Students pursuing vocational and career-education programs include: (1) traditional-age students preparing for their first job, (2) working adults seeking the upgrading and retraining of knowledge and skills, (3) students employed by local business or industry in internship or cooperative-education programs, (4) members of labor organizations, (5) the underemployed and unemployed, and (6) older adults and retirees seeking to develop a skill or technical knowledge for personal reasons. The programs they select may include specialized degree programs (such as accounting or occupational therapy), career-ladder programs (e.g., moving from engineering technology to engineering), contract training provided to workers of a local company, apprenticeship training programs operated in cooperation with trade organizations, *two-plus-two* programs articulating high-school and college vocational education, and international training programs. Certain states have separate systems of two-year vocational institutions, such as the Wisconsin Area Vocational Tech-

nical Institutes, while other states, such as Iowa, converted their vocational-technical institutes to comprehensive community colleges in the 1990s.

**Open access to higher education.** In the United States many colleges and universities were established before a system of secondary education was developed. Harvard, America's first college, was founded much earlier than college preparatory programs. Land-grant colleges and universities were established many years prior to the provision of secondary education in rural areas—in their first years, more than half of their students enrolled in precollegiate studies. Women's colleges, colleges and institutes for American Indians, and historically black colleges and universities were established before there were secondary educational programs to prepare these groups for collegiate level studies. This curious American phenomenon required higher education to judge the merits of the students admitted, rather than relying on secondary diplomas and exit exams, as was the case in many countries at the time. Inadvertently, this placed higher education in the position of articulating academic standards for college preparatory and secondary education.

The flood of immigrants coming to the United States between 1900 and 1920 also fueled the growth of community colleges. The educational needs and backgrounds of junior college students diversified as enrollments grew. The suffrage movement and women's educational expectations augmented enrollment as well. In 1920 less than 4 percent of the American population (238,000 students) went to college. By the end of the 1920s, 12 percent of high school graduates were attending college.

A new wave of immigration began in the 1980s, a wave that continued into the twenty-first century. Once again the United States is expanding and extending higher education to new segments of the population. Some come with little or no formal education or language skills, others come with extensive education but few language skills, while a third group consist of those with English language skills but little formal education. English-as-a-second-language instruction represents as much as one-third of all humanities instruction at community colleges.

Community colleges, as open admissions institutions, hold a unique position in this juxtaposition of secondary and postsecondary education. For not only did higher education assume the role of setting

college preparatory standards, but also of providing precollegiate instruction for those able but insufficiently educated to succeed in the rigors of a regular collegiate program. Community colleges increasingly have been called upon to provide remedial and developmental programs and services to those students without adequate levels of academic preparation to succeed in college. Several states and higher education systems, including Colorado, Florida, and California, have prescribed or sought to place developmental and remedial courses in the community colleges.

Community colleges play a significant role in meeting immediate and short-cycle needs of the immigrant, the disabled, and the unemployed with a wide range of courses and programs. Community colleges expanded the scope of higher-education offerings by adding to the curriculum practical and pragmatic courses of study that meet the educational needs of an advanced, complex, and technological society. The federal government has encouraged this expansion through incentives to colleges that serve such groups as displaced homemakers, students with disabilities, those needing adult basic education, and the unemployed seeking job retraining. Programs targeted for these students have broadened the curriculum, subsidized enrollment growth, and provided access to college for those who otherwise could not afford it, thereby widening the demographic profile of students served. The demand for higher education has risen as the value of a high school education has declined in the marketplace of jobs and careers.

**Adult and continuing education and community services.** Programs and services for adults, for the continuing education of workers in the skilled trades, technical occupations, and the allied professions, and courses and programs of general interest and value to personal and corporate development in the local community have always been a distinguishing feature of community and junior colleges. Early junior and technical colleges (e.g., Pratt Institute, St. Joseph Junior College, Oklahoma Institute of Technology) also provided adult education and community services programs. After World War II, and particularly during the presidency of Edmund Gleazer at the AACJC, this function grew in prominence. Gleazer's vision was that community colleges would render educational services to the entire local community, not just to traditional college-age groups.

Providing credit and noncredit courses and nonacademic educational services (e.g., films, lecture series, fine art exhibits, musical performances) to the area served became a priority for community colleges in the 1970s and 1980s. Nevertheless, adult and continuing education and community services have been regarded in two ways. One holds them ancillary to general and liberal education and vocational and technical education in the community college. The second views community services not so much as a separate function of the college, but as an intrinsic quality that distinguishes community colleges from the rest of higher education. From this perspective, the role of service to the surrounding community has become fundamental to the definition of the public community college mission.

### The Community College Mission

Contemporary discussions regarding the mission, role, and function of the community college rely on historical notions of the evolution of the institution. If one chooses to emphasize the vocational education stream, one may reach the conclusion that community colleges are post-high school, but not higher education. If one examines the success of students who otherwise would not have attended college, then one may conclude that community colleges track students into certain social strata or advance their station in society. Examining the adult education and community services function leads one to conclude that the institutions' roots are to be found there. In short, a comprehensive community college incorporates an eclectic set of educational philosophies and purposes into its mission.

The contemporary and prevalent normative view of the American community college is as a local, public institution understood by its commitment and connection to the community it serves. While exceptions and variations abound, the evolution of this view from that of junior college, booster college, normal school, technical institute, or private preparatory college was galvanized largely by the 1947 President's Commission on Higher Education (the Truman Commission), which suggested "the name 'community college' to be applied to the institution designed to serve chiefly local community educational needs. It may have various forms of organization and may have curricula of various lengths. Its dominant feature is its intimate relations to the life of the community its serves" (President's Commission, p. 3). Also significant in its develop-

ment was the advocacy of the Carnegie Commission on Higher Education (1970) for the establishment of community colleges within commuting distance of every adult. These commissions, together with the Higher Education Act of 1964 (and the Educational Amendments of 1972 to the act that promoted state-wide planning and provision of higher education throughout the nation), enabled community colleges to be rapidly established to meet the swelling demand for higher education among the World War II generation—and among their sons and daughters.

The mission of the community college, like that of other institutions, has evolved in relation to social context. In many cases, the community, junior, or technical college was but one phase in the development of a particular institution. This was especially true of those with origins connected to educating teachers. Brigham Young University, Millersville University, Wayne State University, and Midwestern State University all began as two-year colleges with teacher education programs. As the profession matured, these institutions expanded their programs horizontally, to other fields of study, and vertically, becoming baccalaureate-granting institutions. Liberal arts colleges, comprehensive colleges, and doctorate granting universities, such as Mills College, Bradley University, and the Susquehanna University, also evolved from private junior colleges and technical institutes.

This tendency of two-year colleges to become baccalaureate-granting institutions did not erase from their host communities the need for a community college. California State University-Fresno, the University of Texas at El Paso, and the University of Southern Colorado all began as two-year colleges. When these institutions became baccalaureate-granting institutions, they adopted more selective admissions and broadened their curriculum—both vertically and horizontally. They also left an educational vacuum due to the lack of open admissions, adult education and community services, and two-year vocational and technical programs. A growing social need for an urban regional university did not alleviate local need for a community college, and public demand in these cities led to the establishment of new community colleges: Wayne County Community College, El Paso Community College, and Pueblo Community College. In 2002 the Gates Foundation provided support for seventy small high schools to develop associate degree programs, setting in motion changes similar to those in the 1920s

and 1930s that brought about many new two-year colleges. As society changes, so will its institutions of higher learning.

### Conclusions

The distinctive contribution of community colleges to American higher education is their adaptive, transmutable mission. They represent education's local, front-line interface with society. To fulfill this transmutable mission, comprehensive community colleges provide (1) general and liberal education, (2) vocational and technical education, (3) adult, continuing, and community education, (4) developmental, remedial, and college-preparatory education, and (5) counseling, placement, and student development services.

In individual institutions, one or more of these five functions may have grown to predominate in response to local needs and expectations. When the small Baptist colleges faced financial exigency in 1894, they restricted their curriculum to two years and sent their students on to Baylor University. In the 1960s and 1970s, when the focus of public educational policy was on accessibility and affordable higher education, community colleges developed outreach programs, personal development and adult education programs grew, and the community dimension of the institution was promoted. In the 1980s and 1990s, when taxpayers sought to curb public spending and to promote economic growth and competitiveness, community colleges dropped personal development courses, and instead defined the needs of adults in terms of employment and economic development. Thus, the demand for the specific functions, programs, and services of community colleges ebb and swell with the social and economic conditions of the municipality, the region, and the nation—and they often may do so more rapidly than at their four-year college and university counterparts.

The community college, in all its various manifestations, is a truly unique component of American higher education. It provides a flexible and adaptive form of higher education tailored to local needs. It helps a complex industrialized society have a full range of education and training—from bookkeepers to accountants to those with an associate degree in business administration—depending on the demands and needs of society and the workplace. Community colleges train the legal aid and legal assistant with general and specialized knowledge to

support and complement the work of the lawyer. Community colleges educate numerous allied health professionals who work in support of physicians and surgeons. Career and transfer programs are open largely to all, because the community college also provides the development and remedial coursework necessary for individuals with the capacities, but not the formal education prerequisite, for entry into postsecondary education. These adaptive, flexible, and accessible characteristics are what give community, junior, and technical colleges their unique and singularly important role in American society.

## COMMUNITY EDUCATION

In numerous polls and surveys, Americans identify education as one of the leading domestic challenges of the twenty-first century. Specifically, the challenge is not just to reform public schools but also to achieve the goal of academic success for all students. Many educational experts agree that reaching that goal will require increased cooperation among the schools themselves and a new kind of collaboration with the families and communities served by the schools.

Community education offers a structured, effective way to respond to the challenge to improve public education because it expands the school's traditional role and creates a mutually interdependent relationship among home, school, and community. Community education has three basic components—lifelong learning opportunities, community involvement in schools, and efficient use of resources—and is based on a set of ten broad principles:

- *Lifelong learning*. Education is a birth-to-death process, and everyone in the community shares in the responsibility of educating all members of the community. Formal and informal learning opportunities should be available to residents of all ages in a wide variety of community settings.
- *Self-determination*. Community residents have a right and a responsibility to be involved in assessing community needs and identifying community resources that can be used to address those needs.
- *Self-help*. People are best served by their leaders when their capacity to help themselves is acknowledged and developed. When people assume responsibility for their own well-being, they achieve some degree of independence.
- *Leadership development*. Training local leaders in problem solving, decision-making, and group-process skills is essential to community improvement efforts.
- *Institutional responsiveness*. Because public institutions exist to serve the public, they are obligated to develop programs and services that address constantly changing public needs and interests.
- *Integrated delivery of services*. Organizations and agencies that operate for the public good can best use their limited resources, meet their own goals, and serve the public by collaborating with organizations and agencies with similar goals and purposes.
- *Localization*. Community services, programs, and volunteer opportunities close to people's homes have the greatest potential for high levels of public participation.
- *Maximum use of resources*. The physical, financial, and human resources of every community should be fully available and rationally interconnected if the diverse needs and interests of the community are to be met.

- *Inclusiveness.* Community programs, activities, and services should involve the broadest possible cross-section of community residents without segregation by age, income, sex, race, ethnicity, religion, or other characteristics.
- *Access to public information.* Public information should be shared across agency and organization lines because an effective community not only has “the facts,” but it also knows what those facts mean in the lives of the diverse people who make up the community.

### A Comprehensive Plan

The current lack of confidence in public education has been more pervasive and prolonged than the crisis in confidence that followed the launch of *Sputnik* in 1957 by the Soviet Union. Community education has become the approach of choice of many educators who are determined to improve the public confidence in schools and to build partnerships in support of public education.

Community education is a way of looking at public education as a total community enterprise. A community education program is a comprehensive and coordinated plan for providing educational, recreational, social, and cultural services for all people in the community. The following strategies provide a framework for developing such a program. The strategies have overlapping characteristics and functions, but taken together, they outline a comprehensive action plan.

**Strategy 1. Encourage increased use of community resources and volunteers to augment the basic educational program.** Every community has human, physical, and financial resources that can be used to enrich and expand traditional education programs. Community resources and volunteers have been used to expand curricular options, conduct field and study trips, offer various kinds of tutoring, sponsor student-based enterprises, and support experiential learning.

**Strategy 2. Develop educational partnerships between schools and public and private service providers, business and industry, and civic and social service organizations.** Complex, often interrelated, social and economic problems create a broad array of service needs in many communities, and meeting them effectively is likely to require more resources than any single agency or organization can provide. The development of partnerships for cooperative use

of available resources will help prevent unnecessary duplication in the delivery of such services as child care, after-school programs, drug education and treatment, literacy and remedial programs, internships and work-study programs, and career awareness activities.

**Strategy 3. Use public education facilities as community service centers for meeting the educational, social, health, cultural, and recreational needs of all ages and sectors of the community.** Since community attitudes and support affect the schools' ability to carry out their mission to educate all children, educators must consider the needs and concerns of nonparents in the community. This strategy encourages keeping school buildings open on a planned, organized basis at hours beyond the regular school day. It takes advantage of the strong support community centers generally receive, as well as the economic benefits to the community of more efficient use of public facilities.

**Strategy 4. Develop an environment that fosters lifelong learning.** This strategy acknowledges learning as a lifelong process. It recognizes that learning takes place, both inside and outside the school setting, without formal instruction. It encourages the development of education programs to meet learning needs that change over a lifetime, including the need for new skills and knowledge. Lifelong learning programs and activities may include early childhood education, extended-day and enrichment programs for school-age children, adult education, vocational training and retraining programs, leisure activities, and intergenerational programs.

**Strategy 5. Establish a process for involving the community in educational planning and decision-making.** The total community has a stake in the mission of educating community members. Individual community members, therefore, have a right and a responsibility to participate in determining community needs, setting priorities, and allocating resources. The cyclical process of planning, evaluating, and changing takes advantage of a basic fact of human behavior: Those who participate in planning and decision-making develop feelings of ownership. Encouraging the broadest possible involvement capitalizes on another fact: The greater the number and diversity of people involved, the greater the likelihood that diverse needs will be met. Involvement opportunities should range from participation in ongoing advisory councils to membership on ad hoc task forces and committees.

**Strategy 6. Provide a responsive, community-based system for collective action by all educational and community agencies to address community issues.** Many community problems are so complex that resolving them requires cooperative use of a broad range of resources. Seeking the involvement of nonschool agencies can help schools address such social, health, and economic issues as substance abuse, housing, child abuse, mental illness, violence, crime, vandalism, teen pregnancy, and various kinds of discrimination.

**Strategy 7. Develop a system that facilitates home-school-community communication.** Research shows that schools that involve all their publics and keep them well informed have community support, and that those that fail to reach beyond the parents of current students do not. Effective home-school-community communication goes beyond news releases, speeches, newsletters, and open houses; it includes use of the media, home visitations by teachers and administrators, school displays throughout the community, and special community outreach programs conducted both in the schools and at other sites in the community.

### Community School

The term *community school* designates a school site where the concept of community education is put into practice. Community education may also be implemented in community agencies and organizations, but the most common site is a public school.

A community school departs from a traditional public school's schedule and curriculum. A community school is open year-round, eighteen hours or more a day, often seven days a week. The school thus becomes not just a place to teach children but a community learning center with multiple uses.

In a community school, the concept of public education is extended beyond the traditional K–12 program to include the provision of learning opportunities for the entire community. The traditional schedule is expanded through extended day programs (including before- and after-school activities and care), and recreational, social, and educational programs for community residents of all ages. Activities and programs may not be limited to the school building, itself, as the school extends itself into the community, turning agencies, factories, businesses, and the surrounding environment into learning laboratories.

By organizing programs and activities that serve all ages and populations, a community school encourages disparate elements of the community to come together to work toward common goals. It provides a physical setting as well as an organizational structure for school-community collaboration.

### Impact on Education and Communities

Because many community problems ultimately affect a community's ability to educate all children, educators in some communities are taking a leadership role in the search for solutions to community problems. From a problem-solving point of view, a community school can be a support center for a network of agencies and institutions committed to addressing broad community needs. Using schools as community centers is a cost-effective, practical way to use one of the community's largest investments—its school buildings. The community school reaches out to the community and works as a cooperative partner to address community needs, including educational needs.

The possible benefits to schools and communities from a well-designed and carefully implemented community education program have been described in a variety of studies, including the U.S. Department of Education's *Strong Families, Strong Schools* (1994) and *Safe and Smart*, from the U.S. Departments of Education and Justice (1998). Documented improvements include a better school learning climate, reduced violence and vandalism, more efficient energy use, increased family involvement, and broadened community-wide educational opportunities. Other studies show improved institutional responsiveness to the needs of parents and community members and increased public support for schools and other public agencies.

### Community Education in Action

Community education takes advantage of local resources and capabilities and responds to an individual community's particular needs and wishes. Just as no two communities have exactly the same program, no community retains exactly the same program over a period of years. As a community matures, its institutions, population, assets, and problems change, and its community education program must be modified to reflect those changes if it is to remain successful.

Because every community education program is designed to reflect the current needs of a specific

community and the resources available to meet those needs, there are literally hundreds of models of programs. The website of the National Center for Community Education has descriptions of exemplary models and case studies of community education programs in three model settings—school, district, or agency. The website of the Coalition for Community Schools profiles nine community schools (four elementary, two middle, two high schools, and one preschool).

## COMMUTER STUDENTS

According to Laura J. Horn and Jennifer Berktold, approximately 86 percent of college and university students are defined as *commuter students*, that is, students not living in university-owned housing. The commuter student population is a diverse group, which encompasses full-time students who live with their parents, part-time students who live in off-campus apartments, parents with children at home, and full-time workers. Commuters range in age from the traditional college student (eighteen to twenty-four years old) to the older adult. They attend every type of higher education institution, including two-year and four-year public universities or private colleges. Typically commuter students walk, ride bikes, take public transportation, or drive to campus to go to classes. They often attend classes and then go home or to work, rarely spending additional time outside of the classroom on campus.

Students commute to campus for several reasons. Unlike many full-time residential students, commuter students may have competing responsibilities outside the academic classroom, such as family, home, and work interests. For those students who are working full-time, raising a family, or caring for an elderly parent, campus residency is not a viable option. Also, commuting may be economically beneficial because many commuter students cannot afford to live on campus. Despite residing off-campus, most commuter students have high academic aspirations and a strong commitment to learning.

### Commuter Student Challenges

Commuter students encounter many challenges that residential students do not. Commuter students, particularly first-year students, often have a difficult time "fitting in" to the campus community. Commuters often find the task of meeting students challenging because their only point of contact with other students is in the classroom, a small part of the total college experience. Residential students live, eat, study, and socialize together in residence halls, thus having greater opportunities to make friends and to become socially integrated into the campus community. A great amount of socialization for college students also occurs in the cafeteria, student center, recreation center, through extracurricular activities, or during late-night study sessions. Alexander Astin, in his 1993 study, has shown that this peer

group interaction positively affects critical thinking skills, cultural awareness, leadership development, and academic development. As a result of not living in residence halls or spending a substantial amount of time on campus, commuter students miss out on these opportunities to “connect” to the university and other students and to enhance their learning and development.

Not only is frequent contact with students outside the classroom difficult to obtain, but commuters often face limited contact opportunities with faculty and staff members as well. Commuters must make additional trips to campus to meet with faculty members during their designated office hours. Unlike residential students, commuter students rarely have the opportunity to observe faculty and staff members on campus involved in nonclassroom activities, such as playing sports in the recreation center or interacting with students in the student center. These informal student-faculty interactions have been linked to academic performance and to personal and intellectual development for students, according to Ernest Pascarella and Patrick Terenzini’s 1991 report. The interaction time for commuters with faculty members is often limited to a few minutes between classes or briefly during office hours, leaving commuter students feeling disconnected from the academic system of the university. Commuters often find forming relationships with faculty and administrators difficult because of these limited interactions outside of the classroom.

Transportation issues are a large part of commuter concerns. First, because of limited parking availability on most campuses, commuters have difficulty finding parking spaces and must often allow extra time to do so. Further, commuters often re-adjust their course schedules to attend classes in large blocks of time, again reducing the hours spent on campus outside of the classroom and the opportunity to become socially and academically integrated into the college community. Some classes may be scheduled at difficult times for commuters to attend, such as early morning or midafternoon. Because of long commutes to school, these students may encounter difficulty attending such classes, which are easily accessible for residential students.

Because of the short amount of time spent on campus each day, commuter students have a limited knowledge of the university itself, including the location of buildings, functions of university departments, campus policies and procedures, and current

events. Residential students become familiar with the university by spending a substantial amount of time on campus, taking part in student forums, and discussing current campus events in the residence hall or in small groups. Therefore, residential students often have a better understanding of the status of the university, because commuter students must wait to receive pertinent information through mailings or newspaper articles. In addition, greater proximity gives residential students more frequent occasions to establish personal relationships with faculty and staff, who serve as resources and mentors. These mentors may provide assistance and information regarding new policies and procedures.

Finally, research indicates that commuter students have lower retention rates than those living on campus. A study by Vincent Tinto in 1987 indicates that students who have high interaction with their university’s academic and social systems are more likely to persist in college. Because commuter students spend limited time on campus and limited time creating relationships with other students, faculty, and staff, they have fewer opportunities to engage in quality interactions with these individuals. Therefore they are less likely to make a strong commitment to the university or its programs and are more likely to drop out of school than residential students.

### UNITED STATES

The detrimental effects of poverty on children's academic outcomes and general well being are well documented. Children who grow up in poverty suffer higher incidences of adverse physical health, developmental delays, and emotional and behavioral problems than children from more affluent families. In school, children and adolescents living in poverty are more likely to repeat a grade, to be expelled or suspended, to achieve low test scores, and to drop out of high school. Though more research is needed to understand many of the dynamics and general effects of poverty, there is also evidence suggesting that the depth, duration, and timing of poverty are im-

portant considerations. Specifically, children who live in extreme poverty or who live below the poverty line for multiple years seem to suffer the worst outcomes. The impact of poverty during the preschool and early school years also appears to be more deleterious than the effects of poverty in later years.

About one in five children in the United States has the misfortune of living in a family whose income is below the official poverty threshold. In general, these families have trouble meeting basic needs for food, clothing, shelter, and health care. Household resources, including engaging toys, books, and computers—important for children's cognitive development—are also limited. Because of the tight connection between neighborhoods and schools in the United States, poor children tend to be served by schools that offer fewer resources for learning, provide fewer and less challenging opportunities to learn, and are less inviting and friendly places than schools serving children from more affluent communities. These individual, family, neighborhood, and school effects that are associated with poverty conspire to place children at considerable risk for failing in school and in life in general.

### Purpose

The idea behind compensatory education is to, in a sense, "compensate" for these disadvantages by expanding and improving the educational programs offered to children living in poverty. The largest and most celebrated compensatory education programs grew out of President Lyndon B. Johnson's "War on Poverty" in the early 1960s. During an era in which civil rights and desegregation were of profound national significance, the advent of compensatory education programs served as an unprecedented symbol of the federal commitment to equality of educational opportunity. In the nineteenth century, the educator Horace Mann had expressed the notion that one of the classic American ideals for education was that it be the "great equalizer," or "balance wheel of the social machinery." Similarly, President Johnson, a former school teacher, held the belief that if poor children were provided a higher quality education they could attain the same high levels of educational and occupational outcomes as their more advantaged counterparts and, ultimately, could escape the vicious cycle of poverty.

Although state governments have primary responsibility for elementary and secondary education in the United States, the federal government pro-

vides support in a few notable areas. Federal support for compensatory education grew out of two legislative acts: the Elementary and Secondary Education Act of 1965 and the Economic Opportunity Act of 1964. The Elementary and Secondary Education Act established Title I and the Economic Opportunity Act established the Head Start program. Of the total dollar amount spent nationwide on education at all levels, 93 percent comes from state, local, and private sources and about 7 percent comes from federal revenues. That federal investment represents only about 2 percent of the federal government's overall budget. Though this funding level seems slight, a substantial portion of these funds has continued to be targeted on a single mission: ensuring equal access to high-quality education across the nation. President Johnson's War on Poverty surely has lost some of its initial momentum. The federal concern for the education of poor children, though, has remained compelling enough to support the continued funding and commitment to compensatory education policies from the mid-1960s to the early twenty-first century.

### **Title I of the Elementary and Secondary Education Act of 1965**

The central educational component of President Johnson's "Great Society" programs was put into law by Congress as the Elementary and Secondary Education Act (ESEA) of 1965. Title I of the law provided approximately five-sixths of the total funds authorized under the ESEA legislation. Serving more than 10 million children in nearly 50,000 schools, and funded at nearly \$9 billion during fiscal year 2001, Title I has remained as the federal government's largest single investment in America's schools. Title I was mandated "to provide financial assistance to . . . local educational agencies serving areas with concentrations of children from low-income families to expand and improve their educational programs by various means . . . which contribute particularly to meeting the special educational needs of educationally deprived children" (Elementary and Secondary Education Act of 1965, 79 Stat. 27, 27). Title I funds may be used to upgrade the educational programs of children from preschool through high school, but most of the students served are from elementary schools. The overall goal of Title I is to help close the achievement gap separating economically disadvantaged children and their more advantaged peers.

In the early twenty-first century, Title I serves eligible schools and students in diverse ways. Indeed, Geoffrey Borman and Jerome D'Agostino pointed out that Title I is better thought of as a funding mechanism rather than a coherent educational program or set of educational practices. Throughout much of the history of Title I, it has operated as a supplemental targeted, or categorical, program. Specifically, the funds allocated under Title I are provided to schools in order to supplement the regular school program and to target the needs of a certain category of students. Although Title I funds are distributed to schools based on the percentage of poor children they serve, the services within schools traditionally have been targeted toward the most "educationally disadvantaged" students. That is, targeted Title I programs must be established to serve low-achieving students (e.g., more than one-half grade equivalent below grade level or below the thirty-fifth national percentile) attending schools with a significant percentage of children whose families are below the poverty line.

**Early years.** The early years of Title I, during the late 1960s, resulted in poor implementation and large-scale violations in the operation of the program. These outcomes were due to several factors. First, the original program mandates were ambiguous concerning the proper and improper uses of the federal money, and the guidelines and intent of the law were open to varying interpretations. Some local school system officials originally thought of Title I as a general aid fund, which was labeled as a program for the disadvantaged for diplomatic and political reasons only. Second, in 1965 the educational knowledge base for developing effective compensatory education programs was extremely limited. The vast majority of local administrators and teachers had no experience developing, implementing, or teaching compensatory programs. Third, although the federal money provided localities an incentive to improve education for the disadvantaged, a viable intergovernmental compliance system was not in place. Without effective regulation, the receipt of funds did not depend on meeting the letter or the spirit of the law. Responding to local self-interests, and utilizing Title I dollars for established general aid policies, was an easier option than the new and more complicated task of implementing effective educational programs for poor, low-achieving students.

Although federal policymakers were hesitant to restrict local control, these early results, combined with growing pressures exerted by local poverty and community action groups, prompted the U.S. Office of Education to reconsider the legislative and administrative structure of Title I. During the 1970s, Congress and the U.S. Office of Education established more prescriptive regulations related to how schools and students should be selected to receive services, the specific content of programs, and program evaluation, among other things. In addition, the Office of Education made efforts to recover misallocated funds from several states, and warned all states and localities that future mismanagement would not be tolerated. Funded in part by federal dollars, larger and more specialized state and district bureaucracies emerged to monitor local compliance. In turn, state and local compliance was confirmed through periodic site visits and program audits by the U.S. Office of Education and by the Department of Health, Education, and Welfare.

**Delivering Title I to local schools.** One of the most important regulations affecting program delivery has been the provision that the compensatory services provided through Title I must supplement, not supplant, the regular educational programs provided to eligible students. In case of program audits, and to clearly account for the federal money, educators and administrators must be able to show that the targeted Title I program is actually providing something “extra,” and that it is not merely replacing services that the students would have received through the regular school program. This regulation led to widespread use of the “pullout model” as a means for delivering supplemental compensatory services to eligible Title I students. Most often, the students who qualify for services are removed, or “pulled out,” from their regular classrooms for thirty to forty minutes of remedial instruction in reading and math. This arrangement has the advantage of making it clear that the funds are providing something separate from the regular school program, as special teachers, books, and other materials are clearly allocated only to the pulled-out Title I students and not their regular classroom peers. Through the 1970s, 1980s, and much of the 1990s, about three of four Title I schools used the pullout model to deliver supplemental services.

After the initial problems with implementation in the 1960s and early 1970s, the tighter regulations began to have their desired effect. As the 1970s prog-

ressed, the services were delivered to the children targeted by the law. The implementation of Title I became a cooperative concern and professional responsibility of local, state, and federal administrators. In addition, Paul Peterson and his colleagues noted that Title I had inspired greater local concern for, and attention to, the educational needs of the children of poverty. In marked contrast to the first decade of the program, during the later half of the 1970s and throughout the 1980s the specific legislative intents, and the desired hortatory effects, were achieved on a far more consistent basis.

After this basic standard of implementation was achieved, during the late 1980s and throughout the 1990s, new legislation contained in the Hawkins-Stafford Amendments of 1988, the Improving America’s Schools Act (IASA) of 1994, and other laws focused on reforming and improving the educational services offered in Title I schools. This new legislation granted schools greater freedom in designing and implementing effective programs, but also included new provisions that held them accountable for improved student outcomes and designated a program improvement process for those schools with poor or declining performance. Rather than the popular but fragmented pullout programs, the law encouraged educators to establish more frequent and regular coordination between the Title I program and the regular school program. Also, rather than targeting only low-achieving students, all schools serving very high proportions of poor children became eligible to use their Title I funds for schoolwide projects designed to upgrade the school as a whole. Instead of developing fiscal and procedural accountability, Title I policymakers have attempted to develop laws encouraging, and to some degree mandating, accountability for educational reform and improvement.

The Title I of the twenty-first century offers great promise for upgrading the educational opportunities of the nation’s poor children. The emphasis is on high academic standards with aligned curriculum, assessment, and professional development. Title I’s focus is on helping disadvantaged students meet the same high standards expected of all children. As part of its emphasis on high standards, the new law requires Title I funds to be used in new ways. For instance, schools are encouraged to extend learning time—before school, after school, and during the summer months—rather than pulling children out of their regular classrooms. Instructional

programs support higher-order thinking skills rather than rote learning, accelerated curricula rather than remediation, and the use of research-proven strategies rather than services designed to satisfy program audits. These new policies, along with the federal government's increasing support of whole-school reform, are designed to transform Title I from a separate system of remedial teachers, materials, and assessments to an integral component of standards-based, whole-school reform and improvement.

### Head Start

In 1964 the federal government convened a panel of child development experts to develop a program that would help communities meet the special needs of preschool children living in poverty. The recommendations of that panel became the blueprint for project Head Start. The Economic Opportunity Act of 1964 helped initiate the War on Poverty on three fronts by introducing: the Job Corps program to provide education and training for employment; Volunteers in Service to America (VISTA), a domestic Peace Corps program; and Community Action Programs to empower community planning and administration of their own assistance programs for the poor. As part of the Community Action Programs initiative, Head Start was born as an eight-week summer program in 1965, but was quickly converted to the more comprehensive nine-month program that it is in the early twenty-first century.

Recruiting preschoolers, primarily aged three and four, Head Start was designed to help break the "cycle of poverty" by providing young children of low-income families with a comprehensive program to meet their emotional, social, health, nutritional, and psychological needs. Similar to Title I, the educational services provided through Head Start are diverse. There is no single, standardized educational curriculum that every program uses. From the beginning, Head Start program providers have been granted considerable flexibility in planning educational offerings that meet the specific needs of the children and parents within the community. The curricula are designed to improve not only the cognitive abilities of young children, but also their physical well being, social skills, and self-image. In addition to services focused on education and early childhood development, Head Start grantee and delegate agencies offer a broad array of medical, dental, mental health, nutritional, and parent involvement programs.

**Goals.** As noted by Edward Zigler and Jeanette Valentine, the following seven goals set forth by the founders of Head Start in 1965 have remained as the basis for the program's mission and values.

- Improving the child's physical health and physical abilities
- Helping the emotional and social development of the child by encouraging self-confidence, spontaneity, curiosity, and self-discipline
- Improving the child's mental processes and skills, with particular attention to conceptual and verbal skills
- Establishing patterns and expectations of success for the child that will create a climate of confidence for future learning efforts
- Increasing the child's capacity to relate positively to family members and others, while at the same time strengthening the family's ability to relate positively to the child and his problems
- Developing in the child and his family a responsible attitude toward society, and encouraging society to work with the poor in solving their problems
- Increasing the sense of dignity and self-worth within the child and his family

In addition to the strong focus on comprehensive services for preschoolers, Head Start has served as a community empowerment initiative for the parents and community members who live in the impoverished areas that are served by programs. Believing that children develop in the context of their families, culture, and communities, Head Start services are family centered and community based. Rather than passive recipients of services, Head Start casts economically disadvantaged families as active, respected participants and decision makers who help plan and run their own programs. In contrast to Title I, which allocates nearly all of its resources to state and local school systems, Head Start programs are operated by a diverse collection of approximately 2,000 community-based organizations. Grantees include universities, community health centers, tribal governments, city and county governments, school districts, community action agencies, and other for-profit and nonprofit organizations.

During fiscal year 2000, the program served more than 800,000 low-income children and their families at over 18,000 centers with an average per-child cost of nearly \$6,000. During fiscal year 2001,

Head Start allocations exceeded \$6 billion. Although these funding levels still do not provide services for all eligible children and families, the level and quality of services clearly compare favorably to those offered during the hasty beginnings of Head Start in 1965.

**Performance Standards.** Starting the program so quickly and ambitiously may have led the program managers to ignore quality controls during Head Start's early years. Indeed, it was not until 1975 that the Head Start Program Performance Standards were fully implemented. During the 1970s and 1980s, funding cutbacks and inflation, combined with increasing demands for services, further exacerbated problems regarding the quality of services. In 1990 Congress passed the Head Start Expansion and Quality Improvement Act, which, for the first time in the program's history, made a significant commitment to addressing issues of program quality. The act mandated that 10 percent of all appropriations for 1991 be devoted to program improvement rather than expansion and that 25 percent of all new funding in subsequent years be set aside for the same purpose.

Since the 1990s, Head Start programs have placed more emphasis on helping children meet specific academic performance standards, employing well-prepared teachers, and improving the overall quality of the interactions between staff and children and parents. This progress is similar to the story of Title I. In both cases, during the early years of the program the primary concern was simply ensuring eligible children's access to the services. As the years have gone by, though, new legislation and new efforts by those who actually implement and operate the programs have stressed the overall reform and improvement of compensatory education.

### Evaluation of Effectiveness

The Title I and Head Start compensatory education programs have come a long way, but neither has reached its full potential. Title I has evolved from an ineffectual, poorly implemented program to one that is relatively well implemented, modestly effective, but in need of further improvement. Intergovernmental conflict, poor implementation, and a lack of an achievement effect marked the first stage of the program. A second stage, during the 1970s and 1980s, was marked by the development of increasingly specific program implementation and accountability standards, federal and local cooperation, improved implementation, and growing, but mod-

est, program effects. During the late 1980s and during the 1990s, changes in the Title I legislation stressed reform and improvement but, aside from some tinkering around the edges, the administration and operation of Title I remained fairly stable, and the program's effects remained essentially unchanged. In the twenty-first century, a new stage of the program's evolution has emerged; one in which widespread implementation of research-proven programs and practices is increasingly regarded as the key to improving the effectiveness of Title I.

Borman, Samuel Stringfield, and Robert Slavin pointed out that researchers, policymakers, and politicians have disagreed about the effectiveness and overall merits of Title I. Most seem to agree, though, that Title I has not fulfilled its original expectation: to close the achievement gap between disadvantaged students and their more advantaged peers. Given the rather modest level of funding the program provides, though, it may have been naive to have ever thought that Title I, alone, could close the gap. The results from Title I research also appear to show that without the program the children served since 1965 would have fallen further behind academically.

Some of the most exciting research evidence related to Head Start has suggested that if early childhood programs begin early enough, during the preschool years or even during infancy, children may realize lasting benefits through school and into adulthood. Indeed, a long-term experimental research project conducted by Lawrence Schweinhart and colleagues on the Perry Preschool program, which operated during the early 1960s in Ypsilanti, Michigan, has documented sustained effects on the participants through the age of 27 on diverse outcomes including: arrest rates; earnings and economic status; and educational performance. Though Perry Preschool was not a Head Start program, and was funded at a level that was approximately twice as high as a typical Head Start program, the results from this study have been held up as examples of the effects that high-quality early childhood programs can have on participants' outcomes.

The results from Head Start evaluations have been less compelling, but a review of the well-designed evaluations showed that the program has been successful in meeting many of its objectives, including strong short-term effects on participants' cognitive outcomes. Contrary to the findings for Perry Preschool, most long-term studies of Head Start participants have shown a "fade-out" of the

initial program effects. Craig Ramey and Sharon Ramey (1998) indicated, though, that no developmental theory is based on the assumption that positive early learning experiences are alone sufficient to ensure that children perform well throughout their lives. Despite the early optimism of some researchers and policymakers, it is not likely that Head Start, or any other preschool program, could be the educational equivalent to an early inoculation, which provides a child with protection for a lifetime all in one early dose.

Indeed, neither Title I or Head Start may ever serve as the “great equalizer” that President Johnson had envisioned. To compensate for poor schools, suboptimal health care, poverty, and a variety of other contextual conditions known to have adverse effects on students’ development, more of a commitment than one or two isolated federal compensatory educational programs is needed. In the history of both programs, neither has had sufficient funding to provide services to all eligible children. To the millions of children that Title I and Head Start have served, though, it has made important differences in their lives, their families’ lives, and in their schools.

## POLICIES AND PROGRAMS IN LATIN AMERICA

Questions that have puzzled education scholars, policymakers, and social reformers since the 1960s are the following: Do schools reproduce social stratification? Do they enable social mobility? Can schools help poor children learn at high levels? Do deliberate attempts to reform education policy influence school life?

### Theoretical and Historical Context

Whether education policy can change the distribution of educational opportunity depends on the context of schools and of the students they serve. Comparative analysis shows that school quality is more significant in helping disadvantaged children learn. More privileged children, whose parents have higher levels of schooling, often learn much from them. Hence, the potential of education policy to influence schools is greater in marginalized schools. This entry discusses the results of policies aimed at expanding the learning chances of poor and marginalized children in Latin America during the 1990s.

It is fitting to study the potential of policies aimed at improving educational opportunity for the poor in Latin America. During the twentieth century, Latin America experienced a dramatic educational expansion, as did most developing regions. This expansion allowed for intergenerational education mobility: social differences were no longer expressed in terms of access to only the lower levels of schooling, but rather as social differences in the quality of education, as most of the expansion was possible in

fragile institutions of insufficient quality to enable the newly incorporated groups to succeed academically. This in turn transferred preexisting social differences to differences in the likelihood to successfully complete the lower levels of education and therefore to access secondary and tertiary education. With the expansion of public education many of the dominant groups transferred their children to private institutions, hence contributing to further differentiation and stratification of schools.

In spite of the significant educational expansion of the twentieth century much inequality is still reproduced across generations in terms of the lower-education chances for the children of the poor. Low-income groups are the last to access education at any given level, are largely excluded from higher education, and also to a great extent from secondary education and preschool education. Most of those who are still excluded from primary education come from the poorest families. For children of a given education level, disparities exist among schools in per pupil expenditures, in the levels of education of their teachers, in the amount of instructional time they receive, and in the instructional resources to which they have access. These disparities also mirror the inequalities of origin between the children of the poor and the affluent. Low-income children are more likely to be assigned to poorly endowed schools, with less-experienced teachers who are in school fewer hours with the consequent less time on task than their higher-income counterparts.

During the 1980s the region faced a series of economic shocks resulting from a debt crisis and ensuing programs of economic adjustment that negatively affected the already fragile public education systems. These and related changes in the delivery of social services and in economic conditions increased poverty and inequality. In the early 1990s political elites focused on the need to reduce poverty as a way to reduce and prevent social conflict and violence, and to enhance the ability to govern increasingly unstable societies. One of the strategies to reduce poverty was to target resources to improve educational opportunity for the children of the poor.

### Three Types of Compensatory Policies in Latin America

Compensatory policies seek to close the gaps in learning opportunities between children of the poor and the affluent. According to the way compensation is interpreted, policies and programs that seek

to foster equal educational opportunity are of three kinds. A first group of compensatory policies includes those that aim to equalize the distribution of educational inputs financed publicly. The objective is to close the input gap between the school environments attended by the poor and the affluent. These include the following: (1) more equitable funding of schools such as the financing reforms implemented in the 1990s in Brazil that sought to close the gap in per pupil spending across schools; (2) those that aim to increase access to a given education level by building more schools, hiring more teachers, or developing alternative modalities to more effectively reach particular groups such as the use of TV-based secondary education in rural areas in Mexico (*telesecundaria*), the use of community-based modalities of education to offer education to multiage groups in remote rural communities in Mexico (*postprimaria rural*), or the program to expand access to preschool and primary education in rural areas in El Salvador (EDUCO); and (3) those that try to provide schools attended by low-income children with minimum instructional resources commonly available to the affluent such as textbooks, school libraries, and training for teachers. Examples include the program to overcome educational backwardness in Mexico (Pare); the Escuela Nueva program in Colombia to enhance the quality of rural schools; and the program to enhance the quality of the schools with lowest levels of student achievement, the P900 program in Chile (which took its name from targeting the 900 poorest primary schools, representing 10% of the total).

The policies to equalize the distribution of inputs followed in Chile included a new teaching statute that gave salary incentives to teachers working in marginalized areas; instituting programs to improve the quality of the most vulnerable schools at the primary and secondary level, and programs for at-risk children (e.g., the school health program and summer camp programs); and teacher incentives for after-school programs.

In Mexico compensatory programs expanded from a small program that targeted 100 schools in the early 1990s, to coverage of 46 percent of all public schools in 1999. The objective of the programs was to improve the quality of primary education and expand access to preprimary and primary education through the provision of infrastructure, training, materials, and incentives to teachers and supervi-

sors. Starting in 1998, coverage of the programs included lower secondary education.

A second group of compensatory policies includes those that aim to reorient the utilization of public resources to equalize the distribution of educational opportunities understood as outputs. Some call these policies positive discrimination. These policies recognize that the outcomes of schools reflect the contributions of school and family resources; therefore, the purpose of compensation is to offset the greater opportunities some children receive from home resources. For example, success in the first grade of primary school is a function both of what goes on during that year, but also of the conditions of health and nutrition of children prior to entering first grade, and of the cognitive, emotional, and social stimulation received in early childhood. Consequently equality of treatment in school during the first grade would most likely not lead to equality of learning outcomes for children from different social backgrounds. Equality of outcomes would require extra resources and attention to low-income children both during early childhood and in first grade. Similarly, the “opportunity cost” of staying in school varies for children of different social backgrounds; therefore, achieving equal opportunity to attain the same levels of schooling requires interventions that appropriately cover those opportunity costs (e.g., scholarships for low-income students that cover the direct and indirect costs of participation in school). An example of this policy is the scholarship program to support school attendance of low-income children in Mexico (Progresa) or a scholarship program for similar purposes in Brazil (Bolsa Escola). Programs of full-day school sessions for low-income children in Chile, Uruguay, and Venezuela (when the affluent attend half-day sessions) are examples of positive discrimination focused on enhancing the quality or intensity of inputs. Given the stark discrepancies between the conditions of the targeted schools and the nontargeted schools, and the relatively low level of funding of these policies, much of the so-called policies of positive discrimination in Latin America are in fact attempts to equalize the distribution of inputs. At best they are designed to close the resource gap—the levels of initial input inequality among schools—and not to endow schools of low-income children with greater resources to achieve equality of output. For example, the program of the 900 schools in Chile, and the Programa para Abatir el Rezago Educativo in Mexi-

co, target resources and attention to schools attended by disadvantaged children to try to redress previous neglect and gaps in resources between these schools and the schools of the affluent. The same is true of the Escuela Nueva program in Colombia, which attempts to improve the quality of rural multigrade schools through teacher training and provision of instructional materials.

A third group of compensatory policies are those that support differentiated forms of treatment for low-income children in recognition of their unique needs and characteristics. The main objective of these policies is to support opportunities for relevant and meaningful learning for low-income children. The goal is not to achieve equality of learning outputs, but equality of life chances. The assumption is that the school curriculum contributes only a fraction of the cultural and social capital that the affluent acquire in life; the rest attained as a result of experiences facilitated by family, neighbors, and community. In order for the poor to have comparable opportunities to live a life that is consistent with their choices, schools need to provide more cultural and social capital and be capable of associating and accessing vertical and horizontal social networks such as personal effectiveness, and political and negotiation skills. Although equality of inputs and equality of outputs assume the equivalency of the relevance of curricular objectives for all children, this particular group of efforts does not make that assumption, and attempts instead to support curricular goals and pedagogical approaches that specifically allow low-income children to move out of poverty through individual or collective action. The purpose of these policies is to help children learn skills whose significance is contextually situated, “preparing all students to live in and contribute to a diverse society but also preparing them to recognize and work to alter the economic and social inequities of that society” (Cochran-Smith, p. 931). Examples of this approach include various forms of popular education as described by Paulo Freire and his colleagues and followers, the various modalities of education designed and supported by Fe y Alegria, the network of publicly funded schools managed by the Society of Jesus in thirteen Latin American countries, and the early-twenty-first century modality of community-based post-primary education developed in Mexico.

### Effects of Compensatory Policies

Extant evaluations of compensatory policies tend to be descriptive, mostly emphasizing intended policy and short-term effects. When these reports are analytical, they focus on outcomes such as access or achievement on curriculum-based tests and adopt a “black box” approach to policy implementation, often assuming that policy output is implemented as intended. The designs employed rely on pre-post comparisons—often inappropriately disaggregating the effects of the policies being evaluated with those of other policies or changes—or on comparisons between target populations and some quasi-control groups—often assuming learning from differences between groups, inappropriately accounting for the nonrandom selection of students to treatment schools.

Limited studies indicate that some desired outcomes (more typically access, but also achievement levels) improve with the implementation of a compensatory policy, but say nothing about whether the distance separating the beneficiaries of the policy from the rest of the children shortens or widens as a result of the policy. It is unknown whether these policies, embedded in process of general education improvement, represent marginal improvements in the educational opportunities of the poor or real reductions in the equity gaps existing in each country. Most studies concentrate on the effects of the policies, rather than on their costs. Little is known about the practical consequence of some of the effects (many of which are discussed as a percentage increase in student achievement in a test or a percentage change in access). In particular almost nothing is known about the long term effects of compensatory policies, whether they are sustained or interact with further interventions and what kinds of other long-term outcomes they have, such as access to higher levels of schooling, acquisition of skills or life chances.

Education reforms in Brazil, which through a constitutional amendment reduced the gaps in per pupil spending across schools and regions and provided scholarships to children in low-income families to attend school at least 85 percent of the school year, contributed to making access to primary school universal. By 2002, 97 percent of the children in the relevant age group were enrolled in primary school; the gains in access were significantly greater for the children from the lower income families. For the poorest income quintile primary school attendance

increased from 75 percent in 1992 to 93 percent in 1999. Promotion and completion rates increased, as repetition rates declined. There is less conclusive evidence regarding the impact of these reforms on the learning outcomes of students.

Compensatory policies in Mexico expanded coverage significantly in disadvantaged areas, mostly as a result of concentrating the hiring of teachers in indigenous schools and in new modalities of primary and secondary schooling adaptable to small rural communities. Compensatory policies in Mexico have succeeded in distributing inputs (textbooks, pedagogical materials, improving infrastructure) and in providing opportunities for teacher professional development, hence improving the minimum resource base in marginalized schools.

With this improvement in basic conditions, completion rates have improved considerably more in areas targeted by compensatory policies than in other regions of the country. Teachers provide good reports of the training courses, but there is no evidence of impact of the training in teacher practice or on student achievement. Several studies consistently point out that implementation significantly transformed the programs, with negative consequences for learning opportunity.

To sum up, Mexico’s experience with compensatory programs during the 1990s shows that it is possible to provide basic inputs to the most disadvantaged schools, therefore reducing inequality in inputs. Because initial inequalities are so significant, this alone is an important accomplishment of policy. Important gains can be achieved in expanding access and primary school completion by supporting the basic functioning of schools in this way. Achieving changes in learning, and therefore contributing to reduce inequality in learning outcomes, is more complicated. In part this reflects the challenges of changing teacher capacity from very low initial levels. Helping teachers become effective is much harder than providing them or their students with textbooks and notebooks. The simple program theory underlying compensatory policies is more appropriate to achieve the latter than the former. Program theory aside, the implementation challenges to developing new teaching practices are greater than to providing financial incentives for teachers to show up to school or for parents to fix up schools.

Research on the impact of compensatory policies in Chile confirms the results of the few studies

available for Mexico. Most of the research follows a black box approach and fails to identify significant changes in learning outcomes, and there is limited information about program implementation. Only short-term effects are affected in a narrow set of cognitive domains, as measured by multiple option tests. Ernesto Schiefelbein and Paulina Schiefelbein question the predictive validity of these tests of the skills that matter to obtain high-paying jobs in the labor market. As in the case of Mexico the greatest challenge appears to be in documenting changes in teacher capabilities. Also as in Mexico, the existing studies document relatively short-term effects of these policies, spanning six to seven years.

A study of the impact of compensatory programs in Chile documented sustained improvement in levels of student achievement in mathematics and Spanish since 1990. The achievement gap between the highest-performing and lowest-performing schools has narrowed in fourth grade (but not in eighth grade), in line with the emphasis of the programs in the lower cycle of education. An external evaluation conducted by a Chilean center of educational research (CIDE) in 1991 confirmed the greater levels of learning for students in the program than in comparable schools (though the actual learning gains are small, only 3%). The evaluation also documented that for schools involved in the P900 program teachers became more active and provided more opportunities for student participation.

Chile's recent policies to improve equity in education, like Mexico's, suggest that it is possible to provide inputs to the most disadvantaged schools, hence reducing inequality. In spite of the emphasis of Chilean policy on positive discrimination, and its emphasis on assessing inequality in learning outcomes as a starting point for policy, there are conflicting accounts on whether the achievement gaps between the poor and the affluent had narrowed. The conflict stems in part from the kind of adjustment made to student achievement scores to make them comparable over time. It should be pointed out that these reforms were implemented in a context where total expenditures in education increased significantly, and other social policies and the results of significant economic growth resulted in reduction of the incidence of poverty, the existing studies do not discuss this context nor do they attempt to parcel out the contributions of compensatory policies from the effects of these other policy-induced changes. Judging from differences in raw student

achievement scores, the gains over time for all schools are greater than the reduction in the gap between the targeted schools and the non-targeted schools: Some potentially promising avenues to enhance student learning are left unexplored in this study.

The studies of this case, as the studies of the Mexican case, highlight the importance of basic school supplies and infrastructural conditions to enable school learning. Children do better when they have textbooks, when their schools are not in disrepair, when there are school libraries, and their teachers have instructional resources. These effects should not be surprising given that these policies are targeting schools and children in great need, where a simple pencil and notebook is a great addition to facilitate learning. What these studies do not answer is how far can the expansion of such basic provision of school inputs go? It is reasonable to expect that the effects of these strategies will level off after a point. None of the existing studies in Mexico, Chile, or elsewhere focus on the question of which skills are more relevant to facilitate intergenerational social mobility and the reduction of inequality.

Although there are other studies of the effects of compensatory and equity policies in Latin America, their results are consistent with those reviewed. Studies of the impact of these policies suggest that it is easier to distribute inputs than to educate teachers, and that changes in student achievement levels are modest. In Colombia the equity policies emphasized reorienting education expenditures towards rural areas and supporting *Escuela Nueva*, a program to strengthen the quality of rural schools. The reorientation of expenditures has effects in expanding access to different levels. *Escuela Nueva* has been assessed by various studies that document children's improved performance in rural multigrade schools where teachers are appropriately trained and where learning materials are available than those students in less-endowed rural schools. The basic story of these studies is similar: it is possible to improve the learning conditions of poor children through policies that enhance learning inputs. There are great challenges in implementation, particularly when the policies involve altering instructional practices. Although effects in terms of student achievement and completion rates can be documented, the social significance of those and the long-term correlates of those effects has not been assessed. Studies are biased toward short-term effects, probably because spon-

sors of research are more interested in recent policies than in assessing effects over fairly long periods.

On the whole more is known about policies that attempt to reduce disparities in inputs than about policies that aim true positive discrimination or enhancement of the social and cultural capital of poor students. Regarding whether education fosters social reproduction or mobility in a context of rapid expansion and deliberate affirmative policy, the studies of compensatory policies in Mexico and Chile pose more questions than they answer. What is the practical significance of student achievement in the tests used to measure curriculum coverage? How does performance on these tests relate to life chances? How well does performance on those tests predict performance in higher levels of education? What is the influence of the compensatory programs on other social and attitudinal outcomes? What is the impact of these programs in building social capital in the communities? What are the perspectives of the intended beneficiaries of these programs? What do they think they get out of them? What do they think about how these programs should be run? Existing evaluations document relatively the short-term impact of these programs, which does not describe how effects change as the inputs they support in schools consolidate.

The high levels of social exclusion characteristic of Latin America are indicative of politics and history that have produced and maintained such inequities. Compensatory policies are formulated and implemented in a context and through mechanisms that reflect the very inequalities of origin at the root of the problem they try to correct. In what they changed and in what they failed to alter they express the tensions between the role of schools as levers of social change and as mechanisms to reproduce social stratification.

## COMPULSORY SCHOOL ATTENDANCE

---

The term *compulsory attendance* refers to state legislative mandates for attendance in public schools (or authorized alternatives) by children within certain age ranges for specific periods of time within the year. Components of compulsory attendance laws include admission and exit ages, length of the school year, enrollment requirements, alternatives, waivers and exemptions, enforcement, and truancy provisions.

Compulsory age requirements vary by state. Data collected by the Education Commission of the States in March 2000 indicate that the earliest age for compulsory attendance is five, with a range to seven, and the upper age limit varies from sixteen to eighteen. Withdrawal from school prior to the age limit is permissible in some states, provided certain conditions are met. State policies setting the length of the school year differ as well. The 2000 Council of Chief State School Officers Policies and Practices Survey indicates that state requirements for the number of school days range from 175 to 186, with variations on exceptions, minimum hours, and start dates.

Enforcement of compulsory attendance laws is usually accomplished through local school attendance officers, superintendents, law enforcement officers, and municipal or juvenile domestic relations courts. Parents, or those persons with legal custody, are held responsible for school attendance in every state. Penalties for noncompliance can include fines and jail sentences, but these are not usually imposed until administrative measures prove unsuccessful. Consequences for students vary but include removal from regular classrooms and placement in alternative programs and denial of driving privileges. In some states, criminal penalties exist for contributing to truancy.

The authority for compulsory attendance laws has been defined through courts of law as a valid use of the police power of the state provided by the U.S. Constitution. The U.S. Supreme Court opinion in *Meyer v. Nebraska* (1923) describes the police power of states as "founded on the right of the State to protect its citizens, to provide for their welfare and progress and to insure the good of society" (Gee and Sperry, p. C-19).

## Development of Compulsory School Attendance Philosophy and Laws

The authority of a state to mandate that parents send children to school has not always been endorsed or recognized in the United States. Parental provision of instruction for children originated with the English poor laws of the sixteenth century, which required vocational training for destitute youth. Schools were organized in connection with poorhouses and workhouses for training the inhabitants' children.

In colonial America, the earliest educational laws required training in skills and trades through apprenticeships for orphans and needy children—a large population due to the immigration of youth as indentured servants. By the mid-eighteenth century, laws had been expanded to include training in reading and writing. Teaching children the fundamental skill of reading enabled religious instruction and reading of the Bible.

The first compulsory education law in America was enacted in 1642 by the Massachusetts Bay Colony. This law required parents to provide an understanding of the principles of religion to children under their care, as well as an education in reading, writing, and a trade. Other New England colonies adopted similar laws between 1642 and 1671, but the southern colonies did not enact laws for apprenticed children until 1705.

Early laws were driven by the need for individuals to understand religious principles and moral concepts and to meet the expectations of their station as citizens. They provided the foundation for governmental action to require education, even if it was seen as more of a private responsibility than a public one. The concept of freedom of children from work while attending school was not included, and would not be until the nineteenth century.

Interest and support for compulsory education declined during the seventeenth and eighteenth centuries due to several factors, including movement from towns into the frontier, the need for children to work at home, difficulty in enforcement, and less emphasis on religion. After the American Revolution, new reasons for interest in an educated citizenry appeared, based on democratic ideals, religious tolerance, and the integration of immigrants into the mainstream of American society.

In 1852 the state of Massachusetts passed a weak law to require attendance in schools. The Massachu-

setts School Attendance Act of 1852 specified that children between the ages of eight and fourteen had to attend school for twelve weeks per year, six of which had to be consecutive if the school remained open for that time. Although unclear and ill-defined, exemptions were included in the law, as were penalties for enforcement.

Early compulsory attendance laws provided for a minimum time that children had to attend school before they could be lawfully employed, usually three months, but enforcement was lax. The South lagged behind, and many of the laws of the southern states left enforcement and practice to localities. The early laws were vague, and parents who needed children at home to help earn a living resisted.

By 1900 court cases had affirmed state enforcement of compulsory attendance laws based on the benefit to the child and the welfare and safety of the state and community. In 1901 the authority to mandate school attendance was expressed in the Indiana Supreme Court opinion for *State v. Bailey*. The finding stated that “the welfare of the child and the best interests of society require that the state shall exert its sovereign authority to secure to the child the opportunity to acquire an education” (Hudgins and Vacca, p. 275). In the 1944 case of *Prince v. Massachusetts*, the U.S. Supreme Court declared: “Acting to guard the general interest in youth’s well being, the state as *parens patriae* may restrict the parent’s control by requiring school attendance, regulating or prohibiting the child’s labor, and in many other ways” (Gee and Sperry, p C-20).

Lawrence Kotin and William Aiken, in their book *Legal Foundations of Compulsory School Attendance* (1980), cite several conditions in the labor sector that reinforced the sentiment for compulsory attendance in schools. The need for a general education for children was reinforced by the need to protect children from abuse in the workplace (as expressed through child labor laws). In addition, the need for skilled and literate workers increased as the industrial age unfolded. Working children provided competition for employment in unskilled jobs that adults needed, providing another factor for wanting children to be in school. An alignment of labor leaders and advocates of self-sufficiency and improvement in the human condition created a demand for longer years in school and school attendance.

A National Bureau of Economic Research study found that school attendance rates in 1900 were sig-

nificantly raised in those states that combined compulsory school attendance with child labor laws. By the second decade of the twentieth century, a majority of states had specific child labor laws that set the minimum age for employment at fourteen and included specification of the completion of school grades and other educational requirements.

### Exemptions and Alternatives

The expansion of learning arrangements recognized by state law as alternatives to attendance in public schools has evolved through case law. According to Gee and Sperry, compulsory attendance laws must meet the demands of reasonableness. This term was defined in the U.S. Supreme Court case *Pierce v. Society of Sisters* (1925). In this case, the state of Oregon required that children within the age ranges of the compulsory attendance law attend public school only, or their parents would be guilty of a misdemeanor. The Court ruled in favor of the operators of a private school that challenged the state law, finding the statute unconstitutional on the basis of violating the fourteenth amendment rights of the parents and the property rights of schools. The court supported compulsory attendance but not the concept that compliance could only be achieved through public schools. Private schools were an alternative.

The right of parents to provide an alternative to public or private schooling to honor and preserve religious convictions was established through the case of *Wisconsin v. Yoder* (1972). Members of the Old Order Amish Religions objected to formal public schooling beyond the eighth grade because it presented and reinforced values that were in opposition to beliefs of the Amish community. The Amish had experienced conflict with state authorities over compulsory school attendance over the years, but, instead of litigation, would pay fines, be subjected to short-term jailings, or move.

Amish parents Jonas Yoder and Adin Yutzy appealed the decision of the Wisconsin Circuit Court that convicted them for violating Wisconsin's mandate for school attendance until the age of sixteen. The state of Wisconsin justified the conviction based on the need to preserve the political system, ensure economic survival, and provide for the socialization of children. A basic education, the state declared, included the ability to read and reason in order to evaluate issues and exercise citizens' rights such as voting. The Wisconsin Supreme Court, however, reversed the lower court ruling. The court found that

the Amish alternative to formal secondary school education could convey "the social and political responsibilities of citizenship without compelled attendance beyond the eighth grade at the price of jeopardizing their free exercise of religious belief" (Gee and Sperry, p. 23).

The United States Supreme Court upheld this decision in 1972, with Chief Justice Warren Burger ruling: "A State's interest in universal education is not totally free from a balancing process when it impinges on other fundamental rights and interests, such as those specifically protected by the Free Exercise clause of the First Amendment and the traditional interest of parents with respect to the religious upbringing of their children" (Keim, p. 98).

State compulsory attendance statutes have been amended to provide for students attending alternative education programs, as well as for various waivers and exemptions. For example, the Code of Virginia states that requirements for compulsory attendance may be satisfied by sending a child to an alternative program of study or work-study offered through a public, private, denominational, or parochial school, or by a public or private degree-granting institution of higher education. A local school board must excuse from school attendance any pupil who, with his or her parents, is conscientiously opposed to attendance due to religious training or belief. Also mandated is release from attendance by local school boards for verified medical reasons or for personal safety as determined by a juvenile and domestic-relations district court.

Virginia law recognizes home instruction by parents or instruction by tutors, provided that specified conditions are met, and provisions for some form of home schooling are provided in the majority of the fifty states. Other exemptions and delays for attendance are made for children with medical, physical, or emotional problems. Exceptions to compulsory attendance laws may be made if children within certain ages do not have public transportation provided within certain distances from their homes. Information provided by the Education Commission of the States in 2000 shows that, in several states, students sixteen years old may be eligible for withdrawal from the regular classroom if fully employed or enrolled in alternative education programs, with approval by parents and principals.

## Issues Associated with Compulsory Attendance

Despite the changes in state laws to increase flexibility, there are some critics who maintain that compulsory school attendance should be ended. The National Center for Policy Analysis provides some of the arguments to lower the compulsory school upper age limit, or to limit hours. Opponents claim that compulsory school attendance does not necessarily result in better education for students, but could subject them to social engineering. Others claim that compulsory attendance results in prolonged adolescence and suggest that forced attendance in high school could contribute to violence and discipline problems. Compulsory attendance laws have been said to limit innovation and be burdensome for parents who home-school their children. Yet the National Center for Policy Analysis cites statistics indicating that students who attend school a greater percentage of time than their counterparts with lesser attendance records score higher on state knowledge and skills tests.

Respondents to the thirty-third annual Phi Delta Kappa/Gallup Poll of the public's attitudes toward the public schools, conducted in January 2001, support reforming the existing public school system by almost two-to-one, rather than creating alternatives to the existing system. Seventy-five percent of the respondents prefer to improve the existing public school system rather than provide vouchers to pay for private or church-related schools.

Not only is an argument made for attendance at schools in order to prepare children for employment and economic success, but also for the development of values and the character traits needed for citizenship. The Center on Education Policy makes the case that public education is essential not only in teaching the principles of democracy and the role of government, but also in promoting civic values and the philosophy of tolerance for diversity and respect for differences in race and religion.

Whether the basis is economic self-sufficiency, educational reform, preparation for work or further study, character development, or promotion of the citizenry and the democratic way of life, the reasons for compulsory attendance of some kind reinforce the continued existence of state statutes. However, changing circumstances, flexibility for parents and students, and the needs of various student populations continue to shape these laws and contribute to their evolution.

## COMPUTER-SUPPORTED COLLABORATIVE LEARNING

The traditional expansion for the acronym CSCL is *computer-supported collaborative learning*. However, many who work in the field find aspects of this title problematic; therefore a convention has developed to use the acronym as a free-standing designation in its own right. The traditional title is controversial in several ways.

As Pierre Dillenbourg points out, the term *collaborative learning* has been used in two different senses. On the one hand, some have treated collaborative learning as a distinctive form of socially based learning that is fundamentally different from prevailing psychological formulations. For example, Kenneth Bruffee defines collaborative learning as "a reculturative process that helps students become members of knowledge communities whose common property is different from the common property of the knowledge communities they already belong to" (p. 3). An alternative way to think about collaborative learning, however, is not as a type of learning at all, but rather as a theory of instruction. Stated simply, the theory of collaborative learning, as noted by Jeremy Roschelle and Stephanie Teasley, asserts that learning is enhanced when learners are placed in situations involving "coordinated, synchronous activity that is the result of a continued at-

tempt to construct and maintain a shared conception of a problem" (p. 70). It has been incorporated into a variety of well-known instructional methods, including problem-based learning, some versions of cooperative learning, and project-based learning. Collaborative learning is not limited to settings of formal instruction, however. Learning in the context of joint activity occurs in workplaces, homes, and informal learning settings as well as in schools.

Other terms have been suggested as replacements for *collaborative*. Roy Pea, for example, observes that what takes place in settings of joint activity is often anything but collaborative, and he has proposed that the word *collective* be used instead. There are also other possibilities to be considered. In 1987 Yrgö Engeström drew upon a set of distinctions originally proposed by Bernd Fictner in 1984 between coordination, cooperation, and reflective communication in learning. The difference between coordination and cooperation has to do with the degree to which a learning task involves a prescribed division of labor among participants. This same distinction, however, is employed by Dillenbourg, and by Roschelle and Teasley, to differentiate between cooperation and collaboration. The critical point is that there has been no consensus with respect to the basic terminology for describing interaction in these settings, and it is probably premature to try to establish definitive labels for the field.

There are also misunderstandings that arise from the first half (computer-supported) of CSCL. Not all uses of technology applied to learning in groups are necessarily representative of CSCL research, and not all CSCL research necessarily involves computer-based instruction. Though there is a lively interest within the CSCL community in the ways that new and emerging computer and telecommunications technologies might foster and transform collaborative learning, this is not the sole, or even the central, object of inquiry. There is, indeed, a widely held recognition that the fundamental processes by which learning takes place in settings of joint activity are not well understood. As a result, a good number of CSCL researchers are engaged in basic research designed to illuminate how mutual understanding is accomplished in collaborative settings, whether augmented with technology or not.

## A Brief History of CSCL Research

Precursors to what was to become the field of CSCL can be found in three influential projects, all initiated in the early 1980s. The first was a multi-university project known as ENFL, begun at Gallaudet University to support instruction in composition. Workers in this area developed a set of computer-based applications that have subsequently come to be referred to as CSCWriting programs. A second and highly influential project was undertaken by Marlene Scardamalia, Carl Bereiter, and colleagues at the Ontario Institute for Studies in Education (OISE) at the University of Toronto. This project had its origins in reading research and focused from the outset on student epistemologies and the development of skills for knowledge sharing. It led to the development of programs (CSILE, Knowledge Forum) that have been widely used in instructional settings around the world. A third early influence was the 5th Dimension Project organized by Mike Cole and other researchers at the Laboratory of Comparative Human Cognition (LCHC) at the University of California in San Diego. The 5th Dimension is an international multi-site network of after-school teaching programs initially developed as clinical training sites for pre-service teachers. It was less technologically oriented than the other early projects, but the 5th Dimension Project made considerable contributions toward the development of a theoretical framework for studying learning from a sociocultural perspective.

In 1983 a workshop on the topic of “joint problem solving and microcomputers” was held at LCHC. The organizers of this workshop, Mike Cole, Naomi Miyake, and Denis Newman, were all to assume prominent roles in the CSCL community as it developed. Six years later, a NATO-sponsored workshop was held in Maratea, Italy. Though there was some cross-fertilization between the groups (Denis Newman, for instance, participated in both workshops), the Maratea workshop largely involved participants from European research centers, while the San Diego workshop was attended by researchers from the United States and Japan. The Maratea workshop is considered by many to mark the birth of the field since it was the first public and international gathering to use the term *computer-supported collaborative learning* in its title.

The first full-fledged CSCL conference was organized at Indiana University in the fall of 1995. Subsequent international meetings have taken place

biennially, with conferences at the University of Toronto in 1997, Stanford University in 1999, and the University of Colorado in 2002. A European conference was held at the University of Maastricht in the Netherlands in 2001. The fifth international conference in the biennial series will be held in Norway at the University of Bergen in 2003. A specialized literature documenting theory and research in CSCL has developed since the NATO-sponsored workshop in Maratea. Four of the most influential monographs are Kenneth Bruffee’s *Collaborative Learning* (1993), Charles Crook’s *Computers and the Collaborative Experience of Learning* (1994), Newman, Griffin, and Cole’s *The Construction Zone* (1989), and Carl Bereiter’s *Education and Mind in the Knowledge Age* (2002). Additionally, there have been a number of edited collections specifically focusing on CSCL research.

## A Paradigmatic Example of CSCL Research

A paradigmatic example of CSCL research can be found in an early study reported by Jeremy Roschelle in 1992. Roschelle’s data consisted of videotapes of two students, Dana and Carol, working together with a program designed to enable users to visualize and experiment with the trajectories of Newtonian particles. For each of these exchanges he described the “conversation action,” capturing not only the lexical components, but also timing, prosodic features, and affiliated gestures; the “conceptual change” evidenced in the exchange; and finally the displayed “shared knowledge.”

Rather than attending exclusively to *what* was learned using some sort of outcome measure, Roschelle’s study focused instead on *how* learners achieve new conceptual understandings in the presence of computational artifacts. When one examines the actual interaction of learners engaged in such activities it is often unclear what is being accomplished through their discourse or how participants move from their initial levels of understanding to appreciations more closely approximating those of a physicist. Roschelle discussed how convergent change is possible using “only figurative, ambiguous, and imprecise language and physical interactions” (p. 239). He argued that conceptual convergence is made possible by four elements: “(a) the construction of a deep-featured situation at an intermediate level of abstraction from the literal features of the world; (b) the interplay of metaphors in relation to each other and to the constructed situation; (c) an iterative

cycle of displaying, confirming, and repairing situated actions; and (d) the applications of progressively higher standards of evidence for convergence” (p. 237).

Roschelle’s study illustrates three distinctive features of CSCL research. First, as noted by Shelly Goldman and James Greeno, because CSCL research concerns itself with learning in settings of joint activity, learning is treated not as hidden or occult, but rather as a visible and accountable form of social practice. Second, and closely related to the first point, CSCL research is centrally concerned with the process by which meaning is constructed within such settings. Finally, there is an orientation in CSCL research to learning as a form of mediated activity—mediated not only by designed artifacts such as computer programs, but also by the more basic resources of human concentration, such as language and gesture. It is these features that distinguish work in CSCL from other research on the application of instructional technology to learning in groups.

TIMOTHY KOSCHMANN

## CONANT, J. B. (1893–1978)

Twenty-third president of Harvard University, James Bryant Conant witnessed many defining moments of twentieth-century American history. He was intimately involved with transformational events: World War I, as president of Harvard University, the initial formation of federal science policy, the development of the atomic bomb in World War II, the cold war and the postwar atomic energy policy (including opposition to the H-bomb), the reconstruction of Europe, and the reconsideration of public education in the United States. His autobiography is aptly titled *My Several Lives*, and he moved with remarkable ease through lives in academic, scientific, governmental, and diplomatic circles.

Conant was born in Dorchester (Suffolk County), Massachusetts, to James Scott Conant and Jennett Orr Bryant. His father had served the Union in the Civil War, owned an engraving and etching business, and speculated in real estate and residential construction. Conant could trace his lineage back to the ships immediately following the Mayflower on his mother's side and to the founding of Salem on his father's.

In his own words, Conant was raised by "a regiment of women," including his mother, several aunts and cousins, and his two elder sisters. Both parents were members of the Swedenborgian Church, an organization devoted to exploring the entwinement of religion, nature, and life. His mother's interest in the church waned, however, and Conant later referred to himself as a Unitarian.

### Education

Conant attended the Roxbury Latin School, a college preparatory school that required a rigorous entrance

examination for admission. At home, he nurtured his budding interest in science in general and chemistry in particular by practicing magic tricks and doing experiments in his small laboratory equipped by his father. At Roxbury, his career was solidified by his relationship with science teacher Newton Henry Black. Black guided Conant through the high school science curriculum, and then exposed him to more advanced texts and techniques, including college entrance exams. Conant's performance in high school earned him the Harvard Club Scholarship and graduation in 1910 near the top of his class of twenty-one students.

Conant graduated Phi Beta Kappa from Harvard in three years and managed to find enough time away from the classroom and laboratory to write for the Harvard *Crimson*, join Delta Upsilon, and develop a friendship with his rooming house neighbor, novelist J. P. Marquand. Conant's graduate school plans included study with physical chemist Theodore W. Richards, the first American-born winner of the Nobel Prize in chemistry. In his third year of undergraduate studies, he did some special research with organic chemist E. P. Kohler, a new arrival to Harvard from Johns Hopkins University. This project resulted in Conant's becoming Kohler's graduate assistant in advanced organic chemistry for two years. Ultimately, Conant wrote a double thesis in physical and organic chemistry for his Ph.D. degree in 1916.

### War Work

The outbreak of World War I in Europe prevented Conant from realizing his dream of postdoctoral study in Germany. However, in the summer of 1916 Roger Adams left the Harvard faculty, and Conant was selected to fill this vacancy in the chemistry department faculty. At the close of the 1916 through 1917 academic year, Conant joined the United States Bureau of Mines, which was soon absorbed by the Department of Defense as the Chemical Warfare Service. World War I would be remembered as the "chemist's war," primarily due to the use of poison gas warfare initiated by the German army against the French in 1915. Conant worked on gas warfare projects in laboratories at American University in Washington, D.C., the largest federally funded scientific research project to that date.

Newly commissioned Lieutenant Conant immediately went to work on mustard gas and then on a more toxic and easily deliverable gas, lewisite. In July

1918 the Army promoted Conant to the rank of major and placed him in charge of a lewisite production facility at an automobile factory in Cleveland. The gas was a weapon intended to be used offensively, but it was never employed. Significantly, the chemist's war connected chemistry to society through demonstration of its applied uses, and allowed Conant to associate with the leaders of government, the military, business, higher education, and administration who would shape the remainder of his career.

### Academic Career

In September 1919, following demobilization of the war effort, Conant returned to Harvard with an appointment as assistant professor of chemistry, and in 1921 married Grace T. (Patty) Richards, daughter of T. W. Richards, his department chair and mentor. Conant's early research focused on the areas of mechanisms of chemical reactions, equilibrium-rate studies, and free radical structure. His later research interests centered on respiratory pigments and the properties of hemoglobin and other natural products, especially chlorophyll. He was promoted to associate professor, granted tenure in 1924, and elevated to full professor in 1927. During this period, he and his wife had two sons.

In 1931, Conant was named the Shelden Emery Professor of Organic Chemistry and accepted the department chairmanship. Awards and honors accumulated as Conant was elected to the American Academy of Arts and Science and the National Academy of Science. His research won him the Nichols Medal of the American Chemical Society and the Chandler Medal of Columbia University, among others. Between 1919 and 1933 he wrote or coauthored five chemistry textbooks, including his first, *Practical Chemistry* (1920), written with his former Roxbury science teacher, Newton H. Black.

The Conants made three significant sabbatical trips, two to California and one to Germany. In 1924 they spent a semester at the University of California, Berkeley, and in 1927 a semester at the California Institute of Technology in Pasadena. There, contacts with western scientific leaders A. A. Noyes and Robert A. Millikan would not only prove valuable later during World War II, they resulted in a lucrative offer to move to Pasadena to join the faculty there. In 1925, Conant, Patty, and their son, Jimmy, spent nine months in Germany, where Conant was exposed to the fast-paced scientific competition

among individuals and institutions alike. Much of what he learned of science and scientific administration in Germany would be applied to his own administrative practices. He and his biographers characterized his persona as science itself, with all the characterization implied: the scientific method, increasing specialization, and reduction of a problem to its simplest elements.

In 1933 Harvard's president, Abbott Lowell Lawrence, announced his expected retirement amid much speculation on his successor's identity. Lowell was the administrative opposite of his predecessor, Charles W. Eliot. Lowell was a close supervisor of faculty, a harsh master of students, and a highly opinionated, socially conservative policymaker. It is said that a list of forty possible candidates existed at that time, and it did not include the name *Conant*. A difference of opinion among the Harvard corporate board led to a visit from a board member to Conant. His recommendation appears to have solidified the corporation; on May 8, 1933, Conant was selected as the twenty-third president of Harvard University and was formally installed on October 9, 1933.

### President of Harvard University

Conant was immediately forced to begin thinking not only about campus issues and politics, but also about contemporary world events: the Great Depression, the rise of Nazism in Germany, the eventual establishment of the Third Reich, and the foreboding threat of World War II. Conant's presidency would be broken into three distinct eras: 1933 to 1940 was a period of innovative policies at the institutional level and pleas for military and civilian preparedness at the national level; 1940 to 1946 was marked by long absences from Cambridge as Conant became closely involved with the organization and administration of scientific research funded by the federal government; and 1946 to 1953 as postwar equilibrium was achieved and the debates over atomic energy policy and the manufacture of thermonuclear devices heated up.

As president, Conant began to implement policies, some controversial, to improve faculty quality. Among these were the so-called up or out rule—an assistant professor who was not promoted at the end of the probationary term was terminated as a member of the faculty. In addition, university professorships were established to recognize and retain exceptional scholars. Conant put policies in place to

establish a more diversified student body; the Harvard National Scholarships were merit-based awards established with the intent of reducing financial and geographic barriers to a Harvard education. He was elected to the Carnegie Foundation for the Advancement of Teaching board of trustees in 1934 and was an early proponent of standardized testing, including nationwide administration of the Scholastic Aptitude Test as a reliable admissions tool.

As war in Europe seemed imminent, Conant supported the Roosevelt administration's quest for peacetime military conscription legislation, an action that was not warmly received by the undergraduates at Harvard. Following Germany's invasion of her European neighbors, Conant's attitude crystallized; he sought ways that scientists and scholars could mobilize to defeat Hitler.

Vannevar Bush, a contemporary of Conant, had been a professor of engineering at the Massachusetts Institute of Technology and, later, vice president of MIT. Bush moved to Washington, D.C. in 1939 to assume the presidency of the Carnegie Institution with its traditional role of science adviser to the government. Bush convinced President Franklin D. Roosevelt that the military needed to make rapid advances in technology and employ civilian scientists with the necessary expertise to do so. Thus, the new National Defense Research Committee (NDRC) was established almost eighteen months before United States entry into war, and Bush recruited Conant for the committee. The NDRC mobilized civilian scientists for war and let contracts, funded by the federal government, to academic and industrial laboratories.

As 1941 progressed, Conant became chair of the NDRC with direct responsibility for committee-supervised work on uranium fission, and, ultimately, the crash program to build the atomic bomb. He was present at Ground Zero, Alamogordo, New Mexico, for the Trinity atomic device test explosion.

Meanwhile Harvard went about its business without the physical presence of Conant, who took a voluntary twenty-five percent salary reduction from 1942 to 1946. One seminal bit of policymaking that did occur during the war years was the agreement reached with Radcliffe College to merge classroom instruction. As a result of a wartime shortage of faculty, 310 years of all-male Harvard education came to an end.

## Presidential Appointments

When Dwight D. Eisenhower, former president of Columbia University, was inaugurated as president of the United States in 1953, one of his first appointments was the choice of Conant to become the U.S. high commissioner to Germany. Conant took this opportunity to return to Germany to aid reconstruction as the ideal time to retire from Harvard following twenty years as president. Following the ratification of the treaty establishing the Federal Republic of Germany, Conant became the U.S. ambassador to Germany.

## Publications

Conant served in Germany for Eisenhower's first term, then retired from the diplomatic corps in 1957 to undertake a study of American secondary education for the Carnegie Corporation. Several influential books arose from his research, including the *American High School Today* (1959), an on-site examination of the critical problems facing the public "comprehensive" high school. Although the fieldwork began before the launch of the Soviet satellite *Sputnik*, the timing of the publication to coincide with national fears that the country was falling behind the Soviets in secondary education triggered sales of nearly 200,000 copies and Conant's third *Time* magazine cover story. The book outlines twenty-one recommendations, ranging from an increase in the number of guidance counselors to a call for a twelfth-grade capstone course in American democracy. The volume received much attention from parents, educators, and critics, but little substantive reform resulted.

The controversial look at urban schools, *Slums and Suburbs* (1961) presents a contrasting picture of high schools within "half an hour's drive" of one another in the cities of Philadelphia, New York, Detroit, Chicago, and St. Louis. Conant argued that "we are allowing social dynamite to accumulate in our large cities" (p. 2) as evidenced by racial discrimination, poverty, and violence. Contending that a school is a product of the socioeconomic status of the families it serves, he concluded that, "More money is needed in slum schools" (p. 146) rather than busing pupils to other schools. This opinion was not well received among civil rights leaders, thus dooming the rest of Conant's recommendations to obscurity.

Moving to higher levels of the education system, the final two volumes to emerge from this study

were *The Education of American Teachers* (1963), a critique of the curricula and teacher certification of schools of education, and *Shaping Educational Policy* (1964), an examination of state and federal education policy.

### Contribution

Conant's career and his life-long educational philosophy should be remembered as one of service—to education, to science, and to the interests of his country. He took a “hands on” approach to his supervisory duties in the laboratory, the president's office, and his national study of secondary education. Upon assuming the Harvard presidency, he undertook the daunting task of attending and presiding over every faculty meeting of every college in the university.

Conant's admiration for the German university system fueled his belief that Harvard could be transformed from a New England university with a national reputation to a world-level institution. He initiated graduate degrees in education, public policy, and history of science. His innovations included faculty appointments unattached to any specific department so as to strongly encourage interdisciplinary thinking and collaboration. At Harvard, as at other institutions, the budgetary effects of the depression were felt, and Conant found it necessary to keep the faculty ranks spare. He managed to do this without sacrificing quality by eliminating many of Harvard's inbred hiring policies and instituting the practice of opening position vacancies internationally.

Student enrollment reforms accompanied those of the faculty. Conant purposefully directed the admissions office to scrutinize legacies more closely, open the doors to more first-generation and ethnic immigrant applicants, and scour the country for the most brilliant students. The goal of a more diverse student body was pursued through these directives and the addition of standardized admission testing. Conant strongly believed that the American system of higher education allowed for sorting by ability, and, therefore, students need not reach beyond their grasp in the choice of a college.

In the introduction to the *American High School Today*, Conant wrote of his regret over the talent wasted in the European system of early preselection of students for the university. He clearly understood that the diversity of American institutions of higher

education and their ability to absorb all those who wish to go to college are foundational American ideals that promote equality of opportunity and equality of standing. The public benefits of all forms of education were foremost in Conant's pursuit of excellence in science technology education and federal policy. He wrote in his freshman diary at Harvard, “Education is what is left after all that has been learned is forgotten” (Hershberg, p. 20).

In 1963 Conant was awarded the Presidential Medal of Freedom by President John F. Kennedy. An arrhythmic heart condition that was discovered in 1965 caused Conant to curtail drastically his public life. He and his wife spent most subsequent winters in their Manhattan apartment and summers in the hills and mountains of New Hampshire until his death in Hanover, New Hampshire.

## CONSORTIA IN HIGHER EDUCATION

---

A *consortium* is an association of institutions for the purpose of improved and expanded economic collaboration to achieve mutually beneficial goals. In higher education, this organizational form was originally designed to foster interinstitutional cooperation among a group of colleges and universities for the purpose of enhancing services within a geographic region. More recently, as information and communication technologies have increased the availability of resources for research and development purposes, universities have joined with corporations and government agencies to form national and international consortia.

The parameters of academic cooperation may vary in scope by level of control (public-private), discipline (computer science, engineering, medicine), service provider (libraries, universities, science laboratories), or institutional level (research institute, government agency, corporation). Originating initially in the 1960s at a time of unprecedented expansion in higher education, consortia enabled institutions to share abundant resources. These consortia were voluntary, multi-institutional, multipurpose, and designed to serve their member institutions. By the mid-1970s, as institutions became more dependent on external sources of support, universities and colleges established consortia to sustain high-cost programs and facilities, strengthen constituent services, and penetrate new markets beyond their service area. In some instances, governing boards and funding agencies encouraged consortia development as evidence of economic collaboration among local and regional institutions to eliminate superfluous expenditures and achieve economies of scale and cost savings. Contemporary academic consortia may also be structured as school-university partnerships, business-university alliances, community-university coalitions, and multisystem networks. The current status of the academic consortium as an organizational form demonstrates its potential significance as a manifestation of the entrepreneurial university in a consumerist society.

### Types of Consortia

The initial consortium structure consisted of three or more colleges and universities signing an agreement to cooperate in providing joint ventures, such as tuition waivers for cross-registration, faculty ex-

changes and professional development, interuniversity library privileges, joint purchasing of goods and services, and outreach projects. The success of these activities was heightened by comparability in missions, goals, laws, regulations, resources, and sources of support. More sophisticated and complex structural arrangements are now conceptualized around specialized purposes such as supercomputing, scientific research and development, medical school-teaching hospital collaboration, and cooperative degree programs in low-enrollment, specialized fields. In these cases, consortium objectives may be to reduce duplication and redundancy, gain access to federal agency funding, recruit international students, engage in advanced research, and utilize high-cost facilities.

Since the 1990s increased institutional investments in information and communication technology, with support from business and industry, have added important dimensions to consortia design. This growth has been most evident in multisystems and research universities as well as across national and international boundaries. Factors contributing to their longevity include the leadership and commitment of senior executives; formal agreements on resource sharing; collaboration in agenda setting, issue definition, and problem solving; realistic timelines for project development; continuity in personnel; and complementary strategies for overcoming inequities and cultural differences among disparate partners.

**Multipurpose academic consortia.** The Association for Consortium Leadership (ACL) has identified 125 member consortia in the United States; these vary in size from 3 to 100 institutions engaged in a variety of collaborative projects. Two successful multipurpose academic consortia are Five Colleges, Inc. (Amherst, Smith, Mount Holyoke, and Hampshire Colleges and the University of Massachusetts-Amherst) and the Claremont Colleges, Inc., in California. Five Colleges is an independent, not-for-profit entity coordinated by an executive director and staff, drawing financial support from its member institutions and foundation grants, and operating collaborative faculty and student projects, including free transit throughout its service area. The Claremont Colleges in California, founded in 1925, brings together five independent but contiguous liberal arts colleges and two graduate institutions for collaborative business and academic services, most recently involving the development of

an online cross-registration module in the five undergraduate colleges and better utilization of information technology across all seven institutions. The Western Interstate Commission on Higher Education (WICHE) works with fifteen member states in devising cooperative programs and conducting policy research that addresses the needs of students in its service area. These include a student exchange program at the undergraduate, graduate, and professional levels, a cooperative for educational telecommunications, and the Consortium for North American Higher Education Collaboration (CONAHEC).

**Technology-planning consortia.** Other examples of consortia engaged in strategic technology planning across entire regions are the Colleges of Worcester (Massachusetts) Consortium, the New Hampshire College and University Council, and the Consortium of Universities in the Washington Metropolitan Area. The Internet2 Project, a consortium of more than 100 universities, has as its mission cooperative development, operation, and technology transfer of advanced, network-based applications and network services in its member universities as well as internationally. A technology initiative in the greater Chicago area brings together public and private colleges and universities in the North Suburban Higher Education Consortium with museums, school districts, and historical societies. A faculty initiative of twelve of the Pennsylvania State University's academic colleges and its library system, and two historically black institutions, Cheyney and Lincoln Universities, are also engaged in designing and developing standards for quality distance education. Its guiding principles address learning goals and content presentation, teaching-learning interactions, assessment and evaluation criteria, instructional media and software tools, and the development of learner support systems and services. A national initiative, the Community of Agile Partners in Education (CAPE), includes 125 colleges, universities, school districts, medical schools and hospitals, and community-based organizations throughout the United States and abroad, providing training in pedagogical applications of videoconferencing, Internet use, and other technologies, and the sponsorship of interinstitutional cooperative faculty teaching and research projects.

**Local business- and industry-linked consortia.** Multinational as well as local businesses and industries are another catalyst for consortia development,

often providing resources and expertise to influence university participation. One of the earliest examples is the Alliance for Higher Education, a Dallas, Texas-based consortium of thirty two-year and four-year colleges and research universities, corporations, hospitals, and other nonprofit organizations that link business and higher education through distance-education initiatives. Formed in 1965 as the Association for Graduate Education and Research (TAGER) by the cofounder of Texas Instruments, for the purpose of workforce training and economic development in the Dallas-Fort Worth region, it has enabled several thousand area engineers and other professionals to earn advanced degrees on-site through distance education. An education and information network facilitates interactive audio, video, and high-speed data transmission among member institutions and area employers, also fostering faculty consulting, workshops and seminars on corporate training needs and services, and, in 1994, a state-accredited multi-institutional teaching facility, the Universities Center of Dallas.

**Research and academic library consortia.** Research and academic libraries constitute another significant growth area in consortia development as library directors seek mechanisms for meeting user demand in gaining access to electronic databases and other sources of information. These consortia now engage in joint purchasing and referral services, online borrowing, high-speed delivery, the digitization of library holdings, and staff development. Evidence of this growth may be seen in the advent of the International Coalition of Library Consortia (ICOLC) in 1997, an informal, self-organized group comprising nearly 150 library consortia worldwide. ICOLC informs consortia about electronic resources and pricing practices of electronic providers and vendors, also providing guidelines for web-based resources and other services. Examples of library consortia include such statewide links as GALILEO in Georgia, PALCI in Pennsylvania, VIVA in Virginia, MIRACL in Missouri, and CLICNet in Minnesota. Multistate networks include SOLINET in the southeastern United States, CIC Virtual Electronic Network in the Midwest, CIRLA in the mid-Atlantic states, and the New England Land-Grant University Libraries. The transformation of library science academic degree programs into information sciences is accelerating with the introduction of high-speed retrieval of online documents, electronic books and journals, specialized databases in all academic fields, digitized

manuscripts and photographs, interactive video transmission, and other such advances. As informational boundaries become more porous, libraries find it practical and trouble free to pool information, resources, and materials. Such issues as insurance, space, personnel, network compatibility, and cost sharing play important roles in determining the success of library and related consortia.

**Scientific research and development consortia.** Consortia for the purpose of scientific research and development bring together universities, research centers, government agencies, and multinational corporations engaged in supercomputing, geoscience, medical research, and other sophisticated research projects. Numerous examples may be found on the U.S. Department of Defense, Department of Energy, National Science Foundation, and National Aeronautic and Space Administration websites. A recent Department of Defense initiative is the Maui High Performance Computing Center, developed and managed by a consortium led by the University of New Mexico under a cooperative agreement with the U.S. Air Force's Phillips Laboratory. Its mission is "to create a world-class, national, high performance computing center, to foster technology exchange among the governmental, academic, and industrial communities . . ." Its partner organizations include Carnegie Mellon University's Imaging Group, the Cornell Theory Center, the Maui Economic Development Board, and the IBM Corporation. A Coalition of Academic Supercomputing Centers provides another level of cooperation and resource sharing among university-based and autonomous centers for research and development in high-performance communications, enabling businesses and universities to be more cost effective in the allocation of resources and the development of new computer applications.

### Conclusions

The consortium can be likened to an interorganizational network in which environmental conditions affect its activities. Numerous examples of informal partnerships and coalitions can be given, but in practice the formalized agreements of consortia offer structural opportunities of another dimension. A basic problem is the inconsistency between cooperation evolving from the inability to compete that runs counter to the free market model it seeks to protect. A study by Judith S. Glazer of consortia development in 1978 to 1980 showed that unrealistic expectations

could make it difficult to sustain cooperative agreements despite presidential support and large infusions of foundation resources. Issues arising in efforts to establish a doctoral-level consortium in New York City included a lack of clarity in goal setting, perceived differences in the quality and commitment of participating programs, faculty resistance to cooperate in planning their own retrenchment, inadequate incentives for developing substantive agreements, and, above all, the fact that informal collegial networks of presidents, deans, or faculty are not easily transformed into a cohesive working group. The experiences of consortia directors and others engaged in the collaborative process indicate that policymakers and planners need to address the following: (1) the conflict between institutional autonomy and interdependence at a time when state regulatory agencies advocate greater accountability in the deployment of resources; (2) the need for incremental long-range planning rather than grandiose or large-scale schemes; (3) the central role of the full-time executive director and staff in administering consortia projects; (4) the need to distinguish between consortia, partnerships, networks, and other interinstitutional alliances; and (5) the importance of cooperating in areas of strength rather than weakness and in addressing the fundamental differences between government-sponsored and independent institutions. Among all else, the ideal consortium will be based on an understanding that organizational change in response to market shifts necessitates flexibility, long-range planning, and adequate resources among equal partners.

## CONSTITUTIONAL REQUIREMENTS GOVERNING AMERICAN EDUCATION

The right to a free public education is found in the various state constitutions and not in the federal constitution. Every state has a provision in its constitution, commonly called the "education article," that guarantees some form of free public education, usually through the twelfth grade. The federal constitution, on the other hand, contains no such guarantee. In *San Antonio Independent School District v. Rodriguez*, the U.S. Supreme Court in 1973 held that education is not a "fundamental right" under the U.S. Constitution. Thus, as a matter of constitutional law, the founding fathers left it to the states to decide whether to provide an education or not and, if deciding to provide one, determine at what level of quality.

Not only does the federal constitution confer no right to education, it does not even explicitly em-

power the U.S. Congress to legislate on the subject. Most federal education legislation is therefore enacted under the "spending clause" of the Constitution, which gives Congress the authority to tax and spend for the general welfare. Since federal grants to the states may be conditioned upon the state's adoption of certain legal and regulatory structures, the federal government has been able to exercise substantial authority over K-12 education policy. For example, in *South Dakota v. Dole*, the Supreme Court in 1987 upheld a federal law withholding a percentage of federal highway funds from any state that declined to raise its minimum drinking age to twenty-one. This kind of carrot-and-stick approach underlies much federal education law, from the setting of nationwide achievement standards to the education of students with disabilities to Title I and other federal grants relating to education. That other great source of federal regulatory authority, the Constitution's "commerce clause," however, has not been used to justify federal legislation in these areas. In *United States v. Lopez*, the Supreme Court in 1995 held that a law making it a crime to possess a firearm within a certain distance of a school was an impermissible overextension of Congress's commerce power. Even the justices dissenting in *Lopez* agreed that the content of education was a classic area of state, not federal, authority.

Nevertheless, once a state decides to provide an education to its children, as every state has, the provision of such education must be consistent with other federally guaranteed constitutional rights, such as the Fourteenth Amendment's right to equal protection under the law and the First Amendment's right to the free exercise of, and the nonestablishment of, religion. Therefore, even though the U.S. Constitution does not, in the first instance, require that an education be provided, it nevertheless has had a significant effect on American education.

Any treatment of education and constitutional rights must begin with the Fourteenth Amendment, which guarantees every citizen equal protection under the law. Application of this doctrine has been most profound in the area of school desegregation. In 1954 the U.S. Supreme Court struck down state-sponsored racial segregation of schools in the famous case of *Brown v. Board of Education of Topeka, Kansas*. This decision and hundreds of later court decisions applying it to individual school districts all over the United States have had major ramifications on virtually every facet of school district operations

from the mid-1950s into the twenty-first century. This has been true not only in the South, but throughout the rest of the country, as school districts and courts struggled with how to effectively desegregate the nation's schools. In the decades since *Brown*, most school districts have eliminated "vestiges" of state-sponsored segregation, have been declared to be a "unitary" school district (as opposed to a former dual-race system), and have been released from federal court supervision.

Nevertheless, many unitary school districts, now concerned that their schools will become resegregated, are seeking to take steps to preserve racial diversity at their schools. In one of the supreme ironies of American jurisprudence, such efforts may now be illegal under the same Fourteenth Amendment that previously required school districts to employ race-conscious student assignments as a remedial measure but forbids such measures as a means of preserving integrated schools in school districts no longer under court supervision.

Another major constitutional issue facing American education involves public funding of vouchers for private schools. Although several states have enacted limited voucher programs, their legality and continued existence remains in doubt under the First Amendment of the Constitution, which requires the separation of church and state. In June 2002 the Supreme Court ruled that students in the Cleveland, Ohio, area may use state-funded vouchers to pay tuition at private schools, including schools with a religious affiliation. The decision in this case is likely to have a significant impact for decades to come.

As desegregation lawsuits in federal courts wind down, the most important constitutional litigation involving education is increasingly taking place in state courts, as plaintiffs' groups seek to enforce state constitutional guarantees. Beginning in the early 1970s plaintiffs' groups began to make constitutional challenges to the heavy use of local property tax revenues in most states to finance public schools. This system of funding public schools often resulted in large disparities in per-pupil expenditures between property-rich and property-poor districts. As a result of a series of these "equity" suits, which were based on state constitutional guarantees of equal protection and uniformity, most states in the years since the early 1980s have reformed their state education funding formulas to provide a greater degree of equity (although not complete equality) in fund-

ing between school districts. This has been accomplished in many states by providing more state-level funding to property-poor districts to offset their lower local revenues, and less state funding to property-rich districts.

During the same period, plaintiffs' groups also began to challenge the adequacy of state education systems, including the sufficiency of funding of public schools, under the "education articles" of state constitutions. These cases are quite different from "equity" cases, which are based on disparities in funding; "adequacy" cases challenge the sufficiency of the funding to provide the level of educational opportunities required by the particular state constitution, regardless of how such funding is allocated among a state's school districts. It is these state court "adequacy" cases that are likely to be the main source of constitutional litigation in the early twenty-first century.

### Federal Constitutional Requirements

Below are discussed the evolution of school desegregation since the landmark 1954 *Brown* decision and the racial diversity in U.S. schools in the post-desegregation era. This section also reviews the status of school vouchers and their constitutionality under the First Amendment.

**School desegregation.** There is no question that since the early 1960s school desegregation suits under the Fourteenth Amendment have had a greater impact on American schools than almost any other factor. In its 1954 *Brown v. Board of Education* decision, the Supreme Court declared state-mandated racial segregation of schools illegal. A year later, in *Brown II*, the Court ordered that segregated schools be eliminated with "all deliberate speed." The Court, however, gave little practical guidance as to how school districts and the lower courts were to carry out this major transformation in the social fabric of many regions of the country. As a result, the process of desegregating formerly dual-race school systems lasted for decades and in the early twenty-first century had still not been completed in some school districts.

After *Brown*, little happened until the mid-1960s as many southern states waged a program of massive resistance to school desegregation. In *Stanley v. Darlington School District*, the federal court in South Carolina described the different forms of such resistance. In the mid- to late 1960s, token desegre-

gation occurred, but that was due more to the passage of the Civil Rights Act of 1964, which forced school districts to desegregate as a precondition to receiving federal funds, than it was to court enforcement of constitutional guarantees. In 1968 the situation dramatically changed with the Supreme Court decision of *Green v. School Board of New Kent County*. In *Green*, the Court required that school districts promptly take steps to effectively desegregate the operations of their schools in the areas of student assignments, faculty and staff assignments, facilities, extracurricular activities, and transportation. Ineffective plans that resulted in only token desegregation were no longer permitted. *Green* was followed by the Court's 1971 *Swann v. Charlotte-Mecklenburg Board of Education* decision, which approved the use of mandatory busing as a desegregation tool. Thus began the real process of desegregating the schools. Mandatory busing, however, was extremely controversial, especially among white parents, and the effect of such desegregation plans was often undermined by what became known as "white flight" (i.e., white parents moving out of the district or placing their children in private schools). Therefore, in the 1980s, the courts began to rely more and more on voluntary desegregation plans that centered on magnet schools and other measures designed to encourage, but not require, students to transfer to racially mixed schools. One of the first such plans was approved by the federal court in 1989 in *Stell v. Savannah-Chatham County Board of Education*, which involved the school district in Savannah, Georgia.

By the 1990s most school districts had accomplished as much faculty and student desegregation as was practical, given "white flight" and the persistence of de facto segregation in housing patterns. Consequently, the courts began to release more and more school districts from court supervision on the grounds that they had eliminated the vestiges of the former segregated school systems "to the extent practicable." Nevertheless, although not discussed in *Green*, some courts also began to examine whether the "achievement gap" between minority and white students in many school districts was also a "vestige" of the former segregated system. Consequently, in deciding whether to dismiss desegregation cases, courts in the 1990s did not focus as much on student or faculty assignments (the main issues from 1954 through the 1980s), but rather on whether poor academic performance of minority pupils is a "vestige"

of the former segregated system that must be eliminated before court supervision is terminated. In 1995 in *Jenkins v. Missouri*, the Supreme Court held that such low performance had to be causally linked to the prior dual school system. Because this is difficult to establish, plaintiffs have had only limited success in convincing courts that low minority performance is sufficiently related to the prior dual school system to serve as a basis for continued court supervision.

Therefore, as the nation entered the new millennium, the constitutional obligation to desegregate, which greatly influenced operations and planning in many school districts for more than forty years, had been satisfied in most districts and was becoming less and less of a factor in those relatively few districts that remained under active federal court supervision.

**Diversity.** The closing of the desegregation era does not mean, however, that issues of race have disappeared in public education. Many school districts, which successfully desegregated the student populations of their schools and have therefore been declared unitary and released from court supervision, continue the struggle to maintain racial integration or, as it is now more often called, "diversity," in their schools. Nevertheless, the Fourteenth Amendment, which once required race-based student assignments and admissions as a remedial measure, may now prohibit school districts from continuing to use race-conscious plans once such school districts have completed remedial proceedings and been declared unitary. Once the effects of past discrimination have been remedied, as in the case of a school district declared unitary, it is argued that there is no longer a remedial justification for taking student race into account in making student assignments or deciding upon admissions to special programs, such as magnet schools. For example, if student race is considered in admitting students to a magnet school, a student denied admission because her race did not contribute to racial diversity may claim that she was denied admission based on race and that such a decision is discriminatory and a denial of equal protection. School districts often respond that maintaining racial diversity is a compelling governmental interest, and that some use of race in the decision-making process regarding assignment of students should therefore be permitted. The lower courts are split on the issue, although the majority view tends to prohibit race-based admissions and assignment policies

unless they serve a remedial purpose. Until the Supreme Court decides the issue, the lower courts are likely to carefully scrutinize and in most regions of the country prohibit any consideration of student race in the student assignment and admissions process.

**School vouchers.** Many school reform advocates believe that public schools suffer from a lack of competition and that states or school districts should provide vouchers to students, especially poor and minority students attending substandard inner-city schools, to enable them to attend a private school. At least three states (Florida, Wisconsin, and Ohio) have passed legislation funding such vouchers. Until spring 2002 one huge unknown factor in the debate over using public funds to support private, parochial schools was whether such use of public funds violates the First Amendment of the Constitution, which prohibits government from unduly supporting religion or favoring one religion over another. In June 2002 the Supreme Court held in the case *Zelman v. Simmons-Harris* that the use of public funds to pay for religious school tuition is constitutional. Under this program, the State of Ohio provides vouchers to some 4,000 students from low-income families. The vouchers can be used to pay tuition at participating private schools, including religiously affiliated schools. Although the Supreme Court's ruling resolved the constitutionality of school vouchers, the policy debates about the vouchers are likely to continue in the years to come.

### State Constitutional Issues

As school desegregation issues, which have dominated public education for decades, are finally resolved, lawsuits based on state constitutional requirements have moved to the forefront. These lawsuits have become known as either "equity" or "adequacy" cases.

**Equity cases.** These cases began with the unsuccessful efforts of plaintiffs in *San Antonio Independent School District v. Rodriguez*, a case brought in the early 1970s in federal court to challenge the method of funding public education in Texas. At the time, Texas, like most states, financed its schools primarily through local property taxes. Because property values differed greatly between districts, this method of funding resulted in significant spending disparities between school districts, with the wealthier districts in Texas spending more than two to three times as much as the poorest districts on a per-pupil basis. In rejecting plaintiffs' equal protection claim under the Fourteenth Amendment, the Supreme Court held

that education was not a fundamental right under the Constitution. It therefore held that disparities in the provision of education services and facilities did not have to be justified by a showing that they served a compelling governmental interest, but could be justified merely by showing that a rational basis existed for such a taxing mechanism. Because the local property tax system had a rational basis, in the view of the Court, it was not unconstitutional.

Notwithstanding this initial defeat in the federal courts, proponents of equity among school districts in education funding continued their fight in the state courts, and they won victories in the mid-1970s in California (*Serrano v. Priest*) and New Jersey (*Robinson v. Cahill*). In these decisions, the courts struck down property tax-based systems based on state constitutional provisions requiring equal protection and uniformity, and they ordered the use of more equitable funding systems in which the resources provided for a child's education did not depend nearly as much on the property wealth in the community in which a child lived and attended school. Since then, "equity cases," as they are often called, have been brought in almost every state, and plaintiffs have been successful in many of them. While local property taxes remain a major source of school revenues, states have modified their education financing formulas to provide more state aid to property-poor districts to offset lower local property tax revenues in such districts and to provide less state aid to property-rich districts. While complete equality in funding has rarely, if ever, been realized, and is not required under most state court decisions, large disparities in funding between school districts have been greatly reduced in many states.

**Adequacy cases.** Equity cases, while successful in reducing funding disparities between school districts in many states, have fallen short of being the panacea that many school finance reformers believed they would be, for several reasons. First, attaining equity does not necessarily mean increases in education spending. Indeed, while the result of *Serrano v. Priest* was to insure equity in spending among California's school districts, it has at the same time moved California from one of the highest spending states on education to one of the lowest. Moreover, the equity cases did not, in the minds of many plaintiffs' groups, address the claims of many urban school systems. Such school districts and their supporters contend that they need additional funding to address the educational needs of the large numbers of

their students who are at risk of academic failure because of the effects of poverty and other socioeconomic problems. Simply obtaining funding equal to other school districts is not sufficient, it is argued, given the extraordinary needs of such districts.

Since the 1970s plaintiffs have brought “adequacy” suits in more than twenty states, alleging that the state has failed to provide an “adequate” education, a right guaranteed by many state constitutions. Generally, such suits allege that educational “inputs,” such as facilities, curriculum, textbooks and other instructional materials and equipment, and number and quality of teachers, are insufficient to enable schools and school districts to provide an “adequate” education for their students. Plaintiffs also rely on substandard “outcomes,” as evidenced by low scores on standardized tests, low graduation rates, and high dropout rates as proof that the state has failed to provide an adequate education for substantial numbers of its children.

Such suits are normally based on the “education article” contained in most state constitutions that requires the state legislature to provide for some type of a “system” of free public schools. Generally, the education articles are couched in fairly vague terms, such as requiring “a thorough and efficient system of education” or a “system of free common schools.” Although the constitutional language rarely gets any more specific than the foregoing examples, the highest courts of many states have interpreted such language to require an “adequate” or “sound, basic” education.

In several states, adequacy suits have been dismissed on the grounds that they involve political questions reserved by the state constitution to the legislature, and therefore that they violate the separation of powers doctrine. In essence, because the terms used both by the courts (e.g., “adequate”) and the constitution (e.g., “thorough,” “efficient”) are ambiguous and capable of many meanings, these courts have held that if the courts decided such cases, they would in effect be substituting themselves for the legislature in determining important policy questions normally reserved by the state constitution to the legislative branch (e.g., what level of education to provide and how much of the state’s resources to devote to education).

Notwithstanding pretrial dismissals in several states, plaintiffs have enjoyed success in increasing numbers of states, including most notably New Jer-

sey, Ohio, Kentucky, and Wyoming. The highest courts of these states have struck down the state system for financing public schools and required the legislatures to appropriate significantly increased spending for public education. Other important cases, such as those in Arkansas, New York, and North Carolina, have been decided at the trial court level in plaintiffs’ favor, but they have not yet been reviewed by the state’s highest court. In still other states, such as Florida, cases have been filed but not yet decided.

In states where plaintiffs have been successful, often after many years or decades of litigation, such lawsuits have led to higher spending for education, including expenditures for school facilities, teacher’s salaries, special programs, and technology. Whether these lawsuits have resulted or will result in improved student achievement, however, is another oft-debated question that is beyond the scope of this entry.

### Conclusion

Both federal and state constitutional requirements have heavily influenced the organization, funding, and operation of America’s schools in the past and are likely to continue to do so in the future.

## CONTINUING PROFESSIONAL EDUCATION

---

UNITED STATES

INTERNATIONAL CORPORATIONS

Brian Holland

### UNITED STATES

Continuing professional education (CPE) may be thought of as the planned and systematic attempt to introduce, review, or alter the competencies and thereby the professional performance of professionals. Cyril Houle refers to CPE in observing that “whether it designates the improvement of professional competence or any other goal, (it) implies some form of learning that advances from a previously established level of accomplishment to extend and amplify knowledge, sensitiveness or skill” (p. 77). The term *continuing professional education* contains three separate concepts, each worthy of definition as a means to understand the overall concept.

*Education* is a systematic process that seeks to alter knowledge and skill by engaging learners interactively with teachers or other knowledge resources, using a considered strategy to achieve an effect in the altered knowledge, skill, or attitudes of the learner.

*Professional* refers to people who engage in work based on a large, complex body of knowledge usually gained in professional schools. Professions include

law, medicine, architecture, engineering, education, and other disciplines that codify practice. Professionals are thoughtfully engaged in the development and ongoing review of a body of applied knowledge, control over practices and the practice environment, membership criteria, ethics, and the economics of the delivery of services to clients. Although autonomy is an issue for all professions, it exists on a continuum from those with little self-control to those with expansive self-regulatory authority and autonomy.

In this three-part term, *continuing* refers to the post-preparatory phase of professional development. In this phase the professional is engaged in practice on a regular basis and is learning in ways that adjust practice to correct errors, expand or adjust performance, and introduce new or reformed practices and perspectives on practices. This process is continuous in that learning new or better ways of fulfilling professional roles is an everyday occurrence. Self-directed learning is used by professionals to manage their practice performance, therefore it is also considered to be part of the system of ongoing development that is the object of continuing professional education.

When all who participate in the CPE enterprise are considered, the costs are high. It is estimated that CPE costs approximately \$60 billion per year and that when indirect costs are included the annual total may exceed \$210 billion. The degree to which society is likely to invest in CPE is based on the extent to which people depend upon the performance of professionals to solve problems and improve the quality of life. As professional services expand, costs for ongoing development and education will likely follow.

### Constituents of Continuing Professional Education

Although it would seem self-evident that continuing professional education systems direct their energies to professionals, CPE also serves the needs of a variety of groups and organizations that are concerned with the performance of professionals. For example, some professionals practice in partnership organizations, like clinics or firms. Others practice in large and small businesses where an employer may see CPE as means to alter services and therefore improve the prospects for profit. The quality of CPE may also be a high priority for organizations that do not employ professionals but depend on them and their

performance to achieve their organizations' purposes. These organizations are concerned with quality control and coordination of resources. They sponsor or offer CPE in an attempt to influence the performance of the professional in a specific manner. Often these purposes are contrary to the interests of a given profession or reflect an influence that does not necessarily reflect the priorities of the profession in terms of the problems or solutions that are endorsed by the community of practitioners as a whole. This cataract of forces on professional performance creates conflicts that have led to a variety of regulatory and quality control systems to insure that CPE programs sanctioned by a profession are appropriate for the purposes and needs of the practice community.

### **Sources of Continuing Professional Education**

Continuing professional education programs are offered by a variety of organizations, each with a particular set of purposes, some shared and some discreet. Universities, as the homes of most professional training programs, are a major provider of CPE. Often these programs are within the control of the faculty. They may be broadly based updates of an area of practice, or the programs may be designed to introduce new knowledge and skill emanating from research or scholarship in the discipline base of the profession.

Professional associations are also engaged in the planning and delivery of CPE, most often at annual meetings offered over several days at one location or at special sessions, topical in nature, offered nationally or at regional sites. These programs focus on issues the profession has identified as important to the well-being of the profession and the success of its practitioners, or useful in securing desirable outcomes for the profession's client systems.

Practice organizations are the firms, groups, hospitals, or other collections of practitioners who offer professional services in a specific field. Examples of practice organizations include a law office, an architecture or engineering firm, a managed health care organization, or a hospital. The CPE programs offered by these organizations often reflect the problems they encounter in the delivery of services to clients.

There are also private companies that offer CPE as a primary product in an effort to make a profit. These companies are engaged in the production of

CPE programs directed toward the perceived needs of the marketplace. Often they work in concert with an industry that supports a particular profession or its client systems. These companies contract with other CPE organizations or directly offer CPE to address the educational needs and interests of the profession when these interests are congruent with the business interests of the industry and the corporation.

Government agencies are also important sponsors and providers of CPE, offering a variety of continuing professional development programs. These programs may be embedded in other initiatives, such as attempts to improve access to services for indigent populations by educating social workers or teachers in the screening and recruitment of clients. They may be offered for the direct purpose of introducing new techniques and methods, such as the efforts of the National Institutes of Health to improve health care worker practices in the area of HIV infections. Or they may be developed in support of new regulations that have changed the nature of professional practices in a particular area, such as new requirements for documentation or delivery of services to a new clientele.

### **Forms of Continuing Professional Education**

Continuing professional education takes a variety of forms, some more common than others and some that are used often in one profession but almost never in another. One of the most common forms of CPE is in-service or on-the-job training. This may be very formal or almost undetectable to the observer but it is always directed toward introducing, updating, or modifying the way the profession is practiced in the work setting. It is characterized by an emphasis on practice and coaching. It may be loosely organized and episodic, arising as practice problems arise and disappearing as the need disappears. It is an important part of the learning community in any profession.

A more common form of CPE is a formal organized program built around definite objectives such as conferences, institutes, workshops, and lectures. Collectively, these methods represent only a small portion of the learning that occurs continuously for professionals. They are usually short-term in duration and may be focused on a general refresher of professional competencies, an overview of a new issue or collection of practices, or an effort to introduce new technique, skill, or practice protocols.

Short courses are similar to these methods of educating professionals but occur over several meetings with time for preparation or practice between sessions.

Distance education has made a serious impact in most professions, but its success has varied according to the way the profession is practiced. In technical and scientific professions, computer assisted and web-based CPE has grown more rapidly than in fields like teaching and social work, where the practice setting is not as friendly to the insertion of computers and technological solutions. Nevertheless, the notion that education can be delivered at the time and in the setting where the work occurs promises a wider application of distance education in most professions.

The most effective strategies at changing professional performance are those that involve multiple methods of CPE and account for the needs of learners. Emphasis on motivation and needs in successful CPE reflects the role of experience in learning and the belief that the acquisition of new knowledge, skills, and professional practices is facilitated and enhanced when learning efforts are based on existing knowledge and skills and existing practices. This emphasis on knowledge of real and perceived needs as a basis for the design of education is widely accepted as essential for success in CPE.

An emphasis on complex strategies for facilitating learning in the professions is based on the complexities of adopting or modifying practices. Professionals develop means of performing their work based on extensive training and the ongoing evaluation of these practices in their work with clients. They grow confident in these practices and are reluctant to change them without evidence that different practices are better. Professionals desire a sense that new ideas are compatible with overall practice patterns and client needs, and sometimes they want to observe new practices before they incorporate them into their own work. They depend on consistency of information from many different sources, including colleagues, literature from their disciplines, and CPE programs. They often need to solicit feedback on their proficiency before they actually incorporate new knowledge or skill in the performance of their professional duties. A professional may require multiple learning opportunities and multiple methods of education to satisfy these expectations for information, practice, and feedback.

By far the most frequent means employed by professionals to enhance their professional growth is self-directed learning. Self-directed learning refers to the projects that professionals engage in to learn without the formal direction or organization of materials, methods, and educational strategies of a formal program of CPE. In this method of learning, the learner identifies his or her needs, sets objectives, develops strategies, and evaluates success. It is self-education and it is at the heart of the concept of the "learned" professional.

### **Foundations of Continuing Professional Education Practice**

The practice of providing CPE programs and services depends on research and scholarship in several areas of adult education. It includes a focus on the theories and principles of planned change, adult learning and development, program and curricular design, applied research, consultation, and of course, the methods and materials of education. Masters and doctoral level programs of study are available to those who want to develop a concentrated knowledge of adult education and curriculum development. However, the majority of practitioners of CPE develop their areas of competency while "on the job" and have little formal preparation in adult education. Nevertheless, the literature and scholarship of CPE in each of the professions is connected to the literature and scholarship of adult education.

### **Accreditation of Continuing Professional Education Programs**

In some fields there is a high level of interest in quality control over the professional educational process. This is manifest in complex systems that have developed for awarding credit to learners and extensive efforts to ensure the quality of CPE through systems of accreditation. In the United States, Canada, and Australia, the American Medical Association, the American Academy of Family Physicians, and the Royal Colleges of Physicians and Surgeons of Canada and Australia are among the many organizations that allow physicians and surgeons to receive documentation of learning from programs intensively reviewed for compliance with minimum standards for assuring quality. These organizations also record and certify participation by physicians in these programs.

Systems for quality assurance apply standards that focus on such attributes as qualifications of fac-

ulty, relevance to practice needs, adequacy of educational strategy, and documentation of outcomes. They may certify programs individually, or they may certify the organizations that offer the programs. Many professional practitioners depend on receiving career education credits as evidence of their continuing competence to their professional associations, licensing bodies, or client systems.

### Issues and Trends

One of the most important recent trends in CPE has been the growing emphasis on developing a body of knowledge about how professionals learn and how they change their performance. Books and research articles in medicine have focused heavily on this topic as this and other professions struggle with how to make education a more effective tool for influencing the practice of the professions. Related to the need for more research and more effective procedures is the problem of how knowledge is handled across professions. Each profession has developed and implemented a system of CPE without tapping the experience or expertise of other professions. Some have annual research conferences and research journals that report the studies in their field. Most devote attention to the issues of CPE at annual meetings or conferences. It is rare that one profession will cite, or in other ways refer to, the knowledge and experience related to CPE that is gained in another profession. This gap in communication and collaboration on the issues of CPE has resulted in redundancy where coordination of the development of general knowledge and principles of CPE may have been beneficial. This may change as professionals are asked to work in teams more often to solve interdisciplinary societal problems.

Another issue important for the ongoing development of CPE is the growing pressure from society to document and certify professional competence. Two primary approaches have been taken to solve this problem: test on a regular basis or document participation in CPE. Different professions, different political jurisdictions, and even different specialties within professions have adopted one or both of these approaches to assure competence. Both approaches depend upon the continued growth of a competent system of CPE. This encourages research and development of the field as well and accountability from the providers of CPE to clients and client systems.

Continuing professional education is a requirement for professional competence as professionals

encounter new problems and professional schools develop new knowledge and new ways of performing professional roles to meet the problems of practice. The practices of disseminating information, correcting errors in professional performance, and renewing the fund of knowledge and skills of professionals are essential if professionals are to maintain a high level of proficiency over thirty or forty years of practice beyond their formal, pre-professional education programs. For CPE to succeed it must continue to focus on providing learning opportunities that meet professional needs and practice problems while promoting the adoption of new knowledge and skills.

### INTERNATIONAL CORPORATIONS

The United States, western Europe, and Japan all face a common set of economic restructuring and

demographic changes. Each is in transition away from a manufacturing and industrial-sector base, and moving toward a postindustrial, information-based economy. Each is also encountering labor-market population changes as the overall population is aging and birth rates remain relatively low. The effects of these changes have been felt in labor shortages in some sectors. Yet for all the similarities among America, Europe, and Japan, there are striking differences in the coordination of labor markets for private companies to train employees. To explain why these differences exist, it is helpful to look at the history and structure of workforce training efforts in Europe (particularly Britain and Germany) and Japan designed to bring about public-private cooperation for skills development and human capital investment.

### Workforce Training in Britain

Britain has been marked by a more voluntary connection between the public and private sector in workforce development policy. Initially, training policy until 1963 was characterized by a limited state intervention in labor markets—except for occasional efforts during the interwar years and the first decade after World War II to provide training as a means of remedying unemployment. The establishment of industrial training boards (ITBs) in 1963 was the first government recognition that economic growth was slipping in Britain, as compared to other European countries. The ITBs, while developing a compulsory levy/grant system to finance training efforts, did little to raise awareness of the linkage between economic growth and investments in human capital.

The ITBs were weakened by the 1973 Employment and Training Act, which set up the Manpower Services Commission (MSC). Unlike the ITBs, the MSC's main focus (until the rise of Thatcherism in 1981) was on job creation programs, although the legislative intent was to develop a comprehensive manpower strategy. The New Training Initiative (NTI), which was introduced in a 1981 white paper, returned MSC to its adult-training mission and moved to integrate youth into the workforce. The NTI again promoted a volunteer connection between employer training needs and the public sector, but shifted focus to stress portable skills for identified labor shortages and as a bridge for school-to-work connections. But the MSC failed to change the paradigm of employer involvement in training, and

the National Audit Office was critical of the MSC's fiscal accountability and its failure to address the high-level course needs of employers.

Borrowing from the American model of private industry councils, the MSC was replaced by Training and Enterprise Councils (TECs) in 1988. While still being a more voluntarist model of cooperation between the public and private sectors, TECs are designed to be locally based and include private employer representation to set policy direction, although they are publicly funded through the Department of Employment. The charge of TECs, announced in the 1990 white paper *Employment for the 1990s*, was not to deliver training, but rather to transfer responsibility for skills-development investment to employers, who would identify needs and administer public funds. In so doing, Britain embarked on the creation of a true training market, compatible with a limited government role in industrial policy.

### Germany

By contrast, the mark of the German training system is the role of strong financial incentives that promote and enhance the coordination of the public and private sectors, primarily through the apprenticeship training initiatives for younger workers. As early as 1908, industrial employers in Germany recognized the need for a systematic training process to meet their shortage of skilled workers. In response to these problems, a committee called DATSCH (*Deutschen Ausschuss für Technisches Schulwesen*) was formed. In 1909 DATSCH recommended that all apprentices in the areas of industry and commerce be trained at an equivalent level. Following World War I, DATSCH worked with companies such as AEG and Siemens to design an apprenticeship program for these employers, and by 1925 a working committee set out to define industrial trades and distinguish between skill requirements in the labor force.

During the 1930s, before the rise to power of the Nazis, the apprenticeship content developed by DATSCH was recognized more globally by industry and chambers of commerce, and the principles of apprenticeship were refined by industry associations. Accordingly, training was geared toward, and reflected the needs of, employers. Following the war, there was concern that industrial apprenticeships would become fragmented and disorganized, and by 1953 the ABB (*Arbeitsstelle für Betriebliche Berufsausbildung*) had been organized to carry out similar

functions as DATSCH. In the 1960s apprenticeship training met with criticism, as it was viewed as not meeting the needs of employers, and as being neglectful of an organized, tailored curriculum for industry.

The discontent behind the apprenticeship system eventually led to an expansion of the government's role in training. Passage of the 1969 Vocational Training Act shifted the orientation of the apprenticeship system from macroeconomic concerns, such as reducing unemployment, to a set of standards for testing procedures that would ensure that apprenticeships met employer needs. In fact, the law set up the contemporary vertical system of secondary school education with the design of the *Hauptschule* (general secondary school) and *Realschule* (intermediate secondary school) system. Following the passage of the law, any person age eighteen or younger who completes *Hauptschule*, *Realschule*, or level one of *Gymnasium* and does not pursue an *Abitur* (a university education track) is required to attend the apprenticeship system, which combines part-time vocational education with work experience. Accordingly, the German approach is far more interventionist and has been able to achieve higher labor participation rates. These higher labor-force participation rates allow employers to have a stronger labor force with diminished turnover.

### Japan

As a hybrid of both the British and German models, the Japanese tradition of hierarchical mentoring is a pattern that seems to have been replicated in industrial and skills training, although with less formal government support. In Japan, two unique features are present in the implementation of workforce preparation. First, there is an extensive level of on-the-job training that is required to be conducted between senior workers and new, less-experienced workers. Indeed, it has been documented that the ability to teach one's coworkers is a key criterion for promotion within a Japanese firm. These new workers are recruited from schools, where employers have established relationships for identifying and selecting high-performing students. New hires receive orientation sessions in safety and corporate culture (*fudo*) and informal on-the-job-training led by a senior worker.

The second critical element of Japan's investment in human capital is that employers engage their workers in a rotation system over their lifetime

in employment. By engaging in the rotation system, the employee gains firm-specific skills that are commensurate with a career-ladder approach. Accordingly, the employee is trained in both technical skills and employment relations, and the employer is able to provide some measure of lifetime job security. But while job training is conducted formally in classroom settings to complement existing knowledge, the homogeneity of Japanese labor markets within firms encourages private employers to tailor programs that are more firm-specific than industry-specific in focus.

### United States

On the federal government level, a sweeping set of workforce development reforms were implemented with the passage of the Workforce Investment Act (WIA) in 1998. WIA marked a radical departure from past federal workforce/employment policy for adult workers—a patchwork quilt of categorical, tailored responses—to the consolidation of some seventy separate programs under WIA into three funding streams.

In a significant development, policymakers made a conscious decision not to provide WIA with an open-ended authorization as was the case under the Job Training Partnership Act (JTPA). In repealing the JTPA, WIA sought to expand the role of the private sector with a more active voice to ensure that the workforce development system incorporates their input to prepare people for current and future jobs. In addition, WIA recognized that meeting individual needs in the workforce development system was paramount and resulted in a move toward greater decentralized delivery of training services.

Workforce Investment Boards (WIBs) under WIA replace the former Private Industry Councils (PICs) that existed under JTPA and implement the public-funded workforce development strategy of their geography. In so doing, the federal formula dollars are disbursed to WIBs to provide a comprehensive set of services at some 1,500 One Stops across the United States. These services include: a preliminary assessment of skills and support-service needs; information on a full array of employment-related services, including listings of training providers, job search and placement assistance, career counseling, access to up-to-date labor market information (which identifies job vacancies), and skills necessary for in-demand jobs; and information

about local, regional, and national employment trends.

By the same token, the American workforce development system is decentralized for employers. Yet there can be connections between employers and potential employees at the One Stop Centers. In fact, One Stops enable employers with a single point of contact to list job openings and to provide information about their particular company's hiring needs and requisite skills for occupational openings. This emphasis on using market forces to enable customers to get the skills and credentials required in their local economies makes accountability among training providers a paramount concern.

In sum, the differences among Britain, Germany, Japan, and the United States fall along a continuum between individual autonomy and compulsory codetermination for employers in the provision of workforce training. The design of a genuine training market that reflects both employer demands and the existing labor supply (or the potential labor supply) is evolving. However, to encourage employers' investment in their employees will require a set of financial incentives and strategic planning to ensure the connection between school, work, and lifelong learning, rather than a policy approach that solely addresses unemployment and job creation.

## COOPERATIVE AND COLLABORATIVE LEARNING

Cooperative and collaborative learning are instructional contexts in which peers work together on a learning task, with the goal of all participants benefiting from the interaction. Cooperation and collaboration can be treated as synonymous, as a truly cooperative context is always collaborative. Varied perspectives on collaboration and their implications for classroom instruction will be described here, and a number of cooperative techniques involving dyads or larger groups will be outlined, including the costs and benefits associated with them in terms of cognitive or affective outcomes. Finally, the relationship between group and individual performance will be addressed.

#### Theoretical Perspectives on Collaboration

In 1996, Robert Slavin described a variety of perspectives on peer learning, including social-psychological, sociocultural, cognitive-developmental, and cognitive-elaboration approaches. Explanations of how and what peers can learn from one another differ. Angela O'Donnell and James O'Kelly note that classroom decisions a teacher makes in relation to cooperative or collaborative learning depend on the theoretical approach adopted. Social-psychological approaches suggest that the interdependence among group members is the underlying mechanism for effective cooperation. Interdependence is created by using group rewards or by encouraging social cohesion and a norm of caring and helpfulness. From a cognitive-developmental perspective, effective peer learning occurs as a result of processes of cognitive conflict and resolution, or through the modeling of skilled behavior.

A sociocultural perspective would suggest that the joint knowledge of the group members is greater

than the individual knowledge of any member and that the group operates as an interacting system. In contrast, a cognitive-elaboration approach suggests that collaboration enhances student learning by providing a context in which individual learning is promoted by the use of more effective learning processes. In other words, an individual learns better with a peer because the peer provides an audience, prompts more metacognition, or maintains an individual's focus on a task. In creating and using collaborative groups for instructional purposes, teachers' decisions about the size and composition of groups, the kinds of tasks on which students will work, whether or not they should use explicit rewards, and the particular stance to take in relation to the collaborative groups will be influenced by the theoretical perspective that the teachers adopt.

### Collaborative Learning in Dyads and Groups

Dyads have many advantages as a functional unit for collaborative learning. The likelihood of participation by all students is increased when there are only two individuals involved. The larger the group, the more opportunity there is for diffusion of responsibility among group members or for exclusion of some members. Active participation in the collaborative process is essential for learning to occur.

Among the cooperative techniques that can be used by dyads are *scripted cooperation*, devised by Angela O'Donnell and Donald Dansereau; *reciprocal peer tutoring*, devised by John Fantuzzo and colleagues; and *guided peer questioning*, as outlined by Alison King. In scripted cooperation, partners work together to learn text material. The text is broken down into sections and both partners read the first section. One partner summarizes the material for his or her partner, who in turn provides a critique of the summary. Both partners elaborate on the information, and they then alternate roles for the second section of the text, continuing in this way until they have completed the reading. They then review the material together. The activities in which students engage (oral summarization, elaboration, metacognition, elaboration, review) are known to promote effective learning. The technique works well for acquiring information, and students are typically positive about their learning experiences with their partners.

In reciprocal peer tutoring (RPT), students work together to teach one another, and they alternate between the roles of student and teacher. This

technique combines elements of both motivational and cognitive approaches to collaboration. Motivation is encouraged by the use of group rewards, such as choices of desired activities or acting as the teacher's helper or messenger, which are intended to create interdependence among group members. Rewards are based on team achievement. The technique also promotes cognitive processing by using a structured approach to teaching and learning within a tutoring context. RPT has been used successfully to promote achievement and is also associated with positive social outcomes including an increase in students' self-confidence and better scores on measures of behavior.

In contrast to scripted cooperation and reciprocal peer tutoring, King's guided peer questioning technique is explicitly intended to promote knowledge construction through higher-order thinking. This technique can be used in dyads and with larger groups. It involves a process of question asking and answering, which is guided by the provision of question starters, such as: "Why is . . . important?" Students pick a few of the question starters, generate questions that fit the form of the starter, and then ask questions of their peers and answer their peers' questions. The question starters serve as a scaffold for students' thinking. Different kinds of questions can be used that support comprehension or complex knowledge construction. The provision of starters supports students in constructing high-level questions to which their peers must provide explanations rather than simple responses of a terminal nature. In addition, the students must engage in self-monitoring. Because these questions require complex answers, peers must probe their own understanding of material in order to answer. Positive effects on achievement are associated with the use of guided peer questioning.

One of the advantages associated with the techniques described above is the increased participation in cognitive activities by more students in a classroom than would be possible in whole-group instruction. In whole-group instruction, for example, teachers typically ask questions (often low-level questions such as those that simply require the recall of factual information but do not probe understanding) and a small number of students have the opportunity to construct a response. With the focused activity of guided peer questioning, all students have the opportunity not only to respond to questions, but to generate them as well. The techniques previ-

ously described promote active processing of material using activities that are strongly linked to achievement. In all of these techniques, the interactions of students are very structured, and this structure is important to the success of the techniques.

A potential disadvantage to dyadic interaction may emerge on complex tasks, as there may be insufficient resources within a dyad to generate appropriate strategies to complete the task. As group size increases, the likelihood of having someone in the group who can satisfactorily complete a challenging task increases. Larger groups present their own difficulties, however. Although group members can help one another through explanations, reminders, and questions, they can also distract one another from the task at hand. In addition, some students may elect not to participate, while others may be precluded from doing so.

One solution to the problem of differential participation of students is to structure the group interaction to ensure equitable participation. This can be accomplished by assigning specific roles, alternating roles and activities, or requiring that consensus among group members be reached. These strategies can be effective. In a 1999 study, for example, Noreen Webb and Sydney Farivar trained students to both seek and give appropriate help. The collaborative technique used by groups is a more open-ended one than those previously described. By focusing the group norms on helping, Webb and Farivar were successful in ensuring participation by students. Elizabeth Cohen suggests that structuring the interaction of group members may also stifle the spontaneous interaction that may be necessary to effective problem solving in groups. Instead of tightly structuring tasks, Cohen believes that an interest in complex tasks will result in genuine collaboration. Students, however, need to be prepared to work with one another so that patterns of inclusion and exclusion associated with having high or low status in a group are minimized. Cohen and her colleagues have been very successful in promoting achievement among students in collaborative groups using tasks that are interesting, challenging, and that involve higher-order thinking.

Decisions about what size of group to use, whether members of that group should be heterogeneous or homogeneous with respect to ability, and what kind of support students will need to achieve the desired outcomes must be carefully considered. Such decisions will be influenced by the theoretical

perspective one adopts with respect to collaborative learning.

### Group and Individual Performance

The relationship between group and individual performance in cooperative or collaborative learning is not well understood. Slavin's work on cooperative learning emphasizes the role of individual accountability. His techniques depend on group rewards that are earned by each student in a team when performance is improved. In Slavin's work, therefore, there is continuity between individual and group performance. However, the question of the relationship between group and individual performance is often unexamined. The issue of what factors transfer from a group to subsequent individual performance is not well understood. Part of the difficulty in addressing this issue comes from the variability of approaches to peer learning, as the importance or relevance of this issue varies across approaches. Nevertheless, because of the prevalent use of cooperative and collaborative techniques in schools, the increases in high-stakes testing, and the concerns of parents in relation to their children's involvement in collaborative experiences, the relationship of individual and group performance warrants consideration.

Teachers who wish to use cooperative and collaborative learning to promote students' achievement need to be thoughtful in considering the implications of their decisions about group size, rewards, group composition, and their own role in the classroom. The variety of theoretical perspectives available to inform such decisions can be confusing. Fundamentally, cooperative learning that promotes student achievement depends on the quality of student interaction. Such interaction needs to be task oriented, helpful, characterized by deep processing of content that involves organization or restructuring of knowledge, and elaboration of that knowledge. Making decisions about group size, for example, becomes simpler if the teacher focuses on the expected quality of interaction among students. Large groups limit participation while smaller groups provide more opportunities for interaction. Other decisions such as the composition of the group will also be informed by a focus on the quality of interaction. If the group is of mixed ability, other interventions may be needed to maintain the quality of participation (such as the use of question stems or other ways of structuring the interaction to maxi-

mize quality) or to guarantee the inclusion of all participants.

ANGELA M. O'DONNELL

## CORPORATE COLLEGES

Dramatic changes have occurred in the scale of corporate investment in employee education since the end of World War II. Business and industry leaders have recognized that an educated workforce is essential to remaining competitive in a global economy.

It is estimated that organizations in the United States with 100 or more employees spend approximately \$60 billion annually for employee education. This estimate does not include the costs of informal on-the-job education, nor does it include indirect costs, such as the wages and benefits paid to employees while they are participating in educational programs.

Some corporations, such as Arthur D. Little and General Motors, have created and sustained their own in-house educational institutions that offer accredited academic degrees just like traditional universities. These are known as *corporate colleges*. Most of these institutions were created to offer accredited degree programs that were not available elsewhere. Indeed some were established because their parent corporations were unsuccessful in their efforts to forge partnerships with established universities and colleges to create programs that met their corporate needs.

How do corporate colleges compare with traditional universities? Corporate colleges offer degrees ranging from the associate to the doctoral levels with most offering graduate degrees. The curricula offered by corporate colleges varies widely, although each corporate college offers a limited range of programs. Examples of the curricula include insurance, architecture, financial services, business management, health sciences, textile technology, policy analysis, and various types of engineering. These institutions are fully accredited by state authorities and regional accrediting bodies. Their governance models, administrative structures, and academic and administrative titles are very similar to those of traditional postsecondary institutions. Tuition fees charged by corporate colleges are similar to those of traditional institutions, but in some cases, such as the New England College of Finance (NECF), the banks that are member institutions of the NECF may offer tuition reimbursement to their employees.

At the same time there are significant differences between corporate colleges and traditional universities. Corporate colleges make far greater use of part-time faculty, mostly practicing professionals, than is common at traditional postsecondary institutions. Even full-time faculty members do not have tenure; limited-term appointments are the norm. Corporate colleges offer a limited number of highly specialized programs and lack the diversity of programs of traditional universities and colleges. This is

not surprising since they have typically been established to respond to a particular need.

### The Evolution of Corporate Colleges

One of the earliest corporate colleges in the United States was the General Motors Institute (GMI), which was founded in Flint, Michigan, in 1919. In 1945 the Institute's Board of Regents approved a proposal for GMI to award degrees in engineering. Accreditation was received in 1962. GMI changed its name to Kettering University in 1998.

In the 1970s and 1980s there was a significant expansion in the number of corporate colleges. Their rapid growth prompted the prediction that hundreds of corporate colleges might be created in the years to come.

In 2000 a total of twenty-six institutions had been identified as corporate colleges. Their existence was found to be tenuous. A number of these institutions, such as the Wang Institute of Graduate Studies, closed after only a few years in operation: it was created in 1979 and ceased operation in 1987. Others, such as the Arthur D. Little School of Management and Kettering University, evolved into free-standing private institutions that were independent of their original corporate sponsor. Only five of the twenty-six met the definition of a corporate college and continued to exist in 2001 (Clarkson College, the Institute of Paper Science and Technology, the Institute of Textile Technology, the New England College of Finance, and the RAND Graduate School of Policy Studies). No corporate colleges were created in the 1990s. The impetus for corporations to create corporate colleges appears to have passed.

### The Decline of Corporate Colleges

The most likely causes of the lack of growth in the number of corporate colleges are corporate outsourcing of training, the demands of accreditation, and an increased willingness by traditional universities to cooperate in corporate education.

**Outsourcing.** One of the primary corporate strategies for successfully competing in the global economy involves focusing on the core business of the corporation and the core competencies supporting it. Accordingly, many corporations have chosen to rely heavily on outsourcing to meet their educational needs. It is estimated that approximately one-third of corporate training budgets is spent on training products and services supplied by outside providers.

These corporations prefer collaborative arrangements with universities and colleges to creating and sustaining their own corporate colleges.

**Accreditation.** This process involves at least two, and in some cases three, separate stages of evaluation and approval. The first stage requires state legislative approval to receive authority to grant degrees. The second stage requires acceptance by one of six regional accrediting associations in the United States. In order to be recognized as an accredited degree-granting institution approval must be obtained at both of these levels. Some specialized programs also have national accrediting bodies that constitute a third stage of evaluation. For example, business schools are accredited by the Association to Advance Collegiate Schools of Business (AACSB), and engineering schools are accredited by the Accreditation Board for Engineering and Technology (ABET). Each stage of the accreditation process requires an extensive application that must be thoroughly documented. Moreover, accreditation is not a one-time matter. Accredited institutions are periodically reviewed and reassessed. Applying for, receiving, and maintaining accreditation is costly and time-consuming. The expectations of accrediting bodies are quite demanding with extensive requirements regarding organization and governance, programs and instruction, faculty, student services, library and information resources, physical resources, and financial resources. Establishing a corporate college is a substantial, long-term commitment. Corporations must be prepared to relinquish a high degree of independence and autonomy of operation if they want their programs to be accredited. For many corporations these expectations are sufficient to dissuade them from such a course of action.

**Cooperation.** One of the primary reasons that led corporations to create corporate colleges was the unwillingness of universities and colleges to accommodate corporate training needs. A number of the corporations that sponsored the creation of corporate colleges did so after unsuccessfully attempting to cooperate with existing universities and colleges. Much has changed since the early 1980s as a growing number of corporations have established strategic partnerships with universities and colleges and jointly develop degree and certificate programs tailored to meet corporate needs.

In summary, the combined effects of these three factors have contributed to a greatly reduced inclination on the part of corporations to establish their

own corporate colleges. If universities and colleges continue to be willing partners in meeting corporate education needs there are likely to be few, if any, new corporate colleges created. A related, and relatively recent development, is the emergence of *corporate universities*.

### Corporate Universities

One of the major developments in corporate education that emerged in the 1980s and 1990s was the creation of corporate universities. Indeed, the concept of corporate universities may well have its roots in corporate colleges.

Corporate universities are distinguished from corporate colleges in that the latter are accredited degree-granting entities whereas the former are not themselves degree-granting but frequently partner with traditional degree-granting universities and colleges. Corporate universities are essentially re-fashioned corporate training departments that have adopted some of the superficial characteristics of traditional universities, such as terminology. For example, a “dean” usually administers a corporate university. Corporate universities are similar to traditional universities in that their mandate includes training and the dissemination of knowledge, but unlike traditional universities they are not dedicated to the creation of new knowledge.

Most corporate universities serve the training needs of employees of the parent company but some also provide training to employees of corporate suppliers and corporate clients. They are a rapidly expanding creation. It is estimated that in the United States, there were about 400 corporate universities in 1988 and ten years later their number was estimated to be more than 1,000.

A majority of these corporate universities have created partnerships with accredited universities and colleges that lead to degrees and certificates. Such partnerships are founded on a willingness by the educational institutions to design curricula appropriate to the training needs of the corporations and to continually update those curricula as needed. Typically, the corporate partner will pay some, if not all, of the costs associated with the development and delivery of the training program. While the corporate partner will expect to have some input to the curricula, the instruction is given and the degrees and certificates are awarded by the academic institution. This allows corporations to access training programs

relevant to corporate needs while coincidentally allowing their employees to earn university credentials. It also allows corporations interested in offering such training to their employees to avoid the complications associated with accreditation of “in-house” corporate colleges because the university partner is responsible for ensuring that the program is an accredited offering.

### Conclusion

Corporate colleges and corporate universities represent major investments by corporations to achieve corporate objectives through education. Corporate colleges evolved on a limited scale but were a highly visible development that peaked at the end of the twentieth century. Corporate universities are the emerging major development in corporate education at the start of the twenty-first century.

Finally, it is important to note the increasing presence of for-profit educational institutions in postsecondary education. These institutions may come to play an increased role as providers of corporate education.

## COST EFFECTIVENESS IN EDUCATION

---

Cost-effectiveness analysis is an evaluation tool that is designed to assist in choosing among alternative courses of action or policies when resources are limited. Most educational decisions face constraints in the availability of budgetary and other resources. Therefore, limiting evaluation to the educational consequences of alternatives, alone, without considering their costs provides an inadequate basis for decision-making. Some alternatives may be more costly than others for the same results, meaning that society must sacrifice more resources to obtain a given end. It is desirable to choose those alternatives that are least costly for reaching a particular objective or that have the largest impact per unit of cost. This is intuitively obvious because the most cost-effective solution will free up resources for other uses or allow a greater impact for any given investment in comparison to a less cost-effective solution.

Applying this to educational interventions, there are a host of options from which schools, school districts, and higher education institutions can choose to improve educational outcomes. Many have shown at least some evidence of effectiveness, although the standards of evidence vary considerably. Thus, at the very least, consistent standards of evidence are needed to compare the competing alternatives. But estimates of the costs of the alternatives are needed as well. Even if one alternative is 10 percent more effective than another, it will not be preferred if it is twice as costly. Thus, both costs and effectiveness must be known in order to make good public policy choices.

Before reviewing briefly the methodology of cost-effectiveness analysis, it is important to differentiate it from a closely related evaluation tool, cost-benefit analysis. The approach to measuring costs is similar for both techniques, but in contrast to cost-effectiveness analysis where the results are measured in educational terms, cost-benefit analysis uses monetary measures of outcomes. This approach has the advantage of being able to compare the costs and benefits in monetary values for each alternative to see if the benefits exceed the costs. It also enables a comparison among projects with very different goals as long as both costs and benefits can be placed in monetary terms. In education, cost-benefit analysis has been used in cases where the educational outcomes are market-oriented such as in vocational ed-

ucation or in consideration of the higher income produced by more or better education. It has also been used in cases where a variety of benefits can be converted into monetary values such as in the noted study of the Perry Preschool Program discussed in W. Steven Barnett's 1996 book. In most educational interventions, however, the results are measured in educational terms rather than in terms of their monetary values.

### Methodology

The method of doing cost-effectiveness can be summarized briefly, but it is best to refer to more extensive treatments of the subject if a study is being contemplated (for example, *Cost-Effectiveness Analysis*, by Henry M. Levin and Patrick J. McEwan). Cost-effectiveness begins with a clear goal and a set of alternatives for reaching that goal. Comparisons can be made only for alternatives that have similar goals such as improvement of achievement in a particular subject or reduction in absenteeism or in dropouts. A straightforward cost-effectiveness analysis cannot compare options with different goals and objectives, any more than a standard type of evaluation could compare results in mathematics with results in creative writing. Alternatives being assessed should be options for addressing a specific goal where attainment of the goal can be measured by a common criterion such as an achievement test. It should be noted that a more complex, but related, form of analysis, cost-utility, can be used to assess multiple objectives.

In almost all respects, measuring the effectiveness of alternatives for purposes of cost-effectiveness analysis is no different than for a traditional evaluation. Experimental or quasi-experimental designs can be used to ascertain effectiveness, and such studies should be of a quality adequate to justify reasonably valid conclusions. If a study of effectiveness does not meet reasonable standards in terms of its validity, there is nothing in the cost-effectiveness method that will rescue the result. What cost-effectiveness analysis adds is the ability to consider the results of different alternatives relative to the costs of achieving those results. It does not change the criteria for what is a good effectiveness study.

The concept of costs that is used in cost-effectiveness studies is one that is drawn from economics, namely, opportunity cost. When a resource is used for one purpose, individuals or society lose the opportunity to use that resource in some alterna-

tive use. In general, the concept of opportunity cost is viewed as the value of a resource in its best alternative use. This may differ from the everyday understanding of what a cost is. For example, many school districts will refer to an unused facility as having no cost to the district if it is used for a new program. That facility, however, has value in alternative use in the sense that it could be sold or leased in the market or used for other purposes that have value. In this sense it is not "free." If the school district uses it for a new program, it sacrifices the potential income that the facility could yield in the marketplace or the value to other programs that could use the facility.

There is a standard methodology for measuring the cost of an intervention in cost-effectiveness analysis. The ingredients required to replicate the interventions are specified for all alternatives. Most interventions require personnel, facilities, materials, equipment, and other inputs such as client time. Using these categories as organizing rubrics, the ingredients are listed in terms of both quality and quantity such as, for the personnel category, the number of full-time teachers and their qualifications as well as other staff. Information on ingredients is collected through interviews, reports, and direct observations.

When all of the ingredients are accounted for, their cost values are determined. There are a variety of ways to estimate these costs. In the case where ingredients are purchased in competitive marketplaces, the costs are readily obtainable. Of course, the total costs of personnel include both salaries and the employee benefits. Other approaches are often used to estimate the value of facilities and equipment. In general, the technique for measuring costs is to ascertain their annual value. Because facilities and equipment have a life that is greater than one year, the annual value is derived through determining annual depreciation and interest costs. There are standard methods for ascertaining the annualized value of costs for ingredients.

These costs are summed up to obtain total annual costs, and they are usually divided by the numbers of students to get an average cost per student that can be associated with the effectiveness of each intervention. The ratio of cost per unit of effectiveness can then be compared across projects by combining the effectiveness results with costs. Alternatives with the largest effectiveness relative to cost are usually given highest priority in decision-making, although other factors such as ease of im-

plementation or political resistance need to be considered. The cost analysis can also be used to determine the burden of cost among different government or private entities where each alternative has different possibilities in terms of who provides the ingredients. In this respect it should be noted that the total cost of an intervention must even include volunteers and donated resources, although the cost to the sponsor may be reduced by others sharing the cost burden through providing resources in-kind.

### Examples

The application of cost-effectiveness analysis can best be understood by providing examples of its use. In a 1984 study, Bill Quinn, Adrian Van Mondfrans, and Blaine R. Worthen examined the cost-effectiveness of two different mathematics curricula. One approach was based upon a traditional, textbook application. The other was a locally developed curriculum that emphasized highly individualized instruction with special methods for teaching mathematics concepts. With respect to effectiveness, the latter curriculum was found to be more effective in terms of mathematics achievement, on average, than the traditional program. It was also learned that the lower the socioeconomic status (SES) of the student, the greater were the achievement advantages of the innovative program.

But the innovative program had a cost that was about 50 percent higher per student than the traditional one. The question is whether the additional achievement justified the higher cost. The evaluators found that the cost per raw score point on the Iowa Tests of Basic Skills was about 15 percent less for the innovative program than for the traditional one, showing that the higher achievement more than compensated for the higher cost. For low SES students the cost per point of the innovative program was less than 40 percent that of the traditional program. For high SES students, however, the traditional program was slightly more cost-effective. This study demonstrates the value of cost-effectiveness and its usefulness as an evaluation technique among different types of students. In a low SES school or district the innovative program was far superior in terms of its cost-effectiveness. In a high SES school or district, the traditional program might be preferred on cost-effectiveness grounds.

One of the most comprehensive cost-effectiveness studies compared four potential inter-

ventions in the elementary grades: reductions in class size in a range between twenty and thirty-five students per class, peer tutoring, computer-assisted instruction, and longer school days. The measures of educational effectiveness included both mathematics and reading achievement. Tutoring costs per student were highest, followed by decreases in class size from thirty-five to twenty, computer-assisted instruction, and longer school days. The high costs for peer tutoring are a result of the cost of adult coordinators who must organize and supervise the tutoring activities of effective programs. Effectiveness measures were taken from evaluation studies that had focused on the achievement gains associated with each type of intervention. Although peer tutoring had a high cost, it also had very high effectiveness and the highest cost-effectiveness. In general, computer-assisted instruction was second in cost-effectiveness with class size and longer school days showing the lowest cost-effectiveness. Results differed somewhat between reading and mathematics, but the cost-effectiveness of reduced class size and of longer school days was consistently lower than those of peer tutoring and computer-assisted instruction.

A study in northeastern Brazil undertook a cost-effectiveness analysis of different approaches to school improvement. A range of potential school improvements was compared to ascertain effects on student achievement. These included teacher-training programs, higher salaries to attract better teaching talent, better facilities, and greater provision of student textbooks and other materials. The authors used statistical models to determine the apparent impact of changes in these inputs on Portuguese language achievement for second graders. Costs were estimated using the ingredients method outlined above. Effectiveness relative to cost was highest for the provision of more instructional materials and lowest for raising teacher salaries. Given the very tight economic resources available for improving schooling in Brazil, this type of study provides valuable guidance for those people making resource decisions.

### Use of Cost-Effectiveness Analysis

Studies of the effectiveness of educational interventions are very common. Studies of their cost-effectiveness are rare. What might account for this discrepancy? There may be many reasons. Evaluators of social programs rarely have background in cost analysis. Few programs or textbooks in educa-

tional evaluation provide training in cost-effectiveness analysis. That decision makers are often unfamiliar with cost-effectiveness analysis limits their ability to evaluate and use such studies. Yet, in the early 1980s, the field of health was also limited in terms of both the production and use of cost-effectiveness studies. By the early twenty-first century, the concept had been widely applied to health decisions in response to severe resource stringencies in health care. Because the field of education is pressed with similar resource constraints, there might be increased development and use of cost-effectiveness techniques in educational decision-making.

## COUNCIL FOR BASIC EDUCATION

---

The Council for Basic Education (CBE) was founded in 1956 by a group of distinguished citizens alarmed at the shift in American education from intellectual development to an emphasis on social development. From its inception CBE set out, as it states in its by-laws, to ensure “that all students without exception receive adequate instruction in the basic intellectual disciplines, especially English, mathematics, science, history, and foreign languages.” CBE is a nonprofit educational organization whose primary purpose is to strengthen the teaching and learning of the basic liberal arts subjects in American undergraduate schools. A critical voice for education reform, CBE has complemented its strong advocacy by designing and administering practical programs to foster better teaching and learning.

### History

CBE, in the belief that there is an intimate relationship between a healthy democracy and the ideal of excellence in education, from its earliest days published monthly and quarterly periodicals to provide a platform for its advocacy, analysis, and programs. Among its early directors, board members, and supporters were Mortimer Smith, Mary Bingham, Admiral Hyman Rickover, Potter Stewart, and Jacques Barzun. In 1959 James D. Koerner’s *The Case for Basic Education* articulated CBE’s ideals about the goals in education and contained what has become a celebrated essay by one of its founding members, Clifton Fadiman, on what he defined as the “generative” power of what is contained in the basic liberal arts. In 1971 CBE published “Inner-City Children Can Be Taught to Read: Four Successful Schools,” an article by George Weber, then a director at CBE, which continues to be read by those who are alarmed at the number of illiterate students in the nation’s urban schools.

### Activities

In addition to speeches, publications, and conferences, CBE’s programmatic activities began when it was invited by the National Endowment for the Humanities to administer a program that would allow school teachers to engage in independent study in the humanities during the summertime. From 1983 until 1997, more than 3,000 teachers participated as CBE Fellows, and from 1985 until 1996, CBE conducted Writing to Learn, which taught effective writing across the curriculum, primarily in urban school districts.

Following the National Education Summit in 1989 in Charlottesville, Virginia, which called for strong national standards for education, CBE’s historic commitment for high standards established it as a national leader. CBE provided support for the development and implementation of academic standards in a number of states and school districts, including Alaska, Hawaii, Illinois, Kansas, Maryland, Mississippi, Chicago, Los Angeles, Cleveland (Ohio), Milwaukee (Wisconsin), Montgomery County (Maryland), and Sacramento and Santa Barbara (both California). In 1995, through its project known as Standards for Excellence in Education (SEE), CBE condensed, consolidated, and edited the national standards in the basic subjects to form a single volume, which continues to be used in many school systems. During that same period of time, CBE was asked to convene a panel to review the then controversial national history standards, which produced a report that became the basis for the revised national history standards.

In addition to its standards and fellowship programs, CBE developed a program, Standards-Based Teacher Education (STEP), to promote students’ deep understanding of the subjects they will eventually teach and encourage the colleges of the arts and sciences to join forces with the teacher preparation faculties in requiring a strong academic curriculum for future teachers. STEP is operational on campuses in Maryland, Indiana, Kentucky, Georgia, and Delaware. Schools around the World (SAW) is a program that engages teachers from eight nations to compare student work on common science and mathematics topics and trains teachers in the United States to improve instruction.

In 1997 CBE initiated the Humanities Scholars Fellowship program and the Charter School Fellowship program. In 1999 it collaborated with the Labo-

ratory for Student Success and the Maryland State Department of Education to launch the Mid-Atlantic Regional Teachers' Project (MARTP), a coalition of five states that looks at issues of teacher quality and demand in a regional area. CBE is a partner with the George Washington University and the Institute for Educational Leadership to develop a National Clearinghouse for Comprehensive School Reform. CBE also manages American Education Reaches Out (AERO), a project designed to develop a set of voluntary academic-content standards for the American schools overseas that are supported by the U.S. Department of State.

### Legal Status, Governance, and Publications

CBE is incorporated as a 501 (c)(3) organization and is governed by an independent board of directors. The council publishes *Basic Education* (monthly) and occasional special reports and books.

### Assessment of CBE's Influence and Significance

From its beginning, CBE has been known as an independent voice for educational reform, and it is frequently called upon and quoted in national newspapers, periodicals, and on television and radio. Its publications are read by a diverse audience, including professional educators, members of Congress, the U.S. Department of Education, state legislators, and the media, as well as by members of the general public who seek an understanding of educational policies and trends. Both national and international education officials confer regularly with CBE about education policy. As of 2001, CBE had worked in twenty-five states, twenty-eight districts, and eight countries.

## COUNCIL FOR EXCEPTIONAL CHILDREN

---

The Council for Exceptional Children (CEC) is a professional association dedicated to improving the educational success of children with disabilities and/or gifts and talents. Its members include special education teachers and administrators, professors, related service providers, paraprofessionals, and parents.

### Program

CEC focuses on improving the quality of special and general education. To achieve this goal, the council works with state and local education districts, the federal government, and other education organizations to find ways to better identify, teach, and care for children with exceptionalities.

In addition to encouraging the professional growth of its members and other special educators, CEC aids in recruiting personnel and promoting high professional standards. It encourages research in the education of children with exceptionalities and assists in the dissemination of research findings. And it engages in lobbying efforts at all levels of government to promote legislation that supports the education of children with special needs.

Disseminating information about the education of children with exceptionalities is one of CEC's major activities. CEC provides information to members and others who work with children with disabilities and/or gifts and talents through conventions, conferences, the CEC website, and publications. The council publishes two journals, *Teaching Exceptional Children*, a professional, practical-based journal, and

*Exceptional Children*, a research journal. CEC also publishes *CEC Today*, the organization's newsletter, which covers current trends in special education and CEC activities. In addition, CEC publishes books and videos on special education and instructional strategies, research monographs, reviews of research, and special bulletins.

Another significant aspect of the council's activities is developing standards for the field. To date, CEC has developed standards for what special education teachers, diagnosticians, administrators, and paraeducators must know to provide effective instruction and service. An important aspect of CEC's standards activities is providing recognition for outstanding special educators, which it accomplishes through its professional awards program.

CEC also engages in extensive advocacy activities. The council cooperates with other education organizations to promote legislation that supports education in general, and special and gifted education in particular. CEC focuses its legislative efforts on ensuring that gifted children and children with disabilities receive a high quality education and that special and gifted education programs are adequately funded. The council further works to inform legislators at all levels, as well as the general public, of the benefits society receives when children with exceptionalities reach their educational potential.

In addition, CEC operates four national information centers. The centers provide information on the education of children with disabilities and gifts and talents, the special education profession, and the Individuals with Disabilities Education Act (IDEA).

### **Organizational Structure**

CEC consists of state and provincial federations, which are made up of local chapters, branches, and affiliates, and the Student Council for Exceptional Children. Federations address statewide or provincial issues, hold conferences, publish newsletters, and coordinate the activities of the local chapters. The local chapters hold meetings, engage in projects to advance the education of children with exceptionalities, and publish newsletters. Students in full-time attendance at an accredited college or university are eligible for membership in the Student Council for Exceptional Children.

CEC has seventeen divisions, each of which specializes in a particular area of special education (such as learning disabilities, mental retardation, gifted ed-

ucation). Each division holds conferences on its particular area of special education and produces a journal, website, and newsletter. The divisions also provide networking opportunities and support for their members.

CEC's board of directors, the association's primary governing body, makes internal and external policy for the organization. A representative assembly serves as an advisory body to the board of directors. As such, it identifies, discusses, and makes recommendations to the board of directors on positions CEC should take on issues involving special education; advises CEC on public policy issues and initiatives; and oversees CEC internal governance policies and procedures.

### **Membership and Financial Support**

CEC's approximately 50,000 members are special education teachers, administrators, college professors, related service providers, paraprofessionals, and parents. Although CEC has an international membership, the majority of its members reside in the United States.

Financial support comes primarily from membership dues. Various special projects receive funds from the federal government and foundation grants.

### **History and Development**

CEC was organized in 1922 by a small group of administrators and faculty members at Teachers College, Columbia University. In 1941 it merged with the special education department of the National Education Association (NEA) and became a department of NEA. In 1977 CEC withdrew its affiliation with NEA and became its own association. During its history, CEC has grown substantially in membership, and it has become a leading national voice for special education. CEC's national headquarters are located in Arlington, Virginia.

## COUNCIL OF CHIEF STATE SCHOOL OFFICERS

---

The Council of Chief State School Officers (CCSSO) is a nationwide, nonprofit organization composed of the public officials who head the departments of elementary and secondary education in the states, five U.S. extra-state jurisdictions, the District of Columbia, and the Department of Defense Education Activity. The council serves these leaders and their state education agencies by:

- Advocating federal education policy that will most effectively increase student achievement before the U.S. Congress and the administration;
- Providing services and assistance to the chief school officers and members of their agencies to help them carry out their leadership responsibilities, including administration of federal programs; and
- Working in partnership with federal agencies and private foundations on research and statistical studies, such as surveys of mathematics and science programs, and managing projects such as the Wallace–Reader’s Digest Funds’ initiative, Leaders Count, which support state actions to strengthen leadership in schools and districts.

Membership in the council is voluntary. Dues are paid by the state education agencies; each state’s dues are based on the total expenditure for elementary and secondary education for that state related to the total expenditures for the nation. In 2001 council dues totaled \$1.6 million, which was less than 10 percent of the overall budget of \$17.5 million. More than 90 percent of the budget was in grants and contracts from federal agencies and private foundations. The council offices are in Washington, D.C.

### History

Council members first convened in Washington in 1908 at the invitation of the U.S. Congress, which was seeking advice on crafting federal policy for vocational education. In 1927 the council was incorporated as a private nonprofit organization. Since then members have conferred regularly with the Congress and representatives of federal agencies. The council has provided a forum for shaping state consensus on federal educational policy, for exchanging practices among states, and for organizing multistate consor-

tia to attain common objectives such as developing testing strategies and administering teacher licensing examinations.

During the 1960s, in addition to advocacy of federal policy on legislation such as the Elementary and Secondary Education Act of 1965, which relied on the states to administer the programs, the council began to link with the U.S. Office of Education, later the U.S. Department of Education (DoE), to help states administer the act. Similar connections have been made for administering other federal acts such as those for vocational education, education of disabled students, civil rights, telecommunications, and teacher education.

The growth of these supportive administrative activities, together with increased assistance to the DoE on data gathering and securing new foundation funds, expanded annual resources from \$2.5 million with fifteen staff members in 1986 to \$17.5 million and seventy-five staff members in 2001. Major grant projects included support for early childhood and parent education, teacher preparation and licensure, school leadership policies, arts education, and development of student standards and assessments.

### Governance and Operations

Because the total maximum membership is fifty-seven persons, the council operates with extensive direct decision-making by the full membership. The entire membership elects officers and board members, sets state dues, approves all position papers and federal legislative positions, and approves the creation of committees and their membership. The council is guided by a board of nine directors, three of whom are officers. The board approves the budget and receipt of all grants and contract funds, sets the council agenda, and appoints the executive director, who in turn appoints all staff. No board members or officers are paid for their services to the council.

The membership meets three times each year: a federal legislative conference in Washington each March; a Summer Institute for professional development on the priority topic of the year in July, each year in a different host state; and a business meeting held in a different host state each November, at which major policy votes are taken and council priorities set.

The board and membership take extensive time to select and prepare each year’s priority topic. One year is spent in development; the “priority” year is

used for research and preparation of a council policy statement and the design of state implementation activities to be carried out through at least the two following years. Examples of topics include early childhood education, learning technologies, use of standards and assessments in reform strategies, international education, and preparation for employment and leadership for learning.

In addition to providing a network of services to the chiefs, the council offers more than a dozen nationwide networks for specialists in state education agencies. Examples of the network memberships are the deputy leaders of the state education agencies, assessment directors, statistical experts, mathematics and science coordinators, teacher licensing specialists, health education directors, learning technology experts, school reform strategists, and federal legislative representatives. With these networks the council helps to strengthen capacity throughout the state agencies.

The council staff comprises experts in the priority areas as established by the members. Staff strengths are in equity of education opportunity, assessments, standards and improvement strategies, leadership, teacher education, arts education, and federal legislative advocacy.

### **Accomplishments and Influence**

The influence of CCSSO is illustrated by examples of federal legislative success, major policy statements, and significant innovative projects.

**Federal legislation.** The council is considered one of the top education lobbying forces in Washington. The provisions of the 2001 reauthorization of the Elementary and Secondary Education Act (ESEA) illustrate results on council-supported positions including strengthened emphasis on targeted aid to children of poverty; substantial increase of funding; increased state role in assessment and accountability; improved programs of learning technology, teacher preparation, 21st Century Schools, and accountability—with these programs featuring added flexibility in administration; and continued responsibility of state education agencies for state plans and administration. Proposals to transform targeted programs to federal revenue sharing, to establish vouchers for private school enrollment, and to transfer state administration to governors, which were considered by Congress, were omitted from the final legislation as advocated by the council.

Other major legislative successes in the 1990s include enactment of the Goals 2000: Educate America Act, which provided nearly \$2.5 billion for the development of state and local student standards, assessments, and reform strategies, and enactment of the “universal services” funding for learning technology under the Telecommunications Act of 1996, which has provided nearly \$2.2 billion of services to schools and libraries each year since enactment.

**Policy papers.** Among the most influential council statements is the 1984 paper calling for nationwide testing to provide state-by-state comparisons of student achievement. This position has been pivotal for enabling federal legislation authorizing state-by-state reporting of the National Assessment of Education Progress (NAEP), the measurement of progress on the National Goals of 1989, the establishment of state standards and assessments in the 1990s, and the key provisions for measuring progress of schools under the ESEA reauthorizations of 1994 and 2001. A second important CCSSO statement is the 1987 paper “Assuring Education Success for All,” which called for a national goal of virtually 100 percent student graduation from high school. A third is a paper on early childhood education advocating universal opportunity for three- and four-year-olds to attend pre-kindergarten without barrier of cost. A fourth is a set of papers advocating comprehensive education reform based on student standards. These papers provided the underpinning for major federal initiatives in the 1990s, including the Goals 2000 legislation and the ESEA reauthorizations of 1994 and 2001, and for the reform strategies of the states during this period.

**Exemplary projects.** Among the extensive projects of the council, several have made notably unique nationwide contributions. From 1987, the time of authorization for state-by-state NAEP, into the early twenty-first century, the council won the contracts to prepare nearly all of the content frameworks for the subjects of the NAEP. Second, since the early 1960s the council has administered the national and state Teacher of the Year programs, the nation’s most prestigious recognition of teaching.

Third, since 1995 the council, together with the National Association of State Arts Agencies, has provided leadership for the nation’s most extensive advocacy of arts education. Fourth, to anticipate the increasing pressures of the global economy, worldwide security, and communications and to improve American education and better understand educa-

tion in other nations, the council has assisted in shaping the system for international comparative studies of education. The council has served as the U.S. representative to the International Association for the Evaluation of Educational Achievement (IEA), which conducts the major studies of mathematics, science, reading, civics education, and technology. The council has assisted in enabling the major breakthrough of direct state participation in these international comparisons. The council has also organized a decade-long exchange of practices with the education leaders of Japan.

Fifth, CCSSO has led formation of several coalitions of public and private education leaders to promote mutual support for legislative initiatives and exchange of practice, rather than antagonism. Sixth, the council has led the creation of a consortium of the major organizations of state officials—governors, legislators, and state education boards and chiefs—as the major partner with the Wallace-Reader’s Digest Funds to assist states in strengthening policies and programs to improve school and district leadership. Through the Leaders Count program this project has been granted \$8.9 million to help states with policy changes.

### Concluding Note

Global communication, competition, and commerce are generating increasing pressures to nationalize education in the United States. In order to realize the advantages of pooling the nation’s resources for improving education, centralization of authority is occurring at the national level. To assure such centralization does not drive out diversity and options in education, CCSSO is in a unique position to provide a countervailing force. The organization serves both to organize the state partnership with the federal government and as an independent advocate for state and local authorities to craft policies and govern education according to the particular aspirations of their jurisdictions. Around the globe nations are struggling with the task of finding the best mix of centralized and decentralized power to assure the most effective performance of their students gauged by international benchmarks. In the United States the council is uniquely placed to help fashion the best balance between standardized improvement and experimentation toward realizing new goals of equity and excellence.

### COUNTS, GEORGE S. (1889–1974)

Progressive educator, sociologist, and political activist, George S. Counts challenged teachers and teacher educators to use school as a means for critiquing and transforming the social order. Perhaps best known for his controversial pamphlet *Dare the School Build a New Social Order?* (1932), Counts authored scores of scholarly works that advanced the social study of education and emphasized teaching as a moral and political enterprise. His work on schooling and society continue to have relevance to contemporary dilemmas in education.

Counts was born and raised in Baldwin, Kansas. His family was Methodist and, by his own account, imparted strong ideals of fairness and brotherhood. Counts earned his B.A. from Baker University, the local Methodist school, in 1911 with a degree in clas-

sical studies. After graduating, he was employed as a high school math and science teacher, an athletic coach, and principal before beginning postgraduate studies in education at the University of Chicago in 1913, at the age of twenty-four. After receiving a Ph.D. degree with honors, Counts taught at Delaware College, now the University of Delaware (1916–1917) as head of the department of education. He taught educational sociology at Harris Teachers College in St. Louis, Missouri (1918–1919), secondary education at the University of Washington (1919–1920), and education at Yale University (1920–1926) and at the University of Chicago (1926–1927). For nearly thirty years, Counts taught at Teachers College, Columbia University in New York (1927–1956). After being required to retire at the age of 65 from Teachers College, Counts taught at the University of Pittsburgh (1959), Michigan State University (1960), and Southern Illinois University (1962–1971).

### Sociology and Education

Much of Counts's scholarship derives from his pioneering work in the sociology of education. His adviser as a doctoral student at the University of Chicago was the chairman of the department of education, psychologist Charles H. Judd. Significantly, Counts insisted on fashioning for himself a minor in sociology and social science at a time when professors of education wholly embraced psychology as the mediating discipline through which to study educational practice and problems. Although his contemporaries were fascinated with the "science of education" and its psychological underpinnings, Counts was interested in the study of social conditions and problems and their relationship to education. Heavily influenced by Albion Small and other Chicago sociologists, Counts saw in sociology the opportunity to examine and reshape schools by considering the impact of social forces and varied political and social interests on educational practice. For example, in the *Selective Character of American Secondary Education* (1922), Counts demonstrated a close relationship between students' perseverance in school and their parents' occupations. In the *Social Composition of Boards of Education: A Study in the Social Control of Public Education* (1927) and *School and Society in Chicago* (1928), he asserted that dominant social classes control American boards of education and school practices respectively. Because schools were run by the capitalist class who wielded

social and economic power, Counts argued, school practices tended towards the status quo, including the preservation of an unjust distribution of wealth and power.

Counts's educational philosophy was also an outgrowth of John Dewey's philosophy. Both men believed in the enormous potential of education to improve society and that schools should reflect life rather than be isolated from it. But unlike Dewey's *Public and Its Problems*, much of Counts's writing suggests a plan of action in the use of schools to fashion a new social order.

### Social Reform

From 1927 to the early 1930s Counts became fascinated with the Soviet Union precisely for its willingness to employ schools in the inculcation of a new social order. Although he later became disillusioned with mounting evidence of Soviet totalitarianism and an outspoken critic of the Communist Party (he was elected as president of the American Federation of Teachers in 1939 having run as the anti-Communist candidate), Counts—like twenty-first century criticalists—believed that schools always indoctrinated students. What interested Counts was the schools' orientation: what kind of society did the schools favor and to what degree. As he put it, the word *indoctrination* "does not frighten me" (1978, p. 263). This position, in particular, later brought Counts fierce critics like Franklin Bobbit, a leader of the social efficiency movement, who countered that the schools were not to be used as agents of social reform.

Counts was accordingly critical of the child-centered Progressives for their failure to articulate any conception of a good society. He chided their preoccupation with individual growth at the expense of democratic solidarity and social justice. In his speech to the Progressive Education Association (PEA), "Dare Progressive Education be Progressive?" which later became the pamphlet *Dare the School Build a New Social Order?*, he argued that Progressive education had "elaborated no theory of social welfare" (1978, p. 258), and that it must "emancipate itself from the influence of class" (p. 259).

### Political Activism

Counts was also a political activist. He was chairman of the American Labor Party (1942–1944), a founder of the Liberal Party, and a candidate for New York's

city council, lieutenant governor, and the U.S. Senate. He was president of the American Federation of Teachers (AFT) and a member of the Commission on the Social Studies of the American Historical Association. He was the first editor of the Progressive journal *Social Frontier* which, at its peak, boasted a circulation of 6,000, and advocated enlisting teachers in the reconstruction of society.

### Contribution

Counts's importance to and impact on American education remain a matter of debate. His contributions to the evolving discourse on democracy and education are evident in a great deal of his writing, specifically in his conviction that schools could be the lever of radical social change. Highly critical of economic and social norms of selfishness, individualism, and inattention to human suffering, Counts wanted educators to "engage in the positive task of creating a new tradition in American life" (1978, p. 262). He wanted teachers to go beyond abstract, philosophical conceptions of democracy and teach explicitly about power and injustice. He wanted teachers and students to count among their primary goals the building of a better social order.

## CREATIVITY

Creativity is the ability and disposition to produce novelty. Children's play and high accomplishments in art, science, and technology are traditionally called creative, but any type of activity or product, whether ideational, physical, or social, can be creative.

### Characteristics

Creativity has been associated with a wide range of behavioral and mental characteristics, including associations between semantically remote ideas and contexts, application of multiple perspectives, curiosity, flexibility in thought and action, rapid generation of multiple, qualitatively different solutions and answers to problems and questions, tolerance for ambiguity and uncertainty, and unusual uses of familiar objects.

Biographical studies of exceptionally creative individuals have uncovered recurring features. Creative individuals typically master a practice or tradition before they transform it. They organize their lives around a network of interrelated and mutually supporting enterprises. They are prolific. There is no evidence for an inverse relation between quantity and quality; instead, the two appear to be

correlated. Exceptionally creative accomplishments are complex, evolving outcomes of long-term efforts sustained by high levels of intrinsic motivation, often in the absence of societal rewards.

There are many examples of exceptionally creative individuals who led troubled and turbulent lives and there is widespread belief in a relation between creativity and mental disorder, but it has not been conclusively shown that the more frequent such disorders are, the higher the level of creativity.

The rate of professional productivity in art, science, and other creative endeavors increases rapidly at the beginning of a career, reaches a peak in midlife, and then slowly declines. It is not known whether the decline is necessary or a side effect of other factors, for example, health problems. That some individuals begin creative careers late in life is evidence against an inevitable decline.

### **Creativity as Ability**

All individuals with healthy brains have some degree of creative potential, but individuals vary in how much novelty they in fact produce. Psychometric measures of creativity are based on the hypothesis that the ability to create is general across domains of activity (art, business, music, technology, etc.) and stable over time. This view implies that a person whose creativity is above average in one domain can be expected to be above average in other domains also.

The Remote Associations Test (RAT) developed by Sarnoff A. Mednick measures how easily a person can find a link between semantically different concepts. E. Paul Torrance's Tests of Creative Thinking (TTCT) measures divergent production, that is, how many different answers to a question a person can provide within a time limit. For example, a person might be asked to propose alternative titles to a well-known movie. More recent tests developed by Robert J. Sternberg uses complex test items from realistic contexts. Creativity tests correlate modestly with each other. Critics point out that there are no objective criteria for scoring the responses and that test performance might not be indicative of a creative mind.

### **Relation to Intelligence**

Correlations between creativity tests and IQ tests vary in magnitude from study to study and depend on which tests are used. Some correlations are no

smaller than correlations among creativity tests, so they do not provide strong evidence that IQ and creativity are distinct dimensions. The findings can be understood in terms of a so-called triangular correlation (also known as the threshold hypothesis): Individuals in the lower half of the IQ distribution lack the requisite cognitive capacity to create and hence necessarily exhibit low creativity; individuals in the upper half of the IQ distribution have the requisite capacity but may or may not develop a disposition to create. Consequently, creativity and IQ are highly correlated at low IQ levels but weakly correlated at high IQ levels. Alternative interpretations of the relation between creativity and intelligence have been proposed, including that they are two aspects of the same ability, that they are unrelated, and that they are mutually exclusive.

### **Creativity as Process**

The fact that the human mind can generate novel concepts and ideas requires explanation. Cognitive psychologists aim to infer the relevant mental processes from observations of how individuals solve problems that require creativity. One hypothesis states that creation is a process of variation and selection, analogous to biological evolution. The mind of a creative person spontaneously generates a large number of random combinations of ideas, and a few chosen combinations become expressed in behavior. An alternative hypothesis is that a creative person is able to override the constraining influence of past experiences and hence consider a wide range of actions and possibilities. The moment at which a previously unheeded but promising option comes to mind is often referred to as insight. A closely related hypothesis is that creative individuals are more able to break free from mental ruts—trains of thought that recur over and over again even though they do not lead to the desired goal or solution. It has also been suggested that people create by making analogies between current and past problems and situations, and by applying abstractions—cognitive schemas—acquired in one domain to another domain.

These process hypotheses are not mutually exclusive. Each has received support in research studies. Due to the separation within psychology of the cognitive and psychometric traditions, there is little or no interaction between process hypotheses and test development.

### Relation to Imagery

There is widespread belief that highly creative individuals think holistically, in visual images, as opposed to the step-by-step process that supposedly characterizes logical thinking. Although consistent with often quoted autobiographical comments by Albert Einstein, Wolfgang Amadeus Mozart, F. A. Kekulé and others, systematic support for this belief is lacking. There is strong research support for a function for visual imagery in memory recall, but its relevance for creativity is unclear.

### Relation to Knowledge

Cognitive and biographical studies have shown that creative problem solutions require thorough knowledge of the relevant domain and domain-specific strategies. For example, scientific discovery depends, in part, on knowing what the current theory predicts, plus the strategy of paying close attention to data that deviate from those predictions; creativity in other domains requires other strategies. It is possible that creativity is not a general ability or process, but that creative behaviors and products emerge when a competent and knowledgeable person is motivated to engage in a cumulative effort over a long period of time. If so, a person who is unusually creative in one domain of activity is not necessarily unusually creative in other domains.

### Creativity and Education

It is not known to what extent an individual's ability to create can be enhanced. The popular press produces a steady stream of books that advocate particular techniques and training programs; most have not been evaluated, so it is not known whether they work. The small number of training techniques that have been evaluated systematically produce modest effects. It is possible that more effective training techniques exist but have yet to be invented. Most training programs implicitly assume that creativity is a general ability or process.

Although it is unclear whether the ability to create can be enhanced, there is consensus that the disposition to create can be suppressed. Creativity and discipline are not antithetical—creative individuals practice much and work hard—but extensive reliance on overly structured activities can thwart the impulse to create, with negative effects on students' well-being. Students with high ability will perform better than others in activities that require design, imagination, or invention, but participation

in such activities encourages the disposition to create in students at any level of ability.

Creative individuals often elicit negative reactions from others by violating social norms and expectations. In a school setting, care should be taken to distinguish creative students from students who cause disturbances due to emotional or social problems. Creative students who find ways to engage others in their projects are likely to become outgoing and adopt leadership roles. Creative students who experience difficulties in this regard are likely to engage in individual projects. In short, high creativity is compatible with both social and individualistic life styles; either outcome is healthy.

There is widespread concern among educators in Western countries that the trend to define the goals of schooling in terms of standardized tests forces teachers to prioritize fact learning and analytical ability over creativity. Participation in creative activities is emphasized in schools that implement particular pedagogical theories, for example, the Montessori and Waldorf schools.

### Broader View

Creativity is a historical force. Art and science transform people's ideas and worldviews, and technological innovation continuously transforms social practices. Toward the end of the twentieth century, the importance of innovation for economic production was widely recognized among business leaders.

## CUBBERLEY, ELLWOOD (1868–1941)

An influential educator in the field of educational administration, Ellwood Patterson Cubberley helped

guide the teacher education curriculum in the early twentieth century through his edited textbook series. His account of educational history set the historiographical tone for the first half of the twentieth century.

### Education and Career

Cubberley was born in 1868 in Antioch (later to be named Andrews), Indiana. He graduated from Indiana University in 1891 and showed special promise in science and mathematics. His ambition was to become a geologist, but teaching eventually overcame that early goal. Before graduation, he spent a year teaching in a tiny country school in Rock Hill, Indiana. After graduation he taught briefly at Ridgeville College (Ridgeville, Indiana), before moving to Vincennes University (Vincennes, Indiana), where he soon became president. During this period, he married his second cousin Erla Little.

In 1896 he moved to California and became superintendent of the San Diego Board of Education. There he battled local politicians over the appointment of qualified applicants.

In 1898 he left San Diego and took a severe pay cut to accept a teaching position with Stanford University and its fledgling two-person Department of Education (which would later become the School of Education). He would spend the remainder of his career there. On leave from Stanford, he received his Ph.D. from Columbia University in 1905 and was named full professor at Stanford in 1908. He assumed leadership of Stanford's School of Education in 1917 and proceeded to expand vastly the scope of its activities. Throughout his career, Cubberley remained deeply involved in shaping national policy on issues from teacher certification to textbooks. He retired in 1933.

### Contribution

Cubberley was perhaps the most significant educational administrator of his day. At the outset of Cubberley's career, school administration was thought of as a set of general principles without any conception of theoretical or scientific plans. There were no formal textbooks from which to teach educational administration to students. Educational administrators had no place to learn better practices and, as such, learned solely from experience. Indeed, educational administration posts were often political plums requiring little, if any, formal training. Most universities lacked education departments.

In *Changing Concepts of Education* (1909), Cubberley laid the foundation for public schooling in America. He asserted that universal education was indispensable to democracy and was an appropriate exercise of state power. Cubberley refocused school policy to include not just teaching children but also to advance public welfare and democratic institutions. For educational policy to improve, Cubberley sought to free educational administration from technical ignorance and external political pressures. He advocated giving power to technically trained educators. He also urged improved teacher training.

In his landmark *Public School Administration* (1916, followed by second and third editions in 1929 and 1947), Cubberley called for increased social efficiency in schools. He extolled the use of tests and measurements as techniques to measure educational efficiency and to provide scientific accuracy to education. He analogized the educational process to industrial production, in that schools should strive to maximize efficiency and product. Tests and measurements could continually serve as efficiency indicators, providing a basis for reorganization, hiring and firing, and assessing student performance. He further advocated the reorganization of public schools and the appointment of experts as administrators.

Cubberley pioneered the use of the school survey as an instrument to improve education, in his reports on the Baltimore, Maryland; New York City; Oakland, California; Portland, Oregon; and Salt Lake City, Utah schools. In conducting surveys, he applied an integrated theory of organization, administration, and teaching, to assess the strengths and weaknesses of individual schools. He used the latest statistical and quantitative methods. His surveys were significant steps down a new road toward improving school functions.

Additionally, Cubberley edited a series of textbooks for Riverside Press that sold more than 3 million copies. This textbook series helped form education's knowledge base and included seminal works on such important concepts as I.Q. In his textbooks, he advocated autonomy for school administrators. Although school boards might set policy, they lacked expertise to run school systems and Cubberley believed they should give way to the administrator's expertise in day-to-day operations.

Cubberley's *Public Education in the United States* (1919), perhaps his greatest work, set the his-

toriographical tone for educational history for more than forty years. Adopting an instrumentalist approach to education, Cubberley portrayed education as the main tool of America's progress. He saw the rise of universal public schooling as a triumph of democratic forces. Cubberley saw educational systems as continually improving, and he associated the rise and refinement of education with America's continued progress.

Cubberley's legacy has been decidedly mixed. Since his death in 1941, Cubberley's celebrationist historical account has been attacked, perhaps most memorably by Lawrence Cremin's *The Wonderful World of Ellwood Patterson Cubberley* (1965). Historiographically, some academicians have used Cubberley's methodology as a cautionary tale and termed his approach anachronistic and evangelistic. In a similar vein, Cubberley's administration stances have been attacked as sexist and autocratic. Regardless, Cubberley's historical account was a Promethean achievement, in light of the then-existing state of knowledge. And, without a doubt, Cubberley's views on empirical research in education and increased efficiency in public schools have remained dominant paradigms in contemporary public education.

## INNOVATIONS IN THE UNDERGRADUATE CURRICULUM

During the last decade of the twentieth century, significant changes occurred in American higher education generally and in the undergraduate curriculum in particular. These changes were propelled by several developments. Together they provided the momentum to enable higher education to make unprecedented strides. Educational leaders debate whether these changes are primarily additive and limited to small scale programmatic innovations or truly transformative for institutions and higher education. Nonetheless, there is widespread agreement that the academy and the undergraduate curriculum have evolved in significant ways.

### Defining Curriculum

An undergraduate curriculum is a formal academic plan for the learning experiences of students in pur-

suit of a college degree. The term *curriculum*, broadly defined, includes goals for student learning (skills, knowledge and attitudes); content (the subject matter in which learning experiences are embedded); sequence (the order in which concepts are presented); learners; instructional methods and activities; instructional resources (materials and settings); evaluation (methods used to assess student learning as a result of these experiences); and adjustments to teaching and learning processes, based on experience and evaluation. Although the term *curriculum* is variably used, this definition is sufficiently inclusive and dynamic to account for the many innovations in the undergraduate curriculum that involve instructional methods, sequencing, and assessments as well as instructional goals and content, all of which have been implemented in order to improve learning.

### Forces for Change

During the 1980s critiques of American higher education were increasing in frequency and stridence. Reports such as *A Nation at Risk* (1983) and *Integrity in the College Curriculum* (1985) underscored the need for reform, citing a lack of accessibility, quality, and coherence. Business and industry leaders decried the inadequate skills of graduates who were unable to problem-solve, communicate through writing and speaking, engage in ethical decision-making, work in teams, and interact effectively with diverse others. Citizen groups noted the disengagement from civic life of recent graduates, citing low voter participation.

Calls for increased accountability came from outside the academy, including government agencies, state boards, regional and professional accrediting bodies, and professional associations. Their concerns resulted in mandates for assessment of student learning outcomes and the growth of the assessment movement in higher education. Against a backdrop of fiscal constraints, competition for students from for-profit educational vendors was considered a threat to colleges and universities, further fueling the impetus for reform.

Demographic changes led to increased participation by students with varied academic preparation, declining student enrollments, and falling retention rates. The pool of students pursuing science and math was shrinking, and women and minorities were underrepresented. Scientific literacy was weak among non-science graduates, posing a

threat to the economy as well as the future of scientific and technological endeavors.

Concurrently, there were great strides in research on effective college teaching and learning, with shifts in emphasis from what teachers *do* to what students *learn*. New conceptions of learning that emphasize the social construction of knowledge gained advocates. New interdisciplinary fields were burgeoning (e.g., women's studies, ethnic studies). The publication of Ernest Boyer's *Scholarship Reconsidered* in 1990 promoted the re-conceptualization of faculty roles and rewards, giving legitimacy to the scholarship of teaching. From the mid-1980s, faculty development emerged as a field of practice to assist faculty in their instructional efforts; during this time, numerous institutions founded teaching and learning centers. Last but not least, new technologies had implications for new fields of study and their use in instruction and research. Taken together, these forces enabled significant reforms to develop and proliferate in higher education.

### Trends

Many of the curricular innovations and reforms during the last decade of the twentieth century reflect three shifts in emphasis: (1) from learning goals that focus on mastery of content and content coverage to demonstration of broad competencies; (2) from learning in disparate disciplines to integrative learning experiences across the curriculum; and (3) from changes in subject matter as the primary means to improve learning to innovations in instructional methods and assessments as integral to curricular reforms. Diversity and global competency have emerged as major undergraduate curriculum issues, as well.

**From content to competencies.** In the first years of the twenty-first century, the undergraduate curriculum continued to consist of general education or liberal studies (averaging 37.6% of bachelor of arts degree requirements), a major specialization, minors, and electives. The rationale for this configuration has been to ensure breadth through distribution requirements and depth through the major. At the structural level, this model is holding fast at most institutions. What has changed are the goals for learning—from emphasis on knowledge of disciplinary facts and concepts (what students know) to broadly defined competencies (what students are able to do with what they know) to ensure that graduates have

the skills needed by citizens in the twenty-first century.

The expanding list of proficiencies commonly identified by colleges and universities include: critical thinking and problem-solving; multiple modes of inquiry in the natural sciences and mathematics, social sciences, humanities, and arts; communication skills, including writing, speaking, and listening; technology and information literacy; sensitivity to diversity, including multicultural and intercultural competencies for participation in a pluralistic democracy; civic, global, and environmental responsibility and engagement; interpersonal skills, including teamwork and collaboration; self-awareness; moral and ethical reasoning, and integration of knowledge from diverse sources.

**Integration across the curriculum.** The majority of colleges and universities indicate that general education is a high priority among administrators and faculty, and their institutions are actively engaged in reviewing their general education programs. Given the difficulty of learning all the aforementioned competencies within a general education program, many institutions are blurring the boundaries between general education and the major by infusing these competencies throughout the collegiate experience. This can be seen in the adoption of upper division writing requirements and writing-intensive courses in the major; integrative capstone courses that require collaborative teamwork and projects; courses in the major that emphasize ethics and civic engagement; and the integration of technology, information literacy, and multiculturalism throughout the curriculum.

**Diversity learning.** Diversity learning is a high priority, including multicultural and intercultural understanding. Although variably defined, *diversity learning* often refers to sensitivity to difference, including race, gender, socioeconomic class, ethnicity, religion, sexual orientation, and disability. In Debra Humphreys's report of a national survey in 2000, 62 percent of reporting institutions had a diversity course requirement or were developing one; among these, 58 percent require one course and 42 percent require two or more courses. In the most common model among schools with requirements (68%), students select a course on diversity from a list of options. Increasingly multicultural perspectives are also infused throughout the curriculum, particularly in the humanities and social sciences.

**Internationalization.** Global competencies are often identified as a valued goal of liberal learning, but currently few American students develop intercultural competence during college. Four elements commonly associated with internationalization include foreign language study, study abroad, global studies, and the presence of international students. Foreign language enrollments comprise 8 percent of total enrollments, concentrated in a few languages (55% Spanish, 17% French, 8% German, 6% Asian languages, and less than 2% Middle Eastern). This is in sharp contrast to other developed countries where language study is emphasized.

Participation in study abroad is equally limited. Despite indications from incoming first-year students that they hope to study abroad, only 3 percent of American students study abroad, and increasingly they select programs shorter than a semester. Although global and intercultural courses are available, fewer than 7 percent of college students meet even basic standards for global competence. International students accounted for 3 percent of undergraduates and 11 percent of graduate students in the United States in 1998–1999. The United States enrolls more international students than any other country—most of them from Asia. American higher education is likely to increase its emphasis on global competencies in order to better prepare students to participate in global issues during the twenty-first century.

### Curriculum Coherence and Integration

In response to mounting criticism that the undergraduate curriculum is fragmented, burdened with too many isolated bits of information, and lacking coherence, institutions have developed strategies and structures to help students integrate the disparate elements of their college experiences. One strategy has been to clarify, tighten, and sequence requirements so they provide greater coherence. Requirements and prerequisites increased in the 1990s, reversing the trend toward reduced requirements during the 1970s and 1980s. A second strategy has been to provide educational experiences calibrated to the developmental learning needs of students at different stages of their collegiate lives. The most prevalent model is the first-year program, often comprising orientation programs, orientation courses, cocurricular offerings, developmental courses for underprepared students, access to academic support services, first-year seminars, courses of which many are interdisciplinary, and learning communities.

The goal of these offerings is to ease the transition from high school to college, to teach skills and attitudes to enable students to succeed in college, and to improve retention, particularly among at-risk students. K–16 collaborations also support the transition between high school and college by promoting curricular discussions between K–12 teachers and college faculty and by providing collegiate experiences to motivate younger students.

To ease the transition from college to the work world, institutions offer senior seminars and capstone experiences. These are designed to help students integrate intentionally what they have learned in their major specialization and to relate those insights to other disciplinary perspectives, the community, or the work world. Other variants include experiences designed for sophomores and keystone courses that mark the mid-collegiate transition from general education into the major, providing a supportive environment to assess student readiness to move forward.

**Learning communities.** Learning communities comprise curricular models that link courses or course work to reinforce their curricular connections, maximize opportunities for students to collaborate with each other and their instructors, and provide interpersonal support. Although often designed for first-year students, learning communities now appear throughout the curriculum. They are designed to build communities of learners, and in many cases, provide the structure to promote interdisciplinary study and integration.

**Interdisciplinarity.** Interdisciplinary studies, which are considered a major trend in teaching and research, have grown exponentially since 1990. Two widespread innovations are first-year interdisciplinary seminars and courses based on themes or problems, many of which are team-taught. Courses in new interdisciplinary fields are flourishing (e.g., neuroscience, bioengineering) as are courses in multiculturalism, often spurred by diversity requirements. Courses that apply ethics and environmentalism to professional areas, such as undergraduate nursing and engineering, reflect accreditation mandates. In addition, faculty across the disciplines use innovative pedagogies and course structures that promote integration and interdisciplinary perspectives, such as academic-service learning, multidisciplinary group work, internships, fieldwork, and study abroad.

## **Innovative Instructional Methods**

Innovative instructional methods are proliferating in higher education and are integral to curricular reform efforts. Supported by research on how students learn, instructional innovations emphasize active and experiential learning (i.e., learning by doing); inquiry, discovery, and problem-based learning; collaborative and cooperative learning in groups; writing to learn; undergraduate research; academic-service learning; and instructional technology. Although lecture and small group discussions are still the dominant instructional methods, active and collaborative learning is now commonplace in higher education. As reported by George D. Kuh in 2001, 90 percent of seniors polled in a national survey indicated that they had participated in group work in class during college.

Reform efforts in science, math, engineering, and technology (SMET) characterize the integral relationship between innovations in instructional methods and curricular reform in the last decade. In Workshop Physics, for example, lecture and lab sections are integrated. All class instruction is done through hands-on experiments and demonstrations that rely heavily on microcomputers to assist in data analysis. Students work in cooperative learning groups based on the principles of discovery-based learning, emphasizing problem-solving. Similarly, in Calculus Reform, a curricular innovation with roots in the 1980s, students work in groups to problem-solve, often using story problems that relate to the real world, geometric visualization, and instructional technology. A National Science Foundation study published in 1998 indicates that among the most important innovations in SMET since 1990 are (1) Calculus Reform; (2) undergraduate research in which students work on research projects with faculty; and (3) collaborations among institutions, business, industry, and research labs to promote student learning.

## **Assessment of Student Learning**

Widespread efforts to assess student learning are also having an impact on the undergraduate curriculum. While multiple choice tests are still widely used, new evaluation methods provide opportunities to assess and to promote higher-order critical thinking skills and the competencies now valued in higher education. Methods include self-assessments, student portfolios, student journals, case studies, simulations, poster sessions, group projects, and technolo-

gy-based innovations, among others—all of which reflect the shifts from content to competencies, from fragmentation to integration, and from passive to active modes of learning. Increasingly, assessment results are being used to improve programs and promote the ongoing process of curricular reform.

## NATIONAL REPORTS ON THE UNDERGRADUATE CURRICULUM

During the 1980s and 1990s critics and advocates of U.S. higher education issued numerous reports calling for reform of the college and university curriculum. These reports—from individuals, panels of experts assembled by federal agencies, educational lobbying organizations, and private foundations—responded to changes in postsecondary curricula implemented in the 1960s as the baby boom generation swelled college and university enrollments; and as the civil rights movement, the women's liberation movement, and Vietnam War protests led to demands for more relevant and student-centered curricula.

As the era of economic prosperity that fueled the educational innovations of the 1960s ended, a number of social and political forces converged to produce a climate conducive to calls for reform of the undergraduate curriculum. Then the economic recession of the 1970s focused the attention of businesses, students, and parents on employment prospects for graduates and the marketability of a college degree. A downward trend in college admission test scores and related concerns about a decline in U.S. economic competitiveness resulted in calls for higher educational standards at elementary, secondary, and postsecondary levels. At the same time, a Republican administration decentralized responsibility for educational expenditures in an effort to hold the states more accountable for educational improvements, and legislators committed to cost-effectiveness trimmed allocations to higher education.

In 1983 concerns about the widespread public perception of problems in the U.S. educational sys-

tem were the impetus for the widely read report, *A Nation At Risk* (1983), issued by the National Commission on Excellence in Education. In 1981 Terrel Bell, then U.S. Secretary of Education, directed the commission to examine the quality of education in the United States. Although the commission focused primarily on high school education, selective attention was also paid to higher education, elementary education, and vocational and technical programs. The commission's findings regarding decreases in high school students' preparation for college, declines in standardized college admission test scores and college selectivity, and general concerns about the quality of elementary and secondary education raised concerns about the impact of these problems on undergraduate education. Secretary Bell, and his successor, William Bennett, encouraged further scrutiny of college and university education and prompted calls for accountability at the postsecondary level.

### An Emphasis on Curricular Content

The reports on higher education of the 1980s and 1990s often stressed the need to include specific courses or course content in postsecondary curricula, which had recently experienced a period of experimentation. Acceding to student demands for more choice of majors and elective courses, many colleges and universities in the 1960s and 1970s had relaxed requirements for the baccalaureate degree by reducing the number of required courses needed for graduation and permitting more elective courses—or by increasing the number and kinds of courses that would fulfill the requirements. Additional changes had occurred in major concentration programs, allowing students in many institutions to select from an array of courses to fulfill basic requirements or create majors based on their personal interests. Advances in knowledge and the creation of new disciplines, fields of study, and specializations also contributed significantly to changes in the college curriculum. Increased course options, increasing faculty commitment to advancing their disciplines, and growing departmental autonomy led to curricular fragmentation, while the combination of increased disciplinary specialization and student desire for degrees that would lead directly to employment created conditions conducive to the growth and diversification of postsecondary curricula.

In 1984 the National Endowment for the Humanities (NEH), under the leadership of William

Bennett, issued one of the first reports examining higher education. In *To Reclaim a Legacy: A Report on the Humanities in Higher Education*, Bennett, a former humanities professor, maintained that colleges and universities had lost a clear sense of the purpose of education. Defining the primary goal of education as learning about civilization and culture, he contended that students should study Western literature, history, and culture to obtain an understanding of the origins and development of their civilization and culture, as well as a sense of major trends in art, religion, politics, and society. Few college graduates, he argued, received adequate instruction in their own culture because faculty had succumbed to pressure for enrollments and to intellectual relativism, rather than assume “intellectual authority” for what students should learn (p. 20). Bennett also criticized faculty who taught the humanities in a “tendentious, ideological manner” that overtly valued or rejected particular social stances (p. 16). According to advocates of the Western canon such as Bennett, the push for student choice and relevance in the curriculum had backfired, leaving U.S. democracy and society in disarray.

Bennett believed that knowledge of Western civilization and culture should be fostered through careful reading of masterworks of English, American, and European literature. He also recommended that students become familiar with the history, literature, religion, and philosophy of at least one non-Western culture or civilization. Five years later, Bennett’s successor at NEH, Lynne Cheney, issued *50 Hours: A Core Curriculum for College Students*. Arguing, as did Bennett, that a common core curriculum was essential to a coherent education, Cheney proposed a required curriculum that stressed the study of Western civilization, but also included the study of additional civilizations, foreign languages, science, mathematics, and social sciences.

### **From Curricular Content to Educational Processes**

At the same time that Bennett issued *To Reclaim a Legacy*, a study group convened by the National Institute of Education (NIE) issued *Involvement in Learning: Realizing the Potential of American Higher Education* (1984). Rather than prescribe the content of the curriculum, the NIE group recommended that institutions emphasize three conditions of excellence in undergraduate education: (1) student involvement, which would result in improvements in stu-

dents’ knowledge, skills, capacity, and attitudes; (2) high expectations, which must be clearly established and communicated to students; and (3) assessment and feedback, defined as the efficient and cost-effective use of student and institutional resources to realize improvements.

Whereas the reports of Bennett and Cheney emphasized improvements in programs of study and the quality of teaching, *Involvement in Learning* focused primarily on students and their learning. The report urged faculty and chief academic officers to agree upon and disseminate a statement of the knowledge, skills, and attitudes required for graduation, and to systematically assess whether expectations for student learning were met. It contended that individualized and integrated education, learning communities, and the use of active rather than passive instructional processes would foster greater student involvement. Finally, *Involvement in Learning* called upon undergraduate colleges to expand liberal education requirements to two full years of study, and urged graduate schools to require applicants to have a broad undergraduate education to balance their specialized training.

Higher education associations and other concerned parties issued responses to these federally sponsored calls for reform. All accepted the need to improve liberal or general education and decried the perceived erosion of curricular quality. In 1985 the Association of American Colleges (AAC) published *Integrity in the College Curriculum: A Report to the Academic Community*, which described the work of the AAC Project on Redefining the Meaning and Purpose of a Baccalaureate Degree. The AAC committee responsible for the report argued that contemporary students were less well prepared for collegiate study, were more vocationally oriented, and were more materialistic than those in previous generations. The baccalaureate credential, the committee argued, had become more important than the course of study, and colleges and universities had surrendered to the demands of the marketplace rather than developing creative approaches to a changing environment. The report also chided faculty for abdicating their corporate responsibility for the undergraduate curriculum.

In *Integrity in the College Curriculum*, the AAC claimed that faculty were “more confident about the length of a college education than its content and purpose” and that the major in most institutions was little more than “a gathering of courses taken in

one department” (p. 2). The committee identified nine content-related experiences that constitute a “minimum required curriculum.” This set of experiences, intended to provide students with the general knowledge, behaviors, and attitudes needed by citizens and workers in the contemporary world, consists of: (1) inquiry (abstract logical thinking and critical analysis); (2) literacy (writing, reading, speaking, and listening skills); (3) understanding numerical data; (4) historical consciousness; (5) the sciences; (6) values; (7) art; (8) international and multicultural experiences; and (9) study in depth (one’s major specialization). The AAC urged faculty to take responsibility for designing educational experiences that provided students with a “vision of the good life, a life of responsible citizenship and human decency” (p. 6). The committee also recommended that educational programs help students see the connections among domains of knowledge as well as connections among areas of study, life, and work.

The critique and recommendations that Ernest Boyer, president of the Carnegie Foundation, offered in *College: The Undergraduate Experience in America* (1987), greatly resemble those of *Integrity in the College Curriculum*. Boyer noted eight points of tension in the curriculum, including the curriculum itself, the conditions of teaching and learning, and the priorities of the faculty. Boyer argued that vocationalism, intense departmentalism among faculty, the fragmentation of knowledge, and the loss of cultural commonalities and coherence in general, had weakened the undergraduate curriculum.

Boyer asserted that colleges should develop students’ proficiencies in reading, writing, and composition, as well as their capacity for social and civic engagement. He recommended a set of general education objectives that emphasized seven areas of inquiry: language, art, heritage, society, nature, ecology, work, and identity. Boyer urged educators to stress the connections among these discipline-driven areas of inquiry, to relate knowledge to life experiences, and to emphasize the application of knowledge beyond college. He discussed the undergraduate major as well, arguing that such specializations should have both an identifiable intellectual content and the capacity to enlarge students’ visions of the world. Boyer believed that a coherent educational experience would help students develop as individuals, and would also foster a community of learners.

An emphasis on the quality of student learning experiences in reports issued by AAC, the Carnegie Foundation, and others replaced the focus on programs and good teaching common to the NEH reports. In *College*, Boyer reasserted the NIE’s call for greater student involvement in learning and urged faculty to incorporate active learning techniques in their classrooms. Both Boyer and the AAC included discussions, small group and collaborative projects, out-of-class assignments, and undergraduate research among the active learning strategies that faculty should employ to engage students in the educational process and to convince them to take greater responsibility for their learning. In 1988, in *A New Vitality for General Education*, a second AAC task force summarized the increasingly shared sentiment that what was taught was likely less important than how it was taught.

The task force responsible for *A New Vitality* asked faculty to engage students not only as active learners, but to see them as co-inquirers who must become reflective about their own learning. The task group noted that rather than simply suggesting useful teaching techniques, it was redefining teaching: “We propose approaches that make it possible for us to find out not just what our students learn but how they learn it and what motivates them. Informing students about the purposes of our courses and program, obtaining sophisticated feedback from them, and collaborating with them are indispensable activities under this expanded definition of teaching” (p. 39).

### **Continuing Scrutiny of General Education and the Major**

Where *Integrity* spotlighted the undergraduate course of study in general, *A New Vitality* examined the rationale, purposes, and scope of general education, as well as issues of implementation. The report eschewed both normative proposals like those of the NEH and the typical distribution requirement system that “sidestepped” important debates about the content of the curriculum and instead offered “a conglomerate of courses conceived along specialized disciplinary lines” (p. 48). *A New Vitality* argued that general education programs should develop specific competencies and abilities in students, and that these competencies (e.g., critical thinking, problem solving, inquiry in writing) must be grounded in content. The question of what content was suitable for all students, the task group acknowledged,

was complicated by the diversity of the student body, which differed by “age, race, sex, social and economic background, abilities, attitudes, ambitions, and goals” (p. 6).

The task group proposed a broad plan for improving general education that included integrating general education throughout the undergraduate years, improving student advising, involving commuter students and improving residential life on campuses, expanding cross-cultural experiences, creating cross-disciplinary seminars for faculty and students, and organizing campus think tanks to explore the issues of undergraduate and general education. The report also called for student involvement in the assessment of general education, and of administrative support for creative efforts toward improvement of general education programs.

The AAC issued a second report on general education in 1994, titled *Strong Foundations: Twelve Principles for Effective General Education Programs*. This report was based on the experiences of seventeen institutions that had revised their general education curricula. Claiming that flawed conceptions of general education as breadth requirements that merely exposed students to different fields of study needed to be replaced with a new understanding, the report outlined twelve principles focused on communicating the value of general education and fostering support for it among students, faculty, and administration.

Concerns about course requirements and the proper content of general education curricula, however, continued. In 1996 the National Association of Scholars (NAS), a group known for conservative educational ideals, published *The Dissolution of General Education: 1914–1993*. Based on a study of fifty elite colleges and universities, the report claimed that since 1964, many of the required basic survey courses that taught students about the historical, cultural, political, and scientific foundations of their society had been purged from the curriculum. Course requirements in foreign languages, the sciences, mathematics, history, literature, and philosophy were reduced or virtually eliminated, and students now chose courses from broad and formless distribution categories. As a result of decreases in general education requirements, students were not learning a common core of knowledge.

Another AAC task force focused specifically on the undergraduate major (or study-in-depth). *The*

*Challenge of Connecting Learning* (1991) presented the results of a three-year review of liberal arts and sciences majors in the context of liberal education. Members of the AAC national advisory committee developed a set of organizing principles that guided the work of disciplinary task forces appointed by twelve participating learned societies. In its charge to the task forces, the committee asked the learned societies to address (1) faculty responsibility for shaping major programs; (2) organizing principles for study-in-depth; (3) processes for integrating learning; and (4) relations between the major and other parts of the undergraduate curriculum. Students, the committee contended, had a right to expect coherent and integrated curricula that addressed and encouraged relationships among subjects of study. *Integrity in the College Curriculum* urged faculty to help students develop critical perspectives on what they studied and to aid them in connecting what they learned to their lives and to the world of work. Finally, the committee appealed to faculty to create more inclusive communities of learners by reducing barriers to underrepresented students. Abridged reports of the twelve individual task forces were published in *Reports from the Fields* (1991).

In 1988 a report of the Professional Preparation Network, *Strengthening the Ties That Bind: Integrating Undergraduate Liberal and Professional Study*, argued that educators could use different plans to achieve similar purposes. A national task force of instructors from liberal arts and professional fields identified ten student outcomes that were common to both professional and liberal arts education, as well as specific outcomes unique to either type of program. The authors hoped that recognition of common purposes might ease tension in the debate between liberal and professional education and provide opportunities to develop proposals for integration.

### **General Commentaries on the State of Higher Education**

A few reports of this era examined higher education in general rather than the undergraduate curriculum specifically, and these reports often included some recommendations for curricular reform. A 1985 Carnegie Foundation Special Report, *Higher Education and the American Resurgence*, argued that education was essential to the advancement of key national interests. To ensure political, economic, and social health and progress, higher education

must produce individuals who can think creatively and act with conviction and concern. A coherent general education program would educate students for civic responsibility. To develop graduates who would think creatively and act responsibly, the report advocated active learning in the classroom and experiences in public service.

In *To Secure the Blessings of Liberty* (1986), the National Commission on the Role and Future of State Colleges and Universities expressed similar concerns about a constellation of social, political, economic, and educational conditions. According to this report, high dropout rates, poor achievement of underrepresented minority students, adult illiteracy, and the growth of the U.S. underclass jeopardized American society. Thus, the report recommended the integration of experiential and service learning into the undergraduate curriculum in order to expand knowledge about the workplace, cultivate a commitment to the public good, develop students' international perspectives and communications skills through the study of foreign languages and cultures, and improve graduates' abilities to understand science and technology so they could contribute knowledgeably to public discussions. The commission also urged state institutions to provide remedial education.

In 1986 the Education Commission of the States, in an attempt to identify how the states might effectively support improvements in postsecondary education, published *Transforming the State Role in Undergraduate Education: Time for a Different View*. Noting the challenges facing higher education (including student preparation for a changing society and workforce, diversity, and student involvement), the report recommended student assessment at all levels. The National Governors Association, in its 1986 report, *Time for Results*, also considered assessment a key to improving undergraduate education, arguing that assessment results should not only be used for improvement but also shared with the public. The recommendations on assessment in *To Secure the Blessings of Liberty* were more cautious, with the authors advising that assessment be used primarily to enhance program quality rather than as a means to ensure accountability.

In January 1993 four leading private foundations convened a working group to examine the question of what society needed from higher education. The resulting report, *An American Imperative: Higher Expectations for Higher Education*, echoed

concerns about student dropout rates, low educational standards, and credentialing: "The simple fact is that some faculties and institutions certify for graduation too many students who cannot read and write very well, too many whose intellectual depth and breadth are unimpressive, and too many whose skills are inadequate in the face of the demands of contemporary life" (Wingspread Group on Higher Education, p. 1). The report challenged higher education institutions to model the values they taught, to offer students' education opportunities to experience and reflect on their society, and to include moral and spiritual development among their goals. Furthermore, institutions needed to recommit themselves to student learning by setting higher expectations for learning and by effectively helping students to meet those expectations. Finally, the report urged institutions to align education with the personal, civic, and workplace needs of the twenty-first century. Many of the specific recommendations of the report focused on setting, communicating, and assessing goals and expectations.

The higher education community has responded in different ways to these various reports. Some colleges and universities have used the reports to stimulate discussion about the curriculum on their campuses, while a number of campuses have revised their major and general education programs. It is unclear, however, which of these actions were directly attributable to the calls for reform. The reports also had their critics. Feminists and pluralists disagreed with the NEH recommendations for assuming that a canon of works that all students should study could be identified, and for insisting on a Western humanities curriculum that excluded ideas from individuals of different classes, ethnicities, nationalities, faiths, and gender. Others challenged the ideas that students should passively accept tradition and that liberal education truly served society. For example, Daniel Rossides (1987) claimed that liberal education masked a conservative social agenda focused on preserving the self-interest and power of social elites. According to Rossides, the humanities were no longer relevant because the world they interpreted had disappeared.

## TRADITIONAL AND CONTEMPORARY PERSPECTIVES

The term *curriculum* has been associated with academic study and training in higher education since its appearance in vernacular English in the sixteenth century. At several points in its history, the term not only defined an identifiable course or plan of study in a university context, it also referred to the corollary body of scholars engaged in that coursework. As such, curricula refer to both an individual and collective learning experience. In common terminology, a curriculum vitae (literally, the course of one's life) is the accepted form of an academic resume, a brief account of a scholar's education and career.

In the United States, the curriculum designated the form and content of baccalaureate experience in early American colleges beginning with Harvard College in 1636. Because the term lent itself readily to documents in both English and Latin, university administrators and faculty used it frequently, and it appears consistently throughout seventeenth- and eighteenth-century sources. As institutions of higher education expanded rapidly throughout the period preceding the Civil War, the essential curricula forming the core of their instruction continued to

follow the academic inheritance of the classical Greek schools and medieval European universities. The quadrivium—the “higher” arts of arithmetic, geometry, astronomy, and music—fortified more basic instruction in the trivium: grammar, rhetoric, and logic. As early American universities matured, national and institutional leaders influenced curricula and advanced new ideas concerning university philosophy and purpose, especially as land-grant institutions and state universities were founded across the country in the nineteenth century. Academic course offerings in higher education typically reflected both federally recognized and funded curricula along with more localized learning needs. In this respect, curricula continue to serve functions recognizable in higher education today.

While most modern academic departments can trace their roots to the historic plans of study described in the quadrivium and trivium, more recent developments reflect the increasing specialization of academic and administrative systems within institutions of higher education in the United States. In the twentieth century, most societal institutions invoked rational principles and a scientific method of development. Just as the Industrial Revolution fueled technological advances in the nineteenth century, technological revolutions have propelled the form and function of educational institutions. In the latter half of the twentieth century, increasing percentages of the adult population in the United States enrolled in increasingly diverse types of colleges, universities, and vocational programs. The national demographic of education has shifted, and the curriculum in higher education has responded to and reflected changing political, socioeconomic, and cultural dynamics. Growing recognition of professional fields and the attendant expansion of professional education has also fostered curricular adaptation and evolution. As these developments have changed expectations for higher education, they have also transformed perspectives on the meaning and development of curricula.

### **Reflecting on Curriculum in Higher Education in the United States**

Curriculum enables people to make sense of our lives and the world around them. Individuals use curriculum with varying degrees of intentionality to interpret events, to deepen their understanding of what they learn and who they are as learners, and to create a shared experience for teaching and learning.

In simplest terms, any curriculum presents an academic plan, a designed progression of coursework framing a student’s experience in higher education. Certain curricula or designed plans mandate more rigidity and more refined coursework for the student, but minimum undergraduate requirements commonly include these emphases: inquiry and critical thinking; enhanced literacy; numerical comprehension; historical consciousness; scientific, ethical, and artistic pursuits; some kind of international or multicultural experience; and in-depth study in the student’s chosen topic or field.

Consonant with emerging conceptions of curriculum, contemporary perspectives on the curriculum in higher education in the United States consider the necessity of such academic plans and planning as representative of both educational and social experience, as a way of being in, understanding, and assessing a constantly changing world. In turn, researchers and practitioners alike are focusing on learning experiences in general and shared learning experiences in particular. Researchers in curricular studies regularly engage sociological, historical, cultural, psychological, and pedagogical issues in quantitative and qualitative inquiries. Increasing emphasis has been placed on measuring the outcomes of curricular design and implementation, measurements that help students and teachers alike determine the efficacy of curricula, the students’ balance between a breadth of knowledge and depth in training, and the continuity of learning and experience.

### **Developing Shared Learning Experiences: Recurring and Emerging Models of Curricula**

Several theorists have described the design, organization, and delivery of curricula in higher education, and scholars and practitioners from all disciplines have suggested approaches to curricular planning. Many of these approaches are anchored in the rationalist tradition underpinning institutions of higher education in the United States and offer rational models to guide contemporary curricular planning.

Ralph Tyler, arguably the first commentator on postsecondary curricula in the United States, published *Basic Principles of Curriculum and Instruction* in 1949. He posited four essential questions that could be used to structure knowledge in educational contexts: (1) What purpose shall the curriculum serve? (2) What experiences should the institution and its faculty provide to meet these expressed pur-

poses? (3) How might the curriculum be organized most effectively? (4) How can one best determine the outcomes of learning—the purposes and attainment of the curriculum?

In her 1962 book *Curriculum Development: Theory and Practice*, Hilda Taba provided, in essence, the first manual for curricular planning for a generation of college and university leaders. Taba furthered Tyler's essential questions by arguing that a change in the curriculum signals a change in the institution and charges teachers to play an active role in establishing goals and objectives for learning. Taba introduced a seven-step model for developing curriculum, and her efforts to create an orderly process spurred educational scholars to develop additional models and approaches.

Paul Dressel (1968) and Clifton Conrad (1978) advanced rational approaches that acknowledged Tyler's and Taba's seminal works but provided a more modern perspective on topics such as decision-making strategies, political influence, and the role of stakeholders in the curricular planning process. In the early 1980s, William H. Bergquist and his colleagues described eight curricular models that encompassed all undergraduate experience in the United States, models that described knowledge structured according to institutional mission and purpose: thematic, competency, career, experience, student, values, future, and heritage. Since the publication of their 1981 book *Designing Undergraduate Education*, other leading curricular scholars have refined and revealed diagnostic and formulaic assessments drawing upon the taxonomy of Bergquist and his colleagues and the curricular dimensions, or elements, essential to organizing curriculum. In a 1983 article Conrad and Anne M. Pratt examined these elements and introduced a model that considered inputs or curricular design variables that influence the process. Joan S. Stark and Lisa R. Lattuca, authors of the 1997 book *Shaping the College Curriculum: Academic Plans in Action*, also considered influences upon the planning process, in particular the characteristics of academic disciplines. They revisited the idea of curriculum as an academic plan and suggested that this can be used to develop a course, a program, or even a comprehensive college curriculum.

Since the 1980s several curricular scholars, including Kenneth A. Bruffee, William G. Tierney, Jennifer Grant Haworth, and Conrad, have advanced a perspective that acknowledges students as active participants in determining and assessing

their learning experiences in higher education. Their work, along with that of Marcia Baxter Magolda, Marcia Mentkowski, and Becky Ropers-Huilman, marks a departure from traditional, rational approaches and embraces the view that curriculum is more than a static plan created by faculty to direct the academic progress of students. These scholars contend that curriculum is socially constructed and, as such, reflects the engagement of students, teachers, administrators, and other stakeholders. This perspective is attracting renewed attention as enrollment and hiring patterns continue to shift in higher education. College and university students embody the most culturally diverse segment of the national population in the history of the United States, and they will inherit a complex of social, political, economic, and environmental problems. While the composition of student enrollment has changed, so has the number of students. In the early twenty-first century some 70 percent of high school graduates in the United States matriculated in some form of higher education, and educators have pointed to the need for the curriculum to address more holistically a learner's lifelong experience and the profound variation characterizing these experiences.

### Emerging Challenges in Creating Shared Experiences

Arguably the most significant opportunity for leaders of learning communities will be to create enriching shared experiences in healthy tension with diverse individual needs and interests. Existing and emergent perspectives on learning and curricular design, however, are not value-neutral and have engendered unprecedented competition and conflict. Fewer and fewer curricula, too, accommodate comprehensive training for individual learning styles and needs; national trends reflect increasing specialization and fragmentation of subject matter and methodology. Those who wish to create shared learning experiences will face challenges from within and beyond academe, challenges that ask people to understand their roles as teachers and learners, incorporate multiple perspectives on curricular content, and reconsider established curricular features including general education, the liberal arts, and the academic major.

**Incorporating multiple perspectives on curricular content.** Like any other aspect of an educational institution, the curriculum responds to external and internal forces and reflects the identity, assumptions,

and perspectives of decision makers affecting it. Curricular development and practice are not apolitical processes, nor are they static. A flurry of publications in the national media in the early 1980s testified to the importance of curricula in higher education; not only was the curriculum seen as an academic construct, it was also understood to be the repository of cultures, both national and multinational, and the historic medium for the transmission of cultural themes. The conflict of the so-called Culture Wars at the center of the discourse over educational missions and curricula in the 1980s and 1990s reflected a larger and longer shift in the national demographic of education. As more and more women and minorities matriculated in institutions of higher education, the curricula available to them as learners broadened as a result of this development. Some educational leaders and programs balked at more inclusive measures to redesign the curriculum, but the resurgent interest in control of curricula clearly signaled that what students read, and who decides what they will be reading, still shapes the national conversation about higher education and its purpose. Unlike any other single feature of an educational institution, the curriculum represents the core values and shared beliefs of communities. Developing shared learning experiences, then, requires that educational leaders invite and engage the values and beliefs of not one, but many communities.

#### **Balancing the individual and collective experience.**

Curriculum is the rational conversation between learner and coursework in higher education. It is the students' experience, on any given campus, of any given course; each syllabus represents one sequential or supporting piece of evidence that students have indeed engaged the institution. Curricula are as distinct as learners, and more differentiated than ever before in the history of education, in terms of guiding framework, applications and practices, and enrollments. Just as the term was used to imply both direction and pace in its original context in Latin, curriculum, much like a river, follows both a recognizably fluid and formed course.

In the United States, people in the twenty-first century will likely change careers and jobs several times in the course of their productive years. As the nature of employment changes within society, educational goals likewise shift. Curricula serve as an important measure of learning and student achievement within a shifting landscape, so any institutional assessment of curriculum should provide compel-

ling answers to increasingly demanding questions and needs of the society, the state agencies funding higher education, and the individual learners and participants themselves.

**Understanding general education as the formed course.** In the typical college and university setting, general education courses structure the core instruction that is provided by and required by the institution, and these courses usually occupy the first two years of coursework, regardless of a student's designated or intended field of study. These courses stress skills rather than specialized intellectual training, and they are usually designed to overlook disciplinary boundaries, to articulate and expand the implications of knowledge for students. Educators have long agreed that the integration of general requirements within curricula should repeatedly emphasize learning how to learn, the common process by which each individual student integrates their advancing knowledge and skills. Students must be able to meaningfully relate their classroom experiences and the insights they gain in less structured environments. Likewise, general education courses, or core requirements, at most institutions of higher education are designed to evoke the analytical and interpretive sensibilities of scholars and of learning communities, while also providing broader frames of reference for students.

The purpose of general education requirements is to provide coherence and unity in an otherwise specialized undergraduate experience, and to promote the social and intellectual integration of the students enrolled in these courses. Many university leaders have also argued that general education requirements provide students with readily accessible strategies for discerning truth, knowledge, and insight, that is, developing the most general and most useful skills and habits of the mind.

General education requirements are intended to provide a common experience but critics contend that such requirements cannot resolve the problems created by fragmentation and specialization. General education must be considered in concert with liberal and disciplinary studies in order to create meaningful, shared learning experiences.

#### **Recognizing liberal arts as a tradition of fluidity.**

In historical consideration of higher education, the liberal arts have formed a core curriculum since the formation of medieval universities in Europe, and they comprise a tradition of intellectual training that

transferred to most American universities. In theory, a liberal education affords educational experience that encourages and sustains lifelong learning—an education defined not necessarily by specific knowledge, as Paul L. Dressel explained in 1968, but instead by the ways in which individuals think and behave. In practice, the curricula of liberal arts balances innovative and imitative subject matter for undergraduates, generating a breadth of knowledge and depth of insight in the course of required readings. The historical emphasis of the liberal arts is tangible and includes the essential courses listed in the quadrivium and trivium; in modern institutions of higher education, however, the subject matter, pedagogy, and consequential learning of a liberal education typically orient students to the broad array of disciplines represented in the humanities in the evolved curriculum of medieval universities. A liberal arts curriculum asserts that certain texts have been proven historically to be most instructive to think with, although all texts might be useful to think about. In closer reading of these selected texts—the canon—learners engage in elemental inquiry, gaining insights into the nature and meaning of life, human purpose and ethos, and societal organization and improvement.

Leading theorists of liberal curricula have suggested that such an education improves students' cultural awareness and supports the education mission with an identifiable moral agency that affords students an appreciation of wisdom gained in the past. The emphasis is on knowledge as its own end—that learning is valuable for its own sake, and that learners engaged in learning on such levels inherently contribute in service to their communities, in the solution of complex problems, or in the creation of more informed public policies.

**Understanding the purpose of the academic major.** Under the influence of eighteenth- and nineteenth-century European university models, specific academic fields of study began to appear in the United States in the twentieth century, and since the 1950s, majors have become the standard units of curricular organization, the most obvious identifying feature of any student's coursework. Faculty and scholars affiliated with institutions of higher education have rearranged and aligned themselves according to subject matter and specialized areas of interest and research; departments have relocated themselves within institutions in more segmented and narrowly defined components. Learners are asked to organize

and align their own interests and coursework according to these educational constructs. The dominant scientific paradigm mandates increasingly refined focus in order to further inquiry and specify useful study. Rapidly expanding numbers of departments, majors, minors, and subspecialties have occurred throughout American higher education since the 1970s. Recognizably interdisciplinary fields of study (such as the liberal arts) have subsequently receded. This, some critics charge, has encouraged an overemphasis on specialization and denies students the opportunity for a liberal education.

## CURRICULUM, INTERNATIONAL

The field of curriculum studies is cluttered by an array of dissimilar definitions of the term *curriculum*. In empirical studies, definitions of curriculum run the gamut from those that would have the term signify everything that takes place in a classroom to others that restrict its meaning to only the topics that are defined as instructional requirements in the official policy of an educational system. There are also those that limit the definition of curriculum to only those topics actually taught by teachers.

In 1979, during the development of the Second International Mathematics Study (SIMS) conducted under the auspices of the International Association for the Evaluation of Educational Achievement (IEA), Curtis C. McKnight proposed a model that subdivides the curriculum into three components: the intended, the implemented, and the attained (see Figure 1). The intended curriculum is understood to be what an official educational agency (most often a ministry, secretariat, or other national or subnational agency responsible for guiding and articulating the educational intent of a system) expects to be taught or holds as learning goals in its educational system. The intended curriculum is thus distinguishable from both the implemented curriculum—the instructional implementation of the intended curriculum—which is therefore embodied in classroom instruction, and the attained curriculum. The at-

tained curriculum is understood to be the skills, knowledge, and dispositions that students effectively acquire as a result of their schooling. This model subdivides the curriculum for purposes of analysis, and the different levels are not considered wholly independent. This discussion makes use of this model, focusing primarily on the intended curriculum.

The intended curriculum acquired special prominence in educational policy in the latter half of the twentieth century. Many of the world's educational systems experienced a shift of focus in education policies during that period. Whereas the stress had traditionally fallen on improving material investments and guaranteeing universal access to public education, the 1980s and 1990s brought a stronger emphasis on the conceptual understandings, procedural knowledge, and other academic objectives to be met by all students in primary and secondary education—and thus a renewed interest in the intended curriculum as a critical policy instrument. The movement toward the development of educational standards in many educational systems reflects this emphasis on the quality of the content of the intended curriculum, as policymakers and educational leaders have favored the development of official curricula and a variety of implementation tools in order to ensure the delivery and attainment of socially significant disciplinary content. Most new curricula stipulate the acquisition of higher-order knowledge by all students, and such prescription tends to be informed by the type and amount of knowledge that is perceived to be critical for students to function effectively in society and in the economy.

A considerable body of work has been contributed to support the use of educational policy programs focused on the quality of the content of schooling in what has been termed content-driven systemic reform. It is stated that ambitious curriculum intentions must be formulated and subsequently appropriate mechanisms must be designed to implement these curricula so that students have the opportunity to attain high levels of achievement. Content-driven reform holds that a core specification of curriculum goals provides the basis for setting up a policy structure designed to enhance the achievement of pupils. Thus, the intended curriculum is intended to directly influence teacher training and certification, school course offerings, instructional resources, and systems of accountability.

Curriculum reform policy, as espoused in these reform theories, assigns to standards documents, curriculum guides, frameworks, programs of study, and the like a primary role in defining potential educational experiences. They are intended to help shape goals and expectations for learning. These visions are anticipated to guide the experiences of students in classrooms.

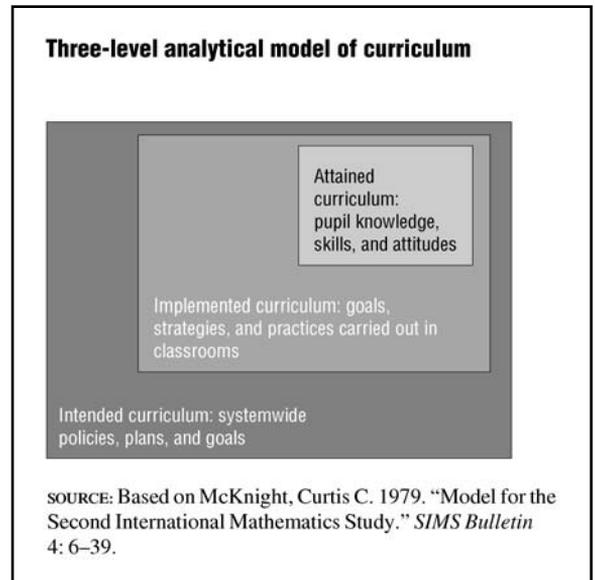

Certainly high expectations concerning the role of policies regarding curriculum intentions have been held in many countries. In a survey of thirty-eight nations conducted as a part of the Third International Mathematics and Science Study (TIMSS) the majority reported a number of reforms and managed changes in the content, pedagogy, and technology prescribed in national curriculum policy for school mathematics and science.

### Authority and Function

At the time TIMSS curriculum data were collected (1990–1992), curriculum guides published by national or subnational governmental bodies existed in all TIMSS countries with the exception of Iran. The guides all carried some degree of official status, although status and authority varied among countries and occasionally within a country in the case of subnational or regional guides. The significance of these documents varied substantially by country. Curriculum guides in Australia, for example, had titles such as “Course Advice,” whereas in Japan they were known as “National Courses of Study” and in Norway as “Curriculum Guidelines.” These diverse titles suggest different statuses and functions. Some guides specified the courses of study for which teachers were responsible. Others specified how teachers might pursue their goals and what types of instructional methods and assessment strategies might be appropriate. Still others left most implementation details to teachers and attempted to achieve their purpose solely by stating shared objectives.

These documents that set forth the intended curriculum for entire educational systems varied in the type of strategic elements they used to present policy and shape its enactment. Specifically, some strategic elements were more prescriptive than others were; they stated policies, formal objectives for instruction, and so on. Other elements were more facilitative; they included such information as suggested strategies for teachers, examples, and assessment ideas. The TIMSS analysis of intended curricula, however, revealed that there was a high

**FIGURE 1**

level of cross-national agreement on the use of a prescriptive approach to setting forth curriculum policy. Most countries favored the prescription of specific policies, objectives, goals, and contents in their curriculum guides, over the use of material that facilitated implementation through the suggestion of appropriate pedagogy, the use of exemplars of particular curriculum elements, or recommendations regarding appropriate ways to assess whether or not goals have been reached. In fact, the countries that exhibited the highest levels of mean student achievement on the TIMSS mathematics and science tests commonly had intended curricula with the heaviest reliance on the prescription of an inventory of skills and contents to be mastered by pupils, grade by grade, throughout primary and secondary schooling. Policy instruments balancing facilitative and prescriptive approaches were rare. This finding, coupled with earlier secondary analysis of SIMS data—which found that countries with the mostly highly centralized forms of curriculum policy structures were the most effective ones in guaranteeing the enactment of a given intended curriculum—provided evidence contradictory to policies intended to promote decentralized decision-making regarding educational goals or standards.

### Curriculum and Globalization

A particularly vexing problem for educational policymakers advocating content-driven reform has been the increasingly international character of dis-

cussions on the intended curriculum. Curriculum experts, professional associations, and policymakers became concerned with how standards defined in their own country compared to those in other countries, especially the countries they regarded as their most important economic competitors. Most traditional cross-national research provided little guidance here, as three associated theoretical-methodological perspectives largely guided it. A large amount of theoretical work was done in the 1970s, and this work largely concentrated on the structure of social and economic relationships that curricula were thought to promote or reproduce. This aspect of the intended curriculum was often termed the “hidden” curriculum, and many theoreticians in the Marxist tradition devoted their attention to describing its nature and its function in perpetuating the class struggle in the world’s most developed capitalist economies. Other theorists used dependency theory, another variant of the Marxist tradition that arose mostly from work done in political economy and economic history in Latin America and Africa, to develop accounts of the imposition of dominant models of schooling on nations of the economic and social periphery. These authors affirmed that the propagation of curricula from the great economic metropolises to the periphery was a particular instance of cultural domination within the framework of an international division of labor. A third tradition, largely influenced by “world systems” theories, studied aspects of curriculum associated with the worldwide expansion of enrollments in schooling. Theorists within this tradition argued that since the 1950s the “Western” model of schooling has spread throughout the world as part of a pervasive phenomenon of the emergence of an increasingly integrated world economic and social system. This was considered to have resulted, for example, in virtually all of the world’s educational systems according similar importance to mathematics and science education in their curricula.

But what of policymakers and curriculum designers who wished to find information to guide their efforts in promoting educational opportunities that would enhance national economic competitiveness? Increasingly, regardless of their specific economic circumstances, many countries developed a consensus in according much importance to prescribing rigorous curricula in academic disciplines, despite a paucity of strong empirical evidence at the time connecting achievement in these disciplines

with economic benefits (subsequently some evidence was advanced in the early 1990s that the character of mathematics courses taken in secondary school affects mean individual income levels, and that increases in hours allocated to elementary instruction in the sciences is associated with increases in national standards of living). Despite the apparent international consensus on the value of teaching mathematics and the sciences, for example, there was clearly considerable cross-national variation in the specific topics that were taught as part of these disciplines and the specific sets of skills and dispositions that were promoted in regard to these topics.

Interest groups in education across the world, such as governments, the business community, professional associations of educators, and many others, began to be concerned with the idea of “world-class standards” and were preoccupied with formulating rigorous and meaningful intended curricula that compare favorably with that elusive standard. But what precisely are “world-class” standards? What expectations do, for example, high-achieving countries have regarding essential knowledge and skills that children must acquire in order to meet the goals held for them by the educational system? As the attention to the intended curriculum increased among educational leaders and policymakers, it thus occasioned an increased interest in the possible educational application of another instrument that—like the idea of “standards” themselves—arose from modern business management strategies: international benchmarking.

**Benchmarking.** Benchmarking originated in efforts of business firms to identify external points of reference for their business practices in order to achieve continuous improvement. As such, the selection of the “point of reference” is central to determining how benchmarking studies can be used. From the perspective of educational systems, this choice is in effect a selection of the school systems from which they would like to learn. As the concern regarding the “international competitiveness” of intended curricula and the interest in benchmarking has increased, consequently so has interest in cross-national studies of student achievement. These have become of critical importance to policymakers, which explains the high levels of participation in the original TIMSS in the 1990s—and in subsequent endeavors conducted, most notably by the Organisation for Economic Co-operation and Development

(the Programme for International Student Assessment—PISA) and the IEA (through the continuation of TIMSS by way of the Trends in Mathematics and Science Study and PIRLS—Progress in International Reading Literacy Study).

The first published reports from the original TIMSS constituted important milestones in curriculum studies. In a pair of companion volumes the U.S. TIMSS research team used the first large-scale cross-national empirical study of the intended curriculum (termed the TIMSS Curriculum Analysis) to identify those curricular standards that are most common to TIMSS countries. These standards were then compared to standards in specific countries—beginning with the United States. Interest in cross-national benchmarking was acute given that on the one hand, a national policy objective was for U.S. schoolchildren to be “first in the world” in mathematics and science—and on the other hand, mean student performance on the TIMSS assessment at the close of the twentieth century proved the nation to be quite distant from that objective. Prior to the TIMSS curriculum analysis, no comprehensive effort to empirically measure and specify intended curricula using a large sample of countries and representative samples of curricular materials had ever been attempted.

These studies uncovered notable differences between the intended curricula of countries exhibiting high levels of mean student achievement in mathematics and science and that of countries with lower mean achievement levels. Focusing on the exhaustive characterization of the disciplinary content and expectations for student performance contained in standards documents and student textbooks, these studies resulted in findings with important implications for the development of curriculum policy.

These findings point to a variety of elements common among most high-achieving countries that are not shared by most low-achieving countries. They make up what appears to be necessary, but not sufficient, conditions for the realization of higher achievement for larger numbers of schoolchildren.

A number of low-achieving countries in the TIMSS had curricula that emphasized the coverage of long lists of topics. Conversely, highest achieving countries intended the teaching and learning of a more focused set of basic contents, to be explored in depth and mastered. The unfocused curriculum of

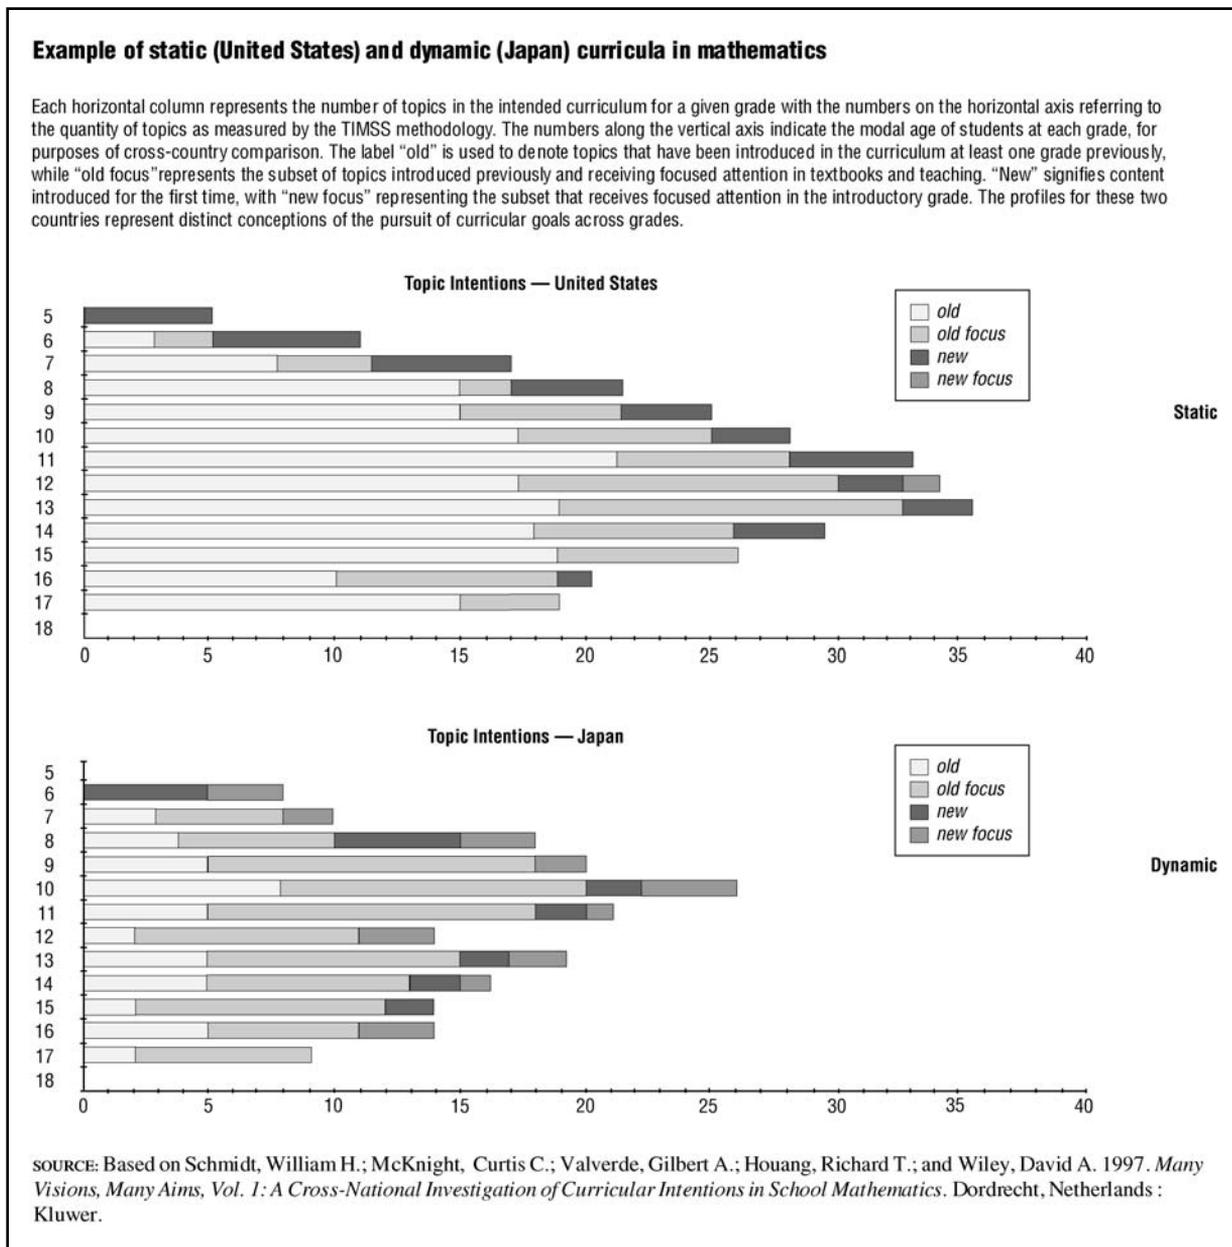

broad-ranging lists of topics to be covered is also typically a curriculum of very little coherence. TIMSS studies reveal that attempting to cover a large number of topics results in textbooks, and teaching methods, that are disjointed and episodic. That is, textbooks and teachers present items from the long lists of topics prescribed by these curricula one after the other, in an attempt to cover them all before the school year runs out with little or no effort invested in exploring the relationships between these topics or in fundamental unifying ideas or themes. Loss of these relationships between ideas appears to encourage students to regard these disciplines as no more than a series of disconnected notions that they are unable to conceive of as belonging to a disciplinary whole.

**Learning goals.** These benchmarking studies also reveal important differences in how school systems define learning goals. In a number of low-achieving countries—with the most relevant example being the United States—there is an extremely static definition of fundamental goals. That is, goals that are deemed fundamental (often termed “the basics”) are considered to be fundamental throughout schooling, requiring repetition in many grades. Arithmetic, for example, is a set of contents and skills prominent in curricula throughout the years of compulsory schooling. Even in eighth grade, when most high-achieving TIMSS countries concentrate their curricular focus on algebra and geometry, arithmetic is a major part of schooling in the United States.

In high-achieving nations, when goals first enter the curriculum they receive concentrated attention with the expectation that they can be mastered and that students can be prepared to attain a new set of different priority goals in ensuing grades. Focused curricula are the motor of a dynamic definition of curricular objectives. In most of the highest achieving countries, each new grade sees a new set of curricular goals receiving concentrated attention to prepare for and build toward mastering more challenging goals yet to come.

The consequence of lack of focus and coherence, and the static approach to defining what is basic, is that these types of curricula are undemanding compared to those of other countries. Materials intended for students in these countries cover a large array of topics, most of which are first introduced in the elementary grades. This cursory treatment does not include much more than the learning of algo-

FIGURE 2

arithms and simple facts. Demanding standards appear to require more sophisticated content taught in depth, as students progress through the grades. Rigorous standards are a result of a dynamic process of focused and coherent transitions from more simple to increasingly more complex content and skills. Figure 2 presents an illustration of the contrast between the static curriculum of the United States—a country that showed mediocre mean student achievement in TIMSS—and the dynamic curriculum of a significantly higher achieving Japan.

### Curriculum and Learning

The fundamental premise of educational reforms that focus on the intended curriculum is that the intended curriculum serves to support the creation of opportunities for students to learn. This is to say that the faith placed in standards—world-class or otherwise—is derived from the assumption that standards are associated with learning. This premise, until recently, had little empirical support. The original TIMSS study, however, by including comprehensive integrated data on all three levels of curriculum, pro-

vided an unprecedented opportunity to test this assumption in a number of ways. Results from these tests indicate clearly that the intended curriculum—oftentimes as mediated through textbooks—is significantly related to specific learning opportunities (that is, the pedagogical decisions of teachers) and consequently to the growth in knowledge and skills that students are able to demonstrate in achievement tests. It is also clear from this work that there are identifiable structural relationships among subareas in mathematics and science curricula that intensify their relationship with learning—such that learning one aspect of an academic subject is related not only to the specific opportunities that are provided to learn that aspect but also to opportunities to learn other aspects of the discipline that are structurally related. Further, there is evidence that the enactment of the intended curriculum—to be effective in promoting learning—is not simply a matter of covering the contents specified in the curriculum, nor even simply a matter of the amount of time devoted to teaching them. Clearly there are pedagogies that are more appropriate to achieve the levels of rigor and cognitive demand promoted by many of the world’s most ambitious curricula.

Thus, there is evidence that the intended curriculum deserves the intense attention of policymakers that it has enjoyed over the past decades. It is a key instrument in assuring access to rich and meaningful educational experiences. New methods have been developed to characterize and benchmark curricular material. These have resulted in the specification of many of the key features of curricula that would promote high achievement. Much empirical work remains, however, particularly in the area of determining whether it is possible to reconcile these most recent findings with the movement toward decentralized systems of curriculum policy formulation and enactment. Future scholarship must focus on the cultural traditions, policy instruments, and other formal and informal processes that determine how power over the intended curriculum is exercised at various levels in different educational systems; how different educational stakeholders interact in these processes; and how decisions regarding curricular objectives are made—with an eye to gauging their influence on the quality of educational experiences that students are provided.

## CURRICULUM, SCHOOL

### OVERVIEW

Ian Westbury

### CORE KNOWLEDGE CURRICULUM

E. D. Hirsch Jr.

### HIDDEN CURRICULUM

Catherine Cornbleth

## OVERVIEW

In its organizational aspect the curriculum is an authoritative prescription for the course of study of a school or system of schools. In their traditional form, such prescriptions set out the content to be covered at a grade level or in a course or sequences of courses, along with recommended or prescribed methods of teaching. In their contemporary form such prescriptions have been re-presented as national and state *standards*, outlining outcomes to be achieved by schools without prescribing the specific bodies of content to be covered or methods of teaching to be used.

Curricula in both of these senses are seen as defining what schools purposefully do. However, most scholars and administrators who work with curricula or evaluate the impact of curriculum prescriptions or reforms do not believe that “curricula-as-documents” direct the work of schools in significant ways. Curricula-as-documents are more often than not developed after the fact, and are based on existing practices of teachers or a simple listing of the content of textbooks being used. Further, many teachers are not familiar with the curriculum their district has mandated.

Nevertheless, curricula and curricular mandates are the objects of persistent and hotly contested debates around schooling, and are widely taken to be important. Interest groups, governments, school districts, and their staffs devote much time and attention to discussions of the curriculum. Why does the idea of the curriculum and curriculum reform assume such importance in educational discourse and policymaking? Is it possible to direct the work of schooling?

### Curricula, Education, and Schooling

All curricula emerge from ideas about what should be taught and learned, and how such teaching and learning might best be undertaken and then certified. As a result the fundamental question lying behind the prescription and development of all curricula is often seen as “What knowledge is of most worth?”—because it is the knowledge that is of most worth that education should, seemingly, reflect. In its ideological or philosophical aspect, much curricular thought seeks to articulate reasoned starting points for one or another form of curriculum. Such work can accept the framework of contemporary understanding of the scope and nature of edu-

cation and schooling. It can be critical, seeking to articulate the hidden assumptions around such categories as race, gender, and class that have driven, and drive, schooling in inappropriate, even morally wrong, directions.

However, looked at more analytically, the curriculum of the school reflects layered cultural understandings of what is considered necessary for young people to know or experience if they are to take their place in the social and cultural order. Thus, as the central component of a pervasive modern institution, the curriculum is necessarily a part of all of the sociological and cultural ambiguities within societies. As such, the scope and nature of the curriculum are viewed as critically important for teachers, parents, cultural critics, interest groups, and the employers of the graduates of the school. As the curriculum as an idea is seen through the eyes of all such groups, it becomes a mirror that reflects different visions of the society and culture, and the tensions within the society around, say, the proper nature of the work of schooling and/or status-attainment and employment possibilities. As a result inevitable and unresolved differences of viewpoint characteristically surface around all discussions of the curriculum as a symbol of both a normative order for education and of the quality and character of what schools are understood as doing.

For these reasons the history of curriculum thinking and practice is marked, on the one hand, by popular and professional conflict and debate about what the curriculum should be and how teaching should be undertaken and, on the other hand, by rationalization of the good and/or bad consequences of one or another curriculum. What, for example, should the curriculum that is most appropriate for young people be based on?

- The needs of the economy for human resources
- National or international ideals
- The need for societal and cultural change or preservation
- Ameliorating pervasive distinctions of gender and race
- The set of perennially “essential” and fundamental forms of knowledge and ways of thinking
- The forms of a life that is most worth living

As a result of the competition between such starting points, there is political, cultural, and policy conflict

around what should be authoritatively prescribed in curricula, how teaching should be undertaken, and how schooling should be organized.

The classification of such different conceptions of education and educating has been one of the core approaches used to give both teachers and laypeople a framework for approaching the normative issues that circle around such starting points for education and curriculum building. Often, as with Elliot Eisner and Elizabeth Vallance's 1974 classification, these issues are presented as involving perennial controversies. Thus in their frame there is a web of controversy built around an unresolved conflict among five classical curriculum "conceptions": (1) curriculum as the development of cognitive processes; (2) curriculum as technology; (3) curriculum as self-actualization or consumatory experience; (4) curriculum for social learning; and (5) curriculum for academic rationalization. But Eisner and Vallance also point to other ways of framing such debates: child-centered versus society-centered; futurist, that is, socially reconstructive, versus presentist or adaptive; values-centered education versus skills-training; and humanist or existential versus behaviorist models of education and teaching.

There are, of course, difficulties associated with such controversy-framed conceptions around the curriculum problem. Such overviews of curricular conceptions reflect abstractions about the curriculum rather than the practices of schooling. Most centrally, they do not reflect the complexities of curricular action.

Walter Doyle has sought to clarify the endemic questions around all curriculum thinking by pointing out that curricular action occurs at three distinct levels.

1. Institutional, where the issues center on policies at the intersection between schooling, culture, and society.
2. Programmatic, where the issues center on (1) the specification of subject content for schools, school types and tracks, with their core and elective course requirements or expectations, subject specifications, and so forth; and (2) the construction of appropriate content for classroom coverage within these subjects.
3. Classroom, where the issues center on the elaboration of the programmatic curriculum and its connection to the worlds of schools and classrooms in their real-world contexts.

For instance, all institutional work around either the scope and rationale of an optimal mathematics curriculum or how the teaching of reading should best be undertaken centers on metaphors that reflect idealized norms for an imagined social institution. More often than not the discourse is framed in terms of *reform* and the need for change if a convergence between a normative ideal and the ongoing work of schools is to be achieved. Such discussions rarely, if ever, connect in any immediate way to the central issues around either programmatic or classroom curricula. There the effective delivery of *existing* procedures and practices, and not reform, is the overriding preoccupation. Nevertheless, the image-making that is characteristic of curriculum policy debates within and among interest groups is important. Such debates symbolize and instantiate what communities should value. In this sense curriculum discussion, debate, and planning—and the public and professional processes involved in such work—is a social form for clarifying the role that schooling *as an idea* plays in the social and cultural order.

Programmatic curriculum work has two tasks. On the one hand, it is focused on the sociocultural, political, and organizational processes through which educational visions that are accepted by elites or publics are translated into operational frameworks for schools. Thus a policy language of "excellence" becomes the introduction of gifted programs in elementary schools or Advanced Placement courses in the high school. Programmatic work is also part of the search for solutions to operational problems, such as a mismatch between the capacity of a school system or school and enrollments, and the need to reconfigure a system around, for instance, middle schools. All such programmatic discourse and action seeks to precipitate social, cultural, and educational symbols into a workable and working organizational interpretation and framework. Such organizational frameworks, however, are only indirectly linked to actual classroom teaching. In such discourse and program building, teaching is seen as a passive agency implementing or realizing both an organizationally sanctioned program and its legitimating ideology. Curriculum work in this programmatic sense *frames* the character of schools and classrooms organizationally, as well as the ways in which schools might be seen within their communities. It does not direct the work of schools or teachers in any straightforward way.

At the classroom level the curriculum is a sequence of activities, jointly developed by teachers, students, parents and communities, that reflects their understanding of the potential for them of the programmatic framework or curriculum. At this level teachers, and the schools they work within, are active interpreters, not passive agents, of the mandated or recommended policy, programmatic, or organizational frameworks. Their interpretations may or may not be well articulated with the curriculum as imaged or mandated at the policy and programmatic levels. The educational legitimacy of such local interpretations, however, is not derived from the organizational framework of the curriculum. Instead it derives from the seeming match between what a local school is, and seems to be, doing and the understandings of its community about what its school can and should be doing.

But consistency among what a community's school does, the language and symbols used to describe and project that work, and the dominant ideologies and values is only one component of the framework for the school or district programs and curricula. Financial and/or personnel issues, state-sanctioned or state-funded mandates for programs such as special education or physical and health education, and the incentives for program change offered by governments and/or foundations are, more often than not, the immediate determinants of whether or not a school offers a pre-kindergarten program or upper-level "academic" courses.

In other words, the curriculum is the symbolic center of a loosely coupled system of ideologies, symbols, organizational forms, mandates, and subject and classroom practices that instantiates collective, and often differing, understandings about what is to be valued about the idea and the ongoing practice of education. At the same time the myth of an authoritative and hierarchical framework by which legislative bodies determine classroom work, with the curriculum as the agent of the linkage, is necessary for the legitimacy of a public schooling that is subject to political control. It is this paradox that gives all discussion of the curriculum its emotional force.

### Curriculum-Making in the Twentieth Century

In an essay written at the beginning of the twentieth century, John Dewey declared his pessimism about the implications for educational reform of a "settlement" he saw between progressive educational re-

formers, who controlled educators' ideologies, and conservatives, who controlled actual school conditions, and had little or no interest in reform. The settlement he described has persisted and has controlled most of the conventional historical writing on the twentieth-century curriculum of the American school. The histories of the American curriculum across the twentieth century offer accounts of the absence of real and lasting Progressive curriculum reform in the school, along with a search for explanations of the seemingly persistent failure of reform impulses. But it was fundamental change that marked the history of the curriculum in the twentieth century. This reality is most clearly seen in the history of the secondary school and its curriculum.

In the late nineteenth century the significant curricular questions around the idea of what was later termed *secondary education* centered on the character of the cultures present in secondary schools or academies—the conflict between cultures achieving its force from its interaction with the changing relationships between social groups. Should the curriculum offer as its core the traditional humanistic inculcation into the classical and liberal culture built around the teaching of Latin and Greek, or should it embrace "modern" subjects like science and English literature? Should the ideology of the high-status secondary school be exclusively liberal (i.e., centered on high-status classical or modern academic knowledge), or should it be directly or indirectly vocational in the sense that it might embrace and give educational legitimacy to agriculture, engineering, applied sciences and arts, and so forth?

The late nineteenth- and early twentieth-century programmatic resolution of these policy conflicts centered around the development of several secondary school types (e.g., classical and modern pre-university, technical/prevocational, and vocational schools), with each type seeking legitimacy in terms of a different curricular ideology and a different clientele of parents and students. At this time the high-status pre-university schools were schools for the elite only. Most adolescents who entered secondary schools sought employment well before graduation, or were enrolled in school types, such as normal schools, that did not lead to matriculation to a university.

In the 1920s and 1930s this situation changed dramatically in the United States in a way that was not repeated in western Europe until the 1960s. Schooling began to assume a much greater signifi-

cance in the pathway to adulthood, with the result that a new form of mass high school emerged as an alternative to apprenticeship as the way to work and adulthood. This new school offered the symbol of a high school diploma, along with a set of tracked four-year courses of study potentially open to the adolescent age cohort. This new school was, in Martin Trow's words, a "mass terminal" secondary school.

This new school required new legitimating ideologies that could serve to make it appear inevitable and desirable to both the range of its external constituencies and to the teachers who would work within it. Schooling as a preparation for work and life, (i.e., life-adjustment; citizenship; Americanization; child-centeredness; and, in the Great Depression, the vision of the school and the curriculum as a seedbed for social and cultural reconstruction) emerged as new educational ideologies to submerge (but not replace) the older public and professional ideology of academic training and mental discipline as the legitimate core tasks of the high school.

Seen in terms of their programs, however, these new schools offered reinterpretations of the modern curricular categories of the traditional high-status pre-university high school in their new, nonuniversity tracks, plus, as appropriate, prevocational or explicitly vocational courses. In other words, the program of the mass terminal high school did not build on the curricular potential of the technical or applied arts curricular traditions, or develop a new curricular form—although its extracurriculum of athletics and music did represent something quite new. It was, of course, the idea of the high school experience that its students and parents were seeking.

The years after World War II saw the second major transformation of the American school as a mass college-preparatory high school emerge from the prewar mass terminal school. This new high school required a rearticulation of the ideology of the high school curriculum with the ideology of the university, creating, in its turn, a need for new ways to frame popular and professional understandings. This required the rejection of the ideological platforms of the very different prewar high school. Thus, the college-preparatory role of the school reemerged into public visibility, a visibility most clearly symbolized by the comprehensive high schools being built in the new suburbs.

The new mission of the high school was presented in terms of academic development and the

need to teach the intellectual structure of the now symbolically important sciences of physics and math—a goal that was interpreted as having implications for national defense and the national welfare. Programs embodying the new ideologies were aggressively introduced as symbols of the new mission of the school, although the program-building practices of those years centered overwhelmingly on merely serving the expanding number of students enrolling in the traditional college-prep track.

The high school of the late 1960s and 1970s reflected the political and cultural turbulence, and the rejection of tradition, of those years. These years brought a renewal of the avant-garde ideologies and curricular platforms of the 1930s (often with a countercultural gloss) as well as of a vision of the school as a site for social, cultural, and racial reconstruction, social justice, and the like. Programmatically, noncanonical works appeared in literature courses; environmentalism emerged as a topic in science; courses in film, black studies, and so forth, emerged in many schools. With these changes the ordered institution of the school was being questioned symbolically and, as a result, appeared at risk. The subject categories of the school seemed to lose their clear meaning and significance, and the quality of, for example, urban schools became an issue as the racial and ethnic makeup of their student bodies changed from majority to minority students. Public anxieties around the symbolic meaning and effectiveness of the high school as the way to adulthood became the focus of demands for a restoration of more traditional understandings of the school.

These tensions were symbolized by the National Commission on Excellence in Education's 1983 report *A Nation at Risk*, an endorsement of the symbols of the "traditional" academic model of the pre-university high school. But most observers of the contemporary school agree that while, programmatically, courses have been renamed and given new rationales, classroom work has continued on its own trajectory. Middle school mathematics courses are renamed *algebra*, but traditional eighth-grade mathematics texts are used. And, to complete the picture of the stable ideological order around the curriculum that Dewey described, constructivism has come to serve as the educators' counterpoint to the symbolic conservative restoration.

### Rethinking Curriculum Discussions

Seen historically, it is clear that much, if not most, public discussion of the curriculum should be seen as a rhetorical form that seeks to stake out positions in the ideological space around the concept of the *school*. Such discourse, as Dewey noted, does not directly influence programmatic or classroom practice, which have their own logics. Thus looked at across the twentieth century, the Progressive educational and curriculum philosophies, conceptions, platforms, and developments that journalists' and educators' discussions have taken as significant have had little demonstrable impact on the day-to-day work of the school. They are part of the changing parade of ideologies and platforms that have been invoked to legitimate one or another image of the school as an institution.

When the characteristic forms of normative educational and curriculum philosophy are looked at analytically, it is clear that they cannot have any significant directive force on the complexities of schooling and teaching. Most important, what such discourse also fails to offer is any explanation of the overwhelming success of the school as an institution across the divides of race, class, gender, and so forth, and of the ways in which the curriculum has both contributed to, and responded to, this success. The secondary school as an institution has achieved an increasingly dominant role in the lives of children and youth across all developed nations. This dominance is overwhelmingly accepted by the societies and cultures that host the modern school, despite the tensions that can circle around it.

Elizabeth McEneaney and John Meyer have argued that all thinking and research around the curriculum, and by extension all policymaking and program development, must be grounded in the recognition of the overwhelming success of the school as an institution. For McEneaney and Meyer an understanding of the idea or model of the modern nation, and of the individually empowered citizen in the nation, lies at the heart of any understanding of the success of the school and the curriculum. Access to high-status forms of schooling has come to be seen as both as a right of citizenship and as a way of integrating citizens within the framework of a common national culture. This culture is, in its turn, seen as both inclusive and rational, a self-understanding that must be instilled by way of the curriculum that frames the knowledge and attitudes

that are seen to undergird the modern nation and modern society.

As a result of this twofold mission of incorporating the population and teaching an understanding of modernity, both the curriculum and teaching have become, paradoxically, increasingly participatory and expressive, yet increasingly rational in terms of their emphasis on mathematics and science, and tolerance of global and local diversity. Conversely, this modern curriculum has increasingly de-emphasized transcending (and often exclusionary) cultural or religious traditions as well as rigid patterns of allocation of student-citizens across schools or school types.

As the implicit expression of the pervasive modern self-image of the citizen and nation, these changes have not, and do not, take place as a result of planned activity or reform. Instead, they come about as the model of society, and modern models for the curriculum, are incorporated, in routinized ways, in the work of teachers and policymakers. Of course, this instantiation of the model of society in the school and curriculum has not come about as a linear process. There are cycles of reform and resistance, the product of the tensions between older and newer models of society and the school and between the global and the local. Organizational structures, as seen for example in the highly centralized French system, can make change problematic at times. In the U.S. school system, with its loosely coupled, locally based structures, many of the tensions that create the need for major cycles of curriculum reform in other countries can be contained. As McEneaney and Meyer point out, schools can be required at the policy level to teach sexual abstinence and at the same time hand out condoms in the classroom. The policy curriculum can be an object of controversy; but the programmatic curriculum works in stable, deliberate ways at further incorporation of youth into the idea and institution of the school, while the classroom curriculum selectively incorporates a changing model of schoolwork in unplanned and unorganized ways. The evolving, changing classroom curriculum can at times be celebrated symbolically at the programmatic level, and made very visible to local communities. Or it can be concealed by a skillful management of the programmatic models and symbols presented to local communities, with their diverse publics.

In one sense, such an "institutionalist" account of the curriculum can be seen as *Progressive*, in the

way that that term has been understood by educators for over a century. But Dewey, in common with most educational reformers of his time and since, bemoaned the absence in American society of what he saw as an appropriately Progressive theory of education, and insistently asked why this was the case in the face of the self-evident claims of the Progressive ideal. The institutional understanding of the curriculum outlined by McEneaney and Meyer, however, suggests that the United States, in common with all developed societies, has in fact institutionalized a normative democratic understanding of the curriculum and the school. It is this understanding that has determined, and is determining, the actual form of both the structures and work of schools.

An institutional understanding of the curriculum, and of the school that gives it agency, presents a major challenge to most of the ways that are used by educators to discuss the school curriculum. It offers a framing context in which their conventional approaches to understanding the curriculum might be placed while at the same time explaining what those approaches cannot explain.

#### CORE KNOWLEDGE CURRICULUM

More properly termed "the Core Knowledge Sequence," Core Knowledge is a grade-by-grade specification of topics in history, geography, literature, visual art, music, language, science, and mathemat-

ics for grades pre-kindergarten through eight. These topics are set forth with some specificity in a publication called *The Core Knowledge Sequence*, available from the nonprofit Core Knowledge Foundation.

The following is an example of the sequence in grade two history and geography:

## II. Early Civilizations: Asia

### A. Geography of Asia

1. The largest continent with the most populous countries in the world
2. Locate: China, India, Japan

### B. India

1. Indus River and Ganges River
2. Hinduism
  - a. Brahma, Vishnu, Shiva
  - b. Many holy books, including the *Rig Veda*
3. Buddhism
  - a. Prince Siddhartha becomes Buddha, “The Enlightened One”
  - b. Buddhism begins as an outgrowth of Hinduism in India, then spreads through many countries in Asia
  - c. King Asoka (also spelled Ashoka)

This example illustrates the specificity and the selectivity of the sequence, as well as its unique feature of providing solid content in the primary grades.

The selectivity of the sequence is partly a result of expert consensus on the importance of topics within a domain, but is mainly determined by whether or not this knowledge tends to be taken for granted in books addressed to a general reader, and whether or not it tends to be possessed by the top economic tier of U.S. society, but not by the bottom economic tier. The sequence is premised on the belief that if schools teach this enabling knowledge, the knowledge gap and the related income gap between the lowest and highest economic groups would be reduced.

The contents of the sequence have evolved as the result of field testing and consensus building, starting in March 1990, with a conference of some 150 teachers, scholars, and administrators meeting in Charlottesville, Virginia.

## The Goals of the Core Knowledge Curriculum

The basic goals of the Core Knowledge Curriculum are congruent with the basic goals of education in a

democracy: fostering autonomous and knowledgeable citizens, giving every person an equal chance, and fostering community. These basic goals are intertwined, and all of them depend upon shared knowledge. The acquired abilities that give people an equal chance in life are the same abilities that make for autonomous citizens and a cohesive society. That is because the ability to communicate and to learn is based upon the same foundation of shared knowledge as the ability to earn a living and to vote intelligently, as well as to communicate with fellow citizens. The founding theory of the Core Knowledge Curriculum was that an inventory of this shared knowledge could be taken, and that imparting this knowledge to all rather than a few would foster all the democratic aims (including the equity aims) of public education.

## Assessments of Effectiveness

Where Core Knowledge is implemented, the effects on achievement and equity have been highly significant both statistically and from the standpoint of effect size. The most important studies of actual school effects include a three-year study conducted by a team from Johns Hopkins University, and a large-scale study conducted by the Oklahoma City public schools. In the Hopkins report, “the gain difference on standardized tests between low and high implementing schools varied from 8.83 NCEs to 16.28 NCEs. That is an average rise of about 12 NCEs (similar to percentile points) over the controls, more than half a standard deviation—a very significant gain” (p. 26). (NCEs are Normal Curve Equivalents, a way of measuring where students fall along the normal curve when the mean is 50 and the standard deviation is 21.06.) The Oklahoma City study analyzed the effects of implementing one year of Core Knowledge in grades three, four, and five using the well-validated Iowa Test of Basic Skills. The study paired some 300 Core Knowledge students with 300 students not in the Core Knowledge program that had the same characteristics on seven variables:

1. Grade level
2. Pre-score
3. Sex
4. Race/ethnicity
5. Free-lunch eligibility
6. Title I eligibility
7. Special-education eligibility

Given the precise matching of these 300 pairs of students, the expectation would be that the end-of-year results of both groups would continue to be similar on the Iowa Test of Basic Skills. But, in fact, the Core Knowledge students made significantly greater one-year gains in reading comprehension, vocabulary, science, mathematics concepts, and social studies. The greatest gains—in reading, vocabulary, and social studies—were computed to be statistically highly significant. The vocabulary gain was especially notable, because vocabulary is the single best predictor of academic achievement and the area where the gap between ethnic and racial groups has proved to be especially difficult to overcome.

## HIDDEN CURRICULUM

*Hidden curriculum* refers to messages communicated by the organization and operation of schooling apart from the official or public statements of school mission and subject area curriculum guidelines. In other words, the medium is a key source of messages. The messages of hidden curriculum usually deal with attitudes, values, beliefs, and behavior. There are numerous such messages conveyed indirectly. For example, that reading and mathematics are the most important elementary school subjects is clearly if implicitly communicated by scheduling more time for these subjects than for others, such as science and social studies, scheduling them in morning prime time rather than in the afternoon, and testing them more often than other subjects or skills.

The messages of hidden curriculum may complement or contradict each other as well as the official curriculum. For example, while school social studies curriculum typically emphasizes and even celebrates democratic political systems and principles, such as one person-one vote, majority rule and minority rights, separation of church and state, equality before the law, and due process, these principles are not always practiced in public school classrooms and corridors. Hidden curriculum can support or undermine official curriculum. Prominent displays of athletic trophies in the hallway near the school's main office—but not recognition for debate or music or scholarship—communicates a hierarchy of valued accomplishments that puts sports ahead of academics. It is likely that hidden curriculum has the most impact when there is an aggregate or a pattern of consistent messages. When hidden and explicit curricula conflict, it may be that hidden curriculum, like nonverbal communication, carries more weight.

Much of the organization and culture of schooling now referred to as hidden curriculum was once explicit assertive socialization according to a 1977 study by Elizabeth Vallance. The nineteenth-century McGuffey readers, for example, were intended to inculcate good behavior, such as passivity, punctuality, and respect for authority, through their stories, Protestant Christian prayers, and direct admonitions. Such teachings became implicit, if not hidden, by the early twentieth century because they were seen to be working and could be taken for granted as natural and normal. Students new to U.S. public schools, such as recent immigrants, were expected to adapt

and fit in, for example, by looking at the teacher when spoken to, learning and using standard English, waiting (to speak, for the teacher's attention, for permission to use the toilet), and working hard.

Thus, a major purpose of the hidden curriculum of U.S. public schools has been cultural transmission or teaching students the routines for getting along in school and the larger society. In other words, hidden curriculum usually serves to maintain the status quo, specifically the dominant culture and prevailing socioeconomic hierarchy. It is this conservative bias, portrayed in articles by Jean Anyon and Michael Apple, that has been targeted by critics concerned about aspects of hidden curriculum, which work against diversity, equity, and social justice. Nonpublic schools, in contrast, such as Quaker or elite private schools, convey different hidden curriculum messages.

Earlier studies of hidden curriculum were conducted primarily in public elementary schools with a focus on academic classrooms. More recent work also has examined physical and business education and student cultures, with attention to messages about race/ethnicity, disability, and gender/sexual orientation as well as social class, politics, and culture. For example, Annette Hemmings investigated what she calls a "hidden corridor curriculum" that students have to negotiate in one way or another. Played out in hallways, lunchrooms, restrooms, and other nonclassroom spaces in two urban high schools she studied, it was dominated by a hostile, alienated youth culture antagonistic to typically middle-class school and social norms.

Two related aspects of hidden curriculum—sources of hidden curriculum messages—can be distinguished: the structural or organizational and the cultural. These categories and the illustrative examples that follow can be useful guides to what to look or listen for in examining the nature and extent of hidden curriculum at a particular school.

Structural or organizational aspects of hidden curriculum include time scheduling of classes and other school activities; facilities provided; materials, such as textbooks and computer software; examinations; required courses; special programs, such as speech therapy or advanced placement; extracurricular activities and services; and grading and grouping policies.

Cultural aspects of hidden curriculum include school norms or ethos; décor and wall decorations;

roles and relationships, including intergroup relations (within and between teachers and students); student cliques, rituals, and celebrations; and teacher expectations of various groups of students.

### Mediation and Effects

While considerable attention has been paid to the messages of hidden curriculum, relatively little has been directed to whether they are received, how they are interpreted, and what effects they have on individuals or groups. Messages sent are not necessarily received or interpreted as intended by the sender. Particularly when a school's hidden curriculum offers varied or contradictory messages, as all but the smallest and most homogeneous tend to do, students have choices regarding which messages to act on and how to do so. Most students appear to neither totally accept nor completely reject the various messages of schooling. Numerous students become adept at "playing school," that is, keeping up appearances and seeming to go along in order to gain advantage, such as good grades, without internalizing the school's values or views of the world.

While the incorporation or Americanization of generations of immigrants and their children attests to the effectiveness of hidden curriculum, evidence of specific effects on individuals or groups of students remains sketchy. Illustrative evidence comes from the political socialization and citizenship education literature. For example, according to a 1980 article by Lee Ehman, a classroom setting in which controversial issues are freely discussed and students believe that they can influence classroom events shows a consistently strong relationship with political and participatory attitudes, including higher political efficacy and trust and lower political cynicism and alienation.

In sum, the primary value of the concept of hidden curriculum is that it calls attention to aspects of schooling that are only occasionally acknowledged and remain largely unexamined. Messages communicated by schools' organization and culture can support or undermine their stated purposes and official curricula.

## CURTI, MERLE (1897–1996)

A leading U.S. historian, Merle Curti studied the complex relationship of education to democratic values and to capitalist institutions. Born in Nebraska, he went to Harvard for his B.A. and stayed to complete his Ph.D. He worked with both Frederick Jackson Turner and Arthur M. Schlesinger, Sr. During Curti's years as a graduate student, he became acquainted with Charles Beard, the most influential American historian between 1910 and the 1940s. Around 1910 Beard had joined with James Harvey Robinson and Carl Becker to call for a "New History." These three believed that historians should be aware of the ways in which they constructed narratives: they should be aware that their narratives either protected the status quo or worked to create a better future.

Curti was an enthusiastic practitioner of the "New History." He rapidly published three books—*The American Peace Crusade, 1815–1860* (1929), *Bryan and World Peace* (1931), and *Peace or War: The American Struggle, 1636–1936* (1936)—that were designed to strengthen the peace movement in the United States. Beard admired Curti's scholarship

and enlisted him to participate in the Commission on the Social Sciences created by the American Historical Association. The purpose of this commission was to improve the teaching of history at the high school and college levels. Curti was asked to write volume ten of the Report of the American Historical Association's Committee on the Social Studies in the School. This book, *The Social Ideas of American Educators* (1935), analyzed the educational philosophy of a group of men from the colonial period onward, concluding with John Dewey. Curti focused on whether the educational ideas of these men encouraged or discouraged the development of democracy. Like his mentors, Charles Beard and John Dewey, Curti argued that capitalism, with its emphasis on competition and with its hierarchical organization, was a threat to democracy. He shared Dewey's hope that schools could provide an alternative environment of cooperation and equality that would strengthen democracy in the United States. Curti's next book, *The Great Mr. Locke: America's Philosopher, 1783–1861* (1937), was another expression of his interest in educational philosophy.

Beard also enlisted Curti to provide leadership for a project of the Social Science Research Council of the American Historical Association. This project resulted in a group of essays called *Theory and Practice in Historical Study: A Report of the Committee on Historiography* (1946). Known in the history profession as *Bulletin 54*, this volume would, in the minds of Beard and Curti, help create a consensus among historians in the 1940s that accepted the outlook of the "New History." During this decade, however, the report received more criticism than support. Beard, Dewey, and Curti were isolationists. Many intellectuals believed in 1918 that American participation in World War I had been a mistake. By the end of the 1930s, numerous scholars were embracing internationalism and wanted the United States to participate in World War II. These pro-war historians believed that the "New History" encouraged a position of moral relativism that made it difficult to condemn the evils of totalitarianism and to support the traditions of liberty in the United States and England. The pro-war historians also argued that Beard, Dewey, and Curti were representatives for a "conflict" school of historical writing. Their emphasis on a conflict between capitalism and democracy would, according to a new school of "consensus" historians, divide the nation in wartime. The "consensus" historians who became dominant in the

1950s argued that there was no conflict between capitalism and democracy.

At the same time Curti experienced this professional political defeat, he experienced success in helping to establish intellectual history as a topic to be taught in history departments. In 1943 he had published an intellectual history of the United States and its colonial past, *The Growth of American Thought*. This book won a Pulitzer Prize, and a poll of historians in 1950 voted it the most important contribution to history between 1936 and 1950. It expressed Curti's belief that ideas should be rooted in social history. It was a challenge to the approach to the history of ideas represented by Arthur Lovejoy and the *Journal of the History of Ideas*. Curti criticized Lovejoy for discussing ideas as if they were autonomous.

After teaching at Smith College, Curti moved to Teachers College of Columbia University and then to the University of Wisconsin in 1942. At Columbia he had directed the work of Richard Hofstadter, who became a leader in the new field of intellectual history. Under Curti's leadership, the University of Wisconsin was probably the most important center in the 1940s and 1950s for the study of the intellectual history of the United States. Several of Curti's first students at Wisconsin—John Higham, Warren Susman, and David W. Noble—became, like Hofstadter, leaders in the new field.

Curti continued to publish steadily, producing eight more books after 1946. The most important of these was *The Making of an American Community: A Case Study of Democracy in a Frontier County* (1959). Here he tested the frontier thesis of Frederick Jackson Turner by a detailed analysis of census materials.

## DALTON SCHOOL

---

The Dalton School, founded by Helen Parkhurst in New York City in 1919, was one of the important Progressive schools created in the early part of the twentieth century and the home of the internationally famous Dalton Plan. In the early twenty-first century it is a competitive, elite, coeducational K–12 independent day school located on Manhattan’s Upper East Side.

Parkhurst opened her school in New York City, naming it after the hometown of her benefactress, Mrs. Murray Crane, of Dalton, Massachusetts. The Dalton School followed Parkhurst’s particular philosophy, “education on the Dalton Plan,” an innovative synthesis of the ideas of the American educator and philosopher John Dewey and Progressive school superintendent (Winnetka, Illinois) Carleton W. Washburne, which featured House, Laboratory, and Assignment, designed to individualize instruction and, concurrently, create community.

Parkhurst’s Dalton Plan reflected the child-centered Progressive movement of its time: often chaotic and disorganized, but also intimate, caring, nurturing, and familial. It focused on child growth and development, community and social service, and it strove to effect a synthesis between the affective and cognitive domains of the child.

In 1942 Parkhurst was forced to resign due to financial irregularities. By the time she did so, the Dalton Plan was firmly established from the nursery school through the high school. In addition, the Dalton Plan was internationally accepted as an important model for schooling and Parkhurst’s ideas had

been implemented in such places as Japan, the former Soviet Union, and the Netherlands.

Charlotte Durham, a teacher and administrator under Parkhurst since 1922, was headmistress from 1942 to 1960. She inherited an innovative, experimental, but financially troubled institution. Under Durham, Dalton was able to retain its child-centered pedagogy and its caring and familial orientation, while placing more emphasis on academic rigor. It was also administered in a more orderly and rational fashion and became perhaps less experimental and more a part of the traditional New York City independent school community. In essence, Durham’s genius was to create a tradition out of a Progressive experiment, using the Dalton Plan as its guiding ritual.

Donald Barr served as Dalton’s headmaster from 1964 to 1974. His educational background included attending the Progressive Lincoln School in New York City. He came to Dalton having been assistant dean of the Engineering School at Columbia University. Although a product of Progressive education, Barr had developed an educational philosophy closer to that of such conservative critics of Progressivism as Arthur Bestor. He thought Progressive education anti-intellectual and permissive and he sought to inject a rigorous and traditional curriculum into the Dalton Plan.

Under Barr, the parent constituency began to change, including a greater proportion of the recently affluent. The curriculum and physical plant expanded, enrollment more than doubled, the high school became coeducational, and the emphasis on academic rigor and achievement intensified still more. Reflecting an actual antipathy for Progressive education, Barr began the transformation of Dalton

into a large, academically competitive, fashionable—and even trendy—institution. Although Barr created a desirable school, his administration was rife with controversy, and in the end, he resigned under a cloud.

Gardner Dunnan served as Dalton's headmaster from 1975 to 1997. He came to Dalton in 1975 after a career as a public school administrator in a number of affluent suburban school districts—the first head to come from the public sector, rather than from the independent school world, or in Barr's case, the university. Dunnan continued Dalton's transformation into an organized, efficient, selective, and academically rigorous institution. He enlarged the physical plant and initiated the Dalton Technology Plan, which he promoted as the link between the Progressivism of Helen Parkhurst and the Dalton of modernity. The school's graduates continued to enter prestigious colleges and universities, reflecting the goals of its parent body. By the time Dunnan resigned amid financial and personal problems in 1997, the Dalton School had become a traditional, elite college preparatory school with only vestiges of its Progressive past.

After four years of uninspired leadership, in which certain members of the board of trustees filled the leadership vacuum, Ellen Stein, a former Dalton student, became head in 2001. Although the school continues to pay lip service to the Dalton Plan, and the school is more progressive than most public schools, it is a far cry from the school Helen Parkhurst founded.

## DECENTRALIZATION AND EDUCATION

The ways in which public primary and secondary education is financed and delivered varies greatly throughout the world. In France, education is highly centralized at the level of the national government, whereas in Canada the national government does not even have an education ministry, and in the United States education is mainly the responsibility of local school districts. Many developing countries and countries in transition to market economies have highly centralized government administration of education and other public services. During the 1990s and early twenty-first century, many of these countries began to decentralize education. This phenomenon proceeded fastest in Latin America and eastern Europe, but several countries in Asia and Africa also began initiating decentralization policies.

### Definition

*Decentralization* is defined as the transfer of decision-making authority closer to the consumer or beneficiary. This can take the form of transferring powers to lower levels of an organization, which is called deconcentration or administrative decentralization. A popular form of deconcentration in education is to give additional responsibilities to schools. This is often called school autonomy or school-based management and may take the form of creating elected or appointed school councils and giving them budgets and the authority to make important educational decisions. Deconcentration may also take the form of empowering school directors or directors and teaching faculty to make decisions within the school.

Another form of decentralization, called devolution, entails transferring powers to lower levels of government. Most often, education responsibilities are transferred to general-purpose governments at the regional or local levels. Examples are the decentralization of basic education to local (district) level governments in India and Pakistan. In rare cases additional responsibilities are given to single-purpose governments, such as the local school district in the

United States. When education responsibilities are transferred to general-purpose governments, the elected governing bodies of those governments must make decisions about how much to spend on education versus other local services.

### Measurement

The measurement of education decentralization is especially difficult. Economists often measure decentralization to lower levels of government by looking at the percent of educational revenues that come from local (or regional) sources, or, alternatively, by looking at the share of educational resources—whatever their origin—that local governments control. Using these measures, education is highly centralized in countries such as Greece, Italy, and Turkey and highly decentralized in countries such as Canada, Norway, the United Kingdom, and the United States.

However, these measures may be misleading when central governments mandate educational policies or programs that require the local government to allocate its revenues in a certain way. Mandating reductions in class size or the creation of special education programs, for example, reduces the degree of power the local government has to allocate its own revenues or resources. In the United States, the federal and state governments influence local education resource allocation both through unfunded policy and program mandates and through the use of conditional grants-in-aid, which require local governments or school districts to match federal or state funding for certain purposes. The combination of these mandates and conditional grants results in local school districts having discretionary expenditure control over only a small portion of their revenues and budgets.

An alternative means of measuring education decentralization is more subjective and entails (1) identifying the major decisions made regarding the finance and provision of education and (2) answering the question, who makes each decision? The Organisation for Economic Co-operation and Development (OECD) has developed a methodology for measuring the degree of education decentralization. This methodology divides educational functions into four groups: the organization of instruction, personnel management, planning and structures, and resources. The content of each group is given in Table 1.

**TABLE 1**

<b>Types of decisions that may be decentralized</b>	
Organization of instruction	Select school attended by student. Set instruction time. Choose textbooks. Define curriculum content. Determine teaching methods.
Personnel management	Hire and fire school director. Recruit and hire teachers. Set or augment teacher pay scale. Assign teaching responsibilities. Determine provision of in-service training.
Planning and structures	Create or close a school. Select programs offered in a school. Define course content. Set examinations to monitor school performance.
Resources	Develop school improvement plan. Allocate personnel budget. Allocate nonpersonnel budget. Allocate resources for in-service teacher training.
SOURCE: Adapted from the Organisation for Economic Co-operation and Development.	

Some educational functions are decentralized even within centralized systems, and others are centralized even within decentralized systems. An OECD survey of its members, for example, shows that, even in centralized systems, schools make most of the decisions about the organization of instruction. On the other hand, in many countries most personnel-management decisions are made at a central level.

Measuring decentralization by answering questions concerning who makes decisions in what areas does not provide an easy answer as to how decentralized one country's education system is relative to another's. Not all decisions are equally important. Indeed, one decision-making area is far more important than the others. Teachers and other school staff represent about 80 percent of total recurrent education spending in developed countries and more than 90 percent of total recurrent education spending in many developing countries. Research on learning also demonstrates that teachers and their ability to teach are the single most important factor in the school that affects learning. Thus, a shortcut for determining whether one country is more decentralized than another is to compare the countries' policies in personnel management. Countries that allow school councils to select school directors and allow schools to recruit, hire, and evaluate teachers have already achieved a significant degree of decen-

tralization even though school finance may still be highly centralized and teachers may be paid according to a national pay scale.

### **Rationale**

The rationale for education decentralization tends to be associated with four distinct objectives: democratization, regional and/or ethnic pressures, improved efficiency, and enhanced quality of schooling. Several countries with a history of authoritarian government have decentralized government in the name of democratization. More specifically, decentralization in these countries is designed to increase the voice of the local citizen and to empower the citizen to more fully participate in decision-making at the local level. Democratization has been the rationale for transferring education responsibilities to local governments in countries as diverse as Poland and Brazil.

In other countries, there have been pressures from regionally based ethnic and language groups to develop their own curriculum, teach in their own languages, and manage their own schools. A good example of this is Spain, where initially the Basque and Catalan regions gained the right to manage their own educational systems, followed later by other regions.

One of the potential benefits of decentralization is increased accountability to the citizen/beneficiary, resulting in improved efficiency in the use of school resources. The improved efficiency results from two effects. One effect is the better match between services provided and the preferences of citizens. The other effect is increased output relative to resources or expenditures. Chile is an example of a country where education was decentralized to local governments primarily in the pursuit of greater efficiency.

When education is decentralized in pursuit of democratization, or in response to regional/ethnic pressures, it is usually just one of several services being transferred to local or regional governments. In addition, educators often resist decentralization for these purposes, fearing greater inequality in spending and educational outcomes. On the other hand, when education is decentralized in pursuit of greater quality, it is usually done as part of a larger reform promoted by educators themselves. An example of this can be found in several large U.S. cities where school councils and school directors have been given greater decision-making autonomy. At

the same time, however, the performance of schools is carefully monitored, and schools are held accountable for improved performance to both parents and system administrators.

These four objectives account for most, but not all, of the reasons for education decentralization. Some countries have transferred the finance and delivery of education to lower levels of government to help solve the central government's own fiscal problems. Argentina, for example, transferred education from the national to the regional governments in order to reduce central government fiscal deficits. Since the education sector employs more personnel than other sectors and also requires large recurrent salary expenditures, it is a tempting target to decentralize for fiscal reasons. Other countries have given local governments the authority to run their own schools as a means of circumventing central government bureaucracies in order to rapidly increase enrollments in remote areas. El Salvador provides an example of decentralization to remote rural communities for this purpose.

### **Implementation**

Like other education reforms, decentralization can result in political winners and losers. The potential winners are those gaining new decision-making powers, while the potential losers are those losing those powers. Two of the potential losers—civil servants and teacher unions—are sufficiently powerful that they can effectively stop decentralization processes. The civil servants working in education ministries have perhaps the most to lose, because some of their jobs become redundant and their power to influence the allocation of resources may be diminished. In countries where corruption in government is a serious problem, reduced power will be also reflected in a reduced ability of civil servants to extract financial or in-kind rents. The leaders of national teacher unions also lose power to the extent that salary negotiations, teacher recruitment, and teacher promotion are moved from national to lower levels of government. Union members may also fear lower salaries if the funding of education is moved to local governments with fewer sources of government revenues. In countries where being elected head of a teacher union is an important stepping-stone to a political career, decentralization of labor negotiations is likely to reduce the political importance of leading the national union.

The implementation of education decentralization reforms can either be rapid or slow. Legislative or constitutional changes that immediately transfer responsibilities from the national to lower levels of government run the risk that lower levels of government will lack the required administrative capacity required to manage the system well. The result may be disruption in the delivery of schooling to children that adversely affects their learning, at least for a time. A more gradual decentralization can allow powers to be transferred to lower levels of government as those governments gain administrative capacity. The difficulty with gradual decentralization is that it may never occur at all, as the potential losers marshal their forces to fight the policy change.

In some countries with serious problems of internal conflict, weak public bureaucracies, or very weak government finances, one finds *de facto* decentralization of education. In these cases, the central government abdicates its responsibility for financing and providing public education, especially in remote areas, so local communities organize and finance their own schools and recruit and hire their own teachers. In Africa, the countries of Benin and Togo provide examples of community control and finance of schools resulting from the lack of central government supply. In other cases, the central government finances an inadequate number of teachers and other school resources to ensure schooling of adequate quality. In these cases, parents may form school councils to raise revenues to hire additional teachers, construct and equip school buildings, and provide other school resources. By virtue of their important role in funding education, parents and school councils may exercise significant decision-making power.

### **School Finance**

The financing of decentralized education can be very complicated in systems where two or three levels of government share financing responsibilities. The choices for financing education in such systems can be framed as follows: (1) central versus local funding, (2) conditional versus unconditional grants, and (3) negotiated versus formula-driven grants. The choices made concerning education finance are extremely important as they determine both the degree of effective control local governments have as well as the implications for efficiency and equity.

The single most important choice is whether the level of government providing education (in most

cases, the local government) is expected to generate its own revenues for education from its own tax and other revenues sources or if it will receive the bulk of the required educational revenues from a higher level government. Local government capacity to generate revenues (i.e., its tax base, or its fiscal capacity) tends to vary widely across local governments within regions or countries. Thus, requiring local governments to raise all their own revenues for education ensures an unacceptably high degree of inequality in spending per child. Countries where local governments finance education from their own source revenues (e.g., Brazil, the United States) have adopted intergovernmental grants to help even out spending inequalities. In the case of Brazil, the central government provides additional financing to ensure each jurisdiction spends a minimum amount per student. In the case of the United States, school finance policies vary by state, but in general they, too, ensure a minimum level of spending and, in some cases, put a cap on the maximum amount a local school district can spend.

Most countries have made the choice to fund a large portion of primary and secondary education spending from either the regional or national government budgets. This funding can be provided in one of two ways. Monies can be transferred from the central government to either the general fund of the local (or regional) government or to a special education fund of the local (or regional) government. In the former case, the local or regional government receives funding sufficient to cover a large portion of expected education expenditures, but the local or regional government makes the decision of how much to spend on education. In the latter case, the local or regional government is required to spend the grant monies on education only. Requiring grant monies to be spent on education ensures adequate education spending but reduces the expenditure autonomy of the local (or regional) government.

Once a decision is made to transfer monies to lower levels of government, a further decision needs to be made as to how to determine what amount of money should be transferred to each receiving government. The basic choice is whether to negotiate that amount between governments or to determine the amount using a capitation formula. Negotiation has political advantages in that it allows central governments to reward their political allies, and thus it is often popular. Capitation formulas, however, are more equitable and may also provide incentives for

educational performance. Chile, for example, determines how much it provides to each local government based on a formula that includes indicators of educational cost, educational need, and student average daily attendance. Since local governments receive more revenues if more students are enrolled and attending regularly, the formula has encouraged those governments to undertake campaigns to keep children in school.

### Effects of Decentralization

It is extremely difficult to disentangle the effects of education decentralization policies from other variables simultaneously affecting educational outcomes, and there have been few rigorous attempts to do so. Two studies that did attempt to isolate the effects of devolution in Central America concluded that it increased parental participation, reduced teacher and student absenteeism, and increased student learning by a significant, but small, amount.

## DECISION-MAKING IN DEVELOPING NATIONS, APPLYING ECONOMIC ANALYSIS TO

In mainstream economic analysis, education is seen as a production process in which *inputs* (e.g., students, teachers, and textbooks) are combined to yield desired *outputs* (e.g., student learning) within the education sector, and larger societal outcomes outside the sector (e.g., increased earnings in the workplace or greater social equality), under the prevailing educational technology (encompassing pedagogy, curriculum, and school organization) and input prices. A major application of economic analysis is to inform decision-making in education in order to improve efficiency in educational production; that is, producing more desired education outputs and outcomes given educational resources. Analytically, educational efficiency can be distinguished as internal efficiency and external efficiency. Internal efficiency relates educational outputs to educational inputs, while external efficiency relates educational outcomes to educational inputs. Analysis of educational efficiency is not confined to economic concerns only, since educational outputs and outcomes also pertain to social and political dimensions of national development.

A substantial literature exists concerning the economic analysis of educational development in developing nations. Developing nations are not a homogenous group; there are substantial differences between them in terms of the level of socioeconomic development, extent of ethnic and religious diversity, history, and cultural values.

### Internal Efficiency of Education

The internal efficiency of education is improved when more education outputs are produced at given education resources or fewer education resources are used in producing the same amount of education outputs. Thus educational economic analysis is cen-

trally concerned with the production of education outputs and with education costs.

An educational production function is a mathematical construct that mainstream economists and researchers from other disciplines often use to study educational production. It relates some measure of education output (e.g., student achievement) to various inputs used in education (e.g., student characteristics and family background, teacher characteristics and other school-related factors). An early application in developing nations is the 1975 study by Leigh Alexander and John Simmons that found that family backgrounds and socioeconomic factors, not school factors, were the most important determinants of student achievement. But a 1983 study by Stephen Heyneman and William Loxley countered that school factors could also affect student achievement, and that such factors had stronger effects in low-income nations than in high-income nations. Other studies also tried to identify school factors that could boost student learning and to show that spending on school quality could have a good return. These studies argued that it is not enough to focus on quantitative development of the education system, and that the government and the donor community should pay more attention to improving school quality. Patrick McEwan and Martin Carnoy's 2000 study and Emmanuel Jimenez and Marlaine Lockheed's 1995 study of educational production include data that compare the effectiveness of public versus private schools and that employ more sophisticated statistical techniques.

The costs of education refer to resources utilized in the education production process; they include not only government expenditure on education, but also household spending on education and the foregone opportunities of schooling (e.g., gainful employment). Education cost studies range from macroanalysis of national educational expenditures across nations to microanalysis of educational decision-making by individuals and households. Cross-national studies have found that government spending on education (as a percentage of national output) has declined in the developing nations since the 1980s, after a rising trend in the 1960s and 1970s. Studies in a number of developing nations have shown that private spending on education is a significant part of the total spending on education, and that private costs are an important source of educational inequality and inequity in these nations. In addition, household education costs could be a

heavy economic burden on poor and rural households, resulting in negative educational consequences such as dropping out. Financial assistance targeted at poor and rural populations should be part of the overall strategy to improve school attendance for marginalized population groups. There is a need to carefully estimate the costs of educational inclusion of marginalized groups because such costs tend to be quite different from those for nonmarginalized groups.

Privatization of schooling has been proposed as a strategy for improving the effectiveness and cost-effectiveness of education in developing nations. Proponents of privatization argue that private schools are more effective and are more likely to be less costly than public schools. Competition in the education market could also lead to improvement of public schools. Critics of privatization point out that there is no conclusive evidence to show that private schools are more effective than public schools. For example, in 2000 McEwan and Carnoy found that Chile shows different types of private schools—some more effective; others, less effective than government schools. An unpublished review by Mun C. Tsang of the costs of public and private schools in developing nations finds that most studies tend to underestimate the costs (thus overestimate the internal efficiency) of private schools relative to public schools. Controversy remains as privatization is concerned not only with cost-effectiveness, but also with opposing ideologies and competing goals of schooling.

A subject of sustained interest in developing nations is the economic analysis of new educational technology because of the need to provide educational services in remote and sparsely populated areas, to reduce unit cost and meet educational demand under very tight government education budgets, and more generally to improve educational quality through more cost-effective alternatives to traditional schooling. Studies found that small media (e.g., radio) were less costly and more cost-effective than large media (e.g., television). Distance education is an effective way to reach learners in remote and sparsely populated areas. Cost analysis indicates that programs using educational media demonstrate economies of scale. But since they require large start-up costs, these programs have to have large enrollments and a long period of operation in order to be comparable to traditional schooling in terms of unit costs. The use of computers in

the school context has had mixed success. Of particular current interest is the use of the Internet in education. It is necessary to ascertain the potential of the Internet in developing nations and to address the concern of some observers that there is an increasing digital divide between developing nations and advanced industrialized nations. A mindful introduction of new technology into education, informed by a careful analysis of the education problems to be addressed and the range of technological alternatives available, is highly desirable.

Teachers are a key input in educational production, and an adequate supply of skilled teachers is a prominent policy concern in many nations, including developing ones. Not unexpectedly, teacher supply is influenced by such factors as teachers' salaries and working conditions relative to those in other occupations, and the costs of teacher preparation relative to those for other occupations. The harsh working conditions in rural areas in developing nations often lead to a shortage of skilled teachers in these areas. In some developing nations, low educational quality is related to the existence of a significant proportion of untrained teachers, an uneven distribution of teachers across schools, and teacher absenteeism. There is a lack of published studies of teachers' markets and the utilization of teachers in the developing world.

Educational finance is an important domain in education economics since it deals with the mobilization and allocation of resources in the production of education. For many nations in the developing world, especially poor ones, external resources, in terms of bilateral or multilateral assistance, are a key source of funding for educational development. However, international funding is becoming more problematic over time because of a combination of factors, including declining financial support from advanced industrialized nations, the increasing demand and competition among receiving nations, and the imposition of more stringent conditions for receiving aid. Economic reforms pushed by the International Monetary Fund in developing nations often impose strong limits on government spending. Such a policy was associated with negative effects on the education sector in much of the 1970s and 1980s. Since the 1990s international development agencies have become more vocal in calling for more spending on the social sectors, including education. The ability of developing nations to finance educational development has also been hampered by the need of

each government to make interest payments on international and domestic debts. Increasingly, there is a call that debt relief for developing nations and for international development agencies be in the form of grants instead of loans to these nations, especially in the social sectors. As the leadership of the World Bank pointed out in 1995, however, debt relief is only part of the solution; what is also needed is the opening up of agricultural and other markets in advanced industrialized nations to products from developing nations.

It would be misguided to focus only on central government and external sources for financing education. In many developing nations, the community has been an important source, in cash and/or in kind, for educational development. Community involvement is useful not only for financial reasons, but also for educational and accountability purposes. Participation from parents and community members can discourage teacher and student absenteeism. In addition, fiscal and administrative decentralization in education have the potential for not only mobilizing additional resources to education from various levels, but also enabling more informed and more efficient decision-making about education matters at the local level. To mitigate the disequalizing and inequity effects that often accompany decentralization, however, central and regional governments need to provide equalization aid to poor and rural areas. Moreover, nongovernmental organizations (NGOs) could have an important role to play in raising additional resources for education and/or in implementing educational programs, particularly for marginalized populations. Finally, there is an increasing emphasis on cost recovery in education, especially at the higher-education level, so that the financing responsibility is shifted more from the government to households.

### **External Efficiency of Education**

The external efficiency of education is improved when more education outcomes are produced at given education resources or fewer education resources are used in producing the same amount of education outcomes. During the closing decades of the twentieth century, emphasis in developing nations regarding educational development has been placed on three broad outcomes of education: contribution to economic growth and competitiveness, improvement in social equity, and poverty alleviation.

According to human capital theory, education is a form of human capital that could raise the productive capacity of individuals in economic production. Empirical studies in agriculture found a positive and significant relationship between productivity and education. At the macro level, education was also associated with economic growth. Spending on education can be seen as an investment activity with both costs and benefits, and thus subject to a cost–benefit analysis. A review of rate of returns studies, such as the 1994 study of George Psacharopoulos, found that in developing nations education had a high rate of return and that the return was higher at lower education levels. Paul Bennell, however, has criticized these studies, in terms of appropriateness of method and quality of data. Some analysts, such as Ronald Dore, point out that educational expansion in a depressed economy could lead to unemployment of the educated or overeducation. Nevertheless, there is increasing consensus across nations that human capital, particularly in terms of problem-solving skills, communication skills in a diverse setting, and the ability to adapt to change, can enhance economic competitiveness in the global economy of the twenty-first century. There is also increasing attention to investment in preschool education and in education for sustainable development.

### Growth with Social Equity?

There have been different views on whether increased economic growth and improved social equity could coexist. Using the experience of eight East Asian economies, the World Bank concluded in a 1993 publication that growth with equity was possible. This study made a guarded but positive assessment of the role of education: education was only one of many contributing factors to growth with equity but appropriate education policy did matter, especially in terms of adequate investment in education and the focus of government policy on lower levels of education. The financial crisis that began in 1997, however, underscored the importance of noneducation factors that could affect the health of the economy in these nations.

Earlier efforts in promoting education for poverty reduction have been accompanied by high hope and disillusionment. The urgent need for poverty reduction in the developing world is reflected by the World Bank's redefining itself as a poverty-reduction organization. There is common under-

standing in the early twenty-first century that “quality basic education for all” is an important part of the overall strategy for poverty reduction. But education alone is not sufficient; rather a multisectoral approach involving related interventions in agriculture, education, health (including addressing the AIDS epidemic), credit market for small producers, and other social sectors, is needed. Poverty reduction also requires targeted interventions. Women are one of the most important targeted groups because they are often subject to multiple disadvantages in the developing world. Increasing educational access and improving quality for girls could have profound economic, social, and political benefits for women and for society.

## DECISION-MAKING IN SCHOOLS, APPLYING ECONOMIC ANALYSIS TO

---

In the 1999 through 2000 school year, spending for all levels of education amounted to \$646.8 billion. According to the National Center for Education Statistics, of this total, \$389 billion was spent for K–12 education and the remaining \$257.8 billion was expended by postsecondary institutions. Despite the substantial financial commitment to education, the impact of economics on the way educational institutions allocate and use their resources has been remarkably limited. Economics is concerned with obtaining the best possible outcome from a limited budget, and thus seems an ideal approach for dealing with how to allocate resources within schools. Although economists are beginning to analyze educational problems in increasing numbers, they have yet to make major inroads in improving educational productivity. This article describes ways in which economic analysis could be used to improve decision-making in educational institutions, and to inform the allocation and use of educational resources.

Even though virtually all educators believe that additional resources will lead to higher student per-

formance, it remains unclear how best to spend dollars to achieve that goal. As a result, demands for more money, absent a well-reasoned description of how the money will be used, does not build confidence that money—by itself—will make a difference.

Researchers have used production functions—a statistical approach linking outcomes with specific inputs—to understand how money matters. To date, this research has been inconclusive with some arguing that money matters and others suggesting a systematic link between higher levels of resources and more money does not appear to exist. This stems in part from disagreement over the proper outcome of schooling.

Traditional allocation tools like cost–benefit analysis are infrequently applied in educational settings due largely to the difficulty of placing a monetary value on the outcomes or benefits of education. Henry M. Levin and Patrick McEwan suggest that linking costs to some measure of performance, or effectiveness, is a better approach for education. Under this model, the cost per unit gain of achievement is estimated so that programs that are more efficient, or cost effective, can be identified and chosen.

Eric Hanushek argues that the proper incentives for better performance and efficient use of educational resources are not in place, and that holding schools accountable for student performance is essential to use more effectively existing and new money. Improvement of student performance, with or without new funds, requires improved decision-making in the following four areas.

- Reallocation of existing resources
- Incentives for improved performance
- Development of the concept of *venture capital* for schools and school systems
- A more market-based budgeting environment

### **Reallocation of Existing Resources**

Regardless of what impact additional funds might have, it is important that existing resources be used as efficiently as possible. In many districts it may be possible to reduce class size through different assignments of teachers throughout the district. To the extent that smaller class size improves student performance, these changes would offer an improvement in student performance at little or no cost.

Before seeking additional funds, schools may investigate other ways to restructure what is done with

current funds. Allan Odden and Carolyn Busch argue that schools can find additional resources through a combination of creative use of categorical funds, elimination of classroom aides, and reallocation of resources, such as the elimination of one or two teaching positions. Although some of these options may result in larger classes, or fewer teachers, the more intensive use of staff and greater professional development activities available have resulted in improved student performance in many of the schools that have adopted this approach.

### **Incentives**

The use of incentives to encourage schools or school districts to allocate resources in ways that lead to improved student performance is not a new idea. Unfortunately, the incentives that seem to have the most success have been sanctions. Schools faced with threats of intervention often act quickly to improve performance rather than risk the stigma of a sanction. Conversely, many positive incentives have been less successful. For example, high-performing schools are often granted waivers from state regulation in exchange for success. In this case, the regulatory system loosened constraints that may have made the organization successful. Perhaps the more appropriate incentive would be to provide such waivers to under-performing schools with the hope that increased flexibility would lead to improvements.

Hanushek argues that the incentives currently in place in schools do not encourage teachers to work towards improving student performance and therefore need to be changed. He suggests that there is not sufficient awareness of positive performance incentives, and that more experimentation and research is needed.

### **Venture Capital (Equity)**

One problem of education in the early twenty-first century is that once funds are appropriated to a school or program, they become the possession of that entity. In a study of the costs of implementing California's "Caught in the Middle" reforms for middle schools, published in 1992, David Marsh and Jennifer Sevilla found that the annual costs of restructuring schools to meet the requirements of this program were between 3 and 6 percent higher than current average expenditures per pupil in California schools. However, they also concluded that the first year start-up costs amounted to approximately 25

percent of annual costs. The problem schools face is finding those start-up funds. Often such funds are not available for all schools in a district, and schools receiving such funds treat them as a continuous source of revenue. Yet if such funds were rotated among schools, it would be possible to institute new programs in all schools over a few years.

Related to the concept of venture capital is the concept of revolving funds. This notion offers a way for school districts to deal with large purchases, like computers, that occur on a regular but nonannual basis. Budget procedures in school districts do not reward schools for saving resources in one year to make large purchases the next year. A school that receives a sum of discretionary money in one year is likely to lose any of the funds it has not expended by the end of the fiscal year. As a result, schools are often unable to make a large coordinated purchase.

A solution to this would be a revolving fund in the district to pay for such purchases. Schools would receive large appropriations of funds for such purchases once every few years. Finding a way to use the money in a revolving fashion would facilitate continued improvements in educational programs. The major problem is determining who gets the venture capital funds first and who has to wait. In many large districts, the superintendent publishes lists of the best- and worst-performing schools, and such lists could be used to prioritize the allocation of these funds. Another issue is the equity of the distribution. Although some schools will get more funds one year than others, over the established time period, all schools will receive an equal amount—one simply has to accept the idea that equity is measured over some time frame, and not on an annual basis.

### Market Approaches

Many reformers call for market-based changes in the organization of schools. There are many ways to introduce the market into the educational arena, but most of these fall under the heading of school choice. Public school choice can be considered as either an intradistrict or interdistrict choice, and these can be broken down further into the various types of programs in each category. Two other types of choice involve the blurring of the line between public and private education: private school vouchers and privatization of former public schools.

Intradistrict choice programs, by definition confined to one school district, grew largely out of

an attempt to desegregate schools, rather than to provide competition or parent choice. The first of these programs is called controlled choice, where districts created models for assigning students to schools outside of the traditional neighborhood school model as a way of reducing segregation. A second type of intradistrict choice program is the magnet school. Magnet schools were designed to attract white students to schools with high minority populations, often located in heavily minority communities.

The newest model of intradistrict choice is the charter school. With the development of the charter school, the purpose of the choice models shifted away from desegregation to a focus on providing parents with the choice to send their children to schools that may be less regulated than their traditional neighborhood school. These schools operate under a charter between those who organize the school (typically teachers and parents) and a sponsor (typically the local school board or state board of education).

Interdistrict choice programs allow the transfer of students between school districts. Although interdistrict choice programs also grew out of attempts to desegregate, they always had the goal of increasing parental choice as well. Many states allow interdistrict choice through open enrollment policies, which vary from state to state; some states mandate that all districts have open enrollment while others allow districts to choose whether they wish to be open or closed.

Perhaps the most talked-about form of choice program is the voucher program. Voucher programs can be organized in different ways, but the basic idea is to give some children access to private schools by issuing vouchers to their families, which the families then give to the school in lieu of a tuition payment. Often these programs have the intention of allowing low-income students to go to schools they could not otherwise afford to attend, although vouchers are not necessarily limited to those in poverty.

A final market-based approach is the privatization of schools that were formerly public. This is also a relatively new approach, and one that arose largely out of a demand for strategies that could save failing schools. The argument is that if public education functions like a monopoly (a firm that has control over its price and product) because it is not subject to competition, it has little incentive to function effi-

ciently. By introducing some competition through privatization, schools would be forced to provide higher-quality education at a lower price.

Recent efforts to collect resource data at the school site and even student level may lead to enhanced knowledge of how resources impact student outcomes. To the extent that such knowledge is applied to decisions about how schools are operated, the long-term impact may be improved educational productivity through enhanced and informed decision-making.

### DE LIMA, AGNES (1887–1974)

Journalist, educator, and activist, Agnes de Lima wrote significant books and articles about Progress-

sive education. She was born in Holywood, New Jersey, and grew up in Larchmont, New York, and New York City in a prosperous, conservative banking family that had emigrated from Curacao. De Lima attended private school and entered Vassar College in 1904 at the age of seventeen. At Vassar, de Lima received an excellent liberal education and majored in English. Through such teachers as feminist Lucy Salmon she encountered some of the liberal reformist thinking of the Progressive period. She worked with the College Settlement Association and was active in a campus organization that tried to improve the pay and working conditions of college maids. Her Vassar experience led her away from her family's conservative values, and she became active in socialist, feminist, labor, educational, and other reform movements.

After graduating from Vassar in 1908, de Lima moved to New York City, where she lived in a settlement house and worked as a writer for the Russell Sage Foundation and the Bureau of Municipal Research. She continued her education at the New York School of Social Work from which she received a master's degree in 1912. In 1917 there was a major political struggle over the efforts of reformist mayor John Mitchel to begin a "platoon school" innovation in New York City. In these schools students moved through a variety of workshops, assemblies, and libraries in platoons or groups, rather than remaining in one classroom. Willard Wirt, who had created a platoon system in Gary, Indiana, was hired to develop the program in New York. De Lima worked with Randolph Bourne and other young activists to promote the innovation, which was dropped in 1918 after voters rejected the reformist mayor.

These activities led to de Lima's more intense involvement with education and liberal journalism. Randolph Bourne had been the major education writer for the *New Republic* after the founding of that journal in 1914. Following his death in 1918, de Lima became the leading writer on education both for that journal and for the *Nation*, the other influential liberal periodical. She wrote for these journals a series of articles on Progressive education, which she then collected into a 1924 book titled *Our Enemy the Child*. This was one of the earliest books to describe and interpret what was actually happening in Progressive classrooms, and it has since been widely cited by scholars in educational history. It was the first study to identify clearly the three figures of Progressive education that Lawrence Cremin, in his in-

fluent 1960s book *The Transformation of the School*, labeled “scientists, sentimentalists, and radicals.” De Lima’s parallel groups were the “technicians,” who focused on testing and methods; the “child-centered” educators; and the “visionaries,” who hoped to reform society through the schools. De Lima was particularly supportive of the child-centered educators, believing that the best learning began with the needs and interests of children. She was most critical of the behaviorist “technicians” whom she described as “socializers, habit makers, and standardizers.” As a socially concerned reformer, she encouraged the extension of successful Progressive experiments from private to public schools.

De Lima’s brief marriage to Arthur McFarlane in the 1920s ended in divorce. During the 1930s de Lima continued her career as an education writer, publishing articles and reviews in the *Nation*, the *New Republic*, *Progressive Education*, the *New York Times*, the *New York Herald Tribune*, and other periodicals. She also wrote publicity materials for Progressive schools, including the Lincoln School and the Bank Street School.

De Lima’s own teaching career was brief, but the experience of running her own small Progressive school helped her to understand and write about education and related social issues from the perspective of teachers. De Lima worked effectively with Progressive school faculties to help them report on and evaluate their work. She and the elementary teachers of the Lincoln School produced *A School for the World of Tomorrow* in 1939. With the secondary faculty of the same school two years later she wrote *Democracy’s High School*. In 1942, with the same group of high school teachers, she published *South of the Rio Grande: An Experiment in International Understanding*. That same year she published *The Little Red Schoolhouse*, written in collaboration with the faculty of the school by that name. John Dewey, the leading figure in Progressive education, wrote an enthusiastic introduction to the book.

From 1940 to 1960, de Lima was director of public relations for the New School for Social Research in New York City. The New School, led by economist Alvin Johnson, was one of America’s leading Progressive experiments in higher education, and de Lima contributed to its success and reputation by publicizing its innovative programs and activities. De Lima retired from the New School in 1960 and lived quietly in Greenwich Village until her death in 1974. De Lima is remembered chiefly for

her role in describing and interpreting Progressive education and for promoting it as an essential element in broader movements of social and political reform.

JAMES M. WALLACE

## DENTAL HEALTH AND CHILDREN

---

The oral health of children is important to their overall well-being. Just as the mouth cannot be separated from the rest of the body, oral health cannot be considered separate from the rest of children’s health. Often thought to be only the presence or absence of tooth decay, oral health actually includes all the sensory, digestive, respiratory, structural, and emotional functions of the teeth, the mouth, and associated facial structures.

Like other aspects of children’s health, oral health must be considered in the context of social, cultural, and environmental factors. Dental and oral disorders can have a profound impact on children, and the burden of untreated dental health problems is substantial. Untreated dental decay (cavities) can result in pain, infection, tooth loss, difficulty eating or speaking, and poor appearance, all of which present challenges for maintaining self-esteem and attentiveness to learning. Chronic pain can alter a child’s ability to sleep and play, and it hinders efforts to show them that their personal actions can make a difference in their own health.

Tooth decay is one of the most common chronic childhood diseases—it is five times more common than asthma. By the first grade, more than 50 percent of children in the United States have dental caries (decay) in their primary teeth, and more than 80 percent of U.S. adolescents have dental decay by age seventeen. Despite the availability of cost-effective preventive measures and improvements in children's oral health in the United States, many children still lack needed dental care—more, in fact, than lack medical care. There are significant and important disparities in oral health and access to dental care for poor and minority children, and for those with unusual health care needs. Hispanic, African-American and Native American children have more severe disease and greater levels of untreated disease than other children. In addition, children from low-income families are much less likely to have access to dental care than their peers, and their disease is almost twice as likely to remain untreated. Sadly, the children at greatest risk for problems resulting from tooth decay are also those least likely to receive dental care. In fact, dental care has become the most frequently reported unmet health need of children.

### **Prevention of Dental Diseases**

Fortunately, most dental diseases can be prevented. The most common oral health problem for children is dental decay, which is preventable by a combination of community, professional, and individual measures, including water fluoridation, professionally applied topical fluorides and dental sealants (protective plastic coatings), regular use of fluoride toothpastes, and healthful dietary practices. Childhood is also a time to form healthful habits to reduce injury to the mouth or face, especially during sporting and recreational activities. Use of protective devices in schools may help young athletes recognize the hazards posed by their athletic interests and as they attain adulthood they may be more comfortable using the devices than if they had not used them at a younger age. A significant proportion of other oral problems, such as destructive gum disease and mouth and throat cancer, do not commonly arise until adulthood, and much of this burden can be attributed to the use of tobacco. Most daily smokers started smoking before age eighteen, and more than 3,000 young persons in the United States begin smoking each day. School programs to prevent tobacco use could become one of the most effective strategies to reduce tobacco use in the United States.

Community water fluoridation is the most effective way to prevent dental caries in all children, regardless of socioeconomic status, race, or ethnicity; and it can reduce cavities in children by up to 40 percent. Yet, more than 100 million people in the United States do not have fluoridated water. Where children do not have fluoridated water and dental screenings have identified them to be at high risk for dental caries, fluoride can be provided through school programs that offer supplemental tablets or rinses, and the importance of brushing with fluoride toothpaste at home every day can be reinforced.

Unfortunately, fluoride has somewhat limited effectiveness on the chewing surfaces of teeth. Not surprisingly, more than 80 percent of tooth decay in schoolchildren is on the chewing surfaces of molar (back) teeth. The use of dental sealants applied to the chewing surfaces can prevent 60 percent of decay on these surfaces, but only about one in four children have at least one sealed tooth. Among poor minority children, less than 5 percent have received dental sealants, except those who attend schools that have programs to assure access to this service.

### **School-Based Health Care Services**

The school is a good setting for programs to assure that children have an opportunity to receive protective dental sealants in a timely manner to prevent tooth decay. Although such programs can be a component of more comprehensive dental programs, it is far more common for school programs to be more narrowly focused on these effective preventive services. Dental sealants can be provided at school or through active referral to participating dentists in the community. Although these programs have been found to be effective among children of varying socioeconomic status and risk of decay, most such programs in the United States target those vulnerable populations less likely to receive private dental care, such as children eligible for free or reduced-cost lunch programs. Accordingly, these programs can not only increase the prevalence of dental sealants, but also reduce disparities in sealant use by race or income.

Health education programs in schools can stress the importance of oral health, increase understanding of the disease process, promote healthful behaviors, and reinforce the value of regular professional care for prevention. Such a role for professional care may not be consistent with the experiences of children who have not received dental care or who only

associate it with treatment of toothaches. Instruction of the children and their parents—through educational materials that are taken home—can help alleviate the consequences of some parents' own experiences and dental fears, which may impede their seeking care for their children.

When preventive measures fail to completely stop disease, schools can assure that tooth decay is treated early so that it does not negatively affect learning and quality of life. Some schools have programs of screening and referral, which are not only helpful to the individual children referred for care, but also provide information that enables the public health system to target, organize, and evaluate programs. In addition, some schools have health centers on the grounds, which have been critical providers of health services for young people, particularly those who are uninsured. Central to the effectiveness of these centers are partnerships with community-based providers and collaboration with parents and school administrators.

Through the initiatives described here, schools can make important contributions to the quality of life of low-income, minority, migrant, and immigrant children, who frequently have difficulty accessing information and services for both the prevention of disease and dental care. When these children do not get the dental care they need, their already difficult lives can become even more stressful, and they may be less likely to overcome obstacles, achieve their dreams, and contribute to society.

### **Dental-Health Education Curriculum for Schoolchildren**

The ideal dental-health education curriculum would encourage students to think about the relationships between knowledge, choice, behavior, and enhanced human health. Knowledge and choice equals power, and having power and engaging in appropriate behavior can lead to enhanced human health. In addition to acquiring knowledge, students need to develop the skills to incorporate healthful behaviors into their lives. Behaviors that promote oral health and prevent disease include brushing teeth with fluoride toothpaste, reducing the number of times sugar-rich foods are eaten, and resisting tobacco use. Curricula should be age-appropriate for both children's cognitive abilities and the main health risks they face at each stage of development.

During the preschool years, development of the habit of using fluoride toothpaste twice per day and

acquisition of a positive attitude about visiting the dentist are the most important outcomes of education about oral health. Parental participation may be particularly important for children from disadvantaged homes, where parents may not otherwise appreciate the importance of these behaviors.

During the primary school years, the dental-health education curriculum can support the type of learning that frames experiences for children in a way that builds on their prior knowledge and encourages them to explore and seek answers to new concepts by themselves. Ideally, such a curriculum should link lessons with the National Science Education Standards developed by the National Academy of Sciences for grades K–4. Children at this age can learn to brush plaque from their teeth, and to protect their teeth with a toothpaste containing fluoride. In addition, these children should receive dental care within a year after the eruption of their first permanent molars (age six or seven), so that protective sealants can be placed on the chewing surfaces. These children are old enough to understand that eating several times during the day can create as many problems as eating too many sugary or starchy foods, especially if they eat those foods as between-meal snacks. Curricula should help students see that choices they make can affect their overall oral health.

During adolescence, when children increasingly make their own decisions regarding both self-care and diet, the health education curriculum should reinforce oral hygiene, prevention of tobacco use, and healthful dietary practices. Interest in the social advantages of a healthy mouth can make students more receptive to information about oral hygiene techniques, as they can be shown that appropriate use of the toothbrush and dental floss can make their teeth more attractive, prevent bleeding gums, and reduce halitosis (bad breath). These are the years to reinforce healthful lifestyle behaviors that will have important consequences for maintaining oral health with minimal need for expensive dental care repair—behaviors that will provide benefits for a lifetime.

### **Summary**

The oral health of children is essential to their overall well-being. Education in schools prepares girls and boys to accept responsibility for their own health and to engage in personal care that will maintain and improve health. The use of precious classroom time to teach personal self-care skills, using the classroom

to deliver fluoride products, and using the school setting to screen and refer children for needed dental services can be justified by the impact on children's health and welfare. Dental health problems can profoundly affect children, impairing their performance as students, lowering self-esteem, and slowing personal development. In addition, failure to prevent dental diseases has a large effect on school attendance. It is estimated that more than 50 million school hours are lost nationally each year due to dental-related illness or care, a loss that could be sharply reduced with more timely receipt of preventive services.

## DENTISTRY EDUCATION

There are fifty-four dental schools in the United States as of 2001. These schools share the goal of producing graduates who are dedicated to the highest standards of health involving the teeth, gums, and other hard and soft tissues of the mouth. Dentists are educated in the basic and clinical sciences and are capable of providing quality dental care in several specialty areas.

More than 17,000 students were enrolled in U.S. dental schools during the 1998-1999 academic year; 4,268 of them were first-year students. The first-year enrollees were selected from 9,477 individuals who applied for admission to dental schools. The process of applying to dental school involves several defined steps, including completion of specific undergraduate college courses, earning an acceptable score on the Dental Admissions Test (DAT), and submitting formal applications to selected schools.

### Undergraduate Requirements

The minimum requirement for admission to dental school is two years of undergraduate or pre dental education. Most dental schools, however, accept students who have three or four years of undergraduate education. Science courses are the mainstay of the pre dental education. Most dental schools require courses with laboratory experience in inorganic and organic chemistry, biology, and physics for admission to their degree-granting programs. In addition to these nearly universally required courses, some schools also require courses in mathematics, English composition, zoology, psychology, a foreign lan-

guage, social sciences, biochemistry, microbiology, and physiology. Because requirements vary from school to school, applicants should obtain specific information about required undergraduate courses from the individual dental schools.

The majority of applicants to dental schools major in science, pre dentistry, or pre medicine; however, majoring in a science is not a prerequisite for admission. The most important consideration at the majority of schools is whether the applicant has met the minimum course requirements. Most dental schools have established a minimum undergraduate grade point average (GPA) for admission. The lowest acceptable GPA for admission to a dental school is 2.0 (on a 4.0 scale). The preferred GPA for most dental schools is 3.0 or above.

### **The Dental Admissions Test**

The single mandatory requirement for admission to all U.S. dental schools is the DAT. Dental schools view the DAT, along with the undergraduate GPA, as a predictor of performance in dental education. This standardized test has been administered on a national basis since 1950. The test is designed to assess general academic ability, comprehension of scientific information, and perceptual ability. The DAT consists of four separate examinations of 100 multiple-choice questions, which test knowledge of the natural sciences, reading comprehension, quantitative reasoning, and perceptual ability. Most students who sit for the DAT have completed two or more years of undergraduate education. The American Association of Dental Schools (AADS) recommends taking the DAT one year prior to entering dental school. As of 1999 the DAT is administered only on the computer. The DAT can be taken on almost any day of the year at designated testing centers. Scoring of the DAT, which ranges from 1 to 30, is based on the number of correct answers. Nationally a score of 17 on the examination is considered average.

### **The Application Process**

The American Association of Dental Schools sponsors a centralized application service. Applicants to U.S. dental schools complete one application form, which (for a fee) is distributed in a standardized format to the schools designated by the applicant. Most participants in the AADS Application Service (AADSAS) complete and submit the application using the Internet.

Upon receiving the AADSAS application, admission committees at each school may ask appli-

cants to submit an institution-specific application form, letters of recommendation, and academic transcripts. The admission committee, generally composed of dental school faculty members, review the academic and biographical information provided by applicants. Results of the DAT, the GPA, and letters of recommendation are evaluated by the committee. Students who meet requirements for admission are invited for personal interviews. Some dental schools have special programs for underrepresented minority students, which are designed to enhance the diversity of the student population and increase racial and ethnic diversity within the profession. Admissions committees strive to select applicants whose academic and personal qualities appear to mesh with their school's program objectives and suggest the candidate has the potential to successfully complete the academic program.

Choosing and applying to dental school requires careful consideration of one's career goals, personal interests, and family circumstances. Applicants may choose to apply to traditional four-year dental programs that award the Doctor of Dental Surgery (D.D.S.) or Doctor of Dental Medicine (D.M.D.), which are equivalent degrees, or to combined-degree programs. Twenty-seven schools offer formal combined bachelor's and dental degree programs. Thirty-seven schools offer combined dental and graduate degrees. Although deadlines for submitting applications vary among dental schools, most range from October to March. Most schools fill their entering class for the next academic year by December.

Cost is also a major consideration for some applicants. Applicants to dental schools are encouraged to apply for financial assistance at the same time they apply for admission. Federal student financial aid programs, mostly loan programs, are the primary sources of support for dental education. Other sources of support include scholarships and grants, research fellowships, commitment service scholarships, and loan repayment programs. Applicants are advised to contact schools individually to obtain information about financial assistance.

### **Licensing and Certification**

Most students who enroll in dental schools participate in a traditional four-year academic program. During the first two years, dental students study the biological sciences to learn the function and structure of the human body. Courses offered during this phase of education include oral anatomy, oral pa-

thology, oral histology, and principles of oral diagnosis and treatment. The third and fourth years of study provide clinical training. During clinical training, students learn basic techniques for oral diagnosis, restorative dentistry, periodontics, oral surgery, orthodontics, pediatric dentistry, prosthodontics, endodontics, and other areas of treatment. Students acquire these skills by rotating through various dental clinics under the supervision of a clinical instructor.

To fulfill the requirements for licensure to practice dentistry, dental students take Part 1 and Part 2 of the National Board Dental Examination (NBDE) while in dental school. Part 1 is usually taken after the second year, following completion of all biological science courses. Part 1 assesses knowledge in four areas: anatomic sciences, biochemistry/physiology, microbiology/pathology, and dental anatomy and occlusion. Part 2 is usually taken during the last year of dental school and tests for knowledge in the dental sciences. Students are eligible to sit for Part 1 and Part 2 when the dean of the dental school or a designee of the dean certifies the student has successfully completed all subjects covered by the examinations. The minimum standard passing score on each part is 75. Licensure boards in all fifty states, the District of Columbia, and Puerto Rico and the U.S. Virgin Islands use the NBDE as a major portion of their requirements for licensure. All states also require a performance-based clinical examination for licensing.

Upon graduation from dental school, graduates may pursue licensure in general dentistry or one of nine recognized specialties: dental public health, endodontics, oral and maxillofacial pathology, oral and maxillofacial radiology, oral and maxillofacial surgery, orthodontics and dentofacial orthopedics, pediatric dentistry, periodontics, or prosthodontics. Dentists who pursue postdoctoral training through residencies and advanced education programs are encouraged to obtain certification from dental specialty boards.

## DEPARTMENT CHAIRPERSON, THE

---

Over time, the profile of academic department chairpersons, often referred to as chairs, has remained fairly constant. They are tenured faculty, primarily male, and between the ages of forty and sixty. For the most part, chairs are internal appointees, either selected by their deans or elected by their departments and then appointed by their deans for terms of usually three to five years.

In some colleges, faculty become chairs out of a sense of duty with little enthusiasm for the job. Many times these chairs see themselves as scholars who temporarily accept responsibility for administrative tasks so other professors can continue their teaching and scholarly pursuits. In fact, few department chairs view themselves as administrators, and less than one-third of them will seek a higher administrative position. Their primary function is to champion their faculty. They work for and with faculty, providing protection from central administrative intrusion and support for faculty academic endeavors.

In the first instance, department chairs guard faculty autonomy and academic freedom by filtering and interpreting demands placed on faculty and departments by college deans. In the second, they foster collegiality, honor specialized expertise, and promote excellence in teaching, research, and service to the department, college, and university by ensur-

ing that department work gets shared equitably, that a collaborative work environment exists, and that requisite resources are allocated properly.

The dilemma for many department chairs arises from their treatment as faculty in some venues, such as evaluation for promotion and merit, and as administrators in others, where eleven- or twelve-month contracts preclude research time. In addition, the task of carrying out administrative mandates can often pit them against their faculty peers.

### Chairperson Roles

Chairs engage in four primary categories of tasks: faculty development, management, scholarship, and leadership. Each role is important to success as a department chair.

**Faculty development.** As faculty developers, chairs are responsible for supervising the recruitment, selection, and evaluation of faculty and for enhancing faculty teaching, research, and morale through development and support. Certain behaviors help build and monitor an environment that prizes effective teaching, research excellence, and service to the community of scholars in which they reside. These actions fall into several categories that include, but are not limited to, selection, support, development, networking, recognition, rewarding, and reinforcement.

*Selection* refers to the establishment of deliberate and well thought out faculty hiring policies, which are in accord with departmental practices and governing procedures and clearly delineate what the department values. Chairs *support* faculty in their academic endeavors by encouraging faculty to attend learned societies and professional meetings, and by sponsoring activities such as team teaching, collaborative research efforts, and peer mentoring.

*Development* of faculty is closely related to providing support. Here, the chair shows concern for each faculty member's growth as both an instructional leader and an academic expert. Providing departmental reimbursement of the expenses that faculty incur while attending workshops and seminars on effective teaching or professional conferences where they present their research to peers outside their departments sends the message that excellence counts. So does creating individual development plans annually with faculty members.

When a department chair promotes *networking*, faculty can engage in dialogue with each other and

debate about effective practice. Mentoring also occurs, with veteran faculty teaching new colleagues the bureaucratic ropes of a department and an institution.

*Recognition* and *rewarding* go hand-in-hand. The first refers to such intangibles as praise, verbal communication, and expressions of appreciation. The second denotes tangible benefits, such as merit increases, promotions, better teaching assignments, and release time for pursuing research agendas that accrue to a faculty member as a result of good teaching, research, and departmental citizenship.

Finally, *reinforcement* is used to provide for continued success of the department. An effective chair builds on a foundation set by the development of sound plans for achieving teaching and research effectiveness and engaging in institutional service where progress gets monitored, recognized, and rewarded regularly.

**Management.** As managers, chairs oversee the day-to-day fiduciary requirements of the department. They assign duties to faculty, plan meetings, plan and evaluate curriculum, keep faculty informed of college priorities, and coordinate department activities. In addition, they manage the department's fiscal resources and non-academic staff, prepare budgets, keep accurate records, and serve as the department's representative to the administration. In some instances, chairs also select and supervise graduate students and attempt to obtain external funding for departmental projects.

**Scholarship.** The chair's role as a scholar is perhaps the most comfortable one and at the same time most frustrating. It is comfortable because it encompasses one's academic identity; it can be frustrating because time previously devoted to academic endeavors is now siphoned off by managerial and other duties. In order to retain stature as scholars, department chairs must maintain research plans, obtain resources for personal research, and remain current in their academic discipline.

**Leadership.** Leadership may well be considered by many academic department chairs the most elusive of their roles. Tasks related to leadership focus on either faculty or the department as a whole. The first group includes encouraging faculty research, publication, and professional development. Departmental leadership tasks aim at maintaining a conducive work environment and setting long-range departmental goals. An important part of this second lead-

ership role involves soliciting ideas from faculty to improve the department.

Leadership tasks are often summarily ignored by otherwise well-meaning department chairs. Many surmise that this occurs because chairs come to the position without leadership training or prior administrative experience, and without a clear understanding of the complexity of the role or the cost to their academic careers and personal lives that it can exact. Typically, chairs are not prepared or equipped to deal with increasing legal and organizational demands, and they harbor only vague notions of what it means to be entrepreneurial or responsive to changes in institutional direction. As a result, they misconstrue leadership to mean management, and in doing so, immerse themselves in a process of maintenance rather than one based on creativity and innovation.

### A Challenging, Important Position

Interestingly, experts estimate that more than 80 percent of all administrative decisions in universities take place at the department level. In the early twenty-first century, department chairs face a complex, changing environment. The success of a department chair depends upon department members acting with integrity; engaging in open communication; exhibiting a willingness to accept criticism; valuing human potential, growth, and accomplishment; and manifesting a collective spirit. Strong institutional cultures or governance policies and practices can prove strong inhibitors to any such efforts. Subcultures built on a tradition of mistrust may also render chairs powerless.

Proactive chairs undertake their tasks with the determination to develop faculty as researchers and teachers, the will to persevere as a scholar, a concern for the fiscal viability of the department, and the administrative savvy and foresight to ensure departmental regeneration. As such, department chairs fill one of the most important, yet most challenging, administrative positions in the academy.

## HISTORICAL OVERVIEW

Developmental psychology attempts to understand the nature and sources of growth in children's cogni-

tive, language, and social skills. Within that context, there are four central themes that are unique to a developmental perspective and that bear on issues in childhood education. The first is the role of *nature versus nurture* in shaping development. Specifically, developmentalists want to know the contribution of genetic or maturational influences on development as well as the role played by environmental experiences. One important educational issue related to this topic is the question of whether a child's entrance age, or maturational level, is important for school success. For this and other important educational questions, nature and nurture interact in complex ways to shape a child's academic growth.

The second question focuses on whether children's growth proceeds in a continuous or more stage-like fashion. Stage theories, such as those proposed by Jean Piaget, Erik Erikson, and Sigmund Freud, contend that development progresses through maturationally determined stages. While this perspective underscores the contributions of both biology and the environment, a greater emphasis is placed on a maturationally predetermined progression through a fixed developmental sequence. Many researchers and theorists dispute such a rigid, step-like theory of development, emphasizing instead a more continuous, gradual process influenced equally by both brain maturation and environmental stimulation. Two important educational questions relevant to this issue are the extent to which children can be taught particular concepts or skills prior to entering a given developmental stage, and whether concepts learned in one domain are automatically transferred to other similar domains as a child reaches a new developmental stage.

A distinct but related theme centers on the existence of critical or sensitive periods in human development. A critical or sensitive period is defined as a time of growth during which an organism is maximally responsive to certain environmental or biological events. Critical periods emphasize the interaction of both nature and nurture, with environmental experiences (nurture) activating biologically programmed (nature) developmental changes, or, conversely, biologically determined changes enabling an organism to assimilate certain environmental experiences. In terms of language development, educators often wonder whether there is a critical or sensitive period during which children should learn a second language. While certain components of language, such as phonological process-

ing, are believed to be constrained by sensitive periods in development, other elements of language, such as vocabulary, clearly evolve over the lifespan.

The final theme concerns the importance of early experience in shaping later growth and development. Developmental scientists such as Mary Ainsworth, Alan Sroufe, and Freud emphasize the significance of early attachment and emotional conflict in predicting later psychological adjustment. It is argued that early risk factors have a more permanent influence on the course of development than later experiences. Early negative circumstances such as family conflict and social disadvantage have been linked to later delinquent behavior and school failure. Nevertheless, many children display resilience in the face of such early adverse social and environmental conditions. Thus, it is the cumulative impact of both early and later experiences that determines a child's developmental outcome. Children's literacy development, for example, is a product of both early experiences, such as parent-child book reading, as well as later experiences, such as reading instruction in school.

Modern developmental theory centers on these four central issues. An in-depth examination of these topics within a historical context will provide a more comprehensive understanding of developmental theory and its relevance for educational policies and practices.

### Nature Versus Nurture

Philosophers and psychologists have debated the relative roles of nature and nurture in human development for centuries. The seventeenth-century English philosopher John Locke described a young child's mind as a *tabula rasa* (blank slate) upon which the child's experiences are written. Jean-Jacques Rousseau, an eighteenth-century French philosopher, also argued that human development was primarily a function of experience. He believed in the existence of a *natural*, unspoiled state of humankind that is altered and corrupted by modern civilization. In contrast, nineteenth-century scientists such as Gregor Mendel, Charles Darwin, and Sir Francis Galton highlighted the importance of heredity in shaping development. While all of these scientists provided meaningful insights into the role of heredity and the environment, modern researchers have sought to further explore the dynamic interactions between nature and nurture that shape human development.

The twentieth century saw the evolution of various theories of development that differentially emphasized the role of biological versus environmental factors. These theories can be classified according to four major developmental frameworks: (1) environmental learning (empiricism), (2) biological maturation (nativism), (3) cultural context, and (4) constructivist.

The environmental-learning framework, best exemplified by the behaviorist theories of John B. Watson and B. F. Skinner, underscores the paramount importance of empirical learning in development. According to behaviorist theories, learning is characterized as the process by which an organism's behavior is shaped by experience. While environmental-learning theorists do not completely discount the role of innate factors, they argue that it is the external environment that has the greatest influence on development.

Biological-maturationist theories represent the opposing swing of the theoretical pendulum. This framework posits that biologically and genetically predetermined patterns of change have a greater impact on development than environmental influences. During the early twentieth century, theorists such as Freud and Arnold Gessell proposed that experiential influences were secondary to innate maturational mechanisms. This perspective regained popularity in the late twentieth and early twenty-first centuries as a result of major advances in genetic research, as well as the introduction of twin studies and behavioral genetics. Researchers such as Robert Plomin, Noam Chomsky, and Steven Pinker assert that human characteristics such as personality, intelligence, and language acquisition are, to a great extent, genetically grounded and maturationally controlled.

The cultural-context perspective of psychologists such as Lev Vygotsky and Barbara Rogoff contends that while both biological and experiential factors exert important influences on development, such factors are filtered through an individual's social and cultural context. Lev Vygotsky believed that the activities, symbols, and customs of particular social groups are formed by the collective social, cultural, and historical experiences of their ancestors. Through influences on social customs and practices, parenting, and the environment, culture shapes children's cognitive, language, and social development. For example, children's academic performance has been found to vary cross-culturally, as demonstrated

by studies showing that Asian immigrant children outperform their white peers in the United States, as well as the black-white test score gap.

Finally, the constructivist, or interactionist, approach stresses the balanced interaction of nature and nurture in forming the foundation for developmental change. In such a framework, both genetics and environment play an important role, and it is the dynamic relations among such internal and external influences that ultimately shape development. Piaget's theory of cognitive development asserts that children *construct* their knowledge based on the combination of input received from both maturational and environmental sources. Theorists such as Richard Lerner, Gilbert Gottlieb, Esther Thelen, and Linda Smith have taken this conceptualization one step further with the introduction of dynamic systems theories, which emphasize that the source of developmental change is in the process of bidirectional interaction among complex environmental and biological systems.

Frederick Morrison and colleagues have explored one facet of the nature-nurture question relevant to education by examining the importance of entrance age, or maturation level, on school readiness and academic growth. They found that younger first graders benefited as much from instruction in reading and math as older first graders, and that the younger students made significantly more progress than older kindergarteners of essentially the same age. Thus, entrance age—or maturation level—is not an important indicator of learning or academic risk.

The dispute over the relative importance of nature and nurture in children's development has endured for several centuries, and will no doubt continue to divide theorists for a long time to come. Increasingly, however, developmental scientists are concluding that, for most human characteristics, nature and nurture are inextricably linked and interact in complex ways to shape human growth.

### Stages in Development

According to Piaget's stage theory, children progress through a sequence of qualitative transformations, advancing from simple to more complex levels of thought. Piaget believed these transformations to be universal, innately programmed shifts in a child's perception and understanding of the world. He proposed four main stages of cognitive development:

sensorimotor, preoperational, concrete operational, and formal operational.

The transition from preoperational to concrete operational thought, at about five to seven years of age, corresponds with entry into formal schooling. While children in the preoperational stage are able to internally represent reality through the use of symbols such as language and mental images, concrete-operational children move beyond this simple mental representation of objects and actions and are able to logically integrate, order, and transform these objects and actions. For instance, because preoperational children cannot integrate information about height and width simultaneously, they are unable to recognize that water poured from a short, wide container into a tall, narrow container represents the same volume of water. Yet once they reach the *age of reason*, their maturational level converges with their accumulated experiences to facilitate a qualitative shift toward concrete operational thinking.

In addition to Piaget's stage theory of cognitive development, several others have proposed stage theories of psychosexual/personality development (Freud), psychosocial/identity development (Erikson), moral reasoning (Lawrence Kohlberg), and social development (Theory of Mind). These theories claim that children proceed through universal, age-specific stages of growth. Yet not all psychologists agree with such a rigid, step-like representation of development. Recently, neo-Piagetian theorists such as Kurt Fischer, Robbie Case, Annette Karmiloff-Smith, and others have attempted to reconcile the variability and domain-specificity observed in children's cognitive growth with Piaget's static stage theory.

In general, the neo-Piagetian perspective expands upon Piagetian theory by asserting that, while some general constraints or core capacities are hard-wired at birth, learning and experience lead to variation and domain-specificity in the acquisition of knowledge and skills. Cross-cultural studies have shown that varying cultural experiences result in the acquisition of different, contextually relevant skills. For example, children from a Mexican village known for its pottery-making learn conservation of solids (e.g., the fact that a ball of clay has the same mass even when it is molded into a long, thin roll) before conservation of number, which is generally mastered first in formally schooled children. Thus, most neo-Piagetians believe that while learning is constrained by innate mechanisms or information processing ca-

pacities, it proceeds in an individualized, domain-specific manner.

The question of whether certain knowledge or skills can be acquired before a child has reached a specified stage of development has also been addressed by neo-Piagetians. Renee Baillargeon conducted experiments with young infants and found that they recognize properties of object permanence prior to reaching that designated Piagetian stage of development. In addition, researchers have demonstrated that children can be taught concrete-operational concepts even before they have formally reached that stage of cognitive understanding—though these children are unable to transfer such knowledge outside the context of the testing situation.

Other theorists construe development as a constructive web (Kurt Fischer) or as a series of overlapping waves (Robert Siegler), rather than a sequence of qualitatively distinct steps. They recognize that cognitive development is the result of gradually acquired skills and abilities that build upon each other. Siegler, in particular, emphasizes the overlapping use of progressively more advanced strategies in the acquisition of skills such as addition. He found that children learning addition use various strategies in “overlapping waves,” such as finger counting, verbal counting in their head, the Min strategy (taking the larger of two numbers as a base and adding the smaller number to it) and, eventually, retrieval from memory. They gradually move from using easier, less efficient strategies to more difficult, but more efficient, strategies.

The neo-Piagetian view resembles the information-processing perspective in that both contend that cognitive development is limited by general constraints that are hard-wired at birth. Information-processing researchers such as Robert Kail, Wolfgang Schneider, and David Bjorklund argue that children's learning is restricted by the broad processing capacities of the brain, which improve with age. This perspective regards development as a more gradual, continuous process that evolves as children's processing speed or capacity for holding information increases. Thus, the step-like progression of development is rejected for a more linear representation.

### Critical Periods

A *critical*, or *sensitive* period is defined as a period of time in development when a particular environ-

mental experience or biological event has its greatest influence. Evidence demonstrates that some physiological and psychological processes are constrained by critical periods.

The existence of sensitive periods in children's psychological development has been noted in aspects of language acquisition. Children deprived of verbal stimulation during the first few years of life are severely impaired in their capacity to learn language and have great difficulty acquiring normal language later on. In addition, while young infants are able to distinguish among the variety of phonemes present in all human languages, after about six months of age the infant's knowledge becomes more focused, and they are only able to discriminate between the various phonemes in their own native language. Consequently, infants can learn any language that they are exposed to, yet it is more difficult for an older child or adult to completely master a non-native or secondary language.

Taken together, such information lends support to the argument that the first few years of life represent a sensitive period for certain aspects of language development. However, the fact that children continue to benefit from exposure to new vocabulary, semantics, and grammatical rules well into elementary school and beyond leads researchers to question whether all language learning is restricted by a sensitive period. During the first few years of life, children's brains grow and become more organized, specialized, and efficient. Yet brain growth and development does not end at three years of age, but rather continues throughout childhood, benefiting from the effects of schooling and other environmental stimulation. Thus, the question of when educators should teach children a second language depends on the components of language being considered (e.g., phonology, semantics, vocabulary, grammar) and the level of proficiency desired.

Another area of development believed to be constrained by a sensitive period is attachment. Psychologists such as John Bowlby, Ainsworth, Sroufe, Erikson, and Freud contend that children's early attachment to their primary caregiver (e.g., mother, father) during the first few years of life sets the foundation for their later socioemotional development. Research conducted by Harry Harlow on infant monkeys found that those deprived of maternal attachment prior to six months of age had a more difficult time recovering socially than those deprived of maternal contact after six months of age, thus lend-

ing support to the existence of a critical period for social development in monkeys. Yet many "natural experiments" looking at orphan children who have been deprived of adequate affection and sensitivity from a primary caregiver have found that, if removed from such a socioemotionally impoverished environment and placed in a loving adoptive home, most children are able to recover socially, emotionally, and cognitively. Thus, while early experiences can and do have an impact on later development, children often demonstrate resilience in response to adverse early experiences.

### Early Experience

Early experience is the consummate critical period. During the broad social reform of the late 1800s, scientists in the newly evolving field of developmental psychology brought attention to the harmful effects of child industrial labor and validated the importance of a healthy and nurturing environment for promotion of normal development. Throughout the twentieth century, psychologists such as Bowlby, Freud, Erikson, and Sroufe have stressed the profound importance of early socioemotional experiences on later psychological outcomes. In addition, scientists and policymakers have recognized the importance of early intervention programs, such as Head Start, that seek to enrich the cognitive development of socially disadvantaged children. During the late twentieth and early twenty-first centuries, public interest and government policy has advocated even earlier interventions, focusing on *zero to three* as the most important age range on which to concentrate resources. Yet, as theorists such as John Bruer argue, the importance of the first three years of life has reached "mythical" proportions. According to Bruer, it is important to recognize the cumulative nature of development, emphasizing both early and later experiences in shaping children's growth.

Evidence from researchers such as Baillargeon and Susan Rose has demonstrated that cognitive skills begin to develop very early in life, and that these skills follow rather stable trajectories over time. Such findings suggest that children's developmental course begins to solidify before they enter formal schooling, and even before they utter their first words.

A problem of particular interest is the poor state of literacy in America, and the impact of early experiences on literacy development. The amount of cognitive enrichment, verbal stimulation, and book

reading, for example, that children are exposed to at an early age is predictive of later literacy skills. Research conducted by Betty Hart and Todd Risley (1995) found a wide range of variability in young children's vocabulary skills as early as two years of age, and this variability was highly correlated with the number of words spoken by their parents. Socioeconomically disadvantaged toddlers were exposed to a substantially lower number of words per day as compared to toddlers from professional families. It is clear from such research that children's early experiences can lead to striking differences among children from enriching versus impoverished environments. Furthermore, studies have shown that the achievement gap between low- and high-performing children widens once children enter school.

With respect to socioemotional development, psychologists such as Freud, Sroufe, Bowlby, Erikson, and Mary Main have claimed that children's early attachment relationships with their primary caregivers lay the foundation for later social functioning. Researchers have found that securely attached children are more cooperative with their mothers, achieve higher cognitive and academic scores, are more curious, and maintain better relationships with teachers and peers, as compared to insecurely attached children. Taken together, such research affirms the impact of early attachment and socioemotional experiences on later psychosocial and cognitive development.

While early risk factors such as poor attachment and socioeconomic disadvantage can have long-term effects on children's cognitive, academic, social, and emotional development, children do demonstrate varying levels of vulnerability and resilience toward such early conditions. Differences in temperament and coping abilities, for example, can moderate the degree to which a child's early experiences forecast their later developmental outcomes. Furthermore, while there is ample evidence that early experiences have a substantial effect on later cognitive and social outcomes, the real question is whether early experiences are any more important than later experiences. Growing evidence suggests that it is the cumulative effects of both early and later experiences that define an individual's trajectories later in life.

In summary, developmental theory pursues four central themes: (1) the importance of nature versus nurture, (2) stages in development, (3) the

existence of critical or sensitive periods, and (4) the impact of early experience. Significant progress has been made over the last thirty years on each of these topics, resulting in a more complex view of human psychological growth and the forces that shape it. With regard to educational practice, modern developmental theory stresses that rigid notions of genetic determinism, stages, critical periods, or the lasting impact of early experience are being replaced by more flexible views that emphasize the malleability of human nature and its potential for change.

## COGNITIVE AND INFORMATION PROCESSING

Cognitive development typically refers to age-related changes in knowledge and acts of knowing, such as perceiving, remembering, problem solving, reasoning, and understanding. The development of cognition is studied most frequently in infants, children, and adolescents, where changes often are relatively rapid and striking. Many researchers also study cog-

nitive development in aging adults, in children and adults during recovery of function following brain damage, and in a variety of species other than humans. Since the 1890s, when researchers such as James Mark Baldwin and Alfred Binet established cognitive development as a substantive area of inquiry, two overlapping goals have been evident. One goal is to provide insights into how complex, organized knowledge systems develop, an issue with a long history in philosophy and science. The other goal is to provide insights into optimizing human development, especially with respect to education. Researchers have adopted many different theoretical approaches to the study of cognitive development over the past 100 years, and they continue to do so. During the latter part of the twentieth century a relatively new approach, information processing, gained a degree of ascendancy because of its potential for providing rich insights into how cognition develops and how instruction might be improved.

### Assumptions and Findings

In the 1950s and 1960s researchers began to notice similarities between human thinking and the new computers of that era, which could manipulate not only numbers but also a variety of nonnumeric symbols. Allen Newell and Herbert Simon were among the first to suggest that humans and computers could both be viewed as general symbol manipulators, and that knowledge of computers could be used as a metaphor for exploring human cognition. The argument that emerged was not that humans are computers, but rather that computers could be used as a source of ideas about how human cognition works and also as a tool for expressing ideas about how humans process information mentally. Information-processing studies of cognition and its development began to flourish in the 1960s and 1970s.

Information processing is not a theory of cognition but rather a general framework that comprises a family of theories sharing certain core assumptions. One assumption is that all cognitive activities involve mental processes that operate over real time on internal, symbolic representations of information. That is, information of all sorts—including the words on this page, memories of past events, knowledge about friends or world events, and abstract concepts such as "justice"—are all coded as mental representations with certain structural properties.

When one sees a painting for the first time, for example, perceptual processes code new sensory in-

formation and may also create more elaborate representations of what is seen. Memory processes store these representations and also retrieve previously developed representations that can be useful for interpreting the painting. Problem-solving and reasoning processes operate to help understand the artist's intent in creating the painting. From an information-processing view, one does not simply *experience* the painting. Instead, one is engaged in a series of events in which mental representations are created and manipulated by processes operating over time. Information-processing researchers seek to identify these processes and representations and to understand their properties. Researchers therefore focus less on *whether* children solve problems correctly and more on *how* problems are solved. This approach has led to a rich set of findings about the skills and knowledge children acquire on specific tasks in such domains as reading, mathematics, and scientific thinking.

A second assumption is that these processes and representations exist within an organized system with definable properties and constraints. An important goal of research is to define the *cognitive architecture*, that is, the general structural characteristics of the information-processing system. For example, the amount of information that can be activated at any one time is limited, as is often evident when people try to remember new telephone numbers or solve difficult problems. This phenomenon is often interpreted in terms of *working memory*, an important, limited capacity system for manipulating information. Research on working memory has revealed the operation of three interacting components: a *phonological loop* for storing speech-based information; a *visual-spatial sketchpad* for storing visual information; and an *executive system* for combining information from various sources to solve problems and create plans. New research, such as that reported in 2000 by Susan E. Gathercole and Susan J. Pickering, is beginning to link developmental change and individual differences in cognitive performance to changes in these components of working memory. Another constraint on cognitive processing is the speed at which processes operate. In general, faster processing speed should enable more competent performance on particular tasks. Not only does general processing speed increase from early childhood through adolescence, but as researcher Robert Kail reported in 1991, it does so at a consistent and well-defined rate of change. The

reasons for this phenomenon still are not understood.

A third assumption is that cognitive development occurs via self-modification of the information-processing system. Although environmental events critically influence development, the mechanisms by which the information-processing system changes over time are assumed to be internal to the system itself. A number of such mechanisms have been proposed. For example, as children develop some processes become *automatized* in the sense that they are executed more rapidly and with less demand on limited attentional capacity than earlier in development. According to some theories, increasing automatization allows children to operate at higher levels of complexity and flexibility. Knowledge modification processes, such as *generalization* and *discrimination*, operate to create more powerful and accurate processes and representations. A critical task for developmental theorists is defining a cognitive architecture and self-modification mechanisms that, together, can account for the striking changes in thinking that emerge as children develop.

Information-processing theories of development differ significantly from other approaches in fundamental ways. They are not *phenomenological* because they are not limited to conscious experience, and they are not *neurological* in that they do not rely on neural or biochemical mechanisms as explanations. They differ from traditional stimulus-responses theories because of their emphasis on detailed descriptions of mental processes and representations that interact over time. Unlike *structural* theories, such as that of Jean Piaget, the focus is on very specific processes and representations that underlie performance. Information-processing theories often can be amalgamated to some extent with these other approaches, however. In contemporary neuroscience research, for example, information-processing concepts, such as working memory and processing speed, are often used to explore relations between brain and behavior.

## Methods

The assumptions of information processing have led researchers to adapt or create methods appropriate for identifying processes, representations, and characteristics of cognitive architecture. Given the emphasis on temporal properties of processes, researchers have developed highly specialized, *chronometric methods* for measuring the speed of partic-

ular mental processes. With *rule assessment*, tasks are structured so that patterns of responses can be used to identify particular processes and decision rules. *Protocol analysis* is used to examine verbal self-reports, provided by participants as they solve problems, for evidence about solution procedures, internal representations, and processing constraints. When applied to the study of development, these methods need to be used carefully so that they are equally sensitive to important aspects of performance at different developmental levels.

Information-processing researchers also have adopted a number of distinctive methods for illustrating or representing their theories. Because of the emphasis on specific processes and their organization, flow charts and diagrams often are used to indicate how processing is structured. Some researchers take a more formal approach: They implement their theories of cognitive development as computer programs. To the extent that the programs mimic children's behavior and development, researchers receive some support for the veridicality of their theory. If, however, the program crashes, then clearly the theory is lacking.

### Educational Implications

Ideally, educational assessment would provide specific insights about how to adapt instruction to individual children so as to optimize learning. In principle, information processing should provide a basis for assessing specific strengths and weaknesses and for identifying specific processes and representations that can be targeted for instruction. Teachers want their students to answer problems correctly, but measuring achievement only in terms of correct answers can be misleading: Often children can answer a problem correctly but for the wrong reasons, or incorrectly but for reasons that make sense. More important than answering correctly, in terms of educational goals, are whether students use appropriate solution strategies and whether they understand what they are doing. The value of information-processing research for education lies in its inherent distinction between the *products* of children's thinking (i.e., *whether* children solve problems correctly) and the *processes* (i.e., *how* problems are solved). Research on the development of school-related knowledge and skills is beginning to yield impressive advances.

In studies of young children's arithmetic, for example, researchers have identified a wide range of

solution procedures, correct and incorrect, that children use to solve problems. To account for how children select among these procedures, how procedures change as children gain experience, and how some new procedures arise, Robert S. Siegler and Christopher Shipley (1995) developed an information-processing model that includes assumptions about an associative memory for number facts, a memory system for recording the results of past solutions, and a system for deciding whether and how to apply particular procedures. This model accounts extremely well for some aspects of children's development in arithmetic, and it has some specific instructional implications. For example, according to this model, associating problems and correct solutions is critical for later development of efficient solution procedures. Discouraging children from counting accurately with their fingers may increase the chance of incorrect associations developing and thus delay the use of more advanced procedures. The model is far from complete, but it provides a coherent basis for analyzing how children solve arithmetic problems, how and why change occurs, and how instruction might be adapted to the needs of individual children.

Similar progress has been made in other areas. Reading, for example, is a complex skill consisting of numerous components, and information-processing methods have been useful for identifying and measuring these components. One such component is phonological awareness, which includes the ability to identify and manipulate phonemes. Lynette Bradley and Peter E. Bryant (1983) found that instruction designed to enhance phonological awareness in young children strongly and positively influences the rate at which they become effective readers. Problem solving is critical to success in many academic domains. Amarjit S. Dhillon (1998) studied the behavior of experts and novices as they solved physics problems and found that their strategies could be analyzed in terms of fourteen processes or activities. Experts and novices differed systematically in the use and sequence of these activities, a finding that provides insights into understanding students' knowledge in terms of specific concepts and procedures. The results of this research were used to develop problem-solving instruction for high school and university students.

Aside from its use in specific academic domains, information processing also has provided a basis for assessing broad intellectual skills. A new generation

of tests is emerging that are constructed so that children's performance can be interpreted in terms of relatively specific processing skills that, in principle, may be amenable to targeted instruction. One example is the Cognitive Assessment System (CAS), developed by Jagannath P. Das and Jack A. Naglieri, in which tasks from information-processing research have been adapted to measure four aspects of processing (planning, attention, simultaneous processing, and successive processing) that are emphasized in a comprehensive theory developed by the neuropsychologist Aleksandr Luria. Because of the links between theory and measures, the CAS has proved useful in interpreting performance for children with or without learning disabilities and for developing specific instructional interventions.

### Prospects

Information processing is by no means the only approach for studying cognitive development, but its assumptions and methods have proved helpful in exploring the many ways in which children's thinking changes with development. Its greatest utility to date has been in studying task-specific or domain-specific processes and representations. It has been applied with somewhat less success to domain-general characteristics of development, as well as to topics such as motivation and affect that are critical to understanding development and optimizing education. At this point, it is not clear whether these apparent deficiencies are inherent to information processing or whether they are simply a result of how information-processing concepts and methods have been applied to date. The information-processing approach is challenged by connectionist and dynamic systems theories that do not share the assumptions about symbolic representations and discrete processes; by ecological theories that focus on environmental factors and their structure; by neuroscientific theories that provide explanations in terms of neural functioning and neuroanatomy; and by traditional theories, such as those of Jean Piaget and Lev Vygotsky, in which a more general level of analysis and explanation is emphasized. The extent to which information processing succeeds will depend, in part, on the extent to which its practitioners can adapt to accommodate these challenges and contribute to research that enriches educational assessment and instruction.

## EVOLUTIONARY APPROACH

The English naturalist Charles Darwin's principles of natural selection provide the theoretical foundation for the biological sciences and are frequently used to address issues in the medical and social sciences. Evolutionary theory can also be used to understand human development in general and children's academic development in particular.

### Life History

Biologists study development by documenting species' life history. Life history refers to the typical ages associated with developmental milestones, such as length of gestation, age of weaning, and life span. Certain life history patterns have been found in many different species. For instance, a long developmental period is common for species that have large brains and sophisticated cognitive skills, and live in complex social groups. The implication is that the demands of living in a complex social world resulted in evolutionary expansions of the developmental period and brain size, and resulted in more complex social-cognitive abilities. The larger brain supports complex social-cognitive abilities, such as language in humans. The long developmental period allows the individual to engage in activities that refine social and other (e.g., foraging) skills.

**Human life history.** The same life history perspective has been applied to human development and is understood in the context of hunter-gatherer societies, that is, societies that are similar to those in which humans evolved. In these societies, there are five distinct periods in the human life cycle. *Infancy* is the time of breast-feeding, and lasts until the age of three years. *Childhood* begins with weaning and lasts until age seven. During this four-year span, children are still heavily dependent on parents, but are becoming increasingly independent. *Juvenility* ranges from seven years until the onset of puberty, which often does not occur until the mid-teens in hunter-gatherer societies. *Adolescence* is the time of

physical maturation, and *adulthood* is the period of mature reproductive activities. These include finding a mate and providing for the well-being of children. Each of these periods is characterized by different social relationships and degree of cognitive maturity.

**Social development.** Social relationships in infancy and childhood function to allow normal physical development (e.g., rapid brain development) and to reduce mortality risks. In hunter-gatherer societies, a high percentage (50%) of children die before reaching juvenility. Social relationships and other activities during juvenility involve a preparation for later survival-related (e.g., hunting) and reproductive activities. Social relationships in adolescence and adulthood are focused more directly on survival and reproduction.

The primary relationship during infancy and childhood is between the child and his mother, although the father is also heavily involved in some cultures. The nature of this relationship is termed *attachment*. Attachment-related behaviors, such as separation anxiety, keep the child close to his parents and thus safe. Play becomes an important activity during childhood, and models adult activities, as in play parenting. During juvenility, the focus of social relationships shifts from parents to peers. Peer relationships mirror and thus provide a context for practicing adult social activities. As an example, boys engage in play fighting and organize themselves into large groups that then compete against other groups of boys. These activities result in the practice and refinement of the social and cognitive skills associated with primitive warfare.

Adolescence is defined by the physical changes that prepare the individual for reproductive activities, such as bearing children or competing for mates. During this time, juvenile play activities become increasingly adult-like. Early adulthood is the reproductive period and in hunter-gatherer societies usually begins in the late teens for girls and a few years later (sometimes much later) for boys. In hunter-gatherer societies, many men will have more than one wife and thus continue to reproduce into old age. Older women, in contrast, focus their activities on raising their later-borne children and investing in the well-being of grandchildren.

**Cognitive development.** In hunter-gatherer societies, people have to learn how to deal with other people; use the local ecology to find food and medicine;

navigate from one place to another; and use tools. The cognitive skills that allow people to engage in social activities and maintain relationships are called *folk psychology*. These skills include language, understanding body language and facial expressions, as well as theory of mind. Theory of mind is the ability to make inferences about what other people are thinking or feeling and predicting their later behavior. The cognitive skills that allow people to understand the behavior, growth patterns, and potential uses of plants and animals for food and medicine are called *folk biology*. *Folk physics* includes the ability to move about in the physical environment, remember the location of things in the environment, and know how to use objects as tools.

The basic skeletal knowledge that supports these cognitive abilities appears to be innate, but must be fleshed out during development. Infants, for instance, automatically attend to human voices and faces, and toddlers easily learn human language through innate brain and cognitive systems that guide children's attention to other people and process social information (e.g., language sounds). However, these brain and cognitive systems are immature, and require extended exposure to language, human faces, and so forth to develop appropriately. Children's play and other activities, such as exploration of the environment and objects, provide the experiences needed to flesh out these innate skeletal systems. The result is an elaboration of the systems that support folk psychology, folk biology, and folk physics. The elaboration results in the adaptation of these brain and cognitive systems to local conditions, such as the local language and the plants and animals in the local ecology.

### Implications for Education

The folk psychological, biological, and physical knowledge that emerges through an interaction between innate brain and cognitive systems on the one hand and children's play and exploration on the other is not sufficient for living in industrial societies. In industrial societies, schools exist to facilitate the acquisition of competencies, such as reading, that are essential for living in these societies, but are not part of our evolutionary heritage. Several educational issues arise from this perspective.

**Academic development.** The evolved cognitive competencies that comprise folk psychology, biology, and physics are called *biologically primary abilities*, and skills that build upon these primary abilities

but are principally cultural inventions, such as reading, are *biologically secondary abilities*. The mechanisms by which evolved systems are adapted to produce secondary competencies are not yet fully understood, but involve, in part, co-opting primary systems for secondary learning, and access to knowledge built into primary systems.

As an example of co-opting, consider the relation between language, a primary ability, and reading, a secondary ability. The acquisition of reading-related abilities, such as word decoding, involves co-opting language and language-related systems, among others (e.g., visual scanning). The result is that these systems can be used for purposes for which they were not designed. For instance, individual differences in the sensitivity of kindergarten children's phonological processing systems, which are part of the language domain, are strongly predictive of the ease with which basic reading skills are acquired in first grade. In other words, the evolutionary pressures that selected for phonological processing, such as the ability to segment language sounds, were unrelated to reading, but these systems are used, or co-opted, when children learn how to read.

As an example of using implicit knowledge for secondary learning, consider that the development of geometry may have been initially based on access to knowledge built into the primary navigation system. In cataloging the basic principles of classical geometry, Euclid started with self-evident truths—implicit navigational knowledge—and then proceeded to prove the rest by logic, that is, by means of fundamental theorems. For example, the implicit understanding that the fastest way to get from one place to another is to go “as the crow flies,” was made explicit in the formal Euclidean postulate, “a line can be drawn from any point to any point,” that is, a line is a straight line. The former reflects an evolved but implicit understanding of how to quickly get from one place to another and is knowledge that is built into the brain and cognitive systems that support navigation. The latter was discovered, that is, made explicit, by Euclid. Once explicit, this knowledge was integrated into the formal discipline of geometry and became socially transmittable and teachable.

**Motivation to learn.** Another implication of the evolutionary perspective is that the motivation to acquire school-taught secondary abilities is based on the requirements of the wider society and not on the

inherent interests of children. Given the relatively recent advent of near-universal schooling in contemporary societies, there is no reason to believe that all children are inherently motivated to acquire the skills that are taught in school, nor is school learning likely to be inherently interesting or enjoyable. Stated differently, an important difference between primary and secondary abilities is the level and source of motivation to engage in the activities needed for their acquisition.

This does not preclude the self-motivated engagement in some secondary activities. Many children and adults are motivated to read. The motivation to read, however, is driven by the content of what is being read rather than by the process itself. In fact, the content of many stories and other secondary activities (e.g., video games) appears to reflect evolutionarily relevant themes that motivate engagement in these activities, such as social relationships and social competition. Furthermore, the finding that intellectual curiosity is a basic dimension of human personality suggests that there will be many intellectually curious individuals who will pursue secondary activities. Euclid's investment in formalizing the principles of geometry is one example. However, this type of discovery typically reflects the activities and insights of only a few individuals, and the associated advances spread through the larger society only by means of informal (e.g., newspapers) and formal education. The point is, the motivation to engage in the activities that will promote the acquisition of secondary abilities is not likely to be universal.

**Instructional activities.** The basic brain and cognitive systems that support the acquisition of primary abilities are inherent, and children are inherently motivated to seek out experiences, through social play, for example, that ensure the appropriate fleshing out and development of these systems. In contrast, there is no inherent structure supporting the acquisition of secondary abilities, nor are most children inherently motivated to engage in the activities that are necessary for secondary learning. Although this conclusion might seem self-evident, it runs counter to many assumptions about children's learning in contemporary education; for example, that children are inherently motivated to learn secondary abilities and will do so through activities that involve play and social discourse.

Thus, from the evolutionary perspective, one essential goal of schooling is to provide content, orga-

nization, and structure to the teaching of secondary abilities, features that have been provided by evolution to primary abilities. It cannot be assumed that children's inherent interests (e.g., social relationships) and preferred learning activities (e.g., play) will be sufficient for the acquisition of secondary abilities. Instruction must often involve engaging children in activities that facilitate the acquisition of secondary abilities, whether or not children would naturally engage in these activities. This does not mean that play and social activities cannot be used to engage children in some forms of secondary learning. It does, however, mean that it is very unlikely that the mastery of many secondary domains (e.g., reading or algebra) will occur with only these types of primary activities. In fact, research in cognitive and educational psychology indicates that some forms of secondary learning will require activities that differ from those associated with fleshing out primary abilities. These would include, among others, direct instruction, where teachers provide the goals, organization, and structure to instructional activities and explicitly teach basic competencies, such as how to sound out unfamiliar words or manipulate algebraic equations. In closing, the evolution of brain, cognition, behavior, and motivation has profound but largely unrecognized implications for educational theory and practice.

## VYGOTSKIAN THEORY

Lev Semenovich Vygotsky was born 1896 in Orsha (in what is now Belarus), and grew up in Gomel in a prosperous Jewish family in the western provinces of the Russian Empire. His higher education was at Moscow University, despite the fact that in Russia under Czar Nicholas II there were strict laws limiting how many Jewish people could receive advanced degrees. His university studies focused on medicine,

and later law. In addition, he studied in an independent university majoring in philosophy and history. After working as a schoolteacher and then as an instructor in a teacher training college, Vygotsky turned to psychology. His career as a psychologist spanned just ten years, ending with his death in 1934. In that time Lev Vygotsky produced about one hundred books and papers, many of which have only recently been published and translated into English. At the time of his death, Lev Vygotsky’s work included numerous powerful ideas, however, many were not fully developed and some were even speculative. His students, including most notably Alexander Luria, Alexei Leontiev, Daniel Elkonin, and Alexander Zaporozhets, and others (in Russia and throughout the world) have been responsible for further elaborating many of the ideas of his initial papers.

In the last decade, the intellectual climate of educational theory in the United States has had been dramatically influenced by the work of Lev Vygotsky. His work was first introduced to the West in 1962 through the translation of *Thought and Language*. Many Westerners learned about the basic ideas of cultural-historical theory from *Mind in Society*, edited by James Wertsch and published in 1978. This brief entry presents the major ideas pioneered by Vygotsky and successors, along with an overview of contemporary Vygotskian educational efforts taking place in Russia and the United States.

Vygotsky’s theory is known in the West as sociocultural, although Vygotsky himself and his close colleagues preferred to describe it as *cultural-historical*, emphasizing the dual focus of this theory: the history of human development and the cultural tools that shape this development. At the core of this theory is Vygotsky’s belief that human development—child development as well as the development of all humankind—is the result of interactions between people and their social environment. These interactions are not limited to actual people but also involve cultural artifacts, mainly language-based (written languages, number systems, various signs, and symbols). Many of these cultural artifacts serve a dual purpose: not only do they make possible the integration of a growing child into the culture but they also transform the very way the child’s mind is being formed. Vygotsky refers to these as special cultural tools, acquisition of which extends one’s mental capacities, making individuals the master of their own behavior. In the course of child development,

a child typically learns how to use these cultural tools through interactions with parents, teachers, or more experienced peers. As a result of using these tools—first in cooperation with others and later independently—the child develops higher mental functions: complex mental processes that are intentional, self-regulated, and mediated by language and other sign systems. Examples of these higher mental functions include focused attention, deliberate memory, and verbal thinking. According to Vygotsky, although all human beings are capable of developing these functions, the particular structure and content of higher mental functions depend on specific social interactions, as determined by culture in general and by each person's unique social situation of development.

Of all the processes involved in acquisition of mental tools, Vygotsky focused primarily on the use of language (it was through the work of his colleagues and students that acquisition of non-verbal mental tools was studied). For him, language is both the most important mental tool and a medium facilitating the acquisition of other mental tools. One of the best-known concepts that illustrates Vygotsky's view of language is the concept of *private speech*. Private speech, or self-talk, originates in social speech, the initial form of speech that is directed to other people. Although it retains the audible characteristic of social speech, private speech changes its function. It now becomes speech directed to oneself rather than speech that is regulated or directed by a more capable person. Noticing that children tend to increase the amount of self-talk when facing more challenging tasks, Vygotsky hypothesized that at some point, they start using private speech to organize (plan, direct, or evaluate) their behaviors. The use of private speech peaks during preschool years and then decreases. Vygotsky associates this decrease with private speech turning first into inner speech and then into verbal thinking. This evolution of speech—from social to self-directed to internalized—exemplifies the path of all higher mental functions, which was described by Vygotsky in his “law of the development of higher mental functions.” According to this law, each higher mental function appears twice in the course of child development: first as shared or carried out by an individual jointly with other people—*intersubjective*—and then as appropriated or internalized by this individual and used independently—*intrasubjective*.

Vygotsky's view of child development and education is an extension of his general approach to the development of higher mental functions. Consistent with his definition of development as socially determined, Vygotsky introduced a new relationship between education, learning, and development. Vygotsky argued against the theorists who believed that child development occurs spontaneously and is driven by the processes of maturation and cannot be affected by education. Neither did he agree with those who claimed that instruction could alter development at any time regardless of a child's age or capacities. Instead, he proposed a more complex and dynamic relationship between learning and development that is determined by what he termed a child's *zone of proximal development* (ZPD).

Vygotsky's theory is based on the idea that learning can lead development, and development can lead learning, and this process takes place through a dynamic interrelationship. The ZPD is the area between a learner's level of independent performance (often called developmental level) and the level of assisted performance—what the child can do with support. Independent performance is the best the learner can do without help, and assisted performance is the maximum the learner can achieve with help. By observing assisted performance one can investigate a learner's potential for current highest level of functioning. ZPD reveals the learner's potential and is realized in interactions with knowledgeable others or in other supportive contexts (such as make-believe play for preschool children). By providing assistance to learners within their ZPD we are supporting their growth.

Through identification of a learner's ZPD, teachers find out what knowledge, skills, and understandings have not yet surfaced for the learner but are on the edge of emergence. Teachers also study ways to engage the learner in shared or co-operative learning experience through participation in the learner's ZPD. This involves doing more than completing a task in a combined fashion; it involves developing the learner's higher mental functions, such as the ability to plan, evaluate, memorize, and reason. In *How Children Think and Learn* (1998), David Wood points out: “By *reminding* children we are helping them to bring to mind and exploit those aspects of their past experience that we (as experts) but not they (as novices) know to be *relevant* to what they are currently trying to do” (p. 97).

### Applications in Contemporary Russia

Examples of work being done in contemporary Russia within Vygotsky's cultural-historical paradigm are too numerous to be listed in a short article. One could say that most of Vygotsky's ideas, suppositions, and insights were further elaborated upon, verified in empirical studies, and often implemented into practical applications. Some of these ideas became starting points to new theories such as the theory of periods in child development developed by Daniel Elkonin, based on Vygotsky's ideas of psychological age and leading activity. Other theories developed by Vygotsky's colleagues and students can be better described as Vygotsky-inspired in a broader sense rather than purely Vygotskian. Among these are Alexei Leont'ev's activity theory and Piotr Gal'perin's theory of step-by-step formation of mental actions. Common features of most of these theories can be traced back to Vygotsky; these include beliefs in social and cultural determination of child development and in the power of education to shape this development. Because of these assumptions, post-Vygotskians were generally successful in implementing their theoretical principles in classroom practice to create innovative educational programs. Examples of those include a number of preschool and kindergarten curricula based on theories of Alexander Zaporozhets and his student Leonid Venger and the system of "developmental education" based on the work of Daniel Elkonin and his student Vasili Davidov, which has been implemented in curricula for school-aged children from primary grades through high school.

### Applications in the United States

As mentioned above, this entry focuses on just a couple of examples of Vygotsky-inspired educational work in the United States. For more perspectives, see the work of Michael Cole and colleagues in *The Construction Zone: Working for Cognitive Change in School*, and Roland G. Sharp and Ronald Gallimore's 1988 book, *Rousing Minds to Life: Teaching, Learning and Schooling in Social Context*. The following are descriptions of two examples: Tools of the Mind, which is an early childhood education program, and Reciprocal Reading, used with older children.

**Tools of the mind.** This first example might be considered a transitional model. Though the work is being developed in the United States, one of the lead authors is Russian and has worked at the Institute

of Preschool Education with Lev Vygotsky's student Alexander Zaporozhets. Elena Bodrova and Deborah Leong have developed an early childhood education model titled, *Tools of the Mind* (1996, 2001). The model has a Vygotskian theoretical basis: development cannot be separated from its social context; learning can lead development; language plays a central role in mental development; teaching should provide organized experiences that are in advance of a child's independent functioning but still remain within the child's ZPD; and teachers should encourage (and even create) opportunities for problem-solving. Implemented in Head Start, preschools, and kindergartens, the program focuses on play, the leading activity of this age. In addition, there are a number of activities designed to promote symbolic representation and self-regulation, such as play planning using Scaffolded Writing, and specially designed artifacts or tools, including the Sound Map, the purpose of which is to support young children in their beginning efforts to spell.

**Reciprocal listening/reading.** A second program motivated by the work of Lev Vygotsky and developed in the United States is *reciprocal listening/reading*, which was introduced in the mid-1980s by Annemarie Sullivan Palincsar and Ann Brown. It is a strategy for teaching reading comprehension that addresses children's need to examine the background of a text and particular words while learning to monitor their own reading process. Children are taught to interact with text and as a result to regulate their own thinking about the text as they read and listen (when being read to).

The ties of this program to Vygotsky lie in the belief that development of complex comprehension strategies has to start in a cooperative activity (intersubjective) and then move inward for use by a student (intrasubjective). Reciprocal teaching provides guided practice in the use of four strategies—predicting, question generating, summarizing, and clarifying—that are designed to enhance children's ability to construct the meaning of text. These strategies for interacting with the text are most often used automatically and soundlessly by readers and listeners. In reciprocal reading and listening, the strategies are vocalized and made available to other learners. To engage in reciprocal teaching dialogues, the children and their teacher read a piece of common text. This reading may be done as a read-along, a silent reading, or an oral reading, depending on the decoding abilities of the children and the level of the text.

The children and the teacher take turns leading the discussion of segments of the text, using strategies to support their discussion. The teacher uses the strategies and the children are encouraged to play the “teacher role” and to interact with the text. Children then learn new ways of interacting with the text by implementing these previously unobserved strategies and being an integral part of what is being taught in their role as “teacher.” Following Vygotskian theory, the children begin to internalize the processes until they become an automatic part of their internal reading and listening comprehension activities. An ultimate purpose of the discussion is the application of the strategies for the purpose of coming to a shared sense of the meaning of the text at hand.

#### DEWEY, JOHN (1859–1952)

Throughout the United States and the world at large, the name of John Dewey has become synonymous with the Progressive education movement. Dewey has been generally recognized as the most renowned and influential American philosopher of education.

He was born in 1859 in Burlington, Vermont, and he died in New York City in 1952. During his lifetime the United States developed from a simple

frontier-agricultural society to a complex urban-industrial nation, and Dewey developed his educational ideas largely in response to this rapid and wrenching period of cultural change. His father, whose ancestors came to America in 1630, was the proprietor of Burlington's general store, and his mother was the daughter of a local judge. John, the third of their four sons, was a shy boy and an average student. He delivered newspapers, did his chores, and enjoyed exploring the woodlands and waterways around Burlington. His father hoped that John might become a mechanic, and it is quite possible that John might not have gone to college if the University of Vermont had not been located just down the street. There, after two years of average work, he graduated first in a class of 18 in 1879.

There were few jobs for college graduates in Burlington, and Dewey spent three anxious months searching for work. Finally, a cousin who was the principal of a high school in South Oil City, Pennsylvania, offered him a teaching position which paid \$40 a month. After two years of teaching high school Latin, algebra, and science, Dewey returned to Burlington to teach in a rural school closer to home.

With the encouragement of H. A. P. Torrey, his former philosophy professor at the University of Vermont, Dewey wrote three philosophical essays (1882a; 1882b; 1883) which were accepted for publication in the *Journal of Speculative Philosophy*, whose editor, William Torrey Harris, hailed them as the products of a first-rate philosophical mind. With this taste of success and a \$500 loan from his aunt, Dewey left teaching to do graduate work at Johns Hopkins University. There he studied philosophy—which at that time and place primarily meant Hegelian philosophy and German idealism—and wrote his dissertation on the psychology of Kant.

After he received the doctorate in 1884, Dewey was offered a \$900-a-year instructorship in philosophy and psychology at the University of Michigan. In his first year at Michigan, Dewey not only taught but also produced his first major book, *Psychology* (1887). In addition, he met, wooed, and married Alice Chipman, a student at Michigan who was herself a former schoolteacher. Fatherhood and ten years' teaching experience helped his interest in psychology and philosophy to merge with his growing interest in education.

In 1894 the University of Chicago offered Dewey the chairmanship of the department of phi-

losophy, psychology, and pedagogy. At Chicago he established the now-famous laboratory school (commonly known as the Dewey School), where he scientifically tested, modified, and developed his psychological and educational ideas.

An early statement of his philosophical position in education, *My Pedagogic Creed* (1897), appeared three years after his arrival at Chicago. Four other major educational writings came out of Dewey's Chicago experience. The first two, *The School and Society* (1899), which was first published in 1899, and *The Child and the Curriculum* (1902), were lectures which he delivered to raise money and gain support for the laboratory school. Although the books were brief, they were clear and direct statements of the basic elements of Dewey's educational philosophy and his psychology of learning. Both works stressed the functional relationship between classroom learning activities and real life experiences and analyzed the social and psychological nature of the learning process. Two later volumes, *How We Think* (1910) and *Democracy and Education* (1916), elaborated these themes in greater and more systematic detail.

Dewey's work at Chicago was cut short when, without consulting Dewey, Chicago's president, William Rainey Harper, arranged to merge the laboratory school with the university training school for teachers. The merger not only took control of the school from Dewey's hands but changed it from an experimental laboratory to an institution for teacher-training. Dewey felt that he had no recourse but to resign and wrote to William James at Harvard and to James M. Cattell at Columbia University, informing them of his decision. Dewey's reputation in philosophy had grown considerably by this time, and Cattell had little difficulty in persuading the department of philosophy and psychology at Columbia to offer him a position. Because the salary offer was quite low for a man with six children (three more had been born during his ten years at Chicago), arrangements were made for Dewey to teach an additional two hours a week at Columbia Teachers College for extra compensation. For the next twenty-six years at Columbia, Dewey continued his illustrious career as a philosopher and witnessed the dispersion of his educational ideas throughout the world by many of his disciples at Teachers College, not the least of whom was William Heard Kilpatrick.

Dewey retired in 1930 but was immediately appointed professor emeritus of philosophy in resi-

dence at Columbia and held that post until his eightieth birthday in 1939. The previous year he had published his last major educational work, *Experience and Education* (1938). In this series of lectures he clearly restated his basic philosophy of education and recognized and rebuked the many excesses he thought the Progressive education movement had committed. He chastised the Progressives for casting out traditional educational practices and content without offering something positive and worthwhile to take their place. He offered a reformulation of his views on the intimate connection between learning and experience and challenged those who would call themselves Progressives to work toward the realization of the educational program he had carefully outlined a generation before.

At the age of ninety he published his last large-scale original philosophical work, *Knowing and the Known* (1949), in collaboration with Arthur F. Bentley.

### **Experience and Reflective Thinking**

The starting place in Dewey's philosophy and educational theory is the world of everyday life. Unlike many philosophers, Dewey did not search beyond the realm of ordinary experience to find some more fundamental and enduring reality. For Dewey, the everyday world of common experience was all the reality that man had access to or needed. Dewey was greatly impressed with the success of the physical sciences in solving practical problems and in explaining, predicting, and controlling man's environment. He considered the scientific mode of inquiry and the scientific systematization of human experience the highest attainment in the evolution of the mind of man, and this way of thinking and approaching the world became a major feature of his philosophy. In fact, he defined the educational process as a "continual reorganization, reconstruction and transformation of experience" (1916, p. 50), for he believed that it is only through experience that man learns about the world and only by the use of his experience that man can maintain and better himself in the world.

Dewey was careful in his writings to make clear what kinds of experiences were most valuable and useful. Some experiences are merely passive affairs, pleasant or painful but not educative. An educative experience, according to Dewey, is an experience in which we make a connection between what we do to things and what happens to them or us in conse-

quence; the value of an experience lies in the perception of relationships or continuities among events. Thus, if a child reaches for a candle flame and burns his hand, he experiences pain, but this is not an educative experience unless he realizes that touching the flame resulted in a burn and, moreover, formulates the general expectation that flames will produce burns if touched. In just this way, before we are formally instructed, we learn much about the world, ourselves, and others. It is this natural form of learning from experience, by doing and then reflecting on what happened, which Dewey made central in his approach to schooling.

Reflective thinking and the perception of relationships arise only in problematical situations. As long as our interaction with our environment is a fairly smooth affair we may think of nothing or merely daydream, but when this untroubled state of affairs is disrupted we have a problem which must be solved before the untroubled state can be restored. For example, a man walking in a forest is suddenly stopped short by a stream which blocks his path, and his desire to continue walking in the same direction is thwarted. He considers possible solutions to his problem—finding or producing a set of stepping-stones, finding and jumping across a narrow part, using something to bridge the stream, and so forth—and looks for materials or conditions to fit one of the proposed solutions. He finds an abundance of stones in the area and decides that the first suggestion is most worth testing. Then he places the stones in the water, steps across to the other side, and is off again on his hike. Such an example illustrates all the elements of Dewey's theoretical description of reflective thinking: A real problem arises out of present experiences, suggestions for a solution come to mind, relevant data are observed, and a hypothesis is formed, acted upon, and finally tested.

### **Learning**

For Dewey, learning was primarily an activity which arises from the personal experience of grappling with a problem. This concept of learning implied a theory of education far different from the dominant school practice of his day, when students passively received information that had been packaged and predigested by teachers and textbooks. Thus, Dewey argued, the schools did not provide genuine learning experiences but only an endless amassing of facts, which were fed to the students, who gave them back and soon forgot them.

Dewey distinguished between the psychological and the logical organization of subject matter by comparing the learner to an explorer who maps an unknown territory. The explorer, like the learner, does not know what terrain and adventures his journey holds in store for him. He has yet to discover mountains, deserts, and water holes and to suffer fever, starvation, and other hardships. Finally, when the explorer returns from his journey, he will have a hard-won knowledge of the country he has traversed. Then, and only then, can he produce a map of the region. The map, like a textbook, is an abstraction which omits his thirst, his courage, his despairs and triumphs—the experiences which made his journey personally meaningful. The map records only the relationships between landmarks and terrain, the logic of the features without the psychological revelations of the journey itself.

To give the map to others (as a teacher might) is to give the results of an experience, not the experience by which the map was produced and became personally meaningful to the producer. Although the logical organization of subject matter is the proper goal of learning, the logic of the subject cannot be truly meaningful to the learner without his psychological and personal involvement in exploration. Only by wrestling with the conditions of the problem at hand, “seeking and finding his own way out, does he think . . . . If he cannot devise his own solution (not, of course, in isolation but in correspondence with the teacher and other pupils) and find his own way out he will not learn, not even if he can recite some correct answer with one hundred percent accuracy” (Dewey 1916, p. 160).

Although learning experiences may be described in isolation, education for Dewey consisted in the cumulative and unending acquisition, combination, and reordering of such experiences. Just as a tree does not grow by having new branches and leaves wired to it each spring, so educational growth does not consist in mechanically adding information, skills, or even educative experiences to students in grade after grade. Rather, educational growth consists in combining past experiences with present experiences in order to receive and understand future experiences. To grow, the individual must continually reorganize and reformulate past experiences in the light of new experiences in a cohesive fashion.

## School and Life

Ideas and experiences which are not woven into the fabric of growing experience and knowledge but remain isolated seemed to Dewey a waste of precious natural resources. The dichotomy of in-school and out-of-school experiences he considered especially wasteful, as he indicated as early as 1899 in *The School and Society*:

From the standpoint of the child, the great waste in the school comes from his inability to utilize the experiences he gets outside the school in any complete and free way within the school itself; while on the other hand, he is unable to apply in daily life what he is learning in school. That is the isolation of the school—its isolation from life. When the child gets into the schoolroom he has to put out of his mind a large part of the ideas, interests and activities that predominate in his home and neighborhood. So the school being unable to utilize this everyday experience, sets painfully to work on another tack and by a variety of [artificial] means, to arouse in the child an interest in school studies . . . . [Thus there remains a] gap existing between the everyday experiences of the child and the isolated material supplied in such large measure in the school. (1956, pp. 75–76)

To bridge this chasm between school and life, Dewey advocated a method of teaching which began with the everyday experience of the child. Dewey maintained that unless the initial connection was made between school activities and the life experiences of the child, genuine learning and growth would be impossible. Nevertheless, he was careful to point out that while the experiential familiar was the natural and meaningful place to begin learning, it was more importantly the “intellectual starting point for moving out into the unknown and not an end in itself” (1916, p. 212).

To further reduce the distance between school and life, Dewey urged that the school be made into an embryonic social community which simplified but resembled the social life of the community at large. A society, he reasoned, “is a number of people held together because they are working along common lines, in a common spirit, and with reference to common aims. The common needs and aims demand a growing interchange of thought and grow-

ing unity of sympathetic feeling.” The tragic weakness of the schools of his time was that they were endeavoring “to prepare future members of the social order in a medium in which the conditions of the social spirit [were] eminently wanting” (1956, pp. 14–15).

Thus Dewey affirmed his fundamental belief in the two-sidedness of the educational process. Neither the psychological nor the sociological purpose of education could be neglected if evil results were not to follow. To isolate the school from life was to cut students off from the psychological ties which make learning meaningful; not to provide a school environment which prepared students for life in society was to waste the resources of the school as a socializing institution.

### Democracy and Education

Dewey recognized that the major instrument of human learning is language, which is itself a social product and is learned through social experiences. He saw that in providing a pool of common meanings for communication, the language of each society becomes the repository of the society’s ideals, values, beliefs, and accumulated knowledge. To transmit the contents of the language to the young and to initiate the young in the ways of civilized life was for Dewey the primary function of the school as an institution of society. But, he argued, a way of life cannot be transmitted by words alone. Essential to acquiring the spirit of a way of life is immersion in ways of living.

More specifically, Dewey thought that in a democratic society the school should provide students with the opportunity to experience democracy in action. For Dewey, democracy was more than a form of government; it was a way of living which went beyond politics, votes, and laws to pervade all aspects of society. Dewey recognized that every social group, even a band of thieves, is held together by certain common interests, goals, values, and meanings, and he knew that every such group also comes into contact with other groups. He believed, however, that the extent to which democracy has been attained in any society can be measured by the extent to which differing groups share similar values, goals, and interests and interact freely and fruitfully with each other.

A democratic society, therefore, is one in which barriers of any kind—class, race, religion, color, pol-

itics, or nationality—among groups are minimized, and numerous meanings, values, interests, and goals are held in common. In a democracy, according to Dewey, the schools must act to ensure that each individual gets an opportunity to escape from the limitations of the social group in which he was born, to come into contact with a broader environment, and to be freed from the effects of economic inequalities. The schools must also provide an environment in which individuals may share in determining and achieving their common purposes in learning so that in contact with each other the students may recognize their common humanity: “The emphasis must be put upon whatever binds people together in cooperative human pursuits . . . and the fuller, freer, intercourse of all human beings with one another . . . [This] ideal may seem remote of execution, but the democratic ideal of education is a farcical yet tragic delusion except as the ideal more and more dominates our public system of education” (Dewey, 1916, p. 98).

Dewey’s belief in democracy and in the schools’ ability to provide a staging platform for social progress pervades all his work but is perhaps most clearly stated in his early *Pedagogic Creed*:

I believe that education is the fundamental method of social progress and reform. All reforms which rest simply upon the enactment of law, or the threatening of certain penalties, or upon changes in mechanical or outward arrangements, are transitory and futile . . . By law and punishment, by social agitation and discussion, society can regulate and form itself in a more or less haphazard and chance way. But through education society can formulate its own purposes, can organize its own means and resources, and thus shape itself with definiteness and economy in the direction in which it wishes to move . . . Education thus conceived marks the most perfect and intimate union of science and art conceivable in human experience. (1964, pp. 437–438)

Perhaps it was with these ideas in mind that Dewey was prompted to equate education with philosophy, for he felt that a deep knowledge of man and nature was not only the proper goal of education but the eternal quest of the philosopher: “If we are willing to conceive of education as the process of forming fundamental dispositions, intellectual and emotion-

al, toward nature and fellow men, philosophy may even be defined as the general theory of education” (1916, p. 328).

### CLASSROOM DISCOURSE

The term *classroom discourse* refers to the language that teachers and students use to communicate with each other in the classroom. Talking, or conversation, is the medium through which most teaching takes place, so the study of classroom discourse is the study of the process of face-to-face classroom teaching.

The earliest systematic study of classroom discourse was reported in 1910 and used stenographers to make a continuous record of teacher and student talk in high school classrooms. The first use of audiotape recorders in classrooms was reported in the 1930s, and during the 1960s there was a rapid growth in the number of studies based on analysis of transcripts of classroom discourse. In 1973, Barak Rosenshine and Norma Furst described seventy-six

different published systems for analysing classroom discourse.

It soon became clear from these early studies that the verbal interaction between teachers and students had an underlying structure that was much the same in all classrooms, and at all grade levels, in English-speaking countries. Essentially, a teacher asks a question, one or two students answer, the teacher comments on the students' answers (sometimes summarizing what has been said), and then asks a further question. This cyclic pattern repeats itself, with interesting variations, throughout the course of a lesson.

The following excerpt from a whole-class discussion in a fifth-grade science class illustrates the nature of this typical participation structure. The teacher was reviewing what the students learned earlier in the day during a science activity on light.

*Teacher.* What's transparent? Something is transparent. What does that mean? We did that this morning, didn't we? What does transparent mean?

*Valerie.* Ah, it doesn't . . . It goes through.

*Teacher.* Can you explain that a little more? What goes through?

*Valerie.* Well it goes through like, um . . . You can, like, you shine a torch on and you can see.

*Teacher.* What goes through?

*Valerie.* The light.

*Teacher.* The light. Light can pass through something if it's transparent. What's the next one? Translucent. What does it mean?

*Jordan?*

*Jordan.* Um, just some light can get through.

*Teacher.* Absolutely. Some light can get through. Can you look around the room and see an example of something that might be translucent? Well, you all can tell me something in here that's translucent because you discovered something this morning that would let some light through. What was it?

*Clarice.* Paper.

*Teacher.* Right. Some paper is translucent. It will allow some light to pass through it. Think of something else that's translucent.

*Morgan.* Oh, um, the curtains over there, you can see right through them.

*Teacher.* OK. Yes that's interesting. They do let some light through don't they. Another

example? Think about light bulbs. Do you think some light bulbs would be translucent?

*Pupils.* Yes.

*Teacher.* They would allow some light through?

*Pupil.* No. Transparent.

*Teacher.* You think they're transparent. They let all the light through. I'm not too sure about that one either. So we might investigate that one.

This excerpt contains two episodes, each initiated by a question ("What does transparent mean?" and "Translucent. What does it mean?"). Within each episode the teacher directed the discussion by commenting on student answers and asking further questions. Each question set off a question-answer-comment cycle. At the beginning of the first episode, the teacher set the context by repeating the question several times and reminding the students that they had learned the answer during the morning's activity. This focused the students' attention and let them know (from their previous experiences with this teacher) that they were expected to know the answer.

The first answer (from Valerie) was not in the appropriate language of a definition. Through two further questions the teacher elicited the missing information and, through a summary, modelled the form of a scientific definition ("Light can pass through something if it's transparent.").

In the next episode, after Jordan copied this model to define translucent, the teacher asked a question to find out if the students understood the term well enough to identify an example ("Can you look around the room and see an example?"). After two answers (paper, curtains) the teacher provided additional help by suggesting an example (light bulb) and asking if the students agreed.

This excerpt illustrates how teachers use questions and student answers to progressively create the curriculum, to engage the students' minds, and to evaluate what the students know and can do. Underlying this exchange are the implicit rules and expectations that determine what, and how, teachers and students communicate. Each statement depends for its meaning on the context in which it occurs and, in turn, adds to the context that determines the meaning of subsequent statements.

Analysis of the patterns of interaction characteristic of most classrooms has shown that, on average, teachers talk for more than two-thirds of the time,

a few students contribute most of the answers, boys talk more than girls, and those sitting in the front and center of the class are more likely to contribute than those sitting at the back and sides. Bracha Alpert has identified three different patterns of classroom discourse: (1) silent (the teacher talks almost all the time and asks only an occasional question), (2) controlled (as in the excerpt above), and (3) active (the teacher facilitates while the students talk primarily to each other). Recent attempts to reform teaching based on constructivist views of learning have called for teachers to ask fewer questions and for students to learn to state and justify their beliefs and argue constructively about reasons and evidence.

Earlier research on classroom discourse tended to focus on specific teacher or student behaviors, and, because of the key role that they play, teacher questions have been most frequently studied. Questions that challenge students to think deeply about the curriculum are more likely to develop students' knowledge and intellectual skills than questions that require recall of facts. In the excerpt above, the first question required simple recall ("what does transparent mean?) while the last question ("do you think some light bulbs would be transparent?") required the students to apply their understanding of *transparent* to their own experience.

The results of this early research were often equivocal, and researchers have argued more recently that specific utterances cannot be separated from the context in which they occur. Greater attention is now being paid to the ways in which meanings evolve as teachers and students mutually construct the unique discourse (with its roles, rules, and expectations) that characterizes each classroom.

An entirely different form of classroom discourse occurs when students are working together in small groups. The following excerpt is from a sixth-grade class studying Antarctica. The teacher organized the students to work in groups of two or three and instructed the students to "write down all the different types of jobs that you think people might do down in Antarctica." Ben, Paul, and Jim worked together, and Ben wrote down the list that they created. A nearby group consisted of Tilly, Koa, and Nell.

*Ben.* Most of the people there are scientists. In fact, just about all of them are.

*Jim.* Even the cooks would be scientists?

*Ben.* Not necessarily. OK.

*Jim.* Some of them?

*Ben.* Pilots.

*Jim.* Yeah, they'd need pilots.

*Ben.* All the things that need to be done to keep you living. You know, you need to have food, you need to have shelter.

*Jim.* I know, a driver. But you could have a scientist to be a driver.

*Ben.* What else would they do? A-ah, what are they called? I don't know.

*Jim.* Maintenance man. Maintenance man.

*Tilly (overhearing).* Thank you. Maintenance person!

*Jim.* Or lady. Maintenance person.

*Paul.* I'll tell you what. Um, explorer.

*Jim.* Um, expedition leader.

*Ben (aware that the next group is listening).* Just whisper, will you?

*(to next group)* Stop copying, you lot. Can't you use your own brain?

*Jim.* Yeah, they haven't got any brain to use.

*Ben.* Exactly.

*Tilly.* How many have you got [on your list]?

*Jim.* Twenty-eight thousand.

*Ben.* You'll have a job to beat that.

*Jim (whispering to Ben).* Mm. Builder?

*Ben (to teacher passing group).* They're copying.

*Tilly and Nell.* We are not.

*Jim.* Yeah, they are too.

*Teacher.* Oh, you don't need that sort of carry on.

*Jim.* Let's see, um . . . um . . . a guide.

*Ben.* Isn't that kind of like a leader?

*Jim.* No, 'cause the expedition leader is a leader. He just, the guide knows where everything is. The expedition leader doesn't.

*Ben.* An expedition leader has to know where everything is as well, or else he wouldn't be an expedition leader 'cause he's supposed to guide them all around the place and tell 'em where to go. He's the most experienced and therefore he should be the guide.

*Jim.* Yeah, but first of all they'd need a guide that's been there. While he's learning.

*Ben.* Well, he wouldn't be the leader while he was learning.

*Jim.* Yeah.

Unlike the teacher-led discussions, the structure of this excerpt is determined by the social relationships between the students. Paul and Jim thought Ben knew a lot and encouraged him to assume a leadership role. Mimicking the role of a teacher, he evaluated Jim's contributions ("Not necessarily. OK."), and provided guidance about how to think about the problem ("All the things that need to be done to keep you living."). When Jim suggested "guide," Ben questioned whether this was different from "expedition leader." Jim tried to defend his suggestion but, in the face of Ben's reasons and authority, he agreed with Ben. Researchers have noted that students are more likely to have their thinking changed by their peers than by their teacher, and that resolving differences is simultaneously about negotiating social relationships and consideration of reasons and evidence.

In this classroom there was an underlying competitiveness, and the teacher had previously talked with the students about the gender bias in their texts and personal experiences. These two agendas combined in the conflict that erupted between Ben's and Tilly's groups. When Tilly overheard Jim use a sexist title ("maintenance man"), she corrected him. This alerted Ben to the possibility that Tilly's group was listening and copying his group's ideas. He told his own group to whisper and told the other group they had no brains. Jim followed Ben's lead ("Yeah, they haven't got any brain to use") and challenged Tilly's group by claiming they had a list of "twenty-eight thousand" items. Clearly, the structure and function of this discourse reflects both the requirements of the task and the evolving social relationships and culture (e.g., about gender and ability differences) of this class.

### Classroom Discourse and Learning

There have been two distinct approaches to explaining how classroom discourse relates to what students learn. Since the 1960s a large number of studies have been carried out in which frequencies of teacher and student verbal behaviors and interaction patterns (such as asking higher-order questions, providing structuring information, praising student answers) have been correlated with student achievement. These developed into experimental studies in which

teachers were scripted to talk in specific predetermined ways. Such studies came to be criticized for their impersonal empiricism and lack of theory. They failed to consider the contextual nature of classroom discourse, particularly the meanings that participants attributed to what was being said.

As interest in the constructivist nature of language developed, researchers argued that the learning process was contained in the process of participating in classroom discourse. As students engage in the discourse they acquire ways of talking and thinking that characterize a particular curriculum area. For example, to learn science is to become an increasingly expert participant in classroom discourse about the procedures, concepts, and use of evidence and argument that constitutes science. This approach is supported by the theories of the Russian psychologist Lev Vygotsky who argued that the higher mental processes are acquired through the internalization of the structures of social discourse. There is still a need, however, for these detailed linguistic and ethnographic analyses of classroom discourse to include independent evidence of how students' knowledge and beliefs are changed by their participation in the discourse.

## COGNITIVE PERSPECTIVE

The field of *discourse processing* investigates the structures, patterns, mental representations, and processes that underlie written and spoken discourse. It is a multidisciplinary field that includes psychology, rhetoric, sociolinguistics, conversation analysis, education, sociology, anthropology, computational linguistics, and computer science.

Researchers in discourse processing have identified a number of mechanisms that promote learning. The practical mission of the field is to improve the comprehension and production of discourse in textbooks, tutoring sessions, classrooms, computer-based training, and other learning environments. While focused primarily on cognitive mechanisms, it is clear that cognitive, social, emotional, and cultural foundations are tightly intertwined in contemporary theories of discourse processing.

### Levels of Discourse Processing

Discourse researchers have identified five levels of cognitive representation that are constructed during comprehension. These include the *surface code*, the *textbase*, the *situation model*, *pragmatic communication*, and the *discourse genre*. In order to illustrate these five levels, suppose that a high school student had a broken door lock and was reading the following excerpt from the book *The Way Things Work*:

Inserting the key raises the pins and frees the cylinder. When the key is turned, the cylinder rotates, making the cam draw back the bolt against the spring. (Macaulay, p. 17)

The *surface code* is a record of the exact wording and syntax of the sentences. This code is preserved in

memory for only a few seconds when technical text is read. The *textbase* contains explicit propositions in the text in a stripped-down form that captures the semantic meaning but loses details of the surface code. For example, the textbase of the first part of the second sentence includes the following: (1) someone turns a key, and (2) the cylinder rotates when the key is turned. The textbase is preserved in memory for several minutes or longer.

The *situation model* (sometimes called the *mental model*) is the referential mental world of what the text is about. In the above example, the situation model contains causal chains of events that unfold as the key unlocks the door, a visual spatial image of the parts of the lock, and the goals of the person who uses the lock. The construction of an adequate situation model requires a sufficient amount of relevant world knowledge, such as general knowledge about locks and mechanical equipment. *Deep comprehension* consists of the construction of this referential situation model, whereas *shallow comprehension* is limited to the surface code and textbase. The situation model is retained in memory much longer than the textbase and the surface code, assuming that the comprehender has adequate world knowledge to build a situation model.

The *pragmatic communication* level refers to the information exchange between speech participants. In a two-party oral conversation, the two speech participants take turns speaking while pursuing conversational goals. There may be additional participants in a conversation, such as side participants in the circle of conversation and bystanders who are outside of the circle. Speech acts are crafted in a fashion that is sensitive to the common ground (shared knowledge) between speech participants, and linguistic cues differentiate given (old) information in the dialog history from new information. The cognitive representation of a spoken utterance can be quite complex when there are several communication channels between multiple participants (sometimes called *agents*) in a conversation. When printed text is read and comprehended, the pragmatic communication is somewhat simplified, although there are vestiges of oral communication and multiple communication channels in textual matter. For example, there is communication between the reader and writer, between the narrator and audience, and between agents in embedded dialogues within the text content. Text comprehension improves when

readers are sensitive to the communication channel between author and reader.

*Discourse genre* is the type of discourse—such as narration (stories), exposition, persuasion, and so on. Discourse analysts have proposed several different discourse classification schemes, which are organized in a multilevel hierarchical taxonomy or in a multidimensional space (a set of features or levels of representation that are potentially uncorrelated). The Macaulay excerpt above would be classified as *expository text*. *Narrative text* is normally much easier to comprehend than expository text because narrative has a closer affinity to everyday experiences.

Deep comprehenders construct rich representations at the levels of the situation model, pragmatic communication, and discourse genre, whereas the textbase and surface code have a secondary status. Paradoxically, the examinations that students normally receive tap the surface code and textbase rather than the deeper levels. Teachers generally ask students to recall explicit content or to answer multiple-choice questions that tap word recognition, definitions, or attributes of concepts. One way of promoting deep comprehension is to compose exams with questions that emphasize the situation model, inferences, reasoning, and other aspects of the deeper levels. Since the late 1980s, researchers have advocated a shift in assessment standards to encourage deep comprehension.

### Discourse Coherence

Coherence is achieved both *within* and *between* the levels of representation when comprehension occurs. This means that there should be no serious coherence gaps within a particular level and there should be harmony between the levels of representation. A coherence gap occurs within the situation model, for example, when an incoming clause (the clause currently being read) in the text cannot be linked to the previous content on any conceptual dimension, such as causality, temporality, spatiality, or motives of characters. Simply put, a coherence gap occurs when information is mentioned out of the blue. Similarly, there may be coherence gaps at the levels of the surface code, textbase, pragmatic communication, and discourse genre. Regarding coherence between levels, the elements of the representation at one level need to be systematically related to the elements at another level. Comprehension suffers, for example, when there is a clash between the textbase and situation model. If the text stated,

“The key is turned after the cylinder rotates,” there would be a discrepancy between the order of events in the correct situation model (the key is, in fact, turned before the cylinder rotates) and the explicit textbase, which reverses the correct order.

Comprehension breaks down when there are deficits in world knowledge or processing skills at particular levels of representation. When there is a deficit at one level of representation, the problems can propagate to other levels. For example, non-native speakers of English may have trouble processing the words and syntax of English, so they may also have trouble constructing the deeper levels of representation. Readers have trouble comprehending technical texts on arcane topics because they lack world knowledge about the topic. A barrier in constructing the situation model ends up confining the processing to the surface code and textbase levels, so the material will soon be forgotten.

While studying a test about heart function, McNamara et al. (1996) documented an intriguing interaction among readers' knowledge about a topic, coherence of the textbase, and the level of representation that was being tapped in a test. The readers varied in the amount of prior knowledge they had about the topic covered in the text. In the study, half of the readers read a text with a coherent textbase. That is, clauses were linked by appropriate connectives (e.g., therefore, so, and), and the topic sentences, headings, and subheadings were inserted at appropriate locations. The other texts had low coherence due to violations in the insertion of connectives, topic sentences, headings, and subheadings. The tests tapped either the textbase level of representation (which included recall tests) or the situation level (which included tests of inferences and answers to deep-reasoning questions).

The results of the McNamara study were not particularly surprising for low-knowledge readers. For these readers, texts with high coherence consistently produced higher performance scores than texts with low coherence. The results were more complex for the readers with a high amount of prior knowledge about the heart. A coherent textbase slightly enhanced recall, but actually lowered performance on tasks that tapped the situation model. The gaps, or breaks in temporality, spatiality, and causality, in text coherence forced the high-knowledge reader to draw inferences, construct rich elaborations, and compensate by allocating more processing effort to the situation model. In essence, deep com-

prehension was a positive compensatory result of coherence gaps at the shallow levels of representation.

### Comprehension Calibration

One counterintuitive finding in comprehension research is that most children and adult readers have a poor ability to calibrate the success of their comprehension. *Comprehension calibration* can be measured by asking readers to rate how well they comprehend a text, and then correlating such ratings with comprehension scores on objective tests. These correlations are always either low or modest ( $r = .2$  to  $.4$ ), which suggests that college students have disappointing comprehension calibration. Another method of calibrating comprehension is to plant contradictions in a text and observe whether readers detect them. Such contradictions are not detected by a surprising number of adult readers. Instead, there is a strong tendency for readers to have an illusion of comprehension by adjusting their expectations at handling the surface code and textbase. Readers need to be trained to adjust their metacognitive expectations and strategies to focus on the deeper levels.

Classroom discourse is too often skewed to the shallow rather than the deep end of the comprehension continuum. Teachers typically follow a curriculum script that covers definitions, facts, concepts, attributes of concepts, and examples. This content is at the lower levels of Benjamin Bloom's taxonomy of cognitive objectives. Teachers rarely attempt to encourage Bloom's higher levels of inference, synthesis, integration, and the application of knowledge to practical problems.

### Discourse Mechanisms that Promote Deep Comprehension

There are some methods of improving deep comprehension and learning by invoking discourse processing mechanisms, including: (1) constructing explanations, (2) asking questions, (3) challenging a learner's beliefs and knowledge, and (4) tutoring.

**Constructing explanations.** Good comprehenders generate explanations as they read text or listen to lectures. These explanations trace the causes and consequences of events, the plans and goals of agents (humans, animals or organizations), and the logical derivations of assertions. The questions that drive explanations are *why*, *how*, *what-if*, and *what-if-not* questions. For example, a deep comprehender might implicitly ask the following questions while reading

the cylinder lock text: Why would the person turn the key to the right? How does the bolt move back? What causes the cam to rotate? What if the pins don't rise? Students learn much more when they construct these explanations on their own (self-explanations) than when they merely read or listen to explanations.

**Asking questions.** Students should be encouraged to ask and answer deep-reasoning questions to help them construct explanations. Unfortunately, students are not in the habit of asking many questions, and most of their questions are shallow. A typical student asks only .11 questions per hour in a classroom, and less than 10 percent of student questions involve deep reasoning. When students are trained how to ask good questions while reading or listening to lectures, their comprehension scores increase on objective tests. Teachers rarely ask deep-reasoning questions in classroom settings, so it would be prudent to improve the questioning skills of teachers.

**Challenging the learner's beliefs and knowledge.** One of the easiest ways to get students to ask questions is to challenge one of their entrenched beliefs, and thereby put them in *cognitive disequilibrium*. Suppose, for example, that a teacher expresses the claim that overpopulation is not a significant problem to worry about. This will normally stimulate a large number of student questions and counterarguments. Research on question asking has revealed that genuine information-seeking questions are inspired by contradictions, anomalies, incompatibilities, obstacles to goals, salient contrasts, uncertainty, and obvious gaps in knowledge. Therefore, one secret to eliciting student questions is to create cognitive disequilibrium and then provide useful information when students ask questions.

**Tutoring.** One-to-one human tutoring is superior to normal learning experiences in traditional classroom environments. This advantage cannot entirely be attributed to the possibility that tutors are more accomplished pedagogical experts than teachers. Peers often do an excellent job serving as tutors. Normal tutors rarely implement sophisticated pedagogical strategies, such as the Socratic method, building on prerequisites, error diagnosis and repair, or modeling-scaffolding-fading. It is the discourse patterns in normal tutoring that explain much of the advantages of tutoring over the classroom. The discourse in tutoring emphasizes collaborative problem solving, question asking and answering, and explanation building in the context of specific problems, cases,

and examples. There is a turn-by-turn collaborative exchange (speakers take turns talking) in tutoring that would be impractical to implement in the classroom.

In summary, research in discourse processing can help solve some of the pressing challenges in education. Discourse plays an important role in helping the learner shift from shallow to deep comprehension, and from being a fact collector to being an inquisitive explainer.

## DISTANCE LEARNING IN HIGHER EDUCATION

---

For more than a century, distance learning in higher education has constantly evolved—both in practice and in the definition of the term. As in many academic pursuits that are still in a state of development, there have been debates not only about the

definition, but also about the words *distance* and *learning* themselves. While there is no one authority to arbitrate this issue, reviewing some well-researched definitions yields some common concepts.

In the mid-1990s, the U.S. Department of Education undertook two studies that tallied the number of U.S. institutions offering distance-learning courses, the number of courses that they offered, and the number of students served by the courses. The studies defined *distance education* as “education or training courses delivered to remote (off-campus) location(s) via audio, video (live or prerecorded), or computer technologies” (Lewis, Farris, and Levin, p. 2). To gain a precise count, the Department of Education listed what should and should not be counted as distance education. For example, they asked that courses taught by faculty traveling to a remote site not be included.

In the late 1990s the American Association of University Professors addressed the rapid adoption of distance learning in their *Statement on Distance Education*. This document defined distance education (or distance learning) as education in which “the teacher and the student are separated geographically so that face-to-face communication is absent; communication is accomplished instead by one or more technological media, most often electronic (interactive television, satellite television, computers, and the like)” (American Association of University Professors website).

Also late in the 1990s, the Western Cooperative for Educational Telecommunications (WCET) developed a publication entitled *The Distance Learner’s Guide* to assist learners in successfully finding and taking courses at a distance. The authors sought a definition that did not focus on technology and would be easy for anyone to understand: “Perhaps the simplest definition is that distance learning takes place when the instructor and student are not in the same room, but instead are separated by physical distance” (Connick, p. 3).

Three main concepts are common to these definitions:

- **Education.** A course of study is being undertaken involving both teaching and learning.
- **Overcoming barriers of place and/or time.** Teachers and learners traditionally meet at an appointed place at an appointed time to pursue a course of study. Distance learning originally

developed to overcome the difficulties of teachers and learners who were not in the same geographic location. More recently, distance learning may also serve those who might be at the same location, but choose not to meet at the same time.

- **A tool is used to facilitate learning.** To overcome the distance of place or time, some form of technology is used to communicate between the teacher and learner. Originally, the technologies of pen, paper, and the postal service were used to connect them. As electronic communication technologies (audio, video, and data) became readily accessible to learners, these have been increasingly used.

### Related Terms and Concepts

While the term *distance learning* is widely used, the rapid development of communications technologies in the late 1990s and early 2000s created many variations on the theme. To understand distance learning, it is helpful to examine other closely related terms and concepts.

**Correspondence study.** The original form of distance learning, correspondence study involves the exchange of the written word, on paper, between teacher and learner. Improvements in transportation technologies (i.e., trains, trucks, planes) have assisted the postal service in making this an increasingly more viable method of study.

**Distance education.** Those wishing to focus on the learner as the center of the instructional process favor using the word *learning*. Others insist that the higher education institution cannot force someone to learn, and that the activity undertaken by the institution is *education*, not *learning*.

**Distributed education.** As electronic technologies provided more assistance to overcome the barriers of time, instead of just distance, some felt that the focus on *distance* had outlived its usefulness. In distributed education, education is available (or “distributed”) to any location at any time. Often a mix of technologies is proposed, including face-to-face instruction.

**Hybrid classes.** These courses use a mixture of distance learning and face-to-face techniques. For example, a group of learners in a biology class may meet face-to-face for their laboratory work, but the remainder of the instruction may be offered via television or computer.

**Open learning.** This is a term for distance learning commonly used in the British Commonwealth countries. The term derives from the Open University of the United Kingdom. To assist those not privileged to attend Britain's selective universities, the Open University began offering classes in the 1960s via a combination of written materials, televised programs, and local tutors. Open universities have spread throughout the Commonwealth countries and serve millions of students throughout the world.

**Online learning.** Distance learning where the bulk of instruction is offered via computer and the Internet is called online learning.

**E-learning.** Gaining popularity in the early 2000s, the term *e-learning* refers to any electronically assisted instruction, but is most often associated with instruction offered via computer and the Internet.

### Goals of Distance Learning

Educational opportunities are numerous: There are colleges and universities throughout the world, and there are specialty colleges that teach trades of every kind. Why then is distance learning needed?

The main goal of distance learning is to overcome barriers of place and time. Learners may live in isolated, rural areas and have no access to education. Other learners may have ready access to a college, but that college might not offer the course of study needed by that learner. Distance learning allows education to reach those who are not able to physically attend courses on a campus. Further, as learners attempt to balance family, work, and education, time becomes a precious commodity. Driving to campus, parking, and spending time in class at an appointed (and probably inconvenient) time may not fit into the learner's overall schedule. Distance learning courses increasingly allow learners to participate at a time that is most suitable for their schedule.

Distance learning can also overcome barriers of learning styles. "We now know that people learn in different ways, and that because some students do not absorb information well from a lecture style of instruction does not mean they are stupid. . . . But research won't change things until its findings are put to use" (Hull, p. 7). The common complaint about distance learning is that "it is not for everyone." While this complaint could also be made of the lecture method of teaching, it still predominates on campus. Electronic education tools, formerly

used only in distance learning, are increasingly being used in both on- and off-campus courses. "Almost two-thirds (64.1%) of all college courses now utilize electronic mail, up from . . . 20.1 percent in 1995" (Green, p. 7). Using video, audio, active learning, simulations, and electronic advances can overcome problems encountered by learners who do not adapt to just one learning style.

Other educational barriers can also be overcome by distance learning. Learners with physical or mental handicaps have attained degrees without going to a campus. Distance learning allows those with physical handicaps that prevent or hamper their attendance in person to pursue an education. Distance learning allows those with mental handicaps to follow the instructional materials at their own pace.

Workers may find that they are in need of additional skills to maintain a job or advance in the workplace. Distance learning allows these workers to obtain these skills without quitting their jobs, uprooting their families, and moving to a campus.

Distance learning can help students advance toward a degree more quickly. Utah has made a statewide strategic plan to use distance learning to allow high school students to take college courses while still in high school. Distance learning allows students to enter college with credits and obtain a higher education degree in less time.

Learners already enrolled on a campus may seek specialized courses not available on that campus. Distance learning has allowed some learners to transfer courses into their program that are only available at other campuses.

There is also a cost avoidance, or cost saving, factor. Some countries and U.S. states have avoided or delayed investments in campus buildings by serving some learners via distance or open learning. Sometimes erroneously labeled a *cost savings*, the investments in distance learning assist the government in avoiding the higher costs of building new campuses or campus buildings.

### Technologies Used in Distance Learning

Various technologies have been used to overcome the distance between the teacher and the learner. Using these technologies, the teacher prepares the lesson and sends it to the learner, and the learner then interacts with the lesson and sends feedback (questions, assignments, tests) to the teacher. As technologies have improved, so has the quality of this interaction.

An important concept to understand is the difference between two distinct forms of communications: synchronous and asynchronous. “*Synchronous communication* is communication in which all parties participate at the same time. Synchronous communication in distance learning emphasizes a simultaneous group learning experience. Teachers and students communicate in ‘real time’” (Connick, p. 8). An example of synchronous (happening at the same time) communication is a conversation. Whether face-to-face or on the telephone, to have a conversation both parties in the conversation must participate at the same time.

“*Asynchronous communication* is communication in which the parties participate at different times. Asynchronous communication offers a choice of where and, above all, when you will access learning . . . you may read or view these materials at your own convenience” (Connick, p. 8). Examples of asynchronous (not at the same time) communication include letters and e-mails. To communicate by letter does not require both parties to communicate at the same time. One person composes a letter and mails it. The other reads the letter upon receiving it and then responds.

Most teachers and learners are much more familiar with synchronous communication in education. All teacher and learners come to the classroom at the same time, make presentations, and hold discussions. As communication technologies have developed, distance-learning teachers have experimented with them to find ways to improve teacher-learner and learner-learner interactions.

Advances in printing, writing, and transportation led to correspondence study, the first major form of distance learning. Teachers would identify books, prepare lessons, and mail them to the learner. Initially, these materials were completely in printed or written form, and the learner would study the lessons, complete the assignments, and mail them back to the teacher. Communication depended on the speed of the postal service. Given the long lag time between lessons, learners often failed to complete the courses.

In the first half of the twentieth century, *broadcast technologies*, such as radio and television, became staples in every home, and colleges experimented with offering lectures via radio as a way to supplement correspondence courses. “The advent of television brought *Sunrise Semester* and its

relatives: the first telecourses. Professor Frank Baxter introduced Shakespeare to millions . . . there was a heavy instructional component in the schedules of America’s first educational television stations in the 50’s and 60’s, well before the creation of PBS” (Witerspoon, p. 5). In the early twenty-first century, open universities (in the United Kingdom and throughout the British Commonwealth) and the Public Broadcasting System in the United States still broadcast many courses via television. The increasingly high production values and use of experts of world-renown have increased the educational effectiveness of these courses. With the advent of cable television, federal regulations in the United States required that a few channels be set aside for public, education, and government use. Some colleges broadcast classes to cable television subscribers.

*Recording and playback technologies* are asynchronous technologies that have also found their ways into the homes of learners. Colleges in metropolitan areas have used audiotapes of lectures to reach learners who spend a considerable amount of time commuting to work. Videotapes of lectures and classroom interaction have been used to supplement correspondence course materials. Some colleges have also created highly produced courses that rival those made by PBS. CD-ROMs have increased in popularity as a recording medium as they can contain audio, video, and data files. CD-ROMs are durable, easy to reproduce, and inexpensive to mail.

All of these technologies have relied on consumer products that are available in many homes. There is also experimentation and widespread use of *closed-circuit technologies* that require special equipment and often require the learner to travel to a local college, library, or other learning center to access the instruction. “In 1959 . . . two DC-6 aircraft became high-altitude TV stations, operating from Purdue University and flying figure eights over Indiana to serve K–12 schools in portions of six Midwestern states” (Witerspoon, p. 5). That experiment was the precursor of satellite transmissions of courses. National Technological University still transmits engineering courses via satellite from its member colleges to corporate sites throughout the world. Students may participate synchronously, or they may tape the courses and view them later. In the United States, the federal government has set aside a portion of the microwave broadcast spectrum for educational use only. Colleges use the resulting Instructional Television Fixed Services (ITFS) to transmit courses to

sites and homes that have special receivers. In the late 1980s and into the mid-1990s, two-way video was adopted by a large number of colleges. This synchronous technology employs cameras and monitors at geographically dispersed sites, allowing teachers and learners to both see and hear each other.

The most recent advances in technologies have focused on computers and the Internet. The popularity of these technologies has grown as an increasing number of personal computers entered homes, and as an increasing amount of data could be transmitted over regular telephone lines. The 1960s and 1970s saw experiments using computer-assisted instruction, which were self-contained computer programs that led the learner through the lessons. Given the speed of the computers, many of these programs were originally text-based, and they were greatly improved in later years when graphics, pictures, animation, video, and audio could be added. The Internet created a boom in online learning at the end of the twentieth century. The choice of either synchronous or asynchronous communications options, the ability to add audio and video, as well as a variety of new teaching techniques has made the online learning environment more attractive to both teachers and learners.

In the future, computer processing power should continue to increase at the same great rate that it did during the 1890s and 1990s. *Internet 2*, a high-speed Internet focused on education and research, is one of many high-speed communications options that are under development. Such advances will allow distance learners to have more access to both synchronous and asynchronous audio, video, and computer simulations. As teachers become more familiar with these technologies, they will continue to become part of nearly every class, both on and off campus.

## DIVINITY STUDIES

The nature of divinity schools' programs of study and admissions policies, procedures, and qualifications differ greatly from institution to institution. Some generalizations can be made, however. The Association of Theological Schools—the central accrediting agency for divinity schools and seminaries—is a good source for more specific information regarding individual schools or programs.

### Admission to Divinity School

The admissions processes at divinity schools in the United States are typically less strenuous than those of many other graduate programs. Generally, with a few notable exceptions, standardized tests are not required, though they may be used when considering students for scholarships and other kinds of financial aid. Most programs implement a rolling admissions process (admissions is ongoing until a certain number of students is attained) and require submission of all postsecondary transcripts, multiple essays, recommendations, and a consideration fee. Some may also request an interview. Despite the lack of a required standardized test, however, gaining admission to some divinity schools can be a highly competitive endeavor. Most programs require applicants to have completed a minimum of a bachelor's degree

from an accredited four-year institution of higher education, and others mandate certain minimum grade point averages.

Significant financial aid awards usually accompany admission to a divinity school, compensating the student for the reality that most persons who graduate from one of these programs do not find themselves in monetarily lucrative fields.

### **Degrees Conferred**

Divinity school programs of study are diverse, and their respective foci are even more numerous. Generally, however, there are roughly a dozen or so degrees that are most common to divinity schools.

The master of divinity (M.Div.) is considered a professional degree and is probably the most common one awarded by divinity schools. The aim of this program is generally to prepare an individual to move in the direction of ordained ministry, although this is not always the case. Many such programs do, in fact, allow for significant elective credit hours to be spent in other areas of study. However, most M.Div. degrees consist of anywhere from seventy-two to ninety semester hours of study, comprising a mostly Christian-centered curriculum, and require a significant emphasis on practicum. Potential areas of focus include pastoral counseling, missionary work, parish ministry, youth ministry, and social justice ministry. Also, the vast majority of M.Div. programs have a mandatory thesis or "senior project" that must be completed for graduation.

The master of theological studies (M.T.S.) tends to be more of an academically focused degree, although it would still fall under the classification of professional degree. It rarely has a practicum component and is generally thought of as a degree that serves as a broad introduction to theological study. The potential fields of study tend to include a more diverse curriculum, including non-Christian religions, social ethics, and philosophy. This program may also allow individual students the opportunity to design (usually under the guidance of professors and the academic dean) their own program of study. The M.T.S. degree is often sought out by those interested in various kinds of social reform, or by persons looking to go on to pursue another degree. The length of this program generally varies anywhere from thirty to fifty-four semester hours of study, and may or may not require a thesis to be written at its culmination.

Usually understood as an academic degree, the master of arts (M.A.) is a program more often found within the graduate school at a university. Even so, many divinity schools that are not affiliated with universities also offer the degree. It is seen as a program of study that will probably lead to another degree, possibly a Ph.D. The master of arts degree usually spans twenty-four to thirty-six semester hours and requires a thesis, but does not have a practicum component. Areas of concentration may include New Testament, Hebrew Bible, ethics, church history, homiletics, and theology.

The master of theology (Th.M., M.Th.) generally requires that a student already hold the M.Div. or equivalent degree. It affords an opportunity for students to pursue advanced theological studies for one year or roughly twenty-four semester hours. The program is especially recommended for students who seek to gain additional competence for the ministry beyond that provided by the master of divinity degree.

A professional degree, the master of religious education (M.R.E.) centers on the process of education as it relates to understanding the Christian faith and its implications for human existence. Areas such as creativity, imagination, spirituality, and pedagogy are often fused to create a holistic process whereby individuals learn to educate the entire person. The length of the degree may last anywhere from twenty-four to fifty-four semester hours, and usually requires a practicum component.

Quite similar to the Th.M. and M.T.S. in terms of degree requirements, the master of sacred theology (S.T.M.) tends to focus primarily on Christian theology, texts, and history.

The master of sacred music (M.S.M) is also a professional degree and generally consists of a series of required courses in three categories: theology, music, and the ministry of music. It requires the successful completion of anywhere from thirty to sixty credit hours, and a final project is generally mandatory. Proficiency in music theory and history as well as choral conducting is usually required to graduate. In addition to the other general requirements for admission to this program, an audition is sometimes also expected.

Those who wish to enhance their knowledge and their ministerial or teaching competence in certain advanced areas of theology and ministry obtain the doctor of theology degree (Th.D.). It has a

stronger academic specialization than the D.Min, but also differs from the Ph.D. in its integrative character and clear connection to the church. Admission to this program generally requires the M.Div or equivalent degree and superior performance in the respective master's program. The Th.D. program consists of thirty-six to fifty-four hours of credit and a major project, thesis, or dissertation.

A terminal academic degree, the doctor of philosophy (Ph.D.) is usually sought by those with the aim of research and teaching. And like the M.A., this is a degree that is generally offered through the graduate school in cases where a divinity school is part of a greater university. Whatever the case may be, admission to the program is generally very difficult and requires at least one master's degree in a related field, usually accompanied by a significant research paper or thesis. Areas of concentration may include New Testament, Hebrew Bible, ethics, church history, homiletics, and theology.

The Doctor of Ministry (D.Min) is a professional degree that generally has a prerequisite of the M.Div., and serves as a more advanced ministerial degree. Often it allows for more in-depth study in a specific area of Christian ministry than is generally possible in the M.Div. program. A thesis or dissertation is almost always required.

Other degrees that are conferred by divinity schools in the United States may include doctor of educational ministry (D.Ed.Min.), doctor of musical arts (D.M.A.), doctor of missiology (D.Miss.), doctor of education (Ed.D.), master of church music (M.C.M.), master of Christian studies (M.C.S.), master of religion (M. Rel.), master of ministry (M.Min.), and master of pastoral studies (M.P.S.). In addition, there are a few divinity schools that have dual degree programs with other schools at either their own university or those of nearby institutions (i.e., J.D./M.Div., M.D./M.T.S., M.B.A./Th.M.).

BRIAN LLOYD HEUSER

## DOCTORAL DEGREE, THE

Advanced education culminates with the awarding of the doctoral degree. Allen R. Sanderson and Bernard Dugoni, in the 1997 edition of their annual survey of new doctoral recipients from U.S. universities, identified fifty-two different research doctorates. Traditionally, the nonprofessional doctoral degree most often awarded is the doctor of philosophy (Ph.D.), although other degrees such as the doctor of education (Ed.D.), doctor of arts (D.A.), and the doctor of science (D.Sc./Sc.D.) are being offered in greater numbers. Professional doctoral degrees such as the doctor of jurisprudence (J.D.) and the doctor of medicine (M.D.) also indicate the ending of advanced education, but the requirements for these doctoral degrees differ from those of the Ph.D. and its equivalents.

Requirements for doctoral degrees are generally established within the United States. While there are differences with course requirements and completion rates, the basic doctoral degree begins with one to two years of course work and ends with the oral defense of the dissertation. Credit hours generally range from sixty to seventy-five points beyond a master's degree, and course work is most often individually tailored based on the student's background, interests, and professional goals. In addition to completing class work prior to the dissertation, doctoral students are required to take comprehensive exams. Depending on the program, a student may be required to take more than one comprehensive exam throughout the course of study. Typically, a comprehensive exam is administered immediately following completion of course work, and the exam itself may take various forms such as a daylong session where students answer questions based on knowledge obtained in their studies. In most circumstances this is a closed-book exam and, after faculty have had the opportunity to grade the exam, doctoral students must defend their responses orally before a faculty panel.

### The Dissertation

The dissertation is an original topic of research investigated by the student in his final years as a doc-

toral student. A typical dissertation completed by a Ph.D. candidate will include five chapters: the first is a general introduction, the second is a thorough literature review of the subject, the third chapter contains the methodology or how the research is to be conducted, the fourth chapter shows the findings from research, and the final chapter is a discussion of the findings with suggestions for possible future research.

Prior to conducting the dissertation research, the graduate student must defend her proposal to her dissertation committee, which is generally made up of three to five members. The proposal is typically the first three chapters of the dissertation. After the proposal is approved the doctoral student may begin her research and work to complete the dissertation. After the research has been conducted and data analyzed, the doctoral student must again orally defend the dissertation before her committee. Each Ph.D. candidate must show a thorough knowledge of the subject being studied and present original research and findings that add to the body of knowledge for her discipline.

### Ph.D.'s, M.D.'s, and J.D.'s

The Ph.D. is the typical doctoral degree awarded at universities, although the areas of study range from the basic humanities to the sciences and education. Those receiving Ph.D.'s have traditionally gone on to faculty positions at colleges or universities. It is not uncommon, however, for Ph.D. recipients to go immediately into careers outside of academe.

Professional doctoral education, as previously mentioned, is postbaccalaureate study in the professions. Two of the most established professional education fields are medicine and law. The requirements for obtaining an M.D. or J.D. are rigid and do not vary greatly at different universities. In contrast, students in research doctoral programs have more flexibility in their individual courses of study. Professional doctoral students enter their graduate program as a cohort, take the same classes, and graduate within the recommended time period unless serious circumstances delay their progress. The curriculum focuses on more applied areas of study. Unlike a Ph.D. where the dissertation is the culmination of study, often after the professional education is completed, the graduate is required to take state-regulated exams in order to practice their profession such as medicine, law, or nursing.

### Trends

Sanderson and Dugoni's 1997 doctoral survey shows several trends that are expected to continue. One is an upward trend of Ph.D.'s awarded. While the number of doctorates awarded annually is typically the greatest for the life sciences, the largest growth during the 1990s came in engineering. Doctorates granted to women have been on an upward trend since the late 1960s, but women continue to receive the fewest doctorates in the physical sciences and engineering. Racial/ethnic minority groups also have seen increases in the numbers of Ph.D.'s awarded.

## DRIVER EDUCATION

---

Driver and traffic safety education began as a concept in 1928 as part of a doctoral thesis by Albert W. Whitney. Whitney argued that since so many high school students were learning to drive cars, schools had a responsibility to include driver education and safety instruction in the curriculum. Driver and traffic safety education was developed as a method for persons to gain licensure to use an automobile on public roadways. Prior to this period, state licensure to operate an automobile was not required in all states and localities. As automobiles became less costly and more available, the need to control the interaction of trucks, cars, trains, horse-drawn vehicles, ridden horses, bicyclists, and pedestrians became evident as death rates became an issue in larger cities. Public agencies such as the American Automobile Association (AAA), the Highway Users Federation for Safety and Mobility, and the Association of Casualty and Surety Companies called on government agencies to provide better roadway surfaces, roadway signs, roadway controls, driver evaluation, and driver licensing.

Government agencies responded to these lobbying efforts with roadway building projects and driver

licensing programs. Legislative actions provided funding for roadways and licensing agencies. Minimum requirements for licensure established a need to train novice automobile drivers to operate a vehicle effectively. Some local school districts in Pennsylvania and Michigan conducted training programs to help novice drivers as early as 1929. Amos Neyhart, a professor at Pennsylvania State University, established the first recognized driver education curriculum program in 1934. He worked with the State College School District to develop a curriculum for driver education at the high school level. Neyhart became known throughout the United States as the father of high school driver education. His efforts to train high school driver education instructors—efforts that were supported by AAA—have long been recognized as the start of driver education for high-school-age youth. Herbert J. Stack developed the Center for Safety Education at New York University in 1938 and is remembered as the father of safety education in the United States.

### Goals and Purposes

The American Driver and Traffic Safety Education Association (ADTSEA) developed a comprehensive driver education plan to provide an effective educational component for graduated licensing efforts. The goals of such a program would include:

- ensuring that novice drivers are trained for practice driving and capable of entering the restricted licensing process, through the use of a competency-based training and assessment process
- instituting a competency-based training and assessment process for drivers moving from a restricted licensing stage to an unrestricted licensing stage
- ensuring that trained novice drivers qualify for appropriate reductions in insurance premiums
- ensuring that novice drivers are trained to recognize risk and potential consequences in order to make reduced-risk choices
- ensuring that novice drivers make choices to eliminate alcohol or other drug use while using a motor vehicle
- ensuring that novice drivers will use occupant protection as a crash countermeasure
- ensuring that novice drivers are capable of using anger management skills to avoid aggressive driving

- ensuring that novice drivers are capable of recognizing fatigue factors that contribute to crashes
- ensuring that novice drivers are trained to deal successfully with new vehicle technologies
- ensuring that novice drivers and mentors work together as a team in practicing risk-reduction driving strategies as a component of the lifelong driver development process

### Course Offerings in the School Curriculum

Course offerings in the public school curriculum vary in each state, commonwealth, or territory as a result of licensing efforts controlled by state agencies and institutions not under direct federal government control. The course offerings, when offered in the public setting, are often conducted outside the school day or as a summer course. The courses are usually minimum requirement courses consisting of thirty to thirty-five hours of classroom instruction combined with four to eight hours of in-car training. The school curriculum includes traffic safety programs from kindergarten through senior high school in the scope and sequence of the school district program. These programs are usually not coordinated efforts but develop on the expertise and interest of the instructor, students, or parents.

### Student Enrollment

Student enrollment in driver education varies as a result of state requirements, but studies funded by AAA and ADTSEA indicated that 30 percent of the nation's driving population had enrolled in a driver education program prior to licensing. Nearly 40 percent of novice drivers had completed a driver education program for licensing or insurance requirements. These figures are significantly lower than those for the period from 1965 through 1980 when more than 60 percent were enrolled prior to licensing and up to 70 percent of novice drivers completed a state-approved program for licensing or insurance requirements.

### Issues and Trends

Trends in driver and traffic safety education include the shifting of training responsibility from public agencies to private agencies in larger cities. Rural areas are continuing to provide training in the public agencies often because of the lack of an appropriate private agency to provide the training.

The advancement of new vehicle technology has provided a challenge for driver and traffic safety in-

structors. The technology development is moving forward at a rapid pace while instruction techniques are slow to be released by agencies developing the technologies. Instructors and novice drivers often use vehicles with the new technologies and therefore have to teach/learn new driving techniques even though the vehicles that novice drivers often use do not have the new features and technology.

Public financing of driver education continues to decline, so parents and novice drivers are increasingly bearing most of the costs associated with driver and traffic safety education. Parents are beginning to assume new roles because the instructor needs to work with both student and parent regarding new technology and techniques for vehicle control. Parents are assuming more responsibility under graduated licensing programs for training novice drivers and for developing them into responsible roadway users.

### Effectiveness of the Program

Program effectiveness has been considered by many agencies and been the subject of a number of reports throughout the period of federal involvement in crash reduction that began with the passage of the Federal Highway Safety Act of 1966. This act required that states provide comprehensive highway safety programs, including driver education. Unfortunately, the state of knowledge regarding the effectiveness of driver education in the early twenty-first century provides no certainty, and much doubt, that the return on this enormous effort will be commensurate with the investment. The National Highway Traffic Safety Administration (NHTSA) has supported training efforts for drivers in a number of ways. NHTSA supported a study of driver training techniques over a period of five years in De Kalb County, Georgia, and found that elaborate training programs were no more effective than more basic instruction in crash reduction. The study found that a more comprehensive program resulted in a reduction in crashes for a six-month period but that the effects diminished as time increased. The comparisons in this study involving education methods were misconstrued by the public and media to mean that driver education did not work. The Insurance Institute for Highway Safety continues to support driver education as an adequate program for prelicensing efforts in a graduated licensing system, but not as a crash reduction program.

Driver education has been criticized as a program that does not reduce young driver crashes. To their credit, driver and traffic safety education efforts have long been designed to aid the driver in gaining a license to meet minimum standards designed by state agencies. The driver education programs designed in states that require driver education for state licensure have demonstrated a reduced crash rate for fifteen-, sixteen-, and seventeen-year-old drivers when compared to states that do not require driver education for licensure. Michigan developed a graduated licensing program involving two phases of driver education for novice drivers and has demonstrated a reduced crash rate for teen drivers. North Carolina provides driver education as the first stage of a graduated license and has demonstrated a reduction in crash rates. Kentucky, however, does not require driver education as part of its initial phase of graduated licensing and has not demonstrated a reduced crash rate for teen drivers. Such research may indicate that driver and traffic safety education needs to be part of a graduated licensing program as well as the lifelong learning process.

## DROPOUTS, SCHOOL

Individuals who leave school prior to high school graduation can be defined as school dropouts. From the early 1960s into the twenty-first century, as universal secondary school attendance became the norm, such individuals were the subject of study by educators, educational researchers, and concerned policymakers in the United States. With some variation in local circumstances, they are of increasing concern around the world as the educational requirements for full participation in modern societies continue to increase.

### Extent of the Problem

Dropout rates have been examined from several perspectives. Event dropout rates measure the proportion of students who drop out of school in a single year without completing a certain level of schooling. Status dropout rates measure the proportion of the entire population of a given age who have not completed a certain level of schooling and are not currently enrolled. Cohort dropout rates measure dropping out among a single group or cohort of students over a given period. High school completion rates measure the proportion of an entire population of a given age who have left high school and earned a high school diploma or its equivalent.

The U.S. National Center for Education Statistics (NCES) reports annual event dropout rates that describe the proportion of young adults ages fifteen through twenty-four who dropped out during the school year prior to the data collection. Between 1972 and 2000 this annual event dropout rate ranged between 4 and 6.7 percent. This rate decreased from 1972 through 1987. From 1987 to 2000 there were

year-to-year fluctuations, but the overall pattern was one of stable rates ranging from 4 to 5.7 percent.

Status dropout rates are reported by the NCES as the proportion of young adults ages sixteen through twenty-four not currently enrolled in school who have not completed a high school diploma or the equivalent. Between 1972 and 2000 the annual status dropout rate declined from 14.6 percent to 10.9 percent.

Cohort dropout rates are calculated for various cohorts studied as they make their way through secondary school. The most recent large-scale secondary school cohort is found in the National Educational Longitudinal Study of 1988. That study examined the cohort dropout rates for the eighth-grade class of 1988 followed up at two-year intervals through 1994. For this national sample of U.S. secondary school students, the cohort dropout rate in the spring of 1992, when they were scheduled to complete high school, was 10.8 percent. The rate declined to 10.1 percent by August 1992 after some of the students completed high school in the summer. The rate declined further to 7.2 percent by August 1994, two years following their scheduled completion of high school.

High school completion rates reported by the NCES are the proportions of those aged eighteen to twenty-four not in high school who have earned a diploma or the equivalent. Between 1972 and 2000 this rate ranged from 82.8 percent to 86.5 percent.

Dropout rates differ by various demographic factors, including gender, race and ethnicity, immigration status, and geographic location. In the United States dropout rates are higher for males than for females. Hispanics have the highest dropout rates by far, followed by African Americans, non-Hispanic whites, and Asian Americans. For example, in 2000 the status dropout rate for Hispanics was 27.8 percent, while the corresponding rates for African Americans, non-Hispanic whites, and Asian Americans were 13.1 percent, 6.9 percent, and 3.8 percent, respectively. Individuals born outside the United States have a higher dropout rate than those born in the United States. There are also regional differences in the United States, with the South and West having higher dropout rates than the Northeast and Midwest. Students in urban areas are more likely to drop out of school than students in suburban areas.

Internationally, there is considerable variation in dropout rates, because different nations are in dif-

ferent stages of extending universal secondary education. Among developed countries the high school completion rates are generally as high as or higher than in the United States, though the nature of the secondary programs varies considerably. Rates in other countries lag behind those in developed countries, but secondary enrollments and graduation rates have been increasing worldwide. There are also differences in dropout rates associated with socioeconomic and demographic factors. One notable demographic difference concerns the dropout rates for males and females. Females are less likely to drop out in developed countries and in Latin American and the Caribbean, but females are more likely to drop out prior to high school completion in the rest of the world.

### Factors Associated with Early School Leaving

In searching for the reasons that students drop out of school prior to graduation, researchers have focused on three different types of factors. The earliest line of work in this area examined the characteristics of students and their immediate circumstances. This work has been joined by research examining the role of school characteristics. Another set of investigations concerns the impact of broader factors outside of schools, including policies governing the overall educational system.

**Student and family factors.** In view of the pronounced associations between easily recognized student characteristics and dropout rates, it is not surprising that investigators have devoted attention to the potential impact of such characteristics. Among the student characteristics identified as contributing to dropping out have been gender, racial and ethnic minority status, low socioeconomic status, poor school performance, low self-esteem, delinquency, substance abuse, and pregnancy. In addition to these individual characteristics, research has also examined the impact of certain family characteristics, including single-parent families, non-English-speaking families, and families that are less involved in the educational process.

**School factors.** Noting differences in dropout rates among schools, researchers have investigated the characteristics of schools and their programs that appear to be associated with early school leaving. These investigations have considered the academic and social dimensions of schooling as well as the issue of the availability of schooling.

Schools in which students have limited opportunities for academic success appear to have higher dropout rates. One of the strongest correlates of early school leaving in studies of students is the lack of academic success. Students who more often get low grades, fail subjects, and are retained in grade are more likely to leave school prior to graduation. Students experiencing difficulty meeting the academic demands of the school tend to leave rather than continue in the face of the frustration of failing to achieve good grades. The lack of opportunities for success can be viewed as an imbalance between the academic demands of the school and the resources students have to meet those demands. The availability of such resources appears to be related to the structure and organization of schools. In 2000 Russell W. Rumberger and S. L. Thomas found that public, urban, and large schools and those with higher student-teacher ratios tended to have higher dropout rates.

The failure of students to find positive social relationships in schools and the lack of a climate of caring and support also appear to be related to increased rates of dropping out. Positive relationships between teachers and students and among students and a climate of shared purpose and concern have been cited as key elements in schools that hold students until graduation. In 1994 Nettie Legters and Edward L. McDill pointed to organizational features of schools conducive to positive social relations including small school size, teacher and student contacts focused on a limited number of people within the school, and teachers who have been prepared to focus on the needs of students and their families and communities. In 2001 Robert Croninger and Valerie E. Lee found lower dropout rates in schools where students report receiving more support from teachers for their academic work and where teachers report that students receive more guidance about both school and personal matters.

In addition to issues of access to academic success and social acceptance within schools, in some contexts there is an issue of the availability of schooling at all. This is primarily an issue in areas of the world where secondary schooling is not widely available. Although this situation tends to be more prevalent in the developing world, there are areas within developed countries, such as sparsely populated or geographically isolated areas, where access to schooling is not readily available. Completing high school in such circumstances often takes students far from

home and from family and community support and so makes dropping out more likely.

**Outside factors.** Factors outside of schools have also been considered for their impact on dropping out. Examinations of these outside factors typically concern the degree to which they are supportive of schooling or the degree to which schooling is perceived as relevant to the current or future lives of students. In both cases external factors can be the natural consequence of broader social forces or the result of deliberate educational policies.

Support for schooling in general or for the continued enrollment of students through graduation can vary from community to community and society to society. For example, in the United States the long-held view that schooling is essential for a democratic society was reinforced in the late twentieth century by the notion that schooling is essential to meeting the increasing technical requirements of the U.S. economy. These ideologies of support for schooling are reflected in specific policies, such as educational requirements for jobs, and in media campaigns emphasizing the importance of staying in school.

The relevance of schooling and school completion as perceived by students also has an impact on dropping out. When conditions outside of school indicate to students that school completion is important for their current and future success, students are more likely to remain in school. These conditions can be structured by indirect processes as when high school diplomas become so common that they lose their value and are replaced by university graduation as a mark of distinction. Such conditions can also be structured directly through policies such as those requiring students to remain in school to obtain a driver's license.

### **Dropout Prevention Programs and Their Effects**

The major approaches to dropout prevention seek to use knowledge of the factors associated with dropping out to craft interventions to increase the chances that students will remain in school through high school graduation. The various prevention efforts fall into three major categories: school-based approaches, environmental approaches, and system-building approaches.

School-based approaches have included both programs and practices designed to enhance the prospects for student academic success and those de-

signed to strengthen the positive social relationships and climate of support and concern students find in school. Approaches to the former have included improved diagnosis of student abilities and tailoring of instruction to individual students, altering evaluation processes to recognize student effort, restructuring school tasks to draw on a wider range of abilities, enhancing remediation programs to make use of more time for instruction during the school year and during the summer, and increasing the use of tutoring and technology to deliver instruction to students whose needs are not met by regular classroom instruction. Efforts to improve social relationships and create a shared climate of concern for students have included mentoring programs linking adults and students, house plans in large schools to create smaller environments in which a limited number of students and teachers work on the entire academic program, and the use of older students as peer mentors for younger students.

Environmental approaches have included strategies to address unsupportive outside conditions by developing new relationships between families and schools and the integration of educational and human services to address the social and economic problems that impede progress through school. Attempts to reduce the problem of the lack of relevance of school to the current and future lives of students have involved revised curricula that more clearly relate to real-world experiences, updated vocational education programs that integrate academic and vocational skills and make clear links to the world of work, multicultural curricula that include materials and role models from students' own ethnic or cultural backgrounds, and programs that make more salient the link between schooling and work.

System-building approaches include all those activities entailed in continuing to expand secondary education in those societies in which secondary schooling is not widely available. Included are things such as establishing schools closer to the local communities of students and enhancing the quality of the teaching force and the curriculum.

The evaluation evidence on the effectiveness of the various dropout prevention efforts is limited, with most programs subjected to little in the way of rigorous study. Attempts at evaluation are complicated by the long lead time between early interventions and on-time high school completion and by the complex and multifaceted approaches often attempted with students in secondary schools.

## SCHOOL

Drug and alcohol abuse are important problems that affect school-age youth at earlier ages than in the

past. Young people frequently begin to experiment with alcohol, tobacco, and other drugs during the middle school years, with a smaller number starting during elementary school. By the time students are in high school, rates of substance use are remarkably high. According to national survey data, about one in three twelfth graders reports being drunk or binge drinking (i.e., five or more drinks in a row) in the past thirty days; furthermore, almost half of high school students report ever using marijuana and more than one-fourth report using marijuana in the past thirty days. Marijuana is the most commonly used illicit drug among high school students. However, use of the drug ecstasy (MDMA) has seen a sharp increase among American teenagers at the end of the twentieth century, from 6 percent in 1996 up to 11 percent reporting having tried ecstasy in 2000. Indeed, at the beginning of the twenty-first century, ecstasy was used by more American teenagers than cocaine.

Many educators recognize that drug and alcohol abuse among students are significant barriers to the achievement of educational objectives. Furthermore, federal and state agencies and local school districts frequently mandate that schools provide health education classes to students, including content on drug and alcohol abuse. The Safe and Drug-Free Schools Program is a comprehensive federal initiative funded by the U.S. Department of Education, which is designed to strengthen programs that prevent the use of alcohol, tobacco, drugs, and violence in and around the nation's schools. In order to receive federal funding under this program, school districts are expected to develop a comprehensive education and prevention plan, which involves students, teachers, parents, and other members of the community. Thus it is clear that schools have become the major focus of drug and alcohol abuse education and prevention activities for youth. This makes sense from a practical standpoint because schools offer efficient access to large numbers of youth during the years that they typically begin to use drugs and alcohol.

Since the 1970s several approaches to drug and alcohol abuse education and prevention have been implemented in school settings. Traditionally, drug and alcohol abuse education has involved the dissemination of information on drug abuse and the negative health, social, and legal consequences of abuse. Contemporary approaches include social resistance and competence-enhancement programs,

which focus less on didactic instruction and more on interactive-skills training techniques. The most promising contemporary approaches are conceptualized within a theoretical framework based on the etiology of drug abuse and have been subjected to empirical testing using appropriate research methods. Contemporary programs are typically categorized into one of three types: (1) *universal* programs focus on the general population, such as all students in a particular school; (2) *selective* programs target high-risk groups, such as poor school achievers; and (3) *indicated* programs are designed for youth already experimenting with drugs or engaging in other high-risk behaviors.

### Traditional Educational Approach

**Information dissemination.** The most commonly used approach to drug and alcohol abuse education involves simply providing students with factual information about drugs and alcohol. Some information-dissemination approaches attempt to dramatize the dangers of drug abuse by using fear-arousal techniques designed to attract attention and frighten individuals into not using drugs, accompanied by vivid portrayals of the severe adverse consequences of drug abuse.

**Methods.** Informational approaches may include classroom lectures about the dangers of abuse, as well as educational pamphlets and other printed materials, and short films that impart information to students about different types of drugs and the negative consequences of use. Some programs have police officers come into the classroom and discuss law-enforcement issues, including drug-related crime and penalties for buying or possessing illegal drugs. Other programs use doctors or other health professionals to talk about the severe, often irreversible, health effects of drug use.

**Effectiveness.** Evaluation studies of informational approaches to drug and alcohol abuse prevention have shown that in some cases a temporary impact on knowledge and antidrug attitudes can occur. However, 1997 meta-analytic studies by Nancy Tobler and Howard Stratton consistently fail to show any impact on drug use behavior or intentions to use drugs in the future. It has become increasingly clear that the etiology of drug and alcohol abuse is complex, and prevention strategies that rely primarily on information dissemination are not effective in changing behavior.

## Contemporary Educational Approaches

**Social resistance approach.** There has been a growing recognition since the 1970s that social and psychological factors are central in promoting the onset of cigarette smoking and, later, drug and alcohol abuse. Drug abuse education and prevention approaches are increasingly more closely tied to psychological theories of human behavior. The social resistance approach is based on a conceptualization of adolescent drug abuse as resulting from pro-drug social influences from peers, persuasive advertising appeals, and media portrayals encouraging drug use, along with exposure to drug-using role models. Therefore, social influence programs focus extensively on teaching students how to recognize and deal with social influences to use drugs from peers and the media. These resistance-skills programs focus on skills training to increase students' resistance to negative social influences to engage in drug use, particularly peer pressure.

**Methods.** The goal of resistance-skills training approaches is to have students learn ways to avoid high-risk situations where they are likely to experience peer pressure to smoke, drink, or use drugs, and/or acquire the knowledge, confidence, and skills needed to handle peer pressure in these and other situations. These programs frequently include a component that makes students aware of pro-smoking influences from the media, with an emphasis on the techniques used by advertisers to influence consumer behavior. Also, because adolescents tend to overestimate the prevalence of tobacco, alcohol, and drug use, social resistance programs often attempt to correct normative expectations that nearly everybody smokes, drinks alcohol, or uses drugs. In fact, it has been proposed that resistance skills training may be ineffective in the absence of conservative social norms against drug use, since if the norm is to use drugs, adolescents will be less likely to resist offers of drugs.

**Effectiveness.** Resistance skills programs as a whole have generally been successful. A comprehensive review of resistance skills studies published from 1980 to 1990 reported that the majority of prevention studies (63%) had positive effects on drug use behavior, with fewer studies having neutral (26%) or negative effects on behavior (11%)—with several in the neutral category having inadequate statistical power to detect program effects. Furthermore, several follow-up studies of resistance skills interventions have reported positive behavioral effects lasting

for up to three years, although longer term follow-up studies have shown that these effects gradually decay over time, suggesting the need for ongoing intervention or booster sessions.

The most popular school-based drug education program based on the social influence model is Drug Abuse Resistance Education, or Project DARE. The core DARE curriculum is typically provided to children in the fifth or sixth grades and contains elements of information dissemination and social influence approaches to drug abuse prevention. DARE uses trained, uniformed police officers in the classroom to teach the drug prevention curriculum. Despite the popularity of DARE, 1998 evaluation studies of DARE by Dennis Rosenbaum and Gordon Hanson examined the most scientifically rigorous published evaluations of DARE and concluded that DARE has little or no impact on drug use behavior, particularly beyond the initial posttest assessment. Some of the possible reasons why DARE is ineffective may be that the program is targeting the wrong mediating processes, that the instructional methods are less interactive than more successful prevention programs, and that teenagers may simply “tune out” what may be perceived as an expected message from an ultimate authority figure.

**Competence enhancement approach.** A limitation of the social influence approach is that it assumes that young people do not want to use drugs but lack the skills or confidence to refuse. For some youth, however, using drugs may not be a matter of yielding to peer pressure but may have instrumental value; it may, for example, help them deal with anxiety, low self-esteem, or a lack of comfort in social situations. According to the competence-enhancement approach, drug use behavior is learned through a process of modeling, imitation, and reinforcement and is influenced by an adolescent's pro-drug cognitions, attitudes, and beliefs. These factors, in combination with poor personal and social skills, are believed to increase an adolescent's susceptibility to social influences in favor of drug use.

**Methods.** Although these approaches have several features that they share with resistance-skills training approaches, a distinctive feature of competence-enhancement approaches is an emphasis on the teaching of generic personal self-management skills and social coping skills. Examples of the kind of generic personal and social skills typically included in this prevention approach are decision-making and problem-solving skills, cognitive skills for resist-

ing interpersonal and media influences, skills for enhancing self-esteem (goal-setting and self-directed behavior change techniques), adaptive coping strategies for dealing with stress and anxiety, general social skills (complimenting, conversational skills, and skills for forming new friendships), and general assertiveness skills. These skills are best taught using proven cognitive-behavioral skills training methods: instruction and demonstration, role playing, group feedback and reinforcement, behavioral rehearsal (in-class practice) and extended (out-of-class) practice through behavioral homework assignments.

**Effectiveness.** Over the years, a number of evaluation studies have been conducted, testing the efficacy of competence-enhancement approaches to drug abuse prevention. These studies have consistently demonstrated behavioral effects as well as effects on hypothesized mediating variables. More important, the magnitude of reported effects of these approaches has typically been relatively large, with studies reporting reductions in drug use behavior in the range of 40 to 80 percent. Long-term follow-up data indicate that the prevention effects of these approaches can last for up to six years. In summary, drug abuse prevention programs that emphasize resistance skills and general life skills (i.e., competence-enhancement approaches) appear to show the most promise of all school-based prevention approaches.

### Challenges for School-Based Drug Abuse Prevention

In the final analysis, research-based prevention programs proven to be successful are unlikely to have any real public health impact unless they are used in a large number of schools. However, programs with proven effectiveness are not widely used. Drug prevention programs most commonly used in real-world settings are those that have not shown evidence of effectiveness or have not been evaluated properly. Thus an important area that deserves further attention is how effective school-based drug abuse prevention programs can be widely disseminated, adopted, and institutionalized. Furthermore, once effective programs are disseminated, steps must be taken to ensure that programs are implemented with sufficient fidelity. Regardless of how effective a prevention program may be, it is not likely to produce the desired results unless it is provided in full and by qualified and motivated staff.

## COLLEGE

Alcohol, tobacco, and other drugs used in American colleges and universities represents a public health problem of critical proportions. Institutions of higher education are under increased scrutiny due to policy developments from the public health, governmental, and higher education sectors in the 1990s that place revised importance on initiatives addressing student substance use. Despite variation in campus use rates, no institution of higher education is immune to substance use and its related adverse consequences. The negative effects reach beyond the parameters of the campus, catapulting this issue into the forefront of the national agenda. It is in the interest of society to design and implement policies and programs that aim to curb college student substance use and abuse.

### Extent of Use

Alcohol, tobacco, and other drug use represents a ubiquitous problem for American colleges. Alcohol and other drug use on college campuses radically increased between 1993 and 1997, then stabilized between 1997 and 1999. This trend produces great concern as college student use rates are expected to climb due to a radical increase in drug use among those aged twelve to seventeen.

Alcohol, tobacco, and marijuana represent the most frequently used drugs on college campuses. Nationwide, 84 percent of college students report having drunk alcohol within the last year, 68 percent within the previous month, and 3.6 percent on a daily basis, according to Henry Wechsler (1996). Tobacco use shares a student use rate similar to alcohol. Schools indicate a significant increase of 28 percent in student smoking during the 1990s, with nearly one-third of college students having smoked within the past year. Drug use rates are rising on campuses; Arthur Levine and Jeanette S. Cureton estimated that 25 percent of students indicated that they had used some form of illegal drug within the past year. The prevalence of marijuana use rose 22 percent between 1993 and 1999—an increase that occurred among most student demographic groups and at almost all kinds of colleges. Marijuana is used by 24 percent of college students, cocaine by 4 percent, and hallucinogens by nearly 5 percent.

### Alcohol

Alcohol is the number one drug of choice for college students of both two-year and four-year institutions,

and continues to pose tremendous challenges to higher education. On average, college students consume about 4.5 drinks per week and about two in five college students engage in high-risk or binge drinking at least once in an average two-week period. Binge drinking, consuming five or more drinks in succession for men and four for women, is on a substantial increase, affecting about two fifths of the college population. It accounts for the majority of alcohol consumed and is associated with the bulk of problems encountered on campuses, impacting students' social lives, health, and education.

The negative consequences of student alcohol use span well beyond the parameters of the college campus and affect students, the institution, and the community. Alcohol is associated with increased absenteeism from class and poor academic performance, which results in a lower grade point average. The majority of injuries, accidents, vandalism, sexual assaults and rape, fighting, and other crime, on and off college campuses, are linked to alcohol and other drug use. Unplanned and uninhibited sexual behavior may lead to pregnancy and exposure to sexually transmitted diseases and HIV/AIDS. Alcohol use can be associated with injury and death from drinking and driving, alcohol poisoning, and suicide.

### Tobacco

Many students perceive the college years as a time of experimentation, although in fact it is a period heavily shaped by environmental factors, social norms, and peer influences. During these years, it is common for intermittent tobacco use to quickly manifest into a life-long habit. For college students, tobacco in the form of cigarettes, smokeless tobacco, and cigars presents a legal and accessible alternative to other drug use. Its use is linked to various cancers, emphysema, heart disease, and other life-threatening illnesses.

### Other Drugs

By their nature, illicit drugs do not carry a legal age for purchase, consumption, or distribution. Therefore, colleges must address the problem somewhat differently than they do alcohol and tobacco. Students are entering higher education with increased exposure to drugs, which predisposes them to substance dependency. Variation exists among college and universities as to the rate and type of substances used. Marijuana, amphetamines, hallucinogens, in-

halants, cocaine, steroids, and designer drugs represent but a few general forms entering the higher education arena. Marijuana is reported as the illicit drug of choice on campuses. Illicit drug use factors into tragedies that include rape, overdose, vandalism, violence, and death. Memory loss, diminished concentration and attention, increased absenteeism, impaired academic performance, and physical illness are also associated with drug use.

### **Secondhand Effects**

The secondhand effects of substance use on campus are often overlooked and underappreciated for the deleterious effects they may have on students and the quality of their collegiate experience. Students who abstain, use legally, or in moderation often suffer secondhand effects from the behaviors of students that use substances in excess. Nonbinging and abstaining students may become the targets of insults and arguments, physical assaults, unwanted sexual advances, vandalism, and humiliation. Sleep deprivation and study interruption results when these students find themselves caring for intoxicated students. Passive smoke is associated with life-threatening health risks, and smoking within residence halls places people at risk due to fire.

### **Campus Environment**

Perceptions of campus use, campus climate, substance availability, awareness of campus policies and enforcement, and students' family histories of substance abuse impact the extent of substance use on any given campus. The campus and surrounding community exert profound influence on innumerable facets of student life. Establishments encircling college campuses that cater specifically to college students contribute to the substance use climate by selling to underage or intoxicated students. The social, academic, and cocurricular milieus are often shaped by the social norms and perceptions related to campus alcohol, tobacco, and other drug use.

Students typically overestimate the amount and the extent of high-risk drinking, tobacco use, and illicit drug use on their campus and on college campuses in general. These misconceptions lead students to feel pressured and justified in their increased substance use. By exploring how students perceive substance use, policies, and rule enforcement on campus, college administrators are better able to discern and roughly predict how students will react to the perceptions of social norms.

Social fraternities, sororities, and athletics typify student groups at high risk for substance abuse. Fraternities and sororities often find themselves at the center of growing concern as their mere presence on campus is associated with higher campus-wide levels of substance use, particularly alcohol consumption. Leaders of Greek organizations, particularly male members, accounted for the highest alcohol consumption on many college campuses. Due to the integral social role these organizations occupy on most college campuses, the practices they espouse often advocate the use of alcohol, tobacco, and other drugs.

Intercollegiate athletics represents an important aspect of the college experience. However, the college athlete may experience anxiety associated with the dual roles and conflicting expectations of being both an athlete and a student. Attempting to rectify this discourse, college athletes may become increasingly susceptible to substance dependency. Collegiate athletes are more likely to use alcohol and smokeless tobacco, and experience binge drinking more than nonparticipating students. Colleges and universities compound the problem by sending students mixed messages concerning substance use by endorsing alcohol and tobacco industry advertising at collegiate sporting events.

### **Policies**

Affecting the campus environment relies heavily on the pervasive commitment of the college or university. Focused policy, procedures, prevention strategies, data gathering, counseling, and referral approaches enable schools to effectively address this problem. Institutions often find themselves caught in a legal quagmire when they attempt to combat rising substance use and are confronted with issues of legal responsibility and institutional liability while simultaneously acknowledging the behavioral and health implications related to substance abuse.

Local, state, and federal governments play a central role in assisting and bolstering higher education's efforts to reduce substance use and the resulting problems that plague American college campuses. Federal legislative such as the 1986 amendments to the Higher Education Act of 1965, Drug-Free Schools and Communities Act of 1989, and the Crime Awareness and Campus Security Act of 1990 represent such initiatives. The 1998 Parental Notification law permits schools to inform parents if their child violates the rules or laws governing al-

cohol or controlled substances. The Drug-Free Schools and Campuses regulations mandate that schools prepare a biennial report, which certifies that the school has implemented and assessed prevention policy and programs and documents the consistency of policy enforcement. This report must be made available to anyone who requests it.

With increasing cost pressures on colleges, it is difficult to assure adequate and continuous funding for substance-related programs and policy enforcement. In 1993, the Higher Education Center for Alcohol and Other Drug Prevention was established by the United States Department of Education to assist in developing and carrying out substance prevention policies and programs. The U.S. Department of Education and other granting organizations provide national funding support in an effort to address this issue. Specialized task forces and advocacy groups, such as the National Institute on Alcoholism and Alcohol Abuse task force on college drinking, illustrate the nation's commitment to this problem.

Substance abuse is not a campus-centered problem but one that impacts the entire community. To effect change, institutions of higher education acknowledge the need to form committees and coalitions, comprised of administration, students, parents, faculty, alumni, campus organizations, governmental and law enforcement agencies, and the community. By activating multiple, campus-wide policy levers, campus leaders ensure that initiatives span all facets of the institution.

Schools are tightening regulations, strengthening academic requirements, adjusting course scheduling, and offering extended hours for library and recreational facilities, while providing alternative alcohol-free campus-sponsored activities. Schools are withdrawing endorsement of alcohol and tobacco industry advertising on campus and establishing substance-free residences. By targeting social groups such as fraternities and sororities for programming and monitoring of policy compliance, schools are attempting to further shape the social climate. Novel disciplinary actions exhibit the decisive consequences of such behavior, provide support services, and offer mandatory alcohol or drug assessment with the possible introduction of counseling, Twelve Step, and treatment services.

### **Programs**

Through a paradigm that conceptualizes students' college experience systemically, substance-related

strategies strive to alter the social, physical, intellectual, legal, and economic environment on campus and in surrounding communities. Effective initiatives offer diversified programs that account for students' developmental level year in school, age, and level of readiness to change behavior with special attention to the first-year experience.

A variety of creative and versatile approaches are available to institutions of higher education to address issues related to substance use. Education, prevention, counseling, and treatment programs are the most commonly utilized. Approaches that promote increased understanding about substance use and the related effects, provide suggestions for alternative substance-free activities, and attempt to counter misconceptions around social norms comprise the foundation to effective program initiatives.

Standardized programs, developed and distributed by external vendors, offer schools an alternative method for educating students. Many schools find these programs beneficial because of the variety of issues targeted. With the advent of novel technology, innovative and interactive computer programs add to the program arsenal. Often expensive, standardized programming may not be a viable option for institutions with limited resources.

Campus-initiated programming offers another option for colleges and universities. These efforts may include programming such as alcohol awareness month, safe spring break, and substance-free social activities. The formation of substance use task forces, student organizations, and committees corals the campus community around efforts to devise strategies and initiate change in campus norms, perceptions, and climate. Typically cheaper than standardized initiatives, these methods are readily utilized.

Higher education must recognize that alcohol and other drug use and the problems that result from substance abuse are never entirely going to go away. Nevertheless, through continued commitment, campus communities significantly impact the problem through policy and program initiatives that are directed at altering social norms, climate, and practices. To initiate and maintain change in higher education with respect to alcohol, tobacco, and other drugs, programs, policies, and partnerships must become permanent and pervasive fixtures on college and university campuses.

## DU BOIS, W. E. B. (1868–1963)

Scholar, educator, philosopher, and social activist, William Edward Burghardt Du Bois is among the most influential public intellectuals of the twentieth century. A pioneer of the civil rights movement, Du Bois dedicated his life to ending colonialism, exploitation, and racism worldwide. Experiencing many changes in the nation's political history, he served as a voice for generations of African Americans seeking social justice.

### The Formative Years

Du Bois was born the only child of Alfred and Mary Burghardt Du Bois in Great Barrington, Massachusetts. In the period following the Civil War, Great Barrington was a small town with fewer than 50 African Americans among its 5,000 residents. Du Bois's father, of French and African descent, left home soon after William was born. His mother, of Dutch and African descent, encouraged Du Bois in his educational studies. Aunts, uncles, and close friends gave poverty-stricken Du Bois adequate clothing, food, and finances for schooling.

Attending an integrated grammar school, Du Bois had little direct experience with color discrimination; much of what he did learn came from the visible social divisions within his community as he discovered the hindrances that African Americans faced. Du Bois, however, was quite aware of his intellectual acuity. He excelled and outperformed his white contemporaries, receiving a number of promotions throughout his public schooling.

By the age of seventeen, Du Bois had already served as a correspondent for newspapers in both Great Barrington and New York. He was the first African American to graduate as valedictorian from Great Barrington High School. Influential community members arranged for Du Bois to attend Fisk University in Nashville, Tennessee, where he began studies in 1885. While on a partial scholarship at Fisk University, Du Bois had far greater exposure to African-American culture. In the white South, Du Bois encountered firsthand the oppression faced by the sons and daughters of former slaves, whom he taught in country schools during the summer. As Du Bois witnessed politicians and businessmen destroy the gains of Reconstruction, and African Americans struggle against social, political, and economic injustice, he formed his stance on race relations in America. He began to speak out against the atrocities of

racism as a writer and chief editor of the *Fisk Herald*, until his graduation in 1888.

After receiving his first baccalaureate, Du Bois entered Harvard University in 1888 as a junior. Two years later, he earned a second B.A. in a class of 300 and was one of six commencement speakers. In the fall of 1890, Du Bois began graduate work at Harvard. He studied under legendary professors William James, Josiah Royce, George Santayana, and Albert Bushnell Hart. His studies focused primarily on the subjects of philosophy and history and then gradually shifted into the areas of economics and sociology.

Du Bois acquired his master's degree in the spring of 1891 and chose to further his studies at the University of Berlin (1892–1894), observing and comparing race problems in Africa, Asia, and America. After two years in Berlin, Du Bois became the first African American to earn a Ph.D. from Harvard. His doctoral thesis, approved in 1895, was published in the first volume of the Harvard Historical Studies series as *The Suppression of the African Slave-Trade to the United States of America, 1638 to 1870*.

### Early Scholarship

In 1896 Du Bois married Nina Gomer; they had two children, Yolande and Burghardt (who died at the age of three). After teaching Greek and Latin at Wilberforce University (1894–1896), Du Bois accepted an assistant professorship at the University of Pennsylvania to conduct a research project in Philadelphia. For two years, Du Bois and his wife lived in the heart of Philadelphia's seventh ward, where the notable work *The Philadelphia Negro, A Social Study* (1899) took form.

*The Philadelphia Negro* marked the first major study of American empirical sociology and represented Du Bois's quest to expose racism as a problem of ignorance. Du Bois personally interviewed several thousand residents, and his study documented the living conditions of poor African Americans enduring dilapidated housing, inadequate health care, disease, and violence. In this body of work, Du Bois contended that crime and poverty were manifestations of institutional and structural racism.

In 1897 Du Bois and his family moved to Atlanta, where he taught economics and history at Atlanta University. Here Du Bois witnessed racism, lynching, Ku Klux Klan cross burnings, race riots, and disfranchisement. To challenge these acts, he published

papers in the *Atlantic Monthly* and other journals that explored and confronted discriminatory southern society.

A compilation of unpublished papers led to what many consider Du Bois's greatest work, *The Souls of Black Folk* (1903). In it Du Bois wrote, "The problem of the twentieth century is the problem of the color-line" (p. 54). *The Souls of Black Folk* provided a philosophical framework by which Du Bois addressed the problem of race and the distressing realities of African-American life in America. Within its pages, he challenged the prominent African-American leader, Booker T. Washington. Du Bois firmly opposed Washington's policies of accommodation, calling instead for more social agitation to break the bonds of racial oppression. In addition to his writings, publications, teachings and public speeches, Du Bois served as secretary for the first pan-African congress in London in 1900. He would later go on to organize subsequent sessions in 1919, 1921, 1923, and 1945.

In 1905, Du Bois took on the leadership role in organizing a group of African-American leaders and scholars in what became known as the Niagara Movement. The group was opposed to the conservative platform of Booker T. Washington and the Tuskegee Machine. Despite the failure of the Niagara Movement, it would later serve as a model for another of Du Bois's initiatives in 1909, the National Association for the Advancement of Colored People (NAACP).

### The Crisis Years

Upon leaving his professorship at Atlanta University, Du Bois joined the central staff of the NAACP in November 1910. Having been instrumental in that group's formation, he became the only African American on its executive board, and, more importantly, director of publications and research. In that position, he assumed control of the *Crisis*, the official journal of the NAACP.

While the expanding economy provided former slaves with moderate economic and educational gains, discrimination, violence, and lynching were rampant. Black anger, impatience, and heightened consciousness, combined with expanding literacy, provided a growing audience for the *Crisis*. This journal expanded Du Bois's influence and audience beyond academia to the public. By 1913 its regular circulation reached 30,000.

The *Crisis* informed people about important events, offered analysis, and sowed themes of uplift and civil rights. Du Bois's voice dominated as though it were his own personal journal. His authoritative editorials spoke against injustice, discriminatory practices, lynching, miseducation, and the widespread mistreatment of African Americans. Du Bois was not hesitant to confront those whom he believed misled his people.

World War I was significant for Du Bois. He believed the enthusiastic participation of black soldiers would lead to returned favors from white America. He traveled to France in 1919 reporting the heroism of black soldiers to the *Crisis* directly from the front.

Du Bois was optimistic that the new generations of African Americans would advance the struggles for civil rights and racial justice. His magazine produced articles and pictures about young people. In 1920 he launched the short-lived *Brownies Book*, a *Crisis*-type publication for children.

*Crisis* came to be seen as an authoritative and informative resource by many in black America. Beyond ideological commentary, it published and supported black artistic expression. Langston Hughes, Countee Cullen, Jean Toomer, Claude McKay, and Alain Locke were among the core group of the "Harlem Renaissance" supported by the *Crisis*. Columbus Salley (1999) asserts that Du Bois deserves as much credit as anyone in giving birth to the Harlem Renaissance.

While editing the *Crisis*, Du Bois continued to write books and essays that explained his theories and fueled antagonism. In 1920 he examined global race issues and conflict in *Darkwater: Voices from within the Veil*. Over the years the internationalist and radical Du Bois clashed regularly with the leadership of the NAACP who were committed to gradualism and legalism. In 1934, under fierce pressure, Du Bois retired from the executive board and the *Crisis*.

### After the *Crisis*

Du Bois lost his national platform in the midst of economic depression, international fascism, and political uncertainty. With no resources or base from which to operate, in 1934 he accepted an invitation to return to Atlanta University as chair of the sociology department.

Since his study of the *Philadelphia Negro* (1899), Du Bois was drawn to big research projects. He ad-

hered to the new school of social science, arguing that knowledge of social problems could lead to social change. He proposed that his university along with others undertake large studies of black life including employment, education, family life, and so forth. Additionally, he was hopeful for the eventual publication of an *Encyclopedia Africana*. Lack of funds, changes in university administration, and a changing political climate all worked against Du Bois.

This period found Du Bois refining his views on pan-Africanism and Marxian socialism. He wrote *Black Reconstruction in America* (1935), *Black Folk Then and Now* (1939), *Dusk of Dawn* (1940), and *Color and Democracy* (1945). In 1940 he began *Phylon*, a journal of social science, published at Atlanta University.

Undermined by the new school administration, Du Bois retired from the faculty of Atlanta University in 1943. Declining offers at Howard and Fisk universities, he would never return to academia. As the nation's largest and most recognized civil rights organization, the integrationist NAACP was increasingly drawn into public dialogue. Its leaders, believing that Du Bois could be useful in their research activities, offered him the position of director of special research. Du Bois, fiercely independent and outspoken, challenged American capitalism, imperialism, racial inequality, and the legal system that supported privilege. His linking of pan-Africanism to socialism, and then to democracy, offered an interesting and provocative position. He was denounced by some as a bourgeois intellectual, and by others as a radical extremist.

Although pan-Africanists had gathered since the turn of the century, until 1945 those meetings did little more than unleash indignation from middle-class intellectuals. The 1945 fifth pan-African congress held in Manchester, England, was different. Revolutionary students and activists from throughout colonized sub-Saharan Africa gathered to confront the colonial masters. They resolved to "control their own destiny. . . . All colonies must be free from imperialist control whether political or economic. . . . We say to the peoples of the colonies that they must fight for these ends by all means at their disposal" (Lemelle and Kelley, p. 352). A "third world" movement for independence and social justice now accompanied the modern civil rights movement slowly emerging in the United States. By 1948, Du Bois's support of the Soviet Union, revolution in

Africa, strident criticism of American apartheid, and support of Progressive candidate Henry Wallace in the United States alienated him from the NAACP leadership, especially its moderate chairperson, Walter White. He was dismissed from his position in 1948 leading to a final break with the organization.

### The Final Years

Once again without funds or an organizational base, Du Bois continued his critique of American capitalism and racial inequality. At the end of World War II and the beginning of the cold war, the nation's political climate moved decidedly to the right. Du Bois's Africanist and prosocialist sentiment placed him at odds with the unfolding hysteria. His social circle now consisted of avant-garde intellectuals, internationalists, and left-leaning cultural workers such as Paul Robeson and Shirley Graham. Amid the new jingoism, Du Bois was drawn to the "peace" community. By 1950 he was chair of the Peace Information Center, drawing the antagonism of federal authorities.

In July 1950 Du Bois's first wife, Nina, died, and later that year he ran for the U.S. Senate in New York on the ticket of the American Labor Party. Surprisingly he received 210,000 votes—equivalent to 4 percent of the vote. In early 1951 Du Bois and his Peace Information Center were ordered by the Justice Department to register as foreign agents. Refusing, Du Bois was indicted and jailed but soon exonerated.

Now remarried to Shirley Graham, Du Bois was both vilified and celebrated during the difficult McCarthy period. He watched as friends, associates, and notables such as poet Langston Hughes, actress Lena Horne, Africanist Alphaeus Hunton, actor William Marshall, black professors Forrest Wiggins and Ira Reid, Harlem politician Benjamin Davis, and black Marxists Claude Lightfoot, Claudia Jones, and Henry Winston and others were discredited. Du Bois and his wife were also frequent targets of communist-baiters. As the hysteria escalated, so did Du Bois's defense of those victimized.

Du Bois continued to speak out against the cold war, capitalist exploitation, colonialism, and the international mistreatment of African people. He foresaw a new period of socialistic pan-Africanism, writing in 1955, "American Negroes, freed of their baseless fear of communism, will again begin to turn their attention and aim their activity toward Africa" (p. 5). Denounced at home, Du Bois was regarded as a champion of human rights around the world.

As the civil rights movement began, Du Bois attended the Stockholm Peace Conference where he delivered an address. After visiting Czechoslovakia and Germany, the Du Boises spent five months in the Soviet Union. Having visited the Soviet Union on several previous occasions, Du Bois marveled at the country's continued progress in employment, housing, education, the status of women, and race relations. During this visit, he lobbied endlessly for increased Soviet interactions with Africans and for more research on that continent. Du Bois's visit to the People's Republic of China profoundly influenced him since China served as a reminder that people of color could successfully engage socialism. He noted that a majority of the world's people lived under socialism and declared that egalitarian socialism was the economic system of the future. He believed that African Americans, given their history of mistreatment, could benefit from this type of social system.

Upon returning to America, Du Bois expressed grave pessimism that black Americans could ever achieve economic and political justice under corporate monopoly capitalism, and continued to advocate connection with Africa. He now had a special relationship with Kwame Nkrumah and the revolution in Ghana.

In 1960 Du Bois had one longstanding unfilled objective, to publish his *Encyclopedia Africana*, which would explore every aspect of black life. He had contacted scholars, funding agencies, and anyone who would listen to him to accomplish this project. On October 1, 1961, Du Bois joined the U.S. Communist Party and made a statement that began "Capitalism cannot reform itself; it is doomed to self-destruction. No universal selfishness can bring social good to all. . . . this is the only way of human life. . . . In the end communism will triumph." (Manning, p. 212). Four days later he and his wife moved to Ghana. Working on his encyclopedia to the very end, Du Bois died one day before the famous March on Washington.

## EARLY CHILDHOOD EDUCATION

### OVERVIEW

Janet S. Hansen

### PREPARATION OF TEACHERS

Daniel J. Walsh

Betty J. Liebovich

### INTERNATIONAL CONTEXT

Robert G. Myers

### OVERVIEW

Early childhood education is concerned with the learning experiences of children below the age when compulsory schooling begins (usually age five or six). In terms of organized educational programs, it generally encompasses kindergartens (enrolling mainly five-year-olds) and pre-kindergartens and preschools aimed at children starting at about age three.

#### Mapping American Early Education

Kindergarten, while not compulsory in most states, became over the course of the twentieth century largely the responsibility of public schools. In the process it became accessible and free to most children, and it came to be administered as part of elementary education. By contrast, preschool at the beginning of the twenty-first century is part of a piecemeal and haphazard “nonsystem” of early care and education in which a wide range of providers offer varying mixtures of structured learning and child care to interested parents who either can afford to enroll their children or receive public subsidies, most of which are targeted to lower income families.

**Kindergarten.** Margarethe Schurz founded the first American kindergarten in her home in 1855; a cen-

tury later kindergarten education was available as part of public school systems to just over half of children of kindergarten age. By October 2000, 73 percent of five-year-olds were enrolled in kindergarten, along with 4 percent of three- and four-year-olds and 14 percent of six-year-olds. The overwhelming majority of kindergartners (83%) attended public schools—just 17 percent attended private kindergartens.

Although most children attend public kindergarten, attendance is not compulsory in most states and not all states require that public schools offer kindergarten. In 2001, eleven states did not require that districts offer kindergarten, though districts could choose to do so. Only eight states set their compulsory school age at five and required children to attend kindergarten. Several others mandated kindergarten attendance and either permitted parents to hold their children out of kindergarten until the children were six years old or allowed the children to skip kindergarten by demonstrating “readiness” for first grade.

State and district policies about the length of the kindergarten day vary enormously, and the absence of data on and common definitions of “full-day” and “part-day” complicate the task of portraying the availability of different kindergarten offerings. A study of a national sample of about 22,000 kindergartners enrolled in 1998 indicated that 55 percent attended full-day programs and 45 percent attended half-day programs. Some states required districts to offer full-day kindergarten but not necessarily to the exclusion of half-day offerings.

States were slower to assist districts with the funding of kindergarten than with elementary and secondary education, but in 2001 all provided some

assistance with kindergarten costs of public schools. Twenty-five states and the District of Columbia financed full-day kindergarten for all districts or schools or those that chose to provide it. The remaining twenty-five states financed half-day programs or provided partial funds for kindergarten.

**Preschool.** Characterizing the early education experiences of three- to five-year-olds who have not yet entered kindergarten is made difficult by the absence of clear rules defining the offerings of the myriad providers who serve these children in center-based settings (as distinct from services provided to children by relatives or nonrelatives in home-based settings). What is known is that by the late twentieth century, it had become the norm for these children to spend at least part of a week in a center-based program. In 1999, 59 percent of these pre-kindergarten-age children were enrolled in settings variously labeled day care, nursery school, pre-kindergarten, preschool, and Head Start. The older the child, the more likely she was to be enrolled in such a program: 46 percent of three-year-olds were so enrolled, 69 percent of four-year-olds, and 76 percent of five-year-olds.

Center providers operate under a variety of auspices. Nonprofit groups, including religious organizations, operate some of the centers. Some centers are profit-making businesses, in the form of both single centers and large corporate chains. In some places the public school system offers pre-kindergarten classes, often targeted to children who are at risk of not being ready to succeed in school because of poverty, limited ability to speak English, disabilities, or other factors.

It is not known precisely how many centers serve children age three and over who have not yet entered kindergarten, but in 2001 there were well over 100,000 licensed child-care centers. States differ, however, in the extent to which they include or exclude educationally oriented preschool programs in their child-care licensing requirements. Some states, for example, exclude pre-kindergartens operated by public schools, which may be regulated by different agencies. Some states exclude religiously affiliated centers from licensing requirements.

While precise information on who pays for preschool education is unavailable, it is clear that at the start of the twenty-first century parents bear far more responsibility for preschool costs than they do for kindergarten or elementary and secondary edu-

cation. Federal and state subsidies supplement parent-paid fees through a variety of programs that differ in the extent to which they emphasize educational purposes or custodial care to help working parents.

**Federal preschool initiatives.** At the start of the twenty-first century, most of the federal funding that subsidized education and care for children under age five came from two programs: Head Start and the Child Care Development Fund (CCDF). The former had its origins in 1960s' efforts to expand educational opportunity by giving disadvantaged children a "head start" in school. The CCDF was created out of several earlier child-care programs as part of the Welfare Reform Act of 1996.

Head Start furnishes grants to local agencies to provide comprehensive early childhood developmental, educational, health, nutritional, social, and other services to low-income children and their families. Most participants must be from families whose income is below the poverty level, and in fiscal year 2000, 94 percent of the enrolled children were ages three to five, with a modal age of four. Head Start programs have traditionally been half-day and part-year programs, and local grantees have had wide flexibility in deciding on program structure. They must comply with federal program standards, which have increasingly put more emphasis on school readiness.

The CCDF provides federal grants to states for subsidizing the child-care costs of eligible families and for improving the overall quality and availability of child-care services. Children up to age thirteen who reside with a family whose income does not exceed 85 percent of the state median income are eligible to participate. States are free to set lower eligibility levels and most do. States also set subsidy levels and fee schedules. Parents share responsibility for paying child-care fees, which states may waive for families below the poverty line. In keeping with the CCDF's link to welfare policy, the law requires parents to be working or in education or training.

Although children benefiting from the CCDF may receive care that helps prepare them for school, school readiness and organized educational instruction are not explicit program goals. As of 2002 there were no national performance standards for services or staff other than a basic requirement that states must have and enforce health and safety rules.

In addition to some smaller child-care subsidy programs, federal aid for children with disabilities

included educational assistance for children under age five. Some federal aid for supplemental educational and related services to educationally disadvantaged children in low-income areas went to children under age five, though the bulk of it was used for elementary and secondary students.

**State preschool initiatives.** As of 1998–1999, forty-one states and the District of Columbia invested in state pre-kindergarten initiatives offering regularly scheduled group experiences to help young children learn and develop before entering elementary school. Only Georgia offered pre-kindergarten to all four-year-olds whose parents wanted them to participate. New York and Oklahoma had launched school-district-based initiatives to open pre-kindergarten to all four-year-olds, regardless of income, but not all districts in these states participated (in New York the state limited district eligibility because of funding constraints). The remaining states tended to target pre-kindergarten services to lower-income children or those considered especially in need of preschool preparation. Some served mainly four-year-olds and others included younger children as well.

Unlike publicly funded elementary and secondary education, which was provided through public schools, pre-kindergarten programs in many states operated in a variety of settings, such as public and private schools, Head Start centers, profit-making and nonprofit child-care centers, and churches. Most state pre-kindergarten programs offered only part-day (two to four hours a day), part-year services, although a few states provided the necessary funding for full-day and/or full-year pre-kindergarten for eligible children and also required that it be offered by at least some percentage of eligible programs. Parental fees were required in these extended programs. Many but not all state pre-kindergarten initiatives required providers to meet quality standards that were higher than the state's child-care licensing standards.

### **Pressures for Improvement**

While educators and other child advocates repeatedly urged the expansion of formal early education opportunities for young children during the twentieth century, what had developed by the dawn of the new century was a fragmented and haphazard early learning “nonsystem” that seemed increasingly inadequate to meet the needs of both children and society.

### **Changing views of education, work, and welfare.**

Changing societal perspectives on education, work, and welfare make early education an important public issue and not just a family concern. Efforts in the 1980s and 1990s to improve the quality of elementary and secondary education for all children caused reformers to increasingly realize that student achievement is affected by differences in children's development that are already evident when formal schooling begins.

State courts in New Jersey in 1998 and in North Carolina in 2000 ordered state officials to provide preschool education to children at risk of developing later educational problems. The judicial decisions came in school finance lawsuits challenging the legality of state school funding laws on the grounds that insufficient and inequitable funding denied some students their constitutional rights to an adequate education.

Preschool education also was increasingly seen as a factor helping families balance child-rearing and work responsibilities. Most women are in the labor force; 60 percent of women were working in 2000. This included 73 percent of all women with children under age 17 and 72 percent of women with children aged three to five years.

Reflecting that employment had become the norm for American women, public policy concerning welfare also shifted in its expectations about low-income mothers' participation in the workplace. The major overhaul of welfare policy enacted by the U.S. Congress in 1996 had as key assumptions that all adults, even those with young children, should be self-supporting and that receipt of public income subsidies should be contingent on meeting work or work preparation requirements. This, too, had the effect of shining a brighter spotlight on arrangements for the early care and education of young children.

**Untapped capacity for learning.** Research provides growing evidence that young children have much greater power to learn than has traditionally been realized or developed. In 2001 the National Research Council (NRC) published a report that claimed to be “the first attempt at a comprehensive, cross-disciplinary examination of the accumulated theory, research, and evaluation literature relevant to early childhood education” (p. 31). The review documented a shift in view about “the major tasks for children during the preschool years” (p. 37). In ear-

lier times, these tasks were seen primarily as ones of “socialization: separating from home, learning how to interact with peers and unfamiliar adults, and experiencing new material in a novel environment. Today we recognize the first five years as a time of enormous growth of linguistic, conceptual, and social competence” as well (p. 37).

The NRC review found that there was no one preschool curriculum that was superior to others in terms of effectiveness. The study panel did not find this surprising in light of the evidence that other aspects of learning in addition to curriculum are important to early learning: the adult-child relationship, temperament, social class, and cultural traditions. The panel did, however, find that “children who attend well-planned, high-quality early childhood programs in which curriculum aims are specified and integrated across domains tend to learn more and are better prepared to master the complex demands of formal schooling” (p. 307). It concluded that, among other factors, incorporating more ambitious learning goals into programs for young children requires teachers who are deeply knowledgeable about how children develop in the early years and about how to teach preschool youngsters.

Such expectations about teachers were quite at odds with the training levels of many of the adults who work with young children. Public school kindergarten teachers generally have college degrees and often have additional degrees and certificates common to elementary school teachers, though they may not have specific backgrounds in early childhood education. In 2000, twenty-nine states required their pre-kindergarten teachers to be certified, which required a college degree.

In other pre-kindergarten and preschool settings, however, training levels were significantly lower. In 2000, thirty-one states set no minimum requirements for teachers in child-care centers, and individuals could often be hired with only a high school diploma and little or no experience. Of states with minimum requirements, only Rhode Island and New York City (which has regulations separate from New York State) required teachers in child-care centers to have bachelor’s degrees.

In 2002 the most widely held credential among child-care workers (which also qualified holders to teach in pre-kindergarten programs in some states) was the child development associate (CDA). A nationally recognized credential originally developed

for Head Start workers, it certifies that high school graduates with experience working with children and 120 hours of formal child-care education have also passed a performance-based assessment of their care-giving knowledge and skills. Efforts to upgrade preschool teacher qualifications are likely to reduce the importance of the CDA: the Georgia Prekindergarten Program removed it from the list of acceptable credentials for lead teachers for the 2002–2003 school year, and Congress decreed in 1998 that by 2003 half of Head Start teachers must have an associate’s degree.

The poor pay of early education teachers makes it difficult to attract a highly qualified and stable workforce. Median annual earnings for those teaching in preschools was \$17,310 in 1998, with higher averages for those teachers working in elementary and secondary school systems and lower averages for those classified as working in “child day-care services.” Other child-care workers fared even worse. Moreover, preschool teachers and child-care workers frequently do not receive benefits such as paid vacation and health care. Not surprisingly, high levels of turnover have plagued the preschool and child-care industries.

**Access to educational opportunities.** While kindergarten opportunities are widely available to children from all socioeconomic backgrounds, preschool enrollment patterns in 2000 indicated that children of higher-income and better-educated parents were mostly likely to have the advantage of structured educational programs.

In October 2000 the U.S. Census Bureau found that 52 percent of all three- to five-year-olds not yet enrolled in kindergarten were enrolled in “nursery school”—a group or class organized to provide educational experiences for pre-kindergarten children that included instruction as an important and integral phase of its program. Hispanic children were significantly less likely to be enrolled than non-Hispanic white and African-American children, and only 44 percent of children from the poorest families were enrolled as compared to 71 percent of children from families in the top income level (\$75,000 and over). An even wider gap was evident between the enrollment rates of children whose mothers had only an elementary school education and those whose mothers had college degrees. Poorer children were mostly enrolled in public nursery schools, whereas children from wealthier families depended mostly on private schools.

Unequal access to early education is worrisome because learning gaps are developing among children in the preschool years, and children who are behind when they enter school are unlikely to catch up with their peers. In 2000 the National Center for Education Statistics reported initial findings from a longitudinal study of 22,000 kindergartners that documented many differences in what children know and can do when they enter kindergarten that are linked to family income and mother's education. Differences were found not only in knowledge and academic skills but also in noncognitive domains that are important for school success (such as physical health) and in learning-related experiences that children have at home (such as being read to frequently).

Unequal access to early education is also disturbing in light of a growing body of research showing that early education offers long-term benefits that can substantially offset the large costs involved. Evidence from model demonstration programs providing intensive, high-quality educational and related services to young children from disadvantaged backgrounds shows that participation increased enrollee's school success on such measures as reduced referral to special education, lower incidence of retention in grade, reduced dropout rates, and improved test scores.

The most persuasive results were produced by the High/Scope Perry Preschool and the Carolina Abecedarian projects, both of which employed "gold standard" research designs using randomized treatment and control groups and follow-up of participants over many years. Analyses of the age twenty-seven follow-up on the Perry Preschool program, for example, found that benefits exceeded costs by ratios ranging from 2:1 to 7:1, depending on whether benefits included just savings to government or benefits to program participants, their families, and other members of society as well.

Because model programs are typically small and more expensive than "scaled-up" programs are likely to be, there have long been questions about whether investments in more typical and less-expensive early education programs, such as Head Start and pre-kindergarten, would have similar payoffs. The first large-scale, random-assignment research study on Head Start was scheduled to begin data collection in the fall of 2002 and continue through 2006. Prior research suggests that childcare, health and nutrition, and educational benefits

of Head Start partially or perhaps substantially offset the costs of public investment. Methodological concerns (absence of control or comparison groups, short-term perspectives rather than long-term follow-up, and others) have made findings about the size and sustainability of cognitive gains among Head Start participants controversial.

The most persuasive evidence that large-scale programs that run at lower cost than model preschool programs can also generate significant benefits comes from the Chicago Child-Parent Center (CPC) program begun in 1967. CPC provides preschool and other services to three- to five-year-olds as well as extended interventions into the elementary school years to economically disadvantaged minority children. Researchers followed a group of 1,539 children, born in 1980, who received some combination of CPC services or who were enrolled in locally funded full-day kindergarten programs but did not receive preschool services (the comparison group). The follow-up study of participants at age twenty-one showed that each component of CPC had economic benefits that exceeded costs, with the greatest return resulting from the preschool component. Benefits included increased earnings for participants expected from attaining higher education levels, lower crime rates, and reduced need for school remedial services.

Comparatively little research has been done on the costs and benefits of early education programs for children from middle- and upper-income families, because these children historically were not eligible for public subsidies. As early education programs grow through such developments as the adoption by states of universal pre-kindergarten, this situation should change. While the "payoff" to public investments in disadvantaged children will almost certainly be higher, it is reasonable to expect that all children can potentially benefit from early education, especially if findings from research on the learning capacities of young children are translated into high-quality preschool programs.

**The need for integrated early education and care.** Public policy at the start of the twenty-first century has not caught up with economic and social realities facing parents and society. In fact, "education and care in the early years are two sides of the same coin" (National Research Council, p. 306). Children need early education to develop social competence and exploit their learning potential. Parents, most of whom are employed, need to know that their young

children not only are learning but also are being well-cared-for during the working day.

Public programs, however, are not connected by a comprehensive vision that encompasses both the goals of school readiness for children and support of working parents. Programs tend to emphasize one goal or the other. The result is a service delivery system with disparate missions, administrative mechanisms, and objectives. As a consequence, states face a huge challenge in trying to build comprehensive and coordinated systems of services for young children. Service providers must cope with different eligibility requirements for children and families, different methods of delivering federal and state funds, and different requirements and standards for the programs they deliver. Families face barriers trying to understand the public subsidies for which they are eligible and looking for providers who can meet both the educational and child-care needs of their children.

**Falling behind internationally.** The United States entered the twenty-first century significantly behind other industrialized countries in recognizing the wisdom of investments in young children. European countries in particular have made much progress in providing early learning opportunities available for all with convenient schedules for working parents.

Countries such as Belgium, France, and Italy offer universal, voluntary, and free programs for preschool children age three to six and in 1999–2000 enrolled 95 to 99 percent of this age group. Preschool in these countries lasted for the normal school day, seven or eight hours, with supplemental services (with costs shared by parents) available before and after school and during school holidays. Denmark, Sweden, and Finland enrolled 73 to 83 percent of their three- to six-year-olds in early education programs that integrated education and care, with government paying most of the costs. Austria, the Netherlands, Spain, Germany, and the United Kingdom also had preschool enrollment rates above 70 percent either for children age three and over or those age four and over.

These figures are especially impressive because they apply to education-oriented programs that are required to recruit staff with specialized qualifications in education and exclude day-care centers and similar facilities. Professional staff in Europe who work with children age three and over are generally required to have completed at least three years of

postsecondary education (which is the equivalent of a bachelor's degree in many countries).

Public financing is widely accepted as the appropriate way to pay for preschool in the industrialized countries of Europe. Parents share costs on an ability-to-pay basis in some cases, but their share is small and sometimes limited to the wraparound care needed by those who work.

### Conclusion

Public investment in education in the United States appears seriously unbalanced. In 2001 governments spent roughly \$20 billion to \$25 billion annually on early education for children from birth to age five, compared to roughly \$400 billion on elementary and secondary education and at least \$100 billion on postsecondary education, including student aid. Nobel laureate economist James Heckman argued that at these levels of investment devoting additional funds to improving the basic learning and socialization skills of the very young is the best way to improve the skill levels of American workers. Early education is as vital to both individual and society well-being as the education of older children and young adults and equally worthy of public support.

## PREPARATION OF TEACHERS

A major theme endures through the history of early childhood education: Because young children learn differently than older children, their schooling must be different. Thus, their teachers require specialized training.

### History

The kindergarten became the first large-scale early childhood program in the United States. With it came the first formal training for teachers of young children.

**Kindergartens.** Private kindergarten training schools, usually connected to a kindergarten, spread as the kindergarten spread. The first kindergarten training school was begun in Boston in 1868 by German kindergartners Matilda Kriege and her daughter Alma (the term "kindergartner" is used both for a child attending a kindergarten and for a teacher at a kindergarten). Matilda Kriege studied with Baroness von Marenholtz-Buelow, a patroness and disciple of the German educator Friedrich Froebel (1782–1852), the founder of the kindergarten.

Initially kindergartens were German-speaking and were started by German immigrants, many fleeing the failed 1848 Prussian Revolution. Margarethe Schurz started the first in the United States in her home in Watertown, Wisconsin, in 1855. Schurz had worked in the London kindergarten run by her sister Bertha Ronge, immigrating to the United States in 1852. In 1859 Schurz and her young daughter Agathe met Elizabeth Peabody by chance in Boston. Impressed by Agathe, Peabody pressed Schurz to describe the kindergarten. In 1860 Peabody began the first English-language kindergarten in Boston. In 1867, dissatisfied with her kindergarten, Peabody traveled to Europe. She visited many kindergartens, including the training class in Hamburg run by Luise Froebel, Friedrich Froebel's widow. On her return, Peabody advocated tirelessly for kindergartens and for normal-school training for kindergarten teachers.

In 1873 William Torrey Harris, superintendent of the St. Louis Public Schools, opened the first public kindergarten in the United States, with Susan Blow as head teacher. The kindergarten had twenty children and twelve kindergartners in training, who, for a year, assisted Blow in the mornings and studied Froebelian theory in the afternoons. The second year, Blow taught an advanced class on Saturdays. Blow studied in New York with Maria Kraus-Boelte, who had trained in Hamburg for two years with Luise Froebel and then worked at Ronge's London kindergarten. In 1873 Kraus-Boelte opened the New York Seminary for Kindergartners with her husband, John Kraus, a friend of Froebel. The training consisted of one year of course work and one year of practice teaching. She trained kindergartners until her retirement in 1913.

Alice Putnam, an early Chicago kindergartner, studied with Kraus-Boelte and Blow. From 1876 she ran kindergarten-training classes at Hull-House and later at the University of Chicago and Cook County Normal School. Putnam was instrumental in founding the Chicago Free Kindergarten Association and the Chicago Froebel Association, where many kindergartners trained. In 1887 Elizabeth Harrison, a Putnam student, founded the Chicago Kindergarten and Training School, which evolved through many name changes to become National-Louis University. Another Putnam student, Anna Bryan, founded the Louisville Kindergarten and Training School in 1887. Patty Smith Hill, the dominant figure in early childhood education in the early 1900s, was her first student.

Emma Marwedel, a student of Froebel's, came to the United States at Peabody's urging. She ran a training school in Washington, DC, from 1872 to 1876, then founded a training school in Los Angeles. Her first graduate, Kate Douglas Wiggin, began the Silver Street Kindergarten Training School in San Francisco in 1880. Wiggin's student Caroline Dunlap began the first Kindergarten Training School in Oregon in 1881.

As training schools proliferated, educational publications warned of spurious training schools. In 1894 the president of the National Education Association's (NEA) Department of Kindergarten Education decried "'so-called trainers' who were . . . turning out all graduates with enough money to pay for a course" (Hewes, p. 10).

Kindergartens spread rapidly. By 1880, 7,800 children were enrolled in kindergartens in St. Louis.

Milwaukee included kindergartens in the public schools in 1882. In 1884 the NEA established the Department of Kindergarten Education. One year later, the NEA recommended kindergartens in all public schools. In 1892, in Sarasota Springs, New York, the International Kindergarten Union was founded. By 1890, 150 local kindergarten associations had been formed. By 1900, 189 cities had kindergartens, with 250,000 children attending; by 1910, the latter number had increased to 360,000. In 1912 there were 7,557 kindergartens and 8,856 teachers. By 1933 public kindergartens enrolled 723,000 children and private kindergartens, 54,000.

As the kindergarten became part of the public schools, administrators pressed for kindergarten teachers to meet the same licensure standards as other teachers. Training began to move from private kindergarten-training schools to normal schools. The New York Normal School began a short-lived training program in 1870, reopening it in 1874 with a Kraus-Boelte-trained supervisor. By 1880 some kindergarten training was available at the Milwaukee Normal School. In 1892 the Wisconsin State Normal School of Milwaukee added a Department of Kindergarten Education, which required two years of normal school. Students received a kindergarten assistant certificate after one year and a kindergarten director diploma after two.

Between 1880 and 1895 kindergarten training was incorporated into state normal schools in Oshkosh, Wisconsin; Winona, Minnesota; Oswego and Fredonia, New York; Emporia, Kansas; Connecticut; and Michigan; as well as into the city normal schools in New York and Boston, the Cook County (Illinois) Normal School, and the Philadelphia Girls Normal School.

By 1913, 147 institutions offered kindergarten training. As more normal schools offered kindergarten training, kindergarten-training schools declined—a 1916 report of 126 teacher-training programs showed only twenty-four freestanding kindergarten-training schools. During the 1900s normal schools slowly transformed into colleges and universities. As normal schools became colleges, training for kindergarten teachers became four-year degree programs.

**Nursery schools.** With the nursery school movement, early childhood education became increasingly identified with preschool (pre-kindergarten) education. The nursery school was founded in En-

gland by Margaret and Rachel McMillan in 1911. The first American nursery teachers went to England for training, many with the McMillans.

Nursery schools spread rapidly. In 1924 there were twenty-eight nurseries in eleven states; by 1933 the number grew to 1,700. In 1926 Patty Smith Hill invited a select group of early educators to New York. This group formed the National Committee on Nursery Schools, which later became the National Association for Nursery Education, and still later the National Association for the Education of Young Children (NAEYC). Nursery schools also became part of many universities. Between 1924 and 1930, Lawrence Frank, at the Laura Spelman Rockefeller Memorial Fund, directed funding toward the establishment of many university laboratory nursery schools, most often in home economics departments, at, for example, Iowa State University, the Ohio State University, Cornell University, the University of Georgia, Spelman College, and Michigan State University.

The Merrill-Palmer Nursery School in Detroit and the Ruggles Street Nursery in Boston were early nursery-teacher-training institutes. By the mid-1920s teacher training was occurring at nursery laboratory schools at the Iowa Child Welfare Research Station, the University of California—Los Angeles, the University of Minnesota, Columbia University, Yale University, National Kindergarten and Elementary College, Cleveland Kindergarten—Primary Training School of Western Reserve University, and normal schools in Kalamazoo, Michigan, and Milwaukee. In 1927 the National Committee on Nursery Schools Second Conference recommended a four-year college degree for nursery teachers to better enable them to deal with specialists from such fields as nutrition and psychology.

The primary focus at many laboratory schools, however, was research on child development. The training was seen as important for women in general. Edna Noble White, who founded Merrill-Palmer, stated in a letter to Lawrence Frank in 1924 that a “laboratory for training young women in child care . . . should be made part of the training of every young woman since they come in contact with children in many capacities—mothers, teachers, social workers etc.” (Braun and Edwards, p. 149).

During the Great Depression of the 1930s, the Works Progress Administration (WPA) set up emergency nursery schools to provide work for unem-

ployed teachers. As many as 2,500 nursery schools appeared in the public and private sector by 1940. WPA nursery funding ended in 1942, the year that the Lanham Act set up about 2,000 day-care centers to enable mothers to enter the work force to support the war effort. Both programs required rapid and large-scale training, often of teachers without experience with young children. A survey in the second year of the WPA nursery schools found that of 3,775 teachers, 158 had nursery experience, 290 had kindergarten experience, and 64 percent had teaching experience. Many groups were involved in the training, including the National Association of Nursery Educators, the Association for Childhood Education, and the National Committee on Parent Education. The training itself is not well documented.

Following World War II, the Lanham Act day care centers closed down. Early schooling returned to the pre-depression level until the summer of 1965 when Head Start began with 652,000 children in 2,500 centers, employing 41,000 teachers and 250,000 other workers, including volunteers. Head Start spawned more federally funded early intervention programs, such as Child Parent Education Centers, which targeted poor young children. In the 1980s and 1990s individual states began funding preschool programs for young children termed “at-risk.” At the same time, the day-care industry grew rapidly as more women worked outside of the home.

### Current Structure and Organization

The Council for Professional Development reported that almost 1,400 two- and four-year institutions offered early childhood programs in 2000. More than half of these were two-year institutions offering associate degrees. As early schooling and care expands, many teachers of young children receive their training in other than four-year institutions. The 1985 NAEYC guidelines for an early childhood associate degree specified that at least half the program be professional courses. Programs vary greatly across institutions.

Many early childhood teachers earn the Child Development Associate (CDA) degree, which was initiated in 1971 by the U.S. Office of Child Development. The goal was to identify basic competencies and provide training in them, leading to a national credential. Since 1985, NAEYC has administered the program. The program’s competency goals emphasize performance rather than prescribed courses or

credits. There is considerable local control in interpreting standards and providing training.

Early childhood programs at four-year institutions also vary greatly depending on how early childhood is defined in a given state. In 1997, sixteen states had licensure for teaching ages zero to eight. Seventeen others and the District of Columbia had licensure for ages three to six. Three states defined early childhood as age five to age nine. Five states had an early childhood endorsement to be added to the elementary license, while ten included kindergarten in the elementary license. Increasingly four-year institutions educate early childhood teachers for public school programs requiring state certification, and two-year programs educate teachers for other early childhood programs.

### **In-Service and Staff Development Programs**

NAEYC, the Association for Childhood Education International (ACEI), and Head Start offer guidelines and recommendations for professional development and in-service training. Historically, the goal of in-service and staff development has been to improve weak areas of practice. In the late 1980s the goal shifted to a developmental model that emphasizes growth and collegiality. This model prepares teachers to participate in decision-making and to advance professionally.

NAEYC's 1993 position statement on early childhood professional development specifically addresses "an effective system of early childhood professional development that provides meaningful opportunities for career advancement to ensure a well-qualified and stable work force" (p. 1). NAEYC and ACEI offer publications that support preparation and training, conferences to improve professional preparation and training, and professional preparation and program review. NAEYC stresses the importance of developing a professional development system embedded within the larger system of effective early childhood programs.

Head Start's in-service training approach addresses the needs of teachers, children, and families. From its inception Head Start has been committed to staff development. Educators in Head Start programs have a wide range of early childhood experiences and credentials. Head Start offers a variety of in-service approaches to assist staff in developing their practice and professionalism. Some of the in-service programs include integration of training with

exemplary Head Start programs, hands-on participatory activities, mentoring, collaborative learning, training teams, individualized training, goal-setting strategies, and follow-up training.

### **Trends, Issues, and Controversies**

Programs at four-year institutions face the perennial challenges of teacher education: how to balance professional education, general education, and specific areas of academic study; and how to balance university course work and clinical experience. In the 1980s and 1990s, the general trend was to decrease professional education and to increase general education and courses in a noneducation specialization. The amount of clinical experience has generally stayed the same or increased. The tension between the amount of coursework in pedagogy versus child development in the professional education component remains.

The importance of training for early childhood teachers has become increasingly recognized. For example, Head Start has mandated that half of all program staff must have an associate degree by 2003. In 1998 forty-one states and the District of Columbia had early childhood initiatives, many with more stringent requirements for early educators. At least nineteen states require some pre-service training for child-care providers.

Many early childhood educators promote a system of certification by which teachers would move up a career ladder from, for example, a CDA to an AA (Associate in Arts) to a bachelor's degree and state licensure. Although some progress has been made toward such a system, differences in course types and patterns between two-year and four-year institutions remain an obstacle. Arguments for academic credit for work experience further complicate matters.

Both ACEI and NAEYC now define early childhood as birth through age eight (or third grade). It remains to be seen how this shift in emphasis from preschool to preschool through third grade will actually affect teacher training. Early childhood programs in traditional home economics programs and two-year colleges focus on preschools. Preschool education is often regulated by state agencies other than education, usually child-welfare agencies.

A serious teacher shortage is predicted for the first decades of the twenty-first century. A shortage may lead, once again, to abbreviated teacher training

and different routes to licensure. It should be noted, however, that discussions of alternative licensure generally focus on high school and elementary teachers, in specified shortage areas, not on early childhood.

The question of who controls teacher credentialing remains. Originally local districts credentialled teachers but soon states took over. Many groups have a stake in credentialing, in particular, state boards of education, professional organizations, teachers unions, and universities; and shifting coalitions across these groups are common. NAEYC's 1996 *Guidelines for Preparation of Early Childhood Professionals*, for example, cites endorsements by the Association of Teacher Educators, the Division of Early Childhood of the Council for Exceptional Children, and the National Council for Accreditation of Teacher Education.

Given the changing and local nature of teacher licensure, generalizing about credentialing is difficult. Nevertheless, the general historical trend has been as follows. Until the early 1900s teachers were credentialled by examination. They were then credentialled based on professional training. In the 1950s states moved from credentialing based on state-specified courses and hours to approved programs, which meet state requirements but vary across colleges and universities. In most states the approved program is accompanied by some form of state competency examination in one or more of the following areas: basic skills, subject matter, and professional knowledge. By the early twenty-first century, the trend was toward performance-based credentialing, often requiring student-produced portfolios as evidence of successful performance.

## Conclusion

The major challenge to education of early childhood teachers is the broad and changing nature of the field. The term *teacher-caregiver* has become common, giving some sense of this breadth and change. Across teaching in general and in early childhood teaching in particular, the diversity of roles people take in working with young children makes it difficult to identify a single knowledge base. Early childhood education serves an increasingly diverse population and is expected to provide an increasingly wide range of services to these children and their families. The most pressing, and perennial, challenge is the "widespread misconception that work with young children can be carried out effectively without

the benefit of specialized knowledge" (Powell and Dunn, p. 63).

### INTERNATIONAL CONTEXT

Early education, sometimes referred to as *early childhood care and development* (ECCD), emerged at the 1990 World Conference on Education for All, held in Jomtien, Thailand, as an important extension of the more traditional approach to basic education, in which "education" begins with entrance into school. According to the Jomtien Declaration, "learning begins at birth. This calls for early childhood care and initial education. These can be provided through arrangements involving families, communities or institutional programs, as appropriate." One of the

targets for the 1990s of the Jomtien Framework for Action was an "expansion of early childhood care and development activities, including family and community interventions, especially for poor, disadvantaged and disabled children." The Jomtien Declaration and Framework for Action gave international presence and sanction to early childhood care and development, and to "initial education" in a way that it had not enjoyed previously. Expectations were raised at Jomtien in relation to: (a) the well-being of young children; (b) enrollments; (c) conditions favoring improvement in ECCD programs; and (d) shifts in the type and quality of program being provided.

It is difficult to understand changes in the field of early childhood care and development without paying attention to the broader context in which changes occur. Trends that have important effects on ECCD include: industrialization, urbanization, and internal migration; declining birth rates; technological and scientific developments; globalization; changing social values; the mobilization and emancipation of women; internal strife and civil wars; the ecology movement, the HIV/AIDS pandemic; and moves toward greater administrative decentralization. While space does not allow a detailed description and analysis of these changing contexts, or of their effects on childrearing practices, the welfare and quality of life of young children, and the evolution of ECCD programs, it should be noted that conditions and contexts, as well as the rate at which they are changing, vary widely among and within countries, making it likely that changes in ECCD, for good or ill, may be more closely related to local circumstances than to the influence of the World Conference on Education for All and the ensuing activities.

#### The Well-Being of Young Children

**Health and nutritional status.** Despite the fact that millions of children in the world still die from preventable diseases, major advances have been made since the 1980s in reducing infant and child mortality. For example, the positive effect of immunization programs on infant mortality has been widely documented, and polio is on the verge of being eradicated. Micronutrient supplementation programs seem to have had important positive effects; particularly notable are advances related to the provision of vitamin A and iodine.

At the same time, it is important to note the dramatic setback in general well-being related to the HIV/AIDS pandemic, particularly in Africa. Major health advances and remaining challenges are documented in the annual reports of the World Health Organization and United Nations Children's Fund (UNICEF). Relatively high levels of undernourishment and vitamin deficiencies continue in many parts of Asia, Africa, and Latin America. Moreover, feeding programs have not always lived up to expectation. For example, two evaluations carried out in Latin America found that there was little or no improvement in the nutritional status of participants in ECCD programs, despite a relatively high cost of feeding children in the programs. Evaluations suggest that broad approaches, directed to the whole family, need to be promoted if health and nutrition components of ECCD programs are to be effective in improving the well-being of young children—simple supplementary feeding programs are insufficient.

**Psychosocial development and learning.** Unfortunately, very few countries provide measures of the psychosocial well-being of young children, or of their advances in learning during their early years. It is therefore impossible to judge advances in this area for national populations or to link advances to the many program initiatives that have been undertaken.

### Enrollment

The most commonly used indicator for early childhood programs is the percentage of a particular age group who are enrolled in recognized programs, creating a *gross enrollment ratio* (GER). From the evaluation reports presented by countries prior to the World Education Forum held in Dakar in 2000, it is possible to obtain a rough overview of enrollments and changes over the last decade of the twentieth century. Although the data need to be interpreted with caution, a number of conclusions seem to be valid.

**General enrollment trends.** The general tendency has been for enrollments to increase since 1990. In Latin America and southern and eastern Asia, all of the countries reporting data showed an increase in enrollments, with the exception of Afghanistan. In the Caribbean, all but one country (Grenada) showed increases (or remained steady at more than 100 percent). Cook Islands in the Pacific showed a decrease, but all other countries in the region in-

creased their enrollments. A summary from the Spanish-, Portuguese-, and French-speaking countries in Africa notes a marginal increase for the region during the 1990s (from 0.7% percent to 3.6%), and specifically mentions a decrease only in Togo. The United Nations Educational, Scientific and Cultural Organization (UNESCO) reported in 1999 that “enrollment has grown and access, although small, has improved” (UNESCO 1999b); there is no indication, however, of cases in which there may have been a decrease.

As a major exception to the above, decreases in enrollments were found in all the central Asian countries that were former members of the Soviet Union, and for which data were available. These decreases are a product of the breakup of the former Soviet Union, of economic difficulties associated with independence and the shift to a market-based economy (sometimes accompanied by civil war or territorial battles with neighbors), and of a decentralization process within the countries. With these changes, the centrally supported, extensive, and expensive system of relatively high-quality early-childhood provision broke down. This was particularly significant for rural areas where attention had been provided through rural cooperatives. It appears, however, that enrollments began to recover slightly during the late 1990s, related to somewhat greater stability, financial assistance from abroad, and the emergence of a range of new alternatives.

The most dramatic increases during the 1990s appeared in the Caribbean, where statistics for the tiny Turks and Caicos Islands show a jump from zero coverage at the beginning of the decade to an enrollment of 99 percent. Cuba showed a major increase over the period (from 29% to 98%), a result of having introduced (and having included in their statistics) a massive parental education program. Honduras, Nicaragua, and Paraguay also showed significant advances, but began from a relatively low baseline. The same is true of the Philippines. China, Thailand, and Vietnam also showed important enrollment increases.

In most cases, however, change has been modest, slogging along at one or two per cent per year. UNESCO reported that “ten years after Jomtien, despite efforts of some governments, very little progress has been made to achieve the set goals” (UNESCO 1999b). It can be concluded, therefore, that a great deal of work is still needed if ECCD pro-

grams are to have a significant effect on the lives of children, families, and countries.

In 1998, the variation in enrollment rates was enormous, ranging from almost zero to more than 100 percent:

- In Latin America, Ecuador reported a coverage of 14 percent for children up to age five, contrasting with 98 percent for Cuba.
- In the Caribbean, Belize reported 26 percent of its children three to five years of age were enrolled, contrasted with 100 percent for the Bahamas and Jamaica.
- In the Middle East and North Africa, Yemen reported 1 percent, and Bahrain 36 percent, of children ages three to five were enrolled.
- In southern and eastern Africa, Zambia reported 7 percent of children ages three to six were enrolled, whereas Mauritius report an enrollment of 98 percent for children four and five years of age.
- In central Asia and eastern Europe, Afghanistan reported 0 percent enrolled, Tajikistan reported 4 percent of children ages one to six were enrolled, and Russia reported an enrollment of 54 percent. Seychelles, an island nation in the Indian Ocean, however, had 107 percent enrollment.
- Enrollments in the Pacific Islands vary from 15 percent in Fiji to 73 percent in Papua New Guinea and 100 percent in Tuvalu.

These immense disparities across countries, when added to the obvious cultural and economic differences within countries, reinforces the idea that formulas should be avoided.

**Preschool trends.** Attention to ECCD continues to be very much focused on preschool, and is concentrated on the age just prior to entry into primary school. This preprimary age may be as young as four (because kindergarten is considered part of the primary-school system and the enrollment at age five is virtually 100 percent, a situation found in various Caribbean countries), or as old as age six. Data from the evaluation reports, when broken down by age, shows the greatest enrollments for age five or ages five to six. In Chile, for instance, 83 percent of children five to six are enrolled, as compared with only 35 percent of children three to four. In Japan, the corresponding figures are 97 percent and 58 percent. These figures support the notion of a strong bias to-

wards preschool education as the main strain of ECCD. In Latin America, at least seven countries (Argentina, Chile, Costa Rica, Cuba, Mexico, Peru, and Uruguay) can point to enrollment figures of more than 80 percent for the year prior to entry into primary school. The general point is reinforced when one takes into account that various countries include in their statistics special programs designed specifically to prepare children for primary schooling.

Coverage is very low, however, in institutionalized ECCD programs for children under two, and even under four, years of age. In most of the world, the tradition of mothers or other family members caring for very young children at home on a full-time basis continues to be the norm. Accordingly, parental support and education programs that will guide parents in helping their young children not only to survive and grow, but also to develop their full potential, are extraordinarily important. Together with the hope that many people can be reached at a relatively low cost, this has led to a spate of *parenting education* programs. These are often mentioned in country reports, but are not usually included in statistics.

Although countries in the Third World, and in eastern Europe and central Asia, are likely to provide families with noninstitutionalized support (e.g., maternity and paternity work leave, sick leave, child payments, housing subsidies), this type of support for families with young children is seldom found in developed nations, where responsibility for the first years falls squarely, and even exclusively in some places, on family and community. Sweden has reported a relatively high proportion of children ages one to two in child-care centers.

**Urban versus rural education.** Urban children are more likely than rural children to be enrolled in some sort of ECCD program, though in a number of countries there is a suggestion that rural enrollments grew more than urban enrollments during the 1990s. The bias towards urban areas is probably greater for daycare programs, which are usually linked to urban work situations, but this information is not available in reports.

**Socioeconomic factors.** Children from families that are better off economically and socially are more likely to be enrolled than are children from families with few resources or that are part of groups discriminated against socially. Although this statement

is logical and comes from a general literature review, in evaluation reports prepared for the World Education Forum almost no attempt was made to present hard data showing how enrollment is related to economic or social status. The main exception is Chile, which reported a direct relationship between enrollment and income based on household survey data—in 1996, enrollment for children under six years of age was more than twice as high for children from families in the upper fifth of the income distribution (48%) as it was for children from families in the lowest fifth (22%). In the period from 1990 to 1996, enrollment grew 32 percent for the lowest income group and 49 percent for the highest.

**Boys versus girls.** In most countries, there is virtual parity between boys and girls, but there are exceptions in which girls lag behind. Nepal, Pakistan, India, Maldives, and Iran are cases in point. Several of the countries in the Middle East and North also show lower enrollments for girls, but there is evidence that the gap is slowly narrowing. Gender inequality tends to be magnified in rural areas.

**Political factors.** The role of the state, of private-sector institutions, and of communities varies widely from region to region and country to country. In nations with a socialist bent (including former members of the Soviet Union, the Lao People's Democratic Republic, Cuba, and Sweden, among others) education has been a major responsibility of the state, including education and care during the preschool years. Accordingly, important efforts were made prior to the 1990s to develop state-funded systems of comprehensive care and early education. During the 1990s, however, the role of the state changed dramatically in many of these countries, sometimes with newfound independence and a shift towards a market economy.

The socialist stance contrasts markedly with that of the United States and the United Kingdom, where ECCD has developed along mixed private and governmental lines, but with a heavy bias towards private and community provision regulated through the market. In Africa, with some exceptions, governments have paid little attention to ECCD, which has been viewed as the responsibility of families and communities. Nongovernmental organizations (NGOs)—which are statistically labeled as private, but might better be considered part of a social sector—have played an important role in the region.

In Latin America, the percentage of enrollments accounted for by nongovernmental programs runs

between 10 percent and 15 percent for most countries. In the Caribbean, heavy emphasis is placed on private and community programs. In Southeast Asia, Indonesia reported 19 percent (1996) and Thailand reported 24 percent (1998) of their enrollments were administered by organizations that are not part of the government.

### Changes in Conditions Affecting ECCD Programming

The immediate conditions affecting ECCD are changing, including shifts in: (1) knowledge and its dissemination, including the conceptual and scientific bases available to be drawn upon and the formation of communication networks; (2) attitudes and awareness of political leaders, funders, planners, and the population at large about the importance of ECCD and its potential benefits; (3) policies and legal and legislative frameworks for programming, both internationally and nationally; (4) the availability of resources, both financial and human; and (5) organizational bases, both governmental and non-governmental.

**Changes in the knowledge base and conceptual shifts.** In a survey carried out by Robert Myers, the most frequently mentioned advance in knowledge related to ECCD during the 1990s was an advance in understanding how the brain develops and functions. To many survey respondents, it was clear that new discoveries in neuroscience—and their dissemination through scientific, professional, and popular channels—have had an important influence on the demand for, and the willingness to consider support for, early childhood education and development programs. An example is the finding that there are “windows of opportunity” for learning during the early years when learning particular practices is most efficient and which, if missed, make subsequent learning very difficult.

Also mentioned with some frequency was a growing body of knowledge from research studies and program evaluations showing long-term benefits of early intervention programs for children at risk. It is now possible to point to longitudinal studies in various countries showing clearly that ECCD programs can have effects on children in primary school. A prime example is the excellent work done in Turkey, in which children cared for in different settings, and whose mothers participated in a parent education program, were shown to benefit in later life from such programs. These studies have

helped to convince policymakers and programs of the value of investing in ECCD. They reinforce the Jomtien commitment to including early education within basic education.

These studies, together with the few cases where there has been some agreement on an indicator of psychosocial development and where consistent measurement has occurred over time (e.g., Chile), show that:

- Programs of reasonable quality do have important positive effects on early development, often with longer-term effects.
- The effects can favor rural children who are at a social disadvantage.
- An important improvement in the nutritional status of children does not automatically bring about the anticipated improvement in various dimensions of psychosocial development.
- The area of language development seems to show a consistent lag in development related to socioeconomic conditions, as well as to first-language differences.

Other new avenues of research that are beginning to influence practice include studies of resilience; conditions under which programs can have a negative effect on child development (for example, when the quality of a center is very low); and child-rearing practices and patterns.

A range of conceptual shifts was also noted by survey respondents. For example, although a behaviorist model that is not very “child friendly” still holds sway in some countries, there has been a shift towards active learning and the constructivist ideas of Jean Piaget (1896–1980). Although Piaget has had a strong influence on early childhood curricula and practices, particularly in the developed world and in Latin America, even more of a shift has been noted towards programs based on the thinking of Lev Vygotsky (1896–1934). While not contradicting Piaget, Vygotsky places greater emphasis on social and cultural influences that affect all aspects of children’s development (as contrasted with emphasis on individual discovery) giving renewed importance to the role of the teacher and to the place of language in the teaching/learning process.

The influence of ecological and transactional models that gained prominence in the 1980s continues to provide a basis for complementary approaches to ECCD that work towards changing the family,

community, and broader institutional and cultural environments with which a child interacts in the process of developing and learning.

The search for *best practices*, which took off in the 1980s, continues, but the chorus of those who question the search for universals and the base for best practices in developmental psychology has grown ever louder. Additional importance is being attached to discovering, respecting, and incorporating cultural differences into thinking about how early childhood education and care should occur. Viewpoints grounded in anthropology, sociology, ethics, and other fields are being brought to bear on ECCD, highlighting the need to begin with the cultural and social definitions of childhood and education held by those who are the participants in early childhood programs rather than with a predetermined set of definitions and models imposed from outside. This tendency is consistent with a strand of thinking about social and economic development that is grounded in local participation, and in “putting the first last,” as Robert Chambers aptly subtitled his study.

To try to overcome inevitable tensions between international and local expressions of what “should be,” a third path is evolving in which the search for best practices begins by looking for and supporting those practices valued both in terms of traditional wisdom based on experience and their scientific value. Points of difference are handled through dialogue in which underlying values are made explicit.

There are also shifts in the way planning, programming, and implementing organizations are going about moving knowledge into action. For instance, there is a tendency for ECCD programming to be set within broader frameworks such as poverty alleviation. There have also been calls for a “new citizenry” as transitions to democracy occur, and for moderating problems of street children and criminal behavior. Incipient is a tendency to think more in preventive, rather than compensatory, terms.

Related to globalization, there appears to be a conceptual shift in how governments see their role in the provision of ECCD services, with a tendency toward privatization.

**Changes in attitudes, awareness, policies, and legal frameworks.** The 1980s and 1990s saw an important increase in awareness of the importance of ECCD, sometimes linked to research findings, sometimes to evaluations and the perceived effectiveness of partic-

ular programs, and sometimes to discussions of children's rights. In some circles, awareness has grown of the importance of the very early years, not only linked to research on the brain, but also to a new appreciation for the effects of *bonding* and *attachment*.

In some cases, this new awareness has been translated into policies and/or legal and legislative frameworks. Some countries have lowered the age of entrance into primary school, thereby giving what had been one year of preschool a new obligatory status; others have declared one or more years of preschool education to be obligatory. New policy statements have been issued in several countries, India being a prime example. In Africa, new policies appeared in at least ten countries during the 1990s. In the Caribbean, a regional plan of action has been jointly approved and is moving into an operational phase. However, new awareness and new laws do not necessarily translate into greater financial commitment to ECCD, or to major advances in enrollment or quality.

#### **Changes in the availability of financial resources.**

During the 1990s the availability of financing from international banks and donors for ECCD programs increased significantly, particularly from the World Bank, with important new initiatives financed also by the Inter-American Development Bank and the Asian Development Bank. The picture is less clear, however, with respect to national budgets. Little specific information is available about national financing of ECCD programs, but the general impression is that very small proportions of educational budgets are devoted to early childhood programs. According to a UNESCO report, "governments in general have neither the financial nor administrative capacity to engage in early childhood education in the way they are involved in the provision of primary universal education" (UNESCO 1999b).

Estimates are not available for the financial support that is provided by the private and social sectors. Despite laws in some countries that mandate employers to provide child care, the contributions of the private sector to ECCD seem to be minimal. The low allocations by governments and the private sector suggest that the major burden of financing ECCD continues to fall on families and communities, as well as on civic and religious organizations.

**Changes in program strategies and quality.** Shifts appear to be occurring, albeit slowly, in the strategies used to foster early childhood development and to

improve learning and education during the pre-school years. For example:

- Although most attention in the field continues to be focused on the immediate pre-school years, there is more attention being given to children under four years of age—not only through health programs, but also through programs of parental education that include attention to psychosocial development.
- Although fractured and uncoordinated sectoral and monofocal programs still predominate, more attention is being given to multidimensional strategies that seek convergence, coordination, or integration.
- Strategies more often provide for a variety of service models, using a range of different agents, as contrasted with the still prominent strategy that extends the same service and the same model to all families and children, regardless of their culture and circumstances.
- Somewhat greater attention is being given to adjusting curricula to culture, as the idea of "beginning where people are" is gaining ground.
- The presence of nonformal programs has grown.

Unfortunately, very little is known, in a systematic way, about the quality of ECCD programs in the developed world, whether defined in terms of inputs, processes, or results. It has been difficult to arrive at an agreement about the instruments and methods that should be used for measuring quality. Nevertheless, it seems fair to say that program expansion has outrun attention to quality.

#### **Problems and Proposals**

**Weak political will.** In many, even most, countries, the need continues to convince politicians, policymakers, programmers, and education officials of the importance of ECCD. To do so, better strategies of communication, lobbying, and advocacy are needed, together with a better information base related to systematic monitoring efforts.

**Weak policy and legal frameworks.** In order to formulate and strengthen policy there is a need to: (1) undertake analytical studies of existing policies affecting children, looking beyond narrowly conceived educational policies to (for example) social welfare, health, and labor policies; (2) seek conformity with the Convention on the Rights of the Child; (3) estab-

lish norms and standards that are not so rigid or high as to be unworkable, but which will assure positive attention to children; and (4) clarify the roles of the family, state, civil society, and the private sector—as well as forms of partnerships among them.

**Lack of, or poor use of, financial resources.** ECCD programs generally command a small portion of government budgets. There is a need to increase, and make more permanent allocations to, ECCD in national budgets; strengthen the capacity of states and municipalities to obtain resources for ECCD; and seek cost-effective approaches, including quality community-based nonformal programs. In addition, alternative avenues of funding, such as debt swaps, philanthropic contributions, and private-sector involvement, need to be explored, and local organizations should have access to central pools of money in order to better respond to the needs of local communities.

**Uniformity (lack of options).** The bureaucratically convenient tendency to extend the same program to all children conflicts with the need to tailor ECCD programs to cultural, geographic, economic, and age differences. There is therefore a need to: (1) think in terms of complementary and varied approaches to ECCD that include family and community-based programs; (2) involve NGOs more actively as partners; (3) decentralize; and (4) construct culturally relevant programs with local communities.

**Poor quality.** There is a pressing need to reexamine training and supervision, and provide sound training (both pre-service and in-service) at all levels, with respect to a diversity of ECCD approaches, and to reduce the number of children (or families) per education/care agent. Curricula must be improved and reformulated, taking into account local definitions of what constitutes best practices. In addition, existing experience can be drawn upon in a more systematic way, and better systems for monitoring and evaluating children and programs need to be established.

**Lack of attention to particular populations.** The following “disadvantaged” populations need to be given greater attention: low-income, rural, and indigenous populations; girls; HIV/AIDS patients; children up to three years of age; pregnant and lactating mothers; working mothers; and fathers.

**Lack of coordination.** If a holistic and integrated notion of learning and development is to be honored, and if resources are to be used more effectively,

greater coordination is needed among governmental programs, within the education sector (especially between ECCD and primary schooling), and between governmental and nongovernmental organizations. There is a need to create intersectoral, interorganizational coordinating bodies; to construct joint programs crossing bureaucratic boundaries; to strengthen the ability of families and communities to call upon and bring together services that are currently offered in an uncoordinated fashion; and to seek agreement on the populations that are most in need of attention, and then direct services to those populations in a converging manner.

**Narrow conceptualization.** The conceptual frameworks guiding programs intended to improve early childhood care and development and early learning have come primarily from developmental psychology and formal education. There is a need to go beyond the knowledge that these fields provide to incorporate broader views, with cultural, social, and ethical dimensions brought to bear. There is also a need to relate ECCD programming, conceptually and operationally, to other program lines that begin from (for example) analyses of children’s rights, poverty, working mothers, rural development, special needs, refugees, adolescents, and gender.

ROBERT G. MYERS

## **EAST ASIA AND THE PACIFIC**

The region of East Asia and the Pacific encompasses some of the richest and poorest nations in the world,

as well as the largest (China) and some of the smallest (the island states). It includes states with most successful record of economic development in the late twentieth century—the high-performing Asian economies (HPAEs) of the Republic of Korea, Taiwan, Hong Kong (China), and Singapore—and those where growth has been fragile and disrupted by strife and natural disasters (Vietnam and Cambodia). Cultural, ethnic, and linguistic diversity exists throughout the region, both between and within countries. So also do different historic legacies, which influence the form, content, and future development of education.

There are a number of possible criteria that could be applied to groups of countries in this area that highlight some of these differences. Conventional geographical groupings can be useful, but conceal large variations in educational development, economic conditions, history, and culture. An alternative is to select a set of general indicators, which might include demographic factors (e.g. population size, population growth rates, measures of the rate of urbanization); levels of literacy; and economic status, which is determined by measures such as GNP (gross national product), GDP (PPP) (gross domestic product, based on purchasing power parity estimates), growth rates, and changes in the structure of employment. The Human Resource Development Index (HDI) of the United Nations Development Program (UNDP), based on measures of life expectancy, literacy, and real GDP per capita, is also potentially useful.

Using a combination of these characteristics, five groups of countries can be identified. The first group consists only of China, which stands on its own as a mega-state containing most of the region's population. China itself is very diverse, and includes areas where educational participation and achievement levels are very high (predominantly the coastal provinces), alongside parts where educational disadvantage is widespread and literacy levels are low (in the interior and among national minorities). The HDI is used by the UNDP to rank levels of development using an aggregate measure of life expectancy, literacy, and real GDP per capita. China in the early twenty-first century has an HDI rank of 87, placing it among other medium (49 to 127) human-development countries as does its GDP (PPP) per capita of \$5,200. More than 35 percent of its population is urban, and it has a low population growth rate, creating a dependency ratio of less than 40

percent (the dependency ratio reflects the number of 0–14 year olds as a percentage of 15–65 year olds).

The second group includes the HPAEs (Korea, Taiwan, Hong Kong (China), and Singapore). These countries have an HDI rank between 24 and 27 (HDI not available for Taiwan), and more than 80 percent urban populations. GDP (PPP) per capita is more than \$15,000, and the largest proportions of their labor force are employed in services. Malaysia shares many characteristics with this group, as does Brunei Darussalam. The former has experienced rapid sustained growth, ranks 56 on the HDI, and has a small (15%) and diminishing proportion of its labor force in agriculture. The latter has a high HDI ranking (32) and high levels of GNP per capita, with a labor force mostly concentrated in the service sector.

The third group comprises a collection of states that have HDI rankings between 50 and 100 (Indonesia, Philippines, and Thailand). These countries have low- to middle-levels of GDP (PPP) per capita, and most have experienced substantial levels of growth, have an average of about 50 percent of the labor force in agriculture, and generally low illiteracy. Thailand is both the richest and fastest growing nation in this group, but also has the lowest level of urbanization. Vietnam is also urbanizing and developing rapidly.

The fourth group of countries have HDI ranks from 120 to about 135, and all have lower GDP (PPP) per capita than those in the third group. On average, they have lower levels of urbanization and industrialization. Included in this group are Myanmar, Cambodia, and the Lao People's Democratic Republic. They are all low-income and low-growth countries, with less than 20 percent urbanization and predominantly agricultural economies—with the great majority of employment in this sector and little industrial production.

The Pacific Islands fall into the last grouping, though they are far from homogeneous. All have populations of less than one million, except Papua New Guinea, which shares historic and cultural links with many of the islands. HDI ranks are between 85 and 125 (for countries where HDI is available) with the exception of Fiji (67). Most of these countries have middle levels of GDP (PPP) per capita and low rates of urbanization. Countries in this group include Kiribati, Samoa, the Solomon Islands, Tonga,

Tuvalu, the Cook Islands, and Vanuatu. Table 1 presents basic data on countries in East Asia and the Pacific Islands and profiles population, national wealth, the length of school cycles, participation, and educational expenditure.

### Some Key Issues

The key issues confronting these nations reflect different priorities, historic preferences, expectations about the future, and responses to changing exogenous circumstances. It is therefore difficult to look across East Asia and the Pacific Islands as if they were homogeneous. However, if there is some consensus that the purposes of public investment in education is intended to promote economic growth, improve equity in access to basic education services, enhance quality and internal efficiency, and respond to emerging needs, then several sets of issues suggest themselves as likely to be prominent across groups of countries.

First, educational investment in the region will be conditioned by the resources available and the sociopolitical environment in which choices are made. Macroeconomic conditions are likely to remain difficult in some countries (Cambodia, Laos, Myanmar, and Papua New Guinea and some other Pacific Islands). Growth in real GDP per capita (and hence the ability to invest in educational services) seems likely to be slow and unlikely to release substantial additional resources for educational investment. External assistance may have the biggest role to play in these countries. Indonesia has better prospects of real growth, as do Vietnam and the Philippines—assuming political stability is a reality. In these countries, national resources should be largely sufficient to support educational development if it is prioritized in public expenditure plans. The HPAEs, Malaysia, and Thailand should continue to experience sustained economic growth. This, coupled with falling proportions of school-age children and an increased propensity to invest private resources in education, should lead to rapid growth in higher levels of educational investment.

Second, in those countries where spending is relatively low as a proportion of GNP per capita and public budget, increased allocations may be a priority. This will especially be the case where what is currently delivered is manifestly inadequate. However, increasing spending in already inefficient systems has few attractions, unless the underlying sources of inefficiency are addressed simultaneously with en-

TABLE 1

SOURCE: Based on data from United Nations Educational, Scientific and Cultural Organization, 2000.

hanced resource allocation. Where much less than 3 percent of GNP per capita is allocated (and less than

15 percent of the public budget), some reconsideration would seem desirable.

Third, where primary enrollment rates are significantly below 100 percent, especially where literacy is also low and gender differences are large, investment at the primary level should be a priority. The benefits for equity and economic development should be considerable. This is likely to be the most cost-effective way to improve adult literacy in the medium term, and one of the easiest ways to reduce gender inequity.

Fourth, internal efficiency needs improvement, both to extend the resources available to make increased access affordable, and to ensure better distribution of participation and achievement of valued outcomes. Where student–teacher ratios are high and very uneven across schools, these need to be reduced; where they are low, they may need increasing. Unequal investment that arises from wide differences in actual resource allocation (uneven teacher deployment and utilization, within-school preferences for spending on higher grades, heavy subsidy of some institutions and levels at the expense of others) is likely to suppress retention and on-schedule graduation rates, increase repetition, and enhance social selectivity and regressive subsidy related to household incomes. (A regressive subsidy is one that favors households with high income rather than low income.) Initiatives that decentralize control and finance may have a role to play in increasing efficiency and engaging the energies of stakeholders to improve quality and relevance, but they appear unlikely to be sufficient unless accompanied by appropriate checks and balances to encourage desired outcomes and monitor effects. Decentralization may be least attractive where infrastructure is weakest and incomes lowest.

Fifth, more effective educational management, administration, and monitoring—and steps to reverse regressive subsidies—can help provide better value and contribute to equity. Where it can be demonstrated that new incentive structures would work to improve quality without adverse effects that compromise their value, these should be incorporated into management systems.

Sixth, the public costs of secondary schooling should be limited to a small multiplier (no more than about 2:1) of those for primary education, unless there are strong contraindications. In those countries where primary schooling is not universalized, high secondary-unit costs may represent a poor allocation choice unless restricted to a small number of schools with open and fair selection. Where pri-

mary schooling of acceptable quality is becoming widely available, access to, and financing of, secondary schooling will become a dominant policy issue.

Seventh, higher-education policy can encourage more cost recovery from those who benefit. This appears to be the most plausible mechanism for expanding access in the face of growing demand without conceding a growing public subsidy to those most likely to enjoy above-average incomes subsequently. How this is implemented must be context sensitive, since in the poorer countries scope may be extremely limited and some possible mechanisms could result in counter-productive outcomes. Cross-border trading of educational services at the tertiary level is likely to grow rapidly, and may begin to have consequences for national institutions that become uncompetitive in cost and quality with institutions in other countries.

Eighth, education systems should be encouraged to respond to the changing characteristics of labor markets, in which there are an increasing proportion of service and manufacturing sector jobs. As these jobs become more knowledge and skill intensive, curricula, especially at the secondary level and above, need adaptation and redesign to promote outcomes valued in the marketplace. Traditional curricula need to be questioned to establish if they meet new needs and opportunities, and to balance domestic priorities for learning with those derived from educational development at an international level.

### **Prospects for the Future**

It is difficult to predict the educational future of the countries in this region. History provides a reminder of how fragile foresight can be. Predictions of China's economic and educational growth, vocationalization of secondary schools, and increasingly autonomous higher education institutions with large numbers of fee-paying, self-supporting students entering into a burgeoning socialist market economy were conspicuously absent in 1975. Malaysia's rapid and sustained educational development was easier to anticipate. However, the successful contribution of education policy to maintaining stability, redistributing employment opportunities, and generating wealth surprised those critical of its strongly interventionist character under the country's New Economic Policy. Nevertheless, it is worth speculating how things will unfold as a way of drawing attention

to some of the issues that will preoccupy future policymakers.

## China

In much of China, access to six to nine years of education is assured, and enrollment rates are high, with gross enrollment rates (GERs) at the primary level over 125 percent (GER is the number enrolled over the size of the relevant age group; it can therefore exceed 100% because of overage enrollment and repetition). The main development agendas are improved internal efficiency, greater quality, and higher levels of achievement. Legislation has been in place since the mid-1980s to universalize enrollment, and this has largely been achieved. In the poorest areas and among the national minorities, underenrollment, high dropout rates, and substantial repetition remain a problem, but one manageable with domestic resources. Sustained rates of economic growth and generally low population growth (though not in many national minority areas) should facilitate the extension of the educational franchise. What will be achieved in basic education will depend on the political will to spread social benefits of development to areas that lag behind the coastal provinces and developed parts of central China.

At the secondary level, enrollments will continue to grow rapidly, to the point where most students will complete the lower secondary level in the near future. This will substantially increase rural enrollments. Participation rates at upper secondary schools will continue to expand, and will probably retain an emphasis on technical and vocational education, where the challenge is to maintain relevance to employment and develop a consistent certification system. Tertiary-level enrollments are likely to grow substantially to meet demand from students. Tertiary institutions will be consolidated into fewer and larger institutions, and will progressively take more responsibility for their own funding. It is probable that a core of universities, perhaps twenty or so, will remain directly supported as national institutions, and a similar-sized group will retain provincial government support. Most of the others will move away from the control of specific ministries and will have to seek mixed sources of funding. At the upper secondary and tertiary levels, it can be expected that fee systems will provide a growing proportion of operating costs, and the number of self-financing students will continue to increase.

Competition for access to secondary *key schools* (schools with selective entry for the most able children, and which have additional resources and high-quality teachers) will intensify, as it will for entry to associated primary schools and to prestigious universities. Providing access in ways that are seen as equitable and socially efficient will be an important issue. In many respects, China will probably move towards patterns of participation and access found in several of the HPAEs, while retaining and developing a large range of educational delivery services using the media, adult study programs, and training related to the workplace.

During the early twenty-first century, China will experience the effects of rapid urbanization (which was already well advanced in 2000) and an aging population. The former will concentrate more and more educational services in towns and cities, and may exacerbate the problem of the relative neglect of educational development in rural areas. The aging population will ultimately cause the dependency ratio to rise (in this case, dependency ratio includes those over sixty-five), with possible consequences for the amounts available to subsidize public educational provision.

## The HPAEs

Among the high-performing Asian economies, economic growth has been strong, despite temporary setbacks in the late 1990s. Population growth rates are low and declining, enrollments are approaching universal levels at the primary and secondary levels, illiteracy only exists on the margins, and distribution of public expenditure is fairly even. At the primary and lower secondary levels, enrollments are likely to fall for demographic reasons, creating further opportunities to improve quality and enrich curricula offerings. Student-teacher ratios may continue to decline slowly, and at the primary level are likely to converge towards those at the secondary level. Private provision is likely to continue to grow, both in separate schools and in parallel systems providing complementary services. Preschool enrollments will increase rapidly (mostly outside state provision) as a result of available income continuing to rise, parental investments in schooling being concentrated on fewer children, and strong beliefs in the value of a head start in schooling.

At the secondary level, school facilities are often good and will continue to improve, especially in relation to access to new information technologies.

Skill-based and competency-linked curricula are likely to spread, and links with changing patterns of employment, especially the continued growth of the service sector, will have an impact on teaching and learning. Some of these countries appear to have low between-school variations in achievement, while in others the school attended seems to account for much of the variation in performance in particular subjects. Differences between schools may be expected to diminish as resource distribution ceases to be a major constraint and competitive pressures improve the performance of lower-achieving schools.

Competition for access to higher education is likely to intensify, though participation rates will increase to levels where a majority of the population experience some post-school periods of study and training. The competition will center on the most prestigious institutions at home and abroad. The tertiary sector as a whole is likely to become more diversified and accessible to a wide range of students, including those in midcareer and those in nontraditional fields of specialization. Cross-border flows of students will also increase both from HPAEs to richer countries and from other Asian countries to HPAEs. Private financing and mixed systems of support will develop where these are not already dominant, and where they are already substantial they will grow further. The integration of Hong Kong's education system into China may influence the rate of change in Chinese institutions, particularly at the tertiary level.

### **Middle- and Low-Income Countries**

In middle-income countries with industrialization already under way, several scenarios are possible. In Thailand and Indonesia, survival rates up until the fourth grade are high, and enrollment rates are approaching universal levels for all primary grades. Quality remains a problem, as does repetition and the number of dropouts. Uneven resource distribution remains a critical issue, and urbanization will result in more resources being needed for city and town schools. In these countries a demographic transition to low growth is already established, and universal access to a basic education cycle is achievable by 2020. Enrollment rates at the secondary level will increase, especially in Thailand and Indonesia, and it is here that the resource demands are likely to be largest. Malaysia will converge towards the educational characteristics of the HPAEs, with which it now has much in common. Higher education

growth will occur, especially in privately financed institutions, which already enroll large numbers in the Philippines, Indonesia, and Thailand.

Poorer Asian countries with a developing industrial base include Myanmar and Vietnam. Myanmar's development will be partly determined by the extent to which it adopts reforms similar to those in surrounding countries, which would lead to increased resources for education and higher participation rates. Vietnam is rapidly modernizing, and economic growth and industrialization are taking place. Secondary school participation rates will start to rise, and tertiary-level enrollment is likely to begin to grow rapidly.

The poorest agriculturally based countries confront the most difficult conditions. Basic educational infrastructure is impoverished, resources for growth are heavily constrained, and needs are greatest. School provision is predominantly rural, retention is poor, repetition is high, and illiteracy widespread. These fundamental realities will condition educational development (e.g., in Cambodia and Laos) and should focus attention on building basic delivery systems with reasonable coverage and quality. Expansion at higher levels that utilizes public funding should probably be deferred until greater proportions of the population acquire basic skills.

In most of the Pacific Islands, primary enrollment rates are high, except in Papua New Guinea, where there is some way to travel to reach universal access. Fiji stands out as having high levels of enrollment. There are problems associated with small populations in these countries, and most will continue to send students overseas for higher education. Migration will also affect demand in many of these states, and curriculum will remain dependent and derived from larger and richer metropolitan countries, many of which receive high levels of external support for education and have close links with larger countries that sponsor educational development and receive students and migrant labor.

### **Conclusion**

This short review has highlighted some of the main characteristics of education in East Asia and the Pacific Islands. It gives some of the flavor of the diversity of circumstances, current problems, and future developments. In particular, it distinguishes five broad groups of countries at different points in their development. The challenges these groups face are

somewhat different. However, across the region there is cause for optimism that educational participation will grow and become more equitable, quality will improve, and labor markets will benefit from more and more investment in the skills and competencies associated with education and training. This will be accelerated by governments that maintain stability, prioritize educational investment, judiciously take advantage of opportunities created by globalization, learn from the experience of the HPAEs, and capitalize on the special characteristics of each national system.

## EASTERN EUROPE AND CENTRAL ASIA

---

The Europe and Central Asia (ECA) region includes Central Europe (the Czech Republic, Hungary, Poland, and the Slovak Republic), Southeast Europe (Albania, Bulgaria, and Romania), the Baltic States (Estonia, Latvia, and Lithuania), the western Commonwealth of Independent States (Belarus, Moldova, Russia, and Ukraine), the Caucasus (Armenia, Azerbaijan, and the Republic of Georgia), former Yugoslavia (Slovenia, Croatia, Republic of Macedonia, Bosnia and Herzegovina, and the Federal Republic of Yugoslavia), and the Central Asian republics (Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan). In the early 1990s, the countries of the ECA began a transition from command economies to market economies. As the transition began, the countries had reason to take pride in their education systems. They had solved educational problems that still bedeviled several other regions of the world. Adult literacy was generally universal; participation and completion rates for children and youth of both genders were high at all levels of education; teachers came to work; students had textbooks; students in countries that participated in international assessments of mathematics and science performed well; school dropout rates and rates of grade repetition were low.

In the early 1990s, therefore, education seemed so secure that it could safely be ignored as countries

faced the staggering problems of collapsing economies, fragile democracies, unproductive state-owned enterprises, and rapidly increasing poverty. Within ten years that reality changed. ECA education systems joined the ranks of the deeply troubled sectors.

### **New Rules for Education in the ECA Region**

The rules for market economies and open political systems differ from those for command economies and authoritarian political systems. For example, the continuous changes characteristic of market economies and the ambiguities of a democracy require such skills as knowing how to learn, problem solving, and evaluating. Most ECA education systems, however, focus on memorized factual and procedural knowledge, which is adequate for the predictability of a planned economy and the dogma of authoritarianism but not for the volatility of a market economy or the choices required of citizens in democracies.

Analyses of the education systems of ECA identified five central problems:

- **Alignment:** Educational quality is contextual; it is not a constant under all conditions. ECA education systems that were a good fit with planned economies and authoritarian political systems do not fit well with open market economies and open political systems.
- **Fairness:** Education is an important mechanism for reducing and preventing poverty. Differences in children's learning opportunities are emerging in ECA countries at that very point in the region's history when skills and knowledge increasingly determine a family's poverty status.
- **Financing:** ECA countries need to realign the financing of their education systems with fiscal realities without jeopardizing the fairness and quality of educational services. Their failure to rationalize education finance is eroding the achievements of the pretransition period.
- **Efficiency:** Most ECA education systems use inputs inefficiently. These inefficiencies are the legacy of centrally planned economies, where prices and budgets did not affect allocation decisions.
- **Governance, management, and accountability:** Most ECA education systems do not perform well against standards of transparent and effective governance, efficient management, and vigorous accountability to a range of stakeholders.

The sector is still dominated by governments unchecked by private sector competition and participation of stakeholders.

These problems were found to apply at all levels of education, but they play out in different ways at each level.

### **The Economic Imperative**

Both economic and civic imperatives for ECA countries define how their education systems will have to adapt. In regard to the economic imperative, the region is undergoing three radical economic shifts: (1) from centrally planned to market economies; (2) from protected trade based on politics to global trade based on economic comparative advantage; and (3) from mass production to flexible, or customized, production.

**Market economy.** The implications of a market economy for education are significantly different from those of a planned economy, but they are fairly easy to see. In market economies wages reflect skills and knowledge; in planned economies, there is little relationship between the two.

**Globalization.** Integrating into the global economy imposes a discipline on domestic producers by increasing competition and clarifying comparative advantages. It is a stimulus for doing what producers have to do anyway in order to raise productivity, which is the key to higher wages and higher standards of living. Globalization, in conjunction with the flexible production of goods and services and expanded and cheaper communication and transport systems, gives customers more choice. Thus, moving into the global economy raises the standards for goods and services that suppliers have to meet. These higher standards prevail even within suppliers' domestic markets, because standards "leak" back and forth across national boundaries in the form of traded goods and services.

**Flexible production.** Moving from mass production to the flexible production of goods and services changes the opportunities and ultimately the basis for economic growth. Computerized technologies have revolutionized production by allowing both long and short production runs that can respond to niche or customized markets at the cost savings of mass production.

**Employer responses.** Globalization and flexible production have combined to change the profile of customer demand for manufactured goods, agricultural

products, and services. Customers have come to expect a large, varied, and continuously improving basket of goods and services, fast delivery of orders, high and consistent quality, and low prices. To meet these demands, employers have to change technologies and the organization of work. Mass production of goods and services depended on routinization and a hierarchical specialization of function, where most workers, even middle managers, were order takers. Workers were not expected to exercise judgment, initiative, or problem-solving skills, and most decisions were referred up the chain of command. This productive regime was predicated on slow rates of change that minimized the need for adult learning.

Under flexible production, however, employers broaden job descriptions to give each worker authority over more of the component tasks of production. Employers flatten organizational hierarchies and introduce job rotation and team-based work. These changes save the time lost by referring decisions up and down organizational ladders; they reduce middle management and supervisory jobs. The jobs of less-skilled workers begin to incorporate some of the supervisory, planning, repair, maintenance, and quality-control functions previously reserved for managers or specialists.

**Worker skills required.** In this context workers need solid literacy or information-processing and interpretive skills, better problem-solving skills, better knowing-how-to-learn skills, and greater initiative. Advanced economies confront increasing unemployment rates and falling wages for those with low educational qualifications.

**Status of ECA countries.** Evidence from the Organisation for Economic Co-operation and Development (OECD) International Adult Literacy Survey (IALS) suggests that the region's education systems are a poor fit with modern economies. Four ECA countries—Hungary, Slovenia, Poland, and the Czech Republic—have participated in the IALS. Of these four, three—Hungary, Slovenia, and Poland—seriously lag OECD countries in the information-processing and interpretive skills that modern economies require of their citizens.

A comparison of the IALS data for the low-performing ECA countries with those for the strong ECA performer (the Czech Republic) and with participating OECD countries tells an important story. First of all, in Hungary, Slovenia, and Poland, very high percentages of workers aged sixteen to sixty-

five tested at levels one and two on the prose, document, and quantitative scales, with about 75 percent of the workers in each of the three countries testing below level three on the prose scale. Scores at or above level three predict the ability of a person to function in a modern workplace.

The differences between the tested skills of adults in Hungary, Poland, and Slovenia and those of Czech adults and adults in participating OECD countries cannot be attributed to the *quantity* of education that low-performing ECA populations complete.

The performances of those still in, or recently graduated from, school reflect most pertinently on the quality of their country's education system. Substantially higher percentages of twenty- to twenty-five-year-olds in Hungary, Poland, and Slovenia tested at lower literacy levels than those of the same age group in the Czech Republic and participating OECD countries, indicating that education systems of the transition countries are not producing the skills that new entrants into the workplace will need as these workplaces modernize.

Multivariate analyses show that parental socioeconomic status has a significantly greater effect on scores in the three low-performing ECA countries than in the Czech Republic and OECD countries. Apparently, education policy in these three ECA countries is not designed to minimize the effect of parental background and may operate to reinforce it via mechanisms such as early tracking.

### The Civic Imperative

For decades ECA countries were ruled by authoritarian regimes that controlled their populations through fear and the deliberate creation and manipulation of distrust. In the posttransition era, ECA schools can be important weapons for socializing children to the rights and obligations of citizenship and for developing the trust among groups that leads to a willingness to cooperate across the boundaries that normally divides the groups (e.g., clan, ethnic or religious membership)—provided that the political context supports these values.

### Increasing Inequality in Education

In the pretransition period learning opportunities were inequitable, but given the region's wage compression (the lack of variation in wages), unequal access to education had little effect on family income.

Unequal learning opportunities matter more in ECA countries in the early twenty-first century because education matters more. Skills and knowledge affect individuals' earnings, unemployment probabilities, and likelihood of receiving wage-enhancing training from employers. Because the education acquired by parents affects that acquired by their children, lower levels of education in one generation can ignite intergenerational cycles of poverty through the intergenerational transmission of lower levels of skills and knowledge.

Statistical relationships are emerging in the ECA region between educational attainment and such outcomes as employment status, wage level, and poverty. Figures from 1993 to 1998 show that households whose heads had completed only basic education were 20 to 80 percent more likely to be poor than the average household.

**Declining enrollment rates.** Enrollment rates, the best available measure of learning opportunities in ECA countries, are declining at all levels except at the tertiary level (see Table 1). These enrollment rates indicate that a larger number of young people are building fewer skills and less knowledge and a smaller number are building more. Calculations show a decline in the number of years of full-time education (excluding preschool) that the average six-year-old child in the ECA region can expect to achieve over her lifetime. In 1989 the average full-time school expectancy was 11.2 years; by 1997 it had declined to 10.6 years. In contrast, the average full-time school expectancy for OECD countries in 1998 was 15.4 years.

The secondary vocational/technical track accounts for enrollment losses at the secondary level. Enrollment declines at this level signal emerging educational inequalities of particular significance because a solid upper-secondary education increases the chances of acquiring the skills required in modern workplaces.

**Relationships between enrollment rates and family income and education costs.** Results of poverty assessments show that youth from poorer and less well-educated families in the ECA region are likely to leave school before completing basic education or at the time of its completion. Because students from poorer families tend to select the technical/vocational track, losses out of upper-secondary education are concentrated among poorer families. As a result, upper-secondary enrollments are becoming increasingly biased in favor of the nonpoor.

**TABLE 1**
**Gross enrollment rates in Europe and Central Asia by level of education, 1989–1997**

Level of Education	Year	
	1989	1997
Preschool	51.4	41.0
Basic	94.4	90.6
Upper secondary	71.4	61.3
Academic	26.2	27.4
Vocational/technical	45.2	33.8
Tertiary	13.1	17.8
<b>Expected years of education completed</b>	<b>11.2</b>	<b>10.6</b>

SOURCE: Based on data from World Bank, 2000. *Making Transition Work for Everyone: Poverty and Inequality in Europe and Central Asia*. Washington, DC: World Bank, Europe and Central Asia Region, Human Development Sector Unit.

ECA countries have substantial poverty overall, and income inequality is growing as a predictable and inevitable consequence of the shift to market economies where demand, not central wage-setting, determines the price for labor. Greater income inequality translates into less-equal abilities to pay the costs of education. Early studies indicate that education is costing families more than before the transition, although costs vary by country and among jurisdictions within countries. These studies also show that poor families are paying a higher percentage of per capita consumption for education than nonpoor families. Not surprisingly, the countries and jurisdictions that are under the greatest fiscal pressures are shifting costs to families more than those that are less fiscally constrained. Unfortunately, it is just these countries and jurisdictions that tend to have higher levels of family poverty.

**Problems Stemming from the Financing Structure**

Since the transition, the education systems in many ECA countries have been experiencing serious fiscal constraints that will almost certainly persist for the foreseeable future. Governments have yet to reconcile their education sectors with fiscal realities without jeopardizing education outcomes and fairness of educational opportunities.

The resource imbalance in the sector stems from three causes: (1) macroeconomic declines have reduced total public funds available for education; (2) the removal of subsidies and price distortions has led

to market-based pricing for inputs, particularly for energy; and (3) major inefficiencies inherited from the pretransition period are pervasive in the sector, a problem discussed in the efficiency section below.

Following the disintegration of the Soviet Union, macroeconomic conditions deteriorated dramatically in all ECA countries. Most countries in Central Europe and the Baltics have subsequently recovered, but the rest of the region continues to face macroeconomic decline or stagnation. Countries experiencing declines in gross domestic product (GDP) have tended to react by reducing public spending on education even more rapidly, causing not only an absolute decline but also a decline in the ratio of public education spending to GDP.

**How have education sectors reacted to budget pressures?** ECA governments and local education authorities have not yet adjusted effectively to reduced funding (in some cases) or to increased prices (in all cases). Instead, they have tended to take temporary measures that only paper over fiscal shortfalls and that tend to delay genuine adjustment. Such temporary measures, which increase the eventual costs of adjustment and undermine education outcomes and fairness, include:

- continuing to defer building maintenance, thereby borrowing from the future at exorbitant interest rates because it will cost much more to rehabilitate schools in the future than it would to repair them in the present
- cutting the purchase of teaching materials and equipment
- saving on heating bills by closing schools
- allowing teachers' wage rates to fall relative to other wages
- shifting financing responsibilities to local governments that lack adequate taxing authorities to pay schooling costs
- running up arrears in energy bills and teacher wages
- shifting costs of education to families

### **The Command Economies' Legacy of Inefficiency**

Depending on the country, ECA countries may consume at least double the resources employed per basic and secondary student in the West. The most egregious examples of the inefficient use of resources are space norms per student, utility consumption,

and labor inputs. Many of the inefficiencies are a legacy of pretransition economies when planners, not market forces, determined wages, subsidies, and prices. There were no mechanisms for determining the total costs of anything and therefore no incentives to contain costs.

Schools in the ECA region were not built to conserve energy and consume, on average, between two and three times as much energy as modern school buildings in OECD countries. For example, the average Danish school consumes about 100 kilowatt-hours per square meter per year, in contrast to Latvia's typical 285 kilowatt-hours per square meter per year. Now that energy is being priced at market levels, the percentage of education budgets devoted to energy has increased from less than 5 percent to between 25 and 40 percent, depending on the severity of the climate.

Staffing norms inherited from the pretransition period mean that the proportion of teachers to students is two or three times as great as in OECD countries. Low at the start of the transition, student/teacher ratios worsened over the next decade for most ECA countries. The ECA practice of using single-subject teachers after the primary grades fuels labor inefficiencies, given that highly specialized resources of any kind are more difficult to allocate efficiently. Although data on nonteaching staff are not generally available, limited data hint at further inefficiencies in the countries that had comprised the Soviet Union. For example, in 1999 Moldova had a ratio for all levels of education of 1.35 nonteaching staff to one teacher.

Total fertility rates for all ECA countries declined dramatically between 1989 and 1997, falling from 2.1 to 1.3 children per family in all ECA countries except Albania and the Central Asian republics. Thus, at least in the short- to medium term, ECA education systems are sized for more children than will be going through them, adding to the need to downsize inputs.

### **Failures in Governance, Management, and Accountability**

Because the state takes actions in education on behalf of its citizens and taxpayers, it must respond to questions about how well it represents their interests. Is the education sector doing the right things? Is it doing the right things right? What mechanisms do stakeholders have to hold the state accountable for its actions?

The answers to these questions lie in the sector's arrangements for governance, management, and accountability. Unfortunately, ECA education systems tend to fail spectacularly on these three key dimensions. Improving these functions seems to be absolutely essential for straightening out other problems of the sector.

**Governance—goal setting and monitoring.** Major changes in context, such as ECA countries are experiencing, normally force countries to rethink and debate goals for their education systems. The discussion in the ECA region is not well focused, however, and only the most progressive countries in the region have moved toward goals that are practical rather than focusing on vague ideals.

**Management.** Countries can vary in how they distribute responsibilities and powers among levels of government and still secure reasonably efficient service. In the ECA region's education sector, however, the responsibilities of management tend to be allocated to different levels of government in ways that are contradictory, unclear, or duplicated within or between levels; the responsibilities are often misaligned with the availability of resources, or they may be missing altogether. For example, even in centralized education systems, ministers often do not perform functions that should be centralized, such as leading improvement efforts, setting learning standards and ensuring educational quality, monitoring performance, and ensuring educational fairness.

Even where functions and decision-making powers are complete and sensibly allocated among levels of government, functions may be performed well or poorly. In the ECA region, the performance of functions in the education sector falls woefully short of good international practice.

**Accountability.** The key to accountability in education is a checks-and-balances relationship among the interests of three groups: the public sector (government and professional educators), the private sector, and the civic society (taxpayers, users, and beneficiaries). Each of these three actors plays according to different rules. The public sector uses rules and standards to establish the framework for service delivery; the private sector uses competition and choice; and the civic society uses participation or "voice."

Analyses show that the state cannot be trusted to supply educational goods and services efficiently

without the competitive checks of markets or the exercise of voice by beneficiaries. These same studies, however, also show that efficiency and responsiveness decline if any one of these players dominates. Mechanisms for strengthening accountability carry their own distortions. Thus, it is the checks and balances among the three mechanisms that result in the most efficient and responsive provision of services.

In ECA the state dominates the sector. Competition in the form of private provision and contracting out of services is still in its infancy. Voice is a very weak reed in the region. Several ECA countries impose legal or political constraints on mechanisms for expressing voice—such as constraints on the press.

SUE BERRYMAN

## ECONOMIC BENEFITS OF EDUCATION INVESTMENT, MEASUREMENT

---

The concept of the rate of return on investment in education is very similar to that for any other investment. It is a summary of the costs and benefits of the investment incurred at different points in time, and it is expressed in an annual (percentage) yield, similar to that quoted for savings accounts or government bonds.

Returns on investment in education based on human capital theory have been estimated since the late 1950s. Human capital theory puts forward the concept that investments in education increase future productivity. There have been thousands of estimates, from a wide variety of countries; some based on studies done over time and some based on new econometric techniques. All reaffirm the importance of human capital theory.

The rise in earnings inequality, and the subsequent increase in the returns on schooling experienced during the 1980s and 1990s in many countries, led to renewed interest in estimates of returns on educational investment. The literature suggests that systematic changes in the production process brought about by changes in technology and the

growth of the knowledge-based economy whereby product cycles become shorter and flexibility is needed, led to changes in the demand for skilled labor.

### An Illustration

For illustrative purposes, assume that an eighteen-year-old secondary-school graduate is driven only by monetary considerations in deciding whether or not to invest in a four-year university degree. Such a student will have to contemplate and compare the costs and benefits associated with going to college. The cost per year for tuition and other related expenses (\$10,000 in this hypothetical case) is the *direct cost*. In addition, the student will incur an indirect (or opportunity) cost because he or she will not be able to work while attending college. This cost is approximated by what the average student with a secondary school diploma earns in the labor market, perhaps \$20,000 per year. On the benefits side, the student expects to be making, on average, approximately \$15,000 more than a secondary school graduate over his or her lifetime after graduating from college.

A rough way to summarize the above costs and benefits is to divide the annual benefit of \$15,000 by the lump-sum cost of \$120,000, yielding a 12.5 percent rate of return on investment in education. The logic of this calculation is similar to that of buying a \$120,000 bond giving an annual coupon of \$15,000. The yield of the bond is 12.5 percent.

### Private Versus Social Costs

A very important distinction in rate of return calculations is whether one evaluates the private cost or the social cost of an education. The example given above refers to a private rate of return, where the costs are what the individual actually pays in order to receive an education. A social rate of return calculation includes, on the cost side, the full resource cost of one's education. That is, it includes not only what the individual pays, but also what it really costs society to educate one person. In most countries education is heavily subsidized, so the social cost is much higher than the private cost. The social rate of return, therefore, is typically less than the corresponding private rate of return.

Beyond the above monetary calculations used to arrive at a private rate of return, the social rate of return should ideally include the externalities associated with education. This is, of course, extremely difficult to measure, and the issue of externalities has

remained a qualification accompanying rate of return estimates—in the sense that such rates, as conventionally computed on the basis of monetary earnings and costs, must underestimate the true social return on investment in education.

The earnings of educated individuals do not reflect the external benefits that affect society as a whole. Such benefits are known as *externalities* or *spillover benefits*, since they spill over to other members of the community. They are often hard to identify and even harder to measure. In the case of education, some studies have succeeded in identifying positive externalities, but few have been able to quantify them. If one could include externalities, then social rates of return might well be higher than private rates of return on education.

### Empirical Findings

Typically, returns on educational investment are higher at lower levels of schooling and also higher for countries at lower levels of economic development. The scarcity of human capital in low-income countries provides a significant premium to investing in education. The high returns on primary education provide an added justification for making education a priority in developing countries.

In low-income countries, the returns are high, as can be seen in Table 1, which presents an illustrative summary of typical rates of return. Estimates of rates of return over a range of country types show the usual pattern most researchers find. For low-income countries, rates of return can be as high as 12 percent or more. In middle-income countries similar estimates can be found. In many eastern European transition economies, returns are relatively low, but rising. In high-income countries, rates of return on education tend to be lower than in lower-income countries. However, during the 1980s and 1990s returns on schooling increased in these countries, especially in the United States.

Private rates of return are higher than social returns. This is because of the public subsidization of education and the fact that typical social rate of return estimates are not able to include social benefits. Nevertheless, the degree of public subsidization increases with the level of education, which has regressive policy implications. Illustrative rates of return for a variety of countries are shown in Table 2. Higher education remains a profitable investment for individuals in high-income countries, as repre-

sented by the private rate of return. There is an even greater private incentive to invest in education in middle- and low-income countries. In these countries the social returns on education are particularly high, signaling a priority investment for society.

Overall, women receive higher returns on their schooling investments, though the returns on primary education are much higher for men (20%) than for women (13%). Women experience higher returns on secondary education (18% versus 14%, respectively).

The highest returns on a per-country basis are recorded for low- and middle-income countries. Overall, the average rate of return on another year of schooling is about 10 percent. From 1990 to 2002, average returns on schooling have declined by 0.6 percent. At the same time, average schooling levels have increased. Therefore (and according to human capital theory), everything else being the same, an increase in the supply of education has led to a slight decrease in the returns on schooling. That is, if there are no “shocks,”—such as changes in technology—that increase the demand for schooling, then an increase in overall school levels should lead to a decrease in the returns of schooling. Over the recent decades the returns to schooling have declined in many low income countries, while the technological revolution has increased demand for skilled labor in developed countries and the returns to schooling have increased.

### Estimation Issues

Ideally, a rate of return on investment in education should be based on a representative sample of a country’s population. But in reality this is the exception rather than the rule. It is problematic when the estimated rates of return are based on a survey of firms (rather than households), because firm-based samples are highly selective. In order to control survey costs, such samples focus on large firms with many employees. Second, the questionnaire is typically filled out by the payroll department rather than by the individual employee. This approach leads to the use of samples concentrated only in urban areas.

Another problem occurs when rate-of-return estimates are based on samples that include civil servants, since public-sector wages, in most cases, do not reflect market wages. Of course, in many countries (although fewer than in the past) the majority of graduates end up in public-sector employment.

The concentration of graduates in public-sector employment is identified as a problem in major growth studies. However, rate-of-return estimates based on civil-service pay are useful in private calculations regarding the incentives set by the state to invest in education.

A less serious problem occurs when wage effects are confused for returns on investment. Jacob Mincer has provided a great service and convenience in estimating returns on educational investment by means of the well-known earnings function he first put forward that explains differences in earnings among individuals according to their differences in schooling attainments and work experience.

Another methodological limitation is that many researchers feel obliged to include in the regression whatever independent variables they seem to have in the data set, including occupation. In effect, this procedure leads to those other variables taking away a significant part of the effect of education on earnings that comes from occupational mobility.

Perhaps the returns on education estimates that stem from the work of Ashenfelter and colleagues using twins, and other natural experiments, are the most reliable of all. According to this work, the overall private rate of return on investment in education in the United States is of the order of 10 percent, and this figure establishes a benchmark for what the social rate of return would be (a couple of percentage points lower, if not adjusted for externalities), or what the rate of return should be in a country with a lower per capita income than the United States (several percentage points higher, as based on the extrapolation of the noncomparable returns on education presented earlier).

### Extensions

More research on the social benefits of schooling is needed. For developing countries, there is a need for more evidence on the impact of education on earnings using a quasi-experimental design—for example, looking at the earnings of different groups, say those exposed to a special training program and those who are not; or children who received early interventions such as nutrition and those who did not. There are more opportunities in the early twenty-first century for this type of research. Moreover, this research needs to be used to create programs that promote investment and reform financing mechanisms.

**TABLE 1**

**The overall private rate of return on investment in education**

Type of country	Country	Rate of return (percent)
Low-income countries	Ghana	9.7
	India	10.6
	Indonesia	7.0
	Nicaragua	12.1
Middle-income countries	Bolivia	10.7
	China	12.2
	Poland	7.0
	Venezuela	9.4
High-income countries	Denmark	4.5
	Finland	8.2
	Netherlands	6.4
	United States	10.0

SOURCE: Based on Psacharopoulos, George, and Patrinos, Harry Anthony. 2002. *Returns on Investment in Education: A Further Update*. Washington, DC: World Bank.

There is a concern in the literature with social rates of return that include true social benefits, or externalities. Efforts to make such estimates are numerous, but the estimates vary widely. If one could include externalities, then social rates of return may well be higher than private rates. Richard Venniker's 2000 review found that empirical evidence is scarce and inconclusive, providing some support for human capital externalities (though this support is not very strong and has been disputed). These studies estimate externalities in the form of an individual's human capital enhancing the productivity of other factors of production through channels that are not internalized by the individual (similar to Lucas's 1998 theory). As Venniker states, the evidence is not unambiguous. In fact, some estimates give negative values, while others give very high estimates.

A few studies in Africa have focused on estimating external benefits of education in agriculture using the education of neighboring farmers. A one-year rise in the average primary schooling of neighboring farmers is associated with a 4.3 percent rise in output, compared to a 2.8 percent effect of one's own primary education in Uganda. Another study found that neighboring farmers' education raises productivity by 56 percent, while one's own education raises productivity by only 2 percent in Ethiopia; however, the 56 percent figure seems rather high. Overall, the results are inconclusive.

TABLE 2

## Rate of return on education by level, type, and country, in percent

Income level	Country	Year	Private			Social		
			Primary	Secondary	Higher	Primary	Secondary	Higher
High-income	Greece	1993		8.3	8.1		6.5	5.7
	New Zealand	1991		13.8	11.9		12.4	9.5
Middle-income	Bolivia	1990	20.0	6.0	19.0	13.0	6.0	13.0
	China	1993	18.0	13.4	15.1	14.4	12.9	11.3
	Mexico	1992	18.9	20.1	15.7	11.8	14.6	11.1
Low-income	Ethiopia	1996	24.7	24.2	26.6	14.9	14.4	11.9
	Nepal	1999	16.6	8.5	12.0	15.7	8.1	9.1

SOURCE: Based on Psacharopoulos, George, and Patrinos, Harry Anthony. 2002. *Returns on Investment in Education: A Further Update*. Washington, DC: World Bank.

Not only has the academic literature on returns on schooling increased, both in quantity and quality, but the policy implications have changed as well. Returns on education are no longer seen as prescriptive, but rather as indicators, suggesting areas of concentration. A good example is the impact of technology on wage differentials, which has led to a huge literature on changing wage structures.

At the same time, the importance of returns on education is seen in their adoption as a key indicator by the Organisation for Economic Co-operation and Development (OECD) in their annual *Education at a Glance* series and other policy documents. Increasingly, governments and other agencies are funding studies of returns on education, along with other research, to guide macro-policy decisions about the organization and financing of education reforms. This was the case in the United Kingdom higher education reforms as well as the Australian higher-education financing reforms.

Innovative use of rate-of-return studies is being used to both set overall policy guidelines and to evaluate specific programs. Examples include the Indonesia school building program, India's Operation Blackboard project, and Ethiopia's major sector investment program.

Above all, returns on investment in education are a useful indicator of the productivity of education, and they serve as an incentive for individuals to invest in their own human capital. As such, they can play an important role in the design of policies and the crafting of incentives that both promote investment and ensure that low-income families make an investment in education.

## EDUCATIONAL ACCOUNTABILITY

Accountability has been an educational issue for as long as people have had to pay for and govern schools. The term covers a diverse array of means by which some broad entity requires some providers of education to give an account of their work and holds them responsible for their performance. These means include, among others:

- "performance by results" schemes used by the English school system in the nineteenth century, and later variations on the theme of merit pay;
- the American pattern of a school board held accountable through a local election, with the school board in turn holding a superintendent and district staff accountable;
- marketizing education through charter schools, vouchers, and the Dutch practice of using the same system for funding what Americans would call both public and private schools;
- the school inspections used in many European countries; and
- the recent rise of state testing of students in which test results are sometimes, but not always, linked to rewards or punishments for students or school staffs.

According to a 1999 article written by Jacob E. Adams and Michael W. Kirst, what these and other examples have in common is a relationship in which a "principal" holds an "agent" responsible for certain kinds of performance. The agent is expected to provide an "account" to the principal. This account describes the performance for which that agent is held responsible. It may be simply descriptive—such as the percent of children in a school passing a particular test—or it may also include an explanation for and/or a justification of the performance achieved. Often the principal sets standards for what constitutes adequate performance. The principal may reward the agent for performance that exceeds the standard or punish the agent for below standard work.

Many ideas about accountability come from the business world and are developed in the fields of economics and political science. Attention paid to accountability waxes and wanes. While it never disappears, it often receives more attention in periods of conservative ascendance. This article briefly describes six approaches to educational accountability: moral, professional, bureaucratic, political, market, and legal. These are described singly, although in practice they are usually combined. It then examines one legal strategy that has received a great deal of attention in the United States: the use of state standards and assessment to promote student, school, and district accountability. Finally, it comments on the interaction among different accountability approaches.

### **Moral and Professional Accountability**

The principal has the least control with moral accountability where the agent's actions depend largely on an internalized obligation, reinforced with a personal sense of remorse or potential social ostracism if the obligation is not met.

Professional accountability also provides the agent with a high degree of autonomy. This form operates on the assumption that the agent on the spot—typically a teacher—has special knowledge either of general principles or of the specific situation. Either way, it is difficult for the principal to specify actions or outcomes in great detail, so the agent has a great deal of discretion. On the other hand, before taking a position, the agent must demonstrate that he or she has the required competence, values, and knowledge by taking a prescribed course of study and/or passing specialized certification examinations. Thus, the primary point of control is more at entry to the profession or the specific position rather than over performance across time. Newer developments related to professional accountability include stronger state licensure requirements and the introduction of new assessments of initial competence. These, however, are usually introduced using the authority of the state, so professional and legal accountability intertwine. The National Board for Professional Teaching Standards, with its advanced certification for experienced teachers, tight connections to the field of teaching, and relatively loose ties to government, is closer to the form of professionally guided licensure found in other fields.

In addition, peer review can provide further oversight for the professional. The individual teacher

offers evidence of practice that is reviewed by colleagues to ensure that it meets professional standards. These standards usually refer to the use of appropriate procedures and materials, recognizing that the outcome is usually a joint product of both the teacher and the student. The difficulty with peer review is the tendency for professionals to protect their own. This is especially problematic in education where teaching is usually practiced in isolation. Nevertheless, studies of the formation of professional communities in schools have shown that, under special conditions, teachers can band together to enforce shared and challenging standards and help colleagues improve their practice.

### **Bureaucratic Accountability**

Bureaucratic accountability is based on the superior-subordinate relationship and depends upon the formal definition of the responsibilities of positions within an organization. An educational example might be the relationship between a superintendent and a principal. Where bureaucratic accountability dominates, the superior assigns tasks to subordinates. Rules and procedures for doing the work are specified in advance, and criteria for good performance are established. The supervisor then observes the process and evaluates both the process and the results.

Formal authority alone may be used to enforce compliance, but that authority can be reinforced with incentives that are linked to performance as judged by the superior. These incentives might include promotions, salary increases, and removal from a position. Such incentives work best when agents are held accountable for work processes that are relatively easy to specify in procedures—such as teaching certain content that can be specified in a written curriculum—and that are observable by supervisors. Incentives are more difficult to use when the work is unpredictable and uncertain. There have been several efforts to increase bureaucratic authority through various forms of merit pay and related approaches. While such experimentation continues, for the most part American education has stayed with salary systems that reward experience and formal education and provide few means for superiors to reward subordinates. A major reason for the difficulty in adopting such systems has been the inability to design ones that teachers believe fairly reflect their work rather than reflecting the capricious judgments on the part of higher administrators.

## Political Accountability

Political accountability in its purest form is between an elected official—such as a school board member—and the voters. As with professional accountability, the performances expected can be quite variable and hard to specify. They may include curriculum taught, the level of spending on education, or special treatment for a constituent's children. They may also change radically over time so that what the voters want at one point, they reject at another. Political accountability facilitates the lobbying of elected officials to ensure that they act on one's preferences, and it may include rewarding them by helping them get reelected. Political accountability extends to officers appointed (more or less directly) by elected representatives, especially superintendents appointed by elected school boards.

Historically, American schools have primarily used a mix of political, bureaucratic, and professional accountability. The elected school board set policy and appointed the superintendent, who held the highest position in the formal bureaucracy. Still, teachers had considerable autonomy to choose instructional methods, even if licensure standards were rarely challenging and peer accountability was the exception, not the rule.

This older system remains in place in the early twenty-first century, although it has undergone changes as some forms of site-based management have shifted the balance between bureaucratic and political accountability as well as accountability to local principals from more central ones. New approaches to teacher licensure have also increased professional accountability. The major developments, however, have been the extension of two forms of accountability that historically played a lesser role in education: market and legal accountability.

## Market Accountability

With market accountability, children or parents are customers who choose schools and can shop for the one that best reflects their preferences. The discipline of competition ensures that educators respond to parent and student preferences. Market accountability has become more popular as confidence in government has waned and the public questions the costs of public provision of services. It is especially prescribed where schools have become excessively bureaucratized, politically nonresponsive, and un-

willing or unable to improve their performance. American cities appear to be a ripe target for marketization because performance is so poor and improvement so slow.

The United States has always provided a small measure of choice through private and parochial schools operating alongside the public schools as well as through the housing market that allows some Americans to choose their schools. Recently, there has been a strong upsurge in interest in two new developments. One is charter schools, which are state funded but started by individuals or groups outside the public system and which then compete with public schools for students (and funding). The other is vouchers whereby tax receipts go to schools indirectly. Fixed amounts are given to parents who then use state funds (sometimes supplemented with their own money) to select the school their child will attend. In other countries, the public-private distinction is more muted or, as in New Zealand, parents are given total freedom of choice of which public school their children will attend.

Many claims have been made for various privatization approaches. It is said that they will be more efficient, increase variation in the kind of education delivered, raise test scores, increase equity, and, through competition, promote improvement of regular public schools. In most cases, it is difficult to tell what the effects of market accountability are. For instance, there have been few well-designed studies clarifying the effects of choice on achievement, at least in the American context, and those that have been conducted are much disputed. There is little evidence to suggest that competition is changing public schools in the United States, perhaps because competition is still so limited. On the other hand, there is evidence that choice programs are inequitable. The clientele of such programs tends to be more white and better off, and there tend to be fewer children with the more severe handicaps attending such schools. This is true even when schools of choice must use lotteries and other systems that preclude selecting more advantaged students and when whole countries have gone to choice systems.

## Legal Accountability

Legal accountability occurs when the principal formulates rules and monitors and enforces the agent's compliance with those rules. It differs from bureaucratic accountability where the rules are formulated within an organization in that the principal is usually

one level of government, such as the federal or state government, formulating rules for organizations at a lower level. Rules are usually formulated by legislatures but can be elaborated through executive regulation and formulated *de novo* (over again) by both the executive branch and the courts. Legal accountability often works in conjunction with professional, political, and bureaucratic accountability by establishing the broad framework within which they operate.

Legal accountability structures the inputs and resources teachers receive through funding formulas and teacher licensure regulations. The former have been highly contested and the source of a great deal of school finance litigation. The latter is a central pillar of professional accountability. Legal accountability also defines the structures and processes through which education is delivered by defining forms of governance—for instance, school boards and local control—attendance policies, desegregation orders, and building codes.

What has been new since the 1970s has been the use of legal accountability to specify, monitor, and improve the outcomes of education. Historically, states have specified outcomes indirectly by defining high school graduation requirements. Beginning in the 1970s and more often since the early 1980s, however, state governments took stronger steps. At first, these focused on testing students and increasing high school graduation requirements. More recently, there has been more emphasis on setting standards and assessing performance in light of those standards. By now, almost every American state and many foreign countries take these two linked steps. Because this approach has become so pervasive, it deserves special attention.

### Standards and Assessment

A system of state standards might include the following elements:

- Content standards that set out the knowledge and skills children are expected to develop,
- Tests or assessments aligned with those content standards,
- Student performance standards that define proficient performance in terms of those assessments, and
- Rewards provided to students or schools that meet or exceed the standards and punishments or remediation activities for those that do not.

A strong system would have all four elements. The theory of action behind such a system is that the formal sanctions linked to meeting standards motivate educators and students to learn what is tested. A weak system would certainly not have the last two elements and might not have the first—many states began testing without any guidance from standards. The theory then is that the publication of test scores will motivate improvement either by appealing to professional pride or indirectly to the public, which will use political accountability to promote improvement.

While the theory is clear enough at a general level, states face difficult design issues with both technical and political dimensions related to each element of the accountability system. In practice, the politics of state standards and assessment has led to rapid, dramatic changes in state tests and related policies. Each element listed above has been problematic in some instances. For instance, content standards have become a source of frequent disputes. In science, whether or not to teach evolution has been an issue from the Scopes trial to the 1999 deliberations of the Kansas school board. Even more seemingly neutral subjects have been cause for great debate. For instance, while the National Council of Teachers of Mathematics has urged states to develop standards that focus on exploring mathematical ideas, logical reasoning, and the ability to solve non-routine problems, many people still want state standards to require memorizing mathematical facts and procedures.

The design of tests has created other problems. In the 1970s states relied primarily on multiple-choice tests, which were familiar (thereby ensuring a certain legitimacy), inexpensive, and could obtain reliable scores relatively inexpensively. During the 1990s there was a push for portfolios and performance assessments where students constructed the responses. Such assessments were viewed as more valid measures of higher standards and better guidance, and were believed to encourage teachers to adopt more challenging instructional approaches. It now appears that while performance assessments have many advantages for improving instruction, they often lack the economy and reliability required for public accountability.

Other issues relate to performance standards, including whether and how to take into account the well-known correlation between family background and performance when measuring school perfor-

mance, whether to develop standards for absolute performance or improvement and—if the latter—how to measure improvement, and whether to use norm-referenced (comparison to some larger group) or criterion-referenced (comparison to an absolute level of performance) standards of performance. Developing criterion-referenced standards has been the subject of much research, but a great deal of art is still involved.

Another major issue concerns the usefulness of rewards and punishments. The theory of action behind accountability systems is that the challenge for the principal is to motivate the agent to perform in ways the principal prefers. A criticism of this theory as it applies to state assessment systems is that strong sanctions, also referred to as high stakes, will lead to “teaching to the test.” This term refers to a wide range of behaviors from adjusting the curriculum to ensure that topics tested are taught before the test is given, to cheating. The term implies that something is done to raise test scores without necessarily increasing students’ knowledge of the subject tested. Moreover, critics argue that more challenging forms of instruction are less likely to be adopted in high-stakes settings.

An alternative theory for improving teaching and learning in schools is that the major problem is a lack of capacity—that is, the knowledge, skills, funding, and other resources needed to perform in effective ways. Numerous capacities are needed to raise test scores by improving student knowledge. These include understanding the content taught and effective ways to teach it, the ability to analyze tests and know what performances are really called for, and the collective capacity of members of the target school in question to work together to improve itself. Even a weak accountability system can make teachers aware of the need to change practice and provide general guidance about the kinds of changes preferred. Without appropriate internal capacity or capacity-building efforts, however, movement toward more challenging instruction is not likely.

A number of studies have recently pointed to the need to align internal and external accountability. These studies suggest that schools with reasonably strong cultures develop their own internal accountability often based on peer professional accountability. Such cultures can provide strong support for improvement because they combine motivational and capacity-building efforts. Where internal and external accountability are mutually re-

inforcing, it appears that change is powerfully supported. Where the two are not aligned, internal accountability is likely to overwhelm external accountability or external accountability may undermine local capacity.

### Coordinating Accountability Mechanisms

For all of the difficulty in designing and implementing individual accountability mechanisms, policy analysts recognize that educators face a variety of interacting mechanisms. The American educational system is highly fragmented, with authority dispersed between political and professional organizations and across local, state, and federal levels of government. Consensus on what constitutes effective education and who should be educated are difficult to achieve.

Moreover, educators are accountable to multiple constituencies. The research on internal accountability illustrates how professional accountability may reinforce or work against state assessment systems. Other work suggests that the public may not understand or support state standards and assessment. When they do not, they may protest at the state level, or local school boards may not give top priority to achieving high standards, thus undermining efforts to achieve them.

In sum, educators and policy analysts will always be concerned about educational accountability. It is hard to imagine an educational system where educators are not accountable to multiple constituencies through a variety of mechanisms. This means that educators will be accountable to different people for different things. It is becoming more and more important to design accountability mechanisms that encourage schools to provide a more effective education for all children and to orchestrate these mechanisms so that they send as consistent a message to educators as possible.

## EDUCATIONAL BROADCASTING, FEDERAL SUPPORT

The U.S. federal government has always had a strong interest in broadcasting, but its relationship with the broadcasting industry was not formalized until the enactment of the Communications Act of 1934. The primary objective of this legislation was to clearly and officially assert federal, rather than private, control over all channels of interstate and international communications by wire and radio in the United States. The act created the Federal Communications Commission (FCC), and within a broad range of regulatory power, this body was authorized to grant licenses to eligible persons and organizations for limited periods of time to operate radio (and by subsequent interpretation, television) stations "in the public interest, convenience, and necessity."

Radio, even from its earliest days, incorporated educational and instructional materials in its programming. Nevertheless, both radio and television broadcasting was mainly a commercial endeavor through the 1940s. The first significant action to spur educational television broadcasting on a national level came in 1952 when the FCC, revising its table of frequency allocations, set aside 242 channels for the exclusive use of noncommercial educational television (ETV). FCC actions in 1961 and 1966 increased this number to 329.

The University of Houston became the first institution to establish a noncommercial broadcasting station when it began operation of station KUHT in 1953. Encouraged by grants of \$100,000 from the Ford Foundation, other stations came into being in such cities as Miami, Pittsburgh, Chicago, Denver, and Madison, Wisconsin. Nevertheless, the cost of building, equipping, and operating a television station remained prohibitive for many institutions, and by 1962 there were only eighty ETV stations on the air or under construction throughout the United States.

It became obvious that if the channels reserved by the FCC for noncommercial use were to be used

as intended, federal funding would be required, and so Congress passed the Educational Television Facilities Act (Pub. L. 87-447) in 1962, which included \$32 million in facility construction grants. By June 1967 the number of ETV stations on the air had more than doubled, to 175, with ten more under construction and grants to activate another thirty stations in process. When the ETV Facilities Act expired in 1967, Congress passed the Public Broadcasting Act, which broadened considerably the federal role in noncommercial broadcasting—most notably through the formation of the Corporation for Public Broadcasting (CPB).

CPB was set up as a private, nongovernmental, not-for-profit corporation to provide for the improved quality of “public” broadcasting (previously known as ETV) and for a live network interconnection of educational broadcasting stations. CPB began by establishing entities that would build on the common needs and interests of public broadcasting stations around the country, and create some of the economies of a broadcast network. The Public Broadcast Service (PBS) was incorporated in November 1969 to provide an interconnection, or a means of sharing programs, among public television stations, and a source of production funding. PBS was prohibited, however, from producing programs itself, or from owning and operating any stations. National Public Radio (NPR) plays a similar role in terms of interconnection for radio stations but, unlike PBS, it was chartered as a producing entity as well.

The activities of CPB, PBS, and NPR overlap in terms of their common mission to support public broadcasting, but their operations remain appropriately distinct. CPB receives a federal appropriation for public broadcasting and distributes it to TV and radio stations. The stations, in turn, can choose to become members of PBS or NPR, which in return fund (in the case of PBS) or produce (in the case of NPR) national programming, and both PBS and NPR provide the technical infrastructure necessary to distribute the programming nationally.

### Financial Arrangements

Even with such generous support from taxpayers, the public broadcasting system (a \$2 billion per year industry by 1997) receives just 17 percent of its revenue from the federal government. In addition to an annual appropriation to CPB, public broadcasting stations may receive federal funding through the Na-

tional Telecommunications and Information Administration (NTIA) at the Department of Commerce, or through programming grants from various federal agencies such as the Department of Education, the National Science Foundation, the National Endowment for the Arts, and the National Endowment for the Humanities.

NTIA money, funded through the Public Telecommunications Facilities Program (PTFP) has become particularly crucial as public broadcasting moves into the digital age. Massive infrastructure costs are being incurred for the transition to digital broadcasting that will ultimately increase channel capacity by a factor of five or six, and allow for a wide range of new interactive services for the benefit of the public.

Programming dollars from the Department of Education (and its predecessors) have supported children’s programming from *Sesame Street* to *Arthur*. The National Endowment for the Humanities has supported extraordinary programming like Ken Burns’s documentary *The Civil War* and continuing series such as the *American Experience*. Jazz, classical, and traditional music on the radio, and performance programs on PBS are supported through the National Endowment for the Arts.

### Current Scope of Services and Analysis of Impact

The decentralized and inherently local nature of public broadcasting in the United States is intrinsic to its independence and unique brand of public service. At the same time, this structure limits a range of “efficiencies” that might be practiced in a commercial environment. Consequently, debates flare up on Capitol Hill regarding the role of federal funding in public broadcasting. But while there is little in the way of quantitative measures of public broadcasting’s impact, the ongoing and overwhelming public support that is demonstrated when funding cuts are considered reflects a significant positive impression and impact on the American people.

### The Challenges and Opportunities Ahead

The explosive growth of nonbroadcast (i.e., cable and direct satellite) television has provided a new level of competition to public television. The Discovery Channel, A&E, the History Channel, and Nickelodeon, among others, have built entire channels around particular genres that were previously unique to public broadcasting. Direct satellite radio

began broadcasting in 2001, and may prove to be a similar challenge for public radio.

The Internet has also provided competition for public broadcasting, at least in terms of claiming another slice of time from each individual's media viewing. At the same time, however, the Internet has provided great opportunities to extend the impact of public broadcasting.

Both nonbroadcast television and the Internet have pushed public broadcasting to do what it has always done best: innovate. Public broadcasting must clearly demonstrate that it is a vital public service, and at the same time it must achieve a fine balance between sustainable financial practices while retaining an unimpeded, commercial-free environment to the satisfaction of its viewers and listeners. In an era when media outlets have essentially been consolidated into a handful of international conglomerates, the need for unbiased, public-interest broadcasting is as powerful as ever.

PETER M. NEAL

## EDUCATIONAL CHANGE

---

Education is generally thought to promote social, economic, and cultural transformation during times of fundamental national and global changes. Indeed, educational change has become a common theme in many education systems and in plans for the development of schools. According to Seymour Sarason, the history of educational reform is replete with fail-

ure and disappointment in respect to achieving intended goals and implementing new ideas. Since the 1960s, however, thinking about educational change has undergone several phases of development. In the early twenty-first century much more is known about change strategies that typically lead to successful educational reforms.

#### Phases of Educational Change

The first phase of educational changes was in the 1960s when educational reforms in most Western countries were based on externally mandated large-scale changes that focused on renewing curricula and instruction. The second phase, in the 1970s, was a period of increasing dissatisfaction of the public and government officials with public education and the performance of schools, decreasing financing of change initiatives, and shrinking attention to fundamental reforms. Consequently, in the 1980s the third phase shifted toward granting decision-making power to, and emphasizing the accountability of, local school systems and schools. Educational change gradually became an issue to be managed equally by school authorities and by the local community, including school principals and teachers. The fourth phase started in the 1990s when it became evident that accountability and self-management, in and of themselves, were insufficient to make successful changes in education.

Furthermore, educational change began to place more emphasis on organizational learning, systemic reforms, and large-scale change initiatives rather than restructuring isolated fields of education. In brief, educators' understanding of educational change has developed from linear approaches to nonlinear systems approaches that emphasize the complexity of reform processes, according to Shlomo Sharan and his colleagues. Similarly, the focus of change has shifted from restructuring single components of educational systems towards transforming the organizational cultures that prevail in given schools or school systems, as well as towards transforming large sections of a given school or system rather than distinct components of schooling.

#### Emerging Theories of Educational Change

In the early twenty-first century it is generally acknowledged that significant educational change cannot be achieved by a linear "recipe-like" process. The consensus among theorists and practitioners is growing that traditional models of thinking about

educational change no longer provide sufficient conceptual tools for responding to multidimensional needs and politically contested environments. The major challenge of educational change is how to understand and cope with rapid change in an unpredictably turbulent world. Emerging new theories of educational change are beginning to employ concepts and ideas derived from the sciences of chaos and complexity. The main characteristics of these new theories are nonlinearity of processes, thinking about education as an open system, the interdependency of the various components of the system, and the influence of context on the change process itself.

Although educational change occurs everywhere, it is still not discussed systematically or analyzed by researchers and educators worldwide. Particularly in countries undergoing political and economic transition, educational change remains a political agenda rather than a well-designed engine of social reform. The heart of successful educational change is learning, both at the individual and at the community levels.

## EDUCATIONAL EXPENDITURES, PROJECTING

Every responsible educational organization estimates the amount of expenditures necessary to provide services desired by its students, staff, and faculty. Utilizing historical financial data, an analyst can use a variety of statistical methods to project fairly accurately what expenditures will be needed to provide the same level of educational services in future years. Though there are a number of sophisticated and reliable statistical methods used to project expenditures, three methods are prevalent: (1) average annual increases in expenditures; (2) average annual percentage increases in inflation (i.e., the Consumer Price Index); and (3) regression analysis. These methods have been validated and refined by use in a wide variety of economic, political, and social contexts. Moreover, the accuracy of these expenditure projection methods has improved with advances in data definitions, data reporting, generally accepted accounting principles, and data collection methods.

### Projections Using Average Annual Increases in Expenditures

Although a variety of methods can be used to project educational expenditures, one of the simplest methods is to survey states and educational institutions (e.g., state departments of education or local district offices) to find out some details about their historical spending patterns for educational dollars (see Table 1). Then, based on this contextual information, one would use an average annual increase in educational expenditures—taken over some period of time—to project an incremental increase to the most recent year's actual data.

Table 2 provides sample state-level projections for educational expenditures over multiple time periods using the average annual increases in expenditures to determine projected expenditures for the 2003 academic year. The ten-year projection using the average annual increase methodology is \$5,678; the seven-year projection using the average annual increase is \$5,714, the five-year projection using the average annual increase is \$5,797; and the three-year projection using the average annual increase is \$5,786. Notice that the ten-year and seven-year expenditure projections are substantially lower than the remaining projections due to the inclusion of an unusually low increase in 1997.

TABLE 1

Sample state-level data for educational expenditures and consumer price indices with annual increases				
Year	Expenditures	Annual increase in expenditures	CPI	Annual percent increase in CPI
1992	\$2,409	—	136.2	—
1993	\$2,563	\$154	140.3	3.0
1994	\$2,784	\$221	144.5	3.0
1995	\$3,047	\$263	148.2	2.6
1996	\$3,250	\$203	152.4	2.8
1997	\$3,300	\$50	156.9	3.0
1998	\$3,706	\$406	160.5	2.3
1999	\$4,167	\$461	163.0	1.6
2000	\$4,526	\$359	166.5	2.2
2001	\$4,924	\$398	172.2	3.4
2002	\$5,381	\$457	177.1	2.8

Usually, the longer the time period used when computing an average annual increase, the less likely the probability that an atypical yearly increase (i.e., an annual increase, or decrease, that does not fall within the trend over a period of time) will influence negatively the estimated level of expenditure. In the case of an atypical increase (or decrease) in expenditures, due caution should be noted when examining the results.

### Projections Using Average Annual Percentage Increases in Inflation

Another method used to project educational expenditures is to use an average annual percentage increase in inflation—taken over some period of time—to project an incremental increase to the most recent year's actual data. Again, the longer the time period used when computing an average annual increase, the less likely the probability that an atypical yearly increase will negatively influence the estimated level of expenditure. Table 2 also provides sample state-level projections for educational expenditures over multiple time periods using the average annual percentage increases in expenditures to estimate a projected expenditure for the 2003 academic year. The ten-year projection using the average annual percentage increase in inflation methodology is \$5,525; the seven-year projection using the average annual increase is \$5,520, the five-year projection using the average annual increase is \$5,513; and the three-year projection using the average annual increase is \$5,679. Notice that the five-year expenditure projection is substantially lower than the

TABLE 2

Sample state-level projections of 2003 educational expenditures using average increases in expenditures, average increases in CPI, and OLS regression analysis			
Years of data	Average increases in expenditures	Average increases in CPI	OLS regression analysis
Ten-year projection	\$5,678	\$5,525	\$5,541
Seven-year projection	\$5,714	\$5,520	\$5,663
Five-year projection	\$5,797	\$5,513	\$5,656
Three-year projection	\$5,786	\$5,679	\$5,580

remaining projections due to the inclusion of an unusually low increase in 1999.

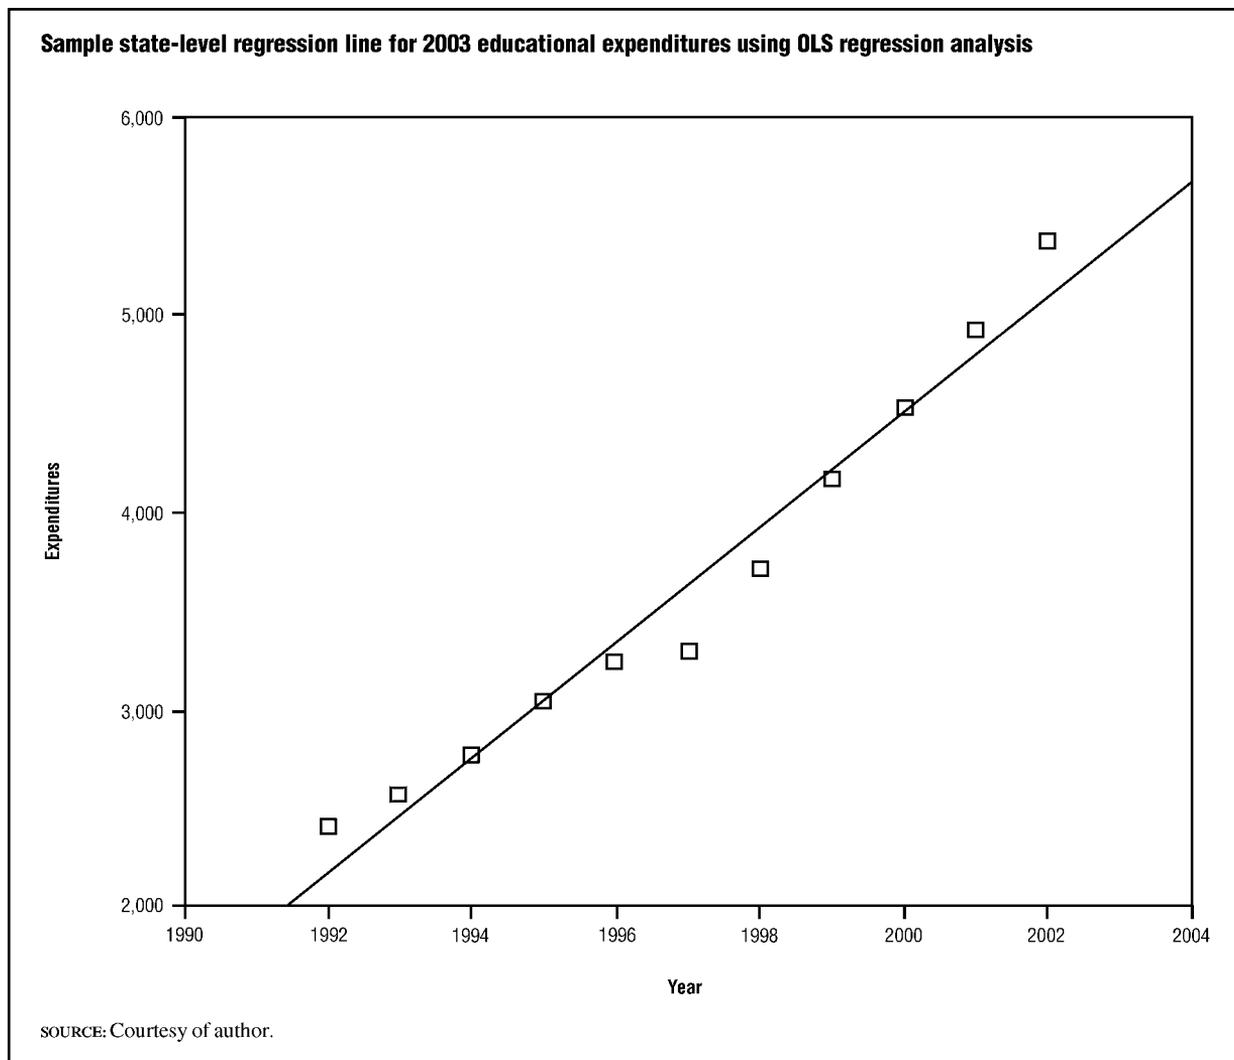

### Projections Using Regression Analysis

This statistical technique for predicting educational expenditures—specifically called Ordinary Least Squares (OLS) Regression Analysis—consists of constructing a line that “best fits the data” over a certain period of time (see Figure 1). The line of best fit (also known as the *regression line*) is the one line—and the only line—that falls as close as possible to every coordinate simultaneously and can be used to make fairly accurate expenditure projections (Because this discussion is limited to linear regression, and does not include non-linear regressions, the mathematical functions discussed will be equations for straight lines). Now the process of expenditure projections using regression analysis involves two steps: (1) determining the mathematical equation for the regression line; and (2) using the mathematical equation to predict scores.

The mathematical equation for the straight line in Figure 1 expresses a direct relationship between time (along the horizontal axis) and expenditures (along the vertical axis). The general form of the equation for a line is  $Y = bX + a$ , where  $Y$  is the predicted expenditure,  $b$  is the slope of the line,  $a$  is  $Y$ -intercept, and  $X$  is the year to be predicted. Theoretically, every line extends infinitely in both directions, but for the purposes of this discussion, the line extends along the horizontal axis from the year 1992 to 2003.

For each set of expenditure data analyzed, a specific regression line is fitted onto the graphed data using the mathematical methods of ordinary least squares. The formulas for the slope—referred to as

FIGURE 1

the *regression coefficient*—and the Y-intercept—referred to as the *regression constant*—are derived using calculus and can be found in any statistics book. Once the specific regression equation has been determined, the prediction of educational expenditures is straightforward: Substitute the values of X, a, and b into the equation and solve for Y. For example, the ten-year projection using OLS regression analysis is \$5,541; the seven-year projection using regression analysis is \$5,663; the five-year projection using regression analysis is \$5,656; and the three-year projection using regression analysis is \$5,580. Notice that the seven-year and five-year expenditure projections are substantially lower than the remaining projections due to the inclusion of an unusually high increase as a percentage of expenditure in 1998 and 1999.

### Summary

Despite the improvements in the precision of expenditure projections methods, it is important to remember that the usefulness of any economic or financial estimate rests upon the strength and validity of the assumptions used to define the context of the analysis. For example, local school districts are expected to provide a broad-based curriculum, fully-equipped classrooms, quality teaching materials, new technologies, qualified teachers, and a wide range of programs, services, and products. Simply investing more money into a school district's total available revenue is not enough to improve educational services or student attainment. However, targeting new expenditures to effective programs that improve the quality of the education system for stu-

dents, staff, and faculty can improve educational services. And, accurately projecting distributions of revenues and expenditures is key for these types of school improvements.

Two major institutions provide primary resources in the determination of educational expenditures: the National Center for Education Statistics (NCES) and the National Education Association (NEA). The National Center for Educational Statistics is the primary federal institution for collecting, analyzing, and reporting educational data related to education in the United States. Annually, NCES sends surveys to state educational agencies and uses this data to publish reports and develop estimates for publications such as *The Condition of Education*, *The Digest of Education Statistics*, and *Early Estimates of Public Elementary and Secondary Education Statistics*. The National Education Association presents its expenditure projections in a combined annual report called *Rankings and Estimates*. The *Rankings* portion of the report presents expenditure data useful in determining how states differ from one another on selected demographic, economic, political, and social arenas. The *Estimates* portion of the report provides projections of information about educational expenditures in addition to data on student enrollment, school employment, personnel compensation, and other educational finances. The data elements presented by both of these organizations permit general assessments of trends and should be used with the understanding that specific contextual elements influence their interpretations.

## EDUCATIONAL INTEREST GROUPS

Public schools in the United States operate in a pluralist democracy that enables competing interests to gain access to the decision-making process. Quite frequently, conflicts over educational issues occur. Political leaders and educational professionals formulate policies that attempt to mediate competing views and contending interests. There are, however, three understandings about the interaction between interest groups and the public educational enterprise. One school of thought finds that the school system benefits from interest group activities as it incorporates diverse demands. Another perspective views interest groups as autonomous centers that can undermine the schools' legitimacy. A third perspective observes a reconfiguration of the goals and functions of interest groups in an era in the early twenty-first century of "postmaterialism."

#### Diversity

Pluralistic representation, according to many researchers, can strengthen public schools. Historically, school responsiveness to its diverse clients is seen in the development of an increasingly professionalized system. In his study of three central-city districts from 1870 to 1940, Paul Peterson observed in 1985 the "politics of institutionalization," where clients who had previously been excluded from school services gradually gained admission to the system. As schools expanded their client base, Peterson saw no single interest as dominant over all school issues. Al-

though the business elites tended to prevail in fiscal issues, working-class organizations exercised substantial influence over compulsory education. Because diverse actors and interests contributed to an expanding school system, the real winners were the school system and its broadening clientele. The urban public school system practiced the politics of nonexclusion, gradually extending services from the middle class to the low-income populations, and from groups with roots in the United States to various immigrant and racial groups.

Conceptually, Peterson's analysis is consistent with the tradition of pluralist scholarship in political science as exemplified by Robert Dahl's classic 1961 work *Who Governs?*. From a policy point of view, interest group competition has encouraged the school bureaucracy to adopt objective, universal criteria in distributing resources to neighborhood schools.

School responsiveness to its diverse clients also improves equal educational opportunity for the disadvantaged since the 1960s. In 1986 Gary Orfield and Susan Eaton discussed "group rights" politics in securing governmental resources for low-income inner-city African Americans in the Atlanta metropolitan area. Further, using data from the U.S. Office of Civil Rights in districts with at least 15,000 students and 1 percent African-American enrollment, Kenneth Meier and colleagues examined in 1989 the practice of second-generation discrimination in the classroom following the implementation of a school desegregation plan. They found that African-American representation on the school board has contributed to the recruitment of African-American administrators, who in turn hired more African-American teachers. African-American teachers, according to the study, are crucial in reducing the assignment of African-American students to classes for the educable mentally retarded. African-American representation in the instructional staff also reduces the number of disciplinary actions against African-American students and increases the latter's participation in classes for the gifted. Luis Fraga and colleagues found a similar situation in 1986 with Hispanic students in thirty-five large urban districts. Thus, "group rights" politics is critical to ensure allocative practices that benefit the disadvantaged.

### **Autonomous Power Centers**

Although interest group politics may facilitate collective concerns, organized interests can become autonomous power centers that undermine the

organizational capacity of the school system. A major interest group is the teacher union. William Grimshaw's 1979 study of Chicago's teacher union suggested that the union had gone through two phases in its relationship with the city and school administration. During the formative years, the union largely cooperated with the administration (and the mayor) in return for a legitimate role in the policy-making process. In the second phase, which Grimshaw characterized as "union rule," the union became independent of both the local political machine and the reform fractions. Instead, it looked to the national union leadership for guidance and engaged in tough bargaining with the administration over better compensation and working conditions. Consequently, Grimshaw argued that policymakers "no longer are able to set policy unless the policy is consistent with the union's objectives" (p. 150).

Organizational growth, in Bruce Cooper's view, has led to problems of "mature institutions," where union leaders have to mediate trade-offs between quality and supply. Seeing a new trend in school competition, Susan Moore Johnson observed the need for replacing "collective bargaining" with "reform bargaining."

Another organized interest is the increasingly well-organized taxpaying public, a substantial portion of which no longer has children in the public schools. The aging population has placed public education in competition with transportation, public safety, community development, and health care over budgetary allocation. Discontent with property taxes became widespread during the time of the much-publicized campaign for Proposition 13 in California. According to Jack Citrin, between 1978 and 1983, of the sixty-seven tax or spending limitation measures on state ballots across the nation, thirty-nine were approved. During the 1990s, business-organized lobbying groups have been successful in pushing for higher academic standards and stronger accountability measures. In districts where public schools fail repeatedly, political leaders tend to seek for alternative ways of delivering schooling services, including privatization or creating charter schools. At the federal level, the No Child Left Behind Act of 2001 that was passed in January 2002 allowed for public school choice as a corrective action to schools that fail repeatedly.

### Postmaterialism

A third perspective sees a weakening of the hierarchical structures of organizing interests. In the post-materialist era, Ronald Inglehart, Terry Clark, Jeffrey Berry, and other social scientists argue that political parties no longer play a key role in mobilizing voter turnout. The union is losing its direct influence over its membership. Ideologically based groups, both left and right, seem to have lost much of their reputation in the nation's capital. Instead, organized interests are realigned in several ways. They have become more focused on "quality of life" issues, less organized along rigid class cleavages, and more pragmatic about governmental and market solutions to educational and social problems. Increasingly, racial and class categories are less predictive of how citizens view and decide on educational policy issues. In short, this early-twenty-first-century re-configuration of interest group politics is likely to shape the research community's understanding of group-based influence in public education.

## EDUCATIONAL LEADERSHIP

Schools are social institutions that play an important role in what is arguably the most complex responsibility of society: the healthy development of children. The people who lead schools must have a deep understanding of the many dimensions of this task, yet the challenges fall within the general category of crafting and carrying out agreements among many stakeholders. Some of these agreements have long timelines and reach into the heart of the enterprise. The bulk of the agreements, however, are short, temporary arrangements that get the various stakeholders—students, teachers, parents, policy makers—from one step in the process to the next. Effective schools are places in which these agreements are fashioned and honored successfully. Effective educational leaders are people who make that happen.

In the United States, the responsibility for public schools falls within the jurisdiction of the states, but from an operational perspective schools are the business of local government. The authority of principals and superintendents derives from that basic structure, and educational leadership is traditionally associated with the people in those positions. Accordingly, principals and superintendents are the parties most responsible for crafting the essential agreements upon which schools either succeed or fail.

The role of these leaders has evolved as society has changed and as schools have been asked to take

on responsibilities that far exceed the basic literacy and numeracy skills that were expected in the early days of American public schools. As communities grew and schools increased in size beyond the point where a single teacher could meet the needs of all pupils, and as the amount of schooling required of all children increased, the position of principal—a term that literally implies the first teacher—or headmaster was created to provide instructional leadership to ensure coordination among the teachers. When the continuing growth of communities forced them to create multiple schools, the superintendent position was created to coordinate the system within those schools operated.

Beginning in the early 1960s with the advent of comprehensive high schools and consolidated school districts, and eventually in response to increased demands placed upon schools by the states and the federal government, there was dramatic growth in the number of other administrative positions in the district's central office. These school leaders are more specialized, working, for example, in a single area such as finance or curriculum.

School administration also became differentiated through positions associated with content-area specialists and, in some cases, basic assistance for the principal. During the last decades of the twentieth century, there was steady growth in the number of educators working in districts who did not participate directly in the instruction of students. Pressures throughout the schools and districts, including the supervision of these new administrators, and the steady flow of multiple mandates from state and federal government, began to erode the opportunity principals and superintendents once had to provide real leadership.

In the late 1990s, another notion about educational leadership arose. Recognizing the value of distributing leadership responsibility to those people who were closest to student learning, some educators began to talk about the need for teacher leadership. The concept was unusual in a system that associates leaders with people who have specific titles. Also, the idea that teachers might be expected to provide leadership for their peers, their schools, and their profession while remaining in the primary role as teacher was a radical departure from the norm.

## A Challenging Environment

The basic context in which schools operate makes leadership difficult. Everyone, it seems, has a vested interest in schools. Each of the nation's chief executives has regularly tried to identify himself as the "Education President." Governors make similar assertions, and states have a chief school officer, either appointed or elected, who is surrounded by an administrative staff to oversee the proper operation of schools. Money, and who provides that money, gives another road map to lines of authority, and for all but the nation's poorest schools, the combined contributions of state and federal dollars do not equal the dollars provided by local government and local taxpayers. That balance leads to a large amount of authority vested in school boards, typically elected officials, who run for these offices for a variety of reasons, or appointed people who have their own allegiances.

Thrown into this mix are teacher unions, connected with powerful national associations, and other unions serving the needs of support staff. Anyone trying to lead a public school cannot take lightly the contract a district has with a bus company, for example, or with the maintenance staff who have control of very basic parts of the operation. This list of interested parties is far from complete, and the challenges of leadership have outpaced the profession's capacity to recruit, prepare, and sustain those who take on that responsibility.

## Recruiting, Preparing, and Sustaining School Leaders

As public schools became larger and more complex, the professional path to becoming a school leader became more prescribed. As with other professions, the responsibility for preparing school leaders came to rest within the universities and particularly in graduate departments of education. In keeping with the traditional patterns of the academic world, preparation was defined by certain courses of study and the successful accumulation of credits. School administration became an actual course and eventually was broken up into a series of courses that included everything from finance to labor relations to organizational behavior. While most graduate degree programs include a practicum or internship, this part of required study has been minimal.

The states have been involved in the formalizing and conceptualizing of what skills and credentials a

person must have in order to become a principal or superintendent. States prescribe these skills and credentials within a certification process. Because supply and demand for principals and superintendents varies over time and sometimes puts districts at risk of losing good candidates or not having enough candidates to fill positions, many states have alternative paths to certification and interim permissions that can be granted in lieu of certain requirements or until those requirements can be completed.

This standard approach to preparing principals and superintendents has been questioned during the school reform era that began in the early 1980s. One response, directly related to an increasing concern over the quantity and quality of the candidate pool for principals, was the rise in what are called *aspiring principal programs*. These programs require educators who hope to become principals to spend large amounts of time with successful principals on the job. The belief is that while formal courses can help prepare people to become principals, the more important skills are acquired through apprenticeship.

The principalship has changed significantly since the 1960s. With the growth of strong central offices and increasing unionization of teachers, principals began to be removed from their role as first teacher or headmaster. They lost the authority to hire and fire their own teachers and were no longer in a position to provide leadership for curriculum and instruction. In many cases, principals are not even the highest paid educators within a school building, while they regularly work a longer school year than teachers do.

Principals have a difficult time finding the authority to secure agreements among the key stakeholders, and they seldom have the resources necessary to support such work. These conditions are not conducive to encouraging educators who have passion and vision about teaching and learning to consider moving from the classroom to the principal's office.

One positive development for principals began in 1981 when the first Principals Center was created at the Harvard Graduate School of Education. This center was founded to provide a professional community for principals, who often are the most isolated educators in their schools, and to encourage the kind of lifelong learning that would improve the skills of principals as leaders and managers of their schools. The concept spread rapidly, and within ten

years, more than one hundred similar centers had been founded throughout the United States and in other countries. These centers are connected through their own international association.

Superintendents have had similar difficulties. Their domain is connected with local politics, the elected or appointed school boards and mayors and city councils that often play a significant role in approving budgets. These challenges have been exacerbated in large urban districts that saw their tax base decline in the last four decades of the twentieth century, their middle class families depart, and a growing number of special challenges related to rapidly changing populations, high levels of poverty, and a physical infrastructure that was crumbling. Many urban districts also face a disproportionate increase in the number of school-age children and a decreasing amount of money to support them. In many cases, these financial pressures lead to greater state subsidies for these districts and the accompanying demands, all of which only add to the political climate surrounding the work of superintendents.

One measurable result of these increased pressures has been the length of time the average superintendent remains in that position, which by the late 1990s had dropped to under three years. Given the difficulties of leading these complex organizations, such a rapid turnover among superintendents makes it nearly impossible for any meaningful change to take place.

Public school superintendents have responsibility in four basic areas: managing a complex enterprise, managing multilayered politics, building community and public support for schools, and leading a whole systems improvement process. Most superintendents accept inherited agreements made by their predecessors in the first three areas. They come into their jobs with all of those areas in place and little opportunity to refashion agreements. Their vision for the fourth area cannot easily penetrate the existing structure of the district, much of which is already dictated by a variety of contracts with teachers, administrators, and different support staff. The budget, too, is often already established, and given the large percentage of school budgets that is earmarked for salaries, benefits, and maintenance, there are very few financial resources superintendents can deploy to help support their initiatives. As is the case with principal preparation programs, university-based programs leading to advanced degrees and certification have had a difficult time keeping up with the

rapid changes in the field and the demands placed on these district leaders.

### **Leadership in the Twenty-First Century**

State standards enacted in the 1990s defined a new goal of helping all students graduate ready for further learning, work and citizenship. States, frustrated by the slow pace of progress in too many schools, began to attach consequences to school failure. Although few could argue with the validity of this new proposition, it challenged the beliefs, assumptions, structures, and practice of the American educational system, and required school leaders to craft new agreements. It also multiplied the complexity and difficulty of educational leadership. By 2000, state assessments regularly were diagnosing the health of schools and were testing the success and strength of the agreements that school leaders either crafted or inherited.

Low-performing schools suffer most from a lack of leadership. The agreements made or tolerated in these schools leave children ill-prepared for the world they will inherit and do a particular disservice to disadvantaged youth. The identification of low-performing schools often results in a variety of district and state interventions. To be effective, these interventions take the shape of new agreements designed to create a clear focus, improve curriculum and assessment of student work, and strengthen staff evaluation and professional development.

While those strategies often find fertile ground in elementary schools, they seldom are enough to improve secondary schools, especially those that are large and comprehensive. In these schools the agreements that exist among stakeholders are simply not conducive to the national goal of leaving no child behind. The first task that the principals of these schools must confront, in concert with their superintendent, is leadership focused on redesigning their large comprehensive high schools into small learning communities.

### **System Leaders as Agreement Crafters**

Least well understood, and central to all of these roles, is the question: how should the system work? With growing diversity, emerging opportunities and challenges of information technology, evolving knowledge about high performance organizations, and the new proposition that all students can and should achieve at high levels, it is often not clear what success at scale looks like. The new proposition

of the standards movement—that all students should leave high school prepared for college, work, and citizenship—is easy to accept in theory but much more difficult to actualize. As school districts grapple with standards, high-stakes tests, growing frustration among taxpayers and politicians, and new alternatives to the public schools, the most important agreement that every superintendent and principal must craft is around the basic way that the district and the schools should work.

Given the multiple layers of federal, state, and local bureaucracy in education, and decades of piling layers of programs and policies onto schools, the first challenge of system leaders is to create coherence—making everything work together for students and teachers. Leaders can either attempt to create coherence, or alignment, throughout the system or create a system where schools achieve their own unique form of coherence.

Whatever the answer to the question about how a school or district should work, the system leader must be able to describe the organizational strategy in simple terms and support it with consistent organizational behavior. In order for that vision to take root, the leader must bring many parties to the agreement. Radically changing the way a school system works takes a reshaping of virtually all of the agreements between the district and schools and many of the basic agreements inside schools. Making any answer work requires a sustained effort, perhaps over a period of at least a decade.

The role of agreement crafter implies the need for new experiences and skills for both principals and superintendents. Superintendents and principals need opportunities to study a variety of approaches and the context in which they are being deployed. They need to adopt, modify, or reject the agreements that they inherit based on a deep understanding of the local context and exposure to strategic options.

Agreement crafters must be politically savvy, possess sophisticated consulting skills, and be adept change managers. Principals and superintendents need to be aware of community power structure, key influencers, and political decision makers. The demands of diversity, technology, and standards, particularly at the secondary level, require a set of consulting skills to design and facilitate a series of linked conversations that lead to adult learning and shared vision. As change managers, principals and

superintendents must sequence complex tasks in a way that is manageable for the staff to incorporate.

## EDUCATIONAL POLICY, UNITED STATES

---

Education is an instrument of the broader social order. When society changes, education, sooner or later, also changes. Few activities or agencies, however, change as slowly, or in such small increments, as formal education—both schools and colleges as well as both public and private institutions. Education's roots are deep and wide, penetrating almost every facet of society. Hence, education is subject to virtually every political force, including those that want change and those that want to protect the status quo.

Public K–12 education—which operates across fifty states, 14,000 local school districts, and 100,000

schools; involves 5 million employees and more than 48 million students; and costs more than \$2 billion each day—is too large, too costly, and too enmeshed in political dynamics to change quickly. Postsecondary institutions—colleges and universities—have become equally ponderous. With the advent of post–World War II enrollment increases; the significance of university-based research for preserving the nation's economic, medical, and military preeminence; and the substantial assumption of student financial aid by government, higher education also has become a major feature of the political landscape and become engulfed by much of the inertia that immobilizes lower schools.

For most of American history, the nation's most prestigious elementary and secondary schools and elite colleges have been few in number, and their private charters and religious affiliations have rendered them generally independent of government. But for colleges and universities, nearly all of which, in the early twenty-first century, are accepting student financial-aid subsidies from government and engaging in government-sponsored research, this situation has changed. Government now is a major constituent for higher education, both public and private.

Even for private preparatory and religious elementary and secondary schools, the condition of independence from government could change. If the U.S. Supreme Court approves allocation of public funds for private and religious institutions, private schools could come under the full umbrella of public policy in the same way as their public institutional counterparts.

Still, even as subjects of increasing politicization, and even if only at a glacial pace, schools and colleges do change. Formal education at the onset of the twenty-first century exhibited many differences from that of even thirty years previous, and it certainly was different from what children and parents experienced in the early part of the twentieth century.

### The Basics of Educational Policy

Societies rely upon the informal socialization of youth and immigrants and the formal education of citizens to preserve the polity and facilitate pursuit of individuals' collective and personal preferences. Because of this mediating role in maintaining a society, formal education systems, and those who steer

them, are unusually sensitive to alterations in citizens' will or shifts in decision makers' views. When a society perceives itself subjected to threat or is engrossed in a major economic, technological, demographic, or ecological transformation, the education system is a principal instrument to which it turns in order to adjust to change and seek a new social equilibrium.

The larger and more democratic a society, the less linear and less transparent its education system alterations will be. In a dictatorship or narrow oligarchy, it is relatively easy to change an education system. In the booming, buzzing cacophony of the open, modern information age and a globally interdependent society, education reform is episodic, conflict prone, inconsistent, and, sometimes painful.

Indeed, the more porous and dynamic a society, the more inconsistent and conflictual its efforts to change its education system will appear. Interests deeply rooted in spheres such as economics, religion, ideology, institutions, geography, race, and ethnicity will vie to have their worldview represented most forcefully in whatever education system emerges. These are the centrifugal forces that threaten the momentum and unity of any society. Countering these are centripetal (unifying) forces, mostly institutions, ideologies, and influential individuals that seek consensus and cohesion. It is the tension between these dynamics that eventually shapes changes to a democracy's education system.

### **The Pressure for Reform in American Education**

The twentieth century, particularly its last two decades, represented a period of remarkably intense change. A brief review of what took place globally during this period suggests the reason why America's education system has been under such intense pressure to reform.

The post-World War II cold war rivalry between East and West ended in the early 1990s. Democratic capitalism generally surmounted totalitarian socialism to become the world's dominant political economy. Modern communication and transportation technologies contributed to globally oriented, highly mobile, and rapidly paced societies. Economic developments created a heretofore-unknown degree of individual, organizational, and international interdependence. The United States emerged as the leading economic and political power in the world. This condition, coupled with globalization, generat-

ed added diplomatic, military, and humanitarian responsibilities for the nation and its citizens.

The United States is fortunate in having vast resources. It has become expected, however, to deploy these riches not only for the protection and promotion of its citizens but also for the well-being of the world. Issues of health in Africa, overpopulation in Asia, political instability in Latin America, religious conflict in the Middle East, trade restrictions in Europe, ozone depletion in Antarctica, overfishing in the North Atlantic, or ice cap reductions in the Arctic are no longer remote issues. The eventual outcome of these conditions now matters as much for a child being raised on a productive family farm in South Dakota as to an apartheid-liberated farm family in South Africa.

This new and fast-paced world has dampened some old issues. Widespread fears of nuclear annihilation, pestilence, and global famine have become ameliorated. But age-old concerns regarding religious and racial intolerance, social injustice, economic inequality, and discouraging instances of inhumanity have by no means been eliminated. Even a few new issues have evolved, for example, fear of widespread environmental degradation and uneven economic development between nations in the northern and southern hemispheres.

In making its adjustments to the new global world, American education policy is moving on two fronts simultaneously. First, the new world order necessitates that everyone be educated. Hence, issues of access and equality remain important. Second, it is no longer sufficient that individuals simply be exposed to schooling, it is increasingly important that they actually learn. Hence, the additional policy pressure is to render education institutions effective, both in achieving their objectives and in the use of the vast resources they command. The upshot is that both equality and efficiency are paramount issues on the education policy agenda. When pressures emerge, however, for maximization of these two ends, then, inevitably, counterforces arise out of reaction to protect and extend the other policy objective, liberty.

### **Defining Policy**

Policy is one of the principal vectors through which influence flows between the larger society and education institutions. The term *policy* refers to the decisions and rules enacted by the three branches of

government at all levels—national, state, and local. The policy pipeline is capable of reciprocal transmission. Whereas society's preferences shape and continually reshape education, the outcomes of education continually influence the values and preferences of the broader society.

The word *policy* is derived from the Greek *polis*, referring to city or citizen. Subsequent Roman usage led to the term *polity*, meaning government, government organization, regime, or nation. In modern parlance, policy refers to a uniform decision rule, a regulation, or a set of prescriptions that applies in all similar circumstances. The term *public policy* refers to a government-specified or -enacted decision rule. Of course, when people speak of education policy, or at least public education policy, they are referring to government decision rules regarding education, schools, colleges, or related matters.

Government rules regarding school attendance, graduation, college entry, what will be studied, who will teach, who will be paid, and who will pay are all illustrations of education policies. Policies are enacted by all three branches of government in the form of executive orders from the president, governors, and mayors; statutes and ordinances enacted by legislative bodies such as the U.S. Congress, state legislatures, and city councils; and judicial decisions issued by courts.

### The Public Values Underlying Education Policy

American culture contains three strongly held values that significantly influence public policy in general and education policy specifically. They are equality, efficiency, and liberty. Government actions regarding national defense, housing, taxation, antitrust regulation, racial desegregation, and literally hundreds of other policy dimensions, including education, are motivated and molded by one or more of these three values.

The overwhelming majority of the public views equality, liberty, and efficiency as conditions that government should attempt to maximize. The historical roots of these values are deeply embedded in the cultural streams that comprise the common heritage of the United States. These values permeate the ideologies promulgated by political parties, religions, schools, and other social institutions.

Despite widespread public devotion to equality, efficiency, and liberty as abstract goals, it is almost impossible to pursue these values to their ultimate

practical fulfillment. At their roots, the three desired conditions are inconsistent and antithetical. Exclusive or concentrated pursuit of equality restricts or eliminates liberty and efficiency. Similarly, one-sided attention to either one of the other values reduces the remaining two. Consequently, efforts to rearrange society so as to maximize fulfillment of one of the three values are constrained by forces desiring to enhance or preserve the status quo of one or both of the others.

The three values are always suspended in dynamic equilibrium. The practical relationships among them constantly shift; the balance at any particular point in time is fixed as a consequence of a complicated series of compromises made within the political and economic systems.

It can be argued that liberty or freedom is the highest of the three values. Efficiency for its own sake is absent much meaning. The justification for desiring that an endeavor be undertaken efficiently is to conserve resources that then can be used for other endeavors, thus achieving greater equality or expanding choice. Similarly, equality as an end in itself appears hollow. Few if any persons desire absolute parity with their peers. Rather, equality of wealth, power, and circumstance can be viewed as desirable means to the end of greater opportunity or choice. Education is one of the prime instruments through which American society attempts to promote fulfillment of all three values.

### Education as Policy Instrument in the Pursuit of Equality, Efficiency, and Liberty

Various large-scale social movements have, over time, contributed to formal education's place among society's major institutions. For example, the sixteenth-century Protestant Reformation encouraged education as a means to facilitate individual interpretation of religious scriptures. Similarly, among eighteenth-century leaders of the new republic, the United States, education was viewed as a means to enable one to participate as an equal in the affairs of government. Under these circumstances, education was important to ensure political liberty. It was not until the nineteenth century, however, that formal education began to assume significance for economic purposes in Western societies.

The increasing technical complexity of nineteenth-century industrialization necessitated a more highly educated workforce. This condition provoked

widespread provision of public schooling, and, in subsequent periods, schooling has been taken as an important contributor to economic efficiency.

In the opening of one of his famous mid-nineteenth-century annual reports as secretary for the Massachusetts Board of Education, Horace Mann said “Education prevents being poor.” Here was one of the first highly visible expressions of the new nineteenth-century relationship between education and economic well-being. By the twentieth century, and even more so in the early twenty-first century, schooling has been rendered crucial for an individual’s economic and social success. Consequently, schooling has assumed new importance for fulfilling the practical expression of individual equality.

Beginning with the 1954 U.S. Supreme Court decision in *Brown v. Board of Education of Topeka, Kansas*, and continuing with the vast increase in federal government education programs of the 1960s and the education finance reform efforts of the 1970s, a major portion of mid- and late twentieth-century education policy was directed at achieving greater equality.

### Equality in and Access to Education

In the latter half of the twentieth century, courts began to apply the U.S. Constitution’s equal protection clause to a spectrum of social conditions, such as voting rights, housing, employment, and education. This Civil War–era constitutional provision stretched the mantle of federally protected civil liberties to include state government. Hence, the 1950s and several decades thereafter marked a period of intense judicial activism by which courts began to ensure that federally guaranteed civil rights were not overridden by state or local policies. A long-heralded era of “local control” regarding schools was now about to be substantially restricted.

**Racial desegregation.** It is possible that the topic of racial desegregation provoked greater controversy in the United States than any other public policy issue in the last half of the twentieth century. National guard mobilization, massive public demonstrations, civil disobedience, heated political campaigns, acrimonious school board elections, and movements aiming to recall state officials are but a few illustrations of the intensity of the conflict.

The initial U.S. Supreme Court decision in *Brown v. Board of Education* incorporated social

science evidence in support of the view that legally enforced segregation of schools violated the Fourteenth Amendment and was damaging to minority students. In subsequent years, researchers, primarily sociologists, conducted numerous analytic studies to assess the effects of desegregated schooling. For the most part, results proved ambiguous. No clear path of direct evidentiary proof exists as to whether minority students benefit from desegregated school settings. Even the original social science research cited by the U.S. Supreme Court is disputed in the early twenty-first century. There are those who contend that the entire school desegregation movement, on balance, is a social experiment that has failed. They cite as evidence for their position the following: more African-American children attended racially isolated classes in 2000 than was the case twenty-five years before. Conversely, there is aggregate evidence that suggests racial desegregation is beneficial for so-called minority families and children. For example 2000 census results show that middle-income African-American students more often than their lower income counterparts attend schools in desegregated suburban communities. In such communities, African-American students’ academic achievement and economic performance measures are higher. Such studies are unable to control for a host of competing hypotheses such as that those who flourish economically, and who choose a suburban lifestyle, are possibly more motivated personally. The confounding of conditions renders a solid answer difficult.

Despite the ambiguity of social science desegregation results and the mixed success of northern school desegregation efforts, one facet of the issue emerges with relative clarity. The *de jure* segregated school systems of southern states, with few exceptions, have been successfully dismantled. This is the case not because of the dramatic findings of policy analysts and researchers, but because of the construction of successful legal strategies and judicial enforcement.

**Education finance.** In 1967 Arthur E. Wise questioned the constitutionality of state school financing arrangements. Wise, then a doctoral student in school administration at the University of Chicago, contributed to the effort to eliminate inequality, not a new set of fiscal analyses, but, rather, the suggestion of a new legal theory. He published his ideas in a 1968 book titled *Rich Schools, Poor Schools*.

Other legal scholars were quick to follow. Subsequently, John E. Coons, William H. Clune III, and

Stephen D. Sugarman wrote *Private Wealth and Public Education*, which, in a lucid fashion, dissected the operation of state school finance statutes and described a strategy whereby they could be challenged legally. Wise, as well as Coons and his colleagues, formulated the principle of fiscal neutrality, that is, the principle that the quality of a child's schooling should not be a function of wealth, other than the wealth of the state as a whole. By providing a negatively phrased decision rule, permitting courts to strike down existing schemes while allowing legislatures to construct a statutory redress of the inequity, Wise and Coons and his colleagues rescued the fledgling "equal protection" school finance movement from judicial oblivion. Prior to that time, courts were deciding against plaintiffs on grounds that no judicially manageable solutions were apparent.

By the close of the twentieth century, most gross fiscal disparities had been mitigated. Only a few egregious inequities remained. Indeed, a study by Sheila Murray, David Evans, and Robert Schwab demonstrated that most school spending differences were between states, not within states.

In the latter years of the twentieth century, proponents of greater equality of education financing began to alter conventional "equal protection" arguments. They took their cue from the Kentucky Supreme Court in its 1989 *Rose v. Council for Better Education* decision. Here the court held the state accountable not only for equal financing but also for equal educational opportunity. The Kentucky decision gave rise to a subsequent genre of what has come to be known as "adequacy" suits. In these suits, the distribution of school dollars has not been the consideration as much as the consequences of school dollars. The contention of plaintiffs is that education is a state constitutional responsibility, and, thus, states must ensure that local districts and schools deliver an education adequate for a student to succeed in the workforce and as a democratic citizen.

**Special education.** Special education was the latest school population category to be the focus for substantial reform. The reform proceeded on two dimensions: the provision of appropriate school services to students with physical and mental disabilities and the provision of bilingual instruction to non- or limited-English-speaking students.

The historic inability or unwillingness of school districts to serve adequately the needs of students

with disabilities had long been recognized. As was the case historically with school finance inequities, however, there appeared no easy means by which the situation could be altered. Specialized services can be extraordinarily expensive; school officials claimed that their budgets simply were too stretched to provide them. When state categorical funds were provided for special education, local school districts all too frequently diverted all or a portion of such moneys to subsidize the regular school program. The mid-1960s innovation aimed at rectifying these conditions was the construction of a successful legal theory to mandate change.

The landmark cases are *Mills v. Board of Education* and *Pennsylvania Association of Retarded Children v. Commonwealth of Pennsylvania* for students with disabilities and *Lau v. Nichols* for the non-English speaking. These cases both altered the special education practices of states and local school districts and influenced Congress in enacting the Education for All Handicapped Children Act of 1975. The consequence of these movements has been to increase dollar spending for special education by billions. At the beginning of the twenty-first century, American public schools were spending 20 percent of their operating budgets on the education of students with disabilities. No claim is made that all problems have disappeared in the schooling of students with disabilities. At the turn of the twenty-first century, however, the landscape was powerfully different than even a quarter of a century before.

**Collective bargaining.** Concerns for equity have not concentrated upon students exclusively. Professional educators have also sought means by which they could be treated more equally.

Beginning in the 1950s, teachers began to expand their unions to engage more effectively in collective bargaining with school boards. This development was initiated in large cities and subsequently spread to almost every school district in the United States. To a large degree, increases in organizational size, bureaucratization, and the expansion of administrative levels probably accounted for teachers' feelings of inefficacy and alienation and prompted them to unionize.

Although it frequently is the case that teacher representatives come to the bargaining table with concerns for the welfare of students and respect for the interests of the broader public, their primary allegiance is to teachers' welfare. They cannot legiti-

mately claim to represent the larger public. Nevertheless, duly elected public representatives—school board members—must share decision-making authority with them. The outcome is to further centralize school policymaking and to erode the ability of the general public to participate in the process. It is conditions such as these that prompt critics of public education to demand yet other changes.

**Higher education.** The pursuit of greater equality has also left an imprint on the nation's colleges. For example, Title IX of the Higher Education Act decrees parity in athletics for males and females at postsecondary institutions. In addition the Higher Education Act requires colleges to pledge themselves not to discriminate racially or in other ways if they use federal funding to subsidize student financial aid, promote research, or construct dormitories.

### The Pursuit of Efficiency in Education

Efficiency advocates, usually overlooking the substantial expansion in functions expected of America's public schools, claim that per-pupil expenditures nationwide have escalated in a troublesome manner. They argue that even when inflation is discounted, the per-pupil increase in school spending between 1950 and 2000 was 500 percent. The additional funds have been used to purchase items that, according to conventional education wisdom, will facilitate production. For example, class sizes have been reduced, and many categories of instructional and administrative specialists have been added. Despite such added resources, there appear to be no dramatic increases in output. Indeed, to the extent that standardized test scores are valid indicators of school production, output has diminished.

Efficiency has always been a major concern for educational policymakers and school administrators. There have existed points in history, however, at which particular attention has been accorded the topic. The mid-1920s was a time of such intense interest. This period coincided with the expansion of school administration as a specialized field. In an effort to enhance their professionalism, education officials attempted to adopt for schools many of the efficiency techniques then popular in industry. Raymond E. Callahan, in his 1960 book *Education and the Cult of Efficiency*, described this movement.

School district consolidation was another strategic arrow in the quiver of pre-World War II education efficiency proponents. By 1930 the number of

local school districts in the United States had reached its high point—in excess of 125,000 separate units. By 1976 this number had been reduced to approximately 16,000. The number of districts hovered around 14,000 at the beginning of the twenty-first century. This drastic reduction in the number of units of a specialized local government took place in a manner so subtle as virtually to escape the notice of policy analysts. It also took place without a shred of persuasive evidence that it would indeed save money. Nevertheless, it constitutes one of the most dramatic of all changes in America's patterns of government.

In the 1960s, sociologists dominated school efficiency research. The premier study of this period was the *Coleman Report*, named after its principal author, James S. Coleman. The Coleman team concluded that school quality had little effect on student achievement independent of the social background of students. This finding, even though not so intended, was widely interpreted by the media and other lay sources as meaning that dollars for schools made little difference in student learning. This misunderstood assertion was widely publicized by efficiency advocates, and the Coleman finding served as justification during the 1970s for reducing the trajectory of school spending increases.

At various points in U.S. education history, the term *accountability* appears as a symbol. It represents a policy effort to control escalating school costs and insufficient student achievement by employing techniques that advocates suggest will improve school productivity. The efficiency movement of the late twentieth and early twenty-first centuries, operating under the episodically popular label of accountability, was launched by the 1983 appearance of *A Nation at Risk*, a highly visible national report by the National Commission on Excellence in Education. Seldom has an elite panel issued a document whose thesis was more inaccurate. Paradoxically, seldom has a blue-ribbon report had such a widespread and long-lasting consequence and had such a profound and lasting impact on public opinion and policy.

The report asserted that America's preeminence in defense, technology, economics, science, and industry was threatened by the mediocrity of its public education system. The report left the impression that the United States was about to succumb to a deluge of foreign dominance, unless its schools were rapidly rendered more rigorous. But twenty years later, it became plain to see that the economic slump

in which the United States found itself at the report's 1983 issuance was far more a consequence of inefficient management practices than it was the nation's ineffective education system. Also in the intervening period, the Japanese economy plummeted, and its once vaunted education system was unable to protect it from its inefficient financial practices and protectionist trade policies. Indeed, beginning in 2000, Japan took steps to pattern its education system more after the United States. Rightly or wrongly, however, *A Nation at Risk* launched two decades of education reform in America, and the call for change shows no signs of subsiding.

### Illustrating the Changes

The early twenty-first century mantra of educational accountability has an accompanying lexicon. This includes terms and ideas such as high performance schools, high-stakes testing, academic accountability, school effectiveness, organizational efficiency, teacher productivity, performance financing, charter schools, alternative schools, break-the-mold schools, privatizing, outsourcing, and pay for results. These and similar terms are illustrative of the slogans, issues, and topics that dominate American education policy and practice at the onset of the twenty-first century.

Underneath the slogans, two major change strategies have evolved. One is called the standards movement. The other travels under the banner of "competition" or "privatization." The two strategies are not mutually incompatible. Each necessitates government specification of learning standards or curricular goals that schools are expected to meet.

In the standards movement, textbooks and other instructional materials, teacher training, professional licensing, financial arrangements, statewide achievement testing, and performance awards and penalties are expected to be aligned and made consistent with these purposes. Advocates for the second strategy, competition, contend that American automobiles improved in the 1970s only under the threat of foreign competition, and schools are no different. Only when the current public school monopoly is severed, the argument goes, will professional educators be motivated to try harder and teach better. Competition or privatization advocates seek magnet schools, charter schools, voucher plans, parent choice plans, and smaller schools and school districts.

At the beginning of the twenty-first century, the standards movement held the upper hand. Literally thousands of legislative enactments, commission reports, gubernatorial campaigns, and regulatory activities had been constructed in its support. It was too early, however, to judge its effects.

Competition or choice has not yet seen a full day. Proposals for greater privatization of schooling have not come to dominate either the marketplace of policy ideas nor the practical arena of school operation. Union leaders speak in substantial opposition to privatization. Other critics fear the prospect of religious and ideological extremists being the recipients of government support. There are yet other critics who fear that greater privatization will further impede achieving a vision of a more fully integrated society, both racially and economically.

The U.S. Supreme Court was expected to rule in 2002 on the constitutionality of an Ohio law permitting public funds to be used in support of students' private schooling. Should the court rule favorably on the plan, privatization and competition might receive a substantial boost. An unfavorable decision might slow or substantially stall competition.

### The Pursuit of Liberty

A third deeply held value that frequently influences the direction of American education policy is liberty. This value provided a major ideological justification for the revolution that gave birth to the United States as a nation. In an essay on the new Constitution published in the *National Gazette* on January 17, 1792, James Madison wrote: "In Europe, charters of liberty have been granted by power. America has set the example, and France has followed it on charters of power granted by liberty."

For Americans, liberty has meant the freedom to choose, to be able to select from among different courses of action. The desire for choice fueled the historical American affection for a market economy. Competition among producers, along with other benefits, is held to expand the range of items from which consumers can choose. In the public sector, responsive governmental institutions are taken to be a crucial element for the expressions and preservation of choice and liberty.

In the view of those who initially designed the structures of American government, authority was vested in the citizenry, who then delegated the power to govern to selected representatives. A measure of

representatives' effectiveness was the degree to which they were responsive to the will of those they governed. Lack of responsiveness eroded power of the citizenry and, thus, constituted grounds for removal from office.

A second means for preserving liberty was to dispense governmental authority widely. This accounts for the separation of powers between three branches and over various levels of government. Efforts to inhibit accumulation of power also account for the deliberate fragmentation of decision-making authority, with some specific powers accorded to the federal government, some accorded to the states, and some reserved for the people themselves. Historically, the power to make educational decisions was structured in the same fashion. Centralized authority was viewed as perilous because of the prospect of exerting widespread control and uniformity. Formation of literally thousands of small local school districts, portending both inefficiency and inequality, was intended as an antidote to the accumulation of power. Proximity to constituents, coupled with the electoral process, was taken as a means to enhance governmental responsiveness and preserve liberty.

The federal constitution provides the state governments with ultimate legal responsibility for school decision-making. Historically states delegated substantial policy discretion to local units of government. In the period since World War II, however, factors such as increasing school costs, the politicization of school decisions, and intensified efforts to achieve greater equality of educational opportunity and more efficient use of school resources have heightened state-level participation.

A consequence of this increased state participation has been to remove a large measure of decision-making discretion from local education authorities. For example, state specifications on accountability dimensions such as the school curriculum, teacher salaries and working conditions, graduation requirements, and school architecture have increased markedly. Fewer persons now determine more decisions regarding schools. Choice is restricted, the ability of local officials to respond to constituent preferences is constrained, and, at least in a legal sense, local autonomy, liberty, and probably efficiency have been diminished.

By the latter half of the 1960s, a reaction to the diminished status of representativeness had begun.

Requests for change stemmed initially from ethnic enclaves in large cities, which perceived themselves as relatively impotent in affecting the operation of their children's schools. They demanded what was then labeled "community control." For example, several community-control experiments were attempted in the New York City schools. The state legislature ultimately recognized the growing political tide by dividing New York City into thirty-two elementary school districts. Given that each of the thirty-two averaged 30,000 students, approximately the size of the entire school system of the city of Syracuse, this could not realistically be characterized as community control. Nevertheless, each of New York's local districts was authorized to elect a nine-member local board of education. Thus, New York's elected school policymakers grew from 9 to 297.

Reaction to the dilution of representativeness also reached Congress. Federal education acts were amended in the early 1970s to mandate parent participation in the making of decisions about the use of federal program funds. Also, by the mid-1970s several state legislatures were requiring formation of parent advisory councils at school sites. Numerous local school districts were voluntarily implementing plans for wider involvement of citizens in school decision-making.

By the 1990s, and extending into the twenty-first century, liberty advocates were pursuing more powerful strategies than simply enhanced parent advisory councils. The new expressions of liberty were charter schools and voucher plans.

Charter schools in effect are local schools free to operate outside the restraint of a school district. Their operating charter can be granted either by state authority or, in some instances, by a local school board. They can be private or public. They derive their financial support from public sources. They are the equivalent of so-called grant-maintained schools in Great Britain. They are required to have a board of directors and to be fiscally responsible. In most states, charter schools are also required to adhere to a minimal state curriculum and to administer state standardized achievement tests. Students are free to attend charter schools or to select their regularly assigned public school.

Voucher plans involve public education funds flowing to households that then choose the school for their children. Vouchers are the subject of experimentation in Milwaukee, Wisconsin; Cleveland,

Ohio; and San Antonio, Texas. They are unusually controversial because their subsidy may pierce the conventional First Amendment prohibition of public funding in support of religious causes. In June 2000 the U.S. Supreme Court ruled that students in Cleveland may use state-funded vouchers to pay tuition at private schools, including schools with a religious affiliation. The decision in this case is likely to have a significant policy impact for years to come.

### Conclusion

Will accountability efforts succeed in elevating U.S. school performance? Will colleges and universities eventually be subjected to the same kind of efficiency requirements experienced by public schools? Will the achievement gap between middle- and lower income students be narrowed? Will public funding of private and religious schools eventually be approved, and, if so, will such arrangements prove the undoing of the great American socialization engine, public schooling?

There is no effort here at predicting the outcome of such queries. The answers will come in time and, no doubt, will be the subject of future analysis and comment. What is predictable, however, is that the significance of education for society will only increase and that government will continue to be challenged by continually having to strike a new balance among the advocates of greater equality, efficiency, and liberty.

JAMES W. GUTHRIE

## EDUCATIONAL PSYCHOLOGY

Educational psychologists "study what people think and do as they teach and learn a particular curriculum in a particular environment where education and training are intended to take place" (Berliner, p. 145). The work of educational psychologists focuses "on the rich and significant everyday problems of education" (Wittrock, pp. 132–133).

### History

Long before educational psychology became a formal discipline, scholars were concerned about what people think and do as they teach and learn. The Greek philosophers Plato and Aristotle discussed topics still studied by educational psychologists—the role of the teacher, the relationship between teacher and student, methods of teaching, the nature

and order of learning, the role of affect in learning. In the 1500s the Spanish humanist Juan Luis Vives emphasized the value of practice, the need to tap student interests and adapt instruction to individual differences, and the advantages of using self-comparisons rather than competitive social comparisons in evaluating students' work. In the 1600s the Czech theologian and educator Johann Amos Comenius introduced visual aids and proclaimed that understanding, not memorizing, was the goal of teaching. Writings of European philosophers and reformers such as Jean-Jacques Rousseau (1712–1778), Johann Heinrich Pestalozzi (1746–1827), Johann Friedrich Herbart (1776–1841), and Friedrich Wilhelm August Froebel (1782–1852) stressed the value of activity, prior experience, and interest. All these ideas are consistent with current work in educational psychology.

In the United States, psychology was linked to education and teachers from its inception. In 1890 the American philosopher William James founded psychology in America and then followed with a lecture series for teachers titled "Talks to Teachers about Psychology." These lectures were given in summer schools for teachers around the country and then published in 1899 both as a book and in the *Atlantic Monthly* magazine. Again, some of James's ideas were quite modern—he supported the use of discussion, projects and activities, laboratory experiments, writing, drawing, and concrete materials in teaching.

James's student, G. Stanley Hall, founded the American Psychological Association and was its first president. Teachers helped him collect data for his dissertation about children's understandings of the world. Hall founded the child-study movement in the United States and wrote extensively about children and adolescents. He encouraged teachers to make detailed observations and keep careful records to study their students' development—as his mother had done when she was a teacher. Hall's ideas influenced education through courses in child study introduced into normal schools beginning around 1863.

Hall's student, John Dewey, founded the Laboratory School at the University of Chicago and is considered the father of the Progressive education movement. Another of William James's students, Edward Lee Thorndike, wrote the first educational psychology text in 1903 and founded the *Journal of Educational Psychology* in 1910.

**Psychology and key ideas in education.** Developments in education continued to be closely tied to psychologists in the first half of the twentieth century. In fact, in 1919, Ellwood Cubberly dubbed educational psychology a "guiding science of the school" (p. 755). It was not uncommon for psychologists such as Thorndike, Charles H. Judd, or their students to be both presidents of the American Psychological Association and authors of materials for teaching school subjects or measuring achievement in reading, mathematics, or even handwriting. The work of Thorndike, Alfred Binet, Jean Piaget, and Benjamin Bloom illustrate earlier connections between psychology and education.

**Thorndike, teaching, and transfer.** Although Thorndike is most well known in psychology for his research on learning that paved the way for B. F. Skinner's later studies of operant conditioning, his impact in education went beyond his studies of learning. He developed methods for teaching reading and arithmetic that were widely adopted, as well as scales to measure ability in reading, arithmetic, handwriting, drawing, spelling, and English composition. He supported the scientific movement in education—an effort to base teaching practice on empirical evidence and sound measurement. His view proved narrow as he sought laws of learning in laboratories that could be applied to teaching without actually evaluating the applications in real classrooms. It took fifty years to return to the psychological study of learning in the classroom, when the Soviet Union's successful launch of *Sputnik* in 1957 startled the United States and precipitated funding for basic and applied research on teaching and learning. Thorndike also had a lasting effect on education by demonstrating that learning Greek, Latin, and mathematics did not "exercise the mind" to improve general thinking abilities. Partly because of his research, required study of the classics decreased.

**Binet and assessments of intelligence.** About the time that Thorndike was developing measures of reading and arithmetic abilities, Alfred Binet was working on the assessment of intelligence in France. Binet, a psychologist and political activist in Paris in the early 1900s, was charged with developing a procedure for identifying students who would need special education classes. He believed that having an objective measure of learning ability could protect students of poor families who might be forced to leave school because they were assumed to be slow

learners. Binet and his collaborator Théodore Simon identified fifty-eight tests, several for each age group from three to thirteen, that allowed the examiner to determine a mental age for a child. A child who succeeded on the items passed by most six-year-olds, for example, was considered to have a mental age of six, whether the child was actually four, six, or eight years old. The concept of intelligence quotient, or IQ, was added after Binet's procedure was brought to the United States and revised at Stanford University to become the Stanford-Binet test. The early Stanford-Binet has been revised four times as of 2002, most recently in 1986. The success of the Stanford-Binet has led to the development of several other modern intelligence tests.

***Piaget and the development of thinking.*** As a new Ph.D. working in Binet's laboratory, Jean Piaget became intrigued with children's wrong answers to Binet's tasks. Over the next several decades, Piaget devised a model to describe the thinking behind these wrong answers and to explain how humans gather and organize information. Piaget's theory of cognitive development is based on the assumption that people try to make sense of the world and actively create their knowledge through direct experience with objects, people, and ideas. Maturation, activity, social interaction, and equilibration (the constant testing of the adequacy of understanding) influence the way thinking and knowledge develop. Piaget believed that young people pass through four stages in their cognitive development: sensorimotor, preoperational, concrete-operational, and formal-operational. Piaget's theory transformed education in mathematics and science and is still a force in the early twenty-first century in constructivist approaches to teaching.

***Bloom and the goals of instruction.*** Also during the 1950s and 1960s, results of a project directed by Benjamin Bloom touched education at all levels around the world. Bloom and his colleagues developed a taxonomy, or classification system, of educational objectives. Objectives were divided into three domains: cognitive, affective, and psychomotor. A handbook describing the objectives in each area was eventually published. These taxonomies have been included in hundreds of books and articles about teaching and testing. Teachers, test developers, and curriculum designers use the taxonomies to develop instructional objectives and test questions. It would be difficult to find an educator trained in the past thirty years who had not heard of Bloom's taxonomy

in some form. The cognitive domain taxonomy was revised in 2001 by Lorin W. Anderson and David R. Krathwohl.

***Moving toward contemporary educational psychology.*** In the 1960s a number of educational psychologists developed approaches to teaching that foreshadowed some of the contemporary applications and arguments. Jerome Bruner's early research on thinking stirred his interest in education. Bruner's work emphasized the importance of understanding the structure of a subject being studied, the need for active learning as the basis for true understanding, and the value of inductive reasoning in learning. Bruner believed students must actively identify key principles for themselves rather than relying on teachers' explanations. Teachers should provide problem situations stimulating students to question, explore, and experiment—a process called discovery learning. Thus, Bruner believed that classroom learning should take place through inductive reasoning, that is, by using specific examples to formulate a general principle.

David Ausubel disagreed. He believed that people acquire knowledge primarily through reception rather than discovery; thus learning should progress not inductively from examples to rules as Bruner recommended, but deductively: from the general to the specific, or from the rule to examples. Ausubel's strategy always began with an advance organizer—a technique still popular in the twenty-first century—which is a kind of conceptual bridge between new material and students' current knowledge.

### **Contemporary Views of Learning and Motivation**

Educational psychologists have studied cognition, instruction, learning, motivation, individual differences, and the measurement of human abilities, to name just a few areas that relate to education and schooling. Of all these, perhaps the study of learning is the most closely associated with education. Different theories of learning have had different impacts on education and have supported different practices.

***Behavioral views of learning.*** The behavioral approach to learning developed out of work by Skinner, whose research in operant conditioning showed that voluntary behavior can be altered by changes in the antecedents of the behavior, the consequences, or both. Early work focused on consequences and demonstrated that consequences following an action

may serve as reinforcement or punishment. Skinner's theories have been used extensively in education, by applying principles of reinforcement and punishment to change behaviors, often called applied behavior analysis. For much of the 1960s Skinner's ideas and those of behaviorists who followed him shaped teaching in regular and special education, training in the military, coaching, and many other aspects of education. Principles of reinforcement continue to be important for all teachers, particularly in classroom management and in decisions about grades and incentives for learning.

In the 1970s and 1980s a number of educational psychologists turned their attention from research on learning to research on teaching. Their findings shaped educational policy and practice during those years and since. Much of the research that focused on effective teaching during that time period pointed toward a model of teaching that is related to improved student learning called direct instruction or explicit teaching.

**Cognitive views of learning.** Behaviorists define learning as a change in behavior brought about by experience with little concern for the mental or internal aspects of learning. The cognitive view, in contrast, sees people as active learners who initiate experiences, seek out information to solve problems, and reorganize what they already know to achieve new insights. In fact, learning within this perspective is seen as “transforming significant understanding we already have, rather than simple acquisitions written on blank slates” (Greeno, Collins, and Resnick, p. 18). Much of the work on behavioral learning principles has been with animals in controlled laboratory settings. The goal is to identify a few general laws of learning that apply to all higher organisms (including humans, regardless of age, intelligence, or other individual differences). Cognitive psychologists, on the other hand, focus on individual and developmental differences in cognition; they have not sought general laws of learning. Cognitive views of learning are consistent with the educational theories of Bruner and Ausubel and with approaches that teach learning strategies, such as summarizing, organizing, planning, and note taking.

**Constructivist theories of learning.** Constructivist perspectives on learning and teaching are increasingly influential today. These views are grounded in the research of Piaget, Lev Vygotsky, the Gestalt psychologists, Fredric Bartlett, and Bruner as well as the Progressive educational philosophy of Dewey. There

are constructivist approaches in science and mathematics education, in educational psychology and anthropology, and in computer-based education. Some constructivist views emphasize the shared, social construction of knowledge; others see social forces as less important.

Even though there is no single constructivist theory, many constructivist teaching approaches recommend the following:

- Complex, challenging learning environments and authentic tasks
- Social negotiation and shared responsibility as a part of learning
- Multiple representations of content
- Understanding that knowledge is constructed
- Student-centered instruction

Inquiry is an example of constructivist teaching. Dewey described the basic inquiry learning format in 1910. There have been many adaptations of this strategy, but the teacher usually presents a puzzling event, question, or problem. The students formulate hypotheses to explain the event or solve the problem, collect data to test the hypotheses, draw conclusions, and reflect on the original problem and on the thinking processes needed to solve it. Like discovery learning, inquiry methods require great preparation, organization, and monitoring to be sure everyone is engaged and challenged.

A second example of constructivist teaching influenced by Vygotsky's theories of assisted learning is called cognitive apprenticeships. There are many models, but most share six features:

1. Students observe an expert (usually the teacher) model the performance.
2. Students get external support through coaching or tutoring (including hints, feedback, models, reminders).
3. Conceptual scaffolding (in the form of outlines, explanations, notes, definitions, formulas, procedures, etc.) is provided and then gradually faded as the student becomes more competent and proficient.
4. Students continually articulate their knowledge—putting into words their understanding of the processes and content being learned.
5. Students reflect on their progress, comparing their problem solving to an expert's performance and to their own earlier performances.

6. Students are required to explore new ways to apply what they are learning—ways that they have not practiced at the professional's side.

**Motivation in education.** Much work in educational psychology has focused on student motivation: the engine that fuels learning and the steering wheel that guides its progress. Just as there are many theories of learning, there are quite a few explanations of motivation. Behaviorists explain motivation with concepts such as “reward” and “incentive.” Rewards are desirable consequences for appropriate behavior; incentives provide the prospect for future rewards. Giving grades, stars, and so on for learning—or demerits for misbehavior—is an attempt to motivate students by extrinsic (external) means of incentives, rewards, and punishments. Humanistic views of motivation emphasize such intrinsic (internal) forces as a person's needs for “self-actualization,” the inborn “actualizing tendency,” or the need for “self-determination.” From the humanistic perspective, motivation of students means to encourage their inner resources—their sense of competence, self-esteem, autonomy, and self-actualization.

Cognitive theorists believe that behavior is determined by thinking, not simply by whether one has been rewarded or punished for the behavior in the past. From this perspective, behavior is initiated and regulated by plans, goals, schemas (generalized knowledge), expectations, and attributions (the causes we see for our own and other people's behavior). Social learning theories of motivation are integrations of behavioral and cognitive approaches: They take into account both the behaviorists' concern with the effects or outcomes of behavior and the cognitivists' interest in the impact of individual beliefs and expectations. Many influential social learning explanations of motivation can be characterized as expectancy and value theories that view motivation as the product of two main forces: (1) the individual's expectation of reaching a goal and (2) the value of that goal to the individual. Attempts to build a sense of efficacy for classroom learning are educational applications of this approach.

### Issues and Controversies

The application of psychology to education has seen many controversies. The psychological content of teacher preparation moved from Hall's emphasis on child study to Thorndike's connectionist approach to learning; to educational psychology texts for teachers in the 1920s that included measurement

and the psychology of school subjects; to an emphasis in the 1950s on mental hygiene, child development, personality, and motivation; to a greater emphasis on learning theories and programmed instruction in the 1960s; to research on teaching in the 1970s; to the dominance of Piagetian theories and the resurgence of cognitive approaches in the 1980s; to current texts that emphasize Vygotskian influences and constructivism along with a return to the instructional psychology of school subjects. Once a requirement in virtually all teacher preparation programs, educational courses have been replaced, renamed, redesigned, and integrated into other education courses. As examples of two issues in educational psychology and schooling, consider conceptions of intelligence and approaches to the teaching of reading.

**What does intelligence mean?** The idea of intelligence has been with us for a long time. Plato discussed similar variations more than 2,000 years ago. Most early theories about the nature of intelligence involved one or more of the following three themes: (1) the capacity to learn; (2) the total knowledge a person has acquired; and (3) the ability to adapt successfully to new situations and to the environment in general.

In the twentieth century there was considerable controversy over the meaning of intelligence. In 1986 at a symposium on intelligence, twenty-four psychologists each offered a different view about the nature of intelligence. More than half of the experts mentioned higher-level thinking processes such as abstract reasoning, problem solving, and decision-making as important aspects of intelligence, but they disagreed about the structure of intelligence: Is it a single ability or many separate abilities? Evidence that intelligence is a single basic ability affecting performance on all cognitively oriented tasks comes from consistent correlations among scores on most tests of specific mental abilities. In spite of these correlations, however, some psychologists insist that there several separate “primary mental abilities.” In 1938 Louis Leon Thurstone listed verbal comprehension, memory, reasoning, ability to visualize spatial relationships, numerical ability, word fluency, and perceptual speed as the major mental abilities underlying intellectual tasks. Joy Paul Guilford and Howard Gardner are the most prominent modern proponents of the concept of multiple cognitive abilities. Gardner's theory of multiple intelligences has had the greatest impact on education. According to

Gardner there are at least eight separate kinds of intelligences: linguistic, musical, spatial, logical-mathematical, bodily-kinesthetic, interpersonal, intrapersonal, and environmental.

**Ability differences in schools.** In the early 1900s, before group intelligence tests were readily available, teachers dealt with student achievement differences by promoting students who performed adequately and holding back others. This worked well for those who were promoted, but not for those who failed. The idea of social promotion was introduced to keep age-mates together, but then teaching had to change. When intelligence test became available, one solution was to promote all students, but group them by ability within their grade level. Ability grouping was the basis of many studies in the 1930s, but fell from favor until 1957 and the era of *Sputnik*, when concern grew about developing talent in mathematics and science. Again, in the 1960s and 1970s, ability grouping was criticized. In the early twenty-first century, teachers are encouraged to use forms of cooperative learning and heterogeneous grouping to deal with ability differences in their classes.

**Learning to read.** Educational psychologists have made great progress understanding how students learn different subjects. Based on these findings, approaches have been developed to teach reading, writing, science, mathematics, social studies, and other subjects. Reading instruction has been the focus of great controversy. Educators have debated whether students should be taught to read and write through code-based (phonics, skills) approaches that relate letters to sounds and sounds to words or through meaning-based (whole-language, literature-based, emergent literacy) approaches that focus on the meaning of the text.

Research in educational psychology demonstrates that whole language approaches to reading and writing are most effective in preschool and kindergarten because they improve students' motivation and interest and help them understand the nature and purposes of reading and writing. Phonemic awareness—the sense that words are composed of separate sounds and that sounds are combined to say words—in kindergarten and first grade predicts literacy in later grades. If children do not have phonemic awareness in the early grades, direct teaching can dramatically improve their chances of long-term achievement in literacy. Excellent primary school teachers use a balance of explicit decoding-skills teaching and whole language instruction.

**Testing in education.** By 1925 Charles Judd proclaimed that “tests and measures are to be found in every progressive school in the land” (p. 807). In fact, psychology has had a profound impact on education through the adoption of testing. On the average, more than 1 million standardized tests are given per school day in classes throughout the United States. But tests are not without controversy. Critics of standardized testing state that these tests measure disjointed facts and skills that have no use or meaning in the real world. Often test questions do not match the curriculum of the schools, so the tests cannot measure how well students have learned the curriculum. Supporters assert that tests provide useful information. As Joseph Rice suggested more than a century ago, a good way to judge if teaching has been effective might be to test what the students learned. The test, however, does not tell all. Also more than 100 years ago, William James suggested that with test results must be combined with observations made “upon the total demeanor of the measured individual, by teachers with eyes in their heads and common sense and some feeling for the concrete facts of human nature in their hearts” (p. 84).

**Expectations of the profession.** Increasingly technology offers an alternative or addition to traditional materials in teaching and learning. For example, the Cognition and Technology Group at Vanderbilt University has developed a problem-based learning environment called anchored instruction. The anchor is the rich, authentic, and interesting situation presented via videodisk or computer that provides a focus—a reason for setting goals, planning, and using mathematical tools to solve problems. Anchored instruction is an example of cognitive apprenticeships described above.

It is likely that educational psychologists will continue to contribute to education as they learn more about the brain and how learning occurs; the development of intellect, affect, personality, character, and motivation; ways of assessing learning; and the creation of multifaceted learning environments. It also is likely that some issues will spiral through these contributions. What is a useful and appropriate balance of discovery and direct instruction? How can teachers, who must work with groups, adapt instruction to individual variations? What should be the role of testing and grading in education? What are the goals of education and how do instructors balance cognitive, affective, and psychomotor objectives? How can learning technologies be used to best

advantage for students? How can teachers help students understand, remember, and apply knowledge? These questions may not be as new as they seem upon attendance to the history of psychology and its applications to education.

## EDUCATIONAL RESOURCES INFORMATION CENTER

The Educational Resources Information Center (ERIC) is a federally funded nationwide information system established to provide easy access to information about education research. ERIC offers educators and researchers a single source through which they can identify and obtain copies of education-related documents, articles, books, monographs, tests, manuals and handbooks, bibliographies, statistical reports, conference papers, dissertations and theses, historical materials, yearbooks, and translations. ERIC's mission is to improve American learning, teaching, and educational decision making by facilitating access to helpful educational research and information.

### Program

The massive ERIC database contains more than 1 million abstracts of education-related documents and articles, making it the world's largest repository of education information. The database is updated monthly, and more than 30,000 items are added each year. Interested parties can access the database via the Internet or through commercial vendors. Access to the ERIC database is also available at more than 1,000 libraries and education resource centers around the world. Many of these sites maintain an ERIC microfiche collection and can provide electronic copies of ERIC documents. In addition, ERIC abstracts are available in the print publications *Resources in Education*, ERIC's main announcement bulletin, and *Current Index to Journals in Education*, a monthly comprehensive index to periodical literature in education research.

Anyone interested in education can obtain copies of the full text of many ERIC documents at any library that owns the ERIC microfiche collection. Full-text microfiche or paper copies can also be ordered from ERIC's Document Reproduction Service. The full texts of some documents are also available online. ERIC does not supply full-text copies of journal articles abstracted in the ERIC database; these can be obtained from many library periodical collections or from the journal publisher.

During the 1990s ERIC implemented several invaluable electronic services. One of the most popular is AskERIC, an Internet-based service begun in 1992. AskERIC provides access to a web-based version of the ERIC database that includes document and journal citations from 1966 to the present. AskERIC also offers education-related question-and-answer services, a question archive, lesson plans, mailing lists, internet links, and listings of educational organizations, meetings, and conferences.

ERIC publications include popular two-page research syntheses called *ERIC Digest*. The digests are short reports that give an overview of a current topic of interest in education. ERIC produces approximately one hundred new digests each year. By 2001 there were nearly 2,500 *ERIC Digests*, most available online. Another publication, the *ERIC Review*, features information about emerging education issues, as well as announcements about ERIC products, services, and developments. ERIC also issues Parent Brochures, produces an online journal called *Parent News*, and sponsors the National Parent Information Network for parents who are interested in their children's education.

### Organization

ERIC is supported by the U.S. Department of Education's Office of Educational Research and Improvement, and is administered by the National Library of Education. Unlike most federal information systems, in which all activities are conducted under one roof with centralized control, ERIC conducts much of its document processing and dissemination activities at decentralized and relatively autonomous clearinghouses. The ERIC network consists of sixteen main clearinghouses, nine adjunct clearinghouses, one affiliate clearinghouse, and three support components. ERIC's clearinghouses and components are located at various sites around the country. Most clearinghouses are associated with a college or university.

Each of ERIC's sixteen main clearinghouses is responsible for the collection, processing, and dissemination of documents in a specific topic or field of education research. ERIC clearinghouses include, for example, the Clearinghouse on Adult, Career, and Vocational Education at the Ohio State University; the Clearinghouse on Information and Technology at Syracuse University in New York; the Clearinghouse on Elementary and Early Childhood Education at the University of Illinois in Champaign-Urbana; and the Clearinghouse for Social Studies/Social Science Education at Indiana University. ERIC clearinghouses also respond to requests for information and produce publications on current research and practices in their designated subject area. The nine adjunct clearinghouses are associated with one of the sixteen larger ERIC clearinghouses and have similar responsibilities.

Support components include the online service AskERIC; the ERIC Document Reproduction Service in Springfield, Virginia; and the ERIC Processing and Reference Facility in Lanham, Maryland. The three ERIC support components are responsible for producing, publishing, and disseminating systemwide products and services.

### History

ERIC was created in 1966 as the Educational Research Information Center by the United States Office of Education; a year later its name was changed by substituting "Resources" for "Research" (the acronym remained ERIC) because ERIC had grown into a national education information system of service to educators and researchers.

## EDUCATIONAL TESTING SERVICE

Educational Testing Service (ETS) is a nonprofit organization whose mission is to help advance quality and equity in education by providing fair and valid assessments, research, and related services. Its products and services measure knowledge and skills, promote learning and performance, and support education and professional development worldwide. Founded in 1947 as an independent organization by the American Council on Education, the Carnegie Foundation for the Advancement of Teaching, and the College Entrance Examination Board, ETS has grown to become the world's largest private educational testing and measurement organization, annually administering more than 11 million tests in 181 countries. Helping ETS carry out its mission are the following key divisions.

The ETS Statistics and Research Division is a group of innovative, internationally respected measurement experts who specialize in research and development in psychometrics, equitable testing, and assessment technology. More than 250 division staff, including some of the nation's most distinguished scientists in the fields of psychometrics and statistics, engage in research and analysis to support existing assessments and generate ideas for future assessment products and services. At the same time, they contribute to the field of educational measurement and policy research more broadly, providing objective data to inform current discussions about policy affecting the national education debates.

The School and College Services Division manages testing and nontesting programs, develops tests and ancillary services, prepares a number of publications, and offers a variety of products and services to the education market.

The division carries out work for a number of clients as well as for ETS. It serves ETS's largest client, The College Board, by providing the development and delivery of programs such as the SAT, the Preliminary SAT/National Merit Scholarship Qualifying Test (PSAT/NMSQT), and Advanced Placement tests (AP).

The School and College Services Division also serves the National Center for Education Statistics through the development and delivery of the National Assessment of Educational Progress (NAEP) tests. Its other clients are the Educational Records

Bureau (ERB), the Southern Regional Education Board (SREB), Johns Hopkins University Institute for the Academic Advancement of Youth (IAAY), the New York City Board of Education, the National Association of Independent Schools (NAIS), the University of California, and the California State University System.

The mission of the Graduate and Professional Education Division is to provide leadership and continuous improvement in fair and equitable assessments and services that serve students, institutions, and society in graduate and professional education. It offers the majority of its testing through computers, and its major programs are the Graduate Record Examinations (GRE), the Graduate Management Admission Test (GMAT) and the Test of English as a Foreign Language (TOEFL).

The division also houses the Fairness, Access, Multiculturalism, and Equity (FAME) Initiative, a research-based effort to help ETS address the concerns of its increasingly diverse graduate and professional school education constituencies. FAME is an ethics-based effort designed to examine the connections between the expressed values underlying the company's assessments, products, and services and actual outcomes.

The purpose of the Information Systems and Technology Division is to deliver business value through information technology. Business value is defined as increasing revenue, decreasing costs, improving productivity, and supporting strategic initiatives and directives. Within Information Systems and Technology is the Advanced Assessment and Delivery Technologies (AADT) Division that is responsible for all enterprisewide systems associated with test creation, scoring, analysis, and delivery of assessments, collecting the candidate results. This includes paper-and-pencil tests as well as computer-based tests.

The Teaching and Learning Division is committed to supporting learning and advancing good teaching through a coherent approach to the licensing, advanced certification, and professional development of teachers and school leaders. Its major assessment programs include the Praxis Series: Professional Assessments for Beginning Teachers, the School Leadership Series, and working as the primary contractor to provide certification for the National Board for Professional Teaching Standards. The division also is responsible for the Pathwise Series

that offers a variety of professional development programs tied to research-based standards to help teachers at all levels (student, beginning, and experienced teachers) improve their teaching practices.

The Communications and Public Affairs Division has the responsibility to meet the communication and information needs of ETS employees and key external constituents to support the company's strategic direction. It aids management to project the public voice of ETS, articulating the philosophy, policy, and position of the organization as a leader in education reform.

## EDUCATION COMMISSION OF THE STATES

---

The Education Commission of the States (ECS) is an interstate compact created in 1965 to improve education by facilitating the exchange of information, ideas, experiences, and innovations among state policymakers and education leaders.

Forty-nine states, three territories, and the District of Columbia constitute the commission's membership, each represented by the governor and six other individuals: legislators, chief state school officers, state and local school board members, higher-education officials, superintendents, teachers, and business leaders. The ECS chairmanship and vice chairmanship are held by a governor and a legislator, respectively, alternating between the two major political parties.

The Education Commission of the States' status as a nonpartisan organization, involving key leaders from all levels of the education system, creates unique opportunities to build partnerships, share information and promote the development of policy based on the best available research and strategies. ECS obtains financial support through a combina-

tion of state fees and contracts, sponsorships, and grants from foundations, corporations and the federal government.

ECS, which is headquartered in Denver, Colorado, has three operating divisions that work together to provide state policymakers with the services and products they need to make informed policy decisions about education. The Information Clearinghouse gathers, analyzes, disseminates, and serves as a repository of information on a broad range of education topics, from a wide variety of sources—including state legislation, research studies, reports, journals, and news articles. ECS provides access to this extensive collection of material through its website, through various print publications, and through customized, quick turnaround searches by Clearinghouse staff.

Through its Policy Studies and Programs Division, ECS identifies, studies, and provides heightened visibility for education trends and issues that are of greatest concern to its constituents. The organization's current areas of focus are accountability, finance, governance, leadership, and teaching quality.

State Services provides a range of customized technical assistance to states: consultation and advice, testimony at legislative hearings, policy audits and analysis, meeting facilitation, and support for partnerships and networks.

ECS sponsors state, regional, and national conferences (including the annual National Forum on Education Policy), all of which provide policymakers, educators, and other interested parties with an opportunity to share ideas and learn from one another.

## EDUCATION DEVELOPMENT PROJECTS

---

Contemporary education development projects can trace their origins to the programs of bilateral and

multilateral official development assistance offered to newly independent and developing countries after World War II. The goals and purposes, content, format, actors, financing, and delivery of education development projects have undergone many changes throughout the last half of the twentieth century.

### History

Official development assistance (hereafter, *aid*) for education expanded rapidly during the 1950s and 1960s when many previously colonized countries became independent. Industrialized countries were seen as partly responsible for the development of poorer and newly independent countries, through the provision of both financial resources and technical skills. Many multilateral institutions were founded to deliver development assistance, including the International Bank for Reconstruction and Development (IBRD), and the United Nations Development Program (UNDP). Foundations such as the Rockefeller and Ford Foundations became early players in the delivery of education development projects. Bilateral development assistance institutions, such as the United States Agency for International Development (USAID), were also established, and came to deliver both the largest share of international funding for development, and for educational development.

Ideas about modernization and progress dominated the work of these organizations. Development was generally defined as linear progress toward the kinds of economic and political systems existing in the Western industrialized world. Education, which was associated in industrialized countries with economic progress and national development through the creation of human resources, quickly became an important component of their development agenda.

Initially, educational aid was primarily used to provide tertiary or graduate training to foreign nationals in donor countries, to bring trained educators to developing countries, or to help establish international professional organizations. However, in the 1960s, the focus of educational aid shifted somewhat as concerns about “brain drain” and continued developing country dependency on external institutions led donor governments and organizations to support vocational programs and the construction of tertiary and secondary institutions in developing countries. Donors began to invest in discrete education projects, which often focused on training for education providers (for example,

teachers), provided technical support to education ministries, or constructed schools. Projects tended to fund capital as opposed to recurrent costs (like teacher salaries), and were small in scale, and staffed and monitored by the donor organization. Individual donors often specialized in a specific type of educational intervention or level of education, thus dominating that field and the pattern of its development in the recipient country.

### **The Project Model**

The project model for delivering aid had several advantages over the initial focus on high level training. It often kept developing country personnel in country for training, trained lower-level personnel, built infrastructure, and offered a greater variety of technical services and training. It allowed for variation and experimentation—leading, for example, to innovative efforts to focus on grassroots educational development and literacy by Scandinavian donors. Joel Samoff (1997) outlines some of the project model's weaknesses. Project aid often fragmented educational development and planning into a set of mismatched and uncoordinated donor-led interventions. It tended to emphasize short-term goals over longer-term needs, and to focus the resources of many of the countries' ministries of education on short term project management and evaluation, rather than on systemwide development. Donor resources were often tied—provided only to finance goods and services from donor nationals. Finally, the choice and implementation paths of education development projects were often highly politicized. Education development projects produced complex donor/recipient government interactions, often colored by the ideological or institutional experience with education in the donor country and by the donor's control over resources. For this reason, education development projects never functioned as the simple transfer of technical and financial resources originally envisaged in modernization theory.

### **Aid for Education**

Hans Weiler notes that in the late 1970s, even as donor organizations reconfirmed the benefits of education for national development, education aid budgets began to stagnate or decline. Although there is a lack of comparable data before 1973, it appears that overall aid for education from Organisation for Economic Co-operation and Development (OECD) member countries barely kept pace with inflation

after 1980. Ever fewer resources came from Eastern European, Soviet, and OPEC states and greater numbers of newly independent states vied for shrinking aid dollars. At the same time, the balance of influence among donors active in educational development projects shifted, with the World Bank emerging as the most significant single lender to education both in terms of technical and financial capacities.

Throughout the 1980s and 1990s, many developing countries faced a serious crisis in national education spending, caused both by widespread scale economic collapse and by subsequent structural adjustment programs. Financial tensions fueled debates among donors about the merits of educational expansion versus qualitative improvement, basic versus postprimary expansion of education, and academic versus technical/vocational or adult education. In the early 1980s, commentators such as Paul Hurst questioned the assumption that investment in education would yield economic growth, since two decades of large growth in educational investment in developing countries had not convincingly supported this claim. Soon after, new economic studies, such as Maraline Lockheed and Adriaan Verspoor's World Bank-sponsored study claimed that a focus on basic education (particularly for girls) was the most cost-effective and developmentally effective form of educational investment. An era of economic austerity also fueled the introduction of new components in educational development projects, including an emphasis on cost recovery mechanisms, the decentralization of educational systems, the introduction of national testing programs, and support for nongovernmental provision of educational services.

The 1990s saw a new convergence of donor activities, perhaps in part because of the ideological convergence that followed the collapse of state socialism. The 1990 World Conference on Education for All, sponsored by the United Nations Educational, Scientific and Cultural Organization (UNESCO), the World Bank, the United Nations Children's Fund (UNICEF), and others, brought donors and developing countries together around a more unified aid agenda focused on the revitalization of primary education in the poorest developing countries. Many donors subsequently reoriented their educational development efforts to focus on primary education. However, despite strong rhetoric, overall

levels of donor aid did not increase substantially during the last decade of the twentieth century.

Donors also began to debate the merits of sectorwide or systemwide approaches in education during the 1990s. Sectorwide approaches differ from project-based approaches in a number of ways. One of the most obvious is that sectorwide aid provides money directly to the developing country government's budget, on the basis of a long-term education development plan. There is debate about whether the effect of this mechanism is to give the recipient government greater control over how money is spent, or whether this shift actually amounts to greater restrictions on the government. First, sectorwide aid is often heavily conditioned, and second, donors now can expect recipient governments' entire sectoral approach to align with their increasingly convergent notion of what kind of education is best for development. Furthermore, instead of providing small-scale aid to many countries, the sectorwide model is highly selective, targeting the few countries able to provide a rational sector plan for educational change. Lastly, sectorwide aid is increasingly linked to wider acceptance of reforms in the areas of governance and economic policy.

Another important shift in educational development projects has been the growth of funding to support nongovernmental organizations (NGOs) as direct providers of educational services. There remains considerable debate about the sustainability of such strategies. Several of the largest international nongovernmental organizations active in educational development believe that NGOs should act more as policy advocates that service providers, and have launched an international campaign to this effect.

There have been tremendous changes in the putative focus of educational development projects—towards basic education, and a greater commitment to donor coordination, systemwide planning and local control. However, many scholars question the depth of such changes. In many countries, education development continues to receive limited external funding. A lack of coordination among donors and a lack of government control over the direction of educational development are commonplace. As in the past, the longer term sustainability of such efforts remains open to question.

## EDUCATION REFORM

---

### OVERVIEW

Jacob E. Adams Jr.

### REPORTS OF HISTORICAL SIGNIFICANCE

Rick Ginsberg

## OVERVIEW

In 1983 American education reform entered a new era. It was in that year that the federal government published a report of the National Commission on Excellence in Education entitled *A Nation at Risk: The Imperative for Educational Reform*. Commissioned in August 1981 by President Ronald Reagan's secretary of education, Terrel H. Bell, and chaired by David P. Gardner, then president of the University of Utah, this eighteen-member blue-ribbon panel of educators and elected officials examined the quality of elementary and secondary public education in the United States and found a "rising tide of mediocrity" that threatened the nation's future. In inflammatory tones, the commissioners reported that the United States had engaged in unthinking, unilateral educational disarmament, asserting that if an unfriendly foreign power had attempted to impose on America the mediocre educational performance the commissioners found, the nation might well have viewed it as an "act of war."

In support of their conclusions, the commissioners presented numerous indicators of risk, including Americans' poor academic performance relative to students overseas, high levels of functional illiteracy among U.S. adults and seventeen-year-olds, and declining achievement-test scores. The commissioners also cited increasing enrollments in college remedial courses, increasing business and military expenditures on remedial education, and a diluted curriculum in the schools. They detailed low expectations for student performance and college admissions, less time devoted to instruction and homework, and poor-quality teaching and teacher preparation. According to the commission's analysis, the nation's schools narrowly emphasized basic

reading and computational skills at the expense of other essential talents, such as comprehension, analysis, problem solving, and the ability to draw conclusions. For the first time in U.S. history, the report concluded, the educational skills of one generation would not surpass, nor would they even equal, those of its predecessors. This development was particularly striking as it would occur during a period of increasing business demand for highly trained workers.

The commission called for a new public commitment to excellence and education reform anchored in higher expectations for all students. It encouraged students to work harder and elected officials to encourage and support students' efforts. The rhetoric of reform proclaimed that all children can learn and that public policies should do everything possible to fully develop the talents of America's youth.

Specifically, the commission recommended tougher high school graduation requirements, more rigorous and measurable standards of student performance and conduct, more time devoted to learning, better teaching and teacher preparation, more effective school leadership, and greater fiscal support. The report struck a national nerve, defining the public dialog about school quality and sparking state action in education reform. California acted first, adopting omnibus education reform legislation that increased high school graduation requirements, lengthened the school day and year, raised expectations for homework and student conduct, expanded student testing, and increased education funding. Other states followed California's lead, adopting education reforms of varying magnitude. The *excellence era* in education reform was launched, ushering in more than two decades of federal, state, and local initiatives to improve America's public schools.

### Reform Groundswell

Why was *A Nation at Risk* such a successful catalyst for U.S. education reform? Arriving against a backdrop of widespread concern regarding the health of the U.S. economy, the report reflected contemporary misgivings that America was losing its "once unchallenged preeminence" in commerce and technology. Confronted by economic recession at home and declining market share abroad, government and business leaders looked to public schools to assign blame and to seek solutions. In fact, one of the fundamental assumptions of education reform in the

mid-1980s was that the quality of K–12 education would determine the nation's economic success. While the booming U.S. economy of the 1990s proved this assumption false in the aggregate, the relationship between improved education and an individual worker's success in the new marketplace remained compelling. According to analysts, the business-related skills needed to earn a middle-class income had changed radically.

In the mid-1990s the economists Richard Murnane and Frank Levy described three elements to these *new basic skills*: (1) basic mathematics, problem-solving, and reading abilities at levels much higher than high school graduates typically attain; (2) the ability to work in groups and to make effective oral and written presentations, skills many schools do not even teach; and (3) the ability to use personal computers to carry out simple tasks such as word processing. To secure these skills, they concluded, schools must help teachers learn to teach new material, devise better tests of student knowledge and understanding, raise expectations, and engage students' attention and energy. Education reform promised an avenue to such changes.

Further reinforcing *A Nation at Risk's* call for education reform, the mid-1980s saw publication of book-length, unflattering critiques of American high schools written by leading academic researchers. All told, philanthropic foundations, business groups, academic researchers, education organizations, political associations, and government agencies produced more than two dozen influential reports on public education between 1983 and the end of the twentieth century. All of these reports found deficiencies in American schools, and all called for education reforms of one kind or another.

The impetus for reform gained additional energy from growing social and political discontent. Social service agencies reported increasing incidences of poverty, drug abuse, unwanted pregnancy, and violence; while citizens, through property-tax revolts and consideration of privatization proposals, demonstrated a declining confidence in public institutions. Could changes in American education address these social and political ills in the same way that they might better prepare students for productive careers? Advocates thought so, and the call for reform broadened.

Buttressing the imperative for education reform, the nation's top political leaders added their

support. In 1989 President George Bush convened an education summit of corporate leaders and the nation's governors. This elite group crafted the first-ever national goals for public education. Subsequently, Presidents Bill Clinton and George W. Bush similarly sponsored national education summits (in 1996 and 2001, respectively), symbolizing the continued importance of public education reform to the nation.

In the 1990s education reform benefited still further from a broad social demand to improve government efficiency. Operating under the moniker *reinventing government*, advocates argued that bureaucratic government had become inefficient, or even bankrupt, and they promoted new forms of government organization and activity that emphasized dispersed authority, competition, flexibility, customer service, community empowerment, performance incentives, and oversight based on results. Many excellence-era education reforms substantially reflected this reinventing government agenda.

Finally, national commissions on teaching and education governance issued reports in the 1990s, the former crafting a blueprint for recruiting, preparing, and supporting excellent teaching; the latter defining options for infusing greater adaptability, flexibility, and accountability into public school governance.

This groundswell for public-education reform was not without critics, however. Contesting the evidence of public education's demise, these critics argued that Americans were being misled about school accomplishments, even to the extent of confronting a "manufactured crisis." The ensuing debate contested the interpretation of student test scores and other performance indicators, while the tone of the debate reflected alternative political claims that conservatives wished to discredit public education and that liberals undercut a legitimate need for education reform. While neither side claimed that public education was satisfactory, they scuffled over which problems deserved attention and which solutions held the key to fundamental school improvement.

This debate was not surprising. As historians David Tyack and Larry Cuban have noted, disagreements about progress and regress in American public education are characteristic of the landscape, and political arguments have often been used to mobilize and direct education reform.

## Reform Policies

During the excellence era two strands of activity have dominated the nation's education reform efforts. The more visible strand involved federal, state, and local initiatives to improve educational programs and governance. Designed to influence what students know and are able to do, program and governance reforms divide into three overlapping periods, which are distinguished by their predominant reform strategy and relative reliance on governmental, professional, citizen, and market mechanisms of education reform.

*Intensification period* initiatives (1983–1987) tightened existing education regulations and raised student requirements. Examples include increased high school graduation requirements, a longer school day and year, and skills tests for beginning teachers. *Restructuring period* initiatives (1986–1995) altered the way education was organized and governed, devolving authority to schools (particularly teachers) and to parents. Examples include school-based management and school choice. So-called whole-school designs emerged during this period as well, representing ambitious attempts to restructure American education. The New American Schools, the Coalition of Essential Schools, Core Knowledge schools, Accelerated Schools, Success for All, and the Edison Project represent these research-based, result-driven comprehensive plans to reorganize entire schools. Restructuring reforms also reached beyond the schoolhouse, linking education and social services in an effort to address poverty, pregnancy, and other nonschool circumstances that inhibit students' learning.

*Standards period* initiatives (beginning in 1992) established content standards for student knowledge, performance standards regarding levels of student mastery, and opportunity-to-learn standards governing conditions of learning. States reinforced the new standards through equally new performance accountability systems composed variously of public reporting requirements and performance tests, some tied to school rewards, sanctions, or state interventions to assist failing schools.

Standards-based reforms adopted a systemic perspective on education change, pursuing greater coherence across the gamut of learning goals, curriculum changes, professional development, accountability assessment, and governance arrangements. Simultaneously, other governance concerns

spawned unrelated experiments with charter schools, contracting, and forms of privatization.

A second strand of education reform activity during the post-1983 period originated in legal challenges to state school-finance systems. Based on equal protection claims, judicially mandated finance changes attempted to ensure the equitable provision of educational resources. In arguing that unequal resources unfairly preclude groups of students from the educational services they need to have even a chance at academic success, equity proponents conceived the problem of poor student performance as an issue of relative, even minimal, educational opportunity.

On the whole, the program-governance and finance reforms developed separately. Program-governance reforms arose as a remedy to the nation's poor showing on international comparisons of economic and educational performance; they sought changes in student achievement, promoted excellence, involved multiple levels of government, mandated changes in educational practice, and promised difficult implementation. In contrast, school finance reforms arose as a remedy to unequal educational resources; they sought a different distribution of dollars, promoted equity, primarily involved state government, and mandated only technical changes in school funding formulas, which were relatively simple to implement.

In the 1990s the two strands began to converge. Fourteen state supreme courts decided school finance cases on the unique basis of education clauses in state constitutions, finding a new obligation that public education must be adequate, not just equitable. Adequacy combines equity concerns regarding resource distribution with attention to what those resources accomplish. Though the future of adequacy as an important impetus to education reform remains uncertain, adequacy does link school finance to the core purposes of public education in ways that equity does not.

### Reform Dynamics

While finance, intensification, restructuring, and standards-based reform strategies all sought improvements in student learning, they operated from different conceptions of the problems that hamper school success. Finance reforms attempted to remedy inequitable resource allocations. Intensification policies targeted low expectations. Restructuring ad-

ressed outmoded forms of school organization. Systemic initiatives combated fragmented and uncoordinated state education policies, and standards redressed unspecified student learning goals and measures of success.

Within the excellence era, the transition from one period of reform to another resulted from judgments that current initiatives were not improving student achievement, primarily because they were not addressing the right problem. The transitions signaled the continued search for a sound theory of education reform.

Analysts working from different disciplinary perspectives have identified other dynamics that shape the promise of reform. Political scientists, for instance, have highlighted fundamental value conflicts in education reform proposals. Because values conflict, reform goals and resources shift as often as their supporting political coalitions shift, or as issues gain and lose salience in legislative deliberations.

Policy analysts have depicted the incomplete design of many education reform policies. Researchers Paul T. Hill and Mary Beth Celio coined the phrase *zones of wishful thinking* to describe the situation that occurs when reform initiatives do not cause all of the changes in public education that are necessary to achieve the results they seek, leaving school improvements, in part, to chance. Implementation scholars have noted, at the local level, the lack of motivation or capacity to undertake reform, inspiring Milbrey McLaughlin's conclusion that it is incredibly hard to make something happen, especially across levels of government and institutional settings.

Sociologists have discussed how the organization of schooling shields teaching from education policymaking, protecting classrooms from the turmoil of shifting reform agendas but also fostering a teaching culture of isolated and idiosyncratic practice, rendering uniform changes problematic. This loose coupling of education policy and practice helps explain how constancy and change coexist in public schools. Educators have targeted weak instruction, proposing improvements in teacher preparation, initial licensing, and advanced certification, thus pinning reform hopes on a re-created infrastructure for professional learning and accountability.

While these dynamics influence parts of the education system, political economists have assailed the whole system, arguing that the prevailing bu-

reaucratic organization of public schooling, with its regulatory and compliance mentality and reliance on collective bargaining, precludes serious change. Their remedies would alter education's incentives and governance arrangements.

Psychologists studying adolescent behavior have added a further dimension to the debate, demonstrating how students' home environments, peer culture, and part-time work explain more differences in student achievement than teacher quality or other school factors. From this perspective, education reforms must extend beyond the boundaries of schools.

While demonstrating the complexity of education reform, these analyses also signal how the search for excellence in education has opened the entire educational enterprise to review.

### Reform Results

What are the results so far, in the early twenty-first century, of excellence-era education reforms? First, reform produced policy changes at all levels of government. At the national level, elected officials and business leaders articulated national education goals. Three presidents, George Bush, Bill Clinton, and George W. Bush, launched and touted education reform initiatives, while national education organizations adopted new professional standards for teacher education and administrator licensure.

At the state level, all states developed tests to measure student performance, and forty-nine states developed academic standards. Twenty-seven states began to hold schools accountable for results, promoting performance-based accountability but also inspiring debates about the scope and quality of standards, the adequacy of tests, and needed supports for change. Many states, California and Kentucky notably, legislated substantial programs of reform. Eighteen state courts overturned school finance systems, opening the door to greater equity in educational opportunity or adequacy in school funding.

Locally, with varying degrees of success, school districts and schools either adapted to these reforms or launched their own improvement initiatives. School spending increased approximately 36 percent in real terms, and education agencies grappled with how best to intervene in persistently low-performing schools. Throughout this period, education reform remained on legislative agendas, reflecting the public

commitment to reform envisioned by the National Commission on Excellence in Education.

Second, education reform introduced new structures to the institutional landscape of public education. Notable governance additions included school site councils, charter schools, service contracts, and vouchers. The new National Board for Professional Teaching Standards institutionalized professional teaching certification, while experiments with teacher compensation systems and with labor-management relations challenged teacher pay and work arrangements. At the school level, whole-school designs offered ready-made reform structures, and family resource centers integrated educational and social services.

Third, reform's policies and institutions wrought shifts in authority over education's goals and work. Among key actors, control shifted from educators and education interest groups to state policymakers, business leaders, mayors, and parents—the latter two, respectively, through mayoral takeovers of school districts and the introduction of school councils, charter schools, and school choice. At the organizational level, authority shifted simultaneously from school districts upward to state agencies and downward to schools. The shifts resulted from diminished public confidence in educators and education bureaucracies to accomplish school improvements and from the new focus on performance accountability, which enhanced state-school connections.

Fourth, in contrast to the level of reform activity, academic performance remained essentially flat. A gap persisted between test scores of white and minority students, though some gaps narrowed for some age groups in some subjects. More high school graduates made an immediate transition to college, from 53 percent in 1983 to 63 percent in 1999. Dropout trends were erratic but lower overall. In percentage terms, twice as many students took advanced courses in math, science, English, and foreign languages, though the overall numbers remained low—less than a third in English and language, less than half in math and science. In international comparisons of student performance, fourth and eighth graders in the United States scored above international averages in math and science, while twelfth graders scored below international averages in both subjects. On another dimension, Americans failed to attain even one of the six national education goals by the target year 2000.

Fifth, flat achievement notwithstanding, public support for public schools reached a new high in 2001. For the first time, a majority of Americans (51 percent) graded public schools either A or B, with 68 percent of public school parents grading their child's school A or B. Moreover, when asked to choose between reforming the existing school system and seeking alternatives to it, 72 percent of Americans chose education reform.

Finally, lessons learned from extensive school reform efforts in Kentucky and in Houston, Texas, demonstrated that bold education reform is possible but difficult. Observers credited success in these locations to a common vision of success, high expectations for all students, focus on results, strong leadership and teacher competence grounded in coherent curriculum and professional development, and business involvement. In short, education reform in these locations required incentives for performance, investments in organizational and individual capacity, and greater school autonomy.

### Enduring Issue

Americans have long translated their social ambitions into demands for education reform. In the excellence era, these ambitions primarily addressed economic and civic vitality. The compelling argument behind excellence-era education reform was that persistent, low levels of student achievement failed to equip students for success in the emerging economy and polity. That challenge remains. History's lesson is that, of all education reforms, changes in teaching and student achievement come slowly.

## REPORTS OF HISTORICAL SIGNIFICANCE

Reports compiled by individuals or commissions suggesting reforms for public education have appeared throughout America's postcolonial history. Beginning in the late nineteenth century, committees and commissions of prominent individuals became popular for suggesting innovations to cure some educational ills. Since the 1983 release of the National Commission on Excellence in Education's landmark report, *A Nation at Risk*, reform reports have peppered the landscape on a wide array of topics affecting K-12 and higher education. Most of the waves of reform since the 1980s have been spearheaded by a high-profile study of schooling containing a clarion call regarding the need for improvements. Indeed, reform-by-commission has

become a mainstay in the arsenal of those hoping to change schools.

Those specifically examining the reform-by-commission process have come to a series of conclusions about these reports: (1) they have been around for a long time; (2) they tend to suggest changes in a very general manner; (3) they rarely attend to the significant issues in the implementation of reforms; and (4) their specific recommendations have had little direct impact on schools. That said, it is also clear that reform reports provide the rhetorical and symbolic context for reforms to be considered, as they denounce perceived problems and attempt to incite a sense of urgency demanding resolution.

Educational reform reports can be separated into three distinct periods. The first period, the period of early reform-report activity, includes the few reports generated in the United States up until the late nineteenth century. The second period, the era of Progressive reforms, roughly covers the late nineteenth century up until the 1980s. The final period, the era of the modern reform report, began in the early 1980s.

### Early Reform-Report Activity

A number of reports of Prussian and French educational innovations heightened interest in improving America's schools. For example, the German professor Johann Friederich Herbart published a volume on the psychology of the art of teaching in 1831, while a Frenchman, Victor Cousin, published a report on the Prussian system of preparing teachers that was reprinted in English in 1835. The first U.S. educational reform reports were generally conducted by prominent individuals driven to foster the development of the nation's universal, free, public, and compulsory system of common schools. Leaders such as Henry Barnard of Connecticut, Calvin Stowe of Ohio, Caleb Mills of Indiana, Calvin Whiley of North Carolina, and John Pierce of Michigan advocated reforms for schools. Most significant among these were the reports of Horace Mann, the secretary of the State Board of Massachusetts in the late 1830s and 1840s. Mann's twelve annual reports covered a broad range of topics and decried the poor efficiency of the public schools. His reports analyzed topics including the moral purposes of schooling, the curriculum, libraries, pedagogical methods, the quality and training of teachers, discipline, school facilities, and church-state relations regarding public schools. Mann urged the standardization of the schools.

Toward the end of the early reform period, the analyses of Joseph M. Rice, the editor of *Forum* magazine, were published. Rice, a pediatrician who had studied pedagogy in Germany, visited hundreds of urban classrooms in thirty-six cities during the 1890s. He found the conditions and methods of instruction deplorable. Rice eventually designed a simple method of testing spelling to make more reliable evaluations and reported his findings in a series of articles appearing in *Forum*.

As the design and nature of schooling in the United States unfolded during the nineteenth century, reports emerged that depicted the condition of American education and offered various remedies for reform. The pace of reports about schools intensified as the country expanded west and the American population grew. This pattern was evident in the era of Progressive reforms.

### Era of Progressive Reforms

From the 1890s until the 1980s a number of key education reports were published. These ranged from blue-ribbon commissions produced by elite educators and business persons to studies of schools prepared by prominent individual researchers. In this period the practice of conducting surveys of individual school districts was popularized. A 1940 textbook on educational history by John Russell and Charles Judd of the University of Chicago reported an astounding 3,022 educational surveys between 1910 and 1935. Supporters of this burgeoning examination of schools stressed the importance of using scientific techniques to inform policy.

Beginning in the 1890s the National Education Association (NEA), the leading professional education organization, produced a number of reports, the first and most notable being the 1893 report of the Committee on Secondary School Studies (chaired by Harvard president Charles Eliot), the *Report of the Committee of Ten*. The report identified the lack of uniformity in secondary programs and college admission requirements and sought to formulate curriculum and admissions requirements that would bring some harmony to secondary and higher education. Though scholars differ in their interpretation of the impact of this report's findings, the report did force high schools to work towards greater uniformity in curriculum.

In response to the tremendous growth in secondary school enrollment during the early decades

of the twentieth century, the NEA established the Committee on the Reorganization of Secondary Education, which produced *The Cardinal Principles of Secondary Education* in 1918. Published by the U.S. Department of Education, the document identified several means of preparing students for their duties as citizens, workers, and family members. The bulk of the report dealt with the goals of education in a democracy, the main objectives of education (seven were identified), and the role of secondary education in achieving these objectives. Key recommendations included compulsory schooling for at least eight hours a week until age eighteen and the creation of junior and senior high schools—with a comprehensive high school being one with a core curriculum, variables depending on vocation, and electives to accommodate special interests. The report reflected much of the thinking on education at the time, though its release during World War I no doubt affected its impact.

Other NEA-sponsored reports were released in the 1930s by the Commission on the Orientation of Secondary Education. *Issues of Secondary Education* (1936) and *Functions of Secondary Education* (1937) produced recommendations and key functions for secondary schools, including the idea of universal secondary school; curriculum beyond college preparatory, which was differentiated to meet specific needs; greater articulation between elementary and secondary schools; and, most controversially, that students should be eliminated from school once it was apparent that they would no longer benefit from being there.

Reports produced by the NEA-related Educational Policies Commission (EPC) included *The Unique Functions of Education in American Democracy* (1937) and *The Purposes of Education in American Democracy* (1938). In the first document, *schooling* was characterized as an institution that should be run by professionals with great academic freedom. Schools were to be run in a climate protective of democratic and scientific principles. The *Purposes* document amplified the key aims laid out in the *Cardinal Principles*. Some argued, however, that these recommendations were out of step with burgeoning issues related to the control of American youth.

The Progressive Education Association undertook several studies, the most prominent of which was the Eight-Year Study, the findings of which were released in 1942. This landmark evaluation project

included twenty-nine secondary schools with Progressive curricula whose students were studied for eight years. Several colleges agreed to accept students from these programs who didn't meet usual entrance requirements. The evaluation matched 1,475 pairs of students from Progressive and conventional high schools across an array of variables in college. Much of the impact of the study was clearly blunted by its release during World War II, and although little remained of the programs in the Progressive schools years after the study, the evaluation design served as the model for studies for decades.

Toward the end of World War II, the EPC released *Education for All American Youth* (1944). Re-released in 1952 to account for postwar changes, this report made suggestions for improving secondary education. At that time, more than half of all students never completed high school, yet the growing population and an increased faith in the power of schooling were swelling enrollments. Later in the 1950s, the Carnegie Corporation sponsored James Conant's *The American High School Today*, which involved visitations to fifty-five schools in eighteen states. Schools were evaluated, and it was determined that academically talented students were not being challenged. Key ingredients of successful schools were found to include strong school board members, superintendents, and principals; twenty-one specific recommendations for curriculum were included.

Probably the most significant report of the 1960s was the federally funded research study *Equality of Educational Opportunity*, published in 1966. Authored by James Coleman and associates, the report examined data from 600,000 students in 4,000 schools. The educational and socioeconomic backgrounds of students' families were found to be the most important variables explaining achievement, far outweighing the impact of school or teacher variables. These findings inspired several decades of debate, affecting a variety of school-related policies.

In the 1970s the Kettering Foundation created the National Commission on the Reform of Secondary Education, which worked on updating the Conant findings. Its 1973 report, *The Reform of Secondary Education*, focused primarily on alternatives to the traditional high school curriculum and a general definition for all American high schools.

Most of the reports in this period were driven by the push for scientific inquiry and the expanding

role of schooling in American culture. In the early 1980s, highly visible reports underscored perceived problems and offered solutions for change.

### Era of the Modern Reform Report

The 1980s became the decade of the reform report starting with the publication of Mortimer Adler's *The Paideia Proposal* in 1982. With the 1983 release of *A Nation at Risk*, the most widely acclaimed report of this genre, an unprecedented period of reform report activity began. It stated that a "rising tide of mediocrity" had overcome America's schools, and that if another nation had tried to impose such mediocrity on U.S. schools it would be considered "an act of war." Its many recommendations included strengthening the curriculum, lengthening the school day and the school year, paying teachers based on performance, and increasing homework. These recommendations were debated from statehouse to statehouse across the country. Though the recommendations may not have been followed exactly, the atmosphere for reform generated by the report ushered in a reform period unlike any other in the nation's history.

Other reports soon followed. In 1983 alone, major reports that were released included: Ernest Boyer's *High School*; the Business-Higher Education Forum's *America's Competitive Challenge*; the College Entrance Examination Board's *Academic Preparation for College*; John Goodlad's *A Place Called School*; the National Science Board Commission on Precollege Education in Mathematics, Science and Technology's *Educating Americans for the 21st Century*; the Southern Regional Education Board's *Meeting the Need for Quality Action in the South*; the Task Force on Education for Economic Growth's *Action for Excellence*; and the Twentieth Century Fund's *Making the Grade*. In 1984 TheodoreSizer's influential *Horace's Compromise: The Dilemma of the American High School* was published. Obviously, diverse entities focused on education, and no reforms could be promulgated without a commission-style report.

This reliance on reform reports continued unabated throughout the 1980s. Key areas for scrutiny included teacher education (*A Nation Prepared* [1986], *Tomorrow's Teachers* [1986]), educational administration (Leader's for America's Schools [1987]), improving school performance (*Time for Results* [1986]), and strengthening the economy through schooling (*Investing in Our Children* [1985],

*Children in Need* [1987]). The pace of reform-report activity continued in the 1990s and the early part of the twenty-first century. Examples of such reports include government-sponsored documents, such as *Does School Quality Matter, Beyond Rhetoric: A New American Agenda for Children and Families*, and *Prisoners of Time*; reports from business groups, such as *Investing in Teaching*; and privately financed reports from think tanks and interest groups, such as *The Teachers We Want and How to Get More of Them* and *The Essential Profession*. It appears that any government agency or interest group wishing to propose a series of educational reforms often launch their initiative with a reform report. With the growth of the Internet and its ability to deliver information quickly and cheaply, reports continue to emerge and are readily available to anyone with access to a computer.

### Conclusion

What can be said of reform reports across America's history? Clearly, such reports have been a mainstay of those interested in schools, though their use grew dramatically towards the latter part of the twentieth century. This history suggests that they will continue as a means of examining aspects of schooling and promoting particular solutions. Whether being merely symbolic or ceremonial in terms of creating a climate for considering change, or more directly functional in promoting specific policies into practice, they operate as a form of *trickle-down* reform, where some government agency or other body sets out policy recommendations for policymakers or those close to schools to consider. The policies that ultimately appear may not be as initially intended, but the reform reports help set the tone for the educational reform agenda that policymakers consider.

## EFFICIENCY IN EDUCATION

Educators often feel ambivalent about the pursuit of efficiency in education. On the one hand, there is a basic belief that efficiency is a good and worthy goal; on the other hand, there is sense of worry that efforts to improve efficiency will ultimately undermine what lies at the heart of high-quality education. Part of the difficulty stems from a misunderstanding about the meaning of efficiency as well as from the legacy of past, sometimes misguided, efforts to improve the efficiency of educational systems. It is therefore useful to begin with a basic discussion of the efficiency concept.

The notion of efficiency applies to a remarkably large number of fields, including education. It is a

disarmingly simple idea that presupposes a transformation of some kind. One can think in terms of what was in hand before the transformation, what was in hand after the transformation, and one can also think about the transformation process itself. The *before* elements are commonly referred to as ingredients, inputs, or resources while the *after* elements are called results, outputs, or outcomes. The transformation process is sometimes less obvious and can become confused with ingredients. For example, in an educational setting, a teacher can be thought of as an ingredient while teaching is an important part of the actual transformation process.

The concept of efficiency is often connected to a moral imperative to obtain more desired results from fewer resources. Efficiency needs to be thought of as a matter of degree. Efficiency is not a "yes/no" kind of phenomenon. It is instead better thought of in relative or comparative terms. One operation may be more efficient than another. This said, the more efficient of the two operations could become even more efficient. The quest for greater efficiency is never over, and this sense of a perennially unfinished agenda is one source of the generalized sense of anxiety that tends to surround the efficiency concept.

### The Choice of Outcomes

If the goal is to obtain more desired results from fewer resources, then it is important to be clear about what is being sought. Society might have a very efficient system because a large amount of outcome is being obtained relative to the resources being spent or invested, but if the outcomes are out of sync with what is truly desired, there is a real sense in which the system is not very efficient. Of course, this invites important questions about who gets to decide what counts as a desirable outcome, and in education there are longstanding and ongoing debates over what the educational system ought to be accomplishing.

In the United States, education is viewed as a responsibility of the individual states rather than the national government, and the states have made efforts to define the outcomes they seek from their educational systems. These efforts have come to be known as *standards-driven initiatives*, where the standards constitute pronouncements from the states about the collective expectations for what the schools need to accomplish. The idea has been for each state to articulate the desired outcomes and then provide flexibility to the districts, schools, ad-

ministrators, teachers, and students to meet the standards in ways that make the most sense given local circumstances.

States have handled this in different ways and there are interesting deeper questions about how to balance state judgments with judgments that are made at more localized levels. How, for example, should a disagreement between a duly constituted local school board and the state be settled? Going further, how should the views of local boards be considered as the state sets its standards? What is the proper role for minority views? And how should revisions be handled as time passes?

It is customary to think of the state's setting minimum standards that can be exceeded by individual localities if a locality resolves to do so and can muster the necessary resources. This thinking presupposes a hierarchical view of educational outcomes in the sense that outcome "C" builds upon outcome "B" while outcome "B" builds upon outcome "A." A problem is that outcomes may not always have this kind of hierarchical nature. Suppose a school wants to provide a high degree of personalized attention as part of its program. Is this an input or an outcome? Let us suppose that this is a costly thing to do. The school that pursues this strategy is going to consume more ingredients and if only the standard outcomes are looked at, this school is going to look like costs are high relative to the outcomes that are realized. Hence, the school could look inefficient for the simple reason that it has chosen to pursue a different set of educational goals. There is also the possibility that a locally selected goal can interfere with or undermine one of the state selected goals.

In addition to reaching agreement about the mix of outcomes to pursue, there are important measurement issues to consider. An interest in efficiency is frequently accompanied by an interest in measuring magnitudes. If one is seeking more out of less, one frequently wants to know "how much more," and the result has been a boom in the efforts by educational psychologists and others to develop valid and reliable measures of the learning gains of students. Critics of efficiency analysis in education worry that ease of measurement can unduly influence the selection of the outcomes that the system will be structured to achieve. In other words, the worry is that the drive for efficiency will lead, perhaps inadvertently, toward the use of educational outcomes that are chosen more because they are easy

to measure than because of their intrinsic long-term value for either individual students or the larger society. Standardized tests of various kinds have been relied upon as measures of the outcomes of schooling and have been criticized on these grounds.

Sometimes there is interest in the economic consequences of schooling, and this interest has prompted analysts to use earnings as a measure of schooling outcomes. A rich literature has developed in the economics of education where efforts have been made to estimate the economic rate of return to different levels and types of schooling. This is a challenging area of research because earnings are influenced by many factors and it is difficult to isolate the effects of schooling. The goal of this research is to capture the value added by schooling activities.

The relevance of the *value-added* concept is not limited to economists' studies of rates of return. Even in cases where the focus is on learning outcomes as measured by tests or other psychometric instruments, there are questions to answer about the effects of schooling activities relative to the effects of other potentially quite significant influences on gains in students' capabilities. Serious studies of the efficiency of educational systems measure educational outcomes in value-added terms.

Measurement issues also arise from the collective nature of schooling. The results gained from schooling experiences are likely to vary among individual students and this prompts questions about how best to examine the result for the group in contrast to an individual student. Is one primarily interested in, say, the average performance level, or is there a parallel and perhaps even more important concern with what is happening to the level of variation that exists across all of the students within the unit, be it a classroom, grade level within a school, a school, a district, a state, or a nation? The early research on educational efficiency in the 1960s placed a heavy emphasis on average test score results for relatively large units like school districts. More recent work demonstrates greater interest in measures of inequality among students. The standards-driven reform movement includes a considerable amount of rhetoric about all students reaching high standards; the analysis of efficiency presupposes an ability to move beyond the easy rhetoric to make clear decisions about how uniform performance expectations are for students.

In addition, there is an important distinction to maintain between the level at which a system oper-

ates and the rate at which inputs are being transformed into outcomes. One can “get the outputs right” so that the desired items are being taught/learned in the correct proportion to one another. In such a case, gains in the understanding of mathematics are occurring in the correct proportion to, say, gains in language capabilities. But this says nothing about the absolute level at which the system is operating. The naive view might be that the system should operate at 100 percent of its capacity, but this overlooks the fact that scarce resources are needed to operate at this level and that education is not the only worthy use of these precious resources. Policy-makers must make often difficult trade-off decisions about the level at which the educational system will operate relative to the level of other competing social services. The early twenty-first century is witnessing a considerable amount of debate over the proper level at which to set the educational system, often as part of an effort to define what counts as an “adequate” education.

With respect to outcomes, the goal is to reach agreement about (1) the relative mix of performance outcomes to realize; (2) the degree of uniformity of performance across students; and (3) the level of capacity at which the system should operate. In addition, there needs to be an ability to measure what is being accomplished.

### The Choice of Inputs

The outcomes that are selected drive the entire system. Input issues, in contrast, are more straightforward and almost mechanical in nature. Once what is to be accomplished is known, at what level, and for whom, society can then turn to the challenge of doing so in as economical a way that is possible. In other words the goal is to accomplish the desired results for as little cost as possible, and this involves making the best possible use of whatever ingredients or resources that are available.

Although this seems straightforward, there are a number of complexities that need to be considered. First, there is the dynamic nature of the process. As time passes, more is learned about how to make better and better use of the available resources and new resources may also become available. A good example of a new resource lies in the area of telecommunication and computing technology. These advances have great potential to affect the day-to-day life of educational practice. It is also important to keep in mind that the nature of how tech-

nology develops is not external to the system. Technology does not develop in a vacuum. Instead, there are sometimes powerful forces that shape the nature of how technology develops. For example, many existing instructional computing technologies are designed to supplement rather than to supplant existing classroom activities. This tendency for computing to be treated as the handmaiden of the traditional classroom structure may not be in the best long-term interest of the larger society.

Second, there is the technical versus cost dimension to consider. A particular resource or input might be highly productive in the sense that a small amount could make a significant difference, but this same highly productive resource might be extraordinarily costly. For example, suppose having one hour per week of a Nobel prize winning physicist’s time turns out to be an extraordinarily productive input for high school students who are learning physics. Suppose further that such a resource is quite costly. In contrast, an hour per week of a local Ph.D. in physics might be less costly but let us also say that it is less productive. From an efficiency perspective, the question is: How do the ratios of benefit relative to cost compare? It is quite conceivable that the benefit/cost ratio for the Nobel prize winner is smaller than the comparable ratio for the local Ph.D., even though the absolute measure of the Nobel prize winner’s effectiveness (i.e., the result per unit of input) is higher.

Third, in addition to making sense of benefits relative to costs, there is also the challenge of making the best possible use of whatever resource is being employed. For example, just because a Nobel prize winner has the potential to be a very productive input does not preclude the possibility of that resource being squandered in a particular setting, and the same can be said of the local Ph.D. in physics, or an artist who is hired to spend some time in a school. The quest for greater efficiency requires the parties to make the best possible use of whatever resources come into their possession.

Finally, there is the potential for the costs of inputs to influence the selection of outcomes. Some outcomes are more costly to produce than others. For example, a student who finds it difficult to learn will, by definition, be relatively costly to educate, and these extra costs could influence decisions that are made about how uniform to make the learning outcome standards. And thus, the distinction between outcomes and inputs begins to break down.

## The Transformation Process and Implications for Policy

Policymakers are very interested in assessing the degree of efficiency in educational systems. One difficulty arises when indicators are used that fail to provide accurate information. For example, a widely available statistic is the level of spending on education expressed on a per pupil basis. At first glance, this looks like an efficiency indicator since it provides insight into the commitment of resources (the expenditure figure) and the result (the number of students being served by the system). Critics note that this statistic has been rising over time and conclude that the system is becoming less efficient. There are many reasons to be wary of using an expenditure per pupil statistic and its changes over time to reach such a conclusion. Even with a control for the effects of inflation, there remains a fundamental problem on the outcome side of the analysis since there is no direct measure of what the schools are accomplishing and how this might have changed over the period.

Even if accurate, noncontroversial measures of efficiency and its changes over time can be obtained, it is difficult to obtain clear insight into what policies should be developed to ensure gains in efficiency without undermining other key social goals like fairness and freedom of choice. Much of the challenge here depends on the fundamental nature of the transformation process that is presupposed as part of the efficiency concept. The efficiency concept derives from the field of economics where it was initially applied to industrial production processes such as the manufacture of automobiles. These industrial manufacturing processes involve the combination of numerous nonhuman ingredients such as lengths of steel, aluminum, glass, chrome, and so forth. These ingredients are transformed thanks to various physical and chemical processes whose scientific properties are relatively well understood, making the results quite predictable.

For a manager whose goal is to improve efficiency, this kind of information is invaluable. With this information the manager can compare higher performing units with lower performing units and make a diagnosis about the source of the inefficiency in the underperforming units. There may be problems with a unit's ability to get the most out of the inputs it is using; there may be a less than optimal mix of inputs being used; and/or the mix of outputs being produced may be misaligned. The "efficiency

expert" in such a situation is able to pinpoint the source of the difficulty and can prescribe steps for improvements.

In contrast, the educational process is heavily committed to the use of human resources and the various inputs are brought together and transformed in ways that are sometimes difficult to predict. Without denying the significance of the human dimension within industrial manufacturing processes, it stands to reason that the production or transformation process that lies at the center of educational systems is fundamentally more complex and less well-understood than production in the industrial sector. A better comparison comes from studies of efficiency in crop production in the field of agricultural economics. But even here, the production process for growing a particular plant is better understood than is the process through which human minds mature and acquire knowledge and understanding. Indeed, it is possible to question whether the educational process really lends itself to the input-output, mechanical formulation that lies at the heart of the efficiency concept. According to this view, educational growth is inherently unpredictable, and the teacher is better thought of as a creative artist than as a productive input whose impact can be measured and predicted in a rigorous and scientific way.

While it is clear that knowledge of the technical properties of the educational process is more limited than what exists, say, in the area of automobile manufacturing, it does not follow that the educational process is inherently unknowable in this sense. In other words, the lack of progress to date in coming to grips with the technical properties of the education transformation process does not mean the process is inherently unpredictable and unmanageable. A more prudent conclusion is that care needs to be exercised in efforts to assess the efficiency of educational systems. It also follows that care needs to be exercised in the use of the efficiency assessment data that are gathered.

Consider the following example of how the results of an efficiency analysis in education can be misapplied. Suppose an analysis goes forward that suggests that a particular school or school district is less efficient than most others. Suppose the response is to penalize the less efficient unit by reducing the flow of state or federal resources. A byproduct of such a policy is a reduction in the funding of the education being provided to students who through no fault of their own find themselves located within an

inefficient educational system. Those who work to improve the efficiency of educational systems must guard against this potential to “blame the ultimate victim” of the situation. Similarly, the use of incentives to encourage greater efficiency runs the risk of rewarding those who are already enjoying considerable success. If the problem lies with the unknown nature of the production process, it is perverse to be implicitly penalizing the underperforming districts because they do not have knowledge that is lacking elsewhere. Penalizing underperformers makes sense only if the knowledge is available and the penalties are meant to provide greater incentive to find it. States sometimes handle this by providing technical assistance but technical assistance really works only when it is based on bona fide knowledge, something which is not always possible, given the continued limited understanding of the properties of educational production under a wide range of circumstances.

At this stage of development in efforts to apply the efficiency concept to the field of education several conclusions can be reached.

1. It is important to make sure that the comparative information suggesting that one educational unit is more or less efficient than another is accurate.
2. This accurate comparative information needs to be used as a set of guidelines/suggestions and needs to stop short of becoming overly rigid and prescriptive.
3. Efforts need to be made to monitor very carefully the results of attempts to improve the efficiency of educational systems that are perceived to be below expectations.
4. Additional research efforts need to be made to better understand the technical properties of the transformation process that gives rise to desired educational results.

The results of this continuing research will be instrumental in future efforts to make further efficiency improvements in education and can go far toward reducing the ambivalence that historically has characterized educators' reaction to the efficiency concept and its application to the field of education.

## EFFORT AND INTEREST

The research literature provides support for John Dewey's observation that effort and interest in education can be understood as being both oppositional and complementary. Five minutes of work on a task may feel like hours to a student who does not know what the next steps need to be, or even what the longer-range goals for the work are—especially if the student does not have a developed interest for the task. Similarly, a student with a well-developed individual interest for Latin may be able to briefly glance at the third declension adjective endings and decide he knows them, while another, equally able student with a less-developed interest for Latin, has to work after school to learn these endings.

### Effort

*Effort* usually refers to whether a student tries hard, asks for help, and/or participates in class. Studies of

student effort suggest that the more difficult a task appears—in the sense of the task’s difficulty and the likelihood that the student can complete it successfully—the less likely it is that the student will be motivated to take the task on. On the other hand, studies of student effort also suggest that effort is associated with the possibility of doing well on a task. Thus, students might be expected to figure out what they need to study, study it, and be successful—if they have the *ability* to do the assigned task, confidence in this ability, and no anxiety about the task.

Whether students exert effort or not is typically described as a choice or decision that is made by the student about whether success is possible. Students’ *expectancy value* is influenced by their previous success, their perceptions about teachers’ beliefs and practices, their goals, and by their self-concept. Students’ beliefs about both their own abilities, and about the relation between ability and effort, influence the likelihood that they will exert effort. As Carol Dweck points out, students’ beliefs develop over time in conjunction with experience. She also notes that students are increasingly influenced by the feedback they receive, meaning that some change in students’ beliefs and motivation is possible.

Deborah Stipek’s research, for example, suggests that students are engaged and learning takes place when teachers promote effort in the classroom by emphasizing participation, setting high expectations, and encouraging students to support each other as learners. If students have a clear understanding of the goals of the tasks they are assigned, they also might be expected to be better able to effectively regulate the possibility of their success. In fact, students who have a sense of efficacy, who both value and experience feelings of enjoyment for the task, can also be expected to expend effort to master the task.

## Interest

*Interest* describes the cognitive and affective relationship between a student and particular classes of subject matter. However, one student’s effort to master Latin, mathematics, or lacrosse is not likely to be the same as another student’s efforts. Moreover, how a student approaches different subjects can be expected to vary, just as the background and basic abilities that each student brings to each subject will vary.

Interest can hold a student’s attention, encourage effort, and support learning. It also has been found to enhance strategic processing. Furthermore,

students can experience more than one type of interest concurrently.

Three types of interest can be identified, each of which reflects differing amounts of knowledge, value, and feelings. These are: (1) situational interest, (2) individual interest (sometimes referred to as *topic interest*), and (3) well-developed individual interest. *Situational interest* refers to the short-lived or momentary attention to, or curiosity about, particular subject matter, and can be accompanied by either positive or negative feelings. *Individual interest* is a relatively enduring predisposition to experience enjoyment in working with particular subject matter. An individual interest may or may not provide a student with the support to put forth effort when faced with a difficult task, presumably because the identification of individual interest in terms of enjoyment provides no information about the depth of a student’s knowledge about the topic. *Well-developed individual interest* is a relatively enduring predisposition to re-engage particular classes of subject matter over time. A student with a well-developed individual interest for a subject has more stored knowledge and stored value for that subject than he or she has for other subjects. With more stored knowledge and stored value for a given subject matter, the student is positioned to begin asking curiosity questions that drive knowledge acquisition, consolidation, and elaboration, and that leads the student to persist in the face of frustration or difficulty.

Well-developed interest is the type of student interest to which most people are referring when they talk about interest and its impact on learning. For example, students who immerse themselves in a task they have been assigned, or who are willing to expend a lot of effort to master a skill that will allow them to begin work on some future project, are likely to have a well-developed interest for the subject of that project. Importantly, the student who has a well-developed interest for a subject area may not seem to be aware that he or she is exerting effort. Instead, it appears that interest may free up possibilities for students to push themselves, just as it frees up their ability to process interesting stories.

A student does not simply decide to have a well-developed interest for a subject about which he or she has previously had either little knowledge or value. Nor is a well-developed interest a set of beliefs about utility or value. In fact, a student who has a well-developed interest for mathematics may or may

not be aware that he or she has begun to think and question in ways that are similar to a mathematician.

A student could, however, make a decision to learn about a subject, and in so doing move rather rapidly from having a situational interest to having an individual interest for it. In this instance, the student's decision to work on developing his or her knowledge is a choice and would involve effort, and would probably be identified as an individual interest. Once the student began to generate his or her own questions about the subject, worked to understand these, and did not find major investments of time effortful, the student might then be considered to have a well-developed individual interest for the subject matter.

All types of interest require conditions that allow the interest to be maintained, to continue to deepen, and to merge with other content. A number of studies have suggested the importance of providing students with meaningful choices, well-organized texts that promote interest, and the background knowledge necessary to fully understand a topic. Even students with a well-developed interest for a particular subject need to be supported to continue challenging what they know and assume in order for their interest to be sustained.

### Effort and Interest

The research reviewed here suggests that effort needs to be understood as involving choice, as being rooted in beliefs, and as being influenced by feedback. In addition, interest needs to be understood as a cognitive and affective relationship between a student and a particular subject that varies depending on the type of interest being described. As Andreas Krapp has observed, students who want to be doing what they are supposed to be doing because of a well-developed interest are not a problem for educators. The challenge for education could be understood as one that involves figuring out how to get students to want to do what teachers want them to do. However this interpretation sets effort and interest at cross purposes and is not productive. Instead, the research suggests that educators should focus on the complementarity qualities of effort and interest. Providing students with conditions that will involve them in deepening their knowledge should position them to begin asking their own questions about a particular subject matter; recognize that they both have the ability to work on developing their understanding of, as well as their confidence about their ability to

work with, the subject matter; and provide support for developing interest and effort that includes trying hard, asking for help, and/or participating. In fact, as John Dewey anticipated, it appears that when conditions to support student interest are in place, effort will follow.

## EIGHT-YEAR STUDY

---

The Eight-Year Study (also known as the Thirty-School Study) was an experimental project conducted between 1930 to 1942 by the Progressive Education Association (PEA), in which thirty high schools redesigned their curriculum while initiating innovative practices in student testing, program assessment, student guidance, curriculum design, and staff development.

### Purpose

By the late 1920s the members of PEA acknowledged that only one out of six American high school students continued on to college, yet conventional college preparation programs still dominated the basic course of study at the secondary school level. Seeking to address the needs of non-college-bound students while also providing better coordination between high schools and colleges for those students who continued their postsecondary education, the PEA initiated in 1930 the first of three Eight-Year Study commissions, the Commission on the Relation of School and College (also known as the Aikin Commission), chaired by Wilford Aikin. The purpose of the commission was to foster relations between schools and colleges that would permit experimentation of the secondary school curriculum and would address how the high school could serve youth more effectively.

The Aikin Commission proceeded to select approximately thirty schools (including some school systems) that were freed to revise their secondary curriculum. Over 250 colleges agreed to suspend their admissions requirements for graduates of the participating high schools, and alternative forms of documentation were provided by the secondary schools for college admission. All of these secondary schools did not embrace Progressive Education practices, however. While some of the most progres-

sive schools in the country participated, including Denver's public high schools, Chicago's Parker School, New York's Lincoln School, Ohio State University's Laboratory School, Des Moines's Roosevelt High School, and Tulsa's Central High School, other participating secondary schools displayed few progressive practices and little interest in experimenting with their curriculum.

### Method

During the initial years of the study, each school staff developed its own curricular program—core curriculum—which sought to integrate and unify the separate academic subjects. A series of innovative staff-development workshops were scheduled beginning in 1936 to assist teachers in reconsidering the basic goals and philosophy of their specific school and to support the development of their own teaching materials. The Aikin Commission coordinated the Follow-Up (evaluation) Study and selected 1,475 students to follow from high school into college. These Progressive school graduates were matched with graduates from traditional secondary school programs, and the pairs of students were evaluated as they proceeded through college. In comparison to their counterparts, the Progressive school graduates performed comparably well academically and were substantially more involved and successful in cultural and artistic activities. The Follow-Up Study also concluded that graduates from these thirty experimental schools did not experience any impairment in their college preparation. The Eight-Year Study confirmed that schools could experiment with the curriculum while attending to the needs of all students, and in so doing, those college-bound graduates would not be ill-prepared. The Commission on the Relation of School and College released a five-volume report in 1942, titled *Adventures in Learning*, which described the curriculum and evaluation of the schools.

As the Aikin Commission worked with school and college staff, the Commission on Secondary School Curriculum (also known as the Thayer Commission), chaired by V. T. Thayer, was formed in 1932 to develop curriculum materials for the participating schools. The Thayer Commission recognized that further study of youth needed to be undertaken, and within the auspices of this PEA commission, the Study of Adolescents was conducted. Between 1937 and 1940, five volumes of curriculum materials aligned to the traditional subject areas of general ed-

ucation (science, mathematics, social studies, arts, and language) and an additional six volumes encompassing the study of adolescence were published. A third PEA commission, the Commission on Human Relations (also known as the Keliher Commission) formed in 1935, prepared social-science-related curriculum materials—incorporating the then-innovative use of motion pictures—and examined those human problems faced by youth. Six volumes were released by the Keliher Commission between 1938 and 1943, some written directly for high school students and others written for professional educators who sought to integrate the school curriculum around the needs, interests, and problems of youth. Membership among these three commissions overlapped greatly and are now viewed as integral components of the Eight-Year Study.

### Results

To correct a general misconception, the Aikin Commission's Follow-Up Study was not the sole purpose of the Eight-Year Study. Important outcomes of the Eight-Year Study included developing more sophisticated student tests and forms of assessment; innovative adolescent study techniques; and novel programs of curriculum design, instruction, teacher education, and staff development. Moreover, the Eight-Year Study proved that many different forms of secondary curricular design can ensure college success and that the high school need not be chained to a college preparatory curriculum. In fact, students from the most experimental, nonstandard schools earned markedly higher academic achievement rates than their traditional school counterparts and other Progressive-prepared students.

## HISTORY OF

Elementary schools exist worldwide as the basic foundational institution in the formal educational structure. Elementary schooling, which prepares children in fundamental skills and knowledge areas, can be defined as the early stages of formal, or organized, education that are prior to secondary school. The age range of pupils who attend elementary schools in the United States is from six to twelve, thirteen, or fourteen, depending on the organizational pattern of the particular state or school district. While a few, mainly small rural, districts, retain the traditional pattern of grades one through eight, a more common pattern is grades one through six. In most school districts as well as in many teacher preparation programs, elementary education is organized into the following levels: primary, which includes kindergarten and grades one, two, and three; intermediate, which includes grades four, five, and six; and upper, which includes grades seven and eight. A commonly found organizational pattern places grades seven and eight, and sometimes grade six and nine, into middle or junior high schools. When the middle school and junior high school pattern is followed, these institutions are usually linked into secondary education, encompassing grades six through twelve.

In comparing elementary schools in the United States with those of other countries, some distinc-

tions in terminology are necessary. In the United States, *elementary* education refers to children's first formal schooling prior to secondary school. (Although kindergartens, enrolling children at age five, are part of public schools, attendance is not compulsory.) In school systems in many other countries, the term *primary* covers what in the United States is designated as elementary schooling. In American elementary schools, the term *primary* refers to the first level, namely kindergarten through grades one, two, and three.

The elementary school curriculum provides work in the educational basics—reading, writing, arithmetic, an introduction to natural and social sciences, health, arts and crafts, and physical education. An important part of elementary schooling is socialization with peers and the creating of an identification of the child with the community and nation.

### History of Elementary Education in the United States

The European settlers in the North American colonies, in the sixteenth and seventeenth centuries, initially re-created the school systems of their homelands. They established a two-track school system in which the lower socioeconomic classes attended primary vernacular schools and upper class males attended separate preparatory schools and colleges. The primary schools—elementary institutions under church control—offered a basic curriculum of reading, writing, arithmetic, and religion.

**Colonial period.** While many similarities existed in the colonial schools, there were some important differences between New England, the Mid-Atlantic, and the South. The New England colonies of Massachusetts, Connecticut, and New Hampshire, which were settled primarily by Puritans, were characterized by a strong sense of religious and social conformity. Because of their Calvinistic emphasis on reading the Bible and other religious literature, the Puritans quickly established elementary schools. In 1642 the Massachusetts General Court, the colony's legislative body, made parents and guardians responsible for making sure that children were taught reading and religion. In 1647 the General Court enacted the Old Deluder Satan Act, which virtually established elementary education by requiring every town of fifty or more families to appoint a reading and writing teacher. Massachusetts and the other New England colonies developed the town school, a locally controlled, usually coeducational elementary

school, attended by pupils ranging in age from six to thirteen or fourteen. The school's curriculum included reading, writing, arithmetic, catechism, and religious hymns. The model of the town school, governed by its local trustees or board, became an important feature of later U.S. elementary schooling.

The Middle Atlantic colonies of New York, New Jersey, Delaware, and Pennsylvania were settled by diverse ethnic and religious groups. In addition to English, Scots, and Scotch-Irish, there were Dutch in New York, Swedes in Delaware, and Germans in Pennsylvania. The Middle Atlantic colonies' religious and language diversity had important educational implications. Elementary schools were usually parochial institutions, supported and governed by the various churches.

In the southern colonies—Maryland, Virginia, the Carolinas, and Georgia—enslaved Africans were used as forced labor on the plantations. Wealthy families employed private teachers or tutors to educate their children. Enslaved Africans were trained to be agricultural workers, field hands, craftspeople, or domestic servants, but they were legally forbidden to learn to read or write. There were some notable exceptions who learned to read secretly.

**Early national period.** After the establishment of the United States as an independent nation, the earliest U.S. federal legislation relating to education was included in the Northwest Ordinance of 1785. The ordinance divided the Northwest Territory into townships of thirty-six square miles, and each township was subdivided into thirty-six 640-acre sections. Each township's sixteenth section was to be used to support education. Unlike constitutions or basic laws in other nations, the U.S. Constitution, ratified as the law of the land in 1789, did not refer specifically to education. The Tenth Amendment's "reserved powers" clause (which reserved to the states all powers not specifically delegated to the federal government or prohibited to the states by the Constitution) left education as a responsibility of each individual state.

During the early national period, the first half of the nineteenth century, American leaders, such as Thomas Jefferson (1743–1826), argued that the United States needed to develop republican schools that were different from those found in the European monarchies. Jefferson's "Bill for the More General Diffusion of Knowledge," introduced in the Virginia legislature in 1779, would have made the

state responsible for providing both girls and boys with a basic elementary education, in a local ward school, at public expense. Although not enacted, Jefferson's bill had an important influence on later developments.

The movement to establish an American version of elementary education was promoted by Noah Webster (1758–1843), who sought to create an American version of the English language and instill an American identity into the young through language instruction. Webster's *American Spelling Book* and *American Dictionary* were widely used in schools.

**The movement to common or public schools.** In the 1830s and 1840s, several Western nations began to develop national elementary or primary school systems that were intended to augment or replace the existing church-controlled institutions. In France, Francois Guizot, the Minister of Education in the regime of Louis Philippe, promoted national elementary schools. In the United States, with its historic tradition of local and state control, the movement to establish public elementary schools was not national but carried on in the various states.

Before public elementary schools were established, attempts were made in the United States to establish various kinds of philanthropic elementary schools, such as the Sunday and monitorial schools. The United Kingdom, a leading industrial nation, also experimented with these approaches to primary education. The Sunday school, developed by Robert Raikes, an English religious leader, sought to provide children with basic literacy and religious instruction on the one day that factories were closed. In both the United States and the United Kingdom, Sunday schools were established in the larger cities.

Monitorialism, also known as mutual instruction, was a popular method of elementary education in the early nineteenth century in the United Kingdom, the United States, and other countries. Two rival English educators, Andrew Bell, an Anglican churchman, and Joseph Lancaster, a Quaker teacher, promoted monitorialism independently. The monitorial method relied heavily on *monitors*—more advanced pupils, trained by a master teacher—to teach younger children. Monitors aided teachers in conducting classes, taking attendance, and maintaining order. In using this method, the master teacher trained a selected group of older students as monitors in a particular skill, such as adding single-digit

numbers or reading simple words. These monitors then taught that particular skill to subgroups of less advanced pupils. Since the monitorial method promised to teach large numbers of pupils basic literacy and numeracy skills, it gained the support of those who wanted to provide basic elementary education at limited costs.

Initially, monitorial schools were popular in the larger American cities such as New York and Philadelphia, where they were typically supported by private philanthropists and occasionally received some public funds. In the early 1840s monitorial schooling experienced a rapid decline and virtually disappeared. By the time that the New York Free School Society, which had operated monitorial schools, turned them over to the public school system in 1853, more than 600,000 children had attended its schools.

**The common school.** The common school movement refers to the establishment of state elementary school systems in the first half of the nineteenth century. The term *common* meant that these state-supported public elementary schools, exalted as the school that “educated the children of all the people,” were open to children of all socioeconomic classes and ethnic and racial groups. Nevertheless, many children, particularly enslaved African Americans, did not attend.

Not a selective academic institution, the common school sought to develop the literacy and numeracy needed in everyday life and work. Its basic curriculum stressed reading, writing, spelling, arithmetic, history, and geography. Emphasizing American patriotism and Christian piety, it was regarded as the educational agency that would assimilate and Americanize the children of immigrants.

The common school movement in the United States paralleled some trends taking place in western Europe in the first half of the nineteenth century. In the 1830s the British parliament, though not creating a state school system, began to provide grants to educational societies for primary schooling. In France, under Guizot, a primary school system, too, was established during the regime of Louis Philippe. These transnational trends, found in Europe and America, indicated that governments were beginning to take the responsibility for providing some kind of elementary schooling. Unlike in France, which was beginning to create a highly centralized national educational system, U.S. public schools

were decentralized. The U.S. Constitution's Tenth Amendment reserved education to each state. The states, in turn, delegated considerable responsibility for providing and maintaining schools to local districts. Even within a particular state, especially on the frontier where many small school districts were created, resources available for schooling varied considerably from district to district.

The common school movement scored its initial successes in New England, particularly in Massachusetts and Connecticut. Massachusetts, in 1826, required every town to elect a school committee to provide and set policy for the local schools. The Massachusetts legislature established the first state board of education in 1837. It named Horace Mann (1796–1859), an eloquent spokesman for common schooling, as its secretary. Mann, as editor of the *Common School Journal* and a popular orator, gained considerable support for public schools.

Other northern states emulated New England's common school model. As the frontier moved westward and new states joined the Union, they, too, followed the model and passed laws to create public elementary school systems. In the South, with a few exceptions, common schools were rare until the post–Civil War Reconstruction.

A unique feature in the United States was the small one-room school, found in rural areas and small towns across the country. These schools served local school districts, governed by elected boards. Although small one-room village schools existed in other countries, the American ones were local creations rather than impositions of a national government. The American school's immediacy to its people made the local school a trusted institution rather than an alien intruder into small town life. In contrast, the teacher in France might be suspected as an outsider, a representative of the intrusive central government. Similarly, in tsarist Russia, the *zemstvo* school, established in the villages, was often extraneous to the needs of life in the countryside. The *zemstvo* teachers often were not accepted by the peasants whose children they tried to teach or were regarded as rivals of the village priest. In America's one-room schools, the elected school board determined the tax levy and hired and supervised the teacher. This pattern of local control contrasted with the visiting school inspectors sent to inspect teachers and schools in France or even with the royal inspectors in the United Kingdom.

The pupils enrolled in the local one-room schools, often ranging in age from five to seventeen, studied a basic curriculum of reading, writing, arithmetic, history, geography, grammar, spelling, and hygiene. They were instructed by the recitation method in which each pupil stood and recited a previously assigned lesson. Group work might include writing exercises, arithmetic problems, and grammar lessons that stressed diagramming sentences. The values of punctuality, honesty, and hard work were given high priority.

**African-American and Native American elementary education.** The Civil War, Reconstruction, and the Thirteenth Amendment ended slavery in the United States. Although a small number of free blacks had attended elementary school in some northern states before the war, southern slave states had prohibited instruction of African-American children. After the Civil War, the U.S. Congress, in 1865, established the Freedmen's Bureau, which established elementary schools for the children of former slaves. By 1869 more than 114,000 students were attending bureau schools. Many bureau schools functioned until 1872 when the bureau ceased operations.

In the late nineteenth century, the federal government, assisted by well-intentioned but often misguided reformers, sought to "civilize" Native Americans by assimilating them into white society. From 1890 to the 1930s the Bureau of Indian Affairs, in a policy of forced assimilation, relied heavily on boarding schools, many of which contained elementary divisions. Seeking to remove Native American youngsters from their tribal cultures, the students, forbidden to speak their native languages, were forced to use English. The boarding schools stressed a basic curriculum of reading, writing, arithmetic, and vocational training.

**Nonpublic elementary schools.** In addition to the public elementary school, the United States also has private elementary schools, many of which are church-related. Today, nonpublic schools enroll about 11 percent of the pupils in U.S. schools. Roman Catholic parochial schools, serving the children of a particular parish, represent the largest number of private elementary schools. Evangelical and fundamentalist Christian schools are the fastest growing sector in nonpublic elementary education.

## Goals of Elementary Schools

Elementary schools in the United States, as in other countries, have the goals of providing children with fundamental academic skills, basic knowledge, and socialization strategies. They are key institutions in instilling a sense of national identity and citizenship in children.

In the United States, elementary schools prepare children to use language by teaching reading, writing, comprehension, and computation. Elementary schools worldwide devote considerable time and resources to teaching reading, decoding, and comprehending the written and spoken word. The stories and narratives children learn to read are key elements in political and cultural socialization, the forming of civic character, and the shaping of civility and behavior. Throughout the history of American education, the materials used to teach reading exemplified the nation's dominant values. For example, the *New England Primer*, used in colonial schools, stressed Puritanism's religious and ethical values. Noah Webster's spelling books and readers emphasized American national identity and patriotism. The *McGuffey Readers*, widely used in late nineteenth century schools, portrayed boys and girls who always told the truth, who worked diligently, and who honored their fathers and mothers and their country. McGuffey values were reinforced by the American flag, which hung at the front of elementary classrooms, flanked by portraits of Presidents Washington and Lincoln. The "Dick and Jane" readers of the 1930s and 1940s depicted the lifestyle and behaviors of the dominant white middle class. Contemporary reading books and materials portray a much more multicultural view of life and society.

The language of instruction in elementary or primary schools is often highly controversial in many countries, especially in multilingual ones. The ability to use the "official" language provides access to secondary and higher education and entry into professions. In such multilanguage nations as India, Canada, and Belgium, protracted controversies have occurred over which language should be the official one. In the United States, the dominant language of instruction in public schools has been English. The children of non-English-speaking immigrants were assimilated into American culture by the imposition of English through the elementary school curriculum. The later entry of bilingual education in the United States was an often controversial educational

development, and remains so in the early twenty-first century.

Along with the development of language competencies, elementary education prepares children in the fundamental mathematical skills—in counting, using number systems, measuring, and performing the basic operations of adding, subtracting, multiplying, and dividing. Further, the foundations of science, social science, health, art, music, and physical education are also taught.

## Curriculum and Organization

In the United States at the primary level, the first level of organization, the curriculum is highly generalized into broad areas such as language arts or life sciences. It gradually becomes more specialized at the intermediate and upper grade levels into more specific subjects. Because of the generality of the elementary curriculum, especially at the primary and intermediate levels, there is likely to be a greater emphasis on methods and styles of teaching in elementary schools in the United States than in primary schools in other countries. For example, U.S. teachers, in their professional preparation and classroom practices, are more likely to emphasize the process of learning, inquiry skills, and social participation than teachers in other countries. Instruction in many other countries tends to be more oriented to specific skills and subjects. While elementary or primary classrooms in the United States and in other countries are likely to be self-contained, the American teacher generally has more autonomy and is not concerned with visitations by outside government inspectors.

The typical U.S. elementary school curriculum is organized around broad fields such as language arts, social studies, mathematics, and the sciences. The essential strategy in this approach is to integrate and correlate rather than departmentalize areas of knowledge. Curricular departmentalization often begins earlier in some other countries such as Japan, China, and India than in the United States.

The language arts, a crucial curricular area, includes reading, handwriting, spelling, listening, and speaking. It includes the reading and discussing of stories, biographies, and other forms of children's literature. Here, the U.S. emphasis on reading and writing is replicated in other countries. The methods of teaching language, however, vary. In the United States, the teaching of reading is often controversial.

Some teachers and school districts prefer phonics; others use the whole language approach or a combination of several methods such as phonics and guided oral reading.

Social studies, as a component of the U.S. elementary curriculum, represents a fusion and integration of selected elements of history, geography, economics, sociology, and anthropology. It often uses a gradual, step-by-step method of leading children from their immediate home, family, and neighborhood to the larger social and political world. While the U.S. approach to social education has been subject to frequent redefinition and reformulation, its defenders argue that the integration of elements of the various social sciences is a more appropriate way to introduce children to society than a strictly disciplinary approach. Critics, some of them educators from other countries, argue that American students lack the structured knowledge of place that comes from the systematic teaching of geography as a separate discipline or the sense of chronology that comes from the study of history.

Like social studies, science in the elementary curriculum consists of the teaching of selected and integrated concepts and materials from the various natural and physical sciences rather than a focus on the specific sciences. Frequently, science teaching will stress the life and earth sciences by way of field trips, demonstrations, and hands-on experiments. Critics contend that the elementary science curriculum in the United States is too unstructured and does not provide an adequate foundational base of knowledge. Defenders contend, however, that it is more important for students to develop a sense of science as a process and mode of inquiry than to amass scientific facts.

The main part of the elementary curriculum is completed by mathematics, with an emphasis on basic computational skills—addition, subtraction, multiplication, division, measuring, and graphing. The curriculum also includes health concepts and practices, games, safety, music, art, and physical education and fitness, which involves the development of motor skills.

As children in the United States progress from the primary to the intermediate grades, the emphasis on reading continues but changes from stories to more informational narratives. The goal is to develop students' interpretive skills as well as to continue to polish the basic decoding skills related to mechan-

ics and comprehension that were stressed in the primary grades. The broad fields of the curriculum—social studies, mathematics, and science—are pursued but now become more disciplinary.

Depending on the particular organizational pattern being followed, the upper grades—six, seven, and eight—offer a more specialized and differentiated curriculum. Subject matters such as English, literature, social studies, history, natural and physical sciences, and mathematics are taught in a more differentiated way. In addition to the more conventional academic subjects, areas such as vocational, industrial, home arts, career, sex, and drug abuse prevention education appear, especially in the upper grades and in junior high and middle schools.

At the beginning of the twenty-first century, curriculum is being shaped by an emphasis on subject-matter competencies in English, mathematics, and basic sciences. Computer literacy, computer-assisted instruction, and other technologies in school programs reflect the nation's transition to a high-tech information society.

### **The Standards Movement**

The standards movement, which gained momentum in the late 1990s, has required more standardized testing in U.S. elementary education. Standards advocates argue that academic achievement can be best assessed by using standardized tests to determine whether students are performing at prescribed levels in key areas such as reading and mathematics. Most of the states have established standards and require testing in these areas. Strongly endorsed by U.S. President George W. Bush, the standards approach was infused into the federal No Child Left Behind Act of 2001. The act requires that, in order to receive Title I funds, states and school districts must develop and conduct annual assessments in reading and mathematics in grades three through eight. Opponents of the standards movement argue that it is based on a narrow definition of education that encourages teachers to teach for the test rather than for the development of the whole child.

**CURRENT TRENDS**

Reform of elementary education in the United States, which began in the latter part of the twentieth century and intensified after the publication of *A Nation at Risk* in 1983, has been aimed at improving the academic performance of all children, with accountability for student achievement being placed on the schools, districts, and states. The federal government is also playing a larger role in elementary education through the funding provided to states under the Elementary and Secondary Education Act. There is concern that the U.S. educational system is not enabling its students to perform as well academically as students in other nations, although some

critics disagree with this assessment. Though the elementary curriculum is constantly in a state of reform and refinement, some common threads exist.

**Goals and Purposes of Elementary Education**

Democratization of education is the evolution of education away from models intended to support ideological, social, or industrial systems toward open, universal public education. Great Britain demonstrates the evolution of open, democratic systems of European education since the Renaissance. Japan in Asia has redesigned its public education system since World War II to reflect those same open democratic values. Chile in South America is currently undergoing an aggressive democratization of public education. The similarities of the reforms in these nations parallels similar reforms underway in the United States.

**United States.** Throughout the history of the United States, Americans have expressed a desire for an educated citizenry. Efforts to establish or reform education in this country include the Old Deluder Satan Act, enacted in Massachusetts in 1647, Thomas Jefferson's 1779 Bill for the More General Diffusion of Knowledge, The Common School Movement of the 1800s, the Education for All American Youth initiative of 1944, and George W. Bush's No Child Left Behind Act of 2001. The existence of a cumulative and consecutive system of universal public education for young children is a part of the national heritage of the United States, and it is expected that elementary education will play a major role in preparing future citizens to live in a modern, industrialized, global society.

Control over elementary education is reserved to the states; however, in 1979 the U.S. Department of Education was created by President Jimmy Carter to coordinate, manage, and account for federal support of educational programs. National and local attention continues to be directed at elementary education in the twenty-first century, as leaders, teachers, and parents seek ways to make the first step in the American education system educative, meaningful, and positive.

While current educational reforms reflect a myriad of societal changes, elementary education at the beginning of the new millennium still resembles the vernacular schools of colonial America. The essential skills of reading, writing, spelling, and arithmetic occupy center stage, and the "common

school” moral themes of honesty, hard work, diligence, and application prevail.

**Europe.** Elementary education in the United States has roots in European models of education, and, in fact, elementary education systems around the world share many common characteristics. Efforts to create public elementary school systems in Europe (mostly in the nineteenth century) were initiated by leaders in the national or central governments. Dominant political, social, and economic classes used elementary schools to encourage conformity with the ideas and values that perpetuated the status quo and provided little opportunity for upward socioeconomic mobility. In the twentieth century the requirement for a more educated workforce has enhanced the place of elementary education within the continuum of formerly hierarchical European education systems.

The compulsory age for children to begin elementary school is five or six and elementary education may last for six years. Typical subjects include reading, writing, arithmetic, art, geography, history, physical education, fine arts, and foreign languages. In some countries, noncompulsory religion classes may be offered. Since the fall of Communism, most eastern European elementary school systems follow the western European education model. Elementary schools in Europe experience many of the same issues related to student achievement, diversity, poverty, and violence that face their U.S. counterparts, and standardized testing has become increasingly important in many countries, such as Great Britain.

**Asia (Japan).** Elementary education in Japan is built on a model of communities of people working together to become healthy in mind, body, and spirit. Students are educated to respect the value of individuals, and to love truth and justice. Elementary education begins at age six in Japan and ends at age eleven or twelve. The structure of Japan’s 6-3-3-4 school system was established by the School Education Law of 1947. The educational reforms resulting from this law, carried out under the direction of the American Occupation, decentralized control of education, authorized autonomous private schools, and encouraged the development of community education. The authority to establish schools is limited to the Ministry of Education, local governments, and private organizations that fulfill the requirements of becoming a school corporation. Municipalities are responsible for establishing elementary schools. Parents, especially mothers, take an active role in their

children’s education and reinforce the school curriculum through teaching their children at home or enrolling them in *Jukus*, which are privately run “cram” schools.

**South America (Chile).** Children in Chile attend primary (elementary) school for eight years. They study a curriculum and use textbooks approved by the government’s Ministry of Education, though following the 1980 educational reforms the oversight of elementary education in Chile was transferred to municipal governments. The typical primary school curriculum includes reading, writing, mathematics, social studies, music, physical education, and art. A national program of school breakfasts and lunches recognizes the importance of nutrition in the education of children. Chilean elementary education is faced with inequities in access to education among the rich and poor and a high dropout rate among the nation’s poorest children. The National Council for School Aid and Grants is charged with making scholarships available to all children. Since 1988, the national government of Chile has provided support for private schools, and this has caused a downturn in public primary school enrollments.

### The Importance of Elementary Education

In America, children normally enroll in elementary schools at age five or six and exit elementary school at age eleven or twelve. In 2002 approximately 25 million children attended elementary schools in the United States. Readiness for elementary school is viewed as highly important. Through Head Start programs, the government provides educational opportunities for children from disadvantaged circumstances in order for them to be prepared for elementary school. Parents of the children who may not qualify for government-supported programs often enroll their children in privately run preschools in hopes of setting their children on a successful path to elementary school. Although school attendance is not mandatory in most states until first grade, national surveys of parents of early elementary pupils show that 98 percent of primary school children attend kindergarten before entering first grade.

The rapid changes in cognitive, social, and moral growth of an elementary school student makes the elementary classroom an ideal setting for shaping individual attitudes and behaviors. The elementary classroom may provide the best opportunity to set in place moral and ethical characteristics

and understandings that have the potential to improve society. Children in the elementary schools are still malleable, and this emphasis on character education is seen as a particularly urgent matter in American classrooms. In fact, the socialization of children in America is no longer viewed as the sole responsibility of their parents.

The view of using the elementary classroom as a stage for molding future citizens of a democratic society is not new, but it does give rise to controversy regarding programs and methods, as parents may disagree with specific curriculum being promoted by local, state, or national agencies. For example, sex education at the elementary school level has been the object of much debate among religious and special interest groups. One result of the disagreements over such controversial curricula may be the large number of children home schooled in 1999–2001 (estimated to be more than 1.3 million). Even so, support may still be offered to home-schooled students through curriculum, books, and materials provided by local schools or districts, as well as access to extracurricular activities and special classes in areas such as technology.

### The Curriculum of the Elementary School

Unlike many other nations, the United States does not have a national curriculum. As mentioned previously, control of the schools is reserved to the states, which in turn give local school districts some control over what is taught and how it is taught. Curriculum may be looked at as a negotiated set of beliefs about what students should know or be able to do. A curriculum framework includes these beliefs, and then specifies by what point students should have mastered specific skills and performances. This is known as the *scope and sequence* of curriculum. Until recently, states and local districts had significant latitude in the development of elementary curriculum. The advent of the standards movement, however, has mitigated this freedom—for the better according to some, and for the worse according to others.

Do standards-based curriculum frameworks and standardized tests prepare children for the twenty-first century workplace where problem solving, creativity, and teamwork are necessary tools? Some people in the business world do not think so. Others argue that it is necessary to insure that all children master at least the basic essentials of reading, mathematics and writing in order to be able to perform at higher levels of performance and thinking. At any

rate, the standards movement has had a definite impact on the curriculum of the elementary school. In the early twenty-first century, forty-nine states have curriculum standards. Recent studies indicate that 87 percent of U.S. teachers believe the standards movement is a step in the right direction, and that the curriculum is more demanding and teacher expectations of students are higher as a result of standards. Many teachers also express frustration that they are not provided with the resources necessary to align the standards to the curriculum.

Prior to the standards movement, curriculum development was impacted by the notion of *cultural literacy* advocated by E. D. Hirsch. Hirsch began a national debate with the 1987 publication of what he considered essential common knowledge that all school children need to possess in order to be literate members of their society. His argument was that students could not be successful at understanding the world around them without a grounding in geography, history, literature, politics, and democratic principles. Hirsch then went on to develop a grade-by-grade outline of the knowledge students should master at each grade level. His book stimulated much national debate, especially with regard to whose cultural knowledge should be included in the curriculum—Western civilization only, or a more inclusive body of knowledge. His theories have had a definite impact on the elementary curriculum in many districts and states.

The current elementary school curriculum is influenced by societal needs and political influence. President George H. W. Bush endorsed the *America 2000* goals for American schooling, several of which have had a particular influence on the elementary curriculum. Basically, the goals stipulated that students would demonstrate mastery in five areas: English, mathematics, science, history and geography. President Clinton's *Goals 2000* program continued in the same vein. Societal concerns resulted in federal attention to the national curriculum, which has resulted in state accountability standards.

The state standards and curriculum are also influenced by the professional societies and their development of standards and benchmarks in their subject areas. The National Council of Teachers of Mathematics (NCTM), for example, developed an extensive set of standards that are centered on the need to develop problem-solving skills in addition to basic skills in math. The NCTM stresses conceptual knowledge as a framework for all mathematics learn-

ing and provides standards and expectations for each grade level. Other societies have provided similar frameworks that are used by the states in the development of standards.

Elementary curriculum is dynamic, changing as the needs and conditions of society evolve and change. While it cannot be said that there will ever be consensus on the content of the curriculum, the negotiated curriculum serves as a framework for the national agenda for education.

### Issues, Trends, and Controversies

The United States has engaged in a national debate over the purposes of schooling since the inception of the public school system. Such debate has resulted in numerous reforms and change efforts over the years. Some reforms have made lasting changes in elementary schooling, while others have gone away as quickly as they arrived. There are a number of burning issues that currently engage the public in discourse and negotiation.

Poor student performance is seen as a failure of the education system and numerous state and national mandates have been put in place to assure equal access to a quality education for all children. In 1983, the National Commission on Excellence in Education's *A Nation at Risk* outlined the decline of American education. This report heralded a revival of academic-driven curricula and resulted in an emphasis on standardized testing and accountability. The No Child Left Behind Act of 2001 requires each state to implement a system of accountability that will identify low-performing schools. It also requires that all students in grades three through eight must be assessed annually in at least reading and mathematics. Parents may also, under certain circumstances, receive governmental support to secure tutoring for children who attend low-performing schools. Such legislation gives rise to controversies surrounding charter schools and school vouchers.

Immigration in the United States has been an issue in elementary education since the advent of public schooling. Immigration patterns shifted dramatically at the beginning of the twentieth century, and continue to shift as children from Southeast Asia, Central America, and eastern European countries enroll in elementary schools. In 2000, 18 percent of the American populace spoke a language other than English at home. In 1990, 15 percent of the total child population was African American, 12

percent Hispanic, 3 percent Asian, and 1 percent Native American. It is projected that, by 2010, Hispanic children will surpass African-American children as the largest child minority. In addition, by 2020, more than one in five American children are expected to be of Hispanic descent. Immigrant children have special needs that must be addressed by the public elementary school. The debate over what form of English education children of immigrants should take has attracted much attention. At the beginning of the twenty-first century, programs for English learners in elementary schools are striving to focus on a holistic approach to educating transcultural/transnational peoples in a global context.

Incidences of school violence and drug use erupted on the school landscape during the late twentieth century. More than half of the nation's schools experienced criminal incidents in 1996–1997, and school security personnel have employed metal detectors to help assure the safety of students. The National Education Association supplies information and tools to help school administrators, teachers, and parents create safe schools. Conflict resolution and counseling have become a part of the elementary education curriculum, as have programs to teach children the dangers of drug use. The Drug Abuse Resistance Education (DARE) program, designed to give kids the life skills they need to avoid involvement with drugs, gangs, and violence, is seen as most influential when delivered to students attending elementary school.

The condition of children living in poverty is an issue of importance to elementary education. Poor children are more likely than more affluent children to experience difficulties in school. The strategies found to be most effective in teaching children of poverty may require special training for teachers, administrators, and school staff. Communication with parents is critical to student success in elementary schools, especially with parents of children of poverty. Many elementary schools in the United States incorporate programs that invite parents to participate in school activities and to feel welcome within the school environment, thereby supporting the families of their students.

The United States has firmly entered the information age. Computers are a common sight in most elementary schools, and school districts employ specialists in instructing students in the use of technology. An important issue that technology brings to elementary education is equal and controlled access.

Questions arise concerning frequent use of computers in schools, supervision of students' access to the Internet, and whether computer use has any impact at all on student learning. National standards have been established to direct the use of technology in schools, and federal funding has been made available to facilitate the widespread use of technology in classrooms. One remarkable problem regarding the use of technology in classrooms stems from the fact that most elementary children have learned technology skills faster than their teachers.

The Education for All Handicapped Children Act of 1975 was designed to assure an "appropriate public education" to meet the unique needs of all students with disabilities. Attached to this bill was a list of provisions for mainstreaming children with disabilities within the public school system. In order to comply with these provisions, elementary schools are faced with the problems of inclusion inherent in making their programs and facilities user-friendly for students with physical, mental, and behavioral disabilities of all sorts.

These issues are just a few of the current challenges faced by elementary education in the early twenty-first century. In spite of the debate, the basic framework of curriculum has survived.

### **The Evaluation of the Elementary Curriculum**

Evaluation of the curriculum has become a focus of concern and disagreement. The use of standardized tests, some argue, drives the curriculum. The importance placed on these tests by local, state, and national entities all but defines what will be taught in schools, thus negating local control of schools and, in fact, creating a form of national curriculum. Teachers who "teach to the test" are neglecting the development of powerful thinking skills and creativity. In fact, the tests are said to penalize those children who are creative thinkers. This limitation was noted by Hilda Taba in 1962, and remains a relevant concern. Some standardized tests, for example, have writing portions that consist solely of multiple-choice questions.

Others insist, however, that standardized tests are a vital tool for measuring the effectiveness of schooling and for holding schools and districts accountable for the education of children. They note that newer versions of these tests include questions to evaluate problem solving and higher-order thinking skills. Yet only a handful of states currently have

tests that directly measure student achievement with regard to mastery of state standards.

Standardized test scores of elementary schools are published and are public record. States maintain Internet sites where anyone can find the test scores of a particular school or district. Schools that consistently fall below state averages may be placed in a special category of *at-risk schools*, and in some instances they may actually be taken over by committees appointed by the state department of education if test scores do not rise within a certain probationary period.

National measures of achievement (e.g., the National Assessment of Educational Progress) are also reported to provide information at a national level about the achievement of all students. These national assessments have found that achievement levels of all children have risen annually, including the achievement of minority children. The gap between the scores of minority students and white students still exists, however, and the latest data show that it actually increased during the 1990s. This information has informed the federal government's educational policies of accountability. Federal legislation now requires that all children in grades three through eight to be assessed annually in mathematics and reading. As of 2002, however, only thirteen states and the District of Columbia met this requirement.

School districts often administer their own criterion-referenced tests to measure the effectiveness of the district curriculum framework. These tests attempt to measure the mastery of skills in the district framework at each grade level. The information provided by these tests is designed to give schools and teachers information about the effectiveness of the delivery of the district curriculum.

State, federal, and district assessments are conducted, in addition to the ongoing assessment performed in individual classrooms. Teachers utilize performance assessments, teacher-developed tests, tests that accompany textbooks, and other measures to monitor student progress. Students of the early twenty-first century are becoming the most frequently evaluated students in history. Whether more frequent testing leads to higher achievement in academic skills has yet to be determined, however.

### **Conclusion**

Elementary education is in an exciting period of reform. Technological advances and improved knowl-

edge about how children learn are being infused into the curriculum and instructional practices in schools. The national debate over the purposes and governance of elementary schools continues in the same historical tradition. Educators and policy-makers throughout the world are grappling with the determination of the skills and knowledge necessary for effective citizenship in the twenty-first century.

#### PREPARATION OF TEACHERS

During the first two centuries following the settlement of the American colonies the education of youngsters was a shared endeavor, with the family assuming major responsibility and the church typically taking on a prominent role as well. Various agencies and businesses in the community also contributed as children early on served in apprenticeships and indentures. Certain individuals did formally teach youngsters. However, in his major history of colonial education (1970), Lawrence Cremin noted that usually these individuals did not view teaching as their primary occupation nor were they formally prepared to do so. Some tutored the youngsters of the upper class. Others, typically women, taught the basics of reading, writing, and ciphering in their homes in what were known as dame schools. This rather informal and shared approach to educating youngsters continued well into the nineteenth century.

When the common school evolved in the early decades of the nineteenth century, the principles of free tuition, universal attendance, and hence tax support also became more prevalent. Correspondingly, the need for qualified teachers spread and the first public normal school was established in Massachusetts in 1839. These teacher preparation institutions spread quickly throughout New England and by the end of the nineteenth century to the rest of the country.

The curriculum in these normal schools focused on the subjects these prospective teachers were eventually to teach. Jesse May Pangburn's 1932 review of normal schools revealed, "students needed to show a mastery of reading, writing, spelling, geography, grammar, and arithmetic for admission to the regular professional courses" (p. 14). Examples of these "professional" courses were thirteen weeks devoted to the history of education, twenty-seven weeks in the science of education, and thirty-one weeks in methods in the elementary branches. Observation in elementary schools followed by practice teaching was a culminating feature of the normal school cur-

riculum and the curriculum was spread out over one or two years.

As late as 1898 there were approximately 250 normal schools; however, these institutions graduated only about a fourth of the total number of elementary teachers needed. Most elementary teachers were simply graduates of elementary schools. These teachers were nearly always women who could be recruited for lower salaries than men and who were believed to possess the nurturing qualities needed to interact effectively with younger children.

With the advent of the twentieth century departments of education in universities evolved. Wayne Urban (1990) reported that the motivation for universities to incorporate teacher preparation into the curriculum stemmed from their need for increased enrollment and the positive public relations that came from addressing the needs of the expanding public school systems. The creation of specific departments of education would “also allow women to enroll but not spread their presence or influence across the campuses” (p. 63).

The normal schools now had to transform themselves in order to compete with the universities. Many of these normal schools became teachers colleges. Some of the teachers colleges eventually included other majors, and in the last half of the twentieth century some even became universities. Bachelor’s degrees were now offered in both universities and teachers colleges. This resulted in adding general education requirements to the more technical teacher education curriculum. In the late 1920s and throughout the 1930s the foundations movement, guided by the social and philosophical ideas of John Dewey, took place in teacher education. The disciplines of history, philosophy, and psychology were brought to bear more directly on both the problems of teaching and the role of school in addressing broader societal issues. Thus, by World War II, the general structure of the preparation of elementary teachers was shaped much as it remains at the beginning of the twenty-first century: academic study, foundational study, professional study, and practice teaching.

### **Current Structure and Organization**

In the early twenty-first century, teacher preparation in the United States is a huge enterprise. There are more than 3 million teachers in public schools in the United States and more than 1,400 institutions of

higher education of various types that offer programs preparing teachers. The preparation of teachers is also increasingly undertaken as a partnership endeavor with elementary and secondary personnel assuming an expanded role, especially in the clinical aspects of this endeavor. A distinctive trend in the 1980s and 1990s was the formulation of professional development, professional practice, or partner schools specifically designed to assist in the preparation of prospective teachers.

The Research About Teacher Education (RATE) Study (1989) was a national survey of the organizational and structural properties of programs preparing elementary teachers in the United States. This study reported that the typical distribution of college credits for an elementary education program consisted of approximately 132 semester hours accordingly: general studies (58 credits), professional studies (42 credits), an area of concentration (20 credits), and student teaching (12 credits). About a third of the programs required an academic major averaging 32 credits, and another fourth required an academic minor averaging 20 credits.

A typical professional sequence for prospective elementary teachers includes six hours in the methods of teaching reading and approximately three hours each in the methods of teaching social studies, math, science, and language arts. Student teaching is usually completed in one setting and lasts about twelve weeks. Many programs preparing elementary teachers are organized into “blocks” of courses so that related subjects can be studied in an integrated fashion.

At the baccalaureate level, one can find preparation programs in relatively equal numbers that begin at the freshman, sophomore, junior, and senior year. However, elementary teacher preparation increasingly has taken on a postbaccalaureate flavor. History shows a pattern of teacher preparation from no formal preparation to two years, then four years, and at the turn of the twenty-first century, often five years and more. Some five-year programs combine undergraduate and graduate credits. Others result in a master’s degree along with the baccalaureate award. In addition there are teacher preparation programs offered solely at the masters level, often designed to attract prospective teachers whose undergraduate degree is in another field. Finally, there are also many alternative licensure programs usually intended to accommodate the “nontraditional” student and to recruit teachers for “high need” schools.

### The Continuing Education of Elementary Teachers

In addition to the trend towards extended programs of preparation, many states and school districts are offering what are referred to as induction or entry year programs wherein novice teachers in the critical first years of teaching are provided assistance by veteran teachers. Novice teachers also come together periodically to continue their education. Some of these programs are sponsored by the district, others by teachers' unions, and still others in partnership with universities.

The education of teachers hardly stops at this point. Licensing requirements mandate that teachers continue their education, and the rapidly changing student demography, new technologies, and ever-expanding information underscore why they continually need to do so. While many teachers return to universities for further coursework (the majority of elementary teachers now complete at least a master's degree), they also regularly engage in educational activities sponsored by their school districts and teachers' unions. Although summer and after-school workshops remain a staple of this continuing education, increasingly forms of continuing professional development are built into teachers' ongoing daily activities with an emphasis on inquiry into and reflection upon how they are impacting student learning. During the 1990s professional development guidelines and accountability measures were put in place so that veteran teachers could be certified by a national board as accomplished teachers.

### Unresolved Issues and Problems

Although inroads generally have been made in the recruitment, preparation, and induction of elementary teachers, problems remain and several issues can be raised as well. First, studies of teaching effectiveness underscore the essentiality of knowing the subject one teaches in considerable depth and having a repertoire of teaching strategies indigenous to that subject. Thus a strong argument can be made that most elementary teachers simply are not adequately prepared to teach five or six subjects well. Rather, what is needed are schools where elementary teachers work in teams assuming collective responsibilities for a group of youngsters but with each teacher on the team teaching only one or two subjects. This suggests quite a different pattern of preparing elementary teachers with an emphasis on effective collaboration among other needed changes. Second, the

plurality of cultures and languages that is now represented in many classrooms calls for teaching that is sensitive and responsive to pluralism and youngsters who live in very different neighborhoods; a daunting challenge indeed. Third, the pervasive presence and massive potential of the computer as a teaching tool and vehicle for learning presents particular challenges in preparing teachers. Fourth and finally, while the preparation of elementary teachers has generally been improved and extended over time and entry-year programs are becoming more common, these endeavors tend to be uncoupled and not aligned with one another.

Although partnerships in the preparation of teachers are evolving and outstanding veteran teachers are contributing in expanded ways, these partnerships tend to be ad hoc in nature and tenuous, involving a few individuals rather than interinstitutional arrangements. Reform in teacher preparation tends not to proceed in an aligned and simultaneous manner with needed reforms in elementary schools.

KENNETH R. HOWEY  
LINDA M. POST

### ELIOT, CHARLES (1834–1926)

During Charles Eliot's forty-year tenure as president of Harvard, he helped transform the relatively small college into a modern university and became a leading spokesman for Progressive educational reform in America.

The son of a prominent Bostonian businessman, Charles Eliot entered Harvard in 1849. After graduating second in his class, Eliot became a tutor and was then promoted to assistant professor of mathematics and chemistry. When Harvard did not renew Eliot's appointment in 1863, he traveled to Europe to study. He returned home to accept a professorship at the new Massachusetts Institute of Technology. In 1869 Eliot published a two-part essay in the *Atlantic Monthly* entitled "The New Education," which solidified his position as an educational reformer and helped him secure a nomination for the presidency of Harvard.

### Harvard: From College to University

While Eliot's ideas concerning education brought him the nomination for Harvard's presidency, it also brought great criticism of his possible selection. Clergy dominated the leadership of American higher education, and the college curriculum generally centered on classical studies. Eliot, a thirty-five-year-old scientist, threatened these traditions. Even though his election as president in 1869 was not unanimous, he did not shirk from delineating a reform agenda during his inaugural address. He recommended that Harvard reject the notion of antagonism between classical and scientific studies and proposed, among other things, expanding the curriculum, reforming teaching methods, implementing higher standards, and recognizing individual differences and preferences in education. In short, Eliot presented an outline for Harvard's metamorphosis from college to university.

Eliot understood that graduate and professional education provided an integral part of any true university, and in 1872 his administration created a graduate department. The department, however, failed to have any impact as it did not offer any courses designed specifically for graduate students. In contrast, Johns Hopkins and Cornell provided clear examples of institutions devoted to the university ideal by emphasizing specialization and research. Eliot assimilated many of the philosophies espoused by these universities and used Harvard's resources to develop a stronger graduate program. In 1890 Harvard dropped its graduate department in favor of a graduate school, and offered courses designed specifically for graduate students. At the same time Eliot proposed that professional programs, such as law and medicine, become the arbiters of professional standards. With this in mind, Harvard

required a bachelor's degree to enter its top professional schools. This reform encouraged greater scholarship among faculty and students and prompted other institutions to do the same.

### Recruiting a Superior Faculty

High-quality graduate education would not be possible without scholars possessing advanced knowledge in their specific fields, so Eliot provided incentives to lure leading professors to Cambridge. During his first year as president Harvard increased faculty salaries from \$3,000 to \$4,000. Eliot also ignored theological issues when hiring faculty. The opening of Johns Hopkins provided Harvard with a new school from which to hire American Ph.D.'s. Eliot, however, did not stop with hiring the graduates of new universities; he also raided other institutions' faculties, a standard practice in American higher education. In 1880 Eliot promoted the creation of a pension system to encourage the retirement of unproductive employees. Eventually this system expanded to include all faculty members at Harvard. Then, Eliot helped secure a sabbatical year for Harvard professors wishing to focus on scholarship. All of these practices and innovations allowed Harvard to recruit a superior faculty.

### The Elective System

Of all the reforms Eliot implemented at Harvard, none brought more renown than the elective system. Ironically, student freedom in choosing classes was not a new controversy. Thomas Jefferson encouraged the practice when founding the University of Virginia, as did other reformers during the 1840s. While the rationale against student choice as expressed in the Yale Report of 1828 still held sway at Northeastern colleges, even Harvard allowed limited student choice when Eliot took office. The university prescribed all freshmen courses, but some options existed for upperclassmen. Eliot, to the dismay of many colleges, proposed a much more radical version of the elective system. He allowed Harvard seniors to choose all their courses, and gradually loosened restrictions on younger students. By 1884 Harvard granted freshmen some choice in course offerings.

Eliot's primary defense of the elective system emphasized the liberty expressed in both the Protestant Reformation and in American political theory. Freedom, he argued, allowed students to develop true growth of character. Individuals possessed God-

given propensities that students needed to cultivate in order to fulfill their mission of service after leaving Harvard. In addition, allowing students to choose classes helped expand the curriculum and graduate programs. Electives promoted specialization and encouraged professors to work closely with students in order to push the boundaries of knowledge in their specific field. Finally, by providing students with options Eliot could determine which professors were no longer inspiring students with their subject matter or teaching methods.

Closely related to Eliot's philosophy of freedom in academics was his policy of increased student freedom outside the classroom. Eliot delegated responsibility of student conduct to the dean, and he encouraged relaxing restrictions on pupils. During his tenure as president the student rulebook shrank from forty pages down to five. Eliot also lobbied to remove conduct as a factor in deciphering class rank. Finally, the *in loco parentis* attitude was challenged with the ending of mandatory class attendance. All these changes signaled the transformation from college to university.

### **As an Undenominational Institution**

In attempting to end the parental role of Harvard, Eliot diminished the school's religious traditions, and he encouraged other institutions to do the same. The president classified Harvard as "undenominational" and contrasted the institution in Cambridge with smaller denominational liberal arts colleges across the country. The analysis, as his detractors complained, carried a condescending tone, yet Eliot continued to advocate a liberal compatibility between science and religion. At the same time, Eliot derided denominational competition, which spawned large numbers of poorly funded and academically questionable sectarian institutions. As he argued for religious reform nationally, he had more difficulty actually implementing his ideas at Harvard. Eventually the institution followed Eliot's recommendations by abolishing compulsory attendance at daily prayers and emphasizing scientific and intellectual pursuits in the Harvard Divinity School. By doing so, Harvard continued to shed its old-time college image in favor of university status.

### **Admission Practices**

Eliot also sought to raise entrance requirements and to provide standardization for admissions practices. He convinced Harvard to accept the College En-

trance Examination Board's test for admission. This test provided students across the country with the opportunity to apply to Harvard. A more geographically diverse student population, argued Eliot, gave the school another opportunity to shed its historically provincial recruiting practices.

Eliot's ambivalent statements concerning education for minorities mitigated his reforms in admissions. During a tour of the south in 1909 Eliot publicly supported the region's laws prohibiting miscegenation and also opposed relationships between different ethnic groups of European-Americans. Apparently the influx of Irish in Massachusetts convinced him that the proper way to assimilate minorities was through education alone. At the same time Eliot advocated an appeasement approach toward the acceptance of African Americans and failed to condemn Jim Crow laws in the South. Although Harvard accepted a small minority of African Americans, Eliot conceded that a larger black population in the Northeast would precipitate segregated education. Finally, Eliot proved ambivalent on the question of higher education for women. He supported the teaching activities for women at the "Harvard Annex," and he celebrated the creation of Radcliffe College. This system of coordinate education allowed him to argue that Harvard had not become truly coeducational, while he also advanced the notion that Harvard had accepted its role in educating American women. Still, the Harvard president made numerous comments about the possible dangers of educating women, while advocating further inquiry as to the subjects best suited for women to study. These assertions reveal that Eliot's progressivism, like many other reform efforts at the time, did not include the concept of social justice that developed later in the twentieth century.

### **Harvard's Democratic Ideals**

Harvard had always been charged by its critics as elitist and relatively useless to the common man. Eliot used a number of strategies to change this perception and restore the close relationship Harvard once had with the commonwealth and the nation. First, he modified the mission of "practical" higher education advocated by new state universities. He emphasized the progressive reliance on expert scholars who trained other professionals to function in democratic leadership positions. This elitist attitude offended many, but Eliot sought to assuage that tendency. He understood the growing importance of

public image and began distributing literature about Harvard to alumni who worked in the media. He also traveled across the nation to speak on behalf of his institution.

While emphasizing Harvard's "democratic" ideals, Eliot also sought the support of wealthy individuals in order to expand Harvard's offerings. His cordial relations with J. P. Morgan and John D. Rockefeller led to donations that funded the building of the medical school. At the same time, other contributions made the creation of the Graduate School of Business Administration possible. Though funded by the elite, these schools exemplified Eliot's assimilationist tendencies by providing education that would help society at large while avoiding overtly vocational activities. His connections with these "robber barons" and the creation of professional schools offended traditionalists, but allowed Harvard to maintain its status as a leading institution of higher education. Eliot also convinced many of Boston's elite that financial support of Harvard's attempts to become a national university also promoted the status and well-being of their city.

### Eliot as a National Figure

As president of America's leading institution of higher education, Charles Eliot implicitly wielded national influence in educational reform. Success of his agenda in Cambridge gave him more freedom as an ambassador of the university to the rest of the nation. As the years of his tenure increased so did his travel and speaking engagements. During his educational speeches Eliot did not limit himself to collegiate reform. He became increasingly interested in secondary education and its relationship to higher education. He and John Tetlow, a secondary educator, formed the New England Association of Colleges and Preparatory Schools. The organization regulated primary and secondary education in the region and became a model for other regional accreditation agencies. He also expanded his leadership role in the National Education Association. In 1892 he chaired the Committee of Ten, a group of scholars who sought to provide guidelines for high school curricula and admissions standards for colleges. The report of the committee helped solidify Eliot's position as a leading educator in America and also coerced reluctant Harvard administrators to accept the standardization of admissions. In this way Eliot's public role in American education provided reciprocal benefit to himself, his institution, and ed-

ucation in general. He remained active in this capacity after he retired as Harvard's president in 1909 until his death in 1926. His nomination as the honorary president of the Progressive Education Association revealed his importance to educational professionals and the general public.

Eliot's reforms at Harvard were not offered in a vacuum. He was part of a much larger reform movement in higher education that included such individuals as Andrew D. White of Cornell, James Angell of Michigan, and Daniel Coit Gilman of Johns Hopkins. Eliot provided an example of a leader willing to modify his views in light of changing evidence. He adjusted his stance on such issues as his advocacy of graduate teaching and research, curriculum matters, and the government's role in education. Although Eliot often appeared condescending to those who opposed his ideas, he provided opportunity for dissent. Occasionally his dissenters won, as evidenced by the failure of his three-year plan for a bachelor's degree, his attempts to merge Massachusetts Institute of Technology with Harvard, and early failures with entrance requirements. As president of the nation's oldest institution of higher education, he implemented reforms at Harvard that eventually became commonplace in educational institutions across the country. As he defended his reforms to the nation he became a well-respected public figure whom many considered the most important educational reformer of his time. Opposing factions often criticized Eliot's actions, but his reforms proved to be lasting changes that continue to shape American education in the twenty-first century.

## EMOTIONAL DEVELOPMENT

See: AFFECT AND EMOTIONAL DEVELOPMENT.

## EMOTIONALLY DISTURBED, EDUCATION OF

Since enactment of the Education of All Handicapped Children Act of 1975, under 1 percent of school children have been identified for special education and related services as having *serious emotional disturbance* (SED); since 1997, the term *emotional disturbance* (ED) has been applied under the Individuals with Disabilities Education Act (IDEA). Although the percentage has remained stable for decades, professional estimates suggest the true prevalence is probably three to six times greater. An early twenty-first century report by the U.S. Surgeon General noted that only about one in five children and youth with ED receive mental health services or special education. Reasons for underidentification include economic factors, concern about a stigmatizing label, confusion among professionals, and a vague definition.

Federal legislation incorporates almost verbatim a definition proposed by Eli M. Bower in 1960, which includes five characteristics, one or more of which a student displays to a marked degree and over a long period of time: (1) an inability to learn, which cannot be explained by intellectual, sensory, or health factors; (2) an inability to build or maintain satisfactory interpersonal relationships with peers and teachers; (3) inappropriate types of behavior or feelings under normal circumstances; (4) a general, pervasive mood of unhappiness or depression; and (5) a tendency to develop physical symptoms or fears associated with personal or school problems. Federal language specifies that ED must adversely affect educational performance but does not specifically include social learning or behavior as “educational performance.” The definition has been criticized as vague and highly subjective (e.g., what is “a marked extent,” or a “long period of time?”), and an additional federal clause makes the definition self-contradictory. The addition is an exclusionary statement that the category “does not include children who are socially maladjusted, unless it is also determined that they are seriously emotionally disturbed” (45 C.F.R. 121a.5[b][8][1978]). Nevertheless, the federal definition remains unchanged.

In the 1990s an alternative definition and the term *emotional or behavioral disorder* (EBD) were proposed by the National Mental Health and Special Education Coalition. The coalition consisted of more than thirty professional organizations serving children’s mental health needs. The proposed definition and terminology are thought to be less stigmatizing, to emphasize disorders of emotions and behavior, and they include disabling disorders excluded in the federal definition. Notwithstanding widespread support from coalition members, federal language has not changed. Administrators of special education oppose the alternative definition and terminology, fearing significant increases in the number of students qualifying for special education and related services.

The problems of students with ED are severe and chronic. Only those with the most severe disorders receive services, and appropriate educational services have remained a persistent challenge. Students with ED tend to be served in more restrictive settings (e.g., separate classrooms or schools instead of regular classrooms or schools) than their peers with other disabilities, and student outcomes (school completion, later employment, successful

community adjustment) are poorer for students with ED. Research suggests that for children not receiving effective services before the age of eight years, ED should be viewed as a chronic, lifelong condition requiring continuing support services.

In the late twentieth century and into the twenty-first century, controversies surrounded the full inclusion of students with disabilities in regular schools and classrooms. ED students were generally ignored, although serious questions arose about the advisability and feasibility of including all students with ED in general education. Even as other students with disabilities were increasingly included in regular classrooms, those with ED were more likely to be educated in separate classes.

In 1990 Jane Knitzer, Zina Steinberg, and Brahm Fleisch highlighted the overemphasis in many programs on controlling acting-out behavior at the expense of a focus on instruction in academic skills and social behavior. Subsequently, others emphasized design and delivery of effective academic and social instruction.

Controversy continues about placement and programming. Growing evidence that early intervention and prevention are effective has not resulted in widespread prevention. A particular obstacle to truly effective services is the extreme difficulty in coordinating services from multiple agencies and fostering collaboration among schools and numerous community, family, and adult service providers. Awareness of the cultural differences in behavior is increasing. The complexity of the relationship between behavior and culture is underscored by simultaneous calls for increased attention to the mental health needs of students of minority ethnicity and complaints that students of color with ED are over-represented in special education.

### REASONS STUDENTS WORK

Katherine L. Hughes

## GENERAL IMPACT ON STUDENTS

Paid employment begins at a relatively young age in the United States. While exact figures vary, depending on the means of measurement, a survey published in 2000 by the U.S. Department of Labor found that half of American twelve-year-olds have had some kind of work experience. While at such young ages work experiences tend to be informal and short-term, as American youth progress through their teenage years their work becomes more formal and more time-consuming. Researchers have been paying increasing attention to the effects on youth of working. In general, the results from this body of research lead to neither a blanket endorsement nor a condemnation of school-aged youth working for pay.

There have been several phases of research on youth and work. Before 1970, researchers paid almost no attention to students' paid work. The influential report of the Coleman commission of the President's Science Advisory Committee (1974) blamed schooling—because it isolates young people from adults and from productive work—for actually retarding youth's transition to adulthood. The report called for placing young people into work situations earlier, as a tool for social development. Presumably, work would provide a valuable educational experience, even if the work took place in an occupation not related to the eventual employment.

As national surveys in the 1970s and 1980s were demonstrating that paid youth work was very com-

mon, Ellen Greenberger and Laurence Steinberg's *When Teenagers Work*, which reported the results of research on primarily middle-class youth in California, brought attention to some negative consequences of work. This spurred a lively debate and further study among academics. In particular, some feared that work could have negative consequences on school engagement and performance. While youths tend to work more during the summer than during the school months, some data show that the majority of high school juniors and seniors do work during the academic year. At the start of the twenty-first century, researchers have been turning their focus to the quality of young people's jobs and proposing to increase jobs' learning content through formal linkages with school curricula.

In contrast to the concern over too much working, some find access to work for minority and low socioeconomic status youth to be a greater problem. Working during high school does reduce the risk of unemployment later. Racial and ethnic disparities in teenage job-holding and in the number of hours worked are well-established. Multiple studies indicate that minority teenagers, and teens in poor families and families receiving public assistance, are less likely to work than white or higher socioeconomic status youth. As Jeylan T. Mortimer and her colleagues reported in 1990, "employment is very much a middle-class phenomenon" (p. 208). In one study of several hundred youth in Baltimore, African-American youth reported equal or greater job-seeking as white youth but lower rates of obtaining jobs. Hence African-American youth started working later, and were less often employed. The U.S. Department of Labor reported in 2000 that African-American and Hispanic youth have much higher unemployment rates than do white youth. However, when they do work, Hispanic youth work more hours during the school year than do other youth.

Young people's first paid jobs tend to be informal (or "freelance jobs," as the U.S. Department of Labor refers to them), such as child care and lawn work. According to Mortimer and associates (1990), girls tend to start paid work earlier, yet their first jobs are more likely than those of boys to be of the informal type and concentrated within a smaller number of areas. Of the ninth-graders in this study, most of the girls were working in private households while the boys were more divided among informal work, sales work, and restaurant work.

Research has established that there are sex differences in industry and occupation of young workers. Male and female youth are about equally likely to work in eating and drinking places, with about 27 percent of fifteen-year-old boys and 31 percent of fifteen-year-old girls working in such establishments, but males are more likely to be employed in the agriculture, mining, construction, and manufacturing industries. Boys fifteen to seventeen years of age are much more likely to work in farm, forestry, and fishing occupations, as well as blue-collar occupations, while girls of the same ages tend to work in sales occupations such as cashier (this is true for the school year *and* the summer months).

Youth tend to give the reason for working as “to buy things,” noted the Mortimer study in 1990. Katherine S. Newman makes the point that teenagers from poor families in particular need to work so that they have money with which to participate in youth culture, yet Doris R. Entwistle and associates reported that lower-status youth are more likely than other youth to share their earnings with their family. The young fast-food workers in Harlem that Newman studied also sought work as a place to escape from violence in their own neighborhoods.

Earnings for teenage workers are generally just above minimum wage; in 1998 median earnings of fifteen- to seventeen-year-olds were \$5.57 per hour, while minimum wage was \$5.15. Hourly earnings do increase with age. White and Hispanic males tend to have the highest median hourly earnings while Hispanic and African-American females have the lowest. Mortimer’s 1990 report found significant wage differences between boys and girls overall, with boys reporting a higher mean wage.

### **Employment after School and Effects on Academic Outcomes**

The propensity of American youth to work (and often to work a significant number of hours) during the school year has led to debate among researchers and policymakers about the effect of this work on young people, particularly on their academic engagement and achievement.

According to the U.S. Department of Labor, during the 1996–1998 school months, 39 percent of seventeen-year-olds were employed during the average month. This method of measurement, tabulating the percentage of young people employed at a particular point in time, minimizes the extent of youth

work; when students are asked if they have *ever* worked during their high school years, figures are significantly higher. An analysis of National Longitudinal Survey of Youth (NLSY) data in 1995 by Michael Pergamit found that about 64 percent of juniors and 73 percent of seniors said that they had worked at least one week during the school year.

The concern over youth working while in school emanates from two perspectives. One focuses on the amount of time spent at the workplace, reasoning that time spent at work is likely to be time taken away from academic pursuits such as homework. While young people work longer hours during the summer than they do during the school year, the number of hours spent on the job in the academic months, about 17 per week according to the Department of Labor, is still significant. Another concern is about the low quality of the jobs youth tend to hold. As noted above, young people tend to start with informal jobs, such as child care and lawn work, with the majority then moving into the retail trade industry, which includes eating and drinking places such as fast-food outlets. There is the question of whether youth gain developmentally at all on the job, given the low-level positions they tend to have. Young people themselves say they work to earn money to buy things and save for college, rather than to add to their knowledge or skills.

In general, an examination of the literature on youth working while in high school finds costs and benefits, and some of the literature is conflicting. In terms of effects on academic achievement, some researchers have found a negative relationship between the number of hours worked during the school year and both high school and postsecondary school attainment measures. However, David Stern and Derek Briggs reviewed the literature and concluded that the relationship between hours of work and performance in school actually follows an inverted-U pattern, meaning that students who work more moderate hours perform at a higher level in high school than students who work more heavily or not at all. This pattern appears to extend to postsecondary achievement as well; Department of Labor analysis of NLSY data shows that teenagers who worked twenty or fewer hours per week while in high school were more likely to have achieved at least some college education by age thirty than those who had worked more than twenty hours or not at all.

However, some researchers contend that the observed effects are spurious because they do not take

into account preexisting differences between students who work and those who do not. And some of the research is not able to fully sort out the direction of causality. For example, students who are not already performing well in school may seek more hours at their paid jobs, rather than spending long hours studying. Researchers have also questioned the zero-sum assumption that hours on the job are hours not spent in study. An analysis of longitudinal data by Mark Schoenhals, Marta Tienda, and Barbara Schneider found that youth employment lowered the amount of time spent in watching television, not the time spent reading or doing homework.

### Employment during the Summer

Youth are more likely to work during the summer than during the school year, and according to the Department of Labor, 20 percent of employed youth aged fifteen to seventeen work full-time over the summer months, compared with 6 percent during the rest of the year. Mihaly Csikszentmihalyi and Barbara Schneider report that youth from higher-income families generally have more work experience and are particularly more likely to work solely in the summer.

Employed youth aged fifteen to seventeen tend to work in similar industries in the summer as they do during the school year, with the majority working in retail, which includes eating and drinking establishments. However, in the summer the proportion in retail declines somewhat as teens take more jobs in agriculture, construction, and service industries. Csikszentmihalyi and Schneider note that affluent teenagers tend to have jobs such as camp counselor and lifeguard, likely reflecting their tendency to work only during the summer and the opportunities available in their communities, while working-class youth were found more likely to hold positions in fast-food outlets. Hourly earnings for youth working during the summer versus the school months are about the same.

In the research literature there is much less concern about, and hence much less attention given to, paid work that students perform during the summer months. One study that did attempt to measure the costs and benefits of summer work to youth found that summer employment had positive effects on post-high school employment status and other outcomes. According to Herbert W. Marsh, no negative effects were found. Thus the summer employment problem may be better redefined as the difficulty

that minority and low socioeconomic status youth face in gaining access to valuable paid positions. As noted above, there are racial and ethnic disparities in teenage job-holding and in the number of hours worked. While the federal government has long funded summer job programs aimed at youth with serious barriers to employment, the 1998 Workforce Investment Act changed the focus to year-round services, eliminating the separate appropriation for summer activities.

### Effects on Psychosocial Outcomes

There is no doubt about the importance of the work role in adulthood, thus most recognize that for an adolescent, taking on a new social role as worker can be a formative experience. Yet there is considerable debate about whether the experience affects the development of youth positively or negatively. In addition, there may be sex differences with regard to developmental impact, as girls and boys tend to have different types of jobs, particularly in their early teens.

Some researchers question whether youth gain any skills at all on the job, given the positions youth have and the workplaces they are in, and argue, as do Greenberger and Steinberg, that youth work can lead to stress as well as to adult behaviors such as alcohol use. Studies do report that working is associated with “problem behaviors” such as substance abuse and other delinquent activities; Mortimer, Carolyn Harley, and Pamela Aronson provided a review of a number of these studies in 1999. Again, however, the direction of causality is difficult to determine.

Most research finds that the general public regards youth work positively, believing it to have developmental benefits. For example, a study by Mortimer and associates published in 1999 examined parents’ retrospective views of their early jobs, as well as their attitudes toward their children’s work. The parents were enthusiastic about working during adolescence, listing a variety of competencies they believed they had acquired as a result, such as gaining a sense of responsibility, money management skills, discipline, and so on. Not surprisingly, then, the parents had favorable attitudes about their children’s employment. The children reported benefits of working quite similar to those their parents had reported.

With regard to skills learned on the job, a study of youth working in fast food argues that these posi-

tions do yield skills, as they require much in the way of information processing, coordination, and responding to unpredictable events. Youth also must learn to handle customers, which can help them to develop what Newman characterizes as “people skills.” Other research has found that even positions such as child care can develop innovative thinking skills in and provide challenge to young people. Mortimer and Catherine Yamoore (1987) pointed out that the opportunity for self-direction in a work setting can have positive consequences for a worker’s self-concept and interest in work. Thus research has examined not only the types of specific skills youth workers might gain on the job, but also psychological effects that might influence attitudes and behaviors.

An important point brought out in the research is that the influence of a particular job on a young person likely depends on the nature of the job. One study finds that “the quality of the work (i.e., its stressful or rewarding character) is a more important determinant of adolescent psychological functioning than either work status or its intensity” (Finch et al., p. 606). However, young people actually report little stress from their jobs alone; it is combining or juggling being both a worker and a student that can be stressful.

### Connecting Work and School

Several researchers have observed that youth perceive school and the workplace as conflicting, not complementary, and argue that more efforts should be made to integrate the two. A study by Barbara Schneider and David Stevenson found that youth enjoy working more than they enjoy being in school.

There seems little chance that students will cease working. Thus researchers and policymakers are increasingly turning to a focus on building and strengthening connections between work and school, which should help to improve the nature of some youth work. While school-arranged work placements such as co-op and internships have been in place for years, the 1990s saw a renewed emphasis on school-sponsored work-based learning, particularly through the 1994 School-to-Work Opportunities Act. Research by Alan M. Hershey, Marsha K. Silverberg, and Joshua Haimson evaluating the effectiveness of the legislation included surveys of 1998 high school seniors, who reported that work opportunities offered through the schools had important advantages over the workplace activities students re-

ported finding on their own. School-developed positions tended to be in a wider range of industries, and tended to more closely match students’ career goals. Students with school-arranged paid jobs were more likely than other students to spend at least half their time in training on the job. They were also more likely to report discussing possible careers with adults at their workplace, and were more likely to receive a performance evaluation from school or employer staff. Students who had obtained positions through school more often reported using academic or technical skills learned in school at the workplace, and were more likely to draw on their work experience in school assignments or discussions, thus experiencing more substantive connections between their studies and work experience.

Despite the challenges of coordinating work activities through school, advocates of these arrangements hope to expand them. While there is no definitive answer to the question of whether working during the school year negatively affects students’ school work, it is certainly desirable to help youth perceive school and the workplace as complementary, rather than conflicting. Since it is unlikely that young people will stop working, the idea is to help youth gain as much as possible from their employment experiences.

KATHERINE L. HUGHES

## EMPLOYERS' PERCEPTIONS OF EMPLOYMENT READINESS

Employers in the business community are getting into the education business. From companies like Cisco Systems and Manpower to the Bill and Melinda Gates Foundation, American businesses and business leaders are spending millions of dollars to address what they perceive to be a deficiency in the ability of the American education system to adequately prepare students to meet the demands of the workplace of the early twenty-first century. From funding for inner city computer centers to school-to-work participation, their interest is driven by the belief that high school and college graduates are not ready to adequately contribute in the workplace. This article addresses employer perceptions of employee readiness by outlining what employers need from employees, followed by their perceptions of the readiness of new employees to contribute to the organization's ability to meet these challenges.

Concern about readiness for work is not new. There is a history of government initiatives on this topic, perhaps most notably the Secretary's Commission on Achieving Necessary Skills (SCANS) in 1991. Readiness for work entails preparedness to learn and perform on the job, the ability to continue

to learn, and the personal characteristics that contribute to successful accomplishment of work. According to Harold F. O'Neil Jr., Keith Allred, and Eva L. Baker, general categories of readiness skills consist of basic academic skills, higher order thinking or problem solving skills, interpersonal and teamwork skills, and attitudes or other characteristics such as the willingness and ability to take initiative and responsibility.

### **Organizational Needs and the Employment Environment**

Perceptions of readiness are based on a framework of organizational needs that have been influenced significantly in recent years by changes in the competitive environment, in technology, and in theories of managerial best practices. Intense competition has forced organizations to become more customer-focused, with greater emphasis on understanding and quickly satisfying customer needs and on responding rapidly to changing customer preferences. Whereas Harry Braverman argued in 1974 that the technologies of the future would reduce workers to button-pushing automatons, the opposite has been the case. Workers at low levels of the organization are often expected to perform across a range of roles and responsibilities and must take initiative and use judgment in determining how to best satisfy customer needs and keep their team running smoothly. Whether responding to customer needs, competitor activities, or rapidly changing technology, the organizational imperatives are clear: speed, agility, and adaptability are crucial. Traditional command-and-control hierarchies with narrow, highly structured, routine jobs and tightly supervised workers are poorly suited to this kind of environment. Instead, organizations today are often more flexible, utilizing team-oriented, decentralized structures that empower lower-level workers to make decisions and take initiative.

Employer perceptions of employee readiness are influenced by a dynamic interplay among evolving organizational needs, educational institutions' practices, and the preparation of the students who enroll in educational institutions. These factors have changed the employers' needs and expectations of employees on all fronts. First, to function effectively in the twenty-first century workplace, employees need greater ability in the basics such as reading, writing, and arithmetic. Thus, employers desire workers with more formal education. In fact, where-

as jobs requiring at least a bachelor's degree constituted 21 percent of jobs in 2000, they are forecast to comprise 29 percent of jobs by 2010. Employers expect employees to have the interpersonal skills necessary to communicate, solve problems, coordinate activities, and resolve conflict. Employees also need to possess the ability to self-manage, take initiative, and engage in self-directed learning. Moreover, employers want employees who are ethical and flexible. Research by Kristy Lauver and Huy Le shows a relationship between higher levels of emotional stability, agreeableness, and conscientiousness and lower numbers of workplace accidents.

### **Perceptions of Readiness**

Employers tend to expect schools to build general skills such as basic knowledge, discipline, professionalism, good work habits, the ability to communicate, openness, perseverance, problem-solving ability, and well roundedness. Employers have not seen schools as being effective in producing specific, job-related skills, and employers do not view schooling as the sole or even primary source for developing such skills. For example, Madelyn Schulman's 1999 study of high school interns in school-to-work transition across various occupations revealed that, once at work, interns found themselves in an environment of which they had little or no understanding. Furthermore, 73 percent of managers in one survey described in *The Lessons of Experience* (1988) indicated that they used the skills taught in their master's of business administration (MBA) programs either "marginally or not at all" in their initial managerial assignments. Lynne Leveson reports that despite the efforts invested in building general competencies, the essential differences in the educational environment and the work environment create the inevitability of certain discontinuities between the two. Thus, many employers believe that job-related skills are company-specific and best acquired on the job and see the schools' role as making people trainable.

Daniela Gabric and Kathleen L. McFadden reported in 2001 that both employers' and students' judgment of the value of general skills such as working in teams, problem solving, and effective communication was significantly higher than the value of technical skills (which were still important but to a lesser degree). This approach is consistent with an ability to address the ever-changing demands from the competitive environment. However, despite the fact that both students and employers see great value

in these general skills, employers still see schools as falling short. As noted above, this can be inferred from the actions taken and expenses incurred by employers to increase the readiness of individuals before, and as, they reach the workplace. In addition, anecdotal comments from employers suggest that many people in the early twenty-first century are coming out of school with a genuine lack of basic skills. Such comments are supported by empirical data from a variety of organizations. For example, Donald F. Treadwell and Jill B. Treadwell studied employers of communications graduates from multiple business sectors. They found that only 18.5 percent of the employers reported that new hires could perform the duties for which they were hired without additional time investment in training. The most critical weaknesses cited were the ability to write effectively for multiple audiences, to write persuasively, to engage in logical or critical thinking, and to work responsibly without supervision. In this area alone, problems resulting from poor written communication have been estimated to cost U.S. businesses more than \$1 billion annually.

### Employer and Employee Agreement

In order to address employee readiness, it is important for employers, employees, and educational institutions to recognize that there is, in fact, a problem. Are the perceptions of employers and new employees similar regarding employees' readiness for work?

John Arnold and Kate Mackenzie Davey examined whether new employees rated themselves comparably with their new managers on various workplace competencies, including company know-how, interpersonal skills, product and service knowledge, specialist skills and knowledge, and achieving results; their findings indicated that perceptions varied between the two groups. Overall new employees rated themselves higher in skill level than did their managers. However, both new employees and their managers were least confident about the new employees' knowledge of the products and services of their organization and its competitors.

Similarly, differences have been found in the skills or traits deemed to be most important by employers and students about to enter the workforce. Gabric and McFadden noted that one of the major differences between employers' and students' ratings was in how highly they ranked the skill of conscientiousness. In a ranking of 34 personality traits,

"being conscientious" was ranked sixth most important by employers but eighteenth by students, suggesting that students may not realize how important employers consider conscientiousness to be in employees.

Reducing the gap between new employee abilities and employer expectations may be facilitated by providing students with a better understanding of what qualities and characteristics employers value most and an accurate assessment of where students currently rank on these competencies and traits. Both schools and employers can assist in this process. Teachers may need to learn more about what employers want, do a better job of conveying this information to students, give students feedback, and encourage students to learn in applied settings as well as in the classroom. Employers may assist by providing internships and summer jobs that expose students to employer expectations, and by providing feedback to the students.

### Conclusion

In sum, employers see schools as responsible for preparing students for productive work. Changes in technology, managerial practices, and the competitive environment have raised the level and breadth of knowledge, skills, and abilities that employers require from employees. This has further widened the already significant gap between employer needs and the actual skill levels and abilities of the graduates who enter the labor pool. Employers recognize that some forms of training are best conducted on the job and do not expect schools to produce students with specific job skills. However, employers expect schools to produce students with the ability to use general knowledge and with traditional academic skills such as reading, mathematics, writing, oral communication, and problem solving. Employers would also like schools to prepare students with general characteristics that enhance work performance, such as the ability to work productively with others and demonstrate initiative and responsibility.

#### REASONS STUDENTS WORK

Most American teenagers work for pay; figures vary depending on whether labor force participation is measured at a particular point in time or over the course of several years. A U.S. Department of Education survey published in 2000 found two-thirds of twelfth graders saying that they worked for pay; other research asking high school students if they have ever worked has yielded even higher figures.

Beginning in the 1980s, researchers have increasingly paid attention to this phenomenon. Yet rather than exploring the reasons for the high incidence of youth employment, for the most part researchers have engaged in a study and debate of the

costs and benefits to American youth of their working. Much of the literature has focused on whether working has detrimental effects on young people's engagement in school and academic outcomes, as well as youth's social and psychological development. While some studies have found a negative relationship between the number of hours worked during the school year and school attainment measures, David Stern and Derek Briggs's review of the literature concluded that students who work moderate hours perform better in school than students who work extensively or not at all.

In addition, some of the research is not able to fully sort out the direction of causality, for example, whether students with lower grade point averages tend to work more hours or whether working lowers the grades. Thus negative effects could be due to selection, that is, the possibility that students who are already not engaged in school choose to work more. In *The Ambitious Generation*, Barbara Schneider and David Stevenson report their findings that youth generally enjoy working more than they enjoy being in school.

There has been surprisingly little research examining why youth work, or why many work quite long hours. Youth employment has tended to be studied after the fact, rather than examining reasons or motivations leading to employment. That high school students have part-time jobs has come to be seen as the norm, likely due to the American cultural emphasis on occupation as a primary component of identity, and appreciation for work ethic and entrepreneurship. American youth do tend to start working earlier and work more than youth in other countries. And research has found that adults have quite positive retrospective views of their own early jobs, as well as favorable attitudes about their children's employment.

Some researchers speculate that the motivation for working is entirely financial, as it has been estimated that 54 percent of American youth receive no allowance, as reported by James R. Stone III and Jeylan T. Mortimer in 1998. Certainly American youth require money to participate in the automobile culture and buy the consumer goods that are significant parts of society. Hence, youth do tend to give the reason for working as "to buy things," according to Mortimer and colleagues in a report published in 1990. Teenagers from poor families in particular need to work so that they have money with which to participate in youth culture. Poor and immigrant

youth also tend to share their earnings with their families. And some teenagers work primarily to save money for college, which appears to have positive effects on several outcome measures such as the likelihood of attending college and educational aspirations.

There are other reasons for working aside from monetary gain. Researchers have found that some young people seem to have an internal drive towards working; they like to be occupied by productive activity. In 2000 Mihaly Csikszentmihalyi and Barbara Schneider reported that the young people they studied who spent the most time working perceived work more positively than young people who worked less, and saw work as important to themselves and to their future. Finally, the young fast-food workers in Harlem that Katherine S. Newman reported about in *No Shame in My Game: The Working Poor in the Inner City* needed income but also sought work in order to have a safe, structured place to go, away from the pressures of street violence.

In keeping with the idea that paid employment is the norm for American youth, researchers have examined why some youth do not work. It is well-established that work experience is more common among upper socioeconomic status and white teenagers. Most experts believe that this is due to a lack of employment opportunities for poorer youth, rather than less desire for work. According to Csikszentmihalyi and Schneider's *Becoming Adult: How Teenagers Prepare for the World of Work* (2000), upper class youth are more likely to work during the summer than during the school year, however, likely reflecting a concern about work interfering with studies. However, the minority youth in this study had a more positive view of work than the other young people.

Based on the types of jobs American youth tend to hold, it is unlikely that they are working in order to learn about possible adult career fields. Young people's first paid jobs tend to be informal (or "freelance jobs," as the U.S. Department of Labor refers to them), such as child care and lawn work. As youth progress into their mid-teens, the majority work in retail, which includes eating and drinking establishments such as fast-food restaurants. Even affluent teenagers tend to hold jobs, such as camp counseling and life guarding, that they are not likely to pursue as career fields. To remedy this situation, the 1990s saw a renewed emphasis on school-sponsored work-based learning, particularly through the 1994

School-to-Work Opportunities Act. Research on work opportunities offered through school has found that those positions tend to be in a wider range of industries and tend to more closely match students' career goals. Advocates hope that youth can gain more than money from their employment experiences.

KATHERINE L. HUGHES

## ENGINEERING EDUCATION

As of 1997, 315 institutions housed 1,516 accredited engineering programs within the United States. To receive accreditation for their engineering programs, university departments comply with the standards established by the Accreditation Board of Engineering and Technology (ABET). ABET is an organization that consists of twenty-six professional engineering societies and six other affiliating professional organizations. The twenty-five accredited engineering specializations in the United States include the following: aerospace engineering, agricultural engineering, bio-engineering, ceramic engineering, chemical engineering, civil engineering, computer engineering, construction engineering, electrical engineering, engineering management, engineering mechanics, environmental engineering, geological engineering, industrial engineering, manufacturing engineering, materials engineering, mechanical engi-

neering, metallurgical engineering, mining engineering, naval architecture and marine engineering, nuclear engineering, ocean engineering, petroleum engineering, survey engineering, and nontraditional programs.

Despite the existence of an accreditation board, however, not all engineering schools and engineering programs within the United States are accredited. Therefore, prospective students are responsible for investigating the accreditation status of the department to which they apply. Accredited degrees are especially significant for undergraduate students who wish to pursue advanced degrees in engineering.

In addition to investigating the accreditation status of their proposed schools, engineering students must decide where they will pursue their engineering degrees. Engineering programs within research universities target both undergraduate and graduate engineering scholars. These departments are usually large and sometimes have undergraduate classes that are taught by graduate students pursuing a degree in the department. Schools with a majority of students whose primary area of study is engineering are often called *institutes of technology*. State universities house departments that usually produce the greatest number of engineers in the country because of the increased affordability of an engineering education at these schools and because of the larger number of students who enroll in state universities.

### Undergraduate Curricula

The curricula of undergraduate engineering programs may be completed within four years, although most engineering students take longer to complete their bachelor of science (B.S.) degree requirements. Typically, engineering students begin classes within their major during their sophomore year. By their junior year, students continue to fulfill their major's requirements with an increased emphasis on laboratory assignments. Within their senior year design courses, students are expected to use their cumulative knowledge of engineering, writing, and the humanities to solve a problem within their major area of study.

General undergraduate engineering requirements as established by ABET mandate that each student's curriculum includes mathematics, engineering topics, and humanities. Because the entering level of mathematics varies depending upon a stu-

dent's beginning knowledge of the subject, the amount of time required to complete mathematics requirements also varies. Once engineering students meet necessary mathematics prerequisites, they are required to complete differential and integral calculus, differential equations, and one or more upper-level mathematics classes successfully.

Students are also required to complete general engineering courses on topics such as mechanics, thermodynamics, electrical and engineering circuits, transport phenomena, and computer science. Students fulfill the third requirement, humanities, they complete classes in subjects such as literature, art, foreign languages, and social sciences.

In addition to the three requirements established by ABET, all engineering students must take core classes in physics and chemistry, as well as free and technical electives. Within the undergraduate engineering curriculum, electives may be classified as either free electives or technical electives. Free electives are classes that students can take in any department of the university if they meet prerequisites for that class. Technical electives are electives that are a part of a student's major course of study. In the process of fulfilling technical electives and major requirements, students might also fulfill minor area requirements and therefore obtain engineering knowledge across disciplines.

### Graduate Curricula

Compared to the undergraduate engineering program, graduate study in engineering is more research intensive and flexible. In addition, the class requirements for graduate students are not as restrictive as the requirements for the undergraduate degree. Because of the variation of specialization in graduate engineering courses across the United States, defining a standard program of study for a particular discipline is difficult. By working closely with an adviser in their major, however, students may create a program of study with classes that not only interest them but also will prepare them to specialize in an area within their field of engineering.

Admission requirements to U.S. graduate engineering departments vary. Students are generally admitted to a program, however, if they have a "B" average in their undergraduate classes. Once admitted into a program, students typically fulfill course requirements within one to two years, depending upon any deficiencies that a student might have prior to beginning a program of study.

Upon completion of a graduate engineering program, students may obtain one of two types of master's degrees within their discipline, the master of science (M.S.) or the master of engineering (M.Eng.). The master of science degree requires the writing of a thesis, whereas the master of engineering degree requires the completion of course work. Two types of degrees also exist for doctoral students of engineering, the doctor of philosophy (Ph.D.) and the doctor of science (Sc.D.). The doctor of philosophy degree is more research oriented than the doctor of science degree and obtaining it requires a student to write and defend a dissertation successfully. A student can typically complete an engineering doctorate two to four years after the completion of the master's degree.

### Traditional Degree Areas

The five largest and most traditional areas of engineering study in United States colleges and universities are chemical, civil, electrical, industrial, and mechanical engineering. Within the United States, approximately 260 departments award these five degrees. Over the years, twenty-five specializations have emerged from the basic fields, and in 2001, eighty-five subdivisions of these fields existed in colleges across the United States. Following are descriptions of the five major types of engineering degrees.

Chemical engineering is a field of engineering that combines the knowledge of chemistry and engineering. Unlike chemists, however, chemical engineers develop new materials and design processes for manufacturing. In an effort to design these processes, chemical engineers must stay abreast of technological advancement in society. Specific curricula requirements for undergraduate chemical engineering students include engineering science, engineering design, communications, and basic life sciences. In addition to general engineering requirements, chemical engineering students are expected to earn course credit for classes in materials science and material and energy balances. Engineering design courses include engineering economics, design of chemical reactors, heating and cooling apparatus, and piping. In addition, chemical engineering students are required to understand computer programming languages and complete a technical writing class.

Civil engineers utilize their knowledge of structural processes in a variety of ways. They often oversee the development of facilities such as buildings

and bridges, in addition to the construction of highways, water resource facilities, and environmental projects. Specific course requirements for civil engineering undergraduates include classes in engineering and scientific programming, soil mechanics, engineering geology, strength of materials, analysis of determinate and indeterminate structures, hydraulics, highway geometrics, and surveying. A sample topic within a civil engineering design course might include an investigation of the design of steel and concrete structures.

Electrical engineers design and develop various types of electrical processes. Examples of their contributions include computer chips and systems, radio and television equipment, and power generation and control systems. Specific courses for electrical engineering students include classes in logic, set theory, algorithms, probability and statistics, numerical methods and analysis, and operating systems. Subdivisions of electrical engineering include power generation, control systems, communications, or electronics.

Industrial engineers contribute to the successful integration of processes and people. They look at the broad picture of engineering in an effort to maximize the benefits of a system. Additional courses for industrial engineering students include engineering economics, organizational development, computer simulation, statistical quality control, human factors engineering, and system evaluation. Other suggested classes include biology and psychology. Finally, mechanical engineers examine how mechanical work and various types of energy combine in an effort to design materials and processes for use. In addition to core engineering classes, mechanical engineers may complete several courses in electrical and materials engineering.

### Other Engineering Specializations

In addition to the traditional engineering fields, there are several branches of engineering and areas of specialization. Aerospace engineering is the study of aspects of aeronautics and space. Aerospace engineers may select from several divisions of study within their field. They are encouraged, however, to also obtain knowledge about mass transportation, environmental pollution, and medical science within their curricula.

Agricultural engineering is a field of engineering that is most closely related to the environment. Agri-

cultural engineers are concerned about the conservation of natural resources and are required to build new tools that will aid the production and distribution of food and fibers.

Biomedical engineering applies the principles of anatomy and engineering to biological systems. With their knowledge of these systems, biomedical engineers may assist the health care industry through the design and maintenance of medical systems and equipment. In addition, biomedical engineering students often use their engineering training as a foundation for medical school.

Computer engineering mandates that students become knowledgeable in the areas of computer information systems, computer science, computer hardware, and information science. In many schools, computer and electrical engineering is a dual specialization. Next, environmental engineering improves the quality of life through the preservation of the environment. Environmental engineers are interested in reducing pollution, encouraging hygiene, and reducing waste and toxins found in air and water.

Nuclear engineering closely resembles the science of physics, because nuclear engineers study matter, including protons, neutrons, and electrons. They primarily investigate the nature of inanimate objects. Metallurgical engineers study metals and investigate ways to improve the characteristics of metal for society's use. Three areas of specialization within this field include process metallurgy, physical metallurgy, and materials science.

## ENGLISH AS A SECOND LANGUAGE

*See:* BILINGUALISM, SECOND LANGUAGE LEARNING, AND ENGLISH AS A SECOND LANGUAGE; LANGUAGE MINORITY STUDENTS.

---

### ENGLISH EDUCATION

TEACHING OF

Stephen Tchudi

PREPARATION OF TEACHERS

Pamela L. Grossman

#### TEACHING OF

The teaching of the English language has a long history in U.S. education; the practice of teaching a native language can be traced to antiquity. In the Greek and Roman worlds, literacy was encouraged both to foster citizen participation in a democracy as advocated by Plato, Quintilian, and Cicero; much later it was fostered by the emergence of print and print cultures in western Europe.

#### The History of English in the Schools

In the American colonies, education in literacy was the essence of education, along with arithmetic. Literacy education followed patterns of instruction that could also trace their ancestry to Greek and Roman education, transmitted to the colonies via Great Britain. The tradition in early literacy instruction was one of formalism, which posits that knowledge of the forms of language (as identified in such studies as grammar, logic, rhetoric, and orthography) enables a learner to read and write successfully. Thus such seminal books as the *New England Primer* (1775) concentrated heavily on the basic elements of English: the alphabet, then words of one, two, and more syllables—a pattern of small to large language particles to whole meaning.

In a seminal book written in the late 1960s, *Growth Through English*, John Dixon described this formalist approach as characteristic of the first phase in the development of literacy: an era of basic skills. A second stage is one of enculturation, where the mastery of basic skills opens up a canon of “great books” to young learners. A third stage, Dixon asserted, is concerned with personal growth, where knowledge of culture through literacy allows the

learner to move freely and flexibly through the full range of language to enhance his or her personal life, philosophy, and aesthetic.

In the United States, Dixon's first two stages can clearly be seen in the nineteenth century, when first grammar, then composition and literature, became standard features in the emerging curricula of the American elementary schools and, in particular, of that dramatic experiment in democracy: the free public high school. By the end of the nineteenth century, the tripod curriculum of language, literature, and composition was established, taught primarily from a formalist perspective.

In the 1960s and 1970s a shift of perspective away from basic skills and enculturation prompted educators to declare that a paradigm shift of major proportions was taking place, matching trends in American education away from formalism toward student- and child-centered education. Proclamation of this paradigm shift may have been premature, for in fact, English education has been and continues to be subject to contrary and contradictory influences and philosophies.

The alleged paradigm shift was toward a contrary (or possibly contradictory) curriculum that can be called *naturalistic* or *experiential*. Its roots can be found in the European philosophies of such educators as Johann Amos Comenius and Jean-Jacques Rousseau, both of whom argued for engagement in learning practices as opposed to rote study. The experiential movement can also be labeled romantic, traceable to the humanistic and naturalistic philosophies of such writers as William Wordsworth and Samuel Taylor Coleridge. In the United States, John Dewey's Progressive education movement translated the experiential strand of educational thought into curriculum designs, reflected most prominently in two publications of the National Council of Teachers of English in the 1930s: one outlining the essentials of an "experience curriculum in English," the other advocating a "correlated curriculum," with language activities infused throughout the school curriculum in all disciplines.

Yet the formalist tradition persisted, setting the stage for conflict in the final quarter of the twentieth century between formalist and experiential schools of thought. For the general public and the legislators who represent them, the formalist strategy—teach the basics and move on to larger activities—makes common sense. Among English language arts educa-

tors, according to Rodger D. Sell, those favoring a formalist approach have become increasingly sophisticated in their understanding of language structures, arguing for teaching multiple discourse forms and an increasingly broad and inclusive literary canon.

Those from the experiential camp, such as Kenneth Goodman and Frank Smith, on the other hand, have developed philosophies of whole language—hotly contested in both convention halls and legislative chambers. The experiential school argues Dewey's theme that the formal structures of language are mastered, not by study of forms, but through engagement with a wide range of "real world" or purposeful discourse.

### Consensus: The National Standards

In the 1990s concern about the quality of American education became centered—in English language arts as in other fields—on a quest for national standards in the subject fields. The concept of *standards* appears to be formalist; that is, it posits that by identifying discrete "learnings" that are to be required of all students, one can systematize curriculum and improve scores on standardized tests of literacy. The tests themselves tend to measure formalist rather than experiential "knowledges" and skills. Thus there has often been ideological conflict between, on the one hand, parents and legislators who favor a standards and testing approach, and, on the other, English teachers, who are moving toward an experiential curriculum.

The task of creating national standards in English fell to the National Council of Teachers of English and the International Reading Association, whose members and their representatives agonized over the challenge of defining and describing what young people ought to be able to know and do with language. The resulting document, *Standards for the English Language Arts*, described a consensus view of what the English studies can, could, and should be. The fourteen standards outlined for K–12 classrooms emphasize growth and development of language use for personal, social, academic, and vocational purposes. The standards present a series of illustrative vignettes showing students who are engaged in extending the range of literature they read; developing increasing competence in a broadening range of forms and genres in speaking and writing; reading and writing for personal and aesthetic pleasure as well as public competence; and in-

creasing their skill at using language within the purposeful settings. Perhaps disappointing to the public and legislators, the national standards did not spell out basic skills and knowledges in grammar, spelling, and the like; nor did they suggest a canon of books that all children should read. In short, the standards tended toward the Progressive/experiential model, while making a genuine effort to accommodate the interests and traditions of formalism. The authors of the standards note very clearly that theirs is a work in progress and that it would indeed be naive to suppose that any group of specialists can define and describe the parameters of language study for the unforeseeable future.

### Current Issues in the English Language Arts

The national standards in the English language arts thus provide a platform for the development of curricula in the twenty-first century. Clearly, the coming years will produce new demands on literate people and call for new forms of literacy; in addition, research in human learning can be expected to increase educators' understanding of language acquisition and thus how to establish increasingly successful venues for offering language instruction. Ongoing issues, problems, concerns, and debates over the English language arts include the following topics.

**Basic skills, testing, and accountability.** The standards movement has been part of an ongoing call for accountability for English language arts teachers (and teachers in all fields). The general public wants concrete evidence that teachers are teaching well and that students are learning. In turn, this pressure has led to increased testing in all fields and disciplines, but in no field more than English, where students experience local or state progress testing virtually every year, standardized testing on nationally normed tests at regular intervals, state or district proficiency examinations for high school diplomas, and national measures such as the National Assessment of Educational Progress. Given pressures for students to perform well on these tests, teachers in the schools find themselves increasingly focusing the curriculum on test preparation or, more broadly, on teaching the kinds of formalist knowledge that is most frequently encountered on those tests.

**Literacy and society.** Beyond the immediate concerns of test scores, there remains considerable debate over the fundamental aims of literacy education. The English teaching profession is in gen-

eral agreement with the notion that literacy instruction needs to go beyond the demands for practical skills and must include Dixon's category of language for personal and aesthetic growth. This is not to say that English teachers are committed to an elitist view of "art for art's sake" or falsely elevated notions of "taste" and "culture." Rather, from the experiential philosophy of language education, teachers generally believe that broad language education—teaching students to speak, read, and write articulately on a range of issues and problems—not only encompasses, but moves beyond simple mastery of basic English. The work of Paulo Freire has been especially influential in encouraging educators to consider the social and political implications of what they teach, exploring the possibility that narrow training in literacy fosters citizen subservience, while general literacy arguably leads to independent thinking.

However, such issues are also linked more broadly to issues and trends in education, specifically, the role that the general public perceives for the schools. In the last quarter of the twentieth century, an increasingly global economy and greater demands on the American economic system increased pressures on the schools to be a direct part of the economic engine. The accountability and testing movements, for example, are often linked to the goal of keeping the United States competitive in world markets. Although few would disagree with that expression of need, opinions differ dramatically in how it can be met. Some would have the schools focus primarily on job literacy (in both the immediate and long-range senses), which implies an English curriculum more like that advocated by the formalists. Others insist that schools must resist the push to become employment oriented and should return to the concept of general or liberal education, creating well-educated individuals who are equipped to adapt to changing conditions. Contemporary English theory and research lean in the direction of general/liberal education, but the outcome of this debate is more likely to be determined in the legislatures.

**Multiple types of English.** If there is a single unifying trend in English education, it is that what has been labeled *the English language arts* is becoming increasingly broad through what can be called *the multiple English curriculum*, including the following.

**Multidisciplinary English.** In the 1970s through the end of the twentieth century, parallel movements for writing across the curriculum and reading in the content areas moved English language arts outside

the immediate confines of the language classroom. English educators proposed that reading and writing skills could not be expected to be developed if they are limited to practice inside the English classroom. Moreover, they claimed that by attending to language, teachers in other disciplines would find student learning improved; that is, by attending to the language skills and needs of their own disciplines, educators would find students improving in their understanding of the processes of inquiry and expression and thus of the discipline itself. These movements toward multidisciplinary English in every classroom have found limited success. Although the concept receives widespread general support, many disciplinary teachers do not feel they have the training to deal with language problems, especially with curricula that are already crowded with concepts, national standards, and parental expectations.

**Multicultural English.** Due in no small measure to the activism of minority and feminist groups, English language arts teachers have greatly broadened the cultural content of their field. Courses in literature by and about minorities and by about women have led to a realization that the traditional English canon of English and American literature, much of it written by white males, is both culturally biased and intellectually limited. Originally isolated in their own courses or units, these multicultural literatures are increasingly being found throughout the curriculum, and they include not only literatures written by people whose first language is not English, but also world literature translated into English. Like every other trend in English, this one is not without its detractors, particularly those who argue that cultural literacy begins at home, and that the canon of Anglo literatures, not world “Englishes,” should be the substance of the curriculum.

**Multilingual English.** Immediately linked to multicultural teaching are questions concerning the use of multiple languages, both languages other than English (e.g., Spanish), and dialects other than standard English (e.g., African-American English). Much theory and research has argued for teaching methodologies based on the concept of bilingualism: that students should be provided with opportunities to develop and learn in their native language as they receive instruction in English. The counterposition to bilingualism argues for quick introduction into the structures of the target language and mainstreaming of bilingual students into classes where

English is used exclusively. The latter position also reflects strong public interest in “English Only,” a concept that would legislate English as the official national (or adopted state) language. Opponents of that movement note that the United States is rapidly becoming a bilingual country, that the evolution of language is natural, and that one cannot either limit or prescribe peoples’ mastery of language.

Analogous arguments are offered in favor and in opposition to insistence on a single dialect of standard English instead of recognizing that all speakers operate in the a range of dialects. Particularly controversial was a decision in the Oakland, California, schools to include the understanding of “Ebonics,” a dialect of African-American English, as a curriculum goal for both teachers and students.

**Multigenre and multimedia English.** Whether one supports the concept of English as practical in orientation—preparing students for the immediate demands of society, the workplace, and school—or more general and liberal in application, research and practice are responding to the rapidly broadening array of discourse forms and technologies. Computer literacy has been widely adopted as an aim of school curricula, with mastery of basic computer skills seen as necessary for any graduate of public education. For the English teacher, such literacy moves beyond the mechanical operation of machinery. In the twenty-first century, English/computer literacy will also include the critical analysis and evaluation of language and information sources as well as the ability to compose and create in new media forms. Thus as an extension of print literacy, many English classes now commonly include language experiences involving e-mail, chat and discussion groups, the Internet, presentation software, and even video and audio production. It is clear that the traditional English classroom centered on books, pencils, and papers will evolve considerably in the coming years.

### **Reflective Practice, Teacher Preparation, and In-Service Reeducation**

Even as the public and legislators have expressed reservations about the performance of students in the English language, the English profession has made great strides in elaborating and rationalizing English programs. Considerable research in English education conducted since the early 1990s has led to widespread discussion of the research-based curriculum, where teachers operate from known principles of rhetoric, linguistics, psychology, and literary criti-

cism rather than from teacher lore and tradition. Equally important is the concept of *reflective practice*, where teachers consciously articulate the reasons for their instruction and seek ways of assessing whether or not it is succeeding.

Particularly notable in English is the growth of portfolio assessment as an alternative to standardized testing, where students prepare collections of materials that demonstrate their best work and their competencies, engage in self-analysis, and discuss with teachers and community members the success of the work.

Also noteworthy is the great success of the National Writing Project (NWP) in promoting growth in English curricula through the sharing of practices among teachers. Founded in the 1970s in response to the "back to basics" crisis, the NWP has branches in every state and in several other countries. Its methodology features the sharing of best practices by teachers, reading and discussion of theory and research, and systematic in-service education.

The NWP is part of a broader movement toward teacher empowerment, which argues that curriculum decisions are best made by teachers themselves. This movement is understandably in opposition to other approaches, most notably the widespread belief that legislation, standards, accountability, and even "teacher-proof" materials can lead to educational reform. By contrast, some professionals, such as Denny T. Wolfe and Joe Antinarella, present the case that English language arts teachers themselves can and should be leaders in educational reform.

## PREPARATION OF TEACHERS

The field of English education includes research and practice related to both the teaching and learning of English/language arts and the preparation of English teachers. As befits a broad and comprehensive subject matter, the field of English education includes a wide range of topics and lines of research. Under the umbrella of English education, one might find research on rhetoric and the teaching of writing, on the literature curriculum and different approaches to the teaching of literature, as well as a range of topics related to communication, visual literacy, drama, journalism, and language more broadly. In fact, one of the persistent challenges facing the field of English has been the difficulty of self-definition, as Peter Elbow (1990) plaintively inquires in the title of his book, *What is English?* Others have asked, equally plaintively, what important topics might not be considered the province of English teachers. This lack of self-definition leads to what Robert Protherough termed "a pervasive uncertainty about the nature of the discipline" (p. 1).

The sheer scope of the subject matter and its blurry definition have its roots in the history of the subject matter. In a definitive history of the field, Arthur Applebee demonstrated the various ways in which the subject has been defined over time, from its first emergence as a major school subject in the 1890s. While earlier battles focused more on the relative centrality of classical versus vernacular texts,

more recent skirmishes have tackled the role of literature—and the type of literature—in the English classroom. One of the enduring themes in the history of English education has been the search for a way to unify the subject.

In addition to breadth and lack of clear definition, English education is characterized by a multiplicity of theoretical perspectives regarding the subject. Different versions of English to be found in classrooms might include a basic skills approach, an approach that privileges cultural heritage, a personal growth approach, an apprenticeship into the discipline, and an approach that advocates critical or transformative literacy. Each of these versions implies a different set of assumptions regarding the goals for teaching English, posits a different curriculum, and advocates distinctive approaches to teaching.

### Preparation of English Teachers

These features of the subject matter pose challenges to the preparation of English teachers. The sheer breadth of the subject raises questions about how to assure that prospective teachers develop a deep understanding of the field. The existence of multiple, and often competing, versions of English suggests that pre-service teachers will encounter quite different practices during their own experiences in schools. Finally, the inherent complexity of the subject, with its separate domains and subcomponents, offers teachers greater autonomy in developing curriculum. For beginning teachers, however, such autonomy can be daunting as they struggle to decide what exactly to teach.

One critical question concerning the preparation of English teachers has to do with how well prepared they are within the subject matter itself. According to a national survey conducted by Applebee in the early 1990s, approximately 95 percent of English teachers received degrees in English or a related major. However, Richard Ingersoll's 1998 study of out-of-field teaching found that nearly one-fourth of teachers who teach English have neither a major nor a minor in English or related fields. While a major in English does not guarantee the depth of subject matter knowledge required for teaching, the fact that people without English majors are teaching the subject is certainly cause for concern.

English teachers in the United States receive their professional preparation in a wide variety of

programs, from undergraduate programs lasting four or five years, to fifth-year programs in which teachers have one year of professional preparation following completion of an undergraduate degree, to alternative route programs. In the early twenty-first century, research has only begun to chart how differences among programs affect the quality of teacher preparation. Michael Andrew's 1990 study, for example, found that graduates of five-year programs reported greater satisfaction with both their teacher preparation and chosen career and were more likely to remain in teaching than graduates of four-year programs. However, much more work needs to explore how structural differences among preparation programs affect the quality of their graduates.

Relatively few studies have looked systematically at teacher education within the field of English. Studies on the preparation of English teachers have focused primarily on teachers' knowledge and beliefs about the subject matter, and on how teachers develop their understandings of how to teach English. A growing body of research suggests that what English teachers know and believe about literature influences both their curricular and instructional choices. How teachers choose to teach a literary text reflects their own understanding of literature and its interpretation. Similarly, teachers' knowledge of the complexity of the writing process affects their approaches to the teaching of writing. The teaching of writing requires knowledge of how the demands of writing vary depending upon the nature of the task, audience, and genre, among other factors. Lack of this knowledge among teachers may help explain why writing instruction too often reduces the writing process to a lock-step series of discrete stages.

Another body of research has focused on the development of pedagogical content knowledge—the knowledge of how to teach English to a wide range of students. A number of studies have looked at how teachers transform their knowledge of the subject, *per se*, to knowledge of how to teach the subject to diverse learners. In looking at this transformation, a number of studies have focused on the importance of subject-specific methods courses. This line of research suggests that prospective teachers begin the task of rethinking their subject matter from a pedagogical perspective within the context of English methods courses. Such courses often require prospective teachers to confront their implicit assumptions about the subject matter, through assignments such as literacy autobiographies or the examination

of personal metaphors for teaching. Methods courses also provide opportunities to learn more about how students learn to read and write, and some of the predictable struggles they may face. The potential of methods classes to shape prospective teachers' classroom practice is mediated by their experiences in actual classrooms. When they do not have opportunities to observe or try out the practices they are studying in methods classes, they may begin to doubt their feasibility.

Learning to teach English takes longer than the brief period allotted for teacher education. Research conducted by Pamela Grossman and colleagues in 2001 suggests that new teachers are still in the process of learning to teach when they enter the classroom. Given the importance of the first few years of teaching, many districts provide support to beginning teachers through mentoring programs. This also suggests the need for more longitudinal studies of learning to teach, that span teacher education and the first few years of teaching.

### **Professional Development**

Perhaps the best-known professional development opportunities for English teachers are the workshops offered by the National Writing Project (NWP) and its affiliates. The NWP is a national network that began in 1974 at the University of California, Berkeley. Its goal is the improvement of the teaching of writing and the quality of student writing. The NWP has served more than 2 million teachers, across all grades and subjects, since it first came into existence. Some of the basic tenets of the NWP model include the need for writing teachers to become writers themselves; the importance of teacher knowledge and expertise in the teaching of writing; and the value of teachers teaching other teachers. Although relatively little systematic research has investigated the influence of teachers' participation in NWP activities on classroom practice, teachers are generally enthusiastic about their experiences and value the sense of community and professionalism engendered by the writing project activities.

No equivalent large-scale professional development model exists for the teaching of literature or language. The closest equivalents are teachers' book clubs, in which teachers read literature, including memoirs, fiction, and other genres, as way of learning both about their students or about literature and how to teach it. However, these are primarily local innovations. Other models that exist are summer in-

stitutes for teachers, run by organizations such as the National Endowment for the Humanities and the Bread Loaf School of English, in which teachers have the opportunity to learn more about the subject matter.

The most common form of professional development for English teachers, however, continues to be the district in-service day. By their very structure, in-service days are generally dedicated to technical issues important to the district, such as learning new assessment schemes, writing objectives for student learning, or implementing a new curriculum or textbook series. Because district in-service programs are designed to appeal to a broad spectrum of teachers, they are generally unlikely to address subject-specific concerns.

If English teachers are to benefit from the growing body of knowledge about effective professional development, those responsible for teacher learning will need to invest more strategically in school-based structures that support ongoing teacher learning, collegial interaction, and experimentation. Critiques of the NWP have suggested that without strong support at the school site and without opportunities to get ongoing help in developing new practices, teachers find it difficult to implement the ideas they encountered in summer workshops. Another body of work suggests that departments may be the locus for professional community and provide the impetus and opportunity for continued learning.

## Conclusion

English continues to be a contested field of study. Although recent debates have focused on what literature should be taught in schools, others have questioned whether literature should even continue to occupy the center of the subject. The range of literacy required of students, from print literacy to visual and technological literacy, has again expanded the scope of the English curriculum. Such expansions to the curriculum inevitably pose challenges for the education of teachers, as both teacher education and professional development must prepare teachers to incorporate new content and skills into their teaching. Given the features of the subject matter that make such redefinitions inevitable, prospective English teachers will need opportunities to grapple with the multiple purposes envisioned for the teaching of English and to explore ways of bringing coherence to students' experiences in English classes.

## ENROLLMENT MANAGEMENT IN HIGHER EDUCATION

During the last decades of the twentieth century, the concept of enrollment management emerged as a new organizational structure within two- and four-

year colleges and universities. The term *enrollment management* refers to the ability of institutions of higher education to exert more systematic influence over the number and characteristics of new students, as well as influence the persistence of students to continue their enrollment from the time of their matriculation to their graduation. The emergence of enrollment management as a new administrative structure within institutions of higher education originated in North America, but it has also been employed in Europe, Africa, and Asia.

This phenomenon can be explained by shifting public-policy priorities in many countries that are the result governments reducing their subsidies for institutions of higher education, and for students earning a postsecondary degree. Increasingly, attending college is being viewed primarily as a private benefit to individuals rather than as a public benefit to society. Colleges and universities are being asked to fund more of their own budgets through tuition revenues, and students are borrowing increasing amounts of money to pay the rising costs of higher education. As a result of these trends, more and more students have come to view postsecondary education as a consumptive decision, and the increased competition for (and reliance upon) student dollars has caused governmental agencies, university governing boards, and university administrators to pay considerable attention to developing more effective student enrollment strategies.

### Defining Enrollment Management

Don Hossler, John P. Bean, and colleagues defined *enrollment management* as "an organizational concept and a systematic set of activities designed to enable educational institutions to exert more influence over their student enrollments. Organized by strategic planning and supported by institutional research, enrollment management activities concern student college choice, transition to college, student attrition and retention, and student outcomes. These processes are studied to guide institutional practices in the areas of new student recruitment and financial aid, student support services, curriculum development, and other academic areas that affect enrollments, student persistence, and student outcomes from college" (p. 5). Enrollment management is an open-systems and synergistic organizational approach that fosters an organizational atmosphere that makes reporting relationships among student-service units more transparent. It also fosters an environment

where offices and divisions work collaboratively to enhance the quality of the student experience, thus facilitating the strategic management of enrollments.

Enrollment management can be viewed as a synergistic organizational concept that can be used to link several administrative functions within a college or university in order to optimize institutional enrollment goals. Examples of this approach can be found among the financial strategies of many college campuses, where important linkages have emerged between senior enrollment managers and chief financial administrators. Both private and public colleges use some of their tuition income to fund campus-based scholarships for students. Tuition revenue accounts for millions of dollars, and campus-based financial aid has become a large expenditure at most four-year institutions. Enrollment management efforts have therefore become closely linked to budgeting and campus financial planning. Successful enrollment management strategies and practices must also take into account the growing importance of college and university rankings. For many institutions of higher education, enrollment management has come to involve a combination of student enrollment strategy, budgeting strategy, and institutional positioning strategy.

### **Key Offices and Tasks in Enrollment Management**

A university's office of institutional research should play a major role in successful enrollment management efforts. The more enrollment management professionals know about the characteristics, attitudes, and values of prospective students, the better able they are to design effective recruitment and orientation programs. Persistence studies conducted by institutional researchers can inform strategies to enhance the success of first-year students, and institutional research professionals can examine the impact of various forms of student financial assistance upon matriculation decisions and the academic success. A strong institutional function is a critical element of a sound enrollment management effort.

The office of admissions plays a key role in enrollment management efforts. The first order of business for enrollment managers is to ensure that their university has broad marketing efforts in place to make the institution visible and sufficiently attractive, so that desirable prospective students are motivated to seriously consider them. These marketing efforts should be segmented to appeal to differ-

ent types of students, emphasizing different strengths of the institution. Once prospective students have expressed interest, campuses need to provide the right information at the right time in order to be perceived as a good match, and thereby attract applications.

The office of financial aid has a dual purpose. The first purpose is that of providing federal, state, and campus-based need-based financial aid to enable students to attend the institution of their choice. The second purpose is the growing use of campus-based financial aid to reward academic merit and other special talents to enable colleges and universities to attract a desired number of students with the academic ability and other special talents they are seeking. Historically, institutions of higher education relied primarily upon endowed gifts to fund campus-based scholarships. Toward the close of the twentieth century, however, more and more institutions began using part of the tuition students pay to fund scholarships. This practice is often described as *tuition discounting*.

Orientation programs in the summer and fall bring prospective students (and sometimes their parents) to campus for as little as one or two days and for as long as a week. These programs give students a closer look at an institution, and they also help prospective students to succeed once they decide to attend. Through campus tours, academic advising and registration, and structured academic and social programs, orientation programs help aspiring students to become familiar with the campus culture, the norms, and the values of the faculty and of peers. This is crucial to the anticipatory socialization process and the getting-ready behaviors can facilitate a successful transition to college.

Student retention efforts are an important aspect of enrollment management efforts. Few colleges or universities have formal retention offices. Instead they have retention programs that can be organized by a range of academic and student-life offices. The dean of academic affairs, the dean of student affairs, or an enrollment management division can sponsor academic support programs. A number of institutional interventions are known to exert a positive influence upon student success and persistence during the first year of college. These include enhanced student life and academic initiatives to encourage in-class and out-of-class interaction between first-year students and faculty, staff, and other students; creating more opportunities for students to work on

campus; engagement in student activities and events; providing academic and career advising that promotes clear career and academic goals; enacting academic and pedagogical policies and practices that enhance student study habits and promote regular class attendance; a strong orientation program; special support programs for international students and students of color; and family and/or spousal/partner support for degree completion.

Other student-life offices can also be integral to the success of enrollment management offices, including academic advising, academic support and tutoring centers, career planning, student activities, and residence life.

### Organizational Models

The literature on enrollment management often addresses different administrative approaches for organizing enrollment management efforts.

**The enrollment management coordinator.** The enrollment management coordinator is charged with organizing recruitment and retention activities. Usually, a midlevel administrator, such as the dean of admissions or financial aid, is asked to coordinate offices such as admissions, financial aid, and registration and records. An important disadvantage is that the coordinator model provides no formal mechanism for linking enrollment concerns into the decision-making agenda of senior level administrators.

**The enrollment management matrix.** The enrollment management matrix is a more centralized approach. In the matrix model, an existing senior level administrator, such as the vice president for student affairs, academic affairs, or institutional advancement, directs the activities of the enrollment management matrix. In this model, administrative units such as financial aid or student retention are not formally reassigned to a new vice president. Instead, the administrative heads of these units continue their existing reporting relationships, but they also become part of the enrollment management matrix.

**The enrollment management division.** The most centralized organizational model is the enrollment management division. In the division model, a vice president or associate vice president is assigned the responsibilities for most or all of the administrative areas that influence student enrollments, housed within one large functional unit. This model requires high levels of administrative support; the

president or a senior vice president generally has to become a strong advocate of this model. One important advantage of this model is that an enrollment management vice president can carry enrollment-related concerns directly to the president and the board of trustees.

There is little empirical evidence to indicate that any particular organizational approach is inherently better than another. Most experienced enrollment managers place more emphasis on strong working relationships with other key administrators on campus than on advocating for a specific organizational model. Another recurring theme is the need for a senior campus administrator, such as the president or provost, to provide visible and consistent support for the institution's enrollment management efforts. In colleges and universities of all sizes, support from the top appears to be more important than a specific administrative structure established to manage enrollments.

Given the current pressures on institutions to maximize revenue, and the attention being given to the characteristics of enrolled students, enrollment management is likely to remain an important administrative focus at most colleges and universities.

### ERIKSON, ERIK (1902–1994)

Child psychoanalyst Erik Homburger Erikson focused his research on the effects of society and culture on individual psychological development; he also developed the eight-stage model of human development. Erikson was born in Frankfurt, Germany, of Danish parents who had separated before his birth. His surname for the first four decades of his life, Homburger, was that of his stepfather, a physician. Upon becoming a U.S. citizen in 1939 he adopted the surname Erikson.

#### Career

Although Erikson graduated from a classical gymnasium where he studied Latin, Greek, German literature, and history, he was not a good student. For the next seven years following his graduation, he was a wandering artist through Europe, sketching, doing woodcuts and etchings, and intermittently studying art. In 1927, at age 25, he received an invitation from a childhood friend in Vienna to teach in a small progressive school for English and American children. While teaching art and history, he became acquainted with the Freud family and was judged an excellent candidate for psychoanalytic training. As Robert Coles observed, at that time candidates did not apply, but were chosen.

He graduated with a diploma from the Vienna Psychoanalytic Society in 1933, where he was viewed as a gifted student. He also was one of two men to graduate from the Montessori teachers association. Upon graduation, he and his wife and young son fled from the encroaching Nazi domination to the United States.

Although Erikson had no formal degree, he became the first child analyst in Boston and a research associate at Harvard Medical School. From 1936

through the 1940s, he served as a research associate at Yale, then at the University of California, finally receiving a professional appointment at the latter institution. During this period, in addition to his analytic work with children, he undertook the in-depth observational study of children in two American Indian tribes, the Sioux of South Dakota and the Yuron of northern California. These studies marked the beginning of his integration of the analytic clinical perspective with the social and economic events that influence child development.

Shortly after Erikson received a professorial appointment at the University of California, the signing of a loyalty oath became a contractual requirement for faculty. Refusing to sign the oath, Erikson resigned in June 1950. Noting that his field, psychoanalysis, included the study of hysteria, he stated he could not participate in this inadequate response to public hysteria. Erikson then returned to the analysis of troubled children by accepting a position at the Austen Riggs Center in Stockbridge, Massachusetts. In 1960 he was appointed professor at Harvard University, where he remained until his retirement in the early 1970s.

#### Contribution

Although trained as a psychoanalyst, Erikson's scholarship, which included fourteen books, transcended the discipline in his interweaving of culture, history, and the individual across a variety of topics. Specifically, he applied psychoanalysis in addressing anthropological, religious, and historical questions in addition to developing a comprehensive life span model of psychological development.

In his work, Erikson went beyond the Freudian focus on dysfunctional behavior to pursue the ways that the normal self is able to function successfully. His unique contribution to the applications of psychoanalysis, his inclusion of the effects of society and culture on individual psychological development, led to the designation of his perspective as psychosocial. Early examples are the study of the American Indian children, which combined anthropological observation and clinical analysis with tribal history and economic circumstances.

Erikson also applied psychoanalysis to develop richly detailed biographical histories of leaders who made a difference in society. Included are his chapter on Maxim Gorky, his lectures on Thomas Jefferson, and his books on Martin Luther (*Young Man Luther*:

*A Study in Psychoanalysis and History*, 1962) and Mahatma Gandhi. The latter work, *Gandhi's Truth: On the Origins of Militant Nonviolence* (1969), received both the 1970 Pulitzer Prize and the National Book Award. In these works, Erikson applied clinical analysis to develop an understanding of the ways that leaders faced with untenable situations rose above them to forge new identities for themselves and other citizens.

In education and psychology, Erikson is best known for his eight-stage model of the human life cycle, developed with the assistance of his wife, Joan. This model identifies particular goals, challenges, and concerns at each stage of life. They are the following: (1) Basic Trust versus Basic Mistrust (infancy); (2) Autonomy versus Shame and Doubt (early childhood); (3) Initiative versus Guilt (play age); (4) Industry versus Inferiority (school age); (5) Identity versus Role Confusion (adolescence); (6) Intimacy versus Isolation (young adulthood); (7) Generativity versus Stagnation (adulthood); (8) Ego Identity versus Despair (later adulthood). Further, the stages are interdependent in that unresolved conflicts at one stage influence development at later stages, as in the development of either a loving trusting relationship with a caregiver in infancy or mistrust of others.

Unlike Freud, who focused on early childhood, Erikson emphasized adolescence and adulthood. Erikson introduced the term *identity* and *identity crisis* to explain the psychological and social complexities faced by young people in attempting to find their place in a specific town, nation, and time. Adolescent development, in other words, is a complex answer to the question, "Who am I?" and requires organization of the individual's drives, abilities, beliefs, and history into a view of oneself. This focus reflects Erikson's own youthful wanderings before finding his place as a teacher, analyst, and writer.

In the 1960s Erikson focused on the seventh or "generative" stage of adulthood. In this stage, adults are obligated to care for the next generation, either one's own children or a broader group, through personal deeds and words. In the case of Gandhi, his contribution to the next generation was his militant nonviolence as a means to address social injustice. In addition Erikson described the final stage, late adulthood, as an active period that involves acceptance of self and the development of wisdom.

A third focus in Erikson's writing, ethical and moral responsibility, is reflected most prominently

in *Insight and Responsibility* (1964). In this work, he included a set of eight virtues that correspond with his eight life stages (hope, will, purpose, competence, fidelity, love, care, and wisdom). He also introduced the term *pseudospeciation* to describe the destructive mechanism that leads to human conflict, aggression, and war. Specifically, pseudospeciation refers to the "arrogant placing of one's nation, race, culture, and (or) society ahead of others; the failure to recognize that all of humanity was of one species" (Friedman, p. 357). Groups of individuals, in other words, are assigned membership in a not-quite human or pseudo-species. With this concept, as in his other writings, Erikson spoke to human psychological issues within the broader context of history and culture.

## ETHICS

---

SCHOOL TEACHING

Kenneth A. Strike

HIGHER EDUCATION

Carol J. Auster

### SCHOOL TEACHING

Ethical concerns about teachers and teaching occur in a variety of contexts and can be thought of in several ways. This article discusses (1) how ethical issues are represented in the law; (2) how ethical issues are represented in the National Education Association's (NEA's) code of ethics; (3) ethically based comprehensive views of education; (4) the role of ethics in educational policy; and (5) meta-ethical disputes relevant to education.

#### **Ethics and the Law**

The education codes of many states require that teachers be persons of good character. Most states also permit teachers to be dismissed for unethical conduct. States also forbid particular forms of misconduct, such as child abuse, sexual harassment, and drug abuse, and their violation may be grounds for dismissal.

What counts as good character or conduct can be a contentious matter. In past decades teachers might have been dismissed not only for drunkenness, homosexuality, unwed pregnancy, or cohabitation, but also for myriad other offenses against the moral code of their community. Some of these may still be gray areas; however, in recent years, courts have been inclined to insist that actionable immoral conduct be job-related, providing some protection for the private lives of teachers. Here a particularly contentious matter is whether being a role model is part of the job of teachers, because this expectation can expand public authority over the lives of teachers. In certain cases, as when teachers discuss controversial matters in class or employ controversial teaching methods, they may be protected by the First Amendment. Teachers, especially those who are tenured, are also likely to have significant due-process rights. Dismissal for immoral conduct is most likely when the teacher has committed a felony, in cases of inappropriate sexual advances toward students, or in cases of child abuse. In this last case, teachers may also have a duty to report suspected misconduct by others.

The kinds of misconduct dealt with by the law are usually acts that are (or can be viewed as) unethical in any context. Teachers, like others, are expected to not steal, kill, commit assault, abuse children, or engage in sexual harassment. Although the definition of immoral conduct in the law has not become coextensive with violations of criminal law, there is little in the meaning of immoral conduct that is distinctive to teachers or teaching.

#### **The NEA Code of Ethics and Ethical Principles Internal to Teaching**

The most prominent code of ethics for teachers is the NEA's *Code of Ethics for the Education Profession*. The preamble to this code begins: "The educator, believing in the worth and dignity of each human being, recognizes the supreme importance of the pursuit of truth, devotion to excellence, and the nurture of democratic principles. Essential to these goals is the protection of the freedom to learn and to teach and the guarantee of equal education opportunity for all."

The code has two sections with eight provisions in each. The first section, entitled "Commitment to the Student," promotes the freedom to learn, requires equal opportunity, protects students against disparagement, and protects privacy. The freedom-to-learn provisions prohibit teachers from preventing student inquiry, denying students access to diverse points of view, and distorting subject matter. The code-specific provisions do not assert affirmative duties for teachers to create an inquiry-oriented environment or to pursue educational objectives, which might be associated with the pursuit of truth, individual autonomy, or democratic principles. The prohibition against distortion of subject matter falls short of a prohibition of indoctrination.

The second section of the code begins with the comment that "the educator shall exert every effort to raise professional standards, to promote a climate that encourages the exercise of professional judgment, to achieve conditions which attract persons worthy of the trust to careers in education and to assist in preventing the practice of the profession by unqualified persons."

Among its enumerated provisions are prohibitions against misrepresenting one's own qualifications or those of others, prohibitions against assisting unqualified persons to teach, and prohibitions against the defamation of colleagues. Although

the ideals expressed in the introduction of the second section of the code might lead one to expect specific provisions requiring conscientious professional development, the maintaining of qualifications, or the creation of a collegial learning environment, no such provisions are found.

The NEA code implicitly recognizes three sources of ethical ideals and principles. The first is what might be termed the *ethics of inquiry*. The second area might be called the *civic ethic*. That is, the NEA code recognizes those ideals and principles that regulate the public conduct of citizens of liberal democratic states to be ideals and principles that should also regulate the practice of education. A reason for this is that one goal of education is the creation of citizens. The third source of ethical ideals is the ideal of *professionalism*.

There are difficulties and questions associated with such ideals and principles. Consider the following examples:

1. What fundamental values underlie these principles? The NEA code suggests that the value that underlies the ethics of inquiry is truth, but another possibility is autonomy.
2. What is the best construction of these abstract principles? The NEA code indicates that students may not be unfairly excluded, denied a benefit, or given favoritism on the basis of a list of presumptively irrelevant characteristics. The use of the word *unfairly* cloaks a multitude of issues. For example, how do we know when exclusion or inclusion on the basis of race (one of the irrelevant characteristics listed) is unfair? Is affirmative action unfair?
3. Are there values that must be balanced against these principles? In some understandings of professionalism, a core commitment of professionalism is: *Those who know should rule*. If so, professionalism in education needs to be balanced against the expectation that public schools are under the democratic authority of school boards and state legislatures.
4. What is omitted? These three sources of ethical content do not clearly include various conceptions concerning human relations that seem relevant to teaching. Examples might be caring and trust. Nor are ideals such as promoting the growth of the whole child or creating community mentioned.

## Ethics and the Philosophy of Education

It has been common in the philosophy of education to begin an inquiry into the aims of education by asking questions such as “What is the nature of the good life?” and “What kinds of societies promote the best lives?” The Greek philosopher Plato’s *Republic* is a classical example. Such questions fall within the range of the subject matter of ethics. Answers to these questions can provide part of the framework for building a comprehensive vision of education rooted in what John Rawls has termed a “comprehensive doctrine” (1993, p. 13), and they may guide the professional practice of teachers. In societies characterized by what Rawls calls durable pluralism, there are serious difficulties with such an approach. In such societies, the educational systems cannot be rooted in a single comprehensive doctrine without marginalizing or oppressing those who hold other doctrines and without restricting personal autonomy.

Arguably, societies committed to liberal democratic values may respect pluralism and personal autonomy while also emphasizing creation of citizens. Amy Gutmann in *Democratic Education* (1987) argues that the central aim of the schools of a democratic society must be to develop democratic character. Eamonn Callan in *Creating Citizens* (1997) argues that societies committed to liberal principles of tolerance and reasonableness must provide students with an education enabling them to understand and sympathetically engage a variety of ways of life. It may, however, be argued that such an education is itself intolerant of those who wish to transmit a distinctive way of life to their children. One of the more difficult issues for the schools of liberal democratic societies is how to respect diversity while having common schools that produce good citizens.

## Ethics and Educational Policy

The civic ethic provides conceptions that are relevant, not only to teachers’ classroom practice, but to wide-ranging areas of educational policy. For example, it has been common in recent years to claim that equality of opportunity should emphasize equal educational outcomes instead of equal access or equal inputs. Assume that achievement can be measured by test scores. What pattern of test scores would be desired, and how should resources be distributed to attain it? Consider three possibilities:

1. Emphasize increasing average test scores.

Possible objections are that this is consistent with considerable disparity in levels of achievement. Moreover, average scores might be increased by focusing resources on the most able at the expense of the least able.

2. Emphasize the achievement of the least advantaged or least able. Possible objections are that such an approach might lead to significant investment in the education of students where there will be only modest return, and resources will be used inefficiently.
3. Emphasize getting all who are able above some threshold that defines minimal ability to participate in our society. This approach may lead to difficulties similar to the previous one.

These are competing principles for distributing educational resources. Although they concern such matters as state or school district budgets, in fact they may also concern the distribution of teacher time. They shed light on such questions as whether teachers should spend disproportionate time with those who are most needful or with those who will make the most progress. These various approaches are analogous to principles of distributive justice that are widely discussed in philosophical literature. The first is a utilitarian principle emphasizing the maximization of good outcomes. The second seeks to maximize the welfare of those who occupy the least advantaged positions in society. The third is a threshold view emphasizing getting everyone above some defined level. These principles illustrate the ways in which moral conceptions can inform policy and practice.

### Meta-ethical Issues

The term *meta-ethics* concerns the general nature of ethics instead of specific ethical prescriptions. Two meta-ethical disputes are the justice/caring debate and the postmodern critique of modernity.

The justice/caring dispute grows out of a critique of Lawrence Kohlberg's views of moral development by feminist scholars, principally Carol Gilligan. Kohlberg viewed justice as the central moral conception. Gilligan claimed in *In a Different Voice* that women's thinking about ethics emphasizes care. Other advocates of an ethic of care, such as Nel Noddings, have developed the notion into a robust view of ethics and of education. By the early

twenty-first century there was some rapprochement between these views, based on the claim that both justice and caring should be a part of any adequate ethic.

A second meta-ethical perspective is postmodernism. Although understandings of this stance are complex and varied, one useful characterization of postmodernism claims that it is incredulity toward all grand meta-narratives. A grand meta-narrative is a sweeping and general view about human beings and society. Liberalism and socialism are examples. Postmodernists often argue that all such grand stories represent the perspectives of groups or eras and, when viewed as the single truth of the matter, are oppressive. Postmodern critiques often seek to deconstruct such meta-narratives by showing their biased character and how they serve the interests of some over others.

### Summary

The following (not mutually exclusive) sources of ethical ideals and principles are relevant to an informed view of the ethics of teaching:

1. The law pertaining to teacher certification and dismissal, which is likely to proscribe only the most egregious behavior.
2. The NEA code of ethics. This code draws on three sources of ethical content.
  - a. The ethic of inquiry.
  - b. The civic ethic.
  - c. An ethic of professionalism.
3. Ethical conceptions that inform educational policy, such as views of distributive justice.
4. Conceptions of human flourishing and the nature of liberal democratic societies.
5. Competing meta-ethical conceptions.

Of these sources, ethical conceptions rooted in the ethics of inquiry and in the civic ethic may have the most salience to teachers because they are associated with the paramount educational goals of advancing knowledge and creating citizens. They are "internal" to the activity of teaching. Other sources apply to schools because they apply broadly to most social institutions or human activities.

## HIGHER EDUCATION

As members of the academic community, faculty and students have a responsibility to abide by ethical principles regarding academic freedom, intellectual integrity, and the fair and respectful treatment of others. The notion of academic freedom lies at the very heart of the academic enterprise. In the "1940 Statement of Principles on Academic Freedom and Tenure," the American Association of University Professors (AAUP) states, "Academic freedom . . . applies to both teaching and research. Freedom in research is fundamental to the advancement of truth. Academic freedom in its teaching aspect is fundamental for the protection of the rights of the teacher in teaching and of the student to freedom in learning" (p. 3). Intellectual integrity involves using sound and ethical methods in the pursuit of knowledge as well as embracing honesty in the dissemination of knowledge. Individuals' expectation of fair and respectful treatment by faculty and students applies not only to interactions with one another, but also to administrators, staff, and others with whom they interact in their role as members of the academic community. Fair and respectful treatment also extends, for example, to the evaluation of students' academic work and colleagues' scholarly work.

The ethical principles that guide the behavior of faculty are reflected in standards of ethics described in the documents of professional associations for faculty in higher education, such as the "Statement on Professional Ethics (1987)" published by the American Association of University Professors, and

codes of ethics published by disciplinary associations, such as the American Chemical Society, the American Psychological Association, the American Sociological Association, and the Modern Language Association. In addition, college and university faculty handbooks often include a section that addresses ethical standards or expectations regarding the behavior of faculty. Ethical standards for students may be found in official student handbooks or college and university catalogues, although standards for graduate students are also addressed in some of the professional and disciplinary association codes of ethics. These various documents embody shared beliefs that are intended to guide both the activities and the behavior of those engaged in the academic enterprise.

### Faculty

Faculty are guided by ethical principles that address their professional responsibilities as teachers, scholars, and, more generally, members of college and university communities. While some aspects of documents concerning ethical standards describe the behavior to be embraced, other aspects make clear what actions must be avoided.

**Plagiarism.** Representing the ideas, words, or data of another person or persons as one's own constitutes plagiarism. Thus, a person's words, ideas, or data, whether published or unpublished, must be acknowledged as such. For example, the MLA (Modern Language Association) Style Manual states, "To use another person's ideas or expressions in your writing without acknowledging the source is to plagiarize" (Gibaldi, sec. 1.8). "The most blatant form of plagiarism is reproducing someone else's sentences more or less verbatim, and presenting them as your own" (Achten and Gibaldi, sec. 1.4). Although scholars have long recognized the importance of citing both published and unpublished work, those engaged in teaching or research also recognize that information from electronic resources must be properly credited. Proper citation allows others to trace the origin and development of ideas, theories, and research outcomes and helps support the integrity of the academic enterprise and needed mutual trust between those seeking and those disseminating knowledge.

**Acknowledgement of contributions.** Acknowledgement of the contributions of others means appropriately recognizing and crediting those who have contributed to a scholarly work whether the work is

a manuscript, exhibit, or performance. Both recognition and accountability come with allocations of credit. Depending on their contributions, such others, including students, may be deserving of credit ranging from acknowledgement in a footnote to coauthorship. Regardless of whether faculty members work with students or colleagues, the work of all parties should be equitably acknowledged in a manner appropriate to the norms of their discipline.

**Data.** Researchers must acknowledge the source(s) of their data and accurately describe the method by which their data was gathered. Moreover, the fabrication or falsification of data or results constitutes a violation of ethical standards. While fabrication is defined as "making up data or results," falsification is "changing or misreporting data or results" (Committee on Science, Engineering, and Public Policy, p. 16). Both of these actions interfere with the search for knowledge and truth and undermine trust both within and outside the academic community.

**Conflict of interest.** Research funded by corporate sponsors potentially leads to a situation in which a conflict of interest may arise. Researchers may feel pressure, for example, to conduct research in a way that would bias the results toward the desires of the sponsor or to reveal only those results that benefit the sponsor. Biomedical research, in particular, brings forth such concerns. Conflict of interest issues are not limited to corporate-sponsored research projects; conflict of interest situations may occur with government-sponsored research as well. Non-profit organizations and social advocacy groups also have the potential to place college and university researchers in situations that make it potentially difficult to conduct the sponsored research in an unbiased manner. Researchers must be able to publicly disclose their sources of funding and the intent of the research, as well as conduct their research in a manner consistent with the ethical standards for investigation in their respective disciplines. Scholars must not let the source of their funding nor the sponsors' goals cloud their own professional and scientific judgments regarding their research.

**Other research concerns.** The prevalence of the discussion of particular ethical concerns varies across disciplines because of the nature of the research process. For example, the American Sociological Association's "Code of Ethics" describes the importance of informed consent for research involving human subjects. That is, human subjects must be aware of the nature of the research as well as voluntarily agree

to be a part of such research. The American Psychological Association discusses not only informed consent in their code of ethics, but also the importance of the humane use and care of animals in research. Disciplines that rely more heavily on archival research may say little about informed consent from human subjects, but may focus on the importance of obtaining permission to use archival data. Professional associations in the sciences, such as the American Chemical Society, are additionally concerned with providing safe working conditions for those who work in research laboratories.

**Harassment.** The most frequently discussed form of harassment is sexual harassment. As the AAUP statement on sexual harassment states, “no member of the academic community may sexually harass another” (p. 209). Such policies are applicable to faculty and students as well as to administrators, staff, other employees, and research subjects. The American Sociological Association notes that “sexual harassment may include sexual solicitation, physical advance, or verbal or non-verbal conduct that is sexual in nature” (p. 7). Some types of sexual harassment are *quid pro quo*, in which the sexual favors are presumably requested in exchange for a promised or implied future benefit, such as a higher grade or appointment to a position. Other conduct, namely that which creates a hostile or uncomfortable work environment, including the classroom environment, also constitutes sexual harassment. The code of ethics of many professional and disciplinary associations addresses the issue of sexual harassment, and faculty handbooks and other institutional documents typically include a set of procedures for dealing with situations in which alleged sexual harassment has occurred.

In addition, members of the academic community should not harass others on the basis of other personal and demographic characteristics, including race, ethnicity, age, religion, national origin, sexual orientation, and disability. Regardless of the basis of harassing or demeaning behavior, victims of harassment may find it helpful to consult with faculty and administrators for advice on avenues of action in such situations.

**Nondiscrimination and fair evaluation.** In their work, members of the academic community should not engage in discrimination “based on age, gender, race, ethnicity, national origin, religion, sexual orientation, disability, socioeconomic status, or any basis proscribed by law” (American Psychological

Association, sec. 1.10). With regard to employment, members of the academic community should not “discriminate in hiring, promotion, salary, treatment, or any other conditions of employment or career development” (American Sociological Association, sec. 8). Furthermore, professors who have agreed to serve as reviewers of manuscripts, grant proposals, or other scholarly submissions, should evaluate those materials in a fair, objective, professional, and timely manner. These standards are also applicable to the evaluation of students’ academic work. In “A Statement of the Association’s Council: Freedom and Responsibility” the AAUP further explains, “Students are entitled to an atmosphere conducive to learning and to even-handed treatment in all aspects of the teacher-student relationship” (p. 135). The principle of fair and respectful treatment also applies to interactions with and evaluation of the work of other members of the academic community.

**Allegations of ethical misconduct.** Alleged ethical violations on the part of faculty are dealt with in a number of ways. A student or faculty member may choose to approach the faculty member thought to have engaged in ethical misconduct. One could also speak with another faculty member, chair of the department, or administrator about the alleged misconduct and seek advice about possible avenues of action. A hearing on the matter is one of the possible outcomes. Faculty members accused of ethical misconduct are entitled to academic due process. That is, the educational institution should follow a set of procedures already in place for dealing with such allegations. For faculty, the AAUP also sets forth a number of parameters related to the allegations of various types and methods for proceeding to pursue such allegations, particularly within the confines of the employing educational institution. Although most incidents of alleged misconduct are handled within such institutional frameworks, many disciplinary and professional associations have provisions for pursuing breaches of ethical conduct through mechanisms within those associations.

### Students

Students are guided by the same general ethical principles as faculty regarding their academic work. Academic honesty and intellectual integrity are central in the educational process. These two principles apply to academic work, including, but not limited to, papers, theses, assignments, laboratory reports,

exams, quizzes, oral presentations, exhibits, and performances. Students can avoid plagiarism by proper citation of the resources that provide them with the ideas, words, and data that they present in their academic work. Although intellectual theft may not have been intended, careless note taking can also result in inadvertent plagiarism. Students must also not engage in the fabrication or falsification of sources, data, or results. If students work on a project together, the work of those students should be equitably acknowledged. Moreover, students must not engage in unauthorized collaboration nor give or receive inappropriate assistance with their academic work. Violation of ethical standards would be grounds for action against a student. The situational context of the violation along with the institutional norms and regulations affect the path of action. Although some situations involving a student's alleged violation of ethical standards may warrant action on the part of a faculty member or an administrative officer, other situations may warrant a hearing by a duly constituted committee to determine whether the alleged act occurred as well as the appropriate sanctions.

Some institutions of higher education have an honor code that makes clear that cheating and other forms of academic dishonesty are violations of ethical standards. These codes typically obligate students to practice academic integrity and avoid engaging in academic misconduct, but also to take action when they believe others have engaged in academic misconduct. The action taken by a fellow student who witnesses the ethical digression can range from directly confronting the alleged perpetrator to reporting the alleged act to individuals acting on the part of the institution, who may find it appropriate to convene a hearing panel for a judicial process in which students usually play an important role.

### Broader Concerns

Some ethical standards apply to members of the academic community in their relationship with wider society. The Committee on Science, Engineering, and Public Policy says, "Society trusts that the results of research reflect an honest attempt by scientists to describe the world accurately and without bias" (preface). Many codes of ethics for professional disciplinary associations specifically recognize the consequences of research beyond its intended goal. For example, the American Chemical Society indicates that, "Chemists should understand and antici-

pate the environmental consequences of their work. Chemists have responsibility to avoid pollution and to protect the environment." Under the heading "Social Responsibility," the American Sociological Association says, "Sociologists are aware of their professional and scientific responsibility to the communities and societies in which they live and work . . . . When undertaking research, they strive to advance the science of sociology and to serve the public good" (Principle E). Both faculty and students need to be aware that their ideas and implications of their research may reach well beyond their own immediate goal.

Socialization to ethical principles needs to be more explicit and the mechanisms of social control within academic profession need to be strengthened in order to improve adherence to ethical principles. To improve faculty adherence to ethical principles, John M. Braxton and Allen E. Bayer suggest, in particular, that faculty and administrations need to (1) better articulate and codify the norms of professional behavior; (2) more explicitly socialize graduate students about the profession and its ethical obligations; (3) increasingly provide incentives for teaching [and research] behavior that is consistent with the standards of the profession; and (4) when necessary, impose sanctions for violations of those standards. Undergraduate and graduate students need to be made more aware of the expectations for their behavior as well as the consequences of the failure to meet those expectations.

If the ethical standards were more explicit, members of the academic community might be more likely to both act in accordance with such standards and speak out against the ethical misconduct of others in the academic community. In fact, the Committee on Science, Engineering, and Public Policy says, "someone who has witnessed misconduct has an unmistakable obligation to act" (p. 18). Yet, allegations of misconduct may require certain types of confidentiality because of the situations or the parties involved. However, if colleges and universities deal with alleged misconduct in a less clandestine manner, it will be easier for members of the academic community, particularly newcomers, to distinguish between ethical and unethical behavior.

CAROL J. AUSTER

**EXCEPTIONAL CHILDREN,  
EDUCATION OF**

See: SPECIAL EDUCATION.

**EXPERIENTIAL EDUCATION**

Although experiential education has come to mean simply "learning by doing" for some, educators utilizing this approach recognize both its distinguished historical and philosophical roots and the complexi-

ty of applying what appears to be so elementary. When education is said to be *experiential*, it means that it is structured in a way that allows the learner to explore the phenomenon under study—to form a direct relationship with the subject matter—rather than merely reading about the phenomenon or encountering it indirectly. Experiential learning, then, requires that the learner play an active role in the experience and that the experience is followed by reflection as a method for processing, understanding, and making sense of it.

Experiential education, most generally, occurs in different kinds of programs that have as their goal the construction of knowledge, skills, and dispositions from direct experience. Service learning, adventure education, outdoor and environmental education, and workplace internships are just a few examples.

**Brief History of the Role of Experience in Education**

The role of experience in education has a history that connects back to philosophical debates between rationalists and empiricists. Rationalists argued that the information that is gained through one's senses is unreliable, and the only reliable knowledge is that which is gained through reason alone. Empiricists argued that knowledge is derived from empirical sense impressions, and abstract concepts that cannot directly be experienced cannot be known. In 1787 the German philosopher Immanuel Kant resolved the debate by arguing that both rationality and experience have a place in the construction of knowledge. Indeed, the human mind imposes order on the experience of the world in the process of perceiving it. Therefore, all experiences are organized by the actively structuring mind.

John Dewey (1859–1952), perhaps the most prominent American philosopher of the early twentieth century, expanded on the relationship between experience and learning in the publication of his well-known book *Experience and Education* (1938). He argued that not all experience is educative, noting:

The belief that all genuine education comes about through experience does not mean that all experiences are genuinely or equally educative . . . . Any experience is mis-education that has the effect of arresting or distorting the growth of further

experience . . . . A given experience may increase a person's automatic skill in a particular direction and yet tend to land him in a groove or rut; the effect again is to narrow the field of further experience. (Dewey, pp. 25–26)

For Dewey, experiences could be judged to be educative if they led to further growth, intellectually and morally; if there was a benefit to the community; and if the experience resulted in affective qualities that led to continued growth, such as curiosity, initiative, and a sense of purpose. Finally, it is important to emphasize that Dewey saw traditional education as hierarchical and inherently undemocratic, and argued that in order to promote the development of a thoughtful and active democratic citizenry, students in schools needed to be able to participate in aspects of the school program democratically.

Kurt Hahn (1886–1974), considered to be one of the foremost educators of the twentieth century, contributed to experiential education as a practitioner worldwide. Hahn established academic schools, such as Salem in Germany and Gordons-toun in Scotland, and the Outward Bound schools, which total twenty-eight in Europe, the United Kingdom, Africa, Asia, Australia, and North America. In addition he founded the Duke of Edinburgh Award for involvement in voluntary, noncompetitive practical, cultural, and adventurous activities for young people between the ages of fourteen and twenty-five. For Hahn, the entire school day—including curricula, daily routines, social life, and extracurricular activities—could be used to help young people develop social responsibility and high aspirations. Most important, it could also provide education and practice in the fundamental principles of democratic life.

The work of field theorist Kurt Lewin (1890–1947), genetic epistemologist Jean Piaget (1896–1980), and educator and activist Paulo Freire (1921–1997) also provides theoretical grounding for experiential education.

### Roles for the Teacher and the Student

Reports by John Goodlad and TheodoreSizer suggest that most teaching, particularly at the high school level, still involves the teacher as the authority and the dispenser of knowledge and the students as passive recipients. Perhaps the most obvious marker of experiential education is the shift in roles required

for both teachers and students. Teachers who utilize experiential education become facilitators and, in doing so, engage their students in some of the decision-making and problem solving that have in the past been the sole responsibility of the teacher. In addition, teachers facilitate the transfer of learning from the experiential activity to the real world, structure the process of reflection for the students in order to derive the most learning from the experience, and ensure that the learning outcomes are reached. Some educators call this shift a move toward *student-centered teaching*, or a *child-centered curriculum*. Overall it means that the students are placed at the center and the teacher's role is to develop methods for engaging the students in experiences that provide them with access to knowledge and practice in particular skills and dispositions.

The role of the student is transformed in relation to the role of the teacher. Therefore, the student role becomes more active and involved, with additional responsibility and ownership over the process of learning, whether in an outdoor education program or in a middle school. For example, students, as members of a particular learning community, may be responsible for certain day-to-day activities, may be engaged in some aspects of curriculum development, or may be engaged in service activities in their community as a method for learning about different careers and contributing to their neighborhood. Whether in an outdoor education program or a service-learning program in a school, the student's role is one of engagement and deliberation—a continuous cycle of action and reflection, or *praxis*, as defined by Paulo Freire.

### The Assessment of Student Learning

The assessment of learning outcomes for students has reflected ongoing economic and political debates surrounding the definition of learning. Legislators in the United States, looking for efficient ways of quantifying learning, advocate standardized multiple-choice tests, which can be mass-produced and are inexpensive to score. Unfortunately, the kind of learning that is measured by these tests is merely a matter of recognition—recognizing the one right answer from among four or five possible answers. Proponents of experiential education define learning in a manner that is more reflective of the complexity of both cognitive and affective development: Learning is “the process whereby knowledge is created through the transformation of experience” (Kolb, p.

41). Central to the process of transformation is reflection.

**Reflection.** In 1984 David A. Kolb published *Experiential Learning: Experience as the Source of Learning and Development*, which outlines a cycle for reflection. The cycle begins with concrete experience, moves to reflective observation, then to abstract conceptualization, and finally to the application stage, active experimentation. Reflection typically includes reconstructing the experience, making connections to prior knowledge or skills, testing understanding, and making decisions about how to apply the knowledge or skills in a new situation. In addition, David Boud, Rosemary Keogh, and David Walker (1985) offered examples of various methods for promoting reflection including oral conversations, such as informal debriefing sessions following experiential activities and written responses to experiences through diaries, journals, portfolios, and student exhibits, which may include text, pictures, and photos.

**Assessing student learning.** Assessing experiential learning is an ongoing process based upon the learning outcomes defined at the beginning of the experience or program. As an example, Norman Evans argues that student assessment is “a matter of making independent judgments about the level and quality of learning which has been reached by an individual at a particular time” (p. 68). He notes a four-stage sequence for compiling evidence in a portfolio assessment: “(1) Systematic reflection on experience for significant learning; (2) Identification of significant learning, expressed in precise statements, constituting claims to the possession of knowledge and skills; (3) Synthesis of evidence to support the claims made to knowledge and skills; (4) Assessment for accreditation” (p. 71).

For K–16 students, and particular to service learning, Kathryn Cumbo and Jennifer Vadeboncoeur note that service and learning goals should be articulated early in the planning process for an experiential activity. Indeed, the discussion surrounding the reason behind the experience and the way it reflects the curriculum goals may be a learning experience in and of itself between the teacher and his or her students. Finally, the definition of the service goals requires input from the community group or organization that provides the experiential site through partnership with the school. Cumbo and Vadeboncoeur offer examples of scoring rubrics and assessment tools to assess curricular knowledge.

## Evidence of Effectiveness

It is important to emphasize that different experiential programs have different learning outcomes, all of which may be assessed using some type of measure, though much of what is learned may not be assessable on a standardized multiple-choice test. Research, which provides evidence for the effectiveness of experiential education, tends to be separated by the type of experiential program. For example, Alan W. Ewert demonstrated effects for outdoor adventure programs, including enhanced self-concept, effectiveness in treating chemical dependency, and a reduction in the rate of recidivism for young people. In addition, John Hattie, H. W. March, James T. Neill, and Garry E. Richards reviewed the literature for adventure education and Outward Bound programs and completed a meta-analysis of ninety-six separate studies. Their work highlights continued gains and longevity of the positive follow-up effects, in particular for programs lasting more than twenty days. Finally, with regard to service learning, in a national study of Learn and Serve America programs completed over three years by Brandeis University, key findings included positive short-term impacts for a range of civic and educational attitudes and behaviors for participants and a positive impact on the community in terms of service performed.

## Major Issues

There are several issues that stand in the way of increasing access to experiential education in schools, although programs that exist outside of schools, such as Outward Bound and the National Outdoor Leadership schools, are flourishing. For in-school programs, the cost of engaging in experiential education, including transportation, can be prohibitive, not to mention the time it takes to plan and carry out experiential programs. In addition, even after the prominence of Dewey’s work and the commitment of so many experiential educators, legislators and some parents seem to prioritize teacher accountability as measured through student achievement on standardized tests, over and above a more complex view of student learning. As long as the definition of learning is narrowed to rote memorization, quantifiable on multiple-choice tests, teachers will be restricted to covering curriculum and teaching to the test. There should be a continued effort to develop and share assessment tools for measuring student learning from experiential education. In addition, the culture as a whole should play a part in

rethinking the definition of learning, taking into account a more broadly conceived view of the role of experience and reflection.

## EXPERTISE

### ADAPTIVE EXPERTISE

Giyoo Hatano

### DOMAIN EXPERTISE

K. Anders Ericsson

Robert R. Hoffman

### ADAPTIVE EXPERTISE

Investigators on knowledge transfer have almost unanimously concluded that students seldom effectively apply short-term training at school to problem-solving situations outside school. Experts, who have had years of problem-solving experience in a given domain, may not be different—they can solve familiar types of problems quickly and accurately but fail to go beyond procedural efficiency. Even in knowledge-rich domains, experts may be characterized by their possession of problem schemas by which they classify problems and apply one of the solution routines accordingly.

The notion of adaptive experts as against routine experts was proposed by Giyoo Hatano as an ideal of educational researchers looking to find ways to teach students so they can apply learned procedures flexibly or adaptively. Keith Holyoak aptly describes the distinction: "Whereas routine experts are able to solve familiar types of problems quickly and accurately, they have only modest capabilities in dealing with novel types of problems. Adaptive experts, on the other hand, may be able to invent new procedures derived from their expert knowledge" (p. 310). Giyoo Hatano and Kayoko Inagaki, in their 1986 paper, slightly expand the above characterization of adaptive experts: They are able to (1) comprehend why those procedures they know work; (2) modify those procedures flexibly when needed; and (3) invent new procedures when none of the known procedures are effective.

### Sources of Adaptiveness

Where does the adaptiveness of adaptive experts come from? Adaptive experts are assumed to pos-

ness, as the source of their flexibility and inventiveness, conceptual knowledge of the objects of the procedures (that is, what each of these objects is like). “Flexibility and adaptability seem to be possible only when there is some corresponding conceptual knowledge to give meaning to each step of the skill and provide criteria for selection among possible alternatives for each step within the procedure” (Hatano 1982, p. 15). Such conceptual knowledge enables experts to construct mental models of the major entities of the domain, which can be used in mental simulation. Using Holyoak’s expression, the key to adaptive expertise is the development of deeper conceptual understanding of the target domain. Needless to say, such conceptual understanding must be connected to procedural competencies and meta-cognitive awareness and monitoring of one’s own understanding.

It is hypothesized that if people ask themselves why a skill works or why each step is needed during its application, this question will tend to lead them to form some conceptual knowledge about the object. This was similar to what Donald Schoen in 1983 called “reflection-in-action” as against technical problem-solving in his attempt to characterize professionals. Although experts are seldom taught conceptual knowledge in the verbalized form, they may construct it in the process of solving problems or performing tasks in the domain.

### Motivational and Contextual Conditions

When are people likely to gain adaptive expertise? Identifying particular kinds of learning experiences that develop adaptive expertise is a serious challenge for educational researchers. In 1992 Hatano and Inagaki proposed four conditions that would promote sustained comprehension activity that is likely to lead to adaptive expertise. Their proposal is based on the assumption that *cognitive incongruity* (a state of feeling that current comprehension is inadequate; for example, wondering why a given procedure works) induces enduring comprehension activity, including seeking further information from the outside, retrieving another piece of prior knowledge, generating new inferences, examining the compatibility of inferences more closely, and so forth. The first two of the proposed conditions are concerned with the arousal of cognitive incongruity and the last two with the elicitation of committed and persistent comprehension activity in response to induced incongruity. The four conditions are: (1) encountering

fairly often a novel problem to which prior knowledge is not readily applicable or a phenomenon that disconfirms a prediction based on prior knowledge; (2) engaging in frequent dialogical interaction, such as discussion, controversy, and reciprocal teaching; (3) being free from urgent external need (e.g., material rewards or positive evaluations), and thus able to pursue comprehension even when it is time consuming; and (4) being surrounded by reference group members who value understanding.

These conditions can be rephrased in terms of the nature of the practice in which people participate. For example, when a practice is oriented toward skillfully solving a fixed class of problems (e.g., making the same products for years), participants tend not to encounter novel problems, and thus they are likely to become experts distinguished in terms of speed, accuracy, and automaticity (i.e., routine experts). In contrast, when successful participation in a practice requires meeting varied and changing demands (e.g., making new, fashionable products), participants’ prior knowledge must be applied flexibly, and they are likely to acquire adaptive skills. From sociocultural perspectives, adaptive experts may not be characterized only by their domain-specific knowledge; in order to invent new procedures, for example, in addition to deeper conceptual understanding, people have to be able to participate in discourse, offer valuable suggestions, evaluate others’ suggestions, and so on.

### Educational Implications

At school students are seldom expected to become experts in a particular domain. Rather they are expected to learn in many subject-matter domains. Thus the extent to which school instruction and vocational expertise share similar goals and processes of learning is debatable. Trying to build a classroom as a community of adaptive experts is challenging, but practically it may be too ambitious or require too much effort on the part of educators.

Whatever the ultimate goal for instruction should be, the concept of adaptive expertise “provides an important model of successful learning” (Bransford, Brown, and Cocking, p. 36). It is thus encouraging to see attempts to apply this notion to teaching and learning in mathematics, science, history, and other subjects.

## DOMAIN EXPERTISE

*Expertise* refers to the psychological mechanisms underlying the superior achievement of an expert and the social forces that designate the status of being an expert, that is, "one who has acquired special skill in or knowledge of a particular subject through professional training and practical experience" (*Webster's Third New International Dictionary*, p. 800). The term expert has been used to describe highly experienced professionals, such as medical doctors, accountants, teachers, and scientists, but has been expanded to include any individual who has attained superior performance by instruction and extended practice, ranging from bird-watchers to pianists, golfers to chess players.

## Theoretical Frameworks

Experts' behavior looks so effortless and natural that it is often attributed to special talents, though knowledge and training are necessary. The role of

acquired skill for the highest levels of achievement has traditionally been minimized. However, when scientists began measuring the experts' presumed superior powers of speed of thought, memory, and intelligence with psychometric tests, no general superiority was found—the demonstrated superiority was domain specific. For example, the chess experts' vastly superior memory was constrained to regular chess positions and did not generalize to other types of materials. Not even IQ could distinguish the chess masters among chess players nor the most successful and creative among artists and scientists. In K. Anders Ericsson and Andreas C. Lehmann's 1996 review, it was found that (1) measures of general basic capacities do not reliably predict success in a domain; (2) the superior performance of experts is often very domain specific and transfer outside their narrow area of expertise is limited; and (3) systematic differences between experts and less proficient individuals nearly always reflect attributes acquired by the experts during their lengthy training.

**Thought processes.** In a pioneering empirical study first published in 1946 of the thought processes at the highest levels of performance, Adrian de Groot instructed expert and world-class chess players to think aloud while they selected their next move for an unfamiliar chess position. The world-class players did not differ in the speed of their thoughts or the size of their basic memory capacity, and their ability to recognize promising potential moves was based on their extensive experience and knowledge of patterns in chess. In their influential 1973 theory of expertise, Herbert A. Simon and William G. Chase proposed that experts with extended experience acquire and remember a larger number of complex patterns and use these new patterns to store new knowledge about which actions should be taken in similar situations.

According to this influential theory, expert performance is viewed as the result of skill acquired with gradual improvements of performance during extended experience in a domain. Furthermore, this theory assigned a central role of acquired knowledge and encouraged efforts to elicit experts' knowledge to build computer models of experts, that is, expert systems.

It is tempting to assume that the performance of experts improves as a direct function of increases in knowledge through training and extended experience. However, there are many demonstrations that extensive domain knowledge does not necessarily

entail superior performance. For example, the outcome of psychological therapy does not increase as a function of the length of training and professional experience of the therapist. Similarly, the accuracy of decision-making—such as medical diagnosis for common diseases and the quality of investment decisions—does not improve with further professional experience. More generally, the number of years of work and experience in a domain is a poor predictor of attained performance.

**The development of expert performance.** In a 1985 pioneering study, Benjamin S. Bloom and his colleagues studied the developmental history of scientists, athletes, and artists who had attained international awards for their outstanding achievements. These elite performers did not attain their performance from regular experience in their respective domains but were given access to superior instruction in the best educational environments. Their families provided them substantial financial and emotional support to allow them to focus fully on the development of their performance. Bloom's influential research demonstrated the necessity for extended training in the best training environments to reach the highest levels of performance.

**Effects of practice and experience.** Subsequent research published in 1993 by Ericsson, Ralf Krampe, and Clemens Tesch-Römer analyzed the effects of different types of experience on the improvement of performance. They found that in activities where individuals had attained an acceptable level of performance, such as recreational golf and many professions, even decades of continued experience was not associated with any improvement of performance. The researchers proposed that in those domains where performance consistently increases, aspiring expert performers seek out particular kinds of experience, that is, deliberate practice—activities designed, typically by a teacher, for the sole purpose of effectively improving specific aspects of an individual's performance. In support of a critical role of deliberate practice, expert musicians differing in the level of attained solo performance also differed in the amounts of time they had spent in solitary practice during their skill development, which totaled around 10,000 hours by age twenty for the best experts, around 5,000 hours for the least accomplished expert musicians, and only 2,000 hours for serious amateur pianists. More generally, the accumulated amount of deliberate practice is closely related to the

attained level of performance of many types of experts, such as musicians, chess players, and athletes.

## Conclusions

Advances in the understanding of the complex representations, knowledge, and skills that mediate experts' superior performance derive from studies where experts are instructed to think aloud while completing representative tasks and from studies using methods of cognitive task analysis and cognitive field research. These process-tracing studies have shown that the difference between experts and less-skilled individuals is not merely a matter of the amount and complexity of the accumulated knowledge; it also reflects qualitative differences in strategies, the organization of knowledge, and the representation of problems. During the acquisition of their performance, experts acquire domain-specific memory skills that allow them to rely on long-term memory to dramatically expand the amount of information that can be kept accessible during planning and during reasoning about alternative courses of action. The superior quality of the experts' mental representations allows them to adapt to changing circumstances as well as anticipate future events in advance, so the expert performers can respond with impressive speed. The same acquired representations appear to be essential for experts' ability to monitor and evaluate their own performance so they can keep improving by designing their own training and assimilating new knowledge.

## **FACULTY AS ENTREPRENEURS**

Although entrepreneurship is a term seldom associated with educational institutions, faculty entrepreneurial activities are not a recent development. Known as consulting, sponsored research, knowledge commercialization, academic capitalism, or moonlighting, the multifaceted phenomenon of faculty entrepreneurship has existed for some time on campuses. Nevertheless, little research has been undertaken on this topic. In part, this reflects the lack of consensus on what constitutes faculty entrepreneurship as well as the secrecy that often surrounds outside activities of faculty members. The objectives of this chapter are threefold. First, the reasons underlying the growth of faculty entrepreneurship are addressed. Second, a definition of what constitutes faculty entrepreneurship is provided. Finally, advantages and disadvantages of faculty entrepreneurship are discussed.

### **Growth of Faculty Entrepreneurship**

Traditionally, faculty members have provided industry, communities, governments, and other entities with their professional expertise and research findings. Faculty entrepreneurial activities date back to the medieval period when members of law and medical faculties engaged in professional practice to supplement their university salaries. Later, in the seventeenth century, university faculty played an important role in the formation of the pharmaceutical industry in Germany. In the initial decades of the twentieth century, the growth of the service element in the university mission, coupled with technological advancement, provided a strong impetus for faculty entrepreneurship by linking research to the needs of

businesses. The railroad industry, petroleum refining, and polymer industries are just a few examples of commercial endeavors that benefited from these linkages. In the second half of the twentieth century, entrepreneurial activities of university faculty played an instrumental role in the development of the computer industry and also contributed to the emergence and rapid growth of biotechnology.

What is new at the start of the twenty-first century is the rapid increase in the scope and intensity of faculty entrepreneurial activities as well as the normative shift towards an emerging academic culture that values equally the intellectual and commercial potential of faculty expertise and research. The growth of faculty entrepreneurship is spurred by the synergetic interaction of pull and push factors. The pull factors include the rise of the knowledge-based economy, technological advancement, and globalization, which generate demands for faculty expertise, thus creating new opportunities for scholars and scientists to engage in commercial activities. The push factors, such as waning public support for higher education, increasing research costs, institutional reward systems that tend to encourage faculty to generate external revenues, and state pressures on institutions to become more active actors in economic development, motivate faculty to engage in paid outside activities, thus augmenting the supply of academic entrepreneurship. Widely publicized successes of university entrepreneurs in biotechnology and new legislations permitting the commercialization of knowledge further encourage faculty entrepreneurship.

## What Is Faculty Entrepreneurship?

Faculty entrepreneurship involves efforts to transform individual academic expertise and research results into intellectual property, marketable commodities, and economic development, thereby enhancing faculty remuneration and professional status. An essential characteristic of a faculty entrepreneur is entrepreneurial expertise, which is described by Sheila Slaughter and Larry L. Leslie as the ability to recognize the market potential of faculty research and other intellectual property, to cultivate commercial partnerships, and to negotiate contracts.

Historically, faculty entrepreneurship has followed two basic patterns. The first represented the application of specialized expertise to solve specific industrial problems by chemical and electrical engineering faculty in the late nineteenth century. Contractual research, consulting, and external teaching generally followed this pattern. The second pattern, which originated at the Massachusetts Institute of Technology in the 1920s, involved the patenting, development, and commercialization of faculty discoveries. In many instances, this involved the formation of firms by researchers—especially in the engineering and life sciences.

Magnus Klofsten and Dylan Jones-Evans suggest the following typology of contemporary faculty entrepreneurial activities: (1) large-scale science projects funded through public grants or industrial sources; (2) research contracted to solve specific problems; (3) consulting or the sale of personal expertise directed towards the resolution of identifiable problems; (4) patenting/licensing; (5) the formation of new firms or organizations to exploit the results of academic research; (6) external teaching; (7) commercial selling of research products; and (8) provision of testing and calibration services to external entities.

The most common types of entrepreneurial activities undertaken by faculty members appear to be consulting, contractual research, large-scale science projects, and external teaching. Although types and levels of entrepreneurial activities vary by academic fields, faculty in the disciplines of engineering, computer science, medicine, agriculture, chemistry, and biotechnology are the most likely to be engaged in entrepreneurial activities, followed by social scientists, natural scientists, and humanists. Traditional activities such as consulting appear to be distributed evenly across the disciplines while activities such as

the formation of private firms, including those involved in the patenting or commercialization of new products and processes, are dominated most often by the life sciences and engineering.

## Advantages of Faculty Entrepreneurship

Individual faculty members, their institutional employers, clients, and the society at large share in the benefits of faculty entrepreneurship. The obvious benefit for the individual faculty member is supplemental income, which improves faculty economic status and sometimes contributes to additional research funding. Furthermore, outside activities often enhance the continuing education of faculty, help to ensure currency of teaching and research, and provide faculty with external affirmation of their expertise and greater peer recognition.

The primary benefit of faculty entrepreneurship for clients is efficient access to sources of specialized expertise. Moreover, sponsors often have first access to research findings and privileged positions with respect to exclusive patent licenses. Involving faculty researchers in product commercialization also enables clients to gain a competitive edge in the marketplace by accelerating new product development and launching. Another important benefit is the cross-fertilization of ideas between industry and institutions of higher education. Synergies with respect to the training and development of staff may be significant as well.

Faculty entrepreneurial activities also benefit institutions. External funds secured by faculty entrepreneurs may supplement monies available to institutions for conducting basic research and offering improved grants or assistantships to graduate students. Permissive policies regarding faculty entrepreneurship enable institutions to recruit professors who otherwise would be inclined to opt for employment in private industry or government. Additionally, successful faculty entrepreneurs improve institutional visibility and reputation.

Faculty entrepreneurs take an active part in solving various social or community problems by providing their expertise to non-profit organizations and governmental agencies. Furthermore, academic entrepreneurship, especially efforts that involve start-up companies, plays an increasingly important role in regional and national economic development. On the whole, faculty entrepreneurial activities promote technological advancement and accel-

erate the transfer of knowledge from discovery to utilization, thus contributing to social progress.

### Disadvantages of Faculty Entrepreneurship

On the negative side, faculty entrepreneurial activities may lead to situations involving conflicts of interest, commitment, or internal equity. Conflicts of interest are usually of a financial nature and may lead to biases in the design of research, the interpretation of results, publication delays and/or secrecy, as well as conflicts with student interests.

Conflicts of interest may arise when faculty entrepreneurs engage in activities to advance their own financial interests that might harm their institutional employer. The potential for conflicts of interest exists, for example, when faculty entrepreneurs use institutional resources for their outside activities or have financial interests in entities that do business with the institution.

A faculty entrepreneur may manipulate research design or fail to present accurate research results if the findings do not yield a profit or desired result for the sponsoring entity, and the dissemination of research findings may be unduly delayed or prevented on the grounds that proprietary information has to be protected in order to secure the competitive edge of the client. Another important, but often overlooked, conflict of interest involves student interests. Potential exists for faculty entrepreneurs to abuse their positions by using students as inexpensive labor or to exploit students' ideas without giving them credit. More subtle conflicts that also represent significant risks include steering student research toward topics that reflect the priorities of a faculty entrepreneur or corporate sponsor, or delaying student publications because of proprietary interests.

Conflicts of commitment between the role of the faculty entrepreneur and the role of teacher, researcher, or public servant merit attention. The central issue to consider when assessing possible conflicts of commitment is whether particular entrepreneurial activities negatively influence faculty teaching, research, and service productivity. Existing research provides mixed results and suggests that the relationships between entrepreneurial activities and faculty productivity are nonlinear, may vary across academic disciplines, and depend on the time spent on outside activities.

Conflicts of internal equity involve conflicts between the values of faculty as entrepreneur and fac-

ulty as collegian. Internal institutional practices increasingly favor academics engaged in entrepreneurial activities. These individuals tend to receive higher salaries and benefits as well as lower workloads than their nonentrepreneurial peers. These considerations, coupled with the unequal positioning of disciplines and institutions relative to the market, are potentially detrimental to collegiality and may exacerbate existing stratification between faculty, disciplines, and institutions.

### Conclusion

Faculty members are increasingly pushed, encouraged, and provided with opportunities to take on new entrepreneurial roles. At a time when "entrepreneurship is the key to present and future institutional and cultural preference, approval, and legitimacy" (Slaughter and Leslie, p. 200), the ignorance of faculty entrepreneurship or attempts to hinder its development may contribute to intellectual stagnation or a loss of talent and knowledge from academia. Faculty entrepreneurial activities should be studied carefully and managed cautiously in order to maximize their benefits and minimize disadvantages.

## FACULTY CONSULTING

The central issue concerning faculty who consult with outside clients is the relationship of the faculty to the college or university that employs them. This relationship is evolving rapidly. The institutions first opposed faculty consulting, then tolerated it, next

encouraged it, and then some even began to sponsor faculty consulting through organized programs of technical assistance to industry.

Three aspects of faculty consulting will be discussed in this entry: major issues associated with the practice; typical policies drawn up by institutions to guide relationships with faculty who consult; and characteristics of faculty who consult compared to those who do not, taking into consideration differences due to academic discipline. Also reported are findings about the amount of outside income faculty earn from consulting.

### Issues

A continuing concern of employing institutions is the extent to which faculty who consult may be shortchanging their teaching responsibilities and restricting their opportunities to interact with students. Institutions may also be concerned that faculty who do outside consulting may have less time for curriculum development or departmental committee work.

In addition, the product of paid consulting work is generally the property of the clients who may keep the results proprietary and not make them available in the public domain. This is considered by many as contrary to the spirit of free inquiry which they believe should characterize the academic world.

From an institutional perspective, management issues may also arise about the extent to which college or university resources, such as office space or equipment, are used by faculty inappropriately for outside consulting projects. Further, involvement of students in outside consulting projects may need to be monitored to determine whether it constitutes a legitimate learning experience, a valuable internship with a potential future employer, or exploitation.

Faculty consulting contracts are considered by institutions to be personal agreements, but these contracts may create conflicts of interest with employing institutions or subject the institutions to risks. Consequently, some institutions provide reviews of the consulting contracts to ensure that the provisions recognize the preexisting obligations of the faculty to their primary employing institution, including the obligations to disclose new inventions and assign patent rights.

On the other hand, companies hiring faculty consultants may require that their company's proprietary information be kept confidential, and re-

strict disclosure and use of the information. This practice may not contribute to the free and open inquiry promoted in the academic world.

Thus, the ultimate issue with respect to faculty consulting is who benefits? Faculty benefit from consulting if they derive opportunities to strengthen their research, especially in fields where the leading edge of scientific inquiry is migrating to industry from academic institutions—because industry has more money. Faculty also benefit from consulting if they collaborate in meeting real-world challenges that may make their teaching more relevant and lively, which in turn benefits students. Consulting also gives faculty opportunities to supplement their income, which may be especially important in fields where there is a great, and growing, disparity between salaries earned in business and in the academic world. Consulting projects may also provide learning opportunities for students, and possibly employment opportunities working on practical projects. Institutions may benefit by building stronger business, community, and governmental relationships, which may lead in the long run to greater financial support. Indeed there is likely a complementary relationship between the reputation of faculty and that of their employing institutions: the better the reputation of the institution, the greater the recognition of the faculty they can attract; the greater the recognition of the faculty, the wider the range of consulting opportunities and the greater the amount of outside support faculty can garner for their institutions.

Financial and academic costs and other negative outcomes are also issues in assessing the value of faculty consulting to an academic institution. An institution has an interest in protecting itself from charges of abuse of the employment relationship by a faculty member consulting and inappropriately invoking the reputation of the institution. Apparent, and real, conflicts of interest sometimes arise that might affect faculty judgments about educational matters. Faculty otherwise engaged may become inaccessible to students or to other faculty. Outside agendas may distort academic priorities, leading to active student opposition, as in the 1960s when students objected to what they considered to be too great involvement of the faculty with defense contractors.

## Policies

Faculty handbooks generally set forth the policies and procedures defining and governing consulting by their faculty with outside clients. These conditions are then incorporated into faculty employment contracts. Typically, these provisions apply only to full-time faculty, not part-time faculty, and apply during the nine-month academic year, including the summer months only if the faculty member is teaching during the summer session. The institution may not limit the amount of consulting done during periods when the faculty is not on the payroll (during the summer or on leave), but the institution's policies with respect to conflict of interest and restrictions on the use of institutional resources still apply. Faculty employment contracts typically allow faculty up to one day, or ten hours, a week—or four days a month—for outside consulting. More than that is considered to jeopardize the commitment to teaching, research, and service at the employing institutions.

Faculty consulting is subject to varying reporting requirements and oversight by the colleges and universities. Some boards of trustees require periodic reporting by the institution of the policies and procedures that cover faculty consulting and how they are enforced. They may consider the following:

- how faculty consulting is defined
- the types of clients served
- the nature of the services performed
- the amount of time that is spent consulting on a particular project
- the total amount of time spent consulting accumulated over the academic year
- the amount and sources of outside remuneration
- reimbursement of the institution for the use of institutional resources, facilities, or services

The board of trustees may also require an evaluation of the value of faculty consulting to their institution.

Some institutions require that faculty make annual reports of their outside consulting, but only of consulting that relates to their academic specialty, which consequently may raise a question about how broadly the specialty is defined. Some institutions have made a distinction between consulting for a single occasion that is reported annually after the fact, and consulting that is of a longer duration and

**TABLE 1****Percentage of faculty who earn income from consulting by academic discipline, 1998**

Engineering	32.7
Business	26.2
Agriculture and home economics	25.4
Education	23.4
Social sciences	23.3
Fine arts	22.6
Natural sciences	18.6
Health sciences	17.9
Humanities	15.4
All other programs	22.2

requires specific prior approval. Public institutions may take into consideration whether the consulting is for another state agency or for an outside client.

Institutions actively reaching out to their local business community have more recently begun to actually sponsor faculty consulting through formal technical assistance programs. The programs are characterized as community service programs which help local businesses and contribute more broadly to regional economic development.

### Characteristics of Faculty Who Consult

At the start of the twenty-first century about one out of every five faculty members at American colleges and universities earns income from consulting or freelance work. Based on estimates derived from the 1999 National Survey of Postsecondary Faculty (NSOPF99) using the data analysis system of the National Center for Education Statistics, the percentage ranges by type of primary employing institution from 30 percent of faculty at private research institutions to only about half that, or 14 percent, at public two-year colleges. In general, a higher percentage of the faculty at all types of private institutions consult than do the faculty at counterpart public institutions.

The percentage of faculty who earn income from consulting also varies significantly by academic discipline. As shown in Table 1, the percentage ranges from 33 percent for engineering faculty to only 15 percent of faculty in the humanities.

The percentage of faculty who consult varies significantly by gender, age, and race. Considering gender, a much higher percentage of faculty men (23

percent) earn consulting income than do faculty women (17 percent). Considering age, a much higher percentage of faculty aged 35 and over (19 to 23 percent) earn consulting income than did those under the age of 35 (only 14 percent). Faculty aged 55 to 59 report the highest percentage earning consulting income (23 percent). Even 21 percent of the faculty aged 70 and over report consulting income. Consulting also varies by race/ethnicity, with only 13 percent of the faculty who are Asian reporting consulting income compared with 18 percent of the African Americans, 19 percent of the Hispanics, and 21 percent of the whites.

It might be expected that lower-income faculty would be using consulting to supplement their income. They do, but an even higher percentage of the higher-income faculty report earning consulting income. About 15 percent of those faculty with base salaries of \$25,000 to \$40,000 report earning consulting income compared with 34 percent of those with base salaries of \$85,000 to \$100,000. The opportunities to consult are much greater for those who are older, tenured, and have well-established reputations in their field.

The higher-income faculty also report earning much higher amounts of consulting income. Of those faculty who do earn consulting income, the amounts range from an average of about \$4,000 for those who earn \$25,000 to \$40,000, rising progressively to about \$19,000 for those faculty who earn \$130,000 or more. Although the dollar amounts of consulting income rise steeply, the percentage of the base salary from the institution increases only from about 12 percent at the \$25,000 to \$40,000 range to about 14 percent at the higher income ranges. Faculty with the lowest base salaries from the institution, under \$25,000, appear to be an exception, reporting about \$8,500 in consulting income, which represents a considerably higher percentage of the base salary.

A slightly higher percentage of faculty (24 percent) who have had previous employment outside of higher education earn consulting income than those who do not (20 percent), a smaller difference than might be expected to result from prior connections with industry or government. Though consulting is likely to be covered by collective bargaining agreements, the consulting practices of union and nonunion members do not significantly differ. Seventeen percent of union members report earning consulting income, compared to 21 percent of those who are not members.

### Impact of Consulting on the Faculty Commitment to Teaching and Research

The most heated debate over the extent of faculty consulting concerns the impact of consulting on teaching and research. The NSOPF99 survey data suggest that there is a positive relationship. Generally speaking, the higher the number of student contact hours per week, the higher the percentage of faculty who earn income from consulting. There is, however, a great difference depending on the level of students instructed. Eighteen percent of those instructing only undergraduate students reported consulting income, compared with 27 to 30 percent for those instructing graduate students.

Opportunities to consult are directly connected with faculty research. In general, the higher the amounts of research grants and contracts awarded to faculty, the higher the percentage of faculty who earn income from consulting. The percentage of faculty who earn income from consulting ranges from under 20 percent for those faculty with less than \$10,000 in outside research grants and contracts to almost 40 percent for those with \$100,000 or more.

Faculty with consulting income also reported comparatively higher rates of participation in unpaid activities at the institutions, including administrative duties, curriculum development, meeting with students, mentoring, and community service. On the other hand, these faculty reported comparatively lower rates of attending faculty meetings, holding office hours, grading papers, or attending athletic events. Thus, it appears that, in general, faculty who consult value their time and are less willing to spend hours on the bureaucratic aspects of academic work. They also appear to have less leisure time, indicating that faculty who consult are not shortchanging their students, but are simply busier.

The opportunities to consult appear to affect somewhat positively overall faculty satisfaction with their work. Of those faculty who are very satisfied with their salary and with their job security, a higher percentage earn consulting income than do those faculty who are very dissatisfied. The opposite is true considering satisfaction with the work load: a higher percentage of those who are dissatisfied report earning consulting income than do those who are satisfied.

Faculty who earn consulting income respond differently from those who do not when asked to contemplate the factors most important to them if

they were to leave their institution. Among those faculty who reported the factors of more opportunities for advancement, greater opportunities to do research, and good research facilities and equipment, a higher percentage earned income from consulting than did those reporting the factors of salary level, benefits, or job security. Interestingly, faculty consulting apparently has little or no effect on interest in taking early retirement.

With faculty salaries slipping further below salaries of comparable professionals, it might be expected that the percentage of faculty who consult to supplement their income would be increasing. This is not the case, however. As cited earlier, about 20 percent of all faculty reported earning income from consulting in 1998, which is almost exactly the same percent as reported in 1992, and slightly lower than the 24 percent reported in 1987. While the extent of consulting is not increasing, the percent of faculty reporting income from self-owned businesses is increasing. Thus, faculty are not only consulting but also becoming more entrepreneurial. Indeed, one of the most important new phenomena in the academic world may be the transformation of the faculty consultant into the faculty entrepreneur.

## FACULTY DIVERSITY

Race, ethnicity, and gender are the most common characteristics that institutions observe in order to

measure faculty diversity. Individuals from various minority or racial/ethnic groups (e.g., American Indian/Alaskan Native, Asian/Pacific Islander, African American, and Hispanic) comprise nearly 30 percent of the population but account for only 15 percent of the professoriate. While females constitute 51 percent of the population; their representation in academe is 45 percent. An even broader approach to faculty diversity involves age, socioeconomic background, national origin, sexual orientation, and diverse learning styles and opinions.

Higher education institutions are generally concerned with structural diversity, which is the numerical representation of women and people of different racial and ethnic groups. Research confirms that institutions desiring to improve the campus climate for diversity must first increase the structural diversity of the institution. Increasing the structural diversity provides a “critical mass” of individuals from diverse social and cultural backgrounds who interact across racial/ethnic and gender groups. However, improving structural diversity alone will not enhance the environment that faculty encounter. Institutions must take steps to transform the psychological and behavioral climate if faculty diversity and all that it encompasses is to be achieved. For example, the diversity of thought and scholarship includes building a group of faculty with different opinions who work within competing paradigms and whose differences serve to foster intellectual growth.

### **The Growth of Faculty Diversity as an Ideal**

In order to understand why diversity has become a worthy goal, one must first understand that, until the latter part of the twentieth century, the professoriate in the western world was composed almost exclusively of wealthy, heterosexual males of Caucasian descent. Prominent studies in 1969 and 1975 include data on changes in faculty background characteristics, but a 20-year lag in the observation of some of these variables left a critical void in the literature pertaining to the changing professoriate. Additionally, all of the previous studies discussed the social origins of faculty across both age and gender. However, none of these studies reported differences in socioeconomic background relative to race.

Although the face of America began to evolve dramatically in the late 1800s with the introduction of newly-freed slaves into society and, later, with the tremendous infusion of immigrants, the representation of various racial/ethnic groups in the ranks of

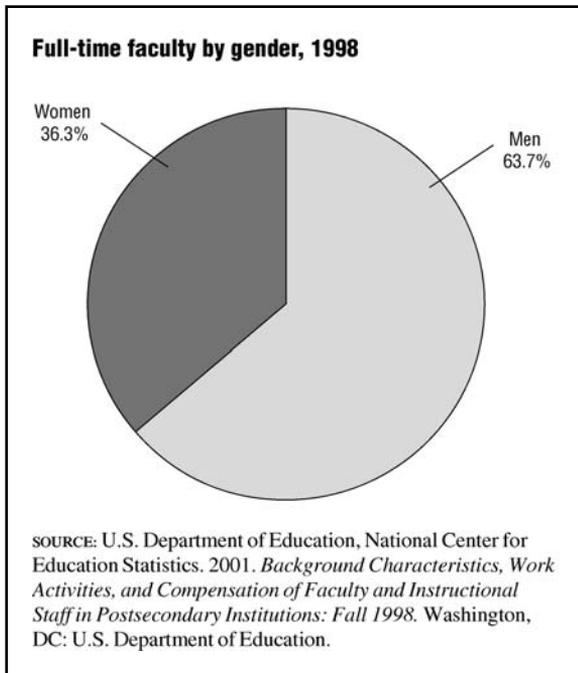

the professoriate remained at insignificant levels throughout much of the twentieth century. It was not until the 1973 court decision of *Adams v. Richardson*, which mandated an increase in minority faculty at public institutions, that noticeable numbers of minority faculty were hired at predominantly white institutions (PWIs). However, historically black colleges and universities (HBCUs), hispanic serving institutions (HSIs) and tribal colleges (TCs) have employed faculty from diverse racial and ethnic groups since their inceptions. Moreover, at least one-third of minority faculty members are employed at HBCUs, HSIs, and TCs, further minimizing their presence at PWIs. For example, 48 percent of full-time African-American faculty work at HBCUs.

The passage of equal employment legislation and the momentum of the civil rights movement in the 1960s stimulated greater participation of women in the workforce. By 1970, 23 percent of all faculty members were females. The next three decades saw female faculty increase to 39 percent in 1993, of which 33 percent were full-time. While encouraging, these gains have been mitigated by the disproportionate representation of women at two-year institutions in non-tenured and part-time positions.

Prompted by affirmative action and encouraged by influential idealists in academe, most colleges and universities continue to espouse the notion that having a diverse faculty can be a positive force in the attempt to increase the breadth of scholarship and the pursuit of knowledge in general. Though some institutions have committed themselves to this ideal in varying degrees and with differing interpretations, the goal of fostering a more diverse faculty seems to have widespread appeal in mainstream post-secondary institutions, though the move from idea to praxis is an arduous one.

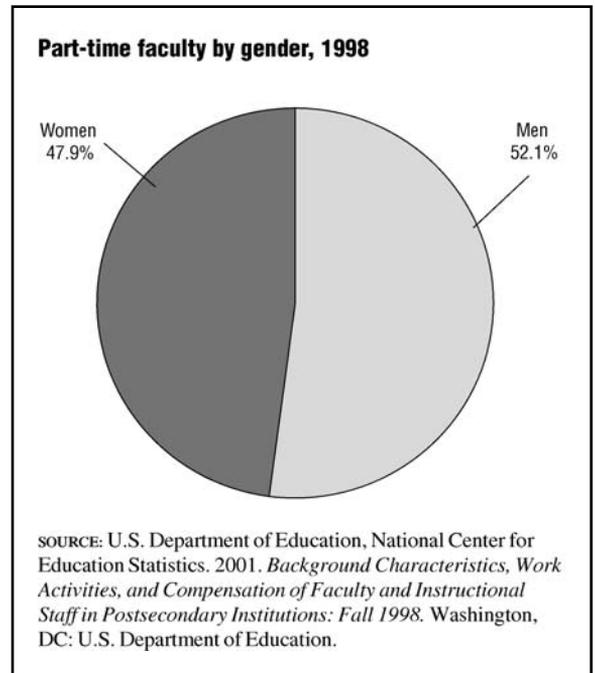

### **Barriers in the Academic Workplace**

Some studies reveal that this paucity of diversity may simply be related to a problem of supply and demand. For example, African Americans, Native Americans, and Hispanics are underrepresented in graduate schools, resulting in the fact that there are relatively few people from these groups available for faculty positions. Therefore, it would seem that an obvious solution would be to increase the supply by encouraging persons of color to attain doctoral degrees, especially in those fields where their numbers are the smallest (e.g., engineering). Opponents of the

**FIGURE 1**

educational pipeline approach maintain that a greater supply will not remove the other barriers within academia that hinder institutional and individual efforts at promoting growth in faculty diversity across gender and racial/ethnic groups.

A review of the literature reveals several common barriers that women and minority faculty encounter across all institutional types: (1) Isolation: Faculty members are often excluded—intentionally or otherwise—from the informal social networks that exist in academia; (2) Tokenism: In some departments, senior faculty believe that they have fulfilled their obligation to diversify once they have hired one minority or female faculty member; (3) Lack of Professional Respect: Senior faculty members often assume that women and minority faculty members are less capable of scholarly pursuits; thus women and minority faculty members are often denied opportunities for research and other scholarly pursuits; (4) Occupational Stress: Minority and female faculty members are often expected to serve on various committees related to diversity as well as to serve as “token” representatives on departmental and institutional committees. They are further burdened when students seeking role models seek them out for mentoring and support; and (5) Institutional Racism: Tenured, mainstream faculty often denigrate research relative to female and minority issues

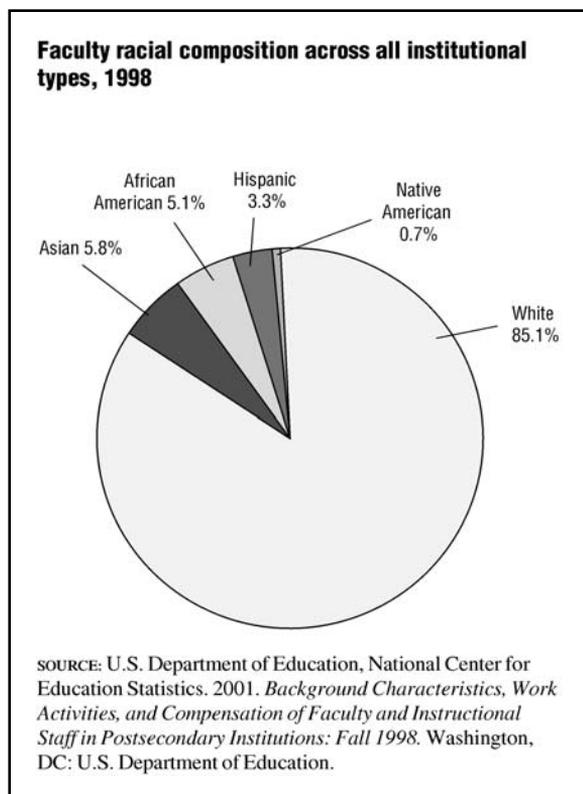

**FIGURE 2**

by viewing such work as less than scholarly, especially if the research is published in periodicals outside of the mainstream. Often the expression “brown on brown research” is used to describe the work of minority faculty members who research issues related to their own minority group. In a related manner, obstacles encountered by women and minority faculty can be likened to many other underrepresented groups if the concept of diversity is broadened to encompass attributes such as age, national origin, and sexual orientation.

Research reveals that an overwhelming majority of post-secondary institutions emphasize structural diversity by recruiting faculty across gender and racial/ethnic groups. However, the fact remains that many of these same institutions provide little—if any—organized support to attain the goal of faculty diversity.

### Demographics

In 1998, the National Center for Education Statistics (NCES) reported that 57 percent of faculty were full-time, of which 64 percent were men and 36 percent were women (see Figure 1). However, males and females were almost evenly divided among part-time faculty with women and men accounting for 48 and 52 percent, respectively (see Figure 2). Also, NCES reported that racial/ethnic faculty members repre-

**FIGURE 3**

sented 15 percent (Asians, 6%; African Americans, 5%; Hispanics, 3%; Native Americans, 1%) of all faculty across all institutional types (see Figure 3). Nonetheless, minority faculty are still disproportionately underrepresented in higher education since they constitute 29 percent of the general population. In contrast, Caucasians comprise 69 percent of the general population but account for 85 percent of the teaching force.

Even though findings from the Martin Finkelstein, Robert Seal, and Jack Schuster (1998) analysis of the National Study of Postsecondary Faculty database confirm the professoriate is becoming more diverse with representation across gender, race and ethnicity, the findings also reveal that there is still a disproportionate number of faculty who are from moderate to high socioeconomic backgrounds. With regard to educational background, research reveals that new career entrants' fathers are better educated (40%) than the fathers of senior faculty (32%). Likewise, as senior faculty increased in age, the educational level of both parents decreased. For example, only 11 percent of fathers of new faculty in the youngest age category (less than 35 years old) held less

than a high school diploma, compared to 24 percent of faculty in the same age range who had already attained the status of senior faculty. This held true for mothers of faculty as well, with 22 percent of senior faculty having mothers with less than a high school diploma versus 12 percent of new career entrants. However, this division across age could be indicative of the increased educational aspirations of society after World War II.

When gender is considered, women of the new academic generation make up 49 percent of all faculty members, while in the senior generation females comprise only 29 percent of the faculty population. Despite the increasing number of women entering the profession, the higher socioeconomic status of the new academic generation continues to be attributed to males. Among new career entrants, both female and male faculty are equal (40% and 41%, respectively) relative to their fathers' possession of bachelor's degrees. Additionally, race is also better-represented in the new generation, with minority faculty members comprising 17 percent of the faculty compared to 12 percent in the senior generation.

## FACULTY MEMBERS, PART TIME

Part-time faculty are employed by colleges and universities to work on some basis that is less than a full-time contract. Some part-time faculty teach a single course, while others teach more than one course per academic term. Some part-timers have only a brief relationship with their employing institution and are used to fill a specific short-term instructional need, while others teach on a part-time basis for many years in order to meet ongoing educational needs. Part-time faculty provide a variety of educational services and represent an important part of the instructional work force in American higher education.

In the fall of 1998, 43 percent of college and university faculty worked part time—a proportion that grew steadily during the preceding three decades. In 1987, for example, 33 percent of all faculty worked part time, while in 1970 only 22 percent of college and university professors worked part time.

Although part-time faculty play important roles throughout higher education, their numbers vary by type of institution and academic field. Community

colleges employ the highest percentage of part-time faculty. In 1997, 65 percent of the faculty in community colleges worked part time. In contrast, only about 33 percent of the faculty in four-year institutions worked on a part-time basis. The use of part-time faculty also varies across different academic fields. According to the U.S. Department of Education, in the fall of 1998 well over one-third of the faculty worked part time in such academic areas as fine arts (49%), education (40%), and the humanities (38%). In contrast, less than one-fourth of the faculty worked part time in areas such as the natural sciences (23%), engineering (20%), and agriculture and home economics (14%). In U.S. colleges and universities, women hold a proportionately greater number of part-time than full-time faculty positions. In 1997 women accounted for 36 percent of full-time faculty positions and 47 percent of part-time faculty posts.

The growth of part-time faculty positions appeared to have leveled off in the 1990s. Between 1992 and 1998 the percentage of part-time faculty in American higher education grew only 1 percent, from 42 percent to 43 percent. This decline in the part-time faculty growth rate may represent an attempt by institutions to achieve balance in their use of part-time and full-time faculty appointments. Even though the rate of growth of part-time positions had moderated, in the early twenty-first century part-time faculty represented a larger component of the instructional work force in colleges and universities than ever before.

#### Reasons for the Growth of Part-Time Faculty

Several reasons account for the increased employment of part-time faculty, including a leveling off of public subsidies of higher education, the aging and *tenuring in* of the full-time faculty, and an oversupply of qualified potential instructors in many fields. The overriding reasons for the heavy reliance on part-time faculty, however, appear to be the expansion of community colleges, and particularly the financial hard times and increased competition that have made many institutions reluctant to make long-term financial commitments to full-time tenure-eligible faculty positions. Hiring an instructor on a part-time basis usually costs substantially less than a full-time appointment, and also provides the flexibility institutions wish to preserve in a time of rapid change.

### Who Are the Part-Time Faculty?

Most part-time faculty have full-time jobs in primary occupations outside of higher education—or they are partially or fully retired from another career. In addition, some part-time faculty are freelancers who have built a career around several part-time teaching positions, often at more than one institution. Another segment of the part-time teaching force includes aspiring professors who hope to achieve full-time, permanent academic employment eventually. In research done in the 1990s, Judith Gappa and David Leslie found that part-time faculty are far less likely than full-time faculty to have doctoral degrees. They also found, however, that while only 16 percent of part-time faculty had doctorates at the time of the study, 10 percent had terminal professional degrees (degrees that indicate that the recipient has reached the end of formal education in his/her field) and 52 percent had one or more master's degrees. Gappa and Leslie concluded from their analysis that “part-time faculty are well qualified by reason of preparation and experience to teach the courses they are assigned—principally undergraduate courses” (1996, p. 9).

### What Do Part-Time Faculty Do?

Typically, part-time faculty have a more limited range of responsibilities than their full-time colleagues. Although part-time faculty roles vary somewhat by discipline and type of institution, most teach primarily lower division, introductory level, or skill building courses (e.g., elementary modern languages, English composition, science laboratories). Often, advanced courses for majors and graduate students are reserved for regular full-time faculty. Many part-time faculty whose primary employment is outside of higher education teach courses directly related to their careers in professional fields such as accounting, journalism, allied health, or education. In addition, part-time faculty typically play no role, or a very restricted role, in curriculum development and institutional governance. Due to the limited nature of their appointments, many are not available to assist students outside of class or to provide long-term career guidance. Furthermore, the American Association of University Professors (AAUP) reports that part-time faculty spend less time on class preparation and have lower publication rates than do full-time faculty. These findings suggest that part-time faculty fill more limited roles involving fewer responsibilities than their full-time faculty counterparts.

### Benefits of Employing Part-Time Faculty

Part-time faculty bring valuable expertise and experience to their institutions at relatively low cost. Those who come from primary careers outside of higher education bring to the classroom the added benefit of a practitioner's perspective and direct contact with their employment sector. Gappa and Leslie (1993) cite evidence that part-time faculty, in general, perform just as well in the classroom as their full-time colleagues. By hiring temporary faculty on a per-course basis, institutions avoid the added costs of fringe benefits, professional development, and office and laboratory facilities that usually accompany full-time faculty appointments. By hiring part-time instructional staff members, institutions also maintain the flexibility to respond quickly to changing student interests and community needs.

### Disadvantages of Employing Part-Time Faculty

Opponents of heavy reliance on part-time faculty cite numerous reservations about this academic employment practice. While recognizing the financial benefits of using part-time academic staff, critics cite the “hidden costs” of substituting part-time faculty for more involved and accessible full-time faculty. Essentially, critics are concerned about the impact of part-time faculty employment on: (1) students and educational program quality, (2) full-time faculty and institutional governance, and (3) the careers of the part-time faculty themselves. Critics fear that using part-time faculty to teach many introductory level courses disadvantages students who may need extra assistance as they make the transition to college. Because part-time faculty are usually compensated only for the courses they teach, and often do not have offices, they can be quite inaccessible to students needing out-of-class assistance. When large numbers of part-time faculty work at an institution, the responsibility for advising students, developing and monitoring academic programs, and institutional policymaking falls more heavily on the full-time faculty. Reduced program coherence is a potential negative consequence when a large segment of those providing instruction are not involved in governance, program planning, and student advising. Extensive use of part-time instructors thus increases the workload and limits the flexibility of the full-time permanent faculty.

Finally, those opposed to heavy use of part-time faculty argue that part-time faculty themselves are disadvantaged by their temporary employment sta-

tus. They contend that the “payment-per-course system” inadequately rewards part-time teaching and provides little incentive for scholarship or continued professional development. Likewise, the uncertainty associated with short-term contracts makes it extremely difficult for many part-time faculty to plan a stable career and advance professionally. The result of dual academic-employment tracks is a two-class faculty in which members of the upper class have opportunities, resources, and benefits unavailable to their second-class (part-time) counterparts. Gappa and Leslie concluded from their national study of part-time faculty that, for the most part, part-timers “do not feel ‘connected to’ or ‘integrated into’ campus life. Instead, they feel powerless, alienated, and invisible” (1996, p. 19).

### Contemporary Issues

Full-time employment with a long-term commitment to the faculty role is the standard model of academic life. Most policies and practices in higher education are based on this conception of faculty work. Part-time faculty do not fit this model, and they are disadvantaged to some extent by their aberrant status. At many institutions they are treated as exceptions to the norm rather than as key members of the academic work force who perform essential services and make important contributions to their institutions’ missions.

Trends in the academic profession suggest that colleges and universities can no longer afford to possess such a narrow and unrealistic view of the roles part-time faculty play in the higher education system of the twenty-first century. Experts on part-time faculty recommend that colleges and universities fully integrate part-time faculty into their academic community in order to maintain a seamless academic work force committed to the same mission and striving to achieve shared goals. The literature on part-time faculty suggests that several important issues must be addressed before a diverse but unified faculty becomes reality.

**Compensation.** The per-course pay system commonly used to compensate part-time faculty takes a narrow view of the faculty role. It rewards the formal teaching process, but fails to encourage or compensate important faculty functions such as out-of-class contact with students, professional development activity, or curriculum development work. One alternative strategy is to compensate part-time faculty according to the percentage of full-time work they

are hired to perform. This alternative can provide part-time faculty with compensation for student advising, governance involvement, or other important faculty functions. A more generous approach to part-time faculty compensation may be a key element of efforts to strengthen the diverse faculty work force common on campuses today.

**Working conditions.** Typically, part-time faculty have access only to whatever support services, office space, and supplies are available after the needs of regular full-time faculty are met. Rarely do part-timers receive offices, computers, or consistent secretarial support. Such difficult working conditions can hamper their job performance, and some institutions that acknowledge the important roles part-time faculty perform are taking steps to enhance their working conditions.

**Professional growth and job security.** Gappa and Leslie found that part-timers typically receive far less support for their professional development than do full-time faculty. Institutions that rely heavily on part-time faculty in a time of rapid changes in knowledge and educational technology cannot afford to neglect their professional development. Faculty advocates argue that colleges and universities should make provisions to support the professional development of part-time faculty who serve important functions, especially over the long term. Job security is also an ongoing concern for many part-time faculty, who often work on an unpredictable “as needed” basis. In cases where part-time faculty meet ongoing instructional needs, the opportunity for an extended contract that recognizes long service and successful performance would benefit both the individual instructor and institution that depends on the part-timer’s services.

**Academic freedom.** Academic freedom is a core value of higher education. For many professors this freedom is protected by tenure status, which prevents the termination of a faculty contract without due process. Most part-time faculty are not eligible for tenure, however, and lack this basic academic freedom protection. To maintain the vitality of the academic enterprise when part-timers play an increasingly important role, the AAUP believes that appeal and grievance procedures should be in place to prevent violations of part-timers’ rights as academic professionals.

**Professional status.** Most literature on part-time faculty acknowledges their second-class status. La-

bels such as *invisible faculty* and *subfaculty* clearly give the impression that part-timers are lower forms of academic life. These status distinctions are harmful to the academic community and belie the valuable contributions part-time faculty make to higher education. Advocates for part-time faculty have recommended a variety of initiatives, such as those listed above, to raise the status of part-timers and strengthen the academic profession as a whole.

### The Future

In 2000 contingent faculty working part-time or in temporary full-time positions made up the majority of the American academic profession, and there is no evidence suggesting that colleges and universities will reduce their use of part-time faculty in the foreseeable future. Researchers who have studied the part-time faculty issue in depth, as well as faculty interest groups, have called for reforms in personnel policies and practices to move part-time faculty from their marginal status to the center of the academic profession. They argue that enhancing the work lives of part-time faculty will, in the long run, strengthen the quality of the educational system and better serve the needs of a society increasingly dependent on lifelong learning.

## FACULTY PERFORMANCE OF RESEARCH AND SCHOLARSHIP

The scholarly performance of faculty is of interest to many groups, including the general public; university faculty, students, and administrators; makers of public policy; and higher-education scholars. A brief history of how the emphasis on research has emerged within American higher education can help one to understand the factors that have intensified pressures on faculty to publish. An appreciation for the nature of scholarship in several fields of study, institutional variations in the priority given to research, and faculty characteristics that can affect their work provides insights into the complexity of defining and documenting scholarly performance and drawing generalizations about professors as a single group.

### Historical Background

The colonial colleges in America were established to prepare citizens to become religious and civic leaders. Faculty members were selected for their religious commitment, not their scholarly accomplishments, and they were held responsible for the civic, moral, and intellectual development of their students.

However, by the mid-nineteenth century, a discernable emphasis on scholarship could be found in

American colleges and universities. A research tradition was emerging in Germany that emphasized scientific rationality and the pursuit of knowledge through experimentation. Growing numbers of American faculty completed their doctoral studies in Germany and sought to replicate these learning environments at home. Established private universities such as Yale and Princeton began to offer programs of study leading to the Ph.D. degree and, in 1876, Johns Hopkins University, a prototype of the modern American research university, was founded. By the late nineteenth century, the University of Chicago had implemented a formal system of faculty review in which research productivity was the primary criterion for promotion in rank and salary. At the same time, the missions of public land-grant institutions were expanding to include service to their states through the application of faculty research to local problems. The idea was that scholarship has utilitarian value, and that research findings could be used to improve production (e.g., agricultural, manufacturing) and the well-being of citizens.

In the twentieth century, particularly during the Great Depression and World War II, the contributions of academic scholars to government efforts and to scientific advancement were widely recognized. The status of professors as an occupational group was enhanced as the value of their expertise, built through research, was publicly acknowledged. Increasing numbers of doctorally prepared scholars moved from research universities to faculty posts on other types of campuses carrying with them a desire to recreate the intellectual climates in which they had studied. Federal monies to support faculty research grew, as did the number of academic presses, disciplinary associations, and professional journals that provided avenues for the dissemination of knowledge. In one decade alone, 1978–1988, more than 29,000 new scientific journals were launched.

By the mid-twentieth century, faculty in general—not just at research universities—understood that they were evaluated primarily as researchers, even though they were hired to teach. At the end of the twentieth century, the issue for many faculty was how to both keep up with and contribute to the ever-expanding body of knowledge in their fields.

### **Factors Affecting Scholarly Performance**

Although the knowledge explosion has occurred across all subject-matter areas, it is a mistake to assume that the amount of time given to research and

the volume of scholarly contributions are uniform across college and university professors. Faculty work is influenced by the cultures of both their institutions and the scholarly fields in which they work. Differences in the norms and rewards lead to variations in scholarly performance.

Institutional cultures serve to bring together people who work in diverse fields around a shared understanding of how they ought to behave as faculty members. One widely used taxonomy of colleges, the Carnegie Classification system, highlights some key differences among campuses, dividing them into several types based on the degrees offered, the comprehensiveness of their mission, and the level of federal support for research achieved by their faculty. Research universities offer baccalaureate and graduate degrees and place a high priority on faculty scholarship. They have the highest level of federal funding for research and award the largest number of doctoral degrees. Doctorate-granting universities share with the research universities a commitment to graduate education, but award fewer doctoral degrees and have fewer research grants. Comprehensive universities and colleges prepare students at the baccalaureate and master's degree levels and tend to emphasize undergraduate education. Liberal arts colleges focus primarily, if not exclusively, on undergraduate education. Two-year community, junior, and technical colleges emphasize instruction and typically offer certificates and associate of arts degrees. The responsibilities and expectations for faculty research, teaching, and service vary across these institutional contexts and in relation to campus priorities.

Disciplinary cultures link people on different campuses who work in the same field through a shared understanding of what constitutes knowledge and how it ought to be communicated. Consider the scholarly lives of chemists and English literature specialists and some key distinctions become clear. Each group has distinctly different sets of research issues on which they focus, as well as assumptions about what constitutes evidence and appropriate methods for collecting and analyzing data. Ultimately, the forms in which they communicate their findings vary—one group employs numeric representations and figures, the other uses words. Whereas teamwork is common among chemists, solitary scholarship is more the prototype in English literature. Funding for chemistry research typically exceeds that available for literary studies. Factors such as

these greatly affect the time and resources available for scholarship and, together with the ways knowledge is customarily reported, affect the rates of publication within a given time period. Teams of chemists simultaneously produce and publish several journal articles, each with multiple authors, while English literature specialists are typically sole authors, more often of books than articles.

Individual characteristics, in addition to the normative pressures exerted by institutions and fields, also affect scholarly performance. Part-time faculty have less time and resources for research than full-time professors, doctorally prepared faculty are more likely to engage in research, individuals with stronger research interests give more time to their scholarship, and professors nearing promotion decisions tend to increase their publication productivity. Tenure often allows faculty more freedom in how they divide their time among teaching, research, and service, resulting in scholarly performance differences within institutions and fields.

### Defining Scholarship

Of course, the preceding discussion begs the question of what scholarship is—by assuming it is inquiries that result in publications. Several writers believe that this perspective is shortsighted and argue for a more expansive definition. In his seminal work, *Scholarship Reconsidered* (1990), Ernest Boyer differentiates among four types of faculty scholarship: (1) *discovery*, consisting of original studies and creative works (e.g., discovering a new planet, composing a symphony); (2) *integration*, consisting of interdisciplinary inquiries, synthetic writing that connects information from multiple sources, and interpretive work that critiques existing research and suggests alternative explanations; (3) *application*, consisting of creative uses of theoretical knowledge to solve problems (e.g., applications of genetic research in the design of medical treatments); and (4) *teaching*, which is what research faculty do to instruct their classes, as well as inquiries into the effectiveness of their instruction. From Boyer's perspective, scholarship culminates in many products, including original ideas, works of art, critiques of other scholars' ideas, books and conference papers, solutions to practical problems developed through the application of abstract theories and principles to real life situations, new computer hardware and programs, and innovative teaching.

### Measurement

Various organizations, as well as individual researchers, gather information about faculty. Government offices, such as the National Center for Educational Statistics (NCES) and the U.S. Department of Education, collect data to monitor the demographic characteristics (e.g., professorial ranks, race, income) and activities (e.g., distribution of effort to different professional activities) of faculty in the United States. Nongovernmental organizations, such as the American Council on Education and the Carnegie Foundation for the Advancement of Teaching, gather similar data, but also conduct international surveys of faculty for comparative purposes. Colleges and universities collect faculty information on a regular basis for annual reports to their governing boards and for decision making (e.g., merit salary increases). Individual investigators conduct studies to answer theoretical and practical questions of interest to their academic communities. Most often, these studies involve faculty self-reports of their activities and publications. Critics note the subjective nature of such estimates, but comparisons of professors' estimates with other independent measures of their workloads and publication rates have found the self-reports to be reliable.

### Scholarly Activities and Products

Given that professors' fields, institutional affiliations, and individual attributes can affect their work, writers must exercise caution when generalizing about the American professoriate as a single group. Furthermore, answers to questions such as who is conducting research, or whether faculty scholarship has positive or negative effects on their teaching, depend on how one defines scholarship. With these caveats in mind, national data on the distribution of faculty across institutional types and fields of study are presented along with findings regarding their scholarship.

In 1992 about 4,000 institutions employed approximately 528,000 full-time faculty in the United States. They were distributed as follows: 26 percent were in research universities, 15 percent in doctoral universities, 25 percent in comprehensive universities, 7 percent in liberal arts colleges, and 21 percent in two-year colleges. In the same year, these institutions employed about 340,000 part-time faculty, the greatest percentages of which were found in two-year colleges (44.2%) and comprehensive universities (22%), with the smallest percentage in liberal

arts colleges (6%). The proportion of full-time faculty with doctorates ranged from about 71 percent in the research universities to about 16 percent in the two-year colleges. The distribution is skewed so that in the early twenty-first century, as in the past, greater proportions of faculty employed in research universities have completed programs of graduate study designed to prepare them as specialized scholars.

In the research, doctoral, and comprehensive universities, the greatest proportion of full-time faculty held the rank of professor (between 30 and 40%) whereas in the liberal arts colleges the percentages were quite evenly distributed across the ranks of professor, associate professor, and assistant professor (between 25 and 29% in each category). Research universities had the largest group of tenured faculty (about 60%) and two-year colleges had the smallest (about 31%). Around half the faculty in the other institutional types were tenured. Nationally, the largest group of full-time faculty was in the natural sciences (19.5%), followed by health (15.3%), humanities (14.2%) and social sciences (11.2%).

Existing studies of scholarly productivity do not provide data on some forms of scholarship identified by Boyer. However, there are data regarding the pressures on faculty to do research—and on how they respond in terms of time given to scholarship and teaching, the number of courses taught, and publications written.

Studies of professors consistently show that, regardless of field, faculty in research universities experience more pressure to conduct research and publish than their counterparts in other types of institutions. Given their graduate preparation, it is not surprising that faculty in these universities also report the most interest in doing research and the greatest sense of competence as researchers.

However, writers have noted a tendency within all institutions, beginning in the 1970s, to increase the emphasis on faculty scholarship in both recruitment and promotion practices. This phenomenon is taken to be a reflection of the importance accorded faculty research in national rankings of universities and colleges. Administrators know that the stature of their faculty as scholars significantly affects the reputations of their campuses. Faculty, too, understand that their tenure and mobility within the faculty labor market is affected by their scholarly accomplishments. Hence, the overall trend has been a heightened emphasis of scholarship, and there has

been a burgeoning of publications across campuses and subject-matter areas. In one year (1989–1990) 300,000 monographs, books, and chapters and a million journal articles were published.

Generally, studies show that faculty in research universities give the most time to research, and faculty in liberal arts and two-year colleges devote the most time to teaching. In 1992 faculty reported an average of fifty-three hours worked per week, with individuals in research universities reporting the highest average (about fifty-seven hours) and two-year colleges the lowest (about forty-seven hours). Faculty in the research universities allocated the greatest portion of this time to research (about 34%), with doctoral and comprehensive universities following in rank order with about 22 percent and 13 percent, respectively. The percentage of time given to teaching was highest in two-year colleges and liberal arts colleges (69% and 64%, respectively), and lowest in research universities (about 38%). Faculty in research universities and doctoral universities, on average, taught two to three courses per year, whereas their counterparts in comprehensive universities and liberal arts colleges typically taught three and four courses, respectively.

Another finding that seems to hold across studies of faculty in all but the two-year colleges is that faculty in the natural sciences (e.g., chemistry, biology, physics) report the greatest portion of their time is given to research, with faculty in the health sciences (e.g., medicine, biochemistry), social sciences (e.g., psychology, sociology), and humanities (e.g., history, languages) following in rank order. The trend is different when one focuses on teaching. Humanities professors give the most time, followed by those in the social sciences, natural sciences, and health sciences.

When the measure of scholarly performance is the number of books, articles, chapters, monographs, and other written products produced within a set time period (e.g., a year) or over the professional life of a faculty member, research university professors consistently publish more than their counterparts in other types of institutions. Similar comparisons across fields of study show that faculty in the natural sciences report the greatest number of publications per year and over their careers. To illustrate the volume produced, consider that, in 1988, faculty in research universities reported they had each authored about thirty-nine publications over their careers, while professors in doctoral universi-

ties authored about twenty-four. Faculty in comprehensive universities and liberal arts colleges, however, had written about twelve and nine publications, respectively. Data for the same year showed that professors in the natural sciences averaged thirty-five publications over their careers, compared with thirty among health scientists, twenty-five among social scientists, and twenty-one among humanities professors.

Questions abound regarding what motivates faculty to do research, teach, and provide service—and empirical studies provide multiple answers. Researchers continue to grapple with questions about how to measure scholarly performance (particularly the outcomes suggested by Boyer) and how to assess the quality of faculty research. Nonetheless, the results of more than forty years of research on faculty consistently document that professors in research universities experience the most pressure to be engaged in research, give more time to their scholarship, and publish most often. Furthermore, natural science faculty tend to write more publications over their careers than their counterparts in other fields. Finally, individuals vary in their research interests, scholarly competence, and tenure status, and these differences contribute to disparities in the scholarly performance of faculty within the same institution and/or within the same field.

## FACULTY RESEARCH AND SCHOLARSHIP, ASSESSMENT OF

Traditional definitions of faculty work frame contemporary views of its assessment. Faculty work generally falls into three categories: (1) research, which is the discovery or creation of knowledge through systematic inquiry; (2) teaching, which is the transmission of knowledge through class instruction and other learning-focused activities; and (3) service, meaning service to others through application of one's special field of knowledge. Assessment protocols have considered, to a varied extent, scholarly activities performed in each of these areas. Faculty assessment is conducted for purposes of reappointment, promotion, the awarding of tenure, and professional development.

During the last decades of the twentieth century, a societal focus on the work of college and university faculty as a measure of return on the public's investment in higher education stimulated a reevaluation of how faculty performance ought to be measured and assessed. The work of Charles Glassick and his colleagues (1997) has significantly influenced scholarship focused on developing workable evaluation systems. Their work is rooted in the broadened definitions of scholarship proposed by Ernest Boyer in 1990, and on how these definitions impact assessment systems. As scholarship is being conceived more broadly, traditional assessment systems are being reexamined to include all work conducted by faculty.

The development of workable assessment systems is difficult largely due to the fact that the value of assessment is often controversial. The controversy stems from several factors, according to Larry Braskamp and John Ory's 1994 study. First of all, faculty are not used to fully describing or judging their work. Secondly, systems that have been devel-

oped are often criticized by faculty as inadequate, particularly as assessment applies to teaching and service work. Lastly, a preoccupation with *how* to assess has resulted in a lack of attention to *what* is to be assessed. Successful assessment systems are based on clearly specified performance assessment criteria and standards for faculty performance in relevant areas of work. Each of these will be covered in turn.

### **Performance Assessment Criteria**

While faculty are typically assessed based on their performance in their teaching, research, and service roles, the weight assigned to each of these areas varies depending on the type of institution and its associated expectations for faculty involvements in each area. For example, the assessment process for tenure-track faculty in research-focused institutions may place relatively more emphasis on the performance of the research role. An exception is for faculty whose appointments are not tenure-eligible, such as adjunct faculty or those in full-time appointments with a specified term. In these cases, assessment is typically weighted according to the specified terms of each individual's contract, or according to expectations for performance as determined by institutional policy or tradition. For faculty in teaching-oriented liberal arts colleges or community colleges, evaluation processes may focus more on teaching.

Assessment criteria also vary by academic discipline to accommodate the sometimes disparate intellectual products. The intellectual work of faculty in management and education, as applied disciplines, may be best evidenced by corporate or institutional testimonial of improved organizational effectiveness as a result of faculty involvement. The intellectual products of the so-called pure disciplines, such as history, are more appropriately characterized by written articles, reviews, and monographs.

### **Performance Standards and Quality**

Standards for performance quality and assessment protocols are to a large extent determined by the governing bodies of each institution. Weighting of performance in teaching, research, and service is variable as well. Largely due to the disproportionate value placed on the research role of faculty, promotion and tenure guidelines have been clearer in articulating standards for research performance. Relative to assessment of teaching and service, the standards for judging research performance are clear and sys-

tematically linked to guidelines for promotion and the awarding of tenure. Performance is typically measured in terms of productivity, relying largely on the use of quantitative measures such as the number of publications or other creative works produced over a specified period of time.

Standards for teaching performance on the other hand, particularly in research-focused institutions, are less clear. The inherent difficulty in judging teaching performance lies in the fact that effectiveness is best measured by how much students learn. Because evidence of learning is often subjective or qualitative, it is more complicated to measure. This leads to questions of what measures are most appropriate for purposes of faculty evaluation, particularly when faculty compensation, if not entire careers, may rest on reliable assessment processes. This dilemma continues to fuel debates around the best way to assess teaching performance and contributes to faculty mistrust of evaluation systems. In many cases, efforts to develop workable measurement systems have stalled.

Evaluation of service remains illusive. Consequently, when it comes to tenure and promotion, service is often forgotten. This has led, unwittingly, to a devaluing of service work, and "virtually no institution has yet figured out how to quantify such work" (Glassick et al., p. 20). Reliable assessment of the service work of faculty must therefore rely on qualitative judgments rooted in institutionally developed standards for performance. Assessing service work across the professoriate is seen as a formidable challenge, yet, unlike the challenge of teaching evaluation, it has yet to benefit from a significant body of research and experimentation.

As the notion of what constitutes legitimate scholarship is broadened, and as increased attention is being paid to the outcomes of faculty teaching, academe is pressed to redefine measures of quality. Institutions, and the profession as a whole, are facing new questions, such as: How is student learning, as evidence of quality teaching, best documented? What processes associated with the transmission of knowledge are to be considered legitimate evidence of faculty performance? What constitutes appropriate evidence of application of a disciplinary knowledge base into service activities? How is integration of one's area of expertise into a multidisciplinary intellectual context best evidenced?

In 1997 Glassick and colleagues offered a solid framework for institutions considering modifica-

tions of faculty assessment systems. This work has received considerable attention by scholars of higher education and, as of the beginning of the twenty-first century, it has presented the most well-defined approach to assessing faculty work. In this book, the authors examined methods for judging scholarly performance by colleges and universities, granting agencies, journal editors, and university presses. Applying Boyer's four domains of scholarship (discovery, teaching, application, and integration) to define faculty work, they identified six standards commonly associated with high-quality scholarly work: clear goals, adequate preparation, appropriate methods, significant results, effective presentation, and reflective critique. These criteria for determining quality are noteworthy in that they offer not only a framework for evaluation, but also aid in understanding the kinds of intellectual activities and outputs that are legitimate components of the work that faculty perform.

### Assessment Tools

There are numerous tools used for collecting evidence of faculty performance quality. Braskamp and Ory cite the following assessment tools: evaluations by students and peers, as well as self-evaluations, of teaching; the evaluative conference; evaluative letters from colleagues and experts in the field; and portfolios that explicate professional accomplishments. Evaluators may vary depending on institution type. For faculty in research-oriented institutions, considerable weight is placed on the judgments of peers, including scholars from other institutions. In many liberal arts colleges and community colleges, where the faculty role is more oriented toward teaching, there may be greater reliance on the judgments of local faculty who are most familiar with institutional teaching and learning philosophies and standards for teaching performance.

Teaching performance has historically been accomplished by student evaluations at the end of each course, with the weight afforded such evaluations varying from institution to institution and, often, from department to department. In liberal arts colleges and other teaching-focused institutions, a combination of student evaluations and peer review is often used. Peer review involves a review of one's pedagogical skills by his or her faculty colleagues. Toward the end of the twentieth century, peer review of teaching became more popular in research-focused institutions, with a goal of providing a simi-

lar level of support, consultation, and evaluation typically provided for research. Some institutions have begun to enhance rewards for teaching performance, largely in response to societal concerns about the quality of undergraduate education. Such rewards have been in the form of cash awards, special stipends for teaching improvement, and endowed chairs devoted to teaching excellence.

While research performance is commonly measured in terms of the number of published articles, books, and other research products, there is a qualitative aspect to such measures. The type of publication, and whether or not selection for publication involved peer review, also determines research quality. Publications subjected to a peer-review process are typically considered to be of higher quality in that they are thought to have undergone a more rigorous critique than published work that is not reviewed.

### The Portfolio as an Assessment Tool

As definitions of faculty work are broadened, ideas about what constitutes adequate evidence of such work must be broadened as well. The notion of the professional portfolio has received wide attention as a comprehensive way to represent the work of a faculty member. The professional portfolio is a collection of artifacts and materials gathered and presented by each faculty member. It represents the requirements for one's work, as defined by expectations specified at the time of appointment or at the start of the review period. Building on Peter Seldin's notion of the teaching portfolio, Robert Froh and his associates in 1993 specified a set of principles to guide the development of portfolios and their evaluation. While the concept of the portfolio does incorporate elements of the traditional dossier compiled by faculty to document their performance, the portfolio takes a broader view of scholarship by integrating the values of the faculty member with those of the departmental and institutional community. This might be accomplished through a reflective essay and work samples that uniquely represent such an integration of values. Thus, the more standardized representation of work that is characteristic of the traditional dossier must be transformed to reflect the work of each individual and the unique contributions he or she has made in relevant areas of scholarship.

### Assessment Challenges

Assessment of faculty work has become an important consideration for both faculty and administrators, particularly as the pressure for measuring outcomes of faculty work over and above the easily quantifiable numbers of publications has escalated. Policymakers are calling for increased accountability of faculty members' time, and for evidence that the time spent produces acceptable outcomes, specifically with respect to undergraduate education. State governing bodies and Congress have become more involved with academic issues associated with student access, equality, and research integrity, all of which influence how faculty conduct their work and how institutions monitor and assess it. Such external pressures, combined with increasing trends that emphasize the importance of faculty professional development have led to increased attention on faculty assessment systems. Reevaluation of these systems is not without its challenges, however.

First, definitions of scholarship vary from discipline to discipline, and these differences have significant implications for how assessment systems are structured and implemented. Also, the importance of communication of discipline-specific performance factors across disciplines must be addressed if faculty on promotion and tenure review committees are to effectively and reliably judge the work of their colleagues. Second, effective evaluation systems depend on the communication of standards upon which judgments of quality will be based and acceptable mechanisms for documenting faculty work. Third, any changes to traditional assessment systems must maintain the historic autonomy of faculty as sole judges of quality scholarship. As members of a profession, faculty reserve the right to be the sole judges of the quality of the work performance of those claiming membership among their ranks.

Judgments of quality are based on standards set by the profession as a whole, the specific mission of the institution within which a faculty member's work is conducted, and standards circumscribed by the discipline and the institution. As definitions of scholarship are broadened, indicators of quality must be well considered in order to preserve the status of the profession and simultaneously satisfy new calls for accountability. Lastly, assessment systems must be flexible enough to consider the unique work profiles and needs of a growing segment of the professoriate—the full-time, non-tenure-track faculty. This is the environment within which effective eval-

uation systems must be developed so as to serve the changing roles of faculty in higher education.

## FACULTY ROLES AND RESPONSIBILITIES

---

The roles and responsibilities of college and university faculty members are closely tied to the central functions of higher education. One primary formal description of these functions was contained in the 1915 "Declaration of Principles" formulated by a representative committee of faculty members including members of the American Association of

University Professors (AAUP). According to the Declaration, the functions of colleges and universities are “to promote inquiry and advance the sum of human knowledge, to provide general instruction to the students, and to develop experts for various branches of the public service” (Joughin, pp. 163–164). Correspondingly, college and university faculty members undertake research, teaching, and service roles to carry out the academic work of their respective institutions. Each of these roles enables faculty members to generate and disseminate knowledge to peers, students, and external audiences. The balance among teaching, research, and service, however, differs widely across institution types and by terms of the faculty member’s appointment. The major portion of this article will deal with these kinds of differences while latter sections will focus on the faculty as collective entities and related trends within higher education.

### The Teaching Role

The teaching role of faculty members reflects their centrality in addressing the primary educational mission among colleges and universities. As faculty members teach, they disseminate and impart basic or applied knowledge to students and assist students with the learning process and applying the knowledge. In this construction of the teaching role, the teacher is the content expert, and students are regarded as learners or novices to the academic discipline or field of study. Faculty members are expected to follow developments in the field so their expertise and knowledge base remain current. At many universities, faculty members are also expected to participate in creating the new developments that are taught, which sometimes leads to tensions about appropriate priorities for research and teaching roles.

In the 1980s and 1990s the teaching role came under increased scrutiny as studies such as the Wingspread Report (1993) appeared, outlining the shortcomings of undergraduate education and the failure of higher education to prioritize appropriately its educational mission. New approaches to revitalizing teaching effectiveness include placing an emphasis on effective pedagogy and paying increased attention to the learning needs of students. Consequently, an emphasis on faculty members as facilitators of students’ learning has emerged. This focus on learning incorporates a broad set of goals for learners, such as students’ mastery of content, their abilities to consider and critique, and particu-

larly in professional fields, the development of skill sets that enable students to undertake career positions.

Faculty members employ a variety of teaching strategies based on the institutions where they work. In a large undergraduate lecture section, a faculty member may deliver lectures that are complemented by regular and smaller recitation sections led by graduate teaching assistants. At a community college, faculty members may work side by side with students diagnosing and addressing a mechanical problem in a piece of machinery. At a liberal arts college, faculty members from different disciplines may team teach a small first-year survey course on human civilization.

In a natural sciences class, students may conduct experiments or field work in regular laboratory sessions to complement their growing conceptual knowledge and hone their inquiry skills. Students in a theater class may work alongside faculty members, fellow students, professional actors, and house staff to produce a stage performance. In a graduate seminar, students may lead selected discussions supplemented by a faculty member’s input and appraisal. Students enrolled in a distance-learning class may attend class using technological real-time hookups or may independently complete learning modules and communicate with the instructor through e-mail only as needed or stipulated. The teacher is also responsible for assessing students’ learning, and a wide range of strategies may be used, such as tests, papers, and project-oriented demonstrations of knowledge.

Of the three roles of teaching, research, and service, the teaching role is the most widely shared among faculty members across institutional types. At liberal arts colleges, regional universities, and community colleges, the teaching role takes precedence for most faculty members. Faculty members spend the majority of their time in teaching-related work, and effective teaching is rewarded. At research universities, some faculty members may hold research-only appointments, but the vast majority of faculty members teach courses in addition to maintaining a research agenda. Although effective teaching is rewarded, teaching may be seen as less prestigious and less well rewarded than success in conducting research and securing external funding. At virtual universities, faculty members may not teach so much as participate in creating instructional

modules and provide feedback to students on their degrees of success in mastering specified knowledge.

Depending on the history of an institution, imparting knowledge and developing students' learning abilities may not be the sole purpose for teaching. In religiously affiliated colleges, institutions may expect a faculty member's teaching to be consistent with and complemented by tenets of the sponsoring religious organization. In these institutions, faculty members may be expected to support the college's ministerial or evangelical objectives. In historically black colleges and universities, women's colleges, and tribal colleges, a complementary teaching focus may be on issues of social justice and empowerment of students from these underrepresented and less empowered groups.

Other institutional personnel increasingly have positioned themselves as educators to complement or enhance the traditional teaching role of faculty members. Student affairs professionals, for example, have placed greater focus on out-of-classroom learning opportunities, learning communities, and community service learning as mutually-reinforcing learning opportunities to create a more complete campus learning environment.

### **The Research Role**

Many university faculty members engage in research, thereby contributing to the knowledge base of the discipline or academic field. Research commonly is associated with conducting empirical studies, whether confirmatory or exploratory, but in some academic disciplines research also encompasses highly theoretical work. The extent to which faculty members have a research role as part of their work responsibilities depends largely on the mission of the employing institution, with larger universities more likely to have research and knowledge creation as a significant part of their missions. Although higher education institutions are most often the sites for and sponsors of faculty members' research, the primary audience for most academic researchers is their national and international community of disciplinary colleagues. Faculty members with active research agendas and involvement in their disciplinary communities have been regarded as more cosmopolitan in orientation, with stronger allegiances and loyalties to their disciplines than to their home institutions.

More emphasis is placed on the faculty research role in large universities in part because large univer-

sities also house the majority of graduate programs and provide resources to support the pursuit of research agendas. Additionally, research-oriented faculty members often participate actively in generating internal and external monetary support to underwrite their laboratories or specific research projects. Faculty rewards often are based on the extent to which faculty members contribute to their disciplines through publishing articles and books, presenting research findings, giving performances and exhibits, or disseminating their work to external audiences in other ways. Additionally, rewards may also be based on the faculty member's success in securing funding from external public agencies or companies.

With the growth of externally funded research, concerns have been raised about the potential conflicts of interest between academic freedom to research and disseminate findings and the proprietary ownership of data and findings from externally financed research. This issue is reminiscent of post-World War I concerns, as articulated in Upton Sinclair's study of American education in 1923, about an "interlocking directorate" of higher education and business representatives that disproportionately served the needs of private companies. However, concerns surrounding this trend have increased as support from traditional funding sources for large public universities, including research support, has declined. Faced with this situation, faculty members have become more entrepreneurial and in some cases more reliant on alternate funding streams such as those accompanying research contracts and grants.

Research is seldom, if ever, a significant part of a community college's or virtual university's mission, and participation in research by faculty members at these institutions is not especially common. Although these institutions may employ part-time and adjunct faculty members who work in the research and development divisions of their companies and agencies, their primary work at the community college is to teach. However, the research role is not restricted to faculty members at research-oriented universities. Faculty members at institutions other than research-oriented universities conduct research as part of their faculty role, partly because faculty members who have earned terminal degrees from large universities likely were socialized to conduct research and seek funding for such pursuits. Also, colleges and universities increas-

ingly have focused on faculty research as a way to increase their institutional profiles and prestige. Over the last quarter of the twentieth century, many higher education institutions saw their missions expand to encompass graduate education and research endeavors.

### **The Service Role**

Institutional service performed by faculty members includes serving on internal committees and advisory boards, mentoring and advising students, and assuming part-time administrative appointments as program or unit leaders. In some cases, faculty members also assume term appointments in full-time roles as mid-level or senior level institutional administrators. Some level of faculty members' service to the institution is expected, although tenure-track faculty members may be discouraged or exempted from heavy service commitments to permit greater focus on their research and teaching. Some institutional service roles may carry some prestige, and appointments may include a salary supplement. However, institutional service is not as highly regarded as research and teaching with respect to advancement within faculty ranks.

The public service role for faculty is associated with colonial colleges' preparation of ministers and teachers to serve the citizenry. A local, outreach-oriented faculty service role was codified through land-grant institutions, with their instruction in agricultural, mechanical, and practical subjects. In addition to incorporating these subjects within the curriculum, land-grant institutions also disseminate scientific knowledge and best practices to residents of the state. These universities utilize extension services, often with satellite offices, to provide information in areas such as agricultural innovations, economic and community development, child development and nutrition, and environmental conservation. Faculty members' extension and service roles tend to be less highly valued and rewarded than the research and teaching roles at universities. However, revitalizing the service role has also been offered as an important way to recapture public trust in higher education and demonstrate institutional responsiveness to society and its concerns.

Faculty service is a more central role in community colleges and regional institutions, both of which are characterized by relatively closer ties to the surrounding area. In these institutions, although teaching is the primary faculty role, faculty are also

expected to address local needs. Many community colleges develop educational programs that are tailored to the needs of local industries, thus assuming partial responsibility for employee training or re-training. The service role and faculty members' outreach and demonstrations of responsiveness to local needs are valued and rewarded more highly at these institutions.

### **Integration of Faculty Roles and Responsibilities**

The teaching, research, and service roles of faculty members overlap conceptually and practically. For example, instruction in a particular discipline or skill yields a service in the form of educated or appropriately trained persons, and outreach to a farmer or small business owner may lead to an applied research project undertaken by the faculty member. Some attempts have been made to validate the various forms of faculty work and unify them conceptually. Perhaps the most famous recent model has been the American educator and government official Ernest Boyer's 1990 stipulation of discovery, application, integration, and teaching as separate but related forms of scholarship. Among other outcomes, these models address concerns regarding the implicit hierarchy that grants the most prestige to research and the least to service.

*Variable career emphasis* programs can also help to integrate these faculty roles by offering opportunities for faculty members to stipulate their role emphases at various points in their work lives. Institutions with such programs acknowledge changes and evolutions in faculty members' professional interests and commitments. In some cases negotiations about role emphasis are part of a developmental post-tenure review program. Post-tenure reviews are considered to be responsive to concerns about faculty members' continued vitality and contributions in their later years, particularly since the abolishment of most mandatory retirement age provisions. However, concerns remain about the potential for post-tenure review and variable role emphasis negotiations to be used for punitive rather than developmental purposes.

### **The Collective Faculty**

Although the faculty of an institution is traditionally considered to refer to full-time faculty members, part-time and adjunct faculty members at many institutions have assumed a larger proportion of teaching responsibilities. Although the proportions of

women and minority group members in the full-time faculty ranks grew slowly in the last quarter of the twentieth century, women and minority group members also are concentrated in the lower faculty ranks such as instructors and part-time and adjunct faculty positions. Some blame this slow progress on inadequate numbers of diverse students in graduate programs, market factors that make other career choices more attractive or lucrative, or individual lifestyle choices. However, focus also has been shifted to institutional structures and norms, professional socialization experiences, and tacit assumptions that serve as barriers to progress within faculty ranks. For example, William G. Tierney and Estela M. Bensimon suggest that faculty members from underrepresented groups are found to pay a cultural tax in the form of increased service loads and disproportionate expectations for student advising and mentoring—service roles that often are not valued or rewarded.

The identity, authority, and functions of an institution's collective faculty are largely dependent on institutional type, history, and traditions, as well as on formal codifications of faculty authority and role. The faculty traditionally is responsible for planning and delivering curricula and instruction consistent with the educational goals of the institution and selecting and evaluating probationary faculty members within their colleges, departments, or units. Individual faculty members also may serve term appointments as administrative officers responsible for various functions of the institution, and faculty members may participate in representative assemblies like faculty senates. These bodies provide arenas for faculty deliberations and decision-making where representative faculty members articulate, endorse, or dissent from positions and draft and pass senate resolutions.

While resolutions or legislated outcomes from faculty senates often do not ultimately become university policy on the targeted issues, at institutions with traditions of strong faculty senates, senate actions represent steps in ongoing negotiated processes with administrators in determining institutional policies, especially but not only with respect to academic matters. Faculty senates also provide a regular, representative forum for administrators to meet with the faculty about proposed or enacted institutional decisions and policies.

Faculty members often are less routinely involved in institution-level budget processes, includ-

ing retrenchment decisions and strategic planning—with the exception of academic planning, curriculum planning, and degree program implications. In general, faculties at older institutions and larger institutions have tended to play a more significant role in shaping or influencing institutional governance decisions.

By contrast, many institutions are now more likely to vest a majority of institutional governance functions with professional administrators. In the last two decades of the twentieth century, the number of administrative personnel at universities expanded concurrently with faculty members' becoming more oriented toward their disciplines and less toward the institution. Because of their academic, curriculum, personnel, and shared or dual governance functions, a university's faculty or the faculty at an established liberal arts college may hold a more central and influential position within the organization. In other institutions, faculties are less likely to have such collective identities and influential statuses, perhaps with the exception of unionized faculties.

Faculty collective bargaining units provide faculty members with a formal voice in institutional deliberations and decision-making, and many faculty members regard collective bargaining as a check against the growing degree of professional administrators' authority. A wave of faculty labor organization in the 1960s and 1970s has been followed by a period of less organizing activity by non-unionized faculties. However, more recent participants in academic labor organizing have been graduate students, particularly teaching assistants, in the 1980s and 1990s at relatively prestigious, research-oriented universities. This turn to collective bargaining measures by graduate teaching assistants may presage a resurgence of academic unionization as these teaching assistants become future faculty members at colleges and universities.

## FACULTY SENATES, COLLEGE AND UNIVERSITY

---

Since the 1960s the concept of shared governance has both blossomed and withered. Founded on the principals of western European worker-participation models, the practice of instituting faculty senates at universities and colleges throughout America was intended to alleviate the growing pains of the higher education system brought about by the influx of baby boomers (persons who were born between the years of 1946 and 1964, and who enrolled as traditional college students between the years of 1964 and 1987). The American Association of University Professors (AAUP) first suggested formalized shared governance schemes in the 1966 *Statement on Government of Colleges and Universities*. As a result, many institutions began to experiment with various shared governance arrangements, primarily in the form of faculty senates.

According to Barbara Lee, the ebb and flow of shared governance has been guided by two driving forces: politics and economics. Valerie Collins, however, contends that during the 1960s and 1970s a unique set of political factors, including the civil rights movement and the Vietnam War, converged on American campuses. In response to the unrest and mistrust this politically ripe time instilled in students, faculties began using senates to ensure their influence over decisions that would affect an increasingly large portion of campus life for both students and faculty. A third interpretation, as expressed in William Tierney and Richard Rhodes's work on faculty socialization, addresses the effect of culture: the culture of the discipline, of the institution, and of the profession. They argue that the culture of the profession engendered a need for faculty service roles in the institution and that this need created a condition that allowed for the inception of faculty senates.

Faculty senates have shared responsibilities, ranging from a limited role in program approval and review of tenure decisions to a more comprehensive role that includes budget review and allocation, senior administrative recruitment, and strategic planning. Faculty senates have been studied to show their effect on participation and influence of faculty members and to critique their inability to meet with campus financial constraints. As a result, they have met with both praise and criticism.

The majority of faculty senates operate under a mission statement. These mission statements give

the senates guidelines and provide them with an outline of their areas of authority. Jack Blendiger and colleagues list six strengths of academic senates, stating that they provide the means for: (1) determining short- and long-range interests and needs of faculty; (2) articulating expectations of faculty, staff, and students; (3) developing goals and planning strategies; (4) establishing standards and procedures for the review and evaluation of proposed administrative action dealing with curricula offerings, budgetary practices, and faculty recruitment and retention; (5) increasing knowledge and understanding of issues in departments and units; and (6) allocating resources equitably.

The debate about the worth and ultimate viability of faculty senates lies in these senates' missions. In cases where so-called corporate mentalities have infiltrated campuses, the fault has often been in the shortsightedness of the faculty senates' missions. Sheila Slaughter and Larry Leslie describe a case at San Diego State University when the administration attempted to lay off more than 130 tenured faculty members (the layoff ultimately did not go through); the faculty senate was up in arms yet was powerless to act because their mission had left them devoid of power in financial situations. Conversely, in some situations the university administration may have no ability to adjust faculty levels and program existence due to lack of authority or shared authority and may be perceived as weak by the public and by its board of trust.

As the baby-boomer enrollment gave way to the baby bust (individuals who were born between 1970 and 1985, and who have been enrolled in colleges as traditional students since 1988 and will continue to be enrolled through 2007), many colleges and universities began to feel the economic effects of declining enrollment. The shortages of students brought about an era in which *streamline*, *retrench*, and *economize* were common words spoken at most campuses, and in which all aspects of campus governance began to come into question.

Faculty senates and the institution of shared governance remain a vital part of academia. While it is true that universities must maintain financial solvency, they exist in their own microcosm that allows for adherence to cultural artifacts, regardless of their economic efficiency. As Robert Birnbaum has suggested, academic senates may not always work, but they will not go away.

STEVEN P. YOUNG

## **FACULTY SERVICE ROLE, THE**

The faculty service role includes a variety of activities: from providing the most advanced knowledge to serve global markets and priorities to performing the most humble committee work designed to assist in the routine functioning of campuses and community groups. Through faculty service activity, colleges and universities maintain shared governance, faculty promote disciplinary networks, and partnerships are sustained between the university and community organizations, governmental agencies, businesses, and industries.

### **Nature of the Faculty Service Role**

In the United States the mission of colleges and universities has long been described as tripartite, including teaching, research, and service. Historic roots of the American faculty service role can be seen in the founding of land-grant, city, metropolitan, and state universities and community colleges, all of which were provided public lands and funds, and nonprofit tax status, with an expectation that faculty members provide not only teaching and research but also service in return. Both the amount and the kinds of faculty service activities have increased over time.

Outside of the United States, the tradition of service activity is not as long. However, developments in many countries during the last two decades of the twentieth century, which have tied universities more closely to national priorities that support economic development, have made the issues surround-

ing the faculty service role no longer a uniquely United States concern.

### **Distinctions among Types of Service**

Ernest A. Lynton suggested in 1995 that faculty engage in four types of activities that tend to be described by their institutions as "service": committee work, program building, and other administrative work related to the promotion of a university's institutional service. When faculty make contributions to their disciplinary associations and edit disciplinary journals they partake in disciplinary service. Faculty provide community service through civic contributions in the form of speeches, board or committee membership, or volunteer work with religious, philanthropic, or other nonprofit organizations. When faculty fulfill their department, college, or university's outreach mission by using their professional expertise to assist communities in responding to real-world problems, they engage in professional service. Examples of professional service activity include agricultural extension, continuing education, social problem solving, policy analysis, program evaluation, assistance with economic development, technology transfer, and entrepreneurial activity. In many institutional mission statements and some of the literature, community service and professional service are combined under the more general rubric of public service.

### **Importance in the Academic Reward Structure**

Through the twentieth century the importance of faculty service in the academic reward structure varied depending on institutional type and priorities, discipline, and status of the profession. In the first colonial colleges, teaching, community service, and institutional service were the primary responsibilities of faculty, and they were rewarded accordingly. As American higher education shifted from colonial colleges to land-grant universities, however, a gradual shift occurred in which faculty became more influenced by networks of colleagues at other institutions than by local, institutional, or community priorities. Although to different degrees depending on institutional type, the reward system followed faculty priorities. By the late 1980s and early 1990s, most colleges and universities favored scholarship, understood as traditional research, over teaching and service in tenure, promotion, merit pay, and contract renewal decisions.

Ironically, at the same time reward systems were evolving to favor research, faculty were being called

upon to engage in more and more service. Land-grant universities, urban and metropolitan universities, and community colleges were all created with explicit outreach missions. These institutions expected all of their faculty, and especially those in professional schools, to link their expertise to real-world problems. As time went on even faculty in liberal arts and private institutions were called upon by the public to engage in community service and professional service.

The tradition of shared governance has always meant a significant proportion of faculty time is spent on maintaining and improving the institution. Typically senior faculty take on more institutional service responsibilities than junior faculty. However, within the last quarter of the twentieth century, women and faculty of color reported increased demands on their time to serve on university committees, advise women and students of color, and serve their respective communities. Also, as the number of disciplinary associations, journals, and professional awards has grown so have the demands on faculty to supervise them.

Despite an increase in activity and demands for service, service is not, and has never been, rewarded comparably to teaching and research within academic communities. In most institutions it occupies a distant and somewhat ambiguous third place behind teaching and research. Service is not easy to evaluate for purposes of reward because it is often difficult to assess the quality of service activities, and to quantify and document service activity that results from ongoing partnerships or ad hoc projects. It is not clear what, if anything, should be evaluated when faculty participate in committees, editorial review boards, or mentoring groups.

During the last decade of the twentieth century, however, significant progress was made in elevating professional service in the academic reward system. In the early 1990s a national movement to reexamine faculty roles and rewards led by the American Association for Higher Education and the 1990 seminal work of Ernest Boyer, *Scholarship Reconsidered*, offered colleges and universities an attractive framework for assessing and rewarding a diversity of faculty work. Hundreds of campuses around the country began to redefine scholarship—the primary activity faculty were rewarded for—to include the teaching, discovery, integration, and application of knowledge. Lynton (1995) and Amy Driscoll (1999) extended this framework by advocating ways in which

faculty could document their professional service as scholarship. Some campuses have written this framework into faculty evaluation policies, offering an opportunity for faculty professional service to be assessed and rewarded with a similar currency to traditional research in the academic reward system.

### Debates about the Faculty Service Role

There is a lively debate about the nature and extent of faculty and institutional service obligations. It is often framed by such questions as the following:

- Do colleges and universities serve best through basic research and the preparation of future generations or through social problem solving, social activism, and social criticism?
- Among the many external demands for the professional expertise of faculty members, whose should have the greatest priority?
- Do colleges and universities have stronger obligations to state and national governments, their primary sources of financial support, than to community groups, the disadvantaged, or the disenfranchised?
- Should faculty consulting work count as service for purposes of the reward system?

The inclusion of economic development and entrepreneurial activities under the banner of service has inspired much controversy, in the United States and elsewhere, about the extent to which such activity is in the public interest or whether it serves the more private financial ambitions of colleges and universities and individual faculty members. Sheila Slaughter and Larry Leslie argue that such activity, which they term *academic capitalism*, changes the nature of the faculty role and the relationship between faculty members and their employing institutions. As institutions come to rely on faculty entrepreneurial activity as part of their financial base, they come to value this activity over other faculty work with negative consequences for teaching and research in areas not close to the market. Slaughter and Leslie anticipate increasing controversies between faculty members and their employing institutions over matters of the ownership of intellectual property, workload, and governance.

From close examination of selected universities in four countries, Burton R. Clark describes a new breed of entrepreneurial university that aggressively seeks to bring in new financial resources to augment and offset the support traditionally provided by na-

tional and state governments. Governmental support, he argues, is no longer sufficient to the ever-increasing demands on universities for new knowledge with marketplace applications. Entrepreneurial universities must rely on their faculty members to turn their knowledge capital into new revenue streams for the institution. Clark describes the “expanded periphery” within entrepreneurial universities—vastly increased numbers of research and outreach centers and institutes as well as multidisciplinary and externally oriented academic units growing up alongside traditional academic departments to engage in applied or policy research and technology transfer. New administrative structures are established to further economic development, manage intellectual property, and profit from the work of the faculty. These institutional changes have important implications for the nature of faculty work and the faculty service role.

Whether as a result of the natural expansion of traditional and generally accepted forms of faculty service or the newer forms propelled by globalization, technology transfer, economic development, academic capitalism, and entrepreneurial behavior, it seems clear that debates about the faculty service role will continue long into the future. There is no doubt that these will be matters of continuing controversy in higher education.

## FACULTY TEACHING

*See:* COLLEGE TEACHING.

## FACULTY TEACHING, ASSESSMENT OF

---

A comprehensive model of evaluating teaching advocates the use of multiple sources of information to confirm decisions. Each source—students, self-reports, colleagues and chairs, and evidence of learning—has particular strengths and limitations. The weight of the accumulated results leads to the most valid personnel decisions. Using a mixture of evaluation sources can also lead to greater improvement in teaching because different sources are helpful to different teachers and can help identify weaknesses in different areas of instruction.

Four major sources of information are used to determine the effectiveness of an individual teacher: student evaluations, teacher self-reports, colleague/department chair evaluations, and evidence of student learning. Each of these approaches can be useful in making personnel decisions (salary, promotion, and tenure) or in improving teaching. Each approach has strengths and weaknesses that must be kept in mind and that make it imperative to combine evidence for the best judgments.

## Student Evaluations

Evaluations of teaching by students have become important and a frequently used method of assessment, the rationale being that students, and only students, are constant observers of what happens in the classroom. Moreover, only students can answer questions about the effects of instruction on them. Research over the past forty-five years has generally demonstrated their validity, reliability, and utility in improving instruction; this same body of research has shown that systematic course evaluations by students can provide useful information in assessing teachers for salary, promotion, and tenure decisions.

Although typically administered during the last week or two of the semester (but prior to final exams and grades), rating forms are on occasion given at midsemester so the instructors may make immediate adjustments for a particular course. Machine-scored forms are frequently used in order to process the large amounts of college and department data, but the open-ended comments solicited by most rating forms often provide teachers with more specific suggestions for improvement. The questions asked about teaching or the course commonly fall into these categories: organization or planning, teacher-student interaction or rapport, clarity or communication skill, workload and course difficulty, grading and assignments, and student self-reported learning. In addition there are always questions asking students to provide a global or overall rating of the course, the instructor, or the instruction received.

Many colleges have assembled their own student rating forms and some allow students to make their ratings by computer. Commercial forms published by the Educational Testing Service (SIR II) and Kansas State University (IDEA) have for many years provided colleges with score summaries, comparison information, and research reports.

Any use of student evaluations should take into account the vast amount of evidence from research (more than two thousand studies in the Educational Resource Information Center (ERIC) system since 1971). This evidence provides the foundation for guidelines for the proper use of student evaluations. Some of the guidelines that institutions should keep in mind follow.

1. Use several sets of evaluation results. Because an individual course may not accurately reflect a teacher's performance, a set of results based on several classes should be used for

personnel decisions. Some research suggests using at least five classes.

2. Have a sufficient number of students evaluate each course. Averaging responses from enough students will minimize the effects of a few divergent opinions. Generally, fifteen students is a sufficient number, assuming they represent at least half of the enrolled students in a class. Research also has shown that student evaluations are consistent over short periods of time.
3. Consider some course characteristic in interpreting ratings. Although any single characteristic does not have a great effect, a combination could effect a teacher's evaluation. Research shows, for example, that small classes receive slightly higher ratings and that subject areas such as natural sciences and mathematics receive somewhat lower ratings. Courses that are college required, but not to satisfy the requirements of a major or minor, are also rated lower.
4. For personnel decisions, emphasize global ratings and estimates of learning. Research has shown that an overall or global rating correlated best with measured student achievement—more highly than ratings dealing with different teaching styles and presentation methods. Likewise, student estimates of their learning in a course are good reflections of instructional effectiveness.
5. Student evaluations can improve instruction, depending on how instructors use the results. Good evaluation forms help teachers diagnose their strengths and weaknesses. Studies indicate that some teachers can use the results directly, while others may need to discuss the results with a colleague or a professional consultant.
6. Give those being evaluated an opportunity to respond to evaluation results and to describe their teaching in writing. Teachers being evaluated for personnel purposes should have a chance to describe what they were trying to accomplish in the course and how their teaching methods fit those objectives. The self-report of teaching, which can be part of a teaching portfolio, gives teachers an opportunity to make their own best case.

## Teacher Self-Reports

Teacher self-reports are descriptive information about teaching, which generally becomes part of a teacher's annual report. Self-ratings or self-evaluations can be included in self-reports but they should not be given much emphasis in personnel decisions because they lack validity and objectivity. In studies in which self-ratings were compared to ratings of the teacher made by students or colleagues, there was little agreement between teacher's view of themselves and others view of them. For personnel decisions, self-reports are important because they give the teacher the opportunity to make their own best case. Annual reports, sometimes called "brag sheets," are the most common type of self-report. The reports usually include information about the following activities.

- **Teaching:** teaching load, advising load, honors received, evaluations by students or others.
- **Scholarship and creative endeavors:** publications completed or in press, works in progress, grants, awards, presentations at conferences, performances, exhibitions.
- **Service:** service to the institution (e.g. committee work), service to the government or local community, service to the profession.

## The Teaching Portfolio

The teaching portfolio has been heralded as an important new contribution to teaching evaluation because it allows teachers to provide continuous documentation of their performance. Borrowed from such fields as art and architecture, where the practice is for professionals to display samples of their work to perspective clients or employers, the teaching portfolio (or teaching dossier) contains three kinds of information:

- Products of good teaching (e.g. student workbooks or logs, student pre- and postexamination results).
- Materials developed by the teacher (course materials, syllabi, descriptions of how materials were used in teaching and in innovations attempted, and curriculum development materials).
- Assessments or comments by others (students, colleagues, alumni).

Most writers, including Russell Edgerton and colleagues, believe that a portfolio should include not

only those items that present the teachers' views about their teaching but also examples and artifacts that they or others contribute. They also argue that the portfolio should be reflective and explain the teachers' thoughts and hopes as they made instructional decisions. During the 1990s many colleges have used teaching portfolios for both instructional improvement and personnel decisions. Some institutions also encourage graduate students to use teaching portfolios to document their experience and to demonstrate their potential for prospective employers.

## Colleague and Department Chair Evaluations

Colleagues and department chairs can provide information that is not available from any other source. Neither students, who lack the background and perspective, nor deans, who lack the time, can contribute the kind of information that colleagues and chairs can. Colleagues and chairs can make judgments about the following areas:

- Organization of the subject matter and course. (Does the content appear to be appropriate and relevant?)
- Effective communication. (Are student assignments well defined?)
- Knowledge of subject matter and teaching.
- Fairness in examinations and grading (Do exams test course objectives?)
- Appropriateness of teaching methodology (Do instructional approaches suggest creativity and flexibility?)
- Appropriate student learning outcomes (Are student-produced documents and examinations consistent with course goals and objectives?)

Colleagues can make their judgments about the effectiveness of the teacher by examining course syllabi, assignments, and other documentary evidence. Colleagues in the same subject field as the person being evaluated can best judge several of the areas. In small institutions or in small departments, however, it is virtually impossible to limit evaluators to those in the same departments. In fact, given possible friendships or rivalries within departments, a more balanced evaluation may be achieved by including colleagues from other departments.

For tenure or promotion decisions, colleagues and chairs usually prepare formal written recommendations for candidates from their departments.

Although tenure and promotion committees include faculty representatives, these committee members usually do not have the time to obtain their own information on a candidate's teaching, scholarship, or service performance. Instead, they must rely on other sources. For teaching an ad hoc faculty subcommittee could review each candidate's dossier or teaching portfolio and collect supplementary evidence of teaching effectiveness. Their report and recommendation then is made to the tenure and promotion committee. At institutions in which teaching is of primary importance, this approach provides a way for colleagues to have greater influences in personnel decisions. At least one study by Lewis S. Root in 1987 has shown that a small group of colleagues relying on a variety of evidence on teaching performance, such as that suggested for the ad hoc committees on teaching, do make reliable and valid assessments.

Colleagues can also play an important role in improving teaching through their evaluations and collaboration. One example is a faculty-mentoring program, in which senior faculty members provide intellectual, emotional, and career guidance for young, untenured colleagues. Another example is the so-called buddy system, in which two or three colleagues agree to collaborate on a teaching improvement program. Activities include mutual classroom visitations, student interviews, and discussions among colleagues. Although faculty members vary in their ability to offer useful suggestions to each other, colleagues can still provide a perspective that students or others cannot.

The department chair should meet annually with any faculty member whose teaching is substantially below the department's expectations. Such meetings should be made well before final personnel decisions are to be made so that the candidate has ample opportunity to develop a plan to improve his or her teaching.

### Evidence of Student Learning

Assessing student learning as a way of evaluating teaching performance has always been an important faculty responsibility. Teachers ask students questions in class, administer examinations, and evaluate projects and performance in laboratories and field settings. Some faculty members feel that student scores on final examinations in their courses provide a valid measure of student learning and that this measure should be used to assess their effectiveness

as a teacher. Yet many factors other than the faculty member's teaching competence can affect examination results. Prior knowledge and their ability, interest, and skills in the subject area can also contribute greatly to how students score on examinations.

Another way to assess student learning is to test students at the beginning and then again at the end of a course and inspect the "gain scores." This procedure also is valuable to improve instruction: if significant numbers of students do not understand an important concept, instructional changes are needed. But because gain scores are easily misinterpreted, manipulated and may not be statistically reliable, they should not be used for examining student learning for tenure, promotion or salary decisions.

### The Importance of Evaluation

Tenure decisions have important financial as well as educational implications for a college. Because a faculty member may spend thirty to thirty-five years at an institution, granting tenure amounts to more than a two million-dollar commitment at early twenty-first century salary and fringe benefits rates. When an institution makes this decision, they must consider their own goals and the faculty member's performance related to those goals. At community colleges and at many four-year colleges, teaching is the primary activity; so faculty members are evaluated largely as teachers, although their service and scholarly activities can also receive emphasis. At universities and certain four-year colleges, evidence of research and scholarship is primary, though teaching and to some extent service are also considered. In fact some doctoral-granting universities have made concerted efforts to evaluate and improve teaching performance.

## FAMILY AND CONSUMER SCIENCES EDUCATION

Family and consumer sciences education is a field of study that focuses on families and work—and on their interrelationships. Family and consumer sciences education tries to empower individuals and families to identify and create alternative solutions to significant everyday challenges and to take responsibility for the consequences of their actions in a diverse global society. These challenges are experienced by people of all ages in their families, workplaces, and communities. Consequently, the central concern of the field is the physical, economic, and sociopsychological well-being of individuals and families within that diverse society. From its inception in the nineteenth century, the field has used knowledge to improve people's quality of life.

### Goals and Purposes

Family and consumer sciences education contributes to a broad range of intellectual, moral, and workforce development goals. Its mission is to prepare students for family life, work life, and careers in family and consumer sciences. Nine specific goals,

developed in 1994 by the Family and Consumer Sciences Division of the American Vocational Association (now the Association for Career and Technical Education [ACTE]) provide the direction for curriculum:

1. Strengthen the well-being of individuals and families across the life span
2. Become responsible citizens and leaders for family, community, and work settings
3. Promote optimal nutrition and wellness across the life span
4. Manage resources to meet the material needs of individuals and families
5. Balance personal, home, family, and work lives
6. Use critical and creative thinking skills to address problems in diverse family, community, and work environments
7. Foster successful life management, employment, and career development
8. Function as providers and consumers of goods and services for families
9. Appreciate human worth and accept responsibility for one's actions and success in family and work life

These goals guided the development of national family and consumer sciences content standards during the 1990s. Recommended content includes reasoning for action; career, community, and family connections; consumer and family resources; family development; human development; interpersonal relationships; nutrition and wellness; and parenting. In addition, standards were recommended for the knowledge, skills, and practices required for careers in consumer service; early childhood education and services; facilities management and maintenance; family and consumer services; food production and services; food science, dietetics, and nutrition; hospitality, tourism, and recreation; and housing, interiors, and furnishings.

Family and consumer sciences education is an interdisciplinary field. Teachers integrate knowledge and processes from empirical, interpretive, and critical sciences to help students identify, understand, and solve continuing human concerns or problems that individuals and families experience. To address these concerns, the field draws on social sciences, physical and biological sciences, arts, humanities,

and mathematics. Core processes are integrated in most courses and programs. Scientific and practical reasoning processes are integrated to learn about and solve *what-to-do* problems. Communication processes, including the use of information technology, are integrated to sensitively identify and meet the needs of self and others through caregiving and education. Shared democratic leadership processes are integrated in classroom and community service learning experiences. Management and other processes, such as mathematics, are also incorporated, as needed, into concrete learning activities like those experienced in homes, families, and communities. Academic partnerships between family and consumer sciences and colleagues in science, language arts, and social studies result in team-taught courses in food and nutrition and family issues and relationships.

Family and consumer sciences education is an action-oriented field. It is concerned with the work of the family through everyday life-enhancing, caregiving activities and interactions carried out privately within the family and publicly in the community. Private caregiving focuses on the optimum development of family members. Public caregiving is provided through public service and service careers, such as child-care and food service careers. These personal service careers provide the caregiving that was provided only in homes before the twentieth century.

Educational experiences focus on developing three interrelated and interdependent kinds of reasoned action or processes needed for the work of the family in the home and community: communicative, reflective, and technical action. Communicative action involves developing learning and interpersonal skills needed for sharing meanings and understanding the needs, intentions, and values of family and community members. Reflective action involves developing the critical and ethical thinking skills needed for evaluating and changing social conditions, norms, and power relationships that may be accepted without question, but may be harmful to families, their members, and, ultimately, to society. This critical reflective action focuses on enhancing human capabilities and the physical, psychosocial, and economic well-being of the family and its members in a rapidly changing society. Finally, technical action involves developing the care-giving skills needed for using a variety of methods and technology to meet family needs for food, clothing, shelter,

protection, and the development of family members. Such technical action varies historically and from culture to culture.

Action-oriented classrooms develop and extend these skills into homes and communities. For example, students in a high school parenting education course take communicative, reflective, and technical actions as they analyze, discuss, and evaluate the effects that violence in Saturday morning cartoons has on children. These kinds of actions can then be integrated and used when students or family members plan and work together to effect change in this type of programming—which has become a cultural norm for many children—such as through community education activities for parents and legislators and for companies who sponsor violent programming.

### **History of Family and Consumer Sciences Education**

From its inception, the field has been concerned with using knowledge to improve the quality of life. Family and consumer sciences education began in the mid-nineteenth century as *domestic economy* for girls. During this time—and into the early twentieth century—women were relegated to the private life of the family and separated from the public life of the community. The educational reformer Catharine Beecher (1800–1878) envisioned a field to help students develop the critical thinking skills needed in their homes and in the wider community. Initially, this new field of study was an integral part of a general science-based liberal arts education that prepared females for their “professions” as wives and mothers. By the late 1800s, land-grant colleges offered *domestic science* courses for young women, thus making it acceptable for women to attend coeducational institutions. Two prevailing cultural assumptions supported this new field: (1) domestic tasks are women’s work; and (2) women need specific formal training for their home-centered duties.

During the twentieth century, the family and consumer sciences field evolved along with cultural, political, legislative, and pedagogical change to meet the needs of diverse populations. In the early 1900s, concern for the deterioration of the family and its members in a rapidly changing society motivated Ellen H. Richards (1842–1911) to found the American Home Economics Association (now the American Association of Family and Consumer Sciences). She envisioned this professional organization as one

that would emphasize cultural, ethical, and social ideals, and the scientific management of household work.

Soon after the establishment of this organization, changing political circumstances culminated in federal legislation that extended the field into communities and schools throughout the country. First, the Smith-Lever Act of 1914 established the Cooperative Extension system to provide community educational programs in every county throughout the United States. Home economics education was established as part of this community-based educational system, which continues to provide links between the U.S. Department of Agriculture and land-grant universities for family and consumer education programming in an effort to improve lives and communities.

The Smith-Hughes Act of 1917 established vocational education for paid employment and vocational home economics education in most public schools. By providing funding for teachers and equipment, this legislature transformed the field of study from a female version of general liberal arts and science education for a few women in colleges to *vocational home economics education* for girls in secondary schools throughout the country. Even though this act defined vocational education as technical education for paid employment, home economics education was meant for useful employment and merged two diverse curricular goals: (1) a general liberal arts and science education for family and community members, and (2) preparation for their assumed life work as homemakers. This educational and social reform played a liberating role for girls, since they were encouraged to stay in school at a time when girls tended to drop out after the eighth grade. It also prepared them to participate in their communities. Community leadership was developed through a cocurricular high school student organization, the Future Homemakers of America (FHA), which was established in 1945. Gradually, home economics education prepared girls for every area of home life in the first half of the twentieth century; namely, clothing construction, food preparation and preservation, sanitation, home furnishings, child care, health care, and family relations. Social benefits centered on the country having wise, prepared mothers; responsible family members and citizens; healthy and moral households; and productive and confident homemakers.

By the 1950s the country and the field had begun a transformation as a result of changing cultural assumptions that had limited women's work to the home—and men to work outside the home. Production of food, clothing, and home furnishings—and home care of children and sick, elderly, and handicapped family members—began to occur outside the home. Most families were becoming consumers rather than producers of these goods and services, and career choices expanded for males and females. More women entered wage-earning careers outside the home—including, but not limited to, home- and family-related service careers. Some men's work expanded to homemaking and parenting roles within the home. Consequently, both males and females needed help with recognizing and meeting new challenges of families and consumers, including deciding the direction of their careers and preparing for and managing family, career, and community responsibilities. To meet these needs, many schools offered at least one home economics course for young men, and when Title IX of the Education Amendments Act of 1972 prohibited sex discrimination in education, all courses were suddenly open to males and females. Consequently, male enrollment increased in middle school and high school career and family-related programs, and especially in food and interpersonal relationships courses, to approximately 40 percent in the 1990s. By 1994 the field changed its name and emphasis to *family and consumer sciences* to reflect these and other cultural and educational developments. Subsequently, the Future Homemakers of America student organization was renamed the Family, Career and Community Leaders of America (FCCLA).

### Major Trends, Issues, and Controversies

These name changes reflect major trends and issues within the field. Over the years the field has shifted between technical and critical-science approaches. In the early twenty-first century the trend is toward a critical science approach, as educators focus on perennial and evolving issues concerning families and communities. Problem solving occurs within the context of real-world issues, and this approach integrates academic and workforce preparation. Skill development continues, but rather than emphasizing the development of homemaking skills, the thinking and interpersonal skills needed in families, workplaces, and communities are emphasized. In addition to scientific reasoning, practical or ethical

reasoning is being added to the curriculum. While economic values such as efficiency and productivity continue to be reflected in the curriculum, moral and ethical values, such as personal and social responsibility and respect for all people, and all other types of values are openly discussed (rather than assumed) when discussing and solving problems affecting family and community members.

Grounded in the concrete and abstract experiences of the home, family, and community, family and consumer sciences education provides meaningful ways of knowing and learning for young people and adults with varying abilities and needs. Courses are being designed to help all students (including students at risk for dropping out of school) meet high academic expectations and stay in school. Authentic experiences help students make connections with other academic disciplines and the world beyond the classroom.

With this approach, family and consumer sciences education has become an integral part of the current educational reform movement. Yearlong, comprehensive courses and programs are being redesigned to meet high academic standards and student needs. National and state academic and family and consumer sciences content standards are used to strengthen programs and plans, and courses are becoming more specialized. However, academics, technology, and workforce-development skills are now integrated into the way students learn. These transferable skills are core learnings in process-centered family and consumer sciences classrooms. Real-world, problem-based instruction often includes service learning and other ways of extending learning beyond the classroom. Teachers are designing courses to fit flexible scheduling options, including semester, nine-week, and block-scheduling courses, to replace comprehensive yearlong courses.

Professionals continue to debate the role of family and consumer sciences in schools, as well as teacher preparation needs, teacher certification/licensure requirements, and ways to recruit teachers. These are interrelated issues, since inadequate numbers of teachers are being prepared to replace and expand the family and consumer sciences teaching force.

### **School and Community Curriculum Offerings**

Family and consumer sciences educational programs are provided for youth and adults in schools and

communities throughout the world. School programs for elementary age children are more likely to be offered in other countries, such as Japan and Malaysia, than in the United States. However, middle schools, high schools, and colleges around the world offer elective and required courses in family and consumer sciences education. Such programs have varying names, such as family and consumer sciences, human development and family science, family studies, work and family life, human ecology, or home economics.

High school curriculum offerings include comprehensive home and family life-skills courses and specialized personal, family, career, or community-focused courses. Comprehensive courses are more likely to be offered in the elementary and middle school levels, and specialized courses tend to be at the high school and college levels. Personal development courses are designed to help adolescents and adults learn about themselves, careers, and family responsibilities so they can make reasoned life choices. Course titles reflect these comprehensive emphases: Building Life Skills, Orientation to Life and Careers, Independent Living, Adult Roles and Responsibilities, Leadership in the Workplace, Career Connections, and Career Choices.

More specialized family-oriented courses include titles such as Family Relationships, Interpersonal Relationships, Human Behavior, Parenting and Child Development, Family and Technology, Families in Society Today, Dynamics of Relationships, Families of Many Cultures, and Families in Crisis. Food, nutrition, and wellness courses may be designed to meet personal, family, and career needs—as well as science requirements. Courses offered include Nutrition and Wellness; Family, Food and Society; Sports Nutrition; Modern Meals; Global Cuisine; Food Science; Chemistry of Food and Nutrition; and Experimental Foods. Consumer and family resource management courses, such as Consumer Economics, Life Management, Financial Management, and Life Planning, tend to be more comprehensive in that they are designed to prepare students for their adult roles and responsibilities.

Career-oriented courses in high schools, colleges, and universities prepare students for their family work and an array of personal service careers. High school courses range from exploring career options and developing core processes in a nine-week or semester course to a one- or two-year workforce development course focused on developing the

knowledge and skills necessary for careers in food service, child care, hospitality and tourism, facilities care and management, housing and interiors, or apparel and textiles related careers. Two-year and four-year college programs include combinations of specialized courses to prepare for professional careers in early childhood education; consumer services; financial planning; dietetics; food science; hospitality and food management; interior design; fashion design and merchandising; and product research and development. Baccalaureate and master's degree programs prepare family and consumer sciences educators for schools and Cooperative Extension. Master's and Ph.D. programs prepare researchers, specialists, and university educators.

Family and consumer sciences content may be combined in a variety of ways to meet the special needs of students and communities. School-based programs and courses are offered for pregnant and parenting students, dropout-prone students, and developmentally handicapped students. Graduation rates for pregnant and parenting students from these programs is more than 85 percent, while the national retention rate for these teenagers is 40 percent. Rates of subsequent pregnancies and low birth weights are also lower than state and national averages. School-based and community-based entrepreneurship courses help students, especially in small communities and developing countries, create their own businesses, often providing family and consumer sciences-related services.

Community-based family and consumer sciences community programs are offered by Cooperative Extension and other community agencies and organizations. These family and consumer sciences programs address a variety of individual, family, and community needs and issues. Cooperative Extension is a non-formal educational system concerned with issues faced throughout the life cycle, including child care, parenting, family life, nutrition and food safety, money management, and adult development and aging. Cooperative Extension family and consumer sciences educators collaborate with other county and state Cooperative Extension educators to provide community programming. Basic programming includes 4-H (a non-formal educational program for five- to nineteen-year olds focused on developing their "head, heart, hands, and health") youth and adult leadership development and adult education; agriculture; community resources and economic development; family development and resource man-

agement; leadership and volunteer development; natural resources and environment management; and nutrition, diet, and health. National initiative programming focuses on nationally important issues, such as financial security, caring for children and youth, food safety and quality, healthy people and communities, and workforce preparation.

### Current Status

Family and consumer sciences education is an integral component of the U.S. educational system, and of some other countries' systems. Some countries, such as Japan, require home economics at all levels of their public schools. Most U.S. secondary schools offer family and consumer sciences courses, and some require middle school life-skills courses and/or high school career connections, parenting and child development, and interpersonal relationships courses for all their students. State and local school funding has replaced most federal funding for these programs. Many family and consumer sciences programs strengthened their place in the middle and high school curriculum during the 1990s, especially when curriculum was revised to contribute to academic, technological, workplace, and family and consumer sciences standards and local and state needs. For example, enrollment more than doubled in Ohio's Work and Family Life program during this period. While family and consumer sciences programs have maintained or expanded enrollment in many middle schools and high schools, some schools have eliminated their programs due to the unavailability of teachers.

Cooperative Extension family and consumer sciences programs have maintained their community educational role in rural and small towns and expanded their urban programs. Websites connect families to sources of information and resources such as fact sheets, educational events, self-directed studies, and research findings. All states provide educational programming with varying emphases to meet local needs.

**OVERVIEW**

Much research has been conducted on what children need to grow up healthy, ready to learn, and to succeed in school. Many aspects of a child's growth and development, family circumstance, and school success have been studied, analyzed, and reported on in an effort to help parents, educators, health care professionals, and policymakers better understand what they can do to assure a child's success. A review of this research reveals two significant circumstances that seem to have the most impact on a child's growth, development, and ultimate educational suc-

cess: poverty and family interactions. Barring significant birth defects or injury, these two circumstances hold the key to virtually every aspect of a child's life that affects his or her ability to grow up healthy and to learn. However, it must be noted that these two factors overlap in many respects and cannot be viewed in isolation. In addition, while it is recognized that a child's behavior is what is sometimes most disruptive to the family, due to the child's drug abuse, mental illness, disability, or other factors, the focus here is on the effects of outside factors on the growth and development of the otherwise normal, healthy child.

### **Effects of Poverty on Children**

All other things being equal, children living in extreme poverty or below the poverty line for many years have the worst outcomes for health and school success. (The most chronically poor counties in the United States are in rural areas of Appalachia and in the South.) The effects of poverty are multiple and profound. Children who are born into families living in poverty generally do not receive adequate prenatal care. Lack of good nutrition for a pregnant woman can result in a baby that has a low birthweight, is more vulnerable to illness, is underdeveloped, and is likely to require more care, compared to the child of a well-nourished mother. Healthy brain development in children from birth to three years of age is critical in the development of speech and language, coordination, and reasoning. Children who suffer from poor brain development are at high risk for delayed speech and motor skills, neurological disorders, learning disabilities, and behavior problems.

Children living in poverty do not usually receive proper and timely health care, which can lead to chronic illness, such as asthma, or chronic infections, such as ear infections that can lead to hearing loss. They often do not receive required immunizations, which can delay school entry and lead to serious childhood illnesses. They are also more prone to complications from minor injuries or illnesses. Many mothers living in poverty suffer from depression, making them less able to properly nurture, stimulate, and interact with their children. As a result, their children suffer from neglect, failure to thrive, and decreased brain development.

Poverty frequently means that a family lives in a neighborhood that has a high rate of violence. Housing in these neighborhoods often exposes children to unsafe living conditions, including environ-

mental toxins, poor ventilation, and infestations of rodents and insects. Low-income children have more than triple the risk of lead poisoning, which causes neurological damage and has been linked to lower IQ and long-term behavior problems such as impaired concentration and violence.

Poor families are more likely to be single-parent families with a parent who is young with unstable employment and low earning potential. These parents suffer stress associated with the constant strain of trying to provide adequate food, housing, clothing, and health care for their children. Parents under stress have a more difficult time providing the nurture and support necessary to establish positive bonding, enable speech acquisition, teach problem-solving skills, and promote early learning activities that affect school readiness. Parents living in poverty are more likely to have low educational attainment and less knowledge about early childhood education and brain development in infants. There are generally fewer books, educational toys and games, and outside opportunities for learning, such as family vacations and trips to a museum.

Children living below the poverty line are 1.3 times more likely to experience learning disabilities and developmental delays than are children who are not poor. Children with learning disabilities and developmental delays are more likely to experience school difficulties, and school failure at an early age is a leading indicator in school drop-out rates.

Families living in poverty also experience housing instability. Children who move frequently tend to have fewer friends, experience social isolation, and have higher truancy rates than those who grow up in more stable homes. In addition, social and educational services designed to support families in poverty are disrupted when the family moves frequently. Many families in poverty experience periods of homelessness, which exposes children to communicable diseases and the chaos found in shelters. Homeless children suffer increased rates of illnesses such as diarrhea, asthma, anemia, and infection. Simply being born into poverty affects a child's ability to grow up healthy, to be nurtured in a safe and stable home, to enter school ready to learn, and to remain in school and complete a high school education.

### **Family Interactions**

Researchers have studied the effects on school success of single-parent families, blended families, ex-

tended families, divorce, death of a parent, foster care, adoption, and gay families. Within each of these family compositions, examples of children who thrive and children who fail can be found. But more important than family composition is family interaction—how family members relate to each other. Can a child who lives in a two-parent home where there is poor family interaction due to drug abuse, domestic violence, or mental illness be said to be at less risk of school failure than a child born into a single-parent family living in extreme poverty?

Family interaction significantly impacts the development of the children in the home, regardless of income level. However, research does show that certain types of family interactions are more common in low-income homes. For example, drug abuse and poverty are the two most common factors cited in domestic violence and child abuse cases.

In families where one or both parents abuse drugs or alcohol, children are frequently neglected, and sometimes injured or abused. In addition, much of the family income is spent on supporting the drug habit, and the family suffers from the diminished resources available for food, clothes, housing, and medical care. Children growing up in homes where drug abuse is present are frequently exposed to violence, unpredictable behavior, overt displays of sexual behavior, absence of one or both parents, poverty, homelessness, and a lack of consistent supervision. Children are often truant from school and may lack school supplies and appropriate seasonal clothing. Nonrelatives are frequently present in the home and prevent the child from maintaining a close relationship with one or both parents. Children may also be expected to perform most household chores, such as cooking and cleaning, and to care for younger siblings or elderly grandparents. Children living in these circumstances may appear tired, lonely, sad, angry, afraid, malnourished, dirty, withdrawn, aggressive, anxious, or defensive, and they may exhibit a wide array of physical symptoms including complaints of stomachaches and headaches, hair loss from stress, nervous tics, stuttering, and thumb/finger/hand sucking when not age appropriate.

Children who live in homes where neglect, abuse, and/or domestic violence are present suffer many of the same effects as those mentioned above. The interactions between adults, and between adult and child, significantly impact the child's growth and development. Children who are abused or ne-

glected suffer from low self-esteem, anger, depression, fear, anxiety, and feelings of abandonment. They manifest these feelings through physical symptoms such as headaches, stomachaches, vomiting, diarrhea, and sometimes sleeping or eating disorders. Very young children are particularly vulnerable to neglect and abuse in homes where domestic violence is present. The victim of domestic violence, which is most often the mother/woman present in the home, may ignore her children to appease the offender. Very young children are particularly at risk of injury or abuse from shaken baby syndrome or battered child syndrome.

### **Effects of Government Intervention**

When the government intervenes to protect children living in homes with drug abuse, domestic violence, or child abuse, the family interactions are again affected. Once a determination is made that a child's safety is at risk, one of two approaches are generally taken: either the child is removed from the home and placed in a home with relatives or in foster care, or the family is provided with in-home counseling and support services. In-home services are considered less intrusive and disruptive to the child and the parent-child relationship. In an ideal situation, the in-home service provider visits with the family members at home and conducts counseling sessions with all family members to help the family interact in more positive ways. However, family members frequently resent the intrusion of an outsider and the child is blamed for the intrusion.

The focus of Child Protective Services, an array of agencies and collaborations designed to assure the safety of children, is specifically on the safety and well-being of the child. As a result, the adults in the home may view the child as the reason for the intervention, causing additional stress on the child. The child may feel guilty that his parents are required to attend counseling sessions, court hearings, or to pay for services. The parents may talk openly around the child about the intrusion and inconvenience of such services, and about their resentment. If the services are not effective, then additional court hearings are held and there may be additional finger pointing and blame directed at the child. Ultimately, the child may be removed from the home, again causing the child to feel that he or she is being punished.

When a child is removed from home, family interactions are very much affected. The child may be in a safer environment, but there is stress associated

with the change in living circumstances. In general, the parent may not be happy with the removal of the child from the home. The parent may call or visit the child and accuse the new caretaker (either a relative or foster parent) of not caring for the child properly, and again the parent may cast blame on the child for causing the disruption.

The parents may also be required to make child-support payments while the child is out of the home, and they may have to receive some type of treatment or counseling as a condition for the child to return home. If the parent fails to complete the court-ordered treatment, the child may view that failure as an indication that the parent has abandoned or does not love him or her. It is reasonable to believe that any period of time in which the child is out of the home is a time of stress and confusion. Even when the child feels more physically safe when not at home, there are emotional attachments that bind the child to the home and make the removal difficult.

### Effects of Mental Illness

The term *mental illness* describes a broad range of mental and emotional conditions that disturb a person's behavior, mood, thought processes and/or social interpersonal relationships. Children who live with a family member who is mentally ill must deal not only with the stigma of mental illness in their family, but also with the stress caused by that illness. While the extreme circumstances of mental illness are widely reported in the news (such as mothers who, while suffering from depression, kill their children), the much more common situations of a parent who suffers from some type of mental disorder or a parent who is caring for a relative with mental illness are found in millions of homes in the United States. Some of the most common types of mental illness are:

- Depression, which is characterized by extreme or prolonged periods of sadness.
- Schizophrenia, a very severe illness characterized by disordered thought processes that can lead to hallucinations and delusions.
- Bipolar disorder, which is a brain disorder involving periods of mania and depression.
- Dementia, which is a loss of mental function usually associated with advanced age and characterized by memory loss, personality change, confusion or disorientation, impairment of judgment, and deteriorating intellectual capaci-

ty. There are many types of dementia, including Alzheimer's disease.

Mental illness can occur in any family. When it first occurs, the family members may at first deny that something different has happened. During an acute episode, family members may react with surprise, fear, and alarm, and once the episode is over there may follow a period of relief and calm. But, as symptoms persist, it becomes clear that life will never again be normal.

Children are particularly affected by the strange behavior of a parent or older sibling. They may have little knowledge about mental illness and blame themselves for what is happening to their relationship with a loved one. They are frequently afraid to discuss their feelings with others, particularly their friends or people outside their families, and they therefore become isolated and withdrawn. How other family members handle the situation is critically important to the child. If other family members, particularly the other parent, become distraught and helpless, then the child will become even more distressed.

A child will receive less attention at this time, because other family members are attending to the member with the illness. The child may begin to exhibit behavior problems at home and at school, become depressed or withdrawn, and exhibit sleeping or eating disturbances. Every episode becomes more difficult to handle, and the child may try to escape by running away from home. Even though the child is not being abused, the effects appear similar, with anger, aggression, fear, depression, anxiety, withdrawal, and sadness all being possible outcomes.

Similar circumstances exist when a family is faced with caring for an extended family member who develops dementia or any other mental illness. If the family member moves into the home, the child is sometimes displaced from his or her room, daily routines may change, and finances may be strained. All of this is very disruptive to children, particularly school-aged children. It is difficult for a child to see a change in the behavior of a beloved relative (grandparent, aunt, uncle, etc.), which might frighten the child. The presence of this person in the household affects the parent-child relationship, as parental responsibility is shifted and there is less time to spend with the child. The resultant stress and concern can create serious family problems. Family life is disrupted and often unpredictable, and the

needs of the ill family member often become the priority.

### What Do Children Need to Be Successful?

Although much research has focused on issues that negatively affect the outcomes for children, little research has focused on what characteristics make children successful. In the mid-1990s the Search Institute, led by Dr. Peter Benson, conducted a nationwide survey of 100,000 young people in more than 200 communities to learn about the assets of successful teens. This research specifically targeted teenagers, but the implications of how the assets were developed are applicable to children of all ages.

The survey identified forty developmental assets that help young people make better decisions, choose positive pathways, and grow up to be competent, caring, and responsible. These assets are grouped into eight categories: support, empowerment, boundaries and expectations, constructive use of time, commitment to learning, positive values, social competencies, and positive identification.

**Support.** Children need to feel loved and supported by their family. Teens reported that spending time with parents, being hugged, being told that they are loved and doing things as a family are important to them. Children learn to love by example. Eating at least one meal per day together as a family, spending time with each child individually, listening and valuing their opinions, respecting their concerns, attending school events, and going to worship together are all examples of how families can show support and love to their children.

**Empowerment.** Young people need to feel that they are valued by their community and that they have the opportunity to contribute to the welfare of others. They need to feel safe at home, at school, and in the neighborhood. Those surveyed reported that they need and want to feel useful in their communities, and that they need to have opportunities to give service back to the community.

**Boundaries and expectations.** Young people need to know what is expected of them and whether their activities and behaviors are acceptable, or “in-bounds.” Boundaries are important not only within the family, but in the school and neighborhood as well. Families need clear rules and consequences for behavior, as well as ways of monitoring behavior. When the rules are clearly communicated and the consequences are fairly and consistently enforced,

children are more comfortable controlling their own behavior, and they make better choices. Teenagers report that positive adult role models are helpful and desirable. Adult role models can be teachers, scout leaders, coaches, parents of friends, or adults they meet and know through community activities such as worship, community service, and sports.

**Constructive use of time.** Young people need opportunities for constructive and creative activities. These opportunities can occur through participation in faith-based organizations and youth programs; through lessons in art, dance, music, drama, and sports; or through learning skills at home, such as cooking, decorating, sewing, building, or designing. Parents can encourage their children to explore arts, sports, or other creative outlets by volunteering to help with a sports team or youth group, or by taking the child to local museums, dance performances, or plays. Activities such as these encourage physical activity, promote problem-solving skills, stimulate creativity, and help young people meet others with similar interests. As an interest in such activities develops, there is less opportunity or interest in watching TV, hanging out on the street with undesirable companions, or experimenting with drugs and sex. As children grow older, parents can encourage them to obtain part-time employment to earn money and teach them how to manage their money.

**Commitment to learning.** Young people need to develop a lifelong commitment to education and learning. Children need to experience at a very young age that learning is fun and that parents value education. Every effort should be made to assure that the child is successful in school. Parents should also model lifelong learning by engaging in new learning experiences, taking part in community and government life, and helping their children apply their knowledge to real life activities. Parents should visit their child’s school, talk with the teacher, and help with homework. Parents can help their children bond with their school by encouraging participation in school activities, showing school spirit, inviting school friends home to work on projects, and participating in school cleanup and work days.

Children who are good readers are better learners, so children should learn to read for pleasure as well as for schoolwork. Parents should start reading to children when they are very young, and they should teach children that books have wonderful stories and interesting information. It is helpful to take children to the public library as soon as they are

able to look at picture books. As children grow older, books can be read together and discussed. Parents can start a young-reader book club with their child and their child's friends to encourage them to read together.

**Positive values.** Young people need to develop strong values that guide their choices. These values include caring, equality and social justice, integrity, honesty, responsibility, and restraint (believing that it is important not to use drugs or alcohol and not to be sexually active). These values help young people make good decisions and it is important for parents to help their children develop these values. It is not enough just to tell children what their values should be; parents must demonstrate that they have these values and how these values translate into everyday life. Children learn by example, so if parents are caring, honest, responsible, and demonstrate restraint in the use of drugs and alcohol, then children will learn these things. As a child grows older, parents can label the values and show how they and others incorporate these values into their lives.

**Social competencies.** Young people need skills and competencies that equip them to make positive choices and to build relationships. Life is full of choices, and how young people make those choices will affect how they spend their time, who their friends are, what work ethics they have, who they choose as a mate, and how they raise their own children. The ability to make choices, and to see how those choices impact the future, is critical in becoming a successful adult. Very young children have a very short sense of time, and they make choices based on what is immediately available to them and what they need or want in that moment. But as children grow older they can learn that choosing to watch TV now means that there is not enough time later to read a story or play a game. Parents can begin to help children understand how a decision will affect their goals. Goal-oriented decision making is a skill that must be learned and practiced successfully.

Another social competency is learning to make friends. Friendships will not last long if a child is self-centered and insensitive to the feelings of others. Parents can help children learn to be empathetic and sensitive by discussing with them how other people feel when they are treated unkindly or when they are hurt. Children learn to respond with empathy and kindness when they see their parents respond to them with these same feelings.

Children must also learn to be comfortable with people of different cultures, races, and ethnic backgrounds. This is sometimes more difficult if the family lives in a very homogenous neighborhood, but through books, films, television programs, and newspapers parents can make children aware of the different people and cultures in the world, and teach them that just because something is different it is not to be feared or disliked. In communities where people of different cultures live, it is important for parents to treat everyone with respect and to introduce their child to experiences of different cultures. Parents can take the child to markets and stores that sell products of different countries, listen to music from other cultures, or invite people of different cultures to speak to a class about their customs, dress, and food.

Children need to learn to resist negative influences and peer pressure. Parents can help by engaging in role-playing situations with them and talking with them about choices that their friends are making. Children need to learn active resistance and about the dangers of being "in the wrong place at the wrong time." Children also need to learn how to resolve conflict peacefully. Parents can start teaching children at a very young age that hitting is not acceptable behavior, and how to resolve conflicts without violence. Parents must also model this behavior in their choice of discipline and in their own behavior.

**Positive identification.** Young people need a strong sense of their own power, purpose, worth, and promise. Teenagers reported in the Search Institute survey that it was important for them to feel that they have control over things that happen to them. Parents can reinforce their children's sense of power and worth in many ways. Helping children learn to make good choices and praising them when those choices are made, helping children identify their strengths and showing them how to use those talents, and giving children time for recognition are all ways of building self-esteem. It is important for young people to feel positive about their future, and to feel that their life has purpose.

Teenagers easily fall into periods of depression due to hormonal changes that occur during different stages of development, and due to the peaks and valleys that occur in friendships and relationships. One day they are on top of the world and the next day everything seems pointless. Some of this is quite normal in the life of a teenager, but parents can help

them view their lives with some perspective and minimize the negative feelings that occur.

Parents should not always shield younger children from failure and disappointment. It is important for children to experience failure along with success, as these experiences help cushion hard times later in life. Children who have learned to cope with disappointment and felt the pride of having overcome adversity become much more resilient teenagers and adults.

While much of what has been learned from research on family composition and circumstance seems quite logical, the impact of this research is profound. It helps explain why some children rise above seemingly overwhelming odds of poverty and family composition to succeed, and why others struggle.

## ADOPTION

In the 1990s an average of 120,000 children were adopted yearly in the United States. Adoption involves the legal transfer of parental rights and responsibilities from birth parents to adoptive parents. The adopted child, adoptive parents, and birth parents form what is known as the *adoptive triad*—three entities profoundly affected by this process. According to the Evan B. Donaldson Adoption Institute, 60 percent of Americans are touched by adoption—either as a relative, friend, or member of the adoption triad.

Most children are placed with their adoptive families through public child-welfare agencies or licensed private adoption agencies. These agencies typically place children after obtaining legal custody of children due to the voluntary or involuntary termination of birth parents' rights. Children are also placed with adoptive parents directly by birth parents; attorneys typically facilitate this process of *independent adoptions*.

Although the legal exchange of rights and responsibilities of parenthood is common to all adoptions, there are different types of adoption. *Infant adoptions* involve the placement of infants; *older-child adoptions* typically involve the placement of children over age three. In *transracial adoptions* children of one race are placed with a family of a different race, while in *international adoptions* children from one country are placed with a family in another country.

Adoptions vary in how much contact or information is shared between adoptive parent and birth parent. Harold Grotevant and Ruth McRoy offer the following definitions: *confidential* adoptions involve no contact at all; *mediated* adoptions involve the exchange of nonidentifying information through a third party; and fully *disclosed* adoptions involve the exchange of at least some identifying information and often include face-to-face meetings.

### Adoption and Children's Development

Two questions typically get asked about adopted children. First, are they better off in adoptive families than they would have been in foster care, institu-

tions, or with their birth families? Coping with the loss of the birth parent is often an important theme for adopted children. However, research on their adjustment clearly shows that they have more positive emotional and behavioral adjustment than children who are raised in foster care, in institutions, or with birth families who continue to have serious problems that impair parenting. Furthermore, Richard Barth and his colleagues have shown that adoption in infancy can greatly minimize the vast problems in learning, social relationships, and emotional development among children who were prenatally exposed to drugs. So, adoption can be an appropriate solution for children whose birth parents cannot, or will not, provide adequate safety and nurturance.

Second, how do adopted children fare in comparison with children in families that more closely resemble their adoptive families? Adopted children tend to receive more mental health services—which some professionals view as a sign that adopted children have many more problems than do their peers. However, adoptive parents also are more likely to seek professional help—for various reasons—than are biological parents. In general, many studies suggest that most adopted children tend to have more adjustment problems than nonadopted children. These problems include school adjustment and learning problems; impulsive, hyperactive, or rule-breaking behavior; and drug use. However, it is important to note that for most adopted children, these problems fall within what is considered a normal range.

Given the slightly higher risk for adopted children to have adjustment difficulties, what are important issues that adoptive families face as children develop? In infancy and toddlerhood, the critical challenge is for adoptive parents to form healthy relationships with the child. Known as a *secure attachment*, this relationship can enable the child to have success in later years forming friendships, learning in school, and learning about the world.

In the preschool years the important step for parents is to begin the process of telling about adoption. David Brodzinsky's work indicates that teaching children about adoption is an ongoing process throughout childhood that should start with words that the child can understand. He and his colleagues have shown that children's understanding of adoption evolves over years—from an ability in the preschool years to make a simple distinction between adoption and birth as paths into a family, to an ability

in adolescence to understand the abstract themes associated with termination of parental rights and adoption.

During the elementary years, as adopted children become able to understand that in order to be adopted someone had to give them up, they become vulnerable to having difficulties with their sense of self. During these years, it is especially important for parents and adopted children to talk openly about adoption.

In the adolescent years, when youth rework their identity, the meaning of being adopted may have little or great significance, depending on how adoption has been handled by family, peers, and the larger community. As adopted adolescents work on their identity, they may explore questions of searching for information about one's birth parents. Marshall Schechter and Doris Bertocci note that although young people vary in their need for information about, or contact with, birth parents, their curiosity about their origins is quite normal. Although little is known about the outcome of searching during adolescence, adults who have searched for birth families have generally been satisfied with the outcome.

### Unique Issues with Different Types of Adoption

Placements of children from foster care are somewhat risky: 10 to 15 percent disrupt or fail, sending children back to foster care. Children who are older, or have severe behavior problems (e.g., fire setting, sexual acting-out, suicidal behavior) are most likely to experience disruption. The adopted child comes with his or her own experiences with previous families and expectations for how families function, and these do not always fit with the expectations that adoptive families have. Flexible parenting styles, maintaining realistic expectations about the adoptee and the placement, and a clear commitment to the placement are important qualities that can enable families to be successful.

In international adoptions challenges for families include medical problems and cultural differences. Children who come from countries lacking in adequate medical care often have physical problems, including infectious disease, growth delay, and neurological diagnoses as a result of their preadoptive experiences. In addition, language and other cultural differences between the adopted child's home country and the adoptive family's country may further complicate adoptive family life.

Transracial adoptions have been very controversial, largely because they often involve European-American parents and adopted children of color. Research generally shows that transracially adopted children can adjust as well as children adopted by families of the same race. The success of such placements are determined, at least in part, by how well adoptive parents promote a sense of ethnic pride, how well they raise their children to be prepared for the discrimination they face, and how well they function as a family of color in the world.

### Summary

Adoption provides children and families with an alternate path to family life that can be both similar to and different from biological family life. Usually, the differences pose unique challenges and complications for family life and children's development; however most adopted children tend to adjust as normally as do nonadopted children. An understanding of the complications and similarities by all—not just the 60 percent of persons touched by adoption—can facilitate more appropriate support for adoptive families and adopted children.

### ALCOHOL, TOBACCO, AND OTHER DRUGS

Substance abuse is a family disease, one that can be transmitted both genetically and through the family environment. Children in families are affected by substance abuse in several ways, as illustrated in Figure 1. This chart shows that legal and illegal use of alcohol, tobacco, and other drugs (ATOD) can affect children through a number of avenues, including prenatal exposure *in utero*. This has very powerful policy implications, including its message that prenatal drug exposure, while very important in its effects on younger children, is only one of the several ways that children can be affected by these substances. Children are also exposed through their parents' and caretakers' use and abuse, through commercial media messages advertising alcohol and tobacco, and through community norms and regulations regarding substance use. The legality of a substance, as well as the way in which children are exposed to its use, plays a significant role in its effect on a child. Often, an emphasis is placed on the effects of illicit drugs, rather than on the harmful effects of tobacco and alcohol. At the federal level, for example, there is an annual "National Drug Policy Strategy" document; no such documents exist for alcohol or tobacco.

FIGURE 1

Both prenatal and postnatal exposure to alcohol, tobacco, and other drugs can affect children in lasting ways. Children who fail to form secure attachments to their parents or caregivers because of their parents' or caregivers' inability to give them sustained attention, children who live in a home where violence and substance abuse are frequent, children who grow up in neighborhoods where there are ten times as many liquor outlets and ads as in the rest of the community, adolescents who receive daily messages that to use alcohol is to be surrounded by attractive people having fun—all of these situations can have a lasting effect on the children involved.

According to the California State Commission on Children and Families, "prenatal exposure to tobacco, alcohol, and illicit drugs increases a child's risk of mental retardation, neurodevelopmental deficits, attention deficit disorders with hyperactivity, fine-motor impairment, as well as more subtle delays in motor performance and speech. Maternal smoking and infant exposure to environmental tobacco smoke has been linked to asthma, low birth

weight and an increased risk of sudden infant death syndrome" (p. 56).

As important as these effects are, however, a 1999 report of the U.S. Department of Health and Human Services cited data showing that 11 percent of all children in the nation live with a parent who is either alcoholic or in need of treatment for their abuse of illicit drugs. According to this report, "children prenatally exposed to drugs and alcohol represent only a small proportion of the children affected and potentially endangered by parental substance abuse" (p. ix).

Thus, as important as prenatal exposure is, a much larger number of children are exposed to milder effects of substance abuse than those exposed to its extreme effects *in utero* such as fetal alcohol syndrome, which has definite facial and other characteristics. The policy and practice questions this raises include whether measurable results will be more readily achieved by targeting severe or milder risk cases; and for which children, and at which points in their development, intervention should be attempted. It may be more appropriate to think of *treatment funds* being allocated to the most affected children and families, *early intervention funds* being allocated to those that are at risk of becoming seriously involved, and *prevention funds* being allocated to a much wider group of children whose needs are not as severe.

### How Are Schools Affected?

For schools, the issues of substance abuse in families arise at many levels of the preschool and school experience. These include:

- The mandated responsibility of schools to identify younger preschool-age children with disabilities, some of whom have been affected by exposure to alcohol and drugs.
- The effects of parental substance abuse on early learning, such as parents' willingness and ability to read to their children regularly.
- The effects of parental substance abuse on the home learning environment, such as whether there is a quiet place to study and a predictable schedule for homework.
- The effects of parental substance abuse on the development of peer-resistance skills that address the learned techniques of responding to negative pressure from peers.

- The effects of adolescent substance experimentation, use, and abuse on learning and social skills.

A 2001 analysis of the impact of substance abuse on schools conducted by researchers at Columbia University found that “substance abuse and addiction will add at least \$41 billion—10 percent—to the costs of elementary and secondary education this year, due to class disruption and violence, special education and tutoring, teacher turnover, truancy, children left behind, student assistance programs, property damage, injury and counseling” (Center for Addiction and Substance Abuse, p. 6).

### Schools’ Responses

Schools have responded with a variety of practices and policies, ranging from *zero-tolerance zones* to drug resistance education and individual counseling. Recent assessments of “what works” have emphasized the following ingredients in successful school-based and school-linked programs:

- They are developmentally appropriate.
- They are culturally sensitive.
- They include the perspectives of young people.
- They have sufficient *dosage* (and when needed, *booster* features) to make a difference. In this context dosage refers to the intensity of the program; some models of prevention programs provide as little as 17 hours of instruction during the fifth grade year, which has been shown to be an inadequate dosage to achieve any lasting impact.
- They are multifaceted, reflecting the dimensions of peers, parents, and the larger community.
- They are evaluated in enough depth to make midcourse corrections possible.

The U.S. Department of Education has rated several programs “exemplary” and “promising,” based on seven criteria developed by the department.

It should also be pointed out that from birth to age eighteen children spend only 9 percent of their lives physically at school, suggesting that one of the most important things schools can also do to respond to the problems of substance abuse is to support effective family- and community-focused prevention and intervention programs.

### Conclusions

The effects of family substance abuse on schools and learning are pervasive. However, as concerns about

adolescent tobacco, drug, and alcohol use have grown, so have the tools available to respond with both preventive and intervention activities. Schools should not venture into these arenas alone, but need to understand the available approaches and the literature on what works.

### FOSTER CARE

According to data from the U.S. Department of Health and Human Services’s Children’s Bureau, the number of children in foster care nationwide increased 93 percent between 1986 and 1999, from approximately 280,000 children to 581,000 children. Approximately 70 percent of the children in foster care in 1999 (405,000) were school-age children. The

following paragraphs provide a definition of foster care before discussing the influence of foster care on students' academic growth and development.

### **Foster Care**

Foster care is a substitute arrangement for children whose families are not able to provide basic social, emotional, and physical care, and who therefore require a substitute caregiver to assume the parental role to provide care, supervision, and support, on a short- or long-term basis. According to the Child Welfare League of America, "children should be removed from their parents and placed in out-of-home care only when it is necessary to ensure their safety and well-being" (p. 7).

Foster care (i.e., out-of-home care) is part of an array of child-welfare services that includes family support programs, family preservation programs, and permanency planning. The array can be described as a continuum, with out-of-home care viewed as a third line defense, following family preservation programs. Family support efforts focus on the prevention of child abuse and neglect, working to educate parents and alleviate a multitude of stressors that may increase the likelihood of maltreatment. Family preservation programs, foster care, and permanency planning efforts occur after a charge of child abuse or neglect has been substantiated by the public child-welfare agency. Family preservation programs, though not instituted in all abuse and neglect cases, provide intensive, in-home services in an effort to avoid out-of-home placement. Permanency planning—efforts to establish a permanent home for the child, either with his or her biological family, through adoption, or in legal guardianship—begins immediately, and permanency is the final goal for a child involved with the child-welfare system. Foster care is defined as a temporary arrangement for children while their families work to resolve the issues that resulted in an out-of-home placement for the child. However, foster care may also be a long-term option when other permanency efforts (i.e., family reunification, adoption, legal guardianship) are not successful.

Children may live in a variety of foster-care settings, depending on the characteristics of their case. Children with urgent substitute care needs may be placed in receiving or shelter homes for a short period of time. Like the array of child-welfare services, the remaining foster-care placement settings can be viewed as a continuum from the least restrictive en-

vironment and level of service intensity to the most restrictive environment and level of service intensity. In kinship foster care, children are placed with a relative; licensing requirements and eligibility for a foster-care payment for costs associated with raising the child depend on policies set by individual states. Family foster care is provided by foster parents who are licensed by a state or county after completing minimal training and meeting health and safety standards, and they receive a federal or state foster-care payment for each child residing in their home. Foster family agencies are private agencies contracted and licensed by the state or county to provide substitute care similar to family foster care but often with a greater level of service intensity. Group homes and residential treatment centers serve children with more specialized needs (i.e., emotional and behavioral difficulties) than other placement settings, are generally operated by private agencies contracted and licensed by the state or county, are more restrictive in their environment and therapeutic in their focus, and are staffed by individuals with more specific skills.

### **Vulnerability of Children in Child Welfare**

School-age children in foster care have any number of life experiences that make them vulnerable to bad outcomes, particularly if those experiences occurred at a young age. Judith A. Silver provides an overview of the risk factors frequently experienced by children who become involved with the child-welfare system and are placed in foster care. Citing Arnold Sameroff, Silver notes that the link between risk factors and outcomes is not deterministic, but the risk factors increase the likelihood of having a negative outcome, such as low test scores. Poverty, the principal risk factor, is a condition faced by the majority of families known to the child-welfare system. Poverty's impact ranges beyond low-socioeconomic status, influencing the effect of other risk factors. A second risk factor, maternal substance abuse, is associated with negative outcomes for children (i.e., low birth weight, premature birth) that influence neurodevelopmental functioning. Exposure to violence, whether during pregnancy or in the home as a child, is another important risk factor that affects a child's mental health as well as his or her cognitive development and ability to learn. Attachment (the stable, emotional connection with a caregiver) is an important consideration for children in foster care, given that the natural parenting structure has collapsed,

children have been removed from their biological families, and face placement within a new and unfamiliar home with new and unfamiliar people. Finally, a substantial proportion of children in foster care are there due to the maltreatment inflicted upon them by a caregiver. Maltreatment can vary (physical abuse, sexual abuse, neglect), but "all forms have predictable outcomes: devastating effects on sense of self, and emotional, social, and cognitive capabilities" (Silver, p. 15).

### The Impact of Foster Care on Student Learning

The impact of foster care on student learning is difficult to assess. The difficulty is due to what Gilles Tremblay calls a "constellation of factors" that determines the influence of foster care on a child (p. 87). Tremblay has organized the factors into five categories: (1) factors relating to the child; (2) familial factors; (3) placement factors; (4) factors related to professional assistance; and (5) external factors. Parsing out the influence of these additional variables to gauge the unique effect of being in care on student learning is problematic.

The educational standing of school-age foster children while in foster care and when leaving foster care is less ambiguous. Researchers using cognitive assessments, academic achievement outcomes, school completion outcomes, and school behavior outcomes as a measure of scholastic achievement have found that children are not faring well while in foster care, or when they leave the foster-care system at the point of their eighteenth birthday.

School-age children in foster care have not fared well in general IQ assessments or on more specific assessments of cognitive functioning. According to reports by Annick Dumaret (1985), Mary Fox and Kathleen Arcuri (1980), and Theresa McNichol and Constance Tash (2001), average IQ scores were 100 or below, and a high number of those studied (up to 46%) were rated as doing poorly on assessments of cognitive functioning.

Performance at the age-appropriate grade level, grade retention, course grades, test scores, and graduation are common indicators of academic performance. A number of studies have found that large percentages (up to 47%) of children in foster care were performing below grade level and that children in foster care were behind in their progress or performing below average across a range of academic subjects. In addition, a high percentage (up to 90%)

of children in foster care repeated at least one grade over their academic career. Researchers also reported that low percentages of students in foster care achieved passing grades, and many had low grade point averages. Children in foster care did not make gains in standardized test scores over time while in care, and scores were below the fiftieth percentile. School completion percentages were low for children discharged from foster care on their eighteenth birthday and a high percentage of children in foster care reported dropping out of school.

School behavior outcomes are important components of educational progress. Attendance appeared to be problematic for some children in foster care, as did general classroom behavior. Study findings for suspension and expulsions were less definitive.

### Conclusion

Assessing the impact of foster care on student learning is difficult due to the influence of various factors. However, research indicates that school-age children in foster care face difficulties in the learning process. Additional research, as well as policies and interventions, are required to assist children in achieving educational goals to ensure a lasting quality of life.

## FAMILY, SCHOOL, AND COMMUNITY CONNECTIONS

The goal of positive and productive family and community involvement is on every school improvement list, but few schools have implemented comprehensive programs of partnership. Research suggests that this goal is an important one to reach because families and communities contribute to children's learning, development, and school success at every grade level.

Studies are accumulating that show that well-designed programs of partnership are important for helping all families support their children's education in elementary, middle, and high schools. That is, *if* schools plan and implement comprehensive programs of partnership, *then* many more families respond, including those who would not become involved on their own.

Three questions need to be addressed to help educators move from believing in the importance of family and community involvement to conducting effective programs of partnership:

1. What is a comprehensive program of school, family, and community partnerships?
2. How do family and community partnerships link to other aspects of successful schools?
3. How can all schools develop and sustain productive programs of partnerships?

### Components of a Comprehensive Program of Partnerships

A framework of six types of involvement guides schools in establishing full and productive programs of school-family-community partnerships. This section summarizes the six types of involvement and discusses a few *sample practices* that are being implemented in schools across the country that are working to improve and increase family and community connections. Also noted are some of the *challenges* that all schools must overcome to create successful partnerships, along with examples of *results* that can be expected from each type of involvement for students, families, and educators.

Comprehensive programs of partnerships include activities for all six types of involvement. Because there are many activities to choose from, elementary, middle, and high schools can tailor their programs of partnerships by selecting activities that match specific school goals and the interests and needs of students and families.

**Type 1—Parenting.** Type 1 activities are conducted to help families strengthen parenting skills, understand child and adolescent development, and set home conditions to support learning at each school level. Type 1 activities also enable families to provide information to schools so that educators understand families' backgrounds, cultures, and goals for their children.

**Sample practices.** Among Type 1 activities, elementary, middle, and high schools may conduct workshops for parents; provide short, clear summaries of important information on parenting; and organize opportunities for parents to exchange ideas with other parents, educators, and community experts on topics of child and adolescent development. Topics may include health, nutrition, discipline, guidance, peer pressure, preventing drug abuse, and planning for the future. Type 1 activities also provide families with information on what to expect and how to prepare for students' transitions from preschool to elementary school, elementary to middle school, and middle to high school. Additional topics for successful parenting may concern family roles and responsibilities in student attendance, college planning, and other topics that are important for student success in school. Schools also may offer parents General Educational Development (GED) programs, family support sessions, family computer classes, and other learning and social opportunities for parents and for students. To ensure that families provide valuable information to the schools, teachers may ask parents at the start of each school year or periodically to share insights about their children's strengths, talents, interests, needs, and goals.

**Challenges.** One challenge for successful Type 1 activities is to get information from workshops to parents who cannot come to meetings and workshops at the school building. This may be done with videos, tape recordings, summaries, newsletters, cable broadcasts, phone calls, and other print and nonprint communications. Another Type 1 challenge is to design procedures that enable all families to share information easily and as needed about their children with teachers, counselors, and others.

**Results expected.** If useful information flows to and from families about child and adolescent development, parents will increase their confidence about parenting, students will be more aware of parents' continuing guidance, and teachers will better understand their students' families. For example, if practices are targeted to help families send their children

to school every day and on time, then student attendance will improve and lateness will decrease. If families are part of their children's transitions to elementary, middle, and high school, then more students will adjust well to their new schools, and more parents will remain involved across the grades.

**Type 2—Communicating.** Type 2 activities increase school-to-home and home-to-school communications about school programs and student progress through notices, memos, conferences, report cards, newsletters, telephone calls, e-mail and computerized messages, the Internet, open houses, and other traditional and innovative communications.

**Sample practices.** Among many Type 2 activities, elementary, middle, and high schools may provide parents with clear information on each teacher's criteria for report card grades; how to interpret interim progress reports; and, as necessary, how to work with students to improve grades or behavior. Type 2 activities include parent-teacher conferences; parent-teacher-student conferences; or student-led conferences with parents and teachers. Student involvement in conferences helps youngsters take personal responsibility for learning. Activities may be designed to improve school and student newsletters by including student work, a feature column for parents' questions, calendars of important events, and parent response forms. Many schools are beginning to use e-mail, voice mail, and websites to encourage two-way communication between families and teachers, counselors, and administrators.

**Challenges.** One challenge for successful Type 2 activities is to make communications clear and understandable for all families, including parents who have less formal education or who do not read English well, so that all families can understand and respond to the information they receive. Other Type 2 challenges are to know which families are and are not receiving and understanding the communications in order to design ways to reach all families; develop effective two-way channels of communication so that families can easily contact and respond to educators; and make sure that students understand their roles as couriers and interpreters in facilitating school and family connections.

**Results expected.** If communications are clear and useful, and if two-way channels are easily accessed, then school-to-home and home-to-school interactions will increase; more families will understand school programs, follow their children's prog-

ress, guide students to maintain or improve their grades, and attend parent-teacher conferences. Specifically, if computerized phone lines are used to communicate information about homework, more families will know more about their children's daily assignments. If newsletters include respond-and-reply forms, more families will send ideas, questions, and comments to teachers and administrators about school programs and activities.

**Type 3—Volunteering.** Type 3 activities are designed to improve recruitment, training, and schedules to involve parents and others as volunteers and as audiences at the school or in other locations to support students and school programs.

**Sample practices.** Among many Type 3 activities, schools may collect information on family members' talents, occupations, interests, and availability to serve as volunteers. These important human resources may help enrich students' subject classes; improve career explorations; serve as language translators; monitor attendance and call parents of absent students; conduct "parent patrols" and "morning greeters" to increase school safety; and organize and improve activities such as clothing and uniform exchanges, school stores, and fairs. Schools may organize volunteers to serve as home-room parents, neighborhood representatives, and sports and club contacts and may establish telephone trees to help parents communicate with each other about school programs and events. Schools may establish a corps of volunteers to offer a "welcome wagon" of information about the school to students and families who enroll during the school year. Schools also may create opportunities for mentors, coaches, tutors, and leaders of after-school programs to ensure that students have experiences that build and expand their skills and talents and that keep them safe and supervised after school. Some Type 3 activities may be conducted in a parent room or family center at the school where parents obtain information, conduct volunteer work, and meet with other parents.

**Challenges.** Challenges for successful Type 3 activities are to recruit volunteers widely so that parents and other family members feel welcome; make hours flexible for parents and other volunteers who work during the school day; provide needed training; and enable volunteers to contribute productively to the school, classroom, and after-school programs. Volunteers will be better integrated in school programs if there is a coordinator who is re-

sponsible for matching volunteers' available times and skills with the needs of teachers, administrators, and students. Another Type 3 challenge is to change the definition of "volunteer" to mean anyone who supports school goals or students' learning at any time and in any place. This includes parents and family members who voluntarily come to school as audiences for students' sports events, assemblies, and musical or drama presentations, and for other events that support students' work. It also includes volunteers who work for the school at home, through their businesses, or in the community. A related challenge is to help students understand how volunteers help their school and to encourage students to interact with volunteers who can assist them with their work and activities.

**Results expected.** If tasks are well designed, and if schedules and locations for volunteers are varied, more parents, family members, and others in the community will assist elementary, middle, and high schools and support students as members of audiences. More families will feel comfortable with the school and staff; more students will talk and interact with varied adults; and more teachers will be aware of and use the time, talents, and resources of parents and others in the community to improve school programs and activities. Specifically, if volunteers serve as attendance monitors, more families will assist students to improve attendance. If volunteers conduct a "hall patrol" or are active in other locations, school safety will increase and student behavior problems will decrease because of a better student–adult ratio. If volunteers are well-trained as tutors in particular subjects, student tutees will improve their skills in those subjects; and if volunteers discuss careers, students will be more aware of their options for the future.

**Type 4—Learning at home.** Type 4 activities involve families with their children in academic learning activities at home that are coordinated with students' classwork and that contribute to student success in school. These include interactive homework, goal-setting for academic subjects, and other curricular-linked activities and decisions about courses and programs.

**Sample practices.** Among many Type 4 activities, elementary, middle, and high schools may provide information to students and to parents about the skills needed to pass each class, course, or grade level and about each teacher's homework policies. Schools also may implement activities that can help

families encourage, praise, guide, and monitor their children's work by using interactive homework strategies; student–teacher–family contracts for long-term projects; summer home-learning packets; student-led at-home conferences with parents on portfolios or folders of writing samples or work in other subjects; goal-setting activities for improving or maintaining good report card grades in all subjects; and other approaches that keep students and families talking about schoolwork at home. Family fun and learning nights are often used as a starting point to help parents and students focus on curricular-related topics and family interactions. These meetings require parents to come to the school building. A systematic approach to increasing academic conversations at home is found in the Teachers Involve Parents in Schoolwork (TIPS) interactive homework for the elementary and middle grades.

**Challenges.** One challenge for successful Type 4 activities is to implement a regular schedule of interactive homework that requires students to take responsibility for discussing important things they are learning, interviewing family members, recording reactions, and sharing their work and ideas at home. Another Type 4 challenge is to create a schedule of activities that involve families regularly and systematically with students on short-term and long-term goal-setting for attendance, achievement, behavior, talent development, and plans for college or careers.

**Results expected.** If Type 4 activities are well designed and implemented, student homework completion, report card grades, and test scores in specific subjects will improve; and more families will know what their children are learning in class and how to monitor, support, and discuss homework. More students should complete required course credits, select advanced courses, and take college entrance tests. Students and teachers will be more aware of families' interest in students' work.

**Type 5—Decision-making.** Type 5 activities include families in developing schools' mission statements and in designing, reviewing, and improving school policies that affect children and families. Family members become active participants on school improvement teams, committees, PTA/PTO or other parent organizations, Title I and other councils, and advocacy groups.

**Sample practices.** Among Type 5 activities, elementary, middle, and high schools may organize and maintain an active parent association and include

family representatives on all committees for school improvement (e.g., curriculum, safety, supplies and equipment, partnerships, fund-raising, postsecondary college planning, career development). In particular, along with teachers, administrators, students, and others from the community, parents must be members of the “Action Team for Partnerships,” which plans and conducts family and community involvement activities linked to school improvement goals. Schools may offer parents and teachers training in leadership, decision-making, policy advocacy, and collaboration. Type 5 activities help to identify and provide information desired by families about school policies, course offerings, student placements and groups, special services, tests and assessments, annual test results for students, and annual evaluations of school programs.

**Challenges.** One challenge for successful Type 5 activities in all schools is to ensure that leadership roles are filled by parent representatives from all of the major race and ethnic groups, socioeconomic groups, and neighborhoods that are present in the school. A related challenge is to help parent leaders serve as effective representatives by obtaining information from and providing information to all parents about school issues and decisions. At the high school level, a particular challenge is to include student representatives along with parents in decision-making groups and in leadership positions. An ongoing challenge is to help parents, teachers, and students who serve on an Action Team for Partnerships or other committees learn to trust, respect, and listen to each other as they collaborate to reach common goals for school improvement.

**Results expected.** If Type 5 activities are well implemented in elementary, middle, and high schools, more families will have input into decisions that affect the quality of their children’s education; students will increase their awareness that families and students have a say in school policies; and teachers will increase their understanding of family perspectives on policies and programs for improving the school.

**Type 6—Collaborating with the community.** Type 6 activities draw upon and coordinate the work and resources of community businesses; cultural, civic, and religious organizations; senior citizen groups; colleges and universities; governmental agencies; and other associations in order to strengthen school programs, family practices, and student learning and development. Other Type 6 activities enable stu-

dents, staff, and families to contribute their services to the community.

**Sample practices.** Among many Type 6 activities, elementary, middle, and high schools may inform students and families about the availability of community programs and resources, such as after-school recreation, tutorial programs, health services, cultural events, service opportunities, and summer programs. This includes the need to assist students and families to gain access to community resources and programs. Some schools work with local businesses to organize “gold card” discounts as incentives for students to improve attendance and report card grades. Collaborations with community businesses, groups, and agencies also strengthen the other five types of involvement. Examples include enhancing Type 1 activities by conducting parent education workshops for families at community or business locations; increasing Type 2 activities by communicating about school events on the local radio or television stations, and at churches, clinics, and supermarkets; soliciting volunteers from businesses and the community to strengthen Type 3 activities; enriching Type 4 activities by offering students learning opportunities with artists, scientists, writers, mathematicians, and others whose careers link to the school curriculum; and including community members on Type 5 decision-making councils and committees.

**Challenges.** One challenge for successful Type 6 activities is to solve problems associated with community-school collaborations, such as “turf” problems of who is responsible for funding, leading, and supervising cooperative activities. The initial enthusiasm and decisions for school-community partnerships must be followed by actions that sustain productive collaborations over the long term. Another Type 6 challenge is to recognize and link students’ valuable learning experiences in the community to the school curricula, including lessons that build on students’ nonschool skills and talents, their club and volunteer work, and, in high school, their part-time jobs. A major challenge is to inform and involve families in community-related activities that students conduct. Related challenges are to help students understand how community partners help their school and to engage students, themselves, as volunteers and in service-learning in their own schools, in other schools, and in the community.

**Results expected.** Well-implemented Type 6 activities will increase the knowledge that families, students, and schools have about the resources and programs in their community that could help them reach important goals. Well-designed community connections will increase student access to and participation in community programs. Coordinated community services could help many students and their families prevent health, social, and educational problems or solve problems before they become too serious. Type 6 activities also should support and enrich school curricular and extracurricular programs.

**Summary.** The six types of involvement create a comprehensive program of partnerships in elementary, middle, and high schools, but the implementation challenges for each type of involvement must be met in order for programs to be effective. The quality of the design and content of the involvement activities directly affect the expected results. Not every practice that involves families will result in higher student achievement test scores. Rather, practices for each type of involvement can be selected to help students, families, and teachers reach specific goals and results. The examples above include only a few of hundreds of suggestions that can help elementary, middle, and high schools develop strong programs of partnerships.

### **How Partnerships Link to Other Aspects of Successful Schools**

Good schools have qualified and talented teachers and administrators, high expectations that all students will succeed, rigorous curricula, engaging instruction, responsive and useful tests and assessments, strong guidance for every student, *and* effective school, family, and community partnerships. In good schools, these elements combine to promote students' learning and to create a school climate that is welcoming, safe, caring, stimulating, and joyful for all students, educators, and families.

All of the elements of successful schools are interconnected. It is particularly important for educators to understand that partnerships are not extra, separate, or different from the "real work" of a school, but that they contribute to the quality of a school's program and to student success. Two examples help clarify the links of family and community involvement to the success students experience in schools' academic and guidance programs.

**Family and community involvement may contribute to the quality of schools' academic programs**

**and student learning.** National and local surveys indicate that students and their families have very high aspirations for success in school and in life. Fully 98 percent of a national sample of eighth-grade students planned to graduate from high school, and 82 percent planned at least some postsecondary schooling, with over 70 percent aiming to complete college. Tenth- and twelfth-grade students had similar high ambitions. In order to help students reach their aspirations, educators and families must work better together to help students: succeed at every grade level, pass the courses they need to complete high school, and initiate actions to attend college. Schools, with families' support, also must provide some students with extra help and more time to learn in coaching classes, extra-help courses, summer school, and tutoring, mentoring, and other responsive programs.

Families need good information about their children's curriculum each year; the teachers' instructional approaches; extra help available to students; and the nature of tests and assessments in order to be able to discuss important academic topics with their children at home. Families also need to understand how their children are progressing in each subject, how to help students set and meet learning goals, and how to work with students to solve major problems that threaten course or grade-level failure. Some elementary, middle, and high schools create individual student educational plans and conferences with all students and parents.

Many schools use new and varied teaching strategies that are unfamiliar to most families. These may include group activities, problem-solving processes, prewriting techniques, student-as-historian methods, interactive homework, and other innovative approaches to promote learning. Families and others in the community also need to know about major tests, report card criteria, and other state and local standards that schools use to determine students' progress and pathways through school. Some schools' Action Teams for Partnerships design daytime or evening workshops for parents to learn about and try items on new performance-based assessments.

With clear information about all aspects of schools' academic programs, more families could guide their children's decisions about courses, homework completion, studying for tests, and taking steps toward college or work. If classroom teachers, students, and parents communicate clearly and frequently about students' academic programs,

progress, and needs, more students will succeed at high levels and fulfill their own and their families' high expectations.

**Family and community involvement may contribute to the quality of schools' guidance programs and students' attitudes and behavior.** School guidance and support services are stronger and serve students better if educators, students, and families are well connected. Students need to know that their guidance counselors and teachers understand and appreciate their families' cultures, hopes, and dreams. As students proceed through the grades, they struggle to balance their love for their family, need for guidance, and need for greater independence. Educators and parents can help students see that these seemingly contradictory pressures can co-exist.

Guidance counselors, school social workers, and school psychologists in elementary, middle, and high schools should meet with students' families and serve as key contacts for parents to call if questions arise about students' academic progress, behavior, peer relations, or interactions with teachers. In some middle and high schools, guidance counselors are members of interdisciplinary teams of teachers who meet with parents and students on a regular schedule. In all schools, guidance counselors could contact parents *before* students are at serious risk of failing courses because of absence, attitudes, classwork, or homework in order to devise collaborative approaches to help students succeed in school.

Families need to know about the formal and informal guidance programs at their children's schools. This includes knowing the names, phone or voice-mail numbers, and e-mail addresses of their children's teachers, counselors, advocates, and administrators in order to reach them with questions about their children's progress or problems. This is particularly important at times of transition when students move into elementary school, or from elementary to middle or middle to high school. With good information, parents and other family partners become and remain more involved in their children's education, and more of them can assist students to adjust successfully to their new schools.

When students, guidance counselors, teachers, and parents communicate well about students' social and emotional development and special needs, more students are likely to succeed each year and stay in school.

## **How Schools Can Develop and Sustain a Productive Partnership Program**

Many schools are demonstrating how to design, implement, and sustain strong programs of school, family, and community partnerships. These schools are using the framework of six types of involvement to ensure that families are well informed about and engaged in their children's education at school and at home. They are using the research base summarized above, and they are being supported and assisted by school principals, district administrators and key staff, state leaders, and others.

In well-designed partnership programs, each school forms an Action Team for Partnerships consisting of teachers, parents, administrators, and others. Each team writes an annual action plan for partnerships, implements and oversees activities, maintains an adequate budget, evaluates the quality of partnerships, and improves plans and activities from year to year. In excellent programs, activities to involve families and community partners are linked to school improvement goals to produce the kinds of results described above. For example, family and community involvement activities may be selected to increase the support that all students receive at home, at school, and in the community to help students improve reading skills, math scores, attendance, behavior, and other indicators of school success. To aid this process, the National Network of Partnership Schools at Johns Hopkins University provides research-based guidelines, training, and ongoing assistance and professional development to schools, districts, and states that want to establish and sustain effective partnership programs.

Many research studies have helped answer the three questions posed at the beginning of this entry. By drawing on the growing research base, educators, parents, and community leaders can work together, think about, talk about, and take action to develop comprehensive programs of school, family, and community partnerships in their schools. Annual plans should include family and community involvement activities that support school improvement goals and that contribute to the success of elementary, middle, and high school academic programs and guidance services for all students. This can be done with new and useful research-based tools, materials, and networks to establish and continually improve programs and practices of partnerships.

Despite important advances since the 1980s in research and in practice on school, family, and community partnerships, there still are many questions that must be addressed to inform and productively involve all families in their children's education. Studies are needed at all grade levels to identify which family and community involvement activities significantly improve students' reading, math, and other skills and attitudes; and which involvement activities are particularly helpful to families and students at times of transitions to new schools. There are important questions to address on how to reach families with diverse cultural and language backgrounds, and how to integrate all families to create a strong, supportive school community. Also needed is more knowledge about how to involve fathers more effectively in their children's education; how community resources can be tapped to assist students, families, and school programs; and how to increase students' understanding of their roles and responsibilities in facilitating partnership activities that link home, school, and community.

Notably, this field of study has successfully linked research results to the development of educational policy and school practice. As new questions about school, family, and community partnerships are systematically addressed, knowledge will accumulate that should continue to improve the connections of home, school, and community to benefit students.

## FAMILY SUPPORT SERVICES

### OVERVIEW

Jacquelyn McCroskey

### INCOME SUPPORT SERVICES FOR CHILDREN AND FAMILIES

Susan E. Smith

## OVERVIEW

Most schools encourage parents to become involved in their children's education, and some may even require parent participation in school activities. Most teachers and educational administrators, however, realize that parents who are working several jobs to make ends meet or struggling with complicated

health or family problems may not be able to help their children learn. Those who are recent immigrants or who did not do well in school themselves may not know how to help or may feel intimidated by school. The challenges of daily life can be so overwhelming—especially for poor families living in dangerous or decrepit inner-city neighborhoods or those living in far-flung rural areas with few resources—that educational success for children may not seem to be a realistic family priority.

In response, many schools are increasing their efforts to support families and to assure that both parents and children get the social and health services they need. Theories and models of how to do this effectively vary widely, and experts have suggested a number of different approaches. Some schools focus on assuring referral to outside agencies providing services for families and children, others on partnering with these allied agencies to bring services on or near school campuses, and still others on increasing support services offered by the school itself. These programs are designed to increase access to needed services, to improve academic performance, and to help parents prevent or resolve problems, develop new skills, and learn how to participate more effectively in their children's education.

Such programs draw from a century of reform efforts on two parallel, but often interrelated, tracks—education reform and neighborhood-based social services. In 1995 David Tyack and Larry Cuban described some of the ways that these ideas have overlapped:

Prodded by a variety of lay reformers to expand social and health services, educational administrators added programs of physical education and recreation and gave instruction in health. Hundreds of cities added vacation schools (later called summer schools), school lunch programs, and medical and dental care, especially for the children of working-class immigrant families. States and urban districts began creating special schools or classes for physically or emotionally handicapped students—the number of separate state or district schools for such children increased from 180 in 1900 to 551 in 1930. Cities also created new categories of classes for “misfits”—children who were too “backward” to proceed at the normal rate in graded classrooms or too

unruly for the teachers to handle. (pp. 20–21)

Late-nineteenth-century settlement houses offer one of the earliest examples of how neighborhood-based services for families can supplement the work of overcrowded inner-city schools. For example, the first Hull-House (established in Chicago in 1889 by Jane Addams and her associates) developed programs such as a day nursery and kindergarten for the children of “hard-driven mothers who went out to work all day, sometimes leaving the little things in the casual care of a neighbor, but often locking them into their tenement rooms” (Addams, p. 127). Hull-House also sponsored “clubs” for the “large number of children who leave school the very week they are fourteen years old, only too eager to close the school-room door forever on a tiresome task that is at last well over” (Addams, p. 86).

While settlement houses offered many ideas about how to support families, another approach was taken in the late nineteenth century by Charity Organization Societies, which developed case-by-case methods of aiding poor and troubled families. During the last century, ideas about how to help poor families and children swung back and forth between these twin poles of casework and neighborhood-based social services. One end of the continuum suggests that problems are primarily within the individual or family (requiring individualized casework) and the other that they are social, structural, or economic (requiring neighborhood and community solutions). Recent interest in orienting family support services around neighborhood schools can be seen, at least in part, as another generation's “reinvention” of neighborhood-based support services for families and their children.

### **Conflicting Values about How Schools Should Support Families**

Some argue that schools need to focus on educational issues, leaving social issues to families, religious, civic, and community institutions. Others believe that children who come to school hungry, sick, or frightened cannot learn, no matter how thoughtful the curriculum or how accomplished the teacher. Opinions on how schools should interact with families are varied and deeply felt, based on individual experiences, values, and perceptions.

While questions about whether and how schools should be involved in supporting families are debat-

ed in forums across the country, however, most schools already provide a broad range of nonclassroom “support services” designed to promote academic achievement. Because each school district or local educational authority sets its own policies in response to local expectations and conditions, there is a very wide range in the nonclassroom-based supports and services offered across school districts or even between schools in the same district. Some schools have many such services whereas others have very few—and some do a better job than others of tracking and organizing the resources they do have. For example, distress over there being “no services” for the children in one inner-city school in Los Angeles in the mid-1990s led to a count of the different kinds of programs already in place to provide support services to students. When the counters found that seventeen different kinds of “school support services personnel” were already working in the school, everyone agreed that the first priority was a “resource coordinating council.” Coordinating the support services that were already available was an essential first step, but the next steps included assessing the other needs of teachers, students, and parents and developing partnerships with local allied agencies to provide some of the services most needed in the community.

### **What Are Family Support Services?**

All families need help and support in raising their children. Some can get by with the informal support of family and friends, employment-related benefits such as health insurance, and fee-for-service arrangements to purchase child care or other needed services. Many families, however, will also need help from public, nonprofit, and community-based agencies that provide services to children and families on a free or low-cost basis. The service delivery systems that provide these services are organized somewhat differently in each community, but the services needed by families generally include child care, parent education, income support, and health and mental health services. Some families also need help in dealing with dependent (abused or neglected) or delinquent youth.

In some communities (often suburbs or relatively homogenous smaller urban areas), the established public and private human service systems work reasonably well, information about and referral to different kinds of services is available, and families find the help they need. In too many other

communities, however, families face serious barriers to accessing and using services. In rural areas, the services may be far away or not available at all. In dense urban areas—especially poor inner-city neighborhoods with large numbers of immigrants and families with multiple needs—human service delivery systems tend to be chaotic, overwhelmed, and confusing. Sometimes even the most knowledgeable people do not know where to find key child and family agencies, much less how families get access to different kinds of specialized services.

Schools are the most visible neighborhood institutions serving families and children, but many school personnel do not know about many community resources so they cannot guide parents who need help. Some school employees are reluctant to get involved in family troubles or to try to bridge complex institutions, and others are frustrated when their efforts to help do not work. Despite these difficulties, however, in many rural areas and inner-city communities where the needs of children and families are most visible and urgent, partnerships between schools, allied public and private agencies, and community-based groups are flourishing.

In some places, reform efforts have led schools to better define and mobilize their internal resources or to develop connections with services offered by allied agencies. In others, schools have opened their buildings and playgrounds after the school day ends to external organizations that provide after-school activities, parent education, and many other family support services. In some jurisdictions, school leaders have actively engaged in partnerships to change local policies to assure that the services families need are available through allied agencies. Assuring that these allied agencies are ready and able to help families can free schools to attend to their primary purpose, as Lisbeth B. Schorr suggested in a 1997 description of Missouri’s Caring Communities program:

teachers who had once been kept at arm’s length by human service professionals, were trained to spot signs of trouble in their pupils—from slumps in classroom performance to depression—and to convey their concerns to Caring Communities coordinators. “The greatest accomplishment of Caring Communities is that I feel relieved of responsibility for social problems,” said one teacher. “I can really teach.” (p. 288)

Because conditions are so different in each community, there are many ways to approach the question of what schools can and should do to support families and assure that children are not so hungry, sick, or troubled that they cannot pay attention to learning. The answers are being invented (and sometimes reinvented) in communities across the country. The solutions devised are as varied and numerous as the communities served, but the following critical issues have received special attention from professionals in the field:

1. How to prevent family problems from developing in the first place
2. How to assure that young children are ready for school
3. How schools can more effectively connect families to specialized treatment services
4. How to improve training for and the evaluation of family support services

### Preventing Family Problems

While the idea of supporting families is not new, discussions took on a different tone in the early 1980s with the establishment of the Family Resource Coalition, later called Family Support America. This national organization serves as a catalyst to assure that families have access to the support they need in welcoming surroundings in their own communities, where knowledgeable and respectful staff speak the family's language and understand its cultural traditions. These services are designed to recognize and build on family strengths, increase family stability, prevent problems, improve parenting skills, and enhance child development.

Whether they are based in schools, child-care centers, social agencies, or medical clinics, preventively oriented family support programs should be guided by shared principles, which include: (1) staff and families work together in relationships based on equality and respect; (2) families are resources to their own members, to other families, to programs, and to communities; (3) programs affirm and strengthen families' cultural, racial, and linguistic identities and enhance their ability to function in a multicultural society; (4) programs advocate with family members for services and systems that are fair, responsive, and accountable; and (5) programs are flexible and responsive to emerging family and community issues. Guided by such principles, the "family support movement" is working to change

professional attitudes and practices, encouraging more egalitarian, flexible, respectful, and responsive interactions with families.

### School Readiness

Guided by the family support movement, many people have focused on providing effective early childhood intervention programs to enhance child development and help children and parents get ready for school. After analyzing results from a number of the most rigorously evaluated early intervention programs, RAND researchers in 1998 concluded that these programs can provide significant benefits, especially for disadvantaged children and their families.

The significance of early childhood experiences in later learning was reaffirmed by the National Research Council and the National Institute of Medicine in a 2000 analysis of the extensive scientific evidence:

A fundamental paradox exists and is unavoidable: development in the early years is both highly robust and highly vulnerable. Although there have been long-standing debates about how much the early years really matter in the larger scheme of lifelong development, our conclusion is unequivocal: What happens during the first months and years of life matters a lot, not because this period of development provides an indelible blueprint for adult well-being, but because it sets either a sturdy or fragile stage for what follows. (Shonkoff and Phillips, pp. 4–5)

Their summary of the evidence affirms the positive effects of high-quality early childhood programs on school performance, and suggests that a number of different kinds of preschool programs can be effective: "Taken together, the follow-up literature provides abundant evidence of intervention-control group differences in academic achievement during middle childhood, but no consistent or distinctive pattern of preschool curriculum or program format" (Shonkoff and Phillips, p. 351).

Recognizing the salience of early development, more programs are being developed to help both preschool children and their parents—assuring that children and parents are ready to get the most from school. For example, school-linked family support services can help parents find affordable, high-

quality child care, improve parenting skills through parent education information and experiences, and help ease the transition between child care and school. At the same time, leaders in communities around the country have also realized that significant changes may be needed to help schools get ready for the changing population of children and families.

### Connecting Families to Specialized Treatment Services

Many schools have focused on identifying children with problems so that they can be referred for testing, special education, or treatment. Even with more access to early childhood development and prevention services, specialized treatment for children and youth with behavior and health problems will still be needed. In this area too, there are enormous local differences in the availability, cost, and quality of specialized treatment services. Not surprisingly, problems are most likely to be found in poor rural districts where families have little access to services and in large inner-city districts where there are not enough resources to go around.

Partnerships between schools and allied public agencies responsible for providing health and mental health services, intervening in cases of child abuse and neglect, and responding to juvenile violence and delinquency are working effectively in some communities. For example, evaluation of California's Healthy Start Initiative, a statewide effort designed to help schools build bridges to allied public and community-based agencies that serve the same families and children, has demonstrated significant improvements in child and family outcomes. The long-term goal of many such reform efforts is to restructure existing child and family services systems so that they are less fragmented and more integrated, less intimidating and more accessible, and less confusing and more understandable to families. Unfortunately, that goal remains a dream in most places.

### The Challenges of Training and Evaluation

Efforts to develop and sustain school-community partnerships present a number of challenges. Two questions require immediate attention.

First, how can education and training be improved to build connections? The possibilities of training different kinds of professionals to form effective interprofessional teams, and to collaborate more effectively with families, are being explored in

university-community pilot projects throughout the country. Most university-based training for teachers and health and human services professionals, however, is still based in separate specialties that do not prepare professionals for work across disciplinary and organizational boundaries. Most of the people who work in school-community partnerships must learn on the job, and only a few have the time, energy, or resources to share the important lessons they are learning.

Second, how can the effectiveness of all kinds of school-community partnerships be continuously evaluated? The people involved in such partnerships should be able to document the costs and benefits of different approaches to family support services. Targeted evaluation research can help to refine and improve programs, to improve planning, and to document results for participants, school boards, principals, teachers, and taxpayers. While some data is available on the outcomes of these efforts, a great deal more information is needed to guide further development of the field.

JACQUELYN MCCROSKEY

### INCOME SUPPORT SERVICES FOR CHILDREN AND FAMILIES

Because of a combination of demographic trends and inadequate income supports, children comprise the demographic group at greatest poverty risk in the United States. In the mid-1970s, there was grave concern about elderly poverty, as nearly one in three elderly adults lived in poor households. Since then, the indexing of social security benefits to inflation has allowed benefits to better keep up with living costs. As a consequence, the elderly are now less likely to be poor than most other Americans. Alongside this success story of social policy ameliorating poverty, however, is the unfortunate fact that children have replaced the elderly at the low end of the U.S. economic ladder.

While the percent of children living in single-parent homes increased from 10 percent in 1960 to 31 percent in 1998, in 2000 more than half of poor families were headed by unmarried mothers. A minority of children will experience a childhood in which both parents are present, and, though mothers are more likely than ever to be employed, many are the only earner in their household. Mother-only families not only rely on lower wages than those typically earned by males but also must manage child-care and other parenting responsibilities alone. Income supports become increasingly important in these instances.

As more middle-class mothers become employed, income support for parents has increasingly required work participation. This trend culminated in the passage in 1996 of the Personal Responsibility and Work Opportunity Reconciliation Act, which created the principal program for poor families,

Temporary Assistance to Needy Families. Cash support for families is limited. In response to concerns over work disincentives and fraud, in-kind benefits have become more common than cash. These in-kind benefits, particularly food stamps, health insurance, and health care, are available to more families than are income supports.

### Specific Income Support Programs

There are six family income support programs, divided into cash supports and tax benefits. The Earned Income Tax Credit (EITC) blurs the line between the two categories. No program alone raises families from poverty, but the EITC, coupled with full-time work, can raise a small family just above the poverty line. To make ends meet, low-earning, single-parent families must often supplement income supports with child-care and housing subsidies, medical assistance, and food stamps.

**Temporary Assistance to Needy Families (TANF).** The TANF program, which is the best-known income support program, is often generically referred to as “welfare.” This program replaced Aid to Families with Dependent Children (AFDC) as part of the Personal Responsibility and Work Opportunity Reconciliation Act of 1996. TANF provides time-limited cash support to families with minor children. While states have discretion in defining program details, particularly benefit levels, states may not use federal money to offer families cash grants for more than two consecutive years or for more than five years over their lifetime. Adult recipients are also mandated to participate in work, or work-related activities, for at least thirty-two hours per week. Certain provisions exempt a small number of parents, such as those with newborns or those caring for children or relatives with disabilities.

**Supplemental Security Income (SSI).** SSI provides cash assistance to elderly persons or persons with disabilities whose income falls below the federal poverty line. Originating as Aid to the Blind and Aid to the Aged, part of the Social Security Act of 1935, then as Aid to the Disabled in 1950, SSI was created in 1972 from the consolidation of existing programs for the disabled and indigent elderly. Eighty-nine percent of SSI recipients also receive Social Security. Children with disabilities are also eligible for SSI.

SSI funding comes solely from the federal government, and it is administered by the Social Security Administration. As a result, benefits and eligibility

are uniform across states. The maximum allowable annual federal SSI benefit in 1999 was \$6,000. Overall, SSI income support is about 75 percent of the poverty level.

**General Assistance (GA).** While no federal program exists to aid able-bodied adults under sixty-five years of age, most states and localities offer minimal cash grants. Most recipients are single adults, but others receiving benefits may include parents with children in public custody, parents previously convicted of a felony (making them ineligible for TANF), and parents who have timed off of TANF. GA grants are generally intended to offset minimal living expenses, not as a substitute for work, and offer support well below the poverty level. In 1992, forty-one states offered GA programs. Since then, there have been severe cutbacks in GA programs, with some states, such as Michigan, eliminating the programs altogether.

**Earned Income Tax Credit (EITC).** The EITC program was originally established in 1975 to address a major criticism of AFDC—that it encouraged single parenting and discouraged work by limiting eligibility to nonworking single parents. The EITC, which is administered by the Internal Revenue Service, functions like a negative income tax, supplementing the earnings of low-income workers who have children. While tax policy is more often used to assist middle-class families, in the form of mortgage deductions and business credits, the EITC uses tax policy for a program targeting low-income families.

In 1996 a family with one child with earnings of up to \$25,000 per year would be eligible for a tax refund under the EITC program. The tax credit has survived several important revisions over the years. Eligibility has expanded to include nearly all low-income families with children. The credit can be paid in installments throughout the year, instead of as a year-end refund. The maximum grant is paid to minimum-wage, full-time workers, with the consequence of lifting their wage up to poverty level. Proponents argue that the credit must be sufficient to ensure that full-time workers, even at minimum wage, do not have to raise their families in poverty.

**Tax deductions and credits.** Nearly all families benefit from tax code provisions, most often from the \$600 per child tax credit and the \$2,900 per person tax exemption. Tax code also allows for the deduction of certain child-care expenses. Unlike most benefits to families and children, these are universal

supports to families regardless of income. Other tax policies, such as mortgage interest deductions, disproportionately assist middle- and upper-income families.

### FAWCETT, HAROLD P. (1894–1976)

Professor of mathematics education at Ohio State University, Harold P. Fawcett was best known for his work on pedagogy in geometry, particularly the teaching of reasoning and proof. Fawcett was born in Upper Sackville, New Brunswick, Canada. In 1914 he received an A.B. from Mount Allison University and obtained a high school teaching position in a New England village. After World War I service with the United States Army in France, Fawcett taught in the home study division of the New York Young Men's Christian Association (YMCA) schools (1919–1924). He was awarded an A.M. in 1924 by Columbia University and continued doctoral work while teaching in Columbia's extension division. In 1937 he received a Ph.D. in mathematics education from Teachers College, Columbia University. Faw-

cett joined the faculty at Ohio State University in 1932, where he rose to full professor (1943), served as chair of the Department of Education (1948–1956), and retired with emeritus rank (1964). During his early years at Ohio State, Fawcett also taught at the affiliated University School, where he served three years as associate director. In 1958 he was elected to a two-year term as president of the National Council of Teachers of Mathematics (NCTM).

The most enduring contribution by Fawcett to the field of mathematics education was the thirteenth yearbook of the National Council of Teachers of Mathematics, *The Nature of Proof* (1938). The publication was, essentially, his doctoral thesis, which drew upon his experiences and experiments in teaching high school geometry at the University School. Fawcett believed that, with respect to geometry, contemporary classroom practice was incongruous with the new emphasis on the development of critical and reflective thought advocated by national committees and influential mathematicians. If asked, Fawcett asserted, many teachers would express agreement with the new emphases for demonstrative (proof-oriented) geometry to introduce students to the nature of deductive reasoning and to develop in them an understanding of what proving something really means. Fawcett's experience, however, suggested to him that, rather than emphasizing the role of logical processes in developing and establishing a geometrical system, most teachers taught geometry as a given set of definitions and theorems to be memorized.

Fawcett's approach was based upon four assumptions: (1) high school students enter a geometry course with practical experience in reasoning accurately; (2) students should be permitted to use their own approaches to reasoning in geometry; (3) the students' logical processes, not those of the teacher, should guide development of the subject; and (4) students need opportunities to apply the deductive method to situations that have clear relevance to their own lives. These assumptions reflect the influence of broader educational trends of the 1930s, including student-centered pedagogy, an investigation–discovery orientation, the incorporation of experiences external to school, and a concern for transfer of skills to areas outside mathematics.

Classroom implementation of Fawcett's pedagogical approach was unique at the time. Virtually nothing was given to the students. Rather than re-

ceiving a published textbook, students developed their own notebooks, with individuality welcomed. Students decided which terms should be undefined and which needed definition. The definitions were developed and refined by the students after discussion, and then entered into their notebooks. If a proposition appeared obvious to the students, it was taken as an assumption. Instead of being given a statement to prove, students were presented with a figure and encouraged to identify properties of the figure that might be assumed. Following this, they were to discover the implications of these properties. With guidance from the teacher, important implications were generalized into theorems, resulting in a limited, but richly understood, structure. In effect the students developed the geometry curriculum themselves, through a process of questions, discussion, and reasoned reflection.

Criteria of success for Fawcett's program was based on its effect on students' behaviors in approaching problem tasks. For example, did students first seek to clarify definitions or conditions of the problem situation? Fawcett's own investigation suggested that his approach, emphasizing reasoning processes rather than skills, improved reflective thinking more than did the traditional course, without significant loss of competence in subject matter knowledge. In light of his ideas on the pedagogy of geometry, Fawcett was invited to join the Committee on the Function of Mathematics in General Education, appointed by the Progressive Education Association's Commission on the Secondary School Curriculum. His work influenced the sections of the committee report that dealt with logic and proof. Renewed interest in Fawcett's pedagogical approach to geometry and his emphasis on helping students to develop critical, reflective thinking processes led the National Council of Teachers of Mathematics to reissue the *Nature of Proof* in 1995.

Although Fawcett championed the role of the student in developing deductive mathematical systems, he viewed the teacher as an indispensable guide to move students toward self-directed, independent learning. He believed that a geometry course could provide opportunities to gain knowledge and develop understanding of deductive reasoning; however, only the teacher could provide the classroom environment in which original and creative thinking could flourish. From his early days as a student in a small Canadian school with an enrollment of just two dozen, Fawcett never forgot the im-

portant part of the new mathematics teacher who arrived at the school when he was fourteen years old. He credited her with taming his rebelliousness and inspiring him to pursue a career in education by engaging his intellect in adventurous pursuit of geometric understanding. It became for Fawcett a lifelong quest.

## FEDERAL EDUCATIONAL ACTIVITIES

---

#### HISTORY

Elizabeth H. DeBray

#### SUMMARY BY AGENCY

Jason L. Walton

#### HISTORY

The roots of federal participation in education lie deep in American history, beginning in the days of the Confederation. When it became clear in 1777 that the soldiers of the Continental Army lacked necessary competence in mathematics and military regimen, instruction was provided in these areas. Soon thereafter it became evident that the nation's safety required a corps of trained military officers. Despite the general fear of a standing army, the national leaders united to establish the U.S. Military Academy at West Point in 1802. These actions in the interest of national defense were the first in which the federal government set up and operated its own educational

programs. Support of education in the individual states began in 1785 when the Congress of the Confederation adopted an ordinance concerning public lands in the Western Territory. This ordinance provided that one section of land owned by the national government be set aside in each township for the endowment of schools.

In the Northwest, the Ordinance of 1787 granted Ohio two townships as an endowment for a university—the first instance of federal support for higher education. Beginning with the admission of Ohio to the Union in 1802, Congress established the policy of granting federally owned lands to new states at the time of admission for the endowment of public education. In addition, as new states were created, Congress granted them 15 percent of the receipts from sales of federal lands within their areas. Of the twenty-nine states receiving such funds, sixteen were required to turn them to the support of education, and after 1889 all new states were required to do so.

### **Aid to Higher Education**

With the passage of the Morrill Act of 1862, higher education became the first major beneficiary of federal educational assistance, and it remained the major beneficiary for more than fifty years. The Morrill Act was passed to provide support and endowment for colleges established, as the act states, “to teach such branches of learning as are related to agriculture and the mechanics arts, in such manner as the legislatures of the States may respectively prescribe.” Perhaps the wartime influence accounted for the requirement that the beneficiary schools, later called land-grant colleges, teach military science. The Morrill Act granted 30,000 acres of federal lands to each state for each senator and representative in Congress from that state. This land was to be sold to provide an endowment for at least one college. When federal lands were insufficient to meet this obligation, the states were granted scrip. The Second Morrill Act of 1890, as amended in 1907, established a new pattern of money grants for the support of instruction in a wide variety of subjects, and none of the money was to go for buildings or land.

The first major support for higher education through student-aid programs came with the passage of the Servicemen’s Readjustment Act of 1944. This act provided stipends and tuition assistance to practically all veterans. Under its provisions, close to 8 million servicemen were able to attend college be-

fore the educational provisions of the act terminated in 1956.

Pell Grants are the major source of grants for college for economically disadvantaged students. Other grant and loan programs include the College Work-Study program, Supplemental Educational Opportunity Grants, and Stafford and Perkins Loans. The Leveraging Educational Assistance Partnerships program matches each dollar that states commit to need-based aid. Other key federal higher education programs such as GEAR UP (Gaining Early Awareness and Readiness for Undergraduate Programs) help prepare middle school students from low-income families for college.

Title IX of the Higher Education Act of 1972 stated that “no person in the United States shall, on the basis of sex, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any education program or activity receiving Federal financial assistance.” Exempted were single-sex undergraduate institutions, religious institutions, and military academies. Title IX’s enforcement has brought federal regulation onto every public and private campus in the nation.

**Impact aid.** In 1941 the federal government began a program of assistance to local school districts whose local tax bases are adversely affected by the presence of defense installations and by other federal activities such as public-housing projects and Indian reservations. The program was set up under the Lanham Act of 1940. Although the full-scale operation of this program to meet the needs of wartime activity ceased in 1946, the expansion of federal activities in the postwar period made it necessary to continue appropriations. The annual appropriation for Impact Aid is approximately \$864 million.

**Aid to elementary and secondary education.** In 1917 the passage of the Federal Vocational Education Act (also known as the Smith-Hughes Act) launched the federal government into a new educational policy arena: for the first time, federal funds were to be used in a specific area of precollege education. The act provided funds both for vocational courses in public schools and for the training of teachers for these courses.

The largest single program is Title I of the Elementary and Secondary Education Act (ESEA), signed into law by President Lyndon B. Johnson in 1965 with the goal of providing compensatory education to economically disadvantaged students. The

proposed budget appropriation for 2003 for Title I is \$11.4 billion, a substantial increase over its prior level of \$8.2 billion. The 1994 reauthorization of the ESEA was an important one in policy terms, as it required states to develop and adopt systems of academic standards, assessments, and accountability. The ESEA was reauthorized by the Congress and signed into law by President George W. Bush in 2002 as the No Child Left Behind Education Act. The law contains provisions for identifying schools that fail to narrow the racial achievement gap, and calls for every state to test all students annually in grades three through eight. Thus Title I is still evolving from a funding stream to a program with specified performance targets for schools.

**The standards movement.** In 1983 Ronald Reagan's Secretary of Education, Terrell Bell, released a commission report entitled *A Nation at Risk*, which asserted that the U.S. elementary and secondary educational system was failing gravely. In the aftermath of the report's release, many states strengthened their graduation course-taking requirements. The report began a movement that was a high federal priority in the 1990s: the educational standards movement. President George Bush, in 1990 following the Charlottesville, Virginia governors' summit on education, proposed an initiative called America 2000. The bipartisan National Education Goals Panel was created to monitor the country's progress toward the six goals by the year 2000. It was not until President Bill Clinton's term, however, that the National Education Goals were enacted into law in 1994 as part of the Goals 2000: Educate America Act. As one of the national goals was that all students demonstrate proficiency in math, science, history, and English/language arts, a variety of federal activities to encourage the development of standards and assessments in those content areas were initiated. The Office of Educational Research and Improvement in the early 1990s made grants to various universities and professional associations to develop standards that states and localities could adopt. In 2002 the National Education Goals Panel was shut down, as its function of monitoring goals was considered obsolete.

**Department of Defense Education Activity (DoDEA) Schools.** Founded after World War II, the overseas elementary and secondary school system created to educate children of military personnel is the Department of Defense Dependent Schools (DoDDS). The Department of Defense Domestic

Dependent Elementary and Secondary Schools (DDESS) serve children of personnel stationed in the United States. In 2001 both parts of the DoDEA system served approximately 112,000 students.

**Students with disabilities.** The Individuals with Disabilities Education Act (IDEA) was funded at \$9.7 billion in the 2002 budget. The federal government provides approximately nine percent of the total funding on special education in the United States. In 1975, the Education for All Handicapped Children Act was created to ensure equal access to education for students with disabilities. The law required that each such child receive an "Individualized Education Program," which encompassed instructional goals and evaluation procedures for determining whether the goals had been reached. The 1997 reauthorization of the IDEA strengthened the requirement for children with disabilities to have access to schools' general education curriculum.

### Vocational Education

The Vocational Rehabilitation Act of 1918 was the first educational program for veterans, providing vocational rehabilitation to any honorably discharged veteran of World War I. The program terminated in 1928. The Vocational Rehabilitation Act of 1943 provided a similar program for World War II veterans; rehabilitation of disabled veterans was separately provided for in the Servicemen's Readjustment Act of 1944. The Carl D. Perkins Vocational-Technical Education Act of 1998 provides basic grants to states for career and technical education for secondary school students. The School-to-Work Opportunities Act of 1994 provided grants for states to build high school learning systems for further education and careers through "work-based learning." A new office was created to administer the program, combining staff from the Departments of Education and Labor. The act expired in 2001.

### U.S. Office of Education

For several years prior to the Civil War, associations of educators had recommended that an agency be established in the federal government for the promotion of education throughout the United States. In 1867 Congress responded by creating an independent department of education under direction of a commissioner. The department began with an authorized staff of four and an appropriation of \$25,000; its stated objectives were the dissemination of educational statistics and promotion of the cause

of education. From 1869 to 1939 the agency was located in the Department of the Interior. In 1939, the Office of Education became part of the new Federal Security Agency, which in turn became the Department of Health, Education, and Welfare (HEW) in 1953. The U.S. Office of Education was reorganized within HEW in 1965.

### U.S. Department of Education

In 1979 the Carter administration created the U.S. Department of Education. While President Ronald Reagan initially sought to dismantle the agency in 1981, it remained intact. Its programmatic offices include the Office for Civil Rights, the Office of Elementary and Secondary Education, and the Office of Indian Education. The federal budget for discretionary education programs, including postsecondary education, was \$48.9 billion in fiscal year 2002.

Research remains one of the primary activities of the federal role in education. The National Institute of Education was created in 1972 during the Nixon administration to oversee a program of studies and data collection. Total funding for the Office of Educational Research and Improvement grew tenfold between 1980 and 2000, but the percentage of those dollars supporting studies fell sharply in the 1980s and by 2002 was approximately just 15 percent. Federally funded educational development activities such as the National Diffusion Network have effectively ceased to exist. The National Center for Education Statistics is the bureau that collects and disseminates data and statistics.

### National Science Foundation (NSF)

The National Science Foundation (NSF) was established by Congress as an independent agency in 1950. Its original programs were concerned with supporting basic research and awarding graduate and postdoctoral fellowships in the sciences. By 1968 approximately 90 percent of NSF's expenditures were directly or indirectly in support of research and education. During the 1990's, NSF's precollegiate strategy was "systemic initiative grants" to states and school districts to help them overhaul their science and mathematics programs.

### International Activities

Under terms of a treaty signed at Buenos Aires in 1936, the United States began a continuous exchange of two graduate students per year with each of the sixteen signatory nations among the Latin

American republics. Later the program was expanded to include exchange of trainees in government and industry as well as exchanges of teachers, professors, and specialists with all the Latin American republics. The Department of Education participates in several international activities. In 2001 these included data collection activities, such as those with the Asia-Pacific Economic Cooperation, and the Organisation for Economic Co-operation and Development's study of school performance and school system characteristics.

ELIZABETH H. DEBRAY

## SUMMARY BY AGENCY

An extensive network of departments and agencies has developed over the course of American history in response to the needs of the government and the nation. In 2001 the executive departments numbered fourteen. The most recent addition was in 1989 when the Veterans Administration was elevated to department-level status and renamed the Department of Veterans Affairs. The president shares the burden of implementing the policies and laws of the nation with these departments and a vast array of other agencies that deal with specific areas of national and international affairs. All departments are headed by a secretary, with the exception of the Department of Justice, which is headed by the attorney general. These department heads, who make up the president's cabinet, must first be nominated by the president and then confirmed by the Senate. These departments can be broken down into divisions, bureaus, offices, and services operating in thousands of locations both in the United States and abroad. The educational activities of these departments and other major agencies can be divided into two categories: those that serve employees of the government and those that serve people outside the government.

### Legal Foundations of Government Employee Training

Government departments and agencies have always had the authority to deliver their own training programs. There are, however, a number of legal references that make up the foundation for government employee training and education. The Government

Employee Training Act of 1958 (GETA) first outlined how departments and agencies would plan, develop, establish, implement, evaluate and fund these activities, which were designed to improve the quality and performance of the government workforce. This act has been amended many times since 1958. Legislative acts that prescribe action by federal departments and agencies are codified and published shortly after passage. Title 5 of the U.S. Code is dedicated to human resource issues, with chapter 41 being devoted to training.

In 1967 Executive Order No. 11348 provided agency and department heads information on how GETA should be carried out. This was amended in 1978 by Executive Order No. 12107, which provided further direction and clarification.

The Code of Federal Regulations (C.F.R.) is the collected general and permanent rules published in the Federal Register by executive departments and agencies. Part 410 of Title 5 of the C.F.R. details the general and specific policies and requirements for training in government agencies. Part 412 of the same title addresses the development of supervisors, managers, and executives. Parts 410 and 412 were both substantially restructured in 1996 to reflect changes to chapter 41 of Title 5 of the U.S. Code.

### Department of Agriculture

The Department of Agriculture assists American farmers and ranchers while providing a number of other services to the general public. The Farm and Foreign Agricultural Services (FFAS) Mission Area comprises three entities, which are designed to protect the interests of American farmers and ranchers amid market and weather uncertainty: the Farm Service Agency, the Foreign Agricultural Service, and the Risk Management Agency. These organizations attempt to strengthen the agricultural economy through delivery of commodity, credit, conservation, disaster, and emergency assistance. FFAS also promotes expansion of export sales to foreign markets. Wide-ranging crop insurance programs and risk management tools are also offered.

The Food, Nutrition, and Consumer Service (FNCS) administers the federal food assistance programs while coordinating policy and research on nutrition. The FNCS comprises two organizations: the Food and Nutrition Service (FNS) and the Center for Nutrition Policy and Promotion (CNPP). Under the FNS umbrella are the following programs:

- Food Stamps Program

- School Breakfast Program
- School Lunch Program
- After-School Snacks Program
- Special Milk Program
- Summer Food Service Program
- Child and Adult Care Food Program
- Special Supplemental Nutrition Program for Women, Infants, and Children (popularly known as WIC)
- Farmer's Market Nutrition Program, Food Distribution, and Team Nutrition

The CNPP was created in 1994 to link research with the nutritional needs of the public.

The Food Safety and Inspection Service (FSIS) works to ensure that meat, poultry, and egg products are safe, wholesome, and accurately labeled. FSIS also works to provide resources on food safety for consumers, educators and health professionals.

The Natural Resources and Environment (NRE) Mission Area is responsible for ensuring the health of the land through sustainable management. The NRE is composed of the Forest Service (FS) and the Natural Resources Conservation Service (NRCS). Each of the agencies assists with rural development and renders aid relative to natural resource concerns like erosion control, watershed protection, and forestry.

The Research, Education, and Economics (REE) Mission area disseminates information resources. The REE includes four services: the Agricultural Research Service, the Cooperative State Research, Education, and Extension Service, the Economic Research Service, and the National Agricultural Statistics Service.

## Department of Commerce

The Department of Commerce and Labor was created on February 14, 1903. Ten years later, separate department designations for labor and commerce were established. Through its numerous and diverse bureaus the modern Department of Commerce (DOC) has evolved to perform an widely varied range of education-related foreign and domestic services.

The Bureau of Export Administration (BXA) is involved in many areas of national security and high technology. Among other activities, the BXA provides technical assistance to Russia and other newly

emerging countries to develop effective export control systems and to help convert their defense industries. Assisting foreign supplier countries establish export control systems helps ensure that U.S. industries will not be undercut.

The Economic and Statistics Administration (ESA) is responsible not only for producing and analyzing some of the nation's most important demographic and economic data, but also for the dissemination of that data to the American public. Major offices under the ESA are the Bureau of the Census, the Bureau of Economic Analysis, and STAT-USA. The Bureau of Census conducts the decennial census of population and is a world leader in statistical research and methodology. The Bureau of Census makes its statistics available in a variety of media and offers assistance to data users from its headquarters in Suitland, Maryland, as well as through the twelve other regional offices. The Bureau of Economic Analysis (BEA) generates a number of important economic reports including a monthly "Survey of Current Business," a quarterly report on Gross Domestic Product, and regional, domestic, and international economic accounts. The BEA also generates occasional reports on travel, tourism, and international transactions.

The Economic Development Administration (EDA) targets economically distressed communities to generate new employment, industry, and commerce. A portion of these efforts involves skill training as well as job retraining.

The International Trade Administration (ITA) is the lead unit for trade in the DOC. The Trade Development area of ITA is organized by industry and provides analysis and advice on trade and investment issues to U.S. businesses, counseling U.S. exporters and service providers about marketing their products globally, and provides literature centers and seminars. The U.S. Foreign and Commercial Service employs trade specialists that assist companies wishing to enter into new markets. These specialists also lend support through alerting businesses to distribution channels, pricing, relevant trade shows, and available trade finance programs.

The Minority Business Development Agency (MBDA) promotes growth and competitiveness of the nation's minority and Native American-owned businesses. The agency has counseling centers located in areas with large concentrations of minority populations and businesses, offering management

and technical assistance in all areas of establishing and operating a business.

The National Oceanic and Atmospheric Administration (NOAA) is dedicated to predicting and protecting the environment. NOAA has five divisions: the National Weather Service (NWS), the Office of Oceanic and Atmospheric Research (OAR), the National Environmental Satellite, Data and Information Service (NESDIS), the National Ocean Service (NOS), and the National Marine Fisheries Service (NMFS). The National Weather Service (NWS) works with federal, state, and local agencies to protect life and property as the official source of all watches and warnings of severe weather for the United States. The NWS also provides data, products, and services to private meteorologists. NOAA funds scientists and university researchers through the National Sea Grant College Program and the National Undersea Research Program to solve critical weather-related environmental problems such as tornadoes, hurricanes, El Niño-driven storms, solar storms, and other severe weather. The National Ocean Service conducts research on the health of the U.S. coasts and provides expertise during oil and hazardous chemical spill cleanup operations, as well as other duties.

The National Telecommunications and Information Administration (NTIA) assists the administration, Congress, and other regulatory agencies by addressing diverse technical and policy questions relative to telecommunications. The agency comprises six offices: the Office of Policy Coordination and Management (OPCM), the Office of Policy Analysis and Development (OPAD), the Office of International Affairs (OIA), the Office of Spectrum Management (OSM), the Institute for Telecommunication Sciences (ITS), as well as the Telecommunications Information Infrastructure Assistance Program (TIIAP). Employees of this agency include policy analysts, computer scientists, electronic engineers, attorneys, economists, mathematicians, and other specialists. The ITS office serves as the federal government's primary research laboratory for telecommunications science and engineering.

The Office of the Inspector General (OIG) was established in 1978 to protect the American public's interests and investments in the Department of Commerce. The office is authorized to conduct audits, investigations, and an array of inspections, systems evaluations, and other reviews of the Department of Commerce. The OIG provides time-

ly, useful, and reliable information and advice to department officials.

The Patent and Trademark Office (PTO) is the federal mechanism that protects new ideas and investments. The PTO encourages innovation in American industry through providing patent and trademark protection. A substantial portion of this protection results from the clerical functions of the office, which includes preservation, classification, and distribution of information. Since its establishment in 1790, the PTO has accumulated the largest collection of applied technical information in the world. The Patent Office Search Room and the Trademark Office Search Room are both located in Arlington, Virginia, and are open to the public. In addition, the PTO publishes *Basic Facts About Patents*, *Basic Facts About Trademarks*, along with weekly publications describing registered patents and trademarks.

The Technology Administration (TA) was established in 1988 and consists of the National Institute for Standards and Technology (NIST), the National Technical Information Service (NTIS), and the Office of Technology Policy (OTP). NIST laboratories specialize in electronics and electrical engineering, manufacturing engineering, chemical science and technology, physics, materials science and engineering, building and fire research, and information technology. NTIS is the repository for all U.S. government research and development results. The NTIS collection is in excess of 3 million titles. These titles are organized, maintained, and disseminated in a variety of media formats. NTIS has also developed an online information dissemination system called FedWorld, which is recognized as a comprehensive electronic source for government information.

### Department of Defense

The Department of Defense (DoD), so named in 1949, evolved from the Department of War, which was established by the first Congress. The mission of the DoD is to "provide military forces needed to deter war and to protect the security of our country." The DoD consists of three military departments, fourteen defense agencies, nine unified combatant commands, and seven field activities. The three military departments are the army, the navy, and the air force (the Marine Corps is a second armed service in the Department of the Navy).

The National Defense University (NDU) is the nation's premier joint professional military educational institution. Its component colleges and centers include the following: the Joint Forces Staff College, the Industrial College of the Armed Forces, the Information Resources Management College, the Institute for National Strategic Studies, the National War College, and the Center for Hemispheric Defense Studies. The NDU also offers a variety of other educational programs separate from these colleges and centers.

Military service academies provide officer education through precommission and reserve training. These academies include the U.S. Military Academy, the U.S. Naval Academy, the U.S. Air Force Academy, the U.S. Coast Guard Academy, and the U.S. Merchant Marine Academy.

Ongoing education and training opportunities for individuals are available immediately upon enlistment in any of the armed services. Military education typically begins with eight to thirteen weeks, depending upon the service, of basic training and continues afterwards with individual job training, which continues throughout enlistment. As men and women are promoted within their job specialty, training becomes more sophisticated. In 2001 there were more than 300 military training centers offering more than 10,000 courses (of which 68 percent were certified for college credit) to train men and women in some 4,100 separate job specialties (of which 88 percent had civilian counterparts).

The military also offers a wide variety of programs that help recruits earn college credit, attend college while in the service, and/or provide cash for college tuition. Department of Defense statistics indicate that in 1999 more than 26,000 military members participated in Servicemember Opportunity Colleges (SOC), which is a group of approximately 1,400 colleges and universities that agree to transfer credits among themselves for military members and their families. In addition, most Base Education Centers will grant course credit to enlisted men and women who can pass available examinations and tests on subjects ranging from mathematics to Western civilization.

The Community College of the Air Force (CCAF) allows its enlisted personnel to earn an associate degree in a job-related field. Beyond one's job specialty, each CCAF degree requires coursework in leadership, management, military studies, general education, and physical education.

Programs of educational financial support include tuition assistance, Montgomery G.I. Bill, college fund programs, and loan repayment programs. The terms and amounts of financial assistance from these programs differ slightly depending on one's branch of service and military status.

The DoD also offers pre-kindergarten through twelfth-grade education through a system of schools in the United States and abroad for dependents of military personnel and civilian employees of the military. This activity is divided between two programs: the Domestic Dependent Elementary and Secondary Schools (DDESS) and the Department of Defense Dependents Schools (DoDDS). The DDESS serves an estimated 36,000 students in seventy schools across seven states, Guam, and Puerto Rico. The DoDDS serves an estimated 76,000 students in 154 schools in thirteen countries.

### Department of Education

One of the Department of Education's earliest historical roles that has remained prominent involves collecting and sharing information on education. Since 1966 the department has operated the Educational Resources Information Center (ERIC), which is the world's largest education database. ERIC is accessible through the Department of Education website. Prominent annual publications include the *Digest of Education Statistics* and the *Condition of Education*. The department funds the National Assessment of Educational Progress (NAEP), which serves as "the nation's report card." The department also funds ten regional educational laboratories aimed at assisting state and local decision makers by providing the most recent teaching and learning knowledge.

Federal financial assistance for postsecondary education is a significant area of department activity. The department prints and processes the Free Application for Federal Student Aid (FAFSA), which students use to apply for financial assistance. Federal aid comes in a variety of formats and is administered through a assortment of programs including the Federal Pell Grant Program, the William D. Ford Direct Loan Program, the Federal Family Education Loan Program, the Federal Perkins Loan Program, the Federal Supplemental Educational Opportunity Grant Program, and the Federal Work-Study Program.

The department manages the distribution of many formula-based grants that target districts and

students with special educational needs. Most federal funding of education is authorized under either the Elementary and Secondary Education Act (ESEA) of 1965 or Part B of the Individuals with Disabilities Education Act Amendments of 1997. Funding for advancement and innovation in elementary, secondary, and postsecondary education are made available through competitive grant programs.

The department provides vocational and lifelong learning opportunities through an assortment of programs developed to maintain American competitiveness in an emerging global economy. These program activities range from providing localities with School-to-Work Opportunities Act seed money designed to prepare students for a first job, to awarding state grants to fund vocational training and rehabilitation. Additional grant programs target literacy, high-school equivalency certification, and English language proficiency.

### **Department of Energy**

The educational activities of the Department of Energy (DOE) are aligned with its longstanding goals of dissemination of energy-related information and increasing the American science and technology base. Department of Energy partnerships with schools such as the Energy Smart Schools Program focus on increasing awareness of energy-related issues, reducing energy consumption, and reinvesting energy cost savings.

The department's website serves as the chief portal for energy-related education resources. The DOE website offers teachers and students from elementary to postsecondary levels links to topics such as energy efficiency, alternative fuels, atmospheric research, and the Human Genome Project. The department serves as an information clearinghouse on internships and fellowships in all areas of endeavor in science and technology. The DOE also sponsors energy-related contests and competitions.

### **Department of Health and Human Services**

The Department of Health and Human Services (HHS) is the primary healthcare and social service agency of the federal government. The department is divided among twelve major operating divisions, which administer more than 300 programs covering a wide range of activities. In fiscal year 2001 the agency employed more than 63,000 employees, provided in excess of 60,000 grants, and had a budget in exceeding \$429 billion.

The Administration for Children and Families (ACF) is the division responsible for the economic and social well being of children, individuals, families, and communities. Programs in the ACF target welfare, refugee assistance, repatriation, foster care, adoption assistance, independent living assistance, low-income energy needs, mental retardation, family preservation, family support, child abuse, child-care, child support enforcement, developmental disabilities, and Native Americans. The most prominent ACF education-related activity is the national Head Start program. Grants are awarded to public or private nonprofit entities at the local level to provide comprehensive developmental services to children between the ages of three and five from low-income families. Legislation in 1994 created the Early Head Start program, expanding the benefits to include children under three and pregnant women. American Indian Head Start and Migrant Head Start offer identical services, but modify delivery of services to better meet the needs of these special populations.

The Administration on Aging (AOA) is the division charged with administering various programs mandated by the Older Americans Act of 2000. In keeping with the many titles of this act, the division is the primary federal advocate for older Americans and their concerns. The educational activities of this division include making resources available on the following: caregiver support, antifraud initiatives, elder abuse prevention, long-term care, retirement information, finance counseling, job vacancies, disaster assistance, and legal advice. The AOA also compiles, storehouses, and disseminates information and statistics on aging.

The Health Care Financing Administration (HCFA) is the division responsible for administering Medicare, Medicaid, and the State Children's Health Insurance Program. The HCFA offers a number of learning resources on its Internet site relative to health insurance. These resources inform interested parties of changes and progress in the range of coverage offered through HCFA. One such resource is the Medicare Learning Network, which provides health care professionals and others appropriate information on topics such as proper submission of Medicare claims and appropriate payment to Medicare beneficiaries for services rendered. Medicare Learning Network users may also subscribe to an array of electronic mailing lists that provide emerging information on specific areas of health coverage.

Two of the more prominent public health divisions are the Food and Drug Administration (FDA), which protects the public's health by screening consumer products before they reach the market using a blend of law and science, and the National Institutes of Health (NIH), which attempts to uncover new knowledge through the research and training conducted at its multiple centers and institutes. The National Library of Medicine is also under the NIH umbrella.

Six of the seven remaining divisions are also considered public health divisions designed to meet the physical and mental health needs of the population. They include the Centers for Disease Control and Prevention (CDC), the Substance Abuse and Mental Health Service Administration (SAMHSA), the Health Resources and Services Administration (HRSA), the Indian Health Service (IHS), the Agency for Healthcare Research and Quality (AHRQ), and the Agency for Toxic Substances and Disease Registry (ATSDR).

The twelfth working division of HHS is the Program Support Center (PSC); it serves the various administrative functions of the department.

### **Department of Housing and Urban Development (HUD)**

While HUD was created as a cabinet-level position within the executive branch of the federal government in 1965, its history extends all the way back to the passage of the National Housing Act of 1935. Aside from orientation of department personnel, education and training activities conducted by HUD are products of its awarding of grants whose scope of activity fulfills the mission of the department. Several examples of such activities during the decade of the 1990s follow.

Youthbuild was authorized as the "Hope for Youth" program as a part of the Housing and Community Development Act of 1992. The program provides HUD grants on a competitive basis to nonprofit organizations assisting high-risk youth between the ages of sixteen to twenty-four to learn housing construction skills. The program also helps participating youth complete their high school education. Skills development takes place as participants assist in the construction of housing for low-to-moderate-income persons.

HUD provided the Philadelphia Housing Authority with an Apprenticeship Demonstration

Grant to provide hands-on training in the removal of asbestos, in lead abatement, and for driver's education training. Participants were eighteen to twenty-four years old and high school dropouts. This grant was coordinated with the welfare-to-work initiatives of the Department of Labor. That same housing authority received additional funding to conduct nurse's assistant training and adult basic education.

HUD has also provided training in the K-12 arena. An education advocacy project was funded through Wright State University in Dayton, Ohio. Tutors were trained to provide academic remedial and enrichment services in the critical areas of reading, mathematics, and science to improve the academic performance of students from low-income groups and ethnic minority groups who have consistently experienced low academic achievement. Tutors were taught techniques for supporting students in their grasp of procedural, declarative, and conditional knowledge.

### **Department of the Interior**

The Department of Interior is composed of eight bureaus and more than twenty-five offices and committees. Education initiatives generated within the department range from the operation of support of local tribal school systems to support for minority higher education institutions to K-12 programs.

The Office of Educational Partnerships was established in 1994 to advance support of minority higher education institutions and the Goals 2000: Educate America Act and other related activities that support K-12 education.

The most extensive education initiative undertaken by Department of the Interior is through the Bureau of Indian Affairs (BIA). Present statutory law allows the BIA to either support local tribal school systems or to actually operate the education enterprise for the local tribal government.

The Department of Interior also conducts management development programs to provide upgrade training to bureau personnel in a variety of occupational specialties who have limited field experience. Orientation programs are also conducted within the various bureaus and departments. Several of the bureaus provide training for foreign personnel in such diverse fields as irrigation project operation and topographic mapping.

## Department of Justice

The Department of Justice represents the citizens of the United States in enforcing the federal laws that have been passed in the public interest. There are thirty-eight components within the department, and a number of those components have specialized education and training responsibilities. Such programs include employee training, programs for inmates of penal and correctional institutions, and training of law enforcement officers. Many of the training and technical assistance initiatives are designed to bring about changes in the law enforcement profession and to enhance the effectiveness of the criminal justice system.

One of the major training activities undertaken by the Department of Justice is the operation of the FBI National Academy through the Federal Bureau of Investigation. The FBI carries the charge of providing leadership and law enforcement assistance to federal, state, local, and international agencies. The academy provides initial training of all new special agents as well as refresher training for all agents. It also provides specialized, needs-based training for full-time law enforcement officials from local, county, and state levels. Officials from the District of Columbia and Puerto Rico are also provided opportunities for training.

Like the FBI, the Immigration and Naturalization Service operates training programs for its border patrol law enforcement personnel. These law officers are charged with maintaining the integrity of the borders of the United States from illegal immigration. The U.S. Federal Marshals Service conducts training of U.S. marshals and provides other training opportunities through regional meetings and conferences.

The Federal Bureau of Prisons is charged with the responsibility of developing and operating correctional programs that are balanced between punishment, deterrence, incapacitation, and rehabilitation. Inmate programs range from high school equivalency to college level courses to help provide for successful reintegration of inmates into society. Vocational training in semiskilled to skilled trades is coordinated by the Federal Prison Industries, Inc., a wholly owned government corporation founded in 1934. Additionally, the National Institute of Corrections is charged with the responsibility of providing training to state and local correctional agency personnel to advance a broad agenda of correctional practices.

The Community Relations Service is the single federal agency with the responsibility to help state and local government agencies, public and private organizations, and community groups resolve and prevent community racial conflicts. Technical assistance is provided to help communities address conflicts arising out of actions, policies, and practices perceived to be discriminatory.

The Office of Justice Programs, created in 1984, is responsible for providing training and technical assistance to state, local, and tribal governments and community groups. Assistance is designed to reduce crime, enforce drug laws, and improve the function of the criminal justice system.

The Office of Community Oriented Policing Services (COPS) is charged with creating change in the police profession. The Training and Technical Assistance Division operates through Regional Community Policing Institutes, the Community Policing Consortium, targeted training initiatives, and training conferences and workshops.

## Department of Labor

In addition to the Office of the Secretary, the Department of Labor includes more than twenty additional agencies, one independent corporation, and related committees and commissions. A variety of education and training programs are made available to both federal employees and private sector workers and employers.

The Occupational Safety and Health Administration (OSHA) was created to advise and assist the Secretary of Labor on all matters related to the policies and programs that are designed to assure safe and healthful working conditions for the working men and women of the nation, and to provide executive direction to the occupational safety and health program. OSHA education and training services include federal agency personnel, programs and assistance for small businesses, and training of workers in nonprofit organizations. The primary scope of all such training is to train individuals to recognize, avoid, and prevent safety and health hazards. Programs in the nonprofit sector are conducted under Susan Harwood Training Grants. Grantees develop pertinent training and educational programs that address OSHA-selected topics. Federal agency training is conducted through a number of educational centers that include the Naval Safety Training Center, the Air Force Safety School, and NASA sites na-

tionwide. The OSHA Outreach Training Program authorizes individuals completing the training to teach courses in general industry or construction safety and health standards. The primary arm within OSHA for coordinating education and training programs is the Office of Education and Training.

The Bureau of Labor Statistics provides a fellowship program in conjunction with the American Statistical Association (ASA), under a grant from the National Science Foundation (NSF). The Senior Research Fellow Program's objective is to bridge the gap between academic scholars and government social science research.

The Office of the Assistant Secretary for Administration and Management conducts the Senior Executive Service (SES) Forum Series. The Senior Executive Service provides convenient, cost-effective learning opportunities for top-level government officials. Forums cover a wide range of topics relevant to the major missions and programs of federal departments and agencies.

The Employment and Training Administration operates programs for both adults and youth. Adult programs include training programs for Native American populations. Programs are also provided for migrant and seasonal workers. Apprenticeship training for industry is designed to assist industry in developing and improving apprenticeship programs. Welfare-to-work services are also provided to assist the hard-to-employ and noncustodial parents to get and keep jobs. Training is provided for workers affected by shutdowns and downsizing and for workers over fifty-five years of age. Youth programs include school-to-work, Job Corps, and apprenticeship programs authorized under the Workforce Investment Act of 1998.

The Women's Bureau sponsors workshops and joint initiatives with other governmental agencies on gender discrimination. Other programs are marked by collaborative efforts that encourage girls to study and pursue careers in information technology, engineering, math, and science. Trade conferences are conducted to highlight the contributions of women in the trades.

The Mine Safety and Health Administration's (MHS) Directorate of Educational Policy and Development implements MHS's education and training programs that are designed to promote safety and health in the mining industry.

## Department of State

The Department of State is the nation's lead foreign affairs agency. The Bureau of Educational and Cultural Affairs and the Foreign Service Institute carry out the Department of State's educational activities.

The Bureau of Educational and Cultural Affairs (ECA) offers an array of international educational and training programs aimed at promoting understanding between the United States and other countries. The bureau promotes personal, professional, and institutional ties among individuals and organizations, and presents overseas audiences with U.S. history, society, art, and culture.

The Fulbright Program, which is sponsored by ECA, was introduced in 1946 under legislation sponsored by Senator J. William Fulbright of Arkansas. The Fulbright Program offers cultural exchange opportunities to individuals from the United States and abroad who have demonstrated leadership potential. The Fulbright program operates in 141 countries and awards approximately 4,500 grants annually.

The Office of Global Education Programs is charged with the administration of three major Fulbright exchange activities. They include the Teacher Exchange Program, the Humphrey Fellowship Program, and various university linkage programs.

The Fulbright Teacher Exchange program arranges exchange opportunities for U.S. and foreign college faculty members, teacher trainers, secondary-level teachers, and school administrators. Many teachers elect to teach their native languages at host institutions. A limited number of semester and shorter-term initiatives are also available.

The Hubert H. Humphrey Fellowship Program is a Fulbright exchange activity. Established in 1978 to honor the late senator and vice president, the program brings accomplished midlevel professionals from foreign countries for one year of study and professional experience.

The university linkage programs enables U.S. colleges and universities to partner with institutions overseas to pursue specific mutually beneficial goals. Projects typically last three years and consist of exchange of teachers, administrators, and graduate students.

The Educational Information and Resources Branch of the ECA offers U.S. educational opportunities to foreign students and scholars and serves as

a resource to U.S. institutions wanting to strengthen international educational exchange. Overseas, the branch provides international students and scholars information on the U.S. educational system through a worldwide network of approximately 450 educational advising centers. Domestically, the branch administers a study abroad scholarship program for U.S. students and connects educational advisers overseas with counterparts at U.S. educational institutions.

ECA also administers a variety of degree and nondegree academic exchange programs for Russia and the new independent states, which include the following:

- Freedom Support Act Undergraduate Program
- Bosnia and Herzegovina Undergraduate Development Program
- Edmund S. Muskie Graduate Fellowship Program
- Ron Brown Fellowship Program
- Community Connection Program
- Russia–U.S. Young Leadership Fellows for Public Services Program
- Regional Scholar Exchange Program
- Freedom Support Act in Contemporary Issues
- Junior Faculty Development Program
- Internet Access and Training Program

The Office of English Language Programs is responsible for U.S. government English teaching activities outside the United States. The office offers a number of products and services primarily in the capital cities of host countries through American embassies.

The Study of the U.S. Branch of ECA promotes better understanding of the United States by offering summer institutes to foreign university faculty. One of the projects of primary importance offered by this branch is the maintenance and dissemination of the American Studies Collection. The collection was established by a congressional endowment to promote a better understanding of the United States abroad. This collection is designed expressly for university libraries outside the United States. The core of the collection consists of 1,000 titles selected by leading American scholars on a wide variety of disciplines germane to the study of American culture.

The ECA International Visitor Program operates under the authority of the Mutual Educational and Cultural Exchange Act of 1961. This program

brings foreign professionals with potential for leadership in the areas of government, politics, media, education, and other fields to meet and confer with their professional counterparts and to experience the United States.

The ECA Office of Citizen Exchanges makes grants available to nonprofit American organizations to develop professional, cultural, and youth programs. The objective is for foreign participants to see how Americans deal with issues of professional interest and for American participants to receive a similarly cross-cultural perspective. The office has three geographic divisions, which include Europe/Asia, the Middle East, and South Asia/Africa.

The ECA International Cultural Property Protection program was established as a result of the 1970 United Nations Educational, Scientific and Cultural Organization (UNESCO) Convention on the Means of Prohibiting and Preventing the Illicit Import, Export, and Transfer of Ownership of Cultural Property. In accordance with the convention's precepts, the requests of foreign countries are accepted for import restrictions on archaeological or ethnological artifacts, whose removal or display might jeopardize the national cultural history of those countries.

The ECA Au Pair Program is a one-year educational and cultural exchange program with a strong emphasis on childcare. Au pairs are put through a screening and selection process and then matched with American families. The au pair provides forty-five hours of childcare per week. Au pairs are also required to attend an institution of higher learning during their stay to earn at least six hours of credit. Host families are required to pay the au pair minimum wage for child care and \$500 for education-related costs.

The Foreign Service Institute is responsible for training all officers and support personnel of the U.S. foreign affairs community. The National Foreign Affairs Training Center in Arlington, Virginia, offers approximately 500 courses, including classes in 60 foreign languages to members of the foreign affairs community from the Department of State, the military service branches, and other government agencies. Course range in length from one day to two years and designed to promote success within professional assignments, ease transitions, enhance leadership and management, and prepare families for a mobile lifestyle and living abroad. Training and

professional development are also available specific to professional assignment.

### **Department of Transportation**

The Department of Transportation (DOT) was created in 1967 when a number of transportation-related agencies, services, and functions that were dispersed throughout the government were combined into one department. In the early twenty-first century the department works to further the vital national transportation interests through promotion of the following broad strategic goals: safety, mobility, economic growth and trade, human and natural environment protection, and national security. The components of the department include the Office of the Secretary, the Transportation Administrative Service Center, the Surface Transportation Board, and eleven major operating divisions.

The U.S. Coast Guard (USCG) is responsible for ensuring safe transportation on American waterways and protection of the marine environment. During times of war and conflict the USCG comes under the control of the Department of Defense. Traditional education-related functions of this division have included marine safety, boating safety, oil spill response, and emergency training.

The most prominent educational component of the division is the U.S. Coast Guard Academy, which is located in New London, Connecticut. The Coast Guard Academy is unique among federal service academies because admission is based on a competitive nationwide application process rather than congressional nomination. Applicants who are accepted to the program are given full four-year scholarships. Founded in 1876, the academy provides cadets a four-year bachelor of science program in eight majors including naval architecture and marine engineering, civil engineering, mechanical engineering, electrical engineering, operations research, marine and environment science, government, and management. Cadets who demonstrate a high level of academic performance can qualify to participate in the academy's honors program or take elective course work at nearby Connecticut College. A range of student government and athletic opportunities are also made available to cadets. Summers are spent in military and professional training, except for three weeks of vacation. Each academy graduate receives a commission as an ensign in the U.S. Coast Guard and is required to serve a minimum of five years of active duty.

Leadership training for both cadets and civilian employees of the USCG is provided through the Leadership Development Center (LDC). Schools which form the LDC include the Chief Petty Officer Academy, the Leadership and Quality Institute, the Chief Warrant Officer Indoctrination, Officer Candidate School, Officer-in-Charge School, Command and Operations School, and the Unit Leadership Training Program.

The Federal Aviation Administration (FAA) was established in 1958 by the Federal Aviation Act, which combined the Civil Aeronautics Administration and the Airways Modernization Board. Although the FAA predates the DOT, it became one of the major operating divisions when the DOT was established in 1967. The FAA is responsible for administering the federal aviation system, which includes activities such as certifying pilots and aircraft, promoting all aspects of aviation safety, enhancing airport security, maintaining the federal air traffic control system, and assisting in the development of commercial and space transportation.

The FAA Aviation Education Program is maintained in fulfillment of the Congressional Mandates of the Airport and Airway Development Act of 1970. The congressional intent of the Aviation Education Program is to maintain America's preeminence in the world of aviation by supporting the growth of aviation through education. This includes increasing the public's knowledge of the dynamics of aviation and its key role in improving America's economic and social well being. The FAA is also congressionally mandated to acquaint young people with the full potential of a career in aviation. An information distribution program in each of the nine FAA regions provides expertise and informational materials on civil aviation, aeronautics, and air commerce safety to state and local administrators, college and university officials, and officers of civil and other interested organizations.

The FAA also hosts a number of educational outreach resources and initiatives including curriculum, activities, summer camps, scholarships, grants, aviation career guides, an online resource library, and a listing of aviation schools and universities.

The Federal Highway Administration (FHWA) is responsible for coordinating highway transportation programs among states and other partners. The FHWA organization comprises the Washington Headquarters, four resource centers, fifty-two oper-

ating federal aid division offices, and three federal lands highway divisions.

The education-related activities include offering training and technical expertise to transportation agency managers at the state and local level, partner agency employees, and to FHWA staff. Training topics cover a range of highway transportation concerns such as snow and ice technology, seismic bridge design, and civil rights contract compliance. Technical expertise is offered in the following areas: roadway and bridge design, construction methods, highway planning and policy, safety, maintenance, environmental protection, innovative financing, and land acquisition.

Nationwide public service announcements are produced in print, audio, and video to educate and inform the public concerning FHWA safety initiatives. Seed money is provided through grants to state and local transportation agencies to promote FHWA safety programs.

FHWA also supports highway-related research, development, and technology transfer through promotion of initiatives such as the Intelligent Transportation Systems. The Intelligent Transportation Systems program partners FHWA with government, industry, and research community partners to develop, test, and implement the latest technological advancements in the transportation system. These technology-infused transportation applications seek to move people and goods more smoothly, safely, and efficiently.

The Federal Railroad Administration (FRA) promotes safe and environmentally sound rail transportation. Much of the educational activity of the FRA revolves around its longstanding responsibility of ensuring railroad safety throughout the nation. The FRA Office of Safety provides the public with safety data on rail incidents, accidents, and inspections. The FRA conducts research, development, tests, evaluations, and projects to support its safety mission and enhance the railroad system as a national transportation resource. The FRA also makes railroading curriculum, presentation aids, and safety resources available to teachers online. Students are offered links rail transportation-related career development links as well as links to an online railroad library.

The National Highway Traffic Safety Administration (NHTSA) is responsible for promoting and implementing effective educational, engineering,

and enforcement programs to end preventable tragedies and reduce economic costs associated with vehicle use and highway travel. NHTSA provides the public with information on motor vehicle safety recalls, child safety seat recalls, seat belts, air bags, antilock breaks, highway safety statistics, federal motor vehicle safety standards, vehicle crash test reports, vehicle safety ratings, vehicle theft ratings, and traffic safety educational materials.

The Federal Transit Administration (FTA) is responsible for providing financial and technical assistance to local transit systems and their forms of mass transportation including buses, rail vehicles, commuter ferryboats, trolleys, inclined railways, and subways.

The National Transit Library is the FTA repository of reports, documents and data generated by professionals and laypersons. The intent of the library is to facilitate document sharing within the transit community.

The FTA Office of Safety and Security offers a range of programs to achieve the highest practical level of safety and security among all modes of mass transit. This office assists in the development of guidelines and best practices, and performs system safety analysis and review. Training is provided through regularly offered courses, conferences, and seminars.

Transit City, U.S.A., is a mythical American city accessible through the FTA homepage, which serves as an online resource for students of all ages, to assist in the development and enhancement of knowledge, skills, and abilities through use of the transit medium.

The University Transportation Center Program, enacted in 1998 under the Transportation Equity Act for the 21st Century, established thirty-three university transportation centers. Of the thirty-three centers, ten were designated as regional centers. The intent of the program is to offer a multidisciplinary program of course work to advance transportation technology and expertise through the mechanisms of education, research, and technology.

The St. Lawrence Seaway Development Corporation (SLSDC) is a corporation wholly owned by the federal government and created by statute in 1954 to construct, operate, and maintain that part of the St. Lawrence Seaway between Montreal and Lake Erie, within the limits of the United States. Education-related services of the SLSDC include publi-

cation of transit regulations for vessels, trade reports, traffic reports, special information newsletters, seminars, workshops, and marketing advice for entities importing to or exporting from the Great Lakes region.

The Maritime Administration (MARAD) promotes the development and maintenance of an adequate, well-balanced, U.S. merchant marine, sufficient to carry the nation's domestic waterborne commerce and a substantial portion of its waterborne foreign commerce, and capable of serving as a naval and military auxiliary in time of war or national emergency.

MARAD administers the U.S. Merchant Marine Academy (USMMA), which is located in Kings Point, New York. The purpose of the academy is to educate young men and women to become officers in the American merchant marine. Cadets are offered a range of professional degree and credential options including: a bachelor of science degree, a U.S. Coast Guard (USCG) license as deck or engineering officers, a commission in the U.S. Naval Reserve, or another uniformed service. USMMA graduates must meet service obligations upon graduation.

MARAD provides financial assistance to six state maritime academies to train merchant marine officers pursuant to the Maritime Education and Training Act of 1980. State maritime academy cadets who participate in the Student Incentive Payment (SIP) Program receive an annual stipend to offset school costs. State Maritime Academy students are obligated to meet service requirements upon successful completion of their program.

MARAD provides supplemental training for seafarers in basic marine firefighting, advanced marine firefighting, defense readiness, hostage threat prevention, piracy, and Chemical Biological and Radiological Defense (CBRD).

The Adopt-a-Ship plan is sponsored through the Propeller Club of the United States. The plan provides the opportunity for a school classroom (fifth through eighth grade) to adopt a ship of the American Merchant Marine and exchange correspondence with it. MARAD also compiles and makes available through both print and electronic sources a comprehensive repository of maritime publications and statistics.

The Research and Special Programs Administration (RSPA) is unique among the major operating

divisions of the DOT because of its multimodal mandate. It was established in 1977 to administer those programs that did not fit within the mandates of the other operating divisions. The educational activities of the RSPA include advancing intermodal transportation and technology, conducting transportation research, and delivering training and technical assistance in transportation safety.

The RSPA's Volpe National Transportation Systems Center in Cambridge, Massachusetts, works on a broad range of transportation projects to enhance the nation's transportation capabilities and meet future requirements. The center serves as a federal bridge between industry, academia, and other government agencies. The Volpe Center receives no appropriation from Congress. It is completely funded through a fee-for-service structure.

The Transportation Safety Institute of the RSPA is located in Oklahoma City, Oklahoma. The institute provides training in aviation safety, hazardous materials, pipeline safety, transit safety and security, highway traffic safety, Coast Guard container inspection, automotive sampling, and other specialized programs.

The Bureau of Transportation Statistics (BTS) is the lead division of the DOT charged with developing and coordinating intermodal transportation statistics. The Bureau of Transportation Statistics compiles and makes available highly detailed national-level data on the all aspects of the U.S. transportation system including economic performance, safety records, energy use, and environmental impacts.

The Federal Motor Carrier Safety Administration (FMCSA) was established as a working division of the DOT on January 1, 2000, pursuant to the Motor Carrier Safety Improvement Act of 1999. Formerly a component of the FHA, the new division's primary mission is to prevent commercial motor vehicle-related fatalities and injuries. The Motor Carrier Research and Development (MCR&D) program is organized into eight focus areas designed to support the commercial carrier industry: crash causation and profiling, regulatory evaluation and reform, compliance and enforcement, hazardous material and cargo tank integrity, commercial driver training and performance management, driver alertness and fatigue, driver physical qualifications, and car-truck proximity. The FMCSA also maintains publications on commercial carrier safety regulations, rules, compliance issues, and notices.

### Department of Treasury

The Department of Treasury is organized into two major components. Departmental offices are primarily responsible for the formulation of policy and overall management of the department. Operating bureaus carry out the specific operations assigned to the department. Including the Office of the Secretary, there are thirty offices and bureaus within the treasury department.

Education and training activities are provided by the Federal Law Enforcement Center. Established in 1970, FLETC instructs agents and officers from various governmental law enforcement agencies. Within the treasury department itself, the center trains agents for the U.S. Secret Service, the U.S. Custom Service, and the Bureau of Alcohol, Tobacco, and Firearms. Nondepartmental agencies whose personnel receive training include the Immigration and Naturalization Service and the U. S. Park Police.

One other departmental component has a training responsibility for non-law enforcement personnel. The Office of the Assistant Secretary (Management) Chief Financial Officer is charged with the responsibility of conducting training necessary to meet the demands of the department's overall mission.

### Department of Veterans Affairs

The Department of Veterans Affairs oversees two areas of program services that provide education and training benefits to veterans. The benefits program for which VA is best known comes under the umbrella of its Education Service. The Education Service administers the Montgomery G.I. Bill for active duty personnel. The MGIB program provides up to thirty-six months of education benefits for degree and certification programs, flight training, apprenticeship and on-the-job training, and correspondence courses. Remedial, deficiency, and refresher courses may be approved under limited circumstances. General MGIB benefits are payable for up to ten years following release from active duty.

Tuition assistance is provided by an amendment to the Montgomery G.I. Bill-Active Duty education program. This amendment permits VA to pay a tuition assistance top-up benefit that is equal to the difference between the total cost of a college course and the amount of the tuition assistance that is paid by the military for the course.

In addition to the MGIB-Active Duty program, there is a program under the Montgomery G.I. Bill

for selected reserve personnel, including the Army Reserve, Navy Reserve, Air Force Reserve, Marine Corps Reserve, and Coast Guard Reserve. It also includes the Army National Guard and the Air National Guard. MGIB-Selected Reserve benefits are similar to active duty benefits.

The Vocational Educational Assistance Program may be used by those veterans who contributed a portion of their military pay to participate in the program. Benefits are similar to those for MGIB-active duty personnel.

Survivors' and Dependents' Educational Assistance provides education and training opportunities to eligible dependents of veterans, if the veteran is permanently or totally disabled due to a service-related condition, or to the surviving dependents of veterans who died on active duty as a result of a service-related condition. Benefits are similar to MGIB-active duty personnel.

Education benefits are also provided under the Educational Assistance Test Program. This program was created by the Defense Authorization Act of 1981 to encourage enlistment and reenlistment in the armed forces.

The Work-Study Program is available to any student receiving VA education benefits who is attending school three-quarter time or more. Work-study students are employed in VA offices and facilities or at approved state employment agencies. Students are paid either the state or federal minimum wage, whichever is greater. The Department of Veterans Affairs also provides tutorial assistance for students receiving VA benefits who are enrolled at least half-time and have a deficiency in a subject, making tutorial necessary.

The Office of Vocational Rehabilitation and Employment, for those veterans who have service-connected disabilities, provides a number of vocational counseling and planning services, coupled with on-the-job training and nonpaid work experience. If needed, the disabled veteran may also qualify for education training leading to a certificate or to a two-year or four-year degree.

JASON L. WALTON

## FEDERAL FUNDING FOR ACADEMIC RESEARCH

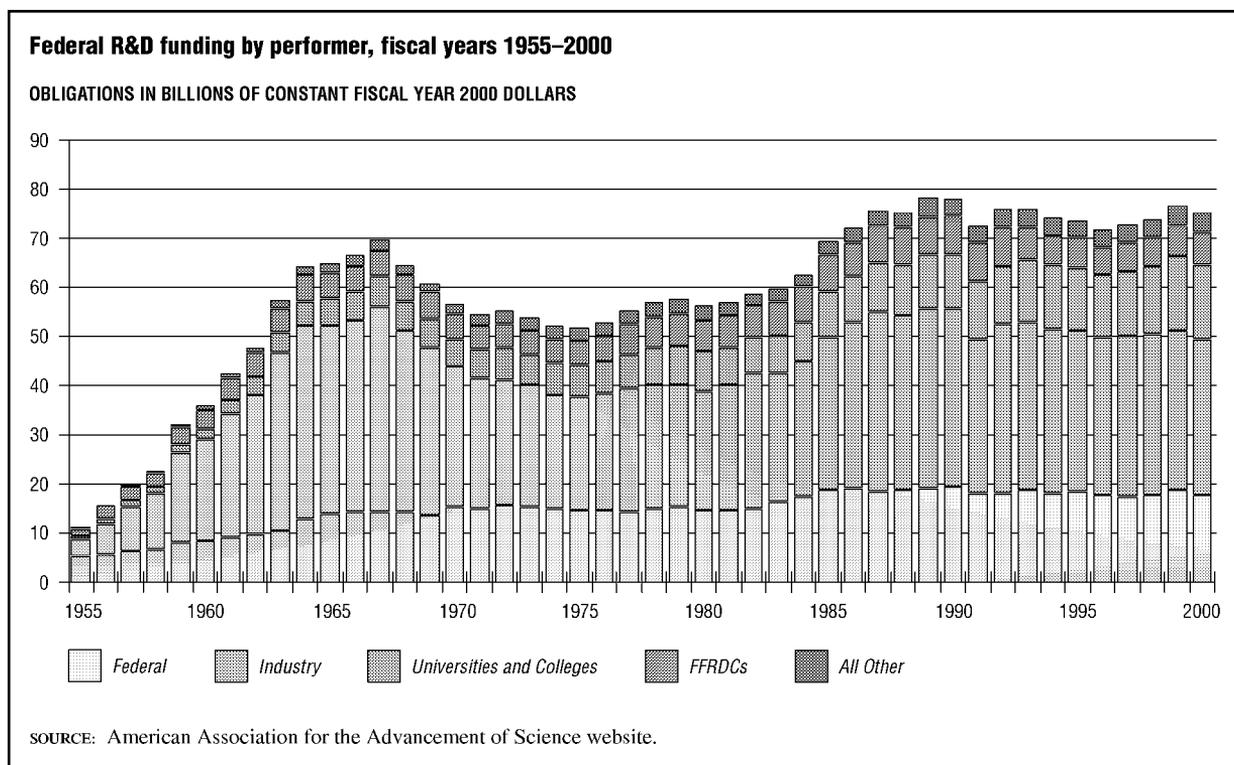

---

The federal government's role in supporting research and development (R&D) in the United States has grown from a very minor one for much of the nation's history to one that was dominant during much of the twentieth century, and finally to one that at the beginning of the twenty-first century is

still significant and essential but has been eclipsed in scale by industry-supported R&D. Federal support for R&D in colleges and universities paralleled this pattern in the first half of the twentieth century but has remained the primary source of R&D funding for these institutions.

Why does the federal government support R&D at all, especially if the private sector invests so much in it? First, the federal government supports R&D that clearly serves important national needs, for example, in areas such as national defense, health, energy, the environment, natural resources, and agriculture. Second, the federal government supports most of the nation's basic or fundamental research—research that is not directed toward any practical problem but is focused on gaining knowledge or understanding phenomena irrespective of any specific application. History is full of examples of such apparently abstract, undirected research providing the basis for applications that prove to be extremely important—for example, disease-fighting medicines, weapons for national defense, and the growth of information technology. According to Albert H. Teich, basic research is "the primary source of the new knowledge that ultimately drives the innovation process" (p. 6). Historically, however, such fundamental research has not been supported on a significant scale by the private sector. Private firms anticipate that they will not be able to appropriate sufficient benefits from basic research to make sizable investments in it cost-effective. Nevertheless, such research is acknowledged by all to be vital to long-term national interests, and so its support is undertaken by the federal government.

Industry and federal research laboratories rank ahead of colleges and universities in terms of federal R&D funding received (see Figure 1). Yet despite their relatively small share of federal R&D support, colleges and universities historically have played an essential role in the nation's overall R&D efforts, for several reasons. First, much of the nation's greatest scientific and technical talent is in these institutions. Second, colleges and universities are particularly well-suited for performing basic research, although they perform a great deal of applied research as well. In 2000 basic research accounted for 69 percent of all college and university R&D. Third, federally funded research at colleges and universities (whether basic or applied) plays a crucial role in educating the next generation of scientists and engineers. It is an investment in the nation's most highly skilled work-

**FIGURE 1**

force, which in turn will be the backbone of an innovative, growing national economy.

### A Brief History of Federal Involvement in University-Based Research

The development of federal involvement in university-based R&D is intertwined with the broader issue of federal involvement in science and technology (S&T) in the United States. Federal involvement in scientific or technical matters was explicitly provided for in the U.S. Constitution only in the provisions for a system of patents and for a census to be held every ten years. For decades in the early history of the country, the doctrine of states' rights (preventing a concentration of authority in the federal government) together with a strain of populist antielitism and a faith in the indigenous development of pragmatic technologies kept the nation from realizing either Thomas Jefferson's vision of strong federal support for science, largely through agriculture, or Alexander Hamilton's advocacy of government subsidies for the advancement of technologies to the benefit of industry. From time to time, the U.S. Congress would deviate from this stance and invest in limited operations in support of exploratory or commercial interests, such as the Lewis and Clark expe-

dition or the establishment of the Coast Survey, both in the early 1800s.

In the 1840s, two events—the establishment of the Smithsonian Institution under federal auspices and the creation of the American Association for the Advancement of Science—highlighted the growing visibility of S&T and foreshadowed the later development of a more significant federal involvement in science and technology. These events, together with what William G. Wells Jr. called a “tide of technological developments . . . in industry, in agriculture, in communications, and in transportation” (p. 8) in the 1850s, set the stage for a qualitative change in the federal role in these areas; this change came in the 1860s as a result of several events. First, the Civil War provided the first of several recurring examples of war focusing the government's attention and resources not just on technology but on the science underlying the technology. Second, the creation of the National Academy of Sciences in 1862 put the elite of American scientists, most of them in universities, at the service of governmental needs. Third, the passage of the Morrill Act and the creation of the U.S. Department of Agriculture, both of which occurred in 1862, established the land-grant

college system, heavily focused on agriculture and the mechanical arts, and developed government bureaus related to agricultural research, in a symbiotic relationship that, by the end of the nineteenth century, approached the Jeffersonian vision of a century earlier.

Meanwhile, in the late nineteenth and early twentieth centuries, the forerunner of the National Institutes of Health was established and undertook programs of research aimed at public-health problems, although much of this work took place in government rather than in university laboratories. Additional initiatives putting governmental resources in the service of S&T-based activities in the areas of conservation, industry, and (to a limited extent) aviation took place in the first two decades of the twentieth century. These did not yet involve significant amounts of university-based R&D, but their importance was that, with the curious exception of military applications, the essential infrastructure of federal government involvement in S&T was firmly in place by the 1920s, and, according to A. Hunter Dupree, “a government without science was already unthinkable” (p. 288). Belief in the importance of research had become infused throughout much of the U.S. economy, and industrially based R&D was becoming established in certain industries.

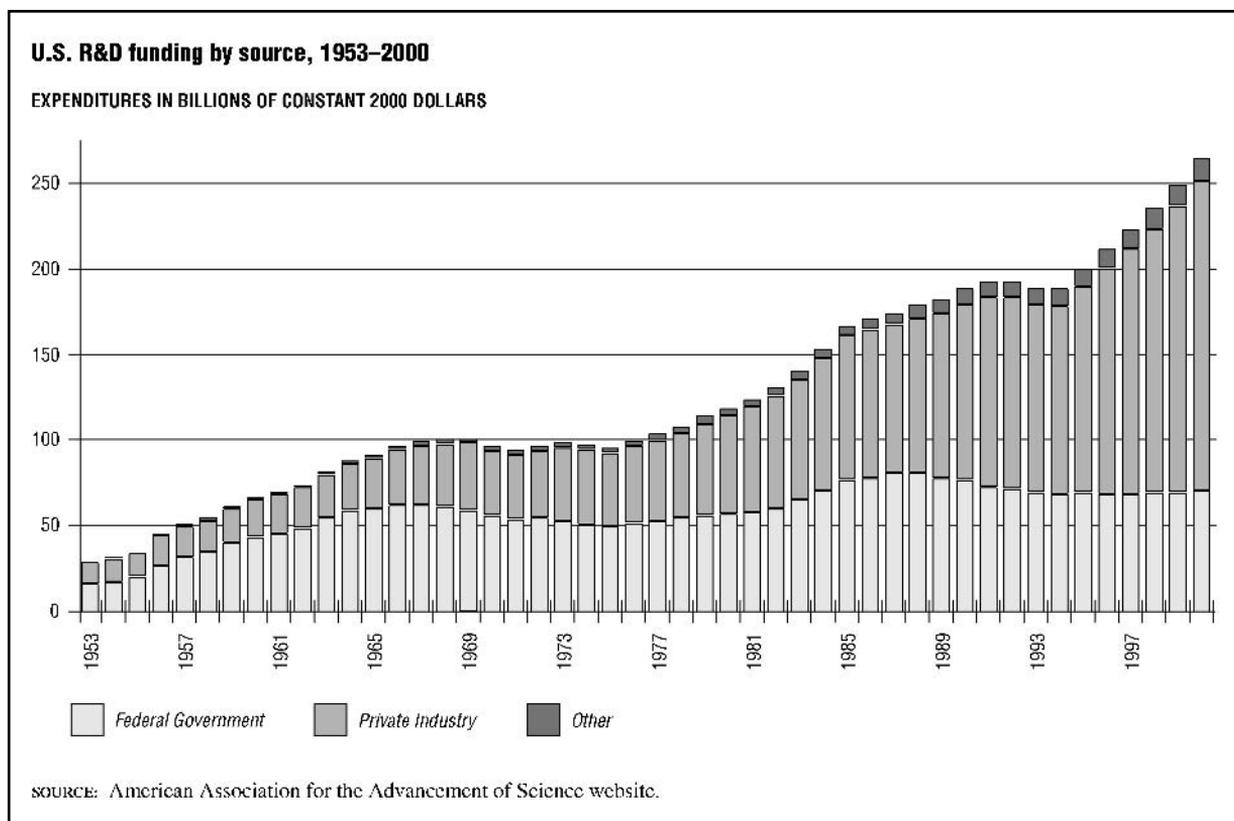

Science, like nearly all other programs, was significantly affected by government cutbacks during the Great Depression. But it was World War II (1939–1945) that was to provide the major turning point in the relationship between the federal government and S&T in the twentieth century. With the establishment by executive order of the National Defense Research Committee in June 1940 and its expansion into the Office of Scientific Research and Development (OSRD) in July 1941—both prior to the attack on Pearl Harbor and the formal entry of the United States into the war—the groundwork was laid for a historically incomparable system for mobilizing science for a war effort. The OSRD, headed by Vannevar Bush, was responsible for developing “a wide range of militarily decisive marvels” (Wells, p. 23), such as radar, medical drugs, and, of course, atomic weapons. This performance demonstrated beyond any doubt the power and effectiveness of federal support for R&D on a large scale, a lesson that carried over into the postwar era and that continued into the twenty-first century. Much of this research took place in university settings, and the massive expansion of federal R&D in the period fol-

lowing World War II included large increases in the amount of federal funds flowing to academically based R&D (see Figure 1).

Vannevar Bush’s report, *Science—the Endless Frontier: A Report to the President on a Program for Postwar Scientific Research*, produced at the close of World War II, set the framework for the “social contract” between science and government that would last for decades, whereby government would provide funds for science but, wherever feasible, leave to scientists the decisions about what projects would be supported and how the research would be conducted. This, it was argued, was the surest path not only to breakthroughs in basic science but also indirectly to the development of products for more direct societal benefit. Bush, in writing it, had clearly in mind the idea that much of that research would be conducted in colleges and universities. In the period immediately following the war, a number of major new S&T agencies were created in the federal government, including the National Science Foundation (NSF), the Atomic Energy Commission, and the Office of Naval Research (ONR); in addition, the National Institutes of Health (NIH) was reformulated and significantly expanded. These agencies—particularly ONR, NIH, and NSF—were soon to become mainstays of federal support for academically based R&D.

Much of the rapid growth in federal R&D in the decades following World War II was driven by cold war concerns and was militarily oriented. The launch of the *Sputnik* satellite by the Soviet Union in 1957 shook U.S. assumptions of technical superiority and fueled an even greater increase in defense- and space-related R&D. In the 1950s and 1960s the federal government was clearly the dominant source for national R&D, although by the early 1970s industrial R&D had caught up and was to move clearly ahead in total investments in R&D over the next three decades (see Figure 2).

Figure 3 illustrates the remarkable growth of R&D support received by colleges and universities over the latter half of the twentieth century. (The figures have been adjusted for inflation, using fiscal year 2002 as the standard, and so represent actual growth in “purchasing power” of those R&D dollars.) The figure dramatically shows not only the overall growth in academic R&D support from all sources but also that this growth was fueled primarily by the growth in federal support. The federal government has been the primary source of support for

**FIGURE 2**

R&D in colleges and universities since the post-World War II days, and it continues to be so.

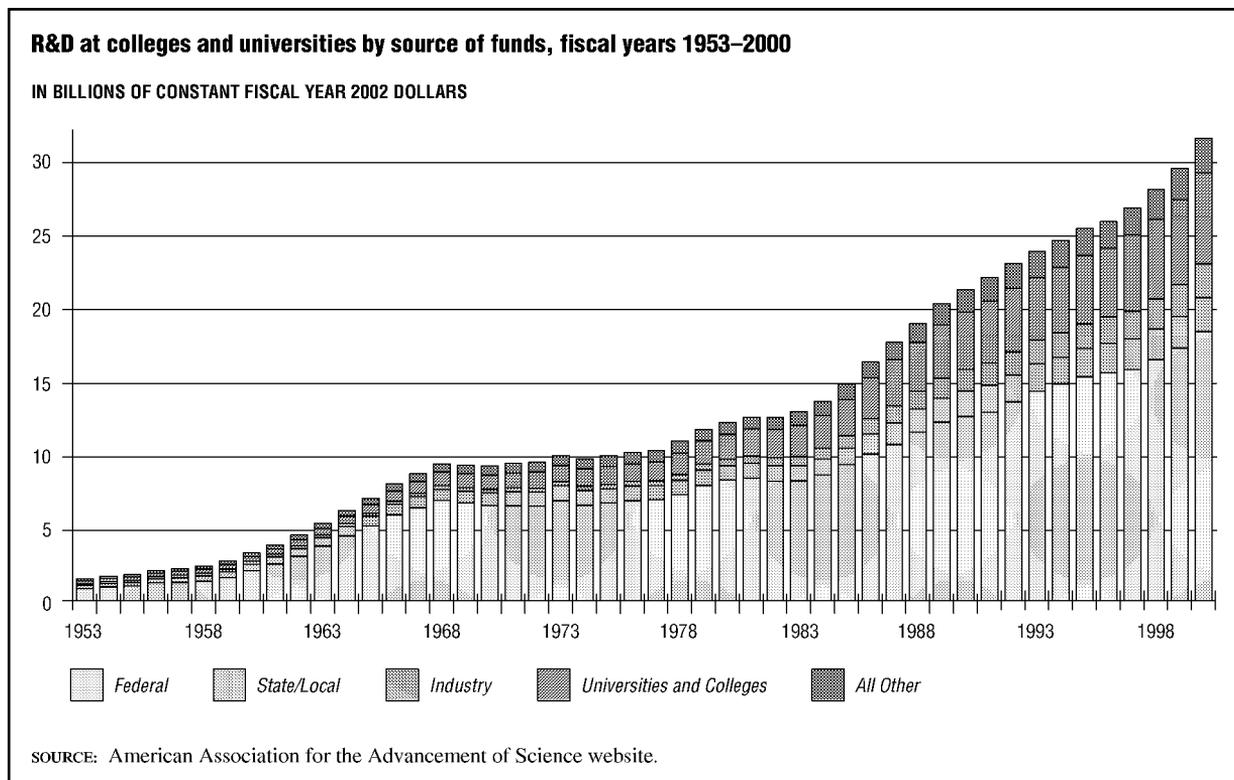

The 1980s saw an important step in federal government–university relations, with the passage (in 1980) and subsequent amendment (in 1984) of the Bayh-Dole Act. This act revised federal patent policy to give recipients of federal funds who invented or developed a product or process with that funding the opportunity to hold title to the item and to realize gains from transferring it into commercial channels. Previously, the federal government had reserved for itself the title to products developed with federal funds, but that policy was seen as bottling up potentially useful and commercializable inventions. Opinions differ about the act's full impact, but it clearly facilitated the growth of activities within universities for retaining intellectual property in items developed under university-based research and for trying to realize income from outside commercial use of those items.

The last two decades of the twentieth century saw the clear movement of research universities into a prominent place in the “knowledge-based econo-

my.” Research support from all sources, not simply federal agencies, became much more aggressively sought, and university R&D portfolios were much more carefully managed with revenue and even commercial goals in mind. It became common knowledge that one of the key elements to commercial development of a region through technology-driven change was the presence of an active, high-quality research university. Consequently, more than ever before, a university's neighbors feel that they have an important stake in that institution's success in securing research funds. Furthermore, according to Teich, “policymakers regard universities as catalysts for high-tech economic development both through entrepreneurial activity that spins off from their research and through the concentrations of highly trained human resources they attract and generate” (p. 5).

Table 1 helps to place federal funding for academic R&D in an overall national context at the beginning of the twenty-first century. Federal R&D funding accounted for \$69.6 billion (roughly 26%) of the national total of \$264.6 billion for R&D in 2000. Colleges and universities received \$30.2 billion

FIGURE 3

from all sources in 2000, which accounted for just over 11 percent of the national totals. The intersection of these two patterns—the federal level of support for R&D in colleges and universities—was \$17.5 billion, a figure that represented 58 percent of all academic R&D support. (It also represented just over 25 percent of total federal R&D support to all R&D performers.) The next section provides further detail about particular agencies and their levels of academic R&D support.

### Key Federal Agencies

Federal support for R&D in colleges and universities in the United States is concentrated in six agencies, which together accounted for 95 percent of the totals in 1999. These six are summarized briefly below, in decreasing order of support. The first three agencies listed—NIH, NSF, and the Department of Defense—alone accounted for 83 percent of college and university R&D from federal sources in 1999. (See Figure 4 for historical trends in support from these agencies.)

The National Institutes of Health, within the Department of Health and Human Services, is by far the largest source of federal support for academic

R&D, providing \$8.2 billion to colleges and universities in 1999—58 percent of federal support to these institutions. The NIH's mission is to advance knowledge promoting improvements in human health, and it does this by supporting biomedical and other fundamental research related to health and disease. The major fields supported by NIH are overwhelmingly in the life sciences (89% of its academic support in 1997), principally microbiology and medical sciences. Other fields that receive NIH support are psychology (4%), the physical sciences (1.5%), and the social sciences (1%). NIH's domination of academic R&D support has shifted the balance among the disciplines in universities' R&D portfolios, with engineering and the physical sciences accounting for smaller shares than in previous years.

The National Science Foundation ranks second in R&D support to colleges and universities, furnishing \$2.2 billion in 1999, or 15 percent of federal totals. NSF is unique among federal agencies, being the only one whose mission is fundamental research and education in all major scientific and engineering fields. Thus, NSF's support is more evenly balanced among the disciplines than most of the mission agencies. The distribution in 1997 was: physical sci-

ences, 22 percent of NSF academic support; engineering, 21 percent; environmental sciences, 17 percent; life sciences, 16 percent; computer sciences and mathematics, 15 percent; and the social and behavioral sciences, 4 percent.

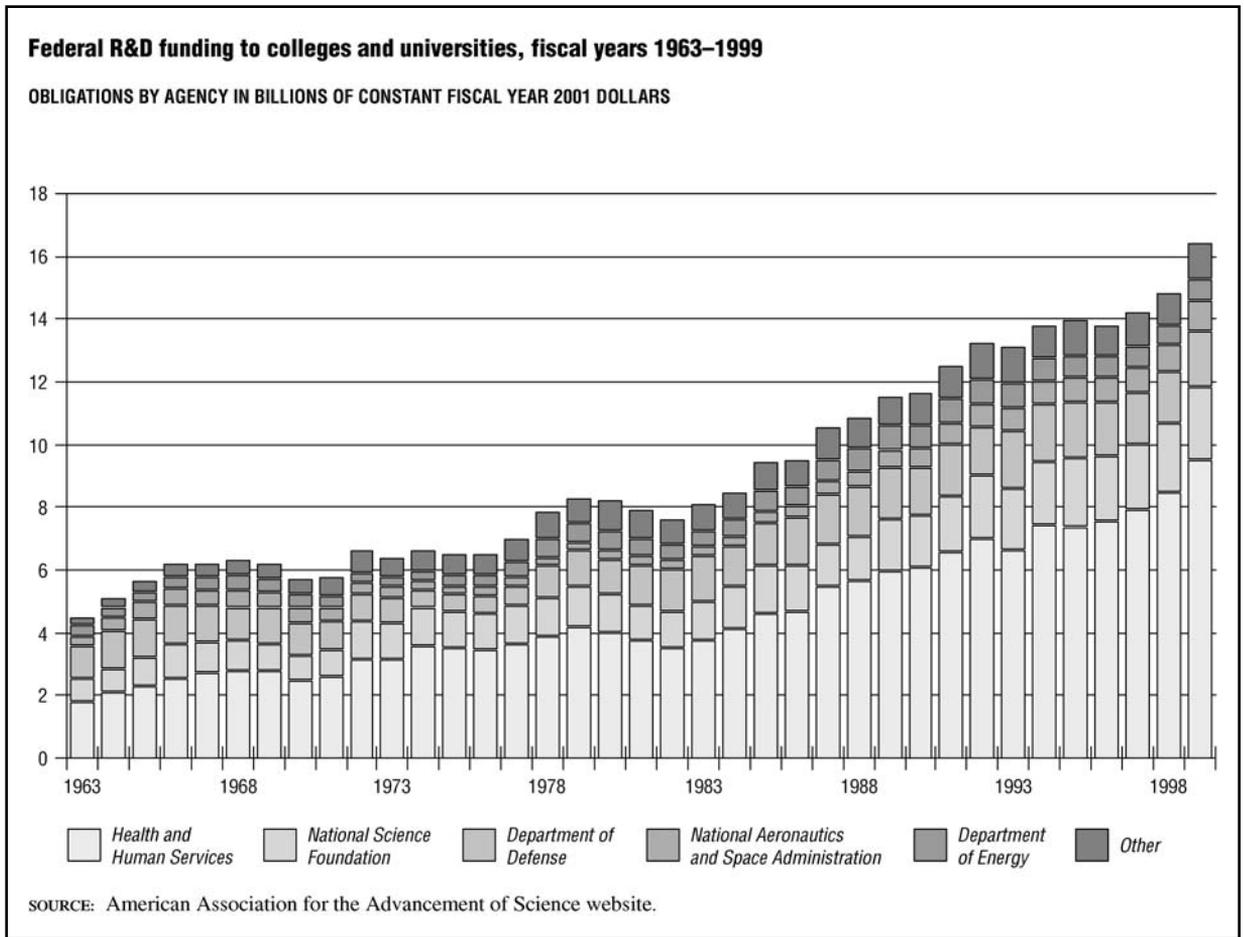

The Department of Defense (DoD) is the third-largest federal agency in terms of support for academic R&D, providing \$1.4 billion in 1999, or 10 percent of federal totals to colleges and universities. DoD is the mission agency par excellence, being responsible for providing the military forces needed to deter or win wars and to protect the security of the country. DoD is by far the largest supporter of R&D among the federal agencies. Most of its R&D, however, is devoted to the development, testing, and evaluation of weapons systems, and only about 12 percent of its R&D has gone for actual research (both basic and applied) in recent years. The major fields supported by DoD academic R&D funds are engineering (40% of DoD academic support in 1997), computer sciences (23%), physical sciences (11%), and life sciences and environmental sciences (at about 10% each).

After the above three, the levels of support by other agencies drop off noticeably. The National Aeronautics and Space Administration (NASA) provided \$719 million in support to colleges and uni-

versities in 1999, which was about 5 percent of federal totals to these institutions. NASA's mission is to undertake aeronautic and space research and activities for the benefit of all humankind. The major fields receiving NASA academic R&D support were physical sciences (37%—principally astronomy), environmental sciences (29%—mostly atmospheric science), engineering (15%), and life sciences (9%).

The Department of Energy contributed \$598 million toward R&D in colleges and universities in 1999, about 4 percent of federal support for them. The Energy Department's mission is much broader than simply energy, and even its R&D programs have several components, including energy research, support for fundamental physical science research, and research involving nuclear security in support of the nation's defense function. The physical sciences (dominated by physics) received 59 percent of Department of Energy support to academic institutions, followed by life sciences, engineering, and environmental sciences, each with about 13 percent.

The U.S. Department of Agriculture (USDA) supported R&D in colleges and universities with \$400 million in 1999, nearly 3 percent of federal totals to such institutions. The USDA's mission is also broad but centers on its responsibility for the ade-

**FIGURE 4**

quacy and safety of the nation's food supply and for developing and expanding markets, both domestically and abroad, for agricultural products. Its academic R&D support, not surprisingly, went overwhelmingly (77%) to the life sciences, comprised largely of agricultural sciences (39%), non-environmental biology (21%), and environmental biology (15%). The next highest supported fields were the social sciences (12%), primarily economics.

All other federal agencies combined accounted for \$739 million of support to academic institutions in 1999, or about 5 percent of the federal totals. This is not to diminish their importance, however. The Departments of Commerce, Transportation, Interior, and Education and such agencies as the Environmental Protection Agency support appreciable amounts of research in colleges and universities, and they rely upon those institutions to provide important research and expertise relevant to their respective missions.

### Advantages and Disadvantages of Federal Research Support

Not surprisingly, research support from federal sources has both advantages and disadvantages. The chief advantage is the sheer scale of support—for most fields, there is simply more money potentially available from federal agencies than from any other source. The decentralized nature of federal R&D support sometimes makes it possible for principal investigators (those submitting proposals) to have more than one potential sponsor to which to submit their ideas. Another advantage is that the researcher usually has greater autonomy with federal support in comparison with support from industry. For most grants (as opposed to private contracts), federal agencies have a relatively hands-off stance regarding the researchers and their work.

Because both the scale of support and the relative autonomy afforded researchers attract large numbers of proposals from researchers, most agen-

cies are quite selective in what they support and pride themselves on supporting only the highest quality work. To ensure this level of excellence, many agencies rely upon “peer review” or “merit review” (review of proposals by those most knowledgeable in the relevant areas of research). In addition, the managers of particular research programs within the agencies are often highly accomplished and knowledgeable researchers in their own right. Thus, there is a certain prestige attached to researchers whose work is supported by certain federal agencies, particularly NSF and NIH. This prestige can carry over not only to the researchers’ own careers generally but also to their home institutions.

On the other hand, federal support has disadvantages as well. The forces that make winning support from the “better” agencies more prestigious—because of the sheer number of applicants relative to the available resources—also make it less likely. Success rates for proposals to NSF and NIH since 1990 and perhaps earlier have been in the 20 and 30 percent range. Eventual success often comes only through resubmitting proposals after revising them based on feedback from the first round of reviews. The high number of applicants also means that grants, even if obtained, may be inadequately funded to complete the proposed research.

In addition to these daunting considerations, the paperwork requirements for submitting proposals to federal agencies are formidable. Researchers spend inordinate amounts of time and effort writing proposals, often with unfavorable chances of success. (As some agencies have shifted to electronic submission of proposals, “paperwork” may no longer be the operative word, but the burden of documentation in proposals remains very high.) Apart from the paperwork burden, the task of dealing, over the several months required for decisions on proposals, with inherently cautious, often ponderous federal bureaucracies can be draining for researchers. Finally there is often a lack of stability in funding levels for some areas of research, resulting from the vagaries of the annual budget process and from changes in policymakers’ enthusiasm for particular areas.

The cumulative effect of these difficulties can extend to the point of discouraging some students from pursuing scientific careers. For many, if they could simply do their science, they would be happy. But when they see that they will also have to expend so much effort in trying to obtain funding, with so

little chance of success, some may turn to other career options.

There is no question that both the nature and the scale of federal funding for R&D has transformed colleges and universities over the past century, especially in the last several decades. The relationship has always been, and continues to be, a dynamic one, filled with both rewards and tensions. A central question for the future is whether that relationship can continue to be a productive one, in which each partner can grow and adapt while also retaining the core of its purpose and identity, in ways that clearly benefit the public.

## FEDERAL FUNDS FOR HIGHER EDUCATION

---

The federal government plays a critical role in providing financial support for higher education. In fiscal year 1996 approximately \$40 billion, or one-fifth of the total revenue received by degree-granting institutions of higher education, originated from the federal government (National Center for Education Statistics). These funds generally are provided in two forms: through direct support to colleges and universities, generally for research or facilities; and through grants and loans made to students enrolled in postsecondary institutions.

This support inevitably comes with political strings attached. The federal government, as does any political entity, establishes program and policy priorities, and expends funds in support of those priorities. The provision of federal funds generally brings along with it rules and regulations that govern how the funds can be used. Recipients of these funds, whether higher education institutions or their students, must agree to comply with these regulations as a condition of their receipt. Throughout history, the relationship between the federal government and higher education has changed, and along with it has been a change in the priorities and regulations with which federal funds are provided to higher education.

### History

Throughout U.S. history, overriding federal policies on higher education have been noteworthy chiefly by their absence. Federal policies have usually been implemented through appropriations rather than general rules and regulations and have thus affected

only selected kinds of institutions, programs, students, and faculty. Even the unrestricted grants of four million acres of federal land, which helped to support universities in seventeen of the twenty-one new states established before the Civil War, were confined to public institutions.

The Morrill Act of 1862 strengthened the budding network of state universities by granting public lands (or the equivalent in scrip) to every state for "the endowment . . . and maintenance of at least one college where the leading object shall be . . . to teach such branches of learning as are related to agriculture and the mechanic arts . . . in order to promote the . . . education of the industrial classes." By 1890 at least twenty new public institutions had been established under the act, and another twenty institutions had expanded or had been placed under public control. The Second Morrill Act of 1890 provided additional annual grants to certain fields of practical instruction but not to the other scientific and classical studies that the 1862 act had embraced.

Gradually, between the Civil War and World War I the principles that continue to govern many federal programs developed: (1) the annual subvention of designated kinds of education and research; (2) the retention by the federal government of the authority to review proposed plans before committing funds, to place conditions on their use, and to audit expenditures; and (3) the encouragement of practical studies and public service activities.

The next major expansion in federal programs came during the Great Depression, when federal outlays rose from \$21 million in 1930 to \$43 million in 1936. This represented an increase of from 4 to 9 percent of institutions' total annual income. In 1937 federal aid to students reached its peak during this era, when 139,000 students (11% of all students) received an average of \$12 per month for undergraduates and \$20 per month for graduate students as part of the National Youth Administration's work-study program.

Federal support for higher education expanded greatly during World War II, increasing to over \$300 million in 1944. The bulk of this expansion was due to research spending in support of the war effort, though colleges and universities also supported the military by providing training courses to over 315,000 army and navy trainees.

Although military research slowed down with the close of World War II, the Servicemen's Read-

justment Act of 1944 (more commonly known as the G.I. Bill) provided a new revenue stream for colleges and universities. In 1948 the federal government supported more than 1 million veterans in college, with payments for tuition totaling approximately \$365 million, and another \$1.3 billion provided to the veterans themselves for subsistence costs. As returning G.I.'s completed their postsecondary education and reentered the workforce, federal support for higher education began to decline. After peaking at \$1.9 billion in 1949 (including subsistence funds for veterans), federal support declined and did not reach this level again until 1963.

The late 1950s saw the creation of the first generally available student loan program through the passage of the National Defense Education Act in 1958. This legislation, passed in response to the launching of the *Sputnik* satellite by the Soviet Union, sought to promote access to higher education as a means toward increasing the technological capabilities of the United States. Now called Perkins Loans, these loans were funded by providing capital directly to colleges, which in turn lent the money to students at highly subsidized interest rates. This era also saw a resurgence in federal support for research, particularly military research to support the cold war efforts of the nation.

The next major milestone in federal support for higher education was the passage of the Higher Education Act of 1965. Title IV of this legislation created the student grant and loan programs that still provided the foundation of financial aid support for students at the beginning of the twenty-first century. Provision of this support was based on the financial need of the students and their families; the aid—both grants and loans—was targeted at the nation's neediest students. In addition to the broad-based student aid programs, the Higher Education Act also provided direct funding for college libraries, historically black colleges and universities, and a number of smaller, specialized programs. The Higher Education Act has undergone reauthorization approximately every five years since its initial passage. With every reauthorization has come changes to how financial aid is provided to students and institutional support to colleges and universities.

Federal support for research has also grown since 1965. According to the National Center for Education Statistics, research support provided to educational institutions (the great majority of which

goes to postsecondary institutions) has grown from \$1.8 billion in 1965 to \$21 billion in fiscal year 2000.

### Federal Support for Students

Since the passage of the Higher Education Act of 1965, financial aid for students has been central to federal support for postsecondary education in the nation. In fiscal year 2000 the federal government provided \$47.7 billion in financial aid to college students at both the undergraduate and graduate levels, a sum that represented 70 percent of all aid available that year. Just over half of this amount (\$24.2 billion) was in the form of private loans guaranteed and subsidized by the federal government; the remaining amount was in the form of grants, work-study, and loan capital provided directly by the federal government. Federal funds for student aid more than doubled in constant dollars between 1975 and 2000, far outpacing the growth in enrollments of 28 percent during the same period.

The Higher Education Act has as one of its goals the equalization of educational opportunity for all students in the United States, seeking to remedy “the appalling frequency with which a student is presently forced to forego the opportunity of postsecondary education because of inability to meet the costs” (Mumper, p. 78). The provision of aid under Title IV of the act has been made almost exclusively based on the financial need of the student and his or her family. In the early years, the emphasis was on meeting the college access needs of poor students through the use of grants. When first fully funded in fiscal year 1975, Pell Grants, the foundation grant program, provided more than 80 percent of the cost of attendance (tuition, room, board, books, and other expenses) at a typical public, four-year institution. Loans were available for students who wanted to attend a more expensive institution.

Over the ensuing twenty-five years, the Pell Grant program did not keep pace with the rise in college costs. By fiscal year 2000 the maximum Pell Grant provided only 40 percent of the cost of attendance at a public four-year institution. While total Pell Grant spending had grown 691 percent over the preceding twenty-five years, federal loan volume had increased 2000 percent over the same period, thus shifting the foundation of the Title IV programs from grants to loans.

The loan programs, which like Pell Grants had initially been targeted at students from financially

needy families, were opened up to all students in 1978. While Congress and the Reagan administration rescinded this change three years later, the income limits in the loan programs (and the limits on the amount of loans that could be taken out) were liberalized again in the 1992 amendments to the Higher Education Act.

Another important milestone in federal funding for higher education students was the passage of the Taxpayer Relief Act of 1997. This legislation, which created the Hope and Lifetime Learning tax credits for college tuition, was initially estimated to cost the government \$40 billion in foregone tax revenue in its first five years, or slightly more than the estimate for Pell Grant spending during that period. Unlike Pell Grants, which are targeted at the nation's neediest students (those from families making less than \$45,000 per year in 2000), the tax credits were made available to families with incomes of up to \$100,000. The structure of the tax legislation helped shift even more federal resources away from the neediest college students and toward middle- and upper-income students.

The changes in the provision of federal support for college students since the passage of the Higher Education Act in 1965 can best be characterized as a shift away from meeting the college access needs of poor students to subsidizing college affordability for students from wealthier families. While the Pell Grant program continues to receive much attention in Congress and on college campuses, its position as the cornerstone of federal support for postsecondary education has been usurped by the emphasis on the use of loans and tax credits as alternative means for providing federal funding to students and their families.

### **Federal Support for Research**

As noted earlier, federal support for research at educational institutions grew to reach a level of more than \$21 billion in fiscal year 2000. These expenditures are generally tightly coupled with national priorities. For example, during the latter half of the 1970s, when the nation faced an energy crisis due primarily to the OPEC oil embargo, there was an expansion of funding for energy-related research. In the 1980s the focus turned back towards military research, as the Reagan administration and Congress created new defense initiatives. In the latter half of that decade, with the end of the cold war and the

aging of the American populace, funding for health-related research grew fastest.

These changing priorities can be demonstrated by examining the amount spent by individual departments and agencies as a percentage of total federal research. In 1965 the Department of Defense represented 24 percent of all federally sponsored research at educational institutions. It dropped to approximately 10 percent of the total in the 1970s, before recovering in the 1980s to 15 percent. In fiscal year 2000 it stood at less than 8 percent of the total (National Center for Education Statistics). In contrast, spending by the Department of Health, Education, and Welfare in 1965 represented approximately 26 percent of total federal research. This share grew steadily (represented by the successor Department of Health and Human Services), reaching 44 percent of the total in 2000.

University-based research tends to follow the priorities established by the federal government. Most federally sponsored research is highly targeted, so that academic researchers need to adjust their research programs to attract federal dollars. Federal research dollars also bring with them support for indirect costs, those expenses associated with operating a large, complex university that cannot be directly attributed to specific research projects. Included in indirect costs are such items as library operations, plant maintenance, repair and operations, administrator salaries, and the costs of managing sponsored research on the campus.

Federally sponsored research has the effect of influencing not just the research agendas of faculty members, but also the decisions of students to enroll in doctoral programs. Doctoral students in most large research universities, particularly those in the sciences and engineering, commonly receive fairly generous fellowships and stipends. Most institutions depend upon sponsored research to support these students. As research dollars flow from sponsors, particularly the federal government, into and out of particular fields, financial support for students also varies. These dollars have the effect of influencing the decisions of students to enroll in specific fields, as well as the ability of universities to support them.

Through its financial support of both students as well as colleges and universities, the federal government has played an influential role in shaping the growth of the higher education industry throughout history. Even though the political and management

control of institutions remains in the hands of states and private boards of trustees, the influence of federal funds for higher education is strongly felt by almost all of the institutions and by most students throughout higher education.

## FEDERAL INTERAGENCY COMMITTEE ON EDUCATION

The Federal Interagency Committee on Education (FICE) is mandated to ensure "effective coordination of Federal education programs." It was first established by Executive Order 11185, issued by President Lyndon B. Johnson on October 16, 1964, and subsequently amended by Executive Order 11260 (1965) and by Executive Order 11761, issued by President Richard M. Nixon in 1974.

FICE was included in section 214 of Public Law 96-88, the Department of Education Organization Act. The act designates the U.S. Secretary of Education as the chair of FICE. On January 12, 1982, President Reagan issued a memorandum to the Secretary of Education stating that "senior policy making offi-

cial from the following agencies, commissions and boards should be assigned to the committee: the U.S. Department of Education; National Endowment for the Arts; National Endowment for the Humanities; National Science Foundation; and the Departments of Agriculture, Defense, Interior, Labor, Health and Human Services, Housing and Urban Development, Transportation, Treasury, and Veterans Affairs."

Subsequently, FICE membership grew to include representatives from the Department of Justice, Federal Emergency Management Agency, Environmental Protection Agency, The GLOBE Program, Institute of Museum and Library Services, Library of Congress, National Aeronautics and Space Administration, Peace Corps, Smithsonian Institution, and U.S. Commission on Civil Rights.

In these acts of legislation, Congress recognized the importance of coordination of federal education programs. FICE assists the Secretary of Education in providing a mechanism to ensure coordination between the Department of Education and other federal agencies that administer education programs. The Department of Education's Office of Intergovernmental and Interagency Affairs is the office responsible for managing FICE.

In the late 1960s and 1970s FICE made recommendations on a variety of postsecondary issues including expanded federal support for graduate study, federal support of historically black colleges and universities, and consumer protection for postsecondary education. These activities led to better interagency cooperation in these areas. FICE's work in consumer protection for postsecondary education led to legislation to protect consumers from the questionable activities of some postsecondary institutions.

Other accomplishments have included planning for an International Conference on Environmental Education in 1987, and making recommendations for research on rural education. The latter were summarized in a 1991 article (later published as a pamphlet) entitled "An Agenda for Research and Development on Rural Education."

In 1999 FICE began an important project to catalog all federal education programs. The committee began with a pilot to test the feasibility of compiling an inventory of federal education programs. The Departments of Education, Treasury, Interior, and Agriculture combined with the National Science Foundation to form a subcommittee that developed

a definition of an education program and inventoried programs meeting the definition within Interior, Agriculture, and the National Science Foundation. This resulted in a report entitled *Single Source: Towards an Inventory of Federal Education Programs*. Since the completion of the report, seven additional agencies have compiled inventories based on the definition.

The Department of Education's interagency team presented *Single Source* to the department in December 2000. After departmental review, several changes were made to the definition of an education program. These changes were presented to and adopted by FICE. All participating agencies were expected to utilize the definition to compile their inventories by the end of fiscal year 2001. FICE defined an education program as one that comprised activities backed by a congressional authorization and current appropriation, with the main purpose of providing support to, or strengthening education at, pre-K through graduate levels. Adult education is included in the definition, but activities such as employment training or public information efforts are excluded. Additional activities that fall under the definition of an education program are development of instructional methods and materials, professional enhancement and utilization of educational technology in schools, provision of assistance to students, upgrading of physical and educational school facilities, and research that has a goal of improving education.

FICE members participate in a number of Department of Education activities and initiatives. In the future, the inventory and list of education activities will provide a better understanding of the depth and breadth of the federal effort to improve education.

## FEDERAL SCHOOLS AND COLLEGES

The U.S. federal government operates, financially supports, or has chartered a number of schools and colleges to meet a variety of specific educational needs thought to be best addressed at the national level. Traditionally, elementary and secondary schools in the United States are primarily the responsibility of local school districts. Two- and four-year institutions of higher education are supported by state and local governments and by private entities. Private nonprofit and religious schools also play an important role in providing K-12 education, and there is a more recent rise in the number of for-profit businesses delivering education and educational services. In several instances, however, based on historical and geographical circumstances, the federal government complements these more customary means of providing education.

### Overview

In elementary and secondary education, the federal government directly operates school systems serving children of personnel living on military bases, and systems serving Native Americans and Native Alaskans living on reservations and in native villages. Within higher education, the federal government provides substantial assistance toward supporting schools for deaf, African-American, Native American, and other students. Several institutions of higher education are also directly operated by the federal government, including the U.S. Military Academy at West Point, the U.S. Naval Academy, and the U.S. Air Force Academy, among others. In addition to operating schools directly, the federal government also provides numerous financial and other incentives aimed at advancing elementary, secondary, and higher education outcomes.

### Elementary and Secondary Schools

Because of the large, diverse, and mobile nature of military deployment, the Department of Defense Education Activity (DoDEA) program operates two elementary and secondary school systems for the children of military and civilian personnel. Children of department employees within the United States, Guam, Puerto Rico, and Cuba are served by the Domestic Dependent Elementary and Secondary Schools (DDESS) system, while dependents living abroad are served by the Dependents Schools (DoDDS) system. Together, these systems enrolled more than 100,000 students in more than 200 schools in the year 2000. If these DoDEA schools were classified as a single state school district, it would rank among the twenty-five largest school districts, based on enrollment, in the United States.

The Bureau of Indian Affairs, within the U.S. Department of Interior, also operates a sizable school system serving Native Americans. The federal responsibility for providing education for Native Americans has been established historically through a succession of laws, treaties, and court decisions. As a result, the Office of Indian Education Programs (OIEP) directly operates nearly 70 schools, and provides grants and contracts to tribes to operate 116 additional schools. These schools enroll more than 50,000 students.

These military and Native American schools maintain curricula, standards, and educational goals that correspond to those found in local public school districts nationally. In addition, they also address unique educational aspects facing the populations they serve. Because military service requires frequent movement, for example, DoDEA teachers and counselors on military bases must be especially aware of how these numerous changes in environment and classmates may affect students academically and personally. In addition, DoDEA schools maintain a consistency of curriculum, which facilitates students' continuum of study and learning despite frequent geographical transfers. At the same time, each locality where students attend school also presents unique opportunities for them to learn local culture and language, which is encouraged in DoDEA schools. Within schools on reservations, efforts are made to maintain native and tribal cultures and languages as aspects of the curriculum. In fact, over the past decades and with the encouragement of the U.S. Congress and the OIEP, more and more schools on reservations are being operated by tribes and tribal

school boards, rather than directly by the federal government, supported through the federal grants and contracts administered by OIEP.

Students from military families living off-base, or on bases with insufficient numbers to support a federally operated school, generally attend local public schools, as do children living on other federal land. These students often comprise a substantial share of the local community's school population, however. To compensate for the financial impacts incurred as the result of this federal presence, the federal Impact Aid Program provides funds to affected local school districts. The basis for this aid is that the federal employees, especially those who live on federal land or military bases, diminish the tax base that traditionally supports local school districts. Local revenues are lost, for example, because personnel living on federal property pay no property taxes, and often shop in stores on bases that generate no local sales tax revenue. Impact Aid also is provided to some school districts enrolling students who live in low-rent housing, and additional students who live on Indian reservations.

In addition to operating schools directly, or providing funds to schools directly affected by its presence, the federal government supports many educational programs and activities geared toward serving populations that have been, or are likely to be, at risk or underserved by traditional educational mechanisms. Federal funds partially support, for example, such students through Title I, Part A of the Elementary and Secondary Education Act of 1965, the Individuals with Disabilities Education Act (formerly the Education for All Handicapped Children Act), and the Head Start programs. Federal assistance is also provided to school systems in the commonwealths of Puerto Rico and the Northern Mariana Islands, and the territories of American Samoa, Guam, and the U.S. Virgin Islands, both through their participation in programs funded partially by the federal government (including those for at-risk students), and through the Department of Defense schools and Impact Aid. Federal revenues for public elementary and secondary schools alone range from nearly 80 percent of all school funding in American Samoa, to 25–30 percent in the Northern Mariana Islands and Puerto Rico, and less in the Virgin Islands and Guam.

## Institutions of Higher Education

Although the federal government does directly operate a number of educational institutions such as the military service academies, it more commonly facilitates the formation of, and provides significant funding support for, schools and colleges established under its auspices, while leaving their organization and management to the institutions themselves.

Two institutions of higher education directly chartered by Congress are Gallaudet University and Howard University, both in Washington, D.C. In 1864, at the height of the Civil War, President Abraham Lincoln signed the bill authorizing Gallaudet University to grant college degrees. Efforts by Amos Kendall, an influential Washington writer and politician, led to the formation in 1857 of a school to serve deaf and blind children, officially known as the Columbia Institution for the Instruction of the Deaf, Dumb, and Blind. Believing that the school should grant college degrees and open the opportunity for higher education to deaf students, Kendall and the school's first president, Edward Miner Gallaudet, presented their case to Congress. They noted that higher learning for deaf individuals was possible with sign language, and that sign language enabled such education to be on a par with that obtained through spoken language. The initial emphasis of this college was to train teachers to work in the growing number of state schools for the deaf, and since these schools were spread across the United States, the federal government was asked to support a postsecondary institution to provide this training. By 1865 the school served only deaf students in both a pre-college school and in the college (blind students were transferred to a state school for the blind). Gallaudet College became Gallaudet University in 1986, and maintains the Kendall Demonstration Elementary School and the Model Secondary School for the Deaf on its campus.

Only a few years after the Civil War ended, the need also became clear for the establishment of a comprehensive institution of higher education serving the four million freed slaves and several hundred thousand free African Americans in the United States. The initial plan was to establish a theology school—an effort led by members of the First Congregational Society, a prominent Washington, D.C., church. General Oliver O. Howard, at the time the Commissioner of the Freedmen's Bureau in the U.S. War Department, was a member of this group and supported the idea. Soon afterwards, the plan was

expanded to create a school for both theological training and to train teachers. While not the first college for African Americans (there is some evidence that Cheyney University in Pennsylvania was the first), the comprehensive plan for the new university soon grew to include programs in the arts, sciences, medicine, and law. These efforts culminated in the signing of the charter for Howard University by President Andrew Johnson in 1867. Although the charter of Howard University indicated the institution was for all individuals, there was no doubt that the intent was to serve freed slaves and other African Americans.

Both Gallaudet University and Howard University were established in times when there was great debate about whether deaf individuals and freed slaves (and freemen) were capable of achieving higher education. At the start, both universities had an initial goal of training teachers for the growing number of deaf institutions and in schools where freed slaves were obtaining public education for the first time. Both universities, although chartered to grant degrees by the federal government and receiving substantial shares of their revenues from the federal government, are private, nonprofit institutions, governed by boards of trustees. While there is some federal review of their policies, they continue to maintain the independence to determine their own academic and strategic planning objectives. Both universities continue to be national in scope, are fully accredited, and enroll both undergraduate and graduate students from across the United States in unique educational, cultural, and social environments. The importance of these two federally chartered schools is similarly seen in their impact on the wider communities they serve.

**Deaf education.** Gallaudet University is the only institution of higher education for deaf and hard of hearing students in the world. As such, it is a center for the study of deaf culture, history, and language. It is also the only institution of higher education where all communication between students, faculty and staff is direct and in sign language. A great majority of deaf teachers for deaf children obtained their bachelor's degree at the university, as have leaders in business, science, the arts, and other endeavors. In 1988, spurred by a student movement, Dr. I. King Jordan was named the university's first deaf president, an event that further served to encourage deaf students around the world to raise their aspirations and expectations for their futures.

**African-American education.** Howard University sets a national standard for the education and aspirations of African-American students in the United States. Established nearly 100 years before the passage of the Civil Rights Act in 1964, it has provided unique and diverse opportunities for African Americans in an era of segregation and discrimination. Howard University's mission continues to emphasize the history, culture, education, and societal role of African Americans, as well as other historically disenfranchised groups. Dr. Mordecai Johnson was named as the university's first African-American president in 1926.

Howard University is one of more than one hundred historically black colleges and universities (HBCUs) in the United States. These colleges and universities were all established prior to 1965, at which time Congress agreed to provide increased financial support to them, compensating for past lapses in federal aid. Subsequent Presidential Executive Orders strengthened the federal role in providing financial and educational support for HBCUs. Among the diverse group of HBCUs are Clark Atlanta University, Florida A&M, Grambling State University, Hampton University, and Southern University. Similarly, the federal government continues its support for additional study by deaf students through funding for the National Technical Institute for the Deaf (NTID) at the Rochester Institute of Technology in New York.

**Native American education.** The first institution of higher education for Native Americans, Diné College (formerly Navajo Community College), opened on the Navajo Reservation in Arizona in 1968, more than one hundred years after the federal government's first impetus to assist the then educationally disenfranchised groups of deaf and African-American students. The founding of this first tribal college was supported by funds from the federal Office of Equal Opportunity, with federal funds continuing to play a crucial role in the ongoing success of this and more than thirty other tribal colleges in the United States. Most of these schools are two-year colleges, but a growing number are adding four-year and graduate degrees, with South Dakota's Oglala Lakota College and Sinte Gleska University being among the first to do so.

The educational environments and philosophies in these comparatively new tribal colleges are strikingly similar to those of their century-old counterparts serving deaf and African-American students.

Chartered by tribal governments, these institution's curricula highlight native culture, language, and traditions. Academic and developmental programs are geared towards the specific needs of the indigenous student populations. The colleges not only serve those on each reservation, but also are resources for the entire reservation and for members of tribal communities nationally. Most tribal college presidents are Native Americans, further encouraging aspirations of future generations in higher education.

### Funding

In addition to direct support to institutions of higher education, the federal government provides many other types of funding for students and organizations as well. Aid to individuals, for example, is given through student financial assistance programs, loans to individuals and families, work-study grants, and other incentives. Colleges and universities also receive aid through research and development grants, and additional federal funds support education at a variety of research facilities. In addition, an institution affiliated with the federal government but receiving no direct U.S. government funding, the U.S. Department of Agriculture Graduate School, offers programs geared towards the needs of federal workers and managers. Although this institution operates on a self-supporting basis, much of its funding is derived through federal agency tuition payments. Further, the government provides training for its senior executives at the Federal Executive Institute and Management Development Centers, as well as training opportunities at various public and private colleges and within federal agencies.

### Goals

A more direct federal role in supporting schools and colleges within the otherwise state, local, and private educational mandate in the United States is presented here; however, in a broader sense, the federal role in education encompasses an extensive range of programs established to promote a wide variety of goals. These goals include improving academic achievement, expanding knowledge, providing equality of educational opportunity, collecting and disseminating education data, encouraging research and development, fostering health, advancing national security, and maintaining international relations. Viewed this way, spending for all types of educational activities accounted for approximately 10 percent of all federal expenditures in fiscal year 2000.

## COMMUNITY AND JUNIOR COLLEGES

Richard L. Alfred

**OVERVIEW**

While many college-bound students and their families view higher education as a means to professional success and economic security, this end belies the myriad of contributions that America's colleges and universities make to the broader society. Although such social benefits often defy precise measurement they nonetheless establish the rationale for the public support of higher education. By any measure, public support of higher education is huge. In fiscal year 1996, federal, state, and local governments gave well in excess of \$75 billion to degree-granting institutions of higher education (calculated from data generated by the National Center for Education Statistics). Tens of billions more dollars were provided indirectly through student financial assistance in the form of scholarships, grants, loans, and tax deductions.

Higher education is a massive enterprise with fiscal year 1996 expenditures of just more than \$190.4 billion. Taking into account further expenditures of \$20.9 billion in additions to physical plant value, combined expenditures on higher education comprised roughly 2.7 percent of the nation's gross domestic product during that year. By all accounts it is expected that higher education will continue to grow throughout the first part of the twenty-first century.

**Expenditures**

Higher education expenditures fall into two general categories: capital outlay (land, buildings, and equipment) and annual operating expenses. Annual operating expenses—or current-fund expenditures—occur in four distinct areas: educational and general expenses, auxiliary enterprises, hospitals, and independent operations.

In fiscal year 1996, colleges and universities devoted roughly \$20.9 billion to capital outlays with the largest expenditure area (60.1% of total) being buildings, followed by expenditures on equipment (36.1%) and land (3.8%). Thus, capital expenditures made up roughly 10 percent of total higher education expenditures in this year. The percentage of all expenditures devoted to capital additions has fluctuated within 1.5 percentage points since the early 1980s.

The remaining 90 percent of higher education expenditures are devoted to education and general expenses—items such as instruction, research, libraries, administration, campus operations and maintenance, institutional scholarships and fellowships, auxiliary enterprises (e.g., residence halls, food services, intercollegiate athletics), independent operations (usually research and development centers), and university hospitals. Almost four-fifths of current-fund spending is accounted for by education and general expenditures. Costs associated with instruction (including faculty salaries) constitute just under one-third of annual expenditures and represent the single largest expense category in the higher education budget. Research expenses and institutional support costs (for example, general administrative services, legal and fiscal operations, community relations) each account for just under 10 percent of current-fund expenditures.

Outside of the educational and general expenditure area, institutions of higher education may devote significant resources to auxiliary services, independent operations, or hospitals. Such expenditures are generally revenue generating (although not always revenue neutral) and therefore have some capacity to be self-supporting. Roughly 20 percent of current-fund expenditures are directed at such units.

While these numbers are helpful in providing a very general description of higher education expenditures, they will vary dramatically across different types of campuses, generally in accordance with size and institutional mission. Relatively few campuses, for example, support hospitals or independent research centers.

**Revenues**

Public investment in higher education is based on the belief that colleges and universities provide social benefits to society that individual students cannot capture. To the degree that this belief is correct, the demand for higher education by individual students would be less than the social demand and an underproduction of higher education would inevitably result. Public subsidies are therefore used to address this imbalance in demand. Historically colleges and universities have been controlled and financed by state as opposed to federal government. While the federal government and students themselves provide a substantial amount of revenue to institutions of higher education, state revenues are the single largest

source of government support for public institutions.

Capital projects on U.S. campuses are supported by revenues from a variety of sources. These most often take the form of private gifts, grants, and loans from the federal government, appropriations by state or local legislative bodies, general obligation bond issues by states or localities, borrowing by state building authorities or similar public corporations, and institutional issues of revenue bonds by the institutions themselves.

Current-fund revenue for higher education—money received during any given fiscal year from revenue that can be used to pay current obligations due, and surpluses reappropriated for the current fiscal year—also comes from many different areas and in many different forms. The majority of current-fund revenue received by institutions of higher education comes from students (through tuition) and federal, state, and local governments. Almost 28 percent of revenues in fiscal year 1996 came from students and their families while federal, state, and local governments combined provided 38 percent during this year. State governments provide the largest share of public funds directed to institutions (comprising roughly 60% of public funds in 1996), followed by the federal government (32%), and local governments (8% of total government support). The remaining 34 percent of current-fund revenues was made up from private sources, endowment income, and sales and services during this fiscal year.

This pattern of support has changed significantly since the early 1990s, with tuition revenue surpassing the amount of state appropriations to higher education institutions. The proportion of current-fund revenues received from each of these sources varies dramatically by sector, with private colleges and universities much more reliant upon tuition revenues. Table 1 shows that most revenues for higher education come from one of four distinct sources: the federal government, state governments, students (through tuition), and the sales of goods and services that are incidental to the conduct of research, instruction, or public service.

### Federal Support

Since the Northwest Ordinance legislation in 1787 authorized land grants for the establishment of educational institutions, the federal government has been a major player in the financing of higher educa-

tion. The first Morrill Act (1862) set the stage for the development of the nationwide system of land-grant colleges and universities to which the United States owes much of its extraordinary agricultural productivity since the late nineteenth century. Subsequent federal legislation supporting higher education has helped ensure the nation's military and industrial dominance for most of the twentieth century.

The U.S. government provides funds directly to institutions as well as to students in the form of financial aid. Most federal support comes through categorical aid programs administered by various departments within the executive branch or through independent agencies of the federal government. Of those funds provided directly to institutions of higher education, the bulk of federal support comes through such categorical programs in the form of restricted or unrestricted grants and contracts. The remainder of federal institutional support is provided either as direct appropriation or through independent operations usually involving major federally funded research and development centers (see Table 2).

Federal grants and contracts have long played an important role the advancement of science and engineering in the country. The National Defense Education Act of 1958 and grants and contracts provided through the Higher Education Act of 1965 and subsequent reauthorizations are good examples of this historic commitment. Toward the end of the twentieth century attention has been drawn to the increasing tendency of federal lawmakers to provide generous earmarks directly to institutions in their respective states. Scientists and college officials across the country have voiced concerns that the purely political distribution of funds traditionally awarded on competitive bases tends to erode the efficient provision of federal support aimed at leveraging the largest advances in knowledge and access to higher education.

While substantial funds flow from the federal government directly to institutions of higher education, the major portion of federal support for higher education comes in the form of student financial aid. Dramatic shifts in the economics of higher education and in policies defining the composition and delivery of student aid occurred between 1972 and 2001.

Civil rights-era ideals of federal student aid programs (largely falling under Title IV of the Higher

Education Act) focused on providing need-based grant aid to ensure that low-income youth would not face a greater economic burden than their peers from more affluent backgrounds. These progressive ideals were soon eroded by the economic and political realities of the mid- to late 1970s, realities that radically altered the funding environment for higher education programs across the country. Marked gains in lower-income student access and persistence associated with Title IV were diminished as the need-based grant aid ideal was nudged toward the margins by more cost-effective and politically palatable loan programs.

The trend away from the need-based ideals outlined in the early Title IV programs was followed by a series of federal policy actions across the 1980s that devolved federal responsibility for a wide variety of public programs down to the state level. This devolution effectively relieved an exploding federal budget from a large share of the funding burden associated with a number of traditionally federally sponsored programs, including numerous high cost health and welfare programs.

One consequence of shifting responsibility to the states was that many states began experiencing severe financial strains—strains associated with unfunded mandates concomitant with the reassignment of many of these high cost federal programs. Strains on state budgets throughout the 1980s and early 1990s, combined with a serious economic recession in the early part of the 1990s, ultimately led to cutbacks in state general fund expenditures directed at public higher education which in turn fueled a run-up in tuition prices in the public postse-

condary education sector. A slightly different but no less malignant set of forces undergirded an even more dramatic tuition escalation in the private sector across this period.

### State Support

States serve as the locus of control for higher education and are the single largest government funding source for public institutions. Any effective consideration of state support for higher education requires the separate treatment of public and private institutions. While public institutions receive generous state appropriations designed to subsidize the real costs of instruction, private institutions are generally less likely to receive such subsidies and are therefore much more reliant on tuition revenues (see Table 3).

**Public institutions.** Appropriations to institutions of higher education were made largely on the basis of political decisions in the post-World War II expansion. This strictly politically driven mode of funding had largely given way to funding based on enrollment-driven formulas by the late 1970s. Throughout the 1970s and 1980s the formulas used by state officials became much more refined to better reflect the varied missions, structures, and histories of state institutions. Many states during the 1980s adopted various forms of budgeting based on performance measures that usually affected a small portion of the overall funding. By the 1990s the mixed results from adherence to these various forms of budgeting led many states to abandon formula-based allocations and attempts to distribute funds on the basis of performance. Those states turning

away from these earlier budgeting schemes began to develop policies that take into account previous allocations then making adjustments for inflation and changes in enrollment.

Similar to the federal government, states provide revenue to institutions directly in the form of appropriations, unrestricted grants and contracts, and restricted grants and contracts. And like the federal government, states provide financial aid to students that is then redirected to the institutions at which they enroll to cover the price of attendance. State student aid has taken many forms over the last half of the twentieth century. Although most programs were initially merit-based, many states had developed need-based aid programs by the mid-1960s. Need-based state aid programs were widely adopted by the mid-1970s to take advantage of the federal State Student Incentive Grant program passed in the 1972 reauthorization of the federal Higher Education Act. In the early twenty-first century, contractions in federal and state spending and political sensitivity to the dismay of middle- and upper-middle class families over spiraling tuition costs are driving state aid programs back toward the merit-based (as opposed to need-based) model.

**Private institutions.** States have long recognized the contributions of private higher education to enhancing the quality of life of its citizens. In addition to providing a greater diversity of higher education opportunity and enhancing states' economic and cultural richness, state leaders realize that these institutions also absorb the subsidization costs of students who would have otherwise attended a public institution in the state. Moreover, private institutions play an important role in the expansion of higher education opportunity in many states that would otherwise be hard pressed to underwrite such growth. Consequently, many states make significant public investments in these institutions.

While some states have chosen to provide direct institutional aid to private colleges and universities, others target their support at specific high need programs or at the development of research and technological capacity. Another important source of state revenue for private institutions comes through state student aid programs. Student aid programs in which students enrolling in private institutions can participate have become ubiquitous. In addition, many states have developed tuition equalization grant programs to encourage access to this sector.

**TABLE 2**
**Current-fund federal revenue of degree granting institutions, fiscal year 1996**

Type of federal revenue	1995–1996 amount (in thousands)	Percentage of federal funds
Appropriations	2,036,948	8.5
Unrestricted grants and contracts	3,652,186	15.3
Restricted grants and contracts	14,713,289	61.5
Independent operations	3,536,653	14.8
Total federal revenue	23,939,076	100.0

SOURCE: U.S. Department of Education, National Center for Education Statistics. 2001. *Digest of Education Statistics*. Washington, DC: U.S. Department of Education.

State allocations to private institutions remain relatively modest however when compared to state contributions to institutions in the public sector (roughly 3% of state institutional support goes to the private sector). Differences in the types of funds made available to private institutions are also noteworthy. While more than 90 percent of state funds provided to public institutions are in the form of straight appropriations, almost three-quarters of state support allocated for private institutions is provided in the form of restricted grants and contracts (see Table 3).

### Tuition Support

Public and private institutions have become more reliant upon tuition revenues than on any other single source. Most institutions chose to raise tuition charges paid by students and their families as revenues from state and federal sources declined throughout the latter part of the twentieth century. Escalating tuition prices during this period resulted in intense political pressure and close scrutiny of college costs. Many, especially those from lower- and middle-class families, expressed fear that they were being rapidly priced out of higher education.

The resultant political pressure combined with a strong economic recovery by the mid-1990s in most states allowed an easing of tuition increases over the course of the last several years. This hiatus, however, appears to be short lived as states come to grips with long-term structural budget deficits that will erode their ability to continue to provide revenue at current levels, let alone fund the further expansion necessary to accommodate the growing

TABLE 3

## Current-fund state revenue of degree granting institutions, public and private, fiscal year 1996

demand for higher education across the country. Many experts have concluded that this is not a cyclical pattern and that state spending on higher education is being permanently altered.

With the continued escalation of public sector costs in areas such as K–12 education, health, welfare, and prisons, higher education's claim on public funds is becoming increasingly tenuous. Most experts agree that as the federal and state governments struggle to meet the demands in areas outside of higher education, tuition revenues will continue to become an ever larger source of revenue for all institutions, public and private.

### Sales of Services, Private Giving, Endowment, and Other Support

As competition for government funds increases, institutions of higher education are becoming increasingly reliant upon other sources of support. Throughout the early 1990s rapid increases in tuition charges highlighted one strategy for replacing funds traditionally provided by state and federal governments. Recognizing that sustained tuition increases such as those in the 1990s were eroding access and would eventually affect demand, higher education leaders began to more aggressively encourage the cultivation of less dominant revenue sources. Colleges and universities are resorting to selling goods and services that were historically provided at no or little cost; faculty and staff are increasingly and openly encouraged to be more entrepreneurial when thinking about their research and teaching; and few institutions, public and private alike, lack coordinated fund-raising mechanisms (despite the reality that only the most prestigious institutions realize much from this source). Such activities are likely to become more pronounced

throughout the early part of this century as higher education leaders struggle to balance the burgeoning demand and dramatic declines in levels of public support.

## COMMUNITY AND JUNIOR COLLEGES

Comprehensive two-year colleges emerged at the beginning of the twentieth century during a period of experimentation in all sectors of American education. In keeping with the spirit of the time, the community college—initially known as the junior college—developed as a result of increasing demand by the American public for accessible and affordable education. This unique institution, in which the associate degree is most commonly the highest degree awarded, quickly became a bridge between work and further education for traditional and adult learner populations. Throughout this entry, the term *community college* will be used to refer to public comprehensive two-year colleges. Included in this designation will be publicly supported associate degree institutions, technical colleges, and branch campuses. Private two-year colleges, usually recognized as junior colleges, are not included in this designation.

### Historical Background

Beginning with Joliet Junior College in 1901, community colleges evolved in three distinct ways: as an upward extension of public school systems, as a downward extension of the university, and through voter approval. In the first half-century, most community and junior colleges were influenced in structure and operation by the public school systems and boards of education of the states in which they were located. According to a 2000 report from the American Association of Community Colleges, growth was steady during the first half of the twentieth century, with 648 institutions enrolling 168,000 students in 1950. With the expansion of the economy following World War II and growing public need for access to

postsecondary education, community college campuses and enrollments grew at an explosive pace. By 1975, the number of two-year colleges (known variously as community colleges, junior colleges, technical colleges, associate degree institutions, branch campuses, etc.) had grown to 1,230 institutions enrolling 3,836,000 students. In fall 1999, the latest year for which official statistics are available, two-year colleges numbered 1,600 institutions and enrolled 5,339,000 students—one out of every two students enrolling in college on a first-time basis and 44 percent of all undergraduate students enrolled in American colleges and universities.

Although much of this growth has been attributed to changing demographic and economic conditions, it was also a product of public sentiment that favored the development of community colleges as a distinct educational entity within a local service region. Citizens committed to the idea of an affordable college within easy reach approved bond and tax referenda that provided capital and operating support at a record pace between 1960 and 1990. Local support not only paved the way for large-scale growth, it also positioned community colleges as a different type of institution from other postsecondary institutions. Public community colleges in most states receive significantly more support from local tax funds than do for-profit and baccalaureate degree granting institutions. And, as a reflection of their status as community-based institutions emphasizing access and convenience, tuition and student fees are typically lower than student charges at other institutions.

### Financing Community and Junior Colleges

In significant ways, the financing of community and junior colleges is similar to college and university finance. All two-year institutions charge tuition and fees. They generate support from gifts and grants and the proportion of support they get from state funds is more like that received by baccalaureate colleges than K-12 school systems. State funds are often distributed to public community colleges by formula rather than by direct appropriation from the state legislature, which is the typical procedure used for state financing of four-year colleges and universities. Private junior colleges, of course, rely much more heavily on tuition than do public community colleges. In this respect, they are more like privately controlled four-year colleges and universities.

By looking at the methods of financing community and junior colleges over the six-year period from academic year 1991–1992 through academic year 1996–1997, one can gain an understanding of both the sources of funding for these colleges and the shifts that have occurred over time. Inclusion of funding data for four-year colleges and universities in the analysis provides a framework for comparison of resources allocated to different institutions by source over a common reporting period.

**Sources of revenue.** The status and methods of financing current operations between 1991–1992 and 1996–1997 for community and junior colleges and four-year colleges are illustrated in Table 1. (In interpreting these data, it is important to note that Pell revenue is not included in tabulations of support from the federal government.) Several observations of note can be gleaned from this information. One is that public community colleges are holding steadily to the principle that funds from state appropriations, local tax, and student payments in the form of tuition should be the primary sources of revenue in support of operations. For independent junior colleges—smaller in number and enrollment—tuition and fees are the primary source of operating income. When public and private two-year colleges are considered together, state, local, and student sources of income constitute, in combined form, more than 80 percent of the operating income. It appears that tuition and local tax are providing a proportionally greater share of support for operations in 1996–1997 compared to their level in 1991–1992 and that state appropriations are declining as a source of support for operations. The percentage of revenue through state appropriations shows a shift from 45 percent in 1991–1992 to 42 percent in 1996–1997. Student tuition and fees accounted for 21 percent of operating revenue in 1991–1992 and 23 percent in 1996–1997. In 1991–1992, local tax constituted 17 percent of operating revenue; by 1996–1997, it had increased to 18 percent.

Support provided through the federal government remained stable at roughly five percent between 1991–1992 and 1996–1997 for community and junior colleges. Gifts, private grants, and contracts account for only one percent of the revenue received by community colleges. This income source has become increasingly important to two-year colleges, however, as indicated in the 24 percent gain registered between 1991–1992 and 1996–1997.

Finally, the table illustrates the great variation in proportion of funding from different sources for public community colleges and four-year colleges. Public and private four-year colleges show a markedly higher reliance on student tuition and fees to support operations in comparison to community colleges. Additionally, they rely more on the federal government, auxiliary enterprises, private gifts and grants, and other revenue to finance their operations. Public community colleges, in contrast, rely more on local tax support. The information in Table 2 shows the proportion of operating revenues from different funding sources on a state-by-state basis for two-year colleges in 1996–1997. Public community colleges in thirty-five states received local tax support for their operations ranging from \$.02 per capita in Washington to \$56.57 per capita in Arizona. Public community colleges in states like Arizona, Wisconsin, California, and Illinois received a healthy portion of their operating revenue—in excess of one-third—from local tax while colleges in states like Connecticut, Indiana, Massachusetts, and Utah relied exclusively on state appropriations and student charges for operating support.

An interesting sidebar to the data in Table 1 is the basic difference in the way public and private two-year colleges are financed. Detailed information showing the distribution of revenue by source and type of institution for 1996–1997 (Table 3) reveal that private junior colleges get about two-thirds of their operating revenue from student tuition and fees. The only other significant sources of operating funds are private gifts, grants, and contracts and revenue earned through auxiliary enterprises. This pattern is similar to that found in privately controlled four-year colleges and universities, but even here significant differences are noted. Private four-year colleges and universities receive only about 43 percent of their income from student tuition and fees and more than one-third of their total revenue from gifts, grants, and contracts and other sources such as endowment. Clearly, private junior colleges have much smaller endowments than private four-year colleges on which to draw to support their current operations.

**Open access.** Student charges are an important source of revenue for all postsecondary institutions. For public community colleges, however, the cost of education is an important part of their mission. Access to educational opportunity is a defining characteristic for them and keeping

the door to opportunity open through low tuition is both a philosophical premise and a practical necessity.

Comparative student charges for two-year colleges and four-year colleges are shown in Table 4. Over the 22-year period from academic year 1976–

**Distribution of revenue by source and type of institution, 1996–1997**

In thousands.

1977 to academic year 1997–1998, tuition and fees in two-year colleges have, on the average, amounted to one-quarter of those for four-year colleges. This differential has widened over time as state appropriations to four-year colleges and universities have diminished in periods of economic fluctuation and tuition has increased to reduce the gap between income and expenditures. In 1976–1977, for example, the average cost of tuition and fees for a full-time student in two-year colleges (\$946) approximated 28 percent of the average cost for students enrolled in four-year colleges (\$3,329). By 1997–1998, the disparity had increased with the cost of tuition and fees in two-year colleges (\$1,592) averaging 25 percent of those for four-year colleges (\$6,329). When private two- and four-year colleges are removed from the analysis leaving only public institutions, the cost differential diminishes considerably with tuition and fees at public community colleges (\$1,318) averaging 42 percent of those at public colleges and universities (\$3,110).

**Expenditures.** Generally speaking, budgets and financial reports of colleges and universities are devel-

oped and analyzed according to categories of educational and general expenses. Subdivisions are commonly used to organize and report expenditures; the most common are instruction, research, public service, academic support, student services, institutional support, plant maintenance and operations, scholarships and fellowships, and transfers.

The information in Table 5 shows that public community colleges employ all nine expenditure subdivisions. As would be expected in any educational institution, the largest category of expenditure is instruction with 43 percent of all educational and general expenditures classified in this category in 1996–1997. When costs for academic support, student services, and institutional support are added to instructional cost, they account for more than three-quarters of all expenditures. These costs, for the most part, are attributable to personnel, which is why two-year colleges, and colleges and universities in general, are described as labor intensive organizations.

It is interesting to note that the categories of cost fluctuate as a percentage of expenditures as cost allo-

percent. This could be a reflection of the tendency of community colleges to shift more of the instructional workload to part-time faculty as a method for decreasing fixed costs and increasing flexibility. Proportionally larger costs for academic support could indicate that more resources are needed to acquire advanced technology in support of classroom instruction and to provide tutorial assistance to students experiencing academic difficulty. Rising costs for student services and institutional support could be a result of more extensive efforts by community colleges to market programs and services to a wide

array of audiences and to make more and better services available using technology and specialized support staff.

Out of these trends a greater focus is emerging on using resources more effectively through strategic planning. In this approach to allocating resources, priorities are determined through gathering and analyzing information about trends in the external environment and internal capabilities. Resources are allocated to these priorities in the operating budget and institutions measure their performance against achievement criteria established for each priority as

a method for determining their progress in reaching stated goals. The fiscal impact that each priority has on expenditure categories in the operating budget is then analyzed to determine cost benefits and additional resource requirements. What are the costs of implementation associated with each priority? How much revenue did the priority generate? What additional resources need to be allocated to fully achieve the priority?

### Critical Issues

A number of important finance and finance-related issues will challenge public community colleges, and to some extent private junior colleges, in the decade ahead. These issues can be organized and described in four categories: limits to institutional development, changing market conditions, new sources of support, and accountability.

**Limits to institutional development.** Public community colleges have been criticized in past years for having an unfocused mission—for being “all things to all people.” As their mission has expanded to encompass new activities such as workforce development and corporate training, the requirement for resources to support these activities, in addition to a comprehensive battery of current programs and services, has stretched to a breaking point. Where will new and additional resources come from to support an expanding mission? Will contraction be necessary to free up resources for new activities? How will institutions support a comprehensive mission in a period when resources are drying up? Planning will become important to institutions in the future as a method to make better decisions with fewer resources.

**Changing market conditions.** Shifting economic conditions and resulting impacts on programs and services are a fact of life for community colleges. In forty-three states, state revenues lag behind projections; governors and legislatures in states including California, Florida, Virginia, and Washington are faced with filling budget holes of \$1 billion. In most states, deep cuts in state expenditures once again mean higher education is facing a sharp-edged budget ax. Cuts in higher education will be used to balance overall state budgets in the short-term.

Demography will exert further pressure on states. By 2020, the retirement of baby boomers will cause an exodus from the workforce of 46 million workers with at least some postsecondary education.

Replacing these workers will be an estimated 49 million new adults with at least some college education—a net gain of 3 million. But this gain of 3 million will not be nearly enough. The Bureau of Labor Statistics projects a 22 percent increase in jobs that will require at least some college by 2008. If the trend holds through 2020, roughly 15 million new jobs that require postsecondary-educated workers will be created. In sum, the nation faces a deficit of approximately 12 million workers with at least some college education by 2020. Community colleges will be expected to address this shortage by providing new and additional programs and services. In a tight economy, however, where will the resources come from to develop and sustain new services?

**New sources of support.** As state spending for higher education declines in periods of economic recession, new sources of revenue will need to be found or community colleges will face the uncomfortable task of reducing their operating budgets. Many colleges are ill-prepared for budgetary reduction: systems for review of programs and services are not in place, performance information is not available, and the culture of most institutions is focused on growth, not decline. To avoid the trauma of reduction, many colleges will turn to new sources of revenue such as training dollars from the corporate sector and private gifts and grants. Resources in these arenas are historically tight, however, in periods of economic recession. What new sources of support will be available to community colleges to finance growth? When will colleges develop a capability to contract—to grow smaller through program and service reductions—as a method to allocate resources to new programs and services?

**Accountability.** Community colleges, and colleges and universities in general, have been criticized for performing quite poorly over time in reporting performance and cost information to the public. Legislators are reluctant to provide blank checks to institutions that are not accountable for what they do or how they spend public money. What is the effect of poor or weak reporting systems on institutional credibility? What new standards will elected officials put in place to improve accountability? What steps will institutions take to improve cost and performance reporting in a way that will help the public understand what they do?

## The Future

What does the future hold for finance in two-year colleges? In the public sector, the long-standing reliance on state appropriations and local tax funds and on student tuition and fees as primary sources of operating income will change dramatically. As economic conditions fluctuate, private sources of revenue will become more important as part of the operating budget. Institutions will seek to establish partnerships as a method for acquiring new revenue and reducing costs.

Community colleges in the twenty-first century will be more complex than their predecessors. At the same time, they will have less mass; many of the functions now handled in-house will be performed through alliances and networks. Shifting market opportunities and continuously evolving external networks will make these organizations dynamic. The power of an institution's "brand" will become increasingly important and new approaches to planning and budgeting will develop around the idea of brand. Budgeting will take on strategic importance as a method for transforming institutions in a turbulent market.

 STATE SUPPORT  
 Lawrence O. Picus

### HISTORY

School finance history is characterized by varying degrees of local, state, and federal support. Throughout history, local support of schools has suffered from glaringly inequitable tax structures resulting in wide variations in funding. State intercession has reduced local control but increased equalization in funding through regulations based on conditions associated with state aid. Federal financial activity evolved rapidly in the latter half of the twentieth century with contributions reaching their highest levels in the 1970s and again in the late 1990s. Federal-level rhetoric about support of education reemerged at the beginning of the twenty-first century, but the levels of funding and programmatic efforts were fractured along political divisions. These trends may be viewed within a historical perspective that encompasses five periods, beginning in 1607.

### The Colonial Period

The colonial period began with the establishment of the permanent settlement at Jamestown and ended with the conclusion of the Revolutionary War in 1783. During this period, support and control of schooling were exclusively a local matter. Local support, grounded in either the church or the home, grew from limited support of European investors. Monies that were earmarked for education were often redirected to other community needs, such as the building of hospitals. Schooling in the southern colonies was based on apprenticeships or the use of pauper schools. Wealthier areas in the Northeast supported community-financed grammar schools. The wide disparity in a revenue base for schooling mirrored similar disparities in quality of teaching, buildings, and curricula.

Once agreement had been reached to build and finance a school, local communities identified revenue sources that included subscriptions (specified amounts paid by townspeople), rents, donations, bequests, land grants from the British Crown, and other efforts made from the resources of the town. Puritan-Calvinist New England supported taxation to support an education system of common schools for all students, Latin schools for upper grades, and a college for ministerial preparation. A different system evolved in the mid-Atlantic colonies because these colonies did not have a church majority. Parochial schools dominated, despite their inevitable decline because of a lack of state regulation. State interference was resented and opposed. The state had no role or obligation to support such schools. The dominant trend emerging from the colonial period was that public education should not be limited to poor children or require tuition.

### **The National Period**

The national period began with the close of the Revolutionary War and extended through the end of the Civil War. Publicly supported and controlled education was implemented slowly. Financing of schools suffered because of needs associated with national security, the economy, and a significantly rapid increase in population. Local schools became less accessible due to westward expansion. Greater dispersion of the general population resulted in town decentralization and the establishment of the school district. Creating districts extended the concept of local control but resulted in poorer financing and reduced quality. Despite such limitations, the idea of the common school prospered between 1830 and 1865. The idea of tax-supported schools for all children also prospered. The driving mechanism for the common school movement was an expanding national economy based on manufacturing, trade, and industry.

Tax support during this period took a tremendous step forward. The designation in the western territories of sixteenth section township revenue increased support to common schools. (Revenue from the sixteenth section of each township was earmarked for the support of the township's common school.) Revenue obtained from two other sections within each township was also set aside to endow a university. States from the original colonies that did not have township revenue looked to other methods of tax support including literary funds (New York,

Maryland, and New Jersey); liquor-license fees (Connecticut); and state lotteries (New York). Bank taxes were also used between 1825 and 1860. States that did not use direct taxation looked to the property tax, but widespread use of this form of taxation was hard-won. Critics of pauper schools argued that the segregation of the poor into special schools did not represent the American ideal of an egalitarian democracy. Free schools also came under attack, because many were not actually free. In many cases, these schools were supported by rate bills that required a family to pay a tuition based on the number of children attending the school.

One of the main outcomes of the national period was an increase in state supervision with accompanying state requirements. Both outcomes were based on conditional state aid, a tactic also followed by the federal government. Government aid through land endowments to church schools was effectively ended. An outcome of the increase of sectarian control (loss of church dominance) over education was a decrease in the quality of local education and school attendance. This condition continued until state supervision over local outcomes began to increase.

### **The Post-Civil War Period**

The post-Civil War period began with the Reconstruction era and continued until 1905. The Civil War slowed educational expansion in the North, and completely stalled it in the South. Not until 1900 did southern educational standards come to meet the standards of 1860. In the South, education was in such a dilapidated state that the average value of a school building in 1900 was about \$100. The South was the last region to establish tax support because of slow improvement in the southern economy and it took the South a much longer time to generate a sufficient revenue stream to meet the needs of a public education system. The North, on the other hand, benefited from rapid urbanization, a vigorous economy, and an increased demand for skilled workers. Taxation reflected earlier trends, with nontax revenues used when possible and the property tax serving as the foundation for securing local support. State funding, when available, was characterized by a wide disparity in levels of aid to wealthy and poor areas.

### **The Early Reform Period**

Beginning in 1905, the early reform period witnessed increases in the general population, the number of

students attending school, average daily attendance (ADA), the number of teachers, and programs for handicapped children. Greater revenue was available for maintenance, operations, capital outlay, and transportation. Competition for tax dollars increased due to the growing number of lobbyists for special interest groups. Taxes, while more acceptable, were no more popular, and tax dollars were not automatically available for school support. Of great concern during this time was the idea of finding a fair and equitable means of distributing school funds and of maintaining local control.

This was also the era that witnessed the birth of school finance theory. The evolution of school finance theory can be traced through the work of a handful of scholars. As early as 1905, Ellwood Cubberly argued that the states should be responsible for ensuring that local communities establish and maintain local schools, for requiring employment of qualified teachers for a minimum annual period of time, and for setting requirements for educational outcomes. In 1922 Harlen Updegraff promoted the idea of rewards for local effort, incentive grants, equalization aid, and a variable level foundation program of state assistance based on local tax effort. George Sturgis followed in 1923 with proposed penalties for noncompliance with minimum state standards. Sturgis used a minimum, uniform tax levied for each school district and a level of state aid based on the difference between revenue acquired by a wealthy and a poor district. In 1924 Paul Mort defined a satisfactory minimum program and developed a measure of financial need based on a weighted pupil-typical teacher method that used such factors as ADA, educational level, and size of district. Henry Morrison argued that earlier efforts had failed and proposed a full state support model based on the fact that under law education is a state responsibility. The practical foundation for establishing state support through various aid formulations was created through the work of such theorists.

### The Modern Reform Period

The modern reform period began in 1965 when President Lyndon B. Johnson signed the Elementary and Secondary Education Act (ESEA) as part of his War on Poverty. Although this period is known for a diversity of finance-related reforms such as improved property assessment and inclusion of income in district wealth determination, ESEA was the signal event in the evolution of federal financial activity.

ESEA enacted a wide range of programs such as Title I, which pushed states to do more to serve their most needy students. Separately, Head Start services were provided for underprivileged preschoolers. Many laws followed ESEA targeting special needs groups including the Bilingual Education Act, the Native American Education Act, and the Education for All Handicapped Children Act (later renamed the Individuals with Disabilities Education Act). Federal aid reached a twentieth-century zenith under the Carter administration (adjusting for inflation), dropped slightly during the Reagan administrations, and resurged again during the two Clinton administrations. Education funding remains a key political issue in the twenty-first century for both Republicans and Democrats, despite their parties' very different views on the funding priorities.

### CAPITAL OUTLAY IN LOCAL SCHOOL SYSTEMS

Construction of facilities, including major renovation, additions, and upgrades for technology, is a major expenditure for public schools. Historically these expenses were borne primarily by local school districts, through the issuance of municipal bonds. In the last decade of the twentieth century, states took on a greater role in paying for capital and debt service costs of school districts. The federal govern-

ment, in a departure from its traditional role, has begun to consider providing a significant amount of support for facilities. This change is stimulated by growing enrollment, the deteriorating condition of buildings, litigation over state funding for facilities, and a desire by lawmakers to equalize funding for facilities as they have done for operating expenditures. States use a variety of approaches to distribute aid for capital, with some states providing a fixed amount per student, some reimbursing districts for a portion of their costs, and some providing support based on a review of the districts' needs. Few components of the school finance system are changing as rapidly as the one focused on facilities.

### **The Magnitude of Capital Costs**

Public elementary and secondary education is provided in more than 91,000 schools nationwide. The majority are elementary schools with enrollments of less than 500 pupils. With the median cost of building a school between \$12,500 and \$17,000 per student, or \$11 million to \$26 million per building depending on the school's grade-span, the cost of constructing facilities is a significant component of public school expenditures. In 1997–1998, school districts spent nearly \$36.2 billion in capital outlay and debt service, about 9 percent of all expenditures.

### **Growth in Student Population**

Although enrollment in public schools declined in the 1970s and 1980s, from 45.6 million in 1969 to 40.5 million in 1989, enrollment rose in the 1990s and was expected to continue to rise for long into the future. By 1999, enrollment was 46.8 million and projected enrollment for 2009 is 47.1 million. This growth varies from state to state and, more importantly, within states, placing a dramatically different burden on different school districts.

The buildings constructed to accommodate the last wave of enrollment growth have reached the end of their useful lives. Because of the location of population growth and the cost of renovating existing facilities, many new buildings are needed while older buildings are likely to be torn down or used for other purposes.

### **The Condition of Buildings**

Nationally, 76 percent of all public schools require work to bring all school features into good overall condition. Fifty percent have at least one building feature rated less than adequate, and 43 percent of

the buildings rate at least one environmental feature less than adequate. Between 1999 and 2001, 51 percent of all U.S. public schools had at least one major repair, renovation or replacement planned. In 1999, 20 percent of public schools had life safety features that rated less than adequate.

More than \$5.8 billion in renovations and an additional \$5.5 billion in school building additions were scheduled to be completed in 2001. New projects started in 2001 decreased slightly, with \$4.6 billion in renovations planned and \$5.4 billion in additions. More than 50 percent of all building upgrades planned for 2001 involved electrical overhaul, accommodating new demands for educational technology needs. Of the new middle and high schools constructed in 2001, 100 percent included security equipment. Of all renovations undertaken, more than 89 percent were changes designed to put buildings in compliance with the Americans with Disabilities Act of 1990.

Many studies have been conducted regarding how the atmosphere and environment of buildings affect student learning. These studies examined furniture arrangement, classroom density, noise, and effect of renovation. Furniture arrangement and floor plan reportedly influences student behavior and attitudes toward school. Studies demonstrate that students in high-density classrooms tend to be more aggressive and less socially integrated. Continued exposure to high noise from external sources, such as airports or traffic, correlates with lower reading scores. Children in classrooms with external noise also exhibit greater distractibility, lack of task persistence, and have significantly higher blood pressure than children in quieter settings. Another study showed that elementary school children exposed to noise had lower reading scores and poorer language acquisition. A study comparing performance of children in newly remodeled facilities to those in facilities that had not been renovated reported a positive correlation between parental involvement and condition of school building, and between upgraded school facilities and math achievement.

### **Litigation**

In some states, lawsuits have led to an increase in state funding for capital. A case in Colorado, *Giardino v. State Board of Education*, resulted in a settlement whereby the state agreed to increase assistance to local districts. This case argued that requir-

ing students to attend less than adequate facilities violated their right to due process, and that the funding system in place created too much variation among public schools, denying a thorough and uniform educational opportunity required by the Colorado Constitution. *Roosevelt v. Bishop*, an Arizona case, led the state supreme court to require state funding of all facilities to a minimum standard. The court there determined that the state school facilities board must set “minimum adequacy requirements,” which every school facility must meet. In response to this decision, three funds were established, providing approximately \$1.3 billion in capital funding. The court also set a date by which facilities must achieve the standard. A 2001 Wyoming state supreme court decision, *State of Wyoming v. Campbell County School District*, found the entire school finance system unconstitutional, but spoke specifically of capital construction, stating that “all facilities must be safe and efficient.” It went on to provide a specific definition of safe and efficient, and provided that “the legislature must fund the facilities deemed required by the state” for all students in Wyoming.

### State Aid for Capital Purposes

Historically, states played a limited role in paying for school construction. Until the 1980s, the primary role of the state was facilitating the use of bonds by school districts to incur debt for construction; states placed limits on the extent of debt districts could have, typically a proportion of their property value, and required that a supermajority of voters approve the issuance of debt. Some states provide an amount per pupil for capital purposes, others provide loans to school districts, reimburse a fixed percentage of annual debt service, or attempt to pay all capital costs. Some states provide no state aid for school facilities. However, an increasing number of states have implemented new forms of state assistance to supplement local funds. In at least four states, lottery ticket sales are put toward capital expenditures. Florida school districts receive funds from a tax on automobile licensing. California taxes new development to help pay for school construction. Other states have loan, reimbursement, or grant programs that allow local districts to supplement or replace money from local budgets with funds from the state. The state of Arizona, in response to the court ruling, pays for nearly all capital construction in order to ensure a uniform, minimal standard of quality.

### The Federal Role

The federal government has provided little support for the capital needs of school districts. During World War II the government provided support to school districts with military installations. This program has continued into the twenty-first century and expanded to include other districts impacted by federal interests. As federal aid for pupils with disabilities expanded after 1965, the government restricted most of its funds to assure that resources were focused on the instructional needs of students. Since the closing years of the twentieth century, attention has been devoted to developing new ways federal aid might be distributed to assist school districts in meeting facilities needs. These include the use of the tax system, through tax credits and tax waivers, to stimulate investment while avoiding direct expenditures. While the federal government is concerned about the condition of buildings and the need for new facilities, it may need to recognize that some of the other policies it promotes, from expanded use of technology to smaller class size, have implications for facilities.

### Other Capital Issues

A variety of other issues have implications for capital funding in the future. One issue is class size. Many states are considering requiring smaller class sizes, particularly in early grades, in light of the literature that supports such a policy. If states do require smaller classes, not only would more teachers be needed but more classrooms would be required as well, creating a major impact on elementary schools. Another issue is the expanding use of schools for preschool as well as for learning opportunities for parents. As more states consider moving to full-day kindergarten or providing preschool activities, the demand for space will increase. Schools may respond to this demand in the same way that some have dealt with playgrounds, athletic facilities, and libraries: by sharing their use with municipalities, which allows costs to be shared.

Another issue is technology. As more schools invest in hardware and software, several issues emerge: (1) the capacity to handle the telecommunications wiring and space needs for technology; (2) sufficient equipment to assure access to technology for all students; and (3) the frequency of upgrading technology. This last issue raises the distinction between current operating expenditures—costs consumed in one year—and capital expenditures, which typically

have a period of use over which costs may be depreciated. Many technological supplies and materials might be expected to last three to five years, creating a new category of expenditures.

A final issue is emerging from both the states' use of new accountability systems, and the expanding use of technology. As more students can fulfill graduation requirements without actually attending school, and more students use technology to take courses and do homework, the concept of a school may change. If schools serve as a place where students meet with teachers periodically, rather than a place they spend a specific amount of time each day, school buildings, particularly high schools, could take on a new look and become smaller than they are now. The cost of these buildings could decrease substantially. At a minimum, the internal organization of schools might change, reducing the need for libraries, laboratories, and auditoriums, which would lower their cost in communities that had those facilities available in other buildings.
