase the number of methods courses and associated practica (experiences in schools) prior to student teaching. Many institutions moved to a five-year program and/or the completion of a master's degree before licensure.

In the 1990s the U.S. Department of Education funded studies, known as Salish I and Salish II, to discern the condition of preservice teacher education programs in the United States. Salish I was a three-year study of programs and graduates from ten different universities across the United States. The study's major findings included the following:

1. During their initial years of teaching, most new science teachers use little of what teacher education programs promote.

2. Few teacher education programs are using what is known about science as envisioned by the National Science Education Standards.
3. The courses comprising teacher education programs are unrelated to each other.
4. There are few ties between preservice and in-service efforts.
5. Support for teacher education reforms has been largely unrecognized and underfunded.

Salish II involved fifteen new universities, which agreed to alter some aspects of their teacher education programs and to use research instruments from Salish I to determine the effectiveness of the changes. Major findings from Salish II were as follows:

1. Significant changes in teacher education majors can be made during a single year, when part of a collaborative research project.
2. There is strength in the diversity of institutions and faculty involved with science teacher education.
3. Science instruction at colleges must change if real improvement is to occur in schools.
4. Collaboration in terms of experimentation and interpretation of results is extremely powerful.

### In-Service and Staff Development Programs

A persistent problem has been the lack of articulation between pre- and in-service science teacher education. NSF support for in-service teacher education from 1960 to 1975 focused on updating science preparation in an attempt to narrow the gap. In fact, NSF efforts often tended to deepen the problem. The NSF assumed that science teachers needed only more and better science backgrounds and the NSF model was simply one of giving teachers current science information, which they were to transmit directly to their students. What was needed was a set of intellectual tools with which teachers could evaluate the instruction they provided.

According to David Holdzkom and Pamela B. Lutz, authors of the 1984 book *Research within Reach: Science Education*, effective science teachers must have a broader view of science and of education. They need to be in tune with the basic goals of science education in K–12 settings and be prepared to deal with all students in efforts to meet such objectives. H. Harty and Larry G. Enochs, in a 1985 article in the journal *School Science and Mathematics*,

offered an excellent analysis of the form in-service programs should take, contending that such programs should:

- Have a well-defined, organized, and responsible governing mechanism
- Involve teachers in needs-assessment, planning, designing, and implementing processes
- Provide diverse, flexible offerings that address current concerns of the practitioner and that can be used readily in the classroom
- Include an evaluation plan of the individual components of the program and their effect in the classroom.

The content versus process debate continues and is counterproductive at best. Science cannot be characterized by either content (products produced by scientists) or process (behaviors that bring scientists to new understandings). Effective teacher education programs cannot be developed if science preparation focuses on content mastery and the education component focuses on process. Teachers must learn to use both the skills and processes of science to develop new knowledge of both science and teaching. They need to use the research concerning learning, such as the National Research Council's 1999 book *How People Learn*.

In the late 1990s NSF initiated new programs designed to improve in-service teachers—and later preservice teachers as well. These systemic projects were funded at approximately \$10 million each in about twenty-five states. Later urban, rural, and local systemic projects were conceptualized and funded. Teacher education programs involving several college/university situations were also funded to relate in-service efforts directly to the preparatory programs. These collaborations often tied institutions together in order to share expertise, faculty, and program features.

### Major Trends, Issues, and Controversies

Major trends in science teacher education include:

- Extending the pedagogical facet of the program over two calendar years with extensive school practica provided as places to try new ideas
- Replacing four-year bachelor's programs with five-year master of arts in education programs
- Using the National Science Education Standards for visions of goals for all students, effective teaching strategies, content and curricula features, assessment strategies, and staff development

- The extensive collaborating of all stakeholders (administrators, parents, community leaders, and all teachers across the curriculum) for reform efforts
- Broadening the view of science to include the human-made world (technology) as well as natural science, science for meeting present and societal challenges, a focus on inquiry as content and skills that characterize science, and the history/philosophy/sociology of science.

Some of the major unresolved controversies include:

- Limiting the number of institutions preparing science teachers
- Teaching teachers, over a five-year program, in the same manner that they should teach
- Using the four goals for school science to prepare teachers to internalize the National Science Education Standards, including experiencing science as: an investigation of natural phenomena, a means for making sound personal decisions, an aid in public discussion and debate of current issues, and a means of increasing economic productivity.

Optimism for even greater successes with meeting the goal of scientific literacy for all is a central focus for science teacher education. Certainly the new Centers for Learning and Teaching that NSF began funding in 2000 are designed to help. By definition they combine preservice and in-service science education—making the two seamlessly connected. They require a common research base while also assuring that a major effort of the center will be to extend that research base. They must design and implement new doctorate programs to prepare future leaders. The history of science education is replete with identification of current problems, new ideas for their resolution, major national funding (since 1960), and then almost immediate abandonment after initial trials are not successful. The current challenge facing science teacher education is whether there is adequate national commitment, determination, and know-how to realize the visions elaborated in current reform documents.

## EXPLANATION AND ARGUMENTATION

The K–12 U.S. science education standards, now published state by state, without exception cite competence in scientific investigation as an important curriculum goal from the early grades on. Students, it is claimed, should be able to formulate a question, design an investigation, analyze data, and draw conclusions. Reference to such skills in fact appears in discussions of curriculum objectives extending well beyond the discipline of science. The following description, for example, comes not from science edu-

cation literature but from a description of language arts goals specified by the National Council of Teachers of English (NCTE): “Students conduct research on issues and interests by generating ideas and questions, and by posing problems. They gather, evaluate, and synthesize data from a variety of sources . . . to communicate their discoveries in ways that suit their purpose and audience” (NCTE and International Reading Association website).

It is important that the cognitive skills involved in such activities be defined in a clear and rigorous enough way to make it possible to specify how they develop and how this development is best supported educationally. At the same time, to make the case that scientific thinking is a critical educational objective, it must be defined more broadly than “what professional scientists do.” Scientific thinking is essential to science but not specific to it.

But are not children naturally inquisitive, it may be asked, observant and sensitive to the intricacies of the world around them and eager to discover more? Do inquiry skills really need to be developed? The image of the inquisitive preschool child, eager and energetic in her exploration of a world full of surprises, is a compelling one. But the image fades as the child grows older, most often becoming unrecognizable by middle childhood and certainly by adolescence. What happens to the “natural” inquisitiveness of early childhood? The answer is that it needs to be channeled into the development of the cognitive skills that make for effective inquiry. More needs to be done than keeping alive a “natural curiosity.” The natural curiosity that infants and children show about the world around them needs to be enriched and directed by the tools of scientific thought.

### Coordination of Theories and Evidence

One way to conceptualize these scientific thinking skills is as skills in the coordination of theories and evidence. Even very young children construct theories to help them make sense of the world, and they revise these theories in the face of new evidence. But they do so without awareness. Scientific thinking, in contrast, involves the *intentional* coordination of theories with new evidence. Another way to define scientific thinking, then, is as *intentional knowledge seeking*. Scientific thinkers intentionally seek evidence that will bear on their theories. Defined in this way, the developmental origins of scientific thinking lie in awareness of knowledge states as generating

from human minds. Awareness of the possibility of false belief is thus a prerequisite to scientific thinking. If knowledge states are fallible, one’s own knowledge may warrant revision in the face of new evidence.

Regarded in this way, scientific thinking is more closely aligned with argument than with experiment and needs to be distinguished from *scientific understanding* (of any particular content). Scientific thinking is something one does, whereas scientific understanding is something one has. When conditions are favorable, the process of scientific thinking may lead to scientific understanding as its product. Indeed, it is the desire for scientific understanding—for explanation—that drives the process of scientific thinking. Enhanced understandings of scientific phenomena are certainly a goal of science education. But it is the capacity to advance these understandings that is reflected in scientific thinking.

Scientific thinking requires that evidence be represented in its own right, distinct from the theory, and that the implications of the evidence for the theory be contemplated. Although older children, adolescents, and even adults continue to have trouble in this respect, young children are especially insensitive to the distinction between theory and evidence when they are asked to justify simple knowledge claims.

Note that the outcome of the theory-evidence coordination process remains open. It is not necessary that the theory be revised in light of the evidence, nor certainly that theory be ignored in favor of evidence, which is a misunderstanding of what is meant by theory-evidence coordination. The criterion is only that the evidence be represented in its own right and its implications for the theory contemplated. Skilled scientific thinking always entails the coordination of theories and evidence, but coordination cannot occur unless the two are encoded and represented as distinguishable entities.

The following six criteria for genuine scientific thinking as a process (in contrast to scientific understanding as a knowledge state) can be stipulated:

1. One’s existing understanding (theory) is represented as an object of cognition.
2. An intention exists to examine and potentially advance this understanding.
3. The theory’s possible falsehood and susceptibility to revision is recognized.
4. Evidence as a source of potential support (or nonsupport) for a theory is recognized.

5. Evidence is encoded and represented distinct from the theory.
6. Implications of the evidence for the theory are identified (relations between the two are constructed).

### The Epistemology of Scientific Learning

There is more to scientific thinking that needs to develop, however, than a set of procedures or strategies for coordinating theories with evidence. As hinted earlier, at its core this development is epistemological in nature, having to do with how one understands the nature of knowledge and knowing. An until recently largely neglected literature on the development of epistemological understanding shows a progression from an absolutist belief in knowledge as certain and disagreements resolvable by recourse to fact, to the multiplist's equation of knowledge with subjective opinion. Only at a final, evaluativist level is uncertainty acknowledged without foregoing the potential for evaluation of claims in a framework of alternatives and evidence.

If facts can be readily ascertained with certainty, as the absolutist understands, or if all claims are equally valid, as the multiplist understands, scientific inquiry has little purpose. There is little incentive to expend the intellectual effort it entails. Epistemological understanding thus informs intellectual values and hence influences the meta-level *disposition* (as opposed to the competence) to engage in scientific thinking.

Similarly, a strategic meta-level that manages strategy selection can be proposed. This meta-strategic level entails explicit awareness of not so much *what* to do as *why* to do it—the understanding of why one strategy is the most effective strategy to achieve one's goals and why others are inferior. It is this meta-strategic understanding that governs whether an appropriate inquiry or inference strategy is actually applied when the occasion calls for it.

The phases of scientific thinking themselves—inquiry, analysis, inference, and argument—require that the process of theory-evidence coordination become explicit and intentional, in contrast to the implicit theory revision that occurs without awareness as young children's understandings come into contact with new evidence. Despite its popularity in educational circles, once one looks below the surface of inquiry learning, it is less than obvious what cognitive processes are entailed. Research suggests that

children lack a mental model of multivariable causality that most inquiry learning assumes. They are not consistent over time in their causal attributions, attributing an outcome first to one factor and later to another, and infrequently do they see two factors as combining additively (much less interactively) to produce an outcome. A mature mental model of causality in which effects combine additively to produce an outcome is critical to adoption of the task goal of identifying effects of individual factors and to the use of the controlled comparison strategy (which has been the focus of research on scientific reasoning) to achieve that goal. If a single (not necessarily consistent) factor is responsible for any outcome (as reflected in the inferential reasoning of many young adolescents), what need is there to worry about controlling for the effects of other factors?

If it is this total structure (including meta-strategic, meta-cognitive, and epistemological understanding, as well as values) that needs to develop, where do educators start? They probably need to begin at multiple entry points. Opportunities should be plentiful for the frequent and regular exercise of skills of inquiry, analysis, inference, and argument, thereby enabling these skills to be practiced, elaborated, consolidated, and perfected. At the same time, meta-level awareness and understanding of skills should be promoted by helping students to reflect on what and particularly *how* they know and what they are doing as they acquire new knowledge. The two endeavors reinforce one another: understanding informs practice and practice enhances understanding.

### The Social Context

Equally critical is the social context in which all of this needs to take place, the often neglected dispositional side of knowing. Educators want children to become skilled scientific thinkers because they believe that these skills will equip them for productive adult lives. But it is not enough that these adults believe it. If children are to invest the sustained effort that is required to develop and practice intellectual skills, they too must believe that learning and knowing are worthwhile. These values and beliefs can develop only through sustained participation in what Ann Brown in 1997 called a "community of learners." Here, scientific thinking skills stand the best chance of developing because they are needed and practiced and socially valued.

Returning scientific thinking to its real-life social context is one approach to strengthening the meta-level components of scientific thinking. When students find themselves having to justify claims and strategies to one another, normally implicit meta-level cognitive processes become externalized, making them more available. Social scaffolding (supporting), then, may assist less able collaborators to monitor and manage strategic operations in a way that they cannot yet do alone. A number of authors have addressed scientific thinking as a form of discourse. This is of course the richest and most authentic context in which to examine scientific thinking, as long as the mistake is not made of regarding these discourse forms as exclusive to science. Scientific discourse asks, most importantly, “How do you know?” or “What is the support for your statement?” When children participate in discourse that poses these questions, they acquire the skills and values that lead them to pose the same questions to themselves. Although central to science, this critical development extends far beyond the borders of traditional scientific disciplines.

#### KNOWLEDGE ORGANIZATION AND UNDERSTANDING

Educational research is frequently construed as focusing on how teachers should teach. However, be-

fore this question is addressed, it is important to ask what should be taught. One might ask if the problem of what to teach is really a problem. Why not just ask scientists or rely on existing textbooks? There are good reasons a serious inquiry cannot be sidestepped, however. A fundamental realization of cognitive science is that almost all of the competence of experts is tacit. Careful studies of what scientists actually do show a vast repertoire of invisible (to them) processes and structures. Furthermore, textbooks are at best secondary sources, and they are much more likely idiosyncratic products of a complex social history than trustworthy sources for the essence of science. Progress is being made, even if cognitive science (including history, philosophy, and sociology of science) has not definitively identified the essence of scientific knowledge.

### Target Areas

The essence of “what to teach” can be divided into five target areas: content, process, meta-content and process, representational competence, and discourse and membership.

**Content.** *Content* concerns science concepts that students need to acquire. Content is of two different types: (1) central, difficult to learn ideas; and (2) concepts that are more peripheral and more amenable to straightforward instruction. Starting in the late 1970s, a huge literature emerged delineating certain misconceptions. The idea behind studying misconceptions is that difficult-to-acquire concepts are difficult not only (if at all) because of any intrinsic complexity, but because they are incompatible with well-developed and entrenched prior ideas. *Conceptual change* describes learning that involves substantial recrafting of prior ideas. While learning science concepts might, in principle, be difficult for many reasons, the preponderance of research suggests that conceptual change is a major factor. Conceptual change has been implicated in learning about force and motion, optics, electricity, heat and temperature, evolution, particulate theory of matter, and other topics.

Probably the most robust result of conceptual change research is that such change is not difficult for simple or accidental reasons, such as bad instruction. Instead, even the best instructional strategies require time and effort on the part of both students and teachers. This has major implications for selecting targets of instruction. Most notably, at the start of the twenty-first century, especially in the United

States, curricula are dramatically overly ambitious in terms of coverage. If students are to understand any science deeply, then choices must be made about the things that are to be taught. Study of cross-national science instruction has come to a similar conclusion. The U.S. science curriculum seems to be lacking in comparison to the best science instruction in the world because it is too shallow; it has been called “a mile wide and an inch deep.”

Another result of conceptual change research is that calculation does not seem to be strongly tied to conceptual change. Students can often calculate without understanding, and numerical exercises do not often promote conceptual change. Quantitative reasoning is a hallmark of scientific thought, yet its centrality to deep understanding is questionable.

Conceptual change researchers have suggested several promising instructional techniques. One notable suggestion is that the curriculum needs pedagogically specific *intermediate models* that abandon a direct aim at scientifically complete and correct ideas. Instead of trying to jump a wide stream directly, metaphorically speaking, one may need to hop to rocks midstream, and then to the far shore. While teaching intermediate ideas—which are prone to be described as “wrong” or “incomplete”—may be counterintuitive, the scientific rationale is sound, and results are encouraging.

Conceptual change research is developing a new and refined vocabulary for various types of knowledge and knowledge system organizations, such as concepts, theories, mental models, ontologies, and various forms of intuitive, inarticulate knowledge. Identifying which of these are central instructional targets helps to define curriculum, plausible instructional techniques, and assessments.

**Process.** The process of *doing* science is the traditional complement to content. For example, introspection of scientists and textbook descriptions of what scientists do led to the introduction of the *scientific method* as part of science instruction. Scientists supposedly (a) define problems carefully; (b) generate hypotheses; (c) design experiments to select among hypotheses; and (d) carry out those experiments to determine results. This sort of instructional goal has generally been discredited by cognitive and other researchers. It seems quite likely that no general skills exist for “defining problems carefully” or “generating hypotheses.” Instead, these are knowledge-intensive activities that require knowing many

specific things about the particular domain that is being investigated. This is an important cognitive principle, which may be called the *virtual knowledge problem*, meaning that naming a process does not entail a particular body of knowledge. Instead, the process might require different knowledge in different circumstances, hence it may not name a coherent instructional target.

Other formulations of process skills in science (e.g., careful observation) seem certain to suffer from the virtual knowledge problem. Even if a general skill is real, rather than virtual, it is often very weak and overwhelmed by domain-specific knowledge. Mathematical problem-solving research has found similar results.

Jean Piaget (1896–1980) began an important line of thinking about science process. However, his assumptions about broad changes in logic and reasoning (e.g., younger students can think only concretely) have proved generally unsupportable. Young students, given proper support, can engage in remarkably abstract and cogent scientific study. More specific skills from Piagetian studies, such as *proportional reasoning* (reasoning in ratios), and *controlling variables* (understanding that experiments that change many things at once are difficult to evaluate), have proven more productive, although their importance is uncertain.

An important trend in the late 1990s was to regard many process issues as matters of effective frameworks for action, rather than matters of knowledge or skills. For example, many educational researchers embed instruction in an *inquiry cycle*, where students formulate ideas, test them, and then iteratively refine them. However, the consequences of such activities may be robust content learning and epistemological sophistication, rather than learning science process. A concern for frameworks for action also reflects the realization that students' taking fuller responsibility for authentic activities has many advantages over exercising isolated skills. This parallels the well-supported result that remediation by practicing isolated skills fails to produce transferable, long-term improvement.

**Meta-content and process.** Starting about 1990 research focused increasingly on students' conceptions of knowledge, or, more specifically, scientific knowledge. Students have naive assumptions about the nature of knowledge, in somewhat the same way that they have naive conceptions about the content of

science. Students may believe (falsely) that their own sense of what is sensible is irrelevant to science—they must be told everything that is true and should not expect to figure anything out on their own. Students may also believe (falsely) that knowledge of science is embodied in small, simple chunks (e.g., sentences or equations) that can be memorized and do not form a larger fabric. Researchers refer to this knowledge as *student epistemologies* (theories of knowledge).

Unlike most versions of science process, it appears in theory and practice that improving student epistemologies also improves science-content learning. However, the precise nature of student epistemologies is unsettled. Some researchers hold closely to epistemological ideas that characterize professional science, such as: “Scientific knowledge is contingent and always subject to revision.” Others focus on general qualities of knowledge, like simplicity or modularity (as in the example beliefs stated above). Still others teach schemes abstracted from the history of science (e.g., evaluating the plausibility and productivity of competing theories) as part of inquiry-based science instruction.

**Representational competence.** A comparative newcomer to the repertoire of potential knowledge goals is *representational competence*. Representation competence entails knowing: How do representations (like pictures, graphs, or algebra) work? What are qualities of good representations? and How does one design effective, new, scientific representations? Older conceptions of representational competence were restricted to a narrower, less creative base, such as being able to generate and interpret a few standard representations. Promising characteristics of this new conception of representational competence are (a) students appear to have strong and productive intuitive ideas to build on; (b) concern for it parallels the broader move toward more authentic frames for action, rather than a focus on isolated skills; and (c) the rapid computerization of science evidently requires a more flexible representational competence than previously. This may entail interpreting dynamic, three-dimensional data displays or adjusting and interpreting color-coded visualizations.

**Discourse and membership.** Among the instructional trends in science learning is an increased reliance on social, rather than individual, methods, such as whole-class or small-group discussion. The parallel theoretical move is the realization that science is,

in essence, a social process. Ways of speaking and interacting, and one's feeling of affiliation to various groups (*membership*), are not only means to an end, but are, in fact, vital to scientific competence. Adherents to this view often hold apprenticeship to be a fundamental model for learning and instruction.

Viewed *instrumentally* (only as a means to another goal—developing robust conceptual or procedural competence), considerations of discourse and membership are particularly appropriate for understanding difficulties encountered by cultural or linguistic minorities. If one does not speak or have values aligned with privileged modes in schools, one will be at a disadvantage. On the other hand, interpreted *essentially* (i.e., particular discourse patterns are goals in themselves, the essence of science), study of discourse and membership suggests a radical shift in current instructional goals.

### Implications

The potential practical impact of research on science learning goals is obvious and immense. The very things students should understand and be able to do are at stake. On the other hand, science is slow and arduous, and although research is progressing, definitive answers are not at hand.

An important social process to determine science-learning goals is to engage multiple stakeholders, particularly disciplinary scientists and teachers, and to establish common standards. While this approach has advantages, a review of existing standards suggests areas of concern.

**Definition and learnability.** Standards rely on common-sense meanings of *understanding* and *knowing*. Cognitive research suggests that there are many different ways of knowing; appropriate means of instruction (memorizing, discussing, experiencing) and assessment (verbal answers, competence in extended inquiry) depend strongly on which is involved. Standards do not systematically distinguish easy-to-accomplish goals from deep conceptual change. Not calibrating how much time it takes to master particular items perpetuates a failing *mile-wide and inch-deep* curriculum. Limited empirical testing of the feasibility of standards does not screen out virtual knowledge.

**Focus.** Current standards only minimally reflect topics that have emerged from cognitive research. Representational competence and student epistemologies are almost absent. Furthermore, interme-

diated models and goals tend to be screened out because they are unfamiliar to both disciplinary scientists and teachers. Lack of consideration of discourse and membership may perpetuate marginalization of cultural or linguistic minority students.

**Sequence.** Bad theories of sequencing, or no theory at all, prevent students from encountering ideas as early as they might—and they do not build optimally. For example, as previously mentioned, characterizing young science students' thinking as *concrete* seems to have inappropriately limited instruction.

**Coherence.** Long lists of goals (the bread and butter of most standards) encourage piecemeal instruction, which is at odds with a fundamental shift in thinking about learning, which is that coherent frames for activity almost always enhance learning—compared to rehearsing isolated facts or skills. A common strategy in standards for providing coherence via *broad themes* is likely to lead to the virtual knowledge problem.

Pitting standards against scientific research suggests a false dichotomy. Both are appropriate. However, bringing standards and the standards-producing process into better alignment with research will provide a great opportunity for advancement.

#### STANDARDS

The release in 1983 of *A Nation At Risk: The Imperative for Educational Reform* is a reasonable place to begin consideration of the standards movement in science education in the United States in the later twentieth and early twenty-first centuries. This document, prepared by the National Commission on Excellence in Education (NCEE), was a response to “the widespread public perception that something is seriously remiss in our educational system” (p. 1). The document contained sentiments that became slogans of the standards movement. Science education for all is foreshadowed: “All, regardless of race or class or economic status, are entitled to a chance and to the tools for developing their individual powers of mind and spirit to the utmost” (p. 4). Recommendations focused on content, standards and expectations, time, teaching and leadership, and fiscal support. Science content was defined as “(a) the concepts, laws and processes of the physical and biological sciences; (b) the methods of scientific inquiry and reasoning; (c) the application of science knowl-

edge to everyday life; and (d) the social and environmental implications of scientific and technological development” (p. 25).

The science education community both anticipated and responded to this report with numerous efforts. The American Association for the Advancement of Science (AAAS) initiated Project 2061, which began by defining scientific literacy for all high school graduates. The National Science Teachers Association (NSTA) began its Scope, Sequence, and Coordination Project and ultimately, in 1992, published *Scope, Sequence, and Coordination: The Content Core*. Professional organizations and curriculum development corporations began to produce curriculum materials that emphasized hands-on science, another slogan of the period.

### Mathematics Standards and National Education Goals

In 1989 two events occurred that would influence the development of national science education standards. The National Council of Teachers of Mathematics (NCTM) released *Curriculum and Evaluation Standards for School Mathematics*. The term *standards* assumed new prominence in education reform.

Also in 1989 the National Governors Association met with then U.S. President George H. W. Bush at an education summit. They endorsed six national education goals, which were articulated as America 2000 under the Bush administration and were enacted as the Goals 2000: Educate America Act in 1994, during the administration of Bill Clinton. Two of the national goals made specific reference to improving the knowledge and skills of students in science:

Goal 3: Student Achievement and Citizenship. By the year 2000, American students will leave grades four, eight and twelve having demonstrated competency in challenging subject matter, including English, mathematics, science, history and geography; and Goal 4: Science and Mathematics. By the year 2000, U.S. students will be first in the world in science and mathematics achievement. (Malcom, p. 4)

The National Council on Education Standards and Testing, instituted by the U.S. Congress, referred explicitly to the mathematics standards when they recommended in 1992 that standards for school sub-

jects were a desirable and feasible vehicle for meeting the national education goals. This council noted that the mathematics standards had been developed by a professional society that included mathematicians and teachers. Further, the standards had been subjected to cycles of public review and feedback that encouraged consensus building about what students should know and be able to do. Development by a professional society and public review became two requirements as federal agencies began awarding grants to develop high, voluntary, national standards in school subjects including science.

While there was public consensus that educational standards were good and useful, there was no consensus on what standards were. Examining ordinary dictionaries, two apparently contradictory meanings are found. A standard is an object used as an emblem, symbol, and rallying point for a leader, people, or movement; standards are banners. A standard also is an established basis or rule of comparison used to measure quality or value; standards are bars. Further, three types of standards were identified: content standards, performance standards, and delivery standards. Shirley Malcom, in a 1993 report of the National Education Goals Panel, defined content standards as what students should know and be able to do and performance standards as specifying how good is good enough. Diane Ravitch, in the 1995 book *National Standards in American Education: A Citizen's Guide*, defined delivery standards, later called opportunity-to-learn standards, as conditions for schooling under which content and performance standards would be attained.

### Two Key Documents: NSES and Benchmarks

When the U.S. Department of Education (DoE) began to deliberate about which association to consider to develop national education standards for science, two were immediately apparent: AAAS and NSTA. Each had reasons to assume leadership in the enterprise. Project 2061 was well underway at AAAS and in 1989 had produced *Science for All Americans*, which was having an impact on thinking and practice in curriculum and instruction in science. Work had begun on *Benchmarks for Science Literacy*, which parsed what students at different grade levels needed to understand if they were to attain science literacy by grade twelve. Alternatively, NSTA is the largest organization of science teachers in the country and is analogous to NCTM.

In spring 1991 the president of NSTA, supported by the unanimous vote of the board, asked the president of the National Academy of Sciences (NAS) with its operating arm, the National Research Council (NRC), to coordinate the development of national science education standards. The DoE encouraged NAS/NRC, a prestigious organization, to draw on expertise and experience from both AAAS and NSTA. Subsequently, by the early twenty-first century, two works were acknowledged at the national level as setting education standards for science: *National Science Education Standards* (NSES), which was produced by NRC in 1996; and *Benchmarks for Science Literacy*, which was published in 1993 by AAAS and is one product of Project 2061. A 1997 analysis of the science content in NSES and *Benchmarks* conducted by Project 2061 revealed that, although organized differently, there is greater than 90 percent overlap in what the two documents claim all students should understand and should be able to do.

NSES describes science content as fundamental and included as a standard if it: represents a central event or phenomena in the natural world; represents a central scientific idea and organizing principle; has rich explanatory power; guides fruitful investigations; applies to situations and contexts common to everyday experience; can be linked to meaningful learning experiences; and is developmentally appropriate for students at the grade levels specified. In NSES, the science content begins with the unifying concepts and process standard: systems, order, and organization; evidence, models, and explanations; change, constancy, and measurement; evolution and equilibrium; and form and function. These are not sorted by grade level but are applicable in some form to all students and all science disciplines. The other science content standards in NSES are displayed in Table 1. An array of the fundamental ideas in science that constitute the standards illustrates three points. The ideas build on one another from grade level to grade level. The ideas increase in complexity and abstractness across grade levels. There is an increase in the number of ideas across grade levels.

At the standard statement level the knowledge and abilities of students about inquiry and about technological design are similar for all students. Across grade levels, the ideas with which inquiry and design interact are increasingly complex and sophisticated. The increased complexity and sophistication of inquiry and design are captured in the guide to

the standards. For example, grade K–4 students are to “Ask a question about objects, organisms and events in the environment” (NRC, p. 122). Grade 5–8 students are to “Identify questions that can be answered through scientific investigations” (p. 145), while grade 9–12 students are to “Identify questions and concepts that guide scientific investigations” (p. 175).

The NSES went beyond the charge from DoE and developed standards for teaching and assessment, recognizing that change in content is not sufficient to produce change in teaching and learning. Further, NSES produced professional development standards, which focus on initial and continuing education of teachers; program standards, which focus on changes for schools and school districts; and system standards, which focus on changes in the entire educational system. *Benchmarks* extended science content to mathematics and to human society.

### Implementation

Although science education standards have been generally well received, their implementation has been difficult and uneven. Returning to an emphasis on local control in education, some states chose to keep the frameworks they had in place prior to 1989, some adopted the NSES or *Benchmarks*, others adapted either NSES or *Benchmarks*, while still others created their own state science standards. By 2000 most instructional materials claimed to be standards based. An analysis of many of them in 2001 by Project 2061, however, indicated that few actually are. Some of the questions that plague those implementing standards include: What is inquiry? What does it mean to understand a science idea? and Are the indicated grade levels appropriate? To answer these and other questions and to extend the influence and implementation of the NSES, the NRC has held numerous conferences and published more than fifteen documents addressed to teachers, parents, policymakers, and curriculum and assessment developers. *Benchmarks* is only one in a series of materials available or planned by Project 2061 to promote science literacy. The *Atlas of Science Literacy*, published by AAAS in 2001, graphically presents how the understanding of important science ideas is developed by students over time. Project 2061 also has developed a number of online tools such as *Blueprints for Reform*, which was published by AAAS in 2001, and conducts meetings and workshops for various stakeholders in science education.

TABLE 1

<b>Science content standards in <i>National Science Education Standards</i></b>		
<b>Grades K–4</b>	<b>Grades 6–8</b>	<b>Grades 9–12</b>
<b>Science as inquiry</b>		
Abilities to do scientific inquiry	Abilities to do scientific inquiry	Abilities to do scientific inquiry
Understanding about scientific inquiry	Understanding about scientific inquiry	Understanding about scientific inquiry
<b>Physical science</b>		
Properties of objects and materials	Properties and changes of properties in matter	Structure of atoms
Position and motion of objects	Motions and forces	Structure and properties of matter
Light, heat, electricity, and magnetism	Transfer of energy	Chemical reactions
		Motions and forces
		Conservation of energy and increase in disorder
		Interactions of energy and matter
<b>Life science</b>		
Characteristics of organisms	Structure and function in living systems	The cell
Life cycles of organisms	Reproduction and heredity	Molecular basis of heredity
Organisms and environments	Regulation and behavior	Biological evolution
	Populations and ecosystems	Interdependence of organisms
	Diversity and adaptations of organisms	Matter, energy, and organization in living systems
		Behavior of organisms
<b>Earth and space science</b>		
Properties of Earth materials	Structure of the Earth systems	Energy in the Earth system
Objects in the sky	Earth's history	Geochemical cycles
Changes in Earth and sky	Earth in the solar system	Origin and evolution of the Earth system
		Origin and evolution of the universe
<b>Science and technology</b>		
Abilities to distinguish between natural objects and objects produced by humans	Abilities of technological design	Abilities of technological design
Abilities of technological design	Understanding about science and technology	Understanding about science and technology
Understanding about science and technology		
<b>Science in personal and social perspectives</b>		
Personal health	Personal health	Personal and community health
Characteristics and changes in populations	Populations, resources, and environments	Population growth
Types of resources	Natural hazards	Natural resources
Changes in the environment	Risk and benefit	Environmental quality
Science and technology in local challenges	Science and technology in society	Natural and human-induced hazards
		Science and technology in local, national, and global challenges
<b>History and nature of science</b>		
Science as a human endeavor	Science as a human endeavor	Science as a human endeavor
	Nature of science	Nature of scientific knowledge
	History of science	Historical perspectives

### Other Standards Documents

The picture of education standards in science would be incomplete without mentioning the *Standards for Technological Literacy* released by the International Technology Education Association in 2000. Also, in 1989 the National Board for Professional Teaching Standards produced standards for experienced science teachers, while the Interstate New Teacher As-

essment and Support Consortium published *Standards in Science for New Teachers: A Resource for State Dialogue* in 2001. There are also standards for programs that educate science teachers and for instructors in such programs.

At the beginning of the twenty-first century, standards are seen alternatively as vision or hurdle, as influential or intrusive, as realistic or impractical.

Beyond question, however, they have become an integral part of the science education enterprise.

### TOOLS

Research on the use of technology to support science learning reveals promise to improve learning and potential pitfalls. Technology offers promise for increasing science inquiry and is a major component

of science education reforms and standards. In inquiry activities, students intentionally address challenging science questions by engaging in complex, sustained, reflective reasoning to design solutions, test ideas, revise solutions, critique ideas, and collaborate with others.

The focus here is on technologies including scientific visualizations, statistical modeling, real time data collection, dynamic modeling software, and collaborative environments that support inquiry practices. This discussion highlights uses of technology that are integrated into an inquiry-based, science curriculum and often delivered using a learning environment, to help students engage in substantial scientific reasoning. Technology research seeks applications that help students develop a coherent understanding of science rather than fragmented ideas, and that set students on a path toward lifelong learning.

Many researchers and software designers have identified pitfalls of technology use. Often technology distracts learners with glitzy animations or colorful photographs that not only do not connect to the ideas that students hold, but also reinforce perceptions of science as inaccessible, irrelevant to personal concerns, or inscrutable. Internet sites and software designed to transmit information can deter students from viewing scientific sources critically. Applications like word processors or spreadsheets designed for business may require valuable classroom time to learn yet not contribute to understanding of science. Software designers are just beginning to develop robust applications that contribute to students' understanding by capitalizing on both late twentieth-century research on learning and iterative design studies conducted in settings where learning takes place.

Consistent with the rapid change in educational technologies, this article presents criteria for selecting promising technological tools that are synthesized from research on effective uses of technology and describes applications that exemplify these criteria and have supporting empirical research to demonstrate effectiveness in the classroom. The purposes is to seek benefits in terms of student learning gains, student engagement in scientific practice, or teacher professional development using a range of methodologies, and the criteria are based on reviews of studies featuring general comparisons, studies based on iterative design, and case studies of student learning.

## Engaging Students in Scientific Inquiry Activities

Technological resources can help students in inquiry activities, such as researching a complex question, building explanations, testing ideas, and refining understanding of the world. Applications that support modeling phenomena, visualizing, or collecting data also support inquiry. Emphasized are highlight modeling and simulation, visualization, and real time data collection.

**Modeling and simulation environments.** Modeling and simulation environments allow students to perform “what if” experiments or simulate experiments that would be difficult, impossible or dangerous to perform using real-world materials. Learners typically manipulate computer-based objects to see how they react under different conditions. Models represent complex scientific situations like an ecosystem or the world of Newtonian physics. Students construct or manipulate models to make conjectures, test ideas, and explore rules underlying scientific phenomena. Modeling and simulation environments generally fall within two types, either content based or open ended.

The software program Interactive Physics is an example of a content-based modeling environment. Interaction Physics provides a simulation environment and libraries of simulations for physics curricula. This program allows students to conduct controlled, simulated experiments without costs in time and materials. Students readily repeat experiments, change values of variables, and explore parameters of experiments. Students interact with their simulations in real time, and display measurements graphically in a variety of ways. Research demonstrates that students improve their physics understanding when interacting with modeling tools.

Open-ended, simplified modeling environments include Model-It, which is based on a more complex precursor, STELLA (Structural Thinking Experimental Learning Laboratory with Animation). Using Model-It, students can readily construct qualitative and quantitative models. Students define objects and factors within a system and build relationships between factors. Students “run” their models and monitor changes by viewing indicators or graphs. The design and use of Model-It in high school and middle school science classrooms is the focus of research at the University of Michigan. Model-It supports learners by allowing students to use personally meaningful images, providing infor-

mation in qualitative, quantitative and graphical form, and prompting students for explanations. Case studies show that students use several higher order cognitive tasks when creating models with Model-It, including identifying causal relationships and elaborating upon explanations. Students learn the scientific content that forms the basis of their models as well as ideas related to the nature of science, including purposes of modeling.

**Visualization software.** Visualization software provides students with access to scientific visualizations such as molecular models or geographic information systems. For example, WorldWatcher uses scientific visualization software and historical data to help students recognize patterns in weather data by translating numerical data, such as temperature, to a palette of colors and displaying results on a world map. The software allows students to annotate data, make predictions, and perform sophisticated analysis by overlaying data sets. A Global Warming Project, an eight-to-ten-week unit intended for students in grades seven to ten, involves teams of students advising world leaders on issues countries may face due to global warming. The WorldWatcher formative classroom research reveals the challenges that students face in interpreting complex data and suggests ways to reduce complexity to support inquiry.

**Real-time data collection software.** An important technological support for science learning connects sensors to a computer, calculator, or handheld Personal Digital Assistant (like a PalmPilot or Visor), and allows students to record real-time data about their environment. Common probes include temperature, voltage, and motion sensors. Researchers have studied the use of probes in computer-based labs and microcomputer-based labs, showing how real-time graphing helps students understand complex scientific phenomena. The use of probes in an inquiry environment assists student in distinguishing between important scientific concepts, such as heat and temperature.

### **Complex Science Content and Integrated Understanding**

Technology can help students make sense of standards-based complex topics and provide a window on science in the making to illustrate science inquiry. To enable students to gather, organize, and display information, technology can combine visualization, modeling, and real-time data collection with a full curriculum. Ideally science instruction encourages

students to build a more coherent understanding of science and to apply ideas from one domain to the next. Processed applications such as simulations depend on the curriculum and the teacher to emphasize connections. Whole curricula can support integrated understanding when well designed and complemented by a thoughtful teacher.

For example, Constructing Physics Understanding (CPU), a National Science Foundation-funded project, encourages robust physics understanding by connecting laboratory and computer-based materials to elicit students' ideas, guide students to modify ideas, and help students apply target ideas to new situations by using simulations.

The Virtual High School (VHS) allows teachers in a consortium to use online materials and collaborative tools to create specialty NetCourses online for students at other schools that belong to the consortium. VHS offers a wide range of courses, but science selections include ethnobotany, evolutionary genetics, paleontology, astronomy, and bioethics. VHS research helps teachers redesign courses and enhance inquiry by supporting inquiry-based teaching online.

### **Supporting Peer Learning**

Research shows benefits when students productively specialize and tutor their peers. To support peer learning, software offers some group and individual activities, specifies how groups should work together, and accommodates the contributions of individuals to the group.

For example, software can support geographically separated students in sharing quantitative and qualitative data that are location dependent and/or time-sensitive, including weather, astronomical, or water quality data. Synchronized collaborative programs provide the tools and curricula to organize students over large distances. Synchronized collaborative programs range from days to weeks to a semester, and work best when several classrooms use them simultaneously and share findings. The programs use communication technologies including e-mail and discussion forums to coordinate activity and discussion. For example, in One Sky Many Voices students serve as "resident experts" and communicate with other sites to compare local environments. Participation encourages scientific discussion and debate, asking questions, and presenting evidence to students in distant classrooms.

Several programs use software, including electronic probes to facilitate group data collection and analysis. For example, the Global Learning and Observations to Benefit the Environment (GLOBE) project has three major goals: “to enhance the environmental awareness of individuals throughout the world; to contribute to scientific understanding of the earth; and to help all students reach higher levels of achievement in science and mathematics” (GLOBE Teacher’s Guide, Program Overview). Through GLOBE, elementary to high school students around the world investigate earth science, including atmosphere, hydrosphere, land use, and soil. Scientists and students partner to collect and use data to gain a better understanding of global environmental processes. Providing online tools and materials, GLOBE uses high quality satellite photos and graphical representations of temperature, climate, and land use data. Students add findings to the Student Data Archive and use an Internet-based forum called GLOBEMail to communicate with schools and scientists. GLOBE is effective in improving student achievement in key mathematics, science, and geography skills. Students and teachers also report more interest and awareness of environmental issues and believe their data contributes to scientific research.

### **Recognizing Relevant Experiences, Diverse Contributions to Science, and Autonomy**

Effective instruction should connect students’ complex and varied ideas from prior observation and instruction, and introduce new scientific ideas. Technology can help students make connections, test their ideas against normative ones, and sort out varied perspectives on a topic.

To promote independent inquiry, technology-enhanced environments can prompt students to reflect on their progress and critique solutions proposed by others. Effective software should invite diverse students to engage in science by providing a variety of ways to learn (discussion, projects, reading, designing, debating), and by using students’ views and experiences as a springboard to further learning. Software can support students in refining ideas, developing interest in new scientific topics, and carrying out sustained, complex projects.

In the early twenty-first century, learning environments are emerging to meet this challenging criteria. Computer-based learning environments combine curricula, classroom activities, and assess-

ments into packages designed to improve teacher effectiveness and to provide cognitive and social supports for students who are conducting inquiry projects. Learning environments incorporate results of cognitive research including hint giving, prompts for reflection, and connections to online discussions. They free teachers to tutor individuals, identify common theories, and monitor progress.

The Web-based Integrated Science Environment (WISE), a browser-based application, offers a library of middle school and high school activities that enable students to critique real-world “evidence” from the Internet, compare scientific arguments, and design solutions to scientific problems. WISE projects offer inquiry activities that are personally relevant to students. These activities present multifaceted, interdisciplinary scientific issues, introduce scientific methodology, and encourage students to gain lifelong learning skills, including the ability to critique websites and support conclusions with appropriate evidence. The WISE technology provides an organizational structure helping students to reflect upon their learning, take notes, sort evidence, and discuss arguments online with peers. Many WISE projects involve hands-on data collection, online modeling of observations, or design activities. WISE provides scientific evidence, differing points of view, and visualizations (e.g., images, diagrams, animations or models). Students perform all work collaboratively, and are assessed in terms of their notes, arguments, models, and designs. WISE draws upon extensive cognitive and educational research, summarized by Marcia Linn and Sherry Hsi, to explore how computer technology can guide and support students’ understanding.

### **Benefits**

There is widespread agreement that students benefit from learning with and about technology in science. Nevertheless, effective incorporation of information technologies into the curriculum has been controversial, difficult, and demanding. Finding ideal uses of technology in science instruction remains an active research area, and the technology itself is a “moving target,” as new projects emerge on a regular basis. The recommendations in this entry capture current practices and research findings, and require regular revision as new tools and new research results become available. The best gift science teachers can give this generation of students is to offer them courses and tools that enable them to become life-

long science learners and to add new technological resources regularly to their repertoire.

## SEA GRANT PROGRAM

The sea is an integral part of American heritage. Historically, marine commerce, seafood products, and the productivity of coastal communities have been essential to the U.S. economy. However, the marine sciences did not enjoy a prominent role in the early development of the country's science enterprise. This began to change during the post-*Sputnik* years, spurred by U.S. President John F. Kennedy's statement in 1961 that "knowledge and understanding of the oceans promise to assume greater importance in the future." By 1963 the Federal Council for Science and Technology published a long-range plan for oceanography that marked a greater federal commitment to the field.

Unlike the ocean sciences, engineering and agricultural research flourished during the late nine-

teenth century and throughout the twentieth century. This was made possible by the land-grant program, perhaps America's greatest contribution to university education. The Morrill Act, in 1862, and subsequent legislation established in every state a unique university-based, federally funded system that combined programs of research and education—and the extension of that knowledge to practical application. The land grant experiment has been an enormously successful model for federal-state partnerships.

The land grant concept provided the model that Athelstan Spilhaus, then a dean at the University of Minnesota, referred to in September 1963 when he remarked, "Why do we not do what wise men have done for the better cultivation of the land a century ago, why not have Sea Grant Colleges?" Thus originated the idea of a National Sea Grant College Program. Given the importance placed on the oceans during the 1960s, the Spilhaus concept rapidly became reality. With support from the academic community, led by Spilhaus and John Knauss, then dean of the University of Rhode Island's Graduate School of Oceanography, the Sea Grant idea attracted the attention of Congress. Under the leadership of Senator Claiborne Pell of Rhode Island and Congressman Paul G. Rogers of Florida, the National Sea Grant College and Program Act (Pub. L. 89-688) was signed into law by President Lyndon Johnson on October 15, 1966.

The fledgling Sea Grant Program was initially housed at the National Science Foundation, and the first grants were awarded in 1968. With the formation of the National Oceanic and Atmospheric Administration (NOAA), Sea Grant was moved to that agency in the early 1970s. By 1974 grants had been made to twenty-three institutional programs in coastal and Great Lakes states.

### **Operating Concepts**

The National Sea Grant College Program operates under authorization of the Sea Grant Act, which is consistent in concept and intent with the original 1966 law. Sea Grant grew out of a desire to achieve preeminence in oceanography and to support education and research in the marine sciences. The current version of the act explicitly states that the objective is to "increase understanding, utilization, and conservation of the Nation's ocean, coastal and Great Lakes resources by providing assistance to promote a strong educational base, responsive re-

search and training activities, and broad and prompt dissemination of knowledge and techniques, assessment, development, and multi-disciplinary approaches to environmental problems." Sea Grant's mission is to engage the nation's research universities in management-critical issues relating to coastal and ocean resources. The mechanism used is federal sponsorship of grants to universities for education, research, and information transfer to users through an extension service.

Eligibility, qualifications, and responsibilities for sea grant programs are set forth in the act and the Federal Register (Vol. 44, No. 244). A sea-grant program is a university-based program administered by an academic institution or consortia. Responsibility for designation of sea-grant colleges rests with the U.S. Secretary of Commerce. Sea-grant colleges receive funds through federal grants that require matching funds from nonfederal sources at 50 percent of the federal portion. Special provisions in the act also allow NOAA to make grants to sea-grant institutions by "passing through" funds from other federal agencies on a nonmatching basis.

### **Magnitude and Scope**

In 2001 Sea Grant managed about \$100 million in funds annually from federal and matching sources. Approximately 75 percent of those funds are invested in grants for the core operations of the thirty designated sea grant institutional programs. Most of the remainder is distributed through a national competitive process open to all programs. Each of these institutions is responsible for developing an integrated program for addressing management-critical issues important to the state, region, and nation. This is done through merit-reviewed research, education, and outreach projects. Emphasis is placed on engaging users and stakeholders, including federal, state, and local agencies.

Sea Grant programs draw upon academic talent not only at the sponsoring institution but also through a wider network of more than three hundred participating universities. Annually, more than 800 individual projects are funded, 300 extension specialists engaged, and about 500 graduate fellowships supported nationally. In the three-year period between 1997 and 1999, more than 2,500 journal articles and publications were produced. Overall, about 60 percent of available funds are expended on merit-based research, 27 percent on outreach, and 5 percent on precollege training programs.

Sea Grant programs focus on three broad portfolios: economic leadership, coastal ecosystem health and public safety, and education and human resources. A broad range of multidisciplinary topics are addressed, including aquaculture, aquatic nuisance species, coastal community development, estuarine research, fisheries habitats and management, coastal hazards, marine biotechnology, marine engineering, seafood safety, and water quality. Educational efforts involve targeting K–12 teachers and their students, mentoring college and graduate students conducting research projects, and transferring useful technology to coastal residents and businesses.

While Sea Grant has yet to gain the stature and resources its founders envisioned, it has been a highly productive investment of public funds and has made significant contributions through its science, education, and extension programs. With the enormous growth in, and the economic importance of, the nation's coasts and associated habitats, the demand for Sea Grant's services continues to increase dramatically.

Athelstan Spilhaus's brainchild promises to increase its contributions to building the United States' capacity to manage its coastal resources in the future. The establishment of a Sea Grant Program in Korea portends an international dimension as well.

## SECONDARY EDUCATION

#### HISTORY OF

Susan L. Mintz

#### CURRENT TRENDS

Gerald N. Tirozzi

#### INTERNATIONAL ISSUES

Donald B. Holsinger

### HISTORY OF

In the mid- to late nineteenth century, the United States became the first country to open secondary education to the general public. In the early twenty-first century, secondary education follows a common elementary school experience, typically beginning at age twelve and continuing through age seventeen or eighteen. Elementary education deals with the rudimentary skills of reading, writing, and computation, as well as social goals deemed important by curriculum developers. Secondary education, however, extends beyond the elementary curriculum and addresses a combination of the personal, intellectual, vocational, and social needs of adolescents in society. Educators and policymakers have engaged in ongoing debate over what should be included in the secondary curriculum. In fact, the emphases of the secondary curriculum have shifted according to local and national goals; the historical, philosophical, and intellectual context; and societal beliefs about the role of youth in society, as well as other factors.

### The Beginnings of Secondary Education

Public secondary schools began to proliferate throughout the United States in the mid- to late nineteenth century. Before then, private endeavors provided a variety of educational experiences. Throughout the seventeenth and eighteenth centuries, private academies and tutors prepared wealthy boys for college. Academies, controlled by an independent board, required tuition and were distinguished from one another by regional and local needs. As a result, the curriculum and religious orientation were not the same at each school. The college preparatory curriculum was classical in nature, focusing on Greek and Latin. Boston Latin Grammar School epitomizes an example of such an academy. Opened in 1635 with some public funding and control, Boston Latin was designed to give boys from elite families the education they needed in order to attend college and take their place in society.

As the merchant and craftsmen class grew, private academies began to cater to the sons of the middle class in order to prepare these young men to succeed in commerce. These academies, called English academies, offered classes in modern languages, literature, mathematics, natural science, history, and geography, rather than Latin and Greek. Both English and Latin academies offered admission through examination. The differences in these academy curricula foreshadowed what would become the continuing debate over what should constitute the secondary curriculum—a question that has been addressed throughout the history of American high schools.

### The First Public High Schools

The first public high school opened in Boston in 1821. What became known as English High School was established as an alternative to private academies that offered a college preparatory curriculum. Boys who passed the entrance examination participated in a three-year English curriculum. High schools became more common in Massachusetts after an 1827 law required towns to provide a free public high school. Other early high schools could be found across the United States, although the biggest growth came in urban areas. Many early high schools did not admit girls and minorities. Boston opened a High School for Girls in 1826 that closed within two years. It was not until Boston Girls High and Normal School opened in 1857 that young women had the opportunity to attend a public secondary school. In

the late eighteenth and nineteenth century, it was not uncommon for urban schools to include a *normal* curriculum at the secondary level. Normal schools trained young women to teach in local elementary schools.

### Growth of Public High Schools

The public high school movement gained momentum following the Civil War (1861–1865). Only 300 high schools existed in the United States prior to the war; by 1900 there were more than 6,000 high schools annually graduating 6 percent of American seventeen-year-olds. Public high schools, however, had their detractors as well as supporters. Advocates argued that high schools completed the public school system, could attract businesses by providing competent labor, and increased the value of land. Opponents viewed the taxes that supported high schools as a burden. In many cases, families could not afford to send their children to school. Family economic stability was needed for high school attendance, and some families did not have this luxury. In other cases, families might choose to send their children to private schools and not get the direct benefit of the public high school. The tax question was resolved in 1872 when the Michigan Supreme Court (in what became known as the Kalamazoo Case) heard arguments for and against using taxes for secondary schools. The ruling favored tax support of public high schools, which subsequently became common practice throughout the United States.

### Curriculum Standardization

As the number of public high schools grew, the variety among curricula increased. No standards existed concerning curriculum or organization. Curriculum decisions made by local school boards hampered the links between colleges and high schools. Entrance to college was usually determined by examinations that had specific, individual requirements, making it difficult to anticipate the necessary preparation. To provide more standardization in the curriculum and help untangle the college admission process, the National Education Association sponsored the Committee of Ten in 1892. Ten influential educators, mostly from colleges and universities, debated the appropriate role of secondary schools. The report of this committee examined a central question in the ongoing curriculum debate—what constitutes a good secondary education?

The Committee of Ten recommended a rigorous academic curriculum for all students, regardless of their future plans, and elucidated the pursuit of knowledge and training of the intellect as the mission of secondary schools. High schools held the responsibility for designing courses of study that focused on the nine core subjects: Latin, Greek, English, modern languages, mathematics, sciences, natural history, history (including economics and government), and geography. College admission would follow for interested students who successfully completed this course of study. But the desire to attend college was not the only reason to partake of these classes. The committee argued that in order for students to be educated, college bound or not, an academic curriculum was necessary. Criticisms of the report abounded. Many academicians believed that there was too little rigor; others commented that the courses were too impractical.

Curriculum standardization was not the only approach to articulating the secondary school-college divide. As noted, in the late nineteenth century admission to most colleges was determined by an entrance examination. High school and state educators wanted to use a diploma admission requirement rather than have to prepare students for the wide range of college admissions tests. The University of Michigan began diploma admission as early as 1871, but this practice did not become common until accreditation became popular.

The New England Association of Schools and Colleges was founded in 1885 and is the oldest of the six regional accrediting agencies servicing the United States in the early twenty-first century. These accreditation agencies helped to cement the distinctions between colleges and universities and standardize the evaluation of high school programs. Accreditation continues to be voluntary and involves parents, teachers, students, and community members. A school self-study that is based on regional standards and is tied to state standards is the basis of the accreditation evaluation. In another regulatory push, the College Entrance Examination Board came into existence in 1899 with the goal of providing uniform examinations for college admission.

The Carnegie unit also played a role in the standardization of high schools in the early part of the twentieth century. Again, the issue was how to report high school experiences to colleges. The Carnegie Foundation for the Advancement of Teaching, a nonprofit corporation founded in 1906, developed

the Carnegie unit as a measure of the amount of time a student had studied a subject. One Carnegie unit was equivalent to 120 hours of contact time, and fourteen units was established as the minimum for an academic high school course of study.

### Curriculum Differentiation

Early in the twentieth century the population of secondary schools increased dramatically. In 1910, 8.8 percent of seventeen-year-olds were in high school; by 1930 this figure rose to almost 30 percent. Progressive educators took note of both this increase and that many of the students in secondary schools would not be attending college. They believed schools needed to expand the rigorous academic curriculum to include more practical subjects and in this way create more equitable schools. Rather than focusing solely on intellectual training, high schools began to emphasize social and vocational skills that prepared students for later life. Social skills were necessary to assimilate the large wave of immigrants and to promote democratic ideals so that new Americans could function in society.

The term *curriculum differentiation* means different courses of study for different students. The comprehensive high school attempts to meet the needs of a variety of students in one location. Curriculum differentiation was championed in another National Education Association report, the *Cardinal Principles of Education*. This report, released in 1918 and authored by the NEA's Committee on the Reorganization of Secondary Education, did not emphasize intellectual skills or the standard school subjects. Rather, the committee recommended that secondary education focus on health, the command of fundamental processes, worthy home membership, vocation, citizenship, worthy use of leisure time, and ethical character. As high school education became universal, comprehensive high schools, the committee argued, should meet the needs of the widely diverse student population. These needs could be met through varied curriculum options relevant to the lives of current students. Guidance departments would help students make appropriate selections from the available choices by determining the students' strengths and weaknesses. IQ tests would be used to determine student placement. The committee emphasized that offering a wide variety of relevant choices for students was the only way universal secondary education could provide equal educational opportunity and allow all students to succeed.

Using the high school curriculum to solve social problems was compatible with the relevant curriculum choices in the Cardinal Principles. This trend has continued in high schools as seen in the substance abuse programs, family life education, and driver's education courses at the beginning of the twenty-first century.

### Secondary School Structures

The development of secondary schools led to a number of different structural arrangements. During the late nineteenth and early twentieth centuries the prevalent pattern was eight years of graded elementary school followed by four years of high school. The first junior high schools, grades seven through nine, were established in California and Ohio around 1910. This organization allowed for greater flexibility in the curriculum and slowly assimilated students into the world of high school subjects, classes, and teaching styles. The junior high school pattern typically includes six years of elementary school, three years of junior high school, and three years of senior high school. There were more than 7,000 junior high schools by the 1960s.

Middle schools evolved in the 1960s with a new pattern—five years of elementary, three years of middle school, and four years of high school. Middle schools were designed to meet the intellectual, social, and physical needs of young adolescents rather than to help these students get ready for high school. The structural and curricular changes in middle schools included advisories (long-term student groups that meet with one faculty member over a period of time), team planning and teaching, exploratory classes, and adequate health and physical education classes. Middle schools are currently the predominant mode of organization in grades six through eight.

### Minorities in Public High Schools

The idea of a public high school education had taken hold in the white, middle-class population by the late 1800s. High schools were mostly coeducational and, in fact, girls made up the majority of the high school population by the late 1800s. The education of blacks and Native Americans, however, took a different turn. During Reconstruction education was aimed at helping African Americans adjust to the prevailing political and social norms. The separate but equal doctrine elucidated in the U.S. Supreme Court case *Plessy v. Ferguson* in 1896 severely cur-

tailed the development of black high schools, yet the perennial high school curriculum debate was also relevant to the education of African Americans. The educators W. E. B. Du Bois and Booker T. Washington disagreed about the course that black education should take. Du Bois believed in an academic curriculum allowing talented students to excel, a curriculum promoting intellectual life, whereas Washington favored industrial and agricultural training, a curriculum promoting the worthiness of hard work.

This debate, centering on how African-American youth should be educated in high school, was a moot point for many years because most localities, particularly in the South, did not provide public high schools for blacks. In an 1899 decision (*Cummings v. School Board of Richmond County, Georgia*), the Supreme Court decided that school boards were not required to provide public secondary education for African Americans. This decision restrained the evolution of black secondary education. Only a few black public high schools managed to struggle into existence. In general, these high schools focused on a college preparatory curriculum. Nevertheless, once the population of African-American youth in urban areas increased, local officials, and later northern philanthropists, promoted black secondary schools focusing on industrial education. Many believed that this curriculum would train students for the kinds of employment then available. Black leaders, however, often argued for a curriculum that would prepare students for college, not work.

In *Brown v. Board of Education of Topeka, Kansas*, the Supreme Court unanimously struck down the *Plessy v. Ferguson* separate but equal ruling, arguing that the separation of children in public schools by race violates the Fourteenth Amendment. This 1954 ruling sent shock waves through the state of Kansas and several other states that had segregated school systems. The *Brown* decision did not solve all of the problems associated with black education. Desegregation did not come easily, and only a year later the Supreme Court needed to create procedures for school boards to integrate schools “with deliberate speed.” In 1957 federal troops had to be called into Little Rock, Arkansas, so that nine black students could attend the previously all-white Central High School. Although high school graduation rates for African-American students have improved since the *Brown* decision, the historic exclusion of black youth from secondary schools continues to be reflected in

the discrepancies in the dropout rates and standardized test scores of white and black adolescents.

The Bureau of Indian Affairs (BIA) in Washington, D.C., was in charge of the education of American Indian youth and developed an official policy of detribalization. Many Native Americans were sent away from their families to boarding schools to be immersed in white culture and values. For example, the curriculum of the Carlisle Indian Industrial School, established in 1879 and closed in 1918, was designed with the intention of transforming Native American children by focusing on the vocational skills that Booker T. Washington was promoting for the education of African Americans. After the U.S. government granted citizenship to Native Americans following World War I (1914–1918), local schools replaced boarding schools.

In the early twenty-first century, Native American schools on reservations are still controlled by the BIA, and Native American students are the least successful students in the public school system. Poverty, low attendance rates, and the lack of exposure to a rigorous academic curriculum directly contribute to high failure rates among Native American students. Almost 50 percent of Native American students drop out of high school, and only 17 percent continue on to college.

### Education and the Economy

The economy directly influenced secondary schools from the time such schools were created. Access to transportation and family economic stability influenced high school enrollment rates, but as jobs required more education, a higher number of students stayed in high school. In the late 1920s youth unemployment emerged as a contentious political and social issue. Politicians and educators wanted students to remain in high school in order to reduce increased delinquency, crime, and political radicalization. With millions of youth unemployed during the Great Depression of the 1930s, every attempt was made to keep more students in school. At the same time, budgets were reduced, putting a major strain on most schools. During the 1920s and 1930s the school curriculum became more custodial in nature in order to meet the immediate needs of youth. Consequently, emphasis shifted from academic courses to consumer-oriented classes, and life skills were emphasized.

In the 1940s and 1950s the common form of secondary education was a comprehensive high

school with differentiated curriculum tracks. During World War II (1939–1945), enrollment in secondary schools dipped, but the curricular trends of making courses relevant to the lives of students continued to be important. In 1944 the Educational Policies Commission released *Education for All American Youth*, a report calling for a highly practical curriculum similar to that described in the Cardinal Principles. Many feared that the economic difficulties that occurred before the war would continue after the war, so the push continued to keep students in school. American youth would not be competing for jobs with returning servicemen.

The economy continued to influence educational decisions in the 1950s, 1960s, and 1970s, but clearly played a central role in the 1980s. *A Nation at Risk*, a report from the National Commission on Excellence in Education, published in 1983, directly tied the quality of American schooling to the strength and position of the American economy in the global marketplace. Alarmed by the economic advances made by Japan and other countries, the commission argued that schools in the United States were declining, which presented an immediate threat to the country's well-being and economic strength.

### Education and the National Defense

The cold war of the 1950s and 1960s brought further challenges to the schools. Many people called for strengthening academics in secondary schools by removing the popular but less rigorous life-adjustment classes. The launching of *Sputnik* by the Soviet Union in 1957 instigated loud cries for educational reform. As a result, the National Defense Education Act that was passed in 1958 provided financial aid to states for the improvement of the teaching of science, mathematics, and foreign languages.

As a result of the cold war, the debate over the public high school curriculum shifted to how the educational system could ensure the survival of the United States and its democratic ideals. Many asserted that American youth could be protected from the ideas of communism and fascism through universal secondary education that emphasized equality of educational opportunity. A central question emerged: Is educational opportunity best served through curriculum differentiation and good guidance services or through a rigorous academic curriculum? The educator James B. Conant studied American high schools and concluded that the solution was universal enrollment in a comprehensive high school that

met the needs of all students by providing the opportunity to succeed. He noted that the comprehensive high school also allowed for student interaction among academic tracks, which facilitated the development of the social skills that are necessary in productive citizens. Conant also suggested that authorities strengthen the differentiation in secondary schools with an increased focus on the gifted. He believed talented students must be exposed to advanced classes in mathematics and science. To this end, there were a number of curricular reform efforts that found their way into secondary schools, several sponsored by the National Science Foundation. Most of these reforms failed because the science and mathematics programs were designed by academicians who paid little attention to the day-to-day realities of schools.

### Standards

The argument between high academic standards and life skills as the central focus of the American high school curriculum continued in the last three decades of the twentieth century. This debate also occurred internationally. Great Britain readjusted its system of examinations that put eleven-year-olds into specific secondary schools and replaced it with comprehensive schools similar to those in the United States. *A Nation at Risk* galvanized the United States into forming higher academic standards. Great Britain did the same with a national curriculum instituted in 1988.

The recommendations from the report *A Nation at Risk* were similar to those discussed by the Committee of Ten a century before. The report called for higher graduation requirements, including rigorous academic study for all students regardless of whether they were college bound. Curricular tracking, the report stated, had led to mediocrity. In response, the standards movement was born. By the end of the twentieth century, forty-nine of the fifty states had adopted academic standards based on the work of national organizations in the major subject areas. States began to hold students, teachers, and schools accountable to these standards through examinations. The reauthorization of the national Elementary and Secondary Education Act, known as the No Child Left Behind Act of 2001, reconfirmed this push for accountability by requiring states to develop annual testing programs for students in grades three through eight in reading and mathematics. School districts must be able to show that all stu-

dents reach proficiency or will be subject to corrective procedures.

### Secondary Education Elsewhere

Many other countries have been faced with similar issues to the United States in terms of secondary education. Discussions about the purpose of secondary schools and the content and focus of the curriculum occur throughout the world. In some countries, vocational and technical programs run parallel to upper secondary education. For example, the Russian Federation and other former Soviet nations provide an eight-year general education program and then funnel qualified students to academic, vocational, or technical schools. At seventeen or eighteen, students are selected for higher education. Only 20 percent of graduates from secondary schools continue to college, whereas in the United States more than 60 percent of high school graduates go on to college.

Several European countries are also invested in secondary school curriculum reform with a stress on national standards. Throughout most of Europe, secondary education is compulsory up to the eighth grade. A large increase in secondary enrollment in the mid-twentieth century led schools to attempt to craft curricula that balanced cognitive, affective, and psychomotor needs of a diverse student population. The European nations also offered secondary options that include comprehensive high schools, parallel schools, and full- or part-time programs. Vocational education programs tend to lag behind general education programs in most countries.

The Republic of China also has a nine-year compulsory education program. The National Ministry of China controls the school curriculum, although there is diversity in secondary school options. Forty-five percent of Chinese secondary students attend the general secondary schools that are the gateway to higher education. Unlike the United States and many European countries, China does not have comprehensive secondary schools. There are vocational schools, teacher-training schools, and craftsmen schools, along with the general academic high schools. Examinations are used to categorize students into the appropriate educational track. After their junior year, secondary school students must pass an examination to go to the next level. The national higher education examination is given only once per year and is highly competitive.

### Trends in Secondary Education

Secondary school reform represents a vitally important topic. In the early twenty-first century, the major goal is helping all students reach high academic standards. This has yielded a number of innovative programs that attempt to balance students' personal and academic needs. Effective curricula include core learning in discrete academic subjects, increased foreign languages, interdisciplinary courses, and alternative assessment approaches. The foundational skills of reading and writing are garnering more attention at the secondary level in all content area classes.

Along with high standards, public schools must meet the needs of all students and provide an appropriate education for students with many diverse needs. Inclusion of students with disabilities requires schools to rethink the way classes are tracked and how services are provided to students who have difficulty in the school environment. Coteaching arrangements, which allow subject area specialists to work with trained special educators in the same classroom, constitute one approach to meeting diverse needs.

Some research indicates that smaller high schools are better settings for meeting adolescent needs and helping students reach their full academic potential. In an attempt to break down large comprehensive high schools, a number of options are being tried. Small school alternatives include schools-within-schools and parallel schools sharing the same physical space with distinct missions and programs. Some large high schools separate students by grade level into separate wings.

Flexible scheduling is used so that students and teachers can have enough time for a variety of instructional strategies and more personalized interactions. Block scheduling, one form of flexible scheduling, has increased class time. These larger blocks allow teachers to use a variety of teaching strategies and provide time for differentiating instruction to meet specific student needs. In addition to academic gains, evidence shows a decrease in behavior problems when block scheduling is used.

Crime and violence in secondary schools garner extensive media attention. Many schools are attempting to circumvent alienated youth through social and emotional intelligence programs, organizational structures, and increased surveillance.

Where schooling takes place is also changing. In some areas, state-supported academies for gifted

students have been established. Charter schools attempt to meet the needs of a diverse group of students by forming a specific vision and plan outside of the ordinary. Technology may also play a role in the place and mode of secondary instruction as distance learning becomes more popular. Secondary schools continue to experiment with a variety of ways to meet the social, intellectual, personal, and vocational needs of students.

## CURRENT TRENDS

The term *secondary school* refers to the levels of schooling that follow elementary school and conclude with high school graduation. Typically, these include middle schools or junior high schools, the most common configuration of which is grades six through eight, and high schools, the most common configuration of which is grades nine through twelve. The 1983 release of the National Commission on Excellence in Education document *A Nation at Risk* focused national attention on the need for school reform. This reform movement took clearer shape in the late 1980s and early 1990s with the introduction, by the first Bush administration, of America 2000, a list of goals for U.S. education to be achieved by 2000. America 2000 was later refined and renamed Goals 2000 by the Clinton administration. So began the standards movement, which evolved throughout the 1990s and was ultimately codified by President George W. Bush and the 107th Congress in the No Child Left Behind Act of 2001. This act sharpened the teeth of the standards movement with accountability measures in the form of "high-stakes" standardized tests that all students must take at various points in their education. It is against this backdrop of the standards, assessment, and accountability movements that secondary schools craft their reform efforts.

### Standards

By the late 1990s nearly every state had developed standards for student achievement in most content areas. Greatest attention has been focused on "core" subjects, typically English/language arts, mathematics, science, and social studies, but "elective" courses—foreign languages, music, and visual arts, for instance—have standards as well that drive the curriculum and instruction in those subject areas. The quantity and quality of content standards vary widely from state to state, though many content-area professional organizations have developed their own

national standards to provide a benchmark for rigor and appropriateness of content-area standards. Many see the standards movement as the great contemporary revolution in U.S. education: No longer is middle level or high school credit granted solely on the basis of attendance. In theory, students would not be promoted or graduated until the standards were achieved.

### Assessment

To assess standards achievement, most states had begun to develop standardized tests by the start of the twenty-first century. These efforts were spurred by the No Child Left Behind Act, which requires states to test every student periodically in certain secondary content areas. Like the standards themselves, the quality of assessments varies widely from state to state, and the implementation of mandatory standardized assessments has introduced several dilemmas and controversies:

- How do schools accommodate students with special needs and English language learners in the administration and reporting of test scores? These students are not exempt from tests, and principals and teachers struggle to find the most equitable way to honor their needs while not violating the integrity of the testing process and the value of the final results.
- Do standardized tests truly address the content standards? Many standards speak to higher-order thinking skills, and educators disagree on the capacity of paper-and-pencil multiple-choice tests—where one answer and only one answer is correct—to adequately gauge problem solving and critical thinking.
- How will test scores be used? Ideally, tests will provide a wealth of data that informs the instructional program of individual students and schools. Questions remain about the capacity of the assessment instruments to provide these data and about the professional capacity of school personnel to interpret the data for instructional decision-making.

### Accountability

With standards and tests in place, most states have begun to implement or develop plans to implement accountability measures for performance on standardized tests. In most cases, students who do not achieve a required score on certain tests—usually in

the core subjects of English/language arts, mathematics, science, and social studies, though some states include foreign language and other elective courses—will not be promoted to the next grade. The accountability issue casts a brighter light on the above questions and introduces other issues:

- Retention versus promotion. Educators do not agree on the placement of a student who does not achieve a required score on standardized tests. Advocates of both student retention and student “social” promotion speak with the backing of practice and research, and the argument remains unsettled in education circles.
- Teaching to the test. With principals’ and teachers’ jobs on the line, many educators perceive a temptation to focus on test-taking skills and test preparation rather than to teach the curriculum the mastery of which the test is intended to assess. This controversy speaks to the perception of the quality of the assessment instruments many states use. If the tests were genuinely aligned with the standards, many educators believe, teaching to the test would not be an issue.

Many states also report each school’s aggregate scores and encourage low-performing schools to develop improvement plans. School accountability was codified in the No Child Left Behind Act, which calls for schools to demonstrate “adequate yearly progress,” as determined by disaggregated test scores in mathematics, reading, and science. Schools that fail to show adequate yearly progress must take required steps to improve, or they will eventually be subject to corrective procedures.

National, state, and local education reforms have produced many positive changes, but in middle level and high schools, reform is still lagging. Although secondary student achievement has increased in some subjects for some groups, progress has been spottier and success more elusive than at the elementary level. The nation still has a way to go to ensure that all students are graduated from high school with the knowledge and skills to compete in a global economy—a challenge that will become even greater as enrollments swell.

Powerful recommendations for transforming secondary schools have come from the National Association of Secondary School Principals, in their 1996 groundbreaking report on the twenty-first-century U.S. high school, titled *Breaking Ranks: Changing an American Institution*; the Carnegie

Foundation in their 1989 and 2000 *Turning Points* reports on middle-level reform; and other groups. But the renaissance has not yet happened. The majority of high schools “seem to be caught in a time warp,” noted U.S. Secretary of Education Richard Riley in his 1999 back-to-school address, which he devoted entirely to high school reform.

The problem is not a lack of understanding about what needs to be done. Across the country, secondary schools are demonstrating what a difference it makes when effective strategies are combined with strong commitment and adequate resources. But, regrettably, secondary school improvement has not been a high priority of the U.S. Congress or the states. Secondary schools are far less likely than elementary schools to receive funds under the Title I program, the largest source of federal K–12 aid. Seventy-seven percent of Title I funds go to the elementary level. When secondary schools are funded, they receive smaller Title I allocations per low-income pupil than elementary schools. Several members of Congress have introduced or endorsed legislation to meet the urgent educational and infrastructure needs of secondary schools.

States have raised student performance standards and are revising secondary curriculum and instruction. The public also supports school improvement: 71 percent of respondents to the 1999 Phi Delta Kappa/Gallup Poll felt that reforming the existing public school system, rather than finding an alternative system, should be the priority for education. Yet, the legislation dedicates disproportionate attention to elementary education at the expense of secondary education. Policymakers often choose to target resources on the early years to promote child development and address learning problems before they become too severe. But early intervention does not necessarily “inoculate” children from later difficulties, and many students need continuing services to cope with the more demanding middle and high school curricula and to avoid falling further behind.

### **Trends That Inform a Reform Initiative for Secondary Schools**

Trends in achievement, demographics, leadership, and funding are among the major reasons secondary schools require additional attention and support.

**Graduation rates.** To succeed in the workplace, further education, and adult life, all students should obtain at least a high school diploma and have a solid

base of knowledge and skills. The percentage of young people completing high school rose during the 1970s and early 1980s and has hovered around 86 percent since then. But too many students—more than 380,000 students in grades ten through twelve—continue to drop out each year. As states raise their requirements for graduation, the challenge of keeping students in school and educating them to high levels will become more daunting.

**Achievement.** The average scores of secondary school students on the National Assessment of Educational Progress (NAEP)—the only national measure of trends in student achievement—increased in science and mathematics during the 1990s but showed mixed results or declines in reading and writing. To assess how much academic growth students made between elementary school and the end of middle school, the Educational Testing Service (ETS) analyzed average gains in students' NAEP scores between the fourth and eighth grades. By this measure, ETS concluded, academic growth from the mid-1970s to the late 1990s was flat in science, reading, and writing and went down in mathematics. Regardless of whether one views the NAEP data with optimism or concern, it seems clear that further improvements in student achievement are necessary.

**International comparisons.** In the 1999 Third International Mathematics and Science Study, which compared achievement in more than twenty nations, U.S. secondary students performed at lower levels for their grades than U.S. elementary students and were outperformed by students from a number of other countries. In science, U.S. fourth graders scored in the very top tier of nations and U.S. eighth graders achieved above the international average, but U.S. twelfth graders performed below the international average. In mathematics, U.S. fourth graders achieved above the international average, whereas U.S. eighth graders performed below average and U.S. twelfth graders scored among the lowest tier of nations.

**The baby boom echo.** Between 1999 and 2009, U.S. secondary school enrollments were expected to grow by 9 percent, or about 1.3 million students. Minority students and children from different language backgrounds will constitute a greater share of enrollments. The nation will need many more well-trained teachers to educate this diverse and growing population.

**Inadequate facilities.** A 1999 report by the Campaign to Rebuild America's Schools revealed that

about 14 million children attend severely dilapidated public schools with leaky roofs, inferior heating, broken plumbing, and other threats to health and safety. Schools in many communities are overcrowded, a problem that will worsen with rising enrollments. The nation will need a projected 6,000 new schools to keep pace with a decade of enrollment growth; this will require substantial resources, as well as creative approaches for using existing facilities.

**Teacher needs.** Federal and state actions during the 1990s to strengthen teacher supply and quality are promising. But it will take more concerted and continuing efforts to fill the demand for well-prepared teachers in secondary schools, where shortages of teachers for particular disciplines are serious and where teachers must be prepared to teach advanced courses, integrate technology, and inspire young people to do their best. More than the supply of new teachers, research shows that teacher retention remains a critical issue in schools, as many teachers leave within their first five years on the job. The problem is exacerbated in secondary schools by the problem of out-of-field teaching—which is most pronounced in urban and rural areas. Again, with the passage of the No Child Left Behind Act, which calls for a “highly qualified teacher” in every classroom, there is a renewed focus on providing all teachers, new and veteran, the support and professional development they need to do their jobs well, as well as salaries commensurate with the value of their work.

**Leadership shortages.** Urban, suburban, and rural districts in every region of the country are experiencing shortages of qualified candidates for principals' jobs, yet this issue has met with near silence. While the responsibilities of the principalship have escalated considerably, there has been no comparable increase in incentives (not the least of which is a commensurate salary) to attract highly qualified candidates. Few school districts have structured recruitment or training programs to find the best candidates or groom their own, or to encourage minorities and women to enter leadership positions. Promising candidates are dissuaded from applying for principals' positions by such factors as mounting job stresses, inadequate school funding, and reluctance to give up their tenure as teachers.

**Secondary school programs.** Federal programs of special importance to secondary schools are significantly underfunded. These include: the Carl D. Per-

kins Vocational and Technical Education Act of 1998, which prepares students for the workforce by integrating academic and technical education; the Individuals with Disabilities Education Act Amendments of 1997, which requires school districts to provide a free and appropriate education to children with disabilities up through age twenty-one, but which covers only a small portion of the costs; and the GEAR UP program (Gaining Early Awareness and Readiness for Undergraduate Programs), which encourages disadvantaged middle school students to prepare for college.

### Elements of Secondary School Reform

Secondary schools throughout the country are achieving positive results through a combination of research-based strategies, committed teachers and leaders, and sufficient resources. National support and momentum could expand these successful efforts into many more schools. Research and practice have shown the following elements to be especially important: academic rigor, individualized attention, and leadership development.

**Academic rigor.** All secondary school students, whether headed for the workforce or postsecondary education, should be held to high expectations and take a challenging academic course of study. The rigor of the academic course work that a student takes in high school is a better predictor than test scores, grade point average, or class rank of whether that student will be graduated from college. This correlation is even stronger for African-American and Latino students and is very significant for low-income students. Taking courses such as algebra and geometry in middle school is an essential step, because it prepares students for the higher-level mathematics courses that correlate highly with college success. Unfortunately, some high schools do not offer advanced courses in mathematics, science, and foreign languages.

**Individualized attention.** To achieve in academic courses, many students will need varied instructional strategies, a different pace, extra help with reading, or intensive interventions, such as tutoring or after-school or summer programs. Students also do better when teachers and other adults take a close, personal interest in their academic progress, but these kinds of connections can be hard to forge in large secondary schools. Educators in some districts are developing individual plans for students, organizing big schools into smaller academic houses, or using other

strategies to create more personalized learning environments.

**Leadership development.** Effective schools research has long recognized that well-trained, capable leaders are the individuals best situated to spur school-wide reform. Although the role of the teacher is essential, an excellent leader can bring about improvements on a wider scale and in a shorter time than is possible with teacher-by-teacher implementation. Yet the needs of principals have been somewhat neglected. Secondary school reform must include support for administrators' professional development as an ongoing, integral part of their responsibilities. In addition, current postsecondary education and training programs should be audited to determine how effectively they are training future principals.

### Making an Investment: A Secondary Schools Achievement Act

The United States must step up its investment in middle and high schools to ensure that all such schools are high achieving, housed in adequate facilities, and staffed and led by well-qualified educators. Toward this end, the National Association of Secondary School Principals (NASSP) has proposed federal legislation with the following two critical components.

First, the NASSP has advocated a "Secondary Schools Achievement Act" to help secondary schools implement or expand promising reforms. This act would provide federal support:

- To ensure that all middle schools offer algebra and some geometry instruction
- To increase attention to reading instruction from the early grades through high school
- To make Advanced Placement, international baccalaureate, foreign language, and other advanced courses available in all high schools and expand opportunities for students to take them
- For technology integration and training
- To create an individualized development plan for all students who are having difficulty in core subject areas
- For intensive and sustained professional development for each principal and teacher
- To improve and modernize facilities and infrastructure
- To improve evaluation systems so that states can measure the results of these new initiatives

All elements of this plan should be funded to ensure that all secondary school students truly meet high standards.

Second, the NASSP has contended that federal legislation to improve secondary schools must include a major national effort to train a sufficient cadre of qualified school principals for the next century. As a nation, the need for leadership development programs for business leaders has been recognized, and the nation has long supported a network of service academies to train outstanding young men and women for military leadership. Preparing the leaders who will guide the educational development of the nation's children should be just as high a priority. The United States needs to do all it can to develop strong, effective leaders who will give vision, focus, and direction to the nation's schools. Qualified leaders will set the course for meeting the challenges of the new century, and their needs must not be overlooked.

### Conclusion

Secondary school reform remains an unfulfilled promise with an incomplete agenda. If all schools are going to improve and if all children are going to reach high standards, the "missing link" must be filled in: National and state leaders must focus attention and support on the secondary level. It is time to stop neglecting the institutions that have played such a formative role in U.S. history and individual citizens' lives.

## INTERNATIONAL ISSUES

Secondary education has increasingly become a central policy concern of developing countries, particularly among those that have made rapid progress in universalizing primary education and among those in which the demographic trend has shifted in favor of adolescents. The majority of countries in Latin America and the Caribbean, East Asia, and the Middle East, as well as some African countries, are grappling with the questions of how to provide skills and knowledge that enable adolescents to move to tertiary education and how to ensure a smooth transition to work for students whose education will end with secondary schooling.

Secondary education also addresses problems unique in human development. Without requisite education to guide their development, not only would young people be ill prepared for tertiary education or for the workplace, but they would also be susceptible to juvenile delinquency and teen pregnancy, thereby exacting a high social cost. Hence the challenge for secondary education is enormous. It represents an unfinished agenda that all countries will face as they develop.

### Secondary Education in Europe and the United States

In Europe, higher education, including secondary education, began with training in religion and philosophy. Its purpose was to prepare leaders—especially religious leaders—and its curriculum reflected this purpose. As time passed, general topics for more applied professions were added as part of secondary and higher education curricula, and the curriculum was broadened accordingly. As these general topics were gradually added to the curriculum, they remained philosophical or theoretical in orientation. They were not studied as systems of empirical data, and proofs and validation of knowledge were theoretical rather than experimental.

The earliest secondary schools were based on Renaissance models, with the role of Latin and Greek being paramount. In 1599 the Jesuits implemented the first clear and complete specification of subjects and content as part of the Counterreforma-

tion. This curriculum was called the *Ration Studiorum* (plan of studies), and it was initially implemented at the University of Salamanca in Spain. These early European secondary schools were almost exclusively for males, focusing on intellectual training in its narrow sense and preparation for leadership roles in all sectors of social and economic life.

The Enlightenment of the eighteenth century and the Industrial Revolution of the late eighteenth and early nineteenth centuries brought a new emphasis on scientific and technology studies and on empirical studies in general. Moreover, formal government involvement in secondary education grew, with concomitant involvement in curriculum. The first public high school in the United States was established in Boston in 1821.

From the nineteenth century to World War II, the curriculum at the secondary level began to encompass more subjects and became more specific, detailing the content to be covered and the time allotted for doing so. During this period, emphasis on philosophy, divinity, classical languages, and ancient history began to wane and was replaced with modern languages and literature, modern history, and scientific and technological subjects. At this time, most governments decided to educate a broader segment of their secondary-school-age population and included females for the first time. Secondary education became less elitist and more universal and its curriculum more inclusive, or diverse. Although the curriculum was dominated by the needs of the socially and economically privileged rather than by the needs of the masses, there began, nevertheless, an irreversible process of change that acknowledged a growing diversity of student backgrounds and postsecondary options.

### A Broader and More Universal Curriculum

In the two decades before World War II, the influence of John Dewey and the Progressive movement, though targeted at the primary education level, had a major influence on secondary-level education. The progressives helped increase curricular emphasis on the practicality and social usefulness of schooling and on “learning by doing.” Moreover, separate lower and junior secondary schools were established to cater to the growing number of students entering the secondary level.

The trend to broaden the curriculum began earliest and went farthest in the United States. In the

twentieth century, it was responsible for introducing many new practical and vocational subjects. In the second half of the century, courses in driver education, family living, consumer economics, and mathematics for everyday life appeared for the first time. As students with a greater range of abilities, interests, and motivation entered the secondary level, “streaming” and “homogeneous grouping” became more prevalent. Academic secondary schools became more comprehensive and diversified. Courses and even course sequences in such vocational areas as graphic design, hair care and styling, automotive repair, carpentry and machine shop, and home economics began to appear. The launching of *Sputnik* by the Soviet Union in 1957 was a powerful impetus behind the increase in the amount of scientific topics taught in the Western secondary curriculum, the rigor with which they were taught, and the care taken in their organization and presentation.

In general, the trend in the post–World War II period has been to divide students into streams, to make a single comprehensive secondary school serve a wider variety of interests and abilities, to provide access to a wide range of higher education through alternative curricula, and to broaden the secondary curriculum to include more subjects. Great Britain is a partial exception to this trend, as students tend to study only three subjects for their A-level examinations.

### Secondary Education in Developing Countries

Colonial powers in the eighteenth, nineteenth, and early twentieth centuries educated only a very small portion of colonized peoples, and they educated this portion only at a basic level. In general, their interest was to produce complacent workers. Little education was necessary for this purpose; indeed, education could be seen as antithetical to it. Colonial policy for those few individuals educated beyond the primary school tended to emphasize the production of middle-level clerical and administrative personnel. Hence, the curriculum stressed correct language, arithmetic and accounting abilities, and an adequate fund of general knowledge—as distinct from scientific, aesthetic, or vocational subjects. Great importance was placed on the authority of the teacher and of the spoken and written word.

The independence of colonial countries in the two decades after World War II brought a near universal recognition of the importance of education at all levels for a greatly increased proportion of local

populations. After independence, former colonial countries kept old colonial curriculums for a surprisingly long time—indeed, some have been maintained intact into the early twenty-first century.

### Some Problems of Definition

The secondary subsector presents some problems of definition in the sense that it falls between primary and tertiary levels and there is no universal agreement as to where primary ends and tertiary begins. The duration of (or the number of grades covered in) secondary education varies from three years in El Salvador to eight years in such countries as Yugoslavia and Kuwait. Similarly, when secondary education begins is highly variable (ranging from grade five to grade nine). The usual duration, however, is grades seven to twelve.

Most countries (the Latin American and Caribbean region is an exception) divide the secondary level of education into a first or lower segment and a second or higher segment. These may be denoted by different names, with a particularly varied set of names for the lower segment: middle, intermediate, lower secondary, junior high, upper elementary, and so on. In different countries these labels may encompass different grades, student ages, curriculum, and objectives, and may be related to the educational levels above and below them in a variety of ways. The higher or upper secondary level is usually labeled simply in these terms or may be called senior high school in areas influenced by American nomenclature. It is also sometimes referred to as the pre-university level.

There is a worldwide trend to establish the concept of *basic education*, which is understood to mean a minimum standard of schooling for everyone in a given society. This is frequently done by adding to the primary grades the first part of the secondary cycle (typically called the lower or junior secondary cycle). The combination of primary and lower secondary grades then becomes “basic education,” which is usually administered separately from secondary education.

An additional complexity of the secondary subsector is the wide range of types of educational institutions falling under this heading. Attempts to define types by organization, curricular emphasis, or outcome objectives almost always reveal substantial overlap among categories. Exceptions to any classification, including this one, are plentiful. The most

common classification includes three overlapping types: (1) general/academic schools, (2) vocational and technical schools, and (3) diversified or comprehensive schools, which are multipurpose institutions that try to combine under one roof the objectives of an academic course of study and one or more vocational fields.

It is clear that these three broad categories of secondary schools are arranged along a continuum of specialization in their dominant instructional objectives. At one end the schools are single-purpose institutions with an intensely academic curriculum. At the other end they are similarly specialized but with a vocational/technical curriculum. Secondary schools lying in the middle of the continuum are multipurpose institutions combining elements of both ends of the spectrum into their instructional program.

Stated outcomes and long-term social objectives of the different types of secondary schools often overlap. Almost all statements of the goals or objectives of all types of secondary education include items such as preparing students for the world of work and making students smoothly functioning members of society.

### **Differentiating National Curricula as a Response to Increased Coverage**

While a traditional academic curriculum may be appropriate for upper level secondary education in a developing country with a relatively low upper secondary school enrollment ratio (for example, 20%), the path toward very much higher enrollment ratios (in excess of 50%) will require much greater curriculum diversity to meet the differing educational needs of different groups. It may well be that vocational education does not have a significant role here; but if not vocational schooling, then what other forms of secondary schooling (either existing or to be developed) would be appropriate? Indeed, for many lower secondary education completers, nonschooling programs, such as apprenticeship, may be more appropriate than continued secondary schooling at the upper level.

The key ideas in secondary education practice can be divided into three categories: organization and subject content, vocationalization, and control. These categories overlap and several ideas could be placed logically in more than one category. Developing countries and development agency projects have dealt with most of these ideas at one time or another.

**Organization and subject content.** A single nationally set curriculum consistently delivered is a successful educational procedure at the primary level. Where flexibility and student choice are present there is widespread consensus that this should begin after primary school, although whether or not flexibility should begin in lower secondary, where it exists, is still debated. The decision as to whether a curriculum should prepare specialist or generalist knowledge and skills is often decided on the basis of whether a particular level is seen as preparatory or terminal. The trend appears to be one in which the mandated curriculum of the lower secondary grades, or their equivalent by whatever name, is a linear extrapolation of primary school.

Primary schools are almost always general-purpose institutions with considerable social and political consensus surrounding their mission, which is, simply put, to prepare all children for competent adulthood by giving them basic literacy and numeracy skills and, in many countries, an explicit set of moral values. The situation at the secondary level is vastly more complex. Nevertheless, a growing number of countries, often for political and economic reasons rather than pedagogical, put together in a single, all-purpose school, students from different backgrounds, with different needs, abilities, and interests. The question most often asked by policymakers is: Do the financial economies and the social integration hoped for by this "comprehensive" arrangement outweigh the problems created by attempting to handle such diversity in a single place?

In the majority of poor countries there appears to exist growing recognition that science education is an important element in the national primary and secondary curricula. This is due to both the now commonly recognized relationship between quality research and development in science and technology and stable economic growth, and also the need to begin to prepare students more effectively for future scientific and technological employment. Agriculture, health, nutrition, population control, environmental management, and industrial development are a few of the areas that benefit directly from a wider understanding of science and technology.

Science education is therefore in a position of privilege and peril. It is privileged because decision makers recognize the relationship between good science and economic development. In many developing countries this recognition has resulted in additional support for science education. Moreover,

in the majority of poor countries there appears to exist growing recognition that science education is an important element in the national secondary curriculum. "Science for all" is a frequently voiced rallying cry. At the same time, science education is imperiled by: (1) unrealistic expectations for quick results, (2) improper and inadequate teacher training, (3) a lifeless, exam-driven curriculum, and (4) expensive and outdated reliance on traditional classroom methods and laboratory equipment.

#### **Vocationalization of the secondary curriculum.**

The issue of education for all versus elite preparation is more than simply a question of coverage. Most countries have based their education curricula on the needs of their elites rather than on the needs of their masses. Yet as coverage expands, the questions of vocational relevance and quality invariably arise. This is so because the single-purpose elite preparation that characterized the curriculum when enrollments were small is not suitable for the needs of the diverse majority.

The debate over the desired degree of vocationalization of the school curriculum is shifting grounds as the nature of the market for schooled labor changes. This debate is worldwide and intense. At the heart of the new debate is a redefinition of the school courses that are vocationally relevant. Science, mathematics, and English, all traditionally viewed as academic in the sense of college preparatory, are increasingly demanded for their vocational relevance. The case for a "new vocational curriculum" can be stated in these terms. At the close of World War II, people in industrialized countries expected to have a single career throughout their productive lifetime. Moreover, skills useful at the start of their careers were expected to remain so throughout their job tenure with only minimal retraining and updating required. Under these conditions specific job-skills training was valued for its immediate and long-term relevance to occupational requirements. But the workplace changed. Jobs were lost from heavy industry and agriculture to service and high-technology sectors. Even the remaining agriculture, equipment repair, and manufacturing jobs began to require higher levels of communication (reading and writing) and mathematics abilities. Market changes have seen massive redeployment of workers across sectors. Lifetime job security in a single sector gave way to needs for a flexibly trained and rapidly redeployable labor force, and with these changes came a redefinition of certain fundamental

education requirements. Suddenly the general curriculum was vocationally relevant for a much larger share of the school-age population, including those not college bound.

**Control.** Who should control the structure and content of curriculum? Politicians? University professors? Teachers? Parent associations? When teachers are in control, the curriculum tends to emphasize individual needs and classroom realities. Teacher control can imply highly trained teachers, a condition difficult to meet in developing countries. When university professors are in control, the latest knowledge may be included but it is often academic—meaning abstract and overloaded with content—which is usually too difficult for the students at the grade level indicated. When politicians are in control, the needs of nationalism and social and economic development may be served, but factors relevant to successful learning may be ignored.

## SEGREGATION, LEGAL ASPECTS

Segregation in education is a systemic practice or policy of establishing and maintaining racially separate educational facilities, services, and activities. Historically, racial segregation in education includes assigning African-American and white students to separate school facilities because of race, and assigning only African-American teachers, staff, and administrators to schools established for African-American students while assigning only white teachers, staff, and administrators to schools established for white students. Racial segregation also involves the use of separate buses for African-American and white students and racially separate extracurricular activities, such as athletic programs. Segregation in education also includes widespread discrimination in the educational process against groups other than African Americans, such as Asian Americans, Native Americans, and Hispanics. The practice of segregation in education involves all levels of the educational process: elementary, secondary, undergraduate, graduate, and professional schools.

The American legal system has played a major role in the creation, maintenance, and elimination of segregation in public education. In the American legal system the courts generally are responsible for the interpretation of laws, and major court decisions constitute a framework of reference for discussion of the legal aspects of segregation in education. There are fifty-one legal systems in the United States: one for each of the fifty states and a separate federal legal system created by the Constitution of the United States. Although each state legal system has some responsibility for resolving legal issues about segregation in education, it is the federal legal system, and particularly the Supreme Court of the United States, that has the major role in deciding legal issues involving segregation in public education.

Any meaningful discussion of the legal aspects of segregation in education inevitably centers on the national commitment to equality that has been read into the Constitution of the United States. America did not formally commit itself to equality until after the Civil War when it abolished slavery in the Thirteenth Amendment (1865), provided individuals equal protection of the law in the Fourteenth Amendment (1868), and guaranteed individuals the right to vote in the Fifteenth Amendment (1870). An important provision of the Constitution that em-

braces the national commitment to equality is the Fourteenth Amendment which provides that “[n]o State shall . . . deny any persons within its jurisdiction the equal protection of the laws.” A primary reason for the national commitment to equality is to eliminate racial discrimination against African-Americans in all aspects of governmental (or public) activities. Congress has a role in implementing the equality policy and carries out this role when it enacts laws, including laws to eliminate segregation in education. In the final analysis the federal courts, and particularly the Supreme Court, have final authority to interpret the meaning of equality. Over time the federal courts have adopted different meanings of equality.

### History

No provision in the Constitution of the United States requires governments to provide an education for any person. Rather the equal protection clause of the Fourteenth Amendment requires only that if a state provides public education it must make it available to all of its individuals without regards to race. All states provide a system of public education at all levels: elementary, secondary, and college-level. Racial segregation in education in the United States has its genesis in the institution of slavery. The dominant social philosophy during slavery was that African Americans were inferior to whites. The Supreme Court legalized slavery’s social philosophy in 1857 in *Dred Scott v. Sanford*. The Court held, in *Dred Scott*, that even emancipated African Americans who had been free for many years were to be “regarded as beings of an inferior order” who were “altogether unfit to associate with the white race,” and were “so far inferior that they [had] no rights which the white man was bound to respect.” Laws prohibited education of slaves prior to the abolition of slavery in slave-holding states.

In some nonslave-holding states, public schools were desegregated when they first appeared in the United States, but eventually some African-American parents took steps to set up privately funded separate schools for their children because of their dissatisfaction with the quality of education their children received in racially integrated schools. Later, some of these African-Americans students sought admission to publicly funded schools, but public school committees instead set up racially separate schools for them.

As early as 1849 a Massachusetts state court, in *Roberts v. City of Boston*, upheld the segregation of African-American and white students in public schools. The plaintiff in *Roberts* was a five-year-old African-American student who challenged the Boston, Massachusetts, school committee's refusal to admit her to an all-white primary school. Rejecting the plaintiff's argument that segregation of students in public schools because of race violated the state's constitutional mandate of equality, the court held that the school committee's decision represented a reasonable and nondiscriminatory exercise of its power. The court held also that if racial segregation generated feelings of prejudice in black students, then law probably could not change those feelings. *Roberts* was one of the first cases to adopt the separate-but-equal theory of equality. The separate-but-equal theory of equality, like the *Dred Scott* philosophy, was motivated by racism; thus it did not make it lawful for school boards to establish racially segregated schools. The Supreme Court relied on the *Roberts* case in its 1886 decision in *Plessy v. Ferguson* to hold that racial segregation of African Americans and whites was lawful and therefore did not violate the equality policy in the federal constitution. A few state courts rejected the *Roberts* case's separate-but-equal doctrine by holding that racially segregated schools violate the rights of African-American students to equality.

Almost immediately after the Civil War and the adoption of the Thirteenth Amendment, southern states enacted laws called "black codes." These codes were enacted to try to retain as much as possible the *Dred Scott* philosophy by codifying almost every aspect of the lives of former slaves, including circumstances under which they could be educated. Legally mandated racial segregation was not confined to public schools, nor was it confined to the south. Many border and northern states maintained some form of segregation, including public schools, until the end of World War II.

### From *Plessy* to *Brown*

In *Plessy v. Ferguson*, the Supreme Court held that a Louisiana law requiring racial segregation of passengers in railway coaches was not prohibited by the equal protection clause of the Fourteenth Amendment. The Louisiana law required "separate railway carriages for the white and colored races" on all passenger railways within Louisiana. In upholding the Louisiana law, the Court legally sanctioned the sepa-

rate-but-equal theory of equality. The separate-but-equal doctrine holds that the equality does not require racial integration if a state provides separate accommodations or services for blacks that are equal to those provided to whites. The *Roberts* decision, rather than its subsequent repeal by the Massachusetts legislature, was a major legal precedent on which the Supreme Court relied in its *Plessy* decision. In *Cumming v. Richmond Board of Education*, the Court suggested that the constitutionality of segregation in the field of education had not yet been decided. But in *Gong Lum v. Rice*, decided in 1927, the Court relied upon both the *Plessy* and *Roberts* cases to reject a claim by a Chinese-American student who claimed that she had been denied equal protection because she had been assigned to a public school for African-American students. Despite the ambivalence in the Supreme Court cases on whether the *Plessy* separate-but-equal theory of equality applied to public education, the courts, including the Supreme Court, accepted the view that the *Plessy* case stated a legal rule that applied equally to public education (*Briggs v. Elliot*).

The separate-but-equal theory of equality provided the legal foundations for racial segregation in education (and all other state supported activities) until the Supreme Court decided the landmark case of *Brown v. Board of Education (Brown I)* in 1954. *Brown I* was the result of a litigation strategy that relied upon a series of test cases to try to convince the Supreme Court to reject the separate-but-equal theory of equality. In a series of "equalization" cases before *Brown I*, major civil rights organizations claimed that state-funded graduate and professional schools for African Americans, although racially "separate," did not provide African-American students an education opportunity "equal" to educational opportunities available to white students in schools reserved for whites. Thurgood Marshall, who later became the first African-American justice of the Supreme Court, played a major role in the legal campaign to overturn the separate-but-equal doctrine. *Brown I* involved legal challenges to segregated elementary and secondary public schools in Kansas, South Carolina, Delaware, Maryland, and the District of Columbia.

The Supreme Court rejected the separate-but-equal doctrine in *Brown I*. The legal issue in *Brown I* was whether state-supported racial segregation in public elementary and secondary schools was lawful under the equal protection clause of the federal con-

stitution even though the physical facilities and other tangible factors may be equal. In specifically addressing this issue, the Court held that “[i]n the field of public education the doctrine of ‘separate but equal’ has no place” because “[s]eparate educational facilities are inherently unequal.” The Court, in *Brown I*, left undecided the issue of what states had to do to eliminate racially segregated schools, but it addressed that issue about year later in *Brown II*. In *Brown II*, the Court ordered lower federal courts to require school authorities to “make a prompt and reasonable start toward full compliance” with *Brown I*, and to admit students to public schools on a “racially nondiscriminatory basis with all deliberate speed.”

### From *Brown* to *Freeman*

The southern states engaged in massive resistance to the *Brown* decisions. “Massive resistance” is a term that was coined in the era after *Brown* to describe southern states’ efforts to evade and avoid the legal mandate of *Brown I*. Massive resistance took many forms. Some southern communities, for example, closed their schools rather than allow African-American and white students to attend the same schools. President Dwight D. Eisenhower had to use the National Guard to help integrate white schools in Arkansas. Other school districts adopted “pupil placement” plans, “minority to majority” transfer plans, or “freedom of choice” schemes, all of which were adopted to avoid compliance with *Brown I*; and most of these tactics succeeded in maintaining racially segregated state-supported school systems for more than a decade. The various massive resistance schemes required African-Americans parents and students to initiate legal action against many school districts in an effort to compel compliance with *Brown I*.

The massive resistance to *Brown I* produced minimal desegregation of schools by the time the Court decided *Green v. School Board of New Kent County* in 1968. In *Green*, the Court held, for the first time, that *Brown I* imposed an affirmative obligation on school districts to convert segregated, dual-school school systems to unitary school systems in which racial discrimination would be eliminated “root and branch.” A unitary school system is one that has fully complied with the mandate of *Brown I*. *Green* also enunciated at least six criteria that lower federal courts should consider in determining whether a school system has achieved a unitary sta-

tus. Those criteria focus on student assignments, faculty assignments, staff assignments, transportation (busing), extracurricular activities, and school facilities. A year later, the Court, in *Alexander v. Holmes County Board of Education*, held that the *Brown II* “‘deliberate speed’ for desegregation is no longer constitutionally permissible.” The federal courts have developed a substantial body of case law on remedies to determine whether dual school systems are progressing toward a unitary, nonsegregated system. These remedies include busing, magnet schools, and the location of new schools in geographical areas to maximize racial integration.

In school desegregation litigation, the Supreme Court has made an important distinction between de jure and de facto racial discrimination. De jure segregation is intentional racial discrimination that is affirmatively required by state law, custom, or usage. De facto segregation is racial separateness that occurs without the sanction of law. *Brown I* generally is inapplicable to de facto segregation. There has been no effort by the Supreme Court to address the constitutionality of de facto segregation since 1973 when the Supreme Court refused in *Keyes v. School District No. 1* to abandon the distinction between de jure and de facto segregation.

During the years following World War II, there developed an exodus of white families who relocated to suburbia. This exodus has been described as “white flight.” In the school desegregation cases, white flight is the mass migration of whites from urban communities to suburban communities to avoid enrolling their children in racially integrated inner-city schools. One of the results of white flight has been that African Americans and other persons of color have largely populated many inner cities. As a result, there are many school districts throughout the United States with a significant number of schools with no or very little racial integration.

Many school districts have been under the supervision of federal courts since 1954 when the Court decided *Brown I*. The Supreme Court has held that federal supervision of school desegregation programs was intended to be a temporary measure, and not to operate in perpetuity. Local control of education comes from the Constitution. The power to control education has not been delegated to the federal government; rather it is the responsibility of the various states. In several cases, the Supreme Court has provided illustrations of circumstances under which school boards should be released from federal

courts supervision of desegregation orders. In *Board of Education of Oklahoma City Public Schools v. Dowel*, the Court held that a formerly segregated school districts may be released from court-ordered busing as long as all “practicable” steps to eliminate the vestiges of past de jure segregation have been taken. In *Freeman v. Pits*, the Court made clear that racial isolation of schools brought on by white flight that was not the fault of school districts is not subject to the mandate of *Brown I* and its progeny. In *Freeman*, the Court held that federal courts are justified in relinquishing supervision over school districts subject to desegregation in piecemeal fashion before full compliance with the *Green* criteria has been achieved. And in *Missouri v. Jenkins*, the Court held that a lower federal district court funding order, which relied upon creating and maintaining “desegregative attractiveness” in order to deal with white flight, was outside of the authority of the federal courts under *Brown I*.

### Segregation in Higher Education

The Supreme Court has held that the rule it announced in *Brown I* is applicable to segregation in higher education, but made a distinction between the obligation of states to remedy segregation in higher education and elementary and secondary education. In *United States v. Fordice*, the Court addressed the issue whether, under *Brown I*, states that have engaged in de jure discrimination in higher education are obligated to take steps beyond adopting race-neutral admission policies to desegregate these educational institutions. In response to this question, the Court held that states have an affirmative legal obligation to remedy the remnants of prior de jure segregation. The standard the Court adopted for higher education was that states have an obligation to eliminate all policies and practices that continue to have a discriminatory effect and that are traceable to the prior de jure system.

### Sex-Based Segregated Schools

*United States v. Virginia* is an important Supreme Court case involving sex discrimination in higher education. The case involved the Virginia Military Institute (VMI), an educational institution established by Virginia. VMI excluded females because of their gender. The Court held that the equal protection clause of the Fourteenth amendment applies to sex segregation, but applied a different standard than is applicable to race discrimination. The legal

rule for determining the legality of publicly supported separate schools based on gender is a more differential standard than the legal rule that is applied to racially segregated schools. Even under the differential standard used in sex discrimination cases, the Supreme Court held that VMI’s policy of excluding women because of their gender was unconstitutional under the equal protection clause.

## SERVICE LEARNING

SCHOOL  
Richard J. Kraft  
HIGHER EDUCATION  
Janet Eyler

## SCHOOL

While the origins of the service-learning movement can be found in volunteerism, community service, citizenship training, character education, youth service, and experiential learning, it is safe to say that the words *service learning* have come into common usage only since the 1980s in the United States, and even later internationally. The Commission on National and Community Service (1993) provides perhaps the most widely accepted definition, and includes the following components.

- the need for active participation
- thoughtful organization
- the meeting of actual community needs
- collaboration between school and community
- integration with the students' academic curriculum
- structured time for reflection
- opportunities to use newly acquired skills in real-life situations
- extension of learning beyond the classroom
- the fostering a sense of caring for others

The typology in Table 1 is based on Robert Sigmon's work that differentiates the types of service learning based on the emphasis given the service or learning in a given program. Although experts in the movement would like to limit it to the fourth type, in which service and learning are given equal weight, the reality varies greatly in schools and colleges implementing programs.

### Involvement of Students

The most comprehensive attempt at discovering the extent of community service and service-learning programs in the schools was conducted by the National Center for Education Statistics (NCES) of the U.S. Department of Education (1999). According to that survey, more than 64 percent of all public schools and 83 percent of all public high schools organized some form of community service for their students. The percentage of high schools involved in some form of community service rose from 27 percent in 1984 to 83 percent in 1999. Nearly a third of the schools and half of the public high schools provide service-learning programs in which service is linked to the curriculum. This translates into 14,063,000 students involved in community service with 57 percent of those students involved in some

**TABLE 1**

<b>Emphases of service-learning programs</b>	
service-LEARNING	Learning goals primary; service outcomes secondary
SERVICE-learning	Service outcomes primary; learning goals secondary
service learning	Service and learning goals separate
SERVICE-LEARNING	Service and learning goals of equal weight; each enhances the other for all participants

SOURCE: Based on Sigmon, Robert. 1996. "The Problem of Definition in Service-Learning." In *The Journey to Service-Learning*, ed. Robert Sigmon et al. Washington, DC: Council of Independent Colleges.

form of service learning. Due in large part to the influence of the national Campus Compact, an association of college presidents, and the student led Campus Outreach Opportunity League (COOL), community service and service learning can now be found on a large majority of college campuses throughout the United States, involving thousands of classes in all disciplines, and hundreds of thousands of postsecondary students.

The NCES survey found that students in grades eleven and twelve were more likely to be involved in some type of community service or service learning than younger students, girls more likely than boys, and white students more likely than black or Hispanic students. The survey also found that community service is positively correlated to parents' highest level of education and to ethnicity (white), but that these factors were inversely correlated to service learning. It appears from the data that schools with larger numbers of black and Hispanic young people are more likely to require and arrange service-learning programs than is true for schools that are predominantly white. Given the historical commitments of many religious groups to volunteerism and service, it is not surprising that the survey found that 72 percent of students in private schools report participation in community service, compared to 50 percent in public schools.

### As a Requirement for Graduation

The issue of requiring community service for graduation or service learning as a course requirement is a contentious one that has led to more than one lawsuit in the United States. Proponents claim that service learning is a pedagogical tool to enhance student learning, while opponents claim it is a form

of “mandatory volunteerism.” Given the separation of the schools from their communities and the traditional academic nature of most schooling, it is likely that this will continue to be an issue in the future. There appears, however, to be strong community support for service learning. A Roper Starch survey (2000) found that while 61 percent of Americans were unfamiliar with the term *service learning*, over 90 percent endorse the concept when it is explained to them. Americans see it is a teaching strategy that will help students transform their academic learning into success after graduation.

### Effect on Student Participants

Most research on the effects of service-learning programs at both the K–12 and higher education levels has only been conducted in the 1990s, and thus there are few, if any, long-term follow up studies. Janet Eyler, Dwight Giles, and Charlene Gray state that the effects of service learning on students can be divided into personal, social, learning outcomes, and career development. On a personal level it appears to have a positive effect on students’ personal efficacy, personal identity, spiritual growth, moral development, interpersonal development, the ability to work well with others, leadership, and communication skills. Lillian Stephens found that students involved in service-learning programs appear to have reduced levels of alienation and behavioral problems, while Allan Melchior found them less likely to engage in behaviors that lead to pregnancy or arrest. Melchior and other researchers have also found a greater acceptance of cultural diversity by service-learning students.

Learning outcomes research indicates that service-learning has a positive impact on students’ academic learning, improves their ability to apply what they have learned in the “real world,” may positively affect academic learning as measured by grades or GPA, and impacts such academic outcomes as demonstrated complexity of understanding, problem analysis, critical thinking, and cognitive development. Daniel Weiler and colleagues found that students in more than half of the high quality service-learning schools studied showed moderate to strong positive gains on student achievement tests in language arts or reading, engagement in school, sense of accomplishment, and homework completion. Other researchers have found an association of service learning with higher scores on state basic skills tests and with higher grades. According to Frank

O’Bannon school attendance appears to be positively correlated with schools sponsoring service-learning programs.

Service-learning programs have recently been linked to the School-to-Work/Career programs in many districts and schools. Career and communication skills, career exploration awareness, and knowledge were increased through service-learning programs, according to Thomas Berkas. This connection to the world of work has been an important factor in increasing support for the movement on the part of legislators, school board members, the business community, and the non-profit sector.

There are literally thousands of adaptations across the curriculum of service learning as practiced in the schools and colleges of the United States. The most widely used service-learning activity is peer and cross-age tutoring, with positive effects found on both the tutor and the tutee. Children, young people, and college students also find environmentally related activities in hundreds of schools and colleges, with water monitoring programs in streams, rivers, and lakes by biology and chemistry classes, tree-planting programs for biology and science classes, and thousands of recycling programs. Many language programs have students teaching English in exchange for learning Spanish or another language from native speakers. Students in social studies and the social sciences explore issues of race, culture, and class through joint projects with persons of other cultural groups and through working at homeless shelters and soup kitchens. Medical, dental, business, and law students conduct free clinics for persons unable to afford assistance, while engineering students design technological assistance for persons with disabilities. The adaptations of service learning are only limited by the creativity of its practitioners, and there are numerous books available on its theory, practice, and evaluation.

### The Voice of the Client

An important critique of the movement is made by those who believe that it is too focused on doing things to people, rather than with them, that it emphasizes the value and benefit to the service provider, while all too often ignoring those served, and that it thus perpetuates societal injustices. Given the growing body of research on the positive effects of service learning on the provider and near complete lack of research on positive or negative effects on “clients,” such a critique is warranted. The voices of

recipients are too often missing in the current service-learning literature. Service and giving must go beyond meeting the short-term needs of recipients, and move towards the removal of societal barriers that keep too many on the margins of American society. As the movement matures and goes beyond its “evangelistic” phase, it is rapidly deepening its intellectual and philosophical roots, and looking more into root causes of societal inequalities and injustice. It is also moving beyond the words service provider and service recipient or client and into the use of term partners in service.

### Future Directions

Service learning appears to have the potential to be an important contributor to bringing about a more just and caring society. It has also been called the “Trojan Horse” of school reform, and has become a mechanism which many schools and colleges are using to bring the school and community closer together and to provide a more active learning environment for students. Government and business are increasingly looking to service-learning as a promising mechanism for preparing children and young people for citizenship and the world of work.

RICHARD J. KRAFT

## HIGHER EDUCATION

Service learning in higher education is an experiential learning pedagogy that balances the needs of student and community members involved, links the service and learning through reflective processes, and if skillfully managed leads to positive student personal, social or citizenship, career, and intellectual development.

### Programs

The central claim of service learning is that both the quality of student learning and the quality of service to the community are enhanced when the two are combined. Although there are literally dozens of definitions of the term, the characteristics identified in the 1990 National and Community Service Act are central to most of them; this act describes service learning as an instructional method that accomplishes the following objectives.

- Students learn and develop through active participation in thoughtfully organized service experiences that meet actual community needs and that are coordinated in collaboration with the school and the community.

- Student's academic curriculum provides structured time for a student to think, talk, or write about what the student did and saw during the actual service activity.
- Students are given opportunities to use newly acquired skills and knowledge in real-life situations in their own communities.
- Enhancement of what is taught in school is accomplished by extending student learning beyond the classroom and into the community and fostering of the development of a sense of caring for others.

While most service-learning programs are part of the school or college curriculum, cocurricular programs in which there are intentional goals for student learning and in which efforts are made to assist students in reflecting on their experience also qualify. The term, however, is also commonly applied to a variety of activities that do not meet these standards. Perhaps because of the growing popularity of community service for young people and because *service learning* sounds more important than *volunteerism*, the term is often applied to volunteer programs where there is very little formal attempt to facilitate learning through reflection. Service learning is also sometimes confused with traditional field-based instructional programs such as clinical experiences for those studying to be nurses, social workers, teachers, or other human services professionals. In an attempt to sort out the many programs that involve students in the community and draw a distinction between service learning and related activities like volunteer service and internships, Andrew Furco (1996) has suggested an approach to assigning programs to categories along two dimensions: the balance between goals (i.e., of service or learning) and the primary intended beneficiary (service recipients or students).

Service-learning programs are designed to equally benefit both the provider and recipient of service and to focus on both the quality of the service and the learning. This is most often accomplished when the service learning is part of an academic course. It is easier to achieve this balance if service is a required part of the class, and all students participate in projects where the service is closely tied to the subject matter goals for the course. For example, a course on program evaluation in which students develop an evaluation plan for a local nonprofit agency program is easily designed to benefit both students and the agency. Discussion and analysis of

the class service project can serve as a central part of the course. Other examples of tight subject matter/service links include the following: (1) courses in women's studies where students work with victims of domestic violence; (2) Spanish courses where students assist new immigrants in learning to negotiate the community; (3) sociology classes where students conduct needs-assessment activities for a mayor's office that is considering new services for the homeless; or (4) a botany class where students classify and remove invasive non-native species from a park.

Many service-learning classes do not integrate the service program into the regular course of study, but make service an option for extra credit or a substitute for a research paper or other assignment; some provide an additional course credit for those choosing that option. Unless the professor plans carefully to incorporate the service work of these students into class discussion and activities, and plans for continuous individual reflection activities for students choosing service, these classes often fail to maximize either the service or the learning. Without reflective integration with the substance of the course, add-on service options become simply classes plus volunteerism. Since some resistance to service learning comes from people who feel that providing course credit for volunteerism is inappropriate, it is important to draw a distinction between volunteerism and service-learning experience, which has an academic focus and yields measurable learning outcomes. And it is important to reserve the label *service learning* for experiences in which intentional efforts are made to link the two through discussion, assignments or other forms of reflective activity.

Of course, students may also learn from volunteer service and community service programs. These are valuable experiences for students and may contribute to their personal development and commitment to active involvement in the community. The primary focus is on service, not learning, and the primary intended beneficiaries are the service recipients, not the students. Some students who have a naturally reflective bent may be motivated to explore questions that arise from their service, but the programs themselves provide little or no challenge to make that happen. Many colleges and universities have volunteer service centers that develop opportunities for students to serve, and hundreds of thousands of hours of community service are donated each year by these students.

A popular program is the Alternative Spring Break (ASB) where college students travel in student-led teams to international and domestic sites to undertake a week of community service. Break Away, founded in 1991 at Vanderbilt University, is the national organization that provides technical assistance to college and university ASB programs; they estimate that in the spring of 2001, 30,000 American college students spent their spring break in an organized service project. College community service programs like ASB do often devote some attention to providing guidance to programs leaders on how to develop reflection sessions for students, and occasionally such programs become service-learning opportunities by being integrated into an academic course or what has been called a curriculum-based alternative break. Most of these programs are probably best placed in the community service rather than service learning category.

Field-based study, clinical practice, and internships all provide useful service to communities, but have as their primary purpose student learning. Student teachers spend time in the classroom to master instructional skills. Student nurses may spend time in clinics giving vaccinations, conducting well baby examinations to master nursing skills. Many students spend a semester in a business internship to develop skills and contacts necessary to move their career forward. All these students also provide a service, but the intended beneficiary of such programs is the student, who develops professional skills.

### **Benefits of Service Learning in Higher Education**

Service learning is a form of experiential learning and is built on the assumption that learning occurs through active engagement and application of academic subject matter to real world problems and vice versa. Many of its founders were followers of John Dewey who believed that for an experience to be educative, it needed to engage students in significant worthwhile activity that leads to curiosity and sustained inquiry. Service learning is thought to enhance learning partly because students become highly motivated to learn when they work with people in the community and see how their efforts can make a difference. Cognitive psychologists are discovering that learning that is absorbed and can be transferred to new settings is best developed through repeated engagement in complex realistic situations.) Community projects used in service-learning programs offer this opportunity.

The dramatic increase in interest in service learning in higher education in the late 1980s and into the twenty-first century may have occurred because it is an approach to learning that seems to answer many criticisms of higher education. The experiential, interdisciplinary, and community-based nature of service learning addresses criticisms that American colleges and universities have created compartmentalized, sterile bodies of knowledge that students have difficulty integrating or applying in their lives in the community. It is also responsive to concerns that the academy is divorced from society and has abdicated its traditional role of service and community citizenship. Concern with these issues led both college leaders and the federal government to create institutions to support development of community service and service-learning programs.

Service learning was first identified as a type of instruction in the mid-1960s but has become visible and grown dramatically since the founding of Campus Compact in the mid-1980s. Campus Compact is a national coalition with more than 750 colleges and universities as members that has provided visibility and support for the development of community service and service-learning programs on campuses.

The goals participating faculty have identified as most important include promoting active engaged learning, developing citizenship skills and responsibility, developing critical thinking capabilities, addressing campus responsibility to community, taking social action, providing opportunities for career development, exposing students to diversity, and promoting moral and religious development.

Service-learning classes are most likely to be in education or the social sciences but there are many examples of courses being developed in the sciences, engineering, the humanities and business as well. The passage of the National and Community Service Act in 1990 and the National and Community Service Trust Act in 1993 and the subsequent creation of the Corporation for National Service provided additional resources to train faculty, support startup costs for new programs, and provide an infrastructure to disseminate information on best practices for these programs.

### **Impact of Service Learning on Students**

An analysis of research conducted by Eyler, Giles, Stenson, and Gray during the 1990s identified more

than 100 higher education studies completed during this period that provide considerable support for the power of service learning. While most of this research has involved evaluation studies or programs in single institutions, there have been several that were national in scope. Most have focused on student outcomes with a lesser number exploring institutional or community impact.

These studies provide evidence of growing presence of service learning on campuses, student endorsement of this pedagogy, and of general satisfaction of community agencies with student contributions. Studies of student impact have consistently shown small but significant effects on personal and social or citizenship development; evidence of academic or cognitive impact is less consistent.

Given the very wide range of experiences labeled *service learning*, it is not surprising that the quality of the program also makes a difference in its impact on students. High quality community placements, in which students are challenged, have opportunities to interact with members of the community and engage in interesting work lead to positive outcomes. Other measures of quality include the quantity and quality of reflective activity (such as discussion and written analysis of the service), application (i.e., the degree to which the service and course of study are related), the duration and intensity of the experience, diversity (i.e., the opportunity to interact with people from different ethnic, racial, or social groups), and community voice (i.e., participation of the community partners in shaping the nature of the service). Some of what is known about the effects of service learning on students including effects of quality is summarized below.

**Students like service learning.** Service learning is popular with college students. Students report that they have good community experiences, they learn more, and are more interested and motivated to work hard in these classes than in their traditional classes. Not surprisingly, service learning that includes strong community placements and is well integrated into coursework through reflection and application is more highly regarded than experiences of lower quality.

**Stronger connections to college or university.** College students tend to do better academically and graduate when they are engaged in college social and academic life, and when they have close personal ties

to faculty members. There is evidence that students who are active in community service during college are more likely to persist to graduation, but this has not yet been established for academic service learning. There is a growing body of evidence however, that suggests that service learning contributes to engagement with college life and satisfaction with the college experience. Students who participate in service learning report closer ties to faculty than those who do not. Closeness to faculty and the amount of time spent in interaction with faculty members are also affected by the quality of the service-learning experience. Courses that involve strong community placements and include a lot of discussion about the service experience and its relationship to the course of study are more likely to build close relationships with faculty members. Service learning can be a powerful tool for creating conditions that enhance college impact on students.

**Personal development.** The college years are an important time for the development of personal identity and the skills needed to function effectively in social groups. Service learning has long been valued because the personal connection students make with diverse others in the community is thought to contribute to personal development, motivation to learn, and commitment to do something about social problems. The research suggests that both community service and service learning lead to increased personal confidence and sense of efficacy; students develop a stronger sense of personal identity, and increased cultural understanding and empathy. Some students report that service learning also leads to their spiritual development. There is also evidence that participation in service learning increases interpersonal and leadership skills.

The quality of service learning may enhance the impact of service on personal development. The two most important factors for increasing personal outcomes are the quality of the placement itself and the degree to which the service is relevant to the subject matter being studied. When students have the chance to work with people from different ethnic groups than their own, they are also likely to show an increase in cultural understanding, identity development, and spiritual growth.

**Career development.** Students who participate in service learning report a greater confidence in their choice of major and in their career choice. They also indicate that they feel better prepared for work than do their peers who do not participate. Alumni also

report that their community service during college has increased the likelihood of incorporating service into their career development.

**Academic or cognitive development.** Students who are engaged in community service during college are likely to get higher grades than those who are not. Faculty and students who participate in service learning report that students learn more from the experience than they do in traditional classes, but research on the impact of service learning on achievement as measured by grades is mixed. Some experimental studies have shown that service-learning students achieve at a higher level; others show no real difference on these traditional academic measures.

Grades might not be the best measure of the intellectual impact of service learning, however, because they are often not based on the outcomes-measures that service learning is best designed to affect. Studies that have analyzed student essays before and after service or that have used taped and transcribed problem-solving interviews have shown that highly reflective service learning, especially when the problems assessed and the service are closely related, has a positive impact on the quality of student understanding of complicated social problems. Similar in-depth analysis of changes in student thinking over the course of a semester shows increases in cognitive development (i.e., the ability of students to use critical thinking to analyze issues that don't have clear answers).

**Citizenship and social responsibility.** Advocates for service learning are convinced that it improves the quality of the college or university's citizenship within its community and that it also helps students develop the skills and commitments necessary for effective community engagement. Participation in service learning increases the sense of social responsibility felt by students and their commitment to community service. It also enhances their sense of engagement in their community and their confidence that community members can solve problems. Many studies show students active in service learning report that they intend to participate in future service. Growing evidence in studies of alumni shows that these students are in fact more likely to become actively engaged in their community after graduation.

Values and commitment—for example, the belief that one ought to and will become involved in

the community—is not sufficient, however, for effective citizenship. In fact all outcomes of service learning summarized previously contribute to effectiveness. Confidence that one can make a difference, personal efficacy, knowing how to work with others on community tasks, understanding complex social issues, and having the critical thinking skills to make good decisions all form part of the contribution of service learning to preparing students for active citizenship. Students who have had service-learning experiences are more likely to feel that they ought to participate in their communities, know how to participate, and understand issues so that they can participate in intelligent ways.

## SEVERE AND MULTIPLE DISABILITIES, EDUCATION OF INDIVIDUALS WITH

---

Individuals with severe disabilities and multiple disabilities are highly diverse in both their abilities and disabilities. What they share is a capacity to learn and a lifelong need for support.

### Definition and Types of Severe and Multiple Disabilities

Persons with *severe disabilities* are: "individuals of all ages who require extensive ongoing support in more than one major life activity in order to participate in integrated community settings and to enjoy a quality of life that is available to citizens with fewer or no disabilities" (TASH, p. 19). Mental retardation is regarded as a characteristic common to those with severe disabilities. Most severely disabled individuals are limited in their ability to communicate, though these skills can become functional with appropriate intervention. In addition, these individuals often have medical conditions or physical limitations that affect their movement, vision, or hearing.

Persons with *multiple disabilities* have a combination of two or more serious disabilities (e.g., cognitive, movement, sensory), such as mental retardation with cerebral palsy. The U.S. federal government definition includes those who have more than one impairment, "the combination of which

causes such severe educational needs that they cannot be accommodated in special education programs solely for one of the impairments" (Code of Federal Regulations, 1999, Vol. 34 Sec. 300.7, [c][7]). (Dual sensory impairment, or deaf-blindness, is defined as a separate disability group.) Multiple disabilities have interactional, rather than additive, effects, making instruction and learning complex.

In 1996 Fred Orelove and Dick Sobsey defined this group as individuals with mental retardation who require extensive or pervasive supports and who also possess one or more significant motor or sensory impairments and/or special health care needs. These physical and medical problems result in the presence of two or more of the following characteristics: restriction of movement, skeletal deformities, sensory disorders, seizure disorders, lung and breathing control, or other medical problems related to these characteristics, such as skin breakdown or bladder infections.

The two groups overlap somewhat in definition. *Multiple disabilities*, depending upon the definition used, may or may not include mental retardation as one disability, while *severe disabilities* requires mental retardation but does not require an additional disability. Some movement disabilities are associated with mental retardation; for example, 60 to 70 percent of those with cerebral palsy have some degree of mental retardation. However, a child with cerebral palsy who does not meet the cognitive requirements of mental retardation might fit the federal definition of multiple disabilities, due to having movement and communication disabilities, but not the definition of severe disabilities. Most individuals who have multiple disabilities also fit the criteria for severe disabilities, while not all with severe disabilities have multiple disabilities.

The primary measures used to diagnose these individuals are individual intelligence tests and tests of adaptive behavior. Early assessment of movement limitations, muscle tone and flexibility, seizure activity, breathing control, sucking and swallowing, vision and hearing, and genetic makeup are also, and prenatal assessment of genetic material or physical identification of deformities via sonograms may be conducted. Accurate psychological testing of these individuals is challenging due to their frequent limitations in controlled movement, vision, hearing, communication, or cooperative behavior. Thus, interviews with family members and educators regard-

ing the person's adaptive behavior skills (i.e., communication, self-care, home living, social skills, community use, self-direction, health and safety, functional academics, leisure, and work) may be more informative and reliable than a norm-based IQ or achievement score.

Definitions of this highly variable group with both severe and multiple disabilities are less precise than some other disability groups, making an estimate of their prevalence difficult. Prevalence ranges from less than .25 percent to .50 percent of the population; and is considered relatively uniform across socioeconomic classes.

Persons with severe and multiple disabilities may carry a variety of diagnostic labels, including: (1) severe or profound levels of mental retardation (IQ scores below 40); (2) mental retardation that requires extensive or pervasive supports for an extended time; (3) autism, childhood disintegrative disorder, or Rett syndrome (several types of autism spectrum disorders); and (4) various genetic disorders accompanied by extensive mental retardation (e.g., Tay-Sachs disease, untreated phenylketonuria, tuberous sclerosis, Lesch-Nyhan syndrome). Individuals with several autism spectrum disorders, by definition, have significant developmental delays in communication and social interaction, and may exhibit extensive limitations in many adaptive skills. Thus, their disability may be extensive enough to fit the definition for mental retardation and severe disabilities, though this is not true for all persons identified with autism (e.g., Asperger's syndrome).

### **A Brief History of Education of People with Disabilities**

In the United States individuals with severe and multiple disabilities are legally entitled to education and other support services; however, these groups do not have the same rights in much of the world. Those with severe and multiple disabilities are identified early in life by their noticeable delays in development or by their physical abnormalities. Many require medical interventions not available until recently; thus, earlier in history (and still today in less-developed countries), many with severe disabilities did not live long. Historically, in many cultures, the presence of severe physical abnormalities at birth has been associated with stigma and shame. Current technology has enabled interventions that extend both the length and quality of life of these persons.

Historical reports of individuals with severe and multiple disabilities who survived indicate that they were subjected to the same poor treatment experienced by persons with milder forms of mental retardation. They suffered greatly prior to the 1700s; but from 1700 to the late 1800s there was an optimistic period, due to education methods that were "discovered" by Jean-Marc-Gaspard Itard (1775–1838) and Edouard Seguin (1812–1880) in France and spread to other Western countries. This period was followed by disillusionment with the nonuniform results of these education practices. From the late 1800s through the 1960s there was widespread building of institutions to house these individuals, and then, starting in the 1970s, the institutional population in the United States was gradually reduced, due primarily to a reduction in admissions. Many former residents were relocated to smaller community-based settings, while others remained in their own homes with services and supports provided to their families. Of those now remaining in state institutions, persons over forty who have profound mental retardation and multiple disabilities dominate the population.

### **Implications of Educational Legislation**

Legislation in the early 1970s addressed the right to education and other habilitation services for all individuals with disabilities. In 1975 the Education for All Handicapped Children Act (known since 1990 as the Individuals with Disabilities Education Act, or IDEA) formed the legal basis for public education for all children, including those with severe and multiple disabilities. IDEA added requirements that are especially valuable for these individuals, including: (1) early intervention starting at birth or whenever a disability is suspected; (2) related services such as physical, occupation, and speech and language therapy, including augmentative and alternative communication (AAC) methods; (3) the requirement for a plan and services to facilitate transition to work and adulthood; and (4) a value placed on inclusion in general education with nondisabled peers. Most states provide services to these students until age twenty-two or beyond, focusing upon functional skill development.

Prior to the 1975 law mandating public education for all children, students with severe and multiple disabilities, if educated, received services in institutions or settings operated by parent groups or state mental health departments. When laws enacted

in the mid-1970s required publicly funded special education, most schools established programs for these students but continued to isolate them from their nondisabled peers in separate buildings or self-contained classrooms in elementary schools. Currently in many states, the “least restrictive environment” for most of these students is the age-appropriate school setting alongside nondisabled peers, though not necessarily in the general education classroom. Currently, a majority of these students are served in separate classrooms for most of the school day.

Since 1975 U.S. courts have defined specific portions of special education law. For those with severe and multiple disabilities, several legal battles have resulted in: (1) summer educational programs being required in many states to lessen or prevent skill regression; (2) interventions that enable students to stay at school (e.g., providing catheterization for those unable to urinate voluntarily); (3) related services and technology to assist with movement, positioning, speech, and alternate forms of communication; (4) the mandate to educate all students with disabilities, and not limit services based on an assessment of educational potential; and (5) the provision of regular opportunities for interaction with nondisabled peers and inclusion in general education classrooms—or justification for not providing these opportunities. While all states are required to provide a free and appropriate education for these students, there are many differences in how localities implement the law and thus in the actual quality of educational services for these students.

### **Educating Students with Severe and Multiple Disabilities**

When compared to their peers, most students with severe and multiple disabilities learn more slowly, forget more readily, and experience problems generalizing skills from situation to situation. These characteristics are best addressed when educators follow accepted practices. First, the public education of these students must start early and continue at some level throughout life. Second, all students typically need speech and language intervention, while many others will need physical and occupational therapy. Students with sensory impairments may need interpreters and mobility trainers, while some with medical needs may require nursing services or supervision. Third, because the educational teams of students are often large, close collaboration between

members is essential if their expertise is to result in improved student functioning. The benefits of integrating therapy into natural activities is widely accepted over the traditional practice of isolated, or pull-out, therapy.

Fourth, curriculum for these students tends to be functional in nature, reflecting skills needed in everyday life across domestic, leisure, school, community, and vocational domains. Students are taught to make choices, communicate in functional ways (which may include AAC methods such as signing, use of pictures, etc.), develop useful skills that reduce their dependence on others, and learn social skills suited to their chronological age. Fifth, when skills are taught in multiple, normalized settings, generalization problems are lessened. Thus, communication and social skills are most effectively taught in the context of interactions with typical classmates, while job and community skills are best taught during community-based instruction.

### **Trends and Controversies**

Several important trends, some considered controversial because they advocate the inclusion of these students in general education with the necessary supports, reflect improvements in the lives of these students. First, through advancements in medicine and technology these individuals not only experience longer lives, but also have better options in mobility, communication, sensory augmentation, and other areas. Second, starting in the 1960s, there has been gradual improvement in societal attitudes toward people with significant disabilities. This has led to legal protections, special education, community living alternatives, supported employment, and an increase in relevant supports. Third, with the Timothy W. decision (*Timothy W. v. Rochester, New Hampshire, School District*, 1989), “free and appropriate education for all” was reaffirmed, schools were required to keep current with best practices for educating those with significant disabilities, and the procedure of selecting who can and cannot learn was declared illegal.

The current trend to include individuals with severe or multiple disabilities in classrooms and community activities with their nondisabled peers has been particularly controversial. Special education placement data show gradual growth of students with disabilities who are placed in a general education setting, but much slower growth for students with severe and multiple disabilities. Schools

have complained that they are not able to include these students or provide the necessary supports and services to achieve a meaningful education for all involved. Some general education teachers have communicated an unwillingness to have these students in their classrooms, even with support, and they also may lack the required skills necessary to teach these children in a general education classroom. However, there are numerous examples of schools meaningfully including these students in ways that promote social and educational participation, as well as evidence to support the benefits of inclusion for both students with severe disabilities and typical classmates. More research, the dissemination of information on inclusion, and improvements in teacher training are needed.

## SEXUALITY EDUCATION

At the turn of the twenty-first century the rate of sexual intercourse among U.S. teenagers has declined; teen contraception rates, particularly condom use, have increased; and, as a result, teen birthrates declined during most of the 1990s.

Support for sexuality education also seems to be at an all-time high. A poll jointly conducted in 1999 by the Sexuality Information and Education Council of the United States (SIECUS) and Advocates for Youth showed that 93 percent of adults supported teaching sexuality education in high school and 84 percent supported teaching sexuality education in middle school/junior high school. And although most Americans believe abstinence should be a topic in sexuality education, the poll indicates that they reject abstinence-only-until-marriage education that denies young people information about contraception and condoms. The poll and subsequent focus groups demonstrate that many American parents do not see a conflict between providing information about abstinence and providing information about contraception in sexuality education programs. For

these parents, it is not a matter of either/or—they want both.

### The Basics of Sexuality Education

Human sexuality encompasses the sexual knowledge, beliefs, attitudes, values, and behaviors of individuals. Its various dimensions include the anatomy, physiology, and biochemistry of the sexual response system; identity, orientation, roles, and personality; and thoughts, feelings, and relationships. The expression of sexuality is influenced by ethical, spiritual, cultural, and moral concerns.

Sexuality education is a lifelong process that begins at birth. Parents, family, peers, partners, schools, religion, and the media influence the messages people receive about sexuality at all stages of life. These messages can be conflicting, incomplete, and inaccurate. SIECUS, along with many other national organizations, believes that all people have the right to comprehensive sexuality education that addresses the biological, sociocultural, psychological, and spiritual dimensions of sexuality from the cognitive domain (information); the affective domain (feelings, values, and attitudes); and the behavioral domain (communication, decision-making, and other relevant personal skills).

Comprehensive school-based sexuality education that is appropriate to students' age, developmental level, and cultural background should be an important part of the education program at every grade. A comprehensive sexuality education program will respect the diversity of values and beliefs represented in the community and will complement and augment the sexuality education children receive from their families, religious and community groups, and health care professionals.

SIECUS's *Guidelines for Comprehensive Sexuality Education: Kindergarten–Twelfth Grade* provide an organizational framework for the knowledge of human sexuality and family living within four development levels. The *Guidelines* are organized into six key concepts that represent the most general knowledge and encompass the components of the broad definition of sexuality. These six key concepts are human development, relationships, personal skills, sexual behavior, sexual health, and society and culture. Each key concept has associated life behaviors, topics, subconcepts, and age-appropriate developmental messages.

The primary goal of sexuality education is the promotion of sexual health. In 1975 the World

Health Organization defined sexual health as “the integration of the physical, emotional, intellectual, and social aspects of sexual being in ways that are positively enriching, and that enhance personality, communication, and love. . . . Every person has a right to receive sexual information and to consider accepting sexual relationships for pleasure as well as for procreation.”

There is public and professional consensus about what is sexually unhealthy for teenagers. Professionals, politicians, and parents across the political spectrum share a deep concern about unplanned adolescent pregnancy; out-of-wedlock childbearing; sexually transmitted diseases, including HIV/AIDS; sexual abuse; date rape; and the potential negative emotional consequences of premature sexual behaviors.

There is, however, little public, professional, or political consensus about what is sexually healthy for teenagers. The public debate about adolescent sexuality has often focused on which sexual behaviors are appropriate for adolescents and has ignored the complex dimensions of sexuality.

Becoming a sexually healthy adult is a key developmental task of adolescence. Achieving sexual health requires the integration of psychological, physical, societal, cultural, educational, economic, and spiritual factors. Sexual health encompasses sexual development and reproductive health, and such characteristics as the ability to develop and maintain meaningful interpersonal relationships; appreciate one's own body; interact with both genders in respectful and appropriate ways; and express affection, love, and intimacy in ways consistent with one's own values.

Adults can encourage adolescent sexual health by providing accurate information and education about sexuality, fostering responsible decision-making skills, offering young people support and guidance to explore and affirm their own values, and modeling healthy sexual attitudes and behaviors. Society can enhance adolescent sexual health by providing access to: comprehensive sexuality education; affordable, sensitive, and confidential reproductive health care services; and education and employment opportunities.

Most scholars and activists argue that adolescents should be encouraged to delay sexual behaviors until they are ready physically, cognitively, and emotionally for mature sexual relationships and

their consequences. This support should include education about intimacy; sexual limit setting; resisting social, media, peer, and partner pressure; the benefits of abstinence from intercourse; and the prevention of pregnancy and sexually transmitted diseases.

### Ongoing Challenges

In spite of recent declines, the birthrates among African-American and Hispanic young women aged fifteen to nineteen are still significantly higher than the overall birthrate in this age group. The rates of intercourse, pregnancy, and sexually transmitted diseases (STDs) are still much higher in the United States than in other industrialized countries.

Adults, whether they agree with young people's actions or not, cannot ignore the fact that millions of America's teenagers are engaging in a range of sexual behaviors. From a public-health perspective, some of these behaviors are less risky in terms of pregnancy or sexually transmitted disease transmission, whereas others carry greater risks. Because of these realities, *all* young people in the United States need the information, skills, and access to services to make and carry out informed, responsible decisions about their sexuality—both at the present time in their lives and in the future.

Americans hold both confused and contradictory attitudes about sexuality. While being generally relaxed enough to participate in sexual behaviors, Americans are not accepting enough of these behaviors to avoid guilt or shame. And Americans often have no commitment to pregnancy and disease prevention. This cultural confusion about sexuality is especially profound considering that adults must deal not only with their own sexuality-related issues but also with adolescent sexuality and sexual behaviors.

In American society, many adults do not model sexual health for young people. In fact, teenagers often behave more responsibly than adults. For example, 75 percent of unintended pregnancies in the United States occur to adult women. Never-married teens use birth control more consistently than never-married young adults in their twenties, and adolescents are much more likely to use condoms than older couples. Nearly all sexually transmitted HIV infection among both female and male teens and 60 percent of all teen births are the result of sexual intercourse with adult males.

Discussions about adolescent sexuality and sexuality education often revolve around adults' per-

ceptions of how “things should be” rather than a realistic understanding or appreciation of the dynamics of adolescents' lives. Adolescence is the time when young people develop the knowledge, attitudes, and skills that become the foundation for their healthy adulthood. Recognizing that nearly all Americans eventually become sexually active, an effective sexuality education program would ensure that young people have the information and skills they need to make responsible decisions about their sexuality—whether they make those decisions as adolescents or adults.

### Supporting Parents in Their Roles as Sexuality Educators

Parents and families play a major role in ensuring adolescent sexual health. Parents are the primary sexuality educators of their children. They educate both by what they say (and do not say) as well as by how they behave. Research indicates that young people who are able to talk to their parents about sexuality often behave more responsibly.

With open communication, young people are more likely to turn to their parents for help and support. Some parents have difficulty communicating with their children about sexuality, particularly because many of *their* parents also had difficulty with this issue. In order to overcome this difficulty, the education community can provide parents with information about sexuality and show them how to provide this education and information to their children. Educational programs may also provide parents with the help and encouragement they need to express their values about sexuality to their children and to provide accurate, honest, and developmentally appropriate sexuality information.

Parents and other trusted adult family members play an important role in encouraging and supporting adolescent sexual health. Parents and adults can assure that young people have access to accurate information and education about sexuality issues through direct communication and by providing books, pamphlets, and videos. Parents and other adults need to foster responsible sexual decision-making skills and need to model healthy sexual attitudes and responsible behaviors in their own lives.

### Training Teachers

Comprehensive sexuality education is an important component of formal schooling. Yet often teachers do not have the skills, knowledge, or inclination to

teach such courses. Few have received training in sexuality education, and even fewer have received certification as sexuality educators. A 1995 SIECUS study revealed that the nation's elementary and secondary school teachers are not adequately prepared at the pre-service level to provide sexuality education, including the teaching of HIV prevention, to their students. Because sexuality issues touch on so many developmental issues relating to children and youth, SIECUS has, since 1965, urged that all pre-kindergarten through twelfth grade pre-service teachers receive at least one course in human sexuality.

Research shows that one of the characteristics that effective sexuality education programs share is that they are taught by teachers and leaders who believe in the program and are trained to deliver it. Trained teachers can complement the education provided by families as well as that provided by religious and community groups. Yet studies reveal that teachers do not feel adequately trained to teach sexuality education. Teachers report concern about their ability to teach personal skills, about their knowledge of HIV/AIDS, and about their knowledge of STDs. Most of those teaching sexuality education report receiving their training in short workshops or seminars.

Training for teachers on how to teach sexuality education is critical to the success of programs and to the health of American children. Teachers responsible for sexuality education must receive specialized training in human sexuality that includes basic information on sexuality topics and a special focus on the philosophy and methodology of teaching sexuality education. Teachers should, ideally, receive this training as pre-service teachers in academic courses or programs in schools of higher education that provide them with time-intensive and rich training. This training can be complemented by extensive in-service courses, continuing education classes, or intensive seminars.

Few states have either training or certification requirements for teachers who deliver sexuality or HIV-prevention lessons. Although the vast majority of states require or recommend teaching about sexuality or HIV/AIDS, a 1995 study found that only twelve states, the District of Columbia, and Puerto Rico required any licensure for teachers of sexuality education and only twelve states and the District of Columbia required licensure for teachers of HIV-prevention education. Only six states and Puerto

Rico required teacher training for sexuality educators, and nine states, the District of Columbia, and Puerto Rico required training for teachers of HIV-prevention education. States should develop requirements that integrate expertise in the methodology and pedagogy of sexuality education into existing health education licensure requirements. Current licensing and accreditation bodies should also integrate these criteria into their requirements for health educators.

### **Building Support Networks for Sexuality Education**

A wide range of organizations support comprehensive sexuality education—including those representing health care professionals, businesses, the media, and faith communities—and are willing to advocate on its behalf. On the national level, the National Coalition to Support Sexuality Education includes more than 130 national organizations that support comprehensive sexuality education such as the American Association of School Administrators, the American Medical Association, the National School Boards Association, the National Association of School Psychologists, the National Education Association Health Information Network, the Religious Institute for Sexual Morality, Justice, and Healing, and the United States Conference of Mayors. Many of these organizations have affiliates at the state and community levels.

Education professionals can also become actively involved in supporting sexuality education programs in their communities. Professionals have an important role to play as outspoken advocates by writing letters to editors, voting in school board elections, writing supportive letters to teachers and administrators, and serving on community advisory committees. This involvement will help assure that young people have access to effective programs.

### **Reaching People outside of School**

While an important component of efforts toward ensuring a sexually healthy society focuses on sexuality education in schools, these efforts need to be broadened beyond schools. Out-of-school adolescents are more likely to report having had sexual intercourse and to having had four or more sexual partners.

One of the challenges for the education and health community is to develop innovative, accessible approaches that meet the sexual health needs of

adolescents who are not in school. Community-based organizations, youth-serving agencies, health agencies, families, and faith communities often have contact with young people who may not be engaged in school, and these entities can be important sources of sexuality information and programming. Agencies need to be encouraged and supported in their efforts to work together to establish and strengthen partnerships for ensuring the sexual health of all young people, particularly those at most risk.

In addition, the Internet and other technologies are making sexuality information more accessible for many young people, both inside school and out. Many Internet sites provide age-appropriate, unbiased sexuality information for teens.

### Conclusion

The debate continues in the United States over the focus and content of sexuality education programs. The prevailing political climate makes it difficult for people to publicly advocate for much beyond abstinence for young people. In spite of this there is much parental and scientific support for a more comprehensive approach to sexuality education. The challenge for the education community is to ensure that school policies and programming provide *all* young people with the information, services, and support they need to grow up to become sexually healthy adults.

## SEXUAL ORIENTATION

Because adolescence is a time of transition from childhood into adulthood, adolescents are “journey people”—neither adults nor children, but traveling somewhere in between. Their identities on all levels are dynamic and convoluted. They are changing rapidly and often unevenly on physical, emotional, intellectual, moral, and spiritual levels.

The sexual identity of an adolescent is also being formed, and it cuts across all categories of human development. Sexual orientation, or the primary di-

rection of one’s romantic, relational, and psychological desires, is in flux for many adolescents. Sexual orientation and the personal, communal, societal, and educational issues surrounding it are instrumental in the lives of all adolescents, especially those who find themselves experiencing attractions to those of the same sex or in the case of transgendered youth, those who are unable or unwilling to adhere to traditional gender roles (behavior that is traditionally understood to be associated with women or men).

While the inclusion of transgendered issues in the lesbian, gay, and bisexual movement is controversial to some, gender and sexual orientation intersect in inseparable ways. For example, many students are harassed in school because they are *perceived* to be lesbian or gay, not because they actually are lesbian or gay. Some individuals do not or cannot adhere to traditional gender roles in the way they look, dress, behave, or speak—for example, when a boy has many feminine mannerisms, or when a girl appears traditionally masculine in dress or behavior. A fear of being labeled gay or lesbian based on gender assumptions can affect students in many different ways, as when boys are reticent to participate in school choir or when girls become ambivalent about academic achievement. Therefore, this discussion of sexual orientation includes transgender issues. Also included are those who are questioning their sexual orientation or gender identity.

### The Problem with Definition

It is important to note that the desire to measure, define, and keep statistics on sexual orientation and gender is a relatively new phenomenon in human history. The terms homosexual, heterosexual, and transgender did not exist until early in the twentieth century with the advent of modern psychology. In ancient times, same sex erotic behaviors and romantic love for those of the same sex existed as part of normal and everyday life. Some researchers and theorists believe that society has created categories for sexual orientation and gender to control sexual behavior and to create a catalogue of sexual deviancies. Society’s need to classify sexual orientation and gender and attitudes toward people who are lesbian, gay, bisexual, transgendered, or questioning (i.e. sexual minorities) reflect society’s assumptions about what is normal and who is welcomed and excluded. Educators should approach the labeling and classifying of sexual orientation of adolescents with great cau-

tion due to its potential for exclusion. James Brundage asserts that people are continuing to live with codes of sexual conduct established in Medieval Europe, and he calls for new reflections on an understanding of people as sexual beings in modern times. Living in a world, however, of what Thomas Popkewitz calls “population reasoning” that seeks to define children as members of groups with certain characteristics requires that people, however hesitantly, must acquiesce.

### Sexual Orientation Hesitantly Defined

When a compass is moved, the needle fluctuates for a bit before settling on true north. Similarly, a significant number of adolescents will find themselves confused about their sexual orientation and gender before settling into their sexual identity. Many will engage in sexual behaviors with others of the same sex. For most, these behaviors are experimental as young people make their way to a heterosexual orientation. But, for others, the attractions to those of the same sex remain consistent as they continue to personally develop and become more experienced in relationships. Many psychologists theorize that one’s sexual orientation is found on a continuum, that no person is 100 percent heterosexual or homosexual, and that some are right in between. Research is suggesting that gender identity can also be understood along a continuum.

Sexual orientation is also understood to be more than just genital-sexual behaviors and includes emotional preference as well as intensity of spiritual connection with another person. Those who fall on the continuum closer to being attracted to those of the opposite sex, which accounts for the majority, are commonly known as straight or heterosexual. Those in the middle (studies show this to be anywhere from 2% to 5%) are considered bisexual. When a person is physically, emotionally, and spiritually attracted primarily to members of the same sex, they are considered to be lesbian, if female, and gay, if male. Studies show these numbers to be anywhere from 5 percent to 10 percent of the general population.

It is difficult to design studies that accurately reveal the proportion of straight and sexual minorities in the adolescent population. Even if a survey is anonymous, those with minority orientations may be denying their attractions to themselves as well as others because of the societal expectation that the only acceptable and normal orientation is heterosex-

ual (i.e. *heteronormativity*). Some adolescents may have sexual attractions to either gender but would not categorize themselves in the same way as the survey instrument would. Others may know that they are members of a sexual minority, but because sexual orientation is invisible, many force themselves to live as heterosexuals, thus feeling one way on the inside, but living another way on the outside.

### The Impact of Invisibility and the Sense of Self

Although evidence shows that more and more individuals are *coming out* (divulging one’s sexual orientation to others), minority adolescents are especially susceptible to the tendency of keeping their orientation invisible and silent. Instead, they choose to emulate their straight peers. This contradiction between a minority adolescent’s developing internal sense of sexual identity and external actions and words exacts a great toll on their emotional and spiritual well-being. This disintegration (lack of ability to integrate invisible identity with visible identity) of the adolescent plays itself out through a higher than average rate of drug and alcohol abuse, depression, misbehavior, and suicide rate among sexual minority adolescents. Some reports show that up to one-third of teen suicides are committed by sexual minority youth. Spiritually, many adolescents find themselves alienated from their faith communities (either internally, externally, or both) and their family’s spiritual traditions. Where do sexual minority youth develop a sense of needing to keep their identities invisible? How do they come to understand the world as a place that is hostile to their sexual desires?

### Sexual Socialization of Adolescents

Heterosexual people often have difficulty understanding the trials of sexual minority individuals. Since the majority of people in the world are heterosexual (including the parents of most minority youth), most persons in the mainstream culture spend little time reflecting on their sexual orientation. However, if one were to imagine what it would be like to be a young person beginning to develop an internal sense of a minority sexual identity, one could quickly notice how modern society is hostile to and nonrepresentative of minority sexual orientations. The comments family members and friends make when sexual orientation issues are discussed, television shows, popular songs, books, movies, billboards, magazines, the content of laws and policies, and people’s assumptions and expectations all teach

children from a very early age that it is best to be heterosexual.

Debbie Epstein and Richard Johnson's work in elementary schools shows that heteronormative sexual roles are rehearsed and reinforced both in the classroom and on the playground. Children play games that celebrate heterosexual pairings, read stories with exclusively straight characters, absorb assumptions about people based on gender behaviors, and are asked questions by teachers and classmates that assume a future heterosexual orientation. In short, from the first day of kindergarten, sexual minority youth are sexually socialized to think and feel in a straight way. When these youth reach adolescence and discover that they cannot fulfill the prepared sexual script, school becomes a place that both explicitly and subtly makes them feel abnormal and deviant.

### High Schools and Sexual Minority Adolescents

Citing a Massachusetts Governor's Task Force report, the Gay Lesbian Straight Education Network (GLSEN) reports that about two-thirds of sexual minority students said they have been verbally, physically, or sexually harassed at school. GLSEN seeks to make schools safer through education about orientation issues. It also provides logistical support for teachers, administrators, and students who want to help make their schools more welcoming to and accepting of sexual minority students. In some schools, lesbian, gay, bisexual, transgender, and questioning students, as well as their straight peers, meet (often in groups called Gay/Straight Alliances or GSAs) to discuss the problems faced by sexual minority students and share ideas about how to cultivate a tolerant atmosphere. The 1984 Federal Equal Access Act permits the formation of such groups anywhere that student clubs of any kind exist. This law, originally heavily promoted by conservative Christian groups to allow students to organize religious clubs in public secondary schools, applies only to public school settings where the administration has been found to have established a policy of making their facilities available to after-school groups. Sexual minority students in smaller or conservative communities are often more isolated, since the topic rarely, if ever, becomes part of the public discourse of the school. Advocates say the presence of GSAs makes sexual minority students feel safer. Opponents argue that GSAs encourage impressionable teens to experiment with homosexuality and a lifestyle that leads to un-

happiness and death. Often, religious language is evoked to explain why homosexuality is unfavorable.

Even if sexual minority students are ready to talk about their sexual orientation (and many are not and just continue pretending to be like their straight peers), the level of support from and comfort level of the adults in the school can vary widely. Even counselors and social workers are often not prepared to discuss issues of sexual orientation with adolescents. Sometimes faculty who want to teach about the contributions of sexual minority individuals throughout history or want to support students individually are prevented from doing so by administrators and school boards. Parental pressure and perceived public opinion often keep school leaders from supporting sexual minority youth. In other places, however, teachers and staff display "safe zone" symbols (a symbol designed as a sign of support to students) and feel comfortable talking about sexual orientation as it comes up in classroom conversation or individual conversations with students.

### The Controversy and Conclusion

In terms of attitudes and actions towards sexual minority issues and students, there is little uniformity across American schools. The majority of schools, however, are not dealing with the issues, and minority students continue to suffer in silence and denial of their own sexual orientation.

The sexual orientation issue in education is at the intersection of societal sexual, psychological, and religious norms with the school. While the legal system tends to defend the rights of lesbian, gay, bisexual, transgender, and questioning students to be free from harassment and to start GSAs, it has not held schools accountable for proactively creating more welcoming and supportive environments for sexual minority youth.

Ultimately, administrators, school boards, and citizens decide on the curriculum and policies of the school. Though the American Psychological Association (APA) removed homosexuality from their list of mental disorders in the 1970s, many still do not consider a minority sexual orientation to be normal or acceptable. Some religious groups such as Focus on the Family contend that adolescents can be converted to heterosexuality using a process known as reparative therapy. While mainstream psychological (e.g., the APA) and religious groups reject such therapies (e.g., see *2000 Religious Declaration of Sexuali-*

ty, *Morality, Justice, and Healing*, written by the Sexuality Information and Education Council of the United States), their level of support for open discourse and action in schools varies widely. The school is simply the crossroads of a much wider societal debate. Sexual minority adolescents challenge educators to think about the tension between pleasing majority publics and serving all students. The presence of minority adolescents can encourage reflection, conversation, and changes in policy and practices that many educators are not ready for and yet which sexual minority adolescents cannot survive without.

COLLEEN A. CAPPER

### SHANKER, ALBERT (1928–1997)

President of the American Federation of Teachers (AFT), the nation's second largest teachers' union, Albert Shanker was born in New York City in 1928 to Russian working-class immigrant parents. He grew up during the depression on the Lower East Side of New York, his father a newspaper deliveryman, his mother a sewing machine operator. Shanker was reared in a union home where, he said, "Unions were just below God" (Swerdlow and Weiner Internet site). When he began school, he spoke no English and endured beatings and anti-Semitic taunts in his mostly non-Jewish neighborhood.
